1.2 Urinary retention

Drugs for urinary retention

Acute retention is painful and is treated by catheterisation.

Chronic retention is painless and often long-standing. Catheterisation is unnecessary unless there is deterioration of renal function. After the cause has initially been established and treated, drugs may be required to increase detrusor muscle tone.

Benign prostatic hyperplasia is treated either surgically or medically with alpha-blockers. Dutasteride p. 676 and finasteride p. 676 are alternatives to alpha-blockers, particularly in men with a significantly enlarged prostate. Tadalafil p. 700, a phosphodiesterase type-5 inhibitor, may also be used in the management of benign prostatic hyperplasia.

Alpha-blockers

The alpha₁-selective alpha blockers, alfuzosin hydrochloride below, doxazosin p. 673, indoramin p. 673, prazosin p. 674, tamsulosin hydrochloride p. 674 and terazosin p. 675 relax smooth muscle in benign prostatic hyperplasia producing an increase in urinary flow-rate and an improvement in obstructive symptoms.

Parasympathomimetics

The parasympathomimetic bethanechol chloride p. 676 increases detrusor muscle contraction. However, it has only a limited role in the relief of urinary retention; its use has been superseded by catheterisation.

ALPHA-ADRENOCEPTOR BLOCKERS

Alfuzosin hydrochloride

INDICATIONS AND DOSE

Benign prostatic hyperplasia

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 2.5 mg 3 times a day; maximum 10 mg per day
- ▶ Elderly: Initially 2.5 mg twice daily, adjusted according to response; maximum 10 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 10 mg once daily

Acute urinary retention associated with benign prostatic hyperplasia

BY MOUTH USING MODIFIED-RELEASE TABLETS

- ▶ Elderly: 10 mg once daily for 2–3 days during catheterisation and for one day after removal; max. 4 days

- **CONTRA-INDICATIONS** Avoid if history micturition syncope · avoid if history of postural hypotension
- **CAUTIONS** Acute heart failure · concomitant antihypertensives (reduced dosage and specialist supervision may be required) · discontinue if angina worsens · elderly · history of QT-interval prolongation · patients undergoing cataract surgery (risk of intra-operative floppy iris syndrome)
- **INTERACTIONS** → Appendix 1 (alpha-blockers). Caution with concomitant use with other drugs known to prolong QT interval.

● SIDE-EFFECTS

- ▶ **Uncommon** Chest pain · flushes
- ▶ **Frequency not known** Angioedema · asthenia · blurred vision · cholestasis · depression · dizziness · drowsiness · dry mouth · erectile disorders (including priapism) · gastro-intestinal disturbances · headache · hypersensitivity · hypotension (notably postural hypotension) · intra-operative floppy iris syndrome · liver damage · oedema · palpitations · pruritus · rash · rhinitis · syncope · tachycardia

SIDE-EFFECTS, FURTHER INFORMATION

First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.

- **HEPATIC IMPAIRMENT** Initial dose 2.5 mg once daily, adjusted according to response to 2.5 mg twice daily in mild to moderate impairment—avoid if severe. Avoid modified-release preparations.
- **RENAL IMPAIRMENT** Initial dose 2.5 mg twice daily and adjust according to response. Manufacturers advise avoid use of modified-release preparations if eGFR less than 30 mL/minute/1.73 m² as limited experience.
- **PATIENT AND CARER ADVICE** May affect performance of skilled tasks e.g. driving. Patient should be counselled on the first dose effect.

Prazosin

INDICATIONS AND DOSE

Hypertension

BY MOUTH

- **Adult:** Initially 500 micrograms 2–3 times a day for 3–7 days, the initial dose should be taken on retiring to bed at night to avoid collapse, increased to 1 mg 2–3 times a day for a further 3–7 days, then increased if necessary up to 20 mg daily in divided doses

Congestive heart failure (rarely used)

BY MOUTH

- **Adult:** 500 micrograms 2–4 times a day, initial dose to be taken at bedtime, then increased to 4 mg daily in divided doses; maintenance 4–20 mg daily in divided doses

Raynaud's syndrome (but efficacy not established)

BY MOUTH

- **Adult:** Initially 500 micrograms twice daily, initial dose to be taken at bedtime, dose may be increased after 3–7 days, then increased if necessary to 1–2 mg twice daily

Benign prostatic hyperplasia

BY MOUTH

- **Adult:** Initially 500 micrograms twice daily for 3–7 days, subsequent doses should be adjusted according to response, maintenance 2 mg twice daily, initiate with lowest possible dose in elderly patients

Dose adjustments due to interactions

Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required

- **CONTRA-INDICATIONS** History of micturition syncope · history of postural hypotension · not recommended for congestive heart failure due to mechanical obstruction (e.g. aortic stenosis)
- **CAUTIONS** Cataract surgery (risk of intra-operative floppy iris syndrome) · elderly · first dose hypotension
- **INTERACTIONS** → Appendix 1 (alpha-blockers).
- **SIDE-EFFECTS**
- **Common or very common** Blurred vision · depression · dizziness · drowsiness · dry mouth · dyspnoea · gastro-intestinal disturbances · headache · nasal congestion · nervousness · oedema · palpitations · syncope · urinary frequency · vertigo · weakness

Tamsulosin hydrochloride

INDICATIONS AND DOSE

Benign prostatic hyperplasia

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- **Adult:** 400 micrograms once daily

- **CONTRA-INDICATIONS** History of micturition syncope · history of postural hypotension
- **CAUTIONS** Cataract surgery (risk of intra-operative floppy iris syndrome) · concomitant antihypertensives (reduced dosage and specialist supervision may be required) · elderly
- **INTERACTIONS** → Appendix 1 (alpha-blockers).
- **SIDE-EFFECTS** Angioedema · asthenia · blurred vision · depression · dizziness · drowsiness · dry mouth · erectile disorders · gastro-intestinal disturbances · headache · hypersensitivity reactions · hypotension (notably postural hypotension) · intra-operative floppy iris syndrome · oedema · palpitations · priapism · pruritus · rash · rhinitis · syncope · tachycardia
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution if eGFR less than 10 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE** May affect performance of skilled tasks e.g. driving.

- **EXCEPTIONS TO LEGAL CATEGORY** Tamsulosin hydrochloride 400 microgram capsules can be sold to the public for the treatment of functional symptoms of benign prostatic hyperplasia in men aged 45–75 years to be taken for up to 6 weeks before clinical assessment by a doctor.

5 α -REDUCTASE INHIBITORS

Dutasteride

- **DRUG ACTION** A specific inhibitor of the enzyme 5 α -reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

INDICATIONS AND DOSE

Benign prostatic hyperplasia

BY MOUTH

- Adult: 500 micrograms daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained).

- **INTERACTIONS** → Appendix 1 (dutasteride).
- **SIDE-EFFECTS** Breast enlargement · breast tenderness · decreased libido · ejaculation disorders · impotence
- **CONCEPTION AND CONTRACEPTION** Dutasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment—no information available.
- **EFFECT ON LABORATORY TESTS** May decrease serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment.
- **HANDLING AND STORAGE** Women of childbearing potential should avoid handling leaking capsules of dutasteride.
- **PATIENT AND CARER ADVICE** Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge.

1.3 Urological pain

Urological pain

The acute pain of *ureteric colic* may be relieved with pethidine hydrochloride p. 372. **Diclofenac** by injection or as suppositories is also effective and compares favourably with pethidine hydrochloride; other non-steroidal anti-inflammatory drugs are occasionally given by injection.

Lidocaine hydrochloride gel p. 1116 is a useful topical application in *urethral pain* or to relieve the discomfort of catheterisation.

Alkalinisation of urine

Alkalinisation of urine can be undertaken with potassium citrate. The alkalinising action may relieve the discomfort of *cystitis* caused by lower urinary tract infections. Sodium bicarbonate p. 848 is used as a urinary alkalinising agent in some metabolic and renal disorders.

Drugs used for Urological pain not listed below; Sodium bicarbonate, p. 848

ALKALINISING DRUGS

Citric acid with potassium citrate

INDICATIONS AND DOSE

Relief of discomfort in mild urinary-tract infections | Alkalinisation of urine

BY MOUTH USING ORAL SOLUTION

- Adult: 10 mL 3 times a day, diluted well with water

- **CAUTIONS** Cardiac disease · elderly
- **INTERACTIONS** → Appendix 1 (potassium salts).
- **SIDE-EFFECTS** Hyperkalaemia on prolonged high dosage · mild diuresis
- **RENAL IMPAIRMENT** Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Potassium Citrate Mixture BP consists of potassium citrate 30%,

citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K⁺/10 mL. Flavours of oral liquid formulations may include lemon.

- **EXCEPTIONS TO LEGAL CATEGORY** Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Effervescent tablet

► Effercitrate (Cambridge Healthcare Supplies Ltd)

Citric acid 250 mg, Potassium citrate 1.5 gram Effercitrate tablets (sugar-free) | 12 tablet [P] £3.51

Oral solution

CAUTIONARY AND ADVISORY LABELS 27

► CITRIC ACID WITH POTASSIUM CITRATE (Non-proprietary)

Citric acid monohydrate 50 mg per 1 mL, Potassium citrate 300 mg per 1 mL Potassium citrate mixture | 200 mL [P] £1.29 DT price = £1.29

Sodium citrate

INDICATIONS AND DOSE

Bladder washouts

- Adult: (consult product literature)

Relief of discomfort in mild urinary-tract infections

BY MOUTH

- Adult: (consult product literature)

MICRALAX[®]

Constipation

BY RECTUM

- Child 3-17 years: 5 mL for 1 dose
- Adult: 5 mL for 1 dose

MICOLETTE[®]

Constipation

BY RECTUM

- Child 3-17 years: 5–10 mL for 1 dose
- Adult: 5–10 mL for 1 dose

RELAXIT[®]

Constipation

BY RECTUM

- Child 1 month-2 years: 5 mL for 1 dose, insert only half the nozzle length
- Child 3-17 years: 5 mL for 1 dose
- Adult: 5 mL for 1 dose

● CONTRA-INDICATIONS

- With rectal use Acute gastro-intestinal conditions

● CAUTIONS

- With oral use Cardiac disease · elderly · hypertension · patients on a sodium-restricted diet
- With rectal use Debilitated patients · sodium and water retention in susceptible individuals

● INTERACTIONS

- With oral use → Appendix 1 (sodium citrate).

● SIDE-EFFECTS

- With oral use Mild diuresis

● PREGNANCY

- With oral use Use with caution.

● RENAL IMPAIRMENT

- With oral use In patients with fluid retention, avoid antacids containing large amounts of sodium.

- **PRESCRIBING AND DISPENSING INFORMATION** Sodium citrate 300 mmol/litre (88.2 mg/mL) oral solution is licensed for use before general anaesthesia for caesarean section (available from Viridian).
- **EXCEPTIONS TO LEGAL CATEGORY** Proprietary brands of sodium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

MEDICINAL FORMS

2 Bladder instillations and urological surgery

Bladder instillations and urological surgery

Bladder infection

Various solutions are available as irrigations or washouts.

Aqueous chlorhexidine p. 1051 can be used in the management of common infections of the bladder but it is ineffective against most *Pseudomonas spp.* Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride solution 0.9% p. 851 (physiological saline) is usually adequate and is preferred as a mechanical irrigant.

Continuous bladder irrigation with amphotericin 50 micrograms/mL p. 517 may be of value in mycotic infections in adults.

Dissolution of blood clots

Clot retention is usually treated by irrigation with sterile sodium chloride solution 0.9% but sterile sodium citrate solution for bladder irrigation 3% may also be helpful.

Bladder cancer

Bladder instillations of doxorubicin hydrochloride p. 754 and mitomycin p. 767 are used for recurrent superficial bladder tumours. Such instillations reduce systemic side-effects; adverse effects on the bladder (e.g. micturition disorders and reduction in bladder capacity) may occur.

Instillation of epirubicin hydrochloride p. 756 is used for treatment and prophylaxis of certain forms of superficial bladder cancer; instillation of doxorubicin hydrochloride p. 754 is also used for some papillary tumours.

Instillation of BCG (bacillus calmette-guérin p. 794), a live attenuated strain derived from *Mycobacterium bovis* is licensed for the treatment of primary or recurrent bladder carcinoma *in-situ* and for the prevention of recurrence following transurethral resection.

Urological surgery

Glycine irrigation solution 1.5% p. 679 is the irrigant of choice for transurethral resection of the prostate gland and bladder tumours; sterile sodium chloride solution 0.9% (physiological saline) is used for percutaneous renal surgery.

Maintenance of indwelling urinary catheters

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

Chlorhexidine with lidocaine

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 1051, lidocaine hydrochloride p. 1161.

INDICATIONS AND DOSE**Urethral sounding and catheterisation**

BY URETHRAL APPLICATION

▶ Adult: 6–11 mL

Cystoscopy

BY URETHRAL APPLICATION

▶ Adult: 11 mL, then 6–11 mL if required

3 Contraception**Contraceptives, hormonal**

The Fraser Guidelines (Department of Health Guidance (July 2004): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health, available at www.tinyurl.com/bpg16) should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at www.fsrh.org) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

Hormonal contraception is the most effective method of fertility control, but can have major and minor side-effects, especially for certain groups of women. Hormonal contraception should only be used by adolescents after menarche.

Intra-uterine devices are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irrespective of parity, but are less appropriate for those with an increased risk of pelvic inflammatory disease.

Barrier methods alone (condoms, diaphragms, and caps) are less effective but can be reliable for well-motivated couples if used in conjunction with a **spermicide**. Occasionally sensitivity reactions occur. A female condom (*Femidom*[®]) is also available; it is pre-lubricated but does not contain a spermicide.

Combined hormonal contraceptives

Oral contraceptives containing an oestrogen and a progestogen ('combined oral contraceptives') are effective preparations for general use. Advantages of combined oral contraceptives include:

- reliable and reversible;
- reduced dysmenorrhoea and menorrhagia;
- reduced incidence of premenstrual tension;
- less symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed 'monophasic'; those with varying amounts of the two hormones are termed 'phasic'. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

Combined Oral Contraceptives Monophasic 21-day preparations

Oestrogen content	Progestogen content	Brand

Choice

The majority of combined oral contraceptives contain ethinylestradiol p. 655 as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content which gives good cycle control and minimal side-effects in the individual woman is chosen. It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age since more suitable alternatives exist.

- **Low strength preparations** (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.
- **Standard strength preparations** (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram *phased* preparations) are appropriate for standard use. Phased preparations are generally reserved for women who *either* do not have withdrawal bleeding or who have breakthrough bleeding with monophasic products.

The progestogens desogestrel with ethinylestradiol p. 685, drospirenone with ethinylestradiol p. 686, and ethinylestradiol with gestodene p. 687 may be considered for women who have side-effects (such as acne, headache, depression, breast symptoms, and breakthrough bleeding) with other progestogens. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

Dienogest with estradiol valerate p. 685 is in the combined oral contraceptive *Qlaira*[®]. Nomegestrol is the progestogen contained in the combined oral contraceptive *Zoely*[®], in combination with estradiol.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (*Eвра*[®]). The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (*NuvaRing*[®]).

Surgery

Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

Reason to stop immediately

Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse *or* sudden partial or complete loss of vision *or* sudden disturbance of hearing or other perceptual disorders *or* dysphasia *or* bad fainting attack or collapse *or* first unexplained epileptic seizure *or* weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg; (in adolescents stop if blood pressure very high);
- prolonged immobility after surgery or leg injury;

- detection of a risk factor which contra-indicates treatment.

Progestogen-only contraceptives

Oral progestogen-only contraceptives

Oral progestogen-only preparations alter cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Progestogen-only contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contra-indicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 95 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura).

Parenteral progestogen-only contraceptives

Medroxyprogesterone acetate (*Depo-Provera*[®], *SAYANA PRESS*[®]) p. 695 is a long-acting progestogen given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without *full counselling backed by the patient information leaflet*. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased).

- In adolescents, medroxyprogesterone acetate (*Depo-Provera*[®], *SAYANA PRESS*[®]) should be used only when other methods of contraception are inappropriate;
- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks;
- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

Norethisterone enantate (*Noristerat*[®]) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

An **etonogestrel-releasing implant** (*Nexplanon*[®]) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant.

Intra-uterine progestogen-only device

The progestogen-only intra-uterine systems, *Mirena*[®] and *Jaydess*[®], releases levonorgestrel p. 692 directly into the uterine cavity. *Mirena*[®] is licensed for use as a contraceptive, for the treatment of primary menorrhagia, and for the prevention of endometrial hyperplasia during

oestrogen replacement therapy. *Jaydess*[®] is licensed for contraception. These may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time.

Surgery

All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Emergency contraception

Hormonal methods

Hormonal emergency contraceptives include levonorgestrel p. 692 and ulipristal acetate p. 691; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 96 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal acetate, a progesterone receptor modulator, is effective if taken within 120 hours (5 days) of unprotected intercourse.

Levonorgestrel is less effective than insertion of an intra-uterine device. Ulipristal acetate is as effective as levonorgestrel, but its efficacy compared to an intra-uterine device is not yet known.

Intra-uterine device

Insertion of an intra-uterine device is more effective than oral levonorgestrel p. 692 for emergency contraception. A copper intra-uterine contraceptive device can be inserted up to 120 hours (5 days) after unprotected intercourse; sexually transmitted infections should be tested for and insertion of the device should usually be covered by antibacterial prophylaxis (e.g. azithromycin p. 469). If intercourse has occurred more than 5 days previously, the device can still be inserted up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle.

Contraceptives, interactions

Combined hormonal contraceptives interactions

The effectiveness of *combined* oral contraceptives, *progestogen-only* oral contraceptives, contraceptive patches, and vaginal rings can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine p. 387, eslicarbazepine acetate p. 390, nevirapine p. 560, oxcarbazepine p. 397, phenytoin p. 398,

phenobarbital p. 409, primidone p. 401, ritonavir p. 570, St John's Wort, topiramate p. 406 and, above all, rifabutin p. 507 and rifampicin p. 508). A condom together with a long-acting method, such as an injectable contraceptive, may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

Women taking combined hormonal contraceptives who require enzyme-inducing drugs should be advised to change to a contraceptive method that is unaffected by enzyme-inducers (e.g. some parenteral progestogen-only contraceptives, intra-uterine devices) for the duration of treatment and for 4 weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed:

- For a *short course* (2 months or less) of an enzyme-inducing drug, continue with a combined oral contraceptive providing ethinylestradiol 30 micrograms or more daily and use a 'tricycling' regimen (i.e. taking 3 packets of monophasic tablets without a break followed by a shortened tablet-free interval of 4 days [unlicensed use]). Additional contraceptive precautions should also be used whilst taking the enzyme-inducing drug and for 4 weeks after stopping. Another option (except for rifampicin or rifabutin) is to follow the advice for long-term courses.

For women using combined hormonal contraceptive patches or vaginal rings, additional contraceptive precautions are also required whilst taking the enzyme-inducing drug and for 4 weeks after stopping. If concomitant administration runs beyond the 3 weeks of patch or vaginal ring use, a new treatment cycle should be started immediately, without a patch-free or ring-free break.

- For a *long-term course* (over 2 months) of an enzyme-inducing drug (except rifampicin or rifabutin), adjust the dose of combined oral contraceptive to provide ethinylestradiol 50 micrograms or more daily [unlicensed use] and use a 'tricycling' regimen; continue for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use], or to use additional precautions, or to change to a method unaffected by enzyme-inducing drugs.

Contraceptive patches and vaginal rings are not recommended for women taking enzyme-inducing drugs over a long period.

- For a *long-term course* (over 2 months) of rifampicin or rifabutin, an alternative method of contraception (such as an IUD) is **always** recommended because they are such potent enzyme-inducing drugs; the alternative method of contraception should be continued for 4 weeks after stopping the enzyme-inducing drug.

Antibacterials that do not induce liver enzymes

Latest recommendations are that no additional contraceptive precautions are required when *combined* oral contraceptives are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur. These recommendations should be discussed with the woman, who should also be advised that guidance in patient information leaflets may differ.

It is also currently recommended that no additional contraceptive precautions are required when contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes. There have been concerns that some antibacterials that do not induce liver enzymes (e.g. ampicillin p. 483, doxycycline p. 496) reduce the efficacy of *combined* oral contraceptives by impairing the bacterial flora

responsible for recycling ethinylestradiol from the large bowel. However, there is a lack of evidence to support this interaction.

Oral progestogen-only contraceptives interactions

Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an enzyme-inducing drug and for at least 4 weeks afterwards. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the progestogen-only oral method may be continued in combination with additional contraceptive precautions (e.g. barrier methods) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

Parenteral progestogen-only contraceptives interactions

Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of norethisterone intramuscular injection p. 656 and medroxyprogesterone acetate intramuscular and subcutaneous injections p. 695 is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs. However, effectiveness of the etonogestrel-releasing implant p. 695 may be reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the enzyme-inducing drug and for at least 4 weeks after stopping. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the implant may be continued in combination with additional contraceptive precautions (e.g. condom) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping it.

Hormonal emergency contraception interactions

The effectiveness of levonorgestrel p. 692, and possibly ulipristal acetate p. 691, is reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

Contraceptives, non-hormonal

Spermicidal contraceptives

Spermicidal contraceptives are useful additional safeguards but do **not** give adequate protection if used alone unless fertility is already significantly diminished. They have two components: a spermicide and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not generally recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol '9' p. 697 has been associated with genital

lesions, which may increase the risk of acquiring these infections.

Products such as petroleum jelly (*Vaseline*®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

Contraceptive devices

The intra-uterine device (IUD) is a suitable contraceptive for women of all ages irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease e.g. women under 25 years.

The most effective intra-uterine devices have at least 380 mm² of copper and have banded copper on the arms. Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

Fertility declines with age and therefore a copper intra-uterine device which is fitted in a woman over the age of 40, may remain in the uterus until menopause.

A frameless, copper-bearing intra-uterine device (*Gyne Fix*®) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus.

3.1 Contraception, combined

OESTROGENS

Combined hormonal contraceptives

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 · gallstones · heart disease associated with pulmonary hypertension or risk of embolus · history during pregnancy of cholestatic jaundice · history during pregnancy of chorea · history during pregnancy of pemphigoid gestationis · history during pregnancy of pruritus · history of breast cancer (but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable) · history of haemolytic uraemic syndrome · migraine with aura · personal history of venous or arterial thrombosis · sclerosing treatment for varicose veins · severe or multiple risk factors for arterial disease · severe or multiple risk factors for venous thromboembolism · systemic lupus erythematosus with (or unknown) antiphospholipid antibodies · transient cerebral ischaemic attacks without headaches · undiagnosed vaginal bleeding
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · Crohn's disease · gene mutations associated with breast cancer (e.g. BRCA 1) · history of severe depression especially if induced by hormonal contraceptive · hyperprolactinaemia (seek specialist advice) · inflammatory bowel disease · migraine · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · risk factors for arterial disease · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed breast mass
- **CAUTIONS, FURTHER INFORMATION**
Risk of venous thromboembolism There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal

contraceptives following a break of four weeks or more. This risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Combined hormonal contraceptives also slightly increase the risk of arterial thromboembolism; however, there is no evidence to suggest that this risk varies between different preparations.

Risk factors for venous thromboembolism Use with **caution** if any of following factors present but **avoid** if two or more factors present:

- *family history of venous thromboembolism* in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
- *obesity*; body mass index ≥ 30 kg/m² (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
- *long-term immobilisation* e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
- *history of superficial thrombophlebitis*;
- *age* over 35 years (avoid if over 50 years);
- *smoking*.

Combined Hormonal Contraception and Risk of Venous Thromboembolism

Progestogen in Combined Hormonal Contraceptive	Estimated incidence per 10 000 women per year of use
Non-pregnant, not using combined hormonal contraception	2

¹Combined with ethinylestradiol ²Combined with estradiol

Risk factors for arterial disease Use with **caution** if any one of following factors present but **avoid** if two or more factors present:

- *family history of arterial disease* in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
- *diabetes mellitus* (avoid if diabetes complications present);
- *hypertension*; blood pressure above *systolic* 140 mmHg or *diastolic* 90 mmHg (avoid if blood pressure above *systolic* 160 mmHg or *diastolic* 95 mmHg); (in adolescents, avoid if blood pressure very high);
- *smoking* (avoid if smoking 40 or more cigarettes daily);

- *age* over 35 years (avoid if over 50 years);
- *obesity* (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
- *migraine without aura* (avoid if *migraine with aura* (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

Migraine Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

Combined hormonal contraceptives should be stopped (pending investigation and treatment), if serious neurological effects occur, including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body.

- **INTERACTIONS** → Appendix 1 (oestrogens, progestogens).

● SIDE-EFFECTS

- ▶ **Rare** Gallstones · systemic lupus erythematosus
- ▶ **Frequency not known** Abdominal cramps · absence of withdrawal bleeding · amenorrhoea after discontinuation · breast enlargement · breast secretion · breast tenderness · cervical erosion · changes in libido · changes in lipid metabolism · changes in vaginal discharge · chloasma · chorea · contact lenses may irritate · depression · fluid retention · headache · hepatic tumours · hypertension · irritability · leg cramps · liver impairment · nausea · nervousness · photosensitivity · reduced menstrual loss · skin reactions · thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) · visual disturbances · vomiting · 'spotting' in early cycles

SIDE-EFFECTS, FURTHER INFORMATION

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years.

Cervical cancer Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years. The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), liver tumours.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With oral use Each tablet should be taken at approximately same time each day; if delayed, contraceptive protection may be lost. 21-day combined preparations, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day

interval (during which withdrawal bleeding occurs); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days. *Every day (ED) combined preparations*, 1 active tablet daily for 21 days, followed by 1 inactive tablet daily for 7 days; subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days.

Changing to combined preparation containing different progestogen If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately. See individual monographs for requirements of specific preparations.

Changing from progestogen-only tablet If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days.

Secondary amenorrhoea (exclude pregnancy) Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for *Qlaira*[®]).

After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days (9 days for *Qlaira*[®]).

After abortion or miscarriage Start same day.

● PATIENT AND CARER ADVICE

Missed pill The critical time for loss of contraceptive protection is when a pill is omitted at the *beginning* or *end* of a cycle (which lengthens the pill-free interval).

If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary.

If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of *everyday* (ED) pills, omitting the 7 inactive tablets). Emergency contraception is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

Travel Women taking oral contraceptives are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days after recovery. If the vomiting and diarrhoea occurs during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).

Dienogest with estradiol valerate

INDICATIONS AND DOSE

Contraception with 28-day combined preparations | Menstrual symptoms with 28-day combined preparations

BY MOUTH

- ▶ Females of childbearing potential: 1 active tablet once daily for 26 days, followed by 1 inactive tablet daily for 2 days, withdrawal bleeding may occur during the 2-day interval of inactive tablets, tablets should be taken at approximately the same time each day

● DIRECTIONS FOR ADMINISTRATION

Combined hormonal contraceptives Each tablet should be taken at approximately same time each day; if delayed, contraceptive protection may be lost.

Qlaira[®], 1 active tablet daily for 26 days, followed by 1 inactive tablet daily for 2 days starting on day 1 of cycle with first active tablet; subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken).

Changing to combined preparation containing different progestogen If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately.

- Changing to *Qlaira*[®]: start the first active *Qlaira*[®] tablet on the day after taking the last active tablet of the previous brand

Changing from progestogen-only tablet Changing to *Qlaira*[®]: start any day, additional precautions (barrier methods) necessary for first 9 days.

Secondary amenorrhoea (exclude pregnancy) Start any day, additional precautions (barrier methods) necessary during first 9 days for *Qlaira*[®].

After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 9 days for *Qlaira*[®]. After abortion or miscarriage Start same day.

● PATIENT AND CARER ADVICE

Missed dose A missed pill for a patient taking *Qlaira*[®] is one that is 12 hours or more late; for information on how to manage missed pills in women taking *Qlaira*[®], refer to product literature.

Diarrhoea and vomiting In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking *Qlaira*[®], refer to product literature.

INDICATIONS AND DOSE

Contraception | Menstrual symptoms

BY VAGINA

- ▶ Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs)

• DIRECTIONS FOR ADMINISTRATION

Changing method of contraception to vaginal ring. Insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle.

Changing from progestogen-only method. From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, insert ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days. After first trimester abortion. Start immediately. After childbirth (not breast-feeding) or second trimester abortion. Start 4 weeks after birth or abortion; if started later than 4 weeks after birth or abortion, additional precautions (barrier methods) should be used for first 7 days.

• PATIENT AND CARER ADVICE

Expulsion, delayed insertion or removal, or broken vaginal ring If the vaginal ring is expelled for less than 3 hours, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

If the ring remains outside the vagina for more than 3 hours or if the user does not know when the ring was expelled, contraceptive protection may be reduced:

- If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
- If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered. No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring. If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

Patients or carers should be given advice on how to administer vaginal ring.

Counselling The presence of the ring should be checked regularly.

Travel Women using the vaginal ring are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Ethinylestradiol with norethisterone

The properties listed below are those particular to the combination only. For the properties of the components please consider, ethinylestradiol p. 655, norethisterone p. 656.

INDICATIONS AND DOSE

Contraception with 21-day combined preparations | Menstrual symptoms with 21-day combined preparations
BY MOUTH

- ▶ Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Brevinor** (Pfizer Ltd)
Ethinylestradiol 35 microgram, Norethisterone 500 microgram Brevinor 500microgram/35microgram tablets | 63 tablet [PoM] £1.99
- ▶ **Loestrin 20** (Galen Ltd)
Ethinylestradiol 20 microgram, Norethisterone acetate 1 mg Loestrin 20 tablets | 63 tablet [PoM] £2.30
- ▶ **Loestrin 30** (Galen Ltd)
Ethinylestradiol 30 microgram, Norethisterone acetate 1.5 mg Loestrin 30 tablets | 63 tablet [PoM] £3.32
- ▶ **Norimin** (Pfizer Ltd)
Ethinylestradiol 35 microgram, Norethisterone 1 mg Norimin 1mg/35microgram tablets | 63 tablet [PoM] £2.28 DT price = £2.28
- ▶ **Ovysmen** (Janssen-Cilag Ltd)
Ethinylestradiol 35 microgram, Norethisterone 500 microgram Ovysmen 500microgram/35microgram tablets | 63 tablet [PoM] £1.89

Ethinylestradiol with norgestimate

The properties listed below are those particular to the combination only. For the properties of the components please consider, ethinylestradiol p. 655.

INDICATIONS AND DOSE

Contraception with 21-day combined preparations | Menstrual symptoms with 21-day combined preparations
BY MOUTH

- ▶ Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day

Ethinylestradiol 35 microgram, Norgestimate 250 microgram Cilest 250microgram/35microgram tablets | 63 tablet [PoM] £7.16
- ▶ Brands may include Lizinna

Ethinylestradiol with norelgestromin

The properties listed below are those particular to the combination only. For the properties of the components please consider, ethinylestradiol p. 655.

INDICATIONS AND DOSE

Contraception | Menstrual symptoms

BY TRANSDERMAL APPLICATION

- ▶ Females of childbearing potential: Apply 1 patch once weekly for 3 weeks, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle, subsequent courses repeated after a 7-day patch free interval (during which withdrawal bleeding occurs)

- **DIRECTIONS FOR ADMINISTRATION** Adhesives or bandages should not be used to hold patch in place. If no longer sticky do not reapply but use a new patch.

Changing to a transdermal combined hormonal contraceptive
Changing from combined oral contraception Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last active tablet, rule out pregnancy before applying first patch.

Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days.

Changing from progestogen-only method

- from an implant, apply first patch on the day implant removed
- from an injection, apply first patch when next injection due
- from oral progestogen, first patch may be applied on any day after stopping pill

For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

After childbirth (not breast-feeding) Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days.

After abortion or miscarriage Before 20 weeks' gestation start immediately; no additional contraception required if started immediately. After 20 weeks' gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch.

PATIENT AND CARER ADVICE

Delayed application or detached patch If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual 'change day'. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new 'Day 1'; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new 'Day 1'; additional non-hormonal methods of contraception should be used for the first 7 days of the

new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch 'change day' remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new 'Day 1'; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual 'change day', the day after day 28; no additional contraception is required.

Patients and carers should be given advice on how to administer patches.

Travel Women using patches are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2003) that *Evra*[®] patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Transdermal patch

▶ *Evra* (Janssen-Cilag Ltd)

Ethinylestradiol 33.9 microgram per 24 hour, Norelgestromin 203 microgram per 24 hour *Evra* transdermal patches | 9 patch [PoM] £19.51 DT price = £19.51

Mestranol with norethisterone

The properties listed below are those particular to the combination only. For the properties of the components please consider, norethisterone p. 656.

3.2 Contraception, devices

Drugs used for Contraception, devices not listed below;
Levonorgestrel, p. 692

CONTRACEPTIVE DEVICES

Intra-uterine contraceptive devices (copper)

INDICATIONS AND DOSE

Contraception

BY INTRA-UTERINE ADMINISTRATION

- ▶ Females of childbearing potential: (consult product literature)

- **CONTRA-INDICATIONS** Active trophoblastic disease (until return to normal of urine and plasma-gonadotrophin concentration) · distorted uterine cavity · established or marked immunosuppression · genital malignancy · medical diathermy · pelvic inflammatory disease · recent sexually transmitted infection (if not fully investigated and treated) · severe anaemia · small uterine cavity · unexplained uterine bleeding · Wilson's disease
- **CAUTIONS** Anaemia · anticoagulant therapy (avoid if possible) · diabetes · disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · endometriosis · epilepsy (risk of seizure at time of insertion) · fertility problems · history of pelvic inflammatory disease · increased risk of expulsion if inserted before uterine involution · menorrhagia (progestogen intra-uterine system might be preferable) · nulliparity · severe cervical stenosis · severe primary dysmenorrhoea · severely scarred uterus (including after endometrial resection) · young age

CAUTIONS, FURTHER INFORMATION

Risk of infection The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:

- they are under 25 years old *or*
- they are over 25 years old *and* have a new partner *or*
- have had more than one partner in the past year *or* their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend *as an emergency* if she experiences sustained pain during the next 20 days. An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

- **SIDE-EFFECTS** Allergy · bleeding (on insertion) · cervical perforation · displacement · dysmenorrhoea · expulsion · menorrhagia · occasionally epileptic seizure (on insertion) · pain (on insertion, alleviated by NSAID such as ibuprofen 30 minutes before insertion) · pelvic infection may be exacerbated · uterine perforation · vasovagal attack (on insertion)

SIDE-EFFECTS, FURTHER INFORMATION

Presence of significant symptoms (especially pain) Advise the patient to seek medical attention promptly in case of significant symptoms.

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated if patient has a copper allergy.
- **PREGNANCY** If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Remove

device; if pregnancy occurs, increased likelihood that it may be ectopic.

- **BREAST FEEDING** Not known to be harmful.
- **MONITORING REQUIREMENTS** Gynaecological examination before insertion, 6–8 weeks after insertion, then annually.
- **DIRECTIONS FOR ADMINISTRATION** The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. *The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet.* Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation.

3.3 Contraception, oral progestogen-only

Drugs used for Contraception, oral progestogen-only not listed below; Norethisterone, p. 656

Ulipristal acetate

- **DRUG ACTION** Ulipristal acetate is a progesterone receptor modulator with a partial progesterone antagonist effect.

INDICATIONS AND DOSE

Emergency contraception

BY MOUTH

- ▶ Females of childbearing potential: 30 mg for 1 dose, to be taken as soon as possible after coitus, but no later than after 120 hours

Pre-operative treatment of moderate to severe symptoms of uterine fibroids

BY MOUTH

- ▶ Adult: 5 mg daily for up to 3 months starting during the first week of menstruation, course may be repeated once if necessary, starting during the second menstruation after the first course completed, maximum 2 courses of 3 months

- **CONTRA-INDICATIONS**

GENERAL CONTRA-INDICATIONS

Repeated use as an emergency contraceptive within a menstrual cycle

SPECIFIC CONTRA-INDICATIONS

- ▶ When used for uterine fibroids Breast cancer · cervical cancer · ovarian cancer · undiagnosed vaginal bleeding · uterine cancer · vaginal bleeding not caused by uterine fibroids

- **CAUTIONS** Uncontrolled severe asthma

- **INTERACTIONS** → Appendix 1 (ulipristal).

The effectiveness of ulipristal as an emergency contraceptive is possibly reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

- **SIDE-EFFECTS**

- ▶ **Common or very common**

- ▶ **When used for emergency contraception** Abdominal pain · back pain · diarrhoea · dizziness · fatigue · gastrointestinal disturbances · headache · menstrual irregularities · muscle spasms · nausea · vomiting
- ▶ **When used for uterine fibroids** Abdominal pain · acne · breast pain · dizziness · endometrial thickening · headache · hot flushes · hyperhidrosis · malaise · menstrual disturbances · myalgia · nausea · oedema · ovarian cyst (including rupture) · pelvic pain · uterine haemorrhage
- ▶ **Uncommon**
- ▶ **When used for emergency contraception** Blurred vision · breast tenderness · dry mouth · hot flushes · pruritus · rash · tremor · uterine spasm
- ▶ **When used for uterine fibroids** Anxiety · constipation · dry mouth · dyspepsia · epistaxis · flatulence · urinary incontinence

- **CONCEPTION AND CONTRACEPTION** When ulipristal is given as an emergency contraceptive the effectiveness of combined hormonal and progestogen-only contraceptives may be reduced—additional precautions (barrier methods) required for 14 days for combined and parenteral progestogen-only hormonal contraceptives (16 days for *Qlaira*®) and 9 days for oral progestogen-only

contraceptives. When ulipristal is given for uterine fibroids non-hormonal contraceptive methods (barrier methods or intra-uterine device) should be used both during treatment and for 12 days after stopping, if required.

- **PREGNANCY** Manufacturer advises avoid for uterine fibroids—no information available. Limited information available when used as an emergency contraceptive.
- **BREAST FEEDING** When used for uterine fibroids, manufacturer advises avoid—no information available. In emergency contraception manufacturer advises avoid for 1 week after administration—present in milk.
- **HEPATIC IMPAIRMENT** Caution with use in uterine fibroids in moderate to severe hepatic impairment—no information available. Manufacturer advises avoiding use as an emergency contraceptive in severe hepatic impairment—no information available.
- **RENAL IMPAIRMENT** Caution in severe renal impairment when used for uterine fibroids—no information available.
- **PATIENT AND CARER ADVICE** When ulipristal is given as an emergency contraceptive, if vomiting occurs within 3 hours of taking a dose, a replacement dose should be given. When prescribing or supplying hormonal emergency contraception, women should be advised:
 - that their next period may be early or late;
 - that a barrier method of contraception needs to be used until the next period;
 - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
 - to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Ellaone** (HRA Pharma UK Ltd)

Ulipristal acetate 30 mg EllaOne 30mg tablets | 1 tablet [P] £14.05

- ▶ **Esmya** (Gedeon Richter (UK) Ltd)

Ulipristal acetate 5 mg Esmya 5mg tablets | 28 tablet [PoM] £114.13

PROGESTOGENS

Desogestrel

INDICATIONS AND DOSE

Contraception

BY MOUTH

- ▶ Females of childbearing potential: 75 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 12 hours or more it should be regarded as a 'missed pill'

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

CAUTIONS, FURTHER INFORMATION

Other conditions The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

- **INTERACTIONS** → Appendix 1 (progestogens).
- **SIDE-EFFECTS** Breast discomfort · changes in libido · depression · disturbance of appetite · dizziness · headache · menstrual irregularities · nausea · skin disorders · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- **HEPATIC IMPAIRMENT** Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.
- **PATIENT AND CARER ADVICE**
Missed pill The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours (12 hours for desogestrel) overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.'

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours (12 hours for desogestrel) late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Surgery All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Starting routine One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours (12 hours for desogestrel) contraceptive protection may be lost). Additional contraceptive precautions are not necessary when initiating treatment.

Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours (12 hours for desogestrel) of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

● NATIONAL FUNDING/ACCESS DECISIONS**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (September 2003) that *Cerazette*[®] should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contra-indicated.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet**► DESOGESTREL (Non-proprietary)**

► Brands may include Aizea; Cerelle; Desomono; Desorex; Feanolla; Nacrez; Zelta

Levonorgestrel**INDICATIONS AND DOSE****Emergency contraception****BY MOUTH**

- Females of childbearing potential: 1.5 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours but no later than after 72 hours

Contraception**BY MOUTH**

- Females of childbearing potential: 1 tablet daily starting on day 1 of the cycle then continuously, dose is to be taken at the same time each day, if administration delayed for 3 hours or more it should be regarded as a 'missed pill'

JAYDESS[®] 13.5MG INTRA-UTERINE DEVICE**Contraception****BY VAGINA**

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester termination; postpartum insertions should be delayed until at least 6 weeks after delivery (12 weeks if uterus involution is substantially delayed); effective for 3 years

MIRENA[®] 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE**Contraception | Menorrhagia****BY INTRA-UTERINE ADMINISTRATION**

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately after first-trimester termination by curettage; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

Prevention of endometrial hyperplasia during oestrogen replacement therapy**BY INTRA-UTERINE ADMINISTRATION**

- Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding or at any time if amenorrhoeic; effective for 4 years

● CONTRA-INDICATIONS

- With intra-uterine use Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration · acute cervicitis · acute vaginitis · distorted uterine cavity · established immunosuppression · genital

malignancy · history of breast cancer but can be considered for a woman in long-term remission who has menorrhagia and requires effective contraception · infected abortion during the previous three months · marked immunosuppression · not suitable for emergency contraception · pelvic inflammatory disease · postpartum endometritis · recent sexually transmitted infection (if not fully investigated and treated) · severe anaemia · small uterine cavity · unexplained uterine bleeding

- ▶ With oral use Acute porphyrias p. 864
 - ▶ With oral use for contraception History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding
- CAUTIONS**
- ▶ With intra-uterine use Anaemia · anticoagulant therapy (avoid if possible) · diabetes · disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · endometriosis · epilepsy (risk of seizure at time of insertion) · fertility problems · history of pelvic inflammatory disease · increased risk of expulsion if inserted before uterine involution · menorrhagia (progestogen intra-uterine system might be preferable) · nulliparity · severe cervical stenosis · severe primary dysmenorrhoea · severely scarred uterus (including after endometrial resection) · young age
 - ▶ With oral use for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
 - ▶ When used for emergency contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · past ectopic pregnancy · severe malabsorption syndromes

CAUTIONS, FURTHER INFORMATION

Risk of infection with intra-uterine devices The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:

- they are under 25 years old or
- they are over 25 years old and have a new partner or
- have had more than one partner in the past year or
- their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days. An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

- ▶ With oral use
- Use as a contraceptive in co-morbidities** The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Advanced uterine atrophy

- **INTERACTIONS** → Appendix 1 (progestogens).

When used orally as an emergency contraceptive, the effectiveness of levonorgestrel is reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

With the progestogen-only intra-uterine device, levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) and therefore progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen-only intra-uterine system and additional contraceptive precautions are not required.

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Depression (sometimes severe) · headache · nausea
- ▶ **Frequency not known** Vomiting

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intra-uterine use Abdominal pain · acne · alopecia · back pain · breast pain · changes in the pattern and duration of menstrual bleeding (spotting or prolonged bleeding) · expulsion · hirsutism · migraine · nervousness · pelvic pain · peripheral oedema · salpingitis
- ▶ **Uncommon**
- ▶ With intra-uterine use Abdominal distension · cervicitis · eczema · pelvic inflammatory disease · pruritus · skin hyperpigmentation
- ▶ **Rare**
- ▶ With intra-uterine use Rash · uterine perforation
- ▶ **Frequency not known**
- ▶ With intra-uterine use Allergy · bleeding (on insertion) · cervical perforation · displacement · dysmenorrhoea · epileptic seizures (on insertion) · functional ovarian cysts (usually asymptomatic and usually resolve spontaneously—ultrasound monitoring recommended) · menorrhagia · pain (on insertion, alleviated by NSAID such as ibuprofen 30 minutes before insertion) · pelvic infection may be exacerbated · vasovagal attack (on insertion)
- ▶ **With oral use** Breast discomfort · breast tenderness · changes in libido · disturbances of appetite · dizziness · fatigue · menstrual irregularities · skin disorders

SIDE-EFFECTS, FURTHER INFORMATION

Endometrial disorders should be ruled out before insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in progestogenic side-effects, such as mastalgia and in the bleeding pattern may often become very light or absent.

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

Although the progestogen-only intra-uterine system produces little systemic progestogenic activity, it is usually available for 5 years after any evidence of breast cancer. However, the system can be considered for a

woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception. Removal of the intra-uterine system should be considered if the patient experiences migraine or severe headache, jaundice, marked increase of blood pressure, or severe arterial disease.

● PREGNANCY

- ▶ With oral use Not known to be harmful.
- ▶ With vaginal use If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Avoid; if pregnancy occurs remove intra-uterine system.

● **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.

● **HEPATIC IMPAIRMENT** Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

● **MONITORING REQUIREMENTS** Gynaecological examination before insertion, 4–6 weeks after insertion, then annually.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intra-uterine use *The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.*

● PRESCRIBING AND DISPENSING INFORMATION

JAYDESS® 13.5MG INTRA-UTERINE DEVICE

When system is removed (and not replaced immediately) and pregnancy is not desired, remove within 7 days of the onset of menstruation; additional precautions (e.g. barrier methods) should be used if the system is removed at some other time during the cycle and there is intercourse within 7 days.

MIRENA®20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

When system is removed (and not immediately replaced) and pregnancy is not desired, remove during first few days of menstruation, otherwise additional precautions (e.g. barrier methods) should be used for at least 7 days before removal.

● PATIENT AND CARER ADVICE

Missed doses When used as an oral contraceptive, the following advice is recommended 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days'. The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken. Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

- ▶ With oral use for Contraception

Starting routine One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not necessary when initiating treatment. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive

course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

- ▶ With oral use for Emergency contraception

If vomiting occurs within 2 hours of taking levonorgestrel, a replacement dose should be given.

When prescribing or supplying hormonal emergency contraception, women should be advised:

- that their next period may be early or late;
- that a barrier method of contraception needs to be used until the next period;
- to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
- to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).
- ▶ With intra-uterine use Counsel women to seek medical attention promptly in case of significant symptoms, especially pain. Patient counselling advised. Patient information leaflet to be provided.

● **EXCEPTIONS TO LEGAL CATEGORY** *Levonelle® One Step* can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

3.4 Contraception, parenteral progestogen-only

Drugs used for Contraception, parenteral progestogen-only not listed below; Norethisterone, p. 656

PROGESTOGENS

Etonogestrel

INDICATIONS AND DOSE

Contraception (no hormonal contraceptive use in previous month)

BY SUBDERMAL IMPLANTATION

- ▶ Females of childbearing potential: 1 implant inserted during first 5 days of cycle, implant should be removed within 3 years of insertion

Contraception (postpartum)

BY SUBDERMAL IMPLANTATION

- ▶ Females of childbearing potential: 1 implant to be inserted 21–28 days after delivery, 1 implant to be inserted after 28 days postpartum in breast-feeding mothers, implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the second trimester

BY SUBDERMAL IMPLANTATION

- ▶ Females of childbearing potential: 1 implant to be inserted 21–28 days after abortion or miscarriage, implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the first trimester

BY SUBDERMAL IMPLANTATION

- ▶ Females of childbearing potential: 1 implant to be inserted within 5 days, implant should be removed within 3 years of insertion

Contraception (changing from other hormonal contraceptive)

BY SUBDERMAL IMPLANTATION

- ▶ Females of childbearing potential: Implant should be removed within 3 years of insertion (consult product literature)

- **CONTRA-INDICATIONS** Acute porphyria · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus · history of jaundice in pregnancy · malabsorption syndromes · possible risk of breast cancer · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
- **INTERACTIONS** → Appendix 1 (progestogens). Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. Effectiveness of the etonogestrel-releasing implant may be reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the enzyme-inducing drug and for at least 4 weeks after stopping. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the implant may be continued in combination with additional contraceptive precautions (e.g. condom) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping it.
- **SIDE-EFFECTS** Breast discomfort · changes in libido · depression · disturbance of appetite · dizziness · headache

- injection-site reactions · menstrual irregularities · nausea · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Cervical cancer Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives. The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

- **PREGNANCY** Not known to be harmful, remove implant if pregnancy occurs.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- **DIRECTIONS FOR ADMINISTRATION** The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.
- **PATIENT AND CARER ADVICE** Full counselling backed by patient information leaflet required before administration.

There can be variation in the licensing of different medicines containing the same drug.

Implant

▶ ETONOGESTREL (Non-proprietary)

Etonogestrel 68 mg Etonogestrel 68mg implant | 1 device **[POM]** no price available

▶ Nexplanon (Merck Sharp & Dohme Ltd)

Etonogestrel 68 mg Nexplanon 68mg implant | 1 device **[POM]** £83.43

Medroxyprogesterone acetate

INDICATIONS AND DOSE

Dysfunctional uterine bleeding

BY MOUTH

- ▶ Adult: 2.5–10 mg daily for 5–10 days, repeated for 2 cycles, begin treatment on day 16–21 of cycle

Secondary amenorrhoea

BY MOUTH

- ▶ Adult: 2.5–10 mg daily for 5–10 days, repeated for 3 cycles, begin treatment on day 16–21 of cycle

Mild to moderate endometriosis

BY MOUTH

- ▶ Adult: 10 mg 3 times a day for 90 consecutive days, begin treatment on day 1 of cycle

Progestogenic opposition of oestrogen HRT

BY MOUTH

- ▶ Adult: 10 mg daily for the last 14 days of each 28-day oestrogen HRT cycle

Endometrial cancer | Renal cell cancer

BY MOUTH

- ▶ Adult: 200–600 mg daily

Breast cancer

BY MOUTH

- ▶ Adult: 0.4–1.5 g daily

continued →

Contraception**BY DEEP INTRAMUSCULAR INJECTION**

- ▶ Females of childbearing potential: 150 mg, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)

BY SUBCUTANEOUS INJECTION

- ▶ Females of childbearing potential: 104 mg, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Long-term contraception**BY DEEP INTRAMUSCULAR INJECTION**

- ▶ Females of childbearing potential: 150 mg every 12 weeks, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)

BY SUBCUTANEOUS INJECTION

- ▶ Females of childbearing potential: 104 mg every 13 weeks, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Contraception (when patient changing from other hormonal contraception)**BY SUBCUTANEOUS INJECTION**

- ▶ Females of childbearing potential: (consult product literature)

● CONTRA-INDICATIONS**GENERAL CONTRA-INDICATIONS**

- Acute porphyrias p. 864 · severe arterial disease · undiagnosed vaginal bleeding

SPECIFIC CONTRA-INDICATIONS

- ▶ With intramuscular or subcutaneous use History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable
- ▶ With oral use Breast cancer (unless progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history of liver tumours

● CAUTIONS**GENERAL CAUTIONS:**

- Possible risk of breast cancer

SPECIFIC CAUTIONS:

- ▶ With intramuscular or subcutaneous use History during pregnancy in disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus
- ▶ With oral use Asthma · cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · epilepsy · history of depression · hypertension · migraine · susceptibility to thromboembolism (particular caution with high dose)

● INTERACTIONS → Appendix 1 (progestogens).

Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of medroxyprogesterone acetate intramuscular and subcutaneous injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs.

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS Breast discomfort · changes in libido · depression · dizziness · headache · indigestion · loss of vision during treatment (discontinue treatment if

papilloedema or retinal vascular lesions) · menstrual irregularities · nausea · pruritus · vomiting · weight gain

SPECIFIC SIDE-EFFECTS

- ▶ **Rare**
- ▶ **With intramuscular or subcutaneous use** Osteoporosis · osteoporotic fractures
- ▶ **Frequency not known**
- ▶ **With intramuscular or subcutaneous use** Disturbance of appetite · injection site-reactions · reduced bone mineral density · skin disorders
- ▶ **With oral use** Acne · adrenergic-like effects (when used for malignant disease) · alopecia · anaphylactoid reactions · bloating · breast tenderness · cervical erosions (when used for malignant disease) · confusion (when used for malignant disease) · congestive heart failure (when used for malignant disease) · constipation (when used for malignant disease) · diarrhoea (when used for malignant disease) · drowsiness · dry mouth (when used for malignant disease) · euphoria (when used for malignant disease) · fluid retention · galactorrhoea (when used for malignant disease) · glucocorticoid effects may lead to a cushingoid syndrome (with high doses for malignant disease) · hirsutism · hypercalcaemia (when used for malignant disease) · hyperpyrexia (when used for malignant disease) · hypertension (when used for malignant disease) · insomnia · jaundice · loss of concentration (when used for malignant disease) · nervousness (when used for malignant disease) · palpitation (when used for malignant disease) · premenstrual-like syndrome · raised platelet count (when used for malignant disease) · raised white blood cell count (when used for malignant disease) · rash · retinal thrombosis (when used for malignant disease) · skin reactions · tachycardia (when used for malignant disease) · urticaria · vision disorders (when used for malignant disease)

SIDE-EFFECTS, FURTHER INFORMATION

Cervical cancer Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives. The risk of cervical cancer with other progestogen-only contraceptives is not yet known. Reduction in bone mineral density occurs in the first 2–3 years of use then stabilises.

● CONCEPTION AND CONTRACEPTION

- ▶ With intramuscular use If interval between dose is greater than 12 weeks and 5 days (in long-term contraception), rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection.
- ▶ With subcutaneous use If interval between dose is greater than 13 weeks and 7 days (in long-term contraception), rule out pregnancy before next injection.

● PREGNANCY

- ▶ With oral use Avoid—genital malformations and cardiac defects reported.
- ▶ With intramuscular use or subcutaneous use Not known to be harmful.
- ▶ **BREAST FEEDING** Present in milk—no adverse effects reported. Progesterone-only contraceptives do not affect lactation.
- ▶ With intramuscular use or subcutaneous use The manufacturers advise that in women who are breast-feeding, the first dose should be delayed until 6 weeks after birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.
- ▶ **HEPATIC IMPAIRMENT**
- ▶ With oral use Avoid in hepatic impairment.

- ▶ With intramuscular use or subcutaneous use Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.
- **RENAL IMPAIRMENT** Use with caution.
- **PATIENT AND CARER ADVICE**
- ▶ With intramuscular use or subcutaneous use Full counselling backed by *patient information leaflet* required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- ▶ **Sayana Press** (Pfizer Ltd)
Medroxyprogesterone acetate 160 mg per 1 ml Sayana Press 104mg/0.65 ml suspension for injection pre-filled disposable devices | 1 pre-filled disposable injection [PoM] £6.90

3.5 Contraception, spermicidal

SPERMICIDALS

Nonoxinol

INDICATIONS AND DOSE

Spermicidal contraceptive in conjunction with barrier methods of contraception such as diaphragms or caps

BY VAGINA

- ▶ Females of childbearing potential: (consult product literature)

- **SIDE-EFFECTS** Genital lesions

SIDE-EFFECTS, FURTHER INFORMATION

High frequency use of the spermicide nonoxinol '9' has been associated with genital lesions, which may increase the risk of acquiring these infections.

- **CONCEPTION AND CONTRACEPTION** No evidence of harm to latex condoms and diaphragms.
- **PREGNANCY** Toxicity in *animal* studies.
- **BREAST FEEDING** Present in milk in *animal* studies.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gel

EXCIPIENTS: May contain Hydroxybenzoates (parabens), propylene glycol, sorbic acid

- ▶ **Gygel** (Marlborough Pharmaceuticals Ltd)

Nonoxinol-9 20 mg per 1 ml Gygel 2% contraceptive jelly | 30 gram [GSL] £4.25 | 81 gram [GSL] £11.00

4 Erectile and ejaculatory conditions

4.1 Erectile dysfunction

Erectile dysfunction

Reasons for failure to produce a satisfactory erection include *psychogenic, vascular, neurogenic, and endocrine abnormalities*; impotence can also be drug-induced. Intracavernosal, urethral or topical application of vasoactive drugs under careful medical supervision are used for the management of erectile dysfunction. Intracavernosal or intraurethral preparations can also be used in the diagnosis of erectile dysfunction.

Erectile disorders may also be treated with drugs given by mouth which increase the blood flow to the penis. Drugs should be used with caution if the penis is deformed (e.g. in angulation, cavernosal fibrosis, and Peyronie's disease).

Priapism

If priapism occurs with alprostadil p. 701, treatment should not be delayed more than 6 hours and is as follows:

- Initial therapy by penile aspiration; using aseptic technique a 19–21 gauge butterfly needle inserted into the corpus cavernosum and 20–50 mL of blood aspirated; if necessary the procedure may be repeated on the opposite side.
- If initial aspiration is unsuccessful a second 19–21 gauge butterfly needle can be inserted into the opposite corpus cavernosum and sterile physiological saline introduced through the first needle and drained through the second.
- If aspiration and lavage of corpora are unsuccessful, *cautious* intracavernosal injection of a sympathomimetic with action on alpha-adrenergic receptors, continuously monitoring blood pressure and pulse (*extreme caution*: coronary heart disease, hypertension, cerebral ischaemia or if taking antidepressant) can be given.
- If necessary the sympathomimetic injections can be followed by further aspiration of blood through the same butterfly needle.
- If sympathomimetics unsuccessful, urgent surgical referral for management (possibly including shunt procedure).

Prescribing on the NHS

Some drug treatments for erectile dysfunction may only be prescribed on the NHS under certain circumstances; for details see the criteria listed in part XVIII B of the Drug Tariff (Part Xlb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The Drug Tariffs can be accessed online at: National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
Health and Personal Social Services for Northern Ireland Drug Tariff: www.dhsspsni.gov.uk/pas-tariff
Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

Alprostadii

Alprostadii p. 701 (prostaglandin E₁) is given by intracavernosal injection, intraurethral application, or topical application for the management of erectile dysfunction (after exclusion of treatable medical causes). Intracavernosal or intraurethral preparations can also be used in the diagnosis of erectile dysfunction.

Phosphodiesterase type-5 inhibitors

Avanafil below, sildenafil below, tadalafil p. 700 and vardenafil p. 701 are phosphodiesterase type-5 inhibitors licensed for the treatment of erectile dysfunction; they are not recommended for use with other treatments for erectile dysfunction. The patient should be assessed appropriately before prescribing avanafil, sildenafil, tadalafil or vardenafil. Since these drugs are given by mouth there is a potential for drug interactions.

Papaverine and phentolamine

Although not licensed the smooth muscle relaxant papaverine has also been given by intracavernosal injection for erectile dysfunction. Patients with neurological or psychogenic impotence are more sensitive to the effect of papaverine than those with vascular abnormalities. Phentolamine mesilate p. 161 is added if the response is inadequate [unlicensed indication].

Persistence of the erection for longer than 4 hours is an emergency.

PHOSPHODIESTERASE TYPE-5 INHIBITORS**Avanafil****INDICATIONS AND DOSE****Erectile dysfunction****BY MOUTH**

- ▶ **Adult:** Initially 100 mg, to be taken approximately 30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

Erectile dysfunction in patients on alpha-blocker therapy**BY MOUTH**

- ▶ **Adult:** Initially 50 mg, to be taken approximately 30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

Dose adjustments due to interactions

Max. 100 mg once every 48 hours with concomitant moderate inhibitors of cytochrome P450 enzyme CYP3A4 e.g. aprepitant, diltiazem, erythromycin, fluconazole, fosamprenavir, or verapamil. Concomitant treatment with a phosphodiesterase type-5 inhibitor and an alpha-blocker can increase the risk of postural hypotension—initiate treatment with a phosphodiesterase type-5 inhibitor (at a low dose) only once the patient is stable on the alpha-blocker.

- **CONTRA-INDICATIONS** Avoid if systolic blood pressure below 90 mmHg (no information available) · blood pressure >170/100 mmHg · hereditary degenerative retinal disorders · history of non-arteritic anterior ischaemic optic neuropathy · life-threatening arrhythmia in previous 6 months · mild to severe heart failure · patients in whom vasodilation or sexual activity are inadvisable · recent history of myocardial infarction · recent history of stroke · recent unstable angina
- **CAUTIONS** Active peptic ulceration · anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · bleeding disorders ·

cardiovascular disease · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)

- **INTERACTIONS** → Appendix 1 (avanafil). Avoid concomitant use of nitrates.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Back pain · dizziness · dyspepsia · flushing · headache · migraine · myalgia · nasal congestion · nausea · visual disturbances · vomiting
 - ▶ **Uncommon** Drowsiness · epistaxis · hypertension · hypotension · malaise · painful red eyes · palpitation · tachycardia
 - ▶ **Rare** Abdominal pain · diarrhoea · dry mouth · facial oedema · gastritis · genital irritation · gout · haematuria · hyperactivity · hyperbilirubinaemia · hypersensitivity reactions · increased serum creatinine · insomnia · muscle spasms · peripheral oedema · pollakiuria · priapism · rash · Stevens-Johnson syndrome · syncope · weight gain
 - ▶ **Frequency not known** Arrhythmia · myocardial infarction · non-arteritic anterior ischaemic optic neuropathy (stop drug if sudden visual impairment occurs) · retinal vascular occlusion · seizures · serious cardiovascular events · sudden hearing loss (discontinue drug and seek medical advice) · unstable angina
- **HEPATIC IMPAIRMENT** Use lowest effective initial dose in mild to moderate impairment, adjusted according to response. Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE** Onset of effect may be delayed if taken with food.

NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions *Spedra*[®] is not prescribable under the NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII B of the Drug Tariff (Part XII b of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'.

The Drug Tariffs can be accessed online at: National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm; Health and Personal Social Services for Northern Ireland Drug Tariff: www.dhsspsni.gov.uk/pas-tariff; Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Sildenafil**INDICATIONS AND DOSE****Pulmonary arterial hypertension****BY MOUTH**

- ▶ **Adult:** 20 mg 3 times a day

BY INTRAVENOUS INJECTION

- ▶ **Adult:** 10 mg 3 times a day, use intravenous route when the oral route is not appropriate

Erectile dysfunction

BY MOUTH

- ▶ **Adult:** Initially 50 mg, to be taken approximately 1 hour before sexual activity, adjusted according to response to 25–100 mg (max. per dose 100 mg) as required, to be taken as a single dose; maximum 1 dose per day

● **CONTRA-INDICATIONS****GENERAL CONTRA-INDICATIONS**

Hereditary degenerative retinal disorders · history of non-arteritic anterior ischaemic optic neuropathy · recent history of myocardial infarction · recent history of stroke

SPECIFIC CONTRA-INDICATIONS

- ▶ When used for erectile dysfunction Avoid if systolic blood pressure below 90 mmHg (no information available) · patients in whom vasodilation or sexual activity are inadvisable · recent unstable angina
- ▶ When used for pulmonary arterial hypertension Sick-cell anaemia

● **CAUTIONS****GENERAL CAUTIONS**

Active peptic ulceration · bleeding disorders · cardiovascular disease · left ventricular outflow obstruction

SPECIFIC CAUTIONS

- ▶ When used for erectile dysfunction Anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)
- ▶ When used for pulmonary arterial hypertension Anatomical deformation of the penis · autonomic dysfunction · hypotension (avoid if systolic blood pressure below 90 mmHg) · intravascular volume depletion · predisposition to priapism · pulmonary veno-occlusive disease

- **INTERACTIONS** → Appendix 1 (sildenafil).

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common**
Back pain · dyspepsia · flushing · migraine · myalgia · nasal congestion · visual disturbances
- ▶ **Frequency not known** Non-arteritic anterior ischaemic optic neuropathy (discontinue if sudden visual impairment occurs) · sudden hearing loss (advise patient to seek medical help)

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ When used for erectile dysfunction Nausea · dizziness · vomiting
- ▶ When used for pulmonary arterial hypertension Abdominal distension · alopecia · anaemia · anxiety · bronchitis · cellulitis · cough · diarrhoea · dry mouth · epistaxis · fever · gastritis · gastro-oesophageal reflux · haemorrhoids · headache · influenza-like symptoms · insomnia · limb pain · night sweats · oedema · painful red eyes · paraesthesia · photophobia · retinal haemorrhage · tremor · vertigo
- ▶ **Uncommon**
- ▶ When used for erectile dysfunction Chest pain · drowsiness · dry mouth · epistaxis · fatigue · hypertension · hypoaesthesia · hypotension · painful red eyes · palpitation · tachycardia · tinnitus · vertigo
- ▶ When used for pulmonary arterial hypertension Gynaecomastia · haematuria · penile haemorrhage · priapism
- ▶ **Rare**
- ▶ When used for erectile dysfunction Atrial fibrillation · cerebrovascular accident · facial oedema · hypersensitivity reactions · priapism · rash · Stevens-Johnson syndrome · syncope

- ▶ **Frequency not known**
- ▶ When used for erectile dysfunction Arrhythmia · myocardial infarction · seizures · unstable angina
- ▶ When used for pulmonary arterial hypertension Rash · retinal vascular occlusion
- **PREGNANCY** Use only if potential benefit outweighs risk—no evidence of harm in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** In pulmonary arterial hypertension, if usual dose not tolerated, reduce *oral* dose to 20 mg twice daily and *intravenous* dose to 10 mg twice daily. For erectile dysfunction, use initial dose of 25 mg. Manufacturer advises avoid in severe impairment.
- **RENAL IMPAIRMENT** Use initial dose of 25 mg in erectile dysfunction if eGFR less than 30 mL/minute/1.73 m². In pulmonary hypertension, if usual dose not tolerated, reduce *oral* dose to 20 mg twice daily and *intravenous* dose to 10 mg twice daily.
- **TREATMENT CESSATION**
- ▶ When used for Pulmonary arterial hypertension Consider gradual withdrawal.
- **PATIENT AND CARER ADVICE**
- ▶ When used for Erectile dysfunction Onset of effect may be delayed if taken with food.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2010 and February 2011) that sildenafil tablets (*Revatio*[®]) should be initiated for patients with pulmonary arterial hypertension only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists and that sildenafil injection (*Revatio*[®]) should be prescribed only on the advice of specialists in the Scottish Pulmonary Vascular Unit or the Scottish Adult Congenital Cardiac Service.

NHS restrictions *Viagra*[®] is not prescribable under NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII B of the Drug Tariff (Part Xib of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under How to use BNF publications p. xi.

● **PREGNANCY** Manufacturer advises avoid.● **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.● **HEPATIC IMPAIRMENT** When used for pulmonary arterial hypertension use initial dose of 20 mg once daily in mild to moderate impairment and avoid in severe impairment. Use maximum dose of 10 mg in erectile dysfunction and benign prostatic hyperplasia. Manufacturer advises caution in severe impairment and for regular once-daily dosing in erectile dysfunction and benign prostatic hyperplasia—no information available.● **RENAL IMPAIRMENT** In pulmonary arterial hypertension for patients with mild to moderate impairment, initially use 20 mg once daily, increased to 40 mg once daily if tolerated; avoid in severe impairment. For erectile dysfunction and benign prostatic hyperplasia, maximum dose 10 mg if eGFR less than 30 mL/minute/1.73 m² (avoid regular once-daily dosing).● **NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (June 2012) that tadalafil (*Adcirca*[®]) should be initiated only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

NHS restrictions *Cialis*[®] is not prescribable under the NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII B of the Drug Tariff (Part Xlb of the Northern Ireland Drug Tariff, Part 12 of

Tadalafil**INDICATIONS AND DOSE****Pulmonary arterial hypertension**

BY MOUTH

- ▶ Adult: 40 mg once daily

Erectile dysfunction

BY MOUTH

- ▶ Adult: Initially 10 mg once daily (max. per dose 20 mg), to be taken at least 30 minutes before sexual activity, subsequent doses adjusted according to response, the effect of intermittent dosing may persist for longer than 24 hours, daily dose of 10–20mg not recommended; maximum 1 dose per day

Erectile dysfunction; for patients who anticipate sexual activity at least twice a week

BY MOUTH

- ▶ Adult: 5 mg once daily, reduced to 2.5 mg once daily, adjusted according to response, the effect of intermittent dosing may persist for longer than 24 hours

Benign prostatic hyperplasia

BY MOUTH

- ▶ Adult: 5 mg once daily

● **CONTRA-INDICATIONS****GENERAL CONTRA-INDICATIONS**

History of non-arteritic anterior ischaemic optic neuropathy

SPECIFIC CONTRA-INDICATIONS

- ▶ When used for benign prostatic hyperplasia or erectile dysfunction Hypotension (avoid if systolic blood pressure below 90 mmHg) · mild to severe heart failure · myocardial infarction · patients in whom vasodilation or sexual activity are inadvisable · recent stroke · uncontrolled arrhythmias · uncontrolled hypertension · unstable angina
- ▶ When used for pulmonary arterial hypertension Acute myocardial infarction in past 90 days

● **CAUTIONS**

- ▶ When used for benign prostatic hyperplasia or erectile dysfunction Anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · cardiovascular disease · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)
- ▶ When used for pulmonary arterial hypertension Anatomical deformation of the penis · aortic and mitral valve disease · congestive cardiomyopathy · coronary artery disease · hereditary degenerative retinal disorders · hypotension

the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under How to use BNF publications p. xi.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ **Adcirca** (Eli Lilly and Company Ltd)

Tadalafil 20 mg Adcirca 20mg tablets | 56 tablet [PoM] £491.22

▶ **Cialis** (Eli Lilly and Company Ltd)

Tadalafil 20 mg Cialis 20mg tablets | 4 tablet [PoM] £26.99 DT price = £26.99 | 8 tablet [PoM] £53.98

Vardenafil

INDICATIONS AND DOSE

Erectile dysfunction

BY MOUTH USING TABLETS

- ▶ **Adult:** Initially 10 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day

BY MOUTH USING ORODISPERSIBLE TABLET

- ▶ **Adult:** 10 mg, to be taken approximately 25–60 minutes before sexual activity; maximum 10 mg per day

Erectile dysfunction (patients on alpha-blocker therapy)

BY MOUTH USING TABLETS

- ▶ **Adult:** Initially 5 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day

Dose adjustments due to interactions

Concomitant treatment with phosphodiesterase type-5 inhibitor and an alpha-blocker can increase the risk of postural hypotension—initiate treatment with a phosphodiesterase type-5 inhibitor (at a low dose) only once the patient is stable on the alpha-blocker.

Dose equivalence and conversion

Levitra[®] 10 mg orodispersible tablets and *Levitra*[®] 10 mg film coated tablets are **not** bioequivalent.

- **CONTRA-INDICATIONS** Avoid if systolic blood pressure below 90 mmHg · hereditary degenerative retinal disorders · myocardial infarction · patients in whom vasodilation or sexual activity are inadvisable · previous history of non-arteritic anterior ischaemic optic neuropathy · recent stroke · unstable angina
- **CAUTIONS** Active peptic ulceration · anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · bleeding disorders · cardiovascular disease · elderly · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia) · susceptibility to prolongation of QT interval
- **INTERACTIONS** → Appendix 1 (vardenafil)
Caution with concomitant use of drugs which prolong QT interval. Avoid concomitant use of nitrates.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Back pain · dizziness · dyspepsia · flushing · headache · migraine · myalgia · nasal congestion · nausea · visual disturbances · vomiting

- ▶ **Uncommon** Drowsiness · dyspnoea · epistaxis · hypertension · hypotension · increased lacrimation · painful red eyes · palpitation · photosensitivity · tachycardia
- ▶ **Rare** Anxiety · facial oedema · hypersensitivity reactions · hypertonia · priapism · raised intra-ocular pressure · rash · Stevens-Johnson syndrome · syncope · transient amnesia
- ▶ **Frequency not known** Arrhythmia · myocardial infarction · non-arteritic anterior ischaemic optic neuropathy (stop drug if sudden visual impairment occurs) · retinal vascular occlusion · seizures · serious cardiovascular events · sudden hearing loss (discontinue drug and seek medical advice) · unstable angina

- **HEPATIC IMPAIRMENT** Initial dose 5 mg in mild to moderate impairment, increased subsequently according to response (max. 10 mg in moderate impairment). Manufacturer advises avoid in severe impairment. Orodispersible tablets not suitable for patients with moderate hepatic impairment.
- **RENAL IMPAIRMENT** Initial dose 5 mg if eGFR less than 30 mL/minute/1.73 m². Orodispersible tablets not suitable if eGFR less than 30 mL/minute/ 1.73 m².

- **PRESCRIBING AND DISPENSING INFORMATION**
Orodispersible tablets not suitable for initiation of therapy in patients taking alpha-blockers.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2011) that vardenafil orodispersible tablets (*Levitra*[®]) are accepted for restricted use within NHS Scotland for men for whom an orodispersible tablet is an appropriate formulation.

NHS restrictions *Levitra*[®] is not prescribable under the NHS for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII B of the Drug Tariff (Part Xlb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under How to use BNF publications p. xi.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

PROSTAGLANDINS (ERECTILE DYSFUNCTION)

Alprostadil

INDICATIONS AND DOSE

Erectile dysfunction (initiated under specialist supervision)

BY URETHRAL APPLICATION

- ▶ **Adult:** Initially 250 micrograms, adjusted according to response; usual dose 0.125–1 mg; maximum 2 doses per day; maximum 7 doses per week continued →

Aid to diagnosis of erectile dysfunction

BY URETHRAL APPLICATION

- ▶ Adult: 500 micrograms for 1 dose

Erectile dysfunction

TO THE SKIN

- ▶ Adult: Apply 300 micrograms, to the tip of the penis, 5–30 minutes before sexual activity; max 1 dose in 24 hours not more than 2–3 times per week

VRIDAL® DUO STARTER PACK**Neurogenic erectile dysfunction**

BY INTRACAVERNOSAL INJECTION

- ▶ Adult: Initially 2.5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

Erectile dysfunction

BY INTRACAVERNOSAL INJECTION

- ▶ Adult: Initially 5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

CAVERJECT® DUAL CHAMBER**Erectile dysfunction**

BY INTRACAVERNOSAL INJECTION

- ▶ Adult: Initially 2.5 micrograms for 1 dose (first dose), followed by 5 micrograms for 1 dose (second dose), to be given if some response to first dose, alternatively 7.5 micrograms for 1 dose (second dose), to be given if no response to first dose, then increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Erectile dysfunction associated with neurological dysfunction

BY INTRACAVERNOSAL INJECTION

- ▶ Adult: Initially 1.25 micrograms for 1 dose (first dose), then 2.5 micrograms for 1 dose (second dose), then 5 micrograms for 1 dose (third dose), increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Aid to diagnosis

BY INTRACAVERNOSAL INJECTION

- ▶ Adult: 10–20 micrograms for 1 dose (consult product literature)

Aid to diagnosis where evidence of neurological dysfunction

BY INTRACAVERNOSAL INJECTION

- ▶ Adult: Initially 5 micrograms (max. per dose 10 micrograms) for 1 dose, (consult product literature)

CAVERJECT®**Erectile dysfunction**

BY INTRACAVERNOSAL INJECTION

- ▶ Adult: Initially 2.5 micrograms for 1 dose (first dose), followed by 5 micrograms for 1 dose (second dose), to be given if some response to first dose, alternatively 7.5 micrograms for 1 dose (second dose), to be given if no response to first dose, then increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Erectile dysfunction associated with neurological dysfunction

BY INTRACAVERNOSAL INJECTION

- ▶ Adult: Initially 1.25 micrograms for 1 dose (first dose), then 2.5 micrograms for 1 dose (second dose), then 5 micrograms for 1 dose (third dose), increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Aid to diagnosis

BY INTRACAVERNOSAL INJECTION

- ▶ Adult: 10–20 micrograms for 1 dose (consult product literature)

Aid to diagnosis where evidence of neurological dysfunction

BY INTRACAVERNOSAL INJECTION

- ▶ Adult: Initially 5 micrograms (max. per dose 10 micrograms) for 1 dose (consult product literature)

VRIDAL® DUO CONTINUATION PACK**Erectile dysfunction**

BY INTRACAVERNOSAL INJECTION

- ▶ Adult: Initially 5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

Neurogenic erectile dysfunction

BY INTRACAVERNOSAL INJECTION

- ▶ Adult: Initially 2.5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

● CONTRA-INDICATIONS**GENERAL CONTRA-INDICATIONS**

Not for use in patients with penile implants or when sexual activity medically inadvisable (e.g. orthostatic hypotension, myocardial infarction, and syncope) · not for use with other agents for erectile dysfunction · predisposition to prolonged erection (as in thrombocythemia, polycythemia, sickle cell anaemia,

multiple myeloma or leukaemia) · urethral application contra-indicated in balanitis · urethral application contra-indicated in severe curvature · urethral application contra-indicated in severe hypospadias · urethral application contra-indicated in urethral stricture · urethral application contra-indicated in urethritis

SPECIFIC CONTRA-INDICATIONS

- ▶ With topical use Balanitis · severe curvature · severe hypospadias · urethral stricture · urethritis
- **CAUTIONS** Anatomical deformations of penis (painful erection more likely)—follow up regularly to detect signs of penile fibrosis (consider discontinuation if angulation, cavernosus fibrosis or Peyronie's disease develop) · priapism (patients should be instructed to report any erection lasting 4 hours or longer)
- **INTERACTIONS** → Appendix 1 (alprostadil).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dizziness · haematoma · haemosiderin deposits · headache · hypertension · hypotension · influenza-like syndrome · injection site reactions · other localised pain (buttocks, leg, testicular, abdominal) · penile fibrosis · penile oedema · penile pain · penile rash · urethral bleeding · urethral burning
 - ▶ **Uncommon** Abnormal ejaculation · asthenia · balanitis · dry mouth · haematuria · irritation · leg cramps · local reactions · micturition difficulties · mydriasis · nausea · pelvic pain · penile numbness or sensitivity · penile warmth · phimosis · priapism · pruritus · rapid pulse · scrotal erythema · scrotal oedema · scrotal pain · supraventricular extrasystole · sweating · syncope · testicular oedema · testicular thickening · urethral stenosis · vasodilatation
 - ▶ **Rare** Anaphylaxis · erythema · hypersensitivity reactions · rash · urinary-tract infection · urticaria · vertigo
- **CONCEPTION AND CONTRACEPTION**
 - ▶ With urethral use If partner is pregnant, barrier contraception should be used. No evidence of harm to latex condoms and diaphragms.
 - ▶ With topical use Condoms should be used to avoid exposure to women of child-bearing age, pregnant or lactating women. No evidence of harm to latex condoms.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intracavernosal use The first dose of the intracavernosal injection must be given by medically trained personnel; self-administration may only be undertaken after proper training.
 - ▶ With urethral use During initiation of treatment the urethral application should be used under medical supervision; self-administration may only be undertaken after proper training.
- **PATIENT AND CARER ADVICE** Patients should be instructed to report any erection lasting 4 hours or longer.
- ▶ With topical use Counsel patients that condoms should be used to avoid local reactions and exposure of alprostadil to women of childbearing age, pregnant, or lactating women.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NHS restrictions *Caverject*[®], *Viridal*[®]*Duo*, *Vitaros*[®] and *MUSE*[®] are not prescribable under the NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIIB of the Drug Tariff (Part XIb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS' For more information see *Prices in the BNF*, under How to use BNF publications p. xi.
- **MEDICINAL FORMS**
 There can be variation in the licensing of different medicines containing the same drug.

4.2 Premature ejaculation

SELECTIVE SEROTONIN RE-UPTAKE INHIBITORS

Dapoxetine

- **DRUG ACTION** Dapoxetine is a short-acting selective serotonin re-uptake inhibitor.

INDICATIONS AND DOSE

Premature ejaculation in men who meet all the following criteria: poor control over ejaculation, a history of premature ejaculation over the past 6 months, marked distress or interpersonal difficulty as a consequence of premature ejaculation, and an intravaginal ejaculatory latency time of less than two minutes

BY MOUTH

- ▶ **Adult:** Initially 30 mg, to be taken approximately 1–3 hours before sexual activity, subsequent doses adjusted according to response; review treatment after 4 weeks (or 6 doses) and at least every 6 months thereafter, not recommended for adults 65 years and over; maximum 1 dose per day; maximum 60 mg per day

continued →

Premature ejaculation in men who meet all the following criteria: poor control over ejaculation, a history of premature ejaculation over the past 6 months, marked distress or interpersonal difficulty as a consequence of premature ejaculation, and an intravaginal ejaculatory latency time of less than two minutes (with concomitant aprepitant, clarithromycin, diltiazem, erythromycin, fluconazole, fosamprenavir, and verapamil)

BY MOUTH

- ▶ **Adult:** Up to 30 mg, to be taken approximately 1–3 hours before sexual activity; review treatment after 4 weeks (or 6 doses) and at least every 6 months thereafter, not recommended for adults 65 years and over; maximum 1 dose per day

Dose adjustments due to interactions

Max. single dose 30 mg with concomitant aprepitant, clarithromycin, diltiazem, erythromycin, fluconazole, fosamprenavir, and verapamil.

Use 60-mg dose with caution with concomitant potent inhibitors of cytochrome P450 enzyme CYP2D6.

- **CONTRA-INDICATIONS** History of bipolar disorder · history of mania · history of severe depression · history of syncope · significant cardiac disease · uncontrolled epilepsy
- **CAUTIONS** Bleeding disorders · epilepsy (discontinue if convulsions develop) · susceptibility to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1 (dapoxetine). Caution with concomitant use of drugs that increase risk of bleeding.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal distension · abdominal pain · abnormal dreams · agitation · anxiety · constipation · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · flushing · headache · hypertension · impaired attention · irritability · malaise · nausea · paraesthesia · sexual dysfunction · sleep disturbances · sweating · tinnitus · tremor · visual disturbances · vomiting
 - ▶ **Uncommon** Abnormal thoughts · bradycardia · bruxism · confusion · depression · eye pain · hypotension · mood disturbances · mydriasis · postural hypotension · pruritus · restlessness · sinus arrest · syncope · tachycardia · taste disturbances · vertigo
 - ▶ **Rare** Defaecation urgency · sudden onset of sleep

SIDE-EFFECTS, FURTHER INFORMATION

Discontinue if psychiatric disorder develops. Avoid if postural hypotension occurs during test dose.

- **HEPATIC IMPAIRMENT** Avoid in moderate to severe impairment.
- **RENAL IMPAIRMENT** Use with caution if eGFR 30–80 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m².
- **PRE-TREATMENT SCREENING** Test for postural hypotension before starting treatment.
- **PATIENT AND CARER ADVICE** Postural hypotension and syncope Patients should be advised to maintain hydration and to sit or lie down until prodromal symptoms such as nausea, dizziness, and sweating abate.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

5 Obstetrics

Obstetrics

Prostaglandins and oxytocics

Prostaglandins and oxytocics are used to induce abortion or induce or augment labour and to minimise blood loss from the placental site. They include oxytocin p. 705, carbococin p. 706, ergometrine maleate p. 707, and the prostaglandins. All induce uterine contractions with varying degrees of pain according to the strength of contractions induced.

Induction of abortion

Gemeprost p. 709, a prostaglandin administered vaginally as pessaries, is suitable for the medical induction of late therapeutic abortion; gemeprost is also used to ripen the cervix before surgical abortion, particularly in primigravida. The prostaglandin misoprostol p. 709 is given by mouth, buccally, sublingually, or vaginally, to induce medical abortion [unlicensed indication]; intravaginal use ripens the cervix before surgical abortion [unlicensed indication]. Extra-amniotic dinoprostone p. 706 is rarely used nowadays.

Pre-treatment with mifepristone p. 708 can facilitate the process of medical abortion. It sensitises the uterus to subsequent administration of a prostaglandin and, therefore, abortion occurs in a shorter time and with a lower dose of prostaglandin.

Induction and augmentation of labour

Dinoprostone p. 706 is available as vaginal tablets, pessaries and vaginal gels for the induction of labour. The intravenous solution is rarely used; it is associated with more side-effects.

Oxytocin p. 705 (*Syntocinon*[®]) is administered by slow intravenous infusion, using an infusion pump, to induce or augment labour, usually in conjunction with amniotomy. Uterine activity must be monitored carefully and hyperstimulation avoided. Large doses of oxytocin may result in excessive fluid retention.

Misoprostol p. 709 is given orally or vaginally for the induction of labour [unlicensed indication].

NICE Guidance, Induction of labour (updated July 2008), available at www.nice.org.uk/guidance/CG70.

Prevention and treatment of haemorrhage

Bleeding due to incomplete miscarriage or abortion can be controlled with ergometrine maleate and oxytocin (*Syntometrine*[®]) given intramuscularly, the dose is adjusted according to the patient's condition and blood loss. This is commonly used before surgical evacuation of the uterus, particularly when surgery is delayed. Oxytocin and ergometrine maleate combined are more effective in early pregnancy than either drug alone.

Active management of the third stage of labour reduces the risk of postpartum haemorrhage; oxytocin is given by intramuscular injection [unlicensed] on delivery of the anterior shoulder or, at the latest, immediately after the baby is delivered. Alternatively, ergometrine maleate with oxytocin (*Syntometrine*[®]) can be given by intramuscular injection in the absence of hypertension; oxytocin alone causes less nausea, vomiting, and hypertension than when given with ergometrine maleate p. 707.

In excessive uterine bleeding, any placental products remaining in the uterus should be removed. Oxytocic drugs are used to treat postpartum haemorrhage caused by uterine atony; treatment options are as follows:

- oxytocin by slow intravenous injection, followed in severe cases by intravenous infusion of oxytocin at a rate that controls uterine atony *or*
- ergometrine by intramuscular injection *or*

- ergometrine by slow intravenous injection (use with caution—risk of hypertension) *or*
- ergometrine with oxytocin (*Syntometrine*®) by intramuscular injection

Carboprost p. 706 has an important role in severe postpartum haemorrhage unresponsive to ergometrine maleate and oxytocin.

Misoprostol p. 709 [unlicensed] can be used in postpartum haemorrhage when oxytocin, ergometrine maleate, and carboprost are not available or are inappropriate.

Mifepristone

For termination of pregnancy, a single dose of mifepristone p. 708 is followed by administration of a prostaglandin (gemeprost p. 709 or misoprostol p. 709 [unlicensed]).

Guidelines of the Royal College of Obstetricians and Gynaecologists (November 2011) include [unlicensed] regimens for inducing medical abortion.

Myometrial relaxants

Tocolytic drugs postpone *premature labour* and they are used with the aim of reducing harm to the child. However, there is no satisfactory evidence that the use of these drugs reduces mortality. The greatest benefit is gained by using the delay to administer corticosteroid therapy or to implement other measures which improve perinatal health (including transfer to a unit with neonatal intensive care facility).

The oxytocin receptor antagonist, atosiban p. 708, is licensed for the inhibition of uncomplicated premature labour *between 24 and 33 weeks* of gestation. Atosiban may be preferable to a beta₂ agonist because it has fewer side effects. The dihydropyridine calcium-channel blocker nifedipine p. 154 also has fewer side-effects than a beta₂ agonist.

The beta₂ agonists salbutamol p. 222 and terbutaline sulfate p. 225 are licensed for inhibiting uncomplicated premature labour between 22 and 37 weeks of gestation to permit a delay in delivery of up to 48 hours. Use of high-dose short acting beta₂ agonists in obstetric indications has been associated with serious, sometimes fatal cardiovascular events in the mother and fetus, particularly when used for a prolonged period of time. Oral therapy is no longer recommended and parenteral therapy should be restricted to a maximum duration of 48 hours, given under the supervision of a specialist, and with close monitoring.

Indometacin p. 929, a cyclo-oxygenase inhibitor, also inhibits labour [unlicensed indication] and it can be useful in situations where a beta₂ agonist is not appropriate; however, there are concerns about neonatal complications such as transient impairment of renal function and premature closure of ductus arteriosus.

5.1 Induction of labour

PROSTAGLANDINS AND OXYTOCICS

Oxytocin

INDICATIONS AND DOSE

Induction of labour for medical reasons | Stimulation of labour in hypotonic uterine inertia

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 0.001–0.004 units/minute, not to be started for at least 6 hours after administration of vaginal prostaglandin, dose increased at intervals of at least 30 minutes until a maximum of 3–4 contractions occur every 10 minutes (0.01 units/minute is often adequate) up to max. 0.02 units/minute, if regular

contractions not established after a total of 5 units, stop induction attempt (may be repeated next day starting again at 0.001–0.004 units/minute)

Caesarean section

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 5 units immediately after delivery

Prevention of postpartum haemorrhage after delivery of placenta

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 5 units, if infusion previously used for induction or enhancement of labour, increase rate during third stage and for next few hours

BY INTRAMUSCULAR INJECTION

- ▶ Adult: 10 units, can be used instead of oxytocin with ergometrine (*Syntometrine*®)

Treatment of postpartum haemorrhage

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 5 units, repeated if necessary

Treatment of severe cases of postpartum haemorrhage (following intravenous injection)

BY INTRAVENOUS INFUSION

- ▶ Adult: 40 units in 500 mL infusion fluid given at a rate sufficient to control uterine atony

Incomplete, inevitable, or missed miscarriage

INITIALLY BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 5 units, followed by (by intravenous infusion) 0.02–0.04 units/minute if required, the rate of infusion can be faster if necessary

- **UNLICENSED USE** Oxytocin doses in the BNF may differ from those in the product literature.

Important safety information

Prolonged intravenous administration at high doses with large volume of fluid (which is possible in inevitable or missed miscarriage or postpartum haemorrhage) may cause water intoxication with hyponatraemia. To avoid: use electrolyte-containing diluent (i.e. not glucose), increase oxytocin concentration to reduce fluid, restrict fluid intake by mouth; monitor fluid and electrolytes.

- **CONTRA-INDICATIONS** Any condition where spontaneous labour inadvisable · any condition where vaginal delivery inadvisable · avoid intravenous injection during labour · avoid prolonged administration in oxytocin-resistant uterine inertia · avoid rapid intravenous injection (may transiently reduce blood pressure) · fetal distress (discontinue immediately if this occurs) · hypertonic uterine contractions (discontinue immediately if this occurs) · severe cardiovascular disease · severe pre-eclamptic toxemia
- **CAUTIONS** Avoid large infusion volumes and restrict fluid intake by mouth (risk of hyponatraemia and water-intoxication) · enhancement of labour—presence of borderline cephalopelvic disproportion (avoid if significant) · history of lower-uterine segment caesarean section · induction of labour—presence of borderline cephalopelvic disproportion (avoid if significant) · mild pregnancy-induced cardiac disease · mild pregnancy-induced hypertension · moderate pregnancy-induced cardiac disease · moderate pregnancy-induced hypertension · risk factors for disseminated intravascular coagulation · secondary uterine inertia · women over 35 years
- **INTERACTIONS** → Appendix 1 (oxytocin). Effects enhanced by concomitant prostaglandins (very careful monitoring of uterine activity). Caudal block anaesthesia (may enhance hypertensive effects of sympathomimetic vasopressors).

● SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmia · headache · nausea · vomiting
- ▶ **Rare** Anaphylactoid reactions (with dyspnoea, hypotension, or shock) · disseminated intravascular coagulation · hyponatraemia associated with high doses with large infusion volumes of electrolyte-free fluid · rash · uterine hyperstimulation (usually with excessive doses—may cause fetal distress, asphyxia, and death, or may lead to hypertonicity, tetanic contractions, soft-tissue damage or uterine rupture) · uterine spasm (may occur at low doses) · water intoxication associated with high doses with large infusion volumes of electrolyte-free fluid

SIDE-EFFECTS, FURTHER INFORMATION

Avoid rapid intravenous injection (may transiently reduce blood pressure).

Overdose Placental abruption and amniotic fluid embolism reported on overdose.

● MONITORING REQUIREMENTS

- ▶ Careful monitoring of fetal heart rate and uterine motility essential for dose titration.
- ▶ Monitor for disseminated intravascular coagulation after parturition.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Syntocinon[®]), give continuously in Glucose 5% or Sodium chloride 0.9%. Preferably given *via* a variable-speed infusion pump in a concentration appropriate to the pump; if given by drip infusion for *induction* or *enhancement of labour*, dilute 5 units in 500 mL infusion fluid or for higher doses, 10 units in 500 mL; for *treatment of postpartum uterine haemorrhage* dilute 40 units in 500 mL; if high doses given for prolonged period (e.g. for inevitable or missed abortion or for postpartum haemorrhage), use low volume of an electrolyte-containing infusion fluid (not Glucose 5%) given at higher concentration than for induction or enhancement of labour; close attention to patient's fluid and electrolyte status essential.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion, infusion

Solution for injection

▶ OXYTOCIN (Non-proprietary)

Oxytocin 10 unit per 1 mL Oxytocin 10units/1mL concentrate for solution for infusion ampoules | 5 ampoule [PoM] £4.55-£4.67

▶ Syntocinon (Novartis Pharmaceuticals UK Ltd)

Oxytocin 5 unit per 1 mL Syntocinon 5units/1mL solution for injection ampoules | 5 ampoule [PoM] £4.01 (Hospital only)

Oxytocin 10 unit per 1 mL Syntocinon 10units/1mL solution for injection ampoules | 5 ampoule [PoM] £4.53 (Hospital only)

- **SIDE-EFFECTS** Abdominal pain · anaemia · back pain · chest pain · chills · dizziness · dyspnoea · feeling of warmth · flushing · headache · hypotension · metallic taste · nausea · pruritus · sweating · tachycardia · tremor · vomiting

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

- **RENAL IMPAIRMENT** Manufacturer advises avoid.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Pabal (Ferring Pharmaceuticals Ltd)

Carbetocin 100 microgram per 1 mL Pabal 100micrograms/1mL solution for injection ampoules | 5 ampoule [PoM] £88.20 (Hospital only)

Carboprost

INDICATIONS AND DOSE

Postpartum haemorrhage due to uterine atony in patients unresponsive to ergometrine and oxytocin

BY DEEP INTRAMUSCULAR INJECTION

- ▶ **Adult:** 250 micrograms at least every 15 minutes, repeated if necessary, total dose should not exceed 2 mg (8 doses)

- **CONTRA-INDICATIONS** Cardiac disease · pulmonary disease · untreated pelvic infection

- **CAUTIONS** Excessive dosage may cause uterine rupture · history of anaemia · history of asthma · history of diabetes · history of epilepsy · history of glaucoma · history of hypertension · history of hypotension · history of jaundice · history of raised intra-ocular pressure · uterine scars

- **INTERACTIONS** → Appendix 1 (prostaglandins).

- **SIDE-EFFECTS** Bronchospasm · cardiovascular collapse · chills · diaphoresis · diarrhoea · dizziness · dyspnoea · erythema at injection site · flushing · headache · hyperthermia · nausea · pain at injection site · pulmonary oedema · raised blood pressure · vomiting

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

- **RENAL IMPAIRMENT** Manufacturer advises avoid.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Hemabate (Pfizer Ltd)

Carboprost (as Carboprost trometamol) 250 microgram per 1 mL Hemabate 250micrograms/1mL solution for injection ampoules | 10 ampoule [PoM] £182.01 (Hospital only)

5.2 Postpartum haemorrhage

PROSTAGLANDINS AND OXYTOCICS

Carbetocin

INDICATIONS AND DOSE

Prevention of uterine atony after caesarean section

BY SLOW INTRAVENOUS INJECTION

- ▶ **Adult:** 100 micrograms for 1 dose, to be given over 1 minute, administer as soon as possible after delivery, preferably before removal of placenta

- **CONTRA-INDICATIONS** Eclampsia · epilepsy · pre-eclampsia

- **CAUTIONS** Asthma · cardiovascular disease (avoid if severe) · hyponatraemia · migraine

Dinoprostone

INDICATIONS AND DOSE

PROSTIN E2[®] VAGINAL GEL

Induction of labour

BY VAGINA

- ▶ **Adult:** 1 mg, inserted high into the posterior fornix (avoid administration into the cervical canal), followed by 1–2 mg after 6 hours if required; max. dose 3 mg

Induction of labour (unfavourable primigravida)

BY VAGINA

- ▶ **Adult:** 2 mg, inserted high into the posterior fornix (avoid administration into the cervical canal), followed by 1–2 mg if required; max. dose 4 mg

PROSTIN E2® VAGINAL TABLETS**Induction of labour**

BY VAGINA

- ▶ **Adult:** 3 mg, inserted high into the posterior fornix, followed by 3 mg after 6–8 hours (max. per dose 6 mg), to be given if labour not established

Dose equivalence and conversion

Prostin E2 Vaginal tablets and *Vaginal Gel* are not bioequivalent.

PROPESS®**Cervical ripening and induction of labour at term**

BY VAGINA

- ▶ **Adult:** 1 pessary, insert pessary (in retrieval device) high into posterior fornix and remove when cervical ripening adequate; if oxytocin necessary, remove 30 minutes before oxytocin infusion; remove if cervical ripening inadequate after 24 hours (dose not to be repeated).

- **CONTRA-INDICATIONS** Active cardiac disease · active pulmonary disease · avoid extra-amniotic route in cervicitis or vaginitis · fetal distress · fetal malpresentation · grand multiparas · history of caesarean section · history of difficult or traumatic delivery · history of major uterine surgery · major cephalopelvic disproportion · multiple pregnancy · placenta praevia or unexplained vaginal bleeding during pregnancy · ruptured membranes · untreated pelvic infection

- **CAUTIONS** Effect of oxytocin enhanced · history of asthma · history of epilepsy · history of glaucoma and raised intra-ocular pressure · hypertension · risk factors for disseminated intravascular coagulation · uterine rupture · uterine scarring

- **INTERACTIONS** → Appendix 1 (prostaglandins).

- **SIDE-EFFECTS** Abruptio placenta · amniotic fluid embolism · backache · bronchospasm · cardiac arrest · diarrhoea · disseminated intravascular coagulation · fetal distress · fever · low Apgar scores · maternal hypertension · nausea · pulmonary embolism · rapid cervical dilation · severe uterine contractions · stillbirth or neonatal death · uterine hypercontractility with or without fetal bradycardia · uterine hypertonus · uterine rupture · vaginal symptoms (warmth, irritation, pain) · vomiting

- **HEPATIC IMPAIRMENT** Manufacturers advise avoid.

- **RENAL IMPAIRMENT** Manufacturers advise avoid.

MONITORING REQUIREMENTS

- ▶ Monitor for disseminated intravascular coagulation after parturition.
- ▶ Monitor uterine activity and fetal status (particular care if history of uterine hypertony)
- ▶ Care needed in monitoring uterine activity when used in sequence following oxytocin.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Prostin E2*®) give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%.

PRESCRIBING AND DISPENSING INFORMATION

- **Important:** Do not confuse dose of *Prostin E2*® vaginal gel with that of *Prostin E2*® vaginal tablets—not bioequivalent.

LESS SUITABLE FOR PRESCRIBING

- Intravenous solution rarely used and is considered less suitable for prescribing. Extra-amniotic solution less commonly used and is considered less suitable for prescribing.

MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Prostin E2** (Pfizer Ltd)

Dinoprostone 1 mg per 1 ml Prostin E2 750micrograms/0.75ml solution for infusion ampoules | 1 ampoule [PoM] £8.52 (Hospital only)

Ergometrine maleate**INDICATIONS AND DOSE****Postpartum haemorrhage caused by uterine atony**

BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION

- ▶ **Adult:** 250–500 micrograms

- **CONTRA-INDICATIONS** Eclampsia · first stage of labour · induction of labour · second stage of labour · sepsis · severe cardiac disease · severe hypertension · vascular disease
- **CAUTIONS** Acute porphyrias p. 864 · cardiac disease · hypertension · multiple pregnancy · risk of hypertension associated with intravenous administration
- **INTERACTIONS** → Appendix 1 (ergot alkaloids).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · arrhythmias · bradycardia · chest pain · dizziness · dyspnoea · headache · hypertension · nausea · palpitation · pulmonary oedema · rash · tinnitus · vasoconstriction · vomiting
- ▶ **Very rare** Myocardial infarction
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild or moderate impairment. Manufacturer advises avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in mild or moderate impairment. Manufacturer advises avoid in severe impairment.

MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **ERGOMETRINE MALEATE (Non-proprietary)**

Ergometrine maleate 500 microgram per 1 ml Ergometrine 500micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £15.00

Ergometrine with oxytocin

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergometrine maleate p. 707, oxytocin p. 705.

INDICATIONS AND DOSE

Active management of the third stage of labour | Postpartum haemorrhage caused by uterine atony

BY INTRAMUSCULAR INJECTION

▶ Adult: 1 mL for one dose.

BY INTRAVENOUS INJECTION

▶ Adult: No longer recommended.

Bleeding due to incomplete miscarriage or abortion

BY INTRAMUSCULAR INJECTION

▶ Adult: Adjusted according to response to, the patient's condition and blood loss.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Syntometrine** (Alliance Pharmaceuticals Ltd)

Ergometrine maleate 500 microgram per 1 mL, Oxytocin 5 unit per 1 mL Syntometrine 500micrograms/1ml solution for injection ampoules | 5 ampoule (PoM) £7.87

5.3 Premature labour

OXYTOCIN RECEPTOR ANTAGONISTS

Atosiban

INDICATIONS AND DOSE

Uncomplicated premature labour between 24 and 33 weeks of gestation

INITIALLY BY INTRAVENOUS INJECTION

▶ Adult: Initially 6.75 mg over 1 minute, then (by intravenous infusion) 18 mg/hour for 3 hours, then (by intravenous infusion) reduced to 6 mg/hour for up to 45 hours. Maximum duration of treatment is 48 hours

- **CONTRA-INDICATIONS** Abruptio placenta · antepartum haemorrhage (requiring immediate delivery) · eclampsia · intra-uterine fetal death · intra-uterine infection · intra-uterine growth restriction with abnormal fetal heart rate · placenta praevia · premature rupture of membranes after 30 weeks' gestation · severe pre-eclampsia

- **CAUTIONS** Abnormal placental site · intra-uterine growth restriction

SIDE-EFFECTS

- **Common or very common** Dizziness · headache · hot flushes · hyperglycaemia · hypotension · injection-site reaction · nausea · tachycardia · vomiting

- ▶ **Uncommon** Fever · insomnia · pruritus · rash

- **HEPATIC IMPAIRMENT** No information available.

- **RENAL IMPAIRMENT** No information available.

- **MONITORING REQUIREMENTS** Monitor blood loss after delivery.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Tractocile® concentrate for intravenous infusion), give continuously in Glucose 5% or Sodium chloride 0.9%. Withdraw 10 mL infusion fluid from 100-mL bag and replace with 10 mL atosiban concentrate (7.5 mg/mL) to produce a final concentration of 750 micrograms/mL.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **ATOSIBAN (Non-proprietary)**

Atosiban (as Atosiban acetate) 7.5 mg per 1 mL Atosiban 6.75mg/0.9ml solution for injection vials | 1 vial (PoM) £18.41 (Hospital only)

▶ **Tractocile** (Ferring Pharmaceuticals Ltd)

Atosiban (as Atosiban acetate) 7.5 mg per 1 mL Tractocile 6.75mg/0.9ml solution for injection vials | 1 vial (PoM) £18.41 (Hospital only)

Solution for infusion

▶ **ATOSIBAN (Non-proprietary)**

Atosiban (as Atosiban acetate) 7.5 mg per 1 mL Atosiban 37.5mg/5ml concentrate for solution for infusion vials | 1 vial (PoM) £52.82 (Hospital only)

▶ **Tractocile** (Ferring Pharmaceuticals Ltd)

Atosiban (as Atosiban acetate) 7.5 mg per 1 mL Tractocile 37.5mg/5ml solution for infusion vials | 1 vial (PoM) £52.82 (Hospital only)

5.4 Termination of pregnancy

PROGESTERONE RECEPTOR MODULATORS

Mifepristone

- **DRUG ACTION** Mifepristone, an antiprogesterogenic steroid, sensitises the myometrium to prostaglandin-induced contractions and ripens the cervix.

INDICATIONS AND DOSE

Cervical ripening before mechanical cervical dilatation for termination of pregnancy of up to 84 days gestation (under close medical supervision)

BY MOUTH

▶ Adult: 200 mg for 1 dose, to be taken 36–48 hours before procedure

Labour induction in fetal death in utero where prostaglandin or oxytocin inappropriate (under close medical supervision)

BY MOUTH

▶ Adult: 600 mg once daily for 2 days, if labour not started within 72 hours of first dose, another method should be used

Medical termination of intra-uterine pregnancy of up to 49 days gestation (under close medical supervision)

BY MOUTH

▶ Adult: 600 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina or misoprostol 400 micrograms by mouth, alternatively 200 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding

Medical termination of intra-uterine pregnancy of 50–63 days gestation (under close medical supervision)

BY MOUTH

▶ Adult: 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding

Termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin) (under close medical supervision)**BY MOUTH**

- ▶ **Adult:** 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36–48 hours later by gemeprost 1 mg by vagina every 3 hours up to max. 5 mg *or* misoprostol; if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 · chronic adrenal failure · suspected ectopic pregnancy (use other specific means of termination) · uncontrolled severe asthma
- **CAUTIONS** Adrenal suppression (may require corticosteroid) · anticoagulant therapy · asthma (avoid if severe and uncontrolled) · existing cardiovascular disease · hemorrhagic disorders · history of endocarditis · prosthetic heart valve · risk factors for cardiovascular disease
- **INTERACTIONS** → Appendix 1 (mifepristone).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Gastro-intestinal cramps · uterine contractions · vaginal bleeding (sometimes severe) may occur between administration of mifepristone and surgery (and rarely abortion may occur before surgery)
 - ▶ **Uncommon** Hypersensitivity reactions · rash · urticaria
 - ▶ **Rare** Chills · dizziness · fever · headache · hot flushes · hypotension · malaise
 - ▶ **Frequency not known** Infections · toxic shock syndrome
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Manufacturer advises avoid.
- **MONITORING REQUIREMENTS** Careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension).
- **PRESCRIBING AND DISPENSING INFORMATION** Supplied to NHS hospitals and premises approved under Abortion Act 1967.
- **PATIENT AND CARER ADVICE** Patient information leaflet to be provided.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 10

▶ **MIFEPRISTONE (Non-proprietary)**

PROSTAGLANDINS AND OXYTOXICS**Gemeprost****INDICATIONS AND DOSE**

Cervical ripening prior to first trimester surgical abortion

BY VAGINA

- ▶ **Adult:** 1 mg, dose to be inserted into posterior fornix 3 hours before surgery

Second trimester abortion**BY VAGINA**

- ▶ **Adult:** 1 mg every 3 hours for maximum 5 administrations, to be inserted into posterior fornix,

second course may begin 24 hours after start of treatment (if treatment fails, pregnancy should be terminated by another method)

Second trimester intra-uterine death**BY VAGINA**

- ▶ **Adult:** 1 mg every 3 hours for maximum 5 administrations only, to be inserted into posterior fornix

Medical termination of intra-uterine pregnancy of up to 49 days gestation following mifepristone | Medical termination of intra-uterine pregnancy of 50–63 days gestation following mifepristone

BY VAGINA

- ▶ **Adult:** 1 mg

Termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin) following mifepristone

BY VAGINA

- ▶ **Adult:** 1 mg every 3 hours (max. per dose 5 mg), if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended, careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension)

- **CONTRA-INDICATIONS** Placenta praevia · unexplained vaginal bleeding · uterine scarring
- **CAUTIONS** Cardiovascular insufficiency · cervicitis · obstructive airways disease · raised intra-ocular pressure · vaginitis
- **INTERACTIONS** → Appendix 1 (prostaglandins).
- **SIDE-EFFECTS** Backache · chest pain · chills · coronary artery spasm · diarrhoea · dizziness · dyspnoea · flushing · headache · mild pyrexia · muscle weakness · myocardial infarction · nausea · palpitation · severe hypotension · uterine pain · uterine rupture (most commonly in multiparas or if history of uterine surgery or if given with intravenous oxytocics) · vaginal bleeding · vomiting
- **RENAL IMPAIRMENT** Manufacturer advises avoid.
- **MONITORING REQUIREMENTS**
 - ▶ If used in combination with mifepristone, carefully monitor blood pressure and pulse for 3 hours.
 - ▶ When used for second trimester intra-uterine death, monitor for coagulopathy during treatment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Pessary▶ **GEMEPROST (Non-proprietary)**

Gemeprost 1 mg Gemeprost 1mg pessaries | 5 pessary [POM] no price available

PROSTAGLANDINS**Misoprostol**

- **DRUG ACTION** Misoprostol is a synthetic prostaglandin analogue that has antisecretory and protective properties, promoting healing of gastric and duodenal ulcers. It also acts as a potent uterine stimulant.

INDICATIONS AND DOSE

Termination of pregnancy following mifepristone (gestation up to 49 days)

BY MOUTH

- ▶ **Adult:** 400 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone continued →

Termination of pregnancy following mifepristone (gestation 50 to 63 days)

INITIALLY BY VAGINA OR BY BUCCAL ADMINISTRATION OR BY SUBLINGUAL ADMINISTRATION

- ▶ Adult: 800 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone, if abortion has not occurred 4 hours after first misoprostol dose a further dose may be given, (by mouth or by vagina) 400 micrograms for 1 dose

Termination of pregnancy following mifepristone (gestation of 9 to 13 weeks)

INITIALLY BY VAGINA

- ▶ Adult: 800 micrograms for 1 dose, dose to be given 36–48 hours after mifepristone, followed by (by vagina or by mouth) 400 micrograms every 3 hours if required for a maximum of 4 doses

Termination of pregnancy following mifepristone (gestation of 13 to 24 weeks)

INITIALLY BY VAGINA

- ▶ Adult: 800 micrograms for 1 dose, dose to be given 36–48 hours after mifepristone, followed by (by vagina or by mouth) 400 micrograms every 3 hours if required for a maximum of 4 doses, if abortion has not occurred 3 hours after the last dose of misoprostol, a further dose of mifepristone may be given, and misoprostol may be recommended 12 hours later

Benign gastric ulceration | Benign duodenal ulceration | NSAID-associated ulceration

BY MOUTH

- ▶ Adult: 800 micrograms daily in 2–4 divided doses continued for at least 4 weeks or may be continued for up to 8 weeks if required, dose to be taken with breakfast (or main meals) and at bedtime

Prophylaxis of NSAID-induced gastric ulcer | Prophylaxis of duodenal ulcer

BY MOUTH

- ▶ Adult: 200 micrograms 4 times a day, reduced if not tolerated to 200 micrograms 2–3 times a day, use lower dose is less effective

- **UNLICENSED USE** Use of misoprostol for termination of pregnancy is an unlicensed use.

- **CAUTIONS** Conditions where hypotension might precipitate severe complications (e.g. cerebrovascular disease, cardiovascular disease) - inflammatory bowel disease

● **SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea
- ▶ **Frequency not known** Abdominal pain · abnormal vaginal bleeding · dizziness · dyspepsia · flatulence · intermenstrual bleeding · menorrhagia · nausea · postmenopausal bleeding · rashes · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Diarrhoea May occasionally be severe and require withdrawal, reduced by giving single doses not exceeding 200 micrograms and by avoiding magnesium-containing antacids.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises that misoprostol should not be used in women of childbearing age unless pregnancy has been excluded. In such patients it is advised that misoprostol should only be used if the patient takes *effective contraceptive measures* and has been advised of the *risks of taking misoprostol if pregnant*.

- **PREGNANCY** Avoid—potent uterine stimulant (has been used to induce abortion). Teratogenic risk in first trimester.

- **BREAST FEEDING** Present in milk, but amount probably too small to be harmful.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

6 Vaginal and vulval conditions

Vaginal and vulval conditions

Symptoms are often restricted to the vulva, but infections almost invariably involve the vagina which should also be treated. Applications to the vulva alone are likely to give only symptomatic relief without cure.

Aqueous medicated douches may disturb normal vaginal acidity and bacterial flora.

Topical anaesthetic agents give only symptomatic relief and may cause sensitivity reactions. They are indicated only in cases of pruritus where specific local causes have been excluded.

Systemic drugs are required in the treatment of infections such as gonorrhoea and syphilis.

Preparations for vaginal and vulval changes

A cream containing an oestrogen may be applied on a short-term basis to improve the vaginal epithelium in *menopausal atrophic vaginitis*. It is **important** to bear in mind that topical oestrogens should be used in the **smallest effective** amount to minimise systemic effects. Modified-release vaginal tablets and an impregnated vaginal ring are now also available.

The risk of endometrial hyperplasia and carcinoma is increased when *systemic* oestrogens are administered alone for prolonged periods. The endometrial safety of long-term or repeated use of *topical* vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

Topical oestrogens are also used in postmenopausal women before vaginal surgery for prolapse when there is epithelial atrophy.

Non-hormonal preparations for vaginal atrophy

Several non-hormonal vaginal moisturisers are available and some are prescribable on the NHS (consult Drug Tariff).

Vaginal and vulval infections

Effective specific treatments are available for the common vaginal infections.

Fungal infections

Candidal vulvitis can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. *Vaginal candidiasis* is treated primarily with antifungal pessaries or cream inserted high into the vagina (including during menstruation). Single-

dose preparations offer an advantage when compliance is a problem. Local irritation may occur on application of vaginal antifungal products.

Imidazole drugs (clotrimazole p. 712, econazole nitrate p. 712, fenticonazole nitrate p. 713, and miconazole p. 713) are effective against candida in short courses of 1 to 14 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with fluconazole p. 518 or itraconazole p. 519 is also effective.

Vulvovaginal candidiasis in pregnancy

Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole p. 712), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

Recurrent vulvovaginal candidiasis

Recurrence of vulvovaginal candidiasis is particularly likely if there are predisposing factors, such as antibacterial therapy, pregnancy, diabetes mellitus, or possibly oral contraceptive use. Reservoirs of infection may also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus as well as the gastro-intestinal tract and the bladder. The partner may also be the source of reinfection and, if symptomatic, should be treated with a topical imidazole cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis.

Other infections

Trichomonal infections commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole p. 475 or tinidazole p. 476.

Bacterial infections with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially *Bacteroides* spp. and can be used prophylactically in gynaecological surgery.

Clindamycin cream below and metronidazole gel are indicated for bacterial vaginosis.

Vaginal preparations intended to restore normal acidity may prevent recurrence of vaginal infections and permit the re-establishment of the normal vaginal flora.

The antiviral drugs aciclovir p. 550, famciclovir p. 552, and valaciclovir p. 552 can be used in the treatment of genital infection due to *herpes simplex virus*, the HSV type 2 being a major cause of genital ulceration; they have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms.

6.1 Vaginal and vulval infections, bacterial

CARBOXYLIC ACIDS

Lactic acid

INDICATIONS AND DOSE

BALANCE ACTIV RX® GEL

Prevention of bacterial vaginosis

BY VAGINA

- ▶ Adult: 5 mL 1–2 times a week, insert the content of 1 tube

RELACTAGEL® GEL

Prevention of bacterial vaginosis

BY VAGINA

- ▶ Adult: 5 mL daily for 2–3 nights after menstruation, insert the contents of one tube

● SIDE-EFFECTS

RELACTAGEL® GEL

Mild irritation

● CONCEPTION AND CONTRACEPTION

RELACTAGEL® GEL

Not recommended if trying to conceive.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Vaginal gel

EXCIPIENTS: May contain Propylene glycol

- ▶ **Balance Activ** (BBI Healthcare Ltd)

Balance Activ BV vaginal pH correction gel | 7 device £5.25

Balance Activ pessaries | 7 pessary £5.25

- ▶ **Relactagel** (KoRa Healthcare)

Relactagel vaginal pH correction gel | 7 device £5.25

Clindamycin

INDICATIONS AND DOSE

DALACIN® 2% CREAM

Bacterial vaginosis

BY VAGINA

- ▶ Adult: 1 applicatorful daily for 3–7 nights, dose to be administered at night

Dose equivalence and conversion

1 applicatorful delivers a 5 g dose of clindamycin 2%.

● SIDE-EFFECTS Cervicitis · irritation · vaginitis

SIDE-EFFECTS, FURTHER INFORMATION

Systemic side-effects Clindamycin 2% cream is poorly absorbed into the blood—low risk of systemic effects.

● CONCEPTION AND CONTRACEPTION

DALACIN® 2% CREAM

Damages latex condoms and diaphragms.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

- ▶ **Dalacin** (Pfizer Ltd)

Clindamycin (as Clindamycin phosphate) 20 mg per 1

gram Dalacin 2% cream | 40 gram PoM £10.86 DT price = £10.86

Metronidazole

- **DRUG ACTION** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

INDICATIONS AND DOSE

Bacterial vaginosis

BY VAGINA USING VAGINAL GEL

- ▶ Adult: 1 applicatorful daily for 5 days, dose to be administered at night

- **CAUTIONS** Not recommended during menstruation · some systemic absorption may occur with vaginal gel

- **SIDE-EFFECTS** Abnormal vaginal discharge · local irritation · pelvic discomfort · vaginal candidiasis

6.3 Vaginal atrophy

OESTROGENS

Estriol

INDICATIONS AND DOSE**GYNEST®**

Improve the vaginal epithelium in menopausal atrophic vaginitis (short-term use)

BY VAGINA

► Adult: Apply 1 applicatorful daily until improvement occurs, dose to be applied preferably in the evening, reduced to 1 applicatorful twice weekly, attempts to discontinue should be made at 3–6 month intervals with re-examination

OVESTIN®

Improve the vaginal epithelium in menopausal atrophic vaginitis (short-term use)

BY VAGINA

► Adult: Apply 1 applicatorful daily for 2–3 weeks, then reduced to 1 applicatorful twice weekly, discontinue every 2–3 months for 4 weeks to assess need for further treatment

Vaginal surgery for prolapse when there is epithelial atrophy in postmenopausal women (before surgery)

BY VAGINA

► Adult: Apply 1 applicatorful daily for 2 weeks before surgery, resume 2 weeks after surgery

- **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) · active thrombophlebitis · Dubin-Johnson syndrome (or monitor closely) · history of breast cancer · history of recurrent venous thromboembolism (unless already on anticoagulant treatment) · oestrogen-dependent cancer · recent arterial thromboembolic disease (e.g. angina or

myocardial infarction) · Rotor syndrome (or monitor closely) · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia · venous thromboembolism

- **CAUTIONS** Acute porphyrias p. 864 · diabetes (increased risk of heart disease) · factors predisposing to thromboembolism · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · hypophyseal tumours · increased risk of gall-bladder disease · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size · interrupt treatment periodically to assess need for continued treatment

CAUTIONS, FURTHER INFORMATION

Risk of breast cancer It is estimated that using *all* types of HRT increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.

Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use. In *women who have predisposing factors* (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. *Travel* involving prolonged immobility further increases the risk of deep vein thrombosis.

Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **INTERACTIONS** → Appendix 1 (oestrogens).
- **SIDE-EFFECTS** Abdominal bloating · abdominal cramps · altered blood lipids (may lead to pancreatitis, rashes and chloasma) · breast enlargement · breast tenderness · changes in libido · cholestatic jaundice · contact lenses may irritate · depression · dizziness · fluid retention · glucose intolerance · headache · leg cramps · migraine · mood changes · nausea · premenstrual-like syndrome · sodium retention · vaginal candidiasis · vomiting · weight changes · local irritation

SIDE-EFFECTS, FURTHER INFORMATION

Leg Cramps Venous thrombosis should be ruled out.

Withdrawal Bleeding Cyclic HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in *regular withdrawal bleeding* towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but *irregular bleeding* may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

- **CONCEPTION AND CONTRACEPTION** Intravaginal cream may damage latex condoms and diaphragms.

GYNEST®

May damage latex condoms and diaphragms.

OVESTIN®

Effect on latex condoms and diaphragms not yet known.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid; adverse effects on lactation.
- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.
- **RENAL IMPAIRMENT** Manufacturer advises caution in renal disease. Evidence for caution is unsatisfactory and many women with these conditions may stand to benefit from HRT.
- **MONITORING REQUIREMENTS**
 - ▶ Closely monitor breast status if history of breast nodules or fibrocystic disease (risk of breast cancer).
 - ▶ The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Arachis (peanut) oil, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

▶ ESTRIOL (Non-proprietary)

Estriol 100 microgram per 1 gram Estriol 0.01% cream | 80 gram **[PoM]** no price available

▶ Ovestin (Aspen Pharma Trading Ltd)

Estriol 1 mg per 1 gram Ovestin 1mg cream | 15 gram **[PoM]** £4.45
DT price = £4.45

▶ Gynest (Marlborough Pharmaceuticals Ltd)

Estriol 100 micrograms per 1 gram Gynest 0.01% cream | 80 gram **[PoM]** £4.91

1 Immune system

1.1 Immune system disorders and transplantation

Immune response

Azathioprine p. 716, ciclosporin p. 717, mercaptopurine p. 762, and methotrexate p. 762 have a role in the treatment of inflammatory bowel disease.

Folic acid p. 836 should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid is usually given weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Immunosuppressant therapy

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mycophenolate mofetil p. 725), calcineurin inhibitors (ciclosporin p. 717 or tacrolimus p. 720), corticosteroids, or sirolimus p. 719. Choice is dependent on the type of organ, time after transplantation, and clinical condition of the patient. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

Impaired immune responsiveness

Modification of tissue reactions caused by corticosteroids and other immunosuppressants may result in the rapid spread of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised—**important**: normal immunoglobulin administration should be considered as soon as possible after measles exposure, and varicella–zoster immunoglobulin (VZIG) is recommended for individuals who have significant chickenpox (varicella) exposure. Specialist advice should be sought on the use of live vaccines for those being treated with immunosuppressive drugs.

Antiproliferative immunosuppressants

Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions,

usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced when allopurinol p. 909 is given concurrently.

Mycophenolate mofetil p. 725 is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine.

There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil reduces the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher.

Cyclophosphamide p. 750 is less commonly prescribed as an immunosuppressant.

Corticosteroids and other immunosuppressants

Prednisolone p. 585 is widely used in oncology. It has a marked antitumour effect in acute lymphoblastic leukaemia, Hodgkin's disease, and the non-Hodgkin lymphomas. It has a role in the palliation of symptomatic end-stage malignant disease when it may enhance appetite and produce a sense of well-being.

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin p. 717 a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-mylotoxic but markedly nephrotoxic. It has an important role in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart–lung transplantation, and for prophylaxis and treatment of graft-versus-host disease.

Tacrolimus p. 720 is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects, but the incidence of neurotoxicity appears to be greater; cardiomyopathy has also been reported. Disturbance of glucose metabolism also appears to be significant.

Sirolimus p. 719 is a non-calcineurin inhibiting immunosuppressant licensed for renal transplantation.

Basiliximab p. 724 is used for prophylaxis of acute rejection in allogeneic renal transplantation. It is given with ciclosporin and corticosteroid immunosuppression regimens; its use should be confined to specialist centres.

Belatacept p. 726 is a fusion protein and co-stimulation blocker that prevents T-cell activation; it is licensed for prophylaxis of graft rejection in adults undergoing renal transplantation who are seropositive for the Epstein-Barr virus. It is used with interleukin-2 receptor antagonist

induction, in combination with corticosteroids and a mycophenolic acid.

Antithymocyte immunoglobulin (rabbit) p. 723 is licensed for the prophylaxis of organ rejection in renal and heart allograft recipients and for the treatment of corticosteroid-resistant allograft rejection in renal transplantation. Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

NICE technology appraisals (TAs)

Immunosuppressive therapy for renal transplantation in adults (September 2004) Immunosuppressive therapy for renal transplantation in children and adolescents (April 2006) NICE TA85

For induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects.

Mycophenolate mofetil [mycophenolic acid also available but not licensed for use in children] is recommended as part of an immunosuppressive regimen only if:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; *or*
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Sirolimus is recommended as a component of immunosuppressive regimen **only if** intolerance necessitates the withdrawal of a calcineurin inhibitor. These recommendations may not be consistent with the marketing authorisation of some of the products. www.nice.org.uk/TA85

Immunosuppressive therapy for renal transplantation in children and adolescents (April 2006)

NICE TA99

NICE has recommended that for induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects. Mycophenolate mofetil is recommended as part of an immunosuppressive regimen **only if**:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; *or*
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Mycophenolic acid is not recommended as part of an immunosuppressive regimen for renal transplantation in children or adolescents.

Sirolimus [not licensed for use in children] is recommended as a component of immunosuppressive regimen **only if** intolerance necessitates the withdrawal of a calcineurin inhibitor.

These recommendations may not be consistent with the marketing authorisation of some of the products. www.nice.org.uk/TA99

ANTIMETABOLITES

Azathioprine

- **DRUG ACTION** Azathioprine is metabolised to mercaptopurine.

INDICATIONS AND DOSE

Severe acute Crohn's disease | Maintenance of remission of Crohn's disease | Maintenance of remission of acute ulcerative colitis

BY MOUTH

- ▶ Adult: 2–2.5 mg/kg daily, some patients may respond to lower doses

Rheumatoid arthritis that has not responded to other disease-modifying drugs | Severe systemic lupus erythematosus and other connective tissue disorders | Polyomyelitis in cases of corticosteroid resistance

BY MOUTH

- ▶ Adult: Initially up to 2.5 mg/kg daily in divided doses, adjusted according to response, rarely more than 3 mg/kg daily; maintenance 1–3 mg/kg daily, consider withdrawal if no improvement within 3 months

Autoimmune conditions

BY MOUTH OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 1–3 mg/kg daily, adjusted according to response, consider withdrawal if no improvement within 3 months, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) *or* by intravenous infusion

Suppression of transplant rejection

BY MOUTH OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 1–2.5 mg/kg daily, adjusted according to response, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) *or* by intravenous infusion

Severe refractory eczema, normal or high TPMT activity

BY MOUTH

- ▶ Adult: 1–3 mg/kg daily

Severe refractory eczema, intermediate TPMT activity

BY MOUTH

- ▶ Adult: 0.5–1.5 mg/kg daily

Generalised myasthenia gravis

INITIALLY BY MOUTH OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 0.5–1 mg/kg daily, then increased to 2–2.5 mg/kg daily, dose is increased over 3–4 weeks, azathioprine is usually started at the same time as the corticosteroid and allows a lower maintenance dose of the corticosteroid to be used, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) *or* by intravenous infusion

- **UNLICENSED USE** Azathioprine doses given in BNF for suppression of transplant rejection and autoimmune conditions may differ from those in product literature. Use for severe refractory eczema is unlicensed.

CONTRA-INDICATIONS

- ▶ When used for severe refractory eczema absent thiopurine methyltransferase (TPMT) activity · very low thiopurine methyltransferase (TPMT) activity

- **CAUTIONS** Reduce dose in elderly · reduced thiopurine methyltransferase activity

- **INTERACTIONS** → Appendix 1 (azathioprine).

SIDE-EFFECTS

- ▶ **Rare** Hepatic veno-occlusive disease · lymphoma · pancreatitis · pneumonitis · red cell aplasia
- ▶ **Frequency not known** Arthralgia · cholestatic jaundice · colitis in patients also receiving corticosteroids · diarrhoea · dizziness · dose-related bone marrow suppression · fever · hair loss · herpes zoster infection · hypersensitivity reactions · hypotension · increased susceptibility to

infections in patients also receiving corticosteroids · interstitial nephritis · liver impairment · malaise · myalgia · nausea · neutropenia · rash · rigors · thrombocytopenia · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Red cell aplasia Cases of pure red cell aplasia have been reported with azathioprine; dose reduction or discontinuation should be considered under specialist supervision.

Neutropenia and thrombocytopenia Usually resolved by reducing the dose.

Nausea, vomiting and diarrhoea Nausea, vomiting and diarrhoea may occur, usually starting early during the course of treatment, and in rheumatoid arthritis it may be appropriate to withdraw the drug.

Hypersensitivity reactions Hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and interstitial nephritis) call for immediate withdrawal.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in hypersensitivity to mercaptopurine.
- **PREGNANCY** Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in *animal* studies. The use of azathioprine during pregnancy needs to be supervised in specialist units. Treatment should not generally be initiated during pregnancy.
- **BREAST FEEDING** Present in milk in low concentration. No evidence of harm in small studies—use if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Reduce dose. Monitor liver function.
- **RENAL IMPAIRMENT** Reduce dose.
- **PRE-TREATMENT SCREENING**
Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for toxicity throughout treatment.
 - ▶ Monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.
 - ▶ Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, give over at least 1 minute (followed by 50 mL sodium chloride intravenous infusion). For *intravenous infusion* (*Imuran*®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute 50 mg with 5–15 mL Water for Injections; dilute requisite dose to a volume of 20–200 mL with infusion fluid.
Intravenous injection is alkaline and very irritant, intravenous route should therefore be used **only** if oral route not feasible.

● PATIENT AND CARER ADVICE

Bone marrow suppression Patients and their carers should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, capsule

CALCINEURIN INHIBITORS AND RELATED DRUGS

Ciclosporin (Cyclosporin)

- **DRUG ACTION** Ciclosporin is a calcineurin inhibitor.

INDICATIONS AND DOSE

Severe acute ulcerative colitis refractory to corticosteroid treatment

BY CONTINUOUS INTRAVENOUS INFUSION

- ▶ Adult: 2 mg/kg, to be given over 24 hours, dose adjusted according to blood-ciclosporin concentration and response

Severe active rheumatoid arthritis when conventional second-line therapy inappropriate or ineffective (administered on expert advice)

BY MOUTH

- ▶ Adult: Initially 2.5 mg/kg daily in 2 divided doses, then increased if necessary up to 4 mg/kg after 6 weeks, dose increase, if required should be gradual, discontinue if response insufficient after 3 months, dose adjusted according to response for maintenance and treatment reviewed after 6 months (continue only if benefits outweigh risks)

Short-term treatment of severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

BY MOUTH

- ▶ Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily) usually maximum 8 weeks but may be used for longer, if good initial response not achieved within 2 weeks, increase dose rapidly up to maximum

Short-term treatment of very severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

BY MOUTH

- ▶ Adult: Initially 2.5 mg/kg twice daily usually maximum 8 weeks but may be used for longer

Severe psoriasis where conventional therapy ineffective or inappropriate (administered on expert advice)

BY MOUTH

- ▶ Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily), increased gradually to maximum if no improvement within

continued →

1 month, initial dose of 2.5 mg/kg twice daily justified if condition requires rapid improvement; discontinue if inadequate response after 3 months at the optimum dose; max. duration of treatment usually 1 year unless other treatments cannot be used

Organ transplantation (used alone)

BY MOUTH

▶ Adult: 10–15 mg/kg, to be administered 4–12 hours before transplantation, followed by 10–15 mg/kg daily for 1–2 weeks postoperatively, then maintenance 2–6 mg/kg daily, reduce dose gradually to maintenance. Dose should be adjusted according to blood-cyclosporin concentration and renal function; dose is lower if given concomitantly with other immunosuppressant therapy (e.g. corticosteroids); if necessary one-third corresponding oral dose can be given by intravenous infusion over 2–6 hours

Bone-marrow transplantation | Prevention and treatment of graft-versus-host disease

INITIALLY BY INTRAVENOUS INFUSION

▶ Adult: 3–5 mg/kg daily, to be administered over 2–6 hours from day before transplantation to 2 weeks postoperatively, alternatively (by mouth) 12.5–15 mg/kg daily, then (by mouth) 12.5 mg/kg daily for 3–6 months and then tailed off (may take up to a year after transplantation)

Nephrotic syndrome

BY MOUTH

▶ Adult: 5 mg/kg daily in 2 divided doses, for maintenance reduce to lowest effective dose according to proteinuria and serum creatinine measurements; discontinue after 3 months if no improvement in glomerulonephritis or glomerulosclerosis (after 6 months in membranous glomerulonephritis)

- **UNLICENSED USE** Not licensed for use in severe acute ulcerative colitis refractory to corticosteroid treatment

Important safety information

Patients should be stabilised on a particular brand of oral cyclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-cyclosporin concentration.

- **CONTRA-INDICATIONS** Abnormal renal function (in non-transplant indications) · malignancy (in non-transplant indications) · uncontrolled hypertension (in non-transplant indications) · uncontrolled infections (in non-transplant indications) · use with tacrolimus specifically contraindicated
- **CAUTIONS** Hyperuricaemia · in atopic dermatitis *Staphylococcus aureus* skin infections—not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative) · in atopic dermatitis allow herpes simplex infections to clear before starting (if they occur during treatment withdraw if severe) · in atopic dermatitis and psoriasis discontinue if lymphoproliferative disorder develops · in psoriasis treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option)
- **INTERACTIONS** → Appendix 1 (cyclosporin). For patients other than transplant recipients, preferably avoid other immunosuppressants (increased risk of infection and malignancies, including lymphoma and skin cancer).
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · anorexia · diarrhoea · fatigue · gingival hyperplasia · headache ·

- hepatic dysfunction · hypercholesterolaemia · hyperkalaemia · hyperlipidaemia · hypertension · hypertrichosis · hyperuricaemia · hypomagnesaemia · muscle cramps · myalgia · nausea · paraesthesia · renal dysfunction (renal structural changes on long-term administration) · tremor · vomiting
- ▶ **Uncommon** Anaemia · oedema · signs of encephalopathy · thrombocytopenia · weight gain
- ▶ **Rare** Gynaecomastia · haemolytic uraemic syndrome · hyperglycaemia · menstrual disturbances · micro-angiopathic haemolytic anaemia · motor polyneuropathy · muscle weakness · myopathy · pancreatitis · visual disturbances secondary to benign intracranial hypertension

SPECIFIC SIDE-EFFECTS

- ▶ **With intravenous use** anaphylaxis

SIDE-EFFECTS, FURTHER INFORMATION

Visual disturbances Discontinue if visual disturbances secondary to benign intracranial hypertension occur.

- **PREGNANCY** Crosses placenta. There is less experience of cyclosporin in pregnancy but it does not appear to be any more harmful than azathioprine. The use of cyclosporin during pregnancy needs to be supervised in specialist units.
- **BREAST FEEDING** Present in milk—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Dosage adjustment based on bilirubin and liver enzymes may be needed.
- **RENAL IMPAIRMENT** In patients with nephrotic syndrome and renal impairment initially 2.5 mg/kg daily. Reduce dose by 25–50% if serum creatinine more than 30% above baseline on more than one measurement. In rheumatoid arthritis, reduce dose if serum creatinine increases more than 30% above baseline in more than 1 measurement; if above 50%, reduce dose by 50% (even if within normal range) and discontinue if reduction not successful within 1 month. In psoriasis and atopic dermatitis, reduce dose by 25–50% if serum creatinine increases more than 30% above baseline (even if within normal range) and discontinue if reduction not successful within 1 month.
- **PRE-TREATMENT SCREENING** In psoriasis, exclude malignancies (including those of skin and cervix) before starting (biopsy any lesions not typical of psoriasis).
- **MONITORING REQUIREMENTS**
 - ▶ Dermatological and physical examination, including blood pressure and renal function measurements required at least twice before starting treatment for psoriasis or atopic dermatitis.
 - ▶ Monitor liver function.
 - ▶ Monitor serum potassium especially in renal dysfunction (risk of hyperkalaemia).
 - ▶ Monitor serum magnesium.
 - ▶ Measure blood lipids before treatment and after the first month of treatment.
 - ▶ In psoriasis and atopic dermatitis monitor serum creatinine every 2 weeks for first 3 months then every month.
 - ▶ Investigate lymphadenopathy that persists despite improvement in atopic dermatitis.
 - ▶ Monitor kidney function—dose dependent increase in serum creatinine and urea during first few weeks may necessitate dose reduction in transplant patients (exclude rejection if kidney transplant) or discontinuation in non-transplant patients.
 - ▶ Monitor blood pressure—discontinue if hypertension develops that cannot be controlled by antihypertensives.
 - ▶ In long-term management of nephrotic syndrome, perform renal biopsies at yearly intervals.
 - ▶ In rheumatoid arthritis measure serum creatinine at least twice before treatment. During treatment, monitor serum

creatinine every 2 weeks for first 3 months, then every month for a further 3 months, then every 4–8 weeks depending on the stability of the disease, concomitant medication, and concomitant diseases (or more frequently if dose increased or concomitant NSAIDs introduced or increased).

- ▶ Monitor hepatic function if concomitant NSAIDs given.

● DIRECTIONS FOR ADMINISTRATION

▶ With oral use Mix solution with orange juice (or squash) or apple juice (to improve taste) or with water immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. With capsules and oral solution, total daily dose should be taken in 2 divided doses.

▶ With intravenous use For *intravenous infusion* (*Sandimmun*[®]), give intermittently or continuously in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 50 mg in 20–100 mL; give intermittent infusion over 2–6 hours; not to be used with PVC equipment. Observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.

● PRESCRIBING AND DISPENSING INFORMATION

Brand name prescribing Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentration, serum creatinine, blood pressure, and transplant function. *Sandimmun*[®] capsules and oral solution are available direct from Novartis for patients who cannot be transferred to a different oral preparation.

● **HANDLING AND STORAGE** Keep medicine measure away from other liquids (including water).

● **PATIENT AND CARER ADVICE** Patients and carers should be counselled on the administration of ciclosporin capsules and oral solution. Avoid excessive exposure to UV light, including sunlight. In psoriasis and atopic dermatitis, avoid use of UVB or PUVA.

● MEDICINAL FORMS

Sirolimus

● **DRUG ACTION** Sirolimus is a non-calcineurin inhibiting immunosuppressant.

INDICATIONS AND DOSE

Prophylaxis of organ rejection in kidney allograft recipients
BY MOUTH

▶ **Adult:** Initially 6 mg for 1 dose, to be given after surgery once wound has healed, then 2 mg once daily for 2–3 months (in combination with ciclosporin and corticosteroid; sirolimus dose should be given 4 hours after ciclosporin), followed by maintenance 2 mg once daily, ciclosporin should then be withdrawn over 4–8 weeks (if not possible, sirolimus should be discontinued and an alternate immunosuppressive regimen used), dose to be adjusted according to whole blood-sirolimus trough concentration

Dose equivalence and conversion

The 500 microgram tablet is not bioequivalent to the 1 mg and 2 mg tablets. Multiples of 500 microgram tablets should **not** be used as a substitute for other tablet strengths.

● **CAUTIONS** Hyperlipidaemia · increased susceptibility to infection (especially urinary-tract infection) · increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light)

● **INTERACTIONS** → Appendix 1 (sirolimus).

● SIDE-EFFECTS

▶ **Common or very common** Abdominal pain · acne · anaemia · arthralgia · ascites · constipation · diarrhoea · epistaxis · haemolytic uraemic syndrome · headache · hypercholesterolaemia · hyperglycaemia · hypertension · hypertriglyceridaemia · hypokalaemia · hypophosphataemia · impaired healing · leucopenia · lymphoecrosis · nausea · neutropenia · oedema · osteonecrosis · pleural effusion · pneumonitis · proteinuria

- pyrexia · rash · stomatitis · tachycardia · thrombocytopenia · thrombotic thrombocytopenic purpura · venous thromboembolism
- ▶ **Uncommon** Nephrotic syndrome · pancreatitis · pancytopenia · pericardial effusion · pulmonary embolism · pulmonary haemorrhage
- ▶ **Rare** Alveolar proteinosis · anaphylactic reactions · angioedema · exfoliative dermatitis · hepatic necrosis · hypersensitivity reactions · hypersensitivity vasculitis · interstitial lung disease · lymphoedema
- ▶ **Frequency not known** Focal segmental glomerulosclerosis · reversible impairment of male fertility
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment and for 12 weeks after stopping.
- **PREGNANCY** Avoid unless essential—toxicity in *animal* studies.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** In severe impairment decrease dose by 50% and monitor whole blood-sirolimus trough concentration every 5–7 days until 3 consecutive measurements have shown stable blood-sirolimus concentration. Clearance reduced in mild to moderate impairment. Monitor whole blood-sirolimus level closely and consult local treatment protocol in hepatic impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses).
 - ▶ Manufacturer advises pre-dose ('trough') whole blood-sirolimus concentration (using **chromatographic** assay) when used with ciclosporin should be 4–12 micrograms/litre (local treatment protocols may differ); after withdrawal of ciclosporin pre-dose whole blood-sirolimus concentration should be 12–20 micrograms/litre (local treatment protocols may differ).
 - ▶ Close monitoring of whole blood-sirolimus concentration required if concomitant treatment with potent inducers or inhibitors of metabolism and after discontinuing them, or if ciclosporin dose reduced significantly or stopped.
 - ▶ When changing between oral solution and tablets, measurement of whole blood 'trough' sirolimus concentration after 1–2 weeks is recommended.
 - ▶ Sirolimus whole-blood concentration is measured using either high performance liquid chromatography (HPLC) or immunoassay. Switching between different immunoassays or between an immunoassay and HPLC can lead to clinically significant differences in results and therefore incorrect dose adjustments. Adjustment to the target therapeutic dose range should be made with knowledge of the assay used and corresponding reference range.
 - ▶ Monitor kidney function when given with ciclosporin; monitor lipids; monitor urine proteins.
- **DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food). Sirolimus oral solution should be mixed with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sirolimus. Patients should be advised to avoid excessive exposure to UV light.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Rapamune** (Pfizer Ltd)

Sirolimus 500 microgram Rapamune 0.5mg tablets | 30 tablet [PbM] £69.00 DT price = £69.00

Sirolimus 1 mg Rapamune 1mg tablets | 30 tablet [PbM] £86.49 DT price = £86.49

Sirolimus 2 mg Rapamune 2mg tablets | 30 tablet [PbM] £172.98 DT price = £172.98

Oral solution

EXCIPIENTS: May contain Ethanol

- ▶ **Rapamune** (Pfizer Ltd)

Sirolimus 1 mg per 1 ml Rapamune 1mg/ml oral solution (sugar-free) | 60 ml [PbM] £162.41

Tacrolimus

- **DRUG ACTION** Tacrolimus is a calcineurin inhibitor.

INDICATIONS AND DOSE

ADOPT®

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation
BY MOUTH

- ▶ Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

BY MOUTH

- ▶ Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy

BY MOUTH

- ▶ Adult: Seek specialist advice

ADVAGRAF®

Prophylaxis of graft rejection following liver transplantation, starting 12–18 hours after transplantation

BY MOUTH

- ▶ Adult: 100–200 micrograms/kg once daily, to be taken in the morning

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

BY MOUTH

- ▶ Adult: 200–300 micrograms/kg once daily, to be taken in the morning

Allograft rejection resistant to conventional immunosuppressive therapy

BY MOUTH

- ▶ Adult: Seek specialist advice

CAPEXION®

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

BY MOUTH

- ▶ Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

BY MOUTH

- ▶ Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy

BY MOUTH

- ▶ Adult: Seek specialist advice

ENVARUSUS[®]**Prophylaxis of graft rejection following liver transplantation, starting within 24 hours of transplantation**

BY MOUTH

- ▶ Adult: 110–130 micrograms/kg once daily, to be taken in the morning

Prophylaxis of graft rejection following renal transplantation, starting within 24 hours of transplantation

BY MOUTH

- ▶ Adult: 170 micrograms/kg once daily, to be taken in the morning

Rejection therapy

BY MOUTH

- ▶ Adult: Seek specialist advice

MODIGRAF[®]**Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation**

BY MOUTH

- ▶ Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

BY MOUTH

- ▶ Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Rejection therapy

BY MOUTH

- ▶ Adult: Seek specialist advice

PROGRAF[®] CAPSULES**Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation**

BY MOUTH

- ▶ Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

BY MOUTH

- ▶ Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy

BY MOUTH

- ▶ Adult: Seek specialist advice

PROGRAF[®] INFUSION**Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation when oral route not appropriate**

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 10–50 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation when oral route not appropriate

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 50–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Allograft rejection resistant to conventional immunosuppressive therapy

BY CONTINUOUS INTRAVENOUS INFUSION

- ▶ Adult: Seek specialist advice (consult local protocol)

TACNI[®]**Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation**

BY MOUTH

- ▶ Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

continued →

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

BY MOUTH

- ▶ Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy

BY MOUTH

- ▶ Adult: Seek specialist advice

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

BY MOUTH

- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy

BY MOUTH

- ▶ Adult: Seek specialist advice

Important safety information

MHRA/CHM ADVICE: ORAL TACROLIMUS PRODUCTS: PRESCRIBE AND DISPENSE BY BRAND NAME ONLY, TO MINIMISE THE RISK OF INADVERTENT SWITCHING BETWEEN PRODUCTS, WHICH HAS BEEN ASSOCIATED WITH REPORTS OF TOXICITY AND GRAFT REJECTION (JUNE 2012)
Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- *Adoport*®, *Prograf*®, *Capexion*®, *Tacni*®, and *Vivadex*® are immediate-release capsules that are taken twice daily, once in the morning and once in the evening;
- *Modigraf*® granules are used to prepare an immediate-release oral suspension which is taken

twice daily, once in the morning and once in the evening;

- *Advagraf*® is a prolonged-release capsule that is taken once daily in the morning.

Switching between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist.

Important: Envarsus® is not interchangeable with other oral tacrolimus containing products; the MHRA has advised (June 2012) that oral tacrolimus products should be prescribed and dispensed by brand only.

- **CAUTIONS** UV light (avoid excessive exposure to sunlight and sunlamps) · increased risk of infections · lymphoproliferative disorders · malignancies · neurotoxicity · QT-interval prolongation
- **INTERACTIONS** → Appendix 1 (tacrolimus). Contra-indication—avoid concurrent administration with ciclosporin (care if patient has previously received ciclosporin).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** acne · alopecia · anaemia · anorexia · anxiety · arthralgia · ascites · bile-duct abnormalities · bloating · blood disorders · cholestasis · confusion · constipation · depression · diarrhoea · dizziness · dyspepsia · dyspnoea · electrolyte disturbances · flatulence · gastro-intestinal inflammation · gastro-intestinal perforation · gastro-intestinal ulceration · haemorrhage · headache · hepatic dysfunction · hyperglycaemia · hyperkalaemia · hypertension · hyperuricaemia · hypokalaemia · impaired hearing · ischaemic events · jaundice · leucopenia · mood changes · muscle cramp · nausea · oedema · pancytopenia · paraesthesia · parenchymal lung disorders · peripheral neuropathy · photophobia · pleural effusion · psychosis · renal failure · renal impairment · renal tubular necrosis · seizures · sleep disturbances · sweating · tachycardia · thrombocytopenia · thromboembolic events · tinnitus · tremor · urinary abnormalities · visual disturbances · vomiting · weight changes
 - ▶ **Uncommon** amnesia · arrhythmia · cardiac arrest · cardiomyopathy · cataract · cerebrovascular accident · coagulation disorders · coma · dermatitis · dysmenorrhoea · encephalopathy · gastro-intestinal reflux disease · heart failure · hypertension · hypoglycaemia · influenza-like symptoms · palpitation · pancreatitis · paralysis · paralytic ileus · peritonitis · photosensitivity · respiratory failure · speech disorder
 - ▶ **Rare** blindness · dehydration · hirsutism · pericardial effusion · posterior reversible encephalopathy syndrome · respiratory distress syndrome · thrombotic thrombocytopenic purpura · toxic epidermal necrolysis
 - ▶ **Very rare** haemorrhagic cystitis · myasthenia · Stevens-Johnson syndrome
 - ▶ **Frequency not known** agranulocytosis · haemolytic anaemia · pure red cell aplasia
- **SIDE-EFFECTS, FURTHER INFORMATION**
Cardiomyopathy Cardiomyopathy has been reported in children. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur.
- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated if history of hypersensitivity to macrolides.
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment.
- **PREGNANCY** Avoid unless potential benefit outweighs risk—crosses the placenta and risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia.
- **BREAST FEEDING** Avoid—present in breast milk.
- **HEPATIC IMPAIRMENT** Dose reduction may be necessary in severe impairment.

● MONITORING REQUIREMENTS

- ▶ After initial dosing, and for maintenance treatment, tacrolimus doses should be adjusted according to whole-blood concentration. Monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details.
- ▶ Monitor blood pressure, ECG (for hypertrophic changes—risk of cardiomyopathy), fasting blood-glucose concentration, haematological and neurological (including visual) and coagulation parameters, electrolytes, hepatic and renal function.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Prograf*[®]); give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute concentrate in infusion fluid to a final concentration of 4–100 micrograms/mL; give over 24 hours. Tacrolimus is incompatible with PVC.

● **PATIENT AND CARER ADVICE** May affect performance of skilled tasks (e.g. driving). Avoid excessive exposure to UV light including sunlight.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2010) that tacrolimus granules for oral suspension (*Modigraf*[®]) are accepted for restricted use within NHS Scotland in patients for whom tacrolimus is an appropriate choice of immunosuppressive therapy and where small changes (less than 500 micrograms) in dosing increments are required (such as, in paediatric patients) or in seriously ill patients who are unable to swallow tacrolimus capsules.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, paste, oral solution, mouthwash

Modified-release tablet

Tacrolimus 5 mg per 1 ml Prograf 5mg/1ml solution for infusion ampoules | 10 ampoule [PoM](#) £584.51

IMMUNOGLOBULINS

Antithymocyte immunoglobulin (rabbit)

INDICATIONS AND DOSE

Prophylaxis of organ rejection in heart allograft recipients

BY INTRAVENOUS INFUSION

▶ Adult: 1–2.5 mg/kg daily for 3–5 days, to be given over at least 6 hours

Prophylaxis of organ rejection in renal allograft recipients

BY INTRAVENOUS INFUSION

▶ Adult: 1–1.5 mg/kg daily for 3–9 days, to be given over at least 6 hours

Treatment of corticosteroid-resistant allograft rejection in renal transplantation

BY INTRAVENOUS INFUSION

▶ Adult: 1.5 mg/kg daily for 7–14 days, to be given over at least 6 hours

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.

● **CONTRA-INDICATIONS** Infection

● **SIDE-EFFECTS** Anaphylaxis · cytokine release syndrome · diarrhoea · dysphagia · fever · hypotension · increased susceptibility to infection · increased susceptibility to malignancy · infusion-related reactions · lymphopenia · myalgia · nausea · neutropenia · pruritus · rash · serum sickness · shivering · thrombocytopenia · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **MONITORING REQUIREMENTS** Monitor blood count.

● **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion* (*Thymoglobuline*[®]) in Glucose 5% or Sodium chloride 0.9%; reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with infusion fluid to a total volume of 50–500 mL (usually 50 mL/vial); begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); not to be given with unfractionated heparin and hydrocortisone in glucose infusion—precipitation reported.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for infusion

▶ **Thymoglobulin** (Sanofi)

Antithymocyte immunoglobulin (rabbit) 25 mg Thymoglobuline 25mg powder and solvent for solution for infusion vials | 1 vial [PoM](#) £158.77 (Hospital only)

MONOCLONAL ANTIBODIES

Canakinumab

● **DRUG ACTION** Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding.

INDICATIONS AND DOSE

Acute gout in patients whose condition has not responded adequately to treatment with NSAIDs or colchicine, or who are intolerant of them

BY SUBCUTANEOUS INJECTION

▶ Adult: 150 mg for 1 dose, dose may be repeated at least 12 weeks after initial response if symptoms recur, patients who do not respond to initial dose should not be retreated

Treatment of cryopyrin-associated periodic syndromes, including severe forms of familial cold auto-inflammatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological cutaneous and articular syndrome)

BY SUBCUTANEOUS INJECTION

▶ Adult: (consult product literature)

● **CONTRA-INDICATIONS** Active infection · leucopenia · neutropenia

● **CAUTIONS** History of recurrent infection · latent and active tuberculosis · predisposition to infection

CAUTIONS, FURTHER INFORMATION

Vaccinations Patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature for further information.

● **INTERACTIONS** → Appendix 1 (canakinumab).

Contra-indicated with concomitant use with tumour necrosis factor inhibitors (possible increased risk of infections).

● **SIDE-EFFECTS**

● **Common or very common** Back pain · increased susceptibility to infection (including serious infection) · injection-site reactions · malaise · neutropenia · vertigo

▶ **Uncommon** Gastro-oesophageal reflux

▶ **Frequency not known** Malignancy · vomiting

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for up to 3 months after last dose.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

● **BREAST FEEDING** Consider if benefit outweighs risk—not known if present in human milk.

● **HEPATIC IMPAIRMENT** No information available.

● **RENAL IMPAIRMENT** Limited information available but manufacturer advises no dose adjustment required.

● **PRE-TREATMENT SCREENING** Patients should be evaluated for latent and active tuberculosis before starting treatment.

● **MONITORING REQUIREMENTS**

▶ Monitor full blood count including neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter.

▶ Monitor for signs and symptoms of tuberculosis during and after treatment.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ **Ilaris** (Novartis Pharmaceuticals UK Ltd) ▼

Canakinumab 150 mg Ilaris 150mg powder for solution for injection vials | 1 vial [PoM](#) £9,927.80

MONOCLONAL ANTIBODIES (ANTI-LYMPHOCYTE)

Basiliximab

● **DRUG ACTION** Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation.

INDICATIONS AND DOSE

Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with ciclosporin and corticosteroid-containing immunosuppression regimens (specialist use only)

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

▶ Adult: Initially 20 mg, administered within 2 hours before transplant surgery, followed by 20 mg after 4 days, dose to be administered after surgery, withhold second dose if severe hypersensitivity or graft loss occurs

● **CAUTIONS** Off-label use in cardiac transplantation—increased risk of serious cardiac side-effects

● **INTERACTIONS** → Appendix 1 (basiliximab).

● **SIDE-EFFECTS** Atrial flutter · cardiac arrest · cytokine release syndrome · palpitations · severe hypersensitivity reactions

● **CONCEPTION AND CONTRACEPTION** Adequate contraception must be used during treatment and for 16 weeks after last dose.

● **PREGNANCY** Manufacturer advises avoid—no information available.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Simulect*[®]) give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute 10 mg with 2.5 mL water for injections then dilute to at least 25 mL with infusion fluid; reconstitute 20 mg with 5 mL water for injections then dilute to at least 50 mL with infusion fluid; give over 20–30 minutes.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

▶ **Simulect** (Novartis Pharmaceuticals UK Ltd)

Basiliximab 10 mg Simulect 10mg powder and solvent for solution for injection vials | 1 vial [PoM](#) £758.69 (Hospital only)

Basiliximab 20 mg Simulect 20mg powder and solvent for solution for injection vials | 1 vial [PoM](#) £842.38 (Hospital only)

Belimumab

INDICATIONS AND DOSE

Adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy

BY INTRAVENOUS INFUSION

- ▶ Adult: 10 mg/kg every 2 weeks for 3 doses, then 10 mg/kg every 4 weeks, review treatment if no response within 6 months

- **CAUTIONS** Do not initiate until active infections controlled · history or development of malignancy · predisposition to infection
- **INTERACTIONS** → Appendix 1 (belimumab).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Infusion-related reactions
 - ▶ **Frequency not known** Depression · diarrhoea · hypersensitivity reactions · infections · insomnia · leucopenia · migraine · nausea · pain in extremities · pyrexia · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION** Infusion-related side-effects are reported commonly, including severe or life-threatening hypersensitivity and infusion reactions. Premedication with an antihistamine, with or without an antipyretic may be considered.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment and for at least 4 months after last dose.
- **PREGNANCY** Avoid unless essential.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Delay in the onset of acute hypersensitivity reactions has been observed; patients should remain under clinical supervision for several hours following at least the first 2 infusions.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Benlysta*®), give intermitently in Sodium chloride 0.9%; reconstitute with water for injections (120 mg in 1.5 mL, 400 mg in 4.8 mL) to produce a solution containing 80 mg/mL; gently swirl vial for 60 seconds, then allow to stand; swirl vial (without shaking) for 60 seconds every 5 minutes until dissolved; dilute requisite dose with infusion fluid to a final volume of 250 mL and give over 1 hour.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Benlysta** (GlaxoSmithKline UK Ltd) ▼

Belimumab 120 mg Benlysta 120mg powder for concentrate for solution for infusion vials | 1 vial [POM] £121.50 (Hospital only)

PURINE SYNTHESIS INHIBITORS

Mycophenolate mofetil

INDICATIONS AND DOSE

Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and ciclosporin) (under expert supervision)

BY MOUTH

- ▶ Adult: 1 g twice daily, to be started within 72 hours of transplantation

BY INTRAVENOUS INFUSION

- ▶ Adult: 1 g twice daily for maximum 14 days, then transfer to oral therapy, to be started within 24 hours of transplantation

Prophylaxis of acute rejection in cardiac transplantation (in combination with ciclosporin and corticosteroids) (under expert supervision)

BY MOUTH

- ▶ Adult: 1.5 g twice daily, to be started within 5 days of transplantation

Prophylaxis of acute rejection in hepatic transplantation (in combination with ciclosporin and corticosteroids) (under expert supervision)

INITIALLY BY INTRAVENOUS INFUSION

- ▶ Adult: 1 g twice daily for 4 days, up to a maximum of 14 days, to be started within 24 hours of transplantation, then (by mouth) 1.5 g twice daily, the dose route should be changed as soon as is tolerated

MYFORTIC®

Renal transplantation

BY MOUTH

- ▶ Adult: 720 mg twice daily, to be started within 72 hours of transplantation

Dose equivalence and conversion

Mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences.

- **CAUTIONS** Active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation) · children (higher incidence of side-effects may call for temporary reduction of dose or interruption) · delayed graft function · elderly (increased risk of infection, gastro-intestinal haemorrhage and pulmonary oedema) · increased susceptibility to skin cancer (avoid exposure to strong sunlight) · risk of hypogammaglobulinaemia or bronchiectasis when used in combination with other immunosuppressants
- CAUTIONS, FURTHER INFORMATION** **Hypogammaglobulinaemia or bronchiectasis** Measure serum immunoglobulin levels if recurrent infections develop, and consider bronchiectasis or pulmonary fibrosis if persistent respiratory symptoms such as cough and dyspnoea develop.
- **INTERACTIONS** → Appendix 1 (mycophenolate).
- ▶ **Live vaccines** Specialist advice should be sought for those being treated with immunosuppressive drugs.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · acne · agitation · alopecia · anaemia · anorexia · anxiety · arthralgia · blood disorders · confusion · constipation · convulsions · cough · depression · disturbances of blood lipids · disturbances of electrolytes and blood lipids · dizziness · dyspnoea · flatulence · gastro-intestinal bleeding · gastro-intestinal inflammation · gastro-intestinal ulceration · gingival hyperplasia · headache · hepatitis · hyperglycaemia · hypertension · hypotension · infections · influenza-like syndrome · insomnia · jaundice · leucopenia · malignancy (particularly of the skin) · myasthenic syndrome · nausea · oedema · pancreatitis · pancytopenia · paraesthesia · rash · red cell aplasia · renal impairment · skin hypertrophy · stomatitis · tachycardia · taste disturbance · thrombocytopenia · tremor · vasodilatation · vomiting · weight loss
 - ▶ **Frequency not known** Interstitial lung disease · intestinal villous atrophy · progressive multifocal leucoencephalopathy · pulmonary fibrosis
- SIDE-EFFECTS, FURTHER INFORMATION** Cases of pure red cell aplasia have been reported with mycophenolate mofetil; dose reduction or

discontinuation should be considered under specialist supervision.

- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before starting treatment. Effective contraception required before treatment, during treatment, and for 6 weeks after discontinuation of treatment.
- **MYFORTIC®** Manufacturer advises that men should use condoms during treatment and for 13 weeks after last dose.
- **PREGNANCY** Manufacturer advises avoid—congenital malformations reported.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** No data available in cardiac or hepatic transplant patients with renal impairment.
- **MONITORING REQUIREMENTS** Monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops).
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (CellCept®), give intermittently in Glucose 5%; reconstitute each 500–mg vial with 14 mL glucose 5% and dilute the contents of 2 vials in 140 mL infusion fluid; give over 2 hours.
- **PATIENT AND CARER ADVICE**
Bone marrow suppression Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

▶ MYCOPHENOLATE MOFETIL (Non-proprietary)

Mycophenolate mofetil 500 mg Mycophenolate mofetil 500mg tablets | 50 tablet [PoM] £42.50 DT price = £10.15

▶ CellCept (Roche Products Ltd)

Mycophenolate mofetil 500 mg CellCept 500mg tablets | 50 tablet [PoM] £82.26 DT price = £10.15

- ▶ Brands may include Myfenax

Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 25

▶ Myfortic (Novartis Pharmaceuticals UK Ltd)

Mycophenolic acid (as Mycophenolate sodium) 180 mg Myfortic 180mg gastro-resistant tablets | 120 tablet [PoM] £96.72

Mycophenolic acid (as Mycophenolate sodium) 360 mg Myfortic 360mg gastro-resistant tablets | 120 tablet [PoM] £193.43

Capsule

▶ MYCOPHENOLATE MOFETIL (Non-proprietary)

Mycophenolate mofetil 250 mg Mycophenolate mofetil 250mg capsules | 100 capsule [PoM] £82.26 DT price = £82.26

▶ CellCept (Roche Products Ltd)

Mycophenolate mofetil 250 mg CellCept 250mg capsules | 100 capsule [PoM] £82.26 DT price = £82.26

Mycophenolate mofetil (as Mycophenolate mofetil hydrochloride) 500 mg CellCept 500mg powder for solution for infusion vials | 4 vial [PoM] £36.49

T-CELL ACTIVATION INHIBITORS

Belatacept

INDICATIONS AND DOSE

Prophylaxis of graft rejection in adults undergoing renal transplantation who are seropositive for the Epstein-Barr virus

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature)

- **CAUTIONS** Increased risk of acute graft rejection—with tapering of corticosteroid, particularly in patients with high immunologic risk · increased risk of infection · latent and active tuberculosis · risk factors for post-transplant lymphoproliferative disorder

SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · constipation · cough · dehydration · diarrhoea · headache · hypertension · hypophosphataemia · infection · leucopenia · malignancy · nausea · peripheral oedema · pyrexia · vomiting
- ▶ **Uncommon** Infusion related reactions · progressive multifocal leucoencephalopathy

SIDE-EFFECTS, FURTHER INFORMATION

Side effects are reported when used in combination with basiliximab, mycophenolate mofetil and corticosteroids.

- **CONCEPTION AND CONTRACEPTION** Adequate contraception must be used during treatment and for up to 8 weeks after last dose.
- **PREGNANCY** Use only if essential.
- **BREAST FEEDING** Avoid—no information available.
- **PRE-TREATMENT SCREENING** Patients should be evaluated for latent and active tuberculosis before starting treatment.
- **MONITORING REQUIREMENTS** Patients should be monitored for signs and symptoms of tuberculosis during and after treatment.
- **PATIENT AND CARER ADVICE** Patients should be advised to avoid excessive exposure to UV light including sunlight.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ Nulojix (Bristol-Myers Squibb Pharmaceuticals Ltd) ▼

Belatacept 250 mg Nulojix 250mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £354.52 (Hospital only) | 2 vial [PoM] £709.04 (Hospital only)

1.2 Multiple sclerosis

ACETYLCHOLINE-RELEASE ENHANCERS

Fampridine

INDICATIONS AND DOSE

Improvement of walking disability in multiple sclerosis (specialist use only)

BY MOUTH

- ▶ Adult: 10 mg every 12 hours, discontinue treatment if no improvement within 2 weeks

- **CONTRA-INDICATIONS** History of seizures (discontinue treatment if seizures occur)
- **CAUTIONS** Atrioventricular conduction disorders · predisposition to seizures · sinoatrial conduction disorders · symptomatic cardiac rhythm disorders
- **INTERACTIONS** → Appendix 1 (fampridine). Caution in concomitant use of drugs that lower seizure threshold.

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · back pain · constipation · dizziness · dyspepsia · dyspnoea · headache · insomnia · malaise · nausea · paraesthesia · pharyngolaryngeal pain · tremor · urinary tract infection · vomiting
- ▶ **Uncommon** Seizures
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 80 mL/minute/1.73 m².
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (pack contains a desiccant) and discard any tablets remaining 7 days after opening.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 23, 25

▶ Fampyra (Biogen Idec Ltd) ▼

Fampridine 10 mg Fampyra 10mg modified-release tablets | 28 tablet [PoM] £181.00 | 56 tablet [PoM] £362.00

FUMARIC ACIDS

Dimethyl fumarate

- **DRUG ACTION** Dimethyl fumarate has immunomodulatory and anti-inflammatory properties.

INDICATIONS AND DOSE

Treatment of adults with relapsing-remitting multiple sclerosis (initiated by a specialist)

BY MOUTH

- ▶ Adult: 120 mg twice daily for 7 days, then increased to 240 mg twice daily, for dose adjustment due to side effects—consult product literature

- **CAUTIONS** Reduced lymphocyte count · risk of serious infections (do not start treatment until resolved and consider suspending treatment if infection develops during treatment) · severe active gastro-intestinal disease
- **SIDE-EFFECTS** Abdominal pain · burning sensation · diarrhoea · dyspepsia · erythema · flushing (may be severe and indicate hypersensitivity) · gastritis · gastroenteritis · leucopenia · lymphopenia · nausea · proteinuria · pruritus · rash · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Progressive multifocal leukoencephalopathy (PML) Severe prolonged lymphopenia reported, and patients are exposed to a potential risk of PML. Treatment should be stopped immediately if PML is suspected.

- **CONCEPTION AND CONTRACEPTION** Contraception required in women of child-bearing potential (consider non-hormonal methods).
- **PREGNANCY** Manufacturer advises avoid unless essential and potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor full blood count (including lymphocytes) before treatment (within 6 months before initiation), then every 6 to 12 months thereafter, and as clinically indicated.
 - ▶ Monitor patient closely for features of progressive multifocal leukoencephalopathy (PML) (e.g. signs and

symptoms of neurological dysfunction) and other opportunistic infections.

- ▶ Monitor renal and hepatic function before treatment, after 3 and 6 months of treatment, then every 6 to 12 months thereafter, and as clinically indicated.
 - **PATIENT AND CARER ADVICE** Patient information leaflet should be provided. Counselling is advised on progressive multifocal leukoencephalopathy.
 - **NATIONAL FUNDING/ACCESS DECISIONS**
 - **NICE technology appraisals (TAs)**
 - ▶ Dimethyl fumarate for treating relapsing-remitting multiple sclerosis (August 2014) NICE TA320
- Dimethyl fumarate is recommended for the treatment of active relapsing-remitting multiple sclerosis, only if:
- the patient does not have highly active or rapidly evolving severe relapsing-remitting multiple sclerosis and
 - the manufacturer provides dimethyl fumarate with the discount agreed in the patient access scheme
- Patients currently receiving dimethyl fumarate whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA320

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

▶ Tecfidera (Biogen Idec Ltd)

Dimethyl fumarate 120 mg Tecfidera 120mg gastro-resistant capsules | 14 capsule [PoM] £343.00

Dimethyl fumarate 240 mg Tecfidera 240mg gastro-resistant capsules | 56 capsule [PoM] £1,373.00

IMMUNOMODULATING DRUGS

Fingolimod

- **DRUG ACTION** Fingolimod is an immunomodulating drug.

INDICATIONS AND DOSE

Treatment of highly active relapsing-remitting multiple sclerosis in patients who have high disease activity despite treatment with at least one disease modifying therapy or in those with rapidly evolving severe relapsing-remitting multiple sclerosis (initiated under specialist supervision)

BY MOUTH

- ▶ Adult: 500 micrograms once daily

Important safety information

MHRA/CHM ADVICE: FINGOLIMOD—NOT RECOMMENDED FOR PATIENTS AT KNOWN RISK OF CARDIOVASCULAR EVENTS. ADVICE FOR EXTENDED MONITORING FOR THOSE WITH SIGNIFICANT BRADYCARDIA OR HEART BLOCK AFTER THE FIRST DOSE AND FOLLOWING TREATMENT INTERRUPTION (JANUARY 2013)

Fingolimod is known to cause transient bradycardias and heart block after the first dose. Fingolimod is not recommended in the following patient groups who are at high risk of cardiovascular events unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist is sought before initiation:

Patients with the following medical conditions:

- 2nd degree Mobitz Type II or higher degree atrioventricular block, sick sinus syndrome, or sinoatrial heart block
- significant QT prolongation (QT-interval greater than 470 milliseconds in women, or greater than 450 milliseconds in men)
- history of symptomatic bradycardia or recurrent syncope, known ischaemic heart disease, cerebrovascular disease, history of myocardial

infarction, congestive heart failure, history of cardiac arrest, uncontrolled hypertension, or severe sleep apnoea.

Patients receiving the following antiarrhythmic or heart-rate lowering drugs:

- class Ia or class III antiarrhythmics
- beta blockers
- heart rate-lowering calcium channel blockers
- other substances which may decrease heart rate (e.g. digoxin, anticholinesteratic drugs or pilocarpine).

All patients receiving fingolimod should be monitored at treatment initiation, (first dose monitoring), and after treatment interruption (see note below); monitoring should include:

Pre-treatment

- a 12-lead ECG and blood pressure measurement before starting

During the first 6 hours of treatment

- continuous ECG monitoring for 6 hours
- blood pressure and heart rate measurement every hour

After 6 hours of treatment

- a further 12-lead ECG and blood pressure measurement

If heart rate at the end of the 6 hour period is at its lowest since fingolimod was first administered, monitoring should be extended by at least 2 hours and until heart rate increases.

Extended monitoring, (at least overnight), should be performed in patients with evidence of clinically important cardiac effects during first dose monitoring. Monitoring in patients requiring pharmacological intervention for bradyarrhythmia-related symptoms during first dose monitoring should be extended at least overnight, and first dose monitoring should be repeated after the second dose.

Note

First dose monitoring as above **should be repeated** in all patients whose treatment is interrupted for:

- 1 day or more during the first 2 weeks of treatment
- more than 7 days during weeks 3 and 4 of treatment
- more than 2 weeks after one month of treatment

If the treatment interruption is of shorter duration than the above, repeated monitoring is not required and treatment should be continued with the next dose as planned.

- **CONTRA-INDICATIONS** Active infection · active malignancies (except cutaneous basal cell carcinoma) · immunosuppression
- **CAUTIONS** Check varicella zoster virus status—consult product literature for further information · chronic obstructive pulmonary disease · pulmonary fibrosis · risk of macular oedema · severe respiratory disease · susceptibility to QT-interval prolongation (including electrolyte disturbances)
- **INTERACTIONS** → Appendix 1 (fingolimod). Caution with concomitant use of drugs that prolong QT interval.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · AV block · back pain · blurred vision · bradycardia · bronchitis · cough · depression · diarrhoea · dizziness · dyspnoea · eczema · eye pain · gastroenteritis · headache · herpes · hypertension · influenza · leucopenia · lymphopenia · malaise · migraine · paraesthesia · pruritus · sinusitis · tinea · weight loss
 - ▶ **Uncommon** Macular oedema · neutropenia · pneumonia
 - ▶ **Frequency not known** Haemophagocytic syndrome · lymphoma
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment. Ensure effective contraception during and for at least 2 months after treatment.

- **PREGNANCY** Avoid (toxicity in *animal studies*).
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Eye examination recommended 3–4 months after initiation of treatment (and before initiation of treatment in patients with diabetes or history of uveitis).
 - ▶ Monitor hepatic transaminases before treatment, then every 3 months for 1 year, then periodically thereafter.
 - ▶ Monitor full blood count before treatment, at 3 months, then at least yearly thereafter and if signs of infection—interrupt treatment if lymphocyte count reduced—consult product literature.
 - ▶ Monitor for signs and symptoms of haemophagocytic syndrome (including pyrexia, asthenia, hepatosplenomegaly and adenopathy—may be associated with hepatic failure and respiratory distress; also progressive cytopenia, elevated serum-ferritin concentrations, hypertriglyceridaemia, hypofibrinogenaemia, coagulopathy, hepatic cytotoxicity, hyponatraemia)—initiate treatment immediately.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

 - ▶ **NICE technology appraisal of highly active relapsing-remitting multiple sclerosis (April 2012)** NICE TA254 Fingolimod is recommended as an option for the treatment of highly active relapsing-remitting multiple sclerosis in adults, only if:
 - they have an unchanged or increased relapse rate or ongoing severe relapses compared with the previous year despite treatment with interferon beta, **and**
 - the manufacturer provides fingolimod with the discount agreed as part of the patient access scheme
 Patients currently receiving fingolimod whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA254

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2012) that fingolimod (*Gilenya*[®]) is accepted for restricted use within NHS Scotland as single disease modifying therapy in highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta, with an unchanged or increased relapse rate or ongoing severe relapses, as compared to the previous year.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Capsule

- ▶ **Gilenya** (Novartis Pharmaceuticals UK Ltd) ▼
Fingolimod (as Fingolimod hydrochloride) 500 microgram Gilenya 0.5mg capsules | 7 capsule [PoM](#) £367.50 | 28 capsule [PoM](#) £1,470.00

Glatiramer acetate

- **DRUG ACTION** Glatiramer is an immunomodulating drug comprising synthetic polypeptides.

INDICATIONS AND DOSE

Treatment of initial symptoms in patients at high risk of developing multiple sclerosis (initiated under specialist supervision) | Reducing frequency of relapses in ambulatory patients with relapsing-remitting multiple sclerosis who have had at least 2 clinical relapses in the past 2 years (initiated under specialist supervision)

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 20 mg daily

- **CAUTIONS** Cardiac disorders
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anxiety · arthralgia · asthenia · back pain · chest pain · constipation · depression · dyspepsia · dyspnoea (may occur within minutes of injection) · flushing · headache · hypersensitivity reactions · hypertension · influenza-like symptoms · injection-site reactions · lymphadenopathy · nausea · oedema · palpitation · rash · sweating · syncope · tachycardia · tremor
 - ▶ **Rare** Seizures
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** No information available—manufacturer advises caution.
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - **NICE technology appraisals (TAs)**
 - ▶ **Interferon beta and glatiramer for multiple sclerosis (January 2002) NICE TA32**
Interferon beta and glatiramer acetate are **not** recommended for the treatment of multiple sclerosis in the NHS in England and Wales.
Patients who are currently receiving interferon beta or glatiramer acetate for multiple sclerosis, whether as routine therapy or as part of a clinical trial, should have the option to continue treatment until they and their consultant consider it appropriate to stop, having regard to the established criteria for withdrawal from treatment. www.nice.org.uk/TA32
 - **NHS restrictions**
 - ▶ **Provision of disease-modifying therapies for multiple sclerosis**
The Department of Health, the National Assembly for Wales, the Scottish Executive, the Northern Ireland Department of Health, Social Services & Public Safety, and the manufacturers have reached agreement on a risk-sharing scheme for the NHS supply of interferon beta and glatiramer acetate for multiple sclerosis. Health Service Circular (HSC 2002/004) explains how patients can participate in the scheme. It is available on the Department of Health website (www.dh.gov.uk).

- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
- **Solution for injection**
 - ▶ **Copaxone** (Teva UK Ltd)
Glatiramer acetate 20 mg per 1 ml Copaxone 20mg/1ml solution for injection pre-filled syringes | 28 pre-filled disposable injection (Pom) £513.95 (Hospital only)
Glatiramer acetate 40 mg per 1 ml Copaxone 40mg/1ml solution for injection pre-filled syringes | 12 pre-filled disposable injection (Pom) £513.95 (Hospital only)

INTERFERONS

Interferon beta

INDICATIONS AND DOSE

REBIF® PRE-FILLED PEN AND SYRINGE

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

BY SUBCUTANEOUS INJECTION

- ▶ Adult: (consult product literature)

REBIF® CARTRIDGE

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

BY SUBCUTANEOUS INJECTION

- ▶ Adult: (consult product literature)

AVONEX® INJECTION

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

BY INTRAMUSCULAR INJECTION

- ▶ Adult: (consult product literature)

EXTAVIA®

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For secondary progressive multiple sclerosis with active disease | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

BY SUBCUTANEOUS INJECTION

- ▶ Adult: (consult product literature)

AVONEX® VIAL

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

BY INTRAMUSCULAR INJECTION

- ▶ Adult: (consult product literature)

BETAFERON® INJECTION

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For secondary progressive multiple sclerosis with active disease | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

BY SUBCUTANEOUS INJECTION

- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Decompensated liver disease · severe depressive illness

CONTRA-INDICATIONS, FURTHER INFORMATION

Consult product literature for further information on contra-indications.

- **CAUTIONS** History of cardiac disorders · history of depressive disorders (avoid in severe depression or in those with suicidal ideation) · history of seizures · history of severe myelosuppression

CAUTIONS, FURTHER INFORMATION

Consult product literature for further information on cautions.

- **SIDE-EFFECTS** Alopecia · anaphylaxis · blood disorders · chills · confusion · convulsions · fever · hepatitis · hypersensitivity reactions · influenza-like symptoms (decreasing over time) · irritation at injection site (including inflammation, hypersensitivity, necrosis) · malaise · menstrual disorders · mood and personality changes · myalgia · nausea · nephrotic syndrome · suicide attempts · thrombotic microangiopathy · thyroid dysfunction · urticaria · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Also consult product literature for all side effects.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in animal studies).
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Caution in severe hepatic impairment.
- **RENAL IMPAIRMENT** Caution in severe renal impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for signs of hepatic injury—hepatic failure has been reported rarely.
 - ▶ Patients should be monitored for clinical features of thrombotic microangiopathy (TMA), including thrombocytopenia, new onset hypertension, fever, central nervous system symptoms (e.g. confusion and paresis), and impaired renal function. Any signs of TMA should be investigated fully and, if diagnosed, interferon beta should be stopped immediately and treatment for TMA promptly initiated (consult product literature for details).
 - ▶ Patients should also be monitored for signs and symptoms of nephrotic syndrome, including oedema, proteinuria, and impaired renal function—monitor renal function periodically. If nephrotic syndrome develops, treat promptly and consider stopping interferon beta treatment.

● PRESCRIBING AND DISPENSING INFORMATION

BETAFERON® INJECTION

An auto-injector device is available from Bayer Schering.

EXTAVIA®

An auto-injector device (*ExtaviPro*® 30g) is supplied as part of the *ExtaviPro*® 30g kit.

REBIF®

Cartridges for use with RebiSmart® auto-injector device.

Peginterferon beta-1a

- **DRUG ACTION** Peginterferon beta-1a is a polyethylene glycol-conjugated ('pegylated') derivative of interferon beta; pegylation increases the persistence of interferon in the blood.

INDICATIONS AND DOSE

Treatment of relapsing, remitting multiple sclerosis

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** (consult product literature)

- **CONTRA-INDICATIONS** Severe depression · suicidal ideation
- **CAUTIONS** History of cardiac disorders · history of depressive disorders (avoid in severe depression or in those with suicidal ideation) · history of seizures · history of severe myelosuppression
- **CAUTIONS, FURTHER INFORMATION** Consult product literature for further information about cautions.
- **SIDE-EFFECTS** Consult product literature for information about side effects.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.
- **PREGNANCY** Do not initiate during pregnancy. Avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Caution in severe hepatic impairment.
- **RENAL IMPAIRMENT** Caution in severe renal impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for signs of hepatic injury—hepatic failure has been reported rarely.
 - ▶ Thrombotic microangiopathy Patients should be monitored for clinical features of thrombotic microangiopathy (TMA), including thrombocytopenia, new onset hypertension, fever, central nervous system symptoms (e.g. confusion and paresis), and impaired renal function. Any signs of TMA should be investigated fully and, if diagnosed, interferon beta should be stopped immediately and treatment for TMA promptly initiated (consult product literature for details).
 - ▶ Nephrotic syndrome Patients should also be monitored for signs and symptoms of nephrotic syndrome, including oedema, proteinuria, and impaired renal function—monitor renal function periodically. If nephrotic syndrome develops, treat promptly and consider stopping interferon beta treatment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Plegridy (Biogen Idec Ltd) ▼

Peginterferon beta-1a 126 microgram per 1 ml Plegridy 63micrograms/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] no price available

Peginterferon beta-1a 188 microgram per 1 ml Plegridy 94micrograms/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] no price available

Peginterferon beta-1a 250 microgram per 1 ml Plegridy 125micrograms/0.5ml solution for injection pre-filled pen | 2 pre-filled disposable injection [PoM] £654.00 | 6 pre-filled disposable injection [PoM] £1,962.00

MONOCLONAL ANTIBODIES (ANTI-LYMPHOCYTE)

Anti-lymphocyte monoclonal antibodies

- **DRUG ACTION** The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

Important safety information

All anti-lymphocyte monoclonal antibodies should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities are immediately available.

● SIDE-EFFECTS

- ▶ **Common or very common** Allergic reactions · angioedema · bronchospasm · chills · cytokine release syndrome · dyspnoea · fever · flushing · nausea · pruritus · rash · tumour pain · vomiting
- ▶ **Frequency not known** Cardiac events

SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related side-effects In rare cases infusion reactions may be fatal. Infusion-related side-effects occur predominantly during the first infusion. Patients should receive premedication before administration of anti-lymphocyte monoclonal antibodies to reduce these effects—consult product literature for details of individual regimens. The infusion may have to be stopped

temporarily and the infusion-related effects treated—consult product literature for appropriate management. Evidence of pulmonary infiltration and features of tumour lysis syndrome should be sought if infusion-related effects occur.

Cytokine release syndrome Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored **very closely** (and a slower rate of infusion considered).

- **PRE-TREATMENT SCREENING** All patients should be screened for hepatitis B before treatment.
- **MONITORING REQUIREMENTS** Patients should also be monitored for cytopenias—consult product literature for specific recommendations.

Alemtuzumab

INDICATIONS AND DOSE

Treatment of adults with relapsing-remitting multiple sclerosis with active disease defined by clinical or imaging features

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature)

- **UNLICENSED USE** Although no longer licensed for oncological and transplant indications, alemtuzumab is also available through a patient access programme for these indications.

Important safety information

Alemtuzumab should be given under the care of a specialist with facilities for the management of hypersensitivity and anaphylactic reactions.

- **CONTRA-INDICATIONS** Human immunodeficiency virus
- **CAUTIONS** Hepatitis B carriers · hepatitis C carriers · in patients with active infection, a delay in initiation of alemtuzumab treatment should be considered until the infection is fully controlled · not recommended for inactive disease · not recommended for stable disease · patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course · patients with previous autoimmune conditions other than multiple sclerosis · pretreatment before administration is required (consult product literature)
- **CAUTIONS, FURTHER INFORMATION**
Autoimmune mediated conditions The risk of autoimmune mediated conditions may increase during treatment, including immune thrombocytopenic purpura, thyroid disorders, nephropathies, and cytopenias, and should be monitored for throughout the course of treatment (consult product literature).
For full details of cautions, consult product literature.
- **INTERACTIONS** → Appendix 1 (alemtuzumab).
- **SIDE-EFFECTS** For full side effects details (including monitoring and management) consult product literature
- **CONCEPTION AND CONTRACEPTION** Women of childbearing potential should use effective contraception during and for 4 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. Autoimmune thyroid disease during treatment may affect fetus (consult product literature).

- **BREAST FEEDING** Manufacturer advises avoid during and for 4 months after each treatment course unless potential benefit outweighs risk.
- **PRE-TREATMENT SCREENING** Screening patients at high risk of hepatitis B or C is recommended before treatment. All patients should be evaluated for active or latent tuberculosis before starting treatment.
- **MONITORING REQUIREMENTS** HPV screening should be carried out annually in female patients.
- **PRESCRIBING AND DISPENSING INFORMATION** All patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course.
- **PATIENT AND CARER ADVICE** Patients should be provided with a Patient Alert Card and Patient Guide.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
▶ **Alemtuzumab for treating relapsing-remitting multiple sclerosis (May 2014)** NICE TA312
Alemtuzumab is recommended as an option, within its marketing authorisation, for treating adults with active relapsing-remitting multiple sclerosis. www.nice.org.uk/TA312

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Lemtrada** (Genzyme Therapeutics Ltd) ▼
Alemtuzumab 10 mg per 1 ml Lemtrada 12mg/1.2ml concentrate for solution for infusion vials | 1 vial [POM](#) £7,045.00 (Hospital only)

Natalizumab

- **DRUG ACTION** Natalizumab is a monoclonal antibody that inhibits the migration of leucocytes into the central nervous system, hence reducing inflammation and demyelination.

INDICATIONS AND DOSE

Highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta or glatiramer acetate, or those patients with rapidly evolving severe relapsing-remitting multiple sclerosis (initiated under specialist supervision)

BY INTRAVENOUS INFUSION

- ▶ Adult: 300 mg every 4 weeks, treatment should be discontinued if no response after 6 months

- **CONTRA-INDICATIONS** Active infection · active malignancies (except cutaneous basal cell carcinoma) · immunosuppression · progressive multifocal leucoencephalopathy

● **CAUTIONS**

CAUTIONS, FURTHER INFORMATION

Progressive Multifocal Leucoencephalopathy Natalizumab is associated with an increased risk of opportunistic infection and progressive multifocal leucoencephalopathy (PML) caused by JC virus. The risk of developing PML increases with the presence of anti-JCV antibodies, previous use of immunosuppressant therapy, and treatment duration (especially beyond 2 years of treatment); the risk beyond 4 years of treatment is not known. Patients with all three risk factors should only be treated with natalizumab if the benefits of treatment outweigh the risks. Treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.

For information on cautions consult product literature.

- **INTERACTIONS** → Appendix 1 (natalizumab).

Concurrent use of interferon beta or glatiramer acetate contra-indicated.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Arthralgia · autoantibodies · nasopharyngitis · urinary-tract infection
- ▶ **Uncommon** Hypersensitivity reactions (discontinue permanently)
- ▶ **Frequency not known** Arthralgia (during infusion) · dizziness (during infusion) · fatigue (during infusion) · flushing (during infusion) · headache (during infusion) · increased risk of opportunistic infection · liver toxicity · nausea (during infusion) · pruritus (during infusion) · pyrexia (during infusion) · rigors (during infusion) · urticaria (during infusion) · vomiting (during infusion)

SIDE-EFFECTS, FURTHER INFORMATION

Progressive Multifocal Leucoencephalopathy If Progressive Multifocal Leucoencephalopathy (PML) is suspected, treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.

Liver toxicity Discontinue treatment if significant liver injury occurs.

- **PREGNANCY** Avoid unless essential—toxicity in *animal* studies.
- **BREAST FEEDING** Present in milk in *animal* studies—avoid.
- **PRE-TREATMENT SCREENING**
Progressive Multifocal Leucoencephalopathy A magnetic resonance image (MRI) scan is recommended before starting treatment with natalizumab. Testing for serum anti-JCV antibodies before starting treatment or in those with unknown antibody status already receiving natalizumab is recommended and should be repeated every 6 months (consult product literature for full details).
- **MONITORING REQUIREMENTS**
▶ Monitor liver function.
▶ **Progressive Multifocal Leucoencephalopathy** A magnetic resonance image (MRI) scan is recommended annually. Patients should be monitored for new or worsening neurological symptoms, and for cognitive and psychiatric signs of PML. All patients should continue to be monitored for signs and symptoms that may be suggestive of PML for approximately 6 months following discontinuation of treatment.
▶ Hypersensitivity reactions Patients should be observed for hypersensitivity reactions, including anaphylaxis, during the infusion and for 1 hour after completion of the infusion.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Tysabri*®), give intermittently in Sodium chloride 0.9%; dilute 300 mg in 100 mL infusion fluid; gently invert to mix, do not shake. Use within 8 hours of dilution and give over 1 hour.
- **PATIENT AND CARER ADVICE** A patient alert card should be provided.

Hypersensitivity reactions Patients should be told the importance of uninterrupted dosing, particularly in the early months of treatment (intermittent therapy may increase risk of sensitisation).

Progressive Multifocal Leucoencephalopathy Patients should be informed about the risks of PML before starting treatment with natalizumab and again after 2 years; they should be given an alert card which includes information about the symptoms of PML.

Liver toxicity Advise patients to seek immediate medical attention if symptoms such as jaundice or dark urine develop.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ **Natalizumab for the treatment of adults with highly active relapsing-remitting multiple sclerosis (August 2007)**
NICE TA127

Natalizumab is an option for the treatment only of rapidly evolving severe relapsing-remitting multiple sclerosis (RES). RES is defined by 2 or more disabling relapses in 1 year, and 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI. www.nice.org.uk/TA127

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2007) that natalizumab is accepted for restricted use as single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Tysabri** (Biogen Idec Ltd) ▼

Natalizumab 20 mg per 1 ml Tysabri 300mg/15ml concentrate for solution for infusion vials | 1 vial **[PoM]** no price available (Hospital only)

PYRIMIDINE SYNTHESIS INHIBITORS

Teriflunomide

- **DRUG ACTION** Teriflunomide is a metabolite of leflunomide which has immunomodulating and anti-inflammatory properties.

INDICATIONS AND DOSE

Treatment of relapsing-remitting multiple sclerosis (initiated under specialist supervision)

BY MOUTH

- ▶ Adult: 14 mg once daily

- **CONTRA-INDICATIONS** Anaemia · leucopenia · neutropenia · serious infection · severe hypoproteinaemia · severe immunodeficiency · significantly impaired bone-marrow function · thrombocytopenia
- **CAUTIONS** Adult over 65 years · anaemia · dyspnoea—assess for interstitial lung disease and consider suspending treatment · hypoproteinaemia (avoid if severe) · impaired bone-marrow function (avoid if severe) · latent tuberculosis · leucopenia · persistent cough—assess for interstitial lung disease and consider suspending treatment · severe infection—delay or suspend treatment until resolved · significant alcohol consumption · signs or symptoms of serious skin reactions (including ulcerative stomatitis, Stevens-Johnson syndrome, and toxic epidermal necrolysis)—discontinue treatment · switching between other immunomodulating drugs · thrombocytopenia
- **INTERACTIONS** → Appendix 1 (teriflunomide).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Acne · alopecia · anxiety · carpal tunnel syndrome · cystitis · diarrhoea · elevated liver enzymes · gastroenteritis · hyperaesthesia · hypertension · laryngitis · leucopenia · menorrhagia · musculoskeletal pain · myalgia · nausea · neuralgia · neutropenia · oral infection · paraesthesia · peripheral neuropathy ·

- pollakiuria · rash · respiratory tract infection · sciatica · tinea pedis · urinary tract infection · vomiting · weight loss
- ▶ **Uncommon** Anaemia · thrombocytopenia
- ▶ **Very rare** Interstitial lung disease · pancreatitis

SIDE-EFFECTS, FURTHER INFORMATION

Accelerated elimination procedure **Important:** accelerated elimination procedure recommended following discontinuation due to serious adverse effects (consult product literature).

Hepatic injury Discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.

- **CONCEPTION AND CONTRACEPTION** Effective contraception essential for women of child-bearing potential during treatment and for up to 2 years after treatment. In patients undergoing treatment with teriflunomide that are planning to conceive, the accelerated elimination procedure should be used prior to conception. Use of non-oral contraception is recommended during the accelerated elimination procedure—consult product literature.
- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor full blood count (including differential white cell count and platelet count) before treatment and as clinically indicated during treatment.
 - ▶ Monitor blood pressure before treatment and periodically thereafter.
 - ▶ Hepatic monitoring Monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks thereafter or as clinically indicated (pre-existing liver disease may increase risk). Increase to weekly monitoring if alanine aminotransferase (ALT) is 2–3 times the upper limit of reference range; discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.
- **TREATMENT CESSATION** Accelerated elimination procedures To aid drug elimination in case of serious adverse effect or before conception, stop treatment and give *either* colestyramine p. 173 or charcoal, activated p. 1130. After the accelerated elimination procedure a plasma concentration of less than 20 micrograms/litre (measured on 2 occasions at least 14 days apart) and a waiting period of one and a half months are necessary before conception.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

 - ▶ **Teriflunomide for treating relapsing-remitting multiple sclerosis (January 2014)** NICE TA303
Teriflunomide is recommended for the treatment of adults with active relapsing-remitting multiple sclerosis (previously defined as 2 clinically significant relapses in the previous 2 years), in adults who:
 - do not have highly active or rapidly evolving severe relapsing-remitting multiple sclerosis **and**
 - the manufacturer provides teriflunomide with the discount agreed in the patient access scheme www.nice.org.uk/TA303

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2014) that the use of teriflunomide (*Aubagio*)[®] in NHS Scotland is restricted to use in patients with relapsing-remitting multiple sclerosis who do not have highly active disease, and only as an alternative to treatment with interferon beta or glatiramer acetate.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

MONOCLONAL ANTIBODIES (ANTI-LYMPHOCYTE)

Rituximab

The properties listed below are those particular to the drug only. For properties common to the class, see Anti-lymphocyte monoclonal antibodies, p. 731.

INDICATIONS AND DOSE

Treatment of severe active rheumatoid arthritis in patients whose condition has not responded adequately to other disease-modifying antirheumatic drugs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them (in combination with methotrexate)

BY INTRAVENOUS INFUSION

- ▶ Adult: 1 g, then 1 g after 2 weeks, patients should receive premedication before each infusion (consult product literature for details)

Treatment of previously untreated stage III-IV follicular lymphoma (in combination with other chemotherapy) |

Maintenance therapy in patients with follicular non-Hodgkin's lymphoma that has responded to induction therapy (in combination with other chemotherapy) |

Treatment of diffuse large B-cell non-Hodgkin's lymphoma (in combination with other chemotherapy) | Treatment of

chemotherapy-resistant or relapsed stage III-IV follicular non-Hodgkin's lymphoma | Previously untreated or relapsed chronic lymphocytic leukaemia | Induction of remission in patients with severe, active granulomatosis with polyangiitis (Wegener's) and microscopic polyangiitis (in combination with glucocorticoids)

BY INTRAVENOUS INFUSION

- ▶ Adult: Patients should receive premedication before each dose (consult product literature for details) (consult product literature or local protocols)

- **CONTRA-INDICATIONS** Severe heart failure (when used to treat granulomatosis with polyangiitis or microscopic polyangiitis) · severe infection · severe, uncontrolled heart disease (when used to treat granulomatosis with polyangiitis or microscopic polyangiitis)

CONTRA-INDICATIONS, FURTHER INFORMATION

For full details on contra-indications, consult product literature.

CAUTIONS

GENERAL CAUTIONS

History of cardiovascular disease; in adults exacerbation of angina, arrhythmia, and heart failure have been reported · patients receiving cardiotoxic chemotherapy; in adults exacerbation of angina, arrhythmia, and heart failure have been reported · transient hypotension occurs frequently during infusion (anti-hypertensives may need to be withheld for 12 hours before infusion)

SPECIFIC CAUTIONS

- ▶ When used for rheumatoid arthritis predisposition to infection

CAUTIONS, FURTHER INFORMATION

Hepatitis B infection and reactivation Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking rituximab. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

For full details on cautions, consult product literature or local treatment protocol.

- **INTERACTIONS** → Appendix 1 (rituximab).
- **SIDE-EFFECTS** Abdominal pain · anaemia · antibody formation · aplastic anaemia · arthralgia · asthenia · blood disorders · depression · dyspepsia · headache · hypertension · hypotension · injection-site reactions · leucopenia · lupus erythematosus-like syndrome · migraine · muscle spasm · pancytopenia · paraesthesia · progressive multifocal leucoencephalopathy · pruritus · rhinitis · severe fatal skin reactions · severe skin reactions (permanently discontinue treatment if occurs) · sore throat · Stevens-Johnson syndrome (permanently discontinue treatment if occurs) · thrombocytopenia · toxic epidermal necrolysis (permanently discontinue treatment if occurs) · urticaria · worsening heart failure

SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, septicæmia, and hepatitis B reactivation. **Progressive multifocal leucoencephalopathy** Progressive multifocal leucoencephalopathy (which is usually fatal or causes severe disability) has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded.

For full details, including management of side-effects, consult product literature.

- **CONCEPTION AND CONTRACEPTION** Effective contraception (in both sexes) required during and for 12 months after treatment.
- **PREGNANCY** Avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus.
- **BREAST FEEDING** Avoid breast-feeding during and for 12 months after treatment.
- **MONITORING REQUIREMENTS** For full details on monitoring requirements consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*MabThera*®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to 1-4 mg/mL and gently invert bag to avoid foaming.
- **PATIENT AND CARER ADVICE**
Alert card Patients treated for granulomatosis with polyangiitis and microscopic polyangiitis or rheumatoid arthritis should be provided with a patient alert card with each infusion.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
▶ **Rituximab for aggressive non-Hodgkin's lymphoma (September 2003)** NICE TA65
This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with cyclophosphamide, doxorubicin, vincristine, and prednisolone, is recommended for first-line treatment of

CD20-positive diffuse large-B-cell lymphoma at clinical stage II, III or IV.

The use of rituximab for localised (stage I) disease should be limited to clinical trials. www.nice.org.uk/TA65

▶ **Rituximab for the treatment of relapsed or refractory stage III or IV follicular non-Hodgkin's lymphoma (February 2008) NICE TA137**

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with chemotherapy, is an option for the induction of remission in patients with relapsed stage III or IV follicular non-Hodgkin's lymphoma.

Rituximab monotherapy as maintenance therapy is an option for the treatment of patients with relapsed stage III or IV follicular non-Hodgkin's lymphoma in remission induced with chemotherapy (with or without rituximab). Rituximab monotherapy is an option for the treatment of patients with relapsed or refractory stage III or IV follicular non-Hodgkin's lymphoma, when all alternative treatment options have been exhausted (that is, if there is resistance to or intolerance of chemotherapy). www.nice.org.uk/TA137

▶ **Rituximab for the first-line treatment of chronic lymphocytic leukaemia (July 2009) NICE TA174**

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with fludarabine and cyclophosphamide, is recommended as an option for the first-line treatment of chronic lymphocytic leukaemia. www.nice.org.uk/TA174

▶ **Rituximab for the treatment of relapsed or refractory chronic lymphocytic leukaemia (July 2010) NICE TA193**

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab in combination with fludarabine and cyclophosphamide is recommended as a treatment option for people with relapsed or refractory chronic lymphocytic leukaemia except when the condition:

- is refractory to fludarabine (that is, it has not responded to fludarabine, or has relapsed within 6 months of treatment), **or**
- has previously been treated with rituximab, unless it was in the context of a clinical trial, at a dose lower than the dose currently licensed for chronic lymphocytic leukaemia or with chemotherapy other than fludarabine and cyclophosphamide.

Rituximab in combination with fludarabine and cyclophosphamide is recommended only in the context of research for patients with relapsed or refractory chronic lymphocytic leukaemia that has previously been treated with rituximab, unless rituximab has been given as specified above. www.nice.org.uk/TA193

▶ **Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) NICE TA195**

Rituximab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or are intolerant of, other disease-modifying antirheumatic drugs (DMARDs), including at least 1 tumour necrosis factor (TNF) inhibitor. Repeat courses of rituximab should be given no more frequently than every 6 months, and should only be continued if an adequate response is achieved and maintained. www.nice.org.uk/TA195

▶ **Rituximab for the first-line maintenance treatment of follicular non-Hodgkin's lymphoma (June 2011) NICE TA226**

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab maintenance therapy is recommended as an option for the treatment of people with follicular non-Hodgkin's lymphoma that has responded to first-line induction therapy with rituximab in combination with chemotherapy. www.nice.org.uk/TA226

▶ **Rituximab for the first-line treatment of stage III-IV follicular lymphoma (January 2012) NICE TA243**

- This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with:
- cyclophosphamide, vincristine and prednisolone (CVP);
 - cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP);
 - mitoxantrone, chlorambucil and prednisolone (MCP);
 - cyclophosphamide, doxorubicin, etoposide, prednisolone and interferon- α (CHVPi); **or**
 - chlorambucil

is recommended as an option for the treatment of symptomatic stage III and IV follicular lymphoma in previously untreated patients. www.nice.org.uk/TA243

▶ **Rituximab in combination with glucocorticoids for treating anti-neutrophil cytoplasmic antibody-associated vasculitis (March 2014) NICE TA308**

- This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with glucocorticoids, is recommended as an option for inducing remission in adults with anti-neutrophil cytoplasmic antibody [ANCA]-associated vasculitis (severely active granulomatosis with polyangiitis [Wegener's] and microscopic polyangiitis), only if:
- further cyclophosphamide treatment would exceed the maximum cumulative cyclophosphamide dose, **or**
 - cyclophosphamide is contraindicated or not tolerated, **or**
 - the patient has not completed their family, and treatment with cyclophosphamide may materially affect their fertility, **or**
 - the disease has remained active or progressed despite a course of cyclophosphamide lasting 3–6 months **or**
 - the patient has had uroepithelial malignancy. www.nice.org.uk/TA308

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2013) that Rituximab (*MabThera*[®]) is accepted for restricted use within NHS Scotland, in combination with glucocorticoids for the induction of remission in adult patients with severe, active granulomatosis with polyangiitis (Wegener's) and microscopic polyangiitis. It is restricted to use in patients who have relapsed following treatment with cyclophosphamide or who are intolerant to or unable to receive cyclophosphamide. The *Scottish Medicines Consortium* has advised (June 2014) that subcutaneous rituximab (*MabThera*[®]) is accepted for restricted use within NHS Scotland, in accordance with UK licensing, except in the maintenance setting, where use is restricted to patients who have responded to induction therapy with rituximab plus chemotherapy.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

MONOCLONAL ANTIBODIES (ANTINEOPLASTIC)

Bevacizumab

- **DRUG ACTION** Bevacizumab is a monoclonal antibody that inhibits vascular endothelial growth factor.

INDICATIONS AND DOSE

Treatment of metastatic colorectal cancer in combination with fluoropyrimidine-based chemotherapy | First-line treatment of metastatic breast cancer in combination with paclitaxel when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate | First-line treatment of metastatic breast cancer in combination with capecitabine when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate (patients who have received adjuvant taxane or anthracycline-containing regimens in the previous 12 months should not be treated with bevacizumab in combination with capecitabine) | Advanced or metastatic renal cell carcinoma in combination with interferon alfa-2a | First-line treatment of unresectable advanced, metastatic or recurrent non-small cell lung cancer other than predominantly squamous cell histology (in combination with platinum-based chemotherapy) | First-line treatment of advanced (FIGO stages IIIB, IIIC and IV) epithelial ovarian, fallopian tube, or primary peritoneal cancer (in combination with carboplatin and paclitaxel) | First recurrence of platinum-sensitive epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who have not been treated previously with bevacizumab or other drugs that target vascular endothelial growth factor (in combination with carboplatin and gemcitabine)

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult local protocol)

Important safety information

MHRA/CHM ADVICE: BEVACIZUMAB AND SUNITINIB: RISK OF OSTEONECROSIS OF THE JAW (JANUARY 2011)
Treatment with bevacizumab or sunitinib may be a risk factor for the development of osteonecrosis of the jaw. Patients treated with bevacizumab or sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.
Dental examination and appropriate preventive dentistry should be considered before treatment with bevacizumab or sunitinib.
If possible, invasive dental procedures should be avoided in patients treated with bevacizumab or sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

- **CAUTIONS** Elective surgery (withhold treatment and avoid for at least 28 days after major surgery or until wound fully healed) · history of arterial thromboembolism · history of cardiovascular disease (increased risk of cardiovascular events, especially in the elderly) · history of hypertension (increased risk of proteinuria—discontinue if nephrotic syndrome) · increased risk of fistulas (discontinue permanently if tracheo-oesophageal or grade 4 fistula develops) · increased risk of haemorrhage · increased risk of tumour-associated haemorrhage · intra-abdominal inflammation (risk of gastro-intestinal perforation and gall bladder perforation · uncontrolled hypertension · untreated CNS metastases
- **INTERACTIONS** → Appendix 1 (bevacizumab).
- **SIDE-EFFECTS** Abdominal pain · alopecia · anaemia · anorexia · arterial thromboembolism · asthenia · bone marrow suppression · chest pain · congestive heart failure · constipation · dehydration · diarrhoea · drowsiness · dry skin · dysarthria · dyspnoea · exfoliative dermatitis · extravasation · eye disorders · fistulas · flushing · gall bladder perforation · gastro-intestinal perforation · haemorrhage · hand-foot syndrome · headache · hypersensitivity reactions · hypertension · hyperuricaemia · hypotension · hypoxia · impaired wound healing · infection · intestinal obstruction · lethargy · mucocutaneous bleeding · nausea · necrotising fasciitis (discontinue and initiate treatment promptly) · neutropenia · oral mucositis · osteonecrosis of the jaw · peripheral neuropathy · posterior reversible encephalopathy syndrome · proteinuria · pulmonary hypertension · pyrexia · rash · rhinitis · rigors · skin discoloration · supraventricular tachycardia · syncope · taste disturbances · thrombocytopenia · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 6 months after treatment in women
- **PREGNANCY** Avoid—toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Manufacturer advises avoid breast-feeding during and for at least 6 months after treatment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for necrotising fasciitis (usually secondary to wound healing complications, gastro-intestinal perforation or fistula formation)—discontinue and initiate treatment promptly.
 - ▶ Monitor blood pressure.
 - ▶ Monitor for congestive heart failure.
 - ▶ Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, headache, altered mental status, visual disturbance or cortical blindness, with or without hypertension).
 - ▶ Consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw).
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - **NICE technology appraisals (TAs)**
 - ▶ **Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007) NICE TA118**
Bevacizumab in combination with fluorouracil plus folinic acid, with or without irinotecan, is **not** recommended for the first-line treatment of metastatic colorectal cancer; see also NICE guidance Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy. www.nice.org.uk/TA118
 - ▶ **Bevacizumab (first-line), sorafenib (first and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009) NICE TA178**
Bevacizumab, sorafenib, and temsirolimus are **not** recommended as first-line treatments for people with advanced or metastatic renal cell carcinoma. Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma. www.nice.org.uk/TA178

Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine is **not** recommended for the treatment of metastatic colorectal cancer. www.nice.org.uk/TA212
 - ▶ **Bevacizumab in combination with a taxane for the first-line treatment of metastatic breast cancer (February 2011) NICE TA214**
Bevacizumab in combination with a taxane is **not** recommended for the first-line treatment of metastatic breast cancer. www.nice.org.uk/TA214

- ▶ **Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012)** NICE TA242
Bevacizumab in combination with non-oxaliplatin (fluoropyrimidine-based) chemotherapy is **not** recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy; see also NICE guidance Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007). www.nice.org.uk/TA242
 - ▶ **Bevacizumab in combination with capecitabine for the first-line treatment of metastatic breast cancer (August 2012)** NICE TA263
Bevacizumab in combinations with capecitabine is **not** recommended within its marketing authorisation for the first-line treatment of metastatic breast cancer, that is, when treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate, or when taxanes or anthracyclines have been used as part of adjuvant treatment in the previous 12 months. www.nice.org.uk/TA263
 - ▶ **Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013)** NICE TA284
Bevacizumab in combination with paclitaxel and carboplatin is **not** recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer). www.nice.org.uk/TA284
 - ▶ **Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013)** NICE TA285
Bevacizumab in combination with gemcitabine and carboplatin is **not** recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents. www.nice.org.uk/TA285
- Scottish Medicines Consortium (SMC) Decisions**
The *Scottish Medicines Consortium* has advised (April 2012) that bevacizumab (*Avastin*®) is **not** recommended for use within NHS Scotland for the first line treatment of patients with metastatic breast cancer in whom treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for infusion

▶ Avastin (Roche Products Ltd)

Bevacizumab 25 mg per 1 ml Avastin 400mg/16ml solution for infusion vials | 1 vial [PoM] £924.40 (Hospital only)
Avastin 100mg/4ml solution for infusion vials | 1 vial [PoM] £242.66 (Hospital only)

Brentuximab vedotin

INDICATIONS AND DOSE

Treatment of relapsed or refractory CD-30 positive Hodgkin's disease following autologous stem cell transplant or following at least two prior therapies, when autologous stem cell transplant or multi-agent chemotherapy is not a treatment option | Relapsed or refractory systemic anaplastic large cell lymphoma

BY INTRAVENOUS INFUSION

▶ Adult: (consult product literature)

- **CAUTIONS** Elevated BMI—risk of hyperglycaemia · high tumour burden—risk of tumour lysis syndrome · rapidly proliferating tumours—risk of tumour lysis syndrome
- **INTERACTIONS** → Appendix 1 (brentuximab vedotin).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaphylaxis · arthralgia · back pain · constipation · cough · demyelinating polyneuropathy · diarrhoea · dizziness · dyspnoea · fatigue · hyperglycaemia · infusion-related reactions · myalgia · peripheral neuropathy · pruritus · rash
 - ▶ **Uncommon** Stevens-Johnson syndrome
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · progressive multifocal leucoencephalopathy · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for 6 months after treatment in men and women.
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in *animal* studies).
- **BREAST FEEDING** Avoid—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or behavioural signs or symptoms).
 - ▶ Monitor for new or worsening abdominal pain—investigate and withhold treatment if acute pancreatitis suspected and discontinue if confirmed (fatal cases reported).
 - ▶ Monitor for pulmonary toxicity—treat symptoms promptly.
 - ▶ Routinely monitor hepatic function.
 - ▶ Monitor for infusion-related (including anaphylactic) reactions.
 - ▶ Monitor for signs of peripheral neuropathy—consult product literature for treatment adjustment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

▶ Adcetris (Takeda UK Ltd) ▼

Brentuximab vedotin 50 mg Adcetris 50mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £2,500.00

Catumaxomab

INDICATIONS AND DOSE

Treatment of malignant ascites in patients with epithelial cell adhesion molecule (EpCAM) positive carcinomas, where standard therapy is not available or no longer feasible

BY INTRAPERITONEAL INFUSION

▶ Adult: (consult product literature)

- **CAUTIONS** Haemodynamic insufficiency · hypoproteinaemia · oedema
- **INTERACTIONS** → Appendix 1 (catumaxomab).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anorexia · anxiety · arthralgia · cholangitis · constipation · cough · dehydration · diarrhoea · dizziness · dyspepsia · dyspnoea · electrolyte disturbances · flatulence · flushing · haematuria · headache · hyperglycaemia · hypertension · hypotension · hypoxia · ileus · infection · insomnia · leucocyturia · myalgia · pleural effusion · proteinuria · rash · skin reactions · sweating · tachycardia · vertigo

- ▶ **Uncommon** Acute renal failure · gastro-intestinal haemorrhage · intestinal obstruction · seizures
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · infusion related side-effects · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related side-effects Infusion-related side-effects have been reported with catumaxomab; premedication with analgesics, antipyretics, or NSAIDs is recommended by the manufacturer.

- **PREGNANCY** Avoid—limited information available.
- **BREAST FEEDING** Avoid—limited information available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Removab** (Neovii Biotech GmbH)

Catumaxomab 100 microgram per 1 ml Removab
50micrograms/0.5ml concentrate for solution for infusion pre-filled syringes | 1 pre-filled disposable injection [PoM] £2,550.00 (Hospital only)

Removab 10micrograms/0.1ml concentrate for solution for infusion pre-filled syringes | 1 pre-filled disposable injection [PoM] £510.00 (Hospital only)

Cetuximab

INDICATIONS AND DOSE

Treatment of wild-type RAS metastatic colorectal cancer in patients with tumours expressing epidermal growth factor receptor, as combination therapy, or as monotherapy if oxaliplatin- and irinotecan-based therapy has failed or if irinotecan is not tolerated | Treatment of locally advanced squamous cell cancer of the head and neck (in combination with radiotherapy) | Treatment of recurrent or metastatic squamous cell cancer of the head and neck (in combination with platinum-based chemotherapy)

BY INTRAVENOUS INFUSION

- ▶ Adult (initiated by a specialist): (consult product literature or local protocols)

Important safety information

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012) Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

Patients must receive an antihistamine and a corticosteroid at least one hour before infusion. Resuscitation facilities should be available and treatment should be initiated by a specialist.

- **CONTRA-INDICATIONS** RAS mutated colorectal tumours (or if RAS tumour status unknown) · combination of cetuximab with oxaliplatin-containing chemotherapy is contra-indicated in patients with metastatic colorectal cancer who have mutant or unknown RAS status
- **CAUTIONS** Cardiopulmonary disease · cardiovascular disease · history of keratitis · pulmonary disease—discontinue if interstitial lung disease · risk factors for

keratitis · severe dry eye · ulcerative keratitis (including contact lens use)

- **INTERACTIONS** → Appendix 1 (cetuximab).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Acne · aseptic meningitis · blepharitis · bronchospasm · chills · conjunctivitis · desquamation · diarrhoea · dizziness · dry skin · dyspnoea · fever · headache · hypertension · hypertrichosis · hypocalcaemia · hypomagnesaemia · hypotension · infusion-related reactions · keratitis · nail disorders · nausea · pruritus · rash · severe (sometimes fatal) hypersensitivity reactions (possibly delayed onset) · shock · skin reactions · urticaria · vomiting
- ▶ **Very rare** Stevens-Johnson syndrome · toxic epidermal necrolysis
- **PREGNANCY** Use only if potential benefit outweighs risk—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Avoid breast-feeding during and for 2 months after treatment—no information available.
- **PRE-TREATMENT SCREENING** Evidence of non-mutated (wild-type) RAS status (at exons 2, 3 and 4 of KRAS and NRAS) is required before cetuximab is initiated for the treatment of metastatic colorectal cancer, and should be determined by an experienced laboratory using a validated test method.
- **DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- ▶ **Cetuximab for the treatment of locally advanced squamous cell cancer of the head and neck (June 2008)** NICE TA145 Cetuximab in combination with radiotherapy is an option for the treatment of locally advanced squamous cell cancer of the head and neck in patients who have a Karnofsky performance status of 90% or greater and when all forms of platinum-based chemoradiotherapy treatment are contra-indicated. www.nice.org.uk/TA145
- ▶ **Cetuximab for the treatment of recurrent or metastatic squamous cell cancer of the head and neck (June 2009)** NICE TA172 Cetuximab in combination with platinum-based chemotherapy is **not** recommended for the treatment of recurrent or metastatic squamous cell cancer of the head and neck. www.nice.org.uk/TA172
- ▶ **Cetuximab for the first-line treatment of metastatic colorectal cancer (August 2009)** NICE TA176 Cetuximab in combination with fluorouracil, folinic acid and oxaliplatin is an option for the first-line treatment of metastatic colorectal cancer under the following circumstances:
 - the primary tumour has been resected or is potentially operable;
 - the metastatic disease is confined to the liver and is unresectable; and
 - the patient is fit to undergo surgery to resect the primary colorectal tumour and to undergo liver surgery if the metastases become resectable after treatment with cetuximab.

In patients unable to tolerate oxaliplatin, or in whom oxaliplatin is contra-indicated, cetuximab in combination with fluorouracil, folinic acid and irinotecan can be used as an alternative.

In addition, the manufacturer is required to rebate 16% of the amount of cetuximab used per patient when used in combination with fluorouracil, folinic acid, and oxaliplatin.

Patients who meet the above criteria should receive cetuximab for no more than 16 weeks. At 16 weeks, cetuximab should be stopped and the patient should be

assessed for resection of liver metastases. www.nice.org.uk/TA176

- ▶ **Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012)** NICE TA242
Cetuximab monotherapy or combination chemotherapy is **not** recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy. www.nice.org.uk/TA242
- Scottish Medicines Consortium (SMC) Decisions**
The *Scottish Medicines Consortium* has advised (December 2014) that cetuximab (*Erbix[®]*) is accepted for restricted use within NHS Scotland, in combination with irinotecan or oxaliplatin-based chemotherapy, for the treatment of RAS wild-type metastatic colorectal cancer in patients who have not previously received chemotherapy for their metastatic disease (first-line treatment).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Erbix[®]** (Merck Serono Ltd)

Cetuximab 5 mg per 1 ml Erbix 100mg/20ml solution for infusion vials | 1 vial [PoM] £178.10 (Hospital only)
Erbix 500mg/100ml solution for infusion vials | 1 vial [PoM] £890.50 (Hospital only)

Ipilimumab

- **DRUG ACTION** Ipilimumab causes T-cell activation.

INDICATIONS AND DOSE

Treatment of unresectable or metastatic advanced melanoma

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature)

- **CAUTIONS** For full details consult product literature.
- **INTERACTIONS** → Appendix 1 (ipilimumab).
- **SIDE-EFFECTS** Infusion-related side-effects
SIDE-EFFECTS, FURTHER INFORMATION
Immune-related reactions A corticosteroid can be used after starting ipilimumab, to treat immune-related reactions.
For further information on side-effects, (including monitoring and management of side effects) consult product literature.
- **CONCEPTION AND CONTRACEPTION** Use effective contraception.
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in animal studies).
- **BREAST FEEDING** Discontinue breast-feeding—no information available.
- **HEPATIC IMPAIRMENT** Use with caution if plasma-bilirubin concentration greater than 3 times upper limit of normal range or if plasma-transaminase concentration 5 times or greater than the upper limit of normal range.
- **MONITORING REQUIREMENTS** For information on monitoring of side effects, consult product literature.
- **PRESCRIBING AND DISPENSING INFORMATION** Infusion-related side-effects have been reported; premedication with paracetamol and an antihistamine is recommended.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
▶ **Ipilimumab for previously treated advanced (unresectable or metastatic) melanoma (December 2012)** NICE TA268
Ipilimumab is recommended as an option for the treatment of advanced (unresectable or metastatic) melanoma in patients who have received prior therapy,

only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.

www.nice.org.uk/TA268

- ▶ **Ipilimumab for previously untreated advanced (unresectable or metastatic) melanoma (July 2014)** NICE TA319
Ipilimumab is recommended, within its marketing authorisation, as an option for treating adults with previously untreated advanced (unresectable or metastatic) melanoma, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme. www.nice.org.uk/TA319

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2013) that ipilimumab (*Yervoy[®]*) is accepted for restricted use within NHS Scotland for the treatment of advanced (unresectable or metastatic) melanoma in adults who have received prior therapy, only whilst ipilimumab is available at the price agreed in the patient access scheme.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Yervoy[®]** (Bristol-Myers Squibb Pharmaceuticals Ltd) ▼

Ipilimumab 5 mg per 1 ml Yervoy 50mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £3,750.00 (Hospital only)
Yervoy 200mg/40ml concentrate for solution for infusion vials | 1 vial [PoM] £15,000.00 (Hospital only)

Obinutuzumab

The properties listed below are those particular to the drug only. For properties common to the class, see Anti-lymphocyte monoclonal antibodies, p. 731.

INDICATIONS AND DOSE

Treatment of previously untreated chronic lymphocytic leukaemia in patients for whom full-dose fludarabine-based therapy is unsuitable due to co-morbidities

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS** For obinutuzumab contra-indications, consult product literature.
- **CAUTIONS**
CAUTIONS, FURTHER INFORMATION
Hepatitis B infection and reactivation Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking **obinutuzumab**. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).
For full details on the cautions of obinutuzumab, consult product literature.
- **INTERACTIONS** → Appendix 1 (obinutuzumab).
- **SIDE-EFFECTS** For full side effect details for obinutuzumab (including monitoring and management), consult product literature.
- **CONCEPTION AND CONTRACEPTION** Use effective contraception during and for 18 months after treatment.
- **PREGNANCY** Avoid unless potential benefit outweighs risk of B-lymphocyte depletion in fetus.

- **BREAST FEEDING** Avoid breast-feeding during and for 18 months after treatment—present in milk in *animal* studies.
- **MONITORING REQUIREMENTS** Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- ▶ **Obinutuzumab in combination with chlorambucil for untreated chronic lymphocytic leukaemia (June 2015)**

NICE TA343

Obinutuzumab, in combination with chlorambucil, is an option for untreated chronic lymphocytic leukaemia in patients who have comorbidities that make full-dose fludarabine-based therapy unsuitable for them, only if:

- bendamustine-based therapy is not suitable **and**
- the manufacturer provides obinutuzumab with the discount agreed in the patient access scheme.

Patients currently receiving obinutuzumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA343

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Gazyvaro** (Roche Products Ltd) ▼
Obinutuzumab 25 mg per 1 ml Gazyvaro 1000mg/40ml concentrate for solution for infusion vials | 1 vial (POM) £3,312.00 (Hospital only)

Ofatumumab

The properties listed below are those particular to the drug only. For properties common to the class, see Anti-lymphocyte monoclonal antibodies, p. 731.

INDICATIONS AND DOSE

Treatment of chronic lymphocytic leukaemia (CLL) in patients refractory to fludarabine and alemtuzumab | Treatment of CLL in patients who have not received prior therapy and who are not eligible for fludarabine based therapy (in combination with chlorambucil or bendamustine)

BY INTRAVENOUS INFUSION

- ▶ **Adult:** Premedication must be given 30 minutes to 2 hours before each dose—consult product literature for details (consult local protocol)

- **CONTRA-INDICATIONS** For full details on the contra-indications for ofatumumab, consult product literature.
- **CAUTIONS** History of cardiac disease—monitor closely and discontinue treatment if cardiac arrhythmias occur

CAUTIONS, FURTHER INFORMATION

Hepatitis B infection and reactivation Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking **ofatumumab**. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

For full details about the cautions for ofatumumab, consult product literature

- **INTERACTIONS** → Appendix 1 (ofatumumab).

- **SIDE-EFFECTS**

SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related side-effects (including cytokine release syndrome) have been reported with ofatumumab; premedication with paracetamol, an antihistamine, and a corticosteroid must be given—consult product literature. For full details (including monitoring and management of side-effects) consult product literature.

- **CONCEPTION AND CONTRACEPTION** Use effective contraception during and for 12 months after treatment.
- **PREGNANCY** Avoid unless potential benefit outweighs risk.

- **BREAST FEEDING** Discontinue breast-feeding during and for 12 months after treatment—no information available.

- **RENAL IMPAIRMENT** No information available for creatinine clearance less than 30 mL/minute.

- **MONITORING REQUIREMENTS**

- ▶ Monitor electrolytes (including potassium and magnesium) before and during administration and correct if abnormal.
- ▶ Patients must be monitored closely during each infusion for the onset of infusion reactions.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- ▶ **Ofatumumab for the treatment of chronic lymphocytic leukaemia refractory to fludarabine and alemtuzumab (October 2010)** NICE TA202

Ofatumumab is **not** recommended for the treatment of chronic lymphocytic leukaemia that is refractory to fludarabine and alemtuzumab.

Patients currently receiving ofatumumab for this condition should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA202

- ▶ **Ofatumumab in combination with chlorambucil or bendamustine for untreated chronic lymphocytic leukaemia (June 2015)** NICE TA344

Ofatumumab in combination with chlorambucil is an option for untreated chronic lymphocytic leukaemia only if:

- the person is ineligible for fludarabine-based therapy **and**
- bendamustine is not suitable **and**
- the manufacturer provides ofatumumab with the discount agreed in the patient access scheme.

Patients currently receiving ofatumumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA344

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Arzerra** (Novartis Pharmaceuticals UK Ltd) ▼
Ofatumumab 20 mg per 1 ml Arzerra 100mg/5ml concentrate for solution for infusion vials | 3 vial (POM) no price available (Hospital only)
Arzerra 1000mg/50ml concentrate for solution for infusion vials | 1 vial (POM) £1,820.00 (Hospital only)

Panitumumab

● **DRUG ACTION** Panitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR).

INDICATIONS AND DOSE

Treatment of non-mutated RAS metastatic colorectal cancer (combination therapy) | Treatment of non-mutated RAS metastatic colorectal cancer (monotherapy after failure of fluoropyrimidine-, oxaliplatin-, and irinotecan-containing chemotherapy regimens)

BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

Important safety information

MHRA/CHM ADVICE: SEVERE SKIN REACTIONS
Severe skin reactions have been reported very commonly in patients treated with panitumumab. Patients receiving panitumumab who have severe skin reactions or develop worsening skin reactions should be monitored for the development of inflammatory or infectious sequelae (including cellulitis, sepsis, and necrotising fasciitis). Appropriate treatment should be promptly initiated and panitumumab withheld or discontinued.

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)
Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

- **CONTRA-INDICATIONS** Interstitial pulmonary disease - the combination of panitumumab with oxaliplatin-containing chemotherapy is contra-indicated in patients with mutant RAS metastatic colorectal cancer or for whom RAS status is unknown
- **CAUTIONS** History of keratitis · history of severe dry eye · history of ulcerative keratitis · pulmonary disease—discontinue if interstitial lung disease develops · risk factors for keratitis · risk factors for severe dry eye · risk factors for ulcerative keratitis (including contact lens use)
- **INTERACTIONS** → Appendix 1 (panitumumab).
- **SIDE-EFFECTS**
 - **Common or very common** Anorexia · anxiety · back pain · biochemical disturbances · cellulitis · cheilitis · chills · cough · deep vein thrombosis · dyspepsia · dyspnoea · electrolyte disturbances · epistaxis · eyelash growth · flushing · folliculitis · gastro-oesophageal reflux disease · hyperhydrosis · insomnia · malaise · pain in extremities · peripheral oedema · pulmonary embolism · pyrexia · rectal haemorrhage · severe hypersensitivity reactions (possibly delayed) · urinary tract infection · weight loss
 - **Uncommon** Bronchospasm · cyanosis · hirsutism · infusion-related reactions · nasal dryness
 - **Rare** Keratitis · skin necrosis · Stevens-Johnson syndrome · toxic epidermal necrolysis
 - **Frequency not known** Abdominal pain · acne · alopecia · bone-marrow suppression · conjunctivitis · constipation · dehydration · diarrhoea · dizziness · dry eyes · dry mouth · dry skin · erythema · extravasation · hand-foot syndrome · headache · hypertension · hypertrichosis · hyperuricaemia

· hypocalcaemia · hypomagnesaemia · hypotension · increased lacrimation · interstitial lung disease · mucosal inflammation · nail disorders · nausea · ocular disorders · ocular hyperaemia · oral mucositis · pruritus · rash · skin reactions · tachycardia · thromboembolism · tumour lysis syndrome · vomiting

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in women
- **PREGNANCY** Avoid (toxicity in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Manufacturer advises avoid breastfeeding during and for 2 months after treatment.
- **PRE-TREATMENT SCREENING** Evidence of non-mutated RAS status (at exons 2, 3 and 4 of *KRAS* and *NRAS*) is required before panitumumab treatment is initiated, and should be determined by an experienced laboratory using a validated test method.
- **MONITORING REQUIREMENTS**
 - Monitor for hypomagnesaemia.
 - Monitor for hypocalcaemia.
 - Monitor for dermatological reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis (consult product literature).
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - **NICE technology appraisals (TAs)**
 - Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242
Panitumumab monotherapy is **not** recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy. www.nice.org.uk/TA242
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion
ELECTROLYTES: May contain Sodium

 - **Vectibix** (Amgen Ltd)
 - Panitumumab 20 mg per 1 ml Vectibix 400mg/20ml concentrate for solution for infusion vials | 1 vial [POM] £1,517.16 (Hospital only)
 - Vectibix 100mg/5ml concentrate for solution for infusion vials | 1 vial [POM] £379.29 (Hospital only)

Pertuzumab

● **DRUG ACTION** Pertuzumab is a recombinant humanised monoclonal antibody, and acts by inhibiting human epidermal growth factor receptor 2 protein (HER2) dimerisation.

INDICATIONS AND DOSE

Treatment of HER2-positive metastatic or locally recurrent unresectable breast cancer in combination with trastuzumab and docetaxel, in patients who have not received previous anti-HER2 therapy or chemotherapy (initiated by a specialist)

BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

- **CAUTIONS** Conditions that could impair left ventricular function · history of congestive heart failure · impaired left ventricular function · prior anthracycline exposure · radiotherapy to the chest area · recent myocardial infarction · serious cardiac arrhythmia · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1 (pertuzumab).

● SIDE-EFFECTS

▶ **Common or very common** When used in combination with trastuzumab and docetaxel: anaemia · arthralgia · chills · constipation · cough · decreased appetite · diarrhoea · dizziness · dry skin · dyspepsia · dyspnoea · febrile neutropenia · headache · increased lacrimation · infusion-related reactions · insomnia · left ventricular dysfunction · leucopenia · malaise · myalgia · nail disorder · nasopharyngitis · neutropenia · oedema · pain · paronychia · peripheral neuropathy · pleural effusion · pruritus · pyrexia · rash · severe hypersensitivity reactions · taste disturbance · upper respiratory-tract infection

▶ **Uncommon** Interstitial lung disease (when used in combination with trastuzumab and docetaxel)

▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

● **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least six months after treatment in women of childbearing potential

● **PREGNANCY** Avoid (toxicity in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

● **BREAST FEEDING** Avoid—no information available.

● **HEPATIC IMPAIRMENT** Caution—no information available.

● **RENAL IMPAIRMENT** Caution in severe impairment—no information available.

● MONITORING REQUIREMENTS

▶ Assess for signs and symptoms of congestive heart failure (including left ventricular ejection fraction) before and during treatment—consult product literature, and withhold treatment if necessary.

▶ Monitor for febrile neutropenia.

● **DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ **Perjeta** (Roche Products Ltd) ▼

Pertuzumab 30 mg per 1 ml Perjeta 420mg/14ml concentrate for solution for infusion vials | 1 vial [PoM] £2,395.00 (Hospital only)

Siltuximab

● **DRUG ACTION** Siltuximab is a monoclonal antibody that inhibits interleukin-6 receptor binding.

INDICATIONS AND DOSE

Treatment of multicentric Castlemann's disease (MCD) in patients who are human immunodeficiency virus (HIV) negative and human herpesvirus-8 (HHV-8) negative

BY INTRAVENOUS INFUSION

▶ Adult: 11 mg/kg every 3 weeks

● **CAUTIONS** Patients at increased risk of gastrointestinal perforation—promptly investigate those presenting with symptoms suggestive of gastrointestinal perforation · severe infection—withhold treatment until resolved · treat infection prior to treatment

CAUTIONS, FURTHER INFORMATION

Hypersensitivity reactions Infusion-related side-effects are reported commonly with siltuximab; resuscitation facilities should be available during treatment. Consult product literature for further information about siltuximab cautions.

● **INTERACTIONS** → Appendix 1 (siltuximab).

Live vaccines should not be given concurrently or within 4 weeks before starting siltuximab treatment.

● SIDE-EFFECTS

▶ **Common or very common** Infusion related side effects

▶ **Frequency not known** Abdominal pain · anaphylaxis · hepatitis B reactivation · hypersensitivity reactions · hypertension · hypertriglyceridaemia · hypoglobulinaemia · increased haemoglobin levels · infections · localised oedema · maculopapular rash · nasopharyngitis · neutropenia · pruritus · renal impairment · thrombocytopenia · upper respiratory tract infection · weight gain

SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related side effects Siltuximab therapy should be discontinued permanently in the event of a severe infusion-related reaction, anaphylaxis, a severe allergic reaction, or the occurrence of cytokine-release syndrome. Mild to moderate infusion-related reactions may improve by temporarily reducing the rate or stopping the infusion. When restarting treatment, a reduced infusion rate and the administration of antihistamines, paracetamol, and corticosteroids should be considered. Consider discontinuation of siltuximab if more than 2 doses are delayed due to treatment-related toxicities during the first 48 weeks—for full details consult product literature.

● **CONCEPTION AND CONTRACEPTION** Women of childbearing potential should use effective contraception during and for 3 months after treatment.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Use with caution in hepatic impairment.

● MONITORING REQUIREMENTS

▶ Monitor neutrophil and platelet count, and haemoglobin levels prior to each dose of siltuximab treatment for the first 12 months and thereafter prior to every third dosing cycle. Consider delaying treatment if required neutrophil, platelet, and haemoglobin levels not achieved—consult product literature for details.

▶ Monitor for infection during treatment.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Sylvant®), give intermittently in Glucose 5%. Allow vials to reach room temperature over approximately 30 minutes, then reconstitute each 100 mg vial with 5.2 mL of water for injection, and each 400 mg vial with 20 mL of water for injection, to produce a 20 mg/mL solution. Gently swirl without shaking to dissolve. Further dilute to 250 mL with glucose 5% and gently mix. Use within 6 hours of dilution and give over 60 minutes using an administration set lined with polyvinyl chloride or polyurethane, through a low-protein binding in-line 0.2 micron filter.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Sylvant** (Janssen-Cilag Ltd) ▼

Siltuximab 100 mg Sylvant 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £415.00 (Hospital only)

Siltuximab 400 mg Sylvant 400mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £1,661.00 (Hospital only)

Trastuzumab

INDICATIONS AND DOSE

Treatment of early breast cancer which overexpresses human epidermal growth factor receptor-2 (HER2) (initiated by a specialist) | Treatment of metastatic breast cancer in patients with HER2-positive tumours who have not received chemotherapy for metastatic breast cancer and in whom anthracycline treatment is inappropriate (in combination with paclitaxel or docetaxel) (initiated by a specialist) | Treatment of metastatic breast cancer in postmenopausal patients with hormone-receptor positive HER2-positive tumours not previously treated with trastuzumab (in combination with an aromatase inhibitor) (initiated by a specialist)

BY INTRAVENOUS INFUSION OR BY SUBCUTANEOUS INJECTION

► Adult: (consult product literature or local protocols)

Monotherapy for metastatic breast cancer in patients with tumours that overexpress HER2 who have received at least 2 chemotherapy regimens including, where appropriate, an anthracycline and a taxane (initiated by a specialist)

BY INTRAVENOUS INFUSION OR BY SUBCUTANEOUS INJECTION

► Adult: Women with oestrogen-receptor-positive breast cancer should also have received hormonal therapy (consult product literature or local protocols)

Treatment of metastatic gastric cancer in patients with HER2-positive tumours who have not received treatment for metastatic gastric cancer (in combination with capecitabine or fluorouracil and cisplatin) (initiated by a specialist)

BY INTRAVENOUS INFUSION

► Adult: (consult product literature or local protocols)

● **CONTRA-INDICATIONS** Severe dyspnoea at rest

● **CAUTIONS** Coronary artery disease · history of hypertension · symptomatic heart failure · uncontrolled arrhythmias

● **INTERACTIONS** → Appendix 1 (trastuzumab)

► **Use with anthracyclines** Concomitant use of trastuzumab with anthracyclines is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to 24 weeks. If an anthracycline needs to be used, cardiac function should be monitored closely.

● **SIDE-EFFECTS** Acne · alopecia · alopecia · anaphylaxis · angioedema · anxiety · arthralgia · arthritis · asthenia · bone pain · bone-marrow suppression · cardiotoxicity · chest pain · chills · depression · dizziness · drowsiness · dry eye · dry skin · ecchymosis · extravasation · fever · gastro-intestinal symptoms · headache · hepatitis · hypersensitivity reactions · hypertension · hypertonica · hyperuricaemia · hypotension · increased lacrimation · infection · infusion-related side-effects (possibly delayed onset) · insomnia · leg cramps · malaise · mastitis · myalgia · nail disorders · nausea · oedema · oral mucositis · paraesthesia · paresis · peripheral neuropathy · pruritus · pulmonary events (possibly delayed onset) · rash · sweating · taste disturbance · thromboembolism · tremor · tumour lysis syndrome · urticaria · vomiting · weight loss

● **PREGNANCY** Manufacturer advises avoid—oligohydramnios reported. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

● **BREAST FEEDING** Avoid breast-feeding during treatment and for 7 months afterwards.

● MONITORING REQUIREMENTS

► Cardiotoxicity Monitor cardiac function before and during treatment—for details of monitoring and managing cardiotoxicity, consult product literature.

● **DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available during administration of trastuzumab.

● **PRESCRIBING AND DISPENSING INFORMATION** When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab is **not** interchangeable with trastuzumab emtansine.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

► **Guidance on the use of trastuzumab for the treatment of advanced breast cancer (March 2002) NICE TA34** Trastuzumab in combination with paclitaxel is recommended as an option for patients with tumours expressing human epidermal growth factor receptor 2 (HER2) scored at levels of 3+ who have not received chemotherapy for metastatic breast cancer, and in whom anthracycline treatment is inappropriate. Trastuzumab monotherapy is recommended as an option for patients with tumours expressing HER2 scored at levels of 3+ who have received at least two chemotherapy regimens for metastatic breast cancer. Prior chemotherapy must have included at least an anthracycline and a taxane where these treatments are appropriate. It should also have included hormonal therapy in suitable oestrogen-receptor-positive patients. www.nice.org.uk/TA34

► **Trastuzumab for the adjuvant treatment of early-stage HER2-positive breast cancer (August 2006) NICE TA107** Trastuzumab, given at 3-week intervals for 1 year or until disease recurrence (whichever is the shorter period), is recommended as an option for women with early-stage HER2-positive breast cancer following surgery, chemotherapy (neoadjuvant or adjuvant) and radiotherapy (if applicable). www.nice.org.uk/TA107

► **Trastuzumab for the treatment of HER2-positive metastatic gastric cancer (November 2010) NICE TA208** Trastuzumab in combination with cisplatin and capecitabine or fluorouracil is recommended for human epidermal growth factor receptor-2-positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction in patients who:

- have not received treatment for metastatic disease **and**
- have tumours expressing high levels of HER2 as defined by a positive immunohistochemistry score of 3. www.nice.org.uk/TA208

► **Lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2 (June 2012) NICE TA257**

Lapatinib or trastuzumab in combination with an aromatase inhibitor is **not** recommended for first-line treatment in postmenopausal women of metastatic hormone-receptor-positive breast cancer that overexpresses human epidermal growth factor receptor 2 (HER2).

Postmenopausal women currently receiving lapatinib or trastuzumab in combination with an aromatase inhibitor for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA257

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2013) that subcutaneous trastuzumab injection (*Herceptin*®) is accepted for restricted use within NHS Scotland for the treatment of adults with HER2 positive metastatic breast cancer and early breast cancer, when used within licensed indications excluding use in combination with an aromatase inhibitor for the treatment of postmenopausal patients with hormone-receptor positive metastatic breast cancer, not previously treated with trastuzumab.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► **Herceptin** (Roche Products Ltd)

Trastuzumab 120 mg per 1 ml Herceptin 600mg/5ml solution for injection vials | 1 vial [PoM] £1,222.20 (Hospital only)

Powder for solution for infusion

► **Herceptin** (Roche Products Ltd)

Trastuzumab 150 mg Herceptin 150mg powder for solution for infusion vials | 1 vial [PoM] £407.40

● **HEPATIC IMPAIRMENT** Consult product literature for dose modification in cases of abnormal liver function tests. Consult product literature for initiating treatment and discontinuation in cases of abnormal liver function tests.

● **RENAL IMPAIRMENT** No information available—manufacturer advises caution in severe impairment.

MONITORING REQUIREMENTS

- Monitor hepatic function before each dose.
- Monitor for signs and symptoms of neurotoxicity.
- Monitor closely for infusion-related and hypersensitivity reactions.
- Monitor platelet count before each dose and as clinically indicated (consult product literature for treatment modification in thrombocytopenia).
- Test cardiac function before treatment and regularly during treatment—delay or discontinue treatment in cases of left ventricular dysfunction.
- Monitor for dyspnoea, cough, fatigue and pulmonary infiltrates—discontinue if interstitial lung disease or pneumonitis confirmed (fatal cases reported).
- **DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available during administration of trastuzumab emtansine.
- **PRESCRIBING AND DISPENSING INFORMATION** When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab emtansine and trastuzumab are **not** interchangeable.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► **Kadcyla** (Roche Products Ltd) ▼

Trastuzumab emtansine 100 mg Kadcyla 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £1,641.01

Trastuzumab emtansine 160 mg Kadcyla 160mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £2,625.62

Trastuzumab emtansine

● **DRUG ACTION** Trastuzumab emtansine is an antibody-drug conjugate that contains trastuzumab covalently linked to DM1, a cytotoxic microtubule inhibitor.

INDICATIONS AND DOSE

Monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have previously received trastuzumab and a taxane separately or in combination (initiated by a specialist) | Monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have developed disease recurrence during or within 6 months of completing adjuvant therapy (initiated by a specialist)

BY INTRAVENOUS INFUSION

► **Adult:** (consult product literature or local protocols)

- **CAUTIONS** Dyspnoea at rest—increased risk of pulmonary events · history of congestive heart failure · patients over 75 years · peripheral neuropathy (temporarily discontinue treatment—consult product literature) · recent history of myocardial infarction · recent history of unstable angina · risk of left ventricular dysfunction—consult product literature for specific risks with trastuzumab treatment · serious arrhythmias
- **INTERACTIONS** → Appendix 1 (trastuzumab). Caution with concomitant anticoagulant medication—increased risk of thrombocytopenia with haemorrhagic events.
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · arthralgia · blurred vision · chills · conjunctivitis · constipation · cough · diarrhoea · dizziness · dry eye · dry mouth · dysgeusia · dyspepsia · dyspnoea · epistaxis · gingival bleeding · haemorrhage · hand-foot syndrome · headache · hypertension · hypokalaemia · increased lacrimation · infusion-related reactions · insomnia · left ventricular dysfunction · malaise · memory impairment · myalgia · nail disorder · peripheral neuropathy · peripheral oedema · pruritus · pyrexia · rash · thrombocytopenia · urinary tract infection · urticaria
 - **Uncommon** Hepatic failure · hepatic toxicity · interstitial lung disease · nodular regenerative hyperplasia · pneumonitis · portal hypertension
 - **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during and for 6 months after stopping treatment in women and men.
- **PREGNANCY** Manufacturer advises avoid—oligohydramnios reported with trastuzumab. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Manufacturer advises avoid breast-feeding during and for 6 months after treatment.

2.2 Cytotoxic responsive malignancy

Cytotoxic drugs

The chemotherapy of cancer is complex and should be confined to specialists in oncology. Cytotoxic drugs have both anti-cancer activity and the potential to damage normal tissue; most cytotoxic drugs are teratogenic. Chemotherapy may be given with a curative intent or it may aim to prolong life or to palliate symptoms. In an increasing number of cases chemotherapy may be combined with radiotherapy or surgery or both as either neoadjuvant treatment (initial chemotherapy aimed at shrinking the primary tumour, thereby rendering local therapy less destructive or more effective) or as adjuvant treatment (which follows definitive treatment of the primary disease, when the risk of subclinical metastatic disease is known to be high). All cytotoxic drugs cause side-effects and a balance has to be struck between likely benefit and acceptable toxicity.

Combinations of cytotoxic drugs, as continuous or pulsed cycles of treatment, are frequently more toxic than single drugs but have the advantage in certain tumours of enhanced response, reduced development of drug resistance and increased survival. However for some tumours, single-agent chemotherapy remains the treatment of choice.

Cytotoxic drugs fall into a number of classes, each with characteristic antitumour activity, sites of action, and toxicity. A knowledge of sites of metabolism and excretion

is important because impaired drug handling as a result of disease is not uncommon and may result in enhanced toxicity.

Guidelines for handling cytotoxic drugs

- Trained personnel should reconstitute cytotoxics
- Reconstitution should be carried out in designated pharmacy areas
- Protective clothing (including gloves, gowns, and masks) should be worn
- The eyes should be protected and means of first aid should be specified
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard)
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material
- Staff exposure to cytotoxic drugs should be monitored

Intrathecal chemotherapy

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available.

Copies, and further information may be obtained from:

Department of Health
PO Box 777
London
SE1 6XH

Fax: 01623 724524

It is also available from the Department of Health website (www.dh.gov.uk).

Safe systems for cytotoxic medicines

NHS cancer networks have been established across the UK to bring together all stakeholders in all sectors of care, to work collaboratively to plan and deliver high quality cancer services for a given population. NHS cancer networks have websites containing information on local chemotherapy services and treatment (see www.cancer.nhs.uk/networks.htm).

Safe system requirements:

- cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care coordinated by a multidisciplinary team
- cytotoxic drugs should be prescribed, dispensed, and administered only in the context of a written protocol or treatment plan
- injectable cytotoxic drugs should only be dispensed if they are prepared for administration
- oral cytotoxic medicines should be dispensed with clear directions for use

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy.

Standards to be followed to achieve this include:

- non-specialists who prescribe or administer on-going oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity;
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for

monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital.

Doses

Doses of cytotoxic drugs are determined using a variety of different methods including body-surface area or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient's neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from some of the drug entries in this chapter. However, even where dose statements have been provided, detailed specialist literature, individual hospital chemotherapy protocols, or local cancer networks (www.cancer.nhs.uk/networks.htm) should be consulted before prescribing, dispensing, or administering cytotoxic drugs.

Prescriptions should **not** be repeated except on the instructions of a specialist.

Side-effects of cytotoxic drugs

Side-effects common to most cytotoxic drugs are discussed below whilst side-effects characteristic of a particular drug or class of drugs (e.g. neurotoxicity with vinca alkaloids) are mentioned in the appropriate sections. Manufacturers' product literature, hospital-trust protocols, and cancer-network protocols should be consulted for full details of side-effects associated with individual drugs and specific chemotherapy regimens.

Many side-effects of cytotoxic drugs often do not occur at the time of administration, but days or weeks later. It is therefore important that patients and healthcare professionals can identify symptoms that cause concern and can contact an expert for advice. Toxicities should be accurately recorded using a recognised scoring system such as the Common Toxicity Criteria for Adverse Events (CTCAE) developed by the National Cancer Institute.

Extravasation of intravenous drugs

A number of cytotoxic drugs will cause severe local tissue necrosis if leakage into the extravascular compartment occurs. To reduce the risk of extravasation injury it is recommended that cytotoxic drugs are administered by appropriately trained staff. See information on the prevention and management of extravasation injury.

Oral mucositis

A sore mouth is a common complication of cancer chemotherapy; it is most often associated with fluorouracil p. 761, methotrexate p. 762, and the anthracyclines. It is best to prevent the complication. Good oral hygiene (rinsing the mouth frequently and effective brushing of the teeth with a soft brush 2–3 times daily) is probably beneficial. For fluorouracil, sucking ice chips during short infusions of the drug is also helpful.

Once a sore mouth has developed, treatment is much less effective. Saline mouthwashes should be used but there is no good evidence to support the use of antiseptic or anti-inflammatory mouthwashes. In general, mucositis is self-limiting but with poor oral hygiene it can be a focus for blood-borne infection.

Tumour lysis syndrome

Tumour lysis syndrome occurs secondary to spontaneous or treatment-related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non-Hodgkin's lymphoma (especially if high grade and

bulky disease), Burkitt's lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration, and renal impairment are also predisposing factors. Features include hyperkalaemia, hyperuricaemia (see below), and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early identification of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

Hyperuricaemia

Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure. Allopurinol p. 909 should be started 24 hours before treating such tumours and patients should be adequately hydrated. The dose of mercaptopurine p. 762 or azathioprine p. 716 should be reduced if allopurinol needs to be given concomitantly.

Rasburicase p. 784, a recombinant urate oxidase, is licensed for hyperuricaemia in patients with haematological malignancy. It rapidly reduces plasma-uric acid concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

Bone-marrow suppression

All cytotoxic drugs except vincristine sulfate p. 773 and bleomycin p. 766 cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as carmustine p. 749, lomustine p. 752, and melphalan p. 752. Peripheral blood counts must be checked before each treatment, and doses should be reduced or therapy delayed if bone-marrow has not recovered.

Cytotoxic drugs may be contra-indicated in patients with acute infection; any infection should be treated before, or when starting, cytotoxic drugs.

Fever in a neutropenic patient (neutrophil count less than 1.06×10^9 /litre) requires immediate broad-spectrum antibacterial therapy. Appropriate bacteriological investigations should be conducted as soon as possible. Patients taking cytotoxic drugs who have signs or symptoms of infection should be advised to seek prompt medical attention. All patients should initially be investigated and treated under the supervision of the appropriate oncology or haematology specialist.

In selected patients, the duration and the severity of neutropenia can be reduced by the use of recombinant human granulocyte-colony stimulating factors.

Symptomatic anaemia is usually treated with red blood cell transfusions. For guidance on the use of erythropoietins in patients with cancer, see MHRA/CHM advice and NICE guidance.

See advice on the use of live vaccines in individuals with impaired immune response.

Alopecia

Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients. No pharmacological methods of preventing this are available.

Thromboembolism

Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

Pregnancy and reproductive function

Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Exclude pregnancy before treatment with cytotoxic drugs. Contraceptive advice should be given before cytotoxic therapy begins—women of childbearing age should use effective contraception during and after treatment. Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

Alkylating drugs often severely affect gametogenesis and carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

Nausea and vomiting

Nausea and vomiting cause considerable distress to many patients who receive chemotherapy and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Patients vary in their susceptibility to drug-induced nausea and vomiting; those affected more often include women, patients under 50 years of age, anxious patients, and those who experience motion sickness. Susceptibility also increases with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered and to the individual's susceptibility to emetogenic stimuli.

Mildly emetogenic treatment—flourouracil, etoposide, methotrexate (less than 100 mg/m², low dose in children), the vinca alkaloids, and abdominal radiotherapy.

Moderately emetogenic treatment—the taxanes, doxorubicin hydrochloride, intermediate and low doses of cyclophosphamide, mitoxantrone, and high doses of methotrexate (0.1–1.2 g/m²).

Highly emetogenic treatment—cisplatin p. 768, dacarbazine p. 751, and high doses of cyclophosphamide.

Prevention of acute symptoms

For patients at *low risk of emesis*, pretreatment with dexamethasone p. 581 or lorazepam p. 412 may be used.

For patients at *high risk of emesis*, a 5HT₃-receptor antagonist, usually given by mouth in combination with dexamethasone p. 581 and the neurokinin receptor antagonist aprepitant p. 351 is effective.

Prevention of delayed symptoms

For delayed symptoms associated with moderately emetogenic chemotherapy, a combination of dexamethasone and 5HT₃-receptor antagonist is effective; for highly emetogenic chemotherapy, a combination of dexamethasone and aprepitant is effective. Metoclopramide hydrochloride p. 347 is also licensed for delayed chemotherapy-induced nausea and vomiting.

Prevention of anticipatory symptoms

Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam can be helpful for its amnesic, sedative, and anxiolytic effects.

Treatment for cytotoxic-induced side effects**Anthracycline side-effects***Anthracycline-induced cardiotoxicity*

The anthracycline cytotoxic drugs are associated with dose-related, cumulative, and potentially life-threatening cardiotoxic side-effects.

Anthracycline extravasation

Local guidelines for the management of extravasation should be followed or specialist advice sought.

See further information on the prevention and management of extravasation injury.

Chemotherapy-induced mucositis and myelosuppression

Folinic acid p. 781 (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate p. 762 and thus speed recovery from methotrexate-induced mucositis or myelosuppression ('folinic acid rescue').

Folinic acid is also used in the management of methotrexate overdose, together with other measures to maintain fluid and electrolyte balance, and to manage possible renal failure.

Folinic acid does not counteract the antibacterial activity of folate antagonists such as trimethoprim p. 462.

When folinic acid and fluorouracil p. 761 are used together in metastatic colorectal cancer the response-rate improves compared to that with fluorouracil alone.

The calcium salt of levofolinic acid p. 782, a single isomer of folinic acid, is also used for rescue therapy following methotrexate administration, for cases of methotrexate overdose, and for use with fluorouracil for colorectal cancer. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolinic acid are also used for rescue therapy following methotrexate therapy, and for use with fluorouracil for colorectal cancer.

Urothelial toxicity

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide p. 750 and ifosfamide p. 751; it is caused by the metabolite acrolein. Mesna p. 783 reacts specifically with this metabolite in the urinary tract, preventing toxicity. Mesna is used routinely (preferably by mouth) in patients receiving ifosfamide, and in patients receiving cyclophosphamide p. 750 by the intravenous route at a high dose (e.g. more than 2 g) or in those who experienced urothelial toxicity when given cyclophosphamide previously.

Anthracyclines and other cytotoxic antibiotics

Drugs in this group are widely used. Many cytotoxic antibiotics act as radiomimetics and simultaneous use of radiotherapy should be **avoided** because it may markedly increase toxicity. Daunorubicin p. 754, doxorubicin hydrochloride p. 754, epirubicin hydrochloride p. 756 and idarubicin hydrochloride p. 756 are anthracycline antibiotics. Mitoxantrone p. 778 is an anthracycline derivative.

Doxorubicin hydrochloride is available as both *conventional* and *liposomal* formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable. *Conventional* doxorubicin hydrochloride is used to treat the acute leukaemias, Hodgkin's and non-Hodgkin's lymphomas, paediatric malignancies, and some solid tumours including breast cancer.

Epirubicin hydrochloride is structurally related to doxorubicin hydrochloride and clinical trials suggest that it is as effective in the treatment of breast cancer.

Idarubicin hydrochloride has general properties similar to those of doxorubicin hydrochloride; it is mostly used in the treatment of haematological malignancies.

Daunorubicin also has general properties similar to those of doxorubicin hydrochloride.

Mitoxantrone is structurally related to doxorubicin hydrochloride.

Pixantrone p. 779 is licensed as monotherapy for the treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas, although the benefits of using it as a fifth-line or greater chemotherapy in refractory patients has not been established.

Bleomycin p. 766 is given intravenously or intramuscularly to treat metastatic germ cell cancer and, in some regimens, non-Hodgkin's lymphoma.

Dactinomycin is principally used to treat paediatric cancers. Its side-effects are similar to those of doxorubicin, except that cardiac toxicity is not a problem.

Mitomycin p. 767 is given intravenously to treat upper gastrointestinal and breast cancers and by bladder instillation for superficial bladder tumours. It causes delayed bone marrow toxicity and therefore it is usually administered at 6-weekly intervals.

Vinca alkaloids

The vinca alkaloids, vinblastine sulfate p. 773, vincristine sulfate p. 773, and vindesine sulfate p. 774, are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer).

Vinorelbine p. 775 is a semi-synthetic vinca alkaloid. See also, role of vinorelbine in the treatment of breast cancer.

Antimetabolites

Antimetabolites are incorporated into new nuclear material or combine irreversibly with cellular enzymes, preventing normal cellular division.

Alkylating drugs

Extensive experience is available with these drugs, which are among the most widely used in cancer chemotherapy. They act by damaging DNA, thus interfering with cell replication.

Cyclophosphamide p. 750 is used mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours. It is given by mouth or intravenously; it is inactive until metabolised by the liver.

Ifosfamide p. 751 is related to cyclophosphamide and is given intravenously.

Melphalan p. 752 is licensed for the treatment of multiple myeloma, polycythaemia vera, childhood neuroblastoma, advanced ovarian adenocarcinoma, and advanced breast cancer. However, in practice, melphalan is rarely used for ovarian adenocarcinoma; it is no longer used for advanced breast cancer. Melphalan is also licensed for regional arterial perfusion in localised malignant melanoma of the extremities and localised soft-tissue sarcoma of the extremities.

Lomustine p. 752 is a lipid-soluble nitrosourea and the drug is given at intervals of 4 to 6 weeks.

Carmustine p. 749 has similar activity to lomustine; it is given to patients with multiple myeloma, non-Hodgkin's lymphomas, and brain tumours. Carmustine implants are licensed for intralesional use in adults for the treatment of recurrent glioblastoma multiforme as an adjunct to surgery. Carmustine implants are also licensed for high-grade malignant glioma as adjunctive treatment to surgery and radiotherapy.

Estramustine phosphate p. 751 is a combination of an oestrogen and chlormethine used predominantly in prostate cancer. It is given by mouth and has both an antimetabolic effect and (by reducing testosterone concentration) a hormonal effect.

Mitobronitol is occasionally used to treat chronic myeloid leukaemia; it is available on a named-patient basis from specialist importing companies.

ALKYLATING AGENTS

Bendamustine hydrochloride

INDICATIONS AND DOSE

Treatment of chronic lymphocytic leukaemia | Treatment of non-Hodgkin's lymphoma | Treatment of multiple myeloma

BY INTRAVENOUS INFUSION

► Adult: (consult local protocol)

- **CONTRA-INDICATIONS** Jaundice · low leucocyte count · low platelet count · major surgery less than 30 days before start of treatment · severe bone marrow suppression
- **CAUTIONS** Avoid in Acute porphyrias p. 864 · cardiac disorders—monitor serum potassium and ECG
- **INTERACTIONS** → Appendix 1 (bendamustine).
- **SIDE-EFFECTS**
 - **Common or very common** Amenorrhoea · angina · anorexia · arrhythmias · chills · constipation · dehydration · diarrhoea · electrolyte disturbances · haemorrhage · hypertension · hypokalaemia · hypotension · infection · insomnia · malaise · pain · palpitation · pyrexia · respiratory dysfunction
 - **Uncommon** Pericardial effusion
 - **Rare** Acute circulatory failure · drowsiness · sweating · voice changes
 - **Very rare** Anticholinergic syndrome · ataxia · cardiac failure · encephalitis · haemolysis · multiple organ failure · myocardial infarction · neurological disorders · paraesthesia · peripheral neuropathy · phlebitis · pulmonary fibrosis · tachycardia · taste disturbance
 - **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · Stevens-Johnson syndrome · thromboembolism · toxic epidermal necrolysis · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

- **CONCEPTION AND CONTRACEPTION** Effective contraception is required during treatment in men or women, and for 6 months after treatment in men.
- **PREGNANCY** Avoid (teratogenic and mutagenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Consider a 30% dose reduction in moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** No information available on use in patients with creatinine clearance less than 10 mL/minute.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

 - Bendamustine for the first-line treatment of chronic lymphocytic leukaemia (February 2011) NICE TA216

Bendamustine is recommended as an option for the treatment of chronic lymphocytic leukaemia in patients

for whom fludarabine combination chemotherapy is not appropriate. www.nice.org.uk/TA216

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2011) that bendamustine (Levact[®]) is accepted for restricted use within NHS Scotland for the treatment of chronic lymphocytic leukaemia in patients for whom fludarabine combination chemotherapy is not appropriate.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► **Levact** (Napp Pharmaceuticals Ltd)

Bendamustine hydrochloride 25 mg Levact 25mg powder for concentrate for solution for infusion vials | 5 vial (PoM) £347.26 (Hospital only)

Bendamustine hydrochloride 100 mg Levact 100mg powder for concentrate for solution for infusion vials | 5 vial (PoM) £1,379.04 (Hospital only)

Busulfan

(Busulphan)

INDICATIONS AND DOSE

Chronic myeloid leukaemia, induction of remission

BY MOUTH

► Adult: 60 micrograms/kg daily (max. per dose 4 mg); maintenance 0.5–2 mg daily

Conditioning treatment before haematopoietic stem-cell transplantation

BY MOUTH OR BY INTRAVENOUS INFUSION

► Adult: (consult local protocol)

Doses at extremes of body-weight

Dose may need to be calculated based on body surface area or adjusted ideal body weight in obese patients—consult product literature.

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CAUTIONS** Avoid in Acute porphyrias p. 864 · high dose (antiepileptic prophylaxis required) · history of seizures (antiepileptic prophylaxis required) · ineffective once in blast crisis phase · previous progenitor cell transplant (increased risk of hepatic veno-occlusive disease) · previous radiation therapy (increased risk of hepatic veno-occlusive disease) · risk of second malignancy · three or more cycles of chemotherapy (increased risk of hepatic veno-occlusive disease)
- **INTERACTIONS** → Appendix 1 (busulfan).
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

 - **Common or very common** Cardiac tamponade in thalassaemia · hepatic fibrosis · hepatic veno-occlusive disease · hepatotoxicity · hyperbilirubinaemia · jaundice · pneumonia · skin hyperpigmentation
 - **Rare** Aplastic anaemia · seizures · visual disturbances
 - **Very rare** Gynaecomastia · myasthenia gravis
 - **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · irreversible bone-marrow aplasia · lung toxicity · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

SPECIFIC SIDE-EFFECTS

 - With intravenous use extravasation

SIDE-EFFECTS, FURTHER INFORMATION

Lung toxicity Discontinue if lung toxicity develops.

Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

- **CONCEPTION AND CONTRACEPTION** Manufacturers advise effective contraception during and for 6 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic in *animals*). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. In patients with hepatic impairment, manufacturer advises regular liver function tests—consult product literature.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor cardiac and liver function.
 - ▶ Frequent blood tests are necessary because excessive myelosuppression may result in irreversible bone-marrow aplasia.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, capsule

Tablet

- ▶ **Myleran** (Aspen Pharma Trading Ltd)
Busulfan 2 mg Myleran 2mg tablets | 25 tablet [PoM] £65.22

Solution for infusion

- ▶ **Busilvex** (Pierre Fabre Ltd)
Busulfan 6 mg per 1 ml Busilvex 60mg/10ml concentrate for solution for infusion ampoules | 8 ampoule [PoM] £1,610.00 (Hospital only)

Carmustine

INDICATIONS AND DOSE

Multiple myeloma | Non-Hodgkin's lymphomas | Brain tumours

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature)

Recurrent glioblastoma multiforme as an adjunct to surgery | High-grade malignant glioma as adjunctive treatment to surgery and radiotherapy

BY INTRALESIONAL IMPLANTATION

- ▶ Adult: (consult product literature)

- **CAUTIONS** Avoid in Acute porphyrias p. 864
- **INTERACTIONS** → Appendix 1 (carmustine).
- **SIDE-EFFECTS**
- **GENERAL SIDE-EFFECTS**
Alopecia · bone-marrow suppression (delayed) · hyperuricaemia · irritant to tissues · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting
- **SPECIFIC SIDE-EFFECTS**
- ▶ **With intravenous use** pulmonary fibrosis (delayed) · renal damage (cumulative)
- **SIDE-EFFECTS, FURTHER INFORMATION**
- **Secondary malignancy** Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment in men or women.

- **PREGNANCY** Avoid (teratogenic and embryotoxic in *animals*). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **NICE technology appraisals (TAs)**
 - ▶ **Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007)** NICE TA121 Carmustine implants are an option for the treatment of newly diagnosed high-grade (Grade 3 or 4) glioma **only** for patients in whom at least 90% of the tumour has been resected. Carmustine implants should only be used within specialist centres. www.nice.org.uk/TA121

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Implant

- ▶ **Glialid** (Eisai Ltd)
Carmustine 7.7 mg Glialid 7.7mg implant | 8 device [PoM] £5,203.00 (Hospital only)

Chlorambucil

INDICATIONS AND DOSE

Some lymphomas and chronic leukaemias (used either alone or in combination therapy)

BY MOUTH

- ▶ Adult: (consult local protocol)

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CAUTIONS** Avoid in Acute porphyrias p. 864 · children with nephrotic syndrome (increased seizure risk) · history of epilepsy (increased seizure risk)
- **SIDE-EFFECTS**
- ▶ **Uncommon** Skin rash
- ▶ **Very rare** Male sterility (in prepubertal and pubertal males)
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · premature menopause · secondary malignancy · Stevens-Johnson syndrome · thromboembolism · toxic epidermal necrolysis · tumour lysis syndrome · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
- **Secondary malignancy** Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.
- **Skin reactions** If a rash occurs further chlorambucil is contra-indicated and cyclophosphamide is substituted.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment in men or women.
- **PREGNANCY** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises consider dose reduction in severe impairment—limited information available.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **NICE technology appraisals (TAs)**
 - ▶ **Obinutuzumab in combination with chlorambucil for untreated chronic lymphocytic leukaemia (June 2015)** NICE TA343
Obinutuzumab, in combination with chlorambucil, is an option for untreated chronic lymphocytic leukaemia in

patients who have comorbidities that make full-dose fludarabine-based therapy unsuitable for them, only if:

- bendamustine-based therapy is not suitable **and**
- the manufacturer provides obinutuzumab with the discount agreed in the patient access scheme.

Patients currently receiving obinutuzumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA343

- ▶ **Ofatumumab in combination with chlorambucil or bendamustine for untreated chronic lymphocytic leukaemia (June 2015) NICE TA344**

Ofatumumab in combination with chlorambucil is an option for untreated chronic lymphocytic leukaemia only if:

- the person is ineligible for fludarabine-based therapy **and**
- bendamustine is not suitable **and**
- the manufacturer provides ofatumumab with the discount agreed in the patient access scheme.

Patients currently receiving ofatumumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA344

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ CHLORAMBUCIL (Non-proprietary)

Chlorambucil 2 mg Chlorambucil 2mg tablets | 25 tablet [PoM]
£40.51 DT price = £40.51

Cyclophosphamide

INDICATIONS AND DOSE

Rheumatoid arthritis with severe systemic manifestations
BY MOUTH

▶ Adult: 1–1.5 mg/kg daily

Severe systemic rheumatoid arthritis | Other connective tissue diseases (especially with active vasculitis)

BY INTRAVENOUS INJECTION

▶ Adult: 0.5–1 g every 2 weeks, then reduced to 0.5–1 g every 1 month, frequency adjusted according to clinical response and haematological monitoring. To be given with prophylactic mesna

Used, mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours

BY MOUTH OR BY INTRAVENOUS INFUSION

▶ Adult: (consult local protocol)

- **UNLICENSED USE** Not licensed for rheumatoid arthritis with severe systemic manifestations.

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CONTRA-INDICATIONS** Haemorrhagic cystitis
- **CAUTIONS** Avoid in Acute porphyrias p. 864 · diabetes mellitus · previous or concurrent mediastinal irradiation—risk of cardiotoxicity
- **INTERACTIONS** → Appendix 1 (cyclophosphamide).
- **SIDE-EFFECTS**
- GENERAL SIDE-EFFECTS**
- ▶ **Common or very common** Anorexia · cardiotoxicity at high doses · disturbances of carbohydrate metabolism · inappropriate secretion of anti-diuretic hormone ·

interstitial pulmonary fibrosis · pancreatitis · pigmentation of nails · pigmentation of palms · pigmentation of soles · urothelial toxicity

- ▶ **Rare** Hepatotoxicity · renal dysfunction
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · haemorrhagic cystitis · hyperuricaemia · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

SPECIFIC SIDE-EFFECTS

- ▶ **With intravenous use** extravasation

SIDE-EFFECTS, FURTHER INFORMATION

Haemorrhagic cystitis A urinary metabolite of cyclophosphamide, acrolein, can cause haemorrhagic cystitis; this is a rare but serious complication; increased fluid intake for 24–48 hours after intravenous injection, can prevent this complication. When high-dose therapy (e.g. more than 2 g intravenously) is used or when the patient is considered to be at high risk of cystitis (e.g. because of pelvic irradiation), mesna (given initially intravenously then by mouth) can also help prevent cystitis.

Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment in men or women.
- **PREGNANCY** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding during and for 36 hours after stopping treatment.
- **HEPATIC IMPAIRMENT** Reduce dose—consult local treatment protocol for details.
- **RENAL IMPAIRMENT** Reduce dose if serum creatinine concentration greater than 120 micromol/litre.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (cyclophosphamide injection; *Baxter*) give via drip tubing in Glucose 5% or Sodium chloride 0.9%; reconstitute 500 mg with 25 mL sodium chloride 0.9%; reconstitute 1 g with 50 mL sodium chloride 0.9%.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, solution for injection, oral suspension, solution for infusion, oral solution

Dacarbazine

INDICATIONS AND DOSE

Metastatic melanoma | Soft tissue sarcomas (combination therapy) | Hodgkin's disease (combination therapy)

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION

► Adult: (consult local protocol)

- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1 (dacarbazine).
- **SIDE-EFFECTS**
 - **Rare** Irritant to skin · irritant to tissues · liver necrosis due to hepatic vein thrombosis
 - **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · myelosuppression · oral mucositis · severe nausea · severe vomiting · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (carcinogenic and teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Dacarbazine is a component of a commonly used combination for Hodgkin's disease (ABVD—doxorubicin [previously *Adriamycin*®]), bleomycin, vinblastine, and dacarbazine).

MEDICINAL FORMS

Dacarbazine (as Dacarbazine citrate) 1 gram Dacarbazine 1g powder for solution for infusion vials | 1 vial [PoM](#) £70.00

Estramustine phosphate

INDICATIONS AND DOSE

Prostate cancer

BY MOUTH

► Adult: Initially 560–840 mg daily in divided doses; maintenance 140–1400 mg daily in divided doses

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CONTRA-INDICATIONS** Peptic ulceration · severe cardiovascular disease · thromboembolic disorders
- **CAUTIONS** Avoid in Acute porphyrias p. 864 · cardiovascular disease · cerebrovascular disease · conditions which might be aggravated by fluid retention

(such as epilepsy or migraine) · congestive heart failure · diabetes · hypercalcaemia · hypertension

- **INTERACTIONS** → Appendix 1 (estramustine).
- **SIDE-EFFECTS**
 - **Rare** Angioedema
 - **Frequency not known** Alopecia · altered endocrine function · altered liver function · bone-marrow suppression · congestive heart failure · diarrhoea · gynaecomastia · hyperuricaemia · impotence · ischaemic heart disease · male sterility · myocardial infarction · nausea · oedema · oral mucositis · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**

Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.
- **CONCEPTION AND CONTRACEPTION** Men should use effective contraceptive methods during treatment.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. Avoid in severe impairment. In hepatic impairment, manufacturer advises regular liver function tests.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **DIRECTIONS FOR ADMINISTRATION** Each dose should be taken not less than 1 hour before or 2 hours after meals and should not be taken with products containing calcium, magnesium or aluminium, including dairy products and antacid medication.
- **PATIENT AND CARER ADVICE** Patients should be given advice on how to administer estramustine capsules.

Estramustine phosphate (as Estramustine sodium phosphate) 140 mg Estracty 140mg capsules | 100 capsule [PoM](#) £171.28

Ifosfamide

INDICATIONS AND DOSE

Malignant disease

BY INTRAVENOUS INFUSION

► Adult: (consult local protocol)

- **CONTRA-INDICATIONS** Acute infection · urinary-tract infection · urinary-tract obstruction · urothelial damage
- **CAUTIONS** Avoid in Acute porphyrias p. 864 · diabetes mellitus
- **INTERACTIONS** → Appendix 1 (ifosfamide).
- **SIDE-EFFECTS**
 - **Common or very common** Confusion · disorientation · drowsiness · psychosis · renal toxicity (may lead to tubular dysfunction, Fanconi's syndrome, or diabetes insipidus) · restlessness · urothelial toxicity
 - **Uncommon** Severe encephalopathy
 - **Rare** Anorexia · constipation · convulsions · diarrhoea
 - **Very rare** Jaundice · syndrome of inappropriate antidiuretic hormone secretion · thrombophlebitis
 - **Frequency not known** Acute pancreatitis · alopecia · arrhythmias · bone-marrow suppression · extravasation · heart failure · hyperuricaemia · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Urothelial toxicity Mesna is routinely given with ifosfamide to reduce urothelial toxicity.

Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic and carcinogenic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Avoid if serum creatinine concentration greater than 120 micromol/litre.
- **MONITORING REQUIREMENTS** Ensure satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi's syndrome or diabetes insipidus if renal toxicity not treated promptly).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

Temozolomide

- **DRUG ACTION** Temozolomide is structurally related to dacarbazine.

INDICATIONS AND DOSE

Newly diagnosed glioblastoma multiforme in adults (in combination with radiotherapy) and subsequently as monotherapy | Second-line treatment of malignant glioma in adults

BY MOUTH

- Adult: (consult product literature)

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CAUTIONS** *Pneumocystis jirovecii* pneumonia—consult product literature for monitoring and prophylaxis requirements
- **INTERACTIONS** → Appendix 1 (temozolomide).
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
For further information on side-effects consult product literature.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Use with caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS**
 - Monitor liver function before treatment initiation, after each treatment cycle and midway through 42-day treatment cycles—consider the balance of benefits and risks of treatment if results are abnormal at any point (fatal liver injury reported).
 - Monitor for myelodysplastic syndrome.
 - Monitor for secondary malignancies.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

 - Temozolomide for the treatment of recurrent malignant glioma (brain cancer) (April 2001) NICE TA23
Temozolomide may be considered for the treatment of recurrent malignant glioma, which has not responded to first-line chemotherapy. www.nice.org/TA23
 - Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007) NICE TA121

Thiotepa**INDICATIONS AND DOSE**

Conditioning treatment before haematopoietic stem cell transplantation in the treatment of haematological disease or solid tumours, in combination with other chemotherapy

BY INTRAVENOUS INFUSION

- Adult: (consult local protocol)

- **CAUTIONS** Avoid in Acute porphyrias p. 864
- **INTERACTIONS** → Appendix 1 (thiotepa).
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium* has advised (June 2012) that thiotepa (*Tepadina*®) is **not** recommended for use within NHS Scotland in combination with other chemotherapy as conditioning treatment in adults or children with haematological diseases, or solid tumours prior to haematopoietic stem cell transplantation.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion▶ **Tepadina** (Adienne Pharma & Biotech)

Thiopepa 15 mg Tepadina 15mg powder for concentrate for solution for infusion vials | 1 vial [PoM] no price available

Thiopepa 100 mg Tepadina 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] no price available

Treosulfan

INDICATIONS AND DOSE**Ovarian cancer**

BY MOUTH OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION OR BY INTRAPERITONEAL INSTILLATION

▶ Adult: (consult product literature)

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CAUTIONS** Avoid in Acute porphyrias p. 864
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Skin pigmentation
 - ▶ **Rare** Allergic alveolitis · haemorrhagic cystitis · pulmonary fibrosis
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation of intravenous drugs · hyperuricaemia · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

- **PREGNANCY** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.

Treosulfan 5 gram Treosulfan 5g powder for solution for injection vials | 5 vial [PoM] £990.64

ANTHRACYCLINES

Daunorubicin

INDICATIONS AND DOSE

Acute myelogenous leukaemia | Acute lymphocytic leukaemia

BY INTRAVENOUS INFUSION

▶ Adult: (consult local protocol)

Advanced AIDS-related Kaposi's sarcoma (liposomal formulation only)

BY INTRAVENOUS INFUSION

▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Myocardial insufficiency · previous treatment with maximum cumulative doses of daunorubicin or other anthracycline · recent myocardial infarction · severe arrhythmia

- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** Caution is necessary with concomitant use of cardiotoxic drugs, or drugs that reduce cardiac contractility. Concomitant use with trastuzumab is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to 24 weeks. If trastuzumab needs to be used, cardiac function should be monitored closely.
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**

Cardiotoxicity All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible
- **PREGNANCY** Avoid (teratogenic and carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose according to serum bilirubin concentration—consult local protocol for details. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Reduce dose by 25% if serum creatinine 105–265 micromol/litre. Reduce dose by 50% if serum creatinine greater than 265 micromol/litre. Avoid in severe impairment.
- **MONITORING REQUIREMENTS** Cardiac monitoring essential.

MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion▶ **DAUNORUBICIN (Non-proprietary)**

Daunorubicin (as Daunorubicin hydrochloride)

20 mg Daunorubicin 20mg powder for solution for infusion vials | 10 vial [PoM] £550.00 (Hospital only)

Emulsion for infusion▶ **DaunoXome** (Galen Ltd)

Daunorubicin (as Daunorubicin hydrochloride citrate)

50 mg DaunoXome 50mg emulsion for infusion vials | 1 vial [PoM] £131.75

Doxorubicin hydrochloride

INDICATIONS AND DOSE

Acute leukaemias | Hodgkin's lymphoma | Non-Hodgkin's lymphoma | Some solid tumours including breast cancer

BY INTRAVENOUS INJECTION

▶ Adult: (consult product literature)

Some papillary bladder tumours (bladder instillation) |

Recurrent superficial bladder tumours (bladder instillation) | Transitional cell carcinoma (bladder instillation) | Carcinoma in situ (bladder instillation)

BY INTRAVESICAL INSTILLATION

▶ Adult: (consult product literature)

CAELYX®

For AIDS-related Kaposi's sarcoma in patients with low CD4 count and extensive mucocutaneous or visceral disease | Advanced ovarian cancer when platinum-based chemotherapy has failed | Progressive multiple myeloma (in combination with bortezomib) in patients who have received at least one prior therapy and who have undergone or are unsuitable for bone-marrow transplantation | Monotherapy for metastatic breast cancer in patients with increased cardiac risk

BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

MYOCET®

For use with cyclophosphamide for metastatic breast cancer

► Adult: (consult product literature)

- **CONTRA-INDICATIONS** Consult product literature
- **CAUTIONS** Cardiac disease · caution in handling—irritant to tissues · consult product literature · elderly · hypertension · previous myocardial irradiation
- **INTERACTIONS** → Appendix 1 (doxorubicin). Caution is necessary with concomitant use of cardiotoxic drugs, or drugs that reduce cardiac contractility. Concomitant use with trastuzumab is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to 24 weeks. If trastuzumab needs to be used, cardiac function should be monitored closely.
- **SIDE-EFFECTS**
 - **Common or very common** Dehydration · diarrhoea · red colouration of the urine
 - **Uncommon** Supraventricular tachycardia (related to drug administration)
 - **Frequency not known** Alopecia · bone-marrow suppression · cardiomyopathy (with higher cumulative doses) · consult product literature · extravasation · heart failure (potentially fatal) · hyperuricaemia · nausea · oral mucositis · renal damage · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Extravasation Extravasation can cause severe tissue necrosis.

Cardiomyopathy Higher cumulative doses are associated with cardiomyopathy and it is usual to limit total cumulative doses to 450 mg/m² because symptomatic and potentially fatal heart failure is common above this dose. **Cardiotoxic** Some evidence suggests that weekly low-dose administration may be less cardiotoxic.

Liposomal formulations *Liposomal* formulations of doxorubicin may reduce the incidence of cardiotoxicity and lower the potential for local necrosis, but infusion reactions, sometimes severe, may occur. Hand-foot syndrome (painful, macular reddening skin eruptions) occurs commonly with liposomal doxorubicin and may be dose limiting. It can occur after 2–3 treatment cycles and may be prevented by cooling hands and feet and avoiding socks, gloves, or tight-fitting footwear for 4–7 days after treatment.

Elevated bilirubin concentration Doxorubicin is largely excreted in the bile and an elevated bilirubin concentration is an indication for reducing the dose.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic and toxic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Reduce dose according to bilirubin concentration—consult product literature or local treatment protocol for details. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Consult product literature in severe impairment.

- **MONITORING REQUIREMENTS** Patients should be assessed before treatment, by echocardiography. Cardiac monitoring during treatment may assist in determining safe dosage.

- **DIRECTIONS FOR ADMINISTRATION** *Conventional* doxorubicin is given by injection into a fast-running infusion, commonly at 21-day intervals.

- **PRESCRIBING AND DISPENSING INFORMATION** Doxorubicin is available as both *conventional* and *liposomal* formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable.

NATIONAL FUNDING/ACCESS DECISIONS**NICE technology appraisals (TAs)**

- Paclitaxel, pegylated liposomal doxorubicin, and topotecan for second-line or subsequent treatment of advanced ovarian cancer (May 2005) NICE TA91

Paclitaxel, combined with a platinum compound (carboplatin or cisplatin), is an option for advanced cancer that relapses 6 months or more after completing initial platinum-based chemotherapy. Paclitaxel alone is an option for advanced ovarian cancer that does not respond to, or relapses within 6 months of completing initial platinum-based chemotherapy.

Pegylated liposomal doxorubicin is an option for advanced ovarian cancer that does not respond to, or relapses within 12 months of completing initial platinum-based chemotherapy.

Paclitaxel alone or pegylated liposomal doxorubicin are options for advanced ovarian cancer in patients who are allergic to platinum compounds. Topotecan alone is an option only for advanced ovarian cancer that does not respond to, or relapses within 6 months of completing initial platinum-based chemotherapy or in those allergic to platinum compounds *and* for whom paclitaxel alone or pegylated liposomal doxorubicin are inappropriate.

Epirubicin hydrochloride

INDICATIONS AND DOSE

Treatment of breast cancer | Treatment and prophylaxis of certain forms of superficial bladder cancer

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INSTILLATION

► **Adult:** (consult product literature or local protocols)

- **CONTRA-INDICATIONS** Bladder inflammation or contraction (when used as a bladder instillation) · catheterisation difficulties (when used as a bladder instillation) · haematuria (when used as a bladder instillation) · invasive tumours penetrating the bladder (when used as a bladder instillation) · myocardioathy · previous treatment with maximum cumulative doses of epirubicin or other anthracycline · recent myocardial infarction · severe arrhythmia · severe myocardial insufficiency · unstable angina · urinary tract infections (when used as a bladder instillation)
 - **CAUTIONS** Caution in handling—irritant to tissues
 - **INTERACTIONS** → Appendix 1 (epirubicin). Caution is necessary with concomitant use of cardiotoxic drugs, or drugs that reduce cardiac contractility. Concomitant use with trastuzumab is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to 24 weeks. If trastuzumab needs to be used, cardiac function should be monitored closely.
 - **SIDE-EFFECTS** Alopecia · bone-marrow suppression · cardiotoxicity · extravasation · hyperpigmentation of nails · hyperpigmentation of oral mucosa · hyperpigmentation of skin · hyperuricaemia · nausea · oral mucositis · red colouration of the urine · thromboembolism · tumour lysis syndrome · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
- Cardiotoxicity** A maximum cumulative dose of 0.9–1 g/m² is recommended to help avoid cardiotoxicity.
- **PREGNANCY** Avoid (carcinogenic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
 - **BREAST FEEDING** Discontinue breast-feeding.
 - **HEPATIC IMPAIRMENT** Reduce dose according to bilirubin concentration—consult local treatment protocol for details. Avoid in severe impairment.
 - **RENAL IMPAIRMENT** Dose reduction may be necessary in severe impairment.
 - **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Idarubicin hydrochloride

INDICATIONS AND DOSE

Acute non-lymphocytic leukaemias monotherapy

BY MOUTH

► **Adult:** 30 mg/m² daily for 3 days; maximum 400 mg/m² per course

Acute non-lymphocytic leukaemia in combination therapy

BY MOUTH

► **Adult:** 15–30 mg/m² daily for 3 days; maximum 400 mg/m² per course

Advanced breast cancer after failure of first-line chemotherapy (not including anthracyclines)—monotherapy

BY MOUTH

► **Adult:** 45 mg/m² for 1 dose, repeat treatment every 3–4 weeks, alternatively 15 mg/m² daily for 3 consecutive days, repeat treatment every 3–4 weeks; maximum 400 mg/m² per course

Acute leukaemias | Advanced breast cancer after failure of first-line chemotherapy (not including anthracyclines)

BY INTRAVENOUS INJECTION

► **Adult:** (consult product literature)

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CONTRA-INDICATIONS** Previous treatment with maximum cumulative dose of idarubicin or other anthracycline · recent myocardial infarction · severe arrhythmias · severe myocardial insufficiency
 - **CAUTIONS** Caution in handling—irritant to tissues
 - **INTERACTIONS** → Appendix 1 (idarubicin). Concomitant use with trastuzumab is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to 24 weeks. If trastuzumab needs to be used, cardiac function should be monitored closely.
 - **SIDE-EFFECTS**
- GENERAL SIDE-EFFECTS**
- **Common or very common** Abdominal pain · cardiac disorders · diarrhoea · haemorrhage · rash · red pigmentation of the urine
 - **Uncommon** Nail hyperpigmentation · skin hyperpigmentation

- ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

SPECIFIC SIDE-EFFECTS

- ▶ **With intravenous use** extravasation
- **PREGNANCY** Avoid (teratogenic and toxic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose according to serum bilirubin concentration. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Reduce dose. Avoid in severe impairment.

ANTIMETABOLITES

Azacitidine

- **DRUG ACTION** Azacitidine is a pyrimidine analogue.

INDICATIONS AND DOSE

Treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, and acute myeloid leukaemia, in adults who are not eligible for haematopoietic stem cell transplantation

BY SUBCUTANEOUS INJECTION

- ▶ Adult: (consult local protocol)

- **CONTRA-INDICATIONS** Advanced malignant hepatic tumour
- **CAUTIONS** History of severe congestive heart failure · unstable cardiac disease (consider cardiopulmonary assessment before and during treatment) · unstable pulmonary disease (consider cardiopulmonary assessment before and during treatment)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anorexia · anxiety · arthralgia · cerebral haemorrhage · constipation · diarrhoea · dizziness · drowsiness · dyspepsia · dyspnoea · gastro-intestinal disturbances · haematoma · haematuria · haemorrhage · headache · hypertension · hypokalaemia · hypotension · injection-site reactions · insomnia · myalgia · pneumonia · rash
 - ▶ **Uncommon** Anaphylactic reactions · hypersensitivity reactions
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hepatic coma · hepatic failure · hyperuricaemia · nausea · oral mucositis · renal failure · thromboembolism · tumour lysis syndrome · vomiting

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 3 months after treatment in men or women.

- **PREGNANCY** Avoid (toxicity in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Caution in severe impairment.

- **RENAL IMPAIRMENT** Delay next treatment cycle if serum-creatinine or blood urea nitrogen greater than twice baseline value and above the upper level of normal until values return to normal or baseline, and then reduce dose by 50% on the next treatment cycle. Reduce dose by 50% on the next treatment cycle if serum-bicarbonate concentration less than 20 mmol/litre.

MONITORING REQUIREMENTS

- ▶ Monitor liver function tests, serum creatinine, and serum bicarbonate before initiation of treatment and before each treatment cycle.
- ▶ Monitor full blood count before initiation of treatment, before each treatment cycle, and as clinically indicated.
- ▶ Monitor for bleeding.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ **Azacitidine for the treatment of myelodysplastic syndromes, chronic myelomonocytic leukaemia and acute myeloid leukaemia (March 2011)** NICE TA218

Azacitidine is recommended in adults who are not eligible for haematopoietic stem cell transplantation as an option for the treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, or acute myeloid leukaemia. www.nice.org.uk/TA218

MEDICINAL FORMS

Azacitidine 100 mg Vidaza 100mg powder for suspension for injection vials | 1 vial [PoM] £321.00

Capecitabine

- **DRUG ACTION** Capecitabine is metabolised to fluorouracil.

INDICATIONS AND DOSE

Stage III colon cancer, adjuvant following surgery (monotherapy)

BY MOUTH

- ▶ Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, recommended duration of treatment is 6 months, adjust dose according to tolerability—consult product literature

Stage III colon cancer, adjuvant following surgery (combination therapy)

BY MOUTH

- ▶ Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, recommended duration of treatment is 6 months, adjust dose according to tolerability—consult product literature

Metastatic colorectal cancer (monotherapy)

BY MOUTH

- ▶ Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

continued →

Metastatic colorectal cancer (combination therapy)

BY MOUTH

- ▶ Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

Advanced gastric cancer (first-line treatment in combination with a platinum based regimen)

BY MOUTH

- ▶ Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, alternatively 625 mg/m² twice daily given continuously, adjust dose according to tolerability—consult product literature

Locally advanced or metastatic breast cancer (second-line treatment as monotherapy after failure of a taxane and anthracycline regimen or where further anthracycline treatment is not indicated) | Locally advanced or metastatic breast cancer (second-line treatment, in combination with docetaxel, where previous therapy included an anthracycline)

BY MOUTH

- ▶ Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

- **CONTRA-INDICATIONS** Dihydropyrimidine dehydrogenase deficiency
- **CAUTIONS** Diabetes mellitus · diarrhoea or dehydration—consult product literature for guidance on dose modification and treatment interruption · electrolyte disturbances · history of angina pectoris · history of arrhythmias · history of significant cardiovascular disease · nervous system disease
- **INTERACTIONS** → Appendix 1 (capecitabine).

- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

For further information on side-effects, consult product literature.

- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises monitor liver function in mild to moderate impairment—consult product literature for guidance on treatment interruption; avoid in severe impairment.
- **RENAL IMPAIRMENT** Reduce starting dose of 1.25 g/m² to 75% if creatinine clearance 30–50 mL/minute. Avoid if creatinine clearance less than 30 mL/minute.
- **MONITORING REQUIREMENTS**
 - ▶ Severe skin reactions Monitor for symptoms of severe skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis)—permanently discontinue treatment immediately if symptoms occur.
 - ▶ Hand-foot syndrome Monitor for symptoms of hand-foot syndrome—interrupt treatment if significant syndrome occurs and refer to product literature.
 - ▶ Monitor plasma-calcium concentration.
 - ▶ Monitor for eye disorders (including keratitis and corneal disorders).
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
 - ▶ Capecitabine and tegafur with uracil for metastatic colorectal cancer (May 2003) NICE TA61

Cladribine**INDICATIONS AND DOSE****LITAK[®]****Hairy cell leukaemia**

BY SUBCUTANEOUS INJECTION

- ▶ Adult: (consult product literature or local protocols)

LEUSTAT[®]

B-cell chronic lymphocytic leukaemia in patients who have failed to respond to standard regimens containing an alkylating agent | Hairy cell leukaemia

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature or local protocols)

- **CAUTIONS** Use irradiated blood only

CAUTIONS, FURTHER INFORMATION

Immunosuppressive effect of cladribine Cladribine has a potent and prolonged immunosuppressive effect. Patients treated with cladribine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be

administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

- **INTERACTIONS** → Appendix 1 (cladribine).
- **SIDE-EFFECTS** Abdominal pain · acute renal failure (with high doses) · alopecia · anxiety · arthralgia · asthenia · bone-marrow suppression · chills · constipation · cough · diarrhoea · dizziness · dyspnoea · extravasation · flatulence · haemolytic anaemia · headache · hyperuricaemia · insomnia · malaise · myalgia · nausea · oedema · oral mucositis · pruritus · purpura · rash · severe myelosuppression (with neutropenia, anaemia and thrombocytopenia) · severe neurotoxicity (with high doses) · sweating · tachycardia · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises that men should not father children during and for 6 months after treatment.
- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Regular monitoring recommended in hepatic impairment.
- **RENAL IMPAIRMENT** Regular monitoring recommended in renal impairment.
- **DIRECTIONS FOR ADMINISTRATION** *Litak*® for subcutaneous use only—no dilution required.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ *Litak* (Lipomed GmbH)

Cladribine 2 mg per 1 ml *Litak* 10mg/5ml solution for injection vials | 1 vial [PoM] £165.00 (Hospital only) | 5 vial [PoM] £820.00 (Hospital only)

Solution for infusion

▶ *Leustat* (Janssen-Cilag Ltd)

Cladribine 1 mg per 1 ml *Leustat* 10mg/10ml solution for infusion vials | 1 vial [PoM] £159.70

Clofarabine

INDICATIONS AND DOSE

Relapsed or refractory acute lymphoblastic leukaemia in patients who have received at least two previous regimens

BY INTRAVENOUS INFUSION

▶ Adult 18-20 years: (consult local protocol)

- **CAUTIONS** Cardiac disease
- **SIDE-EFFECTS** Abdominal pain · agitation · alopecia · anxiety · arthralgia · bone-marrow suppression · cough · diarrhoea · dizziness · drowsiness · dyspnoea · extravasation · flushing · haematoma · haematuria · hand-foot (desquamative) syndrome · headache · hyperuricaemia · hypotension · jaundice · myalgia · nausea · oedema · oral mucositis · pancreatitis · paraesthesia · pericardial effusion · peripheral neuropathy · pruritus · rash · restlessness · sweating · tachycardia · thromboembolism · tumour lysis syndrome · vomiting
- **PREGNANCY** Manufacturer advises avoid (teratogenic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

▶ *Evoltra* (Sanofi) ▼

Clofarabine 1 mg per 1 ml *Evoltra* 20mg/20ml concentrate for solution for infusion vials | 4 vial [PoM] £5,304.72 (Hospital only)

Cytarabine

- **DRUG ACTION** Cytarabine acts by interfering with pyrimidine synthesis.

INDICATIONS AND DOSE

Induction of remission of acute myeloblastic leukaemia

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION OR BY SUBCUTANEOUS INJECTION

▶ Adult: (consult local protocol)

Lymphomatous meningitis

BY INTRATHECAL INJECTION

▶ Adult: (consult local protocol)

Important safety information

Not all cytarabine preparations can be given by intrathecal injection—consult product literature.

- **INTERACTIONS** → Appendix 1 (cytarabine).
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose—consult product literature.
- **MONITORING REQUIREMENTS** Cytarabine is a potent myelosuppressant and requires careful haematological monitoring.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium* has advised (July 2007) that liposomal cytarabine suspension (*Depocyte*®) is not recommended for use within NHS Scotland for the intrathecal treatment of lymphomatous meningitis.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

▶ **CYTARABINE (Non-proprietary)**

Cytarabine 20 mg per 1 ml Cytarabine 500mg/25ml solution for injection vials | 1 vial [PoM] £19.50

Cytarabine 100mg/5ml solution for injection vials | 5 vial [PoM] £20.98-£30.00

Cytarabine 100 mg per 1 ml Cytarabine 500mg/5ml solution for injection vials | 5 vial [PoM] £100.00

Cytarabine 100mg/1ml solution for injection vials | 5 vial [PoM] £30.00

Cytarabine 2g/20ml solution for injection vials | 1 vial [PoM] £79.00

Cytarabine 1g/10ml solution for injection vials | 1 vial [PoM] £40.00

Suspension for injection

▶ **DepoCyte** (Napp Pharmaceuticals Ltd)

Cytarabine 10 mg per 1 ml *DepoCyte* 50mg/5ml suspension for injection vials | 1 vial [PoM] no price available (Hospital only)

Decitabine

● **DRUG ACTION** Decitabine is a pyrimidine analogue.

INDICATIONS AND DOSE

Treatment of newly diagnosed acute myeloid leukaemia in patients over 65 years of age who are not candidates for standard induction chemotherapy

BY INTRAVENOUS INFUSION

► Elderly: (consult local protocol)

● **CAUTIONS** History of severe congestive heart failure · history of unstable cardiac disease

● **INTERACTIONS** → Appendix 1 (decitabine).

● SIDE-EFFECTS

► **Common or very common** Diarrhoea · epistaxis · headache

► **Uncommon** Acute febrile neutrophilic dermatosis

► **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

● **PREGNANCY** Avoid (teratogenic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.

● **RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 30 mL/minute—no information available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Potassium, sodium

► **Dacogen** (Janssen-Cilag Ltd) ▼

Decitabine 50 mg Dacogen 50mg powder for concentrate for solution for infusion vials | 1 vial (POM) £970.86

Fludarabine phosphate

INDICATIONS AND DOSE

Initial treatment of advanced B-cell chronic lymphocytic leukaemia (CLL) or after first line treatment in patients with sufficient bone-marrow reserves

BY MOUTH

► Adult: 40 mg/m² for 5 days every 28 days, usually given for 6 cycles

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

● **CONTRA-INDICATIONS** Haemolytic anaemia

● **CAUTIONS** Increased susceptibility to skin cancer · worsening of existing skin cancer

CAUTIONS, FURTHER INFORMATION

Immunosuppression Fludarabine has a potent and prolonged immunosuppressive effect. Patients treated with fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs. Co-trimoxazole is used to prevent pneumocystis infection.

● **INTERACTIONS** → Appendix 1 (fludarabine).

● SIDE-EFFECTS

► **Common or very common** Acute myeloid leukaemia · anorexia · chills · cough · diarrhoea · fever · immunosuppression · malaise · myelodysplastic syndrome · myelosuppression (may be cumulative) · oedema · peripheral neuropathy · pneumonia · rash · visual disturbances · weakness

► **Uncommon** Autoimmune disorder · confusion · fibrosis · haemorrhage · immune-mediated haemolytic anaemia · neutropenia · pneumonitis · pulmonary toxicity · thrombocytopenia

► **Rare** Agitation · arrhythmia · blindness · coma · heart failure · optic neuropathy · seizures · skin cancer · Stevens-Johnson syndrome · toxic epidermal necrolysis

► **Frequency not known** Alopecia · bone-marrow suppression · extravasation · haemorrhagic cystitis · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

● **PREGNANCY** Avoid (embryotoxic and teratogenic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

● **BREAST FEEDING** Discontinue breast-feeding.

● **RENAL IMPAIRMENT** Reduce dose by up to 50% if creatinine clearance 30–70 mL/minute. Avoid if creatinine clearance less than 30 mL/minute.

● MONITORING REQUIREMENTS

► Monitor for signs of haemolysis.

► Monitor for neurological toxicity.

► Assess creatinine clearance in patients over 65 years before treatment initiation.

● **DIRECTIONS FOR ADMINISTRATION** Concentrate for intravenous injection or infusion must be diluted before administration (consult product literature).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

► Fludarabine for the treatment of B-cell chronic lymphocytic leukaemia (September 2001) NICE TA29

Oral fludarabine is recommended for the second-line treatment of B-cell chronic lymphocytic leukaemia in patients who have either failed, or are intolerant of, first line chemotherapy, and who would otherwise have received combination chemotherapy of either:

● cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP)

● cyclophosphamide, doxorubicin and prednisolone (CAP) or

● cyclophosphamide, vincristine and prednisolone (CVP)

Intravenous fludarabine should only be used when oral fludarabine is contra-indicated. www.nice.org.uk/TA29

► Fludarabine monotherapy for the first-line treatment of chronic lymphocytic leukaemia (February 2007) NICE TA119
Fludarabine monotherapy is **not** recommended for the first-line treatment of chronic lymphocytic leukaemia. www.nice.org.uk/TA119

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2006) that fludarabine is accepted for restricted use for the treatment of B-cell chronic lymphocytic leukaemia (CLL) in patients with sufficient bone marrow reserves. First-line treatment should only be initiated in patients with advanced disease, Rai stages III/IV (Binet stage C), or Rai stages I/II (Binet stage A/B) where the patient has disease-related symptoms or evidence of progressive disease.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Fludara** (Sanofi)
Fludarabine phosphate 10 mg Fludara 10mg tablets | 15 tablet [PoM] £302.48 (Hospital only) | 20 tablet [PoM] £403.31 (Hospital only)

Solution for injection

- ▶ **FLUDARABINE PHOSPHATE (Non-proprietary)**
Fludarabine phosphate 25 mg per 1 ml Fludarabine phosphate 50mg/2ml solution for injection vials | 1 vial [PoM] £110.42
Fludarabine phosphate 50mg/2ml concentrate for solution for injection vials | 1 vial [PoM] £156.00 (Hospital only) | 1 vial [PoM] £155.00

Powder for solution for injection

- ▶ **FLUDARABINE PHOSPHATE (Non-proprietary)**

- ▶ **Fludara** (Sanofi)
Fludarabine phosphate 50 mg Fludara 50mg powder for solution for injection vials | 5 vial [PoM] £735.34 (Hospital only)

Fluorouracil**INDICATIONS AND DOSE**

Treatment of some solid tumours including gastro-intestinal tract cancers and breast cancer | In combination with folinic acid in advanced colorectal cancer

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION OR BY INTRA-ARTERIAL INFUSION

- ▶ Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1 (fluorouracil).
- **SIDE-EFFECTS**
 - ▶ **Rare** Cerebellar syndrome
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · desquamative hand-foot syndrome (on prolonged infusion) · extravasation · hyperuricaemia · mucositis · myelosuppression · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **PREGNANCY**
Avoid (teratogenic). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **HANDLING AND STORAGE** Caution in handling—irritant to tissues.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **FLUOROURACIL (Non-proprietary)**
Fluorouracil (as Fluorouracil sodium) 25 mg per 1 ml Fluorouracil 500mg/20ml solution for injection vials | 10 vial [PoM] £64.00 Fluorouracil 250mg/10ml solution for injection vials | 5 vial [PoM] £20.00–£24.00
Fluorouracil (as Fluorouracil sodium) 50 mg per 1 ml Fluorouracil 1g/20ml solution for injection vials | 1 vial [PoM] £12.80
Fluorouracil 500mg/10ml solution for injection vials | 1 vial [PoM] £6.40 | 5 vial [PoM] £32.00

Solution for infusion

- ▶ **FLUOROURACIL (Non-proprietary)**
Fluorouracil (as Fluorouracil sodium) 25 mg per 1 ml Fluorouracil 2.5g/100ml solution for infusion vials | 1 vial [PoM] £32.00
Fluorouracil (as Fluorouracil sodium) 50 mg per 1 ml Fluorouracil 5g/100ml solution for infusion vials | 1 vial [PoM] £64.00 Fluorouracil 2.5g/50ml solution for infusion vials | 1 vial [PoM] £32.00

Gemcitabine**INDICATIONS AND DOSE**

First-line treatment for locally advanced or metastatic non-small cell lung cancer (as monotherapy in elderly patients and in palliative treatment; otherwise in combination with cisplatin) | Treatment of locally advanced or metastatic pancreatic cancer | Treatment of advanced or metastatic bladder cancer (in combination with cisplatin) | Treatment of locally advanced or metastatic epithelial ovarian cancer which has relapsed after a recurrence-free interval of at least 6 months following previous platinum-based therapy (in combination with carboplatin) | Treatment of metastatic breast cancer which has relapsed after previous chemotherapy including an anthracycline (in combination with paclitaxel)

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult local protocol)

- **INTERACTIONS** → Appendix 1 (gemcitabine).
- **SIDE-EFFECTS**
 - ▶ **Rare** Haemolytic uraemic syndrome
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · influenza-like symptoms · microangiopathic haemolytic anaemia · mild gastro-intestinal side-effects · musculoskeletal pain · nausea · oral mucositis · pulmonary toxicity · rash · renal impairment · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Microangiopathic haemolytic anaemia Gemcitabine should be discontinued if signs of microangiopathic haemolytic anaemia occur.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment. Men must avoid fathering a child during and for 6 months after treatment.
- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
 - ▶ Gemcitabine for the treatment of pancreatic cancer (May 2001) NICE TA25
Gemcitabine is an option for first-line chemotherapy for patients with advanced or metastatic adenocarcinoma of the pancreas and a Karnofsky score of at least 50 [Karnofsky score is a measure of the ability to perform ordinary tasks].
Gemcitabine is not recommended for patients who can have potentially curative surgery. There is insufficient evidence about its use for second-line treatment of pancreatic adenocarcinoma. www.nice.org.uk/TA25
 - ▶ Gemcitabine for the treatment of metastatic breast cancer (January 2007) NICE TA116
Gemcitabine, in combination with paclitaxel, is an option for the treatment of metastatic breast cancer **only** when docetaxel monotherapy or docetaxel plus capecitabine are also considered appropriate. www.nice.org.uk/TA116
- **Scottish Medicines Consortium (SMC) Decisions**
The *Scottish Medicines Consortium* has advised (November 2006) that gemcitabine is accepted for restricted use for the treatment of metastatic breast cancer, which has relapsed following previous chemotherapy including an anthracycline (unless contra-indicated).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion▶ **GEMCITABINE (Non-proprietary)****Gemcitabine (as Gemcitabine hydrochloride)**

Gemcitabine (as Gemcitabine hydrochloride) 2 gram Gemcitabine 2g powder for solution for infusion vials | 1 vial [PoM] £324.00 (Hospital only) | 1 vial [PoM] £324.00

▶ **Gemzar** (Eli Lilly and Company Ltd)

Gemcitabine (as Gemcitabine hydrochloride) 200 mg Gemzar 200mg powder for solution for infusion vials | 1 vial [PoM] £32.55 (Hospital only)

Gemcitabine (as Gemcitabine hydrochloride) 1 gram Gemzar 1g powder for solution for infusion vials | 1 vial [PoM] £162.76 (Hospital only)

CAUTIONS, FURTHER INFORMATION

Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

- **INTERACTIONS** → Appendix 1 (mercaptopurine).

● **SIDE-EFFECTS**

- ▶ **Rare** Pancreatitis · transient oligospermia
- ▶ **Very rare** Intestinal ulceration · lymphoma
- ▶ **Frequency not known** Alopecia · anorexia · bone-marrow suppression · hepatotoxicity · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Gastro-intestinal side-effects Tioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine.

- **PREGNANCY** Avoid (teratogenic). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** May need dose reduction.
- **RENAL IMPAIRMENT** Reduce dose.
- **PRE-TREATMENT SCREENING** Consider measuring thiopurine methyltransferase (TPMT) activity before starting mercaptopurine therapy.
- **MONITORING REQUIREMENTS** Monitor liver function.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, tablet, capsule

Tablet▶ **MERCATOPURINE (Non-proprietary)**

Mercaptopurine 50 mg Mercaptopurine 50mg tablets | 25 tablet [PoM] £50.47 DT price = £50.47

Oral suspension

EXCIPIENTS: May contain Aspartame

▶ **Xaluprine** (Nova Laboratories Ltd)

Mercaptopurine 20 mg per 1 ml Xaluprine 20mg/ml oral suspension | 100 ml [PoM] £170.00

Mercaptopurine (6-Mercaptopurine)**INDICATIONS AND DOSE**

Severe acute Crohn's disease | Maintenance of remission of Crohn's disease | Ulcerative colitis

BY MOUTH

- ▶ **Adult:** 1–1.5 mg/kg daily, some patients may respond to lower doses

Acute leukaemias | Chronic myeloid leukaemia

BY MOUTH USING TABLETS

- ▶ **Adult:** Initially 2.5 mg/kg daily, adjusted according to response, alternatively initially 50–75 mg/m² daily, adjusted according to response

BY MOUTH USING ORAL SUSPENSION

- ▶ **Adult:** Initially 25–75 mg/m² daily, adjusted according to response

Dose equivalence and conversion

Mercaptopurine tablets and *Xaluprine*[®] oral suspension are **not** bioequivalent, haematological monitoring is advised when switching formulations.

- **UNLICENSED USE** Not licensed for use in severe ulcerative colitis and Crohn's disease.

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CONTRA-INDICATIONS** Absent thiopurine methyltransferase activity
- **CAUTIONS** Reduced thiopurine methyltransferase activity

Methotrexate

- **DRUG ACTION** Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines.

INDICATIONS AND DOSE

Severe Crohn's disease

BY INTRAMUSCULAR INJECTION

- ▶ **Adult:** Initially 25 mg once weekly until remission induced; maintenance 15 mg once weekly

Maintenance of remission of severe Crohn's disease

BY MOUTH

- ▶ **Adult:** 10–25 mg once weekly

Moderate to severe active rheumatoid arthritis

BY MOUTH

- ▶ **Adult:** 7.5 mg once weekly, adjusted according to response; maximum 20 mg per week

Severe active rheumatoid arthritis

BY INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 7.5 mg once weekly, then increased in steps of 2.5 mg once weekly, adjusted according to response; maximum 25 mg per week

Neoplastic diseases

BY INTRAVENOUS INJECTION OR BY INTRATHECAL INJECTION OR BY INTRA-ARTERIAL INFUSION OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION OR BY MOUTH

- ▶ **Adult:** (consult product literature)

Severe psoriasis unresponsive to conventional therapy (specialist use only)

BY MOUTH OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION OR BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 2.5–10 mg once weekly, then increased in steps of 2.5–5 mg, adjusted according to response, dose to be adjusted at intervals of at least 1 week; usual dose 7.5–15 mg once weekly, stop treatment if inadequate response after 3 months at the optimum dose; maximum 30 mg per week

- **UNLICENSED USE** Not licensed for use in severe Crohn's disease.

Important safety information

Note that the dose is a **weekly** dose. To avoid error with low-dose methotrexate, it is recommended that:

- the patient is carefully advised of the **dose** and **frequency** and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).
- **CONTRA-INDICATIONS** Active infection (in non-malignant conditions) · ascites · immunodeficiency syndromes (in non-malignant conditions) · significant pleural effusion
- **CAUTIONS** Acute porphyrias p. 864 · diarrhoea · extreme caution in blood disorders (avoid if severe) · peptic ulceration · photosensitivity—psoriasis lesions aggravated by UV radiation (skin ulceration reported) · risk of accumulation in pleural effusion or ascites—drain before treatment · ulcerative colitis · ulcerative stomatitis
- **CAUTIONS, FURTHER INFORMATION**
Blood count Bone marrow suppression can occur abruptly; factors likely to increase toxicity include advanced age, renal impairment, and concomitant use with another anti-folate drug (e.g. trimethoprim). A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy.
Liver toxicity Liver cirrhosis reported. Treatment should not be started or should be discontinued if any abnormality of liver function tests or liver biopsy is present or develops during therapy. Abnormalities can return to normal within 2 weeks after which treatment may be recommenced if judged appropriate.
Pulmonary toxicity Pulmonary toxicity may be a special problem in rheumatoid arthritis (patient to seek medical attention if dyspnoea, cough or fever); monitor for symptoms at each visit—discontinue if pneumonitis suspected.

Gastro-intestinal toxicity Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity.

- **INTERACTIONS** → Appendix 1 (methotrexate). If aspirin or other NSAIDs are given concurrently the dose of methotrexate should be carefully monitored.
- **SIDE-EFFECTS**
 - ▶ **Rare** Pneumonitis
 - ▶ **Frequency not known** Abdominal discomfort · acne · alopecia · anaphylactic reactions · anorexia · arthralgia · blood disorders · changes in nail pigmentation · changes in skin pigmentation · chills · chronic pulmonary fibrosis · confusion · conjunctivitis · cystitis · diarrhoea · dizziness · drowsiness · dyspepsia · dysuria · ecchymosis · fever · furunculosis · gastro-intestinal bleeding · gastro-intestinal ulceration · haematuria · headache · hepatotoxicity · hypotension · impotence · injection-site reactions · insomnia · interstitial pneumonitis · malaise · menstrual disturbances · mood changes · mucositis · myalgia · myelosuppression · nausea · neurotoxicity · osteoporosis · paraesthesia · pericardial tamponade · pericarditis · photosensitivity · pleuritic pain · precipitation of diabetes · pruritus · pulmonary fibrosis · pulmonary oedema · rash · reduced libido · renal failure · Stevens-Johnson syndrome · telangiectasia · thrombosis · toxic epidermal necrolysis · toxic megacolon · urticaria · vaginitis · vasculitis · visual disturbance · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

In patients taking methotrexate for non-malignant conditions who experience side-effects, folic acid given on a different day from the methotrexate, may help to reduce the frequency of such side-effects. Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity. Treatment with folic acid (as calcium folinate) may be required in acute toxicity.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 3 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic; fertility may be reduced during therapy but this may be reversible).
- **BREAST FEEDING** Discontinue breast-feeding—present in milk.
- **HEPATIC IMPAIRMENT** When used for malignancy, avoid in severe hepatic impairment—consult local treatment protocol for details. Avoid with hepatic impairment in non-malignant conditions—dose-related toxicity.
- **RENAL IMPAIRMENT** Reduce dose. Risk of nephrotoxicity at high doses. Avoid in severe impairment.
- **PRE-TREATMENT SCREENING** Exclude pregnancy before treatment. Patients should have full blood count and renal and liver function tests before starting treatment.
- **MONITORING REQUIREMENTS**
 - ▶ In view of reports of blood dyscrasias (including fatalities) and liver cirrhosis with low-dose methotrexate patients should:
 - have full blood count and renal and liver function tests repeated every 1–2 weeks until therapy stabilised, thereafter patients should be monitored every 2–3 months.
 - be advised to report all symptoms and signs suggestive of infection, especially sore throat
 - ▶ Local protocols for frequency of monitoring may vary.
 - ▶ Treatment with folic acid (as calcium folinate) may be required in acute toxicity.
- **PRESCRIBING AND DISPENSING INFORMATION** Folic acid following methotrexate administration helps to prevent methotrexate-induced mucositis and myelosuppression.
- **PATIENT AND CARER ADVICE** Methotrexate treatment booklets Methotrexate treatment booklets should be issued where appropriate.

In **England, Wales, and Northern Ireland**, they are available for purchase from:

3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham OL9 9QH
Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores. NHS Hospitals can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com.

In **Scotland**, treatment booklets can be obtained by emailing stockorders.dppas@theapsgroup.com or by fax on 0131 629 9967.

These booklets include advice for adults taking oral methotrexate for inflammatory conditions, and a section for recording results of blood tests and dosage information.

Patients should be advised to avoid self-medication with over-the-counter aspirin or ibuprofen. Patients should be counselled on the dose, treatment booklet, and the use of NSAIDs. Patients and their carers should be warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort and dark urine), and respiratory effects (e.g. shortness of breath).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, oral suspension, oral solution

Tablet

▶ METHOTREXATE (Non-proprietary)

Methotrexate 2.5 mg Methotrexate 2.5mg tablets | 24 tablet [PoM] £3.75 | 28 tablet [PoM] £3.82 DT price = £2.80 | 100 tablet [PoM] £14.19

Methotrexate 10 mg Methotrexate 10mg tablets | 100 tablet [PoM] £57.21 DT price = £35.15

▶ Maxtrex (Pfizer Ltd)

Methotrexate 2.5 mg Maxtrex 2.5mg tablets | 24 tablet [PoM] £2.39 | 100 tablet [PoM] £9.96

Methotrexate 10 mg Maxtrex 10mg tablets | 100 tablet [PoM] £45.16 DT price = £35.15

Solution for injection

▶ METHOTREXATE (Non-proprietary)

Methotrexate (as Methotrexate sodium) 2.5 mg per 1 ml Methotrexate 5mg/2ml solution for injection vials | 5 vial [PoM] £30.00-£36.00

Methotrexate (as Methotrexate sodium) 25 mg per 1 ml Methotrexate 1g/40ml solution for injection vials | 1 vial [PoM] £43.68 (Hospital only) | 1 vial [PoM] £44.57-£67.50

Methotrexate 500mg/20ml solution for injection vials | 1 vial [PoM] £38.30 (Hospital only) | 1 vial [PoM] £25.07-£48.00

Methotrexate 50mg/2ml solution for injection vials | 1 vial [PoM] £4.49 (Hospital only) | 1 vial [PoM] £3.00 | 5 vial [PoM] £35.00

Methotrexate 200mg/8ml solution for injection vials | 1 vial [PoM] £10.02

Methotrexate (as Methotrexate sodium) 100 mg per 1 ml Methotrexate 1g/10ml solution for injection vials | 1 vial [PoM] £85.00

▶ Metoject PEN (medac UK)

Methotrexate 50 mg per 1 ml Metoject PEN 30mg/0.6ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £18.95 Metoject PEN 22.5mg/0.45ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £18.45 Metoject PEN 12.5mg/0.25ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £16.50 Metoject PEN 20mg/0.4ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £17.84 Metoject PEN 17.5mg/0.35ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £17.50 Metoject PEN 7.5mg/0.15ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £14.85 Metoject PEN 10mg/0.2ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £15.29 Metoject PEN 27.5mg/0.55ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £18.89 Metoject PEN 25mg/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £18.48 Metoject PEN 15mg/0.3ml solution

for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £16.57

Solution for infusion

▶ METHOTREXATE (Non-proprietary)

Methotrexate (as Methotrexate sodium) 25 mg per 1 ml Methotrexate 5g/200ml solution for infusion vials | 1 vial [PoM] £200.57

Methotrexate (as Methotrexate sodium) 100 mg per 1 ml Methotrexate 5g/50ml solution for infusion vials | 1 vial [PoM] £400.00

Nelarabine

INDICATIONS AND DOSE

T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in patients who have relapsed or who are refractory after receiving at least two previous regimens

BY INTRAVENOUS INFUSION

▶ Adult: (consult local protocol)

- **CAUTIONS** Previous or concurrent craniospinal irradiation (increased risk of neurotoxicity) · previous or concurrent intrathecal chemotherapy (increased risk of neurotoxicity)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Neurotoxicity (discontinue)
 - ▶ **Frequency not known** Abdominal pain · alopecia · amnesia · anorexia · arthralgia · asthenia · ataxia · benign and malignant tumours · blurred vision · bone-marrow suppression · confusion · constipation · cough · demyelination · diarrhoea · dizziness · drowsiness · dyspnoea · electrolyte disturbances · extravasation · fatigue · headache · hyperuricaemia · hypoaesthesia · hypotension · muscle weakness · myalgia · nausea · oedema · oral mucositis · paraesthesia · peripheral neurological disorders · pleural effusion · pyrexia · seizures · taste disturbance · thromboembolism · tremor · tumour lysis syndrome · vomiting · wheezing
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment in men and women.
- **PREGNANCY** Avoid (toxicity in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **MONITORING REQUIREMENTS**
 - ▶ Neurotoxicity Close monitoring for neurological events is strongly recommended—discontinue if neurotoxicity occurs.
- **PATIENT AND CARER ADVICE** Drowsiness may affect performance of skilled tasks (e.g. cycling or driving).
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium* has advised (March 2008) that the use of nelarabine (*Atriance*[®]) within NHS Scotland is restricted to bridging treatment before stem cell transplantation.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion
ELECTROLYTES: May contain Sodium

 - ▶ **Atriance** (Novartis Pharmaceuticals UK Ltd) ▼
 - **Nelarabine 5 mg per 1 ml** Atriance 250mg/50ml solution for infusion vials | 6 vial [PoM] £1,332.00

Pemetrexed

- **DRUG ACTION** Pemetrexed inhibits thymidylate transferase and other folate-dependent enzymes.

INDICATIONS AND DOSE

Treatment of unresectable malignant pleural mesothelioma which has not previously been treated with chemotherapy (in combination with cisplatin) | First-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (in combination with cisplatin) | Second-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (monotherapy) | Maintenance treatment in locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following platinum-based chemotherapy (monotherapy)

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult local protocol)

- **CAUTIONS** Diabetes · history of cardiovascular disease · prophylactic folic acid supplementation required (consult product literature) · prophylactic vitamin B₁₂ supplementation required (consult product literature)
- **INTERACTIONS** → Appendix 1 (pemetrexed). Caution with concomitant nephrotoxic drugs including non-steroidal anti-inflammatory drugs (consult product literature).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Conjunctivitis · dehydration · gastro-intestinal disturbances · increased lacrimation · neuropathy · oedema · skin disorders
 - ▶ **Uncommon** Arrhythmias · colitis · interstitial pneumonitis
 - ▶ **Rare** Acute renal failure · hepatitis · peripheral ischaemia
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · Stevens-Johnson syndrome · thromboembolism · toxic epidermal necrolysis · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment. Men must avoid fathering a child during and for 6 months after treatment.
- **PREGNANCY** Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 45 mL/min/1.73 m²—no information available.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ **Pemetrexed for the treatment of non-small cell lung cancer (August 2007)** NICE TA124
Pemetrexed is **not** recommended for the treatment of locally advanced or metastatic non-small cell lung cancer which has previously been treated with chemotherapy. www.nice.org.uk/TA124
- ▶ **Pemetrexed for the treatment of malignant pleural mesothelioma (January 2008)** NICE TA135
Pemetrexed is an option for the treatment of malignant pleural mesothelioma only in patients who have a WHO performance status of 0 or 1 [WHO performance status is a measure of the ability to perform ordinary tasks], who are considered to have advanced disease and for whom surgical resection is considered inappropriate. www.nice.org.uk/TA135
- ▶ **Pemetrexed for the first-line treatment of non-small cell lung cancer (September 2009)** NICE TA181
Pemetrexed, in combination with cisplatin, is an option for the first-line treatment of locally advanced or

metastatic non-small cell lung cancer only if the histology of the tumour has been confirmed as adenocarcinoma or large-cell carcinoma. www.nice.org.uk/TA181

- ▶ **Pemetrexed for the treatment of non-small cell lung cancer (June 2010)** NICE TA190
Pemetrexed is an option for the maintenance treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following combination therapy of a platinum compound with either gemcitabine, paclitaxel, or docetaxel. www.nice.org.uk/TA190
- ▶ **Pemetrexed maintenance treatment following induction therapy with pemetrexed and cisplatin for non-squamous non-small-cell lung cancer (April 2014)** NICE TA309
Pemetrexed is **not** recommended for the maintenance treatment of locally advanced or metastatic non-squamous non-small-cell lung cancer in patients whose disease has not progressed immediately following induction therapy with pemetrexed and cisplatin. www.nice.org.uk/TA309

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2008) that pemetrexed (*Alimta*[®]) is accepted for restricted use within NHS Scotland as monotherapy for the second-line treatment of locally advanced or metastatic non-small cell lung cancer without predominantly squamous cell histology; it is restricted for use in patients with good performance status who would otherwise be eligible for docetaxel treatment.

The *Scottish Medicines Consortium* has advised (January 2010) that pemetrexed (*Alimta*[®]) is accepted for restricted use within NHS Scotland in combination with cisplatin for the first-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology; it is restricted to patients in whom the histology of the tumour has been confirmed as adenocarcinoma or large cell carcinoma. The *Scottish Medicines Consortium* has advised (July 2005) that pemetrexed (*Alimta*[®]) in combination with cisplatin is accepted for restricted use within NHS Scotland for previously untreated patients with stage III/IV unresectable malignant pleural mesothelioma.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Alimta** (Eli Lilly and Company Ltd)

Pemetrexed (as Pemetrexed disodium) 100 mg Alimta 100mg powder for concentrate for solution for infusion vials | 1 vial [POM] £160.00 (Hospital only)

Pemetrexed (as Pemetrexed disodium) 500 mg Alimta 500mg powder for concentrate for solution for infusion vials | 1 vial [POM] £800.00 (Hospital only)

Tegafur with gimeracil and oteracil

- **DRUG ACTION** Tegafur is a prodrug of fluorouracil. Gimeracil inhibits the degradation of fluorouracil and oteracil decreases the activity of fluorouracil in normal gastrointestinal mucosa.

INDICATIONS AND DOSE

Treatment of advanced gastric cancer when used in combination with cisplatin

BY MOUTH

► Adult: (consult local protocol)

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CONTRA-INDICATIONS** Dihydropyrimidine dehydrogenase deficiency
- **INTERACTIONS** → Appendix 1 (tegafur).
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · neuropathy · ocular toxicity · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for up to 6 months after treatment.
- **PREGNANCY** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Reduce dose if creatinine clearance 30–50 mL/minute—consult product literature. Manufacturer advises avoid if creatinine clearance less than 30 mL/minute.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2012) that tegafur with gimeracil and oteracil (*Teysuno*®) is accepted for restricted use within NHS Scotland for the treatment of advanced gastric cancer, when given in combination with cisplatin, in patients who are unsuitable for an anthracycline, fluorouracil and platinum triplet first-line regimen.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 23

► **Teysuno** (Nordic Pharma Ltd) ▼

Gimeracil 4.35 mg, Oteracil (as Oteracil potassium) 11.8 mg,

Tegafur 15 mg Teysuno 15mg/4.35mg/11.8mg capsules | 126 capsule [PoM] £279.72

Gimeracil 5.8 mg, Oteracil (as Oteracil potassium) 15.8 mg,

Tegafur 20 mg Teysuno 20mg/5.8mg/15.8mg capsules | 84 capsule [PoM] £248.40

Tioguanine

(Thioguanine)

INDICATIONS AND DOSE

Acute leukaemia | Chronic myeloid leukaemia

BY MOUTH

► Adult: 100–200 mg/m² daily, can be given at various stages of treatment in short-term cycles

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CONTRA-INDICATIONS** Absent thiopurine methyltransferase activity
- **CAUTIONS** Thiopurine methyltransferase status

CAUTIONS, FURTHER INFORMATION

Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

Long-term therapy Long-term therapy is no longer recommended because of the high risk of liver toxicity.

- **INTERACTIONS** → Appendix 1 (tioguanine).
- **SIDE-EFFECTS**
 - **Rare** Intestinal necrosis · intestinal perforation
 - **Frequency not known** Alopecia · bone-marrow suppression · hepatotoxicity (discontinue) · hyperuricaemia · nausea · oral mucositis · stomatitis · thromboembolism · tumour lysis syndrome · vomiting · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - **Gastro-intestinal side-effects** Tioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine.
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men or women.
- **PREGNANCY** Avoid (teratogenicity reported when men receiving tioguanine have fathered children). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose.
- **RENAL IMPAIRMENT** Reduce dose.
- **PRE-TREATMENT SCREENING** Consider measuring thiopurine methyltransferase (TPMT) activity before starting tioguanine therapy.
- **MONITORING REQUIREMENTS** Monitor liver function weekly—discontinue if liver toxicity develops.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Tablet► **TIOGUANINE (Non-proprietary)**

Tioguanine 40 mg Tioguanine 40mg tablets | 25 tablet [PoM] £103.54

ANTINEOPLASTIC ANTIBIOTICS

Bleomycin

INDICATIONS AND DOSE

Squamous cell carcinoma | Metastatic germ cell cancer | Non-Hodgkin's lymphoma

BY INTRAVENOUS INJECTION OR BY LOCAL INFILTRATION OR BY INTRA-ARTERIAL INFUSION OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION

► Adult: (consult product literature or local protocols)

- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1 (bleomycin).
- **SIDE-EFFECTS**
 - **Common or very common** Dermatological toxicity · mucositis
 - **Frequency not known** Alopecia · chills (after drug administration) · extravasation · fever (after drug administration) · hypersensitivity reactions · hyperuricaemia · increased pigmentation particularly affecting the flexures and subcutaneous sclerotic plaques · less bone marrow suppression · nausea · oral mucositis · progressive pulmonary fibrosis (dose-related) · pulmonary

toxicity · Raynaud's phenomenon · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Hypersensitivity reactions Hypersensitivity reactions manifest by chills and fevers commonly occur a few hours after drug administration and may be prevented by simultaneous administration of a corticosteroid, for example hydrocortisone intravenously.

Progressive pulmonary fibrosis This is dose-related, occurring more commonly at cumulative doses greater than 300 000 units and in the elderly. Basal lung crepitations or suspicious chest X-ray changes are an indication to stop therapy with this drug.

Respiratory failure Patients who have received extensive treatment with bleomycin (e.g. cumulative dose more than 100 000 units) may be at risk of developing respiratory failure if a general anaesthetic is given with high inspired oxygen concentrations. Anaesthetists should be warned of this.

- **PREGNANCY** Avoid (teratogenic and carcinogenic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast feeding.
- **RENAL IMPAIRMENT** Reduce dose by half if serum creatinine 177–354 micromol/litre; reduce dose further if serum-creatinine greater than 354 micromol/litre.
- **PRESCRIBING AND DISPENSING INFORMATION** To conform to the European Pharmacopoeia vials previously labelled as containing '15 units' of bleomycin are now labelled as containing 15 000 units. The amount of bleomycin in the vial has not changed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ **Bleo-Kyowa** (ProStrakan Ltd)

Bleomycin (as Bleomycin sulfate) 15000 unit Bleo-Kyowa
15,000unit powder for solution for injection vials | 10 vial [PoM]
£190.60

Mitomycin

INDICATIONS AND DOSE

Recurrent superficial bladder tumours (bladder instillation)

BY INTRAVESICAL INSTILLATION

▶ **Adult:** (consult product literature or local protocols)

Upper gastro-intestinal cancers | Breast cancers

BY INTRAVENOUS INJECTION

▶ **Adult:** (consult product literature or local protocols)

- **CAUTIONS** Caution in handling—irritant to tissues

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Alopecia · bone marrow damage · bone-marrow suppression · hyperuricaemia · lung fibrosis · nausea · oral mucositis · renal damage · thromboembolism · tumour lysis syndrome · vomiting

SPECIFIC SIDE-EFFECTS

- ▶ **With intravenous use** extravasation

SIDE-EFFECTS, FURTHER INFORMATION

Bone-marrow toxicity Mitomycin is usually administered at 6-weekly intervals because it causes delayed bone-marrow toxicity. Prolonged use may result in a permanent effect.

- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

Mitomycin 2 mg Mitomycin-C Kyowa 2mg powder for solution for injection vials | 10 vial [PoM] £58.83

Mitomycin 10 mg Mitomycin-C Kyowa 10mg powder for solution for injection vials | 1 vial [PoM] £21.37

Mitomycin 20 mg Mitomycin-C Kyowa 20mg powder for solution for injection vials | 1 vial [PoM] £39.94

Mitomycin 40 mg Mitomycin-C Kyowa 40mg powder for solution for injection vials | 1 vial [PoM] £79.88

PLATINUM COMPOUNDS

Carboplatin

INDICATIONS AND DOSE

Treatment of advanced ovarian cancer and lung cancer (particularly the small cell type)

BY INTRAVENOUS INFUSION

▶ **Adult:** The dose of carboplatin is determined according to renal function rather than body surface area (consult product literature)

- **INTERACTIONS** → Appendix 1 (platinum compounds).

- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · myelosuppression · nausea · nausea · nephrotoxicity · neurotoxicity · oral mucositis · ototoxicity · thromboembolism · tumour lysis syndrome · vomiting · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Carboplatin is better tolerated than cisplatin; nausea and vomiting are reduced in severity and nephrotoxicity, neurotoxicity, and ototoxicity are much less of a problem than with cisplatin. It is, however, more myelosuppressive than cisplatin.

- **PREGNANCY** Avoid (teratogenic and embryotoxic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Reduce dose. Avoid if creatinine clearance less than 20 mL/minute. Monitor haematological parameters in renal impairment. Monitor renal function in renal impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Carboplatin can be given in an outpatient setting.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

infusion vials | 1 vial [PoM] £260.00 Carboplatin 450mg/45ml concentrate for solution for infusion vials | 1 vial [PoM] £168.85

(Hospital only) | 1 vial [PoM] £160.00 Carboplatin 450mg/45ml solution for infusion vials | 1 vial [PoM] £197.48 Carboplatin

150mg/15ml solution for infusion vials | 1 vial [PoM] £65.83 Carboplatin 50mg/5ml solution for infusion vials | 1 vial [PoM] £22.86

Cisplatin

INDICATIONS AND DOSE

Treatment of testicular, lung, cervical, bladder, head and neck, and ovarian cancer (alone or in combination)

BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

CAUTIONS

CAUTIONS, FURTHER INFORMATION

Hydration Cisplatin requires intensive intravenous hydration and treatment may be complicated by severe nausea and vomiting.

- **INTERACTIONS** → Appendix 1 (platinum compounds).
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · hypomagnesaemia · myelosuppression · nephrotoxicity · oral mucositis · ototoxicity · peripheral neuropathy · severe nausea · severe vomiting · thromboembolism · tumour lysis syndrome
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic and toxic in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Avoid if possible—nephrotoxic.
- **MONITORING REQUIREMENTS**
 - Nephrotoxicity Monitoring of renal function is essential.
 - Monitor full blood count.
 - Monitor audiology.
 - Monitor plasma electrolytes.
- **DIRECTIONS FOR ADMINISTRATION** Cisplatin is increasingly given in a day care setting.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► CISPLATIN (Non-proprietary)

Cisplatin 1 mg per 1 ml Cisplatin 50mg/50ml concentrate for solution for infusion vials | 1 vial [PoM] no price available
Cisplatin 100mg/100ml solution for infusion vials | 1 vial [PoM] £50.22 (Hospital only) | 1 vial [PoM] £52.93-£55.64

Oxaliplatin

INDICATIONS AND DOSE

Treatment of metastatic colorectal cancer (in combination with fluorouracil and folinic acid) Treatment of colon cancer after resection of the primary tumour (adjuvant treatment)

BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

- **CONTRA-INDICATIONS** Peripheral neuropathy with functional impairment
- **INTERACTIONS** → Appendix 1 (platinum compounds).
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · gastro-intestinal disturbances · hyperuricaemia · myelosuppression · nausea · neurotoxicity (dose limiting) · ototoxicity · posterior reversible encephalopathy syndrome (associated with

oxaliplatin combination chemotherapy) · sensory peripheral neuropathy (dose limiting) · thromboembolism · transient vision loss (reversible on discontinuation) · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Respiratory symptoms If unexplained respiratory symptoms occur, oxaliplatin should be discontinued until investigations exclude interstitial lung disease and pulmonary fibrosis.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for 4 months after treatment in women and 6 months after treatment in men.
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Reduce dose in mild to moderate impairment (consult product literature). Avoid if creatinine clearance less than 30 mL/minute.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

 - **Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005) NICE TA93**
A combination of fluorouracil and folinic acid with either irinotecan or oxaliplatin are options for first-line treatment for advanced colorectal cancer. Irinotecan alone or fluorouracil and folinic acid with oxaliplatin are options for patients who require further treatment subsequently. www.nice.org.uk/TA93
 - **Capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes' C) colon cancer (April 2006) NICE TA100**
Capecitabine alone or oxaliplatin combined with fluorouracil and folinic acid are options for adjuvant treatment following surgery for stage III (Dukes' C) colon cancer. www.nice.org.uk/TA100

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

RETINOID AND RELATED DRUGS

Bexarotene

- **DRUG ACTION** Bexarotene is an agonist at the retinoid X receptor, which is involved in the regulation of cell differentiation and proliferation. Bexarotene can cause regression of cutaneous T-cell lymphoma.

INDICATIONS AND DOSE

Skin manifestations of cutaneous T-cell lymphoma refractory to previous systemic treatment

BY MOUTH

- ▶ Adult: Initially 300 mg/m² once daily, adjusted according to response, to be taken with a meal

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CONTRA-INDICATIONS** History of pancreatitis · hypervitaminosis A · uncontrolled hyperlipidaemia · uncontrolled hypothyroidism
- **CAUTIONS** Avoid in Acute porphyrias p. 864 · hyperlipidaemia · hypothyroidism
- **INTERACTIONS** → Appendix 1 (bexarotene).
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · headache · hyperlipidaemia · hyperuricaemia · hypothyroidism · immunosuppression · leucopenia · myelosuppression · nausea · oral mucositis · pruritus · rash · thromboembolism · tumour lysis syndrome · vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Caution—hypersensitivity to retinoids.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 1 month after treatment in men and women.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2002) that bexarotene is recommended for restricted use as a second-line treatment for patients with advanced cutaneous T-cell lymphoma.

- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
Capsule
▶ **Targretin** (Eisai Ltd)
Bexarotene 75 mg Targretin 75mg capsules | 100 capsule [POM](#)
E937.50

Tretinoin**INDICATIONS AND DOSE**

Induction of remission in acute promyelocytic leukaemia (used in previously untreated patients as well as in those who have relapsed after standard chemotherapy or who are refractory to it)

BY MOUTH

- ▶ Adult: 45 mg/m² daily in 2 divided doses maximum duration of treatment is 90 days, consult product literature for details of concomitant chemotherapy

- **CAUTIONS** Increased risk of thromboembolism during first month of treatment
- **INTERACTIONS** → Appendix 1 (retinoids).
- **SIDE-EFFECTS** Alopecia · anxiety · arrhythmias · benign intracranial hypertension · bone pain · cheilitis · chest pain · confusion · depression · dizziness · dry mucous membranes · dry skin · erythema · flushing · gastro-intestinal disturbances · genital ulceration · headache · hearing disturbances · hypercalcaemia · insomnia · oedema · pancreatitis · paraesthesia · pruritus · raised lipids · raised liver enzymes · raised serum creatinine · rash

- retinoic acid syndrome · shivering · sweating · thromboembolism · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Retinoic acid syndrome Fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleucocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure requires immediate treatment—consult product literature.

● **CONCEPTION AND CONTRACEPTION**

Exclude pregnancy before starting treatment. Effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives not considered effective).

● **PREGNANCY** Teratogenic. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING** Avoid (discontinue breast-feeding).
- **HEPATIC IMPAIRMENT** Reduce dose to 25 mg/m².
- **RENAL IMPAIRMENT** Reduce dose to 25 mg/m².

- **MONITORING REQUIREMENTS** Monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Tretinoin is the acid form of vitamin A.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

▶ **TRETINOIN (Non-proprietary)**

Tretinoin 10 mg Tretinoin 10mg capsules | 100 capsule [POM](#)
E223.30

TAXANES**Cabazitaxel****INDICATIONS AND DOSE**

Treatment of hormone refractory metastatic prostate cancer in patients who have previously been treated with a docetaxel-containing regimen (in combination with prednisone or prednisolone)

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature or local protocols)

- **CAUTIONS** Avoid in Acute porphyrias p. 864
- **INTERACTIONS** → Appendix 1 (cabazitaxel).
- **SIDE-EFFECTS**
▶ **Common or very common** Hypersensitivity reactions
▶ **Frequency not known** Abdominal pain · alopecia · anxiety · arthralgia · atrial fibrillation · bone-marrow suppression · chest pain · chills · confusion · constipation · cough · dehydration · diarrhoea · dizziness · dry mouth · dry skin · dyspepsia · dyspnoea · electrolyte disturbances · erythema · extravasation · flushing · gastroesophageal reflux · haemorrhoids · headache · hyperglycaemia · hypertension · hyperuricaemia · hypoesthesia · hypotension · increased lacrimation · malaise · muscle spasm · myalgia · nausea · oedema · oral mucositis · paraesthesia · peripheral neuropathy · rectal haemorrhage · renal disorders (fatal cases of renal failure reported) · sciatica · tachycardia · taste disturbance · thromboembolism · tinnitus · tumour lysis syndrome · urinary incontinence · urinary retention · vertigo · vomiting · weight changes

SIDE-EFFECTS, FURTHER INFORMATION

Hypersensitivity reactions Routine premedication with a corticosteroid, an antihistamine, and a histamine H₂-receptor antagonist is recommended to prevent severe hypersensitivity reactions.

For further information on side-effects, consult product literature.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment (women) and for up to 6 months after treatment (men).
- **PREGNANCY** See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Use with caution if creatinine clearance less than 50 mL/minute.
- **MONITORING REQUIREMENTS** Monitor electrolytes—correct dehydration.
- **DIRECTIONS FOR ADMINISTRATION** Intravenous infusion incompatible with PVC.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
 ▶ Cabazitaxel for hormone-refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen (May 2012) NICE TA255
 Cabazitaxel in combination with prednisone or prednisolone is not recommended for the treatment of hormone-refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen. Patients currently receiving cabazitaxel in combination with prednisone or prednisolone for the treatment of hormone-refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen should have the option to continue treatment until they and their clinicians consider it appropriate to stop. www.nice.org.uk/TA255

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Ethanol

▶ Jevtana (Sanofi) ▼

Cabazitaxel 40 mg per 1 ml JEVTANA 60mg/1.5ml concentrate and solvent for solution for infusion vials | 1 vial [PoM] £3,696.00 (Hospital only)

Docetaxel

INDICATIONS AND DOSE

Adjuvant treatment of operable node-positive and operable node-negative breast cancer (in combination with doxorubicin and cyclophosphamide) | Initial chemotherapy of locally advanced or metastatic breast cancer (with doxorubicin) | Locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline or an alkylating drug has failed (monotherapy) | Locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline has failed (with capecitabine) | Initial chemotherapy of metastatic breast cancer which overexpresses human epidermal growth factor-2 (with trastuzumab) | Locally advanced or metastatic non-small cell lung cancer where first-line chemotherapy has failed | Unresectable, locally advanced or metastatic non-small cell lung cancer (with cisplatin) | Hormone-resistant metastatic prostate cancer (in combination with prednisone or prednisolone) | Initial treatment of metastatic gastric adenocarcinoma, including adenocarcinoma of the gastro-oesophageal junction (with cisplatin and fluorouracil) | Induction treatment of locally advanced squamous cell carcinoma of the head and neck (with cisplatin and fluorouracil)

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature or local protocols)

- **CAUTIONS** Avoid in Acute porphyrias p. 864 · consult product literature
- **INTERACTIONS** → Appendix 1 (docetaxel).
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · cystoid macular oedema · extravasation · fatal respiratory disorders · gastro-intestinal toxicity · heart failure · hypersensitivity reactions · hyperuricaemia · nausea · oral mucositis · peripheral neurotoxicity · persistent fluid retention (commonly as leg oedema that worsens during treatment) can be resistant to treatment · severe skin reactions · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Hypersensitivity reactions and fluid retention Pretreatment with dexamethasone by mouth is recommended for reducing fluid retention and hypersensitivity reactions (consult product literature).

Consult product literature for monitoring and management of side effects.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception for men and women during treatment, and for at least 6 months after stopping treatment in men.
- **PREGNANCY** Avoid (toxicity in *animal studies*). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose according to liver enzymes (consult product literature). Avoid in severe impairment. Monitor liver function in hepatic impairment.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
 ▶ Docetaxel for the treatment of hormone-refractory metastatic prostate cancer (June 2006) NICE TA101
 Docetaxel is an option for hormone-refractory metastatic prostate cancer and a Karnofsky score of at least 60% [Karnofsky score is a measure of the ability to perform ordinary tasks]. www.nice.org.uk/TA101
 ▶ Docetaxel for the adjuvant treatment of early node-positive breast cancer (September 2006) NICE TA109
 Docetaxel, when given concurrently with doxorubicin and cyclophosphamide (TAC regimen), is recommended as an option for the adjuvant treatment of women with early node-positive breast cancer. www.nice.org.uk/TA109

SCOTTISH MEDICINES CONSORTIUM (SMC) DECISIONS

The *Scottish Medicines Consortium* has advised that docetaxel (*Taxotere*®) in combination with cisplatin and fluorouracil is accepted for restricted use within NHS Scotland for the induction treatment of patients with unresectable (May 2007) and resectable (June 2008) locally advanced squamous cell carcinoma of the head and neck.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

► Brands may include Taxceus

Paclitaxel

● **DRUG ACTION** Paclitaxel is a member of the taxane group of drugs.

INDICATIONS AND DOSE

Treatment of ovarian cancer (advanced or residual disease following laparotomy) in combination with cisplatin (conventional paclitaxel only) | Treatment of metastatic ovarian cancer where platinum-containing therapy has failed (conventional paclitaxel only) | Treatment of locally advanced or metastatic breast cancer (in combination with other cytotoxics or alone if other cytotoxics have failed or are inappropriate) (conventional paclitaxel only) | Adjuvant treatment of node-positive breast cancer following treatment with anthracycline and cyclophosphamide (conventional paclitaxel only) | Treatment of non-small cell lung cancer (in combination with cisplatin) when surgery or radiotherapy not appropriate (conventional paclitaxel only) | Treatment of advanced AIDS-related Kaposi's sarcoma where liposomal anthracycline therapy has failed (conventional paclitaxel only) | First-line treatment of metastatic adenocarcinoma of the pancreas (in combination with gemcitabine) (conventional paclitaxel only) | Monotherapy of metastatic breast cancer when first-line treatment has failed and standard, anthracycline-containing therapy is not indicated (albumin-bound paclitaxel only) | In combination with gemcitabine for the first-line treatment of metastatic adenocarcinoma of the pancreas (albumin-bound paclitaxel only)

BY INTRAVENOUS INFUSION

► Adult: (consult product literature or local protocols)

● **CAUTIONS** Avoid in Acute porphyrias p. 864 · consult product literature · patients aged over 75 years with metastatic adenocarcinoma of the pancreas

● **INTERACTIONS** → Appendix 1 (paclitaxel).

● SIDE-EFFECTS

- **Common or very common** Arrhythmia · arthralgia · febrile neutropenia · gastro-intestinal disorders · myalgia · peripheral neuropathy · sensory neuropathy · tachycardia
- **Rare** Bradycardia · cardiac arrest · congestive heart failure · left ventricular dysfunction
- **Frequency not known** Alopecia · arrhythmias (nearly always asymptomatic) · asymptomatic hypotension · bone-marrow suppression · bradycardia · cardiac conduction defects · extravasation · hypersensitivity reactions · hyperuricaemia · muscle pain · myelosuppression · nausea · neutropenia · oral mucositis · pneumonitis · Stevens-Johnson syndrome · thromboembolism · toxic epidermal necrolysis · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Hypersensitivity reactions Routine premedication with a corticosteroid, an antihistamine and a histamine H₂-receptor antagonist is recommended to prevent severe hypersensitivity reactions; hypersensitivity reactions may occur rarely despite premedication.

● **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 6 months after treatment in men or women.

● **PREGNANCY** Avoid (toxicity in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Avoid in severe impairment.

● MONITORING REQUIREMENTS

► Cardiac monitoring should be undertaken, particularly if patients have underlying cardiac disease or previous exposure to anthracyclines.

► Patients should be monitored for signs and symptoms of pneumonitis and sepsis.

● **PRESCRIBING AND DISPENSING INFORMATION** Paclitaxel is available as both conventional and albumin-bound formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable. Prescribers should specify the brand to be dispensed.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- **Paclitaxel for ovarian cancer (January 2003)** NICE TA55 *Either* paclitaxel in combination with a platinum compound (cisplatin or carboplatin) *or* a platinum compound alone are alternatives for the first-line treatment of ovarian cancer (usually following surgery). www.nice.org.uk/TA55
- **Paclitaxel, pegylated liposomal doxorubicin, and topotecan for second-line or subsequent treatment of advanced ovarian cancer (May 2005)** NICE TA91 Paclitaxel, combined with a platinum compound (carboplatin or cisplatin), is an option for advanced cancer that relapses 6 months or more after completing initial platinum-based chemotherapy. Paclitaxel alone is an option for advanced ovarian cancer that does not respond to, or relapses within 6 months of completing initial platinum-based chemotherapy. Paclitaxel alone is an options for advanced ovarian cancer in patients who are allergic to platinum compounds. www.nice.org.uk/TA91
- **Paclitaxel for the adjuvant treatment of early node-positive breast cancer (September 2006)** NICE TA108 Paclitaxel, within its licensed indication, is **not** recommended for the adjuvant treatment of women with early node-positive breast cancer. www.nice.org.uk/TA108

Paclitaxel albumin 100 mg Abraxane 100mg powder for suspension for infusion vials | 1 vial [PoM] £246.00 (Hospital only)

TOPOISOMERASE I INHIBITORS

Irinotecan hydrochloride

- **DRUG ACTION** Irinotecan inhibits topoisomerase I, an enzyme involved in DNA replication.

INDICATIONS AND DOSE

Metastatic colorectal cancer in combination with fluorouracil and folinic acid or as monotherapy when treatment containing fluorouracil has failed | Treatment of epidermal growth factor receptor-expressing metastatic colorectal cancer after failure of chemotherapy that has included irinotecan (in combination with cetuximab) | First-line treatment of metastatic carcinoma of the colon or rectum (in combination with fluorouracil, folinic acid and bevacizumab) | First-line treatment of metastatic colorectal carcinoma (in combination with capecitabine with or without bevacizumab)

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS** Bowel obstruction · chronic inflammatory bowel disease
- **CAUTIONS** Raised plasma-bilirubin concentration · risk factors for cardiac disease
- **INTERACTIONS** → Appendix 1 (irinotecan).
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Interstitial pulmonary disease
 - ▶ **Frequency not known** Acute cholinergic syndrome (with early diarrhoea) and delayed diarrhoea (consult product literature) · alopecia · anorexia · asthenia · bone-marrow suppression · extravasation · gastro-intestinal effects (delayed diarrhoea requiring prompt treatment may follow irinotecan treatment) · hyperuricaemia · myelosuppression (dose limiting) · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for up to 1 month after treatment in women and up to 3 months after treatment in men.
- **PREGNANCY** Avoid (teratogenic and toxic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid if plasma-bilirubin concentration greater than 3 times upper limit of normal range. Monitor closely for neutropenia if plasma-bilirubin concentration 1.5–3 times upper limit of normal range (consult product literature).
- **RENAL IMPAIRMENT** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor respiratory function.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Topotecan

- **DRUG ACTION** Topotecan inhibits topoisomerase I, an enzyme involved in DNA replication.

INDICATIONS AND DOSE

Metastatic ovarian cancer when first-line or subsequent treatment has failed | Treatment of recurrent carcinoma of the cervix, after radiotherapy, and for patients with stage IVB disease (in combination with cisplatin)

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature or local protocols)

Relapsed small-cell lung cancer when retreatment with the first-line regimen is considered inappropriate

BY INTRAVENOUS INFUSION OR BY MOUTH

- ▶ Adult: (consult product literature or local protocols)

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **SIDE-EFFECTS** Alopecia · anorexia · asthenia · bone-marrow suppression · extravasation · gastro-intestinal effects · hyperuricaemia · myelosuppression (dose-limiting) · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **PREGNANCY** Avoid (teratogenicity and fetal loss in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **RENAL IMPAIRMENT** Reduce dose. Avoid infusion if creatinine clearance less than 20 mL/minute. Avoid oral route if creatinine clearance less than 60 mL/minute.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

 - ▶ Paclitaxel, pegylated liposomal doxorubicin, and topotecan for second-line or subsequent treatment of advanced ovarian cancer (May 2005) NICE TA91
Topotecan alone is an option only for advanced ovarian cancer that does not respond to, or relapses within 6 months of completing initial platinum-based chemotherapy or in those allergic to platinum compounds and for whom paclitaxel alone or pegylated liposomal doxorubicin are inappropriate. www.nice.org.uk/TA91
 - ▶ Topotecan for the treatment of recurrent and stage IVB cervical cancer (October 2009) NICE TA183
Topotecan in combination with cisplatin is recommended as a treatment option for recurrent or stage IVB cervical cancer in patients who have not previously received cisplatin. www.nice.org.uk/TA183

- ▶ **Topotecan for the treatment of relapsed small-cell lung cancer (November 2009) NICE TA184**
Oral topotecan is recommended as an option for treatment in patients with relapsed small-cell lung cancer only if re-treatment with the first-line regimen is not considered appropriate, and the combination of cyclophosphamide, doxorubicin and vincristine is contra-indicated. Intravenous topotecan is not recommended for people with relapsed small-cell lung cancer.
www.nice.org.uk/TA184

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2007) that topotecan (*Hycamtin*[®]) is accepted for restricted use in combination with cisplatin for treatment of recurrent carcinoma of the cervix after radiotherapy and for stage IVB disease; it is restricted to patients who have not previously received cisplatin treatment. The *Scottish Medicines Consortium* has advised (March 2009) that use of topotecan capsules within NHS Scotland is restricted to patients in whom standard intravenous chemotherapy is inappropriate and who would otherwise receive best supportive care.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

- ▶ Brands may include Potactasol

VINKA ALKALOIDS

Vinblastine sulfate

INDICATIONS AND DOSE

Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)

- ▶ Adult: (consult product literature)

Important safety information

Vinblastine is for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

● CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection **contra-indicated**.

- **CAUTIONS** Caution in handling—irritant to tissues

- **INTERACTIONS** → Appendix 1 (vinblastine).

- **SIDE-EFFECTS** Abdominal pain · alopecia · autonomic neuropathy · constipation · hyperuricaemia · loss of deep tendon reflexes · motor weakness · myelosuppression (dose-limiting) · nausea · neurotoxicity · oral mucositis · ototoxicity · peripheral neuropathy · peripheral paraesthesia · severe bronchospasm following administration (more commonly when used in combination with mitomycin-C) · severe local irritation (care must be taken to avoid extravasation) · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Neurotoxicity Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids; it occurs less often with vinblastine than with vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

- **PREGNANCY** Avoid (limited experience suggests fetal harm; teratogenic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Dose reduction may be necessary—consult local treatment protocol for details.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **VINBLASTINE SULFATE (Non-proprietary)**

Vinblastine sulfate 1 mg per 1 ml Vinblastine 10mg/10ml solution for injection vials | 5 vial [PoM] £85.00

Vincristine sulfate

INDICATIONS AND DOSE

Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)

- ▶ Adult: (consult local protocol)

Important safety information

Vincristine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

● CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection **contra-indicated**.

- **CAUTIONS** Caution in handling—irritant to tissues · neuromuscular disease
- **INTERACTIONS** → Appendix 1 (vincristine).

● SIDE-EFFECTS

- ▶ **Rare** Diarrhoea · inappropriate secretion of antidiuretic hormone · intestinal necrosis · paralytic ileus · seizures · urinary retention
- ▶ **Frequency not known** Abdominal pain · alopecia · autonomic neuropathy · constipation · extravasation · eye disorders · hyperuricaemia · loss of deep tendon reflexes · motor weakness · muscle wasting · myelosuppression (negligible) · nausea · neurotoxicity · oral mucositis · ototoxicity · peripheral neuropathy · peripheral paraesthesia · severe bronchospasm following administration (more commonly when used in combination with mitomycin-C) · severe local irritation (care must be taken to avoid extravasation) · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- Neurotoxicity** Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.
- **PREGNANCY** Avoid (teratogenicity and fetal loss in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
 - **BREAST FEEDING** Discontinue breast-feeding.
 - **HEPATIC IMPAIRMENT** Dose reduction may be necessary—consult local treatment protocol for details.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ VINCRISTINE SULFATE (Non-proprietary)

Vincristine sulfate 1 mg per 1 ml Vincristine 1mg/1ml solution for injection vials | 1 vial [PoM](#) £13.47 | 5 vial [PoM](#) £67.35

Vincristine 2mg/2ml solution for injection vials | 1 vial [PoM](#) £26.66 (Hospital only) | 5 vial [PoM](#) £133.30

Vincristine 5mg/5ml solution for injection vials | 5 vial [PoM](#) £329.50

Vindesine sulfate

INDICATIONS AND DOSE

Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)

- ▶ **Adult:** (consult product literature)

Important safety information

Vindesine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

● CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION Intrathecal injection **contra-indicated**.

- **CAUTIONS** Caution in handling—irritant to tissues · neuromuscular disease
- **INTERACTIONS** → Appendix 1 (vindesine).

- **SIDE-EFFECTS** Alopecia · autonomic neuropathy · bone-marrow suppression · extravasation · hyperuricaemia · irritant to tissues · myelosuppression (dose-limiting) · nausea · neurotoxicity · oral mucositis · peripheral neuropathy · severe bronchospasm following administration (more commonly when used in combination with mitomycin-C) · severe local irritation (if extravasated) · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Neurotoxicity Neurotoxicity, usually as peripheral or autonomic neuropathy; it occurs less often with vindesine than with vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur, and increasing motor weakness calls for dose reduction or discontinuation. Recovery from neurotoxic effects is usually slow but complete.

- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Dose reduction may be necessary.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ **Eldisine** (Genus Pharmaceuticals Ltd)

Vindesine sulfate 5 mg Eldisine 5mg powder for solution for injection vials | 1 vial [PoM](#) £78.30 (Hospital only)

Vinflunine

INDICATIONS AND DOSE

Treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract after failure of a platinum-containing regimen (monotherapy)

- ▶ **Adult:** (consult local protocol)

Important safety information

Vinflunine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

● CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection **contra-indicated**.

- **CAUTIONS** Cardiovascular disease · QT-interval prolongation (avoid hypokalaemia)
- **INTERACTIONS** → Appendix 1 (vinflunine). Caution with concomitant use of drugs that prolong QT-interval.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anorexia · cutaneous reactions · dehydration · diarrhoea · dyspepsia · fatigue · hypertension · hypotension · insomnia · oedema · sweating · tachycardia · thrombosis
 - ▶ **Uncommon** Increased weight · myocardial infarction · renal failure

- ▶ **Frequency not known** Alopecia · autonomic neuropathy · blurred vision · extravasation · hyperuricaemia · inappropriate anti-diuretic hormone secretion · myelosuppression (dose-limiting) · nausea · neurotoxicity · oral mucositis · peripheral neuropathy · QT-interval prolongation · severe bronchospasm following administration (more commonly when used in combination with mitomycin-C) · severe local irritation (if extravasated) · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- **Neurotoxicity** Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for up to 3 months after treatment.
- **PREGNANCY** Avoid unless essential—teratogenicity and embryotoxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose—consult product literature.
- **RENAL IMPAIRMENT** Reduce dose if creatinine clearance less than 60 mL/minute—consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
▶ **Vinflunine for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract (January 2013)** NICE TA272
Vinflunine is **not** recommended for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract that has progressed after treatment with platinum-based chemotherapy. www.nice.org.uk/TA272

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Javlor** (Pierre Fabre Ltd)

Vinflunine (as Vinflunine ditartrate) 25 mg per 1 mL Javlor
250mg/10mL concentrate for solution for infusion | 1 vial [PoM]
£1,062.50 Javlor 50mg/2mL concentrate for solution for infusion | 1 vial [PoM] £212.50

Vinorelbine

- **DRUG ACTION** Vinorelbine is a semi-synthetic vinca alkaloid.

INDICATIONS AND DOSE

Advanced breast cancer | Advanced non-small cell lung cancer

BY MOUTH

- ▶ **Adult:** 60 mg/m² once weekly for 3 weeks, then increased if tolerated to 80 mg/m² once weekly (max. 160 mg once weekly)

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ **Adult:** (consult product literature)

Important safety information

Vinorelbine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

CONTRA-INDICATIONS

- ▶ With oral use concurrent radiotherapy if treating the liver · long-term oxygen therapy · previous significant surgical resection of small bowel · previous significant surgical resection of stomach

CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection **contra-indicated**.

- **CAUTIONS** Caution in handling—irritant to tissues · ischaemic heart disease
- **INTERACTIONS** → Appendix 1 (vinorelbine).

SIDE-EFFECTS

- ▶ **Rare** Pancreatitis

- ▶ **Frequency not known** Alopecia · autonomic neuropathy · extravasation · hyperuricaemia · hyponatraemia · inappropriate secretion of antidiuretic hormone · irritant to tissues · motor weakness · myelosuppression (dose-limiting) · nausea · neurotoxicity · oral mucositis · peripheral neuropathy · severe bronchospasm following administration of the vinca alkaloids (more commonly when used in combination with mitomycin-C) · severe local irritation (if extravasated) · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Neurotoxicity Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids; it occurs less often with vinorelbine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur, and increasing motor weakness calls for dose reduction or discontinuation of these drugs. Recovery from neurotoxic effects is usually slow but complete.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 3 months after treatment; men must avoid fathering a child during and for at least 3 months after treatment.
- **PREGNANCY** Avoid unless essential (teratogenicity, and fetal loss in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce oral dose in moderate impairment. Avoid oral use in severe impairment. Reduce *intravenous dose* in severe impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

OTHER CYTOTOXIC DRUGS

Arsenic trioxide

INDICATIONS AND DOSE

Acute promyelocytic leukaemia in patients who have relapsed or failed to respond to previous treatment with a retinoid and chemotherapy

BY INTRAVENOUS INFUSION

▶ Adult: (consult local protocol)

- **CAUTIONS** Hypokalaemia (correct before treatment) · hypomagnesaemia (correct before treatment) · previous treatment with anthracyclines (increased risk of QT interval prolongation)
- **INTERACTIONS** → Appendix 1 (arsenic trioxide). Avoid concomitant administration with drugs causing QT interval prolongation.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Atrial fibrillation · atrial flutter · diarrhoea · fatigue · haemorrhage · hyperglycaemia · hypokalaemia · leucocyte activation syndrome · musculoskeletal pain · paraesthesia · pleuritic pain · QT interval prolongation
 - ▶ **Uncommon** Abdominal pain · blurred vision · hypotension · oedema · pneumonitis · rash · renal failure · seizures · tachycardia · vasculitis
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Leucocyte activation syndrome Signs and symptoms of leucocyte activation syndrome include unexplained fever, dyspnoea, weight gain, pulmonary infiltrates, pleural or pericardial effusions, with or without leucocytosis—treat with high dose corticosteroids, consult product literature.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment in men and women.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—limited information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution—limited information available.
- **MONITORING REQUIREMENTS** ECG required before and during treatment—consult product literature.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Trisenox (Teva UK Ltd)

Arsenic trioxide 1 mg per 1 ml Trisenox 10mg/10ml concentrate for solution for infusion ampoules | 10 ampoule [PoM](#) £2,920.00 (Hospital only)

Crisantaspace

- **DRUG ACTION** Crisantaspace is the enzyme asparaginase produced by *Erwinia chrysanthemi*.

INDICATIONS AND DOSE

Acute lymphoblastic leukaemia

BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INJECTION

▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** History of pancreatitis related to asparaginase therapy
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Coagulation disorders · confusion · convulsions · diarrhoea · dizziness · drowsiness · headache · lethargy · liver dysfunction · neurotoxicity · pancreatitis
 - ▶ **Uncommon** Anaphylaxis · changes in blood lipids · hyperglycaemia
 - ▶ **Rare** CNS depression
 - ▶ **Very rare** Abdominal pain · hypertension · myalgia
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **PREGNANCY** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **DIRECTIONS FOR ADMINISTRATION** Facilities for the management of anaphylaxis should be available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ Erwinase (EUSA Pharma Ltd)

Crisantaspace 10000 unit Erwinase 10,000unit powder for solution for injection vials | 5 vial [PoM](#) £3,065.00

Eribulin

INDICATIONS AND DOSE

Treatment of locally advanced or metastatic breast cancer when the disease has progressed after treatment with at least 1 chemotherapy regimen for advanced disease

BY INTRAVENOUS INJECTION

▶ Adult: Give on day 1 and day 8 of a 21-day cycle, previous therapy should have included an anthracycline and a taxane in either the adjuvant or metastatic setting unless the patient is unsuitable for these treatments (consult local protocol)

- **CONTRA-INDICATIONS** Congenital long QT syndrome
- **CAUTIONS** Bradycardias (increased susceptibility to QT-interval prolongation) · congestive heart failure (increased susceptibility to QT-interval prolongation) · electrolyte disturbances (increased susceptibility to QT-interval prolongation) · susceptibility to QT-interval prolongation
- **INTERACTIONS** → Appendix 1 (eribulin). Caution with concomitant use of drugs that prolong QT-interval.
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · myelosuppression ·

nausea · oral mucositis · peripheral neuropathy · QT-interval prolongation · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

For further information on side effects, consult product literature.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for up to 3 months after treatment in men or women.
- **PREGNANCY** Avoid unless essential (teratogenic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose.
- **RENAL IMPAIRMENT** Consider dose reduction if creatinine clearance less than 40 mL/minute.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for signs of peripheral neuropathy—severe peripheral neurotoxicity requires treatment delay or dose reduction (consult product literature).
 - ▶ ECG monitoring recommended in patients prescribed concomitant use of drugs that prolong the QT-interval or who are susceptible to QT-interval prolongation.
 - ▶ Monitor electrolytes periodically.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

 - ▶ **Eribulin for the treatment of locally advanced or metastatic breast cancer (April 2012)** NICE TA250

Eribulin is **not** recommended for the treatment of locally advanced or metastatic breast cancer that has progressed after at least two chemotherapy regimens for advanced disease. www.nice.org.uk/TA250

Eribulin 44 mg per 1 ml Halaven 0.88mg/2ml solution for injection vials | 1 vial [PoM] £361.00 (Hospital only) | 6 vial [PoM] £2,166.00 (Hospital only) Halaven 1.32mg/3ml solution for injection vials | 1 vial [PoM] £541.50 (Hospital only)

Etoposide

INDICATIONS AND DOSE

Small cell carcinoma of the bronchus, the lymphomas and testicular cancer

BY MOUTH

▶ Adult: 120–240 mg/m² daily for 5 days

BY INTRAVENOUS INFUSION

▶ Adult: (consult product literature)

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **INTERACTIONS** → Appendix 1 (etoposide).
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · hyperuricaemia · irritant to tissues · nausea · oral mucositis (more common if given with doxorubicin) · thromboembolism · tumour lysis syndrome · vomiting
- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

- **RENAL IMPAIRMENT** Consider dose reduction—consult local treatment protocol for details.
- **DIRECTIONS FOR ADMINISTRATION** Etoposide may be given orally or by slow intravenous infusion, the oral dose being double the intravenous dose. A preparation containing etoposide phosphate can be given by intravenous injection or infusion. Etoposide is usually given daily for 3–5 days and courses should not be repeated more frequently than at intervals of 21 days.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Hydroxycarbamide (Hydroxyurea)

INDICATIONS AND DOSE

Treatment of chronic myeloid leukaemia | Treatment of cancer of the cervix in conjunction with radiotherapy | Polycythaemia

BY MOUTH

▶ Adult: 20–30 mg/kg daily, alternatively 80 mg/kg every 3 days

Sickle-cell disease—consult with a specialist centre

BY MOUTH

▶ Adult: Initially 15 mg/kg daily, increased in steps of 2.5–5 mg/kg daily every 12 weeks according to response; usual dose 15–30 mg/kg daily; maximum 35 mg/kg per day

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CAUTIONS** Leg ulcers (review treatment if cutaneous vasculitic ulcerations develop)
- **INTERACTIONS** → Appendix 1 (hydroxycarbamide).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Headache · myelosuppression · skin reactions
 - ▶ **Rare** Amenorrhoea (in sickle-cell disease) · fever (in sickle-cell disease)
 - ▶ **Frequency not known** Alopecia · bleeding (in sickle-cell disease) · bone-marrow suppression · dizziness · hyperuricaemia · hypomagnesaemia (in sickle-cell disease) · nausea · oral mucositis · rash · reduced sperm count and activity · skin cancers (particularly in elderly patients) · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception before and during treatment.

- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment, unless used for malignant conditions.
- **RENAL IMPAIRMENT** In sickle-cell disease, reduce initial dose by 50% if eGFR less than 60 mL/minute/1.73 m². In sickle-cell disease, avoid if eGFR less than 30 mL/minute/1.73 m². Use with caution in malignant disease.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor renal and hepatic function before and during treatment.
 - ▶ Monitor full blood count before treatment, and repeatedly throughout use; in sickle-cell disease monitor every 2 weeks for the first 2 months and then every 2 months thereafter (or every 2 weeks if on maximum dose).
 - ▶ Patients receiving long-term therapy for malignant disease should be monitored for secondary malignancies.
- **PATIENT AND CARER ADVICE** Patients receiving long-term therapy with hydroxycarbamide should be advised to protect skin from sun exposure.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, capsule

Tablet

Hydroxycarbamide 500 mg Hydrea 500mg capsules | 100 capsule **[PoM]** £10.47 DT price = £11.25

Mitotane

- **DRUG ACTION** Mitotane selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy.

INDICATIONS AND DOSE

Symptomatic treatment of advanced or inoperable adrenocortical carcinoma

BY MOUTH

- ▶ **Adult:** Initially 2–3 g daily in 2–3 divided doses adjusted according to plasma-concentration monitoring, in severe illness initial dose can be increased up to 6 g daily, reduce dose or interrupt treatment if signs of toxicity, discontinue if inadequate response after 3 months

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CAUTIONS** Avoid in Acute porphyrias p. 864 · risk of accumulation in overweight patients
- **INTERACTIONS** → Appendix 1 (mitotane).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · anorexia · asthenia · ataxia · cognitive impairment · confusion · diarrhoea · dizziness · drowsiness · endocrine side effects · epigastric

discomfort · gastro-intestinal disturbances · gynaecomastia · headache · hypercholesterolaemia · hypertriglyceridaemia · hypogonadism · leucopenia · liver disorders · movement disorder · myasthenia · nausea · neuropathy · neurotoxicity · paraesthesia · prolonged bleeding time · rash · thrombocytopenia · thyroid disorders · vomiting

- ▶ **Rare** Flushing · haematuria · haemorrhagic cystitis · hypersalivation · hypertension · hypouricaemia · ocular disorders · postural hypotension · proteinuria · pyrexia · visual disturbances
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

● **PREGNANCY** Manufacturer advises avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment. In mild to moderate hepatic impairment, monitoring of plasma-mitotane concentration is recommended.

● **RENAL IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment. In mild to moderate renal impairment, monitoring of plasma-mitotane concentration is recommended.

● MONITORING REQUIREMENTS

▶ Plasma-mitotane concentration for optimum response 14–20 mg/litre.

▶ Monitor plasma-mitotane concentration—consult product literature.

● PRESCRIBING AND DISPENSING INFORMATION

Corticosteroid replacement therapy Corticosteroid replacement therapy is necessary with treatment with mitotane. The dose of glucocorticoid should be increased in case of shock, trauma, or infection.

● **PATIENT AND CARER ADVICE** Central nervous system toxicity may affect performance of skilled tasks (e.g. driving). Patients should be warned to contact doctor immediately if injury, infection, or illness occurs (because of risk of acute adrenal insufficiency).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Mitotane 500 mg Lysodren 500mg tablets | 100 tablet **[PoM]**
£590.97

Mitoxantrone

(Mitozantrone)

INDICATIONS AND DOSE

Metastatic breast cancer | Non-Hodgkin's lymphoma | Adult acute non-lymphocytic leukaemia | Non-resectable primary hepatocellular carcinoma

BY INTRAVENOUS INFUSION

▶ **Adult:** (consult local protocol)

- **CAUTIONS** Intrathecal administration not recommended
- **INTERACTIONS** → Appendix 1 (mitoxantrone). Caution is necessary with concomitant use of cardiotoxic drugs, or drugs that reduce cardiac contractility. Concomitant use with trastuzumab is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to

24 weeks. If trastuzumab needs to be used, cardiac function should be monitored closely.

- **SIDE-EFFECTS** Abdominal pain · alopecia · amenorrhoea · anorexia · anxiety · blue discoloration of nails · blue discoloration of skin · bone-marrow suppression · confusion · constipation · diarrhoea · dose-related cardiotoxicity · drowsiness · dyspnoea · extravasation · gastro-intestinal bleeding · hyperuricaemia · myelosuppression · nausea · oral mucositis · paraesthesia · thromboembolism · transient blue-green discoloration of urine · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Cardiotoxicity Cardiac examinations are recommended after a cumulative dose of 160 mg/m².

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Use with caution—consult local treatment protocol.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ MITOXANTRONE (Non-proprietary)

Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Mitoxantrone 20mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £121.85

▶ Onkotrone (Baxter Healthcare Ltd)

Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Onkotrone 20mg/10ml solution for infusion vials | 1 vial [PoM] no price available
Onkotrone 25mg/12.5ml solution for infusion vials | 1 vial [PoM] no price available

Pentostatin

INDICATIONS AND DOSE

Hairy cell leukaemia (initiated in specialist centres)

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ **Adult:** To be given on alternate weeks (consult product literature)

- **INTERACTIONS** → Appendix 1 (pentostatin).
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · immunosuppression · myelosuppression · nausea · neurotoxicity (withhold or discontinue) · oral mucositis · severe rash (withhold treatment) · thromboembolism · tumour lysis syndrome · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
 Pentostatin can cause myelosuppression, immunosuppression, and a number of other side-effects that may be severe. Treatment should be withheld in patients who develop a severe rash, and withheld or discontinued in patients showing signs of neurotoxicity.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises that men should not father children during and for 6 months after treatment.
- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—limited information available.
- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 60 mL/minute.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ Nipent (Hospira UK Ltd)

Pentostatin 10 mg Nipent 10mg powder for solution for injection vials | 1 vial [PoM] £863.78 (Hospital only)

Pixantrone

INDICATIONS AND DOSE

Treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas (monotherapy)

BY INTRAVENOUS INFUSION

- ▶ **Adult:** (consult product literature)

- **CONTRA-INDICATIONS** Active severe infection · risk factors for severe infection
- **CAUTIONS** Active cardiovascular disease · cardiac risk factors · caution in handling—irritant to tissues · concurrent radiotherapy to the mediastinal area · history of cardiovascular disease · previous radiotherapy to the mediastinal area · previous therapy with anthracenediones · previous therapy with anthracyclines
- **INTERACTIONS** → Appendix 1 (pixantrone).
 Caution with concurrent use of cardiotoxic drugs - increased risk of cardiotoxicity. Contra-indicated with concurrent immunisation with live virus vaccines.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · abnormal liver function tests · biochemical disturbances · bone pain · cardiac disorders · cardiac toxicity (during or following treatment) · chromaturia · conjunctivitis · constipation · cough · diarrhoea · drowsiness · dry mouth · dyspepsia · dyspnoea · electrolyte disturbances · haematuria · headache · hypotension · infection · loss of appetite · malaise · nail disorder · oedema · pallor · paraesthesia · proteinuria · pruritus · pyrexia · severe myelosuppression · skin discoloration · tachycardia · taste disturbances · vein discoloration · weight loss
 - ▶ **Uncommon** Anxiety · arrhythmia · arthralgia · arthritis · dizziness · dry eye · keratitis · musculoskeletal pain · musculoskeletal weakness · night sweats · oesophagitis · oliguria · petechiae · pleural effusion · pneumonitis · rash · rectal haemorrhage · rhinorrhoea · skin ulcer · sleep disorder · spontaneous erection · tumour progression · vein disorder · vertigo
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · photosensitivity · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** No information available—manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** No information available—manufacturer advises caution.
- **MONITORING REQUIREMENTS**
 - ▶ Baseline investigations should include a full blood count, assessment of cardiac function measured by left ventricular ejection fraction, and measurement of serum concentrations of total bilirubin and total creatinine.

- ▶ Full blood count and cardiac function should be monitored throughout treatment.
- **PATIENT AND CARER ADVICE**
Photosensitivity Photosensitivity is a theoretical risk and patients should be advised to follow sun protection strategies.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
▶ **Pixantrone monotherapy for treating multiply relapsed or refractory aggressive non-Hodgkin's B-cell lymphoma (February 2014) NICE TA306**
Pixantrone monotherapy is recommended as an option for treating adults with multiply relapsed or refractory aggressive non-Hodgkin's B-cell lymphoma in patients:
 - who have previously been treated with rituximab **and**
 - who are receiving third- or fourth-line treatment **and**
 - if the manufacturer provides pixantrone with the discount agreed in the patient access scheme. www.nice.org.uk/TA306

- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
Powder for solution for infusion
ELECTROLYTES: May contain Sodium
▶ **Pixuvri** (CTI Life Sciences Ltd) ▼
Pixantrone (as Pixantrone dimaleate) 29 mg Pixuvri 29mg powder for concentrate for solution for infusion vials | 1 vial [PoM](#) no price available

Procarbazine

- **DRUG ACTION** Procarbazine is a mild monoamine-oxidase inhibitor.

INDICATIONS AND DOSE

Hodgkin's lymphoma

BY MOUTH

- ▶ Adult: (consult local protocol)

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CONTRA-INDICATIONS** Pre-existing severe leucopenia · pre-existing severe thrombocytopenia
- **CAUTIONS** Cardiovascular disease · cerebrovascular disease · epilepsy · phaeochromocytoma · procarbazine is a mild monoamineoxidase inhibitor (dietary restriction is rarely considered necessary)
- **INTERACTIONS** → Appendix 1 (procarbazine). Alcohol ingestion may cause a disulfiram-like reaction.
- **SIDE-EFFECTS**
▶ **Common or very common** Loss of appetite
▶ **Frequency not known** Alopecia · bone-marrow suppression · hypersensitivity rash (discontinue treatment) · hyperuricaemia · jaundice · myelosuppression · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **PREGNANCY** Avoid (teratogenic in *animal* studies and isolated reports in humans). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 4

▶ PROCARBAZINE (Non-proprietary)

Procarbazine (as Procarbazine hydrochloride)

50 mg Procarbazine 50mg capsules | 50 capsule [PoM](#) £295.00

Raltitrexed

- **DRUG ACTION** Raltitrexed is a thymidylate synthase inhibitor.

INDICATIONS AND DOSE

Palliation of advanced colorectal cancer when fluorouracil and folinic acid cannot be used

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult local protocol)

- **INTERACTIONS** → Appendix 1 (raltitrexed).
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · gastro-intestinal effects · hyperuricaemia · myelosuppression · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Reduce dose and increase dosing interval if creatinine clearance less than 65 mL/minute (consult product literature). Avoid if creatinine clearance less than 25 mL/minute.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
▶ **Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005) NICE TA93**
Raltitrexed is **not** recommended for the treatment of advanced colorectal cancer. Its use should be confined to clinical studies. www.nice.org.uk/TA93

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Tomudex** (Hospira UK Ltd)

Raltitrexed 2 mg Tomudex 2mg powder for solution for infusion vials | 1 vial [PoM](#) £175.00

Trabectedin

INDICATIONS AND DOSE

Treatment of advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed or is contra-indicated | Treatment of relapsed platinum-sensitive ovarian cancer (in combination with pegylated liposomal doxorubicin)

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS** Elevated creatine phosphokinase (consult product literature)
- **INTERACTIONS** Caution in concomitant use with hepatotoxic drugs (avoid alcohol).

● SIDE-EFFECTS

- ▶ **Uncommon** Rhabdomyolysis (with raised creatine phosphokinase)
- ▶ **Rare** Hepatic failure (fatal cases reported)
- ▶ **Frequency not known** Abdominal pain · alopecia · anorexia · arthralgia · asthenia · back pain · bone-marrow suppression · constipation · cough · dehydration · diarrhoea · dizziness · dyspepsia · dyspnoea · extravasation · fatigue · flushing · headache · hepatobiliary disorders · hyperuricaemia · hypokalaemia · hypotension · increased blood creatine kinase · insomnia · myalgia · nausea · oedema · oral mucositis · paraesthesia · peripheral neuropathy · pyrexia · taste disturbance · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

A corticosteroid, such as dexamethasone by intravenous infusion, must be given 30 minutes before therapy for its antiemetic and hepatoprotective effects (consult product literature).

- **CONCEPTION AND CONTRACEPTION** Effective contraception recommended during and for at least 3 months after treatment in women and during and for at least 5 months after treatment in men.
- **PREGNANCY** See Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Manufacturer advises avoid breast-feeding during and for 3 months after treatment.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in impairment—consider dose reduction. Avoid in patients with raised bilirubin. Monitor hepatic function closely in patients with hepatic impairment.
- **RENAL IMPAIRMENT** Avoid monotherapy if creatinine clearance less than 30 mL/minute. Avoid combination regimens if creatinine clearance less than 60 mL/minute.
- **MONITORING REQUIREMENTS**
 - ▶ Specific haematological, renal and hepatic parameters must be monitored and within certain ranges prior to starting treatment and repeated weekly during the first 2 cycles and at least once between treatments in subsequent cycles—consult product literature for full details.
 - ▶ Monitor for signs and symptoms of rhabdomyolysis (including myelotoxicity, severe liver function disorder, renal failure, muscle weakness or pain)—monitor creatine phosphokinase closely and discontinue treatment (consult product literature).
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - **NICE technology appraisals (TAs)**
 - ▶ **Trabectedin for the treatment of advanced soft tissue sarcoma (February 2010)** NICE TA185
Trabectedin is an option for advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed, is inappropriate or is not tolerated. The cost of trabectedin for treatment after the fifth cycle is met by the manufacturer. www.nice.org.uk/TA185
 - ▶ **Trabectedin for the treatment of relapsed ovarian cancer (April 2011)** NICE TA222
Trabectedin in combination with pegylated liposomal doxorubicin is **not** recommended for the treatment of relapsed platinum-sensitive ovarian cancer. www.nice.org.uk/TA222

2.3 Cytotoxic drug-induced side effects

FOLATES

Folinic acid

INDICATIONS AND DOSE

Prevention of methotrexate-induced adverse effects

BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ **Adult:** 15 mg every 6 hours for 24 hours, to be started usually 12–24 hours after start of methotrexate infusion, dose may be continued by mouth, consult local treatment protocol for further information

Suspected methotrexate overdose

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initial dose equal to or exceeding dose of methotrexate, to be given at a maximum rate of 160 mg/minute, consult poisons information centres for advice on continuing management

Adjunct to fluorouracil in colorectal cancer

BY SLOW INTRAVENOUS INJECTION

- ▶ **Adult:** (consult product literature)

SODIOLIN®

As an antidote to methotrexate

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION

- ▶ **Adult:** (consult product literature)

Adjunct to fluorouracil in colorectal cancer

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ **Adult:** (consult product literature)

- **CONTRA-INDICATIONS** Intrathecal injection
- **CAUTIONS** Not indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B₁₂ deficiency · avoid simultaneous administration of methotrexate
- **INTERACTIONS** → Appendix 1 (folates).
- **SIDE-EFFECTS**
 - ▶ **Rare** Agitation (after high doses) · depression (after high doses) · insomnia (after high doses) · pyrexia (after parenteral use)
- **PREGNANCY** Not known to be harmful; benefit outweighs risk.
- **BREAST FEEDING** Presence in milk unknown but benefit outweighs risk.
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - **NICE technology appraisals (TAs)**
 - ▶ **Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010)** NICE TA212
Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine is not recommended for the treatment of metastatic colorectal cancer. www.nice.org.uk/TA212

● MEDICINAL FORMS

Levofolinic acid

- **DRUG ACTION** Levofolinic acid is an isomer of folinic acid.

INDICATIONS AND DOSE

Prevention of methotrexate-induced adverse effects

BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ **Adult:** Usual dose 7.5 mg every 6 hours for 10 doses, usually started 12–24 hours after beginning of methotrexate infusion

Suspected methotrexate overdose

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION

- ▶ **Adult:** Initial dose at least 50% of the dose of methotrexate, intravenous infusion to be administered at a maximum rate of 160 mg/minute, consult poisons information centres for advice on continuing management

Adjunct to fluorouracil in colorectal cancer

BY SLOW INTRAVENOUS INJECTION

- ▶ **Adult:** (consult product literature)

- **CONTRA-INDICATIONS** Intrathecal injection
- **CAUTIONS** Not indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B₁₂ deficiency · avoid simultaneous administration of methotrexate
- **INTERACTIONS** → Appendix 1 (folates).
- **SIDE-EFFECTS**

- **PREGNANCY** Not known to be harmful; benefit outweighs risk.
- **BREAST FEEDING** Presence in milk unknown but benefit outweighs risk.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Isovorin** (Pfizer Ltd)

Levofolinic acid (as Calcium levofolinate) 10 mg per 1 ml Isovorin 175mg/17.5ml solution for injection vials | 1 vial [PoM] £81.33 (Hospital only) Isovorin 25mg/2.5ml solution for injection vials | 1 vial [PoM] £11.62 (Hospital only)

IRON CHELATORS

Dexrazoxane

- **DRUG ACTION** Dexrazoxane is an iron chelator.

INDICATIONS AND DOSE

CARDIOXANE®

Prevention of chronic cumulative cardiotoxicity caused by doxorubicin or epirubicin treatment in advanced or metastatic breast cancer patients who have received a prior cumulative dose of 300 mg/m² of doxorubicin or a prior cumulative dose of 540 mg/m² of epirubicin when further anthracycline treatment is required

BY INTRAVENOUS INFUSION

- ▶ **Adult:** Administer 10 times the doxorubicin-equivalent dose or 10 times the epirubicin-equivalent dose, dose to be given 30 minutes before anthracycline administration

SAVENE®

Anthracycline extravasation

BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 1 g/m² daily (max. per dose 2 g) for 2 days, then 500 mg/m² for 1 day, first dose to be given as soon as possible and within 6 hours after injury

- **CONTRA-INDICATIONS** Children
- **CAUTIONS** Myelosuppression (effects may be additive to those of chemotherapy)
- **CARDIOXANE®** Manufacturer advises caution in patients with heart failure—no information available · manufacturer advises caution in patients with myocardial infarction in previous 12 months—no information available · manufacturer advises caution in patients with symptomatic valvular heart disease—no information available · manufacturer advises caution in patients with uncontrolled angina—no information available
- **INTERACTIONS** → Appendix 1 (dexrazoxane).
- **SIDE-EFFECTS**
 - **CARDIOXANE®**
 - ▶ **Common or very common** Anorexia · asthenia · diarrhoea · dizziness · dry mouth · dyspnoea · erythema · infection · malaise · nausea · oedema · paraesthesia · peripheral neuropathy · stomatitis · syncope · vomiting
 - ▶ **Uncommon** Abdominal pain · acute myeloid leukaemia · constipation · cough · dyspepsia · headache · lymphoedema · nail disorder · reduced ejection fraction · tachycardia · thromboembolism (when given with cytotoxic drugs)
 - ▶ **Frequency not known** Alopecia · anaemia · blood disorders · fatigue · injection-site reactions · leucopenia · phlebitis · pruritus · pyrexia · thrombocytopenia
 - **SAVENE®**
 - ▶ **Common or very common** Alopecia · anaemia · anorexia · blood disorders · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · erythema · fatigue · infection · injection-site reactions · leucopenia · malaise · nausea · oedema · peripheral neuropathy · peripheral oedema · phlebitis · pruritus · pyrexia · stomatitis · syncope · thrombocytopenia · tremor · vaginal haemorrhage · vomiting
 - ▶ **Uncommon** Drowsiness · myalgia · thromboembolism (when given with cytotoxic drugs) · weight loss
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 3 months after treatment in men and women.
- **PREGNANCY** Avoid unless essential (toxicity in animal studies).
- **BREAST FEEDING** Discontinue breast-feeding.

● HEPATIC IMPAIRMENT**CARDIOXANE®**

Manufacturer advises that if anthracycline dose is reduced, reduce the *Cardioxane*® dose by a similar ratio.

SAVENE®

Manufacturer advises avoid—no information available.

● RENAL IMPAIRMENT**CARDIOXANE®**

Manufacturer advises reduce dose by 50% if creatinine clearance less than 40 mL/minute.

SAVENE®

Manufacturer advises avoid—risk of accumulation.

● MONITORING REQUIREMENTS

- ▶ Monitor full blood count.
- ▶ Monitor for cardiac toxicity.
- ▶ Monitor liver function.

- **DIRECTIONS FOR ADMINISTRATION** Local coolants such as ice packs should be removed at least 15 minutes before administration.

CARDIOXANE®

For *intravenous infusion*, give intermittently in Compound sodium lactate; reconstitute each vial with 25 mL water for injections and dilute each vial with 25–100 mL infusion fluid; give requisite dose over 15 minutes.

SAVENE®

For *intravenous infusion*, give intermittently in diluent; reconstitute each 500-mg vial with 25 mL of diluent; dilute requisite dose further in remaining diluent and give over 1–2 hours into a large vein in an area other than the one affected.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Cardioxane** (Clinigen Healthcare Ltd)

Dexrazoxane 500 mg Cardioxane 500mg powder for solution for infusion vials | 1 vial **[PoM]** £156.57

Powder and solvent for solution for infusion

ELECTROLYTES: May contain Potassium, sodium

- ▶ **Savene** (Clinigen Healthcare Ltd)

Dexrazoxane 500 mg Savene 500mg powder for concentrate and solvent for solution for infusion vials | 10 vial **[PoM]** no price available

RECOMBINANT HUMAN KERATINOCYTE GROWTH FACTORS**Palifermin**

- **DRUG ACTION** Palifermin is a human keratinocyte growth factor.

INDICATIONS AND DOSE

Management of oral mucositis in patients with haematological malignancies receiving myeloblastic radiochemotherapy with autologous haematopoietic stem-cell support

BY INTRAVENOUS INJECTION

- ▶ **Adult:** 60 micrograms/kg once daily for 3 doses (third dose given 24–48 hours before myeloblastic therapy) then 3 further doses at least 24 hours after myeloblastic therapy, and more than 4 days after most recent palifermin injection, starting on the same day as (but after) stem-cell infusion

- **SIDE-EFFECTS** Arthralgia · discoloration of the tongue · erythema · fever · oedema · oral paraesthesia · pruritus · rash · skin hyperpigmentation · taste disturbance · thickening of the tongue
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- ▶ **Ke pivance** (Swedish Orphan Biovitrum Ltd)

Palifermin 6.25 mg Ke pivance 6.25mg powder for solution for injection vials | 6 vial **[PoM]** £3,265.44

UROPROTECTIVE DRUGS**Mesna****INDICATIONS AND DOSE****Cytotoxic induced urothelial toxicity****BY MOUTH OR BY INTRAVENOUS INJECTION**

- ▶ **Adult:** Dose to be calculated according to oxazaphosphorine (cyclophosphamide or ifosfamide) treatment (consult product literature)

● SIDE-EFFECTS

- ▶ **Common or very common** Colic · depression · diarrhoea · fatigue · headache · hypotension · irritability · joint pains · limb pains · nausea · rash · tachycardia · vomiting
- ▶ **Rare** Hypersensitivity reactions (more common in patients with auto-immune disorders)

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated if history of hypersensitivity to thiol-containing compounds.

- **PREGNANCY** Not known to be harmful. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **EFFECT ON LABORATORY TESTS** False positive urinary ketones. False positive or false negative urinary erythrocytes.

- **DIRECTIONS FOR ADMINISTRATION** For oral administration of the injection, contents of ampoule are taken in a flavoured drink such as orange juice or cola which may be stored in a refrigerator for up to 24 hours in a sealed container.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

- ▶ **MESNA (Non-proprietary)**

Mesna 400 mg Mesna 400mg tablets | 10 tablet **[PoM]** £134.30-£134.40

Mesna 600 mg Mesna 600mg tablets | 10 tablet **[PoM]** £190.60

Solution for injection

Mesna 100 mg per 1 mL Mesna 1g/10mL solution for injection ampoules | 15 ampoule **[PoM]** £441.15 **Mesna 400mg/4mL solution for injection ampoules** | 15 ampoule **[PoM]** £201.15

2.4 Hyperuricaemia associated with cytotoxic drugs

Drugs used for Hyperuricaemia associated with cytotoxic drugs not listed below; Allopurinol, p. 909

URATE OXIDASES

Rasburicase

INDICATIONS AND DOSE

Prophylaxis and treatment of acute hyperuricaemia, before and during initiation of chemotherapy, in patients with haematological malignancy and high tumour burden at risk of rapid lysis

BY INTRAVENOUS INFUSION

▶ Adult: 200 micrograms/kg once daily for up to 7 days according to plasma-uric acid concentration

- **CONTRA-INDICATIONS** G6PD deficiency
- **CAUTIONS** Atopic allergies
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Fever
 - ▶ **Uncommon** Anaphylaxis · bronchospasm · diarrhoea · haemolytic anaemia · headache · hypersensitivity reactions · methaemoglobinaemia · nausea · rash · vomiting
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor closely for hypersensitivity.
- **EFFECT ON LABORATORY TESTS** May interfere with test for uric acid—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Fasturtec[®]), give intermittently in Sodium chloride 0.9%; reconstitute with solvent provided; gently swirl vial without shaking to dissolve; dilute requisite dose to 50 mL with infusion fluid and give over 30 minutes.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for infusion▶ **Fasturtec** (Sanofi)

Rasburicase 1.5 mg Fasturtec 1.5mg powder and solvent for solution for infusion vials | 3 vial [POM] £208.39 (Hospital only)

Rasburicase 7.5 mg Fasturtec 7.5mg powder and solvent for solution for infusion vials | 1 vial [POM] £289.44 (Hospital only)

2.5 *Hormone responsive malignancy***Hormones, malignant disease**

Hormonal manipulation has an important role in the treatment of breast, prostate, and endometrial cancer, and a more marginal role in the treatment of hypernephroma. These treatments are not curative, but may provide excellent palliation of symptoms in selected patients, sometimes for a period of years. Tumour response, and treatment toxicity should be carefully monitored and treatment changed if progression occurs or side-effects exceed benefit.

Oestrogens

Diethylstilbestrol p. 788 is sometimes used to treat prostate cancer, but it is not usually used first-line because of its side-effects. It is occasionally used in postmenopausal women with breast cancer.

Ethinylestradiol p. 655 is the most potent oestrogen available; unlike other oestrogens it is only slowly metabolised in the liver.

Progestogens

Progestogens have a role in the treatment of endometrial cancer; their use in breast cancer and renal cell cancer has declined. Progestogens are now rarely used to treat prostate cancer. Medroxyprogesterone acetate p. 695 or megestrol acetate p. 788 are usually chosen and can be given orally; high-dose or parenteral treatment cannot be recommended.

Androgens

Testosterone esters have largely been superseded by other drugs for breast cancer.

Hormone Antagonists**Breast Cancer**

The management of patients with breast cancer involves surgery, radiotherapy, drug therapy, or a combination of these. For operable breast cancer, treatment before surgery (neoadjuvant therapy) reduces the size of the tumour and facilitates breast-conserving surgery; hormone antagonist therapy (e.g. letrozole) is chosen for steroid hormone-receptor-positive breast cancer and chemotherapy for steroid hormone-receptor-negative tumours or for younger women.

Early breast cancer

All women should be considered for adjuvant therapy following surgical removal of the tumour. Adjuvant therapy is used to eradicate the micrometastases that cause relapses. Choice of adjuvant treatment is determined by the risk of recurrence, steroid hormone-receptor status of the primary tumour, and menopausal status.

Adjuvant therapy comprises cytotoxic chemotherapy and hormone-antagonist therapy. Women with steroid hormone-receptor-positive breast cancer are considered for hormone-antagonist therapy (preceded by cytotoxic chemotherapy if necessary) whilst women with steroid hormone-receptor-negative breast cancer should be considered for cytotoxic chemotherapy.

Aromatase inhibitors act predominantly by blocking the conversion of androgens to oestrogens in the peripheral tissues. They do not inhibit ovarian oestrogen synthesis and should not be used in premenopausal women. Anastrozole p. 792 and letrozole p. 793 are non-steroidal aromatase inhibitors; exemestane p. 792 is a steroidal aromatase inhibitor. Aromatase inhibitors are usually prescribed as initial adjuvant therapy in postmenopausal women with oestrogen-receptor-positive tumours; tamoxifen p. 791, an oestrogen-receptor antagonist, is used if an aromatase inhibitor is not appropriate. Adjuvant hormone antagonist therapy should generally be continued for 5 years following removal of the tumour. In postmenopausal women considered for extended adjuvant therapy, 5 years of tamoxifen is followed by letrozole for a further 2–3 years.

Trastuzumab p. 743 is licensed for use in early breast cancer which overexpresses human epidermal growth factor-2 (HER2) in women who have received surgery, chemotherapy and radiotherapy (as appropriate).

Premenopausal women with oestrogen-receptor-positive breast cancer who decline chemotherapy may benefit from treatment with goserelin or ovarian ablation.

Advanced breast cancer

Treatment of advanced breast cancer depends on the patient's drug history and an assessment of disease severity. Aromatase inhibitors, such as anastrozole or letrozole, are the preferred treatment in postmenopausal women with oestrogen-receptor-positive advanced breast cancer, a long disease-free interval following treatment for early breast cancer, and disease limited to bone or soft tissues; tamoxifen can be used if aromatase inhibitors are not suitable. Progestogens, such as medroxyprogesterone acetate p. 695, may be used after aromatase inhibitors and tamoxifen in postmenopausal women.

Tamoxifen should be considered for pre- and perimenopausal women with oestrogen-receptor-positive breast cancer not previously treated with tamoxifen. Ovarian suppression is used in pre- and perimenopausal women who have had disease progression despite treatment with tamoxifen. The gonadorelin analogue goserelin is licensed for advanced breast cancer in pre- and perimenopausal women suitable for hormone manipulation.

Trastuzumab emtansine p. 744 can be used alone for treating HER2-positive, unresectable, locally advanced breast cancer previously treated with trastuzumab and a taxane, or when there is disease recurrence during or following adjuvant therapy.

Cytotoxic chemotherapy is indicated for advanced steroid hormone-receptor-negative tumours and for aggressive disease, particularly when metastases involve visceral sites (e.g. the liver) or if the disease-free interval following treatment for early breast cancer is short.

Cytotoxic drugs used in breast cancer

An anthracycline combined with fluorouracil p. 761 and cyclophosphamide p. 750, and sometimes also with methotrexate p. 762 is effective. Cyclophosphamide, methotrexate, and fluorouracil can be useful if an anthracycline is inappropriate (e.g. in cardiac disease).

Metastatic disease

The choice of chemotherapy regimen will be influenced by whether the patient has previously received adjuvant treatment and the presence of any co-morbidity.

For women who have not previously received chemotherapy, an anthracycline (such as doxorubicin hydrochloride p. 754 or epirubicin hydrochloride p. 756) alone or in combination with another cytotoxic drug is the standard initial therapy for metastatic breast disease.

Patients with anthracycline-refractory or resistant disease should be considered for treatment with a taxane either alone or in combination with trastuzumab p. 743 if they have tumours that overexpress HER2. Other cytotoxic drugs with activity against breast cancer include capecitabine p. 757, mitoxantrone p. 778, mitomycin p. 767, and vinorelbine p. 775. Trastuzumab p. 743 alone is an option for chemotherapy-resistant cancers that overexpress HER2. Trastuzumab emtansine can be used as monotherapy in HER2-positive metastatic breast cancer previously treated with trastuzumab and a taxane, or when there is a disease recurrence during or following adjuvant therapy.

The use of **bisphosphonates** in patients with metastatic breast cancer may reduce pain and prevent skeletal complications of bone metastases.

Gonadorelin analogues and gonadotrophin-releasing hormone antagonists

Metastatic cancer of the prostate usually responds to hormonal treatment aimed at androgen depletion. Standard treatments include bilateral subcapsular orchidectomy or use of a gonadorelin analogue (buserelin p. 631, goserelin p. 632, leuprorelin acetate p. 633, or triptorelin p. 635). The gonadotrophin-releasing hormone antagonist, degarelix p. 787, is also available. Response in most patients lasts for 12 to 18 months. No entirely satisfactory therapy exists for disease progression despite this treatment (hormone-refractory prostate cancer), but occasional patients respond to other hormone manipulation e.g. with an anti-androgen. Bone disease can often be palliated with irradiation or, if widespread, with strontium ranelate p. 626 or prednisolone p. 585.

Gonadorelin analogues

Gonadorelin analogues are as effective as orchidectomy or diethylstilbestrol p. 788 but are expensive and require parenteral administration, at least initially. They cause initial stimulation then depression of luteinising hormone release by the pituitary.

Gonadorelin analogues are also used in women for breast cancer and other indications. The gonadorelin analogues cause side-effects similar to the menopause in women and orchidectomy in men.

Anti-androgens

Cyproterone acetate p. 662, flutamide p. 787 and bicalutamide p. 786 are anti-androgens that inhibit the tumour 'flare' which may occur after commencing gonadorelin analogue administration. Cyproterone acetate and flutamide are also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy. Bicalutamide is used for prostate cancer either alone or as an adjunct to other therapy, according to the clinical circumstances.

Abiraterone acetate p. 786 (in combination with prednisone p. 586 or prednisolone p. 585) and enzalutamide p. 787 are licensed for metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel-containing chemotherapy regimen. Abiraterone acetate p. 786 and enzalutamide p. 787 are also used to treat metastatic castration-resistant prostate cancer in patients who are asymptomatic or mildly symptomatic after failure of androgen deprivation therapy in whom chemotherapy is not yet clinically indicated. Medical castration with a luteinising hormone-releasing hormone analogue should be continued during treatment in patients not surgically castrated.

Gonadotrophin-releasing hormone antagonists

Degarelix p. 787 is a gonadotrophin-releasing hormone antagonist used to treat advanced hormone-dependent prostate cancer. It does not induce a testosterone surge or tumour 'flare', therefore anti-androgen therapy is not required.

Somatostatin analogues

Lanreotide p. 789, octreotide p. 789 and pasireotide p. 790 are analogues of the hypothalamic release-inhibiting hormone somatostatin. Lanreotide and octreotide are indicated for the relief of symptoms associated with neuroendocrine (particularly carcinoid) tumours and acromegaly. Additionally, lanreotide is licensed for the treatment of thyroid tumours and octreotide is also licensed for the prevention of complications following pancreatic surgery. Lanreotide (*Somatuline Autogel*[®]) is also licensed for the treatment of unresectable locally advanced or metastatic gastroenteropancreatic neuroendocrine tumours of midgut, pancreatic or unknown origin where hindgut sites of origin have been excluded. Octreotide long-acting depot injection is licensed for treatment of advanced neuroendocrine tumours of the midgut, or treatment where primary origin is not known but non-midgut sites of origin have been excluded. Octreotide may also be valuable in reducing vomiting in palliative care and in stopping variceal bleeding [unlicensed indication]—see also vasopressin p. 576 and terlipressin acetate p. 77. Pasireotide is licensed for the treatment of Cushing's disease when surgery has failed or is inappropriate.

ANTI-ANDROGENS

Abiraterone acetate

INDICATIONS AND DOSE

Metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel-containing chemotherapy regimen (in combination with prednisone or prednisolone) | Metastatic castration-resistant prostate cancer in patients who are asymptomatic or mildly symptomatic after failure of androgen deprivation therapy in whom chemotherapy is not yet clinically indicated (in combination with prednisone or prednisolone)

BY MOUTH

- ▶ Adult: 1 g once daily, for dose of concurrent prednisone or prednisolone—consult product literature

- **CAUTIONS** Diabetes (increased risk of hyperglycaemia—monitor blood sugar frequently) · history of cardiovascular disease

CAUTIONS, FURTHER INFORMATION

Cardiovascular disease Correct hypertension and hypokalaemia before treatment (if significant risk of congestive heart failure, such as history of cardiac failure, uncontrolled hypertension or cardiac events, consult product literature for management and increased monitoring).

- **INTERACTIONS** → Appendix 1 (abiraterone). Caution with concurrent chemotherapy—safety and efficacy not established. Caution with concomitant use of drugs known to be associated with myopathy or rhabdomyolysis.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Angina · arrhythmia · atrial fibrillation · diarrhoea · dyspepsia · fractures · haematuria · heart failure · hepatotoxicity · hypertension · hypertriglyceridaemia · hypokalaemia · peripheral oedema · rash · sepsis · tachycardia · urinary tract infection

- ▶ **Uncommon** Adrenal insufficiency · myopathy · rhabdomyolysis

- ▶ **Rare** Allergic alveolitis

- **CONCEPTION AND CONTRACEPTION** Men should use condoms if their partner is pregnant, and use condoms in combination with another effective contraceptive method if their partner is of child-bearing potential—toxicity in animal studies.

- **HEPATIC IMPAIRMENT** Use with caution in moderate impairment and only if benefit clearly outweighs risk. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Use with caution in severe impairment—no information available.

● **MONITORING REQUIREMENTS**

- ▶ Monitor blood pressure, serum potassium concentration, and fluid balance before treatment, and at least monthly during treatment—consult product literature for management of hypertension, hypokalaemia and oedema.
- ▶ Monitor liver function before treatment, then every 2 weeks for the first 3 months of treatment, then monthly thereafter—interrupt treatment if serum alanine aminotransferase or aspartate aminotransferase greater than 5 times the upper limit (consult product literature for details of restarting treatment at a lower dose) and discontinue permanently if 20 times the upper limit.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE technology appraisals (TAs)**

- ▶ Abiraterone for castration-resistant metastatic prostate cancer previously treated with a docetaxel-containing regimen (June 2012) NICE TA259

Abiraterone in combination with prednisone or prednisolone is recommended as an option for the treatment of castration-resistant metastatic prostate cancer only if:

- their disease has progressed on or after one docetaxel-containing chemotherapy regimen, **and**
- the manufacturer provides abiraterone with the discount agreed in the patient access scheme.

Patients currently receiving abiraterone in combination with prednisone or prednisolone whose disease does not meet the first criteria should be able to continue therapy until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA259

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2012) that abiraterone (*Zytiga*®), in combination with prednisone or prednisolone, is accepted for restricted use within NHS Scotland for the treatment of metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with docetaxel-containing chemotherapy regimen, and have received only one prior chemotherapy regimen.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 23

- ▶ *Zytiga* (Janssen-Cilag Ltd) ▼

Abiraterone acetate 250 mg Zytiga 250mg tablets | 120 tablet (POM) £2,930.00

Bicalutamide

INDICATIONS AND DOSE

Locally advanced prostate cancer at high risk of disease progression either alone or as adjuvant treatment to prostatectomy or radiotherapy | Locally advanced, non-metastatic prostate cancer when surgical castration or other medical intervention inappropriate

BY MOUTH

- ▶ Adult: 150 mg once daily

Advanced prostate cancer, in combination with gonadorelin analogue or surgical castration

BY MOUTH

- ▶ Adult: 50 mg once daily, to be started at the same time as surgical castration or at least 3 days before gonadorelin therapy

- **CAUTIONS** Risk of photosensitivity—avoid excessive exposure to UV light and sunlight

- **INTERACTIONS** → Appendix 1 (bicalutamide).

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · alopecia · anaemia · asthenia · breast tenderness · chest pain · cholestasis · constipation · decreased appetite · decreased libido · depression · dizziness · dry skin · dyspepsia · flatulence · gynaecomastia · haematuria · hepatotoxicity · hirsutism · hot flushes · impotence · jaundice · nausea · oedema · pruritus · rash · somnolence · weight gain
- ▶ **Uncommon** Angioedema · hypersensitivity reactions · interstitial lung disease · urticaria
- ▶ **Rare** Hepatic failure · photosensitivity reactions

- **HEPATIC IMPAIRMENT** Increased accumulation possible in moderate to severe impairment—manufacturer advises caution.

- **MONITORING REQUIREMENTS** Consider periodic liver function tests.

● PATIENT AND CARER ADVICE

Risk of photosensitivity. Patients should be advised to consider the use of sunscreen.

Enzalutamide

INDICATIONS AND DOSE

Metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after docetaxel therapy

BY MOUTH

► Adult: 160 mg once daily, for dose adjustments due to side-effects, consult product literature

● **CAUTIONS** Alcoholism · bradycardia · brain injury · brain metastases · brain tumours · history of QT-interval prolongation · history or risk of seizure · recent cardiovascular disease · risk factors for QT-interval prolongation · stroke · uncontrolled hypertension

● **INTERACTIONS** → Appendix 1 (enzalutamide).

Caution with concurrent use of medication which may lower seizure threshold. Caution with concurrent chemotherapy—safety and efficacy not established. Caution with concomitant use of drugs that prolong QT interval.

● SIDE-EFFECTS

► **Common or very common** Anxiety · cognitive disorder · dry skin · falls · fractures · headache · hot flush · hypertension · memory impairment · neutropenia · pruritus · visual hallucinations

► **Uncommon** Leucopenia · seizure

● **CONCEPTION AND CONTRACEPTION** Men should use condoms during treatment and for 3 months after stopping treatment if their partner is pregnant, and use condoms in combination with another effective contraceptive method if their partner is of child-bearing potential—toxicity in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment. Avoid in severe impairment.

● **RENAL IMPAIRMENT** Caution in severe impairment—no information available.

SOMATOSTATIN ANALOGUES**Somatostatin analogues**

- **CAUTIONS** Diabetes mellitus (antidiabetic requirements may be reduced) · insulinoma (increased depth and duration of hypoglycaemia may occur—observe patients and monitor blood glucose levels when initiating treatment and changing doses) · may cause growth hormone-secreting pituitary tumour expansion during treatment (causing serious complications)
- **SIDE-EFFECTS**
 - **Rare** Pancreatitis (shortly after administration)
 - **Frequency not known** Abdominal pain · anorexia · bloating · diarrhoea · flatulence · gallstones (after long-term treatment) · gastro-intestinal disturbances · hyperglycaemia (with chronic administration) · hypoglycaemia · impaired postprandial glucose tolerance (with chronic administration) · irritation at the injection site · nausea · pain at the injection site · steatorrhoea · vomiting
- **MONITORING REQUIREMENTS**
 - Monitor for signs of tumour expansion (e.g. visual field defects).
 - Ultrasound examination of the gallbladder is recommended before treatment and at intervals of 6–12 months during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Injection sites should be rotated.

Lanreotide

INDICATIONS AND DOSE

SOMATULINE AUTOGEL®

Acromegaly (if somatostatin analogue not given previously)

BY DEEP SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 60 mg every 28 days, adjusted according to response, (consult product literature), for patients treated previously with somatostatin analogue, consult product literature for initial dose, dose to be given in the gluteal region

Neuroendocrine (particularly carcinoid) tumours

BY DEEP SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 60–120 mg every 28 days, adjusted according to response, dose to be given in the gluteal region

Unresectable locally advanced or metastatic gastroenteropancreatic neuroendocrine tumours of midgut, pancreatic or unknown origin where hindgut sites of origin have been excluded

BY DEEP SUBCUTANEOUS INJECTION

- ▶ Adult: 120 mg every 28 days

SOMATULINE LA®

Acromegaly and neuroendocrine (particularly carcinoid) tumours

BY INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 30 mg every 14 days, increased to 30 mg every 7–10 days, adjusted according to response

Thyroid tumours

BY INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 30 mg every 14 days, increased to 30 mg every 10 days, adjusted according to response

- **CAUTIONS** Cardiac disorders (including bradycardia) · patients with carcinoid tumours—exclude the presence of an obstructive intestinal tumour before treatment
- **INTERACTIONS** → Appendix 1 (lanreotide).
- **SIDE-EFFECTS**
 - ▶ Common or very common Alopecia · biliary dilatation · bradycardia · constipation · dizziness · dyspepsia · headache · lethargy · malaise · musculoskeletal pain · myalgia · raised bilirubin
 - ▶ Uncommon Hot flashes · insomnia
 - ▶ Rare Hypothyroidism
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS** Monitor for hypothyroidism when clinically indicated.

Lanreotide (as Lanreotide acetate) 120 mg per 1 ml Somatuline Autogel 60mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection [PoM] £551.00

Lanreotide (as Lanreotide acetate) 180 mg per 1 ml Somatuline Autogel 90mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection [PoM] £736.00

Lanreotide (as Lanreotide acetate) 240 mg per 1 ml Somatuline Autogel 120mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection [PoM] £937.00

Powder and solvent for suspension for injection

▶ **Somatuline LA** (Ipsen Ltd)

Lanreotide (as Lanreotide acetate) 30 mg Somatuline LA 30mg powder and solvent for suspension for injection vials | 1 vial [PoM] £323.00

Octreotide

INDICATIONS AND DOSE

Symptoms associated with carcinoid tumours with features of carcinoid syndrome, VIPomas, glucagonomas

BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 50 micrograms 1–2 times a day, adjusted according to response to 200 micrograms 3 times a day, higher doses may be required exceptionally; maintenance doses are variable; in carcinoid tumours, discontinue after 1 week if no effect; if rapid response required, initial dose may be given by intravenous injection (with ECG monitoring)

Acromegaly, short-term treatment before pituitary surgery or long-term treatment in those inadequately controlled by other treatment or until radiotherapy becomes fully effective

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 100–200 micrograms 3 times a day, discontinue if no improvement within 3 months

Prevention of complications following pancreatic surgery

BY SUBCUTANEOUS INJECTION

- ▶ Adult: (consult product literature)

Test dose before use of depot preparation

BY SUBCUTANEOUS INJECTION

- ▶ Adult: Test dose 50–100 micrograms for 1 dose, test dose should be given if subcutaneous octreotide not previously given

Acromegaly | Neuroendocrine (particularly carcinoid) tumour adequately controlled by subcutaneous octreotide

BY DEEP INTRAMUSCULAR INJECTION USING DEPOT INJECTION

- ▶ Adult: Initially 20 mg every 4 weeks for 3 months then adjusted according to response, increased if necessary up to 30 mg every 4 weeks, to be administered into the gluteal muscle, for *acromegaly*, start depot 1 day after the last dose of subcutaneous octreotide, for *neuroendocrine tumours*, continue subcutaneous octreotide for 2 weeks after first dose of depot octreotide

Advanced neuroendocrine tumours of the midgut, or tumours of unknown primary origin where non-midgut sites of origin have been excluded

BY DEEP INTRAMUSCULAR INJECTION USING DEPOT INJECTION

- ▶ Adult: 30 mg every 4 weeks

Reduce intestinal secretions in palliative care | Reduce vomiting due to bowel obstruction in palliative care

BY CONTINUOUS SUBCUTANEOUS INFUSION

- ▶ Adult: 0.25–0.5 mg/24 hours (max. per dose 0.75 mg/24 hours), occasionally doses higher than the maximum are sometimes required

- **INTERACTIONS** → Appendix 1 (octreotide).
- **SIDE-EFFECTS** Alopecia · arrhythmias · biliary colic (associated with abrupt withdrawal of subcutaneous octreotide) · bradycardia · dehydration · dizziness · dyspnoea · headache · hepatitis · pancreatitis (associated with abrupt withdrawal of subcutaneous octreotide) · rash
- **SIDE-EFFECTS, FURTHER INFORMATION** Gastro-intestinal side-effects Administering non-depot injections of octreotide between meals and at bedtime may reduce gastro-intestinal side-effects.
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Adjustment of maintenance dose of non-depot preparations may be necessary in patients with liver cirrhosis.
- **MONITORING REQUIREMENTS**
 - ▶ With intravenous use ECG monitoring required with intravenous administration.
 - ▶ Monitor thyroid function on long-term therapy.
 - ▶ Monitor liver function.
- **TREATMENT CESSATION** Avoid abrupt withdrawal of short-acting subcutaneous octreotide (associated with biliary colic and pancreatitis).
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute with Sodium Chloride 0.9% to a concentration of 10–50%.

900 micrograms twice daily, consider discontinuation if no response within 2 months, for dose adjustment due to side effects—consult product literature

- **CAUTIONS** Cardiac disorders (including bradycardia) · susceptibility to QT-interval prolongation (including electrolyte disturbances)
- **INTERACTIONS** → Appendix 1 (pasireotide). Caution with concomitant use of drugs that prolong QT interval.
- **SIDE-EFFECTS** Adrenal insufficiency · alopecia · anaemia · arthralgia · bradycardia · decreased appetite · fatigue · headache · hyperglycaemia · hypotension · myalgia · pruritus · QT-interval prolongation
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Reduce initial dose to 300 micrograms twice daily (increased if necessary after 2 months to max. 600 micrograms twice daily) in moderate impairment. Avoid in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor liver function before treatment and after 1, 2, 4, 8, and 12 weeks of treatment.
 - ▶ QT-interval prolongation Monitor ECG and electrolytes in patients susceptible to QT-prolongation before treatment, after one week, and periodically thereafter.
 - ▶ Diabetes mellitus In diabetic patients, assess glycaemic status before treatment, weekly for the first 2–3 months of treatment, periodically thereafter, and 3 months after treatment is complete.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Signifor (Novartis Pharmaceuticals UK Ltd) ▼

Pasireotide (as Pasireotide diaspertate) 300 microgram per 1 ml

Signifor 0.3mg/1ml solution for injection ampoules | 60 ampoule [PoM] £2,800.00

Pasireotide (as Pasireotide diaspertate) 600 microgram per 1 ml

Signifor 0.6mg/1ml solution for injection ampoules | 60 ampoule [PoM] £3,240.00

Pasireotide (as Pasireotide diaspertate) 900 microgram per 1 ml

Signifor 0.9mg/1ml solution for injection ampoules | 60 ampoule [PoM] £3,240.00

2.6 Hormone responsive breast cancer

ANTI-OESTROGENS

Fulvestrant

INDICATIONS AND DOSE

Treatment of oestrogen-receptor-positive metastatic or locally advanced breast cancer in postmenopausal women in whom disease progresses or relapses while on, or after, other anti-oestrogen therapy

BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 500 mg every 2 weeks for the first 3 doses, then 500 mg every 1 month, to be administered into the buttock

● SIDE-EFFECTS

- ▶ Common or very common Anorexia · asthenia · back pain · diarrhoea · headache · hot flushes · hypersensitivity reactions · injection-site reactions · nausea · rash · urinary-tract infections · venous thromboembolism · vomiting

Pasireotide

INDICATIONS AND DOSE

Cushing's disease when surgery has failed or is inappropriate

BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 600 micrograms twice daily for 2 months, then increased if necessary to

- ▶ **Uncommon** Leucorrhoea · vaginal candidiasis · vaginal haemorrhage
- **PREGNANCY** Manufacturer advises avoid—increased incidence of fetal abnormalities and death in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 30 mL/minute—no information available.
- **DIRECTIONS FOR ADMINISTRATION** 500 mg dose should be administered as one 250-mg injection (slowly over 1–2 minutes) into each buttock.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Faslodex** (AstraZeneca UK Ltd)

Fulvestrant 50 mg per 1 ml Faslodex 250mg/5ml solution for injection pre-filled syringes | 2 pre-filled disposable injection [PoM] £522.41

Tamoxifen

- **DRUG ACTION** An anti-oestrogen which induces gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used as an adjunct in the treatment of female infertility.

INDICATIONS AND DOSE

Pre- and perimenopausal women with oestrogen-receptor-positive breast cancer not previously treated with tamoxifen

BY MOUTH

- ▶ Adult: 20 mg daily

Anovulatory infertility

BY MOUTH

- ▶ Adult: Initially 20 mg daily on days 2, 3, 4 and 5 of cycle, if necessary the daily dose may be increased to 40 mg then 80 mg for subsequent courses; if cycles irregular, start initial course on any day, with subsequent course starting 45 days later or on day 2 of cycle if menstruation occurs

- **CONTRA-INDICATIONS** Treatment of infertility contra-indicated if personal or family history of idiopathic venous thromboembolism or genetic predisposition to thromboembolism
- **CAUTIONS** Porphyria
- **INTERACTIONS** → Appendix 1 (tamoxifen).
- **SIDE-EFFECTS**
 - ▶ **Rare** Angioedema · bullous pemphigoid · cholestasis · fatty liver · hepatitis · hypersensitivity reactions · hypertriglyceridaemia · interstitial pneumonitis · neutropenia · Stevens-Johnson syndrome
 - ▶ **Frequency not known** Alopecia · anaemia · cataracts · corneal changes · decreased platelet counts · endometrial changes · gastrointestinal disturbances · headache · hot flushes · hypercalcaemia if bony metastases · increased risk of thromboembolic events, especially when used with cytotoxics · leucopenia · light-headedness · liver enzyme changes · occasional cystic ovarian swellings in premenopausal women · occasionally oedema · pancreatitis · pruritus vulvae · rashes · retinopathy · suppression of menstruation in some premenopausal women · thrombocytopenia · thromboembolic events ·

tumour flare · uterine fibroids · vaginal bleeding · vaginal discharge · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Endometrial changes Increased endometrial changes, including hyperplasia, polyps, cancer, and uterine sarcoma reported; prompt investigation required if abnormal vaginal bleeding including menstrual irregularities, vaginal discharge, and pelvic pain or pressure in those receiving (or who have received) tamoxifen.

Risk of thromboembolism Tamoxifen can increase the risk of thromboembolism particularly during and immediately after major surgery or periods of immobility (consider interrupting treatment to initiate anticoagulant measures).

- **CONCEPTION AND CONTRACEPTION** Unless being used in the treatment of female infertility, effective contraception must be used during treatment and for 2 months after stopping. Patients being treated for infertility should be warned that there is a risk of multiple pregnancy (*rarely* more than twins).
- **PREGNANCY** Avoid—possible effects on fetal development.
- **BREAST FEEDING** Suppresses lactation. Avoid unless potential benefit outweighs risk.
- **PATIENT AND CARER ADVICE** Endometrial changes Patients should be informed of the risk of endometrial cancer and told to report relevant symptoms promptly. Thromboembolism Patients should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness and any pain in the calf of one leg.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

- ▶ **TAMOXIFEN (Non-proprietary)**

Tamoxifen (as Tamoxifen citrate) 10 mg Tamoxifen 10mg tablets | 30 tablet [PoM] £37.99 DT price = £33.26

Tamoxifen (as Tamoxifen citrate) 20 mg Tamoxifen 20mg tablets | 30 tablet [PoM] £13.00 DT price = £4.49

Tamoxifen (as Tamoxifen citrate) 40 mg Tamoxifen 40mg tablets | 30 tablet [PoM] £23.97 DT price = £23.52

Oral suspension

- ▶ **TAMOXIFEN (Non-proprietary)**

Tamoxifen (as Tamoxifen citrate) 2 mg per 1 ml Tamoxifen 10mg/5ml oral suspension | 150 ml [PoM] no price available

Oral solution

- ▶ **TAMOXIFEN (Non-proprietary)**

Tamoxifen (as Tamoxifen citrate) 2 mg per 1 ml Tamoxifen 10mg/5ml oral solution sugar free (sugar-free) | 150 ml [PoM] no price available

- ▶ Brands may include Soltamox

Toremifene

INDICATIONS AND DOSE

Hormone-dependent metastatic breast cancer in postmenopausal women

BY MOUTH

- ▶ Adult: 60 mg daily

- **CONTRA-INDICATIONS** Bradycardia · electrolyte disturbances (particularly uncorrected hypokalaemia) · endometrial hyperplasia · heart failure with reduced left-ventricular ejection fraction · history of arrhythmias · QT prolongation
- **CAUTIONS** Avoid in Acute porphyrias p. 864 · history of severe thromboembolic disease
- **INTERACTIONS** → Appendix 1 (toremifene).

Avoid concomitant administration of drugs that prolong QT interval.

● SIDE-EFFECTS

- ▶ **Common or very common** Depression · dizziness · fatigue · hot flushes · nausea · oedema · rash · sweating · vaginal bleeding · vaginal discharge · vomiting
- ▶ **Uncommon** Anorexia · constipation · dyspnoea · endometrial hypertrophy · headache · increased weight · insomnia · thromboembolic events
- ▶ **Very rare** Alopecia · jaundice · transient corneal opacity
- ▶ **Frequency not known** Hypercalcaemia (especially if bone metastases and usually at beginning of treatment)

SIDE-EFFECTS, FURTHER INFORMATION

Endometrial changes Increased endometrial changes, including hyperplasia, polyps and cancer reported. Abnormal vaginal bleeding including menstrual irregularities, vaginal discharge and symptoms such as pelvic pain or pressure should be promptly investigated.

● PREGNANCY

Avoid.

● BREAST FEEDING

Avoid.

● HEPATIC IMPAIRMENT

Elimination decreased in hepatic impairment—avoid if severe.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Fareston** (Orion Pharma (UK) Ltd)
Toremifene (as Toremifene citrate) 60 mg Fareston 60mg tablets | 30 tablet [PoM](#) £29.08

AROMATASE INHIBITORS

Anastrozole

INDICATIONS AND DOSE

Adjuvant treatment of oestrogen-receptor-positive early invasive breast cancer in postmenopausal women | Adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy | Advanced breast cancer in postmenopausal women which is oestrogen-receptor-positive or responsive to tamoxifen

BY MOUTH

- ▶ Adult: 1 mg daily

● CONTRA-INDICATIONS

Not for premenopausal women

● CAUTIONS

Susceptibility to osteoporosis

● SIDE-EFFECTS

- ▶ **Very rare** Allergic reactions · anaphylaxis · angioedema
- ▶ **Frequency not known** Anorexia · arthralgia · arthritis · asthenia · bone fractures · bone pain · cutaneous vasculitis · diarrhoea · drowsiness · hair thinning · headache · hot flushes · nausea · rash · slight increases in total cholesterol levels · Stevens-Johnson syndrome · vaginal bleeding · vaginal dryness · vomiting

● PREGNANCY

Avoid.

● BREAST FEEDING

Avoid.

● HEPATIC IMPAIRMENT

Avoid in moderate to severe impairment.

● RENAL IMPAIRMENT

Avoid if creatinine clearance less than 20 mL/minute.

● PRE-TREATMENT SCREENING

Laboratory test for menopause if doubt.

● MONITORING REQUIREMENTS

▶ Osteoporosis Assess bone mineral density before treatment and at regular intervals.

● PATIENT AND CARER ADVICE

Asthenia and drowsiness may initially affect ability to drive or operate machinery.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **ANASTROZOLE (Non-proprietary)**
Anastrozole 1 mg Anastrozole 1mg tablets | 28 tablet [PoM](#) £68.56 DT price = £1.98
- ▶ **Arimidex** (AstraZeneca UK Ltd)
Anastrozole 1 mg Arimidex 1mg tablets | 28 tablet [PoM](#) £68.56 DT price = £1.98

Exemestane

INDICATIONS AND DOSE

Adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy | Advanced breast cancer in postmenopausal women in whom anti-oestrogen therapy has failed

BY MOUTH

- ▶ Adult: 25 mg daily

● CONTRA-INDICATIONS

Not indicated for premenopausal women

● INTERACTIONS

→ Appendix 1 (exemestane).

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · alopecia · anorexia · constipation · depression · dizziness · dyspepsia · fatigue · headache · hot flushes · insomnia · nausea · rash · sweating · vomiting
- ▶ **Uncommon** Asthenia · drowsiness · peripheral oedema
- ▶ **Rare** Leucopenia · thrombocytopenia

● PREGNANCY

Avoid.

● BREAST FEEDING

Avoid.

● HEPATIC IMPAIRMENT

Manufacturer advises caution.

● RENAL IMPAIRMENT

Manufacturer advises caution.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2005) that exemestane (*Aromasin*[®]) is accepted for restricted use within NHS Scotland as an adjuvant treatment in postmenopausal women with oestrogen-receptor-positive invasive early breast cancer, following 2–3 years of initial adjuvant tamoxifen therapy.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Exemestane 25 mg Exemestane 25mg tablets | 30 tablet [PoM](#) £88.80 DT price = £22.48 | 90 tablet [PoM](#) no price available

▶ Aromasin (Pfizer Ltd)

Exemestane 25 mg Aromasin 25mg tablets | 30 tablet [PoM](#) £88.80 DT price = £22.48

Letrozole

INDICATIONS AND DOSE

First-line treatment in postmenopausal women with hormone-dependent advanced breast cancer | Adjuvant treatment of oestrogen-receptor-positive invasive early breast cancer in postmenopausal women | Advanced breast cancer in postmenopausal women (naturally or artificially induced menopause) in whom their anti-oestrogen therapy has failed | Extended adjuvant treatment of hormone-dependent invasive breast cancer in postmenopausal women who have received standard adjuvant tamoxifen therapy for 5 years | Neo-adjuvant treatment in postmenopausal women with localised hormone-receptor-positive, human epidermal growth factor-2 negative breast cancer where chemotherapy is not suitable and surgery not yet indicated

BY MOUTH

► Adult: 2.5 mg daily

- **CONTRA-INDICATIONS** Not indicated for premenopausal women
- **CAUTIONS** Susceptibility to osteoporosis
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · alopecia · anorexia · appetite increase · arthralgia · bone fracture · constipation · depression · diarrhoea · dizziness · dry skin · dyspepsia · fatigue · headache · hot flushes · hypercholesterolaemia · hypertension · increased sweating · musculoskeletal pain · nausea · osteoporosis · peripheral oedema · rash · vaginal bleeding · vomiting · weight changes
 - **Uncommon** Anxiety · arthritis · blurred vision · breast pain · cardiac events · cataract · cerebrovascular events · cough · dysaesthesia · dyspnoea · eye irritation · general oedema · insomnia · leucopenia · memory impairment · mucosal dryness · palpitation · pruritus · pyrexia · stomatitis · tachycardia · taste disturbance · thrombophlebitis · tumour pain · urinary frequency · urinary-tract infection · urticaria · vaginal discharge
 - **Rare** Arterial thrombosis · pulmonary embolism
 - **Frequency not known** Hepatitis · toxic epidermal necrolysis
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required until postmenopausal status fully established (return of ovarian function reported in postmenopausal women).
- **PREGNANCY** Avoid (isolated cases of birth defects reported).
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 10 mL/minute.
- **MONITORING REQUIREMENTS**
 - Osteoporosis Assess bone mineral density before treatment and at regular intervals.

MEDICINAL FORMS

Letrozole 2.5 mg Femara 2.5mg tablets | 30 tablet PoM £90.92

2.7 Immunotherapy responsive malignancy

IMMUNOMODULATING DRUGS

Mifamurtide

INDICATIONS AND DOSE

Treatment of high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection (in combination with chemotherapy)

BY INTRAVENOUS INFUSION

► Adult: Infusion to be given over 1 hour (consult product literature or local protocols)

- **UNLICENSED USE** Not licensed for use in patients over 30 years of age at initial diagnosis.
- **CAUTIONS** Asthma—consider prophylactic bronchodilator therapy · chronic obstructive pulmonary disease—consider prophylactic bronchodilator therapy · history of autoimmune disease · history of collagen disease · history of inflammatory disease
- **INTERACTIONS** → Appendix 1 (mifamurtide).
- **SIDE-EFFECTS** Abdominal pain · alopecia · anaemia · anorexia · anxiety · blurred vision · confusion · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry skin · dyspepsia · dyspnoea · dysuria · epistaxis · flushing · gastro-intestinal disturbances · granulocytopenia · haematuria · haemoptysis · headache · hearing loss · hypertension · hypoaesthesia · hypokalaemia · hypotension · insomnia · leucopenia · musculoskeletal pain · nausea · oedema · palpitations · paraesthesia · phlebitis · pleural effusion · pollakiuria · rash · respiratory disorders · sweating · tachycardia · tachypnoea · thrombocytopenia · tinnitus · tremor · vertigo · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution—no information available.
- **RENAL IMPAIRMENT** Use with caution—no information available.
- **MONITORING REQUIREMENTS**
 - Monitor renal function, hepatic function and clotting parameters.
 - Monitor patients with history of venous thrombosis, vasculitis, or unstable cardiovascular disorders for persistent or worsening symptoms during administration—consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

 - Mifamurtide for the treatment of osteosarcoma (October 2011) NICE TA235

Mifamurtide in combination with postoperative multi-agent chemotherapy is recommended (within its licensed indication), as an option for the treatment of high-grade resectable non-metastatic osteosarcoma after macroscopically complete surgical resection in children, adolescents and young adults and when mifamurtide is made available at a reduced cost to the NHS under the patient access scheme. www.nice.org.uk/TA235
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder for suspension for infusion

► **Mepact** (Takeda UK Ltd)

Mifamuride 4 mg Mepact 4mg powder for suspension for infusion vials | 1 vial **[PoM]** no price available

IMMUNOSTIMULANTS**Histamine dihydrochloride****INDICATIONS AND DOSE**

Maintenance therapy, in combination with aldesleukin, in patients with acute myeloid leukaemia in first remission
BY SUBCUTANEOUS INJECTION

► Adult: (consult local protocol)

- **CONTRA-INDICATIONS** Consult product literature for information about histamine dihydrochloride contra-indications.
- **CAUTIONS** Consult product literature for information about histamine dihydrochloride cautions.
- **INTERACTIONS** → Appendix 1 (histamine).
- **SIDE-EFFECTS** Consult product literature for side effects.
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Increased risk of tachycardia and hypotension in moderate to severe impairment.
- **RENAL IMPAIRMENT** Increased risk of hypotension in severe impairment.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium* has advised (December 2010) that histamine dihydrochloride (*Ceplene*®) is **not** recommended for use within NHS Scotland.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► **Ceplene** (Meda Pharmaceuticals Ltd) ▼

Histamine dihydrochloride 1 mg per 1 ml Ceplene 0.5mg/0.5ml solution for injection vials | 14 vial **[PoM]** £1,181.32

IMMUNOTHERAPIES**Bacillus calmette-guérin**

- **DRUG ACTION** Bacillus Calmette-Guérin is a live attenuated strain derived from *Mycobacterium bovis*.

INDICATIONS AND DOSE

Bladder instillation for the treatment of primary or recurrent bladder carcinoma and for the prevention of recurrence following transurethral resection

BY INTRAVESICAL INSTILLATION

► Adult: (consult product literature)

- **CONTRA-INDICATIONS** Fever of unknown origin · HIV infection · impaired immune response · severe haematuria · tuberculosis · urinary-tract infection
- **CAUTIONS** Bladder injury (delay administration until mucosal damage healed) · traumatic catheterisation (delay administration until mucosal damage healed) · urethral injury (delay administration until mucosal damage healed)

● SIDE-EFFECTS

- **Rare** Arthralgia · bladder contracture · hypersensitivity reactions · orchitis · rash · renal abscess · transient urethral obstruction
- **Frequency not known** Cystitis · dysuria · fever · haematuria · influenza-like syndrome · malaise · ocular symptoms · systemic BCG infection (with fatalities)—consult product literature · urinary frequency

● **PREGNANCY** Avoid.

● **BREAST FEEDING** Avoid.

● **PRE-TREATMENT SCREENING** Screen for active tuberculosis (contra-indicated if tuberculosis confirmed).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for reconstitution for instillation

► **ImmuCyst** (Alliance Pharmaceuticals Ltd)

Connaught strain Bacillus of Calmette-Guérin 81 mg ImmuCyst 81mg powder for reconstitution for instillation vials | 1 vial **[PoM]** £79.23 (Hospital only)

► **OncoTICE** (Merck Sharp & Dohme Ltd)

TICE strain Bacillus of Calmette-Guérin 12.5 mg OncoTICE 12.5mg powder for reconstitution for instillation vials | 1 vial **[PoM]** £71.61 (Hospital only)

INTERFERONS**Interferon alfa**

- **DRUG ACTION** Interferon alfa has shown some antitumour effect in certain lymphomas and solid tumours.

INDICATIONS AND DOSE**INTRONA® PEN**

Chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine) | Hairy cell leukaemia | Follicular lymphoma | Lymph or liver metastases of carcinoid tumour | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | Maintenance of remission in multiple myeloma

BY SUBCUTANEOUS INJECTION

► Adult: (consult local protocol)

INTRONA® VIALS

Chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine) | Hairy cell leukaemia | Follicular lymphoma | Lymph or liver metastases of carcinoid tumour | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | Maintenance of remission in multiple myeloma

BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INFUSION

► Adult: (consult local protocol)

ROFERON-A®

Chronic myelogenous leukaemia | Hairy cell leukaemia | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | AIDS-related Kaposi's sarcoma | Advanced renal cell carcinoma | Progressive cutaneous T-cell lymphoma | Follicular non-Hodgkin's lymphoma

BY SUBCUTANEOUS INJECTION

► Adult: (consult local protocol)

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates

CONTRA-INDICATIONS, FURTHER INFORMATION

For contra-indications consult product literature and local treatment protocol.

- **CAUTIONS** For cautions consult product literature and local treatment protocol.
- **INTERACTIONS** → Appendix 1 (interferons).

● SIDE-EFFECTS

- ▶ **Common or very common** Anorexia · diarrhoea · influenza-like symptoms · lethargy · nausea
- ▶ **Frequency not known** Alopecia · arrhythmias · cardiovascular problems · coma (usually with high doses in the elderly) · confusion · depression · hepatotoxicity · hyperglycaemia · hypersensitivity reactions · hypertension · hypertriglyceridaemia (sometimes severe) · hypotension · myelosuppression (particularly affecting granulocyte counts) · nephrotoxicity · ocular side-effects · palpitation · psoriasisiform rash · seizures (usually with high doses in the elderly) · suicidal behaviour · thyroid abnormalities

SIDE-EFFECTS, FURTHER INFORMATION

Consult product literature and local treatment protocols for information on side-effects.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in *animal* studies).
- **BREAST FEEDING** Unlikely to be harmful.
- **HEPATIC IMPAIRMENT** Avoid in severe hepatic impairment. Close monitoring required in mild to moderate hepatic impairment.
- **RENAL IMPAIRMENT** Avoid in severe renal impairment. Close monitoring required in mild to moderate renal impairment.
- **MONITORING REQUIREMENTS** Monitoring of lipid concentration is recommended.

● DIRECTIONS FOR ADMINISTRATION

INTRONA® PEN

Introna injection pen for subcutaneous injection Each 1.5-mL multidose cartridge delivers 12 doses of 0.1 mL i.e. a total of 1.2 mL.

INTRONA® VIALS

Introna® injection vials for subcutaneous injection or intravenous infusion.

ROFERON-A®

Roferon-A® injection for subcutaneous injection.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010) NICE TA200
Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa.
www.nice.org.uk/TA200

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Interferon gamma-1b (Immune interferon)

INDICATIONS AND DOSE

To reduce the frequency of serious infection in chronic granulomatous disease

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 50 micrograms/m² 3 times a week

To reduce the frequency of serious infection in severe malignant osteoporosis

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 50 micrograms/m² 3 times a week

- **CAUTIONS** Arrhythmias · cardiac disease · congestive heart failure · ischaemia · seizure disorders (including seizures associated with fever)
- **INTERACTIONS** → Appendix 1 (interferons).
Avoid simultaneous administration of foreign proteins including immunological products (risk of exaggerated immune response).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · arthralgia · chills · depression · diarrhoea · fatigue · fever · headache · injection-site reactions · myalgia · nausea · rash · vomiting
 - ▶ **Rare** Confusion · systemic lupus erythematosus
 - ▶ **Frequency not known** Neutropenia · proteinuria · raised liver enzymes · thrombocytopenia
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.
- **PREGNANCY** Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in *animal* studies).
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—risk of accumulation.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—risk of accumulation.
- **MONITORING REQUIREMENTS** Monitor before and during treatment: haematological tests (including full blood count, differential white cell count, and platelet count), blood chemistry tests (including renal and liver function tests) and urinalysis.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Immunukin** (Boehringer Ingelheim Ltd)

Interferon gamma-1b (recombinant human) 200 microgram per 1 ml Immunukin 100micrograms/0.5ml solution for injection vials | 6 vial [PoM] £450.00

INTERLEUKINS

Aldesleukin

- **DRUG ACTION** Aldesleukin produces tumour shrinkage in a small proportion of patients, but it has not been shown to increase survival.

INDICATIONS AND DOSE

Metastatic renal cell carcinoma (specialist use only)

BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

- **UNLICENSED USE** Aldesleukin is not licensed for use in patients in whom all three of the following prognostic factors are present: performance status of Eastern Co-operative Oncology Group of 1 or greater, more than one organ with metastatic disease sites, and a period of less than 24 months between initial diagnosis of primary tumour and date of evaluation of treatment.

- **CONTRA-INDICATIONS** Consult product literature for information about aldesleukin contra-indications.

- **CAUTIONS** Consult product literature for information about aldesleukin cautions.

- **INTERACTIONS** → Appendix 1 (aldesleukin).

● **SIDE-EFFECTS**

- **Common or very common** Bone-marrow toxicity · CNS toxicity · hepatic toxicity · renal toxicity · thyroid toxicity
- **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

● **SIDE-EFFECTS, FURTHER INFORMATION**

Also consult product literature.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women.

- **PREGNANCY** Use only if potential benefit outweighs risk (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING** Discontinue breast-feeding.

- **DIRECTIONS FOR ADMINISTRATION** Aldesleukin is now rarely given by intravenous infusion because of an increased risk of capillary leak syndrome, which can cause pulmonary oedema and hypotension.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

► **Proleukin** (Novartis Pharmaceuticals UK Ltd)

Aldesleukin 18 mega u Proleukin 18million unit powder for solution for injection vials | 1 vial [PoM] £112.00 | 10 vial [PoM] £1,036.00

THALIDOMIDE AND RELATED ANALOGUES

Lenalidomide

- **DRUG ACTION** Lenalidomide is an immunomodulating drug with anti-neoplastic, anti-angiogenic, and pro-erythropoietic properties.

INDICATIONS AND DOSE

Multiple myeloma (newly diagnosed) in patients not eligible for transplant, given in combination with dexamethasone until disease progression

BY MOUTH

- Adult: 25 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature

Multiple myeloma (newly diagnosed) in patients not eligible for transplant, given in combination with melphalan and prednisone followed by maintenance monotherapy

BY MOUTH

- Adult: 10 mg once daily for 21 consecutive days of repeated 28-day cycles for up to 9 cycles, for doses of melphalan and prednisone, and dose adjustments due to side-effects, consult product literature

Multiple myeloma in patients who have received at least one prior therapy, given in combination with dexame-thasone

BY MOUTH

- Adult: 25 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature

Treatment of transfusion-dependent anaemia due to low- or intermediate-1-risk myelodysplastic syndromes (MDS) associated with an isolated deletion 5q cytogenetic abnormality when other treatment options are insufficient or inadequate

BY MOUTH

- Adult: 10 mg once daily for 21 consecutive days of repeated 28-day cycles, for dose adjustments due to side-effects, consult product literature

- **CAUTIONS** High tumour burden—risk of tumour lysis syndrome · patients with risk factors for myocardial infarction

● **CAUTIONS, FURTHER INFORMATION**

Thromboembolism Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised and thromboprophylaxis should be considered in patients with multiple risk factors.

Second primary malignancy Patients should be carefully evaluated before and during treatment with lenalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated.

- **INTERACTIONS** → Appendix 1 (lenalidomide).

Use caution with concomitant drugs that increase the risk of thromboembolism.

- **SIDE-EFFECTS**

- **Common or very common** Abdominal pain · anaemia · arrhythmias · arthralgia · ataxia · atrial fibrillation · bacterial infections · bradycardia · cardiac failure · cataract · cerebrovascular events · chest pain · cholestasis · constipation · decreased appetite · deep vein thrombosis · dehydration · depression · diarrhoea · dizziness · dry mouth · dyspepsia · dysphagia · dyspnoea · electrolyte disturbances · falls · flu-like illness · fungal infections · haematoma · haematuria · haemorrhagic disorders · headache · hearing disturbances · hyperglycaemia · hyperhidrosis · hypertension · hypotension · hypothyroidism · insomnia · iron-overload · lethargy · leucopenia · malaise · mood changes · musculoskeletal disorders · myalgia · myocardial infarction · nausea · oedema · peripheral neuropathy · pneumonia · pruritus · pulmonary embolism · pyrexia · rash · renal failure · respiratory distress · respiratory tract infections · sepsis · severe neutropenia · sexual dysfunction · sinusitis · skin disorders · stomatitis · syncope · tachycardia · taste disturbance · thrombocytopenia · tremor · urinary incontinence · urinary retention · vasculitis · viral infections · visual disturbances · vomiting
- **Uncommon** Acquired Fanconi syndrome · angioedema · blindness · caecitis · clotting disorders · colitis · haemolysis · hepatic failure · ischaemia · secondary malignancies
- **Rare** Stevens-Johnson syndrome · toxic epidermal necrolysis · tumour lysis syndrome

- ▶ **Frequency not known** Cholestatic hepatitis · cytolytic hepatitis · interstitial pneumonitis · leukocytoclastic vasculitis · pancreatitis · toxic hepatitis

SIDE-EFFECTS, FURTHER INFORMATION

Rash If rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation. Discontinue permanently if angioedema, exfoliative or bullous rash, or if Stevens-Johnson syndrome or toxic epidermal necrolysis is suspected. For information on side effects consult product literature.

- **CONCEPTION AND CONTRACEPTION** For women of child-bearing potential, pregnancy must be excluded before starting treatment with lenalidomide (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intra-uterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of childbearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer's Pregnancy Prevention Programme.

- **PREGNANCY Important: teratogenic risk.**

Lenalidomide is structurally related to thalidomide and there is a risk of teratogenesis.

- **BREAST FEEDING** Discontinue breast-feeding—no information available.

- **RENAL IMPAIRMENT** Reduce dose in moderate to severe impairment—consult product literature.

- **MONITORING REQUIREMENTS**

- ▶ Monitor full blood count (including differential white cell count, platelet count, haemoglobin, and haematocrit) and liver function before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia, thrombocytopenia or impaired liver function develop—consult product literature).
- ▶ Monitor for arterial or venous thromboembolism (if thromboembolic event occurs, discontinue lenalidomide and treat with standard anticoagulation therapy; lenalidomide may be restarted with continued anticoagulation therapy once thromboembolic event resolved—consult product literature).
- ▶ Monitor thyroid function.
- ▶ Monitor for signs and symptoms of peripheral neuropathy.
- ▶ Monitor visual ability regularly (risk of cataract).
- ▶ Hepatic disorders Liver function should be monitored particularly when there is history of, or concurrent viral liver infection, or when lenalidomide is combined with drugs known to be associated with liver dysfunction (e.g. paracetamol).

- **PRESCRIBING AND DISPENSING INFORMATION** Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form.

- **PATIENT AND CARER ADVICE**

Patient counselling is advised for lenalidomide capsules (pregnancy and contraception).
Thromboembolism Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.

Neutropenia and thrombocytopenia Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of

neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE technology appraisals (TAs)**

- ▶ **Lenalidomide for the treatment of multiple myeloma (June 2009)** NICE TA171
Lenalidomide in combination with dexamethasone is an option for the treatment of multiple myeloma in patients who have received two or more prior therapies. The drug cost of lenalidomide will be met by the manufacturer for patients who remain on treatment for more than 26 cycles. www.nice.org.uk/TA171

- ▶ **Lenalidomide for treating myelodysplastic syndromes associated with an isolated deletion 5q cytogenetic abnormality (September 2014)** NICE TA322

Lenalidomide is recommended as an option, within its marketing authorisation, for treating transfusion-dependent anaemia caused by low or intermediate-1-risk myelodysplastic syndromes associated with an isolated deletion 5q cytogenetic abnormality when other therapeutic options are insufficient or inadequate, with the following condition:

- the drug cost of lenalidomide (excluding any related costs) for people who remain on treatment for more than 26 cycles (each of 28 days; normally a period of 2 years) will be met by the company. www.nice.org.uk/TA322

- **Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (April 2010) that lenalidomide, in combination with dexamethasone, is accepted for restricted use within NHS Scotland for patients with multiple myeloma who have received at least two prior therapies and (March 2014) for those who have received prior treatment with bortezomib and for whom thalidomide has not been tolerated or is contraindicated.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Pomalidomide

- **DRUG ACTION** Pomalidomide is structurally related to thalidomide and has immunomodulatory properties and direct anti-myeloma tumoricidal activity.

INDICATIONS AND DOSE

Treatment of relapsed and refractory multiple myeloma in patients who have received at least two prior treatment regimens, including both lenalidomide and bortezomib, and who have had disease progression during the last treatment (in combination with dexamethasone)

BY MOUTH

- ▶ Adult: 4 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone and dose adjustment due to side effects—consult product literature

- **CAUTIONS** Cardiac disease · cardiac risk factors · high tumour burden—risk of tumour lysis syndrome · interstitial lung disease—discontinue if suspected · peripheral neuropathy
- **CAUTIONS, FURTHER INFORMATION**
Thromboembolism Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised. Thromboprophylaxis should be considered, particularly in patients with additional risk factors.
Second primary malignancy Patients should be carefully evaluated before and during treatment with pomalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated.
- **INTERACTIONS** → Appendix 1 (pomalidomide). Use caution with concomitant drugs that increase the risk of bleeding or thromboembolism.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · bone pain · cardiac failure · confusion · constipation · cough · decreased appetite · diarrhoea · dizziness · dyspnoea · febrile neutropenia · hyperkalaemia · hyponatraemia · impaired consciousness · interstitial lung disease · leucopenia · malaise · muscle spasms · nasopharyngitis · nausea · neutropenia · neutropenic sepsis · pelvic pain · peripheral neuropathy · peripheral oedema · pneumonia · pruritus · pyrexia · rash · renal failure · respiratory tract infection · thrombocytopenia · thromboembolic events · tremor · urinary retention · vertigo · vomiting

Thalidomide

- **DRUG ACTION** Thalidomide has immunomodulatory and anti-inflammatory activity.

INDICATIONS AND DOSE

First-line treatment for untreated multiple myeloma, in patients aged 65 years and over, or for those not eligible for high-dose chemotherapy (for example, patients with significant co-morbidity such as cardiac risk factors) in combination with melphalan and prednisolone

BY MOUTH

- ▶ **Adult:** 200 mg once daily for 6-week cycle for a maximum of 12 cycles, dose to be taken at bedtime

- **CAUTIONS** High tumour burden—risk of tumour lysis syndrome
- **CAUTIONS, FURTHER INFORMATION**
Thromboembolism Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised. Thromboprophylaxis is recommended for at least the first 5 months of treatment, especially in patients with additional thrombotic risk factors.
Second primary malignancy Patients should be carefully evaluated before and during treatment with thalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated.
Peripheral neuropathy Patients with pre-existing peripheral neuropathy should not be treated with thalidomide unless the potential clinical benefits outweigh the risk.

● **INTERACTIONS** Use caution with concomitant drugs that increase the risk of peripheral neuropathy or thromboembolism.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Anaemia · asthenia · bradycardia · cardiac failure · confusion · constipation · deep vein thrombosis · depression · dizziness · drowsiness · dry mouth · dysaesthesia · dyspepsia · dyspnoea · interstitial lung disease · leucopenia · lymphopenia · neutropenia · paraesthesia · peripheral neuropathy · peripheral oedema · pneumonia · pulmonary embolism · pyrexia · skin reactions · Stevens-Johnson syndrome · syncope · thrombocytopenia · tremor · vomiting
- ▶ **Frequency not known** Atrial fibrillation · atrioventricular block · cerebrovascular events · convulsions · gastro-intestinal haemorrhage · gastro-intestinal perforation · hearing loss · hepatic disorders · hypothyroidism · intestinal obstruction · menstrual disorders · myocardial infarction · renal failure · second primary malignancy · sexual dysfunction · toxic epidermal necrolysis · worsening of Parkinson's disease symptoms

SIDE-EFFECTS, FURTHER INFORMATION

Rash If rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation.

Peripheral neuropathy If symptoms suggestive of peripheral neuropathy develop (such as paraesthesia, abnormal coordination, or weakness) dose reduction, dose interruption, or treatment discontinuation may be necessary—consult product literature.

● **CONCEPTION AND CONTRACEPTION** For women of child-bearing potential, pregnancy must be excluded before starting treatment with thalidomide (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intra-uterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of childbearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer's Pregnancy Prevention Programme.

● **PREGNANCY Important: teratogenic risk.**

● **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Caution in severe impairment—no information available.

● **RENAL IMPAIRMENT** Caution in severe impairment—no information available.

● **MONITORING REQUIREMENTS**

- ▶ Monitor white blood cell count (including differential count) and platelet count (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop—consult product literature).
- ▶ Monitor for arterial or venous thromboembolism.
- ▶ Monitor patients for signs and symptoms of peripheral neuropathy.
- ▶ Hepatic disorder Liver function should be monitored, particularly when there is history of, or concurrent viral liver infection, or when thalidomide is combined with drugs known to be associated with liver dysfunction (e.g. paracetamol).

● **PRESCRIBING AND DISPENSING INFORMATION** Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a complete Prescription Authorisation Form.

● **PATIENT AND CARER ADVICE** Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb. Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

Patients and their carers should be advised to seek medical advice if symptoms of peripheral neuropathy such as paraesthesia, abnormal coordination, or weakness develop.

Patient counselling advised for thalidomide capsules (pregnancy and contraception).

2.9 Targeted therapy responsive malignancy**HEDGEHOG PATHWAY INHIBITORS****Vismodegib**

- **DRUG ACTION** Vismodegib is a hedgehog pathway inhibitor.

INDICATIONS AND DOSE

Symptomatic metastatic basal cell carcinoma | Locally advanced basal cell carcinoma not appropriate for surgery or radiotherapy

BY MOUTH

▶ Adult: 150 mg once daily

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **INTERACTIONS** → Appendix 1 (vismodegib).
- **SIDE-EFFECTS**
▶ **Common or very common** Abdominal pain · abnormal hair growth · alopecia · amenorrhoea · arthralgia · constipation · decreased appetite · dehydration · diarrhoea · dyspepsia · hyponatraemia · malaise · muscle spasms · musculoskeletal pain · nausea · pruritus · rash · taste disturbances · vomiting · weight loss
- **CONCEPTION AND CONTRACEPTION** For women of child-bearing potential, pregnancy must be excluded before initiation of treatment, and monthly during treatment. Women must use two contraceptive methods (including one highly effective method and one barrier method) during treatment and for 24 months after the final dose of vismodegib. Men must use a condom during treatment and for 2 months after the final dose.
- **PREGNANCY Important: teratogenic risk**—may cause severe birth defects and embryo-foetal death.
- **BREAST FEEDING** Avoid during treatment and for 24 months after final dose.
- **HEPATIC IMPAIRMENT** No information available—manufacturer advises caution in moderate to severe impairment.
- **RENAL IMPAIRMENT** No information available—manufacturer advises caution in severe impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Prescribers and pharmacists must comply with prescribing and dispensing restrictions as specified in the manufacturer's Pregnancy Prevention Programme, and ensure that the patient fully acknowledges the programme's pregnancy prevention measures—consult product literature for further information.
- **PATIENT AND CARER ADVICE** Counselling on pregnancy and contraception advised. Patients must comply with the manufacturer's pregnancy prevention programme.
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

PROTEASOME INHIBITORS

Bortezomib

- **DRUG ACTION** Bortezomib is a proteasome inhibitor.

INDICATIONS AND DOSE

Treatment of multiple myeloma that has progressed despite the use of at least one therapy, and where the patient has already had, or is unable to have, haematopoietic stem cell transplantation (either as monotherapy, or in combination with pegylated liposomal doxorubicin or dexamethasone) | Treatment of previously untreated multiple myeloma in patients who are not eligible for high-dose chemotherapy with haematopoietic stem cell transplantation (in combination with melphalan and prednisolone) | Induction treatment of previously untreated multiple myeloma in patients who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation (in combination with dexamethasone, or with dexamethasone and thalidomide)

BY INTRAVENOUS INJECTION OR BY SUBCUTANEOUS INJECTION
 ▶ Adult: (consult local protocol)

Important safety information

Bortezomib injection is for **intravenous or subcutaneous administration** only. Inadvertent intrathecal administration with fatal outcome has been reported.

- **CONTRA-INDICATIONS** Acute diffuse infiltrative pulmonary disease · pericardial disease
- **CAUTIONS** Amyloidosis · cardiovascular disease · consider antiviral prophylaxis for herpes zoster infection · dehydration · history of syncope · pulmonary disease (discontinue if interstitial lung disease develops) · risk factors for seizures · risk of neuropathy—consult product literature
- **INTERACTIONS** → Appendix 1 (bortezomib). Caution with concurrent use of medication which may cause hypotension.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Constipation (cases of ileus reported) · decreased appetite · diarrhoea · dyspnoea · fatigue · headache · herpes zoster · hypotension · myalgia · paraesthesia · peripheral neuropathy · pyrexia · rash · reactivation of herpes zoster · sensory neuropathy
 - ▶ **Uncommon** Acute diffuse infiltrative pulmonary disorders · heart failure · posterior reversible encephalopathy syndrome (discontinue treatment) · pulmonary hypertension · seizures
 - ▶ **Rare** Autonomic neuropathy
 - ▶ **Very rare** Progressive multifocal leucoencephalopathy
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

For further information on side-effects, consult product literature.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 3 months after treatment in men or women.
- **PREGNANCY** Toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose in moderate to severe impairment—consult product literature.
- **RENAL IMPAIRMENT** No information available for creatinine clearance less than 20 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- ▶ Monitor blood-glucose concentration in patients on oral antidiabetics.
- ▶ Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological signs or symptoms)—discontinue treatment if diagnosed.
- ▶ Chest x-ray recommended before treatment to monitor for pulmonary disease—discontinue if interstitial lung disease develops.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ Bortezomib monotherapy for relapsed multiple myeloma (October 2007) NICE TA129

Bortezomib monotherapy is an option for the treatment of progressive multiple myeloma in patients who are at first relapse having received one prior therapy and who have undergone, or are unsuitable for, bone-marrow transplantation, under the following circumstances:

- the response to bortezomib is measured using serum M protein after a maximum of four cycles of treatment, and treatment is continued only in patients who have a reduction in serum M protein of 50% or more (where serum M protein is not measurable, an appropriate alternative biochemical measure of response should be used) **and**
- the manufacturer rebates the full cost of bortezomib if there is an inadequate response (as defined above) after four cycles of treatment. www.nice.org.uk/TA129
- ▶ **Bortezomib and thalidomide for the first-line treatment of multiple myeloma (July 2011) NICE TA228**
 Bortezomib in combination with an alkylating drug and a corticosteroid is recommended as an option for the first-line treatment of multiple myeloma if:
 - high-dose chemotherapy with stem cell transplantation is considered inappropriate **and**
 - the person is unable to tolerate or has contra-indications to thalidomide. www.nice.org.uk/TA228
- ▶ **Bortezomib for induction therapy in multiple myeloma before high-dose chemotherapy and autologous stem cell transplantation (April 2014) NICE TA311**
 Bortezomib is recommended as an option within its marketing authorisation, in combination with dexamethasone, or with dexamethasone and thalidomide, for the induction treatment of adults with previously untreated multiple myeloma, who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation. www.nice.org.uk/TA311

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium*, has advised (December 2013) that bortezomib (*Velcade*®) is accepted for restricted use within NHS Scotland in combination with dexamethasone and thalidomide for the induction treatment of adults with previously untreated multiple myeloma who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- ▶ **Velcade** (Janssen-Cilag Ltd)
Bortezomib 3.5 mg Velcade 3.5mg powder for solution for injection vials | 1 vial [POM] £762.38 (Hospital only)

PROTEIN KINASE INHIBITORS

Afinatinib

- **DRUG ACTION** Afinatinib is a protein kinase inhibitor.

INDICATIONS AND DOSE

Treatment of locally advanced or metastatic non-small cell lung cancer with activating epidermal growth factor receptor (EGFR) mutations, in patients who have not previously been treated with EGFR tyrosine kinase inhibitor

BY MOUTH

- ▶ Adult: 40 mg once daily for 3 weeks, then increased if tolerated to 50 mg once daily, consult product literature for details on dosing and dose adjustment due to side effects

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CAUTIONS** Cardiac risk factors · conditions which may affect left ventricular ejection fraction—consider cardiac monitoring, including assessment of left ventricular ejection fraction, at baseline and during treatment · diarrhoea—proactive management recommended (consult product literature) · exposure to sun (protect skin from exposure to sun) · history of keratitis · new pulmonary symptoms (including dyspnoea, cough, fever)—interrupt treatment until interstitial lung disease is excluded · severe dry eyes · signs and symptoms of keratitis—promptly refer to ophthalmologist for assessment · signs and symptoms of skin reaction—treat promptly and interrupt afinatinib treatment if severe or if Stevens-Johnson syndrome suspected (consult product literature) · ulcerative keratitis · use of contact lenses · worsening pulmonary symptoms (including dyspnoea, cough, fever)—interrupt treatment until interstitial lung disease is excluded
- **INTERACTIONS** → Appendix 1 (afinatinib).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Acne · conjunctivitis · cystitis · decreased appetite · dehydration · diarrhoea · dry eyes · dry skin · dysgeusia · dyspepsia · epistaxis · hand-foot syndrome · hypokalaemia · muscle spasms · paronychia · pruritus · pyrexia · rash (see Cautions) · renal failure · rhinorrhoea · weight loss
 - ▶ **Uncommon** Interstitial lung disease · keratitis
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least one month after treatment in women of childbearing potential.
- **PREGNANCY** Manufacturer advises avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Monitor hepatic function regularly and consult product literature for dose adjustment in worsening liver function. Manufacturer advises avoid in severe hepatic impairment.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe renal impairment.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken whole on an empty stomach. Food should not be consumed for at least 3 hours before and at least 1 hour after each dose. *Giotrif*[®] tablets may be dispersed in

approximately 100 mL of noncarbonated water by stirring occasionally for up to 15 minutes (must not be crushed). The dispersion should be swallowed immediately, and the glass rinsed with the same volume of water which should also be swallowed. The dispersion can also be administered via a gastric tube.

● **PATIENT AND CARER ADVICE**

Ocular adverse reactions may affect performance of skilled tasks e.g. driving. Patient counselling advised (administration).

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE technology appraisals (TAs)**

- ▶ **Afinatinib for treating epidermal growth factor receptor mutation-positive locally advanced or metastatic non-small-cell lung cancer (April 2014)** NICE TA310

Afinatinib is recommended as an option, within its marketing authorisation, for treating locally advanced or metastatic non-small-cell lung cancer in adults:

- whose tumour tests positive for the epidermal growth factor receptor tyrosine kinase (EGFR-TK) mutation, **and**
- who have not previously had an EGFR-TK inhibitor, **and**
- if the manufacturer provides afinatinib with the discount agreed in the patient access scheme. www.nice.org.uk/TA310

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Axitinib

- **DRUG ACTION** Axitinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Treatment of advanced renal cell carcinoma following failure of previous treatment with sunitinib or a cytokine (aldesleukin or interferon alfa)

BY MOUTH

- ▶ Adult: (consult product literature)

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CONTRA-INDICATIONS** Recent active gastro-intestinal bleeding · untreated brain metastases
- **CAUTIONS** Hypertension (blood pressure should be well-controlled before starting and monitored during treatment)
- **INTERACTIONS** → Appendix 1 (axitinib).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anal fistula · arthralgia · asthenia · cerebral haemorrhage · constipation · cough · decreased appetite · dehydration · diarrhoea · dizziness · dry skin · dysgeusia · dyspepsia · dysphonia · dyspnoea · erythema · fatigue · flatulence · gastro-intestinal haemorrhage · gastro-intestinal perforation · haemoptysis · haemorrhage · haemorrhoids · hand-foot syndrome · headache · hypercalcaemia · hyperkalaemia · hypertension · hyperthyroidism · hypothyroidism · myalgia · proteinuria · pruritus · rash · renal failure · tinnitus · weight loss

- ▶ **Uncommon** Hypertensive crisis · polycythaemia · posterior reversible encephalopathy syndrome
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for up to 1 week after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **HEPATIC IMPAIRMENT** Reduce starting dose in moderate impairment. Avoid in severe impairment—no information available.

● MONITORING REQUIREMENTS

- ▶ Monitor for thyroid dysfunction.
- ▶ Monitor haemoglobin or haematocrit before and during treatment.
- ▶ Monitor for symptoms of gastro-intestinal perforation.
- ▶ Monitor for symptoms of fistula.
- ▶ Monitor for proteinuria before and during treatment.
- ▶ Monitor liver function before and during treatment.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ **Axitinib** for treating advanced renal cell carcinoma after failure of prior systemic treatment (February 2015)
NICE TA333
Axitinib is recommended as an option for treating adults with advanced renal cell carcinoma after failure of treatment with a first-line tyrosine kinase inhibitor or a cytokine, **only** if the company provides axitinib with the discount agreed in the patient access scheme. www.nice.org.uk/TA333

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Bosutinib

INDICATIONS AND DOSE

Treatment of chronic, accelerated and blast phase Philadelphia chromosome-positive chronic myeloid leukaemia, in those previously treated with one or more tyrosine kinase inhibitor, and for whom imatinib, nilotinib and dasatinib are not clinically appropriate

BY MOUTH

- ▶ **Adult:** 500 mg once daily, consult product literature for dose adjustment due to side effects, or incomplete haematologic response by week 8, or incomplete cytogenetic response by week 12

- **CAUTIONS** Cardiac disease · history of pancreatitis—withdraw treatment if lipase elevated and abdominal symptoms occur · history of QT prolongation—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment · recent cardiac event—monitor ECG and correct hypokalaemia and

hypomagnesaemia before and during treatment · risk factors for QT prolongation—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment · significant gastrointestinal disorder

- **INTERACTIONS** → Appendix 1 (bosutinib). Caution with concomitant use of drugs that prolong the QT interval (monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · abnormal liver function · acne · arthralgia · biochemical disturbances · cough · decreased appetite · dehydration · diarrhoea · dizziness · dysgeusia · dyspnoea · electrolyte disturbances · gastritis · headache · hepatotoxicity · infection · malaise · myalgia · oedema · pericardial effusion · pleural effusion · pruritus · pyrexia · QT prolongation · rash · renal failure · renal impairment · urticaria
 - ▶ **Uncommon** Gastric haemorrhage · pancreatitis · pericarditis · pulmonary hypertension · pulmonary oedema · respiratory failure · tinnitus
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment in women.
- **PREGNANCY** Avoid—toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Caution—no information available.

● MONITORING REQUIREMENTS

- ▶ Monitor liver function before treatment initiation, then monthly for the first 3 months and thereafter as clinically indicated—consult product literature for management of raised transaminases.
- ▶ Monitor full blood count weekly for the first month and then monthly thereafter or as clinically indicated.
- ▶ Monitor for signs and symptoms of fluid retention (including pericardial effusion, pleural effusion and pulmonary oedema).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ **Bosutinib** for previously treated chronic myeloid leukaemia (November 2013) NICE TA299
Bosutinib is **not** recommended within its marketing authorisation for treating Philadelphia-chromosome-positive chronic myeloid leukaemia. www.nice.org.uk/TA299

Cabozantinib

- **DRUG ACTION** Cabozantinib is an inhibitor of several protein kinases.

INDICATIONS AND DOSE

Treatment of progressive, unresectable locally advanced or metastatic medullary thyroid carcinoma

BY MOUTH

- ▶ **Adult:** 140 mg once daily, for dose adjustment or treatment interruption due to side effects, consult product literature (closely monitor for first 8 weeks of therapy)

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CONTRA-INDICATIONS** Reversible Posterior Leukoencephalopathy Syndrome
- **CAUTIONS** Hypertension—discontinue treatment if uncontrolled despite medical intervention · palmar-plantar erythrodysesthesia syndrome—consider treatment interruption if severe and restart at a lower dose when resolved to grade 1 · patients at increased risk of fistulas—consult product literature · patients at increased risk of gastro-intestinal perforation—consult product literature · patients at increased risk of intra-abdominal abscess—consult product literature · patients at risk of haemorrhage (including tumour involvement of the trachea or bronchi)—discontinue if symptoms develop · patients at risk of thromboembolic events including myocardial infarction—discontinue if symptoms develop · risk of osteonecrosis of the jaw · susceptibility to QT-interval prolongation (e.g. cardiac disease, electrolyte disturbances, bradycardia, concomitant use of drugs that prolong the QT interval)—monitor ECG and electrolytes periodically

CAUTIONS, FURTHER INFORMATION

Elective surgery Withhold treatment for at least 28 days before elective surgery and restart only if adequate wound healing—discontinue in patients with wound healing complications requiring medical intervention.

Risk of osteonecrosis of the jaw Discontinue treatment at least 28 days before elective invasive dental procedures—monitor for symptoms before and during treatment and discontinue if osteonecrosis develops.

- **INTERACTIONS** → Appendix 1 (cabozantinib). Caution with concomitant use of drugs which increase the risk of osteonecrosis of the jaw e.g. bisphosphonates. Caution with concomitant use of drugs that prolong the QT interval.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · abnormal hair growth · abscess · acne · alopecia · anal fissure · anxiety · arthralgia · aspiration · atrial fibrillation · blurred vision · cheilitis · chills · cholelithiasis · constipation · decreased appetite · dehydration · depression · diarrhoea · dizziness · dry skin · dysgeusia · dyspepsia · dysphagia · dysphonia · dysuria · erythema · face oedema · folliculitis · fungal infection · gastro-intestinal perforation · gastrointestinal haemorrhage · glossodynia · haematuria · haemorrhoids · hair colour changes · headache · hyperbilirubinaemia · hyperkeratosis · hypertension · hypoalbuminaemia · hypocalcaemia · hypokalaemia · hypophosphataemia · hypotension · hypothyroidism · impaired wound healing · lymphopenia · mucosal inflammation · muscle spasms · musculoskeletal chest pain · nausea · neutropenia · non-gastro-intestinal fistula · oropharyngeal pain · osteonecrosis of jaw · pallor · palmar-plantar erythrodysesthesia syndrome · pancreatitis · paraesthesia

- peripheral coldness · peripheral neuropathy · platelet disorders · pneumonia · proteinuria · pulmonary embolism · rash · respiratory tract haemorrhage · skin exfoliation · skin hypopigmentation · stomatitis · tinnitus · tremor · venous thrombosis · vomiting
- ▶ **Uncommon** Acute renal failure · amenorrhoea · angina · arterial thrombosis · aspergilloma · ataxia · atelectasis · cataract · conjunctivitis · cyst · delirium · facial pain · gastro-intestinal fistula · hepatic encephalopathy · hypoacusis · loss of consciousness · oesophagitis · pharyngeal oedema · pneumonitis · posterior reversible encephalopathy syndrome · rhabdomyolysis · skin ulcer · speech disorder · supraventricular tachycardia · telangiectasia · transient ischaemic attack · vaginal haemorrhage
- ▶ **Frequency not known** Bone-marrow suppression · hyperuricaemia · oral mucositis · thromboembolism · tumour lysis syndrome
- **CONCEPTION AND CONTRACEPTION** Patients and their sexual partners must use effective contraception (in addition to barrier method) during treatment and for at least 4 months after the last dose.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Manufacturer advises discontinue breast-feeding during treatment and for at least 4 months after the last dose.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Manufacturer advises caution in renal impairment. Avoid in severe impairment.
- **MONITORING REQUIREMENTS** Monitor urine protein regularly and discontinue if nephrotic syndrome develops.
- **PATIENT AND CARER ADVICE** Fatigue and weakness may affect performance of skilled tasks e.g. driving. Food should not be consumed for at least 2 hours before and at least 1 hour after each dose.

Crizotinib

- **DRUG ACTION** Crizotinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Treatment of previously treated anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer

BY MOUTH

- ▶ **Adult:** 250 mg twice daily, for dose adjustments due to side-effect, consult product literature

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CAUTIONS** History of diverticulitis (risk of gastro-intestinal perforation—discontinue treatment if

gastrointestinal perforation occurs) · metastases of gastrointestinal tract (risk of gastro-intestinal perforation—discontinue treatment if gastrointestinal perforation occurs) · patients with susceptibility to QT-prolongation (including bradycardia, history of cardiac disease, concomitant use of drugs that prolong QT interval, and electrolyte disturbances)—prolong renal monitoring required · risk of gastro-intestinal perforation—discontinue treatment if gastrointestinal perforation occurs · vision disorders reported—consider full ophthalmological evaluation if vision disorder worsens or persists

CAUTIONS, FURTHER INFORMATION

Fatal interstitial lung disease and pneumonitis Fatal interstitial lung disease and pneumonitis reported (monitor patients with pulmonary symptoms, withdraw treatment if suspected, and permanently discontinue treatment if diagnosed).

● INTERACTIONS → Appendix 1 (crizotinib).

Caution with concomitant use of drugs that prolong QT interval—periodic renal monitoring required. Caution with concomitant use of drugs which may cause gastrointestinal perforation—discontinue treatment if gastrointestinal perforation occurs.

● SIDE-EFFECTS

- ▶ **Common or very common** Bradycardia · constipation · decreased appetite · diarrhoea · dizziness · dyspepsia · fatigue · hypophosphataemia · interstitial lung disease · neuropathy · oedema · pneumonitis · pneumonitis · QT-interval prolongation · rash · syncope · taste disturbance · vision disorder
- ▶ **Uncommon** Gastrointestinal perforation (fatalities reported) · hepatotoxicity (including fatal hepatic failure) · renal cyst
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

● CONCEPTION AND CONTRACEPTION

Ensure effective contraception during and for at least 90 days after treatment.

● PREGNANCY

Avoid (toxicity in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

● BREAST FEEDING

Avoid—no information available.

● HEPATIC IMPAIRMENT

Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

● RENAL IMPAIRMENT

Reduce dose to 250 mg once daily in severe impairment not requiring peritoneal dialysis or hemodialysis, may be increased to 200 mg twice daily after at least 4 weeks, based on individual assessment of safety and tolerability.

● MONITORING REQUIREMENTS

- ▶ Monitor liver function once a week during the first 2 months of treatment, then at least monthly thereafter and as clinically indicated.
- ▶ Monitor ECG and electrolytes (correct if abnormal) in all patients before starting treatment, then periodically and as clinically indicated thereafter.
- ▶ Monitor for signs and symptoms of treatment emergent bradycardia (including syncope, dizziness and hypotension)—monitor blood pressure and heart rate regularly.

● PATIENT AND CARER ADVICE

Counsel all patients on the early signs and symptoms of gastrointestinal perforation—advice to seek immediate medical attention.

Driving and skilled tasks

Symptomatic bradycardia (including syncope, dizziness and hypotension), vision disorder and fatigue may affect

performance of skilled tasks (e.g. driving or operating machinery).

● NATIONAL FUNDING/ACCESS DECISIONS

Dabrafenib

● DRUG ACTION

Dabrafenib is a BRAF kinase inhibitor.

INDICATIONS AND DOSE

Monotherapy for the treatment of unresectable or metastatic melanoma with BRAF V600 mutation

BY MOUTH

- ▶ **Adult:** 150 mg every 12 hours, for dose adjustments due to side effects consult product literature

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CONTRA-INDICATIONS** BRAF wild-type melanoma · long QT syndrome · uncorrectable electrolyte abnormalities (including magnesium)
- **CAUTIONS** Pyrexia (interrupt treatment if $\geq 38.5^{\circ}\text{C}$ and assess for signs and symptoms of infection—consult product literature)
- **INTERACTIONS** → Appendix 1 (dabrafenib).
Contra-indicated with concomitant use of drugs that prolong the QT interval.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Acrochordon · arthralgia · basal cell carcinoma · chills · constipation · cough · cutaneous squamous cell carcinoma · decrease in left ventricular ejection fraction · decreased appetite · diarrhoea · dry skin · erythema · hand-foot syndrome · headache · hyperglycaemia · hyperkeratosis · hypophosphataemia · influenza-like symptoms · keratosis · malaise · myalgia · papilloma · pruritus · pyrexia · rash · skin lesions
 - ▶ **Uncommon** Nephritis · new primary melanoma · pancreatitis · panniculitis · QT-interval prolongation · renal failure · uveitis
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Pancreatitis Promptly investigate signs and symptoms of pancreatitis—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Effective non-hormonal contraception required during and for one month after treatment in women of childbearing potential.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in *animal* studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment. Additional monitoring of ECG and electrolytes required in hepatic impairment—consult product literature.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ Assess for cutaneous squamous cell carcinoma and new primary melanoma before treatment, monthly during treatment, and for 6 months after discontinuation or until initiation of alternative treatment.
 - ▶ Assess and monitor for non-cutaneous secondary or recurrent malignancy before, during, and for 6 months after discontinuation or until initiation of alternative treatment—consult product literature.
 - ▶ Monitor serum creatinine and other signs of renal failure—consult product literature and interrupt dose as appropriate.
 - ▶ Monitor for ophthalmologic reactions including uveitis and iritis.
 - ▶ Monitor ECG and electrolytes (including magnesium) before and one month after treatment initiation and after each dose modification—consult product literature if abnormalities occur.
- **PATIENT AND CARER ADVICE** Ocular adverse reactions and fatigue may affect performance of skilled tasks e.g. driving.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ Dabrafenib for treating unresectable or metastatic BRAF V600 mutation-positive melanoma (October 2014) NICE TA321 Dabrafenib is recommended, within its marketing authorisation, as an option for treating unresectable or metastatic BRAF V600 mutation-positive melanoma only if the manufacturer provides dabrafenib with the discount agreed in the patient access scheme. www.nice.org.uk/TA321

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2015) that dabrafenib (*Tafinlar*®) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic BRAFV600 mutation-positive melanoma in patients who have received no prior therapy.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

Dasatinib

- **DRUG ACTION** Dasatinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Chronic phase chronic myeloid leukaemia (consult product literature for details)

BY MOUTH

- ▶ Adult: 100 mg once daily, then increased if necessary up to 140 mg once daily

Accelerated and blast phase chronic myeloid leukaemia (consult product literature for details) Acute lymphoblastic leukaemia (consult product literature for details)

BY MOUTH

- ▶ Adult: 140 mg once daily, then increased if necessary up to 180 mg once daily

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CAUTIONS** Risk of cardiac dysfunction (monitor closely) · susceptibility to QT-interval prolongation (correct hypokalaemia or hypomagnesaemia before starting treatment)
- CAUTIONS, FURTHER INFORMATION**
Pulmonary arterial hypertension Patients should be evaluated for signs and symptoms of underlying cardiopulmonary disease before starting treatment; echocardiography should be performed at the start of treatment in patients with symptoms of cardiac disease and considered for patients with risk factors for cardiac or pulmonary disease. Treatment should be interrupted or the dose reduced in patients who develop dyspnoea or fatigue, while they are evaluated for common aetiologies (e.g. pleural effusion, pulmonary oedema, anaemia or lung infiltration); pulmonary arterial hypertension should be considered in the absence of these conditions, and if there is no improvement following dose reduction or interruption. If pulmonary arterial hypertension is confirmed, dasatinib should be permanently discontinued.
- **INTERACTIONS** → Appendix 1 (dasatinib).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · acne · anorexia · arrhythmias · chest pain · CNS haemorrhage · colitis · congestive heart failure · constipation · cough · depression · dermatitis · diarrhoea · dizziness · dry skin · dyspepsia · dyspnoea · flushing · gastritis · gastro-intestinal haemorrhage · haemorrhage · headache · hypertension · influenza-like symptoms · insomnia · musculoskeletal pain · neuropathy · oedema (more common in patients over 65 years old) · palpitation · pleural effusion · pruritus · pulmonary hypertension · sweating · taste disturbance · tinnitus · urticaria · visual disturbances · weight changes
 - ▶ **Uncommon** Amnesia · asthma · cholecystitis · cholestasis · drowsiness · erythema nodosum · gynecomastia · hepatitis · hypersensitivity reactions · hypocalcaemia · hypotension · irregular menstruation · nail disorders · oesophagitis · pancreatitis · photosensitivity · pigmentation · proteinuria · rhabdomyolysis · seizures · syncope · thrombophlebitis · transient ischaemic attack · tremor · urinary frequency
 - ▶ **Rare** Cor pulmonale
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · interstitial lung disease · nausea · oral mucositis · thromboembolism · thrombosis · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in hepatic impairment.

● NATIONAL FUNDING/ACCESS DECISIONS

INDICATIONS AND DOSE

Treatment of locally advanced or metastatic non-small cell lung cancer after failure of previous chemotherapy |
Monotherapy for maintenance treatment of locally advanced or metastatic non-small cell lung cancer with stable disease after four cycles of platinum-based chemotherapy

BY MOUTH

- ▶ Adult: 150 mg once daily

Treatment of metastatic pancreatic cancer (in combination with gemcitabine)

BY MOUTH

- ▶ Adult: 100 mg once daily

Important safety information

EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

● CAUTIONS

CAUTIONS, FURTHER INFORMATION

Smoking Dose adjustment may be necessary if smoking started or stopped during treatment.

- **INTERACTIONS** → Appendix 1 (erlotinib).
 Caution with concomitant use with hepatotoxic drugs—monitor liver function.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anorexia · conjunctivitis · depression · diarrhoea · dry skin · dyspepsia · fatigue · flatulence · headache · neuropathy · pruritus · rigor
 - ▶ **Uncommon** Eyelash changes · gastro-intestinal perforation · interstitial lung disease—discontinue if unexplained symptoms such as dyspnoea, cough or fever occur
 - ▶ **Rare** Hepatic failure
 - ▶ **Very rare** Corneal perforation · corneal ulceration · Stevens-Johnson syndrome · toxic epidermal necrolysis
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 2 weeks after treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment. Monitor liver function in pre-existing liver disease.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

 - ▶ **Erlotinib for non-small-cell lung cancer (November 2008)** NICE TA162
 Erlotinib is recommended, as an alternative to docetaxel, as second-line treatment for locally advanced or metastatic non-small-cell lung cancer after failure of previous chemotherapy, on the basis that it is provided by the manufacturer at an overall treatment cost equal to that of docetaxel. Erlotinib is **not** recommended in patients for whom docetaxel is unsuitable or as third-line treatment after docetaxel. www.nice.org.uk/TA162
 - ▶ **Erlotinib monotherapy for maintenance treatment of non-small-cell lung cancer (June 2011)** NICE TA227
 Erlotinib monotherapy is **not** recommended for maintenance treatment in people with locally advanced or metastatic non-small-cell lung cancer who have stable disease after platinum-based first-line chemotherapy. www.nice.org.uk/TA227
 - ▶ **Erlotinib for the first-line treatment of locally advanced or metastatic EGFR-TK mutation-positive non-small-cell lung cancer (June 2012)** NICE TA258
 Erlotinib is recommended as an option for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer if:
 - they test positive for the epidermal growth factor tyrosine kinase (EGFR-TK) mutation **and**
 - the manufacturer provides erlotinib at the discounted price agreed under the patient access scheme (as revised in 2012). www.nice.org.uk/TA258

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2006) that erlotinib (*Tarceva*[®]) is accepted for restricted use within NHS Scotland for the treatment of locally advanced or metastatic non-small cell lung cancer, after failure of at least one chemotherapy regimen. Erlotinib is restricted to use in patients who would otherwise be eligible for treatment with docetaxel monotherapy.

The *Scottish Medicines Consortium* has also advised (December 2011) that erlotinib (*Tarceva*[®]) is accepted for use within NHS Scotland for the first-line treatment of patients with locally advanced or metastatic non-small cell lung cancer (NSCLC) with epidermal growth factor receptor (EGFR) activating mutations.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 23

▶ **Tarceva** (Roche Products Ltd)

Erlotinib (as Erlotinib hydrochloride) 25 mg Tarceva 25mg tablets | 30 tablet [PoM] £378.33

Erlotinib (as Erlotinib hydrochloride) 100 mg Tarceva 100mg tablets | 30 tablet [PoM] £1,324.14

Erlotinib (as Erlotinib hydrochloride) 150 mg Tarceva 150mg tablets | 30 tablet [PoM] £1,631.53

Everolimus

- **DRUG ACTION** Everolimus is a protein kinase inhibitor.

INDICATIONS AND DOSE**VOTUBIA[®]**

Subependymal giant cell astrocytoma associated with tuberous sclerosis complex

BY MOUTH

- ▶ Adult: (consult product literature)

Renal angiomyolipoma associated with tuberous sclerosis complex

BY MOUTH

- ▶ Adult: (consult product literature)

AFINITOR[®]

Treatment of advanced renal cell carcinoma when the disease has progressed despite treatment with vascular endothelial growth factor-targeted therapy | Treatment of unresectable or metastatic, well- or moderately-differentiated neuroendocrine tumours of pancreatic origin | Treatment of hormone-receptor-positive, human epidermal growth factor-2 (HER-2) negative advanced breast cancer, in combination with exemestane, in postmenopausal women without symptomatic visceral disease after recurrence or progression following a non-steroidal aromatase inhibitor

BY MOUTH

- ▶ Adult: 10 mg once daily

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CAUTIONS** History of bleeding disorders
- **INTERACTIONS** → Appendix 1 (everolimus). Caution with concomitant use of drugs that increase risk of bleeding.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anorexia · arthralgia · asthenia · chest pain · convulsions · dehydration · diarrhoea · dry mouth · dysphagia · electrolyte disturbance · epistaxis · eyelid oedema · fatigue · hand-foot syndrome · headache · hypercholesterolaemia ·

hyperglycaemia · hyperlipidaemia · hypertension · hypoglycaemia · increased susceptibility to aspergillosis · increased susceptibility to candidiasis · increased susceptibility to infections · increased susceptibility to pneumonia · insomnia · interstitial lung disease · irritability · nail disorders · peripheral oedema · pneumonitis · renal failure · skin disorders · taste disturbance

- ▶ **Uncommon** Aggression · agitation · congestive heart failure · flushing · impaired wound healing · rhabdomyolysis
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · haemorrhage · hepatitis B reactivation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Reduce dose or discontinue if severe side-effects occur—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during and for up to 8 weeks after treatment.
- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Consult product literature.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor blood-glucose concentration, serum-triglycerides and serum-cholesterol before treatment and periodically thereafter.
 - ▶ Monitor renal function before treatment and periodically thereafter.

DIRECTIONS FOR ADMINISTRATION

VOTUBIA[®] Tablets may be dispersed in approximately 30 mL of water by gently stirring, immediately before drinking. After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed.

PATIENT AND CARER ADVICE

Pneumonitis Non-infectious pneumonitis reported. Patients should be advised to seek urgent medical advice if new or worsening respiratory symptoms occur.

NATIONAL FUNDING/ACCESS DECISIONS**NICE technology appraisals (TAs)**

- ▶ **Everolimus for the second-line treatment of advanced renal cell carcinoma (April 2011)** NICE TA219
Everolimus is **not** recommended for the second-line treatment of advanced renal cell carcinoma. www.nice.org.uk/TA219
- ▶ **Everolimus in combination with exemestane for treating advanced HER2-negative hormone-receptor-positive breast cancer after endocrine therapy (August 2013)** NICE TA295
Everolimus, in combination with exemestane, is **not** recommended within its marketing authorisation for treating postmenopausal women with advanced human epidermal growth factor receptor 2 (HER2) negative hormone-receptor-positive breast cancer that has recurred or progressed following treatment with a non-steroidal aromatase inhibitor. www.nice.org.uk/TA295

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2012) that everolimus (*Afinitor*[®]) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic, well- or moderately-differentiated neuroendocrine tumours of pancreatic origin (pNET) in adults with progressive disease.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Everolimus 10 mg Votubia 10mg tablets | 30 tablet PoM £2,970.00

Gefitinib

- **DRUG ACTION** Gefitinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Treatment of locally advanced or metastatic non-small cell lung cancer with activating mutations of epidermal growth factor receptor

BY MOUTH

- ▶ Adult: 250 mg once daily

Important safety information

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)
 Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **INTERACTIONS** → Appendix 1 (gefitinib).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Acne · anorexia · asthenia · blepharitis · conjunctivitis · diarrhoea · dry eye · dry mouth · dry skin · epistaxis · haematuria · interstitial lung disease—discontinue if confirmed · nail disorder · proteinuria · pruritus · pyrexia · rash · skin reactions
- ▶ **Uncommon** Corneal erosion · pancreatitis
- ▶ **Rare** Hepatitis · toxic epidermal necrolysis
- ▶ **Frequency not known** Alopecia · oral mucositis · hyperuricaemia · nausea · bone metastasis · thromboembolism · tumour lysis syndrome · vomiting
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment due to cirrhosis.
- **RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 20 mL/minute.
- **MONITORING REQUIREMENTS**
- ▶ Monitor for worsening of dyspnoea, cough and fever—discontinue if interstitial lung disease confirmed.
- ▶ Monitor liver function—consider discontinuing if severe changes in liver function occur.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
- ▶ Gefitinib for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer (July 2010) NICE TA192

Gefitinib is recommended as an option for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer if the patient tests positive for the epidermal growth receptor tyrosine kinase (EGFR-TK) mutation and the manufacturer provides gefitinib at the fixed price agreed under the patient access scheme. www.nice.org.uk/TA192

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Iressa** (AstraZeneca UK Ltd)
Gefitinib 250 mg Iressa 250mg tablets | 30 tablet PoM £2,167.71

Ibrutinib

- **DRUG ACTION** Ibrutinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Treatment of relapsed or refractory mantle cell lymphoma

BY MOUTH

- ▶ Adult: 560 mg once daily, for dose adjustments due to side effects consult product literature

Treatment of chronic lymphocytic leukaemia, in patients who have received at least one prior therapy, or as first-line treatment in patients with 17p deletion or TP53 mutation who are unsuitable for chemo-immunotherapy

BY MOUTH

- ▶ Adult: 420 mg once daily, for dose adjustments due to side effects consult product literature

Treatment of chronic lymphocytic leukaemia, in patients who have received at least one prior therapy, or as first-line treatment in patients with 17p deletion or TP53 mutation who are unsuitable for chemo-immunotherapy (patients taking concomitant moderate or potent CYP3A4 inhibitors) | Treatment of relapsed or refractory mantle cell lymphoma (patients taking concomitant moderate or potent CYP3A4 inhibitors)

BY MOUTH

- ▶ Adult: 140 mg once daily, for dose adjustments due to side effects consult product literature

Dose adjustments due to interactions

Reduce dose in patients taking concomitant potent CYP3A4 inhibitors (such as cobicistat, clarithromycin, darunavir boosted with ritonavir, idinavir, itraconazole, ketoconazole, ritonavir, saquinavir, telithromycin, and voriconazole) or moderate CYP3A4 inhibitors (such as amiodarone, aprepitant, atazanavir, ciprofloxacin, crizotinib, diltiazem, dronedarone, erythromycin, fluconazole, fosamprenavir, imatinib, and verapamil); alternatively temporarily stop ibrutinib if the potent CYP3A4 inhibitor is only required for 7 days or less. Avoid concomitant use with these drugs unless unavoidable.

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CAUTIONS** Family history of congenital short QT syndrome · increased lymphocytes—increased risk of leukostasis, consider withholding treatment temporarily and monitor closely · patients at risk from further shortening of QTc interval · personal history of congenital short QT syndrome · risk of haemorrhagic events—withhold ibrutinib treatment for at least 3 to 7 days before and after surgery depending on risk of bleeding
- **INTERACTIONS** → Appendix 1 (ibrutinib).
 Avoid concomitant use of drugs that increase risk of bleeding.

● SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · atrial fibrillation · blurred vision · bruising · constipation · dehydration · diarrhoea · dizziness · dry mouth · epistaxis · haemorrhage · headache · musculoskeletal pain · peripheral oedema · petechiae · pyrexia · rash · respiratory tract infection · sepsis · sinusitis · skin infection · subdural haematoma · urinary tract infection

▶ Uncommon

- Leukostasis
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

- **CONCEPTION AND CONTRACEPTION** Highly effective contraception (must include a non-hormonal method) required during and for 3 months after stopping treatment.

- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING** Manufacturer advises discontinue breastfeeding—no information available.

- **HEPATIC IMPAIRMENT** Reduce dose to 280 mg daily in mild impairment and reduce dose to 140 mg daily in moderate impairment—monitor for toxicity and adjust dose if necessary (consult product literature). Avoid in severe impairment.

- **RENAL IMPAIRMENT** Use in severe impairment only if benefit outweighs risk and with close monitoring for toxicity. Maintain hydration and monitor serum creatinine periodically in mild to moderate renal impairment.

● MONITORING REQUIREMENTS

- ▶ Monitor full blood count once a month.
- ▶ Monitor for atrial fibrillation (increased risk in cardiac risk factors, acute infections and history of atrial fibrillation), monitor all patients periodically and complete ECG if arrhythmic symptoms or dyspnoea develop—consult product literature for treatment options.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- **HEPATIC IMPAIRMENT** Max. 400 mg daily; reduce dose further if not tolerated.
- **RENAL IMPAIRMENT** Maximum starting dose 400 mg daily if creatinine clearance less than 60 mL/minute; reduce dose further if not tolerated.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for gastrointestinal haemorrhage.
 - ▶ Monitor complete blood counts regularly.
 - ▶ Monitor for fluid retention.
 - ▶ Monitor liver function.
 - ▶ Monitor growth in children (may cause growth retardation).
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in water or apple juice.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer imatinib tablets.
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - ▶ **NICE technology appraisals (TAs)** NICE TA70
 - ▶ **Imatinib for chronic myeloid leukaemia (October 2003)** Imatinib is recommended as first-line treatment for Philadelphia-chromosome-positive chronic myeloid leukaemia in the chronic phase and as an option for patients presenting in the accelerated phase or with blast crisis, provided that imatinib has not been used previously. www.nice.org.uk/TA70
 - ▶ **Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (October 2004)** NICE TA86 Imatinib 400 mg daily is recommended as first-line management of KIT (CD117)-positive unresectable or metastatic, or both, gastro-intestinal stromal tumours. Continued therapy is recommended only if a response to initial treatment [as defined by Southwest Oncology Group criteria available at www.nice.org.uk/TA86] is achieved within 12 weeks. Patients who have responded should be assessed at 12-week intervals. Discontinue if tumour ceases to respond. www.nice.org.uk/TA86
 - ▶ **Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (November 2010)** NICE TA209 Imatinib 600 mg daily or 800 mg daily is **not** recommended for unresectable or metastatic, or both, gastro-intestinal stromal tumours whose disease has progressed after treatment with imatinib 400 mg daily. www.nice.org.uk/TA209
 - ▶ **Dasatinib, high-dose imatinib and nilotinib for the treatment of imatinib-resistant chronic myeloid leukaemia (CML), and dasatinib and nilotinib for people with CML for whom treatment with imatinib has failed because of intolerance (January 2012)** NICE TA241 High-dose imatinib is **not** recommended for the treatment of chronic, accelerated or blast-crisis phase Philadelphia-chromosome-positive CML that is resistant to standard-dose imatinib. www.nice.org.uk/TA241
 - ▶ **Dasatinib, nilotinib and standard-dose imatinib for the first-line treatment of chronic myeloid leukaemia (April 2012)** NICE TA251 Standard-dose imatinib is recommended as an option for the first-line treatment of adults with chronic phase Philadelphia-chromosome-positive chronic myeloid leukaemia (CML). www.nice.org.uk/TA251
 - ▶ **Imatinib for the adjuvant treatment of gastro-intestinal stromal tumours (November 2014)** NICE TA326 Imatinib is recommended as an option for adjuvant treatment of adult patients who are at high risk of relapse after surgery for KIT (CD117)-positive gastro-intestinal stromal tumours, as defined by the Miettinen 2006 criteria (based on tumour size, location, and mitotic rate), for up to 3 years. Patients currently receiving treatment initiated within the NHS with imatinib that is not recommended for them by NICE in this guidance should be able to continue treatment until they and their NHS clinician consider it appropriate to stop. www.nice.org.uk/TA326

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2002) that imatinib (*Glivec*[®]) should be used for chronic myeloid leukaemia only under specialist supervision in accordance with British Society of Haematology guidelines (November 2001).

The *Scottish Medicines Consortium* has also advised (February 2012) that imatinib (*Glivec*[®]) is accepted for restricted use within NHS Scotland for the treatment of adult patients who are at significant risk of relapse following resection of a KIT (CD117) positive gastrointestinal stromal tumour (GIST) and who are at high risk of recurrence following complete resection (according to the Armed Forces Institute of Pathology (AFIP) risk criteria).

Lapatinib

● **DRUG ACTION** Lapatinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2) with hormone-receptor-negative disease who have had previous treatment with trastuzumab in combination with chemotherapy (in combination with trastuzumab)

BY MOUTH

► Adult: 1 g once daily

Treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2), for patients who have had previous treatment with an anthracycline, a taxane, and trastuzumab (in combination with capecitabine)

BY MOUTH

► Adult: 1.25 g once daily

Treatment of advanced or metastatic breast cancer with tumours that overexpress human epidermal growth factor receptor-2 (HER2), for postmenopausal women with hormone-receptor-positive disease (in combination with an aromatase inhibitor)

BY MOUTH

► Adult: 1.5 g once daily

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CAUTIONS** Diarrhoea—withhold treatment if severe (consult product literature) · low gastric pH (reduced absorption) · susceptibility to QT-interval prolongation (including electrolyte disturbances)
- **INTERACTIONS** → Appendix 1 (lapatinib). Caution with concomitant use of drugs that prolong QT-interval.
- **SIDE-EFFECTS**
 - **Common or very common** Anorexia · cardiac failure (fatal cases reported) · decreased left ventricular ejection fraction · diarrhoea (treat promptly) · hepatotoxicity

(discontinue permanently if severe) · hyperbilirubinaemia · malaise · nail disorders · rash

- **Uncommon** Interstitial lung disease
- **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · respiratory failure (including fatal cases) · thromboembolism · tumour lysis syndrome · vomiting
- **PREGNANCY** Avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Caution in moderate to severe impairment—metabolism reduced.
- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
 - Monitor left ventricular function.
 - Monitor for pulmonary toxicity.
 - Monitor liver function before treatment and at monthly intervals.
- **DIRECTIONS FOR ADMINISTRATION** Always take at the same time in relation to food: either one hour before or one hour after food.
- **PATIENT AND CARER ADVICE** Counselling advised (administration). Patients should be advised to report any unexpected changes in bowel habit.

NATIONAL FUNDING/ACCESS DECISIONS**NICE technology appraisals (TAs)**

► **Lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2** (June 2012) NICE TA257

Lapatinib or trastuzumab in combination with an aromatase inhibitor is **not** recommended for first-line treatment in postmenopausal women of metastatic hormone-receptor-positive breast cancer that overexpresses human epidermal growth factor receptor 2 (HER2).

Postmenopausal women currently receiving lapatinib or trastuzumab in combination with an aromatase inhibitor for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA257

 - ▶ **Dasatinib, high-dose imatinib and nilotinib for the treatment of imatinib-resistant chronic myeloid leukaemia (CML), and dasatinib and nilotinib for people with CML for whom treatment with imatinib has failed because of intolerance (January 2012) NICE TA241**
Nilotinib is recommended for the treatment of chronic or accelerated phase Philadelphia-chromosome-positive chronic myeloid leukaemia (CML) in adults:
 - whose CML is resistant to treatment with standard dose imatinib, **or**
 - who have imatinib intolerance, **and**
 - if the manufacturer makes nilotinib available with the discount agreed as part of the patient access scheme. www.nice.org.uk/TA241
 - ▶ **Dasatinib, nilotinib and standard-dose imatinib for the first-line treatment of chronic myeloid leukaemia (April 2012) NICE TA251**
Nilotinib is recommended as an option for the first-line treatment of adults with chronic phase Philadelphia-

chromosome-positive CML if the manufacturer makes nilotinib available with the discount agreed as part of the patient access scheme. www.nice.org.uk/TA251

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2008) that nilotinib (*Tasigna*[®]) is accepted for restricted use within NHS Scotland for the treatment of chronic-phase chronic myeloid leukaemia in adults resistant to or intolerant of at least one previous therapy, including imatinib, and (July 2011) for the treatment of adults with newly diagnosed chronic myeloid leukaemia in the chronic phase.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 23, 25, 27

▶ **Tasigna** (Novartis Pharmaceuticals UK Ltd)

Nilotinib (as Nilotinib hydrochloride monohydrate)

150 mg Tasigna 150mg capsules | 112 capsule [POM](#) £2,432.85

Nilotinib (as Nilotinib hydrochloride monohydrate)

200 mg Tasigna 200mg capsules | 112 capsule [POM](#) £2,432.85

Pazopanib

- **DRUG ACTION** Pazopanib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

First-line treatment of advanced renal cell carcinoma | Treatment of advanced renal cell carcinoma in patients who have had previous treatment with cytokine therapy
BY MOUTH

▶ Adult: 800 mg daily, adjust dose in steps of 200 mg according to tolerability; maximum 800 mg per day

Treatment of selective subtypes of advanced soft tissue sarcoma

BY MOUTH

▶ Adult: (consult product literature)

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CONTRA-INDICATIONS** Cerebral haemorrhage · clinically significant gastro-intestinal haemorrhage · haemoptysis in the past 6 months
- **CAUTIONS** Cardiac disease · increased risk of gastro-intestinal fistulas · increased risk of gastro-intestinal perforation · increased risk of haemorrhage · increased risk of thrombotic microangiopathy—permanently discontinue if symptoms develop · ischaemic stroke · myocardial infarction · risk of thrombotic events · susceptibility to QT-interval prolongation (including electrolyte disturbances) · transient ischaemic attack
- **CAUTIONS, FURTHER INFORMATION**
 - **Elective surgery** Discontinue treatment 7 days before elective surgery and restart only if adequate wound healing.
 - **Blood pressure** Blood pressure must be controlled before initiating treatment.
- **INTERACTIONS** → Appendix 1 (pazopanib). Caution with concomitant use of drugs that prolong QT-interval.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal distension · abdominal pain · anorexia · blood disorders · blurred vision · chest pain · cough · dehydration · diarrhoea · dizziness · dry mouth · dry skin · dyspepsia · dyspnoea · epistaxis · flatulence · flushing · hair discoloration · headache · hepatic dysfunction · hiccups · hyperalbuminaemia ·

hyperbilirubinaemia · hypertension · hypothyroidism · increased amylase · insomnia · malaise · muscle spasm · myalgia · nail disorders · oedema · paraesthesia · pneumonia · proteinuria (discontinue if grade 4) · skin discoloration · skin reactions · sweating · taste disturbance · thrombocytopenia · venous thromboembolic events · voice changes · weight loss

- ▶ **Uncommon** Arthralgia · bradycardia · cardiac dysfunction · fistula · gastro-intestinal perforation · haemorrhage · hepatic failure · hypotensive crisis · hypomagnesaemia · menstrual disturbances · myocardial infarction · myocardial ischaemia · oropharyngeal pain · pancreatitis · peripheral neuropathy · peritonitis · photosensitivity reactions · pulmonary embolism · QT-interval prolongation · stroke · transient ischaemic attack
- ▶ **Rare** Thrombotic microangiopathy
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

● **CONCEPTION AND CONTRACEPTION** Effective contraception advised during treatment.

● **PREGNANCY** Avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Reduce dose to 200 mg once daily in moderate impairment. Use with caution in mild to moderate impairment. Avoid in severe impairment.

● **RENAL IMPAIRMENT** Use with caution if creatinine clearance less than 30 mL/minute—no information available.

● **MONITORING REQUIREMENTS**

- ▶ Monitor liver function before treatment and at weeks 3, 5, 7, and 9, then at months 3 and 4, and periodically thereafter as clinically indicated—consult product literature if elevated liver enzymes observed.
- ▶ Monitor blood pressure within 1 week of treatment initiation, then frequently throughout treatment (consider dose reduction or interruption if hypertension uncontrolled despite anti-hypertensive therapy; discontinue if blood pressure persistently elevated despite anti-hypertensive therapy and pazopanib dose reduction—consult product literature).
- ▶ Monitor for signs or symptoms of congestive heart failure—monitor left ventricular ejection fraction in patients at risk of heart failure before and during treatment.
- ▶ Monitor for proteinuria.
- ▶ Monitor thyroid function.
- ▶ Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including headache, hypertension, seizure, lethargy, confusion, visual and neurological disturbances)—permanently discontinue treatment if symptoms occur.

● **PATIENT AND CARER ADVICE** Patients should be advised not to take antacids for at least 1 hour before or 2 hours after pazopanib.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- ▶ **Pazopanib for the first-line treatment of advanced renal cell carcinoma (updated August 2013) NICE TA215**
Pazopanib is recommended as a first-line treatment option for people with advanced renal cell carcinoma:
 - who have not received prior cytokine therapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1 **and**
 - if the manufacturer provides pazopanib at the discounted price agreed under the patient access scheme. www.nice.org.uk/TA215

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2011) that pazopanib (*Votrient*[®]) is accepted for restricted use within NHS Scotland for the first-line treatment of advanced renal cell carcinoma and (December 2012) is **not** recommended for use within NHS Scotland for the treatment of selective subtypes of advanced soft tissue sarcoma in patients who have received prior chemotherapy for metastatic disease, or who have progressed within 12 months after neoadjuvant therapy.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 23, 25

▶ **Votrient** (Novartis Pharmaceuticals UK Ltd)

Pazopanib (as Pazopanib hydrochloride) 200 mg *Votrient* 200mg tablets | 30 tablet (POM) £560.50

Pazopanib (as Pazopanib hydrochloride) 400 mg *Votrient* 400mg tablets | 30 tablet (POM) £1,121.00

Ponatinib

INDICATIONS AND DOSE

Treatment of chronic, accelerated, or blast phase chronic myeloid leukaemia in patients who have the T3151 mutation or who have resistance to or intolerance of dasatinib or nilotinib, and for whom subsequent treatment with imatinib is not clinically appropriate | Treatment of Philadelphia chromosome-positive acute lymphoblastic leukaemia in patients who have the T3151 mutation or who have resistance to or intolerance of dasatinib, and for whom subsequent treatment with imatinib is not clinically appropriate

BY MOUTH

- ▶ **Adult:** 45 mg once daily, for dose adjustment due to side effects—consult product literature

Dose adjustments due to interactions

Consider reducing the initial dose to 30 mg once daily with concomitant use of potent inhibitors of cytochrome P450 enzyme CYP3A4 (e.g. clarithromycin, indinavir, itraconazole, ritonavir, saquinavir, telithromycin or voriconazole).

Important safety information

MHRA/CHM ADVICE: PONATINIB: RISK OF VASCULAR OCCLUSIVE EVENTS (NOVEMBER 2014)

The benefits and risks of ponatinib have been reviewed by the European Medicines Agency's Committee on Medicinal Products for Human Use, which has recommended that strengthened warnings should be added to the product information aimed at minimising the risk of blood clots and blockages in the arteries. The review concluded that available evidence shows that the risk of blood vessel blockage with ponatinib is likely to be dose-dependent. However, the data is insufficient to recommend reducing the dose of ponatinib, and there is a risk that a lower dose might not be as effective as the current dose in all patients and in long-term treatment. Therefore, no change has been made to the recommended starting dose.

Prescribers may wish to consider reducing the dose in patients with chronic phase chronic myeloid leukaemia who are responding well to treatment, and who might be at high risk of blood vessel blockage. Stop ponatinib if a complete response has not occurred within 3 months of treatment, and monitor patients for high blood pressure or signs of heart problems.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CAUTIONS** Alcohol abuse—increased risk of pancreatitis · current severe hypertriglyceridaemia—increased risk of pancreatitis · discontinue treatment if a complete haematologic response has not occurred within 3 months · history of myocardial infarction—do not use unless potential benefit outweighs potential risk · history of pancreatitis · history of stroke—do not use unless potential benefit outweighs potential risk · hypertension—medically control during treatment and interrupt treatment if uncontrolled

CAUTIONS, FURTHER INFORMATION

Cardiovascular status Assess cardiovascular status before treatment—manage cardiovascular risk factors before and during treatment.

- **INTERACTIONS** → Appendix 1 (ponatinib).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal discomfort · altered sensations · arthralgia · atrial fibrillation · biochemistry disturbances · blurred vision · bruising · cardiac disorders · cardiac events · cerebrovascular events · constipation · cough · decreased appetite · dehydration · diarrhoea · dizziness · dry eyes · dry mouth · dry skin · dyspepsia · dysphonia · dyspnoea · electrolyte disturbances · epistaxis · erectile dysfunction · exfoliative dermatitis · flushing · gastro-oesophageal reflux disease · headache · hyperhidrosis · hypertension · infection · insomnia · intermittent claudication · malaise · muscle spasms · musculoskeletal pain · oedema · pancreatitis · pericardial effusion · peripheral neuropathy · pleural effusion · pruritus · pyrexia · rash · thromboembolic events · vascular occlusion · weight loss
 - ▶ **Uncommon** Atrial flutter · cerebral artery stenosis · cerebral infarction · gastric haemorrhage · hepatotoxicity · jaundice · retinal vein occlusion · retinal vein thrombosis · visual impairment
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women; effectiveness of hormonal contraception unknown—alternative or additional methods of contraception should be used.
- **PREGNANCY** Avoid—toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Manufacturer advises discontinue breastfeeding—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** No information available—manufacturer advises caution if creatinine clearance less than 50 mL/minute.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor serum lipase every 2 weeks for the first 2 months and periodically thereafter for all patients—withhold treatment if lipase elevated and abdominal symptoms occur.
 - ▶ Monitor full blood count every 2 weeks for the first 3 months and then monthly thereafter or as clinically indicated.
 - ▶ Monitor liver function periodically.
 - ▶ Monitor for vascular occlusion or thromboembolism—interrupt treatment immediately if this occurs.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 3, 25

- ▶ **Iclusig** (Ariad Pharma (UK) Ltd) ▼

Ponatinib (as Ponatinib hydrochloride) 15 mg Iclusig 15mg tablets | 60 tablet [PoM] £5,050.00

Ponatinib (as Ponatinib hydrochloride) 45 mg Iclusig 45mg tablets | 30 tablet [PoM] £5,050.00

Regorafenib

- **DRUG ACTION** Regorafenib is an inhibitor of several protein kinases.

INDICATIONS AND DOSE

Treatment of metastatic colorectal cancer in patients who have previously been treated with, or who are unsuitable for standard treatment including fluoropyrimidine-based chemotherapy, a vascular endothelial growth factor inhibitor, and an epidermal growth factor receptor inhibitor

BY MOUTH

- ▶ **Adult:** 160 mg once daily for 21 consecutive days of repeated 28-day cycles, for dose adjustment due to side effects—consult product literature

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CAUTIONS** Ensure measures to prevent hand-foot skin reaction · Gilbert's syndrome—risk of hyperbilirubinaemia · history of ischaemic heart disease—monitor for signs and symptoms of myocardial ischaemia and interrupt treatment if signs of ischaemia or infarction develop · hypertension—control blood pressure before treatment initiation and monitor as clinically indicated during treatment (review dose and consider treatment interruption if severe or persistent hypertension develops; discontinue treatment if hypertensive crisis occurs) · may impair wound healing—withhold treatment for major surgical procedures · predisposition to bleeding
- **INTERACTIONS** → Appendix 1 (regorafenib). Caution in concomitant treatment with drugs that may increase the risk of bleeding (increased risk of haemorrhagic events).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abnormal international normalised ratio · biochemical disturbances · decreased appetite · diarrhoea · dry mouth · dry skin · dysphonia · electrolyte disturbances · gastro-enteritis · gastro-oesophageal reflux · haemorrhage (including fatal) · hand-foot skin reaction · headache · hypertension · hypothyroidism · infection · malaise · mucosal inflammation · musculoskeletal stiffness · nail disorder · pain · pyrexia · rash · taste disorders · tremor · weight loss
 - ▶ **Uncommon** Gastro-intestinal perforation and fistula (discontinue treatment) · hypertensive crisis · myocardial infarction · myocardial ischaemia · severe (including fatal) liver injury
 - ▶ **Rare** Keratoacanthoma · posterior reversible encephalopathy syndrome · squamous cell carcinoma of the skin · Stevens-Johnson syndrome · toxic epidermal necrolysis
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**

Hand-foot skin reaction Consult product literature if signs or symptoms develop.
- **CONCEPTION AND CONTRACEPTION** Women of childbearing potential and men must use effective

contraception during treatment and up to 8 weeks after last dose.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor blood count and coagulation parameters and consider permanent discontinuation in event of severe bleeding.
 - ▶ Monitor hepatic function before treatment, then at least every two weeks for the first 2 months, then at least monthly thereafter and as clinically indicated—consult product literature if changes in liver function observed.
 - ▶ Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including seizure, headache, altered mental status, visual disturbances or cortical blindness, with or without hypertension)—discontinue treatment if symptoms occur.
 - ▶ Monitor biochemical, electrolyte and metabolic parameters during treatment; ensure measures to prevent hand-foot skin reaction—consult product literature if signs or symptoms develop.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken at the same time each day, swallowed whole with water after a light meal that contains less than 30% fat.
- **PATIENT AND CARER ADVICE** Counselling advised (administration).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Regorafenib 40 mg Stivarga 40mg tablets | 84 tablet (PoM)
£3,744.00 (Hospital only)

Ruxolitinib

- **DRUG ACTION** Ruxolitinib is a selective inhibitor of the Janus-associated tyrosine kinases JAK1 and JAK2.

INDICATIONS AND DOSE

Treatment of disease-related splenomegaly or symptoms in patients with primary myelofibrosis, post-polycythaemia vera myelofibrosis, or post-essential thrombocythaemia myelofibrosis

BY MOUTH

▶ Adult: (consult product literature or local protocols)

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CAUTIONS** Assess risk of developing infection before treatment—do not initiate until active serious infections are resolved

CAUTIONS, FURTHER INFORMATION

Tuberculosis Patients should be evaluated for latent and active tuberculosis before starting treatment and monitored for signs and symptoms of tuberculosis during treatment.

- **INTERACTIONS** → Appendix 1 (ruxolitinib).

● SIDE-EFFECTS

- ▶ **Common or very common** Dizziness · flatulence · headache · hypercholesterolaemia · weight gain
- ▶ **Uncommon** Tuberculosis
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · progressive multifocal leucoencephalopathy · thromboembolism · tumour lysis syndrome · vomiting
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Reduce dose (consult product literature).
- **RENAL IMPAIRMENT** Reduce dose in severe impairment (consult product literature).
- **MONITORING REQUIREMENTS**
 - ▶ Monitor full blood count (including differential white cell count) before treatment, then every 2–4 weeks until dose stabilised, then as clinically indicated.
 - ▶ Monitor for infection during treatment.
 - ▶ Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or psychiatric signs or symptoms)—withhold treatment if suspected.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ **Ruxolitinib for disease-related splenomegaly or symptoms in adults with myelofibrosis (June 2013)** NICE TA289
Ruxolitinib is **not** recommended for the treatment of disease-related splenomegaly or symptoms in adult patients with primary myelofibrosis (also known as chronic idiopathic myelofibrosis), post polycythaemia vera myelofibrosis or post essential thrombocythaemia myelofibrosis. www.nice.org.uk/TA289

Sorafenib

- **DRUG ACTION** Sorafenib is an inhibitor of multiple kinases.

INDICATIONS AND DOSE

Treatment of advanced renal cell carcinoma when treatment with interferon alfa or interleukin-2 has failed or is unsuitable | Treatment of progressive, locally advanced, or metastatic, differentiated thyroid carcinoma that is refractory to radioactive iodine | Treatment of hepatocellular carcinoma

BY MOUTH

▶ Adult: 400 mg twice daily, for dose adjustments due to side effects, consult product literature

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CAUTIONS** Cardiac ischaemia · major surgical procedures · potential risk of bleeding—treat tracheal, bronchial, or oesophageal infiltration with localised therapy before initiating sorafenib in patients with differentiated thyroid carcinoma (DTC) and consider permanent withdrawal of sorafenib in any patient that requires medical intervention for bleeding · susceptibility to QT-interval prolongation

- **INTERACTIONS** → Appendix 1 (sorafenib).

- **SIDE-EFFECTS**

- ▶ **Common or very common** Acne · anorexia · arthralgia · asthenia · congestive heart failure · constipation · depression · dermatitis · desquamation · diarrhoea · dry skin · dysgeusia · dyspepsia · dysphagia · dysphonia · electrolyte disturbances · erectile dysfunction · erythema · fatigue · fever · flushing · gastro-oesophageal reflux disease · haemorrhage · hand-foot skin reaction · hoarseness · hyperkeratosis · hypertension · hypophosphataemia · hypophosphataemia · keratoacanthoma · malaise · muscle spasms · myalgia · myocardial infarction · myocardial ischaemia · peripheral neuropathy · proteinuria · pruritus · rash · renal failure · rhinorrhoea · thyroid dysfunction · tinnitus

- ▶ **Uncommon** Altered INR · altered prothrombin time · cholangitis · cholecystitis · dehydration · eczema · erythema multiforme · gastritis · gastro-intestinal perforations · gynaecomastia · hypertensive crisis · interstitial lung disease-like events · pancreatitis · posterior reversible encephalopathy syndrome

- ▶ **Rare** Hepatitis · leucocytoclastic vasculitis · nephrotic syndrome · QT-interval prolongation · rhabdomyolysis · Stevens-Johnson syndrome · toxic epidermal necrolysis
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

- **MONITORING REQUIREMENTS**

- ▶ Consider periodic monitoring of ECG and electrolytes in patients susceptible to QT-interval prolongation.
- ▶ Monitor blood pressure regularly and consider permanent discontinuation of sorafenib if resistant to antihypertensive therapy.
- ▶ Monitor plasma-calcium concentration (increased risk of hypocalcaemia if history of hypoparathyroidism).
- ▶ Monitor thyroid stimulating hormone in patients with differentiated thyroid carcinoma.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE technology appraisals (TAs)**

- ▶ Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and tsemsilimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009) NICE TA178

Treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours, after failure of imatinib |

Treatment of advanced or metastatic renal cell carcinoma

- **BY MOUTH**

- ▶ **Adult:** 50 mg once daily for 4 weeks, followed by a 2-week treatment-free period to complete 6-week cycle, adjusted in steps of 12.5 mg, doses adjusted according to tolerability; usual dose 25–75 mg daily

Treatment of unresectable or metastatic pancreatic neuroendocrine tumours

- **BY MOUTH**

- ▶ **Adult:** 37.5 mg once daily without treatment-free period; adjusted in steps of 12.5 mg, doses adjusted according to tolerability; maximum 50 mg per day

- **Important safety information**

RISK OF OSTEONECROSIS OF THE JAW (JANUARY 2011)

Treatment with sunitinib may be a risk factor for the development of osteonecrosis of the jaw.

Patients treated with sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk. Dental examination and appropriate preventive dentistry should be considered before treatment with sunitinib.

If possible, invasive dental procedures should be avoided in patients treated with sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CAUTIONS** Cardiovascular disease—discontinue if congestive heart failure develops · hypertension · increased risk of bleeding · susceptibility to QT-interval prolongation

- **INTERACTIONS** → Appendix 1 (sunitinib).

- **SIDE-EFFECTS**

- ▶ **Rare** Nephrotic syndrome
- ▶ **Frequency not known** Abdominal pain · alopecia · anorexia · arthralgia · bone-marrow suppression · constipation · cough · dehydration · diarrhoea · dizziness · dry skin · dyspnoea · epistaxis · fatigue · fistula formation (interrupt treatment if occurs) · gastro-intestinal perforation · hair discoloration · hand-foot syndrome · headache · hepatic failure · hypertension · hyperuricaemia · hypothyroidism · increased lacrimation · insomnia · myalgia · nausea · oedema · oral mucositis · osteonecrosis of the jaw · pancreatitis · paraesthesia · peripheral neuropathy · proteinuria · rash · seizures · skin discoloration · taste disturbance · thromboembolism · tumour lysis syndrome · urine discoloration · vomiting

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See

Temsirolimus

- **DRUG ACTION** Temsirolimus is a protein kinase inhibitor.

INDICATIONS AND DOSE

First-line treatment of advanced renal cell carcinoma | Treatment of relapsed or refractory mantle cell lymphoma

BY INTRAVENOUS INFUSION

- ▶ **Adult:** (consult product literature or local protocols)

- **INTERACTIONS** → Appendix 1 (temsirolimus).
The main active metabolite of temsirolimus is sirolimus—see also interactions of sirolimus and consult product literature.
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · acne · anorexia · anxiety · arthralgia · asthenia · bowel perforation · chest pain · cough · depression · diarrhoea · dizziness · drowsiness · dysphagia · dyspnoea · epistaxis · eye disorders · folliculitis · gastro-intestinal haemorrhage · hypercholesterolaemia · hyperglycaemia · hyperlipidaemia

- hypersensitivity reactions · hypertension · hypokalaemia · hypophosphataemia · impaired wound healing · increased susceptibility to infection · increased susceptibility to pneumonia · increased susceptibility to urinary-tract infection · insomnia · interstitial lung disease · myalgia · oedema · paraesthesia · pyrexia · rash · renal failure · rhinitis · skin disorders · taste disturbance · thrombophlebitis · thrombosis
- ▶ **Uncommon** Intracerebral bleeding
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Hypersensitivity reactions Hypersensitivity reactions, including some life-threatening and rare fatal reactions, are associated with temsirolimus therapy, usually during administration of the first dose. Symptoms include flushing, chest pain, dyspnoea, apnoea, hypotension, loss of consciousness, and anaphylaxis. Where possible, patients should receive an intravenous dose of antihistamine 30 minutes before starting the temsirolimus infusion. The infusion may have to be stopped temporarily for the treatment of infusion-related effects—consult product literature for appropriate management. If adverse reactions are not managed with dose delays, a dose reduction should be considered—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women.
- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Manufacturer advises discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** In renal cell carcinoma, reduce dose in severe impairment (consult product literature). Use with caution. In mantle cell lymphoma, avoid in moderate or severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
- ▶ Monitor respiratory function.
- ▶ Monitor blood lipids.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Vandetanib

● **DRUG ACTION** Vandetanib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Treatment of aggressive and symptomatic medullary thyroid cancer in patients with unresectable locally advanced or metastatic disease

BY MOUTH

► Adult: 300 mg once daily, for dose adjustment due to side effects—consult product literature

Important safety information

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CONTRA-INDICATIONS** Congenital long QT syndrome · QT interval greater than 480 milliseconds
- **CAUTIONS** Brain metastases (intracranial haemorrhage reported) · electrolyte disturbances · history of torsades de pointes · hypertension · phototoxicity reactions reported (wear protective clothing and/or sunscreen) · susceptibility to QT-prolongation
- **INTERACTIONS** → Appendix 1 (vandetanib). Caution with concomitant use of drugs that prolong QT interval.
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · alopecia · anxiety · asthenia · balance disorders · blurred vision · cholelithiasis · colitis · conjunctivitis · constipation · corneal changes (including opacity) · corneal deposits · decreased appetite · dehydration · depression · diarrhoea · dizziness · dry eye · dry mouth · dysaesthesia · dyspepsia · dysphagia · dysuria · electrolyte disturbances · epistaxis · gastritis · gastrointestinal haemorrhage · glaucoma · haematuria · haemoptysis · halo vision · hand-foot syndrome · headache · hyperglycaemia · hypertension · hypothyroidism · insomnia · ischaemic cerebrovascular conditions · keratopathy · lethargy · loss of consciousness · micturition urgency · nephrolithiasis · oedema · pain · paraesthesia · photopsia · photosensitivity reactions · pneumonitis · pollakiuria · proteinuria · pyrexia · QT-interval prolongation · taste disturbance · tremor
 - **Uncommon** Accommodation disorders · anuria · aspiration pneumonia · brain oedema · bullous dermatitis · cardiac arrest · cardiac conduction disorders · cardiac rate disorders · cardiac rhythm disorders · cataract · chromaturia · clonus · convulsions · erythema multiforme · faecal incontinence · heart failure · ileus · impaired healing · increased haemoglobin · interstitial lung disease (sometimes fatal) · intestinal perforation · pancreatitis · peritonitis · posterior reversible encephalopathy syndrome · respiratory failure · Stevens-Johnson syndrome · ventricular arrhythmia
 - **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 4 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (serum bilirubin greater than 1.5 times the upper limit of normal).
- **RENAL IMPAIRMENT** Reduce dose to 200 mg if creatinine clearance 30–49 mL/minute. Avoid if creatinine clearance less than 30 mL/minute.

- **MONITORING REQUIREMENTS** Monitor ECG, serum potassium, calcium, magnesium and thyroid stimulating hormone before treatment, then 1, 3, 6 and 12 weeks after starting treatment and following dose adjustment or interruption, then every 3 months for at least 1 year.
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in half a glass of water by stirring until dispersed (approximately 10 minutes), immediately before drinking (do not crush). After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed. The solution can also be administered via nasogastric or gastrostomy tubes.
- **PATIENT AND CARER ADVICE** Alert card should be provided. Patients or carers should be given advice on how to administer vandetanib tablets. Phototoxicity reactions Patients should be advised to wear protective clothing and/or sunscreen.

MEDICINAL FORMS

Vemurafenib

● **DRUG ACTION** Vemurafenib is a BRAF kinase inhibitor.

INDICATIONS AND DOSE

Monotherapy for the treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma

BY MOUTH

► Adult: 960 mg twice daily, for dose adjustment due to side effects—consult product literature

Important safety information

DRUG RASH WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS SYNDROME)

DRESS syndrome has been reported in patients taking vemurafenib. DRESS syndrome starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal.

Patients should be advised to stop taking vemurafenib and consult their doctor immediately if skin rash develops. Treatment with vemurafenib should not be restarted.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

- **CONTRA-INDICATIONS** Wild-type BRAF malignant melanoma
- **CAUTIONS** Electrolyte disturbances · prior or concurrent cancer associated with RAS mutation—increased risk of tumour progression · susceptibility to QT-prolongation
- **INTERACTIONS** → Appendix 1 (vemurafenib). Caution with concomitant use of drugs that prolong QT interval.
- **SIDE-EFFECTS**
 - **Common or very common** Actinic keratosis · alopecia · arthralgia · arthritis · asthenia · basal cell carcinoma · Bell's palsy · constipation · cough · cutaneous squamous cell carcinoma · decreased appetite · diarrhoea · dizziness · dry skin · erythema · erythema nodosum · fatigue · folliculitis · hand-foot syndrome · headache · hyperkeratosis · keratosis pilaris · musculoskeletal pain · myalgia · new primary melanoma · pain in extremities ·

peripheral oedema · photosensitivity reactions · pyrexia · QT-interval prolongation · seborrhoeic keratosis · skin papilloma · taste disturbance · uveitis

- ▶ **Uncommon** Non-cutaneous squamous cell carcinoma · peripheral neuropathy · retinal vein occlusion · Stevens-Johnson syndrome · toxic epidermal necrolysis · vasculitis
- ▶ **Rare** Progression of pre-existing NRAS mutated chronic myelomonocytic leukaemia
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · hypersensitivity reactions · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during for at least 6 months after treatment.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

● **BREAST FEEDING** Avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises more frequent monitoring in moderate to severe hepatic impairment (including monthly ECG monitoring during first 3 months of treatment).

● **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.

● **MONITORING REQUIREMENTS**

- ▶ Monitor ECG and electrolytes before treatment, after one month and following dose adjustment (treatment not recommended if QT interval greater than 500 milliseconds at baseline).
- ▶ Monitor liver function before treatment and periodically thereafter.
- ▶ Monitor for uveitis, iritis and retinal vein occlusion.
- ▶ Monitor for cutaneous and non-cutaneous squamous cell carcinoma and new primary melanoma before, during and for up to 6 months after treatment—consult product literature.

● **DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food).

● **PATIENT AND CARER ADVICE** Counselling advised (administration).
Drug rash with eosinophilia and systemic symptoms (DRESS syndrome) Patients should be advised to stop taking vemurafenib and consult their doctor immediately if skin rash develops.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)
▶ Vemurafenib for treating locally advanced or metastatic BRAF V600 mutation-positive malignant melanoma (December 2012) NICE TA269

Vemurafenib is recommended as an option for the treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma only if the manufacturer provides vemurafenib with the discount agreed in the patient access scheme. www.nice.org.uk/TA269

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2013) that vemurafenib (*Zelboraf*[®]) is accepted for restricted use within NHS Scotland as monotherapy for the first-line treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

VASCULAR ENDOTHELIAL GROWTH FACTOR INHIBITORS

Aflibercept

● **DRUG ACTION**

Aflibercept is a recombinant fusion protein that acts as a soluble decoy receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placental growth factor (PlGF). Aflibercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels that supply tumours with oxygen and nutrients.

INDICATIONS AND DOSE

In combination with irinotecan, fluorouracil and folinic acid (FOLFIRI) chemotherapy, in metastatic colorectal cancer that is resistant to, or has progressed after, an oxaliplatin-containing regimen

BY INTRAVENOUS INFUSION

▶ Adult: (consult local protocol)

● **CONTRA-INDICATIONS** Moderate or severe congestive heart failure · uncontrolled hypertension

● **CAUTIONS** Febrile neutropenia · history of cardiovascular disease (may be exacerbated by hypertension) · increased risk of haemorrhage (including fatal events) · increased risk of hypertension · increased risk of thromboembolic events (consult product literature if event occurs) · may impair wound healing—withhold treatment for at least 4 weeks before elective surgery and for at least 4 weeks after major surgery, or until wound fully healed · neutropenic infection · risk of fistula formation (discontinue if fistula develops) · risk of neutropenia · risk of thrombocytopenia

● **SIDE-EFFECTS**

▶ **Common or very common** Abdominal pain · aphthous stomatitis · decreased appetite · dehydration · diarrhoea · dysphonia · dyspnoea · fistula · haemorrhage (including nasal, rectal and gastro-intestinal) · haemorrhoids · hand-foot syndrome · headache · hypertension · infection · leucopenia · malaise · nasopharyngitis · neutropenia (including febrile neutropenia) · oropharyngeal pain · proctalgia · proteinuria · rhinorrhoea · sepsis · skin hyperpigmentation · stomatitis · thrombocytopenia · thromboembolic events (arterial and venous) · toothache · urinary tract infection · weight loss

▶ **Uncommon** Gastro-intestinal perforation · impaired wound healing · nephrotic syndrome · posterior reversible encephalopathy syndrome · thrombotic microangiopathy

● **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment. Effective contraception required during and for at least 6 months after treatment in men and women. Contraceptive advice should be given to men and women before therapy begins (and should cover the duration of contraception required after therapy has ended).

● **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Caution in severe impairment—no information available.

● **RENAL IMPAIRMENT** Caution in severe impairment—no information available.

● **MONITORING REQUIREMENTS**

▶ Monitor blood pressure at initiation and at least fortnightly during treatment (do not initiate treatment if pre-existing hypertension is uncontrolled)—consult

product literature if hypertension develops during treatment.

- ▶ Monitor for signs of gastro-intestinal perforation (discontinue if perforation develops).
- ▶ Monitor full blood count, including differential count and platelets at baseline and before each treatment cycle.
- ▶ Monitor for proteinuria before each treatment administration (consult product literature if symptoms develop).
- ▶ Monitor for signs and symptoms of diarrhoea and dehydration, particularly in elderly—consult product literature if severe diarrhoea occurs.
- ▶ Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, altered mental status, nausea, vomiting, headache, or visual disturbance).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ **Aflibercept in combination with irinotecan and fluorouracil-based therapy for treating metastatic colorectal cancer that has progressed following prior oxaliplatin-based chemotherapy (March 2014) NICE TA307**
Aflibercept in combination with irinotecan and fluorouracil-based therapy is **not** recommended within its marketing authorisation for treating metastatic colorectal cancer that is resistant to or has progressed after an oxaliplatin-containing regimen. www.nice.org.uk/TA307

1 Blood and blood-forming organs

1.1 Anaemias

Anaemias

Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

Sickle-cell disease

Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include sickle-cell crisis, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine, haemophilus influenzae type b vaccine, an annual influenza vaccine and prophylactic penicillin reduce the risk of infection. Hepatitis B vaccine should be considered if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased

erythropoiesis; this may increase folate requirements and folate supplementation may be necessary.

Hydroxycarbamide p. 777 can reduce the frequency of crises and the need for blood transfusions in sickle-cell disease. The beneficial effects of hydroxycarbamide may not become evident for several months.

1.2 Anaemias, G6PD deficiency

G6PD deficiency

Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, *Vicia faba*); this is termed *favism* and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies;

thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;

- manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals;
- the risk and severity of haemolysis is almost always dose-related.

The lists below should be read with these points in mind. Ideally, information about G6PD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6PD deficiency is common.

A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.

Drugs with definite risk of haemolysis in most G6PD-deficient individuals

- Dapsone and other sulfones (higher doses for dermatitis herpetiformis more likely to cause problems)
- Methylthioninium chloride
- Nitridazole [not on UK market]
- Nitrofurantoin
- Pamaquin [not on UK market]
- Primaquine (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people)
- Quinolones (including ciprofloxacin, moxifloxacin, nalidixic acid, norfloxacin, and ofloxacin)
- Rasburicase
- Sulfonamides (including co-trimoxazole; some sulfonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6PD-deficient individuals)

Drugs with possible risk of haemolysis in some G6PD-deficient individuals

- Aspirin (acceptable up to a dose of at least 1 g daily in most G6PD-deficient individuals)
 - Chloroquine (acceptable in acute malaria and malaria chemoprophylaxis)
 - Menadione, water-soluble derivatives (e.g. menadiol sodium phosphate)
 - Quinidine (acceptable in acute malaria) [not on UK market]
 - Quinine (acceptable in acute malaria)
 - Sulfonyleureas
- Naphthalene in mothballs also causes haemolysis in individuals with G6PD deficiency.

1.3 Anaemias, hypoplastic, haemolytic, and renal

Anaemias, hypoplastic, haemolytic, and renal

Anabolic steroids, pyridoxine hydrochloride p. 882, antilymphocyte immunoglobulin, and various corticosteroids are used in hypoplastic and haemolytic anaemias.

Antilymphocyte immunoglobulin given intravenously through a central line over 12–18 hours each day for 5 days produces a response in about 50% of cases of acquired *aplastic anaemia*; the response rate may be increased when

ciclosporin p. 717 is given as well. Severe reactions are common in the first 2 days and profound immunosuppression can occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities. Alternatively, oxymetholone tablets (available from 'special order' manufacturers or specialist importing companies) can be used in aplastic anaemia for 3 to 6 months.

It is unlikely that dietary deprivation of pyridoxine hydrochloride produces clinically relevant haematological effects. However, certain forms of *sideroblastic anaemia* respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine hydrochloride is indicated in both *idiopathic acquired* and *hereditary sideroblastic anaemias*. Although complete cures have not been reported, some increase in haemoglobin can occur; the dose required is usually high. *Reversible sideroblastic anaemias* respond to treatment of the underlying cause but in pregnancy, haemolytic anaemias, and alcohol dependence, or during isoniazid treatment, pyridoxine hydrochloride is also indicated.

Corticosteroids have an important place in the management of haematological disorders. They include conditions with an *autoimmune haemolytic anaemia*, *immune thrombocytopenias* and *neutropenias*, and *major transfusion reactions*. They are also used in chemotherapy schedules for many types of *lymphoma*, *lymphoid leukaemias*, and *paraproteinaemias*, including *multiple myeloma*.

Erythropoietins

Epoetins (recombinant human erythropoietins) are used to treat the anaemia associated with erythropoietin deficiency in chronic renal failure, to increase the yield of autologous blood in normal individuals and to shorten the period of symptomatic anaemia in patients receiving cytotoxic chemotherapy.

Epoetin beta p. 828 is also used for the prevention of anaemia in preterm neonates of low birth-weight; only unpreserved formulations should be used in neonates because other preparations may contain benzyl alcohol.

Darbepoetin alfa p. 825 is a hyperglycosylated derivative of epoetin; it has a longer half life and can be administered less frequently than epoetin.

Methoxy polyethylene glycol-epoetin beta p. 824 is a continuous erythropoietin receptor activator that is licensed for the treatment of symptomatic anaemia associated with chronic kidney disease. It has a longer duration of action than epoetin.

ANDROSTAN DERIVATIVES

Oxymetholone

INDICATIONS AND DOSE

Aplastic anaemia

BY MOUTH

- ▶ Adult: 1–5 mg/kg daily for 3 to 6 months

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Capsule

▶ OXYMETHOLONE (Non-proprietary)

- ▶ **Oxymetholone 50 mg** Oxymetholone 50mg capsules | 50 capsule [POM] £395.00 Schedule 4 (CD Anab)

CONTINUOUS ERYTHROPOIETIN RECEPTOR ACTIVATORS

Methoxy polyethylene glycol-epoetin beta

INDICATIONS AND DOSE

Symptomatic anaemia associated with chronic kidney disease in patients on dialysis and not currently treated with erythropoietins

BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INJECTION

▶ Adult: Initially 600 nanograms/kg every 2 weeks, dose to be adjusted according to response at intervals of at least 4 weeks, maintenance dose of double the previous fortnightly dose may be given every 4 weeks, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks; or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia associated with chronic kidney disease in patients not on dialysis and not currently treated with erythropoietins

INITIALLY BY SUBCUTANEOUS INJECTION

▶ Adult: Initially 1.2 micrograms/kg every 4 weeks, alternatively (by subcutaneous injection or by intravenous injection) initially 600 nanograms/kg every 2 weeks, dose to be adjusted according to response at intervals of at least 4 weeks, patients treated once every 2 weeks may be given a maintenance dose of double the previous fortnightly dose every 4 weeks, subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks; or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia associated with chronic kidney disease in patients currently treated with erythropoietins

BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INJECTION

▶ Adult: (consult product literature)

- **SIDE-EFFECTS** Hot flushes
- **PREGNANCY** No evidence of harm in *animal* studies—manufacturer advises caution.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Mircera** (Roche Products Ltd)

Methoxy polyethylene glycol-epoetin beta 100 microgram per 1 ml Mircera 30micrograms/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £44.05

Methoxy polyethylene glycol-epoetin beta 400 microgram per 1 ml Mircera 120micrograms/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £176.18

Methoxy polyethylene glycol-epoetin beta 500 microgram per 1 ml Mircera 150micrograms/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £220.22

Methoxy polyethylene glycol-epoetin beta 600 microgram per 1 ml Mircera 360micrograms/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £528.56

Methoxy polyethylene glycol-epoetin beta 666.667 microgram per 1 ml Mircera 200micrograms/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £293.62

Methoxy polyethylene glycol-epoetin beta 833.333 microgram per 1 ml Mircera 250micrograms/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £367.03

EPOETINS

Epoetins

Important safety information

MHRA/CHM ADVICE (DECEMBER 2007) ERYTHROPOIETINS—HAEMOGLOBIN CONCENTRATION

Overcorrection of haemoglobin concentration in patients with chronic kidney disease may increase the risk of death and serious cardiovascular events, and in patients with cancer may increase the risk of thrombosis and related complications:

- patients should not be treated with erythropoietins for the licensed indications in chronic kidney disease or cancer in patients receiving chemotherapy *unless* symptoms of anaemia are present
- the haemoglobin concentration should be maintained within the range 10–12 g/100 mL
- haemoglobin concentrations higher than 12 g/100 mL should be avoided
- the aim of treatment is to relieve symptoms of anaemia, and in patients with chronic kidney disease to avoid the need for blood transfusion; the haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia (in some patients, this may be achieved at concentrations lower than the recommended range)

MHRA/CHM ADVICE (DECEMBER 2007 AND JULY 2008)

ERYTHROPOIETINS—TUMOUR PROGRESSION AND SURVIVAL IN PATIENTS WITH CANCER

Clinical trial data show an unexplained excess mortality and increased risk of tumour progression in patients with anaemia associated with cancer who have been treated with erythropoietins. Many of these trials used erythropoietins outside of the licensed indications (i.e. overcorrected haemoglobin concentration or given to patients who have not received chemotherapy):

- erythropoietins licensed for the treatment of *symptomatic* anaemia associated with cancer, are licensed only for patients who are receiving chemotherapy
- the decision to use erythropoietins should be based on an assessment of the benefits and risks for individual patients; blood transfusion may be the preferred treatment for anaemia associated with cancer chemotherapy, particularly in those with a good cancer prognosis

- **CONTRA-INDICATIONS** Patients unable to receive thromboprophylaxis · pure red cell aplasia following erythropoietin therapy · uncontrolled hypertension

- **CAUTIONS** Aluminium toxicity (can impair the response to erythropoietin) · concurrent infection (can impair the response to erythropoietin) · correct factors that contribute to the anaemia of chronic renal failure, such as iron or folate deficiency, before treatment · during dialysis (increase in unfractonated or low molecular weight heparin dose may be needed) · epilepsy · inadequately treated or poorly controlled blood pressure—interrupt treatment if blood pressure uncontrolled · ischaemic vascular disease · malignant disease · other inflammatory disease (can impair the response to erythropoietin) · risk of thrombosis may be increased when used for anaemia before orthopaedic surgery—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident · risk of thrombosis may be increased when used for anaemia in adults receiving cancer chemotherapy · sickle-cell disease (lower target haemoglobin concentration may be appropriate) · sudden stabbing migraine-like pain (warning of a hypertensive crisis) · thrombocytosis (monitor platelet count for first 8 weeks)

- **SIDE-EFFECTS**

- ▶ **Common or very common** Aggravation of hypertension (dose-dependent) · cardiovascular events · diarrhoea · dose-dependent increase in platelet count regressing during treatment (but thrombocytosis rare) · headache · hypertensive crisis (in isolated patients with normal or low blood pressure) · increase in blood pressure (dose-dependent) · influenza-like symptoms (may be reduced if intravenous injection given over 5 minutes) · nausea · shunt thrombosis especially if tendency to hypotension or arteriovenous shunt complications · vomiting
- ▶ **Very rare** Sudden loss of efficacy because of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure
- ▶ **Frequency not known** Anaphylaxis · angioedema · hyperkalaemia · hypersensitivity reactions · injection-site reactions · peripheral oedema · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION

Hypertensive crisis In isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention has occurred with epoetin.

Pure red cell aplasia There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should **not** be switched to another form of erythropoietin.

- **MONITORING REQUIREMENTS**

- ▶ Monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes—interrupt treatment if blood pressure uncontrolled.
- ▶ Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients.

Darbepoetin alfa

INDICATIONS AND DOSE

Symptomatic anaemia associated with chronic renal failure in patients on dialysis

BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INJECTION

- ▶ **Adult:** Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately

25% at intervals of at least 4 weeks, maintenance dose to be given once weekly or once every 2 weeks, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 450 nanograms/kg once weekly, alternatively initially 750 nanograms/kg every 2 weeks, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose can be given once weekly, every 2 weeks, or once a month, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

BY INTRAVENOUS INJECTION

- ▶ **Adult:** Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose given once weekly, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 6.75 micrograms/kg every 3 weeks, alternatively initially 2.25 micrograms/kg once weekly, if response inadequate after 9 weeks further treatment may not be effective; if adequate response obtained then reduce dose by 25–50%, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

- **SIDE-EFFECTS** Injection-site pain · oedema
- **PREGNANCY** No evidence of harm in *animal* studies—manufacturer advises caution.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

Epoetin alfa

INDICATIONS AND DOSE

EPREX® PRE-FILLED SYRINGES

Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

BY INTRAVENOUS INJECTION OR BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 75–300 units/kg once weekly, intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, maintenance dose can be given as a single dose or in divided doses, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis

BY INTRAVENOUS INJECTION OR BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 50 units/kg twice weekly; maintenance 25–50 units/kg twice weekly, intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis

BY INTRAVENOUS INJECTION OR BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 50 units/kg 3 times a week, increased in steps of 25 units/kg 3 times a week, adjusted according to response, dose to be increased at intervals of at least 4 weeks; maintenance 17–33 units/kg 3 times a week (max. per dose 200 units/kg 3 times a week), intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia in adults receiving cancer chemotherapy

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 150 units/kg 3 times a week, alternatively initially 450 units/kg once weekly, increased to 300 units/kg 3 times a week, increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks; discontinue if inadequate response after 4 weeks at higher dose, subcutaneous injection maximum 1 mL per injection site, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues

to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery

BY INTRAVENOUS INJECTION

- ▶ Adult: 600 units/kg twice weekly for 3 weeks before surgery, consult product literature for details and advice on ensuring high iron stores, intravenous injection to be given over 1–5 minutes

Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 600 units/kg once weekly for 3 weeks before surgery and on day of surgery, alternatively 300 units/kg daily for 15 days starting 10 days before surgery, consult product literature for details, subcutaneous injection maximum 1 mL per injection site

BINOCRIT® PRE-FILLED SYRINGES

Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 25–100 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis

BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 50 units/kg twice weekly; maintenance 25–50 units/kg twice weekly, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

MONOCLONAL ANTIBODIES

Eculizumab

- **DRUG ACTION** Eculizumab, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein and thereby reduces haemolysis and thrombotic microangiopathy.

INDICATIONS AND DOSE

Reduce haemolysis in paroxysmal nocturnal haemoglobinuria (PNH), in those with a history of blood transfusions (under expert supervision)

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 600 mg once weekly for 4 weeks, then increased to 900 mg once weekly for 1 week; maintenance 900 mg every 12–16 days

Reduce thrombotic microangiopathy in atypical haemolytic uraemic syndrome (aHUS) (specialist use only)

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 900 mg once weekly for 4 weeks, then increased to 1.2 g once weekly for 1 week; maintenance 1.2 g every 12–16 days

- **CONTRA-INDICATIONS** Patients unvaccinated against *Neisseria meningitidis* · unresolved *Neisseria meningitidis* infection
- **CAUTIONS** Active systemic infection
- CAUTIONS, FURTHER INFORMATION**
Meningococcal infection Vaccinate against *Neisseria meningitidis* at least 2 weeks before treatment (trivalent vaccine against serotypes A, C, W135 and Y recommended); revaccinate according to current medical guidelines. Patients receiving eculizumab less than 2 weeks after receiving meningococcal vaccine must be given prophylactic antibiotics until 2 weeks after vaccination. Advise patient to report promptly any signs of meningococcal infection. Other immunisations should also be up to date.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Alopecia · arthralgia · blood disorders · cough · dizziness · dysgeusia · dysuria · fatigue · gastro-intestinal disturbances · headache · infection (including meningococcal infection) · influenza-like symptoms · infusion-related reactions · leucopenia · myalgia · nasopharyngitis · oedema · paraesthesia · pruritus · rash · spontaneous erection · thrombocytopenia · vertigo
 - ▶ **Uncommon** Anorexia · anxiety · chest pain · depression · epistaxis · gingival pain · Graves' disease · haematoma · hot flushing · hyperhidrosis · hypotension · jaundice · malignant melanoma · menstrual disorders · mood

changes · muscle spasms · myelodysplastic syndrome · palpitation · petechiae · renal impairment · skin depigmentation · sleep disturbances · syncope · tinnitus · tremor · visual disturbances

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 5 months after treatment.
- **PREGNANCY** No information available—use only if potential benefit outweighs risk. Human IgG antibodies known to cross placenta.
- **BREAST FEEDING** No information available—manufacturer advises avoid breast-feeding during and for 5 months after treatment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for 1 hour after infusion.
 - ▶ For *paroxysmal nocturnal haemoglobinuria*, monitor for intravascular haemolysis (including serum-lactate dehydrogenase concentration) during treatment and for at least 8 weeks after discontinuation.
 - ▶ For *atypical haemolytic uraemic syndrome*, monitor for thrombotic microangiopathy (measure platelet count, serum-lactate dehydrogenase concentration, and serum creatinine) during treatment and for at least 12 weeks after discontinuation.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion (Soliris[®])*, give intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute requisite dose to a concentration of 5 mg/mL and mix gently; give over 25–45 minutes (infusion time may be increased to 2 hours if infusion-related reactions occur).
- **PRESCRIBING AND DISPENSING INFORMATION** Consult product literature for details of supplemental doses with concomitant plasmapheresis, plasma exchange, or plasma infusion.
- **PATIENT AND CARER ADVICE** A patient information card should be provided. Patient or carers should be advised to report promptly any signs of meningococcal infection.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eculizumab 10 mg per 1 ml Soliris 300mg/30ml concentrate for solution for infusion vials | 1 vial [PoM] £3,150.00 (Hospital only)

1.4 Anaemias, iron deficiency

Anaemias, iron-deficiency

Treatment with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastric erosion, gastro-intestinal cancer).

Prophylaxis with an iron preparation may be appropriate in malabsorption, menorrhagia, pregnancy, after subtotal or total gastrectomy, in haemodialysis patients, and in the management of low birth-weight infants such as preterm neonates.

Oral iron

Iron salts should be given by mouth unless there are good reasons for using another route.

Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the

speed of response is not critical. Choice of preparation is thus usually decided by the incidence of side-effects and cost.

The oral dose of elemental iron for iron-deficiency anaemia should be 100 to 200 mg daily. It is customary to give this as dried ferrous sulfate; for prophylaxis of iron-deficiency anaemia, ferrous sulfate may be effective.

Iron content of different iron salts

Iron salt/amount	Content of ferrous iron
Ferrous fumarate 200 mg	65 mg
Ferrous gluconate 300 mg	35 mg
Ferrous sulfate 300 mg	60 mg
Ferrous sulfate, dried 200 mg	65 mg

Compound preparations

Preparations containing iron and folic acid p. 836 are used during pregnancy in women who are at high risk of developing iron and folic acid deficiency; they should be distinguished from those used for the prevention of neural tube defects in women planning a pregnancy.

It is important to note that the small doses of folic acid p. 836 contained in these preparations are inadequate for the treatment of megaloblastic anaemias.

Some oral preparations contain ascorbic acid p. 884 to aid absorption of the iron but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the **B group of vitamins** (except folic acid for pregnant women).

Modified-release preparations

Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

Parenteral iron

Iron can be administered parenterally as iron dextran p. 832, iron sucrose p. 832, ferric carboxymaltose below, or iron isomaltoiside 1000 p. 832. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the patient cannot tolerate oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption. Parenteral iron may also have a role in the management of chemotherapy-induced anaemia, when given with erythropoietins, in specific patient groups (see NICE guidance).

Many patients with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis.

With the exception of patients with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately. If parenteral iron is necessary, the dose should be calculated according to the patient's body-weight and total iron deficit. Depending on the preparation used, parenteral iron is given as a total dose or in divided doses. Further treatment should be guided by monitoring haemoglobin and serum iron concentrations.

Iron (injectable)

Important safety information

MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS WITH INTRAVENOUS IRON (AUGUST 2013)

Serious hypersensitivity reactions, including life-threatening and fatal anaphylactic reactions, have been reported in patients receiving intravenous iron. These reactions can occur even when a previous administration has been tolerated (including a negative test dose). Test doses are no longer recommended and caution is needed with every dose of intravenous iron. Intravenous iron products should only be administered when appropriately trained staff and resuscitation facilities are immediately available; patients should be closely monitored for signs of hypersensitivity during and for at least 30 minutes after every administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

The risk of hypersensitivity is increased in patients with known allergies, immune or inflammatory conditions, or those with a history of severe asthma, eczema, or other atopic allergy; in these patients, intravenous iron should only be used if the benefits outweigh the risks. Intravenous iron should be avoided in the first trimester of pregnancy and used in the second or third trimesters only if the benefit outweighs the potential risks for both mother and fetus.

- **SIDE-EFFECTS** Hypersensitivity reactions

SIDE-EFFECTS, FURTHER INFORMATION

Anaphylactic reactions Anaphylactic reactions can occur with parenteral administration of iron complexes and facilities for cardiopulmonary resuscitation must be available.

Overdose For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 1123.

Ferric carboxymaltose

INDICATIONS AND DOSE

Iron-deficiency anaemia

BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ **Adult:** Dose calculated according to body-weight and iron deficit (consult product literature)

- **CAUTIONS** Allergic disorders · asthma · eczema · hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available · infection (discontinue if ongoing bacteraemia) · oral iron should not be given until 5 days after last injection
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dizziness · gastro-intestinal disturbances · headache · injection-site reactions · rash
 - ▶ **Uncommon** Anaphylaxis · arthralgia · back pain · chest pain · fatigue · flushing · hypertension · hypotension · malaise · myalgia · paraesthesia · peripheral oedema · pruritus · pyrexia · rigors · urticaria
 - ▶ **Rare** Dyspnoea
- **PREGNANCY** Avoid in first trimester; crosses the placenta in animal studies. May influence skeletal development.
- **HEPATIC IMPAIRMENT** Use with caution. Avoid in conditions where iron overload increases risk of impairment.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Ferinject*®), give intermittently in Sodium chloride 0.9%, dilute 200–500 mg in up to 100 mL infusion fluid and give over at least 6 minutes; dilute 0.5–1 g in up to 250 mL infusion fluid and give over at least 15 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

ELECTROLYTES: May contain Sodium

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Venofer** (Vifor Pharma UK Ltd) ▼

Iron (as iron sucrose) 20 mg per 1 mL Venofer 100mg/5mL solution for injection vials | 5 vial [PoM] £43.52

Iron (oral)

- **SIDE-EFFECTS** Constipation · diarrhoea · epigastric pain (dose related) · faecal impaction · gastro-intestinal irritation · nausea (dose related)
- SIDE-EFFECTS, FURTHER INFORMATION**
- Managing side-effects** If side-effects occur, the dose may be reduced; alternatively, another iron salt may be used, but an improvement in tolerance may simply be a result of a lower content of elemental iron. The incidence of side-effects due to ferrous sulfate is no greater than with other iron salts when compared on the basis of equivalent amounts of elemental iron.
- Altered bowel habit** Iron preparations taken orally can be constipating and occasionally lead to faecal impaction. Oral iron, particularly modified-release preparations, can exacerbate diarrhoea in patients with inflammatory bowel disease; care is also needed in patients with intestinal strictures and diverticular disease. The relationship between dose and altered bowel habit (constipation or diarrhoea) is less clear than for nausea and epigastric pain.
- Overdose** For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 1123.
- **MONITORING REQUIREMENTS** The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the normal range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow.

- **PATIENT AND CARER ADVICE** Although iron preparations are best absorbed on an empty stomach they can be taken after food to reduce gastro-intestinal side-effects. May discolour stools.

Ferrous fumarate

INDICATIONS AND DOSE

Iron-deficiency anaemia (prophylactic)

BY MOUTH USING TABLETS

- ▶ Child 12–17 years: 210 mg 1–2 times a day
- ▶ Adult: 210 mg 1–2 times a day

BY MOUTH USING SYRUP

- ▶ Child 12–17 years: 140 mg twice daily
- ▶ Adult: 140 mg twice daily

Iron-deficiency anaemia (therapeutic)

BY MOUTH USING TABLETS

- ▶ Child 12–17 years: 210 mg 2–3 times a day
- ▶ Adult: 210 mg 2–3 times a day

BY MOUTH USING SYRUP

- ▶ Child 12–17 years: 280 mg twice daily
- ▶ Adult: 280 mg twice daily

FERSADAY[®]

Iron-deficiency anaemia (prophylactic)

BY MOUTH

- ▶ Adult: 322 mg daily

Iron-deficiency anaemia (therapeutic)

Ferrous sulfate dried 150 mg, Folic acid 500 microgram Fefol Spansules | 30 capsule [P] £4.25

Polysaccharide-iron complex

INDICATIONS AND DOSE**Iron-deficiency anaemia (prophylactic)**

BY MOUTH

- ▶ Child 1 month-1 year: 1 drop (approximately 500 micrograms iron) per 450 g body-weight to be given 3 times a daily, dose to be administered from dropper bottle, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4-6 weeks after birth and continued until mixed feeding is established

- ▶ Child 12-17 years: 2.5 mL daily

- ▶ Adult: 2.5 mL daily

Iron-deficiency anaemia (therapeutic)

BY MOUTH

- ▶ Child 2-5 years: 2.5 mL daily

- ▶ Child 6-11 years: 5 mL daily

- ▶ Child 12-17 years: 5 mL 1-2 times a day

- ▶ Adult: 5 mL 1-2 times a day

Iron-deficiency anaemia (therapeutic) if required during second and third trimester of pregnancy

BY MOUTH

- ▶ Child 12-17 years: 5 mL once daily

- ▶ Adult: 5 mL once daily

- **INTERACTIONS** → Appendix 1 (iron salts).
- **PATIENT AND CARER ADVICE** Counselling on the use of the dropper advised.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NHS restrictions *Niferex*[®] is not available on prescription under NHS, except 30-mL paediatric dropper bottle for prophylaxis and treatment of iron deficiency in infants born prematurely; endorse prescription 'SLS'.

1.5 Anaemias, megaloblastic

Anaemias, megaloblastic

Most megaloblastic anaemias result from a lack of either vitamin B₁₂ or folate, and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

One cause of megaloblastic anaemia in the UK is *pernicious anaemia* in which lack of gastric intrinsic factor resulting from an autoimmune gastritis causes malabsorption of vitamin B₁₂.

Vitamin B₁₂ is also needed in the treatment of megaloblastosis caused by *prolonged nitrous oxide anaesthesia*, which inactivates the vitamin, and in the rare syndrome of *congenital transcobalamin II deficiency*.

Vitamin B₁₂ should be given prophylactically after *total gastrectomy* or *total ileal resection* (or after *partial gastrectomy* if a vitamin B₁₂ absorption test shows vitamin B₁₂ malabsorption).

Apart from dietary deficiency, all other causes of vitamin B₁₂ deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B₁₂ orally and none for vitamin B₁₂ intrinsic factor complexes given by mouth. Vitamin B₁₂ in larger oral doses [unlicensed] may be effective.

Hydroxocobalamin p. 837 has completely replaced cyanocobalamin p. 837 as the form of vitamin B₁₂ of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B₁₂ neuropathy.

Folic acid below has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B₁₂ is administered concurrently otherwise neuropathy may be precipitated.

In *folate-deficient megaloblastic anaemia* (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores.

For prophylaxis in *chronic haemolytic states*, *malabsorption*, or in *renal dialysis*, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

Folic acid is also used for the prevention of methotrexate-induced side-effects in severe Crohn's disease, rheumatic disease, and severe psoriasis.

Folic acid p. 781 is also effective in the treatment of folate deficient megaloblastic anaemia but it is generally used in association with cytotoxic drugs; it is given as calcium folinate.

There is **no** justification for prescribing multiple ingredient vitamin preparations containing vitamin B₁₂ or folic acid.

FOLATES

Folic acid

INDICATIONS AND DOSE

Folate-deficient megaloblastic anaemia

BY MOUTH

- ▶ Child 1-11 months: Initially 500 micrograms/kg once daily (max. per dose 5 mg) for up to 4 months, in malabsorption states, doses up to 10 mg daily may be required
- ▶ Child 1-17 years: 5 mg daily for 4 months (until term in pregnant women), in malabsorption states, doses up to 15 mg daily may be required
- ▶ Adult: 5 mg daily for 4 months (until term in pregnant women), in malabsorption states, doses up to 15 mg daily may be required

Prevention of neural tube defects (women at a low risk of conceiving a child with a neural tube defect)

BY MOUTH

- ▶ Adult: 400 micrograms daily, to be taken before conception and until week 12 of pregnancy

Prevention of neural tube defects (women at low risk who have not been taking folic acid and who suspect they are pregnant)

BY MOUTH

- ▶ Adult: 400 micrograms daily, to be taken at once and continued until week 12 of pregnancy

Prevention of neural tube defects (women in the high-risk group who wish to become pregnant or who are at risk of becoming pregnant)

BY MOUTH

- ▶ Adult: 5 mg daily until week 12 of pregnancy

Prevention of neural tube defects (women with sickle-cell disease)

BY MOUTH

- ▶ Adult: 5 mg daily, patient should continue taking their normal dose of folic acid 5 mg daily (or to increase the dose to 5 mg daily) and continue this throughout pregnancy

Prevention of methotrexate-induced side-effects in rheumatic disease

BY MOUTH

- ▶ Adult: 5 mg once weekly, dose to be taken on a different day to methotrexate dose

Prevention of methotrexate side-effects in severe Crohn's disease | Prevention of methotrexate side-effects in severe psoriasis

BY MOUTH

- ▶ Adult: 5 mg once weekly, dose to be taken on a different day to methotrexate dose

Prophylaxis in chronic haemolytic states**BY MOUTH**

- ▶ Adult: 5 mg every 1–7 days, frequency dependent on underlying disease

Prophylaxis of folate deficiency in dialysis**BY MOUTH**

- ▶ Child 1–11 years: 250 micrograms/kg once daily (max. per dose 10 mg)
- ▶ Child 12–17 years: 5–10 mg once daily
- ▶ Adult: 5 mg every 1–7 days

Haemolytic anaemia | Metabolic disorders**BY MOUTH**

- ▶ Child 1 month–11 years: 2.5–5 mg once daily
- ▶ Child 12–17 years: 5–10 mg once daily
- ▶ Adult 18 years: 5–10 mg once daily

● UNLICENSED USE

- ▶ In adults Not licensed for prevention of methotrexate-induced side-effects in severe Crohn's disease, rheumatic disease, or severe psoriasis.

- **CAUTIONS** Should never be given alone for pernicious anaemia (may precipitate subacute combined degeneration of the spinal cord)

- **INTERACTIONS** → Appendix 1 (folates).

● SIDE-EFFECTS

- ▶ Rare Gastro-intestinal disturbances

● PATIENT AND CARER ADVICE

 Hydroxocobalamin 5 gram Cyanokit 5g powder for solution for infusion vials | 1 vial [PoM] no price available

1.6 Iron overload

Iron overload

Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially *thalassaemia major*, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, the long-term administration of the iron chelating compound desferrioxamine mesilate p. 839 is useful. Desferrioxamine mesilate (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine mesilate is **not** added to

the blood and is **not** given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine mesilate is enhanced by administration of ascorbic acid p. 884 (vitamin C) daily by mouth; it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to patients with cardiac dysfunction; in patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine mesilate.

Desferrioxamine mesilate infusion can be used to treat *aluminium overload* in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

IRON CHELATORS

Deferasirox

- **DRUG ACTION** Deferasirox, is an oral iron chelator.

INDICATIONS AND DOSE

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in children aged 2–5 years with thalassaemia major who receive frequent blood transfusions | Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells) | Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with other anaemias | Treatment of chronic iron overload in patients with thalassaemia major who receive frequent blood transfusions (more than 7 mL/kg/month of packed red blood cells)

BY MOUTH

- ▶ **Adult:** Initially 10–30 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature; adjusted in steps of 5–10 mg/kg every 3–6 months, dose adjusted for maintenance according to serum-ferritin concentration; usual dose up to 30 mg/kg daily, increased if necessary up to 40 mg/kg daily and reduced in steps of 5–10 mg/kg, dose to be reduced once control achieved

Treatment of chronic iron overload when desferrioxamine is contra-indicated or inadequate (with non-transfusion-dependent thalassaemia syndromes)

BY MOUTH

- ▶ **Adult:** Initially 10 mg/kg once daily; adjusted in steps of 5–10 mg/kg every 3–6 months, dose adjusted for maintenance according to serum-ferritin concentration and liver-iron concentration (consult product literature); maximum 20 mg/kg per day

- **CAUTIONS** Elderly (increased risk of side-effects) · history of liver cirrhosis · not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes) · platelet count less than 50×10^9 /litre · risk of gastro-intestinal ulceration and haemorrhage · unexplained cytopenia—consider treatment interruption
- **INTERACTIONS** → Appendix 1 (deferasirox).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Fatal gastro-intestinal haemorrhage · gastro-intestinal disturbances · gastro-intestinal ulceration · headache · proteinuria · pruritus · rash
 - ▶ **Uncommon** Anxiety · cholelithiasis · disturbances of hearing and vision · dizziness · fatigue · glucosuria · hepatitis · lens opacity · maculopathy · oedema · pharyngitis · pyrexia · renal tubulopathy · skin pigmentation · sleep disorder

- ▶ **Frequency not known** Acute renal failure · agranulocytosis · alopecia · anaemia · anaphylaxis · angioedema · blood disorders · hepatic failure · hypersensitivity reactions · neutropenia · pancytopenia · thrombocytopenia · tubulointerstitial nephritis

- **PREGNANCY** Manufacturer advises avoid unless essential— toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Use with caution in moderate impairment, reduce dose considerably then gradually increase to max. 50% of normal dose. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Reduce dose by 10 mg/kg if eGFR 60–90 mL/minute/1.73 m² and if serum creatinine increased by more than 33% of baseline measurement on 2 consecutive occasions—interrupt treatment if deterioration in renal function persists after dose reduction. Avoid if eGFR less than 60 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - ▶ Eye and ear examinations required before treatment and annually during treatment.
 - ▶ Monitor body-weight, height, and sexual development in children annually.
 - ▶ Monitor serum-ferritin concentration monthly.
 - ▶ Test liver function before treatment, then every 2 weeks during the first month, and then monthly.
 - ▶ Measure baseline serum creatinine and monitor renal function weekly during the first month of treatment and monthly thereafter.
 - ▶ Test for proteinuria monthly.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be dispersed in water, orange juice, or apple juice; if necessary resuspend residue.

- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer deferasirox dispersible tablets.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2007) that deferasirox is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload associated with the treatment of rare acquired or inherited anaemias requiring recurrent blood transfusions. It is not recommended for patients with myelodysplastic syndromes.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Deferiprone

- **DRUG ACTION** Deferiprone, is an oral iron chelator.

INDICATIONS AND DOSE

Treatment of iron overload in patients with thalassaemia major in whom desferrioxamine is contraindicated or is inadequate

BY MOUTH

- ▶ Adult: 25 mg/kg 3 times a day; maximum 100 mg/kg per day

- **CONTRA-INDICATIONS** History of agranulocytosis or recurrent neutropenia

- **INTERACTIONS** → Appendix 1 (deferiprone).

- **SIDE-EFFECTS** Agranulocytosis · arthropathy · blood dyscrasias · gastro-intestinal disturbances (reducing dose and increasing gradually may improve tolerance) · headache · increased appetite · neutropenia · red-brown urine discoloration · zinc deficiency

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises avoid before intended conception—teratogenic and embryotoxic in *animal* studies. Contraception advised in females of child-bearing potential.

- **PREGNANCY** Manufacturer advises avoid during pregnancy—teratogenic and embryotoxic in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase.

- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

- **MONITORING REQUIREMENTS**

- ▶ Monitor neutrophil count weekly and discontinue treatment if neutropenia develops.
- ▶ Monitor plasma-zinc concentration.

- **PATIENT AND CARER ADVICE**

Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, capsule

Desferrioxamine mesilate

(Deferoxamine Mesilate)

INDICATIONS AND DOSE

Iron poisoning

BY CONTINUOUS INTRAVENOUS INFUSION

- ▶ Adult: Initially up to 15 mg/kg/hour, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service; maximum 80 mg/kg per day

Aluminium overload in dialysis patients

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature or local protocols)

Chronic iron overload (low iron overload)

BY SUBCUTANEOUS INFUSION

- ▶ Adult: The dose should reflect the degree of iron overload

Chronic iron overload (established overload)

BY SUBCUTANEOUS INFUSION

- ▶ Adult: 20–50 mg/kg daily

- **CAUTIONS** Aluminium-related encephalopathy (may exacerbate neurological dysfunction)
- **INTERACTIONS** → Appendix 1 (desferrioxamine).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · arthralgia · bone disorders · growth retardation · headache · hearing disturbances · injection-site reactions · myalgia · nausea · pyrexia · vomiting
 - ▶ **Rare** Anaphylaxis · blood dyscrasias · bone pain · diarrhoea · hepatic impairment · hypotension (especially when given too rapidly by intravenous injection) · leg cramps · lens opacity · leucopenia · rash · retinopathy · thrombocytopenia · visual disturbances · Yersinia and mucormycosis infections
 - ▶ **Very rare** Acute respiratory distress · convulsions · dizziness · neurological disturbances · neuropathy · paraesthesia · renal impairment
 - ▶ **Frequency not known** Muscle spasms
- **PREGNANCY** Teratogenic in *animal* studies. Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS**
 - ▶ Eye and ear examinations before treatment and at 3-month intervals during treatment.
 - ▶ Monitor body-weight and height in children at 3-month intervals—risk of growth retardation with excessive doses.
- **DIRECTIONS FOR ADMINISTRATION**

For full details and warnings relating to administration, consult product literature.

For *intravenous infusion* (*Desferal*®), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute with water for injections to a concentration of 100 mg/mL; dilute with infusion fluid.

1.7 Neutropenia and stem cell mobilisation

Neutropenia

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. Filgrastim (unglycosylated rhG-CSF) and lenograstim p. 842 (glycosylated rhG-CSF) have similar effects; both have been used in a variety of clinical settings, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim p. 841 usually increases the neutrophil count with an appropriate clinical response. Pegfilgrastim p. 842 is a

polyethylene glycol-conjugated ('pegylated') derivative of filgrastim; pegylation increases the duration of filgrastim activity. Lipegfilgrastim p. 842 is a polyethylene glycol-conjugated via a glycine linker derivative of filgrastim. Granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

CHEMOKINE RECEPTOR ANTAGONISTS

Plerixafor

- **DRUG ACTION** Plerixafor is a chemokine receptor antagonist.

INDICATIONS AND DOSE

Mobilise haematopoietic stem cells to peripheral blood for collection and subsequent autologous transplantation in patients with lymphoma or multiple myeloma (specialist use only)

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 240 micrograms/kg daily usually for 2–4 days (max 7 days), to be administered 6–11 hours before initiation of apheresis, dose to be given following 4 days treatment with a granulocyte-colony stimulating factor

● SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · dizziness · dry mouth · erythema · fatigue · gastro-intestinal disturbances · headache · injection-site reactions · insomnia · musculoskeletal pain · oral hypoesthesia · sweating
- ▶ **Uncommon** Dyspnoea · hypersensitivity reactions · periorbital swelling
- **CONCEPTION AND CONTRACEPTION** Use effective contraception during treatment—teratogenic in *animal* studies.
- **PREGNANCY** Manufacturer advises avoid unless essential—teratogenic in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Reduce dose to 160 micrograms/kg daily if creatinine clearance 20–50 mL/minute. No information available if creatinine clearance less than 20 mL/minute.
- **MONITORING REQUIREMENTS** Monitor platelets and white blood cell count.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Mozobil** (Sanofi)
 - Plerixafor 20 mg per 1 ml Mozobil 24mg/1.2ml solution for injection vials | 1 vial [PoM] £4,882.77

GRANULOCYTE-COLONY STIMULATING FACTORS

Granulocyte-colony stimulating factors

- **DRUG ACTION** Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils.
- **CAUTIONS** Malignant myeloid conditions · pre-malignant myeloid conditions · risk of splenomegaly and rupture—spleen size should be monitored · sickle-cell disease
- CAUTIONS, FURTHER INFORMATION**

Acute respiratory distress syndrome There have been reports of pulmonary infiltrates leading to acute respiratory distress syndrome—patients with a recent

history of pulmonary infiltrates or pneumonia may be at higher risk.

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anorexia · asthenia · bone pain · chest pain · fever · gastro-intestinal disturbances · headache · injection-site reactions · leucocytosis · musculoskeletal pain · rash · thrombocytopenia
- ▶ **Rare** Acute febrile neutrophilic dermatosis · cutaneous vasculitis · pulmonary side-effects (particularly interstitial pneumonia)

SIDE-EFFECTS, FURTHER INFORMATION Treatment should be withdrawn in patients who develop signs of pulmonary infiltration.

- **PREGNANCY** There have been reports of toxicity in *animal* studies and manufacturers advise not to use granulocyte-colony stimulating factors during pregnancy unless the potential benefit outweighs the risk.

- **BREAST FEEDING** There is no evidence for the use of granulocyte-colony stimulating factors during breast-feeding and manufacturers advise avoiding their use.

● MONITORING REQUIREMENTS

- ▶ Full blood counts including differential white cell and platelet counts should be monitored.
- ▶ Spleen size should be monitored during treatment—risk of splenomegaly and rupture.

Filgrastim

(Recombinant human granulocyte-colony stimulating factor, G-CSF)

INDICATIONS AND DOSE

Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)

BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ **Adult:** 5 micrograms/kg daily until neutrophil count in normal range usually for up to 14 days (up to 38 days in acute myeloid leukaemia), to be started at least 24 hours after cytotoxic chemotherapy and to be administered over 30 minutes if given by intravenous infusion

Reduction in duration of neutropenia (and associated sequelae) in myeloablative therapy followed by bone-marrow transplantation (specialist use only)

BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ **Adult:** 10 micrograms/kg daily, to be started at least 24 hours following cytotoxic chemotherapy and within 24 hours of bone-marrow infusion, then adjusted according to neutrophil count—consult product literature, doses administered over 30 minutes or 24 hours via intravenous route and over 24 hours via subcutaneous route

Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone (specialist use only)

BY SUBCUTANEOUS INJECTION OR BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 10 micrograms/kg daily for 5–7 days, to be administered by subcutaneous infusion over 24 hours if given

Mobilisation of peripheral blood progenitor cells for autologous infusion, used following adjunctive myelosuppressive chemotherapy—to improve yield (specialist use only)

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 5 micrograms/kg daily until neutrophil count in normal range, to be started the day after completing

chemotherapy, for timing of leucopheresis, consult product literature

Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion (specialist use only)

BY SUBCUTANEOUS INJECTION

- ▶ **Adult 18–59 years:** 10 micrograms/kg daily for 4–5 days, for timing of leucopheresis, consult product literature

Severe congenital neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 12 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

Severe cyclic neutropenia, or idiopathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 5 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

Persistent neutropenia in HIV infection (specialist use only)

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 1 microgram/kg daily, subsequent doses increased as necessary until neutrophil count in normal range, then adjusted to maintain neutrophil count in normal range—consult product literature; maximum 4 micrograms/kg per day

- **CONTRA-INDICATIONS** Severe congenital neutropenia (Kostmann's syndrome) with abnormal cytogenetics
- **CAUTIONS** Osteoporotic bone disease (monitor bone density if given for more than 6 months) · secondary acute myeloid leukaemia
- **INTERACTIONS** → Appendix 1 (filgrastim).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · dysuria · epistaxis · exacerbation of rheumatoid arthritis · haematuria · hepatomegaly · mucositis · osteoporosis · proteinuria · pseudogout · raised uric acid · splenic enlargement · transient decrease in blood glucose · transient hypotension · urinary abnormalities
 - ▶ **Uncommon** Capillary leak syndrome (including fatal cases)
 - ▶ **Rare** Splenic rupture
- **MONITORING REQUIREMENTS** Regular morphological and cytogenetic bone-marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia).
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Neupogen[®]); (Nivestim[®]); (Ratiograstim[®]); (Zarzio[®]) give continuously or intermittently in Glucose 5%; for a filgrastim concentration of less than 1 500 000 units/mL (15 micrograms/mL) albumin solution (human albumin solution) is added to produce a final albumin concentration of 2 mg/mL; should not be diluted to a filgrastim concentration of less than 200 000 units/mL (2 micrograms/mL) and should not be diluted with sodium chloride solution.
- **PRESCRIBING AND DISPENSING INFORMATION** Products containing filgrastim are not identical and although theoretically there should be no important differences in terms of safety and efficacy, when prescribing biological products it is good practice to use the brand name.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Accofil** (Accord Healthcare Ltd) ▼
Filgrastim 60 mega u per 1 ml Accofil 30million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £284.20

Filgrastim 96 mega u per 1 ml Neupogen Singleject 48million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £420.29
- ▶ **Nivestim** (Hospira UK Ltd)
Filgrastim 60 mega u per 1 ml Nivestim 30million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £290.00 (Hospital only)
Nivestim 12million units/0.2ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £180.00 (Hospital only)
Filgrastim 96 mega u per 1 ml Nivestim 48million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £465.00 (Hospital only)
- ▶ **Zarzio** (Sandoz Ltd)
Filgrastim 60 mega u per 1 ml Zarzio 30million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £250.75
Filgrastim 96 mega u per 1 ml Zarzio 48million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £399.50

Lenograstim**(Recombinant human granulocyte-colony stimulating factor, rHuG-CSF)****INDICATIONS AND DOSE**

Reduction in the duration of neutropenia and associated complications following bone-marrow transplantation for non-myeloid malignancy (specialist use only) | Reduction in the duration of neutropenia and associated complications following peripheral stem cells transplantation for non-myeloid malignancy (specialist use only)

BY INTRAVENOUS INFUSION OR BY SUBCUTANEOUS INJECTION

- ▶ Adult: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started the day after transplantation. Intravenous infusion to be given over 30 minutes

Reduction in the duration of neutropenia and associated complications following treatment with cytotoxic-induced neutropenia associated with a significant incidence of febrile neutropenia (specialist use only)

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started on the day after completion of chemotherapy

Mobilisation of peripheral blood progenitor cells for harvesting and subsequent infusion, used alone (specialist use only)

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 10 micrograms/kg daily for 4–6 days (5–6 days in healthy donors)

Mobilisation of peripheral blood progenitor cells, used following adjunctive myelosuppressive chemotherapy (to improve yield) (specialist use only)

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 150 micrograms/m² daily until neutrophil count stable in acceptable range, to be started 1–5 days after

completion of chemotherapy. For timing of leucopheresis, consult product literature

- **SIDE-EFFECTS** Muco-sitis · splenic rupture · toxic epidermal necrolysis

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Granocyte*®), give intermittently in Sodium chloride 0.9%; initially reconstitute with 1 mL water for injection provided (do not shake vigorously) then dilute with up to 50 mL infusion fluid for each vial of *Granocyte*-13 or up to 100 mL infusion fluid for *Granocyte*-34; give over 30 minutes.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

EXCIPIENTS: May contain Phenylalanine

- ▶ **Granocyte** (Chugai Pharma UK Ltd)

Lenograstim 13.4 mega u Granocyte-13 powder and solvent for solution for injection vials | 1 vial [PoM] £40.11 | 5 vial [PoM] £200.55

Lipegfilgrastim**(Glycopegylated recombinant methionyl human granulocyte-colony stimulating factor)****INDICATIONS AND DOSE**

Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes)

BY SUBCUTANEOUS INJECTION

- ▶ Adult (specialist use only): 6 mg, for each chemotherapy cycle, given approximately 24 hours after chemotherapy, dose expressed as filgrastim

- **CAUTIONS** Myelosuppressive chemotherapy
- **INTERACTIONS** → Appendix 1 (lipegfilgrastim).
- **SIDE-EFFECTS** Hypokalaemia

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Lonquex** (Teva UK Ltd) ▼

Lipegfilgrastim 10 mg per 1 ml Lonquex 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £652.06

Pegfilgrastim**(Pegylated recombinant methionyl human granulocyte-colony stimulating factor)****INDICATIONS AND DOSE**

Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 6 mg for each chemotherapy cycle, to be given at least 24 hours after chemotherapy, dose is expressed as filgrastim

- **CAUTIONS** Acute leukaemia · myelosuppressive chemotherapy
- **INTERACTIONS** → Appendix 1 (pegfilgrastim).
- **SIDE-EFFECTS**
- ▶ **Rare** Capillary leak syndrome (including fatal cases)

- ▶ **Very rare** Splenic rupture

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Neulasta** (Amgen Ltd)

Filgrastim (as Pegfilgrastim) 10 mg per 1 ml Neulasta 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [Pom] £686.38

1.8 Platelet disorders, essential thrombocythaemia

Essential thrombocythaemia

Anagrelide below inhibits platelet formation. It is licensed for essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs. An at risk patient is defined by one or more of the following features: over 60 years of age, or a platelet count greater than $1000 \times 10^9/L$ or a history of thrombo-haemorrhagic events. Anagrelide should be initiated under specialist supervision.

CYCLIC AMP PHOSPHODIESTERASE III INHIBITORS

Anagrelide

INDICATIONS AND DOSE

Essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs (initiated under specialist supervision)

BY MOUTH

- ▶ **Adult:** Initially 500 micrograms twice daily, dose to be adjusted at weekly intervals according to response, increased in steps of 500 micrograms daily; usual dose 1–3 mg daily in divided doses (max. per dose 2.5 mg); maximum 10 mg per day

- **CAUTIONS** Cardiovascular disease—assess cardiac function before and regularly during treatment · concomitant use of drugs that prolong QT-interval—assess cardiac function before and regularly during treatment · risk factors for QT-interval prolongation—assess cardiac function before and regularly during treatment

- **INTERACTIONS** → Appendix 1 (anagrelide). Caution with concomitant aspirin in patients at risk of haemorrhage.

● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · dizziness · fatigue · fluid retention · gastro-intestinal disturbances · headache · palpitation · rash · tachycardia
- ▶ **Uncommon** Alopecia · amnesia · anorexia · arrhythmias · arthralgia · back pain · blood disorders · chest pain · confusion · congestive heart failure · depression · dry mouth · dyspnoea · ecchymosis · epistaxis · fever · gastro-intestinal haemorrhage · haemorrhage · hypertension · hypoesthesia · impotence · malaise · myalgia · nervousness · oedema · pancreatitis · paraesthesia · pneumonia pleural effusion · pruritus · skin discoloration · sleep disturbances · syncope · weight changes
- ▶ **Rare** Angina · asthenia · cardiomegaly · cardiomyopathy · colitis · dry skin · dysarthria · gastritis · gingival bleeding ·

impaired coordination · migraine · myocardial infarction · nocturia · pericardial effusion · postural hypotension · pulmonary hypertension · pulmonary infiltrates · renal failure · somnolence · tinnitus · vasodilatation · visual disturbances

- ▶ **FREQUENCY NOT KNOWN** Hepatitis · interstitial lung disease · Torsade de pointes · tubulointerstitial nephritis

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies).
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment. Avoid in moderate to severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 50 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - ▶ Monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established).
 - ▶ Monitor liver function.
 - ▶ Monitor serum creatinine.
 - ▶ Monitor urea.
 - ▶ Monitor urea and electrolytes (including potassium, magnesium and calcium) before and during treatment.
- **PATIENT AND CARER ADVICE** Dizziness may affect performance of skilled tasks (e.g. cycling, driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

- ▶ **Xagrid** (Shire Pharmaceuticals Ltd) ▼

Anagrelide (as Anagrelide hydrochloride) 500 microgram Xagrid 500microgram capsules | 100 capsule [Pom] £404.57

1.9 Platelet disorders, idiopathic thrombocytopenic purpura

Idiopathic thrombocytopenic purpura

Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. In adults, idiopathic thrombocytopenic purpura can be treated with a **corticosteroid**, e.g. prednisolone p. 585, gradually reducing the dose over several weeks. Splenectomy is considered if a satisfactory platelet count is not achieved or if there is a relapse on reducing the dose of corticosteroid or withdrawing it.

Immunoglobulin preparations, are also used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are also used for children often in preference to a corticosteroid. Anti-D (rh0) immunoglobulin p. 1061 is effective in raising the platelet count in about 80% of unsplenectomised rhesus-positive individuals; its effects may last longer than normal immunoglobulin p. 1063 for intravenous use, but further doses are usually required.

Other therapy that has been tried in refractory idiopathic thrombocytopenic purpura includes azathioprine p. 716, cyclophosphamide p. 750, vincristine sulfate p. 773, ciclosporin p. 717, and danazol p. 636. Rituximab p. 734 may also be effective and in some cases induces prolonged remission. For patients with chronic severe

thrombocytopenia refractory to other therapy, tranexamic acid p. 95 may be given to reduce the severity of haemorrhage.

Eltrombopag below and romiplostim p. 845 are thrombopoietin receptor agonists licensed for the treatment of chronic idiopathic thrombocytopenic purpura in splenectomised patients refractory to other treatments, such as corticosteroids or immunoglobulins, or as a second-line treatment in non-splenectomised patients when surgery is contra-indicated (see also NICE guidance). Eltrombopag is an oral preparation and romiplostim is an injection which is made biosynthetically by recombinant DNA technology; they should both be used under the supervision of a specialist.

THROMBOPOIETIN RECEPTOR AGONISTS

Eltrombopag

INDICATIONS AND DOSE

Treatment of chronic idiopathic thrombocytopenic purpura in splenectomised patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision) | Second-line treatment of chronic idiopathic thrombocytopenic purpura in non-splenectomised patients when surgery is contra-indicated (under expert supervision)

BY MOUTH

- ▶ Adult: Initially 50 mg once daily, dose to be adjusted to achieve a platelet count of 50×10^9 /litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day
- ▶ Adult (patients of East Asian origin): Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of 50×10^9 /litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day.

Treatment of thrombocytopenia associated with chronic hepatitis C infection, where the degree of thrombocytopenia is the main factor preventing the initiation or limiting the ability to maintain optimal interferon-based therapy (under expert supervision)

BY MOUTH

- ▶ Adult: Initially 25 mg once daily, dose to be adjusted to achieve a platelet count sufficient to initiate antiviral therapy then a platelet count of $50\text{--}75 \times 10^9$ /litre during antiviral therapy—consult product literature for dose adjustments, discontinue if inadequate response after 2 weeks treatment at maximum dose; maximum 100 mg per day

- **CAUTIONS** Patients of East Asian origin · risk factors for thromboembolism
- **INTERACTIONS** → Appendix 1 (eltrombopag).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · alopecia · arthralgia · bone pain · cataract · constipation · diarrhoea · dry eye · fatigue · gastro-intestinal disturbances · headache · insomnia · myalgia · nausea · paraesthesia · peripheral oedema · pruritus · rash
 - ▶ **Uncommon** Acute myocardial infarction · anaemia · anorexia · anxiety · blood disorders · changes in appetite · cholestasis · cough · deep vein thrombosis · depression · dizziness · dry mouth · ecchymosis · eosinophilia · epistaxis · eye disorders · flushing · gingival bleeding · gout · haemolysis · haemorrhoids · hemiparesis · hepatitis · hypertension · migraine · mood changes · myelocytosis · nocturia · palpitation · peripheral neuropathy · pulmonary embolism · QT-interval prolongation · rectosigmoid

cancer · renal failure · respiratory infections · skin reactions · sleep disorders · sweating · tachycardia · taste disturbances · thromboembolic events · tremor · urinary tract infections · vertigo · weight gain

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** For *idiopathic thrombocytopenic purpura*, avoid unless potential benefit outweighs risk—reduce initial dose to 25 mg once daily. For *thrombocytopenia associated with chronic hepatitis C infection*, in severe hepatic impairment use only if potential benefit outweighs risk and monitor closely—increased risk of hepatic decompensation and thromboembolic events.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor liver function before treatment, every two weeks when adjusting the dose, and monthly thereafter.
 - ▶ Regular ophthalmological examinations for cataract formation recommended.
 - ▶ For *idiopathic thrombocytopenic purpura*, monitor full blood count including platelet count and peripheral blood smears every week during treatment until a stable platelet count is reached (50×10^9 /litre or more for at least 4 weeks), then monthly thereafter.
 - ▶ For *thrombocytopenia associated with chronic hepatitis C infection*, monitor platelet count every week before and during antiviral treatment until a stable platelet count is reached ($50\text{--}75 \times 10^9$ /litre), then monitor full blood count including platelet count and peripheral blood smears monthly thereafter.
- **DIRECTIONS FOR ADMINISTRATION** Each dose should be taken at least 4 hours before or after any dairy products (or foods containing calcium), indigestion remedies, or medicines containing aluminium, calcium, iron, magnesium, zinc, or selenium to reduce possible interference with absorption.
- **PATIENT AND CARER ADVICE** Patient counselling is advised on how to administer eltrombopag tablets.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

 - ▶ **Eltrombopag for treating chronic immune (idiopathic) thrombocytopenic purpura (July 2013) NICE TA293** Eltrombopag is recommended for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in splenectomised adults refractory to other treatments, or as a second-line treatment in non-splenectomised adults when surgery is contraindicated, only if:
 - the manufacturer provides eltrombopag at the agreed discount as part of the patient access scheme *and*
 - their condition is refractory to standard active treatments and rescue therapies *or*
 - they have severe disease and a high risk of bleeding that needs frequent courses of rescue therapies.
 Patients currently receiving eltrombopag whose disease does not meet these criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA293

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2010) that eltrombopag (*Revolade*®) is accepted for restricted use within NHS Scotland for the treatment of both splenectomised and non-splenectomised patients with severe symptomatic immune (idiopathic) thrombocytopenic purpura or a high risk of bleeding.
- **MEDICINAL FORMS**
 - There can be variation in the licensing of different medicines containing the same drug.

Tablet

Romiplostim**INDICATIONS AND DOSE**

Treatment of chronic idiopathic thrombocytopenic purpura in splenectomised patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision) | Second-line treatment of chronic idiopathic thrombocytopenic purpura in non-splenectomised patients when surgery is contra-indicated (under expert supervision)

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 1 microgram/kg once weekly, adjusted in steps of 1 microgram/kg once weekly (max. per dose 10 micrograms/kg once weekly) until a stable platelet count of 50×10^9 /litre or more is reached, discontinue treatment if inadequate response after 4 weeks at maximum dose, consult product literature for dose adjustments
- **SIDE-EFFECTS** Arthralgia · asthenia · bone pain · dizziness · ecchymosis · fatigue · flushing · gastro-intestinal disturbances · increased bone marrow reticulin · influenza-like symptoms · injection site reactions · insomnia · migraine · muscle spasm · myalgia · oedema · paraesthesia · rash
- **PREGNANCY** Manufacturer advises use only if essential—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid in moderate or severe impairment unless potential benefit outweighs risk (e.g. of portal vein thrombosis).
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor full blood count and peripheral blood smears for morphological abnormalities before and during treatment.
 - ▶ Monitor platelet count weekly until platelet count reaches 50×10^9 /litre or more for at least 4 weeks without dose adjustment, then monthly thereafter.
- **PATIENT AND CARER ADVICE** Dizziness may affect performance of skilled tasks (e.g. driving).

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE technology appraisals (TAs)**

- ▶ **Romiplostim for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (April 2011)**
NICE TA221
Romiplostim is recommended for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in adults:
 - if the manufacturer provides romiplostim at the agreed discount as part of the patient access scheme *and*
 - whose condition is refractory to standard active treatments and rescue therapies *or*
 - who have severe disease and a high risk of bleeding that needs frequent courses of rescue therapies.

www.nice.org.uk/TA221

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2009) that romiplostim (*Nplate*®) is accepted for restricted use within NHS Scotland for patients with severe symptomatic idiopathic thrombocytopenic purpura or those at high risk of bleeding.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- ▶ **Nplate** (Amgen Ltd)
Romiplostim 250 microgram Nplate 250microgram powder and solvent for solution for injection pre-filled disposable devices | 1 pre-filled disposable injection [PoM] £482.00

2 Fluid and electrolyte imbalances**Fluids and electrolytes**

The electrolyte concentrations (intravenous fluid) table and the electrolyte content (gastro-intestinal secretions) table may be helpful in planning replacement electrolyte therapy; faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected.

Oral preparations for fluid and electrolyte imbalance

Sodium and potassium salts, may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree.

Oral potassium

Compensation for potassium loss is especially necessary:

- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias;
- in patients in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, cirrhosis of the liver, the nephrotic syndrome, and severe heart failure;
- in patients with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse.

Measures to compensate for potassium loss may also be required in the elderly since they frequently take inadequate amounts of potassium in the diet (but see **warning on renal insufficiency**). Measures may also be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are **seldom required** with the small doses of diuretics given to treat hypertension; **potassium-sparing diuretics** (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide p. 201 or the thiazides when these are given to eliminate oedema.

If potassium salts are used for the prevention of hypokalaemia, then doses of potassium chloride daily (in divided doses) by mouth are suitable in patients taking a normal diet. *Smaller doses* must be used if there is *renal insufficiency (common in the elderly)* to reduce the **risk of hyperkalaemia**.

Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness; when appropriate, potassium-sparing diuretics are preferable.

When there is *established potassium depletion* larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

Management of hyperkalaemia

Acute severe hyperkalaemia (plasma-potassium concentration above 6.5 mmol/litre or in the presence of ECG changes) calls for urgent treatment with calcium

gluconate 10% p. 857 by slow intravenous injection, titrated and adjusted to ECG improvement, to temporarily protect against myocardial excitability. An intravenous injection of soluble insulin (5–10 units) with 50 mL glucose 50% p. 852, reduces serum-potassium concentration; this is repeated if necessary or a continuous infusion instituted. Salbutamol p. 222 [unlicensed indication], by nebulisation or slow intravenous injection may also reduce plasma-potassium concentration; it should be used with caution in patients with cardiovascular disease. The correction of causal or compounding acidosis with sodium bicarbonate p. 848 infusion should be considered (**important**: preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; occasionally haemodialysis is needed.

Ion-exchange resins may be used to remove excess potassium in *mild hyperkalaemia* or in *moderate hyperkalaemia* when there are no ECG changes.

Oral sodium and water

Sodium chloride p. 851 is indicated in states of sodium depletion and usually needs to be given intravenously. In chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride or sodium bicarbonate, according to the acid-base status of the patient, may be sufficient.

Oral rehydration therapy (ORT)

As a worldwide problem *diarrhoea* is by far the most important indication for fluid and electrolyte replacement. Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through diarrhoea can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch.

Oral rehydration solutions should:

- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalinising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to prevent the possible induction of osmotic diarrhoea;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

The WHO oral rehydration salts formulation contains sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. Its is dissolved in sufficient water to produce 1 litre (providing Na^+ 75 mmol, K^+ 20 mmol, Cl^- 65 mmol, citrate 10 mmol, glucose 75 mmol/litre). This formulation is recommended by the WHO and the United Nations Children's fund, but it is not commonly used in the UK.

Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.

Rehydration should be rapid over 3 to 4 hours (except in hypernatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breast-feeding or formula feeds should be offered between oral rehydration drinks.

Oral bicarbonate

Sodium bicarbonate p. 848 is given by mouth for *chronic acidotic states* such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed. For severe *metabolic acidosis*, sodium bicarbonate can be given intravenously.

Sodium bicarbonate may also be used to increase the pH of the urine; it is also used in dyspepsia.

Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Where *hyperchloraemic acidosis* is associated with potassium deficiency, as in some renal tubular and gastrointestinal disorders it may be appropriate to give oral **potassium bicarbonate**, although acute or severe deficiency should be managed by intravenous therapy.

Parenteral preparations for fluid and electrolyte imbalance

Electrolytes and water

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses, when the patient is nauseated or vomiting and is unable to take adequate amounts by mouth. When intravenous administration is not possible, fluid (as sodium chloride 0.9% p. 851 or glucose 5% p. 852) can also be given by subcutaneous infusion (hypodermoclysis).

The nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical investigations. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, e.g. 20% glucose p. 852, are best given through an indwelling catheter positioned in a large vein.

Intravenous sodium

Sodium chloride in isotonic solution provides the most important extracellular ions in near physiological concentrations and is indicated in *sodium depletion*, which can arise from such conditions as gastro-enteritis, diabetic ketoacidosis, ileus, and ascites. In a severe deficit of 4 to 8 litres, 2 to 3 litres of isotonic sodium chloride may be given over 2 to 3 hours; thereafter the infusion can usually be at a slower rate.

Chronic hyponatraemia arising from inappropriate secretion of antidiuretic hormone should ideally be corrected by fluid restriction. However, if sodium chloride is required for acute or chronic hyponatraemia, regardless of the cause, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome and the rise in plasma-sodium concentration should not exceed 10 mmol/litre in 24 hours. In severe hyponatraemia, sodium chloride 1.8% may be used cautiously.

Compound sodium lactate (Hartmann's solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded; it may reduce the risk of hyperchloraemic acidosis.

Glucose with sodium chloride solutions are indicated when there is combined *water and sodium depletion*. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma Na^+ remains extracellular.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium

Electrolyte concentrations—intravenous fluids

Intravenous infusion	Millimoles per litre				
	Na ⁺	K ⁺	HCO ₃ ⁻	Cl ⁻	Ca ²⁺
Normal plasma values	142	4.5	26	103	2.5
Sodium Chloride 0.9%	150	-	-	150	-
Compound Sodium Lactate (Hartmann's)	131	5	29	111	2
Sodium Chloride 0.18% and Glucose 4% (Adults only)	30	-	-	30	-
Potassium Chloride 0.3% and Glucose 5%	-	40	-	40	-
Potassium Chloride 0.3% and Sodium Chloride 0.9%	150	40	-	190	-
To correct metabolic acidosis					
Sodium Bicarbonate 1.26%	150	-	150	-	-
Sodium Bicarbonate 8.4% for cardiac arrest	1000	-	1000	-	-
Sodium Lactate (m/6)	167	-	167	-	-

Electrolyte content—gastro-intestinal secretions

Type of fluid	Millimoles per litre				
	H ⁺	Na ⁺	K ⁺	HCO ₃ ⁻	Cl ⁻
Gastric	40-60	20-80	5-20	-	100-150
Biliary	-	120-140	5-15	30-50	80-120
Pancreatic	-	120-140	5-15	70-110	40-80
Small bowel	-	120-140	5-15	20-40	90-130

chloride p. 851 intravenous infusion 0.9% and glucose p. 852 intravenous infusion 5% with potassium as appropriate.

Intravenous glucose

Glucose solutions (5%) are used mainly to replace water deficit. Average water requirements in a healthy adult are 1.5 to 2.5 litres daily and this is needed to balance unavoidable losses of water through the skin and lungs and to provide sufficient for urinary excretion. Water depletion (dehydration) tends to occur when these losses are not matched by a comparable intake, as may occur in coma or dysphagia or in the elderly or apathetic who may not drink enough water on their own initiative.

Excessive loss of water without loss of electrolytes is uncommon, occurring in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose p. 852 solution needed to replace deficits varies with the severity of the disorder, but usually lies within the range of 2 to 6 litres.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition.

Glucose solutions are given in regimens with calcium and insulin for the emergency management of *hyperkalaemia*. They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuing insulin infusion.

Intravenous potassium

Potassium chloride with sodium chloride intravenous infusion is the initial treatment for the correction of *severe hypokalaemia* and when sufficient potassium cannot be taken by mouth.

Repeated measurement of plasma-potassium concentration is necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should **not** involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

Bicarbonate and lactate

Sodium bicarbonate p. 848 is used to control severe *metabolic acidosis* (pH < 7.1) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anaemia or hypovolaemia, sodium bicarbonate (1.26%) can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock, for example in cardiac arrest, metabolic acidosis can develop without sodium or volume depletion; in these circumstances sodium bicarbonate is best given as a small volume of hypertonic solution, such as 50 mL of 8.4% solution intravenously.

Sodium lactate intravenous infusion is no longer used in metabolic acidosis because of the risk of producing lactic acidosis, particularly in seriously ill patients with poor tissue perfusion or impaired hepatic function.

For *chronic acidotic states*, sodium bicarbonate can be given by mouth.

Plasma and plasma substitutes

Plasma and plasma substitutes ('colloids') contain large molecules that do not readily leave the intravascular space where they exert osmotic pressure to maintain circulatory volume. Compared to fluids containing electrolytes such as sodium chloride p. 851 and glucose p. 852 ('crystalloids'), a smaller volume of colloid is required to produce the same expansion of blood volume, thereby shifting salt and water from the extravascular space. If resuscitation requires a volume of fluid that exceeds the maximum dose of the colloid then crystalloids can be given; packed red cells may also be required.

Albumin solution p. 853, prepared from whole blood, contains soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient's blood group.

Albumin is usually used after the acute phase of illness, to correct a plasma-volume deficit; hypoalbuminaemia itself is

not an appropriate indication. The use of albumin solution in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solution (20%) can be used under specialist supervision in patients with an intravascular fluid deficit and oedema because of interstitial fluid overload, to restore intravascular plasma volume with less exacerbation of the salt and water overload than isotonic solutions. Concentrated albumin solution may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in hepatic cirrhosis).

Recent evidence does not support the previous view that the use of albumin increases mortality.

Plasma substitutes

Dextran, gelatin p. 854, and the hydroxyethyl starch, tetraastarch, are macromolecular substances which are metabolised slowly. Dextran and gelatin may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicæmia; they may also be used as an immediate short-term measure to treat haemorrhage until blood is available. Dextran and gelatin are rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion.

Hydroxyethyl starches should only be used for the treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient; they should be used at the lowest effective dose for the first 24 hours of fluid resuscitation.

Plasma substitutes should **not** be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of *some* plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

BICARBONATE

Sodium bicarbonate

INDICATIONS AND DOSE

Chronic acidotic states such as uraemic acidosis or renal tubular acidosis

BY MOUTH

- ▶ Adult: 4.8 g daily, (57 mmol each of Na⁺ and HCO₃⁻), higher doses may be required and should be adjusted according to response

Severe metabolic acidosis

BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: Administer an amount appropriate to the body base deficit, to be given by slow intravenous injection of a strong solution (up to 8.4%), or by continuous intravenous infusion of a weaker solution (usually 1.26%)

Alkalinisation of urine | Relief of discomfort in mild urinary-tract infections

BY MOUTH

- ▶ Adult: 3 g every 2 hours until urinary pH exceeds 7, to be dissolved in water

Maintenance of alkaline urine

BY MOUTH

- ▶ Adult: 5–10 g daily, to be dissolved in water

- **CONTRA-INDICATIONS** Salt restricted diet

- **CAUTIONS** Avoid prolonged use in urinary conditions · cardiac disease · elderly · patients on sodium-restricted diet · respiratory acidosis

- **INTERACTIONS** → Appendix 1 (antacids).

● SIDE-EFFECTS

- ▶ When used for chronic acidotic states such as uraemic acidosis or renal tubular acidosis, and for maintenance of alkaline urine fluid retention (in those at risk) · hypokalaemia may be exacerbated · increase blood pressure · pulmonary oedema (in those at risk)

- ▶ When used for alkalinisation of urine, and for relief of discomfort in mild urinary-tract infections alkalosis on prolonged use · eructation

- **PREGNANCY** Use with caution in urinary conditions.

- **HEPATIC IMPAIRMENT** In patients with fluid retention, avoid large amounts of sodium.

- **RENAL IMPAIRMENT** Avoid (except for specialised role in some forms of renal disease).

● MONITORING REQUIREMENTS

- ▶ With intravenous use Plasma-pH and electrolytes should be monitored.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use in adults For slow intravenous injection use a small volume of hypertonic solution (such as 50 mL of 8.4%). For continuous intravenous infusion a weaker solution of 1.26% solution can be infused over 3–4 hours.

- ▶ With oral use Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.

- **PRESCRIBING AND DISPENSING INFORMATION** Oral solutions of sodium bicarbonate are required occasionally; these are available from 'special-order' manufacturers or specialist importing companies; the strength of sodium bicarbonate should be stated on the prescription.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on the administration of sodium bicarbonate oral medicines.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, oral suspension, oral solution, powder, capsule, liquid, mouthwash

Tablet

▶ SODIUM BICARBONATE (Non-proprietary)

Sodium bicarbonate 84 mg per 1 ml Polyfusor B sodium bicarbonate 8.4% infusion 200ml bottles | 1 bottle [PoM] £8.94 | 12 bottle [PoM] no price available

ORAL REHYDRATION SALTS

Disodium hydrogen citrate with glucose, potassium chloride and sodium chloride

INDICATIONS AND DOSE

Fluid and electrolyte loss in diarrhoea

BY MOUTH

- ▶ Child 1-11 months: 1–1½ times usual feed volume to be given
- ▶ Child 1-11 years: 200 mL, to be given after every loose motion
- ▶ Child 12-17 years: 200–400 mL, to be given after every loose motion, dose according to fluid loss
- ▶ Adult: 200–400 mL, to be given after every loose motion, dose according to fluid loss

- **DIRECTIONS FOR ADMINISTRATION** Reconstitute 1 sachet with 200mL of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 60 mmol, citrate 10 mmol, and glucose 90 mmol.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include black currant, citrus, or natural.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Oral rehydration salts www.medicinesforchildren.org.uk/oral-rehydration-salts
After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder

- ▶ Dioralyte (Sanofi)

Disodium hydrogen citrate 530 mg, Glucose 3.56 gram, Potassium chloride 300 mg, Sodium chloride 470 mg Dioralyte oral powder sachets citrus | 20 sachet [P] £6.72
Dioralyte oral powder sachets plain | 20 sachet [P] £6.72
Dioralyte oral powder sachets blackcurrant | 20 sachet [P] £6.72

Potassium chloride with rice powder, sodium chloride and sodium citrate

INDICATIONS AND DOSE

Fluid and electrolyte loss in diarrhoea

BY MOUTH

- ▶ Adult: 200–400 mL, to be given after every loose motion, dose according to fluid loss

- **DIRECTIONS FOR ADMINISTRATION** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 50 mmol and citrate 10 mmol.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include apricot, black currant, or raspberry.

- **PATIENT AND CARER ADVICE** Patients and carers should be advised how to reconstitute *Dioralyte*[®] Relief oral powder. After reconstitution any unused solution should be

discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

MEDICINAL FORMS

SODIUM

Sodium chloride

INDICATIONS AND DOSE

Prophylaxis of sodium chloride deficiency

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 4–8 tablets daily, to be taken with water, up to maximum 20 tablets daily in severe depletion

Chronic renal salt wasting

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: Up to 20 tablets daily, to be taken with appropriate fluid intake

Management of diabetic ketoacidosis (if systolic blood pressure is below 90 mmHg and adjusted for age, sex, and medication as appropriate)

BY INTRAVENOUS INFUSION

- ▶ Adult: 500 mL, sodium chloride 0.9% to be given over 10–15 minutes, repeat if blood pressure remains below 90 mmHg and seek senior medical advice, when blood pressure is over 90 mmHg, sodium chloride 0.9% should be given by intravenous infusion at a rate that replaces deficit and provides maintenance, management regimen also includes administration of potassium chloride, soluble insulin, long acting insulin analogues and glucose 10% solution

Diluent for instillation of drugs to the bladder

BY INTRAVESICAL INSTILLATION

- ▶ Adult: (consult product literature)

● CAUTIONS

GENERAL CAUTIONS:

Dilutional hyponatraemia especially in children and the elderly

SPECIFIC CAUTIONS:

- ▶ With intravenous use avoid excessive administration · cardiac failure · hypertension · peripheral oedema · pulmonary oedema · restrict intake in impaired renal function · toxæmia of pregnancy

● SIDE-EFFECTS

- ▶ With intravenous use administration of large doses may give rise to sodium accumulation · hyperchloraemic acidosis · oedema

● MONITORING REQUIREMENTS

- ▶ With intravenous use The jugular venous pressure should be assessed, the bases of the lungs should be examined for crepitations, and in elderly or seriously ill patients it is often helpful to monitor the right atrial (central) venous pressure.

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ With intravenous use The term 'normal saline' should not be used to describe sodium chloride intravenous infusion 0.9%; the term 'physiological saline' is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, solution for injection, irrigation, solution for infusion, oral solution, capsule, eye ointment, nebuliser liquid, infusion

SUGARS

Glucose

(Dextrose Monohydrate)

INDICATIONS AND DOSE**Energy source**

BY INTRAVENOUS INFUSION

▶ Adult: 1–3 litres daily, solution concentration of 20–50% to be administered

Water replacement

BY INTRAVENOUS INFUSION

▶ Adult: The volume of glucose solution needed to replace deficits may vary (consult product literature)

Hypoglycaemia

BY INTRAVENOUS INFUSION

▶ Child: 500 mg/kg, to be administered as Glucose 10% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs

▶ Adult: 10 g, to be administered as Glucose 20% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs

Management of diabetic ketoacidosis

BY INTRAVENOUS INFUSION

- ▶ Child: Glucose 5% or 10% should be added to replacement fluid once blood-glucose concentration falls below 14 mmol/litre
- ▶ Adult: Glucose 10% should be given once blood-glucose concentration falls below 14 mmol/litre, to be administered into a large vein through a large-gauge needle at a rate of 125 mL/hour, in addition to the sodium chloride 0.9% infusion

Oral glucose tolerance test

BY MOUTH

▶ Adult: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid

Establish presence of gestational diabetes

BY MOUTH

▶ Adult: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid

Persistent cyanosis (in combination with propranolol) when blood glucose less than 3 mmol/litre (followed by morphine)

BY INTRAVENOUS INFUSION

▶ Child: 200 mg/kg, to be administered as Glucose 10% intravenous infusion over 10 minutes

Dose equivalence and conversion

75 g anhydrous glucose is equivalent to Glucose BP 82.5 g.

- **CAUTIONS** Do not give alone except when there is no significant loss of electrolytes - prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances

CAUTIONS, FURTHER INFORMATION

- ▶ With intravenous use in children Glucose 4% intravenous infusion fluid should not be used for fluid replacement in children aged 16 years or less because of the risk of hyponatraemia; availability of this infusion should be restricted to high dependency and intensive care units, and specialist wards, such as renal, liver, and cardiac units. Local guidelines on intravenous fluids should be consulted.
- **SIDE-EFFECTS** Glucose injections especially if hypertonic may have a low pH and may cause venous irritation and thrombophlebitis
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use in children Injections containing more than 10% glucose can be irritant and should be given into a central venous line; however, solutions containing up to 12.5% can be administered for a short period into a peripheral line.
- **PRESCRIBING AND DISPENSING INFORMATION** Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose.
- **EXCEPTIONS TO LEGAL CATEGORY**
 - ▶ With intravenous use Prescription only medicine restriction does not apply to 50% solution where administration is for saving life in emergency.

2.1 Low blood volume

COLLOIDS

Albumin solution (Human albumin solution)

INDICATIONS AND DOSE

Acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery (with isotonic solutions) | Plasma exchange (with isotonic solutions) | Severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required (with concentrated solutions 20%) | Adjunct in the treatment of hyperbilirubinaemia by exchange transfusion in the newborn (with concentrated solutions 20%) | Paracentesis of large volume ascites associated with portal hypertension (with concentrated solutions 20%)

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Cardiac failure · severe anaemia
- **CAUTIONS** Correct dehydration when administering concentrated solution · history of cardiac disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) · history of circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) · increased capillary permeability
- **SIDE-EFFECTS** Anaphylaxis · chills · fever · hypersensitivity reactions · hypotension · increased salivation · nausea · tachycardia · vomiting
- **MONITORING REQUIREMENTS** Plasma and plasma substitutes are often used in very ill patients whose

condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.

- **PRESCRIBING AND DISPENSING INFORMATION** A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).

● **MEDICINAL FORMS**

PLASMA SUBSTITUTES

Dextran 70 with sodium chloride

INDICATIONS AND DOSE

Initial treatment of hypovolaemia with hypotension induced by traumatic injury

BY INTRAVENOUS INFUSION

- ▶ Adult: 250 mL, to be given over 2–5 minutes, followed immediately by administration of isotonic fluids, using *RescueFlow*[®].

- **CAUTIONS** Cardiac disease · hyperosmolality · severe hypoglycaemia · severe liver disease
- **SIDE-EFFECTS**
- ▶ Rare Severe anaphylactic reactions
- ▶ Frequency not known Hypersensitivity reactions · transient increase in bleeding time
- **PREGNANCY** Avoid—reports of anaphylaxis in mother causing fetal anoxia, neurological damage and death.
- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS**
- ▶ Where possible, monitor central venous pressure.
- ▶ Urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.
- ▶ Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.

● **EFFECT ON LABORATORY TESTS** Can interfere with some laboratory tests—dextran may interfere with blood group cross-matching or biochemical measurements, and these should be carried out before infusion is begun.

● **PRESCRIBING AND DISPENSING INFORMATION** Dextran 70 is dextrans of average molecular weight of about '70 000'.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Infusion

- ▶ **RescueFlow** (Pharmacosmos UK Ltd)
Dextran 70 60 mg per 1 ml, Sodium chloride 75 mg per 1 ml. RescueFlow 6% infusion 250ml bags | 1 bag [PoM] no price available (Hospital only)

Gelatin

INDICATIONS AND DOSE

Low blood volume in hypovolaemic shock, burns and cardiopulmonary bypass

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 500–1000 mL, use 3.5–4% solution

● **CAUTIONS** Cardiac disease · severe liver disease

● SIDE-EFFECTS

- ▶ **Rare** Severe anaphylactic reactions
- ▶ **Frequency not known** Hypersensitivity reactions · transient increase in bleeding time

● **PREGNANCY** Manufacturer of *Geloplasma*[®] advises avoid at the end of pregnancy.

● **HEPATIC IMPAIRMENT** Use with caution in severe impairment.

● **RENAL IMPAIRMENT** Use with caution in renal impairment.

● MONITORING REQUIREMENTS

- ▶ Urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.
- ▶ Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.

● **PRESCRIBING AND DISPENSING INFORMATION** The gelatin is partially degraded.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Infusion

- ▶ **Gelaspan** (B.Braun Medical Ltd)
Gelatin 40 mg per 1 ml Gelaspan 4% infusion 500ml Ecobags | 1 bag [PoM] £5.78 (Hospital only) | 20 bag [PoM] no price available (Hospital only)

Gelatin 40 mg per 1 ml Volplex 4% infusion 500ml bags | 10 bag [PoM] £47.00 (Hospital only)
Volplex 4% infusion 1litre bags | 6 bag [PoM] £54.54 (Hospital only)

Tetrastarch

INDICATIONS AND DOSE

VOLULYTE[®] INFUSION

Treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 10–20 mL, then increased to up to 30 mL/kilogram daily for a maximum duration of treatment of 24 hours, the initial dose must be given slowly and with careful monitoring of the patient to allow any anaphylactic reaction to be detected as early as possible

VOLUVEN[®] INFUSION

Treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 10–20 mL, then increased to up to 30 mL/kilogram daily for maximum duration of treatment of 24 hours, the initial dose must be given slowly and with careful monitoring of the patient to allow any anaphylactic reaction to be detected as early as possible

● **CONTRA-INDICATIONS** Burns · cerebral haemorrhage · critically ill patients · dehydration · hyperhydration · intracranial haemorrhage · pulmonary oedema · sepsis · severe coagulopathy

● **CAUTIONS** Cardiac disease · care should be taken to avoid haematocrit concentration from falling below 25-30% · children · renal impairment · severe liver disease · surgery · trauma

● SIDE-EFFECTS

- ▶ **Rare** Severe anaphylactic reactions
- ▶ **Frequency not known** Hypersensitivity reactions · pruritus · raised serum amylase · transient increase in bleeding time

● **HEPATIC IMPAIRMENT** Avoid in severe impairment.

● **RENAL IMPAIRMENT** Avoid.

● MONITORING REQUIREMENTS

- ▶ Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times. Treatment with hydroxyethyl starches should be guided by continuous haemodynamic monitoring so that the infusion is stopped as soon as appropriate haemodynamic goals have been achieved.

▶ Monitor renal function.

▶ Monitor for hypersensitivity reactions.

▶ Urine output should be monitored.

● **PRESCRIBING AND DISPENSING INFORMATION** A starch composed of more than 90% of amylopectin that has been etherified with hydroxyethyl groups; the term tetrastarch reflects the degree of etherification.

Hydroxyethyl starches should only be used for the treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient; they should be used at the lowest effective dose for the first 24 hours of fluid resuscitation.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

2.2 Calcium imbalance

Calcium

Calcium supplement

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand, and in old age, due to impaired absorption. In osteoporosis, a calcium intake which is double the recommended amount reduces the rate of bone loss. If the actual dietary intake is less than the recommended amount, a supplement of as much as 40 mmol is appropriate.

In severe acute hypocalcaemia or hypocalcaemic tetany, an initial slow intravenous injection of calcium gluconate p. 857 injection 10% should be given, with plasma-calcium and ECG monitoring (risk of arrhythmias if given too rapidly), and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence. Calcium chloride p. 857 injection is also available, but is more irritant; care should be taken to prevent extravasation. Oral supplements of calcium and vitamin D may also be required in persistent hypocalcaemia. Concurrent hypomagnesaemia should be corrected with magnesium sulfate p. 858.

See the role of calcium gluconate in temporarily reducing the toxic effects of hyperkalaemia.

Severe hypercalcaemia

Severe hypercalcaemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of sodium chloride 0.9% p. 851. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If *severe hypercalcaemia persists* drugs which inhibit mobilisation of calcium from the skeleton may be required. The **bisphosphonates** are useful and pamidronate disodium p. 623 is probably the most effective.

Corticosteroids are widely given, but may only be useful where hypercalcaemia is due to sarcoidosis or vitamin D intoxication; they often take several days to achieve the desired effect.

Calcitonin (salmon)/salcatonin p. 627 can be used for the treatment of hypercalcaemia associated with malignancy; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. *Further treatment* is governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcaemia should be avoided; oral administration of a bisphosphonate may be useful.

Hyperparathyroidism

Paricalcitol p. 888 is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure. Parathyroidectomy may be indicated for hyperparathyroidism.

Hypercalciuria

Hypercalciuria should be investigated for an underlying cause, which should be treated. Where a cause is not identified (idiopathic hypercalciuria), the condition is managed by increasing fluid intake and giving bendroflumethiazide p. 159. Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

2.3 Hypercalcaemia and hypercalciuria

CALCIMIMETIC AGENTS

Cinacalcet

- **DRUG ACTION** Cinacalcet reduces parathyroid hormone which leads to a decrease in serum calcium concentrations.

INDICATIONS AND DOSE

Secondary hyperparathyroidism in patients with end-stage renal disease on dialysis

BY MOUTH

- **Adult:** Initially 30 mg once daily, dose to be adjusted every 2–4 weeks; maximum 180 mg per day

Treatment of hypercalcaemia in parathyroid carcinoma | Primary hyperparathyroidism in patients where parathyroidectomy is inappropriate

BY MOUTH

- **Adult:** Initially 30 mg twice daily (max. per dose 90 mg 4 times a day), dose to be adjusted every 2–4 weeks according to response

Dose adjustments due to interactions

Dose adjustment may be necessary if smoking started or stopped during treatment.

- **CAUTIONS** Treatment should not be initiated in patients with hypocalcaemia
- **INTERACTIONS** → Appendix 1 (cinacalcet).
- **SIDE-EFFECTS**
 - **Common or very common** Anorexia · asthenia · dizziness · myalgia · nausea · paraesthesia · rash · reduced testosterone concentrations · vomiting
 - **Uncommon** Diarrhoea · dyspepsia · seizures
 - **Frequency not known** Allergic reactions · angioedema · heart failure · hypotension
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment. Monitor closely in hepatic impairment especially when increasing dose.
- **MONITORING REQUIREMENTS**
 - Measure serum-calcium concentration before initiation of treatment and within 1 week after starting treatment or adjusting dose, then monthly for secondary hyperparathyroidism, and every 2–3 months for primary hyperparathyroidism and parathyroid carcinoma.
 - In secondary hyperparathyroidism measure parathyroid hormone concentration 1–4 weeks after starting treatment or adjusting dose, then every 1–3 months.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ Cinacalcet for the treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy (January 2007) NICE TA117 Cinacalcet is not recommended for the routine treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy. Cinacalcet is recommended for the treatment of refractory secondary hyperparathyroidism in patients with end-stage renal disease (including those with calciphylaxis) **only** in those:
 - who have 'very uncontrolled' plasma concentration of intact parathyroid hormone (defined as greater than 85 picomol/litre) refractory to standard therapy, and a normal or high adjusted serum calcium concentration, **and**
 - in whom surgical parathyroidectomy is contraindicated, in that the risks of surgery outweigh the benefits.
 Response to treatment should be monitored regularly and treatment should be continued only if a reduction in the plasma concentration of intact parathyroid hormone of 30% or greater is seen within 4 months of treatment. www.nice.org.uk/TA117

Calcium chloride

INDICATIONS AND DOSE

Severe acute hypocalcaemia or hypocalcaemic tetany

BY INTRAVENOUS INJECTION

- ▶ Adult: Dose according to requirements

- **CAUTIONS** Avoid in respiratory acidosis - avoid in respiratory failure
- **DIRECTIONS FOR ADMINISTRATION** Care should be taken to avoid extravasation.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for injection

▶ CALCIUM CHLORIDE (Non-proprietary)

Calcium chloride dihydrate 73.5 mg per 1 mL Calcium chloride 7.35% solution for injection 10mL ampoules | 10 ampoule [PoM] £66.38-£82.44

Calcium chloride dihydrate 100 mg per 1 mL Calcium chloride 10% solution for injection 10mL pre-filled syringes | 1 pre-filled disposable injection [PoM] £9.12-£9.42

Calcium chloride dihydrate 147 mg per 1 mL Calcium chloride 14.7% solution for injection 5mL ampoules | 10 ampoule [PoM] £74.53-£82.44

Calcium chloride 14.7% solution for injection 10mL ampoules | 10 ampoule [PoM] £56.01-£66.38

Calcium gluconate

INDICATIONS AND DOSE

Severe acute hypocalcaemia or hypocalcaemic tetany

INITIALLY BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: Initially 10–20 mL, calcium gluconate injection 10% (providing approximately 2.25–4.5 mmol of calcium) should be administered with plasma-calcium and ECG monitoring, and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence; (by continuous intravenous infusion) 100 mL, adjusted according to response, dose to be diluted, calcium gluconate 10% should be administered

Acute severe hyperkalaemia (plasma-potassium concentration above 6.5 mmol/litre or in the presence of ECG changes)

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 10–20 mL, calcium gluconate 10% should be administered, dose titrated and adjusted to ECG improvement

Calcium deficiency | Mild asymptomatic hypocalcaemia

BY MOUTH

- ▶ Adult: Dose according to requirements

Dose equivalence and conversion

0.11 mmol/kg is equivalent to 0.5 mL/kg of calcium gluconate 10%.

Important safety information

The MHRA has advised that repeated or prolonged administration of calcium gluconate injection packaged in 10 mL glass containers is contra-indicated in children under 18 years and in patients with renal impairment owing to the risk of aluminium accumulation; in these patients the use of calcium gluconate injection packaged in plastic containers is recommended.

- **MONITORING REQUIREMENTS** Plasma-calcium and ECG monitoring required for administration by slow

intravenous injection (risk of arrhythmias if given too rapidly).

- **DIRECTIONS FOR ADMINISTRATION** For continuous intravenous infusion, dilute 100 mL of calcium gluconate 10% in 1 litre of glucose 5% or sodium chloride 0.9% and give at an initial rate of 50 mL/hour adjusted according to response. Avoid bicarbonates, phosphates, or sulfates.

2.5 Hypomagnesaemia

Magnesium

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton. Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulfate p. 858 as an osmotic laxative. Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant *hypermagnesaemia* (causing muscle weakness and arrhythmias) is rare.

Hypomagnesaemia

Since magnesium is secreted in large amounts in the gastrointestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of *hypomagnesaemia*; deficiency may also occur in alcoholism or as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypocalcaemia, and also hypokalaemia and hyponatraemia.

Symptomatic *hypomagnesaemia* is associated with a deficit of 0.5–1 mmol/kg; up to 160 mmol Mg²⁺ over up to 5 days may be required to replace the deficit (allowing for urinary losses). Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate

and duration of infusion and the dose should be reduced in renal impairment. To prevent *recurrence of the deficit*, magnesium may be given by mouth, but there is limited evidence of benefit; magnesium glycerophosphate below tablets and liquid [unlicensed] are available from 'special-order' manufacturers or specialist importing companies.

Arrhythmias

Magnesium sulfate injection has also been recommended for the emergency treatment of *serious arrhythmias*, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as *torsade de pointes*.

Myocardial infarction

Limited evidence that magnesium sulfate below prevents arrhythmias and reperfusion injury in patients with suspected myocardial infarction has not been confirmed by large studies. Routine use of magnesium sulfate for this purpose is not recommended.

Eclampsia and pre-eclampsia

Magnesium sulfate injection is the drug of choice for the treatment of seizures and the prevention of recurrent seizures in women with *eclampsia*. Regimens may vary between hospitals. Calcium gluconate p. 857 injection is used for the management of magnesium toxicity.

Magnesium sulfate injection is also of benefit in women with *pre-eclampsia* in whom there is concern about developing eclampsia. The patient should be monitored carefully.

MAGNESIUM

Magnesium glycerophosphate

INDICATIONS AND DOSE

Prevent recurrence of magnesium deficit

BY MOUTH

▶ Adult: 6 g daily in divided doses

Dose equivalence and conversion

Magnesium glycerophosphate 1 g is equivalent to Mg²⁺ 4 mmol.

- **UNLICENSED USE** Not licensed.
- **INTERACTIONS** → Appendix 1 (magnesium salts, oral).
- **SIDE-EFFECTS** Arrhythmias · colic · coma · confusion · diarrhoea · drowsiness · flushing of skin · hypermagnesaemia associated side-effects · hypotension · loss of tendon reflexes · muscle weakness · nausea · respiratory depression · thirst · vomiting
- **RENAL IMPAIRMENT** Avoid or reduce dose. Increased risk of toxicity.
- **MONITORING REQUIREMENTS** Monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in water.
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, chewable tablet, powder, capsule

Tablet

▶ **MAGNESIUM GLYCEROPHOSPHATE (Non-proprietary)**

1 ml LiquaMag GP (magnesium 121.25mg/5ml (5mmol/5ml)) oral solution (sugar-free) | 250 ml £55.00

Magnesium sulfate

INDICATIONS AND DOSE

Severe acute asthma | Continuing respiratory deterioration in anaphylaxis

BY INTRAVENOUS INFUSION

▶ Child 2-17 years: 40 mg/kg (max. per dose 2 g), to be given over 20 minutes

▶ Adult: 1.2-2 g, to be given over 20 minutes

Prevention of seizures in pre-eclampsia

INITIALLY BY INTRAVENOUS INJECTION

▶ Adult: Initially 4 g, to be given over 5-15 minutes, followed by (by intravenous infusion) 1 gram/hour for 24 hours, if seizure occurs, additional dose of 2 g by intravenous injection to be administered

Treatment of seizures and prevention of seizure recurrence in eclampsia

INITIALLY BY INTRAVENOUS INJECTION

▶ Adult: Initially 4 g, to be given over 5-15 minutes, followed by (by intravenous infusion) 1 gram/hour for 24 hours after seizure or delivery (whichever is later), if seizure recurs, increase the infusion rate to 1.5-2 g/hour or give an additional dose of 2 g by intravenous injection

Hypomagnesaemia

BY INTRAVENOUS INFUSION OR BY INTRAMUSCULAR INJECTION

▶ Adult: Up to 40 g, dose given over up to 5 days may be required to replace the deficit (allowing for urinary losses)

Hypomagnesaemia maintenance (e.g. in intravenous nutrition)

BY INTRAVENOUS INFUSION OR BY INTRAMUSCULAR INJECTION

▶ Adult: 2.5-5 g daily, usual dose 3 g daily

Emergency treatment of serious arrhythmias

BY INTRAVENOUS INJECTION

▶ Adult: 2 g, to be given over 10-15 minutes, dose may be repeated once if necessary

Rapid bowel evacuation (acts in 2-4 hours)

BY MOUTH

▶ Adult: 5-10 g, dose to be mixed in a glass of water, taken preferably before breakfast

Dose equivalence and conversion

Magnesium sulfate heptahydrate 1 g equivalent to Mg²⁺ approx. 4 mmol.

● UNLICENSED USE

- ▶ With intravenous use Unlicensed indication in severe acute asthma and continuing respiratory deterioration in anaphylaxis.

● CONTRA-INDICATIONS

- ▶ With oral use In rapid bowel evacuation—acute gastrointestinal conditions

● CAUTIONS

- ▶ With oral use In rapid bowel evacuation—elderly and debilitated patients (in adults)

- **INTERACTIONS** → Appendix 1 (magnesium, parenteral).

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Arrhythmias · coma · confusion · drowsiness · flushing of skin · hypermagnesaemia associated side-effects · hypotension · loss of tendon reflexes · muscle weakness · nausea · respiratory depression · thirst · vomiting

SPECIFIC SIDE-EFFECTS

- ▶ With oral use colic · diarrhoea

● PREGNANCY

Not known to be harmful for short-term intravenous administration in eclampsia, but excessive doses in third trimester cause neonatal respiratory depression.

- **HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.

- **RENAL IMPAIRMENT** Avoid or reduce dose. Increased risk of toxicity.

- **MONITORING REQUIREMENTS** Monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use In severe hypomagnesaemia administer initially via controlled infusion device (preferably syringe pump).

For intravenous injection, in arrhythmias, hypomagnesaemia, eclampsia, and pre-eclampsia, give continuously in Glucose 5% or Sodium chloride 0.9%. Concentration of magnesium sulfate heptahydrate should not exceed 20% (200 mg/mL or 0.8 mmol/mL Mg²⁺); dilute 1 part of magnesium sulfate injection 50% with at least 1.5 parts of water for injections. Max. rate 150 mg/minute (0.6 mmol/minute Mg²⁺).

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ With intramuscular use or intravenous use The BP directs that the label states the strength as the % w/v of magnesium sulfate heptahydrate and as the approximate concentration of magnesium ions (Mg²⁺) in mmol/mL. Magnesium Sulfate Injection BP is a sterile solution of Magnesium Sulfate Heptahydrate.

- **EXCEPTIONS TO LEGAL CATEGORY** Magnesium sulfate is on sale to the public as Epsom Salts.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, cutaneous solution, solution for infusion, capsule, infusion

Solution for injection

- ▶ **MAGNESIUM SULFATE (Non-proprietary)**

Magnesium sulfate heptahydrate 500 mg per 1 ml Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 10ml ampoules | 10 ampoule [POM] £35.25
Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 5ml ampoules | 10 ampoule [POM] £55.56

Solution for infusion

- ▶ **MAGNESIUM SULFATE (Non-proprietary)**

Magnesium sulfate heptahydrate 100 mg per 1 ml Magnesium sulfate 10% (magnesium 0.4mmol/ml) solution for injection 10ml ampoules | 10 ampoule [POM] £49.46

Powder

- ▶ **MAGNESIUM SULFATE (Non-proprietary)**

Magnesium sulfate dried 1 mg per 1 mg Numark Epsom Salts | 200 gram [GSL] £1.00
Magnesium sulfate powder | 300 gram [GSL] £1.91 | 500 gram [GSL] £3.20 DT price = £3.20 | 2000 gram [GSL] £5.60 | 5000 gram [GSL] £11.49
Epsom Salts | 200 gram [GSL] £0.91

2.6 Phosphate imbalance

Phosphorus

Phosphate supplements

Oral phosphate p. 861 supplements may be required in addition to vitamin D in a small minority of patients with hypophosphataemic vitamin D-resistant rickets.

Phosphate infusion is occasionally needed in alcohol dependence or in phosphate deficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis.

For phosphate requirements in total parenteral nutrition regimens, see Intravenous nutrition p. 873.

Phosphate-binding agents

Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-containing preparations are rarely used as phosphate binding agents and can cause aluminium accumulation.

Sevelamer p. 861 is licensed for the treatment of hyperphosphataemia in patients on haemodialysis or peritoneal dialysis. Sevelamer carbonate is also licensed for the treatment of patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more.

Lanthanum p. 860 is licensed for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD), and in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more that cannot be controlled by a low-phosphate diet.

2.7 Hyperphosphataemia

ALUMINIUM

Aluminium hydroxide

INDICATIONS AND DOSE

Hyperphosphataemia in renal failure

BY MOUTH USING CAPSULES

- ▶ Adult: 4–20 capsules daily in divided doses, to be taken with meals

Antacid

INITIALLY BY MOUTH USING CAPSULES

- ▶ Adult: 1 capsule 4 times a day and (by mouth) 1 capsule, to be taken at bedtime

- **CONTRA-INDICATIONS** Hypophosphataemia · infants · neonates
- **INTERACTIONS** → Appendix 1 (antacids). Antacids should preferably not be taken at the same time as other drugs since they may impair absorption. Antacids may damage enteric coatings designed to prevent dissolution in the stomach.
- **SIDE-EFFECTS** Constipation · hyperalbuminaemia
- **HEPATIC IMPAIRMENT** Avoid; can cause constipation which can precipitate coma.
- **RENAL IMPAIRMENT** There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).
- **PRESCRIBING AND DISPENSING INFORMATION** Alu-caps® are low in sodium.
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: chewable tablet

Tablet

- ▶ **Alu-Cap** (Meda Pharmaceuticals Ltd)
Aluminium hydroxide 475 mg Alu-Cap 475mg capsules | 120 capsule [P] £13.71 DT price = £13.71

CALCIUM**Calcium acetate**

The properties listed below are those particular to the drug only. For properties common to the class, see Calcium salts, p. 856.

INDICATIONS AND DOSE**PHOSEX® TABLETS****Hyperphosphataemia****BY MOUTH**

- ▶ Adult: Initially 1 tablet 3 times a day, to be taken with meals, dose to be adjusted according to serum-phosphate concentration, usual dose 4–6 tablets daily in divided doses, (1 or 2 tablets with each meal); maximum 12 tablets per day

RENACET® TABLETS**Hyperphosphataemia****BY MOUTH**

- ▶ Adult: 475–950 mg, to be taken with breakfast and with snacks, 0.95–2.85 g, to be taken with main meals and 0.95–1.9 g, to be taken with supper, dose to be adjusted according to serum-phosphate concentration; maximum 6.65 g per day

PHOSLO® CAPSULES**Hyperphosphataemia****BY MOUTH**

- ▶ Adult: Initially 2 capsules, to be taken with each meal, dose to be adjusted according to serum-phosphate concentration, usual dose 3–4 capsules, to be taken with each meal

● **DIRECTIONS FOR ADMINISTRATION****PHOSEX® TABLETS**

Phosex® tablets are taken with meals. Tablets can be broken to aid swallowing, but not chewed (bitter taste).

RENACET® TABLETS

Manufacturer advises that other drugs should be taken 1 to 2 hours before or after *Renacet*® to reduce the possible interference with absorption of other drugs. *Renacet*® tablets are taken with meals.

● **PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer *Phosex*® tablets, *Renacet*® tablets, and *PhosLo*® tablets.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Sevelamer

INDICATIONS AND DOSE

RENVELA®

Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis | Hyperphosphataemia in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more
BY MOUTH

- ▶ Adult: Initially 2.4–4.8 g daily in 3 divided doses, dose to be taken with meals and adjusted according to serum-phosphate concentration every 2–4 weeks; usual dose 6 g daily in 3 divided doses

RENAGEL®

Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis

BY MOUTH

- ▶ Adult: Initially 2.4–4.8 g daily in 3 divided doses, dose to be given with meals and adjusted according to serum-phosphate concentration; usual dose 2.4–12 g daily in 3 divided doses

- **CONTRA-INDICATIONS** Bowel obstruction

- **CAUTIONS** Gastro-intestinal disorders

- **INTERACTIONS** → Appendix 1 (sevelamer).

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · constipation · diarrhoea · dyspepsia · flatulence · nausea · vomiting
- ▶ **Frequency not known** Ileus · intestinal obstruction (higher incidence with sevelamer hydrochloride salt) · intestinal perforation · pruritus · rash

RENAGEL®

- ▶ **Frequency not known** Diverticulitis

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING**

RENVELA®

Unlikely to be present in milk (however, manufacturer advises avoid).

RENAGEL®

Manufacturer advises use only if potential benefit outweighs risk.

● **DIRECTIONS FOR ADMINISTRATION**

RENVELA®

For powder for oral suspension, each sachet to be dispersed in 60 mL water.

● **PATIENT AND CARER ADVICE**

RENVELA®

Patients and carers should be advised on how to administer Renvela® powder for oral suspension.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

2.8 Hypophosphataemia

Phosphate

INDICATIONS AND DOSE

Treatment of moderate to severe hypophosphatemia

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature)

For established hypophosphataemia (with monobasic potassium phosphate)

BY INTRAVENOUS INFUSION

- ▶ Adult: 9 mmol every 12 hours, increased if necessary up to 0.5 mmol/kg (max. per dose 50 mmol), dose only increased in critically ill patients; dose is approximately equivalent to 30 mmol in adults, dose to be infused over 6–12 hours, according to severity

Vitamin D-resistant hypophosphataemic osteomalacia

BY MOUTH USING EFFERVESCENT TABLETS

- ▶ Adult: 4–6 tablets daily

● **SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea
- ▶ **Frequency not known** Acute renal failure · hypocalcaemia · hypotension · metastatic calcification · nausea · oedema · phlebitis · tissue necrosis on extravasation

SIDE-EFFECTS, FURTHER INFORMATION

Diarrhoea is a common side-effect and should prompt a reduction in dosage.

- **RENAL IMPAIRMENT** Reduce dose. Monitor closely in renal impairment.

- **MONITORING REQUIREMENTS** It is essential to monitor closely plasma concentrations of calcium, phosphate, potassium, and other electrolytes—excessive doses of phosphates may cause hypocalcaemia and metastatic calcification.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, infusion

Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13

► **Phosphate Sandoz** (HK Pharma Ltd)

Sodium dihydrogen phosphate anhydrous 1.936 gram Phosphate Sandoz effervescent tablets | 100 tablet [P] £16.43

Infusion

► **PHOSPHATE (Non-proprietary)**

Disodium hydrogen phosphate anhydrous 5.75 gram per 1 litre, Potassium dihydrogen phosphate 1.295 gram per 1 litre Polyfusor NA phosphates infusion 500ml bottles | 1 bottle [PoM] £5.15

Solution for infusion

► **PHOSPHATE (Non-proprietary)**

Potassium dihydrogen phosphate 136 mg per 1 ml Potassium dihydrogen phosphate 13.6% (potassium 10mmol/10ml) solution for infusion 10ml ampoules | 10 ampoule [PoM] £69.48

- **BREAST FEEDING** Manufacturers advise use only if potential benefit outweighs risk—no information available.
- **MONITORING REQUIREMENTS** Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).

DIRECTIONS FOR ADMINISTRATION**CALCIUM RESONIUM®**

- With oral use Administer in a small amount of water or honey—do not give with fruit juice or squash, which have a high potassium content.
- With rectal use Mix each 30 g of resin with 150 mL of water or 10% glucose.

SORBISTERIT® POWDER

- With oral use Administer in a small amount of water or soft drink—do not give with fruit juice or squash, which have a high potassium content.
- With rectal use Mix each 40 g of resin with 150 mL of 5% glucose.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: enema

Powder

CAUTIONARY AND ADVISORY LABELS 13, 21

EXCIPIENTS: May contain Sucrose

► **Calcium Resonium** (Sanofi)

Calcium polystyrene sulfonate 999.34 mg per 1 gram Calcium Resonium powder (sugar-free) | 300 gram [P] £68.47

► **Sorbisterit** (Stanningley Pharma Ltd)

Calcium polystyrene sulfonate 854 mg per 1 gram Sorbisterit powder | 500 gram [PoM] £49.95

2.9 Hyperkalaemia

Drugs used for Hyperkalaemia not listed below: *Calcium gluconate*, p. 857 · *Insulin*, p. 603

CATION-EXCHANGE RESINS

Calcium polystyrene sulfonate

INDICATIONS AND DOSE**CALCIUM RESONIUM®**

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

BY MOUTH

► Adult: 15 g 3–4 times a day

BY RECTUM

► Adult: 30 g, retained for 9 hours followed by irrigation to remove resin from colon

SORBISTERIT® POWDER

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

BY MOUTH

► Adult: 20 g 1–3 times a day

BY RECTUM

► Adult: 40 g 1–3 times a day, retained for 6 hours followed by irrigation to remove resin from colon

- **CONTRA-INDICATIONS** Hyperparathyroidism · metastatic carcinoma · multiple myeloma · obstructive bowel disease · sarcoidosis

- **INTERACTIONS** → Appendix 1 (polystyrene sulfonate resins).

SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

Anorexia · constipation (discontinue treatment—avoid magnesium-containing laxatives) · diarrhoea · gastric irritation · gastro-intestinal obstruction · hypercalcaemia (including in dialysed patients and occasionally in those with renal impairment) · hypomagnesaemia · intestinal necrosis (reported with concomitant sorbitol) · ischaemic colitis · nausea · necrosis · ulceration · vomiting

SPECIFIC SIDE-EFFECTS

- With oral use gastro-intestinal concretions
- With rectal use faecal impaction
- **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk—no information available.

Sodium polystyrene sulfonate

INDICATIONS AND DOSE

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

BY MOUTH

► Adult: 15 g 3–4 times a day

BY RECTUM

► Adult: 30 g, retain for 9 hours followed by irrigation to remove resin from colon

- **CONTRA-INDICATIONS** Obstructive bowel disease
- **CAUTIONS** Congestive heart failure · hypertension · oedema
- **INTERACTIONS** → Appendix 1 (polystyrene sulfonate resins).
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

Anorexia · constipation (discontinue treatment—avoid magnesium-containing laxatives) · diarrhoea · gastric irritation · gastro-intestinal obstruction · hypocalcaemia · hypomagnesaemia · intestinal necrosis (reported with concomitant use of sorbitol) · ischaemic colitis · nausea · necrosis · sodium retention · ulceration · vomiting

SPECIFIC SIDE-EFFECTS

- With oral use gastro-intestinal concretions
- With rectal use faecal impaction
- **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturers advise use only if potential benefit outweighs risk—no information available.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS** Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).

● DIRECTIONS FOR ADMINISTRATION

- ▶ With rectal use Mix each 30 g of resin with 150 mL of water or 10% glucose.
- ▶ With oral use Administer dose (powder) in a small amount of water or honey—do not give with fruit juice or squash, which have a high potassium content.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Powder

CAUTIONARY AND ADVISORY LABELS 13

▶ Resonium A (Sanofi)

Sodium polystyrene sulfonate 999.34 mg per 1 gram Resonium A powder (sugar-free) | 454 gram  £67.50

2.10 Hypokalaemia

POTASSIUM

Potassium bicarbonate with potassium acid tartrate

INDICATIONS AND DOSE

Hyperchloraemic acidosis associated with potassium deficiency (as in some renal tubular and gastro-intestinal disorders)

BY MOUTH

- ▶ Adult: (consult product literature)

● **CONTRA-INDICATIONS** Hypochloraemia · plasma-potassium concentration above 5 mmol/litre

● **CAUTIONS** Cardiac disease · elderly

● **INTERACTIONS** → Appendix 1 (potassium salts).

● **SIDE-EFFECTS** Abdominal pain · diarrhoea · flatulence · nausea · vomiting

● **RENAL IMPAIRMENT** Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.

● **DIRECTIONS FOR ADMINISTRATION** To be dissolved in water before administration.

● **PRESCRIBING AND DISPENSING INFORMATION** Tablets do not contain chloride.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13, 21

▶ POTASSIUM BICARBONATE WITH POTASSIUM ACID TARTRATE (Non-proprietary)

Potassium acid tartrate 300 mg, Potassium bicarbonate 500 mg Potassium (potassium 6.5mmol) effervescent tablets BPC 1968 | 56 tablet  £77.77-£99.15 DT price = £92.02

Potassium chloride

INDICATIONS AND DOSE

Prevention of hypokalaemia (patients with normal diet)

BY MOUTH

- ▶ Adult: 2–4 g daily in divided doses

Electrolyte imbalance

BY INTRAVENOUS INFUSION

- ▶ Adult: Dose dependent on deficit or the daily maintenance requirements

Important safety information

SAFE PRACTICE

Potassium overdose can be fatal. Ready-mixed infusion solutions containing potassium should be used. Exceptionally, if potassium chloride concentrate is used for preparing an infusion, the infusion solution should be **thoroughly mixed**. Local policies on avoiding inadvertent use of potassium chloride concentrate should be followed.

● **CONTRA-INDICATIONS** Plasma-potassium concentration above 5 mmol/litre

● CAUTIONS

- ▶ With intravenous use Seek specialist advice in very severe potassium depletion or difficult cases
- ▶ With oral use Cardiac disease · elderly

● **INTERACTIONS** → Appendix 1 (potassium salts).

● SIDE-EFFECTS

▶ Common or very common

▶ With oral use abdominal pain · diarrhoea · flatulence · nausea · vomiting

▶ Frequency not known

▶ With intravenous use heart toxicity (with rapid infusion)

● **RENAL IMPAIRMENT** Smaller doses must be used in the prevention of hypokalaemia, to reduce the risk of hyperkalaemia. Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.

● MONITORING REQUIREMENTS

- ▶ Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements.
- ▶ With intravenous use ECG monitoring should be performed in difficult cases.

● DIRECTIONS FOR ADMINISTRATION

▶ With intravenous use Potassium chloride concentrate must be diluted with **not less** than 50 times its volume of sodium chloride intravenous infusion 0.9% or other suitable diluent and **mixed well**. Ready-mixed infusion solutions should be used where possible; alternatively, potassium chloride concentrate as ampoules containing 1.5 g (K⁺ 20 mmol) in 10 mL, is **thoroughly mixed** with 500 mL of sodium chloride 0.9% intravenous infusion and given slowly over 2 to 3 hours with specialist advice and ECG monitoring in difficult cases. For *peripheral intravenous infusion*, the concentration of potassium should not usually exceed 40 mmol/L. Higher concentrations of potassium chloride may be given in very severe depletion, but require specialist advice.

▶ With oral use Potassium salts are preferably given as a liquid (or effervescent) preparation, they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to *hyperchloraemic* states).

● PRESCRIBING AND DISPENSING INFORMATION

Potassium Tablets Do not confuse Effervescent Potassium Tablets BPC 1968 with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperchloraemic states. Kay-Cee-L contains 1mmol/1ml of each potassium and chloride.

● PATIENT AND CARER ADVICE

Salt substitutes A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. *LoSalt*® and *Ruthmol*®). These should not be used by patients with renal failure as potassium intoxication may result.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion, oral solution, infusion

Oral solution

CAUTIONARY AND ADVISORY LABELS 21

► **Kay-Cee-L** (Geistlich Sons Ltd)

Potassium chloride 75 mg per 1 ml Kay-Cee-L syrup (sugar-free) | 500 ml [P] £7.57

Solution for infusion

► **POTASSIUM CHLORIDE (Non-proprietary)**

Potassium chloride 150 mg per 1 ml Potassium chloride 15% (potassium 20mmol/10ml) solution for infusion 10ml ampoules | 10 ampoule [PoM] £8.85 | 20 ampoule [PoM] £6.50

Potassium chloride 200 mg per 1 ml Potassium chloride 20% (potassium 13.3mmol/5ml) solution for infusion 5ml ampoules | 10 ampoule [PoM] £3.84-£4.00

Potassium chloride 20% (potassium 27mmol/10ml) solution for infusion 10ml ampoules | 10 ampoule [PoM] £109.98

3 Metabolic disorders

3.1 Acute porphyrias

Acute porphyrias

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyrin, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 10 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyric crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

Treatment of serious or life-threatening conditions should not be withheld from patients with acute porphyria. When there is no safe alternative, treatment should be started and urinary porphobilinogen excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute attack of porphyria occurs during pregnancy, contact an expert porphyria service for further advice.

Haem arginate p. 865 is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

In the United Kingdom the National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from three centres (University Hospital of Wales, Addenbrooke's Hospital, and King's College Hospital). To access the service telephone (029) 2074 7747 and ask for the Acute Porphyria Service.

Drugs unsafe for use in acute porphyrias

The following list contains drugs on the UK market that have been classified as 'unsafe' in porphyria because they have been shown to be porphyrinogenic in animals or in vitro, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available.

An up-to-date list of drugs considered **safe** in acute porphyrias is available at www.wmic.wales.nhs.uk/porphyria.info.php.

Further information may be obtained from: www.porphyria-europe.org and also from:

Welsh Medicines Information Centre

- Welsh Medicines Information Centre

- University Hospital of Wales
- Cardiff
- (029) 2074 2979/3877

Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

Unsafe Drug Groups (check first)

- Alkylating drugs (contact Welsh Medicines Information Centre for further advice)
- Anabolic steroids
- Antidepressants (includes tricyclic (and related) antidepressants and MAOIs; fluoxetine, duloxetine, venlafaxine, and trazodone thought to be safe)
- Antihistamines (alimemazine, chlorphenamine, desloratadine, fexofenadine, ketotifen, loratadine, and promethazine thought to be safe)
- Barbiturates (includes primidone and thiopental)
- Calcium channel blockers (amlodipine, felodipine, and nifedipine thought to be safe)
- Contraceptives, hormonal (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progestogen preparations should **never** be used in those at risk of acute porphyria.)
- Ergot derivatives (includes ergometrine (oxytocin probably safe) and pergolide)
- Hormone replacement therapy (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progestogen preparations should **never** be used in those at risk of acute porphyria.)
- Imidazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)
- Non-nucleoside reverse transcriptase inhibitors (contact Welsh Medicines Information Centre for further advice)
- Progestogens (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progestogen preparations should **never** be used in those at risk of acute porphyria.)
- Protease inhibitors (contact Welsh Medicines Information Centre for further advice)
- Sulfonamides (includes co-trimoxazole and sulfasalazine)
- Sulfonylureas (glipizide and glimepiride are thought to be safe)
- Taxanes (contact Welsh Medicines Information Centre for further advice)

- Thiazolinediones (contact Welsh Medicines Information Centre for further advice)
- Triazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)

Unsafe Drugs (check groups above first)

- Aceclofenac
- Alcohol
- Amiodarone
- Aprepitant (contact Welsh Medicines Information Centre for further advice)
- Artemether with lumefantrine
- Bexarotene
- Bosentan
- Bromocriptine
- Buspirone
- Cabergoline
- Carbamazepine
- Chloral hydrate (although evidence of hazard is uncertain, manufacturer advises avoid)
- Chloramphenicol
- Chloroform (small amounts in medicines probably safe)
- Clindamycin
- Cocaine
- Colistimethate sodium
- Danazol
- Dapsone
- Dexfenfluramine
- Disopyramide
- Disulfiram
- Erythromycin
- Etamsylate
- Ethosuximide
- Etomidate
- Fenfluramine
- Flupentixol
- Flutamide
- Fosaprepitant (contact Welsh Medicines Information Centre for further advice)
- Fosphenytoin
- Griseofulvin
- Hydralazine
- Indapamide
- Isometheptene mucate
- Isoniazid (safety uncertain, contact Welsh Medicines Information Centre for further advice)
- Ketamine
- Mefenamic acid (may be used with caution if safer alternative not available)
- Meprobamate
- Methyldopa
- Metolazone
- Metyrapone
- Mifepristone
- Minoxidil (may be used with caution if safer alternative not available)
- Mitotane
- Nalidixic acid
- Nitrazepam
- Nitrofurantoin
- Orphenadrine
- Oxcarbazepine
- Oxybutynin
- Pentazocine (buprenorphine, codeine, diamorphine, dihydrocodeine, fentanyl, methadone, morphine, oxycodone, pethidine, and tramadol are thought to be safe)
- Pentoxifylline
- Phenoxybenzamine
- Phenytoin
- Pivmecillinam

- Porfimer
- Raloxifene
- Rifabutin (safety uncertain, contact Welsh Medicines Information Centre for further advice)
- Rifampicin
- Riluzole
- Risperidone
- Selegiline
- Spironolactone
- Sulfapyrazone
- Tamoxifen
- Telithromycin
- Temoporfin
- Tiagabine
- Tibolone
- Tinidazole
- Topiramate
- Toremfene
- Trimethoprim
- Valproate
- Xipamide
- Zidovudine (contact Welsh Medicines Information Centre for further advice)
- Zuclopenthixol

HAEM DERIVATIVES

Haem arginate (Human hemin)

INDICATIONS AND DOSE

Acute porphyrias | Acute intermittent porphyria | Porphyria variegata | Hereditary coproporphria

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 3 mg/kg once daily for 4 days, if response inadequate, repeat 4-day course with close biochemical monitoring; maximum 250 mg per day

● SIDE-EFFECTS

- ▶ Common or very common pain at injection site · thrombophlebitis at injection site
- ▶ Rare Fever · hypersensitivity reactions
- ▶ Frequency not known Headache
- PREGNANCY Manufacturer advises avoid unless essential.
- BREAST FEEDING Manufacturer advises avoid unless essential—no information available.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Normosang[®]), give intermittently in Sodium chloride 0.9%; dilute requisite dose in 100 mL infusion fluid in glass bottle and give over at least 30 minutes through a filter via large antebraclial or central vein; administer within 1 hour after dilution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ Normosang (Orphan Europe (UK) Ltd)

Haem arginate 25 mg per 1 mL Normosang 250mg/10ml solution for infusion ampoules | 4 ampoule (POM) £1,737.00

3.2 Carnitine deficiency

CARNITINE DERIVATIVES

Levocarnitine (Carnitine)

INDICATIONS AND DOSE

Primary carnitine deficiency due to inborn errors of metabolism

BY MOUTH

▶ Adult: Up to 200 mg/kg daily in 2–4 divided doses; maximum 3 g per day

BY SLOW INTRAVENOUS INJECTION

▶ Adult: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes

Secondary carnitine deficiency in haemodialysis patients

INITIALLY BY SLOW INTRAVENOUS INJECTION

▶ Adult: 20 mg/kg, to be administered over 2–3 minutes, after each dialysis session, dosage adjusted according to plasma-carnitine concentration, then (by mouth) maintenance 1 g daily, administered if benefit is gained from first intravenous course

- **CAUTIONS** Diabetes mellitus
- **SIDE-EFFECTS** Abdominal pain · body odour · diarrhoea · nausea · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
Side-effects may be dose-related—monitor tolerance during first week and after any dose increase.
- **PREGNANCY** Appropriate to use; no evidence of teratogenicity in *animal* studies.
- **RENAL IMPAIRMENT** Accumulation of metabolites may occur with chronic oral administration in severe impairment.
- **MONITORING REQUIREMENTS**
▶ Monitoring of free and acyl carnitine in blood and urine recommended.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Tablet

▶ **Carnitor** (Sigma-Tau Pharma Ltd)

L-Carnitine 330 mg Carnitor 330mg tablets | 90 tablet **[PoM]** £103.95

Chewable tablet

▶ **Carnitor** (Sigma-Tau Pharma Ltd)

L-Carnitine 1 gram Carnitor 1g chewable tablets | 10 tablet **[PoM]** £35.00

Capsule

▶ **LEVOCARNITINE (Non-proprietary)**

L-Carnitine 250 mg L-Carnitine 250mg capsules | 125 capsule £11.06

L-Carnitine 500 mg L-Carnitine 500mg capsules | 60 capsule £11.67

Oral solution

▶ **LEVOCARNITINE (Non-proprietary)**

L-Carnitine 300 mg per 1 ml Levocarnitine 1.5g/5ml (30%) oral solution paediatric | 20 ml **[PoM]** £55.55

▶ **Carnitor** (Sigma-Tau Pharma Ltd)

L-Carnitine 100 mg per 1 ml Carnitor oral single dose 1g solution (sugar-free) | 10 unit dose **[PoM]** £35.00

Solution for injection

▶ **Carnitor** (Sigma-Tau Pharma Ltd)

L-Carnitine 200 mg per 1 ml Carnitor 1g/5ml solution for injection ampoules | 5 ampoule **[PoM]** £59.50

3.3 Fabry's disease

ENZYMES

Agalsidase alfa

- **DRUG ACTION** Agalsidase alfa, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

INDICATIONS AND DOSE

Fabry's disease (specialist use only)

BY INTRAVENOUS INFUSION

▶ Adult: 200 micrograms/kg every 2 weeks

- **INTERACTIONS** → Appendix 1 (agalsidase alfa and beta).
- **SIDE-EFFECTS**
▶ **Common or very common** Acne · angioedema · arthralgia · asthenia · bradycardia · chest pain · cough · dizziness · dyspnoea · eye irritation · fatigue · flushing · gastrointestinal disturbances · headache · hypersensitivity reactions · hypertension · hypotension · influenza-like symptoms · muscle spasms · myalgia · nasopharyngitis · neuropathic pain · oedema · palpitation · paraesthesia · pruritus · rash · rhinorrhoea · sleep disturbances · syncope · tachycardia · taste disturbances · tinnitus · tremor · urticaria
▶ **Uncommon** Cold extremities · ear pain · ear swelling · injection-site reactions · parosmia · skin discoloration
- SIDE-EFFECTS, FURTHER INFORMATION**
Infusion-related reactions Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.
- **PREGNANCY** Use with caution.
- **BREAST FEEDING** Use with caution—no information available.
- **DIRECTIONS FOR ADMINISTRATION** Administration for *intravenous infusion*, give intermittently in sodium chloride 0.9%; dilute requisite dose with 100 mL infusion fluid and give over 40 minutes using an in-line filter; use within 3 hours of dilution.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ **Replagal** (Shire Pharmaceuticals Ltd) ▼

Agalsidase alfa 1 mg per 1 ml Replagal 3.5mg/3.5ml solution for infusion vials | 1 vial **[PoM]** £1,068.64

Agalsidase beta

- **DRUG ACTION** Agalsidase beta, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

INDICATIONS AND DOSE

Fabry's disease (specialist use only)

BY INTRAVENOUS INFUSION

▶ Adult: 1 mg/kg every 2 weeks

- **INTERACTIONS** → Appendix 1 (agalsidase alfa and beta).
- **SIDE-EFFECTS**
▶ **Common or very common** Acne · angioedema · arthralgia · asthenia · bradycardia · chest pain · cough · dizziness ·

dyspnoea · eye irritation · fatigue · flushing · gastro-intestinal disturbances · headache · hypersensitivity reactions · hypertension · hypotension · influenza-like symptoms · muscle spasms · myalgia · nasopharyngitis · neuropathic pain · oedema · palpitation · paraesthesia · pruritus · rash · rhinorrhoea · sleep disturbances · syncope · tachycardia · taste disturbances · tinnitus · tremor · urticaria

▶ **Uncommon** Cold extremities · ear pain · ear swelling · injection-site reactions · parosmia · skin discoloration

SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related reactions Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

● **PREGNANCY** Use with caution.

● **BREAST FEEDING** Use with caution—no information available.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, reconstitute initially with Water for Injections (5 mg in 1.1 mL, 35 mg in 7.2 mL) to produce a solution containing 5 mg/mL. Dilute with Sodium Chloride 0.9% (for doses less than 35 mg dilute with at least 50 mL; doses 35–70 mg dilute with at least 100 mL; doses 70–100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Fabrazyme** (Genzyme Therapeutics Ltd)

Agalsidase beta 5 mg Fabrazyme 5mg powder for solution for infusion vials | 1 vial [PoM](#) £315.08

Agalsidase beta 35 mg Fabrazyme 35mg powder for solution for infusion vials | 1 vial [PoM](#) £2,196.59

● SIDE-EFFECTS

▶ **Common or very common** Angioedema · backache · cyanosis · flushing · hypersensitivity reactions · hypotension · paraesthesia · tachycardia · urticaria
▶ **Uncommon** Abdominal cramps · arthralgia · diarrhoea · dizziness · fatigue · fever · headache · injection-site reactions · nausea · vomiting

● **PREGNANCY** Manufacturer advises use with caution—limited information available.

● **BREAST FEEDING** No information available.

● MONITORING REQUIREMENTS

▶ Monitor for immunoglobulin G (IgG) antibodies to imiglucerase.

▶ When stabilised, monitor all parameters and response to treatment at intervals of 6–12 months.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Cerezyme[®]), give intermittently in Sodium chloride 0.9%; initially reconstitute with water for injections (200 units in 5.1 mL, 400 units in 10.2 mL) to give 40 units/mL solution; dilute requisite dose with infusion fluid to a final volume of 100–200 mL and give initial dose at a rate not exceeding 0.5 units/kg/minute, subsequent doses to be given at a rate not exceeding 1 unit/kg/minute; administer within 3 hours after reconstitution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

▶ **Cerezyme** (Genzyme Therapeutics Ltd)

Imiglucerase 400 unit Cerezyme 400unit powder for solution for infusion vials | 1 vial [PoM](#) £1,071.29

Velaglucerase alfa

● **DRUG ACTION** Velaglucerase alfa is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for the treatment of type I Gaucher's disease.

INDICATIONS AND DOSE

Type I Gaucher's disease (specialist use only)

BY INTRAVENOUS INFUSION

▶ **Adult:** Initially 60 units/kg every 2 weeks; adjusted according to response to 15–60 units/kg every 2 weeks

● **SIDE-EFFECTS** Abdominal pain · arthralgia · back pain · bone pain · dizziness · flushing · headache · hypersensitivity reactions · hypertension · hypotension · malaise · nausea · pyrexia · rash · tachycardia · urticaria

SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related reactions Infusion-related reactions very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

● **PREGNANCY** Manufacturer advises use with caution—limited information available.

● **BREAST FEEDING** Manufacturer advises use with caution—no information available.

● **MONITORING REQUIREMENTS** Monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions or if there is a lack or loss of effect with velaglucerase alfa.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (VPRIV[®]), give intermittently in Sodium chloride 0.9%; reconstitute each 400-unit vial with 4.3 mL water for injections to produce a 100 units/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 60

3.4 Gaucher's disease

Drugs used for Gaucher's disease not listed below;

Miglustat, p. 870

ENZYMES

Imiglucerase

● **DRUG ACTION** Imiglucerase is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for non-neurological manifestations of type I or type III Gaucher's disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

INDICATIONS AND DOSE

Non-neurological manifestations of type I Gaucher's disease (specialist use only) | Non-neurological manifestations of type III Gaucher's disease (specialist use only)

BY INTRAVENOUS INFUSION

▶ **Adult:** Initially 60 units/kg every 2 weeks; maintenance, adjusted according to response, doses as low as 15 units/kg once every 2 weeks may improve haematological parameters and organomegaly

minutes through a 0.22 micron filter; start infusion within 24 hours of reconstitution.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

▶ **VPRIV** (Shire Human Genetic Therapies UK Ltd)

Velaglugcerase alfa 400 unit VPRIV 400units powder for solution for infusion vials | 1 vial **[PoM]** no price available

3.5 Homocystinuria

METHYL DONORS

Betaine

INDICATIONS AND DOSE

Adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism (specialist use only)

BY MOUTH

▶ Adult: 3 g twice daily (max. per dose 10 g), adjusted according to response; maximum 20 g per day

SIDE-EFFECTS

- **Uncommon** Agitation · alopecia · anorexia · depression · gastro-intestinal disorders · personality disorder · reversible cerebral oedema · sleep disturbances · urinary incontinence · urticaria
- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS** Monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur.
- **DIRECTIONS FOR ADMINISTRATION** Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of *Cystadane*[®] powder.
- **PRESCRIBING AND DISPENSING INFORMATION** Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B₁₂, pyridoxine, and folate under specialist advice.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2010) that betaine anhydrous (*Cystadane*[®]) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, tablet

Powder

▶ **Cystadane** (Orphan Europe (UK) Ltd)

Betaine 1 gram per 1 gram Cystadane oral powder | 180 gram **[PoM]** £347.00

3.6 Mucopolysaccharidosis

ENZYMES

Galsulfase

- **DRUG ACTION** Galsulfase is a recombinant form of human N-acetylgalactosamine-4-sulfatase.

INDICATIONS AND DOSE

Mucopolysaccharidosis VI (specialist use only)

BY INTRAVENOUS INFUSION

▶ Adult: 1 mg/kg once weekly

- **CAUTIONS** Acute febrile illness (consider delaying treatment) · acute respiratory illness (consider delaying treatment) · infusion-related reactions can occur · respiratory disease
- **SIDE-EFFECTS** Abdominal pain · apnoea · areflexia · chest pain · conjunctivitis · corneal opacity · dyspnoea · ear pain · facial oedema · gastroenteritis · hypertension · infusion-related reactions · malaise · nasal congestion · pharyngitis · rigors · umbilical hernia
- **SIDE-EFFECTS, FURTHER INFORMATION**
Infusion-related reactions Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Naglazyme*[®]), give intermittently in Sodium chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL infusion fluid and give over at least 4 hours.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ **Naglazyme** (BioMarin Europe Ltd) ▼

Galsulfase 1 mg per 1 ml Naglazyme 5mg/5ml solution for infusion vials | 1 vial **[PoM]** no price available

Idursulfase

- **DRUG ACTION** Idursulfase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

INDICATIONS AND DOSE

Mucopolysaccharidosis II (specialist use only)

BY INTRAVENOUS INFUSION

▶ Adult: 500 micrograms/kg once weekly

- **CAUTIONS** Acute febrile respiratory illness (consider delaying treatment) · infusion-related reactions can occur · severe respiratory disease

● SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmia · arthralgia · bronchospasm · chest pain · cough · cyanosis · dizziness · dyspnoea · erythema · facial oedema · flushing · gastrointestinal disturbances · headache · hypertension · hypotension · hypoxia · infusion-site swelling · peripheral oedema · pruritus · pyrexia · rash · swollen tongue · tachycardia · tachypnoea · tremor · urticaria · wheezing
- ▶ **Frequency not known** Anaphylaxis · infusion-related reactions · pulmonary embolism

SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related reactions Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **CONCEPTION AND CONTRACEPTION** Contra-indicated in women of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Elaprase*®), give intermittently in Sodium chloride 0.9%; dilute requisite dose in 100 mL infusion fluid and mix gently (do not shake); give over 3 hours (gradually reduced to 1 hour if no infusion-related reactions).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Elaprase** (Shire Pharmaceuticals Ltd) ▼
Idursulfase 2 mg per 1 mL Elaprase 6mg/3ml concentrate for solution for infusion vials | 1 vial [PoM] £1,985.00

Laronidase

- **DRUG ACTION** Laronidase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

INDICATIONS AND DOSE

Non-neurological manifestations of mucopolysaccharidosis I (specialist use only)

BY INTRAVENOUS INFUSION

- ▶ Adult: 100 units/kg once weekly

- **CAUTIONS** Infusion-related reactions can occur
- **INTERACTIONS** → Appendix 1 (laronidase).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · alopecia · anaphylaxis · angioedema · blood pressure changes · cold extremities · cough · diarrhoea · dizziness · dyspnoea · fatigue · flushing · headache · influenza-like symptoms · infusion-site reactions · musculoskeletal pain · nausea · pain in extremities · pallor · paraesthesia · pruritus · rash · restlessness · tachycardia · urticaria · vomiting
- ▶ **Frequency not known** Bronchospasm · infusion-related reactions · respiratory arrest

SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related reactions Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-

treatment with a corticosteroid—consult product literature for details.

- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor immunoglobulin G (IgG) antibody concentration.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Aldurazyme*®) give intermittently in Sodium chloride 0.9%; body-weight under 20 kg, use 100 mL infusion fluid; body-weight over 20 kg use 250 mL infusion fluid; withdraw volume of infusion fluid equivalent to volume of laronidase concentrate being added; give through in-line filter (0.22 micron) initially at a rate of 2 units/kg/hour then increase gradually every 15 minutes to max. 43 units/kg/hour.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

3.7 Nephropathic cystinosis

AMINO ACIDS AND DERIVATIVES

Mercaptamine (Cysteamine)

INDICATIONS AND DOSE

Nephropathic cystinosis (specialist use only)

BY MOUTH

- ▶ Adult (body-weight 50 kg and above): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 2 g daily in 4 divided doses

Important safety information

SAFE PRACTICE

Mercaptamine has been confused with mercaptopurine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CAUTIONS** Dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · anorexia · breath and body odour · diarrhoea · dyspepsia · encephalopathy · fever · gastroenteritis · headache · malaise · nausea · rash · vomiting
- ▶ **Uncommon** Drowsiness · gastro-intestinal ulcer · hallucinations · leucopenia · nephrotic syndrome · nervousness · seizures
- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated if history of hypersensitivity to penicillamine.
- **PREGNANCY** Avoid—teratogenic and toxic in *animal* studies.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS** Leucocyte-cystine concentration and haematological monitoring required—consult product literature.

● PRESCRIBING AND DISPENSING INFORMATION

Mercaptamine has a very unpleasant taste and smell, which can affect compliance.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Capsule

Blood and nutrition

3.8 Niemann-pick type C disease

GLUCOSYLCERAMIDE SYNTHASE INHIBITORS

Miglustat

- **DRUG ACTION** Miglustat is an inhibitor of glucosylceramide synthase.

INDICATIONS AND DOSE

Mild to moderate type I Gaucher's disease for whom enzyme replacement therapy is unsuitable (under expert supervision)

BY MOUTH

► Adult: 100 mg 3 times a day, reduced if not tolerated to 100 mg 1–2 times a day

Treatment of progressive neurological manifestations of Niemann-Pick type C disease (under expert supervision)

BY MOUTH

► Adult: 200 mg 3 times a day

- **SIDE-EFFECTS** Abdominal pain · amnesia · anorexia · ataxia · chills · constipation · decreased libido · depression · diarrhoea · dizziness · dyspepsia · flatulence · headache · hypoaesthesia · insomnia · malaise · muscle spasm · muscle weakness · nausea · paraesthesia · peripheral neuropathy · thrombocytopenia · tremor · vomiting · weight changes
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment. Men should avoid fathering a child during and for 3 months after treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** No information available—manufacturer advises caution.
- **RENAL IMPAIRMENT** For Gaucher's disease initially 100 mg twice daily if eGFR 50–70 mL/minute/1.73 m². Initially 100 mg once daily if eGFR 30–50 mL/minute/1.73 m². For Niemann-Pick type C disease, initially 200 mg twice daily if eGFR 50–70 mL/minute/1.73 m². Initially 100 mg twice daily if eGFR 30–50 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - Monitor cognitive and neurological function.
 - Monitor growth and platelet count in Niemann-Pick type C disease.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

3.9 Pompe disease

ENZYMES

Alglucosidase alfa

- **DRUG ACTION** Alglucosidase alfa is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

INDICATIONS AND DOSE

Pompe disease (specialist use only)

BY INTRAVENOUS INFUSION

► Adult: 20 mg/kg every 2 weeks

- **CAUTIONS** Cardiac dysfunction · infusion-related reactions—consult product literature · respiratory dysfunction
- **SIDE-EFFECTS**
 - **Common or very common** Agitation · anaphylaxis · antibody formation · blood pressure changes · bronchospasm · chest discomfort · cold extremities · cough · cyanosis · diarrhoea · dizziness · facial oedema · fatigue · flushing · headache · hypersensitivity reactions · injection-site reactions · irritability · muscle spasm · myalgia · nausea · paraesthesia · pruritus · pyrexia · rash · restlessness · sweating · tachycardia · tachypnoea · tremor · urticaria · vomiting
 - **Frequency not known** Infusion-related reactions · necrotising skin lesions · severe skin reactions · ulcerative skin lesions
- **SIDE-EFFECTS, FURTHER INFORMATION**

Infusion-related reactions Infusion-related reactions very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details.
- **PREGNANCY** Toxicity in animal studies, but treatment should not be withheld.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS**
 - Monitor closely if cardiac dysfunction.
 - Monitor closely if respiratory dysfunction.
 - Monitor immunoglobulin G (IgG) antibody concentration.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Myozyme*®), give intermittently in Sodium chloride 0.9%; reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with infusion fluid to give a final concentration of 0.5–4 mg/mL; give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

3.10 Tyrosinaemia type I

4-HYDROXYPHENYLPYRUVATE DIOXYGENASE INHIBITORS

Nitisinone (NTBC)

INDICATIONS AND DOSE

Hereditary tyrosinaemia type I (in combination with dietary restriction of tyrosine and phenylalanine) (specialist use only)

BY MOUTH

▶ **Adult:** Initially 500 micrograms/kg twice daily, adjusted according to response; maximum 2 mg/kg per day

● SIDE-EFFECTS

- ▶ **Common or very common** Conjunctivitis · corneal opacity · eye pain · granulocytopenia · keratitis · leucopenia · photophobia · thrombocytopenia
- ▶ **Uncommon** Blepharitis · erythematous rash · exfoliative dermatitis · leucocytosis · pruritus

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.

● **BREAST FEEDING** Manufacturer advises avoid—adverse effects in *animal* studies.

● **PRE-TREATMENT SCREENING** Slit-lamp examination of eyes recommended before treatment.

● MONITORING REQUIREMENTS

- ▶ Monitor liver function regularly.
- ▶ Monitor platelet and white blood cell count every 6 months.

● **DIRECTIONS FOR ADMINISTRATION** Capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

AMMONIA LOWERING DRUGS

Sodium phenylbutyrate

INDICATIONS AND DOSE

Long-term treatment of urea cycle disorders (as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy) (under expert supervision)

BY MOUTH

▶ **Adult:** 9.9–13 g/m² daily in divided doses, with meals; maximum 20 g per day

Important safety information

EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

● **CAUTIONS** Congestive heart failure (preparations contain significant amounts of sodium)

● **INTERACTIONS** → Appendix 1 (sodium phenylbutyrate).

● SIDE-EFFECTS

- ▶ **Common or very common** Alkalosis · blood disorders · body odour · decreased appetite · depression · gastro-intestinal disturbances · headache · irritability · menstrual disorders · metabolic acidosis · oedema · rash · renal tubular acidosis · syncope · taste disturbance · weight gain
- ▶ **Uncommon** Arrhythmias · pancreatitis · peptic ulcer · rectal bleeding

SIDE-EFFECTS, FURTHER INFORMATION

Gastro-intestinal side-effects may be reduced by giving smaller doses more frequently.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during administration in women of child-bearing potential.

● **PREGNANCY** Avoid—toxicity in *animal* studies.

3.11 Urea cycle disorders

AMINO ACIDS AND DERIVATIVES

Carglumatic acid

INDICATIONS AND DOSE

Hyperammonaemia due to N-acetylglutamate synthase deficiency (under expert supervision)

BY MOUTH

▶ **Adult:** Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma-ammonia concentration; maintenance 5–50 mg/kg twice daily, the total daily dose may alternatively be given in 3–4 divided doses

Hyperammonaemia due to organic acidaemia (under expert supervision)

BY MOUTH

▶ **Adult:** Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to

- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution (preparations contain significant amounts of sodium).
- **DIRECTIONS FOR ADMINISTRATION** Granules should be mixed with food before taking. *Pheburane*[®] granules must not be administered by nasogastric or gastrostomy tubes.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, capsule

Tablet

- ▶ **Ammonaps** (Swedish Orphan Biovitrum Ltd)

Sodium phenylbutyrate 483 mg per 1 gram Pheburane 483mg/g granules | 174 gram [PoM] £331.00

3.12 Wilson's disease

Drugs used for Wilson's disease not listed below;
Penicillamine, p. 896

COPPER ABSORPTION INHIBITORS

Zinc acetate

- **DRUG ACTION** Zinc prevents the absorption of copper in Wilson's disease.

INDICATIONS AND DOSE

Wilson's disease (initiated under specialist supervision)

BY MOUTH

- ▶ Adult: 50 mg 3 times a day (max. per dose 50 mg 5 times a day), adjusted according to response

Dose equivalence and conversion

Doses expressed as elemental zinc.

PHARMACOKINETICS

Symptomatic Wilson's disease patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

- **CAUTIONS** Portal hypertension (risk of hepatic decompensation when switching from chelating agent)
- **INTERACTIONS** → Appendix 1 (zinc).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Gastric irritation (usually transient)
 - ▶ **Uncommon** Leucopenia · sideroblastic anaemia
- **SIDE-EFFECTS, FURTHER INFORMATION** Transient gastric irritation may be reduced if first dose is taken mid-morning or with a little protein.
- **PREGNANCY** Reduce dose to 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion.
- **BREAST FEEDING** Manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant.

- **MONITORING REQUIREMENTS** Monitor full blood count and serum cholesterol.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 23

- ▶ **Wilzin** (Orphan Europe (UK) Ltd)

COPPER CHELATORS

Trientine dihydrochloride

INDICATIONS AND DOSE

Wilson's disease in patients intolerant of penicillamine

BY MOUTH

- ▶ Adult: 1.2–2.4 g daily in 2–4 divided doses, adjusted according to response, to be taken before food
- **INTERACTIONS** → Appendix 1 (trientine).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Nausea · rash
 - ▶ **Very rare** Anaemia
 - ▶ **Frequency not known** Colitis · duodenitis
- **PREGNANCY** Teratogenic in *animal* studies—use only if benefit outweighs risk. Monitor maternal and neonatal serum-copper concentrations.
- **PRESCRIBING AND DISPENSING INFORMATION** Trientine is **not** an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 6, 22

- ▶ **TRIENTINE DIHYDROCHLORIDE (Non-proprietary)**
Trientine dihydrochloride 300 mg Trientine dihydrochloride 300mg capsules | 100 capsule [PoM] no price available

4 Trace element deficiencies

Trace elements

Selenium

Selenium deficiency can occur as a result of inadequate diet or prolonged parenteral nutrition. A selenium supplement should not be given unless there is good evidence of deficiency.

Zinc

Zinc supplements should not be given unless there is good evidence of deficiency (hypoproteinaemia spuriously lowers plasma-zinc concentration) or in zinclosing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disorders p. 864, or in zinc-losing states.

Zinc is used in the treatment of Wilson's disease and acrodermatitis enteropathica, a rare inherited abnormality of zinc absorption.

Parenteral nutrition regimens usually include trace amounts of zinc. If necessary, further zinc can be added to intravenous feeding regimens.

4.1 Selenium deficiency

SELENIUM

Selenium

INDICATIONS AND DOSE

Selenium deficiency

BY MOUTH OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- ▶ Adult: 100–500 micrograms daily

- **INTERACTIONS** Appendix 1 (selenium).

4.2 Zinc deficiency

ZINC

Zinc sulfate

INDICATIONS AND DOSE

Zinc deficiency or supplementation in zinc-losing conditions

BY MOUTH USING EFFERVESCENT TABLETS

- ▶ Child (body-weight up to 10 kg): 22.5 mg daily, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
- ▶ Child (body-weight 10–30 kg): 22.5 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
- ▶ Child (body-weight 30 kg and above): 45 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
- ▶ Adult (body-weight 30 kg and above): 45 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc

Additional elemental zinc for intravenous nutrition

BY INTRAVENOUS INJECTION

- ▶ Adult: 6.5 mg daily (Zn²⁺ 100 micromol)

- **UNLICENSED USE** *Solvazinc*[®] is not licensed for use in acrodermatitis enteropathica.
- **INTERACTIONS** → Appendix 1 (zinc).
- **SIDE-EFFECTS** Abdominal pain · diarrhoea · dyspepsia · gastric irritation · gastritis · headache · irritability · lethargy · nausea · vomiting
- **PREGNANCY** Crosses placenta; risk theoretically minimal, but no information available.
- **BREAST FEEDING** Present in milk; risk theoretically minimal, but no information available.
- **RENAL IMPAIRMENT** Accumulation may occur in acute renal failure.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, oral solution, capsule, liquid

5 Nutrition

5.1 Nutrition (intravenous)

Intravenous nutrition

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to ordinary oral or tube feeding—**supplemental parenteral nutrition**, or may be the sole source of nutrition—**total parenteral nutrition** (TPN). Indications for this method include preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; severe or prolonged disorders of the gastro-intestinal tract; major surgery, trauma, or burns;

Proprietary Infusion Fluids for Parenteral Feeding

prolonged coma or refusal to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations available is given under Proprietary Infusion Fluids for Parenteral Feeding p. 874.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, fat, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of a 3-litre bag. A single dose of vitamin B₁₂, as hydroxocobalamin p. 837, is given by intramuscular injection; regular vitamin B₁₂ injections are not usually required unless total parenteral nutrition continues for many months. Folic acid p. 836 is given in a dose of 15 mg once or twice each week, usually in the nutrition solution. Other vitamins are usually given daily; they are generally introduced in the parenteral nutrition solution. Alternatively, if the patient is able to take small amounts by mouth, vitamins may be given orally.

The nutrition solution is infused through a central venous catheter inserted under full surgical precautions. Alternatively, infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition for periods of up to a month, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric cannulas and use of feeds of low osmolality and neutral pH. Only nutritional fluids should be given by the dedicated intravenous line.

Before starting, the patient should be well oxygenated with a near normal circulating blood volume and attention should be given to renal function and acid-base status. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment.

Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal

liver function tests. For details of the prevention and management of parenteral nutrition complications, specialist literature should be consulted.

Protein is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of nonessential ones to provide sufficient nitrogen together with electrolytes. Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose p. 852) and electrolytes.

Energy is provided in a ratio of 0.6 to 1.1 megajoules (150–250 kcal) per gram of protein nitrogen. Energy requirements must be met if amino acids are to be utilised for tissue maintenance. A mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

Glucose p. 852 is the preferred source of carbohydrate, but if more than 180 g is given per day frequent monitoring of blood glucose is required, and insulin may be necessary. Glucose p. 852 in various strengths from 10 to 50% must be infused through a central venous catheter to avoid thrombosis.

In parenteral nutrition regimens, it is necessary to provide adequate **phosphate** in order to allow phosphorylation of glucose and to prevent hypophosphataemia; between 20 and 30 mmol of phosphate is required daily.

Fructose and sorbitol have been used in an attempt to avoid the problem of hyperosmolar hyperglycaemic non-ketotic acidosis but other metabolic problems may occur, as with xylitol and ethanol which are now rarely used.

Fat emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolarity with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Daily checks are necessary to ensure complete clearance from the plasma in conditions where fat metabolism may be disturbed. **Additives should not be mixed with fat emulsions unless compatibility is known.**

Administration

Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases *product literature and other specialist literature should be consulted.*

PARENTERAL NUTRITION

Parenteral nutrition supplements

INDICATIONS AND DOSE

DIPEPTIVEN 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES

Amino acid supplement for hypercatabolic or hypermetabolic states

BY INTRAVENOUS INFUSION

- ▶ Adult: 300–400 mg/kg daily, dose not to exceed 20% of total amino acid intake

● CAUTIONS

PEDITRACE®

Reduced biliary excretion, reduced biliary excretion in cholestatic liver disease, reduced biliary excretion in markedly reduced urinary excretion (careful biochemical monitoring required), total parenteral nutrition exceeding one month.

CAUTIONS, FURTHER INFORMATION

Total parental nutrition exceeding one month

Measure serum manganese concentration and check liver function before commencing treatment and regularly during treatment—discontinue if manganese concentration raised or if cholestasis develops.

- **DIRECTIONS FOR ADMINISTRATION** Because of the complex requirements relating to parenteral nutrition, full details relating to administration have been omitted. In all cases *specialist pharmacy advice, product literature, and other specialist literature should be consulted.* Compatibility with the infusion solution must be ascertained before adding supplementary preparations. **Additives should not be mixed with fat emulsions unless compatibility is known.**

DIPEPTIVEN 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES

For addition to infusion solutions containing amino acids.

PEDITRACE®

For addition to Vaminolact®, Vamin® 14 Electrolyte-Free solutions, and glucose intravenous infusions.

DECAN®

For addition to infusion solutions.

ADDITRACE®

For addition to Vamin® solutions and glucose intravenous infusions.

TRACUTIL®

For addition to infusion solutions.

GLYCOPHOS®

For addition to Vamin® and Vaminolact® solutions, and glucose intravenous infusions.

ADDIPHOS®

For addition to Vamin® solutions and glucose intravenous infusions.

CERNEVIT®

Dissolve in 5mL water for injection.

VITLIPID N INFANT

For addition to Intralipid®.

VITLIPID®

For addition to Intralipid®.

SOLVITO®

Dissolve in water for injections or glucose intravenous infusion for adding to glucose intravenous infusion or Intralipid®; dissolve in Vitlipid N® or Intralipid® for adding to Intralipid® only.

- **PRESCRIBING AND DISPENSING INFORMATION**

DIPEPTIVEN®

Dipeptiven® solution contains N(2)-L-alanyl-glutamine 200mg/mL (providing L-alanine 82 mg, L-glutamine 134.6mg)

PEDITRACE®

For use in neonates (when kidney function established, usually second day of life), infants, and children.

DECAN®

For patients over 40kg.

ADDITRACE®

For patients over 40kg.

TRACUTIL®

For adults.

GLYCOPHOS®

Glycophos® Sterile Concentration solution contains phosphate 20mmol, Na⁺ 40mmol/20mL.

ADDIPHOS®

Addiphos sterile solution contains phosphate 40mmol, K⁺ 30mmol, Na⁺ 30 mmol/20mL.

VITLIPID N ADULT®

For adults and children over 11 years.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for injection

▶ **Carnevite** (Baxter Healthcare Ltd)

Alpha tocopherol 11.2 unit, Ascorbic acid 125 mg, Biotin 69 microgram, Colecalciferol 220 unit, Cyanocobalamin 6 microgram, Pantothenic acid (as Dexpantenol) 17.25 mg, Folic acid 414 microgram, Nicotinamide 46 mg, Pyridoxine (as Pyridoxine hydrochloride) 4.53 mg, Retinol 3500 unit, Riboflavin (as Riboflavin sodium phosphate) 4.14 mg, Thiamine 3.51 mg
Carnevite solution for injection vials and diluent | 10 vial [PoM](#) no price available

Emulsion for injection

▶ **Vitlipid N Adult** (Fresenius Kabi Ltd)

Alpha tocopherol 910 microgram per 1 ml, Ergocalciferol 500 nanogram per 1 ml, Phytomenadione 15 microgram per 1 ml, Retinol palmitate 99 microgram per 1 ml
Vitlipid N Adult emulsion for injection 10ml ampoules | 1 ampoule [PoM](#) £1.97

▶ **Vitlipid N Infant** (Fresenius Kabi Ltd)

Alpha tocopherol 640 microgram per 1 ml, Ergocalciferol 1 microgram per 1 ml, Phytomenadione 20 microgram per 1 ml, Retinol palmitate 69 microgram per 1 ml
Vitlipid N Infant emulsion for injection 10ml ampoules | 1 ampoule [PoM](#) £1.97

Solution for infusion

▶ **Additrace** (Fresenius Kabi Ltd)

Chromic chloride 5.33 microgram per 1 ml, Copper chloride 340 microgram per 1 ml, Ferric chloride 544 microgram per 1 ml, Manganese chloride 99 microgram per 1 ml, Potassium iodide 16.6 microgram per 1 ml, Sodium fluoride 210 microgram per 1 ml, Sodium molybdate 4.85 microgram per 1 ml, Sodium selenite 10.5 microgram per 1 ml, Zinc chloride 1.36 mg per 1 ml
Additrace solution for infusion 10ml ampoules | 1 ampoule [PoM](#) £1.96

▶ **Decan** (Baxter Healthcare Ltd)

Molybdenum (as Ammonium molybdate) 625 nanogram per 1 ml, Chromium (as Chromic chloride) 375 nanogram per 1 ml, Cobalt (as Cobalt (II) gluconate dihydrate) 36.75 nanogram per 1 ml, Copper (as Copper gluconate) 12 microgram per 1 ml, Iron (as Ferrous gluconate) 25 microgram per 1 ml, Manganese (as Manganese gluconate) 5 microgram per 1 ml, Fluoride (as Sodium fluoride) 36.25 microgram per 1 ml, Iodine (as Sodium iodide) 38 nanogram per 1 ml, Selenium (as Sodium selenite) 1.75 microgram per 1 ml, Zinc (as Zinc gluconate) 250 microgram per 1 ml
Decan concentrate for solution for infusion 40ml bottles | 25 bottle [PoM](#) no price available

▶ **Dipeptiven** (Fresenius Kabi Ltd)

Glycophos 4.32g/20ml concentrate for solution for infusion vials | 1 vial [PoM](#) £3.91

▶ **Peditrace** (Fresenius Kabi Ltd)

Copper (as Copper chloride) 20 microgram per 1 ml, Manganese (as Manganese chloride) 1 microgram per 1 ml, Iodine (as Potassium iodide) 1 microgram per 1 ml, Fluoride (as Sodium fluoride) 57 microgram per 1 ml, Selenium (as Sodium selenite) 2 microgram per 1 ml, Zinc (as Zinc chloride) 250 microgram per 1 ml
Peditrace solution for infusion 10ml vials | 1 vial [PoM](#) £3.55

▶ **Tracutit** (B.Braun Medical Ltd)

Chromic chloride 5.3 microgram per 1 ml, Copper chloride 204.6 microgram per 1 ml, Ferrous chloride 695.8 microgram per 1 ml, Manganese chloride 197.9 microgram per 1 ml, Potassium iodide 16.6 microgram per 1 ml, Sodium fluoride 126 microgram per 1 ml, Sodium molybdate dihydrate 4.85 microgram per 1 ml, Sodium selenite pentahydrate 10.5 microgram per 1 ml, Zinc chloride 1.36 mg per 1 ml
Tracutit concentrate for solution for infusion 10ml ampoules | 5 ampoule [PoM](#) £7.96

▶ **Addiphos** (Fresenius Kabi Ltd)

Potassium hydroxide 14 mg per 1 ml, Potassium dihydrogen phosphate 170.1 mg per 1 ml, Disodium phosphate dihydrate 133.5 mg per 1 ml
Addiphos solution for infusion 20 ml vials | 1 vial [PoM](#)

Powder for solution for infusion

▶ **Solvitvo N** (Fresenius Kabi Ltd)

Biotin 60 microgram, Cyanocobalamin 5 microgram, Folic acid 400 microgram, Nicotinamide 40 mg, Pyridoxine hydrochloride 4.9 mg, Riboflavin sodium phosphate 4.9 mg, Sodium ascorbate 113 mg, Sodium pantothenate 16.5 mg, Thiamine nitrate 3.1 mg
Solvitvo N powder for solution for infusion vials | 1 vial [PoM](#) £1.97

5.2 Nutrition (oral)

Enteral nutrition

The body's reserves of protein rapidly become exhausted in severely ill patients, especially during chronic illness or in those with severe burns, extensive trauma, pancreatitis, or intestinal fistula. Much can be achieved by frequent meals and by persuading the patient to take supplementary snacks of ordinary food between the meals.

However, extra calories, protein, other nutrients, and vitamins are often best given by supplementing ordinary meals with enteral sip or tube feeds.

When patients cannot feed normally, for example, patients with severe facial injury, oesophageal obstruction, or coma, a nutritionally complete diet of enteral feeds must be given. The advice of a dietitian should be sought to determine the protein and total energy requirement of the patient and the form and relative contribution of carbohydrate and fat to the energy requirements.

Most enteral feeds contain protein derived from cows' milk or soya. Elemental feeds containing protein hydrolysates or free amino acids can be used for patients who have diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored. Haematological and biochemical parameters should also be monitored, particularly in clinically unstable patients. Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed.

Enteral nutrition in children

Children have special requirements and in most situations liquid feeds prepared for adults are totally unsuitable—the advice of a paediatric dietitian should be sought.

5.3 Phenylketonuria

Phenylketonuria

Phenylketonuria (hyperphenylalaninaemia, PKU), which results from the inability to metabolise **phenylalanine**, is managed by restricting dietary intake of **phenylalanine** to a small amount sufficient for tissue building and repair.

Sapropterin dihydrochloride p. 880, a synthetic form of tetrahydrobiopterin, is licensed as an adjunct to dietary restriction of **phenylalanine** in the management of patients with *phenylketonuria* and *tetrahydrobiopterin deficiency*.

TETRAHYDROBIOPTERIN AND DERIVATIVES

Sapropterin dihydrochloride

INDICATIONS AND DOSE

Phenylketonuria (adjunct to dietary restriction of phenylalanine) (specialist use only)

BY MOUTH

- ▶ Adult: Initially 10 mg/kg once daily, adjusted according to response; usual dose 5–20 mg/kg, dose to be taken preferably in the morning

Tetrahydrobiopterin deficiency (adjunct to dietary restriction of phenylalanine) (specialist use only)

BY MOUTH

- ▶ Adult: Initially 2–5 mg/kg once daily, adjusted according to response, dose to be taken preferably in the morning, the total daily dose may alternatively be given in 2–3 divided doses; maximum 20 mg/kg per day

- **CAUTIONS** History of convulsions
- **SIDE-EFFECTS**
 - ▶ Common or very common Abdominal pain · cough · diarrhoea · headache · nasal congestion · pharyngolaryngeal pain · vomiting
 - ▶ Frequency not known Hypersensitivity reactions
- **PREGNANCY** Manufacturer advises caution—consider only if strict dietary management inadequate.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor blood-phenylalanine concentration before and after first week of treatment—if unsatisfactory response increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month.
 - ▶ Monitor blood-phenylalanine and tyrosine concentrations 1–2 weeks after dose adjustment and during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be dissolved in water and taken within 20 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Sapropterin is a synthetic form of tetrahydrobiopterin.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sapropterin dihydrochloride dispersible tablets.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Soluble tablet

CAUTIONARY AND ADVISORY LABELS 13, 21

▶ **Kuvan** (Merck Serono Ltd)

Sapropterin dihydrochloride 100 mg Kuvan 100mg soluble tablets (sugar-free) | 30 tablet **PoM** £597.22

5.4 Special diets

Nutrition in special diets

These are preparations that have been modified to eliminate a particular constituent from a food or that are nutrient mixtures formulated as food substitutes for patients who either cannot tolerate or cannot metabolise

certain common constituents of food. In certain clinical conditions, some food preparations are regarded as drugs and can be prescribed within the NHS if they have been approved by the Advisory Committee on Borderline Substances (ACBS).

Aspartame (used as a sweetener in some foods and medicines) contributes to the **phenylalanine** intake and may affect control of *phenylketonuria*. Where the presence of aspartame is specified in the product literature this is indicated in the BNF against the preparation; the patient should be informed of this.

Celiac disease

Intolerance to **gluten** in *celiac disease* is managed by completely eliminating gluten from the diet. A range of gluten-free products is available for prescription.

6 Vitamin deficiencies

Vitamins

Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements.

Their use as general 'pick-me-ups' is of unproven value and, in the case of preparations containing vitamin A or D, may actually be harmful if patients take more than the prescribed dose. The 'fad' for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid p. 884 and pyridoxine hydrochloride p. 882, is unscientific and can be harmful.

Dietary reference values for vitamins are available in the Department of Health publication:

Dietary Reference Values for Food Energy and Nutrients for the United Kingdom: Report of the Panel on Dietary Reference Values of the Committee on Medical Aspects of Food Policy. *Report on Health and Social Subjects* 41. London: HMSO, 1991.

Dental patients

It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment.

Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if this is suspected the patient should be referred to a medical practitioner.

Vitamin A

Deficiency of vitamin A (retinol) is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption).

Vitamin B group

Deficiency of the B vitamins, other than vitamin B₁₂, is rare in the UK and is usually treated by preparations containing thiamine p. 882 (B₁), riboflavin (B₂), and nicotinamide, which is used in preference to nicotinic acid, as it does not cause vasodilatation. Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol nicotinate p. 206, and pantothenic acid or panthenol may be included in vitamin B preparations but there is no evidence of their value.

The severe deficiency states Wernicke's encephalopathy and Korsakoff's psychosis, especially as seen in chronic alcoholism, are best treated initially by the parenteral administration of B vitamins (*Pabrinex*®), followed by oral

administration of thiamine p. 882 in the longer term. Anaphylaxis has been reported with parenteral B vitamins.

As with other vitamins of the B group, pyridoxine hydrochloride p. 882 (B₆) deficiency is rare, but it may occur during isoniazid therapy or penicillamine treatment in Wilson's disease and is characterised by peripheral neuritis. High doses of pyridoxine hydrochloride p. 882 are given in some metabolic disorders, such as hyperoxaluria, and it is also used in sideroblastic anaemia. There is evidence to suggest that pyridoxine hydrochloride may provide some benefit in premenstrual syndrome. It has been tried for a wide variety of other disorders, but there is little sound evidence to support the claims of efficacy.

Nicotinic acid p. 177 inhibits the synthesis of cholesterol and triglyceride. Folic acid p. 836 and vitamin B₁₂ are used in the treatment of megaloblastic anaemia. Folinic acid p. 781 (available as calcium folinate) is used in association with cytotoxic therapy.

Vitamin C

Vitamin C (ascorbic acid p. 884) therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency are commonly found, especially in the elderly.

Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a patient with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.

Claims that vitamin C ameliorates colds or promotes wound healing have not been proven.

Vitamin D

The term Vitamin D is used for a range of compounds which possess the property of preventing or curing rickets. They include ergocalciferol p. 887 (calciferol, vitamin D₂), colecalciferol (vitamin D₃) p. 886, dihydrotachysterol p. 887, alfalcidol (1 α -hydroxycholecalciferol) p. 885, and calcitriol (1,25-dihydroxycholecalciferol) p. 885.

Simple vitamin D deficiency can be prevented by taking an oral supplement of ergocalciferol (calciferol, vitamin D₂) or colecalciferol (vitamin D₃) daily. Vitamin D deficiency can occur in people whose exposure to sunlight is limited and in those whose diet is deficient in vitamin D. In these individuals, ergocalciferol or colecalciferol daily by mouth may be given to treat vitamin D deficiency; higher doses may be necessary for *severe* deficiency. Patients who do not respond should be referred to a specialist.

Preparations containing calcium carbonate with colecalciferol p. 886 are available for the management of combined calcium and vitamin D deficiency, or for those at high risk of deficiency.

Vitamin D deficiency caused by *intestinal malabsorption* or *chronic liver disease* usually requires vitamin D in pharmacological doses.

Vitamin D requires hydroxylation by the kidney to its active form, therefore the hydroxylated derivatives alfalcidol p. 885 or calcitriol p. 885 should be prescribed if patients with *severe renal impairment* require vitamin D therapy. Calcitriol is also licensed for the management of postmenopausal osteoporosis.

Paricalcitol p. 888, a synthetic vitamin D analogue, is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure.

Vitamin E

The daily requirement of vitamin E (tocopherol) has not been well defined but is probably 3 to 15 mg daily. There is little evidence that oral supplements of vitamin E are essential in adults, even where there is fat malabsorption secondary to cholestasis. In young children with congenital cholestasis, abnormally low vitamin E concentrations may be found in association with neuromuscular abnormalities,

which usually respond only to the parenteral administration of vitamin E.

Vitamin E has been tried for various other conditions but there is little scientific evidence of its value.

Vitamin K

Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Because vitamin K is fat soluble, patients with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. Menadiol sodium phosphate p. 889 is a water-soluble synthetic vitamin K derivative that can be given orally to prevent vitamin K deficiency in malabsorption syndromes.

Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects can be antagonised by giving vitamin K.

Other compounds

Potassium aminobenzoate p. 882 has been used in the treatment of various disorders associated with excessive fibrosis such as scleroderma and Peyronie's disease. In Peyronie's disease there is some evidence to support efficacy in reducing progression when given early in the disease; however, there is no evidence for reversal of the condition. The therapeutic value of potassium aminobenzoate in scleroderma is doubtful.

MULTIVITAMINS

Vitamins A and D

INDICATIONS AND DOSE

Prevention of vitamin A and D deficiency

BY MOUTH

- ▶ Child: 1 capsule daily, 1 capsule contains 4000 units vitamin A and 400 units (10 micrograms) vitamin D
- ▶ Adult: (consult product literature)

- **UNLICENSED USE** Not licensed in children under 6 months of age.

- **INTERACTIONS** → Appendix 1 (vitamins).

● SIDE-EFFECTS

Overdose Prolonged excessive ingestion of vitamins A and D can lead to hypervitaminosis.

- **PRESCRIBING AND DISPENSING INFORMATION** This drug contains vitamin D; consult individual vitamin D monographs.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

▶ VITAMINS A AND D (Non-proprietary)

Vitamin A 4000 unit, Vitamin D 400 unit Vitamins A and D capsules BPC 1973 | 28 capsule [GSL](#) £2.81 | 84 capsule £8.42 DT price = £8.42

Vitamins A, C and D

The properties listed below are those particular to the combination only. For the properties of the components please consider, ascorbic acid p. 884, vitamin D p. 884.

INDICATIONS AND DOSE

Prevention of vitamin deficiency

BY MOUTH

- ▶ Child 1 month-4 years: 5 drops daily, 5 drops contain vitamin A approx. 700 units, vitamin D approx. 300 units (7.5 micrograms), ascorbic acid approx. 20 mg

- **PRESCRIBING AND DISPENSING INFORMATION** This drug contains vitamin D; consult individual vitamin D monographs.

Available free of charge to children under 4 years in families on the Healthy Start Scheme, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

Healthy Start Vitamins for women (containing ascorbic acid, vitamin D, and folic acid) are also available free of charge to women on the Healthy Start Scheme during pregnancy and until their baby is one year old, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Oral drops

▶ **VITAMINS A, C AND D (Non-proprietary)**

Ascorbic acid 150 mg per 1 ml, Sodium ascorbate 18.58 mg per 1 ml, Vitamin A 5000 iu per 1 ml, Vitamin A and D3 concentrate.55 mg per 1 ml, Vitamin D 2000 iu per 1 ml Healthy Start Children's Vitamin drops | 10 ml no price available

VITAMIN B GROUP

Potassium aminobenzoate

INDICATIONS AND DOSE

Peyronie's disease | Scleroderma

BY MOUTH

- ▶ Adult: 12 g daily in divided doses, to be taken after food

- **INTERACTIONS** → Appendix 1 (potassium aminobenzoate).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 21

▶ **Potaba** (Cheplapharm Arzneimittel GmbH)

Potassium aminobenzoate 500 mg Potaba 500mg capsules | 240 capsule [P] £44.75

Pyridoxine hydrochloride (Vitamin B₆)

INDICATIONS AND DOSE

Deficiency states

BY MOUTH

- ▶ Adult: 20–50 mg 1–3 times a day

Isoniazid-induced neuropathy (prophylaxis)

BY MOUTH

- ▶ Adult: 10–20 mg daily

Isoniazid-induced neuropathy (treatment)

BY MOUTH

- ▶ Adult: 50 mg 3 times a day

Idiopathic sideroblastic anaemia

BY MOUTH

- ▶ Adult: 100–400 mg daily in divided doses

Prevention of penicillamine-induced neuropathy in Wilson's disease

BY MOUTH

- ▶ Adult: 20 mg daily

Premenstrual syndrome

BY MOUTH

- ▶ Adult: 50–100 mg daily

- **UNLICENSED USE** Not licensed for prophylaxis of penicillamine-induced neuropathy in Wilson's disease. Not licensed for treatment of premenstrual syndrome.

Important safety information

Prolonged use of pyridoxine in a dose of 10 mg daily is considered safe but the long-term use of pyridoxine in a dose of 200 mg or more daily has been associated with neuropathy. The safety of long-term pyridoxine supplementation with doses above 10 mg daily has not been established.

- **INTERACTIONS** → Appendix 1 (vitamins).
 - **SIDE-EFFECTS** Sensory neuropathy (with high doses when given for extended periods)
- Overdose**
Overdosage induces toxic effects.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, oral suspension, oral solution, capsule

Tablet

▶ **PYRIDOXINE HYDROCHLORIDE (Non-proprietary)**

Thiamine (Vitamin B₁)

INDICATIONS AND DOSE

Mild deficiency

BY MOUTH

- ▶ Adult: 25–100 mg daily

Severe deficiency

BY MOUTH

- ▶ Adult: 200–300 mg daily in divided doses

Important safety information

MHRA/CHM ADVICE (SEPTEMBER 2007)

Although potentially serious allergic adverse reactions may rarely occur during, or shortly after, parenteral administration, the CHM has recommended that:

- This should not preclude the use of parenteral thiamine in patients where this route of administration is required, particularly in patients at risk of Wernicke-Korsakoff syndrome where treatment with thiamine is essential;

- Intravenous administration should be by infusion over 30 minutes;
- Facilities for treating anaphylaxis (including resuscitation facilities) should be available when parenteral thiamine is administered.

● **CAUTIONS** Anaphylaxis may occasionally follow injection

- **BREAST FEEDING** Severely thiamine-deficient mothers should avoid breast-feeding as toxic methyl-glyoxal present in milk.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Vitamin B substances with ascorbic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, ascorbic acid p. 884, thiamine p. 882.

INDICATIONS AND DOSE

Parenteral vitamins B and C for rapid correction of severe depletion or malabsorption (e.g. in alcoholism, after acute infections, postoperatively, or in psychiatric states) | Maintenance of vitamins B and C in chronic intermittent haemodialysis

BY INTRAVENOUS INFUSION

- ▶ Adult: See MHRA/CHM advice in Thiamine monograph (consult product literature).

Treatment of Wernicke's encephalopathy

INITIALLY BY INTRAVENOUS INFUSION

- ▶ Adult: 2–3 pairs 3 times a day for 2 days, discontinue if no response, continue treatment if symptoms respond after 2 days; (by intravenous infusion or by deep intramuscular injection) 1 pair once daily for 5 days or for as long as improvement continues, give deep intramuscular injection into the gluteal muscle

Prophylaxis of Wernicke's encephalopathy in alcohol dependence

BY INTRAVENOUS INFUSION OR BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 1 pair once daily for at least 3–5 days, give deep intramuscular injection into the gluteal muscle

Psychosis following narcosis or electroconvulsive therapy | Toxicity from acute infections

BY INTRAVENOUS INFUSION OR BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 1 pair twice daily for up to 7 days, give deep intramuscular injection into the gluteal muscle

Haemodialysis

BY INTRAVENOUS INFUSION

- ▶ Adult: 1 pair every 2 weeks

- **UNLICENSED USE** *Pabrinex*[®] doses in BNF may differ from those in product literature.

- **DIRECTIONS FOR ADMINISTRATION** Give (*Pabrinex*[®] *I/V High Potency*) intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Ampoules contents should be mixed, diluted, and administered without delay; give over 30 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Some formulations of *Pabrinex*[®] may contain benzyl alcohol (avoid in neonates). *Pabrinex*[®] I/M High Potency injection is for intramuscular use only. *Pabrinex*[®] I/V High Potency injection is for intravenous use only.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Not applicable

EXCIPIENTS: May contain Benzyl alcohol

Vitamins with minerals and trace elements

INDICATIONS AND DOSE

KETOVITE® TABLETS

Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism | Adjunct in restricted, specialised, or synthetic diets

BY MOUTH

► Adult: 1 tablet 3 times a day, use with *Ketovite® Liquid* for complete vitamin supplementation.

FORCEVAL® CAPSULES

Vitamin and mineral deficiency and as adjunct in synthetic diets

BY MOUTH

► Adult: 1 capsule daily, one hour after a meal

- **PRESCRIBING AND DISPENSING INFORMATION** To avoid potential toxicity, the content of all vitamin preparations, particularly vitamin A, should be considered when used together with other supplements.

- **PATIENT AND CARER ADVICE**

KETOVITE® TABLETS Tablets may be crushed immediately before use.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► **VITAMINS WITH MINERALS AND TRACE ELEMENTS (Non-proprietary)**

VITAMIN C

Ascorbic acid (Vitamin C)

INDICATIONS AND DOSE

Prevention of scurvy

BY MOUTH

► Adult: 25–75 mg daily

Treatment of scurvy

BY MOUTH

► Adult: Not less than 250 mg daily in divided doses

- **CAUTIONS**

CAUTIONS, FURTHER INFORMATION

Iron overload Ascorbic acid should not be given to patients with cardiac dysfunction.

In patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine.

- **INTERACTIONS** → Appendix 1 (vitamins).

- **PRESCRIBING AND DISPENSING INFORMATION** It is rarely necessary to prescribe more than 100 mg daily except early in the treatment of scurvy.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, oral suspension, solution for infusion, oral solution

Tablet

Chewable tablet

CAUTIONARY AND ADVISORY LABELS 24

EXCIPIENTS: May contain Aspartame

► **ASCORBIC ACID (Non-proprietary)**

Ascorbic acid 60 mg Ascorbic acid 60mg chewable tablets | 60 tablet no price available | 180 tablet no price available

Ascorbic acid (as Sodium ascorbate) 500 mg Ascorbic acid 500mg chewable tablets (sugar-free) | 60 tablet no price available

Ascorbic acid 500 mg Ascorbic acid 500mg chewable tablets | 60 tablet £3.90 | 100 tablet £5.58

► Brands may include Ascur and Haliborange Halibonbons

Capsule

► **ASCORBIC ACID (Non-proprietary)**

Ascorbic acid 500 mg Ascorbic acid 500mg capsules | 100 capsule no price available

Also available in combination with *vitamin B substances*, p. 883.

VITAMIN D AND ANALOGUES

Vitamin D and analogues (systemic)

- **CONTRA-INDICATIONS** Hypercalcaemia · metastatic calcification

- **INTERACTIONS** → Appendix 1 (vitamins).

- **SIDE-EFFECTS**

Overdose

Symptoms of overdose include anorexia, lassitude, nausea and vomiting, diarrhoea, constipation, weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine.

- **PREGNANCY** High doses teratogenic in *animals* but therapeutic doses unlikely to be harmful.
- **BREAST FEEDING** Caution with high doses; may cause hypercalcaemia in infant—monitor serum-calcium concentration.
- **MONITORING REQUIREMENTS** **Important:** All patients receiving pharmacological doses of vitamin D should have their plasma-calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occur.

Alfacalcidol (1 α -Hydroxycholecalciferol)

INDICATIONS AND DOSE

Patients with severe renal impairment requiring vitamin D therapy

BY MOUTH OR BY INTRAVENOUS INJECTION

- ▶ **Adult:** Initially 1 microgram daily, dose to be adjusted to avoid hypercalcaemia; maintenance 0.25–1 microgram daily
- ▶ **Elderly:** Initially 500 nanograms daily, dose adjusted to avoid hypercalcaemia; maintenance 0.25–1 microgram daily

Hypophosphataemic rickets | Persistent hypocalcaemia due to hypoparathyroidism or pseudohypoparathyroidism

BY MOUTH OR BY INTRAVENOUS INJECTION

- ▶ **Child 1 month–11 years:** 25–50 nanograms/kg once daily, dose to be adjusted as necessary; maximum 1 microgram per day
- ▶ **Child 12–17 years:** 1 microgram once daily, dose to be adjusted as necessary

Prevention of vitamin D deficiency in renal or cholestatic liver disease

BY MOUTH OR BY INTRAVENOUS INJECTION

- ▶ **Child 1 month–11 years (body-weight up to 20 kg):** 15–30 nanograms/kg once daily (max. per dose 500 nanograms)
- ▶ **Child 1 month–11 years (body-weight 20 kg and above):** 250–500 nanograms once daily, dose to be adjusted as necessary
- ▶ **Child 12–17 years:** 250–500 nanograms once daily, dose to be adjusted as necessary

Dose equivalence and conversion

One drop of alfacalcidol 2 microgram/mL oral drops contains approximately 100 nanograms alfacalcidol.

- **CAUTIONS** Nephrolithiasis · take care to ensure correct dose in infants
- **SIDE-EFFECTS**
 - ▶ **Rare** Nephrocalcinosis · pruritus · rash · urticaria
- **RENAL IMPAIRMENT** Monitor plasma-calcium concentration in renal impairment.
- **MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For injection, shake ampoule for at least 5 seconds before use, and give over 30 seconds.
- **PRESCRIBING AND DISPENSING INFORMATION** The concentration of alfacalcidol in *One-Alpha*[®] drops is 10 times greater than that of the former preparation *One-Alpha*[®] solution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

EXCIPIENTS: May contain Sesame oil

▶ ALFACALCIDOL (Non-proprietary)

Alfacalcidol 250 nanogram Alfacalcidol 250nanogram capsules | 30 capsule [PoM] £6.33 DT price = £2.51

Alfacalcidol 500 nanogram One-Alpha 0.5microgram capsules | 30 capsule [PoM] £6.27 DT price = £5.18

Alfacalcidol 1 microgram One-Alpha 1microgram capsules | 30 capsule [PoM] £8.75 DT price = £5.74

Oral drops

EXCIPIENTS: May contain Alcohol

▶ One-Alpha (LEO Pharma)

Alfacalcidol 2 microgram per 1 ml One-Alpha 2micrograms/ml oral drops (sugar-free) | 10 ml [PoM] £21.30 DT price = £21.30

Solution for injection

EXCIPIENTS: May contain Alcohol, propylene glycol

▶ One-Alpha (LEO Pharma)

Alfacalcidol 2 microgram per 1 ml One-Alpha 2micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £41.13
One-Alpha 1micrograms/0.5ml solution for injection ampoules | 10 ampoule [PoM] £21.57

Calcitriol (1,25-Dihydroxycholecalciferol)

INDICATIONS AND DOSE

Renal osteodystrophy

BY MOUTH

- ▶ **Adult:** Initially 250 nanograms daily, adjusted in steps of 250 nanograms every 2–4 weeks if required; usual dose 0.5–1 microgram daily

Renal osteodystrophy (in patients with normal or only slightly reduced plasma-calcium concentration)

BY MOUTH

- ▶ **Adult:** Initially 250 nanograms once daily on alternate days, adjusted in steps of 250 nanograms every 2–4 weeks if required; usual dose 0.5–1 microgram daily

Established postmenopausal osteoporosis

BY MOUTH

- ▶ **Adult:** 250 nanograms twice daily, plasma-calcium concentration and creatinine to be monitored (consult product literature)

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises avoid—no information available. Monitor plasma-calcium concentration in renal impairment.
- **MONITORING REQUIREMENTS** Monitor plasma calcium, phosphate, and creatinine during dosage titration. Monitor plasma-calcium concentration in patients receiving high doses.
- **DIRECTIONS FOR ADMINISTRATION** Contents of capsule may be administered by oral syringe.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Capsule

▶ CALCITRIOL (Non-proprietary)

Calcitriol 250 nanogram Calcitriol 250nanogram capsules | 30 capsule [PoM] £18.04 | 100 capsule [PoM] no price available DT price = £18.04

Calcitriol 500 nanogram Calcitriol 500nanogram capsules | 30 capsule [PoM] £32.25 | 100 capsule [PoM] no price available DT price = £32.25

▶ Rocaltrol (Roche Products Ltd)

Calcitriol 250 nanogram Rocaltrol 250nanogram capsules | 100 capsule [PoM] £18.04 DT price = £18.04

Calcitriol 500 nanogram Rocaltrol 500nanogram capsules | 100 capsule [PoM] £32.25 DT price = £32.25

Coercalciferol (Cholecalciferol; Vitamin D₃)

INDICATIONS AND DOSE

Prevention of vitamin D deficiency

BY MOUTH

- ▶ Adult: 400 units daily

Treatment of vitamin D deficiency

BY MOUTH

- ▶ Adult: 800 units daily, higher doses may be necessary for severe deficiency

- **RENAL IMPAIRMENT** Monitor plasma-calcium concentration in renal impairment.
- **MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.
- **DIRECTIONS FOR ADMINISTRATION**

INVITA D3

- ▶ May be mixed with a small amount of cold or lukewarm food immediately before administration.

Dihydratachysterol 250 microgram per 1 ml AT10 250micrograms/ml oral solution (sugar-free) | 15 ml [P] £22.87

Ergocalciferol (Calciferol; Vitamin D₂)

INDICATIONS AND DOSE

Vitamin D deficiency caused by intestinal malabsorption or chronic liver disease

BY MOUTH

- ▶ Adult: Up to 40 000 units daily
Hypocalcaemia of hypoparathyroidism to achieve normocalcaemia

BY MOUTH

- ▶ Adult: Up to 100 000 units daily

Prevention of vitamin D deficiency

BY MOUTH

- ▶ Adult: 400 units daily

Treatment of vitamin D deficiency

BY MOUTH

- ▶ Adult: 800 units daily, higher doses may be necessary for severe deficiency

- **CAUTIONS** Take care to ensure correct dose in infants
- **RENAL IMPAIRMENT** Monitor plasma-calcium concentration in hepatic impairment.
- **MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.
- **PRESCRIBING AND DISPENSING INFORMATION** The BP directs that when calciferol is prescribed or demanded, colecalciferol or ergocalciferol should be dispensed or supplied. When the strength of the tablets ordered or prescribed is not clear, the intention of the prescriber with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, solution for injection, oral suspension, oral solution, capsule

Tablet

- ▶ **ERGOCALCIFEROL (Non-proprietary)**

- ▶ Brands may include Ecfiferol; Ergoral

Oral solution

- ▶ **Ecfiferol** (Disposable Medical Equipment Ltd)
Ergocalciferol 3000 unit per 1 ml Ecfiferol D2 3,000units/ml liquid | 60 ml £55.00

Ergocalciferol with calcium lactate and calcium phosphate

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergocalciferol above, calcium lactate p. 857.

(Calcium and Vitamin D)**INDICATIONS AND DOSE**

Prevention of calcium and vitamin D deficiency | Treatment of calcium and vitamin D deficiency

BY MOUTH

► Adult: (consult product literature)

- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed before administration, or may be chewed.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer calcium and ergocalciferol tablets.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► **CALCIUM LACTATE WITH CALCIUM PHOSPHATE AND ERGOCALCIFEROL (Non-proprietary)**

Calcium lactate 300 mg, Calcium phosphate 150 mg, Ergocalciferol 10 microgram Calcium and Ergocalciferol tablets | 28 tablet [P] £8.85-£13.62 DT price = £13.42 | 28 tablet no price available DT price = £13.42 | 500 tablet no price available | 500 tablet [P] no price available

Paricalcitol**INDICATIONS AND DOSE**

For prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure

BY MOUTH

► Adult: (consult product literature)

For prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure in patients on haemodialysis

► Adult: To be administered via haemodialysis access (consult product literature)

- **SIDE-EFFECTS** Acne · breast tenderness · dyspepsia · pruritus · rash · taste disturbance
- **PREGNANCY** Toxicity in *animal* studies—manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS**
 - Monitor plasma calcium and phosphate during dose titration and at least monthly when stabilised.
 - Monitor parathyroid hormone concentration.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Capsule

► **Zemlar** (AbbVie Ltd)

Paricalcitol 1 microgram Zemlar 1microgram capsules | 28 capsule [PoM] £69.44

Paricalcitol 2 microgram Zemlar 2microgram capsules | 28 capsule [PoM] £138.88

Solution for injection

EXCIPIENTS: May contain Propylene glycol

► **Zemlar** (AbbVie Ltd)

Paricalcitol 5 microgram per 1 ml Zemlar 5micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £62.00 (Hospital only)

VITAMIN E**Alpha tocopherol (Tocopherol)****INDICATIONS AND DOSE**

Vitamin E deficiency because of malabsorption in congenital or hereditary chronic cholestasis

BY MOUTH USING ORAL SOLUTION

► Child: 17 mg/kg daily, dose to be adjusted as necessary

- **CONTRA-INDICATIONS** Preterm neonates
- **CAUTIONS** Predisposition to thrombosis
- **INTERACTIONS** → Appendix 1 (Vitamin E).
- **SIDE-EFFECTS**
 - **Common or very common** Diarrhoea
 - **Uncommon** Alopecia · asthenia · disturbances in serum-potassium concentration · disturbances in serum-sodium concentration · headache · pruritus · rash
- **PREGNANCY** Manufacturer advises caution, no evidence of harm in *animal* studies.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available. Manufacturer advises monitor closely in hepatic impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution. Risk of renal toxicity due to polyethylene glycol content. Manufacturer advises monitor closely in renal impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Tocofersolan is a water-soluble form of D-alpha tocopherol.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

► **Vedrop** (Orphan Europe (UK) Ltd) ▼

D-alpha tocopherol (as Tocofersolan) 50 mg per 1 ml Vedrop 50mg/ml oral solution (sugar-free) | 20 ml [PoM] £54.55 (sugar-free) | 60 ml [PoM] £163.65

Alpha tocopheryl acetate (Tocopherol)**INDICATIONS AND DOSE**

Vitamin E deficiency

BY MOUTH

► Child: 2–10 mg/kg daily, increased if necessary up to 20 mg/kg daily

Malabsorption in cystic fibrosis

BY MOUTH

- Child 1-11 months: 50 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
- Child 1-11 years: 100 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
- Child 12-17 years: 100–200 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
- Adult: 100–200 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes

Vitamin E deficiency in cholestasis and severe liver disease

BY MOUTH

- ▶ Child 1 month–11 years: Initially 100 mg daily, adjusted according to response, increased if necessary up to 200 mg/kg daily
- ▶ Child 12–17 years: Initially 200 mg daily, adjusted according to response, increased if necessary up to 200 mg/kg daily

Malabsorption in abetalipoproteinaemia

BY MOUTH

- ▶ Adult: 50–100 mg/kg once daily

- **CAUTIONS** Increased risk of necrotising enterocolitis in neonate weighing less than 1.5 kg or in a preterm neonate · predisposition to thrombosis
- **INTERACTIONS** → Appendix 1 (vitamins).
- **SIDE-EFFECTS** Abdominal pain (particularly with high doses) · diarrhoea (particularly with high doses)
- **PREGNANCY** No evidence of safety of high doses.
- **BREAST FEEDING** Excreted in milk; minimal risk, although caution with large doses.
- **DIRECTIONS FOR ADMINISTRATION** Consider dilution of oral suspension for use in neonates due to high osmolality.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: chewable tablet

Chewable tablet

EXCIPIENTS: May contain Sucrose

- ▶ **ALPHA TOCOPHERYL ACETATE (Non-proprietary)**

Alpha tocopheryl acetate 100 mg per 1 ml Alpha tocopheryl acetate 500mg/5ml oral suspension | 100 ml [GSL] £47.50

VITAMIN K**Menadiol sodium phosphate****INDICATIONS AND DOSE**

Prevention of Vitamin K deficiency in malabsorption syndromes

BY MOUTH

- ▶ Adult: 10–40 mg daily, dose to be adjusted as necessary

- **CONTRA-INDICATIONS** Infants · neonates
- **CAUTIONS** G6PD deficiency (risk of haemolysis) · vitamin E deficiency (risk of haemolysis)
- **INTERACTIONS** → Appendix 1 (vitamins).
- **PREGNANCY** Avoid in late pregnancy and labour unless benefit outweighs risk of neonatal haemolytic anaemia, hyperbilirubinaemia, and kernicterus in neonate.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

- ▶ **MENADIOL SODIUM PHOSPHATE (Non-proprietary)**

Menadiol phosphate (as Menadiol sodium phosphate) 10 mg Menadiol 10mg tablets | 100 tablet [P] £128.60 DT price = £128.60

Phytomenadione**(Vitamin K₁)****INDICATIONS AND DOSE**

Major bleeding in patients on warfarin (in combination with dried prothrombin complex or fresh frozen plasma)

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 5 mg for 1 dose, stop warfarin treatment

INR > 8.0 with minor bleeding in patients on warfarin

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 1–3 mg, stop warfarin treatment, dose may be repeated if INR still too high after 24 hours, restart warfarin treatment when INR <5

INR > 8.0 with no bleeding in patients on warfarin

BY MOUTH

- ▶ Adult: 1–5 mg, intravenous preparation to be used orally, stop warfarin treatment, repeat dose if INR still too high after 24 hours, restart warfarin treatment when INR <5

INR 5.0–8.0 with minor bleeding in patients on warfarin

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 1–3 mg, stop warfarin treatment, restart warfarin treatment when INR <5

Peri-operative anticoagulation (after warfarin stopped)

BY MOUTH

- ▶ Adult: 1–5 mg, intravenous preparation to be used orally, dose to be given the day before surgery if INR ≥1.5

- **CAUTIONS** Intravenous injections should be given very slowly—risk of vascular collapse

KONAKION® MM

Reduce dose in elderly.

- **INTERACTIONS** → Appendix 1 (vitamins).

- **SIDE-EFFECTS**

KONAKION® MM

Anaphylactoid reactions.

- **PREGNANCY** Use if potential benefit outweighs risk.

- **BREAST FEEDING** Present in milk.

- **HEPATIC IMPAIRMENT**

KONAKION® MM

Caution—glycocholic acid may displace bilirubin.

- **DIRECTIONS FOR ADMINISTRATION**

KONAKION® MM

May be administered by slow intravenous injection or by intravenous infusion in glucose 5%: **not** for intramuscular injection. For intravenous infusion, give intermittently in glucose 5%; dilute with 55ml; may be injected into lower part of infusion apparatus.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, drops, oral solution

Capsule

- ▶ **PHYTOMENADIONE (Non-proprietary)**

Phytomenadione 10 mg Phytomenadione 10mg capsules | 50 capsule £29.00

- ▶ **Neokay** (Neocenticals Ltd)

Phytomenadione 1 mg Neokay 1mg capsules | 12 capsule [PoM] £3.95 DT price = £3.95 | 100 capsule [PoM] £34.00

Drops

- ▶ **Neokay** (Neocenticals Ltd)

Phytomenadione 200 microgram per 1 ml Neokay 200micrograms/ml oral drops (sugar-free) | 25 ml £3.95

Solution for injection

EXCIPIENTS: May contain Glycocholic acid, lecithin

▶ **Konakion MM** (Roche Products Ltd)

Phytomenadione 10 mg per 1 ml Konakion MM Paediatric
 2mg/0.2ml solution for injection ampoules | 5 ampoule [PoM] £4.71
 Konakion MM 10mg/1ml solution for injection ampoules |
 10 ampoule [PoM] £3.78 DT price = £3.78

6.1 *Neural tube defects* *(prevention in pregnancy)*

Neural tube defects (prevention in pregnancy)

Folic acid p. 836 supplements taken before and during pregnancy can reduce the occurrence of neural tube defects. The risk of a neural tube defect occurring in a child should be assessed and folic acid given as follows:

- Women at a low risk of conceiving a child with a neural tube defect should be advised to take folic acid as a medicinal or food supplement daily (at low-risk group dose) before conception and until week 12 of pregnancy. Women who have not been taking folic acid and who suspect they are pregnant should start at once and continue until week 12 of pregnancy.
- Couples are at a high risk of conceiving a child with a neural tube defect if either partner has a neural tube defect (or either partner has a family history of neural tube defects), if they have had a previous pregnancy affected by a neural tube defect, or if the woman has *coeliac disease* (or other malabsorption state), diabetes mellitus, sickle-cell anaemia, or is taking **antiepileptic medicines**.
- Women in the high-risk group who wish to become pregnant (or who are at risk of becoming pregnant) should be advised to take folic acid daily (at high-risk group dose) and continue until week 12 of pregnancy (women with Sickle-cell disease p. 820 should continue taking their normal dose of folic acid (or to increase the dose to high-risk group daily dose) and continue this throughout pregnancy).

There is no justification for prescribing multiple-ingredient vitamin preparations containing vitamin B₁₂ or folic acid.

1 Arthritis

Arthritis

Rheumatoid arthritis and other inflammatory disorders

A non-steroidal anti-inflammatory drug (NSAID) is indicated for pain and stiffness resulting from inflammatory rheumatic disease; analgesics such as paracetamol p. 354 or codeine phosphate p. 360 can also be used.

Drugs are also used to influence the rheumatic disease process itself. For *rheumatoid arthritis* these disease-modifying antirheumatic drugs (DMARDs) include methotrexate p. 762, cytokine modulators, azathioprine p. 716, ciclosporin p. 717, cyclophosphamide p. 750, leflunomide p. 895, penicillamine p. 896, gold, antimalarials (chloroquine p. 536 and hydroxychloroquine sulfate p. 894), and sulfasalazine p. 37. Corticosteroids also have a significant role in the management of rheumatoid arthritis.

Drugs which may affect the disease process in *psoriatic arthritis* include sulfasalazine, gold, azathioprine, methotrexate, leflunomide, and cytokine modulators.

Osteoarthritis and soft-tissue disorders

For pain relief in osteoarthritis and soft-tissue disorders, paracetamol p. 354 should be used first and may need to be taken regularly. A topical NSAID or topical capsaicin p. 383 0.025% should also be considered, particularly in knee or hand osteoarthritis. An oral NSAID can be substituted for, or used in addition to, paracetamol. If further pain relief is required in osteoarthritis, then the addition of an opioid analgesic may be considered, but with a substantial risk of adverse effects; however, an opioid analgesic should be considered before a NSAID in patients taking low-dose aspirin.

Intra-articular corticosteroid injections may produce temporary benefit in osteoarthritis, especially if associated with soft-tissue inflammation.

Non-drug measures, such as weight reduction and exercise, should also be encouraged.

Glucosamine p. 893 and rubefacients are not recommended for the treatment of osteoarthritis.

Hyaluronic acid and its derivatives are available for osteoarthritis of the knee, but are not recommended. Sodium hyaluronate (*Durolane*®, *Euflexxa*®, *Fermathron*®, *Hyalgan*®, *Orthovisc*®, *Ostenil*®, *Ostenil Plus*®, *RenheVis*®, *Suplasyn*®, *Synocrom*®, *Synopsis*®) or hylan G-F 20 (*Synvisc*®) is injected intra-articularly to supplement natural hyaluronic acid in the synovial fluid. These injections may reduce pain over 1–6 months, but are associated with a

short-term increase in knee inflammation. Sodium hyaluronate (*SportVis*®) is also licensed for the relief of pain and optimisation of recovery following ankle sprain, and for the relief of chronic pain and disability associated with tennis elbow.

Rheumatic disease, suppressing drugs

Certain drugs such as those affecting the immune response can suppress the disease process in *rheumatoid arthritis* and *psoriatic arthritis*; gold, penicillamine p. 896, hydroxychloroquine sulfate p. 894, chloroquine p. 536, and sulfasalazine p. 37 can also suppress the disease process in *rheumatoid arthritis* while sulfasalazine p. 37 and possibly gold can suppress the disease process in *psoriatic arthritis*. Unlike NSAIDs, which are used only for symptom control, disease-modifying anti-rheumatic drugs (DMARDs) can affect the progression of disease but may require 2–6 months of treatment for a full therapeutic response. Response to DMARDs may allow the NSAID dose to be reduced or withdrawn. All patients with suspected inflammatory joint disease should be referred to a specialist as soon as possible to confirm diagnosis and evaluate disease activity; early initiation of DMARDs is recommended to control the signs and symptoms, and to limit joint damage.

Choice

The choice of a disease-modifying antirheumatic drug should take into account co-morbidity and patient preference. Methotrexate p. 762, sulfasalazine p. 37, intramuscular gold, and penicillamine p. 896 are similar in efficacy. However, methotrexate or sulfasalazine may be better tolerated.

A combination of DMARDs (including methotrexate and at least one other DMARD) and a short-term corticosteroid, should be given to patients with newly diagnosed active rheumatoid arthritis, ideally within 3 months of the onset of persistent symptoms. If the use of particular DMARDs is contra-indicated and combination therapy is not possible, monotherapy with a suitable DMARD should be given and the dose rapidly increased until clinically effective. In patients with established and stable rheumatoid arthritis, cautiously reduce drug doses to the lowest that are clinically effective. Response to drug treatment often produces a reduction in requirements of both corticosteroids and other drugs.

Gold and penicillamine p. 896 are effective in *palindromic rheumatism*. Systemic and *discoid lupus erythematosus* are

sometimes treated with chloroquine p. 536 or hydroxychloroquine sulfate p. 894.

If a disease-modifying anti-rheumatic drug does not lead to an objective benefit within 6 months, it should be replaced by a different one.

Gold

Gold can be given as sodium aurothiomalate p. 897 for active progressive rheumatoid arthritis; it must be given by deep intramuscular injection and the area gently massaged. A test dose must be given followed by doses at weekly intervals until there is definite evidence of remission. In patients who do respond, the interval between injections is then gradually increased to 4 weeks and treatment is continued for up to 5 years after complete remission. If relapse occurs the dosage frequency may be immediately increased and only once control has been obtained again should the dosage frequency be decreased; if no response is seen within 2 months, alternative treatment should be sought. It is important to avoid complete relapse since second courses of gold are not usually effective.

Penicillamine

Penicillamine p. 896 has a similar action to gold. More patients are able to continue treatment than with gold but side-effects are common.

Patients should be warned not to expect improvement for at least 6 to 12 weeks after treatment is initiated. Penicillamine should be discontinued if there is no improvement within 1 year.

Sulfasalazine

Sulfasalazine p. 37 has a beneficial effect in suppressing the inflammatory activity of rheumatoid arthritis. Sulfasalazine may also be used by specialists, in the management of psoriatic arthritis affecting peripheral joints [unlicensed indication]. Haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment.

Antimalarials

The antimalarial hydroxychloroquine sulfate p. 894 is used to treat rheumatoid arthritis of moderate inflammatory activity; chloroquine p. 536 is also licensed for treating inflammatory disorders but is used much less frequently and is generally reserved for use if other drugs have failed.

Chloroquine and hydroxychloroquine sulfate are effective for mild systemic lupus erythematosus, particularly involving the skin and joints. These drugs should not be used for psoriatic arthritis. Chloroquine and hydroxychloroquine sulfate are better tolerated than gold or penicillamine. Retinopathy rarely occurs provided that the recommended doses are not exceeded; in the elderly it is difficult to distinguish drug-induced retinopathy from changes of ageing.

Mepacrine hydrochloride p. 438 is sometimes used in discoid lupus erythematosus [unlicensed].

Drugs affecting the immune response

Methotrexate p. 762 is a disease-modifying antirheumatic drug suitable for moderate to severe rheumatoid arthritis. Azathioprine p. 716, ciclosporin p. 717, cyclophosphamide p. 750, leflunomide p. 895, and the cytokine modulators are reviewed more toxic and they are used in cases that have not responded to other disease-modifying drugs.

Methotrexate is usually given by mouth once a week, adjusted according to response. In patients who experience mucosal or gastro-intestinal side-effects with methotrexate, folic acid p. 836 given every week [unlicensed indication], on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

Leflunomide acts on the immune system as a disease-modifying antirheumatic drug. Its therapeutic effect starts after 4–6 weeks and improvement may continue for a further 4–6 months. Leflunomide, which is similar in efficacy to sulfasalazine p. 37 and methotrexate p. 762, may be chosen when these drugs cannot be used.

Ciclosporin p. 717 is licensed for severe active rheumatoid arthritis when conventional second-line therapy is inappropriate or ineffective. There is some evidence that ciclosporin may retard the rate of erosive progression and improve symptom control in those who respond only partially to methotrexate.

Cyclophosphamide p. 750 may be used for rheumatoid arthritis with severe systemic manifestations [unlicensed indication]; it is toxic and regular blood counts (including platelet counts) should be carried out. Cyclophosphamide can also be given for *severe systemic rheumatoid arthritis* and for other connective tissue diseases (especially with active vasculitis).

Drugs that affect the immune response are also used in the management of severe cases of *systemic lupus erythematosus* and other connective tissue disorders. They are often given in conjunction with corticosteroids for patients with severe or progressive renal disease. They may be used in cases of *polymyositis* that are resistant to corticosteroids. They are used for their corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive. Azathioprine p. 716 is usually used.

In the specialist management of psoriatic arthritis affecting peripheral joints, leflunomide p. 895, methotrexate p. 762, or azathioprine p. 716 [unlicensed indication] may be used.

Juvenile idiopathic arthritis

Many children with *juvenile idiopathic arthritis* (juvenile chronic arthritis) do not require disease-modifying antirheumatic drugs. Methotrexate p. 762 is effective; sulfasalazine p. 37 is an alternative [unlicensed indication] but it should be avoided in *systemic-onset juvenile idiopathic arthritis*. Gold and penicillamine p. 896 are no longer used. Cytokine modulators have a role in *juvenile idiopathic arthritis*.

Cytokine modulators

Cytokine modulators should be used under specialist supervision.

Adalimumab p. 901, certolizumab pegol p. 902, etanercept p. 903, golimumab p. 904, and infliximab (TNF inhibit the activity of tumour necrosis factor alpha (TNF- α)).

Adalimumab is licensed for moderate to severe active *rheumatoid arthritis* when response to other disease-modifying antirheumatic drugs (including methotrexate p. 762) has been inadequate; it is also licensed for severe, active, and progressive disease in adults not previously treated with methotrexate. In the treatment of rheumatoid arthritis, adalimumab should be used in combination with methotrexate, but it can be given alone if methotrexate is inappropriate. Adalimumab is also licensed for the treatment of active and progressive *psoriatic arthritis* and severe active *ankylosing spondylitis* that have not responded adequately to other disease-modifying antirheumatic drugs. It is also licensed for the treatment of severe axial spondyloarthritis without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs. Adalimumab also has a role in inflammatory bowel disease and plaque psoriasis.

Certolizumab pegol is licensed for use in patients with moderate to severe active *rheumatoid arthritis* when response to disease-modifying antirheumatic drugs (including methotrexate p. 762) has been inadequate. Certolizumab pegol can be used in combination with

methotrexate, or as a monotherapy if methotrexate is not tolerated or is contra-indicated. Certolizumab pegol is also licensed for the treatment of severe active *ankylosing spondylitis* in patients who have had an inadequate response to, or are intolerant of NSAIDs. It is also licensed for the treatment of severe active *axial spondyloarthritis*, without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs.

Etanercept p. 903 is licensed for the treatment of moderate to severe active *rheumatoid arthritis* either alone or in combination with methotrexate p. 762 when the response to other disease-modifying antirheumatic drugs is inadequate and in severe, active and progressive *rheumatoid arthritis* in patients not previously treated with methotrexate. It is also licensed for the treatment of active and progressive *psoriatic arthritis* inadequately responsive to other disease-modifying antirheumatic drugs, and for severe *ankylosing spondylitis* inadequately responsive to conventional therapy. Etanercept also has a role in plaque psoriasis.

Golimumab p. 904 is licensed in combination with methotrexate for the treatment of moderate to severe active *rheumatoid arthritis* when response to disease-modifying antirheumatic drug (DMARD) therapy (including methotrexate has been inadequate; it is also licensed in combination with methotrexate for patients with severe, active, and progressive rheumatoid arthritis not previously treated with methotrexate. Golimumab is also licensed for the treatment of active and progressive *psoriatic arthritis*, as monotherapy or in combination with methotrexate, when response to DMARD therapy has been inadequate; it is also licensed for the treatment of severe active *ankylosing spondylitis* when there is an inadequate response to conventional treatment.

Infliximab p. 906 is licensed for the treatment of active *rheumatoid arthritis* in combination with methotrexate when the response to other disease-modifying antirheumatic drugs, including methotrexate, is inadequate; it is also licensed in combination with methotrexate for patients not previously treated with methotrexate or other DMARDs who have severe, active, and progressive rheumatoid arthritis. Infliximab is also licensed for the treatment of *ankylosing spondylitis*, in patients with severe axial symptoms who have not responded adequately to conventional therapy, and in combination with methotrexate (or alone if methotrexate is not tolerated or is contra-indicated) for the treatment of active and progressive *psoriatic arthritis* which has not responded adequately to disease-modifying antirheumatic drugs.

Rituximab p. 734 is licensed in combination with methotrexate for the treatment of severe active *rheumatoid arthritis* in patients whose condition has not responded adequately to other disease-modifying antirheumatic drugs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them. Rituximab has a role in malignant disease.

Abatacept p. 900 prevents the full activation of T-lymphocytes. It is licensed for moderate to severe active *rheumatoid arthritis* in combination with methotrexate, in patients unresponsive to other disease-modifying antirheumatic drugs (including methotrexate or a tumour necrosis factor (TNF) inhibitor). Abatacept is not recommended for use in combination with TNF inhibitors.

Anakinra p. 897 inhibits the activity of interleukin-1. Anakinra (in combination with methotrexate) is licensed for the treatment of *rheumatoid arthritis* which has not responded to methotrexate alone. Anakinra is not recommended for the treatment of rheumatoid arthritis except when used in a controlled long-term clinical study. Patients who are already receiving anakinra for rheumatoid

arthritis should continue treatment until they and their specialist consider it appropriate to stop.

Belimumab p. 725 inhibits the activity of B-lymphocyte stimulator. Belimumab is licensed as adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy.

Tocilizumab p. 898 antagonises the actions of interleukin-6. Tocilizumab is licensed for use in patients with moderate to severe active *rheumatoid arthritis* when response to at least one disease-modifying antirheumatic drug or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated.

Ustekinumab p. 899 inhibits the activity of interleukins 12 and 23. It is licensed for the treatment of active *psoriatic arthritis* (in combination with methotrexate or alone) in patients who have had an inadequate response to one or more disease-modifying antirheumatic drugs.

CHONDROPROTECTIVE DRUGS

Glucosamine

- **DRUG ACTION** Glucosamine is a natural substance found in mucopolysaccharides, mucoproteins, and chitin.

INDICATIONS AND DOSE

ALATERIS®

Symptomatic relief of mild to moderate osteoarthritis of the knee

BY MOUTH

- ▶ Adult: 2 tablets once daily, review treatment if no benefit after 2–3 months

DOLENIO®

Symptomatic relief of mild to moderate osteoarthritis of the knee

BY MOUTH

- ▶ Adult: 1 tablet once daily, review treatment if no benefit after 2–3 months

GLUSARTEL®

Symptomatic relief of mild to moderate osteoarthritis of the knee

BY MOUTH

- ▶ Adult: 1 sachet once daily, dose to be dissolved in at least 250 mL of water, review treatment if no benefit after 2–3 months

- **CAUTIONS** Asthma · impaired glucose tolerance · predisposition to cardiovascular disease
- **INTERACTIONS** → Appendix 1 (glucosamine).
- **SIDE-EFFECTS**
 - ▶ Common or very common Abdominal pain · constipation · diarrhoea · drowsiness · dyspepsia · fatigue · flatulence · headache · nausea
 - ▶ Uncommon Flushing · pruritus · rash
 - ▶ Frequency not known Hair loss · visual disturbances
- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated if patient has a shellfish allergy.
- **PREGNANCY** Manufacturers advise avoid—no information available.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor blood-glucose concentration before treatment and periodically thereafter in patients with impaired glucose tolerance.
 - ▶ Monitor cholesterol in patients with predisposition to cardiovascular disease.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2008) that glucosamine (*Alateris*[®]) and (July 2011) glucosamine (*Glusartel*[®]) are **not** recommended for use with NHS Scotland for the symptomatic relief of mild to moderate osteoarthritis of the knee.

- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing—the mechanism of action is not understood and there is limited evidence to show it is effective.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

DISEASE-MODIFYING ANTI-RHEUMATIC DRUGS

Hydroxychloroquine sulfate

INDICATIONS AND DOSE

Active rheumatoid arthritis (including juvenile idiopathic arthritis) (administered on expert advice) | Systemic and discoid lupus erythematosus (administered on expert advice) | Dermatological conditions caused or aggravated by sunlight (administered on expert advice)

BY MOUTH

▶ Adult: 200–400 mg daily, daily maximum dose to be based on ideal body-weight; maximum 6.5 mg/kg per day

- **CAUTIONS** Acute porphyrias p. 864 · elderly · G6PD deficiency · may aggravate myasthenia gravis · may exacerbate psoriasis · neurological disorders (especially in those with a history of epilepsy) · severe gastro-intestinal disorders

CAUTIONS, FURTHER INFORMATION

Screening for ocular toxicity A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on

long-term treatment with chloroquine and hydroxychloroquine (*Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening 2009*). The following recommendations relate to hydroxychloroquine, which is only rarely associated with toxicity.

Before treatment:

- Assess renal and liver function (adjust dose if impaired)
- Ask patient about visual impairment (not corrected by glasses). If impairment or eye disease present, assessment by an optometrist is advised and any abnormality should be referred to an ophthalmologist
- Record near visual acuity of each eye (with glasses where appropriate) using a standard reading chart
- Initiate hydroxychloroquine treatment if no abnormality detected (at a dose not exceeding hydroxychloroquine sulfate 6.5 mg/kg daily)

During treatment:

- Ask patient about visual symptoms and monitor visual acuity annually using the standard reading chart
- Refer to ophthalmologist if visual acuity changes or if vision blurred and warn patient to seek prescribing doctor's advice about stopping treatment
- If long-term treatment is required (more than 5 years), individual arrangement should be agreed with the local ophthalmologist

- **INTERACTIONS** → Appendix 1 (chloroquine and hydroxychloroquine). Concurrent use of hepatotoxic drugs should be avoided.

• SIDE-EFFECTS

- ▶ **Common or very common** Gastro-intestinal disturbances · headache · pruritus · rashes · skin reactions
- ▶ **Uncommon** Convulsions · discoloration of skin, nails, and mucous membranes · ECG changes · hair depigmentation · hair loss · keratopathy · ototoxicity · retinal damage · visual changes
- ▶ **Rare** Acute generalised exanthematous pustulosis · agranulocytosis · angioedema · aplastic anaemia · blood disorders · cardiomyopathy · emotional disturbances · exfoliative dermatitis · hepatic damage · mental changes · myopathy · neuromyopathy · photosensitivity · psychosis · Stevens-Johnson syndrome · thrombocytopenia
- ▶ **Frequency not known** Bronchospasm · diffuse parenchymal lung disease · drug rash with eosinophilia and systemic symptoms

Overdose Hydroxychloroquine is very toxic in overdose; overdose is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

- **PREGNANCY** It is not necessary to withdraw an antimalarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.
- **BREAST FEEDING** Avoid—risk of toxicity in infant.
- **HEPATIC IMPAIRMENT** Caution in moderate to severe hepatic impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution. Monitor plasma-hydroxychloroquine concentration in severe renal impairment.
- **MONITORING REQUIREMENTS** Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory (see advice of the Royal College of Ophthalmologists, above).
- **PRESCRIBING AND DISPENSING INFORMATION** To avoid excessive dosage in obese patients, the dose of hydroxychloroquine should be calculated on the basis of ideal body-weight.
- **PATIENT AND CARER ADVICE** Do not take antacids for at least 4 hours before or after hydroxychloroquine to reduce

possible interference with hydroxychloroquine absorption.

INDICATIONS AND DOSE

Moderate to severe active rheumatoid arthritis (specialist use only)

BY MOUTH

▶ **Adult:** Initially 100 mg once daily for 3 days, then reduced to 10–20 mg once daily

Active psoriatic arthritis

BY MOUTH

▶ **Adult:** Initially 100 mg once daily for 3 days, then reduced to 20 mg once daily

- **CONTRA-INDICATIONS** Serious infection · severe hypoproteinaemia · severe immunodeficiency
- **CAUTIONS** Anaemia (avoid if significant and due to causes other than rheumatoid arthritis) · history of tuberculosis · impaired bone-marrow function (avoid if significant and due to causes other than rheumatoid arthritis) · leucopenia (avoid if significant and due to causes other than rheumatoid arthritis) · thrombocytopenia (avoid if significant and due to causes other than rheumatoid arthritis)
- **INTERACTIONS** → Appendix 1 (leflunomide). Increased risk of toxicity with other haematotoxic and hepatotoxic drugs. Caution if recent treatment with other hepatotoxic disease-modifying anti-rheumatic drugs. Caution if recent treatment with other myelotoxic disease-modifying anti-rheumatic drugs. Caution—washout procedures recommended before switching to other disease-modifying antirheumatic drugs (consult product literature).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · alopecia · anorexia · asthenia · diarrhoea · dizziness · dry skin · headache · increased blood pressure · leucopenia · nausea · oral mucosal disorders · paraesthesia · pruritus · rash · tenosynovitis · vomiting
 - ▶ **Uncommon** Anaemia · anxiety · hyperlipidaemia · hypokalaemia · hypophosphataemia · taste disturbance · tendon rupture · thrombocytopenia
 - ▶ **Rare** Eosinophilia · hepatitis · interstitial lung disease · jaundice · pancytopenia · severe infection
 - ▶ **Very rare** Hepatic failure · pancreatitis · peripheral neuropathy · progressive multifocal leucoencephalopathy · Stevens-Johnson syndrome · toxic epidermal necrolysis · vasculitis
 - ▶ **Frequency not known** Bone-marrow toxicity · hypopouricaemia · malignancy · reduced sperm count · renal failure

SIDE-EFFECTS, FURTHER INFORMATION

Discontinue treatment and institute washout procedure in case of serious side-effect (consult product literature).

Hepatotoxicity Potentially life-threatening hepatotoxicity reported usually in the first 6 months. Discontinue treatment (and institute washout procedure—consult product literature) or reduce dose according to liver-function abnormality; if liver-function abnormality persists after dose reduction, discontinue treatment and institute washout procedure.

- **CONCEPTION AND CONTRACEPTION** Effective contraception **essential** during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (plasma concentration monitoring required; waiting time before conception may be reduced with washout procedure). The concentration of the active metabolite after washout should be less than 20 micrograms/litre (measured on 2 occasions 14 days apart) in men or women before conception—consult product literature.
- **PREGNANCY** Avoid—active metabolite teratogenic in *animal* studies.
- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Avoid—active metabolite may accumulate.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in moderate or severe impairment—no information available.
- **PRE-TREATMENT SCREENING** Exclude pregnancy before treatment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor full blood count (including differential white cell count and platelet count) before treatment and every 2 weeks for 6 months then every 8 weeks.
 - ▶ Monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks.
 - ▶ Monitor blood pressure.
- **TREATMENT CESSATION**

Washout Procedure The active metabolite persists for a long period; to aid drug elimination in case of serious adverse effect, or before starting another disease-modifying antirheumatic drug, or before conception, stop treatment and give *either* colestyramine p. 173 or charcoal, activated p. 1130. Procedure may be repeated as necessary.

Penicillamine

- **DRUG ACTION** Penicillamine aids the elimination of copper ions in Wilson's disease (hepatolenticular degeneration).

INDICATIONS AND DOSE

Severe active rheumatoid arthritis (administered on expert advice)

BY MOUTH

- ▶ **Adult:** Initially 125–250 mg daily for 1 month, then increased in steps of 125–250 mg, at intervals of not less than 4 weeks; maintenance 500–750 mg daily in divided doses, then reduced in steps of 125–250 mg every 12 weeks, dose reduction attempted only if remission sustained for 6 months; maximum 1.5 g per day
- ▶ **Elderly:** Initially up to 125 mg daily for 1 month, then increased in steps of up to 125 mg, at intervals of at least 4 weeks; maximum 1 g per day

Wilson's disease

BY MOUTH

- ▶ **Adult:** 1.5–2 g daily in divided doses, to be taken before food; maintenance 0.75–1 g daily for 1 year; maximum 2 g per day
- ▶ **Elderly:** 20 mg/kg daily in divided doses, adjusted according to response; maximum 2 g per day

Autoimmune hepatitis (used rarely; after disease controlled with corticosteroids)

BY MOUTH

- ▶ **Adult:** Initially 500 mg daily in divided doses, to be increased slowly over 3 months; maintenance 1.25 g daily

Cystinuria, therapeutic

BY MOUTH

- ▶ **Adult:** 1–3 g daily in divided doses, to be adjusted to maintain urinary cystine below 200 mg/litre, to be taken before food

Cystinuria, prophylactic

BY MOUTH

- ▶ **Adult:** 0.5–1 g daily, maintain urinary cystine below 300 mg/litre and adequate fluid intake (at least 3 litres daily), to be taken at bedtime
- ▶ **Elderly:** Minimum dose to maintain urinary cystine below 200 mg/litre is recommended

- **CONTRA-INDICATIONS** Lupus erythematosus
- **CAUTIONS** Neurological involvement in Wilson's disease
- **INTERACTIONS** → Appendix 1 (penicillamine). Caution with gold treatment (avoid concomitant use if adverse reactions to gold). Caution with concomitant nephrotoxic drugs (increased risk of toxicity).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anorexia · fever · nausea · proteinuria · rash · thrombocytopenia
 - ▶ **Rare** Alopecia · breast enlargement (male and female) · elastosis perforans · haematuria (withdraw immediately if cause unknown) · mouth ulceration · pseudoxanthoma elasticum · skin laxity · stomatitis
 - ▶ **Frequency not known** Agranulocytosis · aplastic anaemia · blood disorders · bronchiolitis · cholestatic jaundice · dermatomyositis · glomerulonephritis · Goodpasture's syndrome · haemolytic anaemia · haemolytic leucopenia · late rashes (consider dose reduction) · lupus erythematosus · myasthenia gravis · nephrotic syndrome · neuropathy (especially if neurological involvement in Wilson's disease—prophylactic pyridoxine recommended) · neutropenia · pancreatitis · pemphigus · pneumonitis · polymyositis · pulmonary haemorrhage · rheumatoid arthritis · septic arthritis (in patients with rheumatoid

arthritis) · Stevens-Johnson syndrome · taste loss (mineral supplements not recommended) · urticaria · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Proteinuria Proteinuria, associated with immune complex nephritis, occurs in up to 30% of patients, but may resolve despite continuation of treatment; treatment may be continued provided that renal function tests remain normal, oedema is absent, and the 24-hour urinary excretion of protein does not exceed 2 g.

Rash Rashes are a common side-effect. Those that occur in the first few months of treatment disappear when the drug is stopped and treatment may then be re-introduced at a lower dose level and gradually increased.

Taste loss Loss of taste can occur about 6 weeks after treatment is started but usually returns 6 weeks later irrespective of whether treatment is discontinued.

Nausea Nausea may occur but is not usually a problem provided that penicillamine is taken before food or on retiring and that low initial doses are used and only gradually increased.

- **ALLERGY AND CROSS-SENSITIVITY** Patients who are hypersensitive to penicillin may react rarely to penicillamine.
- **PREGNANCY** Fetal abnormalities reported rarely; avoid if possible.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **RENAL IMPAIRMENT** Reduce dose and monitor renal function or avoid (consult product literature).
- **MONITORING REQUIREMENTS**
 - ▶ Blood counts, including platelets, and urine examinations should be carried out before starting treatment and then every 1 or 2 weeks for the first 2 months then every 4 weeks to detect blood disorders and proteinuria (they should also be carried out in the week after any dose increase).
 - ▶ A reduction in platelet count calls for discontinuation with subsequent re-introduction at a lower dosage and then, if possible, gradual increase.
 - ▶ Longer intervals may be adequate in cystinuria and Wilson's disease.
 - ▶ Consider withdrawal if platelet count falls below 120 000/mm³ or white blood cells below 2500/mm³ or if 3 successive falls within reference range (can restart at reduced dose when counts return to within reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia).
- **PATIENT AND CARER ADVICE** Counselling on the symptoms of blood disorders is advised. Warn patient and carers to tell doctor immediately if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop.

Sodium aurothiomalate

INDICATIONS AND DOSE

Active progressive rheumatoid arthritis (administered on expert advice)

BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: Test dose 10 mg, followed by 50 mg once weekly until there is definite evidence of remission, then gradually reduced to 50 mg every 4 weeks for up to 5 years after complete remission, benefit is not expected until 300–500 mg has been given; it should be discontinued if there is no remission after 1 g has been given

Relapse in patients who have previously received sodium aurothiomalate therapy for active progressive rheumatoid arthritis (administered on expert advice)

BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 50 mg once weekly until control has been obtained again, then reduced to 50 mg every 4 weeks continued for up to 5 years after complete remission, if no response is seen within 2 months, alternative treatment should be sought

- **CONTRA-INDICATIONS** Exfoliative dermatitis · history of blood disorders · history of bone marrow aplasia · necrotising enterocolitis · pulmonary fibrosis · systemic lupus erythematosus
- **CAUTIONS** Colitis · eczema · elderly · history of urticaria
- CAUTIONS, FURTHER INFORMATION**
Sodium aurothiomalate should be discontinued in the presence of blood disorders, gastro-intestinal bleeding (associated with ulcerative enterocolitis), or unexplained proteinuria (associated with immune complex nephritis) which is repeatedly above 300 mg/litre.
- **INTERACTIONS** → Appendix 1 (sodium aurothiomalate).
- **SIDE-EFFECTS** Alopecia · blood disorders (sometimes sudden and fatal) · colitis · gold deposits in eye · hepatotoxicity with cholestatic jaundice · irreversible pigmentation in sun-exposed areas (on prolonged parenteral treatment) · mouth ulcers · nephrotic syndrome · peripheral neuropathy · proteinuria · pulmonary fibrosis · severe anaphylactic reactions · skin reactions · stomatitis · taste disturbances
- SIDE-EFFECTS, FURTHER INFORMATION**
Rashes with pruritus often occur after 2 to 6 months of treatment and may necessitate discontinuation.
- **PREGNANCY** Consider reducing dose and frequency. Manufacturer advises avoid but limited data suggests usually not necessary to withdraw if condition well controlled.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk; theoretical possibility of rashes and idiosyncratic reactions.
- **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Urine tests and full blood counts (including total and differential white cell and platelet counts) must be performed before starting treatment and before each intramuscular injection.
 - ▶ Monitor for pulmonary fibrosis with annual chest X-ray.
- **PATIENT AND CARER ADVICE** Patients should be advised to seek prompt medical attention if diarrhoea, sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, metallic taste, rash, breathlessness, or cough develop.

INTERLEUKIN INHIBITORS

Anakinra

INDICATIONS AND DOSE

Treatment of rheumatoid arthritis (in combination with methotrexate) which has not responded to methotrexate alone

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 100 mg once daily

- **CONTRA-INDICATIONS** Neutropenia
- **CAUTIONS** History of asthma (risk of serious infection) · predisposition to infection
- **INTERACTIONS** → Appendix 1 (anakinra).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Neutropenia
 - ▶ **Frequency not known** Antibody formation · headache · infections · injection-site reactions · malignancy
- SIDE-EFFECTS, FURTHER INFORMATION**
Blood disorders Neutropenia reported commonly—discontinue if neutropenia develops.
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Caution if eGFR 30–50 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor neutrophil count before treatment, then every month for 6 months, then every 3 months.
- **PATIENT AND CARER ADVICE**
Blood disorders Patients should be instructed to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat, bruising or, bleeding) develop.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium* has advised (July 2002) that anakinra is **not** recommended for the treatment of rheumatoid arthritis within NHS Scotland.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Kineret (Swedish Orphan Biovitrum Ltd)

Anakinra 150 mg per 1 ml Kineret 100mg/0.67ml solution for injection pre-filled syringes | 28 pre-filled disposable injection [PoM] £734.44

Tocilizumab

INDICATIONS AND DOSE

Moderate to severe active rheumatoid arthritis (in combination with methotrexate or alone if methotrexate inappropriate) when response to at least one disease-modifying antirheumatic drug or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs

BY INTRAVENOUS INFUSION

- ▶ Adult: 8 mg/kg every 4 weeks (max. per dose 800 mg); for dose adjustment in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count, consult product literature

- **CONTRA-INDICATIONS** Do not initiate if absolute neutrophil count less than 2×10^9 /litre · severe active infection
- **CAUTIONS** History of diverticulitis · history of intestinal ulceration · history of recurrent or chronic infection (interrupt treatment if serious infection occurs) · low absolute neutrophil count · low platelet count · predisposition to infection (interrupt treatment if serious infection occurs)

CAUTIONS, FURTHER INFORMATION

Tuberculosis Patients with latent tuberculosis should be treated with standard therapy before starting tocilizumab.

- **INTERACTIONS** → Appendix 1 (tocilizumab).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · antibody formation · dizziness · gastritis · headache · hypercholesterolaemia · hypersensitivity · hypertension · infection · leucopenia · mouth ulceration · neutropenia · peripheral oedema · pruritus · raised hepatic transaminases · rash · upper respiratory-tract infection
- ▶ **Uncommon** Anaphylaxis · gastric ulcer · gastro-intestinal perforation · hypertriglyceridaemia · hypothyroidism · infusion related reactions · nephrolithiasis
- ▶ **Frequency not known** Thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION

Neutrophil and platelet counts Discontinue if absolute neutrophil count less than 0.5×10^9 /litre or platelet count less than 50×10^3 /microlitre).

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for 3 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—consult product literature.
- **RENAL IMPAIRMENT** Manufacturer advises monitor renal function closely in moderate or severe impairment.
- **PRE-TREATMENT SCREENING**
Tuberculosis Patients should be evaluated for tuberculosis before treatment.
- **MONITORING REQUIREMENTS**
- ▶ Monitor hepatic transaminases every 4–8 weeks for first 6 months, then every 12 weeks.
- ▶ Monitor neutrophil and platelet counts 4–8 weeks after starting treatment and then as indicated.
- ▶ Monitor lipid profile 4–8 weeks after starting treatment and then as indicated.
- ▶ Monitor for demyelinating disorders.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (RoActemra[®]), give intermittently in Sodium chloride

0.9%; dilute requisite dose to a volume of 100 mL with infusion fluid and give over 1 hour.

- **PATIENT AND CARER ADVICE** An alert card should be provided. Patients and their carers should be advised to seek immediate medical attention if symptoms of infection occur, or if symptoms of diverticular perforation such as abdominal pain, haemorrhage, or fever accompanying change in bowel habits occur.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ **Tocilizumab for the treatment of rheumatoid arthritis (February 2012)** NICE TA247

Tocilizumab, in combination with methotrexate, is recommended as an option for the treatment of rheumatoid arthritis in adults if:

- the disease has responded inadequately to disease-modifying anti-rheumatic drugs (DMARDs) and is used as described for tumour necrosis factor (TNF) inhibitor treatments (specifically the recommendations on disease activity and treatment) in the NICE guidance (October 2007) Adalimumab, etanercept and infliximab for the treatment of rheumatoid arthritis, or
 - the disease has responded inadequately to DMARDs and a TNF inhibitor and the patient cannot receive rituximab because of contra-indications or intolerance, and tocilizumab is used as described for TNF inhibitor treatments (specifically the recommendations on disease activity) in the NICE guidance (August 2010) Adalimumab, etanercept, infliximab, rituximab and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor, or
 - the disease has responded inadequately to one or more TNF inhibitor treatments and to rituximab
 - and the manufacturer provides tocilizumab with the discount agreed as part of the patient access scheme. Patients currently receiving tocilizumab for the treatment of rheumatoid arthritis who do not meet these criteria should have the option to continue treatment until they and their clinicians consider it appropriate to stop.
- www.nice.org.uk/TA247

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2012) that tocilizumab (RoActemra[®]) is accepted for restricted use within NHS Scotland as monotherapy in patients who are intolerant to methotrexate or where continued treatment with methotrexate is inappropriate, for the treatment of moderate to severe active rheumatoid arthritis in adults who have either responded inadequately to, or who were intolerant to, previous therapy with one or more disease-modifying antirheumatic drugs or tumour necrosis factor inhibitors, in accordance with the British Society for Rheumatology guidance on prescribing TNF- α blockers in adults with rheumatoid arthritis (2005).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **RoActemra** (Roche Products Ltd)
Tocilizumab 180 mg per 1 ml RoActemra 162mg/0.9ml solution for injection pre-filled syringes | 4 pre-filled disposable injection [PoM]
£913.12 (Hospital only)

Solution for infusion

- ▶ **RoActemra** (Roche Products Ltd)
Tocilizumab 20 mg per 1 ml RoActemra 400mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £512.00 (Hospital only)
RoActemra 200mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £256.00 (Hospital only)
RoActemra 80mg/4ml concentrate for solution for infusion vials | 1 vial [PoM] £102.40 (Hospital only)

Ustekinumab

INDICATIONS AND DOSE

Severe plaque psoriasis that has not responded to at least 2 standard systemic treatments and photochemotherapy, or when these treatments cannot be used because of intolerance or contra-indications

BY SUBCUTANEOUS INJECTION

- ▶ Adult (body-weight up to 100 kg): Initially 45 mg, then 45 mg after 4 weeks, then 45 mg every 12 weeks, discontinue if no response within 16 weeks
- ▶ Adult (body-weight 100 kg and above): Initially 45–90 mg, then 45–90 mg after 4 weeks, then 45–90 mg every 12 weeks, discontinue if no response within 16 weeks

Active psoriatic arthritis (in combination with methotrexate or alone) in patients who have had an inadequate response to one or more disease-modifying antirheumatic drugs

BY SUBCUTANEOUS INJECTION

- ▶ Adult (body-weight up to 100 kg): Initially 45 mg, then 45 mg after 4 weeks, then 45 mg every 12 weeks, review treatment if no response within 28 weeks
- ▶ Adult (body-weight 100 kg and above): Initially 45–90 mg, then 45–90 mg after 4 weeks, then 45–90 mg every 12 weeks, review treatment if no response within 28 weeks

● CONTRA-INDICATIONS Active infection

- **CAUTIONS** Development of malignancy · elderly · history of malignancy · predisposition to infection · start appropriate treatment if widespread erythema and skin exfoliation develop, and stop ustekinumab treatment if exfoliative dermatitis suspected

CAUTIONS, FURTHER INFORMATION

Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting ustekinumab. Patients who have previously received adequate treatment for tuberculosis can start ustekinumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting ustekinumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with ustekinumab.

● INTERACTIONS → Appendix 1 (ustekinumab).

● SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · diarrhoea · dizziness · headache · infections (sometimes severe) · injection-site reactions · malaise · myalgia · nausea · oropharyngeal pain · pruritus
- ▶ **Uncommon** Depression · facial palsy · hypersensitivity reactions (possibly delayed onset) · nasal congestion · pustular psoriasis
- ▶ **Rare** Exfoliative dermatitis

● CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during treatment and for 15 weeks after stopping treatment.

● PREGNANCY Avoid.

● BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

● PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

● MONITORING REQUIREMENTS

- ▶ Monitor for non-melanoma skin cancer, especially in patients with a history of PUVA treatment or prolonged immunosuppressant therapy, or those over 60 years of age.

- ▶ Monitor for signs and symptoms of exfoliative dermatitis or erythrodermic psoriasis.

● PATIENT AND CARER ADVICE

Exfoliative dermatitis Patients should be advised to seek prompt medical attention if symptoms suggestive of exfoliative dermatitis or erythrodermic psoriasis (such as increased redness and shedding of skin over a larger area of the body) develop.

Tuberculosis Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ **Ustekinumab for plaque psoriasis in adults (September 2009)** NICE TA180

Ustekinumab is recommended for the treatment of severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Ustekinumab should be withdrawn if the response is not adequate after 16 weeks. For patients weighing over 100 kg, the manufacturer should provide the 90-mg dose of ustekinumab at the same price as the 45-mg dose. www.nice.org.uk/TA180

- ▶ **Ustekinumab for treating active psoriatic arthritis (June 2015)** NICE TA340

Ustekinumab is an option, alone or in combination with methotrexate, for the treatment of active psoriatic arthritis in adults only when:

- treatment with tumour necrosis factor (TNF) alpha inhibitors is contraindicated but would otherwise be considered (as described in the NICE guidance on etanercept, infliximab and adalimumab for the treatment of psoriatic arthritis (August 2010) and golimumab for the treatment of psoriatic arthritis (April 2011) or
- the patient has had treatment with 1 or more TNF-alpha inhibitors.

Ustekinumab is recommended only if the manufacturer provides the 90 mg dose of ustekinumab for patients who weigh more than 100 kg at the same cost as the 45 mg dose, as agreed in the patient access scheme.

Ustekinumab treatment should be stopped if the patient's psoriatic arthritis has not shown an adequate response using the Psoriatic Arthritis Response Criteria (PsARC) at 24 weeks.

Patients currently receiving ustekinumab whose disease does not meet the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA340

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2014) that ustekinumab (*Stelara*[®]) is accepted for restricted use within NHS Scotland either alone or in combination with methotrexate, for the treatment of active psoriatic arthritis in adults who have responded inadequately to previous therapy with a non-biological disease-modifying anti-rheumatic drug, and failed on, or are unsuitable for, treatment with a TNF inhibitor.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Stelara** (Janssen-Cilag Ltd)

Ustekinumab 90 mg per 1 ml Stelara 45mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection **[PoM]** £2,147.00

T-CELL ACTIVATION INHIBITORS

Abatacept

INDICATIONS AND DOSE

Moderate to severe active rheumatoid arthritis (in combination with methotrexate) in patients unresponsive to other disease-modifying antirheumatic drugs (including methotrexate or a tumour necrosis factor (TNF) inhibitor)

INITIALLY BY INTRAVENOUS INFUSION

- ▶ Adult (body-weight up to 60 kg): 500 mg every 2 weeks for 3 doses (loading dose), then (by intravenous infusion) 500 mg every 4 weeks, alternatively (by subcutaneous injection) 125 mg once weekly, first subcutaneous dose to be given within 1 day of the intravenous loading dose; patients who are unable to receive an infusion may initiate subcutaneous abatacept without receiving an intravenous loading dose
- ▶ Adult (body-weight 60–100 kg): 750 mg every 2 weeks for 3 doses (loading dose), then (by intravenous infusion) 750 mg every 4 weeks, alternatively (by subcutaneous injection) 125 mg once weekly, first subcutaneous dose to be given within 1 day of the intravenous loading dose; patients who are unable to receive an infusion may initiate subcutaneous abatacept without receiving an intravenous loading dose
- ▶ Adult (body-weight 101 kg and above): 1 g every 2 weeks for 3 doses (loading dose), then (by intravenous infusion) 1 g every 4 weeks, alternatively (by subcutaneous injection) 125 mg once weekly, first subcutaneous dose to be given within 1 day of the intravenous loading dose; patients who are unable to receive an infusion may initiate subcutaneous abatacept without receiving an intravenous loading dose

- **CONTRA-INDICATIONS** Severe infection
- **CAUTIONS** Do not initiate until active infections are controlled · elderly (increased risk of side-effects) · predisposition to infection (screen for latent tuberculosis and viral hepatitis) · progressive multifocal leucoencephalopathy (discontinue treatment if neurological symptoms present)
- **INTERACTIONS** → Appendix 1 (abatacept).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · conjunctivitis · cough · diarrhoea · dizziness · dyspepsia · fatigue · flushing · headache · hypertension · infection · leucopenia · nausea · pain in extremities · paraesthesia · stomatitis · vomiting
 - ▶ **Uncommon** Alopecia · anxiety · arthralgia · basal and squamous cell carcinoma · bradycardia · bronchospasm · bruising · depression · dry eye · dry skin · dyspnoea · gastritis · hyperhidrosis · hypotension · menstrual disturbances · palpitation · psoriasis · skin papilloma · sleep disorder · tachycardia · thrombocytopenia · visual disturbance · weight gain
 - ▶ **Frequency not known** Lung cancer · lymphoma
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for 14 weeks after last dose.
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in Sodium Chloride 0.9% to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2–1.2 micron).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) NICE TA195
- Rituximab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or are intolerant of, other disease-modifying antirheumatic drugs (DMARDs), including at least 1 tumour necrosis factor (TNF) inhibitor. Repeat courses of rituximab should be given no more frequently than every 6 months, and should only be continued if an adequate response is achieved and maintained.
- Adalimumab, etanercept, infliximab, or abatacept, in combination with methotrexate, are options for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. In patients who cannot use methotrexate because of intolerance or contra-indications, adalimumab or etanercept can be given as monotherapy. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months. www.nice.org.uk/TA195
- ▶ Abatacept for the treatment of rheumatoid arthritis after the failure of conventional disease-modifying antirheumatic drugs (April 2013) NICE TA280

Abatacept, in combination with methotrexate, is an option for the treatment of highly active rheumatoid arthritis in adults who have had an inadequate response to at least two conventional disease-modifying antirheumatic drugs, including methotrexate, if:

- abatacept is used as described in the NICE guidance (October 2007) for other tumour necrosis factor (TNF) inhibitors (see Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis, *and*
- the manufacturer provides abatacept with the discount agreed in the patient access scheme

Patients already receiving abatacept for this indication, who do not fulfil the criteria for treatment should continue treatment until they and their specialist consider it appropriate to stop. www.nice.org.uk/TA280

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2013) that abatacept (*Orencia*[®]) is accepted for restricted use within NHS Scotland for adults with severe active rheumatoid arthritis, confirmed on at least two occasions, one month apart. This advice is contingent upon continuing availability of abatacept at the price agreed in the patient access scheme.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ ABATACEPT (Non-proprietary)

Abatacept 125 mg per 1 ml Orencia Clicklect 125mg/1ml solution for injection pre-filled pen | 4 pre-filled disposable injection [PoM] £1,209.60

▶ Orencia (Bristol-Myers Squibb Pharmaceuticals Ltd)

Abatacept 125 mg per 1 ml Orencia 125mg/1ml solution for injection pre-filled syringes | 4 pre-filled disposable injection [PoM] £1,209.60 (Hospital only)

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

▶ Orencia (Bristol-Myers Squibb Pharmaceuticals Ltd)

Abatacept 250 mg Orencia 250mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £302.40 (Hospital only)

TUMOR NECROSIS FACTOR ALPHA (TNF- α) INHIBITORS

Adalimumab

INDICATIONS AND DOSE

Severe plaque psoriasis either refractory to at least 2 standard systemic treatments or photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications

BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 80 mg, then 40 mg every 2 weeks, to be started 1 week after initial dose, discontinue treatment if no response within 16 weeks

Moderate to severe active rheumatoid arthritis (in combination with methotrexate or alone if methotrexate inappropriate) when response to other disease-modifying drugs (including methotrexate) has been inadequate | Severe, active, and progressive rheumatoid arthritis (in combination with methotrexate or alone if methotrexate inappropriate) not previously treated with methotrexate

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 40 mg every 2 weeks, then increased if necessary to 40 mg once weekly, dose to be increased only in patients receiving adalimumab alone, review treatment if no response within 12 weeks

Active and progressive psoriatic arthritis that has not responded adequately to other disease-modifying antirheumatic drugs | Severe active ankylosing spondylitis that has not responded adequately to other disease-modifying antirheumatic drugs | Severe axial spondyloarthritis without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of, NSAIDs

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 40 mg every 2 weeks, discontinue treatment if no response within 12 weeks

Severe active Crohn's disease

BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 80 mg, then 40 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose

Severe active Crohn's disease (accelerated regimen)

BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 160 mg, dose can alternatively be given as divided injections over 2 days, then 80 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose

Severe active ulcerative colitis

BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 160 mg, dose can alternatively be given as divided injections over 2 days, then 80 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 8 weeks of initial dose

- **CONTRA-INDICATIONS** Moderate or severe heart failure · severe infection
- **CAUTIONS** Children should be brought up to date with current immunisation schedule before initiating therapy · demyelinating disorders (risk of exacerbation) · development of malignancy · do not initiate until active infections are controlled (discontinue if new serious infection develops) · hepatitis B virus—monitor for active

infection · history of malignancy · mild heart failure (discontinue if symptoms develop or worsen) · predisposition to infection

CAUTIONS, FURTHER INFORMATION

Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with adalimumab.

- **INTERACTIONS** → Appendix 1 (adalimumab).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anxiety · benign tumours · chest pain · cough · dehydration · dermatitis · dizziness · dyspepsia · dyspnoea · electrolyte disturbances · eye disorders · flushing · gastrointestinal haemorrhage · haematuria · hyperlipidaemia · hypertension · hyperuricaemia · impaired healing · mood changes · musculoskeletal pain · oedema · onycholysis · paraesthesia · rash · renal impairment · skin cancer · sleep disturbances · tachycardia · vomiting
 - ▶ **Uncommon** Aortic aneurysm · arrhythmias · cholecystitis · cholelithiasis · dysphagia · erectile dysfunction · hearing loss · hepatic steatosis · interstitial lung disease · leukaemia · lymphoma · malignancy · neuropathy · nocturia · pancreatitis · pneumonitis · rhabdomyolysis · solid tumours · tinnitus · tremor · vascular occlusion
 - ▶ **Rare** Autoimmune hepatitis · demyelinating disorders · myocardial infarction
 - ▶ **Frequency not known** Abdominal pain · anaemia · antibody formation · aplastic anaemia · blood disorders · cutaneous vasculitis · depression · fever · headache · hypersensitivity reactions · injection-site reactions · leucopenia · lupus erythematosus-like syndrome · nausea · new onset psoriasis · pancytopenia · pleural effusion · pruritus · pulmonary embolism · sarcoidosis · Stevens-Johnson syndrome · thrombocytopenia · worsening heart failure · worsening psoriasis

SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during treatment and for at least 5 months after last dose.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid; manufacturer advises avoid for at least 5 months after last dose.
- **PRE-TREATMENT SCREENING** Tuberculosis Patients should be evaluated for tuberculosis before treatment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for infection before, during, and for 4 months after treatment.
 - ▶ Monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy.
- **PATIENT AND CARER ADVICE** An alert card should be provided. Tuberculosis Patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ **Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis (October 2007)** [NICE TA130]

The tumour necrosis factor alpha (TNF- α) inhibitors adalimumab, etanercept, and infliximab are options for the treatment of adults with active rheumatoid arthritis who have failed to respond to at least 2 disease-modifying antirheumatic drugs (DMARDs), including methotrexate (unless contra-indicated). TNF- α inhibitors should be given in combination with methotrexate; however, when methotrexate cannot be used because of intolerance or contraindications, adalimumab or etanercept can be given as monotherapy. Adalimumab, etanercept, and infliximab should be withdrawn if response is not adequate within 6 months. Response to treatment should be monitored at least every 6 months in patients who respond initially; treatment should be withdrawn if response is not maintained. An alternative TNF- α inhibitor may be considered for patients in whom treatment is withdrawn because of intolerance before the initial 6-month assessment of efficacy. Use of TNF- α inhibitors for the treatment of severe, active, and progressive rheumatoid arthritis in adults not previously treated with methotrexate or other DMARDs is not recommended. www.nice.org.uk/TA130

- ▶ **Adalimumab, etanercept, and infliximab for the treatment of ankylosing spondylitis (May 2008)** [NICE TA143]

Adalimumab or etanercept are treatment options for adults with severe active ankylosing spondylitis whose disease satisfies specific criteria for diagnosis where there is confirmation of sustained active spinal disease, and where treatment with two or more NSAIDs taken sequentially at maximum tolerated or recommended doses for 4 weeks has failed to control symptoms. Response to adalimumab or etanercept treatment should be assessed at 12-week intervals and continued only if response is adequate. If response to treatment is not maintained, a repeat assessment should be made after a further 6 weeks and treatment discontinued if there is an inadequate response. Patients who are intolerant of adalimumab or etanercept during the initial 12 weeks may receive the alternative TNF- α inhibitor (adalimumab or etanercept). However an alternative TNF- α inhibitor is not recommended in patients who fail to respond initially or fail to maintain an adequate response. Infliximab is not recommended for the treatment of ankylosing spondylitis. Patients who are already receiving infliximab for the treatment of ankylosing spondylitis can continue treatment until they and their specialist consider it appropriate to stop.

See full NICE guidance for specific criteria to diagnose severe active ankylosing spondylitis, confirm sustained active spinal disease, and assess response to treatment. www.nice.org.uk/TA143

- ▶ **Adalimumab for plaque psoriasis in adults (June 2008)** NICE TA146

Adalimumab is recommended for the treatment of severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Adalimumab should be withdrawn if the response is not adequate after 16 weeks. www.nice.org.uk/TA146

- ▶ **Infliximab and adalimumab for Crohn's disease (May 2010)** [NICE TA187]
NICE recommended. See Infliximab and adalimumab for Crohn's disease (May 2010) TA187 www.nice.org.uk/TA187 p. 907
 - ▶ **Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010)** NICE TA195
NICE recommended. See Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) TA195 www.nice.org.uk/TA195 p. 900
 - ▶ **Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010)** NICE TA199
NICE recommended. See Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010) TA199 www.nice.org.uk/TA199 p. 904
 - ▶ **Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015)** NICE TA329
NICE recommended. See Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015) TA329 www.nice.org.uk/TA329 p. 907
- Scottish Medicines Consortium (SMC) Decisions**
The *Scottish Medicines Consortium* issued advice for plaque psoriasis to NICE TA146 in May 2008.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Humira** (AbbVie Ltd)

Adalimumab 50 mg per 1 ml Humira 40mg/0.8ml solution for injection pre-filled syringes | 2 pre-filled disposable injection [PoM] £704.28

Humira 40mg/0.8ml solution for injection vials | 2 vial [PoM] £704.28
Humira 40mg/0.8ml solution for injection pre-filled disposable devices | 2 pre-filled disposable injection [PoM] £704.28

Certolizumab pegol

INDICATIONS AND DOSE

Moderate to severe active rheumatoid arthritis when response to disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (as monotherapy or in combination with methotrexate)

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 400 mg every 2 weeks for 3 doses, then 200 mg every 2 weeks, review treatment if no response within 12 weeks

Treatment of severe active ankylosing spondylitis in patients who have had an inadequate response to, or are intolerant of NSAIDs | Treatment of severe active axial spondyloarthritis, without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 400 mg every 2 weeks for 3 doses, then 200 mg every 2 weeks, alternatively 400 mg every 4 weeks, review treatment if no response within 12 weeks

- **CONTRA-INDICATIONS** Moderate to severe heart failure · severe active infection
- **CAUTIONS** Demyelinating CNS disorders (risk of exacerbation) · do not initiate until active infections are controlled (discontinue if new serious infection develops and until infection controlled) · hepatitis B virus (monitor for active infection) · history or development of

malignancy · mild heart failure (discontinue if symptoms develop or worsen) · predisposition to infection

CAUTIONS, FURTHER INFORMATION

Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting certolizumab pegol. Patients who have previously received adequate treatment for tuberculosis can start certolizumab pegol but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting certolizumab pegol. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with certolizumab pegol.

- ▶ **Golimumab for the treatment of psoriatic arthritis (April 2011)** NICE TA220
- Golimumab is an option for the treatment of active and progressive psoriatic arthritis in adults only if:
 - golimumab is used as described in the NICE guidance (August 2010) for other tumour necrosis factor (TNF) inhibitors, *and*
 - the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose. www.nice.org.uk/TA220
- ▶ **Golimumab for the treatment of rheumatoid arthritis after the failure of previous disease-modifying antirheumatic drugs (June 2011)** NICE TA225
- Golimumab, in combination with methotrexate, is an option for the treatment of rheumatoid arthritis in adults who have had an inadequate response to conventional disease-modifying antirheumatic drugs (DMARDs) only, including methotrexate, if:
 - golimumab is used as described in the NICE guidance (October 2007) for other tumour necrosis factor (TNF) inhibitors, *and*
 - the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose.
 Alternatively, golimumab, in combination with methotrexate, is an option for the treatment of rheumatoid arthritis in adults who have had an inadequate response to DMARDs including a TNF inhibitor, if:
 - golimumab is used as described in the NICE guidance (August 2010) for other TNF inhibitors, *and*
 - the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose. www.nice.org.uk/TA225

▶ **Golimumab for the treatment of ankylosing spondylitis (August 2011) NICE TA233**

Golimumab is an option for the treatment of severe, active ankylosing spondylitis in adults only if:

- Golimumab is used as described in the NICE guidance (May 2008) for adalimumab and etanercept, *and*
- the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose.

Patients who are already receiving golimumab for the treatment of severe, active ankylosing spondylitis who do not fulfil the criteria for treatment with adalimumab and etanercept, described in the NICE guidance (May 2008), can continue treatment until they and their specialist consider it appropriate to stop. www.nice.org.uk/TA233

▶ **Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015) NICE TA329**

NICE recommended. See Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015) TA329 www.nice.org.uk/TA329 p. 907

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2012) that golimumab (*Simponi*[®]) is accepted for restricted use within NHS Scotland at a dose of 50 mg, alone or in combination with methotrexate, for the treatment of active and progressive psoriatic arthritis in adults whose disease has not responded to adequate trials of at least two standard DMARDs, administered either individually or in combination.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

Golimumab 100 mg per 1 ml Simponi 50mg/0.5ml solution for injection pre-filled disposable devices | 1 pre-filled disposable injection [POM] £762.97 Simponi 100mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection [POM] £1,525.94 Simponi 50mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [POM] £762.97

Infliximab

INDICATIONS AND DOSE

Severe active Crohn's disease

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, then 5 mg/kg after 4 weeks, if condition has responded, then maintenance 5 mg/kg every 8 weeks

Fistulating Crohn's disease

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, if condition has responded consult product literature for guidance on further doses

Severe active ulcerative colitis

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 8 weeks, discontinue if no response 14 weeks after initial dose

Rheumatoid arthritis (in combination with methotrexate)

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 3 mg/kg, then 3 mg/kg after 2 weeks, followed by 3 mg/kg after 4 weeks, then 3 mg/kg every 8 weeks, dose to be increased only if response is inadequate after 12 weeks of initial treatment; increased in steps of 1.5 mg/kg every 8 weeks,

increased if necessary up to 7.5 mg/kg every 8 weeks, alternatively increased if necessary to 3 mg/kg every 4 weeks, discontinue if no response by 12 weeks of initial infusion or after dose adjustment

Ankylosing spondylitis

BY INTRAVENOUS INFUSION

- ▶ Adult: 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 6–8 weeks, discontinue if no response by 6 weeks of initial infusion

Psoriatic arthritis (in combination with methotrexate)

BY INTRAVENOUS INFUSION

- ▶ Adult: 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, followed by 5 mg/kg every 8 weeks

Plaque psoriasis

BY INTRAVENOUS INFUSION

- ▶ Adult: 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 8 weeks, discontinue if no response within 14 weeks of initial infusion

Important safety information

Adequate resuscitation facilities must be available when infliximab is used.

- **CONTRA-INDICATIONS** Moderate or severe heart failure · severe infections
- **CAUTIONS** Demyelinating disorders (risk of exacerbation) · development of malignancy · hepatitis B virus—monitor for active infection · history of colon carcinoma (in inflammatory bowel disease) · history of dysplasia (in inflammatory bowel disease) · history of malignancy · history of prolonged immunosuppressant or PUVA treatment in patients with psoriasis · mild heart failure (discontinue if symptoms develop or worsen) · predisposition to infection (discontinue if new serious infection develops) · risk of delayed hypersensitivity reactions if drug-free interval exceeds 16 weeks

CAUTIONS, FURTHER INFORMATION

Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting infliximab. Patients who have previously received adequate treatment for tuberculosis can start infliximab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting infliximab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with infliximab.

Hypersensitivity reactions Hypersensitivity reactions (including fever, chest pain, hypotension, hypertension, dyspnoea, transient visual loss, pruritus, urticaria, serum sickness-like reactions, angioedema, anaphylaxis) reported during or within 1–2 hours after infusion (risk greatest during first or second infusion or in patients who discontinue other immunosuppressants). Prophylactic antipyretics, antihistamines, or hydrocortisone may be administered.

- **INTERACTIONS** → Appendix 1 (infliximab).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Alopecia · arthralgia · constipation · diarrhoea · dizziness · dry skin · dyspepsia · ecchymosis · epistaxis · flushing · gastro-intestinal haemorrhage · gastro-oesophageal reflux · hyperhidrosis · hypertension · hypoesthesia · hypotension · myalgia · new onset or worsening psoriasis · palpitation · paraesthesia · rash · sleep disturbances · tachycardia

- ▶ **Uncommon** Abnormal skin pigmentation · agitation · amnesia · arrhythmia · bradycardia · bullous eruption · cheilitis · cholecystitis · confusion · eye disorders · heart failure · hepatitis · hyperkeratosis · impaired healing · intestinal perforation · nervousness · neuropathy · pancreatitis · peripheral ischaemia · pleurisy · pulmonary oedema · rosacea · seborrhoea · seizures · syncope · vaginitis
- ▶ **Rare** Demyelinating disorders · interstitial lung disease · leukaemia · lymphoma · pericardial effusion · Stevens-Johnson syndrome · toxic epidermal necrolysis · vasospasm
- ▶ **Frequency not known** Abdominal pain · anaemia · antibody formation · aplastic anaemia · blood disorders · depression · fever · headache · hepatic failure · hepatosplenic T-cell lymphoma (more likely in inflammatory bowel disease) · hypersensitivity reactions · injection-site reactions · leucopenia · lupus erythematosus-like syndrome · nausea · pancytopenia · pruritus · thrombocytopenia · worsening heart failure

SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during and for at least 6 months after last dose.

- **PREGNANCY** Use only if essential.

- **BREAST FEEDING** Amount probably too small to be harmful.

PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

MONITORING REQUIREMENTS

- ▶ Monitor for infection before, during, and for 6 months after treatment.
- ▶ All patients should be observed carefully for 1–2 hours after infusion and resuscitation equipment should be available for immediate use (risk of hypersensitivity reactions).
- ▶ Monitor for symptoms of delayed hypersensitivity if readministered after a prolonged period.
- ▶ When used for plaque psoriasis, monitor for non-melanoma skin cancer before and during treatment.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion (Remicade®)*, give intermittently in Sodium chloride 0.9%; reconstitute each 100-mg vial with 10 mL water for injections using a 21-gauge or smaller needle; gently swirl vial without shaking to dissolve; allow to stand for 5 minutes; dilute requisite dose with infusion fluid to a final volume of 250 mL and give through a low protein-binding filter (1.2 micron or less) over at least 2 hours (adults over 18 years who have tolerated 3 initial 2-hour infusions may be given subsequent infusions of up to 6 mg/kg over at least 1 hour); start infusion within 3 hours of reconstitution.

- **PATIENT AND CARER ADVICE** An alert card should be provided.

Tuberculosis Patients and carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

Blood disorders Patients and carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Hypersensitivity reactions Patients and carers should be advised to keep Alert card with them at all times and seek medical advice if symptoms of delayed hypersensitivity develop.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ **Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis (October 2007)** NICE TA130
NICE recommended. See Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis (October 2007) TA130 www.nice.org.uk/TA130 p. 902
- ▶ **Infliximab for plaque psoriasis in adults (January 2008)** NICE TA134
Infliximab is recommended for the treatment of very severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) or to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Infliximab should be withdrawn if the response is not adequate after 10 weeks. www.nice.org.uk/TA134
- ▶ **Adalimumab, etanercept, and infliximab for the treatment of ankylosing spondylitis (May 2008)** NICE TA143
NICE recommended. See Adalimumab, etanercept, and infliximab for the treatment of ankylosing spondylitis (May 2008) TA143 www.nice.org.uk/TA143 p. 902
- ▶ **Infliximab for acute exacerbations of ulcerative colitis (December 2008)** NICE TA163
Infliximab is recommended as an option for the treatment of acute exacerbations of severe ulcerative colitis when treatment with ciclosporin is contra-indicated or inappropriate. www.nice.org.uk/TA163
- ▶ **Infliximab and adalimumab for Crohn's disease (May 2010)** NICE TA187
Infliximab or adalimumab is recommended for the treatment of severe active Crohn's disease that has not responded to conventional therapy (including corticosteroids and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contra-indications; infliximab can also be used in a similar way in children over 6 years of age. In adults over 18 years of age, infliximab is recommended for the treatment of fistulating Crohn's disease that has not responded to conventional therapy (including antibacterials, drainage, and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contra-indications.
Infliximab or adalimumab should be given as a planned course of treatment for 12 months or until treatment failure, whichever is shorter. Treatment should be continued beyond 12 months only if there is evidence of active disease—in these cases the need for treatment should be reviewed at least annually. If the disease relapses after stopping treatment, adalimumab or infliximab can be restarted [but see Hypersensitivity Reactions under Infliximab]. www.nice.org.uk/TA187
- ▶ **Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010)** NICE TA195
NICE recommended. See Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) TA195 www.nice.org.uk/TA195 p. 900
- ▶ **Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010)** NICE TA199
NICE recommended. See Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010) TA199. www.nice.org.uk/TA199 p. 904
- ▶ **Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015)** NICE TA329
Infliximab, adalimumab and golimumab are options for treating moderately to severely active ulcerative colitis in adults whose disease has responded inadequately to conventional therapy including corticosteroids and

mercaptopurine or azathioprine, or in adults who are intolerant to or have contra-indications for conventional therapies.

Golimumab is recommended only if the manufacturer provides the 100 mg dose of golimumab at the same cost as the 50 mg dose, as agreed in the patient access scheme. The choice of treatment should be made on an individual basis and if more than one treatment is suitable, the least expensive should be chosen.

Infliximab, adalimumab or golimumab should be given as a planned course of treatment until treatment fails (including the need for surgery) or until 12 months after starting treatment, whichever is shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

- ▶ Brands may include Inflectra; Remsima

2 Hyperuricaemia and gout

Gout

It is important to distinguish drugs used for the treatment of acute attacks of gout from those used in the long-term control of the disease. The latter exacerbate and prolong the acute manifestations if started during an attack. The management of gout in adolescents requires specialist supervision.

Acute attacks of gout

Acute attacks of gout are usually treated with high doses of NSAIDs such as diclofenac sodium p. 921, diclofenac potassium p. 920, etoricoxib p. 925, indometacin p. 929, ketoprofen p. 930, naproxen p. 934 or sulindac p. 937.

Colchicine below is an alternative in patients in whom NSAIDs are contra-indicated. Aspirin p. 104 is *not* indicated in gout. Allopurinol p. 909, febuxostat p. 910, and uricosurics are *not* effective in treating an acute attack and may prolong it indefinitely if started during the acute episode.

The use of colchicine is limited by the development of toxicity at higher doses, but it is of value in patients with heart failure since, unlike NSAIDs, it does not induce fluid retention; moreover, it can be given to patients receiving anticoagulants.

Oral or parenteral corticosteroids are an effective alternative in those who cannot tolerate NSAIDs or who are resistant to other treatments. Intra-articular injection of a corticosteroid can be used in acute monoarticular gout [unlicensed indication]. A corticosteroid by intramuscular injection can be effective in podagra.

Canakinumab p. 724, a recombinant monoclonal antibody, can be used for the symptomatic treatment of frequent gouty arthritis attacks (at least 3 in the previous 12 months). It is licensed for use in patients whose condition has not responded adequately to treatment with NSAIDs or colchicine below, or who are intolerant of them.

Long-term control of gout

Frequent recurrence of acute attacks of gout, the presence of tophi, or signs of chronic gouty arthritis may call for the initiation of long-term ('interval') treatment. For long-term control of gout the formation of uric acid from purines may be reduced with the xanthine-oxidase inhibitors allopurinol p. 909 or febuxostat p. 910 alternatively the uricosuric drug sulfipyrazone p. 909 may be used to increase the excretion of uric acid in the urine. Treatment should be continued indefinitely to prevent further attacks of gout by correcting the hyperuricaemia. These drugs should never be started during an acute attack; they are usually started 1–2 weeks after the attack has settled. The initiation of treatment may precipitate an acute attack, and therefore an anti-inflammatory analgesic or colchicine below should be used as a prophylactic and continued for at least one month after the hyperuricaemia has been corrected. However, if an acute attack develops during treatment, then the treatment should continue at the same dosage and the acute attack treated in its own right.

Allopurinol is widely used and is especially useful in patients with renal impairment or urate stones when uricosuric drugs cannot be used; it is *not* indicated for the treatment of asymptomatic hyperuricaemia. It can cause rashes.

Febuxostat is licensed for the treatment of chronic hyperuricaemia where urate deposition has already occurred; it is *not* indicated for patients in whom the rate of urate formation is greatly increased, such as in malignant disease or in Lesch-Nyhan syndrome.

Sulfipyrazone p. 909 can be used instead of allopurinol or in conjunction with it in cases that are resistant to treatment.

Benzbromarone (available from 'special-order' manufacturers or specialist importing companies) is a uricosuric drug that can be used in patients with mild renal impairment.

Crystallisation of urate in the urine can occur with the uricosuric drugs and it is important to ensure an adequate urine output especially in the first few weeks of treatment. As an additional precaution the urine may be rendered alkaline.

Aspirin and other salicylates antagonise the uricosuric drugs; they do not antagonise allopurinol but are nevertheless *not* indicated in gout.

ALKALOIDS

Colchicine

INDICATIONS AND DOSE

Acute gout

BY MOUTH

- ▶ Adult: 500 micrograms 2–4 times a day until symptoms relieved, maximum 6 mg per course, do not repeat course within 3 days

Short-term prophylaxis during initial therapy with allopurinol and uricosuric drugs

BY MOUTH

- ▶ Adult: 500 micrograms twice daily

Prophylaxis of familial Mediterranean fever (recurrent polyserositis)

BY MOUTH

- ▶ Adult: 0.5–2 mg once daily

- **UNLICENSED USE** BNF doses may differ from those in the product literature. Use of colchicine for prophylaxis of familial Mediterranean fever (recurrent polyserositis) is an unlicensed indication.

- **CONTRA-INDICATIONS** Blood disorders

- **CAUTIONS** Cardiac disease · elderly · gastro-intestinal disease
- **INTERACTIONS** → Appendix 1 (colchicine).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · nausea · vomiting
- ▶ **Rare** Alopecia · blood disorders with prolonged treatment · inhibition of spermatogenesis · myopathy · peripheral neuritis
- ▶ **Frequency not known** Excessive doses may cause profuse diarrhoea · gastrointestinal haemorrhage · hepatic damage · rash · renal damage
- **PREGNANCY** Avoid—teratogenicity in *animal* studies.
- **BREAST FEEDING** Present in milk but no adverse effects reported. Manufacturers advise caution.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Reduce dose or increase dosage interval if eGFR 10–50 mL/minute/1.73 m². Avoid if eGFR less than 10 mL/minute/1.73 m².

MEDICINAL FORMS

XANTHINE OXIDASE INHIBITORS

Allopurinol

INDICATIONS AND DOSE

Prophylaxis of gout and of uric acid and calcium oxalate renal stones | Prophylaxis of hyperuricaemia associated with cancer chemotherapy

BY MOUTH

- ▶ **Adult:** Initially 100 mg daily, adjust dose according to plasma or urinary uric acid concentration, dose to be taken preferably after food

Prophylaxis of gout and of uric acid and calcium oxalate renal stones (usual maintenance in mild conditions) |

Prophylaxis of hyperuricaemia associated with cancer chemotherapy (usual maintenance in mild conditions)

BY MOUTH

- ▶ **Adult:** 100–200 mg daily, dose to be taken preferably after food

Prophylaxis of gout and of uric acid and calcium oxalate renal stones (usual maintenance in moderately severe conditions) |

Prophylaxis of hyperuricaemia associated with cancer chemotherapy (usual maintenance in moderately severe conditions)

BY MOUTH

- ▶ **Adult:** 300–600 mg daily in divided doses (max. per dose 300 mg), dose to be taken preferably after food

Prophylaxis of gout and of uric acid and calcium oxalate renal stones (usual maintenance in severe conditions) |

Prophylaxis of hyperuricaemia associated with cancer chemotherapy (usual maintenance in severe conditions)

BY MOUTH

- ▶ **Adult:** 700–900 mg daily in divided doses (max. per dose 300 mg), dose to be taken preferably after food

- **CONTRA-INDICATIONS** Not a treatment for acute gout but continue if attack develops when already receiving allopurinol, and treat attack separately

- **CAUTIONS** Ensure adequate fluid intake (2–3 litres/day) · for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy

CAUTIONS, FURTHER INFORMATION

Administer prophylactic NSAID (*not* aspirin or salicylates) or colchicine until at least 1 month after hyperuricaemia corrected (usually for first 3 months) to avoid precipitating an acute attack.

- **INTERACTIONS** → Appendix 1 (allopurinol).

● SIDE-EFFECTS

- ▶ **Common or very common** Gastro-intestinal disorders · rashes (**withdraw** therapy; if rash mild re-introduce cautiously but **discontinue** promptly if recurrence)
- ▶ **Rare** Alopecia · aplastic anaemia · arthralgia · blood disorders · drowsiness · eosinophilia resembling Stevens-Johnson syndrome · eosinophilia resembling toxic epidermal necrolysis · exfoliation · fever · gynaecomastia · haemolytic anaemia · headache · hepatitis · hepatotoxicity · hypersensitivity reactions · hypertension · leucopenia · lymphadenopathy · malaise · neuropathy · paraesthesia · renal impairment · taste disturbances · thrombocytopenia · vasculitis · vertigo · visual disturbances
- ▶ **Very rare** Seizures

- **PREGNANCY** Toxicity not reported. Manufacturer advises use only if no safer alternative and disease carries risk for mother or child.
- **BREAST FEEDING** Present in milk—not known to be harmful.
- **HEPATIC IMPAIRMENT** Reduce dose.
- **RENAL IMPAIRMENT** Max. 100 mg daily, increased only if response inadequate; in severe impairment, reduce daily dose below 100 mg, or increase dose interval; if facilities available, adjust dose to maintain plasma-oxipurinol concentration below 100 micromol/litre.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

▶ **Febuxostat** for the management of hyperuricaemia in patients with gout (December 2008) NICE TA164
Febuxostat is recommended as an option for the management of chronic hyperuricaemia in gout only for patients who are intolerant of allopurinol or for whom allopurinol is contra-indicated.

For the purposes of this guidance, intolerance of allopurinol is defined as adverse effects that are sufficiently severe to warrant discontinuation, or to prevent full dose escalation for optimal effectiveness.
www.nice.org.uk/TA164

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* issued similar advice to NICE guidance: Febuxostat for the management of hyperuricaemia in patients with gout (December 2008), in August 2010.

● MEDICINAL FORMS

▶ Brands may include Adenuric

Febuxostat

INDICATIONS AND DOSE

Treatment of chronic hyperuricaemia in gout

BY MOUTH

- ▶ **Adult:** Initially 80 mg once daily, if after 2–4 weeks of initial dose, serum uric acid greater than 6 mg/100 mL then increase dose; increased if necessary to 120 mg daily

Important safety information

MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS (JUNE 2012)

There have been rare but serious reports of hypersensitivity reactions, including Stevens-Johnson syndrome and acute anaphylactic shock with febuxostat. Patients should be advised of the signs and symptoms of severe hypersensitivity; febuxostat must be stopped immediately if these occur (early withdrawal is associated with a better prognosis), and must not be restarted in patients who have ever developed a hypersensitivity reaction to febuxostat. Most cases occur during the first month of treatment; a prior history of hypersensitivity to allopurinol and/or renal disease may indicate potential hypersensitivity to febuxostat.

● **CONTRA-INDICATIONS** Not a treatment for acute gout but continue if attack develops when already receiving febuxostat, and treat attack separately

● **CAUTIONS** Congestive heart failure · ischaemic heart disease · thyroid disorders · transplant recipients

CAUTIONS, FURTHER INFORMATION

Administer prophylactic NSAID (*not* aspirin or salicylates) or colchicine for at least 6 months after starting febuxostat to avoid precipitating an acute attack.

● **INTERACTIONS** → Appendix 1 (febuxostat).

● SIDE-EFFECTS

- ▶ **Common or very common** Abnormal liver function tests · gastro-intestinal disturbances · headache · oedema · rash
- ▶ **Uncommon** Appetite change · arthralgia · arthritis · atrial fibrillation · bronchitis · bursitis · chest pain · cholelithiasis

3 Neuromuscular disorders

Neuromuscular disorders

Drugs that enhance neuromuscular transmission

Anticholinesterases are used as first-line treatment in *ocular myasthenia gravis* and as an adjunct to immunosuppressant therapy for *generalised myasthenia gravis*.

Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line

immunosuppressant such as azathioprine p. 716 is frequently used to reduce the dose of corticosteroid.

Plasmapheresis or infusion of intravenous immunoglobulin [unlicensed indication] may induce temporary remission in severe relapses, particularly where bulbar or respiratory function is compromised or before thymectomy.

Anticholinesterases

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in myasthenia gravis. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine sulfate p. 1099.

Neostigmine p. 912 produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine sulfate or propantheline bromide p. 74 may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. The maximum that most patients can tolerate is 180 mg daily.

Pyridostigmine bromide p. 912 is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastrointestinal effect but an antimuscarinic drug may still be required.

Neostigmine is also used to reverse the actions of the non-depolarising neuromuscular blocking drugs.

Immunosuppressant therapy

Corticosteroids are established as treatment for myasthenia gravis; although they are commonly given on alternate days there is little evidence of benefit over daily administration. Corticosteroid treatment is usually initiated under in-patient supervision and all patients should receive osteoporosis prophylaxis.

In *generalised myasthenia gravis* prednisolone p. 585 is given. About 10% of patients experience a transient but very serious worsening of symptoms in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. Smaller doses of corticosteroid are usually required in *ocular myasthenia*. Once clinical remission has occurred (usually after 2–6 months), the dose of prednisolone should be reduced slowly to the minimum effective dose.

In generalised myasthenia gravis azathioprine p. 716 is usually started at the same time as the corticosteroid and it allows a lower maintenance dose of the corticosteroid to be used. Cyclosporin p. 717, methotrexate p. 762, or mycophenolate mofetil p. 725 can be used in patients unresponsive or intolerant to other treatments [unlicensed indications].

Acetylcholine-release enhancers

Amifampridine below is licensed for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS), a rare disorder of neuromuscular transmission.

Fampridine p. 726 is licensed for the improvement of walking in patients with multiple sclerosis who have a walking disability.

Skeletal muscle relaxants

The drugs described are used for the relief of chronic muscle spasm or spasticity associated with multiple sclerosis or other neurological damage; they are not indicated for spasm

associated with minor injuries. Baclofen, diazepam, and tizanidine act principally on the central nervous system. Dantrolene has a peripheral site of action; cannabis extract has both a central and a peripheral action. Skeletal muscle relaxants differ in action from the muscle relaxants used in anaesthesia, which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

Baclofen p. 914 inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon).

A cannabis extract p. 913 containing dronabinol (delta-9-tetrahydrocannabinol) and cannabidiol is licensed as an adjunct treatment for moderate to severe spasticity associated with multiple sclerosis in patients who have not responded adequately to other skeletal muscle relaxants. The dose should be titrated over 2 weeks; response to treatment should be reviewed after 4 weeks and treatment stopped if an adequate response is not achieved.

Dantrolene sodium p. 1101 acts directly on skeletal muscle and produces fewer central adverse effects making it a drug of choice. The dose should be increased slowly.

Diazepam p. 267 can also be used. Sedation and occasionally extensor hypotonus are disadvantages. Other benzodiazepines also have muscle-relaxant properties. Muscle-relaxant doses of benzodiazepines are similar to anxiolytic doses.

Tizanidine p. 913 is an alpha₂-adrenoceptor agonist indicated for spasticity associated with multiple sclerosis or spinal cord injury.

Other muscle relaxants

The clinical efficacy of methocarbamol p. 915 and meprobamate p. 265 as muscle relaxants is **not** well established, although they have been included in compound analgesic preparations.

3.1 Myasthenia gravis and Lambert-Eaton myasthenic syndrome

ACETYLCHOLINE-RELEASE ENHANCERS

Amifampridine

INDICATIONS AND DOSE

Symptomatic treatment of Lambert-Eaton myasthenic syndrome (specialist use only)

BY MOUTH

- ▶ Adult: Initially 15 mg daily in 3 divided doses, then increased in steps of 5 mg every 4–5 days, increased to up to 60 mg daily in 3–4 divided doses (max. per dose 20 mg); maximum 60 mg per day

- **CONTRA-INDICATIONS** Congenital QT syndromes · epilepsy · uncontrolled asthma
- **CAUTIONS** Non-paraneoplastic form of Lambert-Eaton myasthenic syndrome

- **INTERACTIONS** Caution if concomitant use of drugs that lower convulsive threshold. Avoid concomitant use of drugs that prolong QT interval. Avoid concomitant use of drugs with a narrow therapeutic index.
- **SIDE-EFFECTS** Anxiety · arrhythmias · blurred vision · bronchial hypersecretion · chorea · convulsions · cough · dizziness · drowsiness · exacerbation or precipitation of asthma · gastro-intestinal disorders · headache · myoclonia · palpitations · paraesthesia · Raynaud's syndrome · sleep disturbances · weakness
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution. In mild impairment reduce initial dose to 10 mg daily in divided doses, increased in steps of 5 mg every 7 days. In moderate or severe impairment reduce initial dose to 5 mg daily in divided doses, increased in steps of 5 mg every 7 days.
- **RENAL IMPAIRMENT** Use with caution. In mild impairment reduce initial dose to 10 mg daily in divided doses, increased in steps of 5 mg every 7 days. In moderate or severe impairment reduce initial dose to 5 mg daily in divided doses, increased in steps of 5 mg every 7 days.
- **MONITORING REQUIREMENTS** Clinical and ECG monitoring required at treatment initiation and yearly thereafter.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2012) that amifampridine phosphate (*Firdapse*[®]) is not recommended for use within NHS Scotland for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

CAUTIONARY AND ADVISORY LABELS 3, 21

► **Firdapse** (BioMarin Europe Ltd) ▼

Amifampridine (as Amifampridine phosphate) 10 mg Firdapse
10mg tablets | 100 tablet **[PoM]** £1,815.00

ANTICHOLINESTERASES

Anticholinesterases

- **DRUG ACTION** They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase.
- **CONTRA-INDICATIONS** Intestinal obstruction · urinary obstruction
- **CAUTIONS** Arrhythmias · asthma (extreme caution) · atropine or other antidote to muscarinic effects may be necessary (particularly when neostigmine is given by injection) but not given routinely because it may mask signs of overdose · bradycardia · epilepsy · hyperthyroidism · hypotension · parkinsonism · peptic ulceration · recent myocardial infarction · vagotonia
- **INTERACTIONS** → Appendix 1 (parasympathomimetics).
- **SIDE-EFFECTS** Abdominal cramps (more marked with higher doses) · diarrhoea · increased salivation · nausea · vomiting

Overdose Signs of overdose include bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation,

involuntary micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation, excessive dreaming, and weakness eventually leading to fasciculation and paralysis.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount probably too small to be harmful.

Neostigmine

(Neostigmine methylsulfate)

INDICATIONS AND DOSE

Treatment of myasthenia gravis

BY MOUTH

► **Adult:** Initially 15–30 mg, dose repeated at suitable intervals throughout the day, total daily dose 75–300 mg, the maximum that most patients can tolerate is 180 mg daily

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

► **Adult:** 1–2.5 mg, dose repeated at suitable intervals throughout the day (usual total daily dose 5–20 mg)

Reversal of non-depolarising (competitive) neuromuscular blockade

BY INTRAVENOUS INJECTION

► **Adult:** 2.5 mg (max. per dose 5 mg), repeated if necessary after or with glycopyrronium or atropine, to be given over 1 minute

- **UNLICENSED USE** Dose for treatment of myasthenia gravis by subcutaneous or intramuscular injection in neonate is unlicensed.
- **CAUTIONS**
 - With intravenous use glycopyrronium or atropine should also be given when reversing neuromuscular blockade
- **INTERACTIONS** → Appendix 1 (parasympathomimetics).
- **RENAL IMPAIRMENT** May need dose reduction.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

► **NEOSTIGMINE (Non-proprietary)**

Neostigmine bromide 15 mg Neostigmine 15mg tablets | 140 tablet **[PoM]** £99.60

Solution for injection

► **NEOSTIGMINE (Non-proprietary)**

Neostigmine metilsulfate 2.5 mg per 1 ml Neostigmine 2.5mg/1ml solution for injection ampoules | 10 ampoule **[PoM]** £4.95–£5.06

Pyridostigmine bromide

- **DRUG ACTION** Pyridostigmine bromide has weaker muscarinic action than neostigmine.

INDICATIONS AND DOSE

Myasthenia gravis

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► **Adult:** 30–120 mg, dose to be given at suitable intervals throughout day; usual dose 0.3–1.2 g daily in divided doses, it is inadvisable to exceed a total daily dose of 450 mg in order to avoid acetylcholine receptor downregulation; patients requiring doses exceeding 450 mg daily will usually require input from a specialised neuromuscular service.

Immunosuppressant therapy is usually considered if the dose of pyridostigmine exceeds 360 mg daily

● **RENAL IMPAIRMENT** Reduce dose; excreted by kidney.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

▶ **PYRIDOSTIGMINE BROMIDE (Non-proprietary)**

Pyridostigmine bromide 60 mg Pyridostigmine bromide 60mg tablets | 200 tablet [PoM] £45.58 DT price = £45.58

▶ **Mestinon** (Meda Pharmaceuticals Ltd)

Pyridostigmine bromide 60 mg Mestinon 60mg tablets | 200 tablet [PoM] £45.57 DT price = £45.58

3.2 Nocturnal leg cramps

Nocturnal leg cramps

Quinine salts, such as quinine sulfate are effective in reducing the frequency of nocturnal leg cramps by about 25% in ambulatory patients; however, because of potential toxicity, quinine is not recommended for routine treatment and should not be used unless cramps cause regular disruption to sleep. Quinine p. 540 should only be considered when cramps are very painful or frequent; when other treatable causes of cramp have been excluded; and when non-pharmacological treatments have not worked (e.g. passive stretching exercises). It may take up to 4 weeks for improvement to become apparent; if there is benefit, quinine treatment can be continued. Treatment should be interrupted at intervals of approximately 3 months to assess the need for further quinine treatment. In patients taking quinine long term, a trial discontinuation may be considered. Quinine is toxic in overdosage and accidental fatalities have occurred.

3.3 Spasticity

Drugs used for Spasticity not listed below; Dantrolene sodium, p. 1101 · Diazepam, p. 267

ALPHA₂-ADRENOCEPTOR AGONISTS

Tizanidine

INDICATIONS AND DOSE

Spasticity associated with multiple sclerosis or spinal cord injury or disease

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ **Adult:** Initially 2 mg for 1 dose, then increased in steps of 2 mg/24 hours every 3–4 days in divided doses, adjusted according to response; usual dose up to 24 mg daily in 3–4 divided doses; maximum 36 mg per day

● **CAUTIONS** Elderly

● **INTERACTIONS** → Appendix 1 (muscle relaxants).

Caution with concomitant administration of drugs that prolong QT interval.

● SIDE-EFFECTS

▶ **Common or very common** Altered liver enzymes (discontinue if persistently raised—consult product literature) · dizziness · drowsiness · dry mouth · fatigue · gastro-intestinal disturbance · hypotension · nausea

▶ **Uncommon** Bradycardia

▶ **Frequency not known** Asthenia · blurred vision · confusion · convulsions · hallucinations · hepatitis · insomnia · liver failure · syncope

● **PREGNANCY** Avoid (toxicity in animal studies).

● **BREAST FEEDING** Avoid (present in milk in animal studies).

● **HEPATIC IMPAIRMENT** Avoid in severe impairment; use in moderate impairment only if potential benefit outweighs risk.

● **RENAL IMPAIRMENT** Manufacturer advises caution.

● **MONITORING REQUIREMENTS** Monitor liver function monthly for first 4 months and in those who develop unexplained nausea, anorexia or fatigue.

● **TREATMENT CESSATION** Avoid abrupt withdrawal (risk of rebound hypertension and tachycardia); to minimise risk, discontinue gradually and monitor blood pressure.

● **PATIENT AND CARER ADVICE** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 8

▶ **TIZANIDINE (Non-proprietary)**

Tizanidine (as Tizanidine hydrochloride) 2 mg Tizanidine 2mg tablets | 120 tablet [PoM] £28.89 DT price = £26.65

Tizanidine (as Tizanidine hydrochloride) 4 mg Tizanidine 4mg tablets | 120 tablet [PoM] £40.07 DT price = £36.62

▶ **Zanaflex** (Teva UK Ltd)

Tizanidine (as Tizanidine hydrochloride) 2 mg Zanaflex 2mg tablets | 120 tablet [PoM] £30.41 DT price = £26.65

CANNABINOIDS

Cannabis extract

INDICATIONS AND DOSE

Adjunct in moderate to severe spasticity in multiple sclerosis (specialist use only)

BY BUCCAL ADMINISTRATION

▶ **Adult:** (consult product literature)

● **CONTRA-INDICATIONS** Family history of psychosis · history of other severe psychiatric disorder · personal history of psychosis

● **CAUTIONS** History of epilepsy · significant cardiovascular disease

● **INTERACTIONS** → Appendix 1 (cannabis extract).

● SIDE-EFFECTS

▶ **Common or very common** Amnesia · blurred vision · constipation · depression · diarrhoea · disorientation · dissociation · dizziness · drowsiness · dry mouth · dysarthria · impaired attention · increased or decreased appetite · malaise · mood disturbance · mouth ulcers · nausea · oral pain · taste disturbance · vertigo · vomiting

▶ **Uncommon** Abdominal pain · delusions · hallucinations · hypertension · oromucosal discolouration · palpitation · paranoia · pharyngitis · stomatitis · suicidal thoughts · syncope · tachycardia · tooth discolouration

▶ **Frequency not known** Anxiety · seizures

● **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during and for 3 months after treatment in men and women.

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risks.

● **BREAST FEEDING** Avoid—present in milk.

● **HEPATIC IMPAIRMENT** Manufacturer advises more frequent monitoring in significant hepatic impairment—possible risk of prolonged or enhanced effect.

- **RENAL IMPAIRMENT** Manufacturer advises more frequent monitoring in significant renal impairment—possible risk of prolonged or enhanced effect.
- **MONITORING REQUIREMENTS** Monitor oral mucosa—interrupt treatment if lesions or persistent soreness.
- **PATIENT AND CARER ADVICE**
For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including cannabis, see *Drugs and Driving under Guidance on prescribing*, p. 1

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

EXCIPIENTS: May contain Propylene glycol

▶ **Sativex** (Bayer Plc)

Cannabidiol 2.5 mg per 1 dose, Dronabinol 2.7 mg per 1 dose Sativex oromucosal spray | 270 dose [POM] £375.00 [CD4-1]

GAMMA-AMINOBUTYRIC ACID ANALOGUES AND DERIVATIVES

Baclofen

INDICATIONS AND DOSE

Pain of muscle spasm in palliative care

BY MOUTH

▶ Adult: 5–10 mg 3 times a day

Hiccup due to gastric distension (in palliative care)

BY MOUTH

▶ Adult: 5 mg twice daily

Chronic severe spasticity resulting from disorders such as multiple sclerosis or traumatic partial section of spinal cord

BY MOUTH

▶ Adult: Initially 5 mg 3 times a day, gradually increased; maintenance up to 60 mg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 100 mg per day

Severe chronic spasticity unresponsive to oral antispastic drugs (or where side-effects of oral therapy unacceptable) or as alternative to ablative neurosurgical procedures (specialist use only)

BY INTRATHECAL INJECTION

▶ Adult: Test dose 25–50 micrograms, to be given over at least 1 minute via catheter or lumbar puncture, then increased in steps of 25 micrograms (max. per dose 100 micrograms), not given more often than every 24 hours to determine appropriate dose, then *dose-titration phase*, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose (ranging from 12 micrograms to 2 mg daily for spasticity of spinal origin or 22 micrograms to 1.4 mg daily for spasticity of cerebral origin) retaining some spasticity to avoid sensation of paralysis

Important safety information

Consult product literature for details on test dose and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use. Treatment with continuous pump-administered intrathecal baclofen should be initiated within 3 months of a satisfactory response to intrathecal baclofen testing.

● CONTRA-INDICATIONS

- ▶ With intrathecal use Local infection · systemic infection
- ▶ With oral use Avoid oral route in active peptic ulceration

● CAUTIONS

GENERAL CAUTIONS

Cerebrovascular disease · diabetes · elderly · epilepsy · history of peptic ulcer · hypertonic bladder sphincter · Parkinson's disease · psychiatric illness · respiratory impairment

SPECIFIC CAUTIONS

▶ With intrathecal use Coagulation disorders · malnutrition (increased risk of post-surgical complications) · previous spinal fusion procedure

● **INTERACTIONS** → Appendix 1 (muscle relaxants).

● SIDE-EFFECTS

- ▶ **Common or very common** Agitation · anxiety · ataxia · cardiovascular depression · confusion · depression · dizziness · drowsiness · dry mouth · euphoria · gastro-intestinal disturbances · hallucinations · headache · hyperhidrosis · hypotension · insomnia · myalgia · nightmares · rash · respiratory depression · sedation · seizure · tremor · urinary disturbances · visual disorders
- ▶ **Rare** Abdominal pain · changes in hepatic function · dysarthria · erectile dysfunction · paraesthesia · taste disturbances
- ▶ **Very rare** Hypothermia

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk (toxicity in *animal studies*).

● **BREAST FEEDING** Present in milk—amount probably too small to be harmful.

● HEPATIC IMPAIRMENT

▶ With oral use Manufacturer advises use with caution.

● RENAL IMPAIRMENT

▶ With oral use Risk of toxicity—use smaller doses (e.g. 5 mg daily by mouth) and if necessary increase dosage interval; if eGFR less than 15 mL/minute/1.73 m² manufacturer advises use by mouth only if potential benefit outweighs risk. Excreted by kidney.

● **TREATMENT CESSATION** Avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms occur)).

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry.

● **PATIENT AND CARER ADVICE** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

MUSCLE RELAXANTS**Methocarbamol****INDICATIONS AND DOSE**

Short-term symptomatic relief of muscle spasm

BY MOUTH

- ▶ Adult: 1.5 g 4 times a day; reduced to 750 mg 3 times a day if required
- ▶ Elderly: Up to 750 mg 4 times a day, may be sufficient

- **CONTRA-INDICATIONS** Brain damage · coma · epilepsy · myasthenia gravis · pre-coma
- **INTERACTIONS** → Appendix 1 (muscle relaxants).
- **SIDE-EFFECTS** Amnesia · anaphylaxis · angioedema · anxiety · blurred vision · bradycardia · cholestatic jaundice · confusion · dizziness · drowsiness · dyspepsia · fever · headache · hypersensitivity reactions · hypotension · leucopenia · nasal congestion · nausea · pruritus · rash · restlessness · seizures · tremor · urticaria · vomiting
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Present in milk in *animal studies*—manufacturer advises caution.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; half-life may be prolonged.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **PATIENT AND CARER ADVICE** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

4 Pain and inflammation in musculoskeletal disorders**Non-steroidal anti-inflammatory drugs**

In *single doses* non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol p. 354, but paracetamol is preferred, particularly in the elderly.

In regular *full dosage* NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation. Therefore, although paracetamol often gives adequate pain control in osteoarthritis, NSAIDs are more appropriate than paracetamol or the opioid analgesics in the *inflammatory arthritides* (e.g. rheumatoid arthritis) and in some cases of *advanced osteoarthritis*. NSAIDs can also be of benefit in the less well defined conditions of *back pain* and *soft-tissue disorders*.

Choice

Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance to these drugs. About 60% of patients will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. If appropriate responses are not obtained within these times, another NSAID should be tried.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. Several other factors also influence susceptibility to gastrointestinal effects, and a NSAID should be chosen on the basis of the incidence of gastro-intestinal and other side-effects.

Ibuprofen p. 927 is a propionic acid derivative with anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other non-selective NSAIDs but its anti-inflammatory properties are weaker. It is unsuitable for conditions where inflammation is prominent, such as acute gout. Dexibuprofen p. 919 is the active enantiomer of ibuprofen. It has similar properties to ibuprofen and is licensed for the relief of mild to moderate pain and inflammation.

Other propionic acid derivatives:

Naproxen p. 934 is one of the first choices because it combines good efficacy with a low incidence of side-effects (but more than ibuprofen).

Fenoprofen p. 926 is as effective as naproxen, and flurbiprofen may be slightly more effective. Both are associated with slightly more gastro-intestinal side-effects than ibuprofen.

Ketoprofen p. 930 has anti-inflammatory properties similar to ibuprofen and has more side-effects. Dextketoprofen p. 919, an isomer of ketoprofen, has been introduced for the short-term relief of mild to moderate pain.

Tiaprofenic acid p. 938 is as effective as naproxen; it has more side-effects than ibuprofen.

Drugs with properties similar to those of propionic acid derivatives:

Diclofenac sodium p. 921 and aceclofenac below are similar in efficacy to naproxen.

Etodolac p. 924 is comparable in efficacy to naproxen p. 934; it is licensed for symptomatic relief of osteoarthritis and rheumatoid arthritis.

Indometacin p. 929 has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances.

Mefenamic acid p. 932 has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

Meloxicam p. 933 is licensed for the short-term relief of pain in osteoarthritis and for long-term treatment of rheumatoid arthritis and ankylosing spondylitis.

Nabumetone p. 934 is comparable in effect to naproxen p. 934.

Phenylbutazone is licensed for ankylosing spondylitis, but is not recommended because it is associated with serious side-effects, in particular haematological reactions; it should be used only by a specialist in severe cases where other treatments have been found unsuitable.

Piroxicam p. 936 is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions.

Sulindac p. 937 is similar in tolerance to naproxen.

Tenoxicam p. 937 is similar in activity and tolerance to naproxen. Its long duration of action allows once-daily administration.

Tolfenamic acid p. 381 is licensed for the treatment of migraine.

Ketorolac trometamol p. 1107 and the selective inhibitor of cyclo-oxygenase-2, parecoxib p. 1108, are licensed for the short-term management of postoperative pain.

The selective inhibitors of cyclo-oxygenase-2, etoricoxib p. 925 and celecoxib p. 918, are as effective as non-selective NSAIDs such as diclofenac sodium and naproxen. Although selective inhibitors can cause serious gastro-intestinal events, available evidence appears to indicate that the risk of serious upper gastro-intestinal events is lower with selective inhibitors compared to non-selective NSAIDs; this advantage may be lost in patients who require concomitant low-dose aspirin.

Celecoxib and etoricoxib are licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; etoricoxib is also licensed for the relief of pain from acute gout.

Aspirin p. 104 has been used in high doses to treat rheumatoid arthritis, but other NSAIDs are now preferred.

Dental and orofacial pain

Most mild to moderate dental pain and inflammation is effectively relieved by NSAIDs. Those used for dental pain include ibuprofen p. 927, diclofenac sodium p. 921, and diclofenac potassium p. 920.

Asthma

Any degree of worsening of asthma may be related to the ingestion of NSAIDs, either prescribed or (in the case of ibuprofen **and** others) purchased over the counter.

NSAIDs and cardiovascular events

All NSAID use (including cyclo-oxygenase-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use;

however, the greatest risk may be in those receiving high doses long term.

Cyclo-oxygenase-2 selective inhibitors, diclofenac (150 mg daily) and ibuprofen (2.4 g daily) are associated with an increased risk of thrombotic events. Although there are limited data regarding the thrombotic effects of aceclofenac, treatment advice has been updated in line with diclofenac, based on aceclofenac's structural similarity to diclofenac and its metabolism to diclofenac. The increased risk for diclofenac is similar to that of licensed doses of etoricoxib. Naproxen (1 g daily) is associated with a lower thrombotic risk, and low doses of ibuprofen (1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms and the need for long-term treatment should be reviewed periodically.

NSAIDs and gastro-intestinal events

All NSAIDs are associated with serious gastro-intestinal toxicity; the risk is higher in the elderly. Evidence on the relative safety of non-selective NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects—piroxicam, ketoprofen, and ketorolac trometamol are associated with the highest risk; indometacin, diclofenac, and naproxen are associated with intermediate risk, and ibuprofen with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). Selective inhibitors of cyclo-oxygenase-2 are associated with a *lower* risk of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Recommendations are that NSAIDs associated with a low risk e.g. ibuprofen are *generally preferred*, to start at the *lowest recommended dose and* not to use more than one oral NSAID at a time.

The combination of a NSAID **and** low-dose aspirin can increase the risk of gastro-intestinal side-effects; this combination should be used only if absolutely necessary **and** the patient should be monitored closely.

While it is preferable to avoid NSAIDs in patients with active or previous gastro-intestinal ulceration or bleeding, and to withdraw them if gastro-intestinal lesions develop, nevertheless patients with serious rheumatic diseases (e.g. rheumatoid arthritis) are usually dependent on NSAIDs for effective relief of pain and stiffness.

Patients at risk of gastro-intestinal ulceration (including the elderly), who need NSAID treatment should receive gastroprotective treatment.

Systemic as well as local effects of NSAIDs contribute to gastro-intestinal damage; taking oral formulations with milk or food, or using enteric-coated formulations, or changing the route of administration may only partially reduce symptoms such as dyspepsia.

NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Aceclofenac

INDICATIONS AND DOSE

Pain and inflammation in rheumatoid arthritis, osteoarthritis and ankylosing spondylitis

BY MOUTH

► Adult: 100 mg twice daily

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal

ulceration (two or more distinct episodes) · ischaemic heart disease · mild heart failure · peripheral arterial disease · severe heart failure

- **CAUTIONS** Allergic disorders · avoid in Acute porphyrias p. 864 · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)
- **INTERACTIONS** → Appendix 1 (NSAIDs).

● SIDE-EFFECTS

- ▶ **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
- ▶ **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Most manufacturers advise avoiding the use of NSAIDs during pregnancy or avoiding them unless the potential benefit outweighs the risk. NSAIDs should be avoided during the third trimester because use is associated with a risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn. In addition, the onset of labour may be delayed and its duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Initially 100 mg daily. Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution; avoid in moderate to severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

Prevention of postoperative pain (in hospital setting)

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 25–50 mg, to be given after surgery over 15–60 minutes, then 5 mg/hour for maximum 2 days; maximum 150 mg per day

VOLTAROL® EMULGEL**Relief of pain in musculoskeletal conditions | Adjunctive treatment in knee or hand osteoarthritis**

TO THE SKIN

- ▶ Adult: Apply 3–4 times a day, therapy should be reviewed after 14 days (or after 28 days for osteoarthritis)

SOLARAZE®**Actinic keratosis**

TO THE SKIN

- ▶ Adult: Apply twice daily for 60–90 days, to be applied thinly; maximum 8 g per day

VOLTAROL® GEL PATCH**Ankle sprain**

TO THE SKIN

- ▶ Adult: Apply 1 patch daily for up to 3 days

Epicondylitis

TO THE SKIN

- ▶ Adult: Apply 1 patch twice daily for up to 14 days

CONTRA-INDICATIONS

- ▶ With systemic use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · avoid suppositories in proctitis · cerebrovascular disease · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease
- ▶ With intravenous use Dehydration · history of asthma · history of confirmed or suspected cerebrovascular bleeding · history of haemorrhagic diathesis · hypovolaemia · operations with high risk of haemorrhage

CAUTIONS

- ▶ With systemic use Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)
- ▶ With topical use Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

INTERACTIONS → Appendix 1 (NSAIDs).

- ▶ With intravenous use Contra-indicated in concomitant NSAID use. Contra-indicated in concomitant anticoagulant use (including low-dose heparins).
- ▶ With topical use Interactions do not generally apply to topical NSAIDs

SIDE-EFFECTS**▶ Rare**

- ▶ With systemic use Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure ·

pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances

▶ Frequency not known

- ▶ With systemic use Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo
- ▶ With parenteral use Injection site reactions
- ▶ With rectal use Suppositories may cause rectal irritation
- ▶ With topical use Paraesthesia · photosensitivity · rash (discontinue use if develops)

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

- ▶ With topical use Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

CONCEPTION AND CONTRACEPTION

- ▶ With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY

- ▶ With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- ▶ With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy

BREAST FEEDING

- ▶ With systemic use Use with caution during breast-feeding. Amount in milk too small to be harmful.

HEPATIC IMPAIRMENT

- ▶ With systemic use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

RENAL IMPAIRMENT

- ▶ With systemic use Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- ▶ With intravenous use Avoid intravenous use if serum creatinine greater than 160 micromol/litre. Contra-indicated in moderate or severe renal impairment.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Voltarol®), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute 75 mg with 100–500 mL infusion fluid (previously buffered with 0.5 mL sodium bicarbonate 8.4% solution or with 1 mL sodium bicarbonate 4.2% solution). For intermittent infusion give 25–50 mg for 15–60 minutes or 75 mg over 30–120 minutes. For continuous infusion give at a rate of

5 mg/hour. For topical preparations, apply with a gentle massage only.

- **PRESCRIBING AND DISPENSING INFORMATION** Voltarol® dispersible tablets are more suitable for **short-term** use in acute conditions for which treatment required for no more than 3 months (no information on use beyond 3 months). Caution—topical preparations not generally suitable for children.
- **PATIENT AND CARER ADVICE** For topical preparations, patients and their carers should be advised to wash hands immediately after use. Photosensitivity: Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.
- **PROFESSION SPECIFIC INFORMATION** Dental practitioners' formulary Diclofenac Sodium Tablets may be prescribed.
- **NATIONAL FUNDING/ACCESS DECISIONS** **Scottish Medicines Consortium (SMC) Decisions** The *Scottish Medicines Consortium* has advised (February 2008) that *Dyloject*® is accepted for restricted use within NHS Scotland for the treatment or prevention of postoperative pain by intravenous injection in supervised healthcare settings.
- **EXCEPTIONS TO LEGAL CATEGORY** Various pack sizes of gel preparations may be available on sale to the public.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: dispersible tablet, oral suspension, oral solution

Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 13, 21

Diclofenac sodium with misoprostol

The properties listed below are those particular to the combination only. For the properties of the components please consider, diclofenac sodium p. 921, misoprostol p. 709.

INDICATIONS AND DOSE

MISOFEN® 50/200

Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis

BY MOUTH

- ▶ Adult: 1 tablet 2–3 times a day, take with food

MISOFEN® 75/200

Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis

BY MOUTH

- ▶ Adult: 1 tablet twice daily, take with food

ARTHROTEC® 50/200

Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis

- ▶ Adult: 1 tablet 2–3 times a day, take with food

continued →

ARTHROTEC® 75/200

Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis

BY MOUTH

▶ Adult: 1 tablet twice daily, take with food

- **UNLICENSED USE** The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by the combination preparations of diclofenac and misoprostol.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

INDICATIONS AND DOSE

Pain and inflammation in rheumatoid arthritis and osteoarthritis

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Adult: 300–600 mg daily in 1–2 divided doses

BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Adult: 600 mg daily

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1 (NSAIDs).
- **SIDE-EFFECTS**
- ▶ **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure ·

Etoricoxib

INDICATIONS AND DOSE

Pain and inflammation in osteoarthritis

BY MOUTH

- ▶ Child 16–17 years: 30 mg once daily, then increased if necessary to 60 mg once daily
- ▶ Adult: 30 mg once daily, then increased if necessary to 60 mg once daily

Pain and inflammation in rheumatoid arthritis | Ankylosing spondylitis

BY MOUTH

- ▶ Child 16–17 years: 90 mg once daily
- ▶ Adult: 90 mg once daily

Acute gout

BY MOUTH

- ▶ Child 16–17 years: 120 mg once daily for maximum 8 days
- ▶ Adult: 120 mg once daily for maximum 8 days

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · inflammatory bowel disease · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease · uncontrolled hypertension (persistently above 140/90 mmHg)

CAUTIONS

GENERAL CAUTIONS Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · dehydration · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)

SPECIFIC CAUTIONS Elderly (risk of serious side-effects and fatalities)

- **INTERACTIONS** → Appendix 1 (NSAIDs).

SIDE-EFFECTS

- ▶ **Common or very common** Echinymosis · fatigue · influenza-like symptoms · palpitation
- ▶ **Uncommon** Anxiety · appetite change · arthralgia · atrial fibrillation · chest pain · cough · dry mouth · dyspnoea · electrolyte disturbance · epistaxis · flushing · mental acuity impaired · mouth ulcer · myalgia · paraesthesia · taste disturbance · transient ischaemic attack · weight change
- ▶ **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
- ▶ **Very rare** Confusion · hallucinations
- ▶ **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible

exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Max. 60 mg daily in mild impairment. Max. 60 mg on alternate days or 30 mg once daily in moderate impairment. Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
 - ▶ With systemic use in adults Avoid if eGFR less than 30 mL/minute/1.73 m².
 - ▶ With systemic use in children Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor blood pressure before treatment, 2 weeks after initiation and periodically during treatment.

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure ·

Flurbiprofen

INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Migraine | Postoperative analgesia | Mild to moderate pain

BY MOUTH

- ▶ Child 12-17 years: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions
- ▶ Adult: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions

Dysmenorrhoea

BY MOUTH

- ▶ Child 12-17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day
- ▶ Adult: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) (in adults) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1 (NSAIDs).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Stomatitis
 - ▶ **Uncommon** Confusion · fatigue · hallucinations · paraesthesia
 - ▶ **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
 - ▶ **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo
- **SIDE-EFFECTS, FURTHER INFORMATION**
Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.
- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Small amount present in milk—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. The lowest effective dose should be used for the shortest possible duration. Avoid in severe impairment. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

Ibuprofen

INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Mild to moderate pain including dysmenorrhoea | Postoperative analgesia | Migraine | Dental pain

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 1.6 g once daily, dose to be taken in the early evening, increased if necessary to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

Mild to moderate pain | Pain and inflammation of soft-tissue injuries | Pyrexia with discomfort

INITIALLY BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 3-5 months: 50 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- ▶ Child 6-11 months: 50 mg 3–4 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- ▶ Child 1-3 years: 100 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- ▶ Child 4-6 years: 150 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- ▶ Child 7-9 years: 200 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
- ▶ Child 10-11 years: 300 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day continued →

- ▶ Child 12-17 years: Initially 300–400 mg 3–4 times a day; (by mouth) increased if necessary up to 600 mg 4 times a day; (by mouth) maintenance 200–400 mg 3 times a day, may be adequate

Pain and inflammation

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Child 12-17 years: 1.6 g once daily, dose preferably taken in the early evening, increased to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 3 months-17 years: 30–40 mg/kg daily in 3–4 divided doses; maximum 2.4 g per day

Pain and inflammation in systemic juvenile idiopathic arthritis

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 3 months-17 years: Up to 60 mg/kg daily in 4–6 divided doses; maximum 2.4 g per day

Post-immunisation pyrexia in infants (on doctor's advice only)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 2-3 months: 50 mg for 1 dose, followed by 50 mg after 6 hours if required

Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

TO THE SKIN

- ▶ Adult: Apply up to 3 times a day, ibuprofen gel 5% gel to be administered

IBUGEL® FORTE

Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

TO THE SKIN

- ▶ Adult: Apply up to 3 times a day

FENBID® FORTE

Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

TO THE SKIN

- ▶ Adult: Apply up to 4 times a day, therapy should be reviewed after 14 days

- **UNLICENSED USE** Not licensed for use in children under 3 months or body weight under 5 kg. Maximum dose for systemic juvenile idiopathic arthritis is unlicensed.
- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS**
 - ▶ With oral use Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
 - ▶ With topical use Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)
- **INTERACTIONS** → Appendix 1 (NSAIDs). Interactions do not generally apply to topical NSAIDs.

● SIDE-EFFECTS

▶ Rare

- ▶ **With oral use** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
- ▶ **Frequency not known**
- ▶ **With oral use** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo
- ▶ **With topical use** Photosensitivity · rash (discontinue use if develops)

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

- ▶ With topical use in adults Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

Overdose Overdosage with ibuprofen may cause nausea, vomiting, epigastric pain, and tinnitus, but more serious toxicity is very uncommon. Charcoal, activated p. 1130 followed by symptomatic measures are indicated if more than 100 mg/kg has been ingested within the preceding hour. For details on the management of poisoning, see Emergency treatment of poisoning p. 1123.

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY**
 - ▶ With oral use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
 - ▶ With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.
- **BREAST FEEDING**
 - ▶ With oral use Use with caution during breast-feeding. Amount too small to be harmful but some manufacturers advise avoid.
 - ▶ With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.
- **HEPATIC IMPAIRMENT**
 - ▶ With oral use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT**
 - ▶ With oral use Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for

the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- ▶ With topical use Deterioration in renal function has also been reported after topical use.
- **DIRECTIONS FOR ADMINISTRATION** For topical preparations, apply with gentle massage only.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of syrup may include orange. Caution—topical preparations not generally suitable for children.
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Ibuprofen for pain and inflammation www.medicinesforchildren.org.uk/ibuprofen-for-pain-and-inflammation
For topical preparations, patients and their carers should be advised to wash hands immediately after use. Photosensitivity For topical preparations, patients or their carers should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary Ibuprofen Oral Suspension Sugar-free may be prescribed. Ibuprofen Tablets may be prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** Smaller pack sizes of gel preparations may be available on sale to the public. Oral preparations can be sold to the public in certain circumstances.

Indometacin (Indomethacin)

INDICATIONS AND DOSE

Pain and moderate to severe inflammation in rheumatic disease and other musculoskeletal disorders

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 50–200 mg daily in divided doses

BY RECTUM

- ▶ Adult: 100 mg twice daily if required, dose to be administered at night and in the morning, combined oral and rectal treatment, maximum total daily dose 150–200 mg

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 75 mg 1–2 times a day

Acute gout

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 150–200 mg daily in divided doses continued →

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 75 mg 1–2 times a day

Dysmenorrhoea

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: Up to 75 mg daily

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 75 mg daily

- **UNLICENSED USE** Use of indometacin in premature labour is an unlicensed indication.
- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS**
GENERAL CAUTIONS Heart failure
SPECIFIC CAUTIONS: Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · epilepsy · ischaemic heart disease · parkinsonism · peripheral arterial disease · psychiatric disturbances · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1 (NSAIDs).

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · blood disorders · confusion · convulsions · hepatic damage · hyperglycaemia · interstitial fibrosis associated with NSAIDs can lead to renal failure · intestinal strictures · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · peripheral neuropathy · psychiatric disturbances · pulmonary eosinophilia · Stevens-Johnson syndrome · syncope · thrombocytopenia · toxic epidermal necrolysis · visual disturbances
- ▶ **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hyperkalaemia · hypersensitivity reactions · insomnia · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

SPECIFIC SIDE-EFFECTS

- ▶ **With oral use** Nausea
- ▶ **With rectal use** Suppositories may cause occasional bleeding · suppositories may cause rectal irritation

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Amount probably too small to be harmful—manufacturers advise avoid. Use with caution during breast-feeding.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- **MONITORING REQUIREMENTS** During prolonged therapy ophthalmic and blood examinations particularly advisable.
- **PATIENT AND CARER ADVICE** Dizziness may affect performance of skilled tasks (e.g. driving).

- ▶ With topical use Rash (discontinue use if develops)

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915. Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

● CONCEPTION AND CONTRACEPTION

- ▶ With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

● PREGNANCY

- ▶ With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- ▶ With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

● BREAST FEEDING

- ▶ With systemic use Use with caution during breast-feeding. Amount probably too small to be harmful but manufacturers advise avoid.
- ▶ With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

● HEPATIC IMPAIRMENT

- ▶ With systemic use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Should be avoided in severe liver disease.

● RENAL IMPAIRMENT

- ▶ With systemic use Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- ▶ With topical use Deterioration in renal function has also been reported after topical use.

- **DIRECTIONS FOR ADMINISTRATION** For topical preparations apply with gentle massage only.

- **PRESCRIBING AND DISPENSING INFORMATION** Caution—topical preparations not generally suitable for children. Flavours of oral liquid formulations may include strawberry.

- **PATIENT AND CARER ADVICE** For topical preparations, patients and their carers should be advised to wash hands immediately after use.

- ▶ With topical use Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity. Patients should be advised not to expose area treated to sunbeds or sunlight (even on a bright but cloudy day) during, and for two weeks after stopping treatment; treated areas should be protected with clothing.

- **EXCEPTIONS TO LEGAL CATEGORY** Smaller pack sizes of gel preparations may be available on sale to the public.

Mefenamic acid

INDICATIONS AND DOSE

Pain and inflammation in rheumatoid arthritis and osteoarthritis | Postoperative pain | Mild to moderate pain

BY MOUTH

- ▶ **Adult:** 500 mg 3 times a day

Acute pain including dysmenorrhoea | Menorrhagia**BY MOUTH**

- ▶ **Child 12-17 years:** 500 mg 3 times a day
- ▶ **Adult:** 500 mg 3 times a day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · inflammatory bowel disease · severe heart failure

- **CAUTIONS** Acute porphyrias p. 864 · allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · epilepsy · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1 (NSAIDs).

● **SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea (withdraw treatment) · rashes (withdraw treatment) · stomatitis
- ▶ **Uncommon** Fatigue · paraesthesia
- ▶ **Rare** Alveolitis · aplastic anaemia · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · glucose intolerance · haemolytic anaemia (positive Coombs' test) · hepatic damage · hypotension · interstitial fibrosis associated with NSAIDs can lead to renal failure · palpitation · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis · visual disturbances
- ▶ **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

Overdose Mefenamic acid has important consequences in overdosage because it can cause convulsions, which if prolonged or recurrent, require treatment. For details on the management of poisoning, see Emergency treatment of poisoning p. 1123, in particular, Convulsions.

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Avoid in severe impairment. In renal impairment monitor renal function; sodium and water

retention may occur and renal function may deteriorate, possibly leading to renal failure.

Naproxen with misoprostol

The properties listed below are those particular to the combination only. For the properties of the components please consider, misoprostol p. 709, naproxen p. 934.

INDICATIONS AND DOSE

Patients requiring naproxen for rheumatoid arthritis, osteoarthritis, or ankylosing spondylitis, with prophylaxis against NSAID-induced gastroduodenal ulceration

BY MOUTH

- ▶ Adult: 500 mg twice daily, naproxen and 200 micrograms twice daily, misoprostol, taken together with food

- **PRESCRIBING AND DISPENSING INFORMATION** The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by the misoprostol with naproxen combination pack.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Napratec** (Pfizer Ltd)
Napratec OP tablets | 112 tablet **PoM** £23.76 DT price = £23.76

Piroxicam**INDICATIONS AND DOSE**

Rheumatoid arthritis (initiated by a specialist) | Osteoarthritis (initiated by a specialist) | Ankylosing spondylitis (initiated by a specialist)

BY MOUTH

- ▶ Adult: Up to 20 mg once daily

Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

TO THE SKIN

- ▶ Adult: Apply 3–4 times a day, 0.5% gel to be applied; review treatment after 4 weeks

Important safety information**CHMP ADVICE—PIROXICAM (JUNE 2007)**

The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastro-intestinal side effects and serious skin reactions.

The CHMP has advised that:

- piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
- piroxicam should not be used as first-line treatment
- in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
- piroxicam dose should not exceed 20 mg daily
- piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
- treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter
- concomitant administration of a gastro-protective agent should be considered.

Topical preparations containing piroxicam are not affected by these restrictions.

CONTRA-INDICATIONS

- ▶ With systemic use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding · history of gastro-intestinal perforation · history of gastro-intestinal ulceration · inflammatory bowel disease · severe heart failure

CAUTIONS

- ▶ With systemic use Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- ▶ With topical use Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

- **INTERACTIONS** → Appendix 1 (NSAIDs). Interactions do not generally apply to topical NSAIDs.

SIDE-EFFECTS**▶ Rare**

- ▶ With systemic use Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can

lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances

▶ Frequency not known

- ▶ With systemic use Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo
- ▶ With topical use Photosensitivity · rash (discontinue use if develops)

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915. Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

● CONCEPTION AND CONTRACEPTION

- ▶ With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

● PREGNANCY

- ▶ With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- ▶ With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

● BREAST FEEDING

- ▶ With systemic use Use with caution during breast-feeding. Amount too small to be harmful.
- ▶ With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

● HEPATIC IMPAIRMENT

- ▶ With systemic use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

● RENAL IMPAIRMENT

- ▶ With systemic use Avoid if possible or use with caution. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- ▶ With topical use Deterioration in renal function has also been reported after topical use.

- **DIRECTIONS FOR ADMINISTRATION** For topical preparations apply with gentle massage only. Piroxicam orodispersible tablets can be taken by placing on the tongue and allowing to dissolve or by swallowing.

- **PRESCRIBING AND DISPENSING INFORMATION** Caution—topical preparations not generally suitable for children.

- **PATIENT AND CARER ADVICE** For topical preparations, patients and their carers should be advised to wash hands immediately after use.
Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.
- **LESS SUITABLE FOR PRESCRIBING**
- ▶ With oral use Piroxicam is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Orodispersible tablet

Sulindac

INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Acute gout

BY MOUTH

- ▶ Adult: 200 mg twice daily for 7–10 days in peri-articular disorders; acute gout should respond within 7 days, dose may be reduced according to response; maximum 400 mg per day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · ensure adequate hydration · heart failure · history of renal stones · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1 (NSAIDs).
- **SIDE-EFFECTS**
- ▶ **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis

- associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
- ▶ **Frequency not known** Angioedema · blood disorders · bronchospasm · cholestasis · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hepatic failure · hepatitis · hypersensitivity reactions · insomnia · jaundice with fever · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · urine discoloration · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

5 Soft tissue and joint disorders

5.1 Local inflammation of joints and soft tissue

Corticosteroids, inflammatory disorders

Systemic corticosteroids

Short-term treatment with corticosteroids can help to rapidly improve symptoms of rheumatoid arthritis. Long-term treatment in rheumatoid arthritis should be considered only after evaluating the risks and all other treatment options have been considered. Corticosteroids can induce osteoporosis, and prophylaxis should be considered on long-term treatment.

In severe, possibly life-threatening, situations a high initial dose of corticosteroid is given to induce remission and the dose is then reduced gradually and discontinued altogether. Relapse may occur as the dose of corticosteroid is reduced, particularly if the reduction is too rapid. The tendency is therefore to increase the maintenance dose and consequently the patient becomes dependent on corticosteroids. For this reason pulse doses of corticosteroids (e.g. methylprednisolone p. 584 up to 1 g intravenously on 3 consecutive days) are used to suppress highly active inflammatory disease while longer-term treatment with a disease-modifying drug is commenced.

Prednisolone p. 585 may reduce the rate of joint destruction in moderate to severe *rheumatoid arthritis* of less than 2 years' duration. The reduction in joint destruction must be distinguished from mere symptomatic improvement (which lasts only 6 to 12 months at this dose) and care should be taken to avoid increasing the dose above 7.5 mg daily. Evidence supports maintenance of this anti-erosive dose for 2–4 years only after which treatment should be tapered off to reduce long-term adverse effects.

A modified-release preparation of prednisone p. 586 is also available for the treatment of moderate to severe rheumatoid arthritis.

Polymyalgia rheumatica and *giant cell (temporal) arteritis* are always treated with corticosteroids. Relapse is common if therapy is stopped prematurely. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long-term low-dose corticosteroid treatment.

Polyarteritis nodosa and *polymyositis* are usually treated with corticosteroids.

Systemic lupus erythematosus is treated with corticosteroids when necessary using a similar dosage regimen to that for polyarteritis nodosa and polymyositis. Patients with pleurisy, pericarditis, or other systemic manifestations will respond to corticosteroids. It may then be possible to reduce the dosage; alternate-day treatment is sometimes adequate, and the drug may be gradually withdrawn. In some mild cases corticosteroid treatment may be stopped after a few months. Many mild cases of systemic lupus erythematosus do not require corticosteroid treatment. Alternative treatment with anti-inflammatory analgesics, and possibly chloroquine p. 536 or hydroxychloroquine sulfate p. 894, should be considered.

Ankylosing spondylitis should not be treated with long-term corticosteroids; rarely, pulse doses may be needed and may be useful in extremely active disease that does not respond to conventional treatment.

Local corticosteroid injections

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, particularly in rheumatoid arthritis, they are given by *intra-articular injection* to relieve pain, increase mobility, and reduce deformity in one or a few joints; they can also provide symptomatic relief while waiting for DMARDs to take effect. Full aseptic precautions are essential; infected areas should be avoided. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Smaller amounts of corticosteroids may also be injected directly into soft tissues for the relief of inflammation in conditions such as *tennis or golfer's elbow* or *compression neuropathies*. In *tendinitis*, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).

Hydrocortisone p. 583 acetate or one of the synthetic analogues is generally used for local injection. Intra-articular corticosteroid injections can cause flushing and may affect the hyaline cartilage. Each joint should not usually be treated more than 4 times in one year.

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions.

CORTICOSTEROIDS

Methylprednisolone with lidocaine

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1116, methylprednisolone p. 584.

INDICATIONS AND DOSE

Local inflammation of joints

BY INTRA-ARTICULAR INJECTION

- ▶ Adult: 4–80 mg, dose adjusted according to size; where appropriate may be repeated at intervals of 7–35 days, for details consult product literature

5.2 Soft tissue disorders

Soft-tissue disorders

Extravasation

Local guidelines for the management of extravasation should be followed where they exist or specialist advice sought.

Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with **promptly** to prevent tissue necrosis.

Acidic or alkaline preparations and those with an osmolarity greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. In addition, certain patients such as the very young and the elderly are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

Prevention of extravasation

Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and patients receiving repeated doses of hazardous drugs peripherally should have the cannula resited at regular intervals. Attention should be paid to the manufacturers' recommendations for administration. Placing a glyceryl trinitrate p. 190 patch distal to the cannula may improve the patency of the vessel in patients with small veins or in those whose veins are prone to collapse.

Patients should be asked to report any pain or burning at the site of injection immediately.

Management of extravasation

If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy.

Corticosteroids are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone p. 583 or dexamethasone p. 581 can be given either locally by subcutaneous injection or intravenously at a site distant from the injury.

Antihistamines and **analgesics** may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it.

The first method may be appropriate following extravasation of vesicant drugs and involves administration of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering hyaluronidase below. A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should not be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique). Dextrazoxane p. 782 is licensed for the treatment of anthracycline-induced extravasation.

Enzymes

Collagenase

Collagenase below are proteolytic enzymes that are derived from the fermentation of *Clostridium histolyticum* and have the ability to break down collagen. A preparation containing a mixture of two collagenases is licensed for the treatment of Dupuytren's contracture; the preparation should be injected into a palpable cord with a contracture of a metacarpophalangeal joint or proximal interphalangeal joint.

Hyaluronidase

Hyaluronidase is used to render the tissues more readily permeable to injected fluids, e.g. for introduction of fluids by subcutaneous infusion (termed hypodermoclysis).

Rubefacients, topical NSAIDs, capsaicin, and poultices

Rubefacients act by counter-irritation. Pain, whether superficial or deep-seated, is relieved by any method that itself produces irritation of the skin. Topical rubefacient preparations may contain nicotinate and salicylate compounds, essential oils, capsicum, and camphor. The evidence available does not support the use of topical rubefacients in acute or chronic musculoskeletal pain.

Topical NSAIDs

The use of a NSAID by mouth is effective for relieving musculoskeletal pain. **Topical NSAIDs** (e.g. felbinac p. 925, ibuprofen p. 927, ketoprofen p. 930, and piroxicam p. 936 may provide some relief of pain in musculoskeletal conditions; they can be considered as an adjunctive treatment in knee or hand osteoarthritis.

Capsaicin

A preparation containing capsaicin p. 383 0.025% can be considered as an adjunct in hand or knee osteoarthritis. It may need to be used for 1–2 weeks before pain is relieved.

A capsaicin 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia after lesions have healed, and for the relief of painful diabetic neuropathy.

A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients.

ENZYMES

Collagenase

INDICATIONS AND DOSE

Dupuytren's contracture in patients with a palpable cord

BY INTRALESIONAL INJECTION

- ▶ Adult: 580 micrograms, then 580 micrograms every 4 weeks if required, inject into palpable cord, maximum 3 injections per cord, maximum 8 injections in total and only one cord may be treated at a time

- **CONTRA-INDICATIONS** Avoid injecting into other structures containing collagen (e.g. tendons, nerves, and blood vessels)—risk of tendon rupture or ligament damage
- **CAUTIONS** Coagulation disorders · use of anticoagulants
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arthralgia · burning sensation · ecchymosis · hyperhidrosis · hypoesthesia · injection site reactions · joint swelling · lymphadenopathy · myalgia · paraesthesia
 - ▶ **Uncommon** Complex regional pain syndrome · crepitus · ligament injury · monoplegia · muscle spasm · muscle weakness · tendon rupture · tremor · wound dehiscence
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Systemic absorption by mother negligible.
- **DIRECTIONS FOR ADMINISTRATION** Reconstitution and injected volumes vary with site of injection—consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium* has advised (April 2012) that collagenase *Clostridium histolyticum* (Xiapex[®]) is accepted for restricted use within NHS Scotland as an alternative to limited fasciotomy, for the treatment of Dupuytren's contracture of moderate severity (as defined by the British Society for Surgery of the Hand) in patients with a palpable cord and up to two affected joints per hand, who are suitable for limited fasciotomy, but for whom percutaneous needle fasciotomy is not considered a suitable treatment option.

Hyaluronidase

INDICATIONS AND DOSE

Enhance permeation of subcutaneous or intramuscular injections

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: 1500 units, to be dissolved directly into the solution to be injected (ensure compatibility)

Enhance permeation of local anaesthetics

TO THE SKIN

- ▶ Adult: 1500 units, to be mixed with the local anaesthetic solution

continued →

Hypodermoclysis

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride injection, administered before start of 500–1000 mL infusion fluid

Extravasation

BY LOCAL INFILTRATION

- ▶ Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride and infiltrated into affected area as soon as possible after extravasation

Haematoma

BY LOCAL INFILTRATION

- ▶ Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride and infiltrated into affected area

Enhance permeation of ophthalmic local anaesthetic

TO THE EYE

- ▶ Adult: 15 units/mL, to be mixed with the local anaesthetic solution

- **UNLICENSED USE** Licensed for use in children, but age range not specified by the manufacturer.
- **CONTRA-INDICATIONS** Avoid sites where infection is present · avoid sites where malignancy is present · do not apply direct to cornea · not for anaesthesia in unexplained premature labour · not for intravenous administration · not to be used to enhance the absorption and dispersion of dopamine and/or alpha-adrenoceptor agonists · not to be used to reduce swelling of bites · not to be used to reduce swelling of stings
- **CAUTIONS** Elderly (control speed and total volume and avoid overhydration especially in renal impairment) · infants (control speed and total volume and avoid overhydration especially in renal impairment)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Oedema
 - ▶ **Rare** Bleeding · bruising · infection · local irritation
 - ▶ **Frequency not known** Anaphylaxis · severe allergy

Eye

Administration of drugs to the eye

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents). Product-specific devices may be supplied by manufacturers—consult individual manufacturers for information. They are particularly useful for the elderly, visually impaired, arthritic, or otherwise physically limited patients.

Eye drops and eye ointments

Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; one drop is all that is needed. Instillation of more than one drop should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow may occur when one immediately follows the other. The patient should therefore leave an interval of at least 5 minutes between the two; the interval should be extended when eye drops with a prolonged contact time, such as gels and suspensions, are used. Eye ointment should be applied after drops.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

After using eye drops or eye ointments, patients should be warned not to drive or perform other skilled tasks until vision is clear.

Also see warnings relating to eye drops and contact lenses.

Eye lotions

These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign

bodies as a first-aid treatment. Sterile sodium chloride 0.9% solution is usually used. Clean water will suffice in an emergency.

Other preparations administered to the eye

Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy; intracameral and intravitreal routes can also be used to administer certain drugs, for example antibacterials. These injections should only be used under specialist supervision.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat susceptible eye conditions.

Ophthalmic Specials

Certain eye drops, e.g. amphotericin, ceftazidime, cefuroxime, colistimethate sodium, desferrioxamine mesilate, dexamethasone, gentamicin, and vancomycin can be prepared aseptically from material supplied for injection.

The Royal College of Ophthalmologists and the UK Ophthalmic Pharmacy Group have produced the Ophthalmic Specials Guidance to help prescribers and pharmacists manage and restrict the use of unlicensed eye preparations. 'Specials' should only be prescribed in situations where a licensed product is not suitable for a patient's needs. The Ophthalmic Specials Guidance can be accessed on the Royal College of Ophthalmologists website (www.rcophth.ac.uk). The guidance will be reviewed every six months to ensure the most accurate and up-to-date information is available.

Preservatives and sensitisers

Information on preservatives and substances identified as skin sensitisers is provided under Excipients statements in preparation entries. Very rarely, cases of corneal calcification have been reported with the use of phosphate-containing eye drops in patients with significantly damaged corneas—consult product literature for further information.

Control of microbial contamination

Preparations for the eye should be sterile when issued. Care should be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for *domiciliary use* should not be used for more than 4 weeks after first opening (unless otherwise stated by the manufacturer).

Multiple application eye drops for use in *hospital wards* are normally discarded 1 week after first opening—local

practice may vary. Individual containers should be provided for each patient. A separate container should be supplied for each eye only if there are special concerns about contamination. Containers used before an eye operation should be discarded at the time of the operation and fresh containers supplied postoperatively. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue containers that have been dispensed to the patient on the day of discharge.

In *out-patient departments* single-application containers should be used; if multiple-application containers are used, they should be discarded after single patient use within one clinical session.

In *eye surgery* single-application containers should be used if possible; if a multiple-application container is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; intravenous infusion preparations are not usually suitable for this purpose (Hartmann's solution may be used in some ocular surgery). For all surgical procedures, a previously unopened container is used for each patient.

Contact lenses

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid ('hard' or gas permeable) lenses or soft (hydrogel or silicone hydrogel—in adults only) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious and non-infectious keratitis is increased by extended continuous contact lens wear, which is not recommended, except when medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.

Acanthamoeba keratitis, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

Contact lenses and drug treatment

Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic and adverse reactions. Therefore, unless medically indicated, the lenses should be removed before instillation of the eye preparation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and

drugs which increase lacrimation (including ephedrine hydrochloride and hydalazine hydrochloride). Other drugs that may affect contact lens wear are isotretinoin (can cause conjunctival inflammation), aspirin (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin and sulfasalazine (can discolour lenses).

1 Allergic and inflammatory eye conditions

Eye, allergy and inflammation

Corticosteroids

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation, including that which results from surgery.

Topical corticosteroids are applied frequently for the first 24–48 hours; once inflammation is controlled, the frequency of application is reduced. They should normally only be used under expert supervision; three main dangers are associated with their use:

- a 'red eye', when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye. Bacterial, fungal, and amoebic infections pose a similar hazard;
- 'steroid glaucoma' can follow the use of corticosteroid eye preparations in susceptible individuals;
- a 'steroid cataract' can follow prolonged use.

Combination products containing a corticosteroid with an anti-infective drug are sometimes used after ocular surgery to reduce inflammation and prevent infection; use of combination products is otherwise rarely justified.

Systemic corticosteroids may be useful for ocular conditions. The risk of producing a 'steroid cataract' increases with the dose and duration of corticosteroid use.

Intravitreal corticosteroids

An intravitreal implant containing dexamethasone p. 947 (*Ozurdex*®) is licensed for the treatment of adults with macular oedema following either branch retinal vein occlusion or central retinal vein occlusion; it is also licensed for the treatment of adult patients with inflammation of the posterior segment of the eye presenting as non-infectious uveitis.

An intravitreal implant containing fluocinolone acetonide p. 974 (*Iluvien*®) is licensed for the treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies. It should be administered by specialists experienced in the use of intravitreal injections.

Other anti-inflammatory preparations

Other preparations used for the topical treatment of inflammation and allergic conjunctivitis include antihistamines, lodoxamide p. 946, and sodium cromoglycate p. 946.

Eye drops containing antihistamines, such as **antazoline** (with xylometazoline hydrochloride p. 983 as *Otrivine-Antistin*®), azelastine hydrochloride p. 945, epinastine hydrochloride p. 945, ketotifen p. 945, and olopatadine p. 946, can be used for allergic conjunctivitis.

Sodium cromoglycate p. 946 (sodium cromoglycate) and nedocromil sodium p. 946 eye drops can be useful for vernal

keratoconjunctivitis and other allergic forms of conjunctivitis.

Lodoxamide p. 946 eye drops are used for allergic conjunctival conditions including seasonal allergic conjunctivitis.

Diclofenac sodium p. 961 eye drops and emedastine below eye drops are also licensed for seasonal allergic conjunctivitis.

Non-steroidal anti-inflammatory eye drops are used for the prophylaxis and treatment of inflammation of the eye following surgery or laser treatment.

1.1 Allergic conjunctivitis

ANTI-HISTAMINES

Antazoline with xylometazoline

INDICATIONS AND DOSE

Allergic conjunctivitis

TO THE EYE

- ▶ Child 12–17 years: Apply 2–3 times a day for maximum 7 days
- ▶ Adult: Apply 2–3 times a day for maximum 7 days

● **CAUTIONS** Angle-closure glaucoma · cardiovascular disease · diabetes mellitus · hypertension · hyperthyroidism · phaeochromocytoma · urinary retention

● **INTERACTIONS** → Appendix 1 (antihistamines and sympathomimetics). Absorption of antazoline and xylometazoline may result in the possibility of interaction with other drugs.

● SIDE-EFFECTS

- ▶ **Common or very common** Transient stinging
- ▶ **Frequency not known** Blurred vision · eye irritation · mydriasis

SIDE-EFFECTS, FURTHER INFORMATION

Absorption of antazoline and xylometazoline may result in systemic side-effects.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

- EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
- ▶ **Otrivine Antistin** (Spectrum Thea Pharmaceuticals Ltd)
Antazoline sulfate 5 mg per 1 ml, Xylometazoline hydrochloride 500 microgram per 1 ml. Otrivine Antistin 0.5%/0.05% eye drops | 10 ml [P] £2.35 DT price = £2.35

Azelastine hydrochloride

INDICATIONS AND DOSE

Seasonal allergic conjunctivitis

TO THE EYE

- ▶ Child 4–17 years: Apply twice daily, increased if necessary to 4 times a day
- ▶ Adult: Apply twice daily, increased if necessary to 4 times a day

Perennial conjunctivitis

TO THE EYE

- ▶ Child 12–17 years: Apply twice daily; increased if necessary to 4 times a day, maximum duration of treatment 6 weeks
- ▶ Adult: Apply twice daily; increased if necessary to 4 times a day, maximum duration of treatment 6 weeks

● **SIDE-EFFECTS** Bitter taste · mild transient irritation

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Optilast** (Meda Pharmaceuticals Ltd)
Azelastine hydrochloride 500 microgram per 1 ml. Optilast 0.05% eye drops | 8 ml [PoM] £6.40

Emedastine

INDICATIONS AND DOSE

Seasonal allergic conjunctivitis

TO THE EYE

- ▶ Child 3–17 years: Apply twice daily
- ▶ Adult: Apply twice daily

● **SIDE-EFFECTS** Blurred vision · corneal infiltrates (discontinue) · corneal staining · dry eye · headache · irritation · keratitis · lacrimation · local oedema · photophobia · rhinitis · transient burning · transient stinging

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- ▶ **Emedastine** (Alcon Laboratories (UK) Ltd)
Emedastine (as Emedastine difumarate) 500 microgram per 1 ml. Emedastine 0.5mg/ml eye drops | 5 ml [PoM] £7.31 DT price = £7.31

Epinastine hydrochloride

INDICATIONS AND DOSE

Seasonal allergic conjunctivitis

TO THE EYE

- ▶ Child 12–17 years: Apply twice daily for maximum 8 weeks
- ▶ Adult: Apply twice daily for maximum 8 weeks

● SIDE-EFFECTS

- ▶ **Common or very common** Burning
- ▶ **Uncommon** Conjunctival hyperaemia · dry eye · eye pain · eye pruritus · headache · increased lacrimation · nasal irritation · rhinitis · taste disturbance · visual disturbance

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Relestat** (Allergan Ltd)
Epinastine hydrochloride 500 microgram per 1 ml. Relestat 500micrograms/ml eye drops | 5 ml [PoM] £9.90 DT price = £9.90

Ketotifen

INDICATIONS AND DOSE

Seasonal allergic conjunctivitis

TO THE EYE

- ▶ Child 3–17 years: Apply twice daily
- ▶ Adult: Apply twice daily

● **INTERACTIONS** → Appendix 1 (antihistamines). Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines. Interactions do not generally apply to antihistamines used for topical action.

● SIDE-EFFECTS

- ▶ **Common or very common** Punctate corneal epithelial erosion · transient burning · transient stinging
- ▶ **Uncommon** Dry eye · photophobia · subconjunctival haemorrhage
- ▶ **Frequency not known** Drowsiness · dry mouth · headache · skin reactions

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- ▶ **Zaditen** (Spectrum Thea Pharmaceuticals Ltd)
Ketotifen (as Ketotifen fumarate) 250 microgram per 1 ml
Zaditen 250micrograms/ml eye drops | 5 ml [PoM] £7.80 DT price = £7.80

Olopatadine

INDICATIONS AND DOSE

Seasonal allergic conjunctivitis

TO THE EYE

- ▶ Child 3-17 years: Apply twice daily for maximum 4 months
- ▶ Adult: Apply twice daily for maximum 4 months

● SIDE-EFFECTS

- ▶ **Common or very common** Local irritation
- ▶ **Uncommon** Asthenia · dizziness · dry eye · headache · keratitis · local oedema · photophobia
- ▶ **Frequency not known** Dry nose

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- ▶ **Opatanol** (Alcon Laboratories (UK) Ltd)
Olopatadine (as Olopatadine hydrochloride) 1 mg per 1 ml
Opatanol 1mg/ml eye drops | 5 ml [PoM] £4.68 DT price = £4.68

MAST CELL STABILISERS

Lodoxamide

INDICATIONS AND DOSE

Allergic conjunctivitis

TO THE EYE

- ▶ Child 4-17 years: Apply 4 times a day, improvement of symptoms may sometimes require treatment for up to 4 weeks
- ▶ Adult: Apply 4 times a day, improvement of symptoms may sometimes require treatment for up to 4 weeks

● SIDE-EFFECTS

- ▶ **Common or very common** Blurred vision · burning · itching · ocular discomfort · stinging · tear production disturbance
- ▶ **Uncommon** Blepharitis · dizziness · drowsiness · flushing · headache · keratitis · nasal dryness

- **EXCEPTIONS TO LEGAL CATEGORY** Lodoxamide 0.1% eye drops can be sold to the public for treatment of allergic conjunctivitis in adults and children over 4 years.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Alomide** (Alcon Laboratories (UK) Ltd)
Lodoxamide (as Lodoxamide trometamol) 1 mg per 1 ml Alomide 0.1% eye drops | 10 ml [PoM] £5.21 DT price = £5.21
Alomide Allergy 0.1% eye drops | 5 ml [P] £3.12

Nedocromil sodium

INDICATIONS AND DOSE

Seasonal and perennial conjunctivitis

TO THE EYE

- ▶ Child 6-17 years: Apply twice daily, increased if necessary to 4 times a day for maximum 12 weeks treatment for seasonal allergic conjunctivitis
- ▶ Adult: Apply twice daily, increased if necessary to 4 times a day for maximum 12 weeks treatment for seasonal allergic conjunctivitis

Seasonal keratoconjunctivitis

TO THE EYE

- ▶ Child 6-17 years: Apply 4 times a day
- ▶ Adult: Apply 4 times a day

- **SIDE-EFFECTS** Distinctive taste · transient burning · transient stinging

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Rapitil** (Sanofi)
Nedocromil sodium 20 mg per 1 ml Rapitil 2% eye drops | 5 ml [PoM] £2.86 DT price = £2.86

Sodium cromoglicate

(Sodium cromoglycate)

INDICATIONS AND DOSE

Allergic conjunctivitis | Seasonal keratoconjunctivitis

TO THE EYE

- ▶ Child: Apply 4 times a day
- ▶ Adult: Apply 4 times a day

- **SIDE-EFFECTS** Transient burning · transient stinging
- **EXCEPTIONS TO LEGAL CATEGORY** Sodium cromoglicate 2% eye drops can be sold to the public (in max. pack size of 10 mL) for treatment of acute seasonal and perennial allergic conjunctivitis.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

- ▶ **SODIUM CROMOGLICATE (Non-proprietary)**
Sodium cromoglicate 20 mg per 1 ml Sodium cromoglicate 2% eye drops | 13.5 ml [PoM] £6.30 DT price = £1.86
Lloydspharmacy Allergy 2% eye drops | 10 ml [P] no price available
Numark Allergy 2% eye drops | 10 ml [P] £1.53
- ▶ **Catacrom** (Moorfields Pharmaceuticals)
Sodium cromoglicate 20 mg per 1 ml Catacrom 2% eye drops 0.3ml unit dose | 30 unit dose [P] £8.99 DT price = £8.99
- ▶ **Cromolux** (Tubilux Pharma Ltd)
Sodium cromoglicate 20 mg per 1 ml Cromolux 2% eye drops | 13.5 ml [PoM] £3.20 DT price = £1.86
- ▶ **Opticrom** (Sanofi)
Sodium cromoglicate 20 mg per 1 ml Opticrom Allergy 2% eye drops | 5 ml [P] £2.74 | 10 ml [P] £3.35
Opticrom Aqueous 2% eye drops | 13.5 ml [PoM] £8.03 DT price = £1.86
- ▶ **Optrex Allergy** (Reckitt Benckiser Healthcare (UK) Ltd)
Sodium cromoglicate 20 mg per 1 ml Optrex Allergy 2% eye drops | 10 ml [P] £3.88
- ▶ **Pollenase (Sodium cromoglicate)** (Peach Ethical Ltd)
Sodium cromoglicate 20 mg per 1 ml Pollenase Allergy 2% eye drops | 10 ml [P] £2.08
- ▶ **Vividrin** (Bausch & Lomb UK Ltd)
Sodium cromoglicate 20 mg per 1 ml Vividrin 2% eye drops | 13.5 ml [PoM] £10.95 DT price = £1.86

1.2 Inflammatory eye conditions

CORTICOSTEROIDS

Betamethasone

INDICATIONS AND DOSE

Local treatment of inflammation (short term)

TO THE EYE USING EYE DROP

- ▶ Child: Apply every 1–2 hours until controlled then reduce frequency
- ▶ Adult: Apply every 1–2 hours until controlled then reduce frequency

TO THE EYE USING EYE OINTMENT

- ▶ Child: Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops
- ▶ Adult: Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops

- **SIDE-EFFECTS** Adrenal suppression following prolonged use in neonates · corneal thinning · scleral thinning

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

▶ BETAMETHASONE (Non-proprietary)

Betamethasone sodium phosphate 1 mg per 1 ml Betamethasone 0.1% ear/eye/nose drops | 5 ml [POM] no price available

▶ Betnesol (Focus Pharmaceuticals Ltd)

Betamethasone sodium phosphate 1 mg per 1 ml Betnesol 0.1% eye/ear/nose drops | 10 ml [POM] £2.32 DT price = £2.32

▶ Vistamethasone (Martindale Pharmaceuticals Ltd)

Betamethasone sodium phosphate 1 mg per 1 ml Vistamethasone 0.1% ear/eye/nose drops | 5 ml [POM] £1.02 | 10 ml [POM] £1.16 DT price = £2.32

Eye ointment

▶ Betnesol (Focus Pharmaceuticals Ltd)

Betamethasone sodium phosphate 1 mg per 1 gram Betnesol 0.1% eye ointment | 3 gram [POM] £1.41 DT price = £1.41

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 947.

INDICATIONS AND DOSE

Local treatment of eye inflammation and bacterial infection (short-term)

TO THE EYE USING EYE DROP

- ▶ Adult: Apply up to 6 times a day

- **LESS SUITABLE FOR PRESCRIBING** Betamethasone with neomycin eye-drops are less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

▶ Betnesol-N (Focus Pharmaceuticals Ltd)

Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml Betnesol-N ear/eye/nose drops | 10 ml [POM] £2.39

Dexamethasone

INDICATIONS AND DOSE

Local treatment of inflammation (short term)

INITIALLY TO THE EYE USING EYE DROP

- ▶ Child: Apply 4–6 times a day
- ▶ Adult: Apply every 30–60 minutes until controlled, then (to the eye) reduced to 4–6 times a day

Short term local treatment of inflammation (severe conditions)

TO THE EYE USING EYE DROP

- ▶ Child: Apply every 30–60 minutes until controlled, reduce frequency when control achieved

Macular oedema following either branch retinal vein occlusion or central retinal vein occlusion (specialist use only) | Visual impairment due to diabetic macular oedema in adults who are pseudophakic, or who are insufficiently responsive to, or unsuitable for non-corticosteroid therapy (specialist use only) | For the treatment of inflammation of the posterior segment of the eye presenting as non-infectious uveitis (specialist use only)

BY INTRAVITREAL INJECTION

- ▶ Adult: 700 micrograms, to be administered into the affected eye, concurrent administration to both eyes not recommended. For further information on pre-treatment, administration and repeat dosing, consult product literature

- **UNLICENSED USE** *Maxidex*[®] not licensed for use in children under 2 years. *Dropodex*[®] not licensed for use in children.

CONTRA-INDICATIONS

- ▶ With intravitreal use active ocular herpes simplex · active or suspected ocular infection · active or suspected periocular infection · rupture of the posterior lens capsule in patients with aphakia, iris or transscleral fixated intra-ocular lens or anterior chamber intra-ocular lens · uncontrolled advanced glaucoma

CAUTIONS

- ▶ With intravitreal use history of ocular viral infection (including herpes simplex) · posterior capsule tear or iris defect (risk of implant migration into the anterior chamber which may cause corneal oedema and, in persistent severe cases, the need for corneal transplantation) · retinal vein occlusion with significant retinal ischaemia

INTERACTIONS

- ▶ With intravitreal use Caution with concomitant administration of anticoagulant or antiplatelet drugs—increased risk of haemorrhagic events.

SIDE-EFFECTS

- ▶ **Uncommon**
- ▶ **With intravitreal use** Eyelid pruritus · glaucoma · migraine · necrotising retinitis
- ▶ **Frequency not known**
- ▶ **When used by eye** Adrenal suppression following prolonged use in neonates · corneal thinning · scleral thinning
- ▶ **With intravitreal use** Blepharitis · cataract · headache · ocular hypertension · raised intra-ocular pressure · secondary ocular infection · visual disturbance

PREGNANCY

- ▶ With intravitreal use Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

BREAST FEEDING

- ▶ With intravitreal use Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

● MONITORING REQUIREMENTS

▶ With intravitreal use Monitor intra-ocular pressure and for signs of ocular infection. In patients with posterior capsule tear or iris defect monitor for implant migration to allow for; early diagnosis and management.

● **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose dexamethasone eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● NATIONAL FUNDING/ACCESS DECISIONS**NICE technology appraisals (TAs)**

▶ **Dexamethasone intravitreal implant for the treatment of macular oedema secondary to retinal vein occlusion (July 2011)** NICE TA229

Dexamethasone intravitreal implant is recommended as an option for the treatment of macular oedema following central retinal vein occlusion.

Dexamethasone intravitreal implant is also recommended as an option for the treatment of macular oedema following branch retinal vein occlusion when:

- treatment with laser photocoagulation has not been beneficial, or
- treatment with laser photocoagulation is not considered suitable because of the extent of macular haemorrhage. www.nice.org.uk/TA229

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2012) that dexamethasone intravitreal implant (*Ozurdex*®) is accepted for restricted use within NHS Scotland for the treatment of adults with macular oedema (i) following central retinal vein occlusion, and (ii) with branch retinal vein occlusion who are not clinically suitable for laser treatment, including patients with dense macular haemorrhage, or patients who have received and failed on previous laser treatment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

▶ **DEXAMETHASONE (Non-proprietary)**

Dexamethasone sodium phosphate 1 mg per 1 ml Minims dexamethasone 0.1% eye drops 0.5ml unit dose | 20 unit dose [PoM] £11.46 DT price = £11.46

▶ **Dexafree** (Spectrum Thea Pharmaceuticals Ltd)

Dexamethasone sodium phosphate 1 mg per 1 ml Dexafree 1mg/1ml eye drops 0.4ml unit dose | 30 unit dose [PoM] £9.70

▶ **Dropdex** (Moorfields Pharmaceuticals)

Dexamethasone sodium phosphate 1 mg per 1 ml Dropdex 0.1% eye drops 0.4ml unit dose | 20 unit dose [PoM] £9.75 DT price = £9.75

▶ **Maxidex** (Alcon Laboratories (UK) Ltd)

Dexamethasone 1 mg per 1 ml Maxidex 0.1% eye drops | 5 ml [PoM] £1.42 DT price = £1.42 | 10 ml [PoM] £2.80 DT price = £2.80

Implant▶ **Ozurdex** (Allergan Ltd)

Dexamethasone 700 microgram Ozurdex 700microgram intravitreal implant in applicator | 1 device [PoM] £870.00 (Hospital only)

Dexamethasone with framycetin sulfate and gramicidin

The properties listed below are those particular to the combination only. For the properties of the components please consider dexamethasone p. 947.

INDICATIONS AND DOSE**Local treatment of inflammation (short-term)****TO THE EYE**

- ▶ Child: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency
- ▶ Adult: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency

● **UNLICENSED USE** *Sofradex*® licensed for use in children (age range not specified by manufacturers).

● **LESS SUITABLE FOR PRESCRIBING** *Sofradex*® is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye drops solution

EXCIPIENTS: May contain Polysorbates

▶ **Sofradex** (Sanofi)

Dexamethasone (as Dexamethasone sodium metasulfobozoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml, Gramicidin 50 microgram per 1 ml Sofradex ear/eye drops | 10 ml [PoM] £6.25

Dexamethasone with hypromellose, neomycin and polymyxin b sulphate

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 947, neomycin sulfate p. 451.

INDICATIONS AND DOSE**Local treatment of inflammation (short-term)****TO THE EYE USING EYE DROP**

- ▶ Adult: Apply every 30–60 minutes until controlled then reduce frequency to, 4–6 times a day

Local treatment of inflammation (short-term)**TO THE EYE USING EYE OINTMENT**

- ▶ Adult: Apply 3–4 times a day, alternatively, apply at night when used with eye drops

● **LESS SUITABLE FOR PRESCRIBING** Dexamethasone with neomycin and polymyxin B sulphate is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

▶ **Maxitrol** (Alcon Laboratories (UK) Ltd)

Dexamethasone 1 mg per 1 ml, Hypromellose 5 mg per 1 ml, Neomycin (as Neomycin sulfate) 3.5 mg per 1 ml, Polymyxin B sulfate 6000 unit per 1 ml Maxitrol eye drops | 5 ml [PoM] £1.68

Eye ointment

EXCIPIENTS: May contain Hydroxybenzoates (parabens), wool fat and related substances including lanolin

▶ **Maxitrol** (Alcon Laboratories (UK) Ltd)

Dexamethasone 1 mg per 1 gram, Neomycin (as Neomycin sulfate) 3500 unit per 1 gram, Polymyxin B sulfate 6000 unit per 1 gram Maxitrol eye ointment | 3.5 gram [PoM] £1.44

Dexamethasone with tobramycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 947, tobramycin p. 957.

INDICATIONS AND DOSE**Local treatment of inflammation (short-term)**

TO THE EYE

- ▶ Adult: (consult product literature)

- **LESS SUITABLE FOR PRESCRIBING** Dexamethasone with tobramycin eye-drops are less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Tobradex** (Alcon Laboratories (UK) Ltd)

Dexamethasone 1 mg per 1 ml, Tobramycin 3 mg per 1 ml
Tobradex 3mg/ml / 1mg/ml eye drops | 5 ml [PoM] £5.37 DT price = £5.37

Fluorometholone**INDICATIONS AND DOSE****Local treatment of inflammation (short term)**

TO THE EYE

- ▶ Child 2-17 years: Apply every 1 hour for 24–48 hours, then reduced to 2–4 times a day
- ▶ Adult: Apply every 1 hour for 24–48 hours, then reduced to 2–4 times a day

- **SIDE-EFFECTS** Adrenal suppression following prolonged use in neonates · corneal thinning · scleral thinning

Homatropine hydrobromide

INDICATIONS AND DOSE

Anterior uveitis

TO THE EYE

- ▶ Adult: (consult product literature)

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

2 Dry eye conditions

Dry eye

Tear deficiency, ocular lubricants, and astringents

Chronic soreness of the eyes associated with reduced or abnormal tear secretion (e.g. in Sjögren's syndrome) often responds to tear replacement therapy or pilocarpine p. 988 given by mouth in adults. The severity of the condition and patient preference will often guide the choice of preparation.

Hyromellose p. 952 is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hyromellose p. 952 with a mucolytic such as acetylcysteine below can be helpful.

The ability of **carbomers** to cling to the eye surface may help reduce frequency of application to 4 times daily.

Polyvinyl alcohol p. 952 increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

Sodium hyaluronate p. 953 eye drops are also used in the management of tear deficiency.

Sodium chloride p. 953 0.9% drops are sometimes useful in tear deficiency, and can be used as 'comfort drops' by contact lens wearers, and to facilitate lens removal. They are also used to irrigate the eye. Special presentations of sodium chloride p. 953 0.9% and other irrigation solutions are used routinely for intra-ocular surgery. Sodium chloride p. 953 5% eye drops are used for the short-term treatment of corneal oedema in adults.

Eye ointments containing a paraffin can be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application before sleep. Ointments should not be used during contact lens wear.

OCULAR LUBRICANTS

Acetylcysteine

INDICATIONS AND DOSE

Tear deficiency | Impaired or abnormal mucus production

TO THE EYE

- ▶ Adult: Apply 3–4 times a day

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

Soybean oil**INDICATIONS AND DOSE**

Dry eye conditions

TO THE EYE

- ▶ Child: Apply up to 4 times a day
- ▶ Adult: Apply up to 4 times a day

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

- ▶ **Emustil** (Moorfields Pharmaceuticals)
Emustil eye drops 0.3ml unit dose preservative free | 20 unit dose **£6.22**

PARAFFINS**Liquid paraffin with white soft paraffin and wool alcohols****INDICATIONS AND DOSE**

Dry eye conditions

TO THE EYE

- ▶ Child: Apply as required, best suited for application before sleep
- ▶ Adult: Apply as required, best suited for application before sleep

- **PATIENT AND CARER ADVICE** May cause temporary visual disturbance. Should not be used during contact lens wear.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye ointment

► **Lacri-Lube** (Allergan Ltd)

Liquid paraffin 425 mg per 1 gram, White soft paraffin 573 mg per 1 gram, Wool alcohols 2 mg per 1 gram Lacri-lube eye ointment | 3.5 gram P | £2.94 | 5 gram P | £3.88

Paraffin, yellow, soft**INDICATIONS AND DOSE****Eye surface lubrication**

TO THE EYE

- Child: Apply every 2 hours as required
- Adult: Apply every 2 hours as required

● **PATIENT AND CARER ADVICE** Ophthalmic preparations may cause temporary visual disturbance. Should not be used during contact lens wear.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

► **PARAFFIN, YELLOW, SOFT (Non-proprietary)**

Yellow soft paraffin 1 mg per 1 mg Yellow soft paraffin solid | 15 gram [GSL] £0.85-£1.11 | 500 gram [GSL] £10.18 DT price = £10.18 | 4500 gram [GSL] £18.29

Gentamicin, tobramycin, quinolones (except moxifloxacin), and **polymyxin B** are effective for infections caused by *Pseudomonas aeruginosa*.

Ciprofloxacin eye drops are licensed for corneal ulcers; intensive application (especially in the first 2 days) is required throughout the day and night.

Azithromycin p. 955 eye drops are licensed for trachomatous conjunctivitis caused by *Chlamydia trachomatis* and for purulent bacterial conjunctivitis. *Trachoma* which results from chronic infection with *Chlamydia trachomatis* can be treated with azithromycin by mouth [unlicensed indication].

Fusidic acid is useful for staphylococcal infections.

Propamide isetonate p. 957 is of little value in bacterial infections but is used by specialists to treat the rare, but potentially sight-threatening, condition of *acanthamoeba keratitis* [unlicensed indication].

Cefuroxime p. 955 can be administered by intracameral injection for the prophylaxis of endophthalmitis following cataract surgery.

With corticosteroids

Many antibacterial preparations also incorporate a corticosteroid but such mixtures should **not** be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed 'red eye' which is sometimes caused by the herpes simplex virus and may be difficult to diagnose.

Administration

Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibacterial eye preparations are usually administered as follows:

- *Eye drops*, apply 1 drop at least every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing.
- *Eye ointment*, apply *either* at night (if eye drops used during the day) or 3–4 times daily (if eye ointment used alone).

Antifungals

Fungal infections of the cornea are rare but can occur after agricultural injuries, especially in hot and humid climates. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Increasing age, debility, or immunosuppression can encourage fungal proliferation. The spread of infection through blood occasionally produces metastatic endophthalmitis.

Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment will normally be carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (tel. (020) 7253 3411) or www.moorfields.nhs.uk.

Antivirals

Herpes simplex infections producing, for example, dendritic corneal ulcers can be treated with aciclovir p. 958 or ganciclovir p. 958. Aciclovir p. 958 eye ointment is used in combination with systemic treatment for ophthalmic zoster.

Slow-release ocular implants containing ganciclovir p. 958 (available on a named-patient basis from specialist importing companies) may be inserted surgically to treat immediate sight-threatening CMV retinitis. Local treatments do not protect against systemic infection or infection in the other eye. See systemic treatment of CMV retinitis.

3 Eye infections**Eye infections**

Most acute superficial eye infections can be treated topically. Staphylococcal and conjunctivitis are often caused by staphylococci; keratitis and endophthalmitis may be bacterial, viral, or fungal.

Bacterial *blepharitis* is treated by application of an antibacterial eye ointment to the conjunctival sac or to the lid margins. Systemic treatment may occasionally be required and is usually undertaken after culturing organisms from the lid margin and determining their antimicrobial sensitivity; antibiotics such as the tetracyclines given for 3 months or longer may be appropriate.

Most cases of acute bacterial conjunctivitis are self limiting; where treatment is appropriate, antibacterial eye drops or an eye ointment are used. A poor response might indicate viral or allergic conjunctivitis.

Corneal ulcer and *keratitis* require specialist treatment and may call for hospital admission for intensive therapy.

Endophthalmitis is a medical emergency which also calls for specialist management and requires intravitreal administration of antimicrobials; concomitant systemic treatment is required in some cases. Surgical intervention, such as vitrectomy, is sometimes indicated.

Antibacterials

Bacterial eye infections are generally treated topically with eye drops and eye ointments. Systemic administration is sometimes appropriate in blepharitis.

Chloramphenicol p. 955 has a broad spectrum of activity and is the drug of choice for *superficial eye infections*. Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, ciprofloxacin p. 956, levofloxacin p. 956, moxifloxacin p. 957, and ofloxacin p. 957; the aminoglycosides, gentamicin p. 956 and tobramycin p. 957 are also active against a wide variety of bacteria.

3.1 Bacterial eye infection

Azithromycin

INDICATIONS AND DOSE

Trachomatous conjunctivitis caused by *Chlamydia trachomatis* | Purulent bacterial conjunctivitis
TO THE EYE

- ▶ Child: Apply twice daily for 3 days, review if no improvement after 3 days of treatment
- ▶ Adult: Apply twice daily for 3 days, review if no improvement after 3 days of treatment

• SIDE-EFFECTS

- ▶ **Common or very common** Blurred vision · ocular burning · ocular discomfort · ocular pruritus
- ▶ **Uncommon** Conjunctival hyperaemia · eyelid eczema · eyelid erythema · eyelid oedema · keratitis

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

- ▶ **Azyter** (Spectrum Thea Pharmaceuticals Ltd)
Azithromycin dihydrate 15 mg per 1 gram Azyter 15mg/g eye drops 0.25g unit dose | 6 unit dose [PoM] £6.99 DT price = £6.99

Cefuroxime

INDICATIONS AND DOSE

APROKAM® INTRACAMERAL INJECTION

Prophylaxis of endophthalmitis after cataract surgery
BY INTRACAMERAL INJECTION

- ▶ Adult: 1 mg, dose to be injected into the anterior chamber of the eye at the end of cataract surgery

• CAUTIONS

APROKAM® INTRACAMERAL INJECTION

Combined operations with cataract surgery · complicated cataracts · reduced corneal endothelial cells (less than 2000) · severe risk of infection · severe thyroid disease

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- ▶ **Aprokam** (Spectrum Thea Pharmaceuticals Ltd)
Cefuroxime (as Cefuroxime sodium) 50 mg Aprokam 50mg powder for solution for injection vials | 10 vial [PoM] £79.50

Chloramphenicol

- **DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

INDICATIONS AND DOSE

Superficial eye infections

TO THE EYE USING EYE DROP

- ▶ Child: Apply 1 drop every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing, frequency dependent on the severity of the infection. For less severe infection 3–4 times daily is generally sufficient
- ▶ Adult: Apply 1 drop every 2 hours then reduce frequency as infection is controlled and continue for

48 hours after healing, frequency dependent on the severity of the infection. For less severe infection 3–4 times daily is generally sufficient

TO THE EYE USING EYE OINTMENT

- ▶ Child: Apply daily, to be applied at night (if eye drops used during the day), alternatively apply 3–4 times a day, if ointment used alone
- ▶ Adult: Apply daily, to be applied at night (if eye drops used during the day), alternatively apply 3–4 times a day, if ointment used alone

- **UNLICENSED USE** Oral azithromycin not licensed for trachoma which results from chronic infection with *Chlamydia trachomatis*.
- **SIDE-EFFECTS** Transient stinging
- **PREGNANCY** Avoid unless essential—no information on *topical* use but risk of 'neonatal grey-baby syndrome' with *oral* use in third trimester.
- **BREAST FEEDING** Avoid unless essential—*theoretical* risk of bone-marrow toxicity.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose chloramphenicol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **EXCEPTIONS TO LEGAL CATEGORY** Chloramphenicol 0.5% eye drops (in max. pack size 10 mL) and 1% eye ointment (in max. pack size 4 g) can be sold to the public for treatment of acute bacterial conjunctivitis in adults and children over 2 years; max. duration of treatment 5 days.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Phenylmercuric acetate

▶ CHLORAMPHENICOL (Non-proprietary)

Ganciclovir 1.5 mg per 1 gram Virgan 0.15% eye gel | 5 gram [PoM] £19.99 DT price = £19.99

4 Eye procedures

Mydriatics and cycloplegics

Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action.

Short-acting, relatively weak mydriatics, such as tropicamide below 0.5% (action lasts for 4–6 hours), facilitate the examination of the fundus of the eye. Longer-acting options include cyclopentolate hydrochloride p. 950 1% (action up to 24 hours) or atropine sulfate p. 950 (action up to 7 days).

Phenylephrine hydrochloride p. 959 is used for mydriasis in diagnostic or therapeutic procedures; mydriasis occurs within 60–90 minutes and lasts up to 5–7 hours.

Mydriatics and cycloplegics are used in the treatment of anterior uveitis, usually as an adjunct to corticosteroids. Atropine sulfate p. 950 is used in anterior uveitis mainly to prevent posterior synechiae and to relieve ciliary spasm; cyclopentolate hydrochloride p. 950 or homatropine hydrobromide p. 950 (action up to 3 days) can also be used and may be preferred because they have a shorter duration of action.

Drugs used for Eye procedures not listed below;

Fluorescein with lidocaine, p. 960

ANTIMUSCARINICS

Tropicamide

The properties listed below are those particular to the drug only. For the properties common to the class, see Antimuscarinics (eye) p. 949.

INDICATIONS AND DOSE**Funduscopy**

TO THE EYE

- ▶ **Child:** 0.5% eye drops to be applied 20 minutes before examination
- ▶ **Adult:** (consult product literature)

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose tropicamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, edetic acid (edta)

▶ **TROPICAMIDE (Non-proprietary)**

Tropicamide 5 mg per 1 ml Minims tropicamide 0.5% eye drops 0.5ml unit dose | 20 unit dose [PoM] £10.75

Tropicamide 10 mg per 1 ml Minims tropicamide 1% eye drops 0.5ml unit dose | 20 unit dose [PoM] £10.77

▶ **Mydriacyl** (Alcon Laboratories (UK) Ltd)

Tropicamide 5 mg per 1 ml Mydriacyl 0.5% eye drops | 5 ml [PoM] £1.29

Tropicamide 10 mg per 1 ml Mydriacyl 1% eye drops | 5 ml [PoM] £1.60

Phenylephrine with tropicamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, phenylephrine hydrochloride p. 959, tropicamide above.

INDICATIONS AND DOSE

Pre-operative mydriasis | Diagnostic procedures when monotherapy insufficient

TO THE EYE

- ▶ Adult: One insert to be applied into the lower conjunctival sac up to max. 2 hours before procedure; remove insert within 30 minutes of satisfactory mydriasis, and within 2 hours of application

- **DIRECTIONS FOR ADMINISTRATION** Patients with severe dry eyes may require a drop of saline to improve insert tolerance.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ophthalmic insert

- ▶ **Mydriisert** (Spectrum Thea Pharmaceuticals Ltd)
Phenylephrine hydrochloride 5.4 mg, Tropicamide 0.28 mg
Mydriisert 5.4mg / 0.28mg ophthalmic inserts | 20 insert [PoM]
£84.00

DIAGNOSTIC DYES**Fluorescein sodium****INDICATIONS AND DOSE**

Detection of lesions and foreign bodies

TO THE EYE USING EYE DROP

- ▶ Adult: Use sufficient amount to stain damaged areas

MEDICINAL FORMS

- Fluorescein sodium 20 mg per 1 ml Minims fluorescein sodium 2% eye drops 0.5ml unit dose | 20 unit dose [P] £8.89

MIOTICS**Acetylcholine chloride****INDICATIONS AND DOSE**

Cataract surgery | Penetrating keratoplasty | Iridectomy | Anterior segment surgery requiring rapid complete miosis

TO THE EYE

- ▶ Adult: (consult product literature)

- **CAUTIONS** Asthma · gastro-intestinal spasm · heart failure · hyperthyroidism · parkinsonism · peptic ulcer · urinary-tract obstruction

SIDE-EFFECTS

- ▶ Rare Bradycardia · breathing difficulty · flushing · hypotension · sweating
- **PREGNANCY** Avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Avoid unless potential benefit outweighs risk—no information available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Irrigation

- ▶ **Miochol-E** (Bausch & Lomb UK Ltd)
Acetylcholine chloride 20 mg Miochol-E 20mg powder and solvent for solution for intraocular irrigation vials | 1 vial [PoM] £7.28
- ▶ **Miphtel** (Alan Pharmaceuticals)
Acetylcholine chloride 20 mg Miphtel 20mg powder and solvent for solution for intraocular irrigation ampoules | 6 ampoule [PoM]
£6.55 (Hospital only)

SYMPATHOMIMETICS (VASOCONSTRICTOR)**Phenylephrine hydrochloride****INDICATIONS AND DOSE****Mydriasis****TO THE EYE**

- ▶ Child: Apply 1 drop, to be administered before procedure, a drop of proxymetacaine topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging
- ▶ Adult: Apply 1 drop, to be administered before procedure, then apply 1 drop after 60 minutes if required, a drop of topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging

- **CONTRA-INDICATIONS** Hypertension · 10% strength eye drops in neonates, children and the elderly · aneurysms · cardiovascular disease · thyrotoxicosis

- **CAUTIONS** Asthma · cerebral arteriosclerosis (in adults) · corneal epithelial damage · darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage. · diabetes (avoid eye drops in long standing diabetes) · mydriasis can precipitate acute angle-closure glaucoma in a few patients, usually over 60 years and hypermetropic (long-sighted) or children, who are pre-disposed to the condition because of a shallow anterior chamber · mydriasis can precipitate acute angle-closure glaucoma in the very few children who are predisposed to the condition because of a shallow anterior chamber · ocular hyperaemia · susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1 (sympathomimetics).

Phenylephrine may interact with systemically administered monoamine-oxidase inhibitors.

- **SIDE-EFFECTS** Arrhythmias · blurred vision · conjunctivitis on prolonged administration · coronary artery spasm · extrasystoles · hyperaemia on prolonged administration · hypertension · local irritation on prolonged administration · myocardial infarction (usually after use of 10% strength in patients with pre-existing cardiovascular disease) · oedema on prolonged administration · palpitation · photophobia · raised intraocular pressure · tachycardia · transient stinging
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Use only if potential benefit outweighs risk—no information available.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose phenylephrine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **PATIENT AND CARER ADVICE** Patients should be warned not to undertake skilled tasks (e.g. driving) until vision clears after mydriasis.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Disodium edetate, sodium metabisulfite

PHENYLEPHRINE HYDROCHLORIDE (Non-proprietary)

- Phenylephrine hydrochloride 25 mg per 1 ml Minims phenylephrine hydrochloride 2.5% eye drops 0.5ml unit dose | 20 unit dose [P] £11.41
- Phenylephrine hydrochloride 100 mg per 1 ml Minims phenylephrine hydrochloride 10% eye drops 0.5ml unit dose | 20 unit dose [P] £11.41

4.1 Post-operative pain and inflammation

Eye, surgical and peri-operative drug use

Ocular peri-operative drugs

Drugs used to prepare the eye for surgery, drugs that are injected into the anterior chamber at the time of surgery, and those used after eye surgery, are included here.

Cefuroxime p. 955, administered by intra-ocular injection into the anterior chamber of the eye (intracameral use), is used for the prophylaxis of endophthalmitis after cataract surgery.

Non-steroidal anti-inflammatory eye drops such as diclofenac sodium p. 961, flurbiprofen p. 961, ketorolac trometamol p. 961, and nepafenac p. 961, are used for the prophylaxis and treatment of inflammation, pain, and other symptoms associated with ocular surgery or laser treatment of the eye. Bromfenac p. 961 is used for the treatment of postoperative inflammation following cataract surgery. Diclofenac sodium p. 961 and flurbiprofen are also used to prevent miosis during ocular surgery.

Apraclonidine p. 963, an α_2 -adrenoreceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used to control increases in intra-ocular pressure associated with ocular surgery and as short-term treatment to reduce intraocular pressure prior to surgery.

Acetylcholine chloride p. 959, administered into the anterior chamber of the eye during surgery, rapidly produces miosis which lasts approximately 20 minutes. If prolonged miosis is required, it can be applied again.

Intra-ocular sodium hyaluronate p. 953 and balanced salt solution are used during surgical procedures on the eye.

Povidone-iodine is used for peri-ocular and conjunctival antiseptics before ocular surgery to support postoperative infection control.

Local anaesthetics

Oxybuprocaine hydrochloride below and tetracaine p. 961 are widely used topical local anaesthetics. Proxymetacaine hydrochloride below causes less initial stinging and is useful for children. Oxybuprocaine hydrochloride below or a combined preparation of lidocaine hydrochloride and fluorescein sodium p. 960 is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine hydrochloride, with or without adrenaline/epinephrine p. 196, is injected into the eyelids for minor surgery. Local anaesthetics should never be used for the management of ocular symptoms.

CORTICOSTEROIDS

Loteprednol etabonate

INDICATIONS AND DOSE

Treatment of post-operative inflammation following ocular surgery

TO THE EYE

- ▶ Adult: Apply 4 times a day for maximum duration of treatment of 14 days, to be started 24 hours after surgery

- **SIDE-EFFECTS** Corneal thinning · scleral thinning

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

▶ **Lotemax** (Bausch & Lomb UK Ltd)

Loteprednol etabonate 5 mg per 1 ml Lotemax 0.5% eye drops | 5 ml **[PoM]** £5.50 DT price = £5.50

5 Glaucoma and ocular hypertension

Glaucoma

Glaucoma describes a group of disorders characterised by a loss of visual field associated with cupping of the optic disc and optic nerve damage. While glaucoma is generally associated with raised intra-ocular pressure, it can occur when the intra-ocular pressure is within the normal range.

The most common form of glaucoma is primary open-angle glaucoma (chronic open-angle glaucoma), where drainage of the aqueous humour through the trabecular meshwork is restricted. The condition is often asymptomatic, but the patient may present with significant loss of visual-field. Patients with ocular hypertension are at high risk of developing primary open-angle glaucoma.

Drugs that reduce intra-ocular pressure by different mechanisms are available for managing ocular hypertension and glaucoma. A topical beta-blocker or a prostaglandin analogue is usually the drug of first choice for the treatment of ocular hypertension. A prostaglandin analogue should be used to manage patients with early or moderate primary open-angle glaucoma. After checking compliance and eye drop instillation technique, it may be necessary to combine these drugs or add others, such as sympathomimetics, carbonic anhydrase inhibitors, or miotics to control intra-ocular pressure.

Acute angle-closure glaucoma

Acute angle-closure glaucoma occurs when the outflow of aqueous humour from the eye is obstructed by bowing of the iris against the trabecular meshwork; it is a medical emergency that requires urgent reduction of intra-ocular pressure to prevent loss of vision. Patients with acute angle-closure glaucoma should be referred immediately for specialist ophthalmology assessment and treatment.

Standard antiglaucoma therapy is used if supplementary treatment is required after iridotomy, iridectomy, laser treatment, or drainage surgery in either primary open-angle or acute angle-closure glaucoma.

Beta-blockers

Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in *primary open-angle glaucoma*, probably by reducing the rate of production of aqueous humour. Administration by mouth also reduces intra-ocular pressure but this route is not used since side-effects may be troublesome.

Beta-blockers used as eye drops include betaxolol p. 964, carteolol hydrochloride p. 964, levobunolol hydrochloride p. 964, and timolol maleate p. 965.

Prostaglandin analogues and prostamides

The prostaglandin analogues latanoprost p. 969, tafuprost p. 969 and travoprost p. 970, and the synthetic prostamide, bimatoprost p. 968, increase uveoscleral outflow and subsequently reduce intra-ocular pressure. They are used to reduce intra-ocular pressure in ocular hypertension or open-angle glaucoma.

Sympathomimetics

Brimonidine tartrate p. 963, a selective alpha₂-adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow. It is licensed for the reduction of intra-ocular pressure in open-angle glaucoma or ocular hypertension in patients for whom beta-blockers are inappropriate; it may also be used as adjunctive therapy when intra-ocular pressure is inadequately controlled by other anti-glaucoma therapy.

Apraclonidine p. 963 is another alpha₂-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. Eye drops containing apraclonidine p. 963 0.5% are used short-term to delay laser treatment or surgery in patients with glaucoma not adequately controlled by another drug; eye drops containing 1% are used for control of intra-ocular pressure after anterior segment laser surgery.

Apraclonidine may not provide additional benefit in patients already using two drugs that suppress the production of aqueous humour.

Carbonic anhydrase inhibitors and systemic drugs

The **carbonic anhydrase inhibitors**, acetazolamide p. 965, brinzolamide p. 966, and dorzolamide p. 967, reduce intra-ocular pressure by reducing aqueous humour production. Systemic use of acetazolamide also produces weak diuresis.

Acetazolamide is given by mouth or by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is used as an adjunct to other treatment for reducing intra-ocular pressure. Acetazolamide is not generally recommended for long-term use.

Dorzolamide and brinzolamide are topical carbonic anhydrase inhibitors. They are licensed for use in patients resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Brinzolamide can also be used as an adjunct to a prostaglandin analogue. Systemic

absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

The **osmotic diuretics**, intravenous hypertonic mannitol p. 202 or glycerol by mouth are useful short-term ocular hypotensive drugs.

Miotics

Miotics act by opening the inefficient drainage channels in the trabecular meshwork.

Pilocarpine p. 967, a miotic, is not commonly used for the treatment of primary open-angle glaucoma because side-effects are poorly tolerated. It is used mainly in the treatment of primary angle-closure glaucoma and in some secondary glaucomas.

ALPHA₂-ADRENOCEPTOR AGONISTS

Apraclonidine

- **DRUG ACTION** Apraclonidine is an alpha₂-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. It is a derivative of clonidine.

INDICATIONS AND DOSE

Control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery TO THE EYE

- ▶ **Adult:** Apply 1 drop 1 hour before laser procedure, then 1 drop immediately after completion of procedure, 1% eye drops to be administered

Short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug TO THE EYE

- ▶ **Adult:** Apply 1 drop 3 times a day usually for maximum 1 month, 0.5% eye drops to be administered, may not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

- **CONTRA-INDICATIONS** History of severe or unstable and uncontrolled cardiovascular disease
- **CAUTIONS** Cerebrovascular disease · depression · heart failure · history of angina · hypertension · loss of effect may occur over time · Parkinson's syndrome · Raynaud's syndrome · recent myocardial infarction · reduction in vision in end-stage glaucoma (suspend treatment) · severe coronary insufficiency · thromboangiitis obliterans · vasovagal attack
- **INTERACTIONS** → Appendix 1 (apraclonidine).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Conjunctivitis · dry eye · ocular intolerance · rhinitis · taste disturbance
 - ▶ **Uncommon** Asthma · blepharitis · blepharospasm · chest pain · conjunctival vascular disorders · corneal erosion and infiltrates · dyspnoea · eyelid ptosis or retraction · impaired co-ordination · irritability · keratitis · keratopathy · myalgia · mydriasis · nervousness · parosmia · photophobia · rhinorrhoea · throat irritation · visual impairment
- **SIDE-EFFECTS, FURTHER INFORMATION**

Ocular intolerance Withdraw if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur.

Systemic effects Since absorption may follow topical application, see clonidine hydrochloride p. 137.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **RENAL IMPAIRMENT** Use with caution in chronic renal failure.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor intra-ocular pressure and visual fields.
 - ▶ Monitor for excessive reduction in intra-ocular pressure following peri-operative use.
- **PATIENT AND CARER EDUCATION**

Drowsiness may affect performance of skilled tasks (e.g. driving).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- ▶ **Iopidine** (Alcon Laboratories (UK) Ltd)

Apraclonidine (as Apraclonidine hydrochloride) 5 mg per 1 ml iopidine 5mg/ml eye drops | 5 ml [PoM] £10.88 DT price = £10.88

▶ Adult: Apply once daily

TIOPEX[®]

Reduction of intra-ocular pressure in primary open-angle glaucoma

TO THE EYE

▶ Adult: Apply once daily, to be applied in the morning

- **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers · bradycardia · heart block
- **CAUTIONS** Also consider cautions listed for systemically administered beta blockers · patients with corneal disease
- **INTERACTIONS** → Appendix 1 (beta blockers). Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind.
- **SIDE-EFFECTS** Anaphylaxis · blepharoconjunctivitis · burning · corneal disorders · dry eyes · erythema · itching · ocular stinging · pain
- **SIDE-EFFECTS, FURTHER INFORMATION** Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose timolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

NATIONAL FUNDING/ACCESS DECISIONS**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (February 2014) that timolol gel eye drops (*TiopeX*[®]) are accepted for restricted use within NHS Scotland for the reduction of elevated intraocular pressure in patients with ocular hypertension or chronic open angle glaucoma who have proven sensitivity to preservatives.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

▶ **TIMOLOL MALEATE (Non-proprietary)**

Timolol (as Timolol maleate) 2.5 mg per 1 ml Timolol 0.25% eye drops | 5 ml [PoM] £1.80 DT price = £1.36

Timolol (as Timolol maleate) 5 mg per 1 ml Timolol 0.5% eye drops | 5 ml [PoM] £1.95 DT price = £1.33

▶ **Timoptol** (Merck Sharp & Dohme Ltd)

Timolol (as Timolol maleate) 2.5 mg per 1 ml Timoptol 0.25% eye drops | 5 ml [PoM] £3.12 DT price = £1.36

Timoptol Unit Dose 0.25% ophthalmic solution 0.2ml unit dose | 30 unit dose [PoM] £8.45

Timolol (as Timolol maleate) 5 mg per 1 ml Timoptol 0.5% eye drops | 5 ml [PoM] £3.12 DT price = £1.33

Timoptol Unit Dose 0.5% ophthalmic solution 0.2ml unit dose | 30 unit dose [PoM] £9.65 DT price = £9.65

▶ **TiopeX** (Spectrum Thea Pharmaceuticals Ltd)

Timolol (as Timolol maleate) 1 mg per 1 gram TiopeX 1mg/g eye gel 0.4g unit dose | 30 unit dose [PoM] £7.49 DT price = £7.49

Eye gel

EXCIPIENTS: May contain Benzododecinium bromide

▶ **Timoptol-LA** (Merck Sharp & Dohme Ltd)

Timolol (as Timolol maleate) 2.5 mg per 1 ml Timoptol-LA 0.25% ophthalmic gel-forming solution | 2.5 ml [PoM] £3.12 DT price = £3.12

Timolol (as Timolol maleate) 5 mg per 1 ml Timoptol-LA 0.5% ophthalmic gel-forming solution | 2.5 ml [PoM] £3.12 DT price = £3.12

Also available in combination with *Bimatoprost*, p. 968 · *Brimonidine*, p. 964 · *Brinzolamide*, p. 966 · *Dorzolamide*, p. 967 · *Latanoprost*, p. 969 · *Travoprost*, p. 970

CARBONIC ANHYDRASE INHIBITORS**Acetazolamide****INDICATIONS AND DOSE**

Reduction of intra-ocular pressure in open-angle glaucoma |

Reduction of intra-ocular pressure in secondary glaucoma |

Reduction of intra-ocular pressure in angle-closure glaucoma

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES OR BY

INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION

▶ Adult: 0.25–1 g daily in divided doses, intramuscular injection preferably avoided because of alkalinity

Glaucoma

BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Adult: 1–2 capsules daily

- **CONTRA-INDICATIONS** Adrenocortical insufficiency · hyperchloraemic acidosis · hypokalaemia · hyponatraemia · long-term administration in chronic angle-closure glaucoma
- **CAUTIONS** Avoid extravasation at injection site (risk of necrosis) · diabetes mellitus · elderly · impaired alveolar ventilation (risk of acidosis) · not generally recommended for long-term use · pulmonary obstruction (risk of acidosis) · renal calculi
- **INTERACTIONS** → Appendix 1 (diuretics).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Ataxia · depression · diarrhoea · dizziness · excitement · fatigue · flushing · headache · irritability · loss of appetite · nausea · paraesthesia ·

polyuria · reduced libido · taste disturbance · thirst · vomiting

- ▶ **Uncommon** Blood disorders · bone marrow suppression · confusion · crystalluria · drowsiness · electrolyte disturbances on long-term therapy · fever · glycosuria · haematuria · hearing disturbances · melaena · metabolic acidosis · rash · renal calculi · renal colic · renal failure · renal lesions · Stevens-Johnson syndrome · toxic epidermal necrosis · ureteric colic
- ▶ **Rare** Cholestatic jaundice · convulsions · flaccid paralysis · fulminant hepatic necrosis · hepatitis · photosensitivity
- ▶ **Frequency not known** Transient myopia

SIDE-EFFECTS, FURTHER INFORMATION

Acetazolamide is a sulfonamide derivative; blood disorders, rashes, and other sulfonamide-related side-effects occur occasionally—patients should be told to report any unusual skin rash.

If electrolyte disturbances and metabolic acidosis occur, these can be corrected by administering potassium bicarbonate (as effervescent potassium tablets).

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
- **PREGNANCY** Manufacturer advises avoid, especially in first trimester (toxicity in *animal* studies).
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Avoid—risk of metabolic acidosis.
- **MONITORING REQUIREMENTS** Monitor blood count and plasma electrolyte concentrations with prolonged use.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 3

▶ ACETAZOLAMIDE (Non-proprietary)

Acetazolamide 250 mg Acetazolamide 250mg tablets | 100 tablet [PoM] no price available | 112 tablet [PoM] £97.64 DT price = £86.50

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 3, 25

▶ Diamox SR (AMCo)

Acetazolamide 250 mg Diamox SR 250mg capsules | 30 capsule [PoM] £16.66 DT price = £16.66

- ▶ Brands may include Eytazox

Powder for solution for injection

▶ Diamox (AMCo)

Acetazolamide 500 mg Diamox Sodium Parenteral 500mg powder for solution for injection vials | 1 vial [PoM] £14.76

Brinzolamide

INDICATIONS AND DOSE

Reduction of intra-ocular pressure in ocular hypertension and open-angle glaucoma either as adjunct to beta-blockers or prostaglandin analogues or used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated

TO THE EYE

- ▶ **Adult:** Apply twice daily, then increased if necessary up to 3 times a day

- **CONTRA-INDICATIONS** Hyperchloraemic acidosis
- **CAUTIONS** Renal tubular immaturity or abnormality · systemic absorption follows topical application
- **INTERACTIONS** → Appendix 1 (brinzolamide). Since systemic absorption may follow topical application of brinzolamide to the eye, the possibility of interactions should be borne in mind.

● SIDE-EFFECTS

- ▶ **Common or very common** Corneal erosion · corneal oedema · dry mouth · headache · ocular disturbances · photophobia · reduced visual acuity · taste disturbances
- ▶ **Uncommon** Alopecia · amnesia · bradycardia · chest pain · cough · decreased libido · depression · diarrhoea · dizziness · drowsiness · dyspepsia · dyspnoea · epistaxis · erectile dysfunction · flatulence · malaise · nasal dryness · nausea · nervousness · oesophagitis · oral hypoaesthesia and paraesthesia · palpitation · paraesthesia · pharyngitis · renal pain · sinusitis · sleep disturbances · throat irritation · tinnitus · upper respiratory tract congestion · vomiting
- ▶ **Frequency not known** Arrhythmia · asthma · dermatitis · erythema · hypertension · peripheral oedema · rhinitis · tachycardia · tremor · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Use only if benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

▶ BRINZOLAMIDE (Non-proprietary)

Brinzolamide 10 mg per 1 ml Brinzolamide 10mg/ml eye drops |

5 ml [PoM] £6.92 DT price = £6.92

▶ Azopt (Alcon Laboratories (UK) Ltd)

Brinzolamide 10 mg per 1 ml Azopt 10mg/ml eye drops |

5 ml [PoM] £6.92 DT price = £6.92

Brinzolamide with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, brinzolamide above, timolol maleate p. 965.

INDICATIONS AND DOSE

Raised intra-ocular pressure in open-angle glaucoma or ocular hypertension when beta-blocker alone not adequate

TO THE EYE

- ▶ **Adult:** Apply twice daily

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

▶ Azarga (Alcon Laboratories (UK) Ltd)

Brinzolamide 10 mg per 1 ml, Timolol (as Timolol maleate) 5 mg

per 1 ml Azarga 10mg/ml / 5mg/ml eye drops | 5 ml [PoM] £11.05 DT price = £11.05

Dorzolamide

INDICATIONS AND DOSE

Raised intra-ocular pressure in ocular hypertension used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated | Open-angle glaucoma used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated | Pseudo-exfoliative glaucoma used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated

TO THE EYE

► Adult: Apply 3 times a day

Raised intra-ocular pressure in ocular hypertension as adjunct to beta-blocker | Open-angle glaucoma as adjunct to beta-blocker | Pseudo-exfoliative glaucoma as adjunct to beta-blocker

TO THE EYE

► Adult: Apply twice daily

- **CONTRA-INDICATIONS** Hyperchloraemic acidosis
- **CAUTIONS** Chronic corneal defects · history of intra-ocular surgery · history of renal calculi · low endothelial cell count · systemic absorption follows topical application
- **INTERACTIONS** → Appendix 1 (dorzolamide). Since systemic absorption may follow topical application of dorzolamide to the eye, the possibility of interactions should be borne in mind.
- **SIDE-EFFECTS**
 - **Common or very common** Asthenia · bitter taste · blurred vision · conjunctivitis · eyelid inflammation · headache · lacrimation · nausea · throat irritation · superficial punctate keratitis
 - **Uncommon** Iridocyclitis
 - **Rare** Contact dermatitis · corneal oedema · dizziness · dry mouth · epistaxis · eyelid crusting · paraesthesia · Stevens-Johnson syndrome · throat irritation · toxic epidermal necrolysis · transient myopia · urolithiasis

SIDE-EFFECTS, FURTHER INFORMATION

Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose dorzolamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

► DORZOLAMIDE (Non-proprietary)

Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml Dorzolamide 2% eye drops | 5 ml [PoM] £6.33 DT price = £2.33

► **Trusopt** (Merck Sharp & Dohme Ltd)

Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml Trusopt 2% eye drops | 5 ml [PoM] £6.33 DT price = £2.33

Trusopt 2% eye drops 0.2ml unit dose preservative free | 60 unit dose [PoM] £24.18 DT price = £24.18

Dorzolamide with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, timolol maleate p. 965, dorzolamide above.

INDICATIONS AND DOSE

Raised intra-ocular pressure in ocular hypertension when beta-blockers alone not adequate | Raised intra-ocular pressure in open-angle glaucoma when beta-blockers alone not adequate | Raised intra-ocular pressure in pseudo-exfoliative glaucoma when beta-blockers alone not adequate

TO THE EYE

► Adult: Apply twice daily

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose dorzolamide with timolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

► DORZOLAMIDE WITH TIMOLOL (Non-proprietary)

Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml Dorzolamide 2% / Timolol 0.5% eye drops | 5 ml [PoM] £27.16 DT price = £2.58
Dorzolamide 2% / Timolol 0.5% eye drops 0.2ml unit dose preservative free | 60 unit dose [PoM] £27.16 DT price = £28.59

► **Cosopt** (Merck Sharp & Dohme Ltd)

Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml Cosopt eye drops 0.2ml unit dose preservative free | 60 unit dose [PoM] £28.59 DT price = £28.59

Cosopt eye drops | 5 ml [PoM] £10.05 DT price = £2.58

PARASYMPATHOMIMETICS

Pilocarpine

- **DRUG ACTION** Pilocarpine acts by opening the inefficient drainage channels in the trabecular meshwork.

INDICATIONS AND DOSE

Primary angle-closure glaucoma | Some secondary glaucomas

TO THE EYE

► Adult: Apply up to 4 times a day

- **CONTRA-INDICATIONS** Acute inflammatory disease of the anterior segment · acute iritis · anterior uveitis · conditions where pupillary constriction is undesirable · some forms of secondary glaucoma (where pupillary constriction is undesirable)
- **CAUTIONS** A darkly pigmented iris may require a higher concentration of the miotic or more frequent administration and care should be taken to avoid overdosage · asthma · cardiac disease · care in conjunctival damage · care in corneal damage · epilepsy · gastro-intestinal spasm · hypertension · hyperthyroidism · hypotension · marked vasomotor instability · Parkinson's disease · peptic ulceration · retinal detachment has occurred in susceptible individuals and those with retinal disease · urinary-tract obstruction
- **INTERACTIONS** → Appendix 1 (parasympathomimetics). Systemic effects rare after following application to the eye.
- **SIDE-EFFECTS**
 - **Rare** Parasympathomimetics systemic side effects
 - **Frequency not known** Blurred vision · ciliary spasm (leads to headache and browache which may be more severe in

the initial 2–4 weeks of treatment—a particular disadvantage in patients under 40 years of age) · conjunctival vascular congestion · lens changes (with chronic use) · myopia · ocular burning · ocular itching · pupillary block · smarting · vitreous haemorrhage

- **PREGNANCY** Avoid unless the potential benefit outweighs risk—limited information available.
- **BREAST FEEDING** Avoid unless the potential benefit outweighs risk—no information available.
- **PRE-TREATMENT SCREENING** Fundus examination is advised before starting treatment with a miotic (retinal detachment has occurred).
- **MONITORING REQUIREMENTS** Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose pilocarpine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **PATIENT AND CARER ADVICE** Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

▶ Pilocarpine (Non-proprietary)

- **Pilocarpine hydrochloride 10 mg per 1 ml** Pilocarpine hydrochloride 1% eye drops | 10 ml [PoM] £3.15 DT price = £2.92
- **Pilocarpine hydrochloride 20 mg per 1 ml** Pilocarpine hydrochloride 2% eye drops | 10 ml [PoM] £3.63 DT price = £3.63
- **Pilocarpine nitrate 20 mg per 1 ml** Minims pilocarpine nitrate 2% eye drops 0.5ml unit dose | 20 unit dose [PoM] £11.99
- **Pilocarpine hydrochloride 40 mg per 1 ml** Pilocarpine hydrochloride 4% eye drops | 10 ml [PoM] £5.40 DT price = £4.35

PROSTAGLANDIN ANALOGUES AND PROSTAMIDES

Bimatoprost

INDICATIONS AND DOSE

Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension

TO THE EYE

- ▶ **Adult:** Apply once daily, to be administered preferably in the evening

- **CAUTIONS** Angle-closure glaucoma (no experience of use) · aphakia · asthma · chronic obstructive pulmonary disease · compromised respiratory function · congenital glaucoma (no experience of use) · contact lens wearers · history of significant ocular viral infections · inflammatory ocular conditions (no experience of use) · narrow-angle glaucoma (no experience of use) · neovascular glaucoma (no experience of use) · predisposition to bradycardia · predisposition to hypotension · pseudophakia with torn posterior lens capsule or anterior chamber lenses · risk factors for cystoid macular oedema · risk factors for iritis · risk factors for uveitis
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Blepharitis · blood pressure changes · brown pigmentation particularly in those with mixed-colour irides · conjunctival disorders · corneal erosion · darkening, thickening and lengthening of eye lashes · eyelash and vellus hair changes · headache · ocular discomfort · photophobia · pigmentation of periocular skin

- punctate keratitis · reduced visual acuity · transient punctate epithelial erosion
- ▶ **Uncommon** Asthenopia · dizziness · skin rash
- ▶ **Rare** Arthralgia · darkening of palpebral skin · facial oedema · iritis · macular oedema · myalgia · uveitis
- ▶ **Very rare** Chest pain · exacerbation of angina · palpitation · periorbital changes resulting in deepening of the eyelid sulcus
- ▶ **Pregnancy not known** Asthma · blepharospasm · bradycardia · dyspnoea · exacerbation of asthma · exacerbation of COPD · eyelid retraction · malaise · nausea · ocular infection · reactivation of previous corneal infiltrates · retinal haemorrhage
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment—no information available.
- **RENAL IMPAIRMENT** Use with caution—no information available.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose bimatoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available

● PATIENT AND CARER ADVICE

Changes to eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2013) that bimatoprost 300 micrograms/mL preservative-free eye drops (*Lumigan*[®] single-dose eye drops) are accepted for restricted use within NHS Scotland for the reduction of elevated intra-ocular pressure in chronic open-angle glaucoma and ocular hypertension (as monotherapy or as adjunctive therapy to beta-blockers) in adults who have proven sensitivity to benzalkonium chloride.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

▶ Lumigan (Allergan Ltd)

- **Bimatoprost 100 microgram per 1 ml** Lumigan 100micrograms/ml eye drops | 3 ml [PoM] £11.71 DT price = £11.71 | 9 ml [PoM] £35.13
- **Bimatoprost 300 microgram per 1 ml** Lumigan 300micrograms/ml eye drops | 3 ml [PoM] £10.30 DT price = £10.30 | 9 ml [PoM] £30.90
- Lumigan 300micrograms/ml eye drops 0.4ml unit dose | 30 unit dose [PoM] £13.75 DT price = £13.75

Bimatoprost with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, bimatoprost above, timolol maleate p. 965.

INDICATIONS AND DOSE

Raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate

TO THE EYE

- ▶ **Adult:** Apply once daily

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (October 2013) that *Ganfort*[®] unit dose eye drops are accepted for restricted use within NHS Scotland for the reduction of intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension insufficiently responsive to topical beta-blockers or prostaglandin analogues who have proven sensitivity to preservatives.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

► *Ganfort* (Allergan Ltd)

Bimatoprost 300 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml *Ganfort* 0.3mg/ml / 5mg/ml eye drops | 3 ml [PoM] £13.95 DT price = £13.95 | 9 ml [PoM] £37.59
Ganfort 0.3mg/ml / 5mg/ml eye drops 0.4ml unit dose | 30 unit dose [PoM] £17.50

Latanoprost

INDICATIONS AND DOSE

Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension

TO THE EYE

► **Adult:** Apply daily, to be administered preferably in the evening

- **CONTRA-INDICATIONS** Active herpes simplex keratitis · history of recurrent herpetic keratitis associated with prostaglandin analogues
- **CAUTIONS** Angle-closure glaucoma (no experience of use) · aphakia · asthma · chronic obstructive pulmonary disease · compromised respiratory function · congenital glaucoma (no experience of use) · contact lens wearers · do not use within 5 minutes of thiomersal-containing preparations · history of significant ocular viral infections · inflammatory ocular conditions (no experience of use) · narrow-angle glaucoma (no experience of use) · neovascular glaucoma (no experience of use) · peri-operative period of cataract surgery · pseudophakia with torn posterior lens capsule or anterior chamber lenses · risk factors for cystoid macular oedema · risk factors for iritis · risk factors for uveitis
- **SIDE-EFFECTS**
 - **Common or very common** Blepharitis · blood pressure changes · brown pigmentation particularly in those with mixed-colour irides · conjunctival disorders · corneal erosion · darkening, thickening and lengthening of eye lashes · eyelash and vellus hair changes · headache · ocular discomfort · photophobia · pigmentation of periocular skin · punctate keratitis · reduced visual acuity · transient punctate epithelial erosion
 - **Uncommon** Asthenopia · dizziness · skin rash
 - **Rare** Arthralgia · darkening of palpebral skin · facial oedema · iritis · macular oedema · myalgia · uveitis
 - **Very rare** Chest pain · exacerbation of angina · palpitation · periorbital changes resulting in deepening of the eyelid sulcus
 - **Frequency not known** Asthma · dyspnoea · exacerbation of asthma · exacerbation of COPD · iris cyst · nasopharyngitis · pyrexia
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** May be present in milk—manufacturer advises avoid.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose latanoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available

● PATIENT AND CARER ADVICE

Changes in eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only.  - ▶ **Saftutan** (Merck Sharp & Dohme Ltd)
Tafluprost 15 microgram per 1 ml Saftutan 15micrograms/ml eye drops 0.3ml unit dose | 30 unit dose **[PoM]** £12.20 DT price = £12.20
- **CAUTIONS** history of significant ocular viral infections · angle-closure glaucoma (no experience of use) · aphakia · asthma · chronic obstructive pulmonary disease · compromised respiratory function · congenital glaucoma (no experience of use) · contact lens wearers · inflammatory ocular conditions (no experience of use) · narrow-angle glaucoma (no experience of use) · neovascular glaucoma (no experience of use) · pseudophakia with torn posterior lens capsule or anterior chamber lenses · risk factors for cystoid macular oedema · risk factors for iritis · risk factors for uveitis
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Blepharitis · blood pressure changes · brown pigmentation particularly in those with mixed-colour irides · conjunctival disorders · corneal erosion · darkening, thickening and lengthening of eye lashes · eyelash and vellus hair changes · headache · ocular discomfort · photophobia · pigmentation of periocular skin · punctate keratitis · reduced visual acuity · transient punctate epithelial erosion
 - ▶ **Uncommon** Asthenopia · dizziness · skin rash
 - ▶ **Rare** Arthralgia · darkening of palpebral skin · facial oedema · iritis · macular oedema · myalgia · uveitis
 - ▶ **Very rare** Chest pain · exacerbation of angina · palpitation · periorbital changes resulting in deepening of the eyelid sulcus
 - ▶ **Frequency not known** Asthma · bradycardia · cataract · constipation · cough · dry mouth · dysgeusia · dysphonia · dyspnoea · exacerbation of asthma · exacerbation of COPD · gastro-intestinal disorders · herpes simplex · malaise · mydriasis · nasal congestion · oropharyngeal pain · peptic ulcer reactivation · photopsia · throat irritation · tinnitus · vertigo
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Present in milk in *animal* studies; manufacturer advises avoid.
- **PATIENT AND CARER ADVICE**

Changes to eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Eye drops
EXCIPIENTS: May contain Propylene glycol

 - ▶ **Travatan** (Alcon Laboratories (UK) Ltd)
Travastop 40 microgram per 1 ml Travatan 40micrograms/ml eye drops | 2.5 ml **[PoM]** £10.95 DT price = £10.95

Timolol with travoprost

The properties listed below are those particular to the combination only. For the properties of the components please consider, timolol maleate p. 965, travoprost above.

INDICATIONS AND DOSE

Raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate

TO THE EYE

- ▶ **Adult:** Apply once daily

Travoprost

INDICATIONS AND DOSE

Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension

TO THE EYE

- ▶ **Adult:** Apply daily, to be administered preferably in the evening

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Propylene glycol

► **DuoTrav** (Alcon Laboratories (UK) Ltd)

Timolol (as **Timolol maleate**) 5 mg per 1 ml, **Travoprost** 40 microgram per 1 ml DuoTrav 40micrograms/ml / 5mg/ml eye drops | 2.5 ml [PoM] £13.95 DT price = £13.95 | 7.5 ml [PoM] £39.68

6 Retinal disorders

6.1 Macular degeneration

Subfoveal choroidal neovascularisation

Aflibercept below, pegaptanib sodium p. 972 and ranibizumab p. 973 are vascular endothelial growth factor inhibitors licensed for the treatment of neovascular (wet) age-related macular degeneration. Aflibercept is also licensed for the treatment of macular oedema secondary to central retinal vein occlusion, and diabetic macular oedema; ranibizumab is also licensed for the treatment of visual impairment due to diabetic macular oedema, macular oedema secondary to branch or central retinal vein occlusion, and choroidal neovascularisation secondary to pathologic myopia. Ranibizumab can be administered concomitantly with laser photocoagulation for the treatment of diabetic macular oedema and for macular oedema secondary to branch retinal vein occlusion.

PHOTOSENSITISERS

Verteporfin

● **DRUG ACTION** Following intravenous infusion, verteporfin is activated by local irradiation using non-thermal red light to produce cytotoxic derivatives.

INDICATIONS AND DOSE

Photodynamic treatment of age-related macular degeneration associated with predominantly classic subfoveal choroidal neovascularisation or with pathological myopia (specialist use only)

BY INTRAVENOUS INFUSION

► Adult: 6 mg/m², dose to be given over 10 minutes

- **CONTRA-INDICATIONS** Acute porphyria
- **CAUTIONS** Avoid extravasation · biliary obstruction · photosensitivity
- **INTERACTIONS** Caution on concomitant use with other photosensitising drugs.
- **SIDE-EFFECTS**
 - **Common or very common** Back pain · flashing lights · hypercholesterolaemia · malaise · nausea · photosensitivity · reduced visual acuity · visual disturbances · visual-field defects
 - **Uncommon** Hyperaesthesia · hypertension · pyrexia · retinal detachment · subretinal, retinal or vitreous haemorrhage
 - **Rare** Retinal or choroidal vessel non-perfusion
 - **Frequency not known** Chest pain · macular oedema · myocardial infarction · retinal oedema · vasovagal reactions
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk (teratogenic in *animal studies*).

- **BREAST FEEDING** No information available—manufacturer advises avoid breast-feeding for 48 hours after administration.
- **HEPATIC IMPAIRMENT** Use with caution in moderate hepatic impairment. Avoid in severe hepatic impairment.
- **DIRECTIONS FOR ADMINISTRATION** For information on administration and light activation, consult product literature. For *intravenous infusion* (*Visudyne*®), give intermittently in Glucose 5%; reconstitute each 15 mg with 7 ml water for injections to produce a 2 mg/ml solution then dilute requisite dose with infusion fluid to a final volume of 30 mL and give over 10 minutes; protect infusion from light and administer within 4 hours of reconstitution. Incompatible with sodium chloride infusion.
- **PATIENT AND CARER ADVICE** Photosensitivity—avoid exposure of unprotected skin and eyes to bright light during infusion and for 48 hours afterwards.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

 - **Verteporfin photodynamic therapy for wet age-related macular degeneration (September 2003) NICE TA68** Photodynamic therapy is recommended for wet age-related macular degeneration with a confirmed diagnosis of classic (no occult) subfoveal choroidal neovascularisation and best-corrected visual acuity of 6/60 or better. Photodynamic therapy is **not** recommended for wet age-related macular degeneration with predominantly classic but partly occult subfoveal choroidal neovascularisation *except* in clinical studies. www.nice.org.uk/TA68

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

EXCIPIENTS: May contain Butylated hydroxytoluene

► **Visudyne** (Novartis Pharmaceuticals UK Ltd)

Verteporfin 15 mg Visudyne 15mg powder for solution for infusion vials | 1 vial [PoM] £850.00 (Hospital only)

VASCULAR ENDOTHELIAL GROWTH FACTOR INHIBITORS

Aflibercept

● **DRUG ACTION** Aflibercept is a recombinant fusion protein that acts as a soluble decoy receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placental growth factor (PlGF). Aflibercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels that supply tumours with oxygen and nutrients.

INDICATIONS AND DOSE

Neovascular (wet) age-related macular degeneration (specialist use only)

BY INTRAVITREAL INJECTION

► Adult: Initially 2 mg once a month for 3 months, to be injected into the affected eye, then 2 mg every 2 months, review treatment frequency after 12 months

Macular oedema secondary to central retinal vein occlusion (specialist use only)

BY INTRAVITREAL INJECTION

► Adult: Initially 2 mg once a month, to be injected into the affected eye, monitor visual and anatomic outcomes monthly; continue treatment until visual and anatomic outcomes are stable for 3 monthly assessments (discontinue treatment if no improvement in visual and anatomic outcomes after initial 3 injections); if necessary subsequent doses may be given at least 1 month apart

continued →

Diabetic macular oedema (specialist use only)**BY INTRAVITREAL INJECTION**

► **Adult:** Initially 2 mg once a month for 5 months, then maintenance 2 mg every 2 months, to be injected into the affected eye, review treatment frequency after 12 months (discontinue treatment if no improvement in visual and anatomic outcomes)

- **CONTRA-INDICATIONS** Clinical signs of irreversible ischaemic visual function loss · ocular or periocular infection · severe intra-ocular inflammation
- **CAUTIONS** Active systemic infection · diabetic patients with uncontrolled hypertension · discontinue treatment if stage 3 or 4 macular holes develop—consult product literature for full details · discontinue treatment in the event of a retinal break—consult product literature for full details · discontinue treatment in the event of rhegmatogenous retinal detachment—consult product literature for full details · patients at risk of retinal pigment epithelial tear · poorly controlled glaucoma · recent history of myocardial infarction · recent history of stroke · recent history of transient ischaemic attack

CAUTIONS, FURTHER INFORMATION

Aflibercept is given by intravitreal injection by specialists experienced in the management of this condition. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.

● **SIDE-EFFECTS**● **SPECIFIC SIDE-EFFECTS**► **Common or very common**

► **With intravitreal use** blurred vision · cataract formation · conjunctival haemorrhage · conjunctival hyperaemia · corneal abrasion or oedema · corneal erosion · eye pain · eyelid oedema · foreign body sensation in eye · increased lacrimation · injection-site haemorrhage · injection-site pain · ocular hyperaemia · punctate keratitis · raised intra-ocular pressure · reduced visual acuity · retinal degeneration · retinal pigment epithelium detachment · retinal pigment epithelium tear · vitreous detachment · vitreous floaters · vitreous haemorrhage

► **Uncommon**

► **With intravitreal use** anterior chamber flare · blindness · corneal epithelium defect · eyelid irritation · iridocyclitis · iritis · lenticular opacities · retinal detachment · retinal tear · uveitis

► **Rare**

► **With intravitreal use** hypopyon · vitritis

● **CONCEPTION AND CONTRACEPTION** Manufacturer recommends women use effective contraception during and for at least 3 months after treatment.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **MONITORING REQUIREMENTS** Monitor intra-ocular pressure following injection.

● **DIRECTIONS FOR ADMINISTRATION** For further information on administration, consult product literature.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE technology appraisals (TAs)**

► Aflibercept solution for injection for treating wet age-related macular degeneration (July 2013) NICE TA294
Aflibercept solution for injection is recommended as an option for treating wet age-related macular degeneration only if:

- it is used in accordance with the recommendations for ranibizumab in NICE TA 155 and
- the manufacturer provides aflibercept solution for injection with the discount agreed in the patient access scheme www.nice.org.uk/TA294
- **Aflibercept for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion (February 2014) NICE TA305**

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- ▶ **Ranibizumab and pegaptanib for the treatment of age-related macular degeneration (updated May 2012)** NICE TA155
Ranibizumab is recommended for the treatment of wet age-related macular degeneration if all of the following apply:

- the best corrected visual acuity is between 6/12 and 6/96;
- there is no permanent structural damage to the central fovea;
- the lesion size is less than or equal to 12 disc areas in greatest linear dimension;
- there is evidence of recent disease progression;
- the manufacturer provides ranibizumab with the discount agreed in the patient access scheme (as revised in 2012).

Ranibizumab should only be continued in patients who maintain adequate response to therapy. www.nice.org.uk/TA155

- ▶ **Ranibizumab for the treatment of diabetic macular oedema (February 2013)** NICE TA274

Ranibizumab is recommended as an option for the treatment of visual impairment due to diabetic macular oedema only if:

- the eye has a central retinal thickness of 400 micrometres or more at the start of treatment **and**
- the manufacturer provides ranibizumab with the discount agreed in the patient access scheme (as revised in 2012).

Patients currently receiving ranibizumab for treating visual impairment due to diabetic macular oedema whose disease does not meet the criteria should be able to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA274

- ▶ **Ranibizumab for the treatment of visual impairment caused by macular oedema secondary to retinal vein occlusion (May 2013)** NICE TA283

Ranibizumab is recommended as an option for treating visual impairment caused by macular oedema:

- following central retinal vein occlusion **or**
- following branch retinal vein occlusion only if treatment with laser photocoagulation has not been beneficial, or when laser photocoagulation is not suitable because of the extent of macular haemorrhage **and**
- only if the manufacturer provides ranibizumab with the discount agreed in the patient access scheme revised in the context of NICE technology appraisal guidance 274. www.nice.org.uk/TA283

- ▶ **Ranibizumab for treating choroidal neovascularisation associated with pathological myopia (November 2013)** NICE TA298

Ranibizumab is recommended as an option for treating visual impairment due to choroidal neovascularisation secondary to pathological myopia when the manufacturer provides ranibizumab with the discount agreed in the patient access scheme. www.nice.org.uk/TA298

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2007) that ranibizumab (*Lucentis*®) is accepted for use within NHS Scotland for the treatment of neovascular (wet) age-related macular degeneration.

The *Scottish Medicines Consortium* has advised (October 2011 and April 2013) that ranibizumab (*Lucentis*®) is accepted for use within NHS Scotland for the treatment of macular oedema secondary to branch or central retinal vein occlusion, and (November 2012) for restricted use for the treatment of visual impairment due to diabetic macular oedema in adults with best corrected visual acuity 75 Early Treatment Diabetic Retinopathy Study letters or less at baseline, and (October 2013) for the treatment of visual impairment due to choroidal neovascularisation secondary to pathological myopia in adults; SMC advice is contingent upon the continuing availability of ranibizumab at the price agreed in the patient access scheme.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Lucentis** (Novartis Pharmaceuticals UK Ltd)

6.2 Macular oedema

Drugs used for Macular oedema not listed below;
Aflibercept, p. 971; *Ranibizumab*, p. 973

Fluocinolone acetonide

INDICATIONS AND DOSE

Treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies (specialist use only)

BY INTRAVITREAL INJECTION

- ▶ **Adult:** 190 micrograms, to be administered into the affected eye

- **CONTRA-INDICATIONS** Active or suspected ocular infection · active or suspected peri-ocular infection · pre-existing glaucoma
- **CAUTIONS** Raised baseline intra-ocular pressure
- **INTERACTIONS** Caution with concomitant administration of anticoagulant or antiplatelet drugs (higher incidence of conjunctival haemorrhage).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Blurred vision · cataract · conjunctival haemorrhage · glaucoma · ocular discomfort · raised intra-ocular pressure · reduced visual acuity · vitreous floaters · vitreous haemorrhage
 - ▶ **Uncommon** Conjunctival ulcer · endophthalmitis · eye discharge · eye pruritus · headache · iris adhesions · iris neovascularisation · maculopathy · ocular hyperaemia · optic atrophy · optic nerve disorder · posterior capsule opacification · retinal exudates · retinal vascular occlusion · sclera thinning · vitreous degeneration · vitreous detachment
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid unless essential.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for raised intra-ocular pressure (particularly if raised at baseline), retinal detachment, endophthalmitis, vitreous haemorrhage or detachment within 2–7 days following the procedure.
 - ▶ Monitor intra-ocular pressure at least every 3 months thereafter (for approximately 36 months).
- **DIRECTIONS FOR ADMINISTRATION** Concurrent administration to both eyes not recommended. For further information on administration and repeat dosing, consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

 - ▶ **Fluocinolone acetonide intravitreal implant for treating chronic diabetic macular oedema after an inadequate response to prior therapy (November 2013)** NICE TA301

Fluocinolone acetonide intravitreal implant is recommended as an option for treating chronic diabetic macular oedema that is insufficiently responsive to available therapies only if:

 - the implant is to be used in an eye with an intra-ocular (pseudophakic) lens **and**
 - the manufacturer provides fluocinolone acetonide intravitreal implant with the discount agreed in the patient access scheme. www.nice.org.uk/TA301

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2014) that fluocinolone acetonide intravitreal implant (*Iluvien*®) is recommended for restricted use within NHS Scotland for the treatment of vision impairment associated with chronic diabetic macular oedema, considered insufficiently responsive to available therapies, only in patients in whom the affected eye is pseudophakic (has an artificial lens after cataract surgery), **and** retreatment would take place only if the patient had previously responded to treatment with

fluocinolone acetonide and subsequently best corrected visual acuity had deteriorated to less than 20/32.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Implant

6.3 Vitreomacular traction

RECOMBINANT PROTEOLYTIC ENZYMES

Ocriplasmin

INDICATIONS AND DOSE

Treatment of vitreomacular traction, including when associated with a macular hole of diameter less than or equal to 400 microns (specialist use only)

BY INTRAVITREAL INJECTION

▶ **Adult:** 125 micrograms for 1 dose, to be administered into the affected eye, concurrent administration to both eyes is not recommended

- **CONTRA-INDICATIONS** Active or suspected ocular or periocular infection · aphakia · exudative age-related macular degeneration · high myopia · history of rhegmatogenous retinal detachment · ischaemic retinopathies · large diameter macular hole (> 400 microns) · lens zonule instability · proliferative diabetic retinopathy · recent intra-ocular injection (including laser therapy) · recent ocular surgery · retinal vein occlusions · vitreous haemorrhage
- **CAUTIONS** History of uveitis (including severe active inflammation) · non-proliferative diabetic retinopathy · significant eye trauma
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abnormal retinograph · anterior chamber cell or flare · chromatopsia · conjunctival disorders · eyelid oedema · iritis · macular degeneration · macular hole · macular oedema · metamorphopsia · ocular discomfort · ocular hyperaemia · photophobia · photopsia · raised intra-ocular pressure · reduced visual acuity · retinal disorders · retinal pigment epitheliopathy · vitreous disorders
 - ▶ **Uncommon** Anterior chamber inflammation · corneal abrasion · diplopia · eye inflammation · hyphaema · lens subluxation · miosis · scotoma · transient blindness · unequal pupils · visual field defect
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **MONITORING REQUIREMENTS** Monitor intra-ocular pressure, visual acuity, and for signs of intra-ocular inflammation or infection following injection.
- **DIRECTIONS FOR ADMINISTRATION** For further information on administration, consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

 - ▶ **Ocriplasmin for treating vitreomacular traction (October 2013) NICE TA297**
Ocriplasmin is recommended as an option for treating vitreomacular traction in adults, only if:
 - an epiretinal membrane is not present **and**

- they have a stage II full-thickness macular hole with a diameter of 400 microns or less **and/or**
- they have severe symptoms. www.nice.org.uk/TA297

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2014) that ocriplasmin (*Jetrea*[®]) is accepted for restricted use within NHS Scotland for the treatment of patients with vitreomacular traction plus macular hole, regardless of whether they have epiretinal membrane formation, and in patients with vitreomacular traction alone (no epiretinal membrane and no macular hole).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

1 Ear

Ear

Otitis externa

Otitis externa is an inflammatory reaction of the meatal skin. It is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping. A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with **corticosteroid** ear drops or with an astringent such as aluminium acetate solution p. 451. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

If infection is present, a topical anti-infective which is not used systemically (such as neomycin sulfate p. 451 or **clioquinol**) may be used, but for only about a week as excessive use may result in fungal infections; these may be difficult to treat and require expert advice. Sensitivity to the anti-infective or solvent may occur and resistance to antibacterials is a possibility with prolonged use. Aluminium acetate p. 979 ear drops are also effective against bacterial infection and inflammation of the ear. Chloramphenicol p. 955 may be used but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients. Solutions containing an anti-infective and a corticosteroid are used for treating cases where infection is present with inflammation and eczema.

In view of reports of ototoxicity, manufacturers contraindicate treatment with topical **aminoglycosides** or **polymyxins** in patients with a perforated tympanic membrane (eardrum) or patent grommet. However, some specialists do use these drops cautiously in the presence of a perforation or patent grommet in patients with chronic suppurative otitis media and when other measures have failed for otitis externa; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;

- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances.

A solution of **acetic acid** 2% acts as an antifungal and antibacterial in the external ear canal. It may be used to treat mild otitis externa but in severe cases an anti-inflammatory preparation with or without an anti-infective drug is required. A proprietary preparation containing acetic acid 2% (*EarCalm*[®] spray) is on sale to the public.

For severe pain associated with otitis externa, a simple analgesic, such as paracetamol p. 354 or ibuprofen p. 927, can be used. A systemic antibacterial can be used if there is spreading cellulitis or if the patient is systemically unwell. When a resistant staphylococcal infection (a boil) is present in the external auditory meatus, flucloxacillin p. 486 is the drug of choice; ciprofloxacin p. 956 (or an aminoglycoside) may be needed in pseudomonal infections which may occur if the patient has diabetes or is immunocompromised.

The skin of the pinna adjacent to the ear canal is often affected by eczema. A topical corticosteroid cream or ointment is then required, but prolonged use should be avoided.

Otitis media

Acute otitis media

Acute otitis media is the commonest cause of severe aural pain in small children. Many infections, especially those accompanying coryza, are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment and a **simple analgesic**, such as paracetamol p. 354, may be sufficient. In children without systemic features, a **systemic antibacterial** may be started after 72 hours if there is no improvement, or earlier if there is deterioration, if the patient is systemically unwell, if the patient is at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis is present, or in children under 2 years of age with bilateral otitis media. Perforation of the tympanic membrane in patients with *acute otitis media* usually heals spontaneously without treatment; if there is no improvement, e.g. pain or discharge persists, a systemic antibacterial can be given. Topical treatment of acute otitis media is ineffective and there is no place for drops containing a local anaesthetic.

Otitis media with effusion

Otitis media with effusion (glue ear) occurs in about 10% of children and in 90% of children with cleft palates. Systemic antibacterials are not usually required. If glue ear persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of *chronic otitis media*.

Chronic otitis media

Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in patients with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction which may completely resolve long-standing infection. Local cleansing of the meatal and middle ear may be followed by treatment with a sponge wick or ribbon gauze dressing soaked with corticosteroid ear drops or with an astringent such as aluminium acetate p. 979 solution; this is particularly beneficial for discharging ears or infections of the mastoid cavity. An antibacterial ear ointment may also be used. Acute exacerbations of chronic infection may also require systemic treatment with amoxicillin p. 482 (or erythromycin p. 471 if penicillin-allergic); treatment is adjusted according to the results of sensitivity testing.

In view of reports of ototoxicity, manufacturers contraindicate topical treatment with ototoxic antibacterials in the presence of a tympanic perforation or patent grommet. Ciprofloxacin p. 956 or ofloxacin p. 957 eye drops used in the ear [unlicensed use] or ear drops [both unlicensed; available from 'special-order' manufacturers or specialist importing companies] are an effective alternative to such ototoxic ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

However, some specialists do use ear drops containing **aminoglycosides** or **polymyxins** [unlicensed indications] cautiously in patients with chronic suppurative otitis media and a perforation of the tympanic membrane, if the otitis media has failed to settle with systemic antibacterials; treatment should be considered only by **specialists** in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances. It is considered that the pus in the middle ear associated with otitis media also carries a risk of ototoxicity.

Removal of ear wax

Ear wax (cerumen) is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Ear wax can be softened using simple remedies such as **olive oil** ear drops or **almond oil** ear drops; sodium bicarbonate p. 979 ear drops are also effective, but may cause dryness of the ear canal. If the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Some proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely

to cause irritation. Docusate sodium p. 980 or urea hydrogen peroxide p. 980 are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in patients unable to co-operate with the procedure, in those with otitis media in the last six weeks, in otitis externa, in patients with cleft palate, a history of ear drum perforation, or previous ear surgery. A person who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

1.1 Otitis externa

ANTI-INFECTIVES

Chloramphenicol

- **DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

INDICATIONS AND DOSE

Bacterial infection in otitis externa

TO THE EAR

- ▶ Child: Apply 2–3 drops 2–3 times a day
- ▶ Adult: Apply 2–3 drops 2–3 times a day

- **CAUTIONS** Avoid prolonged use

• SIDE-EFFECTS

- ▶ **Common or very common** High incidence of sensitivity reactions to vehicle

• PATIENT AND CARER ADVICE

Medicines for children leaflet: Chloramphenicol ear drops for ear infections (otitis externa)

www.medicinesforchildren.org.uk/

chloramphenicol-ear-drops-ear-infections-otitis-externa

- **LESS SUITABLE FOR PRESCRIBING** Chloramphenicol ear drops are less suitable for prescribing.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear drops

EXCIPIENTS: May contain Propylene glycol

▶ CHLORAMPHENICOL (Non-proprietary)

Chloramphenicol 50 mg per 1 ml Chloramphenicol 5% ear drops | 10 ml [POM] £55.14 DT price = £55.14

Chloramphenicol 100 mg per 1 ml Chloramphenicol 10% ear drops | 10 ml [POM] £27.56

Clioquinol with flumetasone pivalate

INDICATIONS AND DOSE

Eczematous inflammation in otitis externa | Mild bacterial or fungal infections in otitis externa

TO THE EAR

- ▶ Child 2-17 years: 2–3 drops twice daily for 7–10 days, to be instilled into the ear
- ▶ Adult: 2–3 drops twice daily for 7–10 days, to be instilled into the ear

- **CONTRA-INDICATIONS** Iodine sensitivity

- **CAUTIONS** Avoid prolonged use - manufacturer advises avoid in perforated tympanic membrane (but used by specialists for short periods)

- **SIDE-EFFECTS** Local sensitivity

- **PATIENT AND CARER ADVICE** Clioquinol stains skin and clothing

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear drops▶ **CLIOQUINOL WITH FLUMETASONE PIVALATE (Non-proprietary)**

Clioquinol 10 mg per 1 ml, Flumetasone pivalate 200 microgram per 1 ml Flumetasone 0.02% / Clioquinol 1% ear drops | 7.5 ml [PoM] £6.04 DT price = £6.04 | 10 ml [PoM] £8.05 DT price = £8.05

Clotrimazole

INDICATIONS AND DOSE

Fungal infection in otitis externa

TO THE EAR

- ▶ Child: Apply 2–3 times a day continue for at least 14 days after disappearance of infection
- ▶ Adult: Apply 2–3 times a day continue for at least 14 days after disappearance of infection

- **SIDE-EFFECTS** Local irritation · local sensitivity

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Liquid

- ▶ **Canesten (clotrimazole)** (Bayer Plc)
Clotrimazole 10 mg per 1 ml Canesten 1% solution | 20 ml [P] £2.30 DT price = £2.30

Framycetin sulfate with dexamethasone and gramicidin

INDICATIONS AND DOSE

Eczematous inflammation in otitis externa

TO THE EAR

- ▶ Child: 2–3 drops 3–4 times a day
- ▶ Adult: 2–3 drops 3–4 times a day

- **CONTRA-INDICATIONS** Perforated tympanic membrane
- **CAUTIONS** Avoid prolonged use
- **SIDE-EFFECTS** Local sensitivity
- **LESS SUITABLE FOR PRESCRIBING** Sofradex[®] is less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye drops solution

EXCIPIENTS: May contain Polysorbates

- ▶ **Sofradex** (Sanofi)
Dexamethasone (as Dexamethasone sodium metasulfobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml, Gramicidin 50 microgram per 1 ml Sofradex ear/eye drops | 10 ml [PoM] £6.25

Gentamicin

INDICATIONS AND DOSE

Bacterial infection in otitis externa

TO THE EAR

- ▶ Child: Apply 2–3 drops 4–5 times a day (including a dose at bedtime)
- ▶ Adult: Apply 2–3 drops 4–5 times a day (including a dose at bedtime)

- **CONTRA-INDICATIONS** Patent grommet (although may be used by specialists (see Ear p. 976) · perforated tympanic

membrane (although may be used by specialists (see Ear p. 976)

- **CAUTIONS** Avoid prolonged use
- **SIDE-EFFECTS** Local sensitivity

2 Nose

Nose

Rhinitis is often self-limiting but bacterial sinusitis may require treatment with antibacterials. There are few indications for nasal sprays and drops except in allergic rhinitis and perennial rhinitis. Many nasal preparations contain sympathomimetic drugs which may damage the nasal cilia. Sodium chloride 0.9% solution may be used as a douche or 'sniff' following endonasal surgery.

Drugs used in nasal allergy

Mild allergic rhinitis is controlled by **antihistamines** (see under Antihistamines, allergen immunotherapy and allergic emergencies p. 241) or topical **nasal corticosteroids**; systemic nasal decongestants are of doubtful value. Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms and nasal congestion can be relieved by topical nasal **corticosteroids**. The topical antihistamine azelastine hydrochloride p. 945 is useful for controlling breakthrough symptoms in allergic rhinitis. Topical antihistamines are considered less effective than topical corticosteroids but probably more effective than cromoglicate. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous treatment may be required for years in perennial rhinitis.

Montelukast p. 233 is less effective than topical nasal corticosteroids; montelukast can be used in patients with seasonal allergic rhinitis and concomitant asthma.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal ipratropium bromide can reduce watery rhinorrhoea.

Very disabling symptoms occasionally justify the use of **systemic corticosteroids** for short periods, for example, in students taking important examinations. They may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal cavity.

Corticosteroids

Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, after nasal surgery (until healing has occurred), and in pulmonary tuberculosis. Patients transferred from systemic corticosteroids may experience exacerbation of some symptoms. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

Nasal polyps

Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the patient in the 'head down' position. A short course of a systemic corticosteroid may be required initially to shrink large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

Pregnancy

If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclometasone dipropionate p. 984, budesonide p. 984, or fluticasone p. 985 may be considered.

Topical nasal decongestants

The nasal mucosa is sensitive to changes in atmospheric temperature and humidity and these alone may cause slight nasal congestion. The nose and nasal sinuses produce a litre of mucus in 24 hours and much of this finds its way silently into the stomach via the nasopharynx. Slight changes in the nasal airway, accompanied by an awareness of mucus passing along the nasopharynx causes some patients to be inaccurately diagnosed as suffering from chronic sinusitis. These symptoms are particularly noticeable in the later stages of the common cold. Sodium chloride 0.9% given as

nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions.

Inhalation of **warm moist air** is useful in the treatment of symptoms of acute infective conditions. The addition of volatile substances such as menthol and eucalyptus may encourage the use of warm moist air (see under Aromatic inhalations, cough preparations and systemic nasal decongestants p. 258).

Symptoms of nasal congestion associated with vasomotor rhinitis and the common cold can be relieved by the short-term use (usually not longer than 7 days) of decongestant nasal drops and sprays. These all contain sympathomimetic drugs which exert their effect by vasoconstriction of the mucosal blood vessels which in turn reduces oedema of the nasal mucosa. They are of limited value because they can give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events. Ephedrine hydrochloride p. 982 nasal drops is the safest sympathomimetic preparation and can give relief for several hours. The more potent sympathomimetic drugs oxymetazoline and xylometazoline hydrochloride p. 983 are more likely to cause a rebound effect.

Non-allergic watery rhinorrhoea often responds well to treatment with the antimuscarinic ipratropium bromide p. 983.

Sinusitis and oral pain

Sinusitis affecting the maxillary antrum can cause pain in the upper jaw. Where this is associated with blockage of the opening from the sinus into the nasal cavity, it may be helpful to relieve the congestion with inhalation of warm moist air or with ephedrine hydrochloride p. 982 nasal drops.

Systemic antibacterials may sometimes be required for sinusitis (see under Nose infections, bacterial p. 446).

Nasal preparations for infection

There is **no** evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis; see elimination of nasal staphylococci.

Nasal staphylococci

Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing **chlorhexidine** and **neomycin** (*Naseptin*®), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population.

A nasal ointment containing mupirocin p. 987 is also available; it should probably be held in reserve for resistant infections. In hospitals or in care establishments, mupirocin nasal ointment should be reserved for the eradication (in both patients and staff) of nasal carriage of methicillin-resistant *Staphylococcus aureus* (MRSA). A sample should be taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more than one occasion. If the MRSA strain is mupirocin-resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream.

2.1 Nasal congestion

SYMPATHOMIMETICS (VASOCONSTRICTOR)

Ephedrine hydrochloride

INDICATIONS AND DOSE

Nasal congestion | Sinusitis affecting the maxillary antrum
BY INTRANASAL ADMINISTRATION

- ▶ Child 12-17 years: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril, administer ephedrine 0.5% nasal drops
- ▶ Adult: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril
- **CAUTIONS** Avoid excessive or prolonged use · cardiovascular disease (in children) · diabetes mellitus · elderly · hypertension · hyperthyroidism · ischaemic heart disease (in adults) · prostatic hypertrophy (risk of acute urinary retention) (in adults)
- **INTERACTIONS** → Appendix 1 (sympathomimetics).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Headache · nausea
 - ▶ **Frequency not known** After excessive use tolerance with diminished effect · cardiovascular effect · local irritation · rebound congestion
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.
- **PRESCRIBING AND DISPENSING INFORMATION** For nasal drops, the BP directs that if no strength is specified 0.5% drops should be supplied.
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary Ephedrine nasal drops may be prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** Ephedrine nasal drops can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: spray, nasal drops

Nasal drops

▶ EPHEDRINE HYDROCHLORIDE (Non-proprietary)

Ephedrine hydrochloride 5 mg per 1 ml Ephedrine 0.5% nasal drops | 10 ml [P] £1.53 DT price = £1.53

Ephedrine hydrochloride 10 mg per 1 ml Ephedrine 1% nasal drops | 10 ml [P] £1.58 DT price = £1.58

Pseudoephedrine hydrochloride

INDICATIONS AND DOSE

Congestion of mucous membranes of upper respiratory tract

BY MOUTH

- ▶ Child 6-11 years: 30 mg 3–4 times a day
- ▶ Child 12-17 years: 60 mg 3–4 times a day

- ▶ Adult: 60 mg 3–4 times a day

Important safety information

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009): OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN

Children under 6 years should not be given over-the-counter cough and cold medicines containing pseudoephedrine.

- **CAUTIONS** Diabetes · heart disease · hypertension · hyperthyroidism · ischaemic heart disease (in adults) · prostatic hypertrophy (in adults) · raised intra-ocular pressure (in children) · susceptibility to angle-closure glaucoma (in adults)
- **INTERACTIONS** → Appendix 1 (sympathomimetics). Contra-indicated in patients taking monoamine oxidase inhibitors within the previous 2 weeks.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anxiety · headache · hypertension · insomnia · nausea · restlessness · tachycardia · vomiting
 - ▶ **Rare** Hallucinations · rash
 - ▶ **Very rare** Angle-closure glaucoma
 - ▶ **Frequency not known** Urinary retention
- **PREGNANCY** Defective closure of the abdominal wall (gastroschisis) reported very rarely in newborns after first trimester exposure.
- **BREAST FEEDING** May suppress lactation; avoid if lactation not well established or if milk production insufficient.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate renal impairment. Manufacturer advises avoid in severe renal impairment.
- **LESS SUITABLE FOR PRESCRIBING** Pseudoephedrine hydrochloride is less suitable for prescribing.
- **EXCEPTIONS TO LEGAL CATEGORY** *Galpseud*[®] and *Sudafed*[®] can be sold to the public provided no more than 720 mg of pseudoephedrine salts are supplied, and ephedrine base (or salts) are not supplied at the same time; for details see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ Galpseud (Thornton & Ross Ltd)

Pseudoephedrine hydrochloride 60 mg Galpseud 60mg tablets | 24 tablet [PoM] £2.25 | 100 tablet [PoM] £5.42 DT price = £5.42

▶ Sudafed Non-Drowsy Decongestant (pseudoephedrine) (McNeil Products Ltd)

Pseudoephedrine hydrochloride 60 mg Sudafed Decongestant 60mg tablets | 12 tablet [P] £2.04

Oral solution

EXCIPIENTS: May contain Alcohol

▶ Galpseud (Thornton & Ross Ltd)

Pseudoephedrine hydrochloride 6 mg per 1 ml Galpseud 30mg/5ml linctus (sugar-free) | 2000 ml [PoM] £14.00

▶ Sudafed Non-Drowsy Decongestant (pseudoephedrine) (McNeil Products Ltd)

Pseudoephedrine hydrochloride 6 mg per 1 ml Sudafed Decongestant 30mg/5ml liquid | 100 ml [P] £1.92

Xylometazoline hydrochloride

● **DRUG ACTION** Xylometazoline is a sympathomimetic.

INDICATIONS AND DOSE

Nasal congestion

BY INTRANASAL ADMINISTRATION USING NASAL DROPS

- ▶ Child 6–11 years: 1–2 drops 1–2 times a day as required for maximum duration of 5 days, 0.05% solution to be administered into each nostril
- ▶ Child 12–17 years: 2–3 drops 2–3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each nostril
- ▶ Adult: 2–3 drops 2–3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each nostril

BY INTRANASAL ADMINISTRATION USING NASAL SPRAY

- ▶ Child 12–17 years: 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril
- ▶ Adult: 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril

Important safety information

The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine, oxymetazoline, or xylometazoline can be considered for up to 5 days' treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

- **CAUTIONS** Angle-closure glaucoma · avoid excessive or prolonged use · cardiovascular disease (in children) · diabetes mellitus · elderly · hypertension · hyperthyroidism · ischaemic heart disease (in adults) · prostatic hypertrophy (risk of acute retention) (in adults) · rebound congestion

CAUTIONS, FURTHER INFORMATION

Rebound congestion Sympathomimetic drugs are of limited value in the treatment of nasal congestion because they can, following prolonged use (more than 7 days), give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events.

- **SIDE-EFFECTS** Cardiovascular effects · hallucinations in small children · headache · local irritation · nausea · rebound congestion · restlessness in small children · sleep disturbances in small children · tolerance with diminished effect (after excessive use) · transient visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Hallucinations (in small children) Discontinue treatment if the hallucinations occur.

- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises caution—no information available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

- ▶ **Otrivine** (Novartis Consumer Health UK Ltd)
Xylometazoline hydrochloride 1 mg per 1 ml Otrivine Congestion Relief 0.1% nasal spray | 10 ml [GSL] £2.93 DT price = £2.10
Otrivine Adult Measured Dose Sinusitis spray | 10 ml [GSL] £2.55 DT price = £2.10
Otrivine Allergy Relief 0.1% nasal spray | 10 ml [GSL] £2.55 DT price = £2.10
Otrivine Adult nasal spray | 10 ml [GSL] £2.10 DT price = £2.10

Otrivine Adult Metered Dose 0.1% nasal spray | 10 ml [GSL] £3.31 DT price = £2.10

- ▶ **Sudafed Mucus Relief** (McNeil Products Ltd)
Xylometazoline hydrochloride 1 mg per 1 ml Sudafed Mucus Relief 0.1% nasal spray | 15 ml [GSL] £2.37
- ▶ **Sudafed Non-Drowsy Decongestant (xylometazoline)** (McNeil Products Ltd)
Xylometazoline hydrochloride 1 mg per 1 ml Sudafed Blocked Nose 0.1% spray | 15 ml [GSL] £2.38

Nasal drops

- ▶ **Otrivine** (Novartis Consumer Health UK Ltd)
Xylometazoline hydrochloride 500 microgram per 1 ml Otrivine Child nasal drops | 10 ml [P] £1.91 DT price = £1.91
Xylometazoline hydrochloride 1 mg per 1 ml Otrivine Adult 0.1% nasal drops | 10 ml [GSL] £2.10 DT price = £2.10

2.2 Nasal inflammation, nasal polyps and rhinitis

Drugs used for Nasal inflammation, nasal polyps and rhinitis not listed below; *Desloratadine*, p. 247 · *Fexofenadine hydrochloride*, p. 247 · *Ketotifen*, p. 249

ANTIMUSCARINICS

Ipratropium bromide

INDICATIONS AND DOSE

Rhinorrhoea associated with allergic and non-allergic rhinitis

BY INTRANASAL ADMINISTRATION

- ▶ Child 12–17 years: 2 sprays 2–3 times a day, dose to be sprayed into each nostril
- ▶ Adult: 2 sprays 2–3 times a day, dose to be sprayed into each nostril

Dose equivalence and conversion

1 metered spray of nasal spray = 21 micrograms.

- **CAUTIONS** Avoid spraying near eyes · bladder outflow obstruction · cystic fibrosis · prostatic hyperplasia (in adults) · risk of glaucoma (in children) · susceptibility to angle-closure glaucoma (in adults)

SIDE-EFFECTS

- ▶ **Common or very common** epistaxis · nasal dryness · nasal irritation
- ▶ **Uncommon** headache · nausea · pharyngitis (in children)
- ▶ **Very rare** gastro-intestinal motility disturbances · palpitations · urinary retention

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

- EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
- ▶ **Rinatec** (Boehringer Ingelheim Ltd)
Ipratropium bromide 21 microgram per 1 dose Rinatec 21micrograms/dose nasal spray | 180 dose [PoM] £6.54 DT price = £6.54

CORTICOSTEROIDS

Corticosteroids (intranasal)

- **CAUTIONS** Avoid after nasal surgery (until healing has occurred) · avoid in pulmonary tuberculosis · avoid in the presence of untreated nasal infections · patients transferred from systemic corticosteroids may experience exacerbation of some symptoms

CAUTIONS, FURTHER INFORMATION

Systemic absorption Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; therefore also consider the cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

● SIDE-EFFECTS

- ▶ **Rare** Glaucoma · raised intra-ocular pressure
- ▶ **Very rare** Nasal septal perforation (usually following nasal surgery)
- ▶ **Frequency not known** Aggression (particularly in children) · anxiety (particularly in children) · bronchospasm · depression (particularly in children) · dryness · epistaxis · headache · hyperactivity (particularly in children) · hypersensitivity reactions · nasal irritation · nasal ulceration · sleep disturbances (particularly in children) · smell disturbances · taste disturbances · throat irritation

SIDE-EFFECTS, FURTHER INFORMATION

Systemic absorption Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged. Therefore also consider the side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

- ▶ **Beconase** (GlaxoSmithKline UK Ltd, Omega Pharma Ltd)

Beclometasone dipropionate 50 microgram per 1 dose Beconase Aqueous 50micrograms/dose nasal spray | 200 dose [PoM] £2.19 DT price = £2.30
Beconase Hayfever 50micrograms/dose nasal spray | 180 dose [P] £6.46

- ▶ Brands may include Nasobec, Pollenase

Betamethasone**INDICATIONS AND DOSE****BETNESOL®****Non-infected inflammatory conditions of nose**

BY INTRANASAL ADMINISTRATION

- ▶ **Adult:** Apply 2–3 drops 2–3 times a day, dose to be applied into each nostril

VISTAMETHASONE®**Non-infected inflammatory conditions of nose**

BY INTRANASAL ADMINISTRATION

- ▶ **Adult:** Apply 2–3 drops twice daily, dose to be applied into each nostril

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

▶ BETAMETHASONE (Non-proprietary)

Betamethasone sodium phosphate 1 mg per 1 ml Betamethasone 0.1% ear/eye/nose drops | 5 ml [PoM] no price available

▶ Betnesol (Focus Pharmaceuticals Ltd)

Betamethasone sodium phosphate 1 mg per 1 ml Betnesol 0.1% eye/ear/nose drops | 10 ml [PoM] £2.32 DT price = £2.32

▶ Vistamethasone (Martindale Pharmaceuticals Ltd)

Betamethasone sodium phosphate 1 mg per 1 ml Vistamethasone 0.1% ear/eye/nose drops | 5 ml [PoM] £1.02 | 10 ml [PoM] £1.16 DT price = £2.32

Beclometasone dipropionate (Beclomethasone dipropionate)**INDICATIONS AND DOSE**

Prophylaxis and treatment of allergic and vasomotor rhinitis

BY INTRANASAL ADMINISTRATION

- ▶ **Child 6–17 years:** 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day
- ▶ **Adult:** 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day

● EXCEPTIONS TO LEGAL CATEGORY

Preparations of beclometasone dipropionate can be sold to the public for nasal administration as a nasal spray if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 20 mg.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

▶ BECLOMETASONE DIPROPIONATE (Non-proprietary)

Beclometasone dipropionate 50 microgram per 1 dose Numark Hayfever Relief 50micrograms/dose nasal spray | 100 dose [GSL] £2.04 | 200 dose [P] £2.33 DT price = £2.30

Beclometasone Hayfever Relief 50micrograms/dose nasal spray | 200 dose [P] £2.56 DT price = £2.30

Beclometasone 50micrograms/dose nasal spray | 180 dose [P] no price available | 200 dose [PoM] no price available DT price = £2.30 | 200 dose [P] £7.95 DT price = £2.30

Budesonide**INDICATIONS AND DOSE**

Prophylaxis and treatment of allergic and vasomotor rhinitis

BY INTRANASAL ADMINISTRATION

- ▶ **Child 12–17 years:** Initially 200 micrograms daily, dose to be administered into each nostril in the morning, alternatively initially 100 micrograms twice daily, dose to be administered to each nostril; reduced to 100 micrograms daily, dose to be administered into each nostril, dose can be reduced when control achieved
- ▶ **Adult:** Initially 200 micrograms daily, dose to be administered into each nostril in the morning, alternatively initially 100 micrograms twice daily, dose to be administered to each nostril; reduced to 100 micrograms daily, dose to be administered into each nostril, dose can be reduced when control achieved

Nasal polyps

BY INTRANASAL ADMINISTRATION

- ▶ **Child 12–17 years:** 100 micrograms twice daily for up to 3 months, dose to be administered into each nostril
- ▶ **Adult:** 100 micrograms twice daily for up to 3 months, dose to be administered into each nostril

RHINOCORT AQUA®**Rhinitis**

BY INTRANASAL ADMINISTRATION

- ▶ **Adult:** 128 micrograms once daily, dose to be administered into each nostril in the morning,

alternatively 64 micrograms twice daily; reduced to 64 micrograms once daily when control achieved. Use for maximum 3 months, doses to be administered into each nostril

Nasal polyps

BY INTRANASAL ADMINISTRATION

- ▶ Adult: 64 micrograms twice daily for up to 3 months, dose to be administered into each nostril

- **EXCEPTIONS TO LEGAL CATEGORY** Preparations of budesonide can be sold to the public for nasal administration as a nasal spray if supplied for the prevention and treatment of seasonal allergic rhinitis in adults over 18 years subject to max. single dose of 200 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. period of 3 months, and a pack size of 10 mg.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

EXCIPIENTS: May contain Disodium edetate, polysorbates, potassium sorbate

▶ BUDESONIDE (Non-proprietary)

Budesonide 64 microgram per 1 dose Budesonide 64micrograms/dose nasal spray | 120 dose [PoM] £4.77 DT price = £4.76

▶ Rhinocort (AstraZeneca UK Ltd)

Budesonide 64 microgram per 1 dose Rhinocort Aqua 64 nasal spray | 120 dose [PoM] £3.49 DT price = £4.76

Fluticasone

INDICATIONS AND DOSE

Prophylaxis and treatment of allergic rhinitis and perennial rhinitis

BY INTRANASAL ADMINISTRATION USING NASAL SPRAY

- ▶ Child 4-11 years: 50 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 50 micrograms twice daily
- ▶ Child 12-17 years: 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to 50 micrograms once daily, dose to be administered into each nostril, dose to be reduced when control achieved
- ▶ Adult: 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to 50 micrograms once daily, dose to be administered into each nostril, dose to be reduced when control achieved

Nasal polyps

BY INTRANASAL ADMINISTRATION USING NASAL DROPS

- ▶ Child 16-17 years: 200 micrograms 1-2 times a day, to be administered into each nostril, dose of 200 micrograms approximately 6 drops, alternative treatment should be considered if no improvement after 4-6 weeks
- ▶ Adult: 200 micrograms 1-2 times a day, to be administered into each nostril, dose of 200 micrograms approximately 6 drops, alternative treatment should be considered if no improvement after 4-6 weeks

AVAMYS® SPRAY

Prophylaxis and treatment of allergic rhinitis

BY INTRANASAL ADMINISTRATION

- ▶ Adult: 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once

daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose

Dose equivalence and conversion

1 spray equivalent to 27.5 micrograms.

● SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION

Nasal ulceration Nasal ulceration occurs commonly with nasal preparations containing fluticasone furoate.

- **EXCEPTIONS TO LEGAL CATEGORY** Preparations of fluticasone propionate can be sold to the public for nasal administration (other than by pressurised nasal spray) if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years, subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 3 mg.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

▶ FLUTICASONE (Non-proprietary)

Fluticasone propionate 50 microgram per 1 dose Boots Pharmacy Hayfever and Allergy 50micrograms/dose nasal spray |

60 dose [P] no price available

Fluticasone propionate 50micrograms/dose nasal spray |

150 dose [PoM] £29.50 DT price = £11.01

▶ Avamys (GlaxoSmithKline UK Ltd)

Fluticasone furoate 27.5 microgram per 1 dose Avamys

27.5micrograms/dose nasal spray | 120 dose [PoM] £6.44 DT price = £6.44

▶ Flixonase (GlaxoSmithKline UK Ltd)

Fluticasone propionate 50 microgram per 1 dose Flixonase

50micrograms/dose aqueous nasal spray | 150 dose [PoM] £11.01 DT price = £11.01

▶ Brands may include Nasofan, Pirinase Hayfever

Nasal drops

EXCIPIENTS: May contain Polysorbates

▶ Flixonase (GlaxoSmithKline UK Ltd)

Fluticasone propionate 400 microgram Flixonase Nasule

400microgram/unit dose nasal drops | 28 unit dose [PoM] £12.99 DT price = £12.99

Fluticasone with azelastine

The properties listed below are those particular to the combination only. For the properties of the components please consider, azelastine hydrochloride p. 945, fluticasone above.

INDICATIONS AND DOSE

Moderate to severe seasonal and perennial allergic rhinitis, if monotherapy with antihistamine or corticosteroid is inadequate

BY INTRANASAL ADMINISTRATION

- ▶ Child 12-17 years: 1 spray twice daily, dose to be administered into each nostril
- ▶ Adult: 1 spray twice daily, dose to be administered into each nostril

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

▶ Dymista (Meda Pharmaceuticals Ltd)

Azelastine hydrochloride 137 microgram per 1 actuation,

Fluticasone propionate 50 microgram per 1 actuation Dymista

137micrograms/dose / 50micrograms/dose nasal spray |

120 dose [PoM] £14.80

Mometasone furoate

INDICATIONS AND DOSE

Prophylaxis and treatment of allergic rhinitis

BY INTRANASAL ADMINISTRATION

- ▶ Child 6-11 years: 50 micrograms daily, dose to be sprayed into each nostril
- ▶ Child 12-17 years: 100 micrograms daily, increased if necessary up to 200 micrograms daily, dose to be sprayed into each nostril; reduced to 50 micrograms daily, dose to be reduced when control achieved, dose to be sprayed into each nostril
- ▶ Adult: 100 micrograms daily, increased if necessary up to 200 micrograms daily, dose to be sprayed into each nostril; reduced to 50 micrograms daily, dose to be reduced when control achieved, dose to be sprayed into each nostril

Nasal polyps

BY INTRANASAL ADMINISTRATION

- ▶ Adult: Initially 100 micrograms daily for 5-6 weeks, dose to be sprayed into each nostril, then increased if necessary to 100 micrograms twice daily, dose to be sprayed into each nostril, consider alternative treatment if no improvement after further 5-6 weeks, reduce to the lowest effective dose when control achieved

● SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION

Nasal ulceration Nasal ulceration occurs commonly with preparations containing mometasone furoate.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

▶ MOMETASONE FUROATE (Non-proprietary)

Mometasone furoate 50 microgram per 1 dose Mometasone 50micrograms/dose nasal spray | 140 dose [PoM] £7.30 DT price = £4.74

▶ Nasonex (Merck Sharp & Dohme Ltd)

Mometasone furoate 50 microgram per 1 dose Nasonex 50micrograms/dose nasal spray | 140 dose [PoM] £7.68 DT price = £4.74

Triamcinolone acetonide

INDICATIONS AND DOSE

Prophylaxis and treatment of allergic rhinitis

BY INTRANASAL ADMINISTRATION

- ▶ Child 6-11 years: 55 micrograms once daily (sprayed into each nostril), increased if necessary to 110 micrograms once daily (sprayed into each nostril), then reduce to 55 micrograms once daily (sprayed into each nostril) when control achieved; max. duration 3 months
- ▶ Child 12-17 years: 110 micrograms once daily (sprayed into each nostril), reduced to 55 micrograms once daily (sprayed into each nostril) when control achieved; max. duration 3 months
- ▶ Adult: 110 micrograms once daily (sprayed into each nostril), reduced to 55 micrograms once daily (sprayed into each nostril) when control achieved

- **EXCEPTIONS TO LEGAL CATEGORY** Preparations of triamcinolone acetonide can be sold to the public for nasal administration as a non-pressurised nasal spray if supplied for the symptomatic treatment of seasonal allergic rhinitis in adults over 18 years, subject to maximum daily dose of 110 micrograms per nostril for maximum 3 months, and a pack size of 3.575 mg.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: paste

Spray

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

▶ Nasacort (Sanofi)

Triamcinolone acetonide 55 microgram per 1 dose Nasacort Allergy 55micrograms/dose nasal spray | 30 dose [P] £3.01
Nasacort 55micrograms/dose nasal spray | 120 dose [PoM] £7.39 DT price = £7.39

MAST CELL STABILISERS

Sodium cromoglicate

(Sodium cromoglycate)

INDICATIONS AND DOSE

Prophylaxis of allergic rhinitis

BY INTRANASAL ADMINISTRATION

- ▶ Child: 1 spray 2-4 times a day, to be administered into each nostril
- ▶ Adult: 1 spray 2-4 times a day, to be administered into each nostril

● SIDE-EFFECTS

- ▶ **Rare** Transient bronchospasm
- ▶ **Frequency not known** Local irritation
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Unlikely to be present in milk.

● MEDICINAL FORMS

Medicines not identified.

2.3 Nasal staphylococcal infection

ANTI-INFECTIVES

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 984, neomycin sulfate p. 451.

INDICATIONS AND DOSE

Nasal infection

BY INTRANASAL ADMINISTRATION USING NASAL DROPS

- ▶ Child: Apply 2-3 drops 2-3 times a day, to be applied into each nostril
- ▶ Adult: Apply 2-3 drops 2-3 times a day, to be applied into each nostril

● LESS SUITABLE FOR PRESCRIBING

Betamethasone with neomycin nasal-drops are less suitable for prescribing; there is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

▶ Betnesol-N ear/eye/nose drops (Focus Pharmaceuticals)

Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 mL, Neomycin sulfate 5 mg per 1 mL | 10 mL [PoM] £2.39

Chlorhexidine with neomycin

INDICATIONS AND DOSE

Eradication of nasal carriage of staphylococci

BY INTRANASAL ADMINISTRATION

- ▶ Child: Apply 4 times a day for 10 days
- ▶ Adult: Apply 4 times a day for 10 days

Preventing nasal carriage of staphylococci

BY INTRANASAL ADMINISTRATION

- ▶ Child: Apply twice daily
- ▶ Adult: Apply twice daily

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Arachis (peanut) oil, cetostearyl alcohol (including cetyl and stearyl alcohol)

- ▶ **Naseptin** (Alliance Pharmaceuticals Ltd)

Chlorhexidine hydrochloride 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram Naseptin nasal cream | 15 gram [PoM](#) £1.90 DT price = £1.90

Mupirocin

INDICATIONS AND DOSE

BACTROBAN NASAL[®]

For eradication of nasal carriage of staphylococci, including methicillin-resistant *Staphylococcus aureus* (MRSA)

BY INTRANASAL ADMINISTRATION

- ▶ Child: Apply 2–3 times a day for 5 days; a sample should be taken 2 days after treatment to confirm eradication. Course may be repeated if sample positive (and throat not colonised), dose to be applied to the inner surface of each nostril
- ▶ Adult: Apply 2–3 times a day for 5 days; a sample should be taken 2 days after treatment to confirm eradication. Course may be repeated if sample positive (and throat not colonised), dose to be applied to the inner surface of each nostril

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Nasal ointment

- ▶ **Bactroban** (GlaxoSmithKline UK Ltd)

Mupirocin (as Mupirocin calcium) 20 mg per 1 gram Bactroban 2% nasal ointment | 3 gram [PoM](#) £3.89 DT price = £3.89

3 Oropharynx

3.1 Dry mouth

Treatment of dry mouth

Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. antispasmodics, tricyclic antidepressants, and some antipsychotics), by diuretics, by irradiation of the head and neck region or by damage to or disease of the salivary glands. Patients with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene; they may develop increased dental caries, periodontal disease, intolerance of dentures, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of

cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

Artificial saliva can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate. Of the proprietary preparations, *Aquoral*[®], *Biotène Oralbalance*[®] gel or *Xerotin*[®] can be used for any condition giving rise to a dry mouth. *BioXtra*[®], *Glandosane*[®], *Saliva Orthana*[®], and *Saliveze*[®], have ACBS approval for dry mouth associated only with radiotherapy or sicca syndrome. *Salivix*[®] pastilles, which act locally as salivary stimulants, are also available for any condition leading to a dry mouth and SST tablets may be prescribed for dry mouth in patients with salivary gland impairment (and patent salivary ducts).

Pilocarpine p. 988 tablets are licensed for the treatment of xerostomia following irradiation for head and neck cancer and for dry mouth and dry eyes (xerophthalmia) in Sjögren's syndrome. They are effective only in patients who have some residual salivary gland function, and therefore should be withdrawn if there is no response.

Artificial saliva products

● ARTIFICIAL SALIVA PRODUCTS

AS SALIVA ORTHANA[®] LOZENGES

Mucin 65 mg, xylitol 59 mg, in a sorbitol basis, pH neutral

INDICATIONS AND DOSE

Dry mouth as a result of having (or having undergone) radiotherapy | Sicca syndrome

BY MOUTH

- ▶ Adult: 1 lozenge as required, allow to dissolve slowly in the mouth

● **PRESCRIBING AND DISPENSING INFORMATION** Lozenges do not contain fluoride.

- ▶ **AS Saliva Orthana lozenges (A S Pharma Ltd)**

30 lozenge (ACBS) - NHS indicative price = £3.50

AS SALIVA ORTHANA[®] SPRAY

Gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral

INDICATIONS AND DOSE

Symptomatic treatment of dry mouth

BY MOUTH

- ▶ Adult: Apply 2–3 sprays as required, spray onto oral and pharyngeal mucosa

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

AS Saliva Orthana[®] Oral Spray may be prescribed.

BIOXTRA GEL

Lactoperoxidase, lactoferrin, lysozyme, whey colostrum, xylitol and other ingredients.

INDICATIONS AND DOSE

Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)

BY MOUTH

- ▶ Adult: Apply as required, apply to oral mucosa

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

BioXtra[®] Gel may be prescribed.

- ▶ **BioXtra moisturising gel for dry mouths (R.I.S. Products Ltd)**
40 ml (ACBS) · NHS indicative price = £3.94

BIOTENE ORALBALANCE[®]

Lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis.

INDICATIONS AND DOSE

Symptomatic treatment of dry mouth

BY MOUTH

- ▶ Adult: Apply as required, apply to gums and tongue

● **PATIENT AND CARER ADVICE** Avoid use with toothpastes containing detergents (including foaming agents).

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Biotene Oralbalance[®] Saliva Replacement Gel may be prescribed as Artificial Saliva Gel.

- ▶ **Biotene Oralbalance dry mouth saliva replacement gel**

(GlaxoSmithKline Consumer Healthcare)

Glucose oxidase 12000 unit, Lactoferrin 12 mg, Lactoperoxidase 12000 unit, Muramidase 12 mg | 50 gram · NHS indicative price = £4.46

GLANDOSANE[®]

Carmellose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50 g, pH 5.75.

INDICATIONS AND DOSE

Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Sicca syndrome (ACBS)

BY MOUTH

- ▶ Adult: Apply as required, spray onto oral and pharyngeal mucosa

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Glandosane[®] Aerosol Spray may be prescribed.

- ▶ **Glandosane synthetic saliva spray lemon (Fresenius Kabi Ltd)**

50 ml (ACBS) · NHS indicative price = £5.52

- ▶ **Glandosane synthetic saliva spray natural (Fresenius Kabi Ltd)**

50 ml (ACBS) · NHS indicative price = £5.52

- ▶ **Glandosane synthetic saliva spray peppermint (Fresenius Kabi Ltd)**

50 ml (ACBS) · NHS indicative price = £5.52

SST[®]

Sugar-free, citric acid, malic acid and other ingredients in a sorbitol base.

INDICATIONS AND DOSE

Symptomatic treatment of dry mouth in patients with impaired salivary gland function and patent salivary ducts

BY MOUTH

- ▶ Adult: 1 tablet as required, allow tablet to dissolve slowly in the mouth

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

May be prescribed as Saliva Stimulating Tablets.

- ▶ **SST saliva stimulating tablets (Sinclair IS Pharma Plic)**

100 tablet · NHS indicative price = £4.86

SALIVEZE[®]

Carmellose sodium (sodium carboxymethylcellulose), calcium chloride, magnesium chloride, potassium chloride, sodium chloride, and dibasic sodium phosphate, pH neutral

INDICATIONS AND DOSE

Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Sicca syndrome (ACBS)

BY MOUTH

- ▶ Adult: Apply 1 spray as required, spray onto oral mucosa

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Saliveze[®] Oral Spray may be prescribed.

- ▶ **Saliveze mouth spray (Wyvern Medical Ltd)**

50 ml (ACBS) · NHS indicative price = £3.50

SALIVIX[®]

Sugar-free, reddish-amber, acacia, malic acid and other ingredients.

INDICATIONS AND DOSE

Symptomatic treatment of dry mouth

BY MOUTH USING PASTILLES

- ▶ Adult: 1 unit as required, suck pastille

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Salivix[®] Pastilles may be prescribed as Artificial Saliva Pastilles.

- ▶ **Salivix pastilles (Galen Ltd)**

50 pastille · NHS indicative price = £3.55

XEROTIN[®]

Sugar-free, water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral.

INDICATIONS AND DOSE

Symptomatic treatment of dry mouth

BY MOUTH

- ▶ Adult: 1 spray as required

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Xerotin[®] Oral Spray may be prescribed as Artificial Saliva Oral Spray.

- ▶ **Xerotin spray (SpePharm UK Ltd)**

100 ml · NHS indicative price = £6.86

PARASYMPATHOMIMETICS

Pilocarpine

INDICATIONS AND DOSE

Xerostomia following irradiation for head and neck cancer

BY MOUTH

- ▶ Adult: 5 mg 3 times a day for 4 weeks, then increased if tolerated to up to 30 mg daily in divided doses if required, dose to be taken with or immediately after meals (last dose always with evening meal), maximum therapeutic effect normally within 4–8 weeks; discontinue if no improvement after 2–3 months

Dry mouth and dry eyes in Sjögren's syndrome

BY MOUTH

- ▶ Adult: 5 mg 4 times a day; increased if tolerated to up to 30 mg daily in divided doses if required, dose to be taken with meals and at bedtime, discontinue if no improvement after 2–3 months

- **CONTRA-INDICATIONS** Acute iritis · chronic obstructive pulmonary disease (increased bronchial secretions and increased airways resistance) · uncontrolled asthma (increased bronchial secretions and increased airways resistance) · uncontrolled cardiorenal disease

- **CAUTIONS** Asthma (avoid if uncontrolled) · biliary-tract disease · cardiovascular disease (avoid if uncontrolled) · cholelithiasis · chronic obstructive pulmonary disease (avoid if uncontrolled) · cognitive disturbances · maintain adequate fluid intake to avoid dehydration associated with excessive sweating · peptic ulceration · psychiatric disturbances · risk of increased renal colic · risk of increased urethral smooth muscle tone · susceptibility to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1 (parasympathomimetics).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Influenza-like symptoms · abdominal pain · asthenia · conjunctivitis · constipation · diarrhoea · dizziness · dyspepsia · flushing · headache · hypertension · increased urinary frequency · lacrimation · nausea · ocular pain · palpitation · pruritus · rash · rhinitis · sweating · visual disturbances · vomiting
 - ▶ **Uncommon** Flatulence · urinary urgency
 - ▶ **PREGNANCY** Avoid—smooth muscle stimulant; toxicity in animal studies.
 - **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
 - **HEPATIC IMPAIRMENT** Reduce initial oral dose in moderate or severe cirrhosis.
 - **RENAL IMPAIRMENT** Manufacturer advises caution with tablets.
 - **PATIENT AND CARER ADVICE** Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 27

Pilocarpine hydrochloride 5 mg Salagen 5mg tablets | 84 tablet [PoM] £41.14 DT price = £41.14

3.2 Oral hygiene

Mouthwashes and other preparations for oropharyngeal use

Lozenges and sprays

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

Mouthwashes, gargles, and dentifrices

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting compound sodium chloride mouthwash with an equal volume of warm water.

Mouthwashes containing an oxidising agent, such as hydrogen peroxide p. 990, may be useful in the treatment of acute ulcerative gingivitis (Vincent's infection) since the organisms involved are anaerobes. It also has a mechanical

cleansing effect arising from frothing when in contact with oral debris.

Chlorhexidine is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed.

Chlorhexidine mouthwash is used in the treatment of denture stomatitis. It is also used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in patients undergoing dental procedures.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the patient has a haemorrhagic disorder, or is disabled.

Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis. With prolonged use, chlorhexidine causes reversible brown staining of teeth and tongue. Chlorhexidine may be incompatible with some ingredients in toothpaste, causing an unpleasant taste in the mouth; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing products.

There is no convincing evidence that gargles are effective in adults.

Chlorhexidine

INDICATIONS AND DOSE

Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of aphthous ulcers

BY MOUTH USING MOUTHWASH

- ▶ Child: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)
- ▶ Adult: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)

Denture stomatitis

MOUTHWASH

- ▶ Adult: Cleanse and soak dentures in mouthwash solution for 15 minutes twice daily

Oral hygiene and plaque inhibition and gingivitis

BY MOUTH USING DENTAL GEL

- ▶ Child: Apply 1–2 times a day, to be brushed on the teeth
- ▶ Adult: Apply 1–2 times a day, to be brushed on the teeth

Oral candidiasis | Management of aphthous ulcers

BY MOUTH USING DENTAL GEL

- ▶ Child: Apply 1–2 times a day, to affected areas
- ▶ Adult: Apply 1–2 times a day, to affected areas

Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of aphthous ulcers

BY MOUTH USING OROMUCOSAL SPRAY

- ▶ Child: Apply up to 12 sprays twice daily as required, to be applied to tooth, gingival, or ulcer surfaces
- ▶ Adult: Apply up to 12 sprays twice daily as required, to be applied to tooth, gingival, or ulcer surfaces

- **SIDE-EFFECTS** Anaphylaxis · hypersensitivity · mucosal irritation · parotid gland swelling · reversible brown staining of composite restorations · reversible brown

staining of silicate compositions · reversible brown staining of teeth · taste disturbance · tongue discolouration

SIDE-EFFECTS, FURTHER INFORMATION

If desquamation occurs with mucosal irritation, discontinue treatment or dilute mouthwash with an equal volume of water.

- **PATIENT AND CARER ADVICE** Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing product.
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary *Corsodyl*® dental gel may be prescribed as Chlorhexidine Gluconate Gel; *Corsodyl*® mouthwash may be prescribed as Chlorhexidine Mouthwash; *Corsodyl*® oral spray may be prescribed as Chlorhexidine Oral Spray.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

- ▶ **Corsodyl** (GlaxoSmithKline Consumer Healthcare)
Chlorhexidine gluconate 2 mg per 1 ml Corsodyl 0.2% oral spray (sugar-free) | 60 ml [GSL] £4.28 DT price = £4.28

Dental gel

- ▶ **Corsodyl** (GlaxoSmithKline Consumer Healthcare)
Chlorhexidine gluconate 10 mg per 1 gram Corsodyl 1% dental gel (sugar-free) | 50 gram [GSL] £1.26 DT price = £1.26

Mouthwash

- ▶ **CHLORHEXIDINE (Non-proprietary)**
Chlorhexidine gluconate 2 mg per 1 ml Chlorhexidine gluconate 0.2% mouthwash natural | 300 ml [GSL] £2.50 DT price = £3.46
 Chlorhexidine gluconate 0.2% mouthwash | 300 ml [GSL] £1.99-£2.09 DT price = £3.46
 Chlorhexidine gluconate 0.2% mouthwash plain | 300 ml [GSL] £3.46 DT price = £3.46
 Chlorhexidine gluconate 0.2% mouthwash peppermint | 300 ml [GSL] £3.46 DT price = £3.46
 Colgate Pro Gum Health 0.2% antiseptic mouthwash | 300 ml [GSL] £3.06 DT price = £3.46
 Chlorhexidine gluconate 0.2% mouthwash original | 300 ml [GSL] £3.48 DT price = £3.46
 Chlorhexidine gluconate 0.2% mouthwash alcohol free | 300 ml [GSL] no price available DT price = £3.46 | 500 ml [GSL] no price available
- ▶ Brands may include Corsodyl, Curasept

Chlorhexidine with chlorbutanol

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 989.

INDICATIONS AND DOSE

Oral hygiene and plaque inhibition

BY MOUTH

- ▶ Child 6-17 years: Rinse or gargle 10–15 mL 2–3 times a day, to be diluted with lukewarm water in measuring cup provided
- ▶ Adult: Rinse or gargle 10–15 mL 2–3 times a day, to be diluted with lukewarm water in measuring cup provided

Denture disinfection

- ▶ Adult: Soak previously cleansed dentures in mouthwash (diluted with 2 volumes of water) for 60 minutes

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of mouthwash may include mint.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Mouthwash

- ▶ **Eudril** (Pierre Fabre Ltd)
Chlorhexidine gluconate 1 mg per 1 ml, Chlorobutanol 5 mg per 1 ml Eudril mouthwash (sugar-free) | 90 ml [GSL] £1.36 (sugar-free) | 250 ml [GSL] £2.83 (sugar-free) | 500 ml [GSL] £5.06

Hexetidine

INDICATIONS AND DOSE

Oral hygiene

BY MOUTH USING MOUTHWASH

- ▶ Child 6-17 years: Rinse or gargle 15 mL 2–3 times a day, to be used undiluted
- ▶ Adult: Rinse or gargle 15 mL 2–3 times a day, to be used undiluted

SIDE-EFFECTS

- ▶ **Very rare** Taste disturbance · transient anaesthesia
- ▶ **Frequency not known** Local irritation

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of mouthwashes may include mint.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Mouthwash

- ▶ **Oraldene** (McNeil Products Ltd)
Hexetidine 1 mg per 1 ml Oraldene Icemint 0.1% mouthwash (sugar-free) | 200 ml [GSL] £2.21 DT price = £2.21
 Oraldene 0.1% mouthwash peppermint (sugar-free) | 100 ml [GSL] £1.43 (sugar-free) | 200 ml [GSL] £2.21 DT price = £2.21

Hydrogen peroxide

- **DRUG ACTION** Hydrogen peroxide is an oxidising agent.

INDICATIONS AND DOSE

Oral hygiene (with hydrogen peroxide 6%)

BY MOUTH

- ▶ Child: Rinse or gargle 15 mL 2–3 times a day for 2–3 minutes, to be diluted in half a tumblerful of warm water
- ▶ Adult: Rinse or gargle 15 mL 2–3 times a day for 2–3 minutes, to be diluted in half a tumblerful of warm water

PEROXYL®

Oral hygiene

BY MOUTH

- ▶ Child 6-17 years: Rinse or gargle 10 mL 3 times a day for about 1 minute, for maximum 7 days, to be used after meals and at bedtime
- ▶ Adult: Rinse or gargle 10 mL up to 4 times a day for about 1 minute, to be used after meals and at bedtime

- **SIDE-EFFECTS** Hypertrophy of papillae of tongue on prolonged used

- **PRESCRIBING AND DISPENSING INFORMATION** The BP directs that when hydrogen peroxide is prescribed, hydrogen peroxide solution 6% (20 vols) should be dispensed.

Strong solutions of hydrogen peroxide which contain 27% (90 vols) and 30% (100 vols) are only for the preparation of weaker solutions.

When prepared extemporaneously, the BP states Hydrogen Peroxide Mouthwash, BP consists of hydrogen peroxide 6% solution (= approx. 20 volume) BP.

- **HANDLING AND STORAGE** Hydrogen peroxide bleaches fabric.

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Hydrogen Peroxide Mouthwash may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ear drops, liquid

Mouthwash

- ▶ **PeroxyI** (Colgate-Palmolive (UK) Ltd)
Hydrogen peroxide 15 mg per 1 ml PeroxyI 1.5% mouthwash (sugar-free) | 300 ml [G5L] £2.94

Sodium bicarbonate with sodium chloride

INDICATIONS AND DOSE

Oral hygiene

BY MOUTH USING MOUTHWASH

- ▶ Adult: (consult product literature)

- **DIRECTIONS FOR ADMINISTRATION** For mouthwash, extemporaneous preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL. To be diluted with an equal volume of warm water prior to administration.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of mouthwash may include peppermint.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Compound sodium chloride mouthwash may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: mouthwash

3.3 Oral hygiene, dental caries

Dental caries

Fluoride

Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

When the fluoride content of drinking water is less than 700 micrograms per litre (0.7 parts per million), daily administration of fluoride tablets or drops provides suitable supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months.

Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional protection by use of fluoride rinses or by application of fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than weekly use of a more concentrated one. High-strength gels must be applied regularly under professional supervision; extreme caution is necessary to prevent children from swallowing any excess. Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.

FLUORIDE

Sodium fluoride

INDICATIONS AND DOSE

Prophylaxis of dental caries for water content less than 300micrograms/litre (0.3 parts per million) of fluoride ion
BY MOUTH USING TABLETS

- ▶ Child 6 months-2 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)
- ▶ Child 3-5 years: 500 micrograms daily, doses expressed as fluoride ion (F⁻)
- ▶ Child 6-17 years: 1 mg daily, doses expressed as fluoride ion (F⁻)
- ▶ Adult: 1 mg daily, doses expressed as fluoride ion (F⁻)

Prophylaxis of dental caries for water content between 300 and 700 micrograms/litre (0.3-0.7 parts per million) of fluoride ion

BY MOUTH USING TABLETS

- ▶ Child 3-5 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)
- ▶ Child 6-17 years: 500 micrograms daily, doses expressed as fluoride ion (F⁻)
- ▶ Adult: 500 micrograms daily, doses expressed as fluoride ion (F⁻)

Prophylaxis of dental caries for water content above 700micrograms/litre (0.7 parts per million) of fluoride ion

- ▶ Child 6 months-17 years: Supplements not advised
- ▶ Adult: Supplements not advised

Prophylaxis of dental caries for individuals who are caries prone or medically compromised

BY MOUTH USING MOUTHWASH

- ▶ Child 6-17 years: Rinse or gargle 10 mL daily
- ▶ Adult: Rinse or gargle 10 mL daily

Dose equivalence and conversion

Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion.

These doses reflect the recommendations of the British Dental Association, the British Society of Paediatric Dentistry and the British Association for the Study of Community Dentistry (*Br Dent J* 1997; 182: 6-7).

COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE

Prophylaxis of dental caries

BY MOUTH USING PASTE

- ▶ Child 10-17 years: Apply 1 centimetre twice daily, to be applied using a toothbrush
- ▶ Adult: Apply 1 centimetre twice daily, to be applied using a toothbrush

COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE

Prophylaxis of dental caries

BY MOUTH USING PASTE

- ▶ Child 16-17 years: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush
- ▶ Adult: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush

EN-DE-KAY® FLUORINSE

Prophylaxis of dental caries for individuals who are caries prone or medically compromised

INITIALLY BY MOUTH USING MOUTHWASH

- ▶ Adult: 5 drops daily, dilute 5 drops to 10 mL of water, alternatively (by mouth) 20 drops once weekly, dilute 20 drops to 10 mL

- **CONTRA-INDICATIONS** Not for areas where drinking water is fluoridated
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Occasional white flecks on teeth with recommended doses
 - ▶ **Rare** Yellowish-brown discoloration if recommended doses are exceeded

● DIRECTIONS FOR ADMINISTRATION

- ▶ With oral use Tablets should be sucked or dissolved in the mouth and taken preferably in the evening.
- ▶ With oral (topical) use For mouthwash, rinse mouth for 1 minute and then spit out.

COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE
Brush teeth for 1 minute before spitting out.

COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE
Brush teeth for 3 minutes before spitting out.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral tablet formulations may include orange.

● PATIENT AND CARER ADVICE

Mouthwash Avoid eating, drinking, or rinsing mouth for 15 minutes after use.

COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE
Patients or carers should be given advice on how to administer sodium fluoride toothpaste.

COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE
Patients or carers should be given advice on how to administer Sodium fluoride toothpaste.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Tablets may be prescribed as Sodium Fluoride Tablets.

Oral drops may be prescribed as Sodium Fluoride Oral Drops. Mouthwashes may be prescribed as Sodium Fluoride Mouthwash 0.05% or Sodium Fluoride Mouthwash 2%.

Dental information

Fluoride mouthwash, oral drops, tablets and toothpaste are prescribable on form FP10D (GP14 in Scotland, WP10D in Wales). There are also arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes.

Fluoride gels are not prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE
Dental practitioners' formulary May be prescribed as Sodium Fluoride Toothpaste 0.619%.

COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE
Dental practitioners' formulary May be prescribed as Sodium Fluoride Toothpaste 1.1%.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, capsule

3.4 Oral ulceration and inflammation

Oral ulceration and inflammation

Ulceration and inflammation

Ulceration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthae, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy (see also *Chemotherapy induced mucositis* and *myelosuppression* under Cytotoxic drugs p. 744). It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Patients with an unexplained mouth ulcer of more than 3 weeks' duration require urgent referral to hospital to exclude oral cancer.

Simple mouthwashes

A **saline** mouthwash may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.

Antiseptic mouthwashes

Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of a chlorhexidine mouthwash p. 989 is often beneficial and may accelerate healing of recurrent aphthae.

Corticosteroids

Topical corticosteroid therapy may be used for some forms of oral ulceration. In the case of aphthous ulcers it is most effective if applied in the 'prodromal' phase.

Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

Hydrocortisone **oromucosal tablets** p. 993 are allowed to dissolve next to an ulcer and are useful in recurrent aphthae and erosive lichenoid lesions.

Beclometasone dipropionate inhaler p. 993 sprayed on the oral mucosa is used to manage oral ulceration [unlicensed indication]. Alternatively, betamethasone soluble tablets p. 993 dissolved in water can be used as a mouthwash to treat oral ulceration [unlicensed indication].

Systemic corticosteroid therapy (see under Corticosteroids, inflammatory disorders p. 939), is reserved for severe conditions such as pemphigus vulgaris.

Local analgesics

Local analgesics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration so that analgesia cannot be maintained continuously throughout the day. The main indication for a topical local analgesic is to relieve the pain of otherwise intractable oral ulceration particularly when it is due to major aphthae. For this purpose lidocaine hydrochloride 5% p. 994 ointment or lozenges containing a local anaesthetic are applied to the ulcer. Lidocaine hydrochloride 10% p. 994 solution as spray can be applied

thinly to the ulcer [unlicensed indication] using a cotton bud. When local anaesthetics are used in the mouth care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

Preparations on sale to the public: many mouth ulcer preparations, throat lozenges, and throat sprays on sale to the public contain a local anaesthetic. To identify the active ingredients in such preparations, consult the product literature of the manufacturer—the correct proprietary name should be ascertained as many products have very similar names but different active ingredients.

Benzylamine hydrochloride below and flurbiprofen p. 994 are non-steroidal anti-inflammatory drugs (NSAIDs). Benzylamine hydrochloride below mouthwash or spray may be useful in reducing the discomfort associated with a variety of ulcerative conditions. It has also been found to be effective in reducing the discomfort of tonsillectomy and post-irradiation mucositis. Some patients find the full-strength mouthwash causes some stinging and, for them, it should be diluted with an equal volume of water. Flurbiprofen lozenges are licensed for the relief of sore throat.

Choline salicylate p. 994 is a derivative of salicylic acid and has some analgesic action. The dental gel may provide relief for recurrent aphthae, but excessive application or confinement under a denture irritates the mucosa and can itself cause ulceration.

Other preparations

Doxycycline p. 995 rinsed in the mouth may be of value for recurrent aphthous ulceration.

Periodontitis

Low-dose doxycycline p. 995 (*Periostat*®) is licensed as an adjunct to scaling and root planing for the treatment of periodontitis; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis.

For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see under Oropharynx infections, bacterial p. 995. See also Mouthwashes and other preparations for oropharyngeal use p. 989 for mouthwashes used for oral hygiene and plaque inhibition.

CORTICOSTEROIDS

Beclomethasone dipropionate (Beclomethasone dipropionate)

INDICATIONS AND DOSE

Management of oral ulceration

BY BUCCAL ADMINISTRATION

- ▶ Adult: 50–100 micrograms twice daily, use inhaler device to spray dose on to the oral mucosa

- **UNLICENSED USE** Use of soluble tablets and inhaler unlicensed in oral ulceration.

● MEDICINAL FORMS

For preparations see inhaled beclomethasone p. 228.

Betamethasone

INDICATIONS AND DOSE

Oral ulceration

BY MOUTH USING SOLUBLE TABLETS

- ▶ Child 12–17 years: 500 micrograms 4 times a day, to be dissolved in 20 mL water and rinsed around the mouth; not to be swallowed

- ▶ Adult: 500 micrograms 4 times a day, to be dissolved in 20 mL water and rinsed around the mouth; not to be swallowed

- **UNLICENSED USE** Betamethasone soluble tablets not licensed for use as mouthwash or in oral ulceration.
- **CONTRA-INDICATIONS** Untreated local infection
- **SIDE-EFFECTS** Candidal infection · exacerbation of local infection
- **PATIENT AND CARER ADVICE** Patient counselling is advised for betamethasone soluble tablets (administration).
- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary Betamethasone Soluble Tablets 500 micrograms may be prescribed for oral ulceration.

● MEDICINAL FORMS

Soluble tablet

CAUTIONARY AND ADVISORY LABELS 10, 13, 21

▶ BETAMETHASONE (Non-proprietary)

Betamethasone (as Betamethasone sodium phosphate) 500 microgram Betamethasone 500microgram soluble tablets sugar free (sugar-free) | 100 tablet (P6M) £29.85 DT price = £29.70

Hydrocortisone

INDICATIONS AND DOSE

Oral and perioral lesions

BY BUCCAL ADMINISTRATION

- ▶ Child 1 month–11 years: Only on medical advice
- ▶ Child 12–17 years: 1 lozenge 4 times a day, allowed to dissolve slowly in the mouth in contact with the ulcer
- ▶ Adult: 1 lozenge 4 times a day, allowed to dissolve slowly in the mouth in contact with the ulcer

- **UNLICENSED USE** *Hydrocortisone mucoadhesive buccal tablets* licensed for use in children (under 12 years—on medical advice only).
 - **CONTRA-INDICATIONS** Untreated local infection
 - **SIDE-EFFECTS** Candidal infection · exacerbation of local infection
 - **PROFESSION SPECIFIC INFORMATION**
- Dental practitioners' formulary** Mucoadhesive buccal tablets may be prescribed as Hydrocortisone Oromucosal Tablets.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: pastille

Muco-adhesive buccal tablet

▶ HYDROCORTISONE (Non-proprietary)

Hydrocortisone (as Hydrocortisone sodium succinate)

2.5 mg Hydrocortisone 2.5mg muco-adhesive buccal tablets sugar free (sugar-free) | 20 tablet (P) £4.55 DT price = £4.55

NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Benzylamine hydrochloride

INDICATIONS AND DOSE

Painful inflammatory conditions of oropharynx

BY MOUTH USING MOUTHWASH

- ▶ Child 13–17 years: Rinse or gargle 15 mL every 1.5–3 hours as required usually for not more than 7 days, dilute with an equal volume of water if stinging occurs
- ▶ Adult: Rinse or gargle 15 mL every 1.5–3 hours as required usually for not more than 7 days, dilute with an equal volume of water if stinging occurs continued →

BY MOUTH USING OROMUCOSAL SPRAY

- ▶ Child 1 month–5 years: 1 spray every 1.5–3 hours (max. per dose 4 sprays every 1.5–3 hours), one spray per 4 kg body-weight. To be administered to the affected area
- ▶ Child 6–11 years: 4 sprays every 1.5–3 hours, to be administered onto affected area
- ▶ Child 12–17 years: 4–8 sprays every 1.5–3 hours, to be administered onto affected area
- ▶ Adult: 4–8 sprays every 1.5–3 hours, to be administered onto affected area

● **SIDE-EFFECTS**

- ▶ **Rare** Hypersensitivity reactions
- ▶ **Frequency not known** Occasional numbness or stinging

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary Benzydamine Oromucosal Spray 0.15% may be prescribed.
Benzydamine mouthwash may be prescribed as Benzydamine Mouthwash 0.15%.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Spray▶ **BENZYDAMINE HYDROCHLORIDE (Non-proprietary)**

Benzydamine hydrochloride 1.5 mg per 1 ml Benzydamine 0.15% oromucosal spray sugar free (sugar-free) | 30 ml Ⓟ £4.46 DT price = £4.38

▶ **Diffiam** (Meda Pharmaceuticals Ltd)

Benzydamine hydrochloride 1.5 mg per 1 ml Diffiam 0.15% spray (sugar-free) | 30 ml Ⓟ £4.24 DT price = £4.38

Mouthwash▶ **BENZYDAMINE HYDROCHLORIDE (Non-proprietary)**

Benzydamine hydrochloride 1.5 mg per 1 ml Benzydamine 0.15% mouthwash sugar free (sugar-free) | 300 ml Ⓟ £6.83 DT price = £6.71

LOCAL ANAESTHETICS

Lidocaine hydrochloride (Lignocaine hydrochloride)

INDICATIONS AND DOSE**Relief of pain in oral lesions**

TO THE LESION USING OINTMENT

- ▶ Adult: Apply as required, rub sparingly and gently on affected areas

XYLOCAINE®**Relief of pain in oral lesions**

TO THE LESION

- ▶ Adult: Apply thinly to the ulcer using a cotton bud

- **UNLICENSED USE** Spray not licensed for the relief of pain in oral lesions.

- **CAUTIONS** Avoid anaesthesia of the pharynx before meals—risk of choking · can damage plastic cuffs of endotracheal tubes

- **INTERACTIONS** → Appendix 1 (lidocaine). Interactions less likely when lidocaine used topically.

- **PREGNANCY** Crosses the placenta but not known to be harmful in *animal* studies—use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.

- **BREAST FEEDING** Present in milk but amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Caution—increased risk of side-effects.

- **RENAL IMPAIRMENT** Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

● **PROFESSION SPECIFIC INFORMATION****XYLOCAINE®**

Dental practitioners' formulary May be prescribed as lidocaine spray 10%.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: mouthwash, lozenge

Lidocaine hydrochloride 50 mg per 1 gram Lidocaine hydrochloride 5% ointment | 15 gram Ⓟ £6.50

Spray▶ **Xylocaine** (AstraZeneca UK Ltd)

Lidocaine 10 mg per 1 actuation Xylocaine 10mg/dose spray (sugar-free) | 50 ml Ⓟ £6.29

SALICYLATES

Choline salicylate

INDICATIONS AND DOSE**Mild oral and perioral lesions**

TO THE LESION

- ▶ Child 16–17 years: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours
- ▶ Adult: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours

- **CONTRA-INDICATIONS** Children under 16 years

CONTRA-INDICATIONS, FURTHER INFORMATION

Reye's syndrome The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye's syndrome.

● CAUTIONS

GENERAL CAUTIONS

Frequent application, especially in children, may give rise to salicylate poisoning

SPECIFIC CAUTIONS

Not to be applied to dentures—leave at least 30 minutes before re-insertion of dentures

● SIDE-EFFECTS

Transient local burning sensation

● PRESCRIBING AND DISPENSING INFORMATION

When prepared extemporaneously, the BP states Choline Salicylate Dental Gel, BP consists of choline salicylate 8.7% in a flavoured gel basis.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Choline Salicylate Dental Gel may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oromucosal gel

- ▶ **Bonjela** (Reckitt Benckiser Healthcare (UK) Ltd)
Choline salicylate 87 mg per 1 gram Bonjela Cool Mint gel (sugar-free) | 15 gram [G5L] £2.58 DT price = £2.26

Reye's syndrome The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye's syndrome.

● CAUTIONS

GENERAL CAUTIONS Frequent application, especially in children, may give rise to salicylate poisoning

SPECIFIC CAUTIONS Not to be applied to dentures—leave at least 30 minutes before re-insertion of dentures

● SIDE-EFFECTS

Temporary discolouration of oral mucosa · temporary discolouration of teeth · transient local burning sensation

● PATIENT AND CARER ADVICE

May cause temporary discolouration of teeth and oral mucosa.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Paint

EXCIPIENTS: May contain Ethanol

- ▶ **Pyralvex** (Meda Pharmaceuticals Ltd)
Rhubarb extract 50 mg per 1 ml, Salicylic acid 10 mg per 1 ml Pyralvex solution | 10 ml [F] £3.25

3.5 Oropharyngeal bacterial infections

Oropharyngeal bacterial infections

Antibacterial therapy for pericoronitis

Antibacterial required only in presence of systemic features of infection, or of trismus, or persistent swelling despite local treatment.

- Metronidazole p. 475, or *alternatively*, amoxicillin
Suggested duration of treatment 3 days or until symptoms resolve.

Antibacterial therapy for gingivitis: acute necrotising ulcerative

Antibacterial required only if systemic features of infection.

- Metronidazole p. 475, or *alternatively*, amoxicillin
Suggested duration of treatment 3 days or until symptoms resolve.

Antibacterial therapy for periapical or periodontal abscess

Antibacterial required only in severe disease with cellulitis or if systemic features of infection.

- Amoxicillin p. 482, or *alternatively*, metronidazole
Suggested duration of treatment 5 days.

Antibacterial therapy for periodontitis

Antibacterial used as an adjunct to debridement in severe disease or disease unresponsive to local treatment alone.

- Metronidazole p. 475, or *alternatively* in *adults and children over 12 years*, doxycycline below

Antibacterial therapy for throat infections

Most throat infections are caused by viruses and many do not require antibacterial therapy. Consider antibacterial, if history of valvular heart disease, if marked systemic upset, if peritonsillar cellulitis or abscess, or if at increased risk from acute infection (e.g. in immunosuppression, cystic fibrosis); prescribe antibacterial for beta-haemolytic streptococcal pharyngitis.

- Phenoxymethylpenicillin
In severe infection, initial parenteral therapy with benzylpenicillin sodium p. 480, then oral therapy with phenoxymethylpenicillin p. 481 or amoxicillin p. 482 (or ampicillin p. 483). **Avoid** amoxicillin if possibility of glandular fever.
Suggested duration of treatment 10 days.
- If *penicillin-allergic*, clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
Suggested duration of treatment 10 days

Doxycycline

INDICATIONS AND DOSE

Treatment of recurrent aphthous ulceration

BY MOUTH USING SOLUBLE TABLETS

- ▶ Child 12-17 years: 100 mg 4 times a day usually for 3 days, dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2-3 minutes, it should preferably not be swallowed
- ▶ Adult: 100 mg 4 times a day usually for 3 days, dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2-3 minutes, it should preferably not be swallowed

- **UNLICENSED USE** Not licensed for severe recurrent aphthous ulceration.
- **CAUTIONS** Alcohol dependence
- **INTERACTIONS** The metabolism of doxycycline may be influenced by antiepileptics.
- **SIDE-EFFECTS** Anorexia · anxiety · dry mouth · flushing · fungal superinfection (when used for periodontitis) · tinnitus
- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).
- **MONITORING REQUIREMENTS** When used for periodontitis, monitor for superficial fungal infection, particularly if predisposition to oral candidiasis.
- **PATIENT AND CARER ADVICE**
Photosensitivity Patients should be advised to avoid exposure to sunlight or sunlamps.
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary
Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets.
Tablets may be prescribed as Doxycycline Tablets 20 mg.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 6, 11, 27

▶ **Periostat** (Alliance Pharmaceuticals Ltd)

Doxycycline (as Doxycycline hyclate) 20 mg Periostat 20mg tablets | 56 tablet **[PoM]** £17.30 DT price = £17.30

Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 6, 9, 11, 13

▶ **Vibramycin-D** (Pfizer Ltd)

Doxycycline (as Doxycycline monohydrate) 100 mg Vibramycin-D 100mg dispersible tablets (sugar-free) | 8 tablet **[PoM]** £4.91 DT price = £4.91

3.6 Oropharyngeal fungal infections

Oropharyngeal fungal infections

Fungal infections of the mouth are usually caused by *Candida* spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

Thrush

Acute pseudomembranous candidiasis (thrush), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxics or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child's teeth) immediately after using the inhaler may avoid the problem. Treatment with nystatin p. 997 or miconazole p. 1011 may be needed. Fluconazole p. 518 is effective for unresponsive infections or if a topical antifungal drug cannot be used or if the patient has dry mouth. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

Acute erythematous candidiasis

Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and

broad-spectrum antibacterial use and with HIV disease. It is usually treated with fluconazole p. 518.

Denture stomatitis

Patients with denture stomatitis (chronic atrophic candidiasis), should cleanse their dentures thoroughly and leave them out as often as possible during the treatment period. To prevent recurrence of the problem, dentures should not normally be worn at night. New dentures may be required if these measures fail despite good compliance.

Miconazole p. 1011 oral gel can be applied to the fitting surface of the denture before insertion (for short periods only). Denture stomatitis is not always associated with candidiasis and other factors such as mechanical or chemical irritation, bacterial infection, or rarely allergy to the dental base material, may be the cause.

Chronic hyperplastic candidiasis

Chronic hyperplastic candidiasis (candidal leucoplakia) carries an increased risk of malignancy; biopsy is essential—this type of candidiasis may be associated with varying degrees of dysplasia, with oral cancer present in a high proportion of cases. Chronic hyperplastic candidiasis is treated with a systemic antifungal such as fluconazole p. 518 to eliminate candidal overlay. Patients should avoid the use of tobacco.

Angular cheilitis

Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It is commonly associated with denture stomatitis but may represent a nutritional deficiency or it may be related to orofacial granulomatosis or HIV infection. Both yeasts (*Candida* spp.) and bacteria (*Staphylococcus aureus* and beta-haemolytic streptococci) are commonly involved as interacting, infective factors. A reduction in facial height related to ageing and tooth loss with maceration in the deep occlusive folds that may subsequently arise, predisposes to such infection. While the underlying cause is being identified and treated, it is often helpful to apply miconazole p. 1011 cream or fusidic acid p. 1008 ointment; if the angular cheilitis is unresponsive to treatment, hydrocortisone with miconazole p. 1011 cream or ointment can be used.

Immunocompromised patients

See advice on prevention of fungal infections in *Immunocompromised patients* under Antifungals, systemic use p. 512.

Drugs used in oropharyngeal candidiasis

Nystatin p. 997 is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. Miconazole p. 1011 is applied locally (as an oral gel) in the mouth but it is absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci. Fluconazole p. 518 is given by mouth for infections that do not respond to topical therapy or when topical therapy cannot be used. It is reliably absorbed and effective. Itraconazole p. 519 can be used for fluconazole-resistant infections.

If candidal infection fails to respond to 1 to 2 weeks of treatment with antifungal drugs the patient should be sent for investigation to eliminate the possibility of underlying disease. Persistent infection may also be caused by reinfection from the genito-urinary or gastro-intestinal tract. Infection can be eliminated from these sources by appropriate anticandidal therapy; the patient's partner may also require treatment to prevent reinfection.

Antiseptic mouthwashes are used in the prevention of oral candidiasis in immunocompromised patients and in the treatment of denture stomatitis.

IMIDAZOLE ANTIFUNGALS

Miconazole

INDICATIONS AND DOSE

Prevention and treatment of oral candidiasis

BY MOUTH USING ORAL GEL

- ▶ Child 2-17 years: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)
- ▶ Adult: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)

Prevention and treatment of intestinal candidiasis

BY MOUTH USING ORAL GEL

- ▶ Child 4 months-17 years: 5 mg/kg 4 times a day (max. per dose 250 mg (10 mL) 4 times a day), treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared
- ▶ Adult: 5 mg/kg 4 times a day (max. per dose 250 mg (10 mL) 4 times a day), treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared

- **CONTRA-INDICATIONS** Infants with impaired swallowing reflex
- **CAUTIONS** Avoid in Acute porphyrias p. 864
- **INTERACTIONS** → Appendix 1 (antifungals, imidazole).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Nausea · rash · vomiting
 - ▶ **Very rare** diarrhoea (usually on long term treatment) · hepatitis · rash (in children) · Stevens-Johnson syndrome · toxic epidermal necrolysis
- **PREGNANCY** Manufacturer advises avoid if possible—toxicity at high doses in *animal* studies.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **HEPATIC IMPAIRMENT** Avoid.
- **DIRECTIONS FOR ADMINISTRATION** Oral gel should be held in mouth, after food.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral gel may include orange.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer miconazole oromucosal gel.
- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary Miconazole Oromucosal Gel may be prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** 15-g tube of oral gel can be sold to the public.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Nystatin 100000 unit per 1 ml Nystan 100,000units/ml oral suspension (ready mixed) | 30 ml [PoM] £1.80 DT price = £3.35

3.7 Oropharyngeal viral infections

Oropharyngeal viral infections

Viral infections are the most common cause of a sore throat. They do not benefit from anti-infective treatment.

The management of primary herpetic gingivostomatitis is a soft diet, adequate fluid intake, and analgesics as required, including local use of benzydamine hydrochloride p. 993. The use of chlorhexidine p. 989 mouthwash will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.

In the case of severe herpetic stomatitis, a systemic antiviral such as aciclovir p. 550 is required. Valaciclovir p. 552 and famciclovir p. 552 are suitable alternatives for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used for the prevention of frequently recurring herpes simplex lesions of the mouth, particularly when implicated in the initiation of erythema multiforme.

Skin conditions, management

Vehicles

The British Association of Dermatologists list of preferred unlicensed dermatological preparations (specials) is available at www.bad.org.uk/specials.

Both vehicle and active ingredients are important in the treatment of skin conditions; the vehicle alone may have more than a mere placebo effect. The vehicle affects the degree of hydration of the skin, has a mild anti-inflammatory effect, and aids the penetration of active drug.

Applications are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails.

Collodions are painted on the skin and allowed to dry to leave a flexible film over the site of application.

Creams are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.

Gels consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

Lotions have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. *Shake lotions* (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

Ointments are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid, and hard paraffin. Some ointment bases have both *hydrophilic and lipophilic* properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. *Water-soluble ointments* contain macrogols which are freely soluble in water and are therefore readily washed off; they

have a limited but useful role where ready removal is desirable.

Pastes are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

Dusting powders are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

Dilution

The BP directs that creams and ointments should **not** normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

Suitable quantities of dermatological preparations to be prescribed for specific areas of the body

Area of body	Creams and Ointments	Lotions
Face	15–30 g	100 ml
Both hands	25–50 g	200 ml
Scalp	50–100 g	200 ml
Both arms or both legs	100–200 g	200 ml
Trunk	400 g	500 ml
Groins and genitalia	15–25 g	100 ml

These amounts are usually suitable for an adult for twice daily application for 1 week. The recommendations do not apply to corticosteroid preparations. For suitable quantities of corticosteroid preparations, see relevant table on p. 1021.

Excipients and sensitisation

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided. The following excipients in topical preparations are associated, rarely, with sensitisation; the presence of these excipients is indicated in the entries for topical products.

- Beeswax
- Benzyl alcohol
- Butylated hydroxyanisole
- Butylated hydroxytoluene
- Cetostearyl alcohol (including cetyl and stearyl alcohol)
- Chlorocresol
- Edetic acid (EDTA)
- Ethylenediamine
- Fragrances
- Hydroxybenzoates (parabens)
- Imidurea
- Isopropyl palmitate
- N-(3-Chloroallyl)hexaminium chloride (quaternium 15)
- Polysorbates
- Propylene glycol
- Sodium metabisulfite
- Sorbic acid
- Wool fat and related substances including lanolin (purified versions of wool fat have reduced the problem)

1 Dry and scaling skin disorders

Emollient and barrier preparations

Borderline substances

The preparations marked 'ACBS' are regarded as drugs when prescribed in accordance with the advice of the Advisory Committee on Borderline Substances for the clinical conditions listed. Prescriptions issued in accordance with this advice and endorsed 'ACBS' will normally not be investigated.

Emollients

Emollients soothe, smooth and hydrate the skin and are indicated for all dry or scaling disorders. Their effects are short lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis. The choice of an appropriate emollient will depend on the severity of the condition, patient preference, and the site of application. Some ingredients rarely cause sensitisation and this should be suspected if an eczematous reaction occurs. The use of aqueous cream as a leave-on emollient may increase the risk of skin reactions, particularly in eczema.

Preparations such as **aqueous cream** and **emulsifying ointment** can be used as soap substitutes for hand washing and in the bath; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil may also be helpful.

Urea is occasionally used with other topical agents such as corticosteroids to enhance penetration of the skin.

Emollient bath and shower preparations

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. In dry skin conditions soap should be avoided.

The quantities of bath additives recommended for adults are suitable for an adult-size bath. Proportionately less should be used for a child-size bath or a washbasin; recommended bath additive quantities for children reflect this.

Barrier preparations

Barrier preparations often contain water-repellent substances such as dimeticone p. 1014 or other silicones. They are used on the skin around stomas, bedsores, and pressure areas in the elderly where the skin is intact. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. Barrier preparations are not a substitute for adequate nursing care.

Nappy rash

The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation, applied with each nappy change, can be helpful. A mild corticosteroid such as hydrocortisone 0.5% or 1% can be used if inflammation is causing discomfort, but it should be avoided in neonates. The barrier preparation should be applied after the corticosteroid preparation to prevent further damage. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and waterproof pants may increase absorption of corticosteroids. If the rash is associated with candidal infection, a topical antifungal such as clotrimazole p. 1010 cream can be used. Topical antibacterial preparations can be used if bacterial infection is present; treatment with an oral antibacterial may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is considerable inflammation, erosion, and infection.

BARRIER PREPARATIONS

Barrier creams and ointments

INDICATIONS AND DOSE

For use as a barrier preparation

TO THE SKIN

- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Zinc and Castor Oil Ointment, BP consists of zinc oxide 7.5%, castor oil 50%, arachis (peanut) oil 30.5%, white beeswax 10% and cetostearyl alcohol 2%.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Beeswax, butylated hydroxyanisole, butylated hydroxytoluene, cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, fragrances, hydroxybenzoates (parabens), propylene glycol, wool fat and related substances including lanolin

EMULSIDERM®

Dry skin conditions including eczema and ichthyosis

TO THE SKIN

- ▶ Adult: 7–30 mL/bath, alternatively, to be rubbed into dry skin until absorbed

OILATUM® PLUS

Topical treatment of eczema, including eczema at risk from infection

TO THE SKIN

- ▶ Child 6-11 months: 1 mL/bath, not to be used undiluted
- ▶ Adult: 1–2 capfuls/bath, not to be used undiluted

Important safety information

FIRE HAZARD WITH PARAFFIN-BASED EMOLLIENTS
Emulsifying ointment or 50% Liquid Paraffin and 50% White Soft Paraffin Ointment in contact with dressings and clothing is easily ignited by a naked flame. The risk is greater when these preparations are applied to large areas of the body, and clothing or dressings become soaked with the ointment. Patients should be told to keep away from fire or flames, and not to smoke when

using these preparations. The risk of fire should be considered when using large quantities of any paraffin-based emollient.

These preparations make skin and surfaces slippery—particular care is needed when bathing.

- **DIRECTIONS FOR ADMINISTRATION** Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.
- **PRESCRIBING AND DISPENSING INFORMATION**
Preparations containing an antibacterial should be avoided unless infection is present or is a frequent complication. When prepared extemporaneously, the BP states Aqueous Cream, BP consists of emulsifying ointment 30%, phenoxyethanol 1% in freshly boiled and cooled purified water. Hydrous Ointment, BP consists of dried magnesium sulfate 0.5%, phenoxyethanol 1%, wool alcohols ointment 50%, in freshly boiled and cooled purified water.

Patients should be told to keep away from fire or flames, and not to smoke when using these preparations. The risk of fire should be considered when using large quantities of any paraffin-based emollient.

- **DIRECTIONS FOR ADMINISTRATION** Emollients should be applied immediately after washing or bathing to maximise the effect of skin hydration. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Paraffin, Yellow Soft, BP consists of yellow petroleum jelly. Paraffin White Soft, BP consists of white petroleum jelly. Emulsifying ointment, BP consists of emulsifying wax 30%, white soft paraffin 50% and liquid paraffin 20%.

• MEDICAL FORMS

Emollients, urea-containing

- **DRUG ACTION** Urea is a keratin softener and hydrating agent used in the treatment of dry, scaling conditions (including ichthyosis) and may be useful in elderly patients.

INDICATIONS AND DOSE

AQUADRATE®

Dry, scaling and itching skin

TO THE SKIN

- Child: Apply twice daily, to be applied thinly
- Adult: Apply twice daily, to be applied thinly

BALNEUM® CREAM

Dry skin conditions

TO THE SKIN

- Child: Apply twice daily
- Adult: Apply twice daily

BALNEUM® PLUS CREAM

Dry, scaling and itching skin

TO THE SKIN

- Child: Apply twice daily
- Adult: Apply twice daily

CALMURID®

Dry, scaling and itching skin

TO THE SKIN

- Child: Apply twice daily, apply a thick layer for 3–5 minutes, massage into area, and remove excess. Can be diluted with aqueous cream (life of diluted cream is 14 days). Half-strength cream can be used for 1 week if stinging occurs
- Adult: Apply twice daily, apply a thick layer for 3–5 minutes, massage into area, and remove excess. Can be diluted with aqueous cream (life of diluted cream is 14 days). Half-strength cream can be used for 1 week if stinging occurs

DERMATONICS ONCE HEEL BALM®

Dry skin on soles of feet

TO THE SKIN

- Child 12–17 years: Apply daily
- Adult: Apply daily

E45® ITCH RELIEF CREAM

Dry, scaling, and itching skin

TO THE SKIN

- Child: Apply twice daily
- Adult: Apply twice daily

EUCERIN® INTENSIVE CREAM

Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis

TO THE SKIN

- Child: Apply twice daily, to be applied thinly and rubbed into area
- Adult: Apply twice daily, to be applied thinly and rubbed into area

EUCERIN® INTENSIVE LOTION

Dry skin conditions including eczema, ichthyosis, xeroderma and hyperkeratosis

TO THE SKIN

- Child: Apply twice daily, to be applied sparingly and rubbed into area
- Adult: Apply twice daily, to be applied sparingly and rubbed into area

FLEXITOL®

Dry skin on soles of feet and heels

TO THE SKIN

- Child 12–17 years: Apply 1–2 times a day
- Adult: Apply 1–2 times a day

HYDROMOL® INTENSIVE

Dry, scaling and itching skin

TO THE SKIN

- Child: Apply twice daily, to be applied thinly
- Adult: Apply twice daily, to be applied thinly

NUTRAPLUS®

Dry, scaling and itching skin

TO THE SKIN

- Child: Apply 2–3 times a day
- Adult: Apply 2–3 times a day

- **DIRECTIONS FOR ADMINISTRATION** Emollients should be applied immediately after washing or bathing to maximise the effect of skin hydration. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

● MEDICINAL FORMS

- ▶ Brands may include Dermatonic Once Heel Balm

2 Infections of the skin

Skin infections

Antibacterial preparations

Cellulitis, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment. Lower leg infections or infections spreading around wounds are almost always cellulitis.

Erysipelas, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial.

In the community, acute *impetigo* on small areas of the skin may be treated by short-term topical application of fusidic acid p. 1008; mupirocin p. 1009 should be used only to treat meticillin-resistant *Staphylococcus aureus*. If the impetigo is extensive or longstanding, an oral antibacterial such as flucloxacillin p. 486 (or clarithromycin p. 470 in penicillin allergy) should be used. Mild antiseptics can be used to soften crusts.

Although many antibacterial drugs are available in topical preparations, some are potentially hazardous and frequently their use is not necessary if adequate hygienic measures can be taken. Moreover, not all skin conditions that are oozing, crusted, or characterised by pustules are actually infected. Topical antibacterials should be **avoided** on *leg ulcers* unless used in short courses for defined infections; treatment of bacterial colonisation is generally inappropriate.

To minimise the development of resistant organisms it is advisable to limit the choice of antibacterials applied topically to those not used systemically. Unfortunately some of these, for example neomycin sulfate p. 1009, may cause sensitisation, and there is cross-sensitivity with other aminoglycoside antibiotics, such as gentamicin p. 450. If *large areas of skin* are being treated, ototoxicity may also be a hazard with aminoglycoside antibiotics (and also with polymyxins), particularly in children, in the elderly, and in those with renal impairment. *Resistant organisms* are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

Mupirocin p. 1009 is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although *Staphylococcus aureus* strains with low-level resistance to mupirocin are emerging, it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid p. 1008 should not be used for

longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antiseptic such as povidone-iodine p. 1053, chlorhexidine p. 1051 p. 989, or alcohol can be used; their use should be discussed with the local microbiologist.

Retapamulin p. 1009 can be used for impetigo and other superficial bacterial skin infections caused by *Staphylococcus aureus* and *Streptococcus pyogenes* that are resistant to first-line topical antibacterials. However, it is not effective against MRSA.

Silver sulfadiazine p. 1010 is used in the treatment of infected burns.

Antibacterial preparations also used systemically

Fusidic acid p. 1008 is a narrow-spectrum antibacterial used for staphylococcal infections. Fusidic acid has a role in the treatment of impetigo.

An ointment containing fusidic acid is used in the fissures of angular cheilitis when associated with staphylococcal infection. See Oropharynx infections, fungal p. 996 for further information on angular cheilitis.

Metronidazole p. 1008 is used topically for rosacea and to reduce the odour associated with anaerobic infections; oral metronidazole is used to treat wounds infected with anaerobic bacteria.

Antifungal preparations

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy is necessary for scalp infection or if the skin infection is widespread, disseminated, or intractable; although topical therapy may be used to treat some nail infections, systemic therapy is more effective. Skin scrapings should be examined if systemic therapy is being considered or where there is doubt about the diagnosis.

Dermatophytoses

Ringworm infection can affect the scalp (*tinea capitis*), body (*tinea corporis*), groin (*tinea cruris*), hand (*tinea manuum*), foot (*tinea pedis*, athlete's foot), or nail (*tinea unguium*). Scalp infection requires systemic treatment; additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm. Most other local ringworm infections can be treated adequately with topical antifungal preparations (including shampoos). The imidazole antifungals clotrimazole p. 1010, econazole nitrate p. 1011, ketoconazole p. 1011, and miconazole p. 1011 are all effective. Terbinafine p. 1013 cream is also effective but it is more expensive. Other topical antifungals include griseofulvin p. 1012 and the **undecenoates**. **Compound benzoic acid ointment** (Whitfield's ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations. Topical preparations for athlete's foot containing **tolnaftate** are on sale to the public.

Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. However, topical application of amorolfine p. 1012 or tioconazole p. 1012 may be useful for treating early onychomycosis when involvement is limited to mild distal disease, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy.

Pityriasis versicolor

Pityriasis (tinea) versicolor can be treated with ketoconazole shampoo p. 1011. Alternatively, **selenium sulfide** shampoo [unlicensed indication] can be used as a lotion (diluting with a small amount of water can reduce irritation) and left on the affected area for 10 minutes before rinsing off; it should be applied once daily for 7 days, and the course repeated if necessary.

Topical imidazole antifungals such as clotrimazole p. 1010, econazole nitrate p. 1011, ketoconazole p. 1011, and miconazole p. 997, or topical terbinafine p. 514 are alternatives, but large quantities may be required.

If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with a triazole antifungal. Relapse is common, especially in the immunocompromised.

Candidiasis

Candidal skin infections can be treated with a topical imidazole antifungal, such as clotrimazole p. 1010, econazole nitrate p. 1011, ketoconazole p. 1011, or miconazole p. 1011; topical terbinafine p. 1013 is an alternative. Topical application of nystatin p. 997 is also effective for candidiasis but it is ineffective against dermatophytosis. Refractory candidiasis requires systemic treatment generally with a triazole such as fluconazole p. 518; systemic treatment with terbinafine is **not appropriate** for refractory candidiasis.

Angular cheilitis

Miconazole p. 1011 cream is used in the fissures of angular cheilitis when associated with *Candida*.

Compound topical preparations

Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1% p. 993) may be of value in the treatment of eczematous intertrigo and, in the first few days only, of a severely inflamed patch of ringworm.

Combination of a mild corticosteroid with either an imidazole or nystatin p. 997 may be of use in the treatment of intertrigo associated with candida.

Antiviral preparations

Aciclovir cream p. 1016 is licensed for the treatment of initial and recurrent labial and genital *herpes simplex infections*; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections and for *herpes zoster (shingles)*.

Herpes labialis

Aciclovir cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear.

Penciclovir cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream.

Systemic treatment is necessary if cold sores recur frequently or for infections in the mouth.

Parasitocidal preparations

Suitable quantities of parasitocidal preparations

Area of body	Skin creams	Lotions	Cream rinses
Scalp (head lice)		50–100 mL	50–100 mL
Body (scabies)	30–60 g	100 mL	
Body (crab lice)	30–60 g	100 mL	

These amounts are usually suitable for an adult for single application.

Scabies

Permethrin p. 1015 is used for the treatment of *scabies (Sarcoptes scabiei)*; malathion p. 1015 can be used if permethrin is inappropriate.

Benzyl benzoate p. 1014 is an irritant and should be avoided in children; it is less effective than malathion and permethrin.

Ivermectin p. 1015 (available on a named patient basis from 'special-order' manufacturers or specialist importing companies) by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or 'Norwegian') scabies that does not respond to topical treatment alone; further doses may be required.

Application

Although acaricides have traditionally been applied after a hot bath, this is **not** necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.

All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate in adults, up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

Itching

The *itch* and *eczema* of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema may be required. Application of crotamiton p. 1040 can be used to control itching after treatment with more effective acaricides. A topical corticosteroid may help to reduce itch and inflammation after scabies has been treated successfully; however, persistent symptoms suggest that scabies eradication was not successful. Oral administration of a **sedating antihistamine** at night may also be useful.

Head lice

Dimeticone p. 1014 is effective against head lice (*Pediculus humanus capitis*). It coats head lice and interferes with water balance in lice by preventing the excretion of water; it is less active against eggs and treatment should be repeated after 7 days. Malathion p. 1015, an organophosphorus insecticide, is an alternative, but resistance has been reported. Benzyl benzoate p. 1014 is licensed for the treatment of head lice but it is less effective than other drugs and not recommended for use in children. Permethrin is active against head lice but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present. Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected household members should be treated simultaneously.

Wet combing methods

Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks, and continued until no

lice are found on 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process.

Several devices for the removal of head lice such as combs and topical solutions, are available and some are prescribable on the NHS.

The Drug Tariffs can be accessed online at:

- National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
- Health and Personal Social Services for Northern Ireland Drug Tariff: www.dhsspsni.gov.uk/pas-tariff
- Scottish Drug Tariff: www.isdscotland.org/Health-topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

Crab lice

Permethrin p. 1015 and malathion p. 1015 are used to eliminate *crab lice* (*Phthirus pubis*). An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.

2.1 Bacterial skin infections

Bacitracin with polymyxin B

INDICATIONS AND DOSE

Bacterial skin infections

TO THE SKIN

- ▶ Child: Apply twice daily, can be applied more frequently if required
- ▶ Adult: Apply twice daily, can be applied more frequently if required

- **CAUTIONS** Nephrotoxicity · neurotoxicity

CAUTIONS, FURTHER INFORMATION

If large areas of skin are being treated nephrotoxicity and neurotoxicity may be a hazard, particularly in children with renal impairment.

- **SIDE-EFFECTS**

- ▶ **Frequency not known** Contact sensitisation

- **RENAL IMPAIRMENT** Renal impairment increases the risk of nephrotoxicity and neurotoxicity.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Ointment

- ▶ **Polyfax** (Teva UK Ltd)

Bacitracin zinc 500 unit per 1 gram, Polymyxin B sulfate 10000 unit per 1 gram Polyfax ointment | 4 gram [PoM] £3.26 | 20 gram [PoM] £4.62 DT price = £4.62

Fusidic acid

- **DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

INDICATIONS AND DOSE

Staphylococcal skin infection

TO THE SKIN

- ▶ Child: Apply 3–4 times a day usually for 7 days
- ▶ Adult: Apply 3–4 times a day

- **CAUTIONS** Avoid contact of cream or ointment with eyes

CAUTIONS, FURTHER INFORMATION

Avoiding resistance To avoid the development of resistance, fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital.

- **SIDE-EFFECTS**

- ▶ Rare Hypersensitivity reactions

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

May be prescribed as Sodium Fusidate ointment.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol)

- ▶ **FUSIDIC ACID (Non-proprietary)**

Fusidic acid 20 mg per 1 gram Fusidic acid 2% cream | 15 gram [PoM] £1.92 DT price = £1.92 | 30 gram [PoM] £3.59 DT price = £3.59

- ▶ **Fucidin (Fusidic acid)** (LEO Pharma)

Metronidazole

- **DRUG ACTION** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

INDICATIONS AND DOSE

ACEA®

Acute inflammatory exacerbation of rosacea

TO THE SKIN

- ▶ Adult: Apply twice daily for 8 weeks, to be applied thinly

ANABACT®

Malodorous fungating tumours and malodorous gravitational and decubitus ulcers

TO THE SKIN

- ▶ Adult: Apply 1–2 times a day, to be applied to clean wound and covered with non-adherent dressing

METROGEL®

Acute inflammatory exacerbation of rosacea

TO THE SKIN

- ▶ Adult: Apply twice daily for 8–9 weeks, to be applied thinly

Malodorous fungating tumours

TO THE SKIN

- ▶ Adult: Apply 1–2 times a day, to be applied to clean wound and covered with non-adherent dressing

METROSA®

Acute exacerbation of rosacea

TO THE SKIN

- ▶ Adult: Apply twice daily for up to 8 weeks, to be applied thinly

ROSICED®

Inflammatory papules and pustules of rosacea

TO THE SKIN

- ▶ Adult: Apply twice daily for 6 weeks (longer if necessary)

ROZEX® PREPARATIONS

Inflammatory papules, pustules and erythema of rosacea TO THE SKIN

► **Adult:** Apply twice daily for 3–4 months

ZYOMET®

Acute inflammatory exacerbation of rosacea TO THE SKIN

► **Adult:** Apply twice daily for 8–9 weeks, to be applied thinly

● **CAUTIONS** Avoid exposure to strong sunlight or UV light

● **SIDE-EFFECTS** Skin irritation

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: gel, cream

Cream

EXCIPIENTS: May contain Benzyl alcohol, isopropyl palmitate, propylene glycol

► **Rosiced** (Pierre Fabre Dermo-Cosmetique)

Metronidazole 7.5 mg per 1 gram Rosiced 0.75% cream | 30 gram [PoM] £7.50 DT price = £6.60

Metronidazole 7.5 mg per 1 gram Rozex 0.75% cream | 30 gram [PoM] £6.60 DT price = £6.60 | 40 gram [PoM] £9.88 DT price = £9.88

Gel

EXCIPIENTS: May contain Benzyl alcohol, disodium edetate, hydroxybenzoates (parabens), disodium glycol

► **METRONIDAZOLE (Non-proprietary)**

Metronidazole 7.5 mg per 1 gram Metronidazole 0.75% gel | 15 gram [PoM] no price available | 30 gram [PoM] £12.00 | 40 gram [PoM] £19.90

► **Acea** (Ferndale Pharmaceuticals Ltd)

Metronidazole 7.5 mg per 1 gram Acea 0.75% gel | 40 gram [PoM] £9.95

► **Anabact** (Cambridge Healthcare Supplies Ltd)

Metronidazole 7.5 mg per 1 gram Anabact 0.75% gel | 15 gram [PoM] £4.47 | 30 gram [PoM] £7.89

► **Metrogel** (Galderma (UK) Ltd)

Metronidazole 7.5 mg per 1 gram Metrogel 0.75% gel | 40 gram [PoM] £22.63

► **Metrosa** (Lindermia Ltd)

Metronidazole 7.5 mg per 1 gram Metrosa 0.75% gel | 30 gram [PoM] £12.00 | 40 gram [PoM] £19.90

► **Rozex** (Galderma (UK) Ltd)

Metronidazole 7.5 mg per 1 gram Rozex 0.75% gel | 30 gram [PoM] £6.60 | 40 gram [PoM] £9.88

► **Zyomet** (AMCO)

Metronidazole 7.5 mg per 1 gram Zyomet 0.75% gel | 30 gram [PoM] £12.00

Mupirocin**INDICATIONS AND DOSE**

Bacterial skin infections, particularly those caused by Gram-positive organisms (except pseudomonal infection)

TO THE SKIN

► **Child:** Apply up to 3 times a day for up to 10 days

► **Adult:** Apply up to 3 times a day for up to 10 days

● **SIDE-EFFECTS** Burning sensation · local reactions · pruritus · rash · urticaria

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk-no information available.

● **BREAST FEEDING** No information available

● **RENAL IMPAIRMENT** Manufacturer advises caution when mupirocin ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycol).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol)

► **Bactroban** (GlaxoSmithKline UK Ltd)

Mupirocin (as Mupirocin calcium) 20 mg per 1 gram Bactroban 2% cream | 15 gram [PoM] £5.26 DT price = £5.26

Ointment

► **MUPIROICIN (Non-proprietary)**

Mupirocin 20 mg per 1 gram Mupirocin 2% ointment | 15 gram [PoM] £5.35 DT price = £5.35

► **Bactroban** (GlaxoSmithKline UK Ltd)

Mupirocin 20 mg per 1 gram Bactroban 2% ointment | 15 gram [PoM] £4.38 DT price = £5.35

Neomycin sulfate**INDICATIONS AND DOSE**

Bacterial skin infections

TO THE SKIN

► **Child:** Apply up to 3 times a day, for short-term use only

► **Adult:** Apply up to 3 times a day, for short-term use only

● **CONTRA-INDICATIONS** Neonates

● **CAUTIONS**

Large areas If large areas of skin are being treated ototoxicity may be a hazard, particularly in children and the elderly, and in those with renal impairment.

● **SIDE-EFFECTS** Sensitisation (cross sensitivity with other aminoglycosides may occur)

● **LESS SUITABLE FOR PRESCRIBING** Neomycin sulfate cream is less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream

Tablet

► **NEOMYCIN SULFATE (Non-proprietary)**

Neomycin sulfate 500 mg Neomycin 500mg tablets | 100 tablet [PoM] £34.69

Retapamulin**INDICATIONS AND DOSE**

Superficial bacterial skin infection caused by Staphylococcus aureus and Streptococcus pyogenes (if resistant to first line topical antibacterials)

TO THE SKIN

► **Child 9 months–17 years:** Apply twice daily for 5 days, to be applied thinly, maximum area of skin treated 2% of body surface area, review treatment if no response within 2–3 days

► **Adult:** Apply twice daily for 5 days, to be applied thinly, maximum area of skin treated 100 cm² or lesion length 10 cm, review treatment if no response within 2–3 days

● **CONTRA-INDICATIONS** Contact with eyes · contact with mucous membranes

● **SIDE-EFFECTS** Contact dermatitis · localised erythema · localised irritation · localised pain · pruritus

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2008) that retapamulin (*Altargo*®) is **not** recommended

for use within NHS Scotland for the treatment of superficial skin infections.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Butylated hydroxytoluene

► **Altargo** (GlaxoSmithKline UK Ltd)

Retapamulin 10 mg per 1 gram Altargo 10mg/g ointment | 5 gram [PoM] £7.89

Silver sulfadiazine

INDICATIONS AND DOSE

Prophylaxis and treatment of infection in burn wounds TO THE SKIN

- Child: Apply daily, may be applied more frequently if very exudative
- Adult: Apply daily, may be applied more frequently if very exudative

For conservative management of finger-tip injuries

TO THE SKIN

- Child: Apply every 2–3 days, consult product literature for details
- Adult: Apply every 2–3 days, consult product literature for details

Adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions

TO THE SKIN

- Adult: (consult product literature)

Adjunct to short-term treatment of infection in pressure sores

TO THE SKIN

- Adult: Apply once daily or on alternate days

As an adjunct to short-term treatment of infection in leg ulcers

TO THE SKIN

- Adult: Apply once daily or on alternate days, not recommended if ulcer is very exudative

- **CONTRA-INDICATIONS** Not recommended for neonates

- **CAUTIONS** G6PD deficiency

CAUTIONS, FURTHER INFORMATION

Large areas Plasma-sulfadiazine concentrations may approach therapeutic levels with *side-effects* and *interactions* as for sulfonamides if large areas of skin are treated.

- **INTERACTIONS** → Appendix 1 (sulfonamides)—if large amounts given. May inactivate enzymatic debriding agents—concomitant use may be inappropriate.

- **SIDE-EFFECTS** Allergic reactions · argyria (following treatment of large areas of skin or prolonged use) · burning · itching · leucopenia · rashes

SIDE-EFFECTS, FURTHER INFORMATION

Severe blood and skin disorders Owing to the association of sulfonamides with severe blood and skin disorders, treatment should be stopped immediately if blood disorders or rashes develop. Leucopenia developing 2–3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to normality within a few days.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with sensitivity to sulfonamides.

- **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinaemia in third trimester.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution if significant impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution if significant impairment.
- **MONITORING REQUIREMENTS** Monitor for leucopenia.
- **DIRECTIONS FOR ADMINISTRATION** Apply with sterile applicator.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

► **Flamazine** (Smith & Nephew Healthcare Ltd)

Sulfadiazine silver 10 mg per 1 gram Flamazine 1% cream | 20 gram [PoM] £2.91 | 50 gram [PoM] £3.85 DT price = £3.85 | 250 gram [PoM] £10.32 DT price = £10.32 | 500 gram [PoM] £18.27 DT price = £18.27

2.2 Fungal skin infections

IMIDAZOLE ANTIFUNGALS

Clotrimazole

INDICATIONS AND DOSE

Fungal skin infections

TO THE SKIN

- Child: Apply 2–3 times a day
- Adult: Apply 2–3 times a day

- **CAUTIONS** Contact with eyes and mucous membranes should be avoided
- **SIDE-EFFECTS** Local irritation · erythema · hypersensitivity reactions · itching · mild burning sensation
- **SIDE-EFFECTS, FURTHER INFORMATION** Treatment should be discontinued if side-effects are severe.
- **PREGNANCY** Minimal absorption from skin; not known to be harmful.
- **PRESCRIBING AND DISPENSING INFORMATION** Spray may be useful for application of clotrimazole to large or hairy areas of the skin.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Liquid

► **Canesten (clotrimazole)** (Bayer Plc)

Clotrimazole 10 mg per 1 ml Canesten 1% solution | 20 ml [P] £2.30 DT price = £2.30

Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

► **CLOTRIMAZOLE (Non-proprietary)**

Clotrimazole 10 mg per 1 gram Clotrimazole 1% cream | 20 gram [P] £2.79 DT price = £1.36 | 50 gram [P] £5.45 DT price = £3.40

► **Canesten (clotrimazole)** (Bayer Plc)

Clotrimazole 10 mg per 1 gram Canesten 1% cream | 20 gram [P] £2.14 DT price = £1.36 | 50 gram [P] £3.50 DT price = £3.40
Canesten Antifungal 1% cream | 20 gram [P] £1.85 DT price = £1.36
Clotrimazole 20 mg per 1 gram Canesten 2% thrush cream | 10 gram [P] no price available | 20 gram [P] £4.46 DT price = £4.46
Clotrimazole 100 mg per 1 gram Canesten Internal 10% cream | 5 gram [P] £6.23 DT price = £6.23
Canesten 10% VC cream | 5 gram [PoM] £4.50 DT price = £6.23

Spray

CAUTIONARY AND ADVISORY LABELS 15
EXCIPIENTS: May contain Propylene glycol

▶ **Canesten (clotrimazole)** (Bayer Plc)

Clotrimazole 10 mg per 1 ml Canesten Dermatological 1% spray | 40 ml [P] £4.72

Also available in combination with *Hydrocortisone*, p. 1030.

Econazole nitrate**INDICATIONS AND DOSE****Fungal skin infections**

TO THE SKIN

- ▶ Child: Apply twice daily
- ▶ Adult: Apply twice daily

Fungal nail infections

BY TRANSUNGUAL APPLICATION

- ▶ Child: Apply once daily, applied under occlusive dressing
- ▶ Adult: Apply once daily, applied under occlusive dressing

- **CAUTIONS** Avoid contact with eyes and mucous membranes
- **SIDE-EFFECTS** Burning sensation · erythema · hypersensitivity reactions · itching · occasional local irritation
- SIDE-EFFECTS, FURTHER INFORMATION**
Treatment should be discontinued if side-effects are severe.
- **PREGNANCY** Minimal absorption from skin; not known to be harmful.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Butylated hydroxyanisole, fragrances

▶ **Pevaryl** (Janssen-Cilag Ltd)

Econazole nitrate 10 mg per 1 gram Pevaryl 1% cream | 30 gram [P] £3.71

- ▶ Brands may include Gyno-Pevaryl 1% cream

Ketoconazole**INDICATIONS AND DOSE****Tinea pedis**

TO THE SKIN USING CREAM

- ▶ Adult: Apply twice daily

Fungal skin infection (not Tinea pedis)

TO THE SKIN USING CREAM

- ▶ Adult: Apply 1–2 times a day

Treatment of seborrhoeic dermatitis and dandruff

TO THE SKIN

- ▶ Child 12–17 years: Apply twice weekly for 2–4 weeks, leave preparation on for 3–5 minutes before rinsing
- ▶ Adult: Apply twice weekly for 2–4 weeks, leave preparation on for 3–5 minutes before rinsing

Prophylaxis of seborrhoeic dermatitis and dandruff

TO THE SKIN

- ▶ Child 12–17 years: Apply every 1–2 weeks, leave preparation on for 3–5 minutes before rinsing
- ▶ Adult: Apply every 1–2 weeks, leave preparation on for 3–5 minutes before rinsing

Treatment of pityriasis versicolor

TO THE SKIN

- ▶ Child 12–17 years: Apply once daily for maximum 5 days, leave preparation on for 3–5 minutes before rinsing

- ▶ Adult: Apply once daily for maximum 5 days, leave preparation on for 3–5 minutes before rinsing

Prophylaxis of pityriasis versicolor

TO THE SKIN

- ▶ Child 12–17 years: Apply once daily for up to 3 days before sun exposure, leave preparation on for 3–5 minutes before rinsing
- ▶ Adult: Apply once daily for up to 3 days before sun exposure, leave preparation on for 3–5 minutes before rinsing

- **CAUTIONS** Avoid contact with eyes · avoid contact with mucous membranes
- **INTERACTIONS** → Appendix 1 (antifungals, imidazole).
- **SIDE-EFFECTS** Erythema · hypersensitivity reactions · itching · mild burning sensation · occasional local irritation
- SIDE-EFFECTS, FURTHER INFORMATION**
Treatment should be discontinued if side-effects are severe.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NHS restrictions Ketoconazole cream is not prescribable on the NHS except for seborrhoeic dermatitis and pityriasis versicolor and endorsed 'SLS'.

● **EXCEPTIONS TO LEGAL CATEGORY**

- ▶ For Fungal skin infections in adults A 15-g tube is available for sale to the public for the treatment of tinea pedis, tinea cruris, and candidal intertrigo.
- ▶ For Seborrhoeic dermatitis and dandruff Can be sold to the public for the prevention and treatment of dandruff and seborrhoeic dermatitis of the scalp as a shampoo formulation containing ketoconazole maximum 2%, in a pack containing maximum 120 mL and labelled to show a maximum frequency of application of once every 3 days.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

2.3 Parasitic skin infections

PARASITICIDES

Benzyl benzoate

INDICATIONS AND DOSE**Scabies**

TO THE SKIN

- ▶ Adult: Apply over the whole body; repeat without bathing on the following day and wash off 24 hours later; a third application may be required in some cases

● **CAUTIONS** Avoid contact with eyes and mucous membranes · children (not recommended) · do not use on broken or secondarily infected skin

● **SIDE-EFFECTS** Burning sensation (especially on genitalia and excoriations) · rashes · skin irritation

● **BREAST FEEDING** Suspend feeding until product has been washed off.

● **PRESCRIBING AND DISPENSING INFORMATION** Not recommended for children—dilution to reduce irritant effect also reduces efficacy. Some manufacturers recommend application to the body but to exclude the head and neck. However, application should be extended to the scalp, neck, face, and ears.

When prepared extemporaneously, the BP states Benzyl Benzoate Application, BP consists of benzyl benzoate 25% in an emulsion basis.

● **LESS SUITABLE FOR PRESCRIBING** Benzyl benzoate is less suitable for prescribing.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

Dimeticone

INDICATIONS AND DOSE**Head lice**

TO THE SKIN

- ▶ Child: Apply once weekly for 2 doses, rub into hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight)
- ▶ Adult: Apply once weekly for 2 doses, rub into hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight)

● **UNLICENSED USE** Not licensed for use in children under 6 months except under medical supervision.

● **CAUTIONS** Avoid contact with eyes · children under 6 months, medical supervision required

● **SIDE-EFFECTS** Skin irritation

● **PATIENT AND CARER ADVICE** Patients should be told to keep hair away from fire and flames during treatment.

● **MEDICINAL FORMS**

3 Inflammatory skin conditions

3.1 Eczema and psoriasis

Eczema

Eczema (dermatitis) has several causes, which may influence treatment. The main types of eczema are irritant, allergic contact, atopic, venous and discoid; different types may co-exist. Lichenification, due to scratching and rubbing, may complicate any chronic eczema. *Atopic eczema* is the most common type and it usually involves dry skin as well as infection and lichenification.

Management of eczema involves the removal or treatment of contributory factors including occupational and domestic irritants. Known or suspected contact allergens should be avoided. Rarely, ingredients in topical medicinal products may sensitise the skin; the BNF lists active ingredients together with excipients that have been associated with skin sensitisation.

Skin dryness and the consequent irritant eczema requires **emollients** applied regularly (at least twice daily) and liberally to the affected area; this can be supplemented with bath or shower emollients. The use of emollients should continue even if the eczema improves or if other treatment is being used.

Topical corticosteroids are also required in the management of eczema; the potency of the corticosteroid should be appropriate to the severity and site of the condition. Mild corticosteroids are generally used on the face and on flexures; potent corticosteroids are generally required for use on adults with discoid or lichenified eczema or with eczema on the scalp, limbs, and trunk. Treatment should be reviewed regularly, especially if a potent corticosteroid is required. In patients with frequent flares (2–3 per month), a topical corticosteroid can be applied on 2 consecutive days each week to prevent further flares.

Bandages (including those containing ichthammol with zinc oxide p. 1019) are sometimes applied over topical corticosteroids or emollients to treat eczema of the limbs. Dry-wrap dressings can be used to provide a physical barrier to help prevent scratching and improve retention of emollients. See Wound management products and elasticated garments p. 1294 for details of elasticated viscose stockinette tubular bandages and garments, and silk clothing.

See Eczema and psoriasis, drugs affecting the immune response p. 1017 for the role of topical pimecrolimus p. 1019 and tacrolimus p. 1020 in atopic eczema.

Infection

Bacterial infection (commonly with *Staphylococcus aureus* and occasionally with *Streptococcus pyogenes*) can exacerbate eczema and requires treatment with topical or systemic **antibacterial drugs**. Antibacterial drugs should be used in short courses (typically 1 week) to reduce the risk of drug resistance or skin sensitisation. Associated eczema is treated simultaneously with a topical corticosteroid which can be combined with a topical antimicrobial.

Eczema involving widespread or recurrent infection requires the use of a systemic antibiatic that is active against the infecting organism. Products that combine an antiseptic with an emollient application and with a bath emollient can also be used; antiseptic shampoos can be used on the scalp.

Intertriginous eczema commonly involves candida and bacteria; it is best treated with a mild or moderately potent topical corticosteroid and a suitable antimicrobial drug.

Widespread herpes simplex infection may complicate atopic eczema and treatment with a systemic antiviral drug is indicated.

Management of other features of eczema

Lichenification, which results from repeated scratching is treated initially with a potent corticosteroid. Bandages containing ichthammol **paste** p. 1019 (to reduce pruritus) and other substances such as **zinc oxide** can be applied over the corticosteroid or emollient. **Coal tar** and ichthammol can be useful in some cases of *chronic eczema*.

A *non-sedating antihistamine* may be of some value in relieving severe itching or urticaria associated with eczema. A *sedating antihistamine* can be used if itching causes sleep disturbance.

Exudative ('weeping') eczema requires a potent corticosteroid initially; infection may also be present and require specific treatment. Potassium permanganate p. 1052 solution (1 in 10,000) can be used in exuding eczema for its antiseptic and astringent effects; treatment should be stopped when exudation stops.

Severe refractory eczema

Severe refractory eczema is best managed under specialist supervision; it may require phototherapy or drugs that act on the immune system. Alitretinoin p. 1033 is licensed for

the treatment of severe chronic hand eczema refractory to potent topical corticosteroids; patients with hyperkeratotic features are more likely to respond to alitretinoin than those with pompholyx.

Seborrhoeic dermatitis

Seborrhoeic dermatitis (seborrhoeic eczema) is associated with species of the yeast *Malassezia* and affects the scalp, perinasal areas, and eyebrows. Shampoos active against the yeast (including those containing ketoconazole p. 1011 and coal tar) and combinations of mild corticosteroids with suitable antimicrobials are used.

Eczema and psoriasis, drugs affecting the immune response

Drugs affecting the immune response are used for eczema or psoriasis. Systemic drugs acting on the immune system are used under specialist supervision.

Pimecrolimus p. 1019 by topical application is licensed for *mild to moderate atopic eczema*. Tacrolimus p. 1020 is licensed for topical use in *moderate to severe atopic eczema*. Both are drugs whose long-term safety is still being evaluated and they should not usually be considered first-line treatments unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Treatment of atopic eczema with topical pimecrolimus or topical tacrolimus should be initiated only by prescribers experienced in managing the condition. Topical tacrolimus and pimecrolimus have a role in the treatment of psoriasis.

A short course of a systemic corticosteroid can be given for eczema flares that have not improved despite appropriate topical treatment.

Ciclosporin p. 717 by mouth can be used for *severe psoriasis* and for *severe eczema*. Azathioprine p. 716 or mycophenolate mofetil p. 725 are used for severe refractory eczema [unlicensed indication].

Methotrexate p. 762 can be used for *severe psoriasis*, the dose being adjusted according to severity of the condition and haematological and biochemical measurements. Folic acid p. 836 should be given to reduce the possibility of side-effects associated with methotrexate. Folic acid can be given once weekly [unlicensed indication], on a different day from the methotrexate; alternative regimens of folic acid may be used in some settings.

Etanercept p. 903, adalimumab p. 901, and infliximab p. 906 inhibit the activity of tumour necrosis factor (TNF α). They are used for *severe plaque psoriasis* either refractory to at least 2 standard systemic treatments and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications; while either etanercept or adalimumab is considered to be the first choice in stable disease, infliximab or adalimumab may be useful when rapid disease control is required.

Ustekinumab p. 899 (a monoclonal antibody that inhibits interleukins 12 and 23) can be used for *severe plaque psoriasis* that has not responded to at least 2 standard systemic treatments and photochemotherapy, or when these treatments cannot be used because of intolerance or contra-indications. Adalimumab, etanercept, infliximab and ustekinumab are also licensed for psoriatic arthritis.

Psoriasis

Psoriasis is characterised by epidermal thickening and scaling. It commonly affects extensor surfaces and the scalp.

Occasionally, psoriasis is provoked or exacerbated by drugs such as lithium, chloroquine and hydroxychloroquine, beta-blockers, non-steroidal anti-inflammatory drugs, and

ACE inhibitors. Psoriasis may not be seen until the drug has been taken for weeks or months.

Emollients, in addition to their effects on dryness, scaling and cracking, may have an anti-proliferative effect in psoriasis, and may be the only treatment necessary for mild psoriasis. They are particularly useful in *inflammatory psoriasis* and in *plaque psoriasis of palms and soles*, in which irritant factors can perpetuate the condition. Emollients are useful adjuncts to other more specific treatment.

More specific topical treatment for *chronic stable plaque psoriasis* on extensor surfaces of trunk and limbs involves the use of **vitamin D analogues**, coal tar p. 1034, dithranol p. 1018, and the retinoid tazarotene p. 1034. However, they can irritate the skin and they are not suitable for the more inflammatory forms of psoriasis; their use should be suspended during an inflammatory phase of psoriasis. The efficacy and the irritancy of each substance varies between patients. If a substance irritates significantly, it should be stopped or the concentration reduced; if it is tolerated, its effects should be assessed after 4 to 6 weeks and treatment continued if it is effective.

Scalp psoriasis is usually scaly, and the scale may be thick and adherent; this will require softening with an emollient cream, ointment, or oil. A tar-based shampoo is first-line treatment for scalp psoriasis; a keratolytic, such as salicylic acid, should also be used if there is significant scaling, to allow other treatments to work.

Some preparations prescribed for psoriasis affecting the scalp, combine salicylic acid with coal tar or sulfur. The product should be applied generously, and an adequate quantity should be prescribed. It should be left on for at least an hour, often more conveniently overnight, before washing off. The use of scalp preparations containing a potent corticosteroid or a vitamin D analogue, either alone or in combination, can also be helpful.

Facial, flexural and genital psoriasis can be managed with short-term use of a mild or moderate potency topical corticosteroid (a mild potency topical corticosteroid is preferred for the initial treatment of facial psoriasis). Calcitriol p. 1037 or tacalcitol p. 1037 can be used for longer-term treatment, or if the response to mild or moderate potency topical corticosteroids is inadequate; calcipotriol p. 1036 is more likely to cause irritation. Low strength tar preparations can also be used. Pimecrolimus p. 1019 or tacrolimus p. 1020 by topical application [unlicensed indication] can be used short-term, under specialist supervision, in patients whose condition has not responded adequately to other treatments, or who are intolerant of them.

Widespread *unstable psoriasis* of erythrodermic or generalised pustular type requires urgent specialist assessment. Initial topical treatment should be limited to using emollients frequently and generously; emollients should be prescribed in quantities of 1 kg or more. More localised acute or subacute *inflammatory psoriasis* with hot, spreading or itchy lesions, should be treated topically with emollients or with a corticosteroid of moderate potency.

Calcipotriol and tacalcitol are analogues of vitamin D that affect cell division and differentiation. Calcitriol is an active form of vitamin D. Vitamin D and its analogues are used first-line for the long-term treatment of plaque psoriasis; they do not smell or stain and they may be more acceptable than tar or dithranol products. Of the vitamin D analogues, tacalcitol and calcitriol are less likely to irritate.

Coal tar has anti-inflammatory properties that are useful in chronic plaque psoriasis; it also has antiscaling properties. Crude coal tar (coal tar, BP) is the most effective form, typically in a concentration of 1 to 10% in a soft paraffin base, but few outpatients tolerate the smell and mess. Cleaner extracts of coal tar included in proprietary preparations, are more practicable for home use but they are less effective and improvement takes longer. Contact of

coal tar products with normal skin is not normally harmful and they can be used for widespread small lesions; however, irritation, contact allergy, and sterile folliculitis can occur. The milder tar extracts can be used on the face and flexures. Tar baths and tar shampoos are also helpful.

Dithranol below is effective for chronic plaque psoriasis. Its major disadvantages are irritation (for which individual susceptibility varies) and staining of skin and of clothing. Dithranol below is not generally suitable for widespread small lesions nor should it be used in the flexures or on the face. Proprietary preparations are more suitable for home use; they are usually washed off after 5 to 60 minutes ('short contact'). Specialist nurses may apply intensive treatment with dithranol below paste which is covered by stockinette dressings and usually retained overnight. Dithranol below should be discontinued if even a low concentration causes acute inflammation; continued use can result in the psoriasis becoming unstable.

Tazarotene p. 1034, a retinoid, has a similar efficacy to vitamin D and its analogues, but is associated with a greater incidence of irritation. Although irritation is common, it is minimised by applying tazarotene sparingly to the plaques and avoiding normal skin; application to the face and in flexures should also be avoided. Tazarotene does not stain and is odourless.

A topical **corticosteroid** is not generally suitable for long-term use or as the sole treatment of extensive chronic plaque psoriasis; any early improvement is not usually maintained and there is a risk of the condition deteriorating or of precipitating an unstable form of psoriasis (e.g. erythrodermic psoriasis or generalised pustular psoriasis) on withdrawal. Topical use of potent corticosteroids on widespread psoriasis can also lead to systemic as well as local side-effects. However, topical corticosteroids used short-term may be appropriate to treat psoriasis in specific sites such as the face or flexures (with a mild or moderate corticosteroid), and psoriasis of the scalp, palms, and soles (with a potent corticosteroid). Very potent corticosteroids should only be used under specialist supervision.

Combining the use of a corticosteroid with another specific topical treatment may be beneficial in chronic plaque psoriasis; the drugs may be used separately at different times of the day or used together in a single formulation. *Eczema* co-existing with psoriasis may be treated with a corticosteroid, or coal tar, or both.

Phototherapy

Phototherapy is available in specialist centres under the supervision of a dermatologist. **Ultraviolet B** (UVB) radiation is usually effective for *chronic stable psoriasis* and for *guttate psoriasis*. It may be considered for patients with moderately severe psoriasis in whom topical treatment has failed, but it may irritate inflammatory psoriasis.

Photochemotherapy combining long-wave ultraviolet A radiation with a psoralen (PUVA) is available in specialist centres under the supervision of a dermatologist. The psoralen, which enhances the effect of irradiation, is administered either by mouth or topically. PUVA is effective in most forms of psoriasis, including *localised palmoplantar pustular psoriasis*. Early adverse effects include phototoxicity and pruritus. Higher cumulative doses exaggerate skin ageing, increase the risk of dysplastic and neoplastic skin lesions, especially squamous cancer, and pose a theoretical risk of cataracts.

Phototherapy combined with coal tar, dithranol, tazarotene, topical vitamin D or vitamin D analogues, or oral acitretin, allows reduction of the cumulative dose of phototherapy required to treat psoriasis.

Systemic treatment

Systemic treatment is required for severe, resistant, unstable or complicated forms of psoriasis, and it should be initiated only under specialist supervision. Systemic drugs for psoriasis include acitretin and drugs that affect the

immune response (such as ciclosporin p. 717 and methotrexate p. 762).

Systemic corticosteroids should be used only rarely in psoriasis because rebound deterioration may occur on reducing the dose.

Acitretin p. 1032, a metabolite of etretinate, is a retinoid (vitamin A derivative); it is prescribed by specialists. The main indication for acitretin is *psoriasis*, but it is also used in disorders of keratinisation such as severe *Darier's disease* (keratosis follicularis), and some forms of *ichthyosis*. Although a minority of cases of psoriasis respond well to acitretin alone, it is only moderately effective in many cases and it is combined with other treatments. A therapeutic effect occurs after 2 to 4 weeks and the maximum benefit after 4 months. Consideration should be given to stopping acitretin if the response is inadequate after 4 months at the optimum dose. The manufacturers of acitretin do not recommend continuous treatment for longer than 6 months. However, some patients may benefit from longer treatment, provided that the lowest effective dose is used, patients are monitored carefully for adverse effects, and the need for treatment is reviewed regularly.

Apart from teratogenicity, which remains a risk for 3 years after stopping, acitretin is the least toxic systemic treatment for psoriasis; in women with a potential for child-bearing, the possibility of pregnancy must be excluded before treatment and effective contraception must be used during treatment and for at least 3 years afterwards (oral progestogen-only contraceptives not considered effective).

Topical treatment

The vitamin D and analogues, calcipotriol p. 1036, calcitriol p. 1037, and tacalcitol p. 1037 are used for the management of plaque psoriasis. They should be avoided by those with calcium metabolism disorders, and used with caution in generalised pustular or erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia).

ANTRACEN DERIVATIVES

Dithranol (Anthralin)

INDICATIONS AND DOSE

Subacute and chronic psoriasis

TO THE SKIN

- ▶ Adult: (consult product literature)

DITHROCREAM®

Subacute and chronic psoriasis

TO THE SKIN

- ▶ Adult: For application to skin or scalp, 0.1–0.5% cream suitable for overnight treatment, 1–2% cream for maximum 1 hour (consult product literature)

MICANOL®

Subacute and chronic psoriasis

TO THE SKIN

- ▶ Adult: Apply once daily, for application to skin or scalp, to be applied for up to 30 minutes, apply 1% cream, if necessary 3% cream can be used under medical supervision

- **CONTRA-INDICATIONS** Acute and pustular psoriasis · hypersensitivity
- **CAUTIONS** Avoid sensitive areas of skin · avoid use near eyes
- **SIDE-EFFECTS** Local burning sensation · local irritation · stains hair · stains skin
- **PREGNANCY** No adverse effects reported.
- **BREAST FEEDING** No adverse effects reported.

- **DIRECTIONS FOR ADMINISTRATION** When applying dithranol, hands should be protected by gloves or they should be washed thoroughly afterwards. Dithranol should be applied to chronic extensor plaques only, carefully avoiding normal skin.
MICANOL® At the end of contact time, use plenty of lukewarm (not hot) water to rinse off cream; soap may be used after the cream has been rinsed off; use shampoo before applying cream to scalp and if necessary after cream has been rinsed off.
- **PRESCRIBING AND DISPENSING INFORMATION** Treatment should be started with a low concentration such as dithranol 0.1%, and the strength increased gradually every few days up to 3%, according to tolerance. When prepared extemporaneously, the BP states Dithranol Paste, BP consists of dithranol in zinc and salicylic acid (Lassar's) paste. Usual strengths 0.1–1% of dithranol. Dithranol Ointment BP, consists of dithranol, in yellow soft paraffin; usual strengths 0.1–2%. Part of basis may be replaced by hard paraffin if a stiffer preparation is required.
- **PATIENT AND CARER ADVICE** Dithranol can stain the skin, hair and fabrics.
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine if dithranol content more than 1%, otherwise may be sold to the public.

Short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used (initiated by a specialist)

TO THE SKIN

► Adult: Apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks)

Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy (initiated by a specialist)

TO THE SKIN

► Adult: Apply twice daily until symptoms resolve (maximum duration of treatment 4 weeks)

- **UNLICENSED USE** Pimecrolimus is not licensed for short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy.

- **CONTRA-INDICATIONS** Application to malignant or potentially malignant skin lesions · application under occlusion · congenital epidermal barrier defects · contact with eyes · contact with mucous membranes · generalised erythroderma · immunodeficiency · infection at treatment site
- **CAUTIONS** Alcohol consumption (risk of facial flushing and skin irritation) · avoid other topical treatments except emollients at treatment site · UV light (avoid excessive exposure to sunlight and sunlamps)
- **INTERACTIONS** Concomitant use with drugs that cause immunosuppression is contra-indicated (may be prescribed in exceptional circumstances by specialists).
- **SIDE-EFFECTS**
