 - ▶ Specialist evaluation—monitor for pituitary enlargement, particularly during pregnancy; monitor visual field to detect secondary field loss in macroprolactinoma.
 - ▶ Monitor for fibrotic disease.
 - ▶ Monitor blood pressure for a few days after starting treatment and following dosage increase.
- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

PATIENT AND CARER ADVICE

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring. Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 10, 21

▶ BROMOCRIPTINE (Non-proprietary)

Bromocriptine (as Bromocriptine mesilate) 1 mg Bromocriptine 1mg tablets | 100 tablet [PoM] £60.10 DT price = £60.10

Cabergoline

- **DRUG ACTION** Cabergoline is a stimulant of dopamine receptors in the brain and it also inhibits release of prolactin by the pituitary.

INDICATIONS AND DOSE

Prevention of lactation

BY MOUTH

- ▶ Adult: 1 mg, to be taken as a single dose on the first day postpartum

Suppression of established lactation

BY MOUTH

- ▶ Adult: 250 micrograms every 12 hours for 2 days

Hyperprolactinaemic disorders

BY MOUTH

- ▶ Adult: Initially 500 micrograms once weekly, dose may be taken as a single dose or as 2 divided doses on

separate days, then increased in steps of 500 micrograms every 1 month until optimal therapeutic response reached, increase dose following monthly monitoring of serum prolactin levels; usual dose 0.25–2 mg once weekly, usually 1 mg weekly; reduce initial dose and increase more gradually if patient intolerant, doses over 1 mg weekly to be given as divided dose; maximum 4.5 mg per week

Alone or as adjunct to co-beneldopa or co-careldopa in Parkinson's disease where dopamine-receptor agonists other than ergot derivative not appropriate

BY MOUTH

- ▶ **Adult:** Initially 1 mg daily, then increased in steps of 0.5–1 mg every 7–14 days, concurrent dose of levodopa may be decreased gradually while dose of cabergoline is increased; maximum 3 mg per day

Important safety information

FIBROTIC REACTIONS

Cabergoline has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson's disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- **CONTRA-INDICATIONS** Avoid in pre-eclampsia · cardiac valvulopathy (exclude before treatment) · history of pericardial fibrotic disorders · history of puerperal psychosis · history of pulmonary fibrotic disorders · history of retroperitoneal fibrotic disorders
 - **CAUTIONS** Acute porphyrias p. 864 · cardiovascular disease · history of peptic ulcer (particularly in acromegalic patients) · history of serious mental disorders (especially psychotic disorders) · Raynaud's syndrome
- CAUTIONS, FURTHER INFORMATION**
- Hyperprolactinaemic patients** In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).

- **INTERACTIONS** → Appendix 1 (cabergoline). Tolerance may be reduced by alcohol.
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · angina · breast pain · confusion · constipation · depression · dyspepsia ·

epigastric pain · gastritis · hallucinations · headache · nausea · syncope

- ▶ **Rare** Digital vasospasm · epistaxis · hot flushes · muscle weakness · palpitation · paraesthesia · transient hemianopia · vomiting
- ▶ **Frequency not known** Allergic skin reactions · alopecia · cardiac valvulopathy · constrictive pericarditis · drowsiness · dyskinesia · erythromelalgia · hypersexuality · hypotension · increased libido · leg cramps · pathological gambling · pericardial effusion · peripheral oedema · pleural effusion · pleural fibrosis · pleuritis · pulmonary fibrosis · retroperitoneal fibrosis

SIDE-EFFECTS, FURTHER INFORMATION

Gastro-intestinal bleeding Treatment should be withdrawn if gastro-intestinal bleeding occurs.

- **ALLERGY AND CROSS-SENSITIVITY** Cabergoline should not be used in patients with hypersensitivity to ergot alkaloids.
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before starting and perform monthly pregnancy tests during the amenorrhoeic period. Caution—advise non-hormonal contraception if pregnancy not desired. Discontinue 1 month before intended conception (ovulatory cycles persist for 6 months).
- **PREGNANCY** Discontinue if pregnancy occurs during treatment (specialist advice needed).
- **BREAST FEEDING** Suppresses lactation; avoid breast-feeding if lactation prevention fails.
- **HEPATIC IMPAIRMENT** Reduce dose in severe hepatic impairment.
- **MONITORING REQUIREMENTS**
- ▶ Monitor for fibrotic disease.
- ▶ Monitor blood pressure for a few days after starting treatment and following dosage increase.
- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).
- **PATIENT AND CARER ADVICE**
- Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring. Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.
- Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

Pergolide

INDICATIONS AND DOSE

Monotherapy in Parkinson's disease where dopamine-receptor agonists other than ergot derivative not appropriate

BY MOUTH

- ▶ **Adult:** Initially 50 micrograms once daily for day 1, dose to be taken at bedtime, then 50 micrograms twice daily for days 2–4, then increased in steps of 100–250 micrograms daily, dose to be increased at intervals of 3–4 days, increased to 1.5 mg daily in 3 divided doses at day 28, then increased in steps of up to 250 micrograms every 3–4 days, this increase to be started after day 30; maintenance 2.1–2.5 mg daily; maximum 3 mg per day

Adjunctive therapy with co-beneldopa or co-careldopa in Parkinson's disease where dopamine-receptor agonists other than ergot derivative not appropriate

BY MOUTH

- ▶ **Adult:** Initially 50 micrograms daily for 2 days, then increased in steps of 100–150 micrograms every 3 days, dose to be adjusted over next 12 days following initial dose and usually given in 3 divided doses, then increased in steps of 250 micrograms every 3 days, during pergolide titration, levodopa dose may be reduced cautiously; maximum 3 mg per day

Important safety information

FIBROTIC REACTIONS

Pergolide has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with pergolide; it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking pergolide should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist or levodopa should be withdrawn or the dose reduced until the symptoms resolve.

- **CONTRA-INDICATIONS** Cardiac valvulopathy (exclude before treatment) · history of fibrotic disorders

- **CAUTIONS** Acute porphyrias p. 864 · arrhythmias · dyskinesia (may exacerbate) · hallucinations · history of confusion · psychosis · underlying cardiac disease
- **INTERACTIONS** → Appendix 1 (pergolide).
- **SIDE-EFFECTS** Abdominal pain · atrial premature contractions · compulsive behaviour · confusion · constipation · diarrhoea · diplopia · dizziness · drowsiness · dyskinesia · dyspepsia · dyspnoea · erythromelalgia · fever · hallucinations · hiccups · hypotension · insomnia · nausea · palpitation · rash · Raynaud's phenomenon · rhinitis · sudden onset of sleep · syncope · tachycardia · vomiting
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** May suppress lactation.
- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

PATIENT AND CARER ADVICE

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

Pramipexole

INDICATIONS AND DOSE

Parkinson's disease, used alone or as an adjunct to co-beneldopa or co-careldopa

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ **Adult:** Initially 88 micrograms 3 times a day, increased if tolerated to 350 micrograms 3 times a day, dose to be increased by doubling dose every 5–7 days, then increased in steps of 180 micrograms 3 times a day if required, dose to be increased at weekly intervals, during dose titration and maintenance, levodopa dose may be reduced, maximum daily dose to be given in 3 divided doses; maximum 3.3 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ **Adult:** Initially 260 micrograms once daily, increased to 1.05 mg once daily, dose to be increased by doubling dose every 5–7 days, then increased in steps of 520 micrograms every 1 week if required, during dose titration and maintenance, levodopa dose may be reduced according to response; maximum 3.15 mg per day

Restless legs syndrome

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ **Adult:** Initially 88 micrograms once daily, dose to be taken 2–3 hours before bedtime, dose to be increased by doubling dose every 4–7 days, repeat dose titration if restarting treatment after an interval of more than a few days; maximum 540 micrograms per day

Dose equivalence and conversion

Doses and strengths are stated in terms of pramipexole (base).

Equivalent strengths of pramipexole (base) in terms of pramipexole dihydrochloride monohydrate (salt) for immediate-release preparations are as follows:

88 micrograms base = 125 micrograms salt;
180 micrograms base = 250 micrograms salt;
350 micrograms base = 500 micrograms salt;
700 micrograms base = 1 mg salt.

Equivalent strengths of pramipexole (base) in terms of pramipexole dihydrochloride monohydrate (salt) for modified-release preparations are as follows:

260 micrograms base = 375 micrograms salt;
520 micrograms base = 750 micrograms salt;
1.05 mg base = 1.5 mg salt;
1.57 mg base = 2.25 mg salt;
2.1 mg base = 3 mg salt;
2.62 mg base = 3.75 mg salt;
3.15 mg base = 4.5 mg salt.

Important safety information

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- **CAUTIONS** Psychotic disorders · risk of visual disorders (ophthalmological testing recommended) · severe cardiovascular disease
- **INTERACTIONS** → Appendix 1 (pramipexole).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Confusion · constipation · decreased appetite · dizziness · drowsiness · dyskinesia · hallucinations · headache · hyperkinesia · hypotension · nausea · peripheral oedema · postural hypotension · restlessness · sleep disturbances · sudden onset of sleep · visual disturbances · vomiting · weight changes
- ▶ **Uncommon** Amnesia · binge eating · cardiac failure · compulsive behaviour · delusion · dyspnoea · hiccups · paranoia · pneumonia · pruritus · rash · syncope
- ▶ **Frequency not known** Paradoxical worsening of restless legs syndrome
- **PREGNANCY** Use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** May suppress lactation; avoid—present in milk in animal studies.
- **RENAL IMPAIRMENT** For *immediate-release* tablets in Parkinson's disease, initially 88 micrograms twice daily (max. 1.57 mg daily in 2 divided doses) if eGFR 20–50 mL/minute/1.73 m²; initially 88 micrograms once daily (max. 1.1 mg once daily) if eGFR less than 20 mL/minute/1.73 m². If renal function declines during

treatment, reduce dose by the same percentage as the decline in eGFR. For *immediate-release* tablets in restless legs syndrome, reduce dose if eGFR less than 20 mL/minute/1.73 m². For *modified-release* tablets, initially 260 micrograms on alternate days if eGFR 30–50 mL/minute/1.73 m², increased to 260 micrograms once daily after 1 week, further increased if necessary by 260 micrograms daily at weekly intervals to max. 1.57 mg daily. For *modified-release* tablets, avoid if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Risk of postural hypotension (especially on initiation)—monitor blood pressure.
- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.
- **PATIENT AND CARER ADVICE**
- ▶ **Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. in patients over 75 years, when administered as adjunct to levodopa, concurrent dose of levodopa may gradually be reduced by approx. 30%, if treatment interrupted for 1 day or more, consider re-initiation with immediate-release tablets

Moderate to severe restless legs syndrome

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► **Adult:** Initially 250 micrograms once daily for 2 days, increased if tolerated to 500 micrograms once daily for 5 days, then increased if tolerated to 1 mg once daily for 7 days, then increased in steps of 500 micrograms daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 2 mg once daily, doses to be taken at night, repeat dose titration if restarting after interval of more than a few days; maximum 4 mg per day

Dose adjustments due to interactions

Dose adjustment may be necessary if smoking started or stopped during treatment.

● **UNLICENSED USE** Doses in the BNF may differ from those in product literature.

Important safety information

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

● **CAUTIONS** Elderly · major psychotic disorders · severe cardiovascular disease (risk of hypotension—monitor blood pressure)

● **INTERACTIONS** → Appendix 1 (ropinirole).

● SIDE-EFFECTS

► **Common or very common** Abdominal pain · confusion · constipation · dizziness · drowsiness · dyskinesia · dyspepsia · fatigue · gastro-oesophageal reflux disease · hallucinations · hypotension · nausea · nervousness · peripheral oedema · sudden onset of sleep · syncope · vomiting

► **Uncommon** Compulsive behaviour · psychosis

► **Very rare** Hepatic disorders

► **Frequency not known** Paradoxical worsening of restless legs syndrome

● **PREGNANCY** Avoid unless potential benefit outweighs risk—toxicity in *animal* studies.

● **BREAST FEEDING** May suppress lactation—avoid.

● **HEPATIC IMPAIRMENT** Avoid—no information available.

● **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

● **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

● PATIENT AND CARER ADVICE

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of

Ropinirole

INDICATIONS AND DOSE

Parkinson's disease, either used alone or as adjunct to co-beneldopa or co-careldopa

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► **Adult:** Initially 750 micrograms daily in 3 divided doses, then increased in steps of 750 micrograms daily, dose to be increased at weekly intervals, increased to 3 mg daily in 3 divided doses, then increased in steps of 1.5–3 mg daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 9–16 mg daily in 3 divided doses, higher doses may be required if used with levodopa, when administered as adjunct to levodopa, concurrent dose of levodopa may be reduced by approx. 20%, daily maximum dose to be given in 3 divided doses; maximum 24 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

► **Adult:** Initially 2 mg once daily for 1 week, then 4 mg once daily, increased in steps of 2 mg at least every 1 week, adjusted according to response, increased to up to 8 mg once daily, dose to be increased further if still no response; increased in steps of 2–4 mg at least every 2 weeks if required; maximum 24 mg per day

Parkinson's disease in patients transferring from ropinirole immediate-release tablets

BY MOUTH USING MODIFIED-RELEASE MEDICINES

► **Adult:** Initially ropinirole modified-release once daily substituted for total daily dose equivalent of ropinirole immediate-release tablets; if control not maintained after switching, titrate dose, consider slower titration

sleep should refrain from driving or operating machines until these effects have stopped occurring. Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2006) that *Adartrel*[®] should be restricted for use in patients with a baseline score of 24 points or more on the International Restless Legs Scale.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder

Rotigotine

INDICATIONS AND DOSE

Monotherapy in Parkinson's disease

BY TRANSDERMAL APPLICATION USING PATCHES

▶ Adult: Initially 2 mg/24 hours, then increased in steps of 2 mg/24 hours every 1 week if required; maximum 8 mg/24 hours per day

Adjunctive therapy with co-beneldopa or co-careldopa in Parkinson's disease

BY TRANSDERMAL APPLICATION USING PATCHES

▶ Adult: Initially 4 mg/24 hours, then increased in steps of 2 mg/24 hours every 1 week if required; maximum 16 mg/24 hours per day

Moderate to severe restless legs syndrome

BY TRANSDERMAL APPLICATION USING PATCHES

▶ Adult: Initially 1 mg/24 hours, then increased in steps of 1 mg/24 hours every 1 week if required; maximum 3 mg/24 hours per day

Important safety information

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

● **CAUTIONS** Avoid exposure of patch to heat · remove patch (aluminium-containing) before magnetic resonance imaging or cardioversion

● **INTERACTIONS** → Appendix 1 (rotigotine).

● **SIDE-EFFECTS**

▶ **Common or very common** Abnormal behaviour · abnormal thinking · aggression · application site reactions · confusion · constipation · dizziness · drowsiness · dry mouth · dyskinesia · dyspepsia · hallucinations · headache · hiccup · hypertension · malaise · nausea · palpitation · paranoia · peripheral oedema · postural hypotension · pruritus · psychosis · rash · sleep disturbances · sudden onset of sleep · sweating · syncope · vomiting · weight changes

▶ **Uncommon** Abdominal pain · atrial fibrillation · erectile dysfunction · hypotension · impulse control disorders · visual disturbances

▶ **Rare** Irritability · obsessive compulsive disorder · seizures · tachycardia

● **PREGNANCY** Avoid—no information available.

● **BREAST FEEDING** May suppress lactation; avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Caution in severe impairment—no information available.

● **MONITORING REQUIREMENTS** Ophthalmic testing recommended.

● **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

● **DIRECTIONS FOR ADMINISTRATION** Apply patch to dry, non-irritated skin on torso, thigh, or upper arm, removing after 24 hours and sitting replacement patch on a different area (avoid using the same area for 14 days).

● PATIENT AND CARER ADVICE

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring. Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised that *Neupro*[®] is accepted for restricted use for the treatment of advanced Parkinson's disease in combination with levodopa where the transdermal route would facilitate treatment (July 2007).

The *Scottish Medicines Consortium* has advised that *Neupro*[®] is accepted as monotherapy for the treatment of early-stage idiopathic Parkinson's disease (June 2007). The *Scottish Medicines Consortium* has advised (April 2009) that rotigotine (*Neupro*[®]) is accepted for restricted use within NHS Scotland for the symptomatic treatment of moderate to severe idiopathic restless legs syndrome in adults with a baseline score of 15 points or more on the International Restless Legs Scale.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

MONOAMINE-OXIDASE B INHIBITORS

Rasagiline

● **DRUG ACTION** Rasagiline is a monoamine-oxidase B inhibitor.

INDICATIONS AND DOSE

Parkinson's disease, used alone or as adjunct to co-beneldopa or co-careldopa for 'end-of-dose' fluctuations

BY MOUTH

▶ Adult: 1 mg daily

● **INTERACTIONS** → Appendix 1 (rasagiline).

● SIDE-EFFECTS

▶ **Common or very common** Abnormal dreams · angina · anorexia · arthralgia · conjunctivitis · constipation ·

depression · dry mouth · dyspepsia · flatulence · hallucinations · headache · influenza-like symptoms · leucopenia · rash · rhinitis · skin carcinoma · urinary urgency · vertigo · weight loss

▶ **Uncommon** Cerebrovascular accident · myocardial infarction

● **PREGNANCY** Use with caution.

● **BREAST FEEDING** Use with caution—may suppress lactation.

● **HEPATIC IMPAIRMENT** Use with caution in mild impairment. Avoid in moderate to severe impairment.

● **TREATMENT CESSATION** Avoid abrupt withdrawal.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

▶ *Azilect* (Teva UK Ltd)

Rasagiline (as Rasagiline mesilate) 1 mg *Azilect* 1mg tablets | 28 tablet [PoM] £70.72 DT price = £70.72

Selegiline hydrochloride

● **DRUG ACTION** Selegiline is a monoamine-oxidase-B inhibitor.

INDICATIONS AND DOSE

Parkinson's disease, used alone or as adjunct to co-beneldopa or co-careldopa to reduce 'end of dose' deterioration | Symptomatic parkinsonism

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ **Adult:** Initially 5 mg once daily for 2–4 weeks, then increased if tolerated to 10 mg daily, dose to be taken in the morning

BY MOUTH USING ORAL LYOPHILISATE

▶ **Adult:** 1.25 mg once daily, dose to be taken before breakfast

Dose equivalence and conversion

1.25-mg oral lyophilisate is equivalent to 10-mg tablet. Patients receiving 10 mg conventional selegiline hydrochloride tablets can be switched to oral lyophilisates (*Zelapar*[®]) 1.25 mg.

● **CONTRA-INDICATIONS** Active duodenal ulceration · active gastric ulceration · avoid or use with great caution in postural hypotension (when used in combination with levodopa)

● **CAUTIONS** Angina · arrhythmias · avoid in Acute porphyrias p. 864 · duodenal ulceration · gastric ulceration · history of hepatic dysfunction · patients predisposed to confusion and psychosis · psychosis · uncontrolled hypertension

● **INTERACTIONS** → Appendix 1 (selegiline).

Avoid with drugs that increase blood pressure.

● SIDE-EFFECTS

▶ **Common or very common** Arthralgia · bradycardia · confusion · constipation · depression · diarrhoea · dizziness · dry mouth · fatigue · hair loss · headache · hypertension · hypotension · impaired balance · mouth ulcers · movement disorders · muscle cramps · myalgia · myopathy · nasal congestion · nausea · psychosis · sleeping disorders · stomatitis · sweating · tremor

▶ **Uncommon** Agitation · angina · ankle oedema · anxiety · arrhythmias · blurred vision · dyspnoea · leucocytopenia · loss of appetite · micturition difficulties · palpitation · postural hypotension · skin reactions · supraventricular tachycardia · thrombocytopenia

▶ **Frequency not known** Hypersexuality

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects of levodopa may be increased—concurrent levodopa dosage can be reduced by 10–30% in steps of 10% every 3–4 days.

- **PREGNANCY** Avoid—no information available.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in severe impairment.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **DIRECTIONS FOR ADMINISTRATION** Oral lyophilisates should be placed on the tongue and allowed to dissolve. Advise patient not to drink, rinse, or wash mouth out for 5 minutes after taking the tablet.
- **PATIENT AND CARER ADVICE**
Counselling advised on driving.
Drugs and driving Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient's fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.
2015 legislation regarding driving whilst taking certain drugs, may also apply to selegiline, see *Drugs and driving* under Guidance on prescribing p. 1.
Patients or carers should be advised on how to administer selegiline hydrochloride oral lyophilisates.

MEDICINAL FORMS

4 Nausea and labyrinth disorders

Nausea and labyrinth disorders

Antiemetics should be prescribed only when the cause of vomiting is known because otherwise they may delay diagnosis, particularly in children. Antiemetics are unnecessary and sometimes harmful when the cause can be treated, such as in diabetic ketoacidosis, or in digoxin p. 94 or antiepileptic overdose.

If antiemetic drug treatment is indicated, the drug is chosen according to the aetiology of vomiting.

Antihistamines are effective against nausea and vomiting resulting from many underlying conditions. There is no evidence that any one antihistamine is superior to another but their duration of action and incidence of

adverse effects (drowsiness and antimuscarinic effects) differ.

The **phenothiazines** are dopamine antagonists and act centrally by blocking the chemoreceptor trigger zone. They are of considerable value for the prophylaxis and treatment of nausea and vomiting associated with diffuse neoplastic disease, radiation sickness, and the emesis caused by drugs such as opioids, general anaesthetics, and cytotoxics. Prochlorperazine p. 309, perphenazine p. 308, and trifluoperazine p. 310 are less sedating than chlorpromazine hydrochloride p. 304; severe dystonic reactions sometimes occur with phenothiazines, especially in children. Some phenothiazines are available as rectal suppositories, which can be useful in patients with persistent vomiting or with severe nausea; prochlorperazine p. 309 can also be administered as a buccal tablet which is placed between the upper lip and the gum.

Other antipsychotic drugs including haloperidol p. 306 and levomepromazine p. 345 are used for the relief of nausea and vomiting in terminal illness.

Metoclopramide hydrochloride p. 347 is an effective antiemetic and its activity closely resembles that of the phenothiazines. Metoclopramide hydrochloride also acts directly on the gastro-intestinal tract and it may be superior to the phenothiazines for emesis associated with gastroduodenal, hepatic, and biliary disease.

Domperidone p. 346 acts at the chemoreceptor trigger zone; it is licensed only for the relief of nausea and vomiting. It has the advantage over metoclopramide hydrochloride and the phenothiazines of being less likely to cause central effects such as sedation and dystonic reactions because it does not readily cross the blood-brain barrier. In Parkinson's disease, it can be used to treat nausea caused by dopaminergic drugs.

Granisetron p. 348 and ondansetron p. 349 are of value in the management of nausea and vomiting in patients receiving cytotoxics and in postoperative nausea and vomiting. Palonosetron p. 350 is licensed for prevention of nausea and vomiting associated with moderately or highly emetogenic cytotoxic chemotherapy.

Dexamethasone p. 581 has antiemetic effects and it is used in vomiting associated with cancer chemotherapy. It can be used alone or with metoclopramide hydrochloride, prochlorperazine p. 309, lorazepam p. 412, or a 5HT₃-receptor antagonist.

Aprepitant p. 351 and fosaprepitant p. 351 are neurokinin 1-receptor antagonists licensed for the prevention of acute and delayed nausea and vomiting associated with cisplatin-based cytotoxic chemotherapy; they are given with dexamethasone p. 581 and a 5HT₃-receptor antagonist.

Nabilone p. 346 is a synthetic cannabinoid with antiemetic properties. It may be used for nausea and vomiting caused by cytotoxic chemotherapy that is unresponsive to conventional antiemetics.

Vomiting during pregnancy

Nausea in the first trimester of pregnancy is generally mild and does not require drug therapy. On rare occasions if vomiting is severe, short-term treatment with an antihistamine, such as **promethazine**, may be required. Prochlorperazine p. 309 or metoclopramide hydrochloride p. 347 are alternatives. If symptoms do not settle in 24 to 48 hours then specialist opinion should be sought. Hyperemesis gravidarum is a more serious condition, which requires regular antiemetic therapy, intravenous fluid and electrolyte replacement and sometimes nutritional support. Supplementation with thiamine p. 882 must be considered in order to reduce the risk of Wernicke's encephalopathy.

Postoperative nausea and vomiting

The incidence of postoperative nausea and vomiting depends on many factors including the anaesthetic used,

and the type and duration of surgery. Other risk factors include female sex, non-smokers, a history of postoperative nausea and vomiting or motion sickness, and intraoperative and postoperative use of opioids. Therapy to prevent postoperative nausea and vomiting should be based on the assessed risk of postoperative nausea and vomiting in each patient. Drugs used include **5HT₃-receptor antagonists**, droperidol p. 345, dexamethasone p. 581, some **phenothiazines** (e.g. prochlorperazine p. 309), and **antihistamines** (e.g. cyclizine p. 343). A combination of two or more antiemetic drugs that have different mechanisms of action is often indicated in those at high risk of postoperative nausea and vomiting or where postoperative vomiting presents a particular danger (e.g. in some types of surgery). When a prophylactic antiemetic drug has failed, postoperative nausea and vomiting should be treated with one or more drugs from a different class.

Motion sickness

Antiemetics should be given to prevent motion sickness rather than after nausea or vomiting develop. The most effective drug for the prevention of motion sickness is hyoscine hydrobromide p. 344. The sedating antihistamines are slightly less effective against motion sickness, but are generally better tolerated than hyoscine. If a sedative effect is desired **promethazine** is useful, but generally a slightly less sedating antihistamine such as cyclizine p. 343 or cinnarizine below is preferred. Domperidone p. 346, metoclopramide hydrochloride p. 347, 5HT₃-receptor antagonists, and the phenothiazines (except the antihistamine phenothiazine promethazine) are **ineffective** in motion sickness.

Other vestibular disorders

Management of vestibular diseases is aimed at treating the underlying cause as well as treating symptoms of the balance disturbance and associated nausea and vomiting. Vertigo and nausea associated with Ménière's disease and middle-ear surgery can be difficult to treat.

Betahistine dihydrochloride p. 352 is an analogue of histamine and is claimed to reduce endolymphatic pressure by improving the microcirculation. Betahistine dihydrochloride is licensed for vertigo, tinnitus, and hearing loss associated with Ménière's disease.

A **diuretic** alone or combined with salt restriction may provide some benefit in vertigo associated with Ménière's disease; **antihistamines** (such as cinnarizine below), and **phenothiazines** (such as prochlorperazine p. 309) are also used. Where possible, prochlorperazine should be reserved for the treatment of acute symptoms.

Cytotoxic chemotherapy, palliative care, and migraine

Antiemetics have a role in the management of nausea and vomiting induced by cytotoxic chemotherapy, in palliative care, and associated with migraine.

Drugs used for Nausea and labyrinth disorders not listed below: Chlorpromazine hydrochloride, p. 304 · Haloperidol, p. 306 · Lorazepam, p. 412 · Perphenazine, p. 308 · Prochlorperazine, p. 309 · Promethazine hydrochloride, p. 251 · Promethazine teoclate, p. 252 · Trifluoperazine, p. 310

ANTIHISTAMINES

Cinnarizine

INDICATIONS AND DOSE

Relief of symptoms of vestibular disorders, such as vertigo, tinnitus, nausea, and vomiting in Ménière's disease

BY MOUTH

- ▶ Child 5-11 years: 15 mg 3 times a day
- ▶ Child 12-17 years: 30 mg 3 times a day
- ▶ Adult: 30 mg 3 times a day

Motion sickness

BY MOUTH

- ▶ Child 5-11 years: Initially 15 mg, dose to be taken 2 hours before travel, then 7.5 mg every 8 hours if required, dose to be taken during journey
- ▶ Child 12-17 years: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey
- ▶ Adult: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey

- **CONTRA-INDICATIONS** Avoid in Acute porphyrias p. 864 (some antihistamines are thought to be safe) · neonate (due to significant antimuscarinic activity)
- **CAUTIONS** Epilepsy · glaucoma (in children) · Parkinson's disease (in adults) · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · susceptibility to angle-closure glaucoma (in adults) · urinary retention
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Drowsiness
 - ▶ **Rare** Anaphylaxis · angioedema · angle-closure glaucoma · arrhythmias · blood disorders · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · lichen planus · liver dysfunction · lupus-like skin reactions · palpitation · paradoxical stimulation (especially with high doses in children) (in children) · paradoxical stimulation (especially with high doses in the elderly) (in adults) · photosensitivity reactions · rashes · sleep disturbances · sweating · tremor · weight gain
 - ▶ **Frequency not known** Antimuscarinic effects · blurred vision · dry mouth · gastro-intestinal disturbances · headache · psychomotor impairment · urinary retention
- SIDE-EFFECTS, FURTHER INFORMATION** Children and the elderly are more susceptible to side-effects. Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.
- **PREGNANCY** Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.
- **RENAL IMPAIRMENT** Use with caution—no information available.
- **PATIENT AND CARER ADVICE** Drowsiness may affect performance of skilled tasks (e.g. cycling, driving); sedating effects enhanced by alcohol.

ANTIMUSCARINICS

Hyoscine hydrobromide (Scopolamine hydrobromide)

The properties listed below are those particular to the drug only. For properties common to the class, see Antimuscarinics, Systemic, p. 668.

INDICATIONS AND DOSE

Motion sickness

BY MOUTH

- Child 4-9 years: 75–150 micrograms, dose to be taken up to 30 minutes before the start of journey, then 75–150 micrograms every 6 hours if required; maximum 450 micrograms per day
- Child 10-17 years: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day
- Adult: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day

BY TRANSDERMAL APPLICATION

- Child 10-17 years: Apply 1 patch, apply behind ear 5–6 hours before journey, then apply 1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear
- Adult: Apply 1 patch, apply behind ear 5–6 hours before journey, then apply 1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear

Hypersalivation associated with clozapine therapy

BY MOUTH

- Adult: 300 micrograms up to 3 times a day; maximum 900 micrograms per day

Excessive respiratory secretion (in palliative care)

BY SUBCUTANEOUS INJECTION

- Adult: 400 micrograms every 4 hours as required, hourly use is occasionally necessary, particularly in excessive respiratory secretions

BY CONTINUOUS SUBCUTANEOUS INFUSION

- Adult: 1.2–2 mg/24 hours

Bowel colic in palliative care

BY SUBCUTANEOUS INJECTION

- Adult: 400 micrograms every 4 hours as required, hourly use is occasionally necessary

BY SUBCUTANEOUS INFUSION

- Adult: 1.2–2 mg/24 hours

Bowel colic pain in palliative care

BY MOUTH

- Adult: 300 micrograms 3 times a day, Sublingually as *Kwells*®.

Premedication

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- Adult: 200–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia

● UNLICENSED USE

- In children Not licensed for use in excessive respiratory secretions or hypersalivation associated with clozapine therapy.

Important safety information

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

● CAUTIONS Epilepsy

CAUTIONS, FURTHER INFORMATION

Anticholinergic syndrome In some patients, especially children and the elderly, hyoscine may cause the central anticholinergic syndrome (excitement, ataxia, hallucinations, behavioural abnormalities, and drowsiness).

- **PREGNANCY** Use only if potential benefit outweighs risk. Injection may depress neonatal respiration.

- **BREAST FEEDING** Amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Use with caution.

- **RENAL IMPAIRMENT** Use with caution.

● DIRECTIONS FOR ADMINISTRATION

- With topical use *Patch* applied to hairless area of skin behind ear; if less than whole patch required **either** cut with scissors along full thickness ensuring membrane is not peeled away **or** cover portion to prevent contact with skin.

- With oral use in children For administration by *mouth*, injection solution may be given orally.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of chewable tablet formulations may include raspberry.

● PATIENT AND CARER ADVICE

- With transdermal use Explain accompanying instructions to patient and in particular emphasise advice to wash hands after handling and to wash application site after removing, and to use one patch at a time.

Driving and skilled tasks

- With transdermal use Drowsiness may persist for up to 24 hours or longer after removal of patch; effects of alcohol enhanced.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, oral suspension, oral solution

The properties listed below are those particular to the drug only. For properties common to the class, see Antipsychotics, p. 303.

- **DRUG ACTION** Droperidol is a butyrophenone, structurally related to haloperidol, which blocks dopamine receptors in the chemoreceptor trigger zone.

INDICATIONS AND DOSE**Prevention and treatment of postoperative nausea and vomiting**

BY INTRAVENOUS INJECTION

- ▶ **Adult:** 0.625–1.25 mg, dose to be given 30 minutes before end of surgery, then 0.625–1.25 mg every 6 hours as required
- ▶ **Elderly:** 625 micrograms, dose to be given 30 minutes before end of surgery, then 625 micrograms every 6 hours as required

Prevention of nausea and vomiting caused by opioid analgesics in postoperative patient controlled analgesia (PCA)

BY INTRAVENOUS INJECTION

- ▶ **Adult:** 15–50 micrograms of droperidol for every 1 mg of morphine in PCA, reduce dose in elderly; maximum 5 mg per day

- **CONTRA-INDICATIONS** Bradycardia · CNS depression · comatose states · hypokalaemia · hypomagnesaemia · phaeochromocytoma · QT-interval prolongation
- **CAUTIONS** Chronic obstructive pulmonary disease · electrolyte disturbances · history of alcohol abuse · respiratory failure
- **INTERACTIONS** → Appendix 1 (droperidol). Avoid concomitant administration of drugs that prolong QT interval.
- **SIDE-EFFECTS** Anxiety · cardiac arrest · hallucinations · inappropriate antidiuretic hormone secretion
- **PREGNANCY** Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of antipsychotic drugs in the third trimester, neonates should be monitored for symptoms including agitation, hypertonia, hypotonia, tremor, drowsiness, feeding problems, and respiratory distress.
- **BREAST FEEDING** Limited information available—avoid repeated administration.
- **HEPATIC IMPAIRMENT** In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required. For nausea and vomiting caused by opioid

analgesics in postoperative patient-controlled analgesia, reduce dose.

- **RENAL IMPAIRMENT** In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required. For nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose.
- **MONITORING REQUIREMENTS** Continuous pulse oximetry required if risk of ventricular arrhythmia—continue for 30 minutes following administration.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, capsule

Solution for injection▶ **Xomolix** (ProStrakan Ltd)**Droperidol 2.5 mg per 1 ml** Xomolix 2.5mg/1ml solution for injection ampoules | 10 ampoule P £39.40**Levomepromazine****(Methotrimiprazine)**

The properties listed below are those particular to the drug only. For properties common to the class, see Antipsychotics, p. 303.

INDICATIONS AND DOSE**Pain in palliative care (reserved for distressed patients with severe pain unresponsive to other measures)**

BY CONTINUOUS SUBCUTANEOUS INFUSION OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- ▶ **Adult:** Seek specialist advice

Restlessness and confusion in palliative care

BY CONTINUOUS SUBCUTANEOUS INFUSION

- ▶ **Child 1-11 years:** 0.35–3 mg/kg, to be administered over 24 hours
- ▶ **Child 12-17 years:** 12.5–200 mg, to be administered over 24 hours

BY MOUTH

- ▶ **Adult:** 6 mg every 2 hours as required

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 6.25 mg every 2 hours as required

BY SUBCUTANEOUS INFUSION

- ▶ **Adult:** Initially 12.5–50 mg/24 hours, titrated according to response (doses greater than 100 mg/24 hours should be given under specialist supervision)

Nausea and vomiting in palliative care

BY CONTINUOUS INTRAVENOUS INFUSION OR BY SUBCUTANEOUS INFUSION

- ▶ **Child 1 month-11 years:** 100–400 micrograms/kg, to be administered over 24 hours
- ▶ **Child 12-17 years:** 5–25 mg, to be administered over 24 hours

BY MOUTH

- ▶ **Adult:** 6 mg once daily, dose to be taken at bedtime, increased if necessary to 12.5–25 mg twice daily

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 6.25 mg once daily, dose to be given at bedtime, increased if necessary to 12.5–25 mg twice daily

BY SUBCUTANEOUS INFUSION

- ▶ **Adult:** 5–25 mg/24 hours, sedation can limit the dose

Schizophrenia

BY MOUTH

- ▶ **Adult:** Initially 25–50 mg daily in divided doses, dose can be increased as necessary

Schizophrenia (bed patients)

BY MOUTH

- ▶ **Adult:** Initially 100–200 mg daily in 3 divided doses, increased if necessary to 1 g daily

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma
- **CAUTIONS** Diabetes · patients receiving large initial doses should remain supine

CAUTIONS, FURTHER INFORMATION

Risk of postural hypotension; not recommended for ambulant patients over 50 years unless risk of hypotensive reaction assessed.

- **SIDE-EFFECTS** Raised erythrocyte sedimentation rate
- **PREGNANCY** Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of antipsychotic drugs in the third trimester, neonates should be monitored for symptoms including agitation, hypertonia, hypotonia, tremor, drowsiness, feeding problems, and respiratory distress.
- **BREAST FEEDING** There is limited information available on the short- and long-term effects of antipsychotic drugs on the breast-fed infant. *Animal* studies indicate possible adverse effects of antipsychotic medicines on the developing nervous system. Chronic treatment with antipsychotic drugs whilst breast-feeding should be avoided unless absolutely necessary. Phenothiazine derivatives are sometimes used in breast-feeding women for short-term treatment of nausea and vomiting.
- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.
- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With subcutaneous use in children For administration by *subcutaneous infusion* dilute with a suitable volume of Sodium Chloride 0.9%.

MEDICINAL FORMS

CANNABINOIDS

Nabilone

INDICATIONS AND DOSE

Nausea and vomiting caused by cytotoxic chemotherapy, unresponsive to conventional antiemetics (preferably in hospital setting) (under close medical supervision)

BY MOUTH

- ▶ **Adult:** Initially 1 mg twice daily, increased if necessary to 2 mg twice daily throughout each cycle of cytotoxic therapy and, if necessary, for 48 hours after the last dose of each cycle, the first dose should be taken the night before initiation of cytotoxic treatment and the second dose 1–3 hours before the first dose of

cytotoxic drug, daily dose maximum should be given in 3 divided doses; maximum 6 mg per day

- **CAUTIONS** Adverse effects on mental state can persist for 48–72 hours after stopping · elderly · heart disease · history of psychiatric disorder · hypertension

SIDE-EFFECTS

- ▶ **Common or very common** Ataxia · concentration difficulties · drowsiness · dry mouth · dysphoria · euphoria · headache · hypotension · nausea · sleep disturbance · vertigo · visual disturbance
- ▶ **Frequency not known** Abdominal pain · confusion · decreased appetite · decreased coordination · depression · disorientation · hallucinations · psychosis · tachycardia · tremors

SIDE-EFFECTS, FURTHER INFORMATION

Drowsiness and dizziness occur frequently with standard doses.

- **PREGNANCY** Avoid unless essential.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

PATIENT AND CARER ADVICE

Drowsiness may affect performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.
For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including nabilone, see *Drugs and driving* under Guidance on prescribing p. 1. Behavioural effects Patients should be made aware of possible changes of mood and other adverse behavioural effects.

DOPAMINE RECEPTOR ANTAGONISTS

Domperidone

INDICATIONS AND DOSE

Relief of nausea and vomiting

BY MOUTH

- ▶ **Child (body-weight up to 35 kg):** 250 micrograms/kg up to 3 times a day; maximum 750 micrograms/kg per day
- ▶ **Child 12–17 years (body-weight 35 kg and above):** 10 mg up to 3 times a day; maximum 30 mg per day
- ▶ **Adult (body-weight 35 kg and above):** 10 mg up to 3 times a day; maximum 30 mg per day

Gastro-intestinal pain in palliative care

BY MOUTH

- ▶ **Adult:** 10 mg 3 times a day, before meals

- **UNLICENSED USE** Not licensed for use in children for gastro-oesophageal reflux disease.

Important safety information

MHRA/CHM ADVICE—DOMPERIDONE: RISK OF CARDIAC SIDE-EFFECTS—RESTRICTED INDICATION, NEW CONTRA-INDICATIONS, REDUCED DOSE AND DURATION OF USE
The benefits and risks of domperidone have been reviewed. As domperidone is associated with a small increased risk of serious cardiac side-effects, the following restrictions to indication, dose and

duration of treatment have been made, and new contra-indications added:

- Domperidone should only be used for the relief of the symptoms of nausea and vomiting;
- Domperidone should be used at the lowest effective dose for the shortest possible duration (max. treatment duration should not normally exceed 1 week);
- Domperidone is contra-indicated for use in conditions where cardiac conduction is, or could be impaired, or where there is underlying cardiac disease, when administered concomitantly with drugs that prolong the QT interval or potent CYP3A4 inhibitors, and in severe hepatic impairment;
- The recommended dose in adults and adolescents over 12 years and over 35 kg is 10 mg up to 3 times daily;
- The recommended dose in children under 35 kg is 250 micrograms/kg up to 3 times daily;
- Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy.

This advice does not apply to unlicensed uses of domperidone (e.g. palliative care).

- **CONTRA-INDICATIONS** Cardiac disease · conditions where cardiac conduction is, or could be, impaired (in adults) · gastro-intestinal haemorrhage (in children) · if increased gastrointestinal motility harmful (in adults) · mechanical obstruction (in children) · mechanical perforation (in children) · predisposition to cardiac conduction disorders (in children) · prolactinoma
- **CAUTIONS** Children · if there are cardiac concerns, obtain ECG before and during treatment (in children) · patients over 60 years—increased risk of ventricular arrhythmia (in adults)
- **INTERACTIONS** → Appendix 1 (domperidone).
Contra-indicated with concomitant use of drugs that prolong the QT interval.
Contra-indicated with concomitant use of potent CYP3A4 inhibitors.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Drowsiness · dry mouth · malaise
 - ▶ **Uncommon** Anxiety · breast pain · decreased libido · diarrhoea · galactorrhoea · headache · pruritus · rash
 - ▶ **Frequency not known** Agitation · amenorrhoea · convulsions · extrapyramidal disorders · gynaecomastia · nervousness · oculogyric crisis · QT-interval prolongation · sudden cardiac death · urinary retention · ventricular arrhythmias
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Avoid in moderate or severe impairment.
- **RENAL IMPAIRMENT** Reduce frequency.
- **PATIENT AND CARER ADVICE**
Arrhythmia Patients and their carers should be told how to recognise signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncope develop.

Metoclopramide hydrochloride

INDICATIONS AND DOSE

Symptomatic treatment of nausea and vomiting including that associated with acute migraine | Delayed (but not acute) chemotherapy-induced nausea and vomiting | Radiotherapy-induced nausea and vomiting | Prevention of postoperative nausea and vomiting

BY MOUTH OR BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION

- ▶ **Adult (body-weight up to 60 kg):** Up to 500 micrograms/kg daily in 3 divided doses, when administered by slow intravenous injection, to be given over at least 3 minutes
- ▶ **Adult (body-weight 60 kg and above):** 10 mg up to 3 times a day, when administered by slow intravenous injection, to be given over at least 3 minutes

Hiccup in palliative care

BY MOUTH OR BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 10 mg every 6–8 hours

Nausea and vomiting in palliative care

BY MOUTH

- ▶ **Adult:** 10 mg 3 times a day

BY SUBCUTANEOUS INFUSION

- ▶ **Adult:** 30–100 mg/24 hours

Important safety information

MHRA/CHM ADVICE—METOCLOPRAMIDE: RISK OF NEUROLOGICAL ADVERSE EFFECTS—RESTRICTED DOSE AND DURATION OF USE (AUGUST 2013)

The benefits and risks of metoclopramide have been reviewed by the European Medicines Agency's Committee on Medicinal Products for Human Use, which concluded that the risk of neurological effects such as extrapyramidal disorders and tardive dyskinesia outweigh the benefits in long-term or high-dose treatment. To help minimise the risk of potentially serious neurological adverse effects, the following restrictions to indications, dose, and duration of use have been made:

- In adults over 18 years, metoclopramide should only be used for prevention of postoperative nausea and vomiting, radiotherapy-induced nausea and vomiting, delayed (but not acute) chemotherapy-induced nausea and vomiting, and symptomatic treatment of nausea and vomiting, including that associated with acute migraine (where it may also be used to improve absorption of oral analgesics);
- Metoclopramide should only be prescribed for short-term use (up to 5 days);
- Usual dose is 10 mg, repeated up to 3 times daily; max. daily dose is 500 micrograms/kg;

- Intravenous doses should be administered as a slow bolus over at least 3 minutes;
 - Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy.
- This advice does not apply to unlicensed uses of metoclopramide (e.g. palliative care).

- **CONTRA-INDICATIONS** 3–4 days after gastrointestinal surgery · gastro-intestinal haemorrhage · gastro-intestinal obstruction · gastro-intestinal perforation · phaeochromocytoma
- **CAUTIONS** Asthma · atopic allergy · bradycardia · cardiac conduction disturbances · children · elderly · epilepsy · may mask underlying disorders such as cerebral irritation · Parkinson's disease · uncorrected electrolyte imbalance · young adults (15–19 years old)
- **INTERACTIONS** → Appendix 1 (metoclopramide). Caution with concomitant use of other drugs affecting cardiac conduction.

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Extrapyramidal effects (especially in children and young adults (15–19 years old)) · galactorrhoea · gynaecomastia · hyperprolactinaemia · menstrual changes
- ▶ **Very rare** Depression · methaemoglobinaemia (more severe in G6PD deficiency) · neuroleptic malignant syndrome
- ▶ **Frequency not known** Anxiety · confusion · diarrhoea · dizziness · drowsiness · dyspnoea · hypotension · oedema · pruritus · rash · restlessness · tardive dyskinesia on prolonged administration · tremor · urticaria · visual disturbances

SPECIFIC SIDE-EFFECTS

- ▶ **Very rare**
- ▶ **With intravenous use** cardiac conduction abnormalities

SIDE-EFFECTS, FURTHER INFORMATION

Metoclopramide can induce acute dystonic reactions involving facial and skeletal muscle spasms and oculogyric crises. These dystonic effects are more common in the young (especially girls and young women) and the very old; they usually occur shortly after starting treatment with metoclopramide and subside within 24 hours of stopping it. Injection of an antiparkinsonian drug such as procyclidine will abort dystonic attacks.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Small amount present in milk; avoid.
- **HEPATIC IMPAIRMENT** Reduce dose.
- **RENAL IMPAIRMENT** Avoid or use small dose in severe impairment; increased risk of extrapyramidal reactions.
- **DIRECTIONS FOR ADMINISTRATION** Oral liquid preparation to be given via a graduated oral dosing syringe.
- **PATIENT AND CARER ADVICE** Counselling on use of pipette advised with oral solution.

• MEDICINAL FORMS

5HT₃ RECEPTOR ANTAGONISTS

Granisetrone

- **DRUG ACTION** Granisetron is a specific 5HT₃-receptor antagonist which blocks 5HT₃ receptors in the gastrointestinal tract and in the CNS.

INDICATIONS AND DOSE

Nausea and vomiting induced by cytotoxic chemotherapy for planned duration of 3–5 days where oral antiemetics cannot be used

BY TRANSDERMAL APPLICATION USING PATCHES

- ▶ **Adult:** Apply 3.1 mg/24 hours, apply patch to clean, dry, non-irritated, non-hairy skin on upper arm (or abdomen if upper arm cannot be used) 24–48 hours before treatment, patch may be worn for up to 7 days; remove at least 24 hours after completing chemotherapy

Prevention of postoperative nausea and vomiting

BY INTRAVENOUS INJECTION

- ▶ **Adult:** 1 mg, to be administered before induction of anaesthesia, dose to be diluted to 5 mL and given over 30 seconds

Treatment of postoperative nausea and vomiting

BY INTRAVENOUS INJECTION

- ▶ **Adult:** 1 mg, dose to be diluted to 5 mL and given over 30 seconds; maximum 3 mg per day

Management of nausea and vomiting induced by cytotoxic chemotherapy or radiotherapy

BY MOUTH

- ▶ **Adult:** 1–2 mg, to be taken within 1 hour before start of treatment, then 2 mg daily in 1–2 divided doses for up to 1 week following treatment, when intravenous route also used, maximum combined total dose 9 mg in 24 hours

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ **Adult:** 10–40 micrograms/kg (max. per dose 3 mg), to be given 5 minutes before start of treatment, dose may be repeated if necessary, further maintenance doses must not be given less than 10 minutes apart, for intravenous injection, each 1 mg granisetron diluted to 5 mL and given over not less than 30 seconds, for intravenous infusion, to be given over 5 minutes; maximum 9 mg per day

- **CAUTIONS** Subacute intestinal obstruction · susceptibility to QT-interval prolongation (including electrolyte disturbances)
- **INTERACTIONS** → Appendix 1 (5HT₃-receptor Antagonists). Caution with concomitant use of drugs that prolong QT interval.
- **SIDE-EFFECTS**
GENERAL SIDE-EFFECTS
▶ **Common or very common** Constipation · diarrhoea · headache · insomnia

- ▶ **Uncommon** Extrapyramidal reactions · QT-interval prolongation · rash

SPECIFIC SIDE-EFFECTS

- ▶ **Uncommon**
- ▶ **With transdermal use** application-site reactions
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute up to 3 mL in 20–50 mL infusion fluid; give over 5 minutes.
- **PATIENT AND CARER ADVICE** Patients should be advised not to expose the site of the patch to sunlight during use and for 10 days after removal.

INDICATIONS AND DOSE

Moderately emetogenic chemotherapy or radiotherapy

INITIALLY BY MOUTH

- ▶ **Adult:** Initially 8 mg, dose to be taken 1–2 hours before treatment, alternatively (by rectum) initially 16 mg, dose to be administered 1–2 hours before treatment, alternatively (by intramuscular injection or by slow intravenous injection) initially 8 mg, dose to be administered immediately before treatment, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
- ▶ **Elderly:** Initially 8 mg, dose to be taken 1–2 hours before treatment, alternatively (by rectum) initially 16 mg, dose to be administered 1–2 hours before treatment, alternatively (by intramuscular injection or by intravenous infusion) initially 8 mg, dose to be administered immediately before treatment, intravenous infusion dose to be administered over at least 15 minutes, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

Severely emetogenic chemotherapy (consult product literature for dose of concomitant corticosteroid)

INITIALLY BY MOUTH

- ▶ **Adult:** 24 mg, dose to be taken 1–2 hours before treatment, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

INITIALLY BY RECTUM

- ▶ **Adult:** 16 mg, dose to be administered 1–2 hours before treatment, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

INITIALLY BY INTRAMUSCULAR INJECTION OR BY SLOW

INTRAVENOUS INJECTION

- ▶ **Adult 18–65 years:** Initially 8 mg, dose to be administered immediately before treatment, followed by (by intramuscular injection or by slow intravenous injection) 8 mg every 4 hours if required for 2 doses, alternatively followed by (by continuous intravenous infusion) 1 mg/hour for up to 24 hours, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

INITIALLY BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION

- ▶ **Adult 66–74 years:** Initially 8 mg, immediately before treatment, intravenous infusion dose to be administered over at least 15 minutes, followed by (by intramuscular injection or by intravenous infusion) 8 mg every 4 hours if required for 2 doses, alternatively followed by (by continuous intravenous infusion) 1 mg/hour for up to 24 hours, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

INITIALLY BY INTRAVENOUS INFUSION

- ▶ **Adult 18–65 years:** Initially 16 mg, immediately before treatment, to be administered over at least 15 minutes, followed by (by intramuscular injection or by slow intravenous injection) 8 mg every 4 hours if required for 2 doses, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
- ▶ **Adult 66–74 years:** Initially 16 mg, immediately before treatment, to be administered over at least 15 minutes, followed by (by intramuscular injection or by intravenous infusion) 8 mg every 4 hours if required for 2 doses, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
- ▶ **Adult 75 years and over:** Initially 8 mg, immediately before treatment, to be administered over at least 15 minutes, followed by (by intravenous infusion) 8 mg every 4 hours if required for 2 doses, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

Prevention of postoperative nausea and vomiting

INITIALLY BY MOUTH

- ▶ **Adult:** 16 mg, dose to be taken 1 hour before anaesthesia, alternatively (by intramuscular injection or by slow intravenous injection) 4 mg, dose to be administered at induction of anaesthesia

Treatment of postoperative nausea and vomiting

BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION

- ▶ **Adult:** 4 mg for 1 dose

- **CONTRA-INDICATIONS** Congenital long QT syndrome
- **CAUTIONS** Adenotonsillar surgery · subacute intestinal obstruction · susceptibility to QT-interval prolongation (including electrolyte disturbances)
- **INTERACTIONS** → Appendix 1 (5HT₃-receptor Antagonists).

Caution with concomitant use of drugs that prolong QT interval.

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Constipation · flushing · headache · injection site-reactions
- ▶ **Uncommon** Arrhythmias · bradycardia · chest pain · hiccups · hypotension · movement disorders · seizures

SPECIFIC SIDE-EFFECTS

- ▶ **Rare**
- ▶ **With intravenous use** dizziness · transient visual disturbances
- ▶ **Very rare**
- ▶ **With intravenous use** transient blindness
- ▶ **Frequency not known**
- ▶ **With rectal use** rectal irritation
- **PREGNANCY** No information available; avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Present in milk in *animal studies*—avoid.

- **HEPATIC IMPAIRMENT** Maximum 8 mg daily in moderate or severe impairment.

● DIRECTIONS FOR ADMINISTRATION

- ▶ **With intravenous use** For *intravenous infusion (Zofran®)*, give continuously or intermittently in Glucose 5% or Glucose 5% with Potassium chloride 0.3% or Sodium chloride 0.9% or Sodium chloride 0.9% with Potassium chloride 0.3% or Mannitol 10% or Ringers solution; for intermittent infusion, dilute the required dose in 50–100 mL of infusion fluid and give over at least 15 minutes.
- ▶ **With oral use** Orodispersible films and lyophilisates should be placed on the tongue, allowed to disperse and swallowed.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer orodispersible films and lyophilisates.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

▶ **ONDANSETRON (Non-proprietary)**

Ondansetron (as Ondansetron hydrochloride) 4 mg Ondansetron 4mg tablets | 10 tablet [PoM] £25.46 DT price = £1.80 | 30 tablet [PoM] £76.38

Ondansetron (as Ondansetron hydrochloride) 8 mg Ondansetron 8mg tablets | 10 tablet [PoM] £47.99 DT price = £46.94

Palonosetron

- **DRUG ACTION** Palonosetron is a specific 5HT₃-receptor antagonist which blocks 5HT₃ receptors in the gastrointestinal tract and in the CNS.

INDICATIONS AND DOSE

Moderately emetogenic chemotherapy

INITIALLY BY MOUTH

- ▶ **Adult:** 500 micrograms, dose to be taken 1 hour before treatment, alternatively (by intravenous injection) 250 micrograms for 1 dose, dose to be administered over 30 seconds, 30 minutes before treatment

Severely emetogenic chemotherapy

BY INTRAVENOUS INJECTION

- ▶ **Adult:** 250 micrograms for 1 dose, dose to be administered over 30 seconds, 30 minutes before treatment

- **CAUTIONS** History of constipation · intestinal obstruction · susceptibility to QT-interval prolongation (including electrolyte disturbances)

- **INTERACTIONS** Caution with concomitant use of drugs that prolong QT interval.

● SIDE-EFFECTS

- ▶ **Common or very common** Constipation · diarrhoea · dizziness · headache
- ▶ **Uncommon** Abdominal pain · amblyopia · anorexia · anxiety · arrhythmia · arthralgia · asthenia · atrioventricular block · bradycardia · changes in blood pressure · dry mouth · dyspepsia · dyspnoea · electrolyte disturbance · euphoria · extrasystoles · eye irritation · eye swelling · flatulence · glycosuria · hiccups · hyperglycaemia · influenza-like symptoms · insomnia · motion sickness · myalgia · myocardial ischaemia · peripheral neuropathy · rash · tachycardia · tinnitus · urinary retention

- **PREGNANCY** Avoid—no information available.

- **BREAST FEEDING** Avoid—no information available.

- **PATIENT AND CARER ADVICE** Dizziness or drowsiness may affect performance of skilled tasks (e.g. driving).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

- ▶ **Aloxi** (Sinclair IS Pharma Plc)
Palonosetron (as Palonosetron hydrochloride) 500 microgram Aloxi 500microgram capsules | 1 capsule [PoM] £55.89

Solution for injection

- ▶ **Aloxi** (Sinclair IS Pharma Plc)
Palonosetron (as Palonosetron hydrochloride) 50 microgram per 1 ml Aloxi 250micrograms/5ml solution for injection vials | 1 vial [PoM] £55.89

NEUROKININ RECEPTOR ANTAGONISTS**Aprepitant****INDICATIONS AND DOSE**

Adjunct to dexamethasone and a 5HT₃-receptor antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

BY MOUTH

- ▶ **Adult:** Initially 125 mg, dose to be taken 1 hour before chemotherapy, then 80 mg once daily for 2 days, consult product literature for dose of concomitant corticosteroid and 5HT₃-antagonist

- **CONTRA-INDICATIONS** Acute porphyrias p. 864

- **INTERACTIONS** → Appendix 1 (aprepitant).

SIDE-EFFECTS

- ▶ **Common or very common** Anorexia · asthenia · constipation · diarrhoea · dizziness · dyspepsia · headache · hiccups
- ▶ **Uncommon** Abdominal pain · abnormal dreams · acne · anaemia · anxiety · bradycardia · chills · colitis · confusion · conjunctivitis · cough · drowsiness · dry mouth · duodenal ulcer · dysuria · euphoria · flatulence · flushing · haematuria · hyperglycaemia · hyponatraemia · myalgia · neutropenia · oedema · palpitations · pharyngitis · photosensitivity · polyuria · pruritus · rash · sneezing · stomatitis · sweating · taste disturbance · thirst · tinnitus · weight changes
- ▶ **Frequency not known** Dysarthria · dyspnoea · insomnia · Stevens-Johnson syndrome · urticaria · visual disturbances

- **CONCEPTION AND CONTRACEPTION** Effectiveness of hormonal contraceptives reduced—effective non-hormonal methods of contraception necessary during treatment and for 2 months after stopping aprepitant.

- **PREGNANCY** Avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Caution in moderate to severe impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Capsule

- ▶ **Emend** (Merck Sharp & Dohme Ltd)
Aprepitant 80 mg Emend 80mg capsules | 2 capsule [PoM] £31.61
Aprepitant 125 mg Emend 125mg capsules | 1 capsule [PoM] no price available | 5 capsule [PoM] £79.03

Fosaprepitant

- **DRUG ACTION** Fosaprepitant is a prodrug of aprepitant.

INDICATIONS AND DOSE

Adjunct to dexamethasone and a 5HT₃-receptor antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

BY INTRAVENOUS INFUSION

- ▶ **Adult:** 150 mg, dose to be administered over 20–30 minutes and given 30 minutes before chemotherapy on day 1 of cycle only, consult product literature for dose of concomitant corticosteroid and 5HT₃-receptor antagonist

- **CONTRA-INDICATIONS** Acute porphyrias p. 864

- **INTERACTIONS** → Appendix 1 (fosaprepitant).

SIDE-EFFECTS

- ▶ **Common or very common** Anorexia · asthenia · constipation · diarrhoea · dizziness · dyspepsia · headache · hiccups
- ▶ **Uncommon** Abdominal pain · abnormal dreams · acne · anaemia · anxiety · bradycardia · chills · colitis · confusion · conjunctivitis · cough · drowsiness · dry mouth · duodenal ulcer · dysuria · euphoria · flatulence · flushing · haematuria · hyperglycaemia · hyponatraemia · myalgia · neutropenia · oedema · palpitations · pharyngitis · photosensitivity · polyuria · pruritus · rash · sneezing · stomatitis · sweating · taste disturbance · thirst · tinnitus · weight changes
- ▶ **Frequency not known** Dysarthria · dyspnoea · insomnia · Stevens-Johnson syndrome · urticaria · visual disturbances

- **CONCEPTION AND CONTRACEPTION** Effectiveness of hormonal contraceptives reduced—effective non-hormonal methods of contraception necessary during treatment and for 2 months after stopping fosaprepitant.

- **PREGNANCY** Avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Caution in moderate to severe impairment.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion (Ivemend[®])*, give intermittently in Sodium chloride 0.9%; reconstitute each 150-mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 145 mL infusion fluid; give over 20–30 minutes.

NATIONAL FUNDING/ACCESS DECISIONS**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (January 2011) that fosaprepitant (*Ivemend[®]*) is accepted for restricted use within NHS Scotland for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based chemotherapy.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Ivemend** (Merck Sharp & Dohme Ltd)
Fosaprepitant (as Fosaprepitant dimeglumine) 150 mg Ivemend 150mg powder for solution for infusion vials | 1 vial [PoM] £47.42

4.1 Ménière's disease

HISTAMINE ANALOGUES

Betahistine dihydrochloride

INDICATIONS AND DOSE

Vertigo, tinnitus and hearing loss associated with Ménière's disease

BY MOUTH

▶ Adult: Initially 16 mg 3 times a day, dose preferably taken with food; maintenance 24–48 mg daily

- **CONTRA-INDICATIONS** Pheochromocytoma
- **CAUTIONS** Asthma · history of peptic ulcer
- **INTERACTIONS** → Appendix 1 (betahistine).
- **SIDE-EFFECTS** Gastro-intestinal disturbances · headache · pruritus · rashes
- **PREGNANCY** Avoid unless clearly necessary—no information available.
- **BREAST FEEDING** Use only if potential benefit outweighs risk—no information available.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 21

▶ **BETAHISTINE DIHYDROCHLORIDE (Non-proprietary)**

5 Pain

Analgesics

The non-opioid drugs, paracetamol p. 354 and aspirin p. 104 (and other NSAIDs), are particularly suitable for pain in musculoskeletal conditions, whereas the opioid analgesics are more suitable for moderate to severe pain, particularly of visceral origin.

Pain in sickle-cell disease

The pain of mild sickle-cell crises is managed with paracetamol p. 354, a NSAID, codeine phosphate p. 360, or dihydrocodeine tartrate p. 362. Severe crises may require the use of morphine p. 367 or diamorphine hydrochloride p. 361; concomitant use of a NSAID may potentiate analgesia and allow lower doses of the opioid to be used. Pethidine hydrochloride p. 372 should be avoided if possible because accumulation of a neurotoxic metabolite can precipitate seizures; the relatively short half-life of pethidine hydrochloride necessitates frequent injections.

Dental and orofacial pain

Analgesics should be used judiciously in dental care as a **temporary** measure until the cause of the pain has been dealt with.

Dental pain of inflammatory origin, such as that associated with pulpitis, apical infection, localised osteitis or pericoronitis is usually best managed by treating the infection, providing drainage, restorative procedures, and

other local measures. Analgesics provide temporary relief of pain (usually for about 1 to 7 days) until the causative factors have been brought under control. In the case of pulpitis, intra-osseous infection or abscess, reliance on analgesics alone is usually inappropriate.

Similarly the pain and discomfort associated with acute problems of the oral mucosa (e.g. acute herpetic gingivostomatitis, erythema multiforme) may be relieved by benzydamine hydrochloride p. 993 mouthwash or spray until the cause of the mucosal disorder has been dealt with. However, where a patient is febrile, the antipyretic action of paracetamol p. 354 or ibuprofen p. 927 is often helpful.

The *choice* of an analgesic for dental purposes should be based on its suitability for the patient. Most dental pain is relieved effectively by non-steroidal anti-inflammatory drugs (NSAIDs). NSAIDs that are used for dental pain include ibuprofen p. 927, diclofenac sodium p. 921, and aspirin p. 104. Paracetamol p. 354 has analgesic and antipyretic effects but no anti-inflammatory effect.

Opioid analgesics such as dihydrocodeine tartrate p. 362 act on the central nervous system and are traditionally used for *moderate to severe pain*. However, opioid analgesics are relatively ineffective in dental pain and their side-effects can be unpleasant. Paracetamol, ibuprofen, or aspirin are adequate for most cases of dental pain and an opioid is rarely required.

Combining a non-opioid with an opioid analgesic can provide greater relief of pain than either analgesic given alone. However, this applies only when an adequate dose of each analgesic is used. Most combination analgesic preparations have not been shown to provide greater relief of pain than an adequate dose of the non-opioid component given alone. Moreover, combination preparations have the disadvantage of an increased number of side-effects.

Any analgesic given before a dental procedure should have a low risk of increasing postoperative bleeding. In the case of pain after the dental procedure, taking an analgesic before the effect of the local anaesthetic has worn off can improve control. Postoperative analgesia with ibuprofen or aspirin is usually continued for about 24 to 72 hours.

Temporomandibular dysfunction can be related to anxiety in some patients who may clench or grind their teeth (bruxism) during the day or night. The muscle spasm (which appears to be the main source of pain) may be treated empirically with an overlay appliance which provides a free sliding occlusion and may also interfere with grinding. In addition, diazepam p. 267, which has muscle relaxant as well as anxiolytic properties, may be helpful but it should only be prescribed on a short-term basis during the acute phase. Analgesics such as aspirin or ibuprofen may also be required.

Dysmenorrhoea

Use of an oral contraceptive prevents the pain of dysmenorrhoea which is generally associated with ovulatory cycles. If treatment is necessary paracetamol p. 354 or a NSAID will generally provide adequate relief of pain. The vomiting and severe pain associated with dysmenorrhoea in women with endometriosis may call for an antiemetic (in addition to an analgesic). Antispasmodics (such as alverine citrate p. 74) have been advocated for dysmenorrhoea but the antispasmodic action does not generally provide significant relief.

Non-opioid analgesics and compound analgesic preparations

Aspirin p. 104 is indicated for headache, transient musculoskeletal pain, dysmenorrhoea, and pyrexia. In inflammatory conditions, most physicians prefer anti-inflammatory treatment with another NSAID which may be better tolerated and more convenient for the patient. Aspirin is used increasingly for its antiplatelet properties.

Aspirin tablets or dispersible aspirin tablets are adequate for most purposes as they act rapidly.

Gastric irritation may be a problem; it is minimised by taking the dose after food. Enteric-coated preparations are available, but have a slow onset of action and are therefore unsuitable for single-dose analgesic use (though their prolonged action may be useful for night pain).

Aspirin interacts significantly with a number of other drugs and its interaction with warfarin sodium is a **special hazard**.

Paracetamol p. 354 is similar in efficacy to aspirin, but has no demonstrable anti-inflammatory activity; it is less irritant to the stomach and for that reason is now generally preferred to aspirin, particularly in the elderly. **Overdosage** with paracetamol is particularly dangerous as it may cause hepatic damage which is sometimes not apparent for 4 to 6 days.

Nefopam hydrochloride p. 356 may have a place in the relief of persistent pain unresponsive to other non-opioid analgesics. It causes little or no respiratory depression, but sympathomimetic and antimuscarinic side-effects may be troublesome.

Non-steroidal anti-inflammatory analgesics (NSAIDs) are particularly useful for the treatment of patients with chronic disease accompanied by pain and inflammation. Some of them are also used in the short-term treatment of mild to moderate pain including transient musculoskeletal pain but paracetamol is now often preferred, particularly in the elderly. They are also suitable for the relief of pain in *dysmenorrhoea* and to treat pain caused by *secondary bone tumours*, many of which produce lysis of bone and release prostaglandins. Selective inhibitors of cyclo-oxygenase-2 may be used in preference to non-selective NSAIDs for patients at high risk of developing serious gastro-intestinal side-effects. Several NSAIDs are also used for postoperative analgesia.

A non-opioid analgesic administered by intrathecal infusion (**ziconotide** (*Prialt*®), available from Eisai) is licensed for the treatment of chronic severe pain; ziconotide can be used by a hospital specialist as an adjunct to opioid analgesics.

Compound analgesic preparations

Compound analgesic preparations that contain a simple analgesic (such as aspirin p. 104 or paracetamol p. 354) with an opioid component reduce the scope for effective titration of the individual components in the management of pain of varying intensity.

Compound analgesic preparations containing paracetamol p. 354 or aspirin p. 104 with a *low dose* of an opioid analgesic (e.g. 8 mg of codeine phosphate per compound tablet) are commonly used, but the advantages have not been substantiated. The low dose of the opioid may be enough to cause opioid side-effects (in particular, constipation) and can complicate the treatment of **overdosage** yet may not provide significant additional relief of pain.

A *full dose* of the opioid component (e.g. 60 mg codeine phosphate) in compound analgesic preparations effectively augments the analgesic activity but is associated with the full range of opioid side-effects (including nausea, vomiting, severe constipation, drowsiness, respiratory depression, and risk of dependence on long-term administration).

Important: the elderly are particularly susceptible to opioid side-effects and should receive lower doses.

In general, when assessing pain, it is necessary to weigh up carefully whether there is a need for a non-opioid and an opioid analgesic to be taken simultaneously.

Caffeine is a weak stimulant that is often included, in small doses, in analgesic preparations. It is claimed that the addition of caffeine may enhance the analgesic effect, but the alerting effect, mild habit-forming effect and possible provocation of headache may not always be desirable.

Moreover, in excessive dosage or on withdrawal caffeine may itself induce headache.

Co-proxamol tablets (dextropropoxyphene in combination with paracetamol) are no longer licensed because of safety concerns, particularly toxicity in overdose. Co-proxamol tablets [unlicensed] may still be prescribed for patients who find it difficult to change, because alternatives are not effective or suitable.

Opioid analgesics

Opioid analgesics are usually used to relieve moderate to severe pain particularly of visceral origin. Repeated administration may cause dependence and tolerance, but this is no deterrent in the control of pain in terminal illness. Regular use of a potent opioid may be appropriate for certain cases of chronic non-malignant pain; treatment should be supervised by a specialist and the patient should be assessed at regular intervals.

Strong opioids

Morphine p. 367 remains the most valuable opioid analgesic for severe pain although it frequently causes nausea and vomiting. It is the standard against which other opioid analgesics are compared. In addition to relief of pain, morphine also confers a state of euphoria and mental detachment.

Morphine is the opioid of choice for the oral treatment of *severe pain in palliative care*. It is given regularly every 4 hours (or every 12 or 24 hours as modified-release preparations).

Buprenorphine p. 434 has both opioid agonist and antagonist properties and may precipitate withdrawal symptoms, including pain, in patients dependent on other opioids. It has abuse potential and may itself cause dependence. It has a much longer duration of action than morphine and sublingually is an effective analgesic for 6 to 8 hours. Unlike most opioid analgesics, the effects of buprenorphine are only partially reversed by naloxone hydrochloride p. 1133.

Dipipanone hydrochloride used alone is less sedating than morphine but the only preparation available contains an antiemetic and is therefore not suitable for regular regimens in palliative care.

Diamorphine hydrochloride p. 361 (heroin) is a powerful opioid analgesic. It may cause less nausea and hypotension than morphine. In *palliative care* the greater solubility of diamorphine hydrochloride allows effective doses to be injected in smaller volumes and this is important in the emaciated patient.

Alfentanil p. 357, fentanyl p. 362 and remifentanyl p. 1108 are used by injection for intra-operative analgesia; fentanyl is available in a transdermal drug delivery system as a self-adhesive patch which is changed every 72 hours.

Methadone hydrochloride p. 436 is less sedating than morphine and acts for longer periods. In prolonged use, methadone hydrochloride should not be administered more often than twice daily to avoid the risk of accumulation and opioid overdosage. Methadone hydrochloride may be used instead of morphine in the occasional patient who experiences excitation (or exacerbation of pain) with morphine.

Oxycodone hydrochloride p. 369 has an efficacy and side-effect profile similar to that of morphine. It is used primarily for control of *pain in palliative care*.

Papaveretum p. 371 is rarely used; morphine is easier to prescribe and less prone to error with regard to the strength and dose.

Pentazocine p. 371 has both agonist and antagonist properties and precipitates withdrawal symptoms, including pain in patients dependent on other opioids. By injection it is more potent than dihydrocodeine tartrate or codeine phosphate, but hallucinations and thought disturbances may occur. It is not recommended and, in particular, should

be avoided after myocardial infarction as it may increase pulmonary and aortic blood pressure as well as cardiac work.

Pethidine hydrochloride p. 372 produces prompt but short-lasting analgesia; it is less constipating than morphine, but even in high doses is a less potent analgesic. It is not suitable for severe continuing pain. It is used for analgesia in labour; however, other opioids, such as morphine or diamorphine hydrochloride p. 361, are often preferred for obstetric pain.

Tapentadol p. 372 produces analgesia by two mechanisms. It is an opioid-receptor agonist and it also inhibits noradrenaline reuptake. Nausea, vomiting, and constipation are less likely to occur with tapentadol than with other strong opioid analgesics.

Tramadol hydrochloride p. 373 produces analgesia by two mechanisms: an opioid effect and an enhancement of serotonergic and adrenergic pathways. It has fewer of the typical opioid side-effects (notably, less respiratory depression, less constipation and less addiction potential); psychiatric reactions have been reported.

Weak opioids

Codeine phosphate p. 360 can be used for the relief of mild to moderate pain where other painkillers such as paracetamol or ibuprofen have proved ineffective.

Dihydrocodeine tartrate p. 362 has an analgesic efficacy similar to that of codeine phosphate. Higher doses may provide some additional pain relief but this may be at the cost of more nausea and vomiting.

Meptazinol p. 367 is claimed to have a low incidence of respiratory depression. It has a reported length of action of 2 to 7 hours with onset within 15 minutes.

Postoperative analgesia

A combination of opioid and non-opioid analgesics is used to treat postoperative pain. The use of intra-operative opioids affects the prescribing of postoperative analgesics. A postoperative opioid analgesic should be given with care since it may potentiate any residual respiratory depression.

Morphine p. 367 is used most widely. Tramadol hydrochloride p. 373 is not as effective in severe pain as other opioid analgesics. Buprenorphine p. 434 may antagonise the analgesic effect of previously administered opioids and is generally not recommended. Pethidine hydrochloride p. 372 is generally not recommended for postoperative pain because it is metabolised to norpethidine which may accumulate, particularly in renal impairment; norpethidine stimulates the central nervous system and may cause convulsions.

Opioids are also given epidurally [unlicensed route] in the postoperative period but are associated with side-effects such as pruritus, urinary retention, nausea and vomiting; respiratory depression can be delayed, particularly with morphine.

Patient-controlled analgesia (PCA) can be used to relieve postoperative pain—consult individual hospital protocols.

Pain management and opioid dependence

Although caution is necessary, patients who are dependent on opioids or have a history of drug dependence may be treated with opioid analgesics when there is a clinical need. Treatment with opioid analgesics in this patient group should normally be carried out with the advice of specialists. However, doctors do not require a special licence to prescribe opioid analgesics to patients with opioid dependence for relief of pain due to organic disease or injury.

Drugs used for Pain not listed below; *Aspirin*, p. 104 · *Bupivacaine hydrochloride*, p. 1113 · *Bupivacaine with fentanyl*, p. 362 · *Buprenorphine*, p. 434 · *Dexibuprofen*, p. 919 · *Diclofenac potassium*, p. 920 · *Fenopropfen*, p. 926 · *Ibuprofen*, p. 927 · *Levobupivacaine*, p. 1115 · *Levomopromazine*, p. 345 · *Mefenamic acid*, p. 932 · *Methadone hydrochloride*, p. 436 · *Nitrous oxide*, p. 1096 · *Ropivacaine hydrochloride*, p. 1121

ANALGESICS

Aspirin with codeine

The properties listed below are those particular to the combination only. For the properties of the components please consider, aspirin p. 104, codeine phosphate p. 360.

INDICATIONS AND DOSE

Mild to moderate pain | Pyrexia

BY MOUTH

▶ Adult: 1–2 tablets every 4–6 hours as required, dose to be dispersed in water; maximum 8 tablets per day

- **PRESCRIBING AND DISPENSING INFORMATION** When co-codaprin tablets or dispersible tablets are prescribed and no strength is stated, tablets or dispersible tablets, respectively, containing codeine phosphate 8 mg and aspirin 400 mg should be dispensed.
- **LESS SUITABLE FOR PRESCRIBING** Aspirin with codeine is less suitable for prescribing.
- **EXCEPTIONS TO LEGAL CATEGORY** Aspirin with codeine can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 13, 21, 32

▶ **Codis** (Reckitt Benckiser Healthcare (UK) Ltd)

▶ **Aspirin 500 mg, Codeine phosphate 8 mg** Codis 500 dispersible tablets (sugar-free) | 32 tablet  £3.23 Schedule 5 (CD Inv)

▶ **Co-codaprin** (Non-proprietary)

▶ **Aspirin 400 mg, Codeine 8 mg** Co-codaprin 8 mg/400 mg dispersible tablets | 100 tablet  £97.55 Schedule 5 (CD Inv)

Paracetamol (Acetaminophen)

INDICATIONS AND DOSE

Mild to moderate pain | Pyrexia

BY MOUTH

▶ Adult: 0.5–1 g every 4–6 hours; maximum 4 g per day

BY INTRAVENOUS INFUSION

▶ Adult (body-weight 10–50 kg): 15 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 60 mg/kg per day

▶ Adult (body-weight 50 kg and above): 1 g every 4–6 hours, dose to be administered over 15 minutes; maximum 4 g per day

BY RECTUM

▶ Adult: 0.5–1 g every 4–6 hours; maximum 4 g per day

Mild to moderate pain in patients with risk factors for hepatotoxicity

BY INTRAVENOUS INFUSION

- ▶ Adult (body-weight 50 kg and above): 1 g every 4–6 hours, dose to be administered over 15 minutes; maximum 3 g per day

Pain | Pyrexia with discomfort

BY MOUTH

- ▶ Child 3–5 months: 60 mg every 4–6 hours; maximum 4 doses per day
- ▶ Child 6 months–1 year: 120 mg every 4–6 hours; maximum 4 doses per day
- ▶ Child 2–3 years: 180 mg every 4–6 hours; maximum 4 doses per day
- ▶ Child 4–5 years: 240 mg every 4–6 hours; maximum 4 doses per day
- ▶ Child 6–7 years: 240–250 mg every 4–6 hours; maximum 4 doses per day
- ▶ Child 8–9 years: 360–375 mg every 4–6 hours; maximum 4 doses per day
- ▶ Child 10–11 years: 480–500 mg every 4–6 hours; maximum 4 doses per day
- ▶ Child 12–15 years: 480–750 mg every 4–6 hours; maximum 4 doses per day
- ▶ Child 16–17 years: 0.5–1 g every 4–6 hours; maximum 4 doses per day

BY RECTUM

- ▶ Child 3–11 months: 60–125 mg every 4–6 hours as required; maximum 4 doses per day
- ▶ Child 1–4 years: 125–250 mg every 4–6 hours as required; maximum 4 doses per day
- ▶ Child 5–11 years: 250–500 mg every 4–6 hours as required; maximum 4 doses per day
- ▶ Child 12–17 years: 500 mg every 4–6 hours

Post-immunisation pyrexia in infants

BY MOUTH

- ▶ Child 2 months: 60 mg for 1 dose, then 60 mg after 4–6 hours if required

PANADOL OA®**Mild to moderate pain | Pyrexia**

BY MOUTH

- ▶ Adult: 1 g up to 4 times a day, dose not to be taken more often than every 4 hours

- **UNLICENSED USE** Paracetamol oral suspension 500 mg/5 mL not licensed for use in children under 16 years. Not licensed for use in children under 2 months by mouth; under 3 months by rectum. Intravenous infusion not licensed in pre-term neonates, or children and neonates with body-weight under 10 kg.

- **CAUTIONS** Alcohol dependence · before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours · chronic alcoholism · chronic dehydration · chronic malnutrition · hepatocellular insufficiency

- **INTERACTIONS** → Appendix 1 (paracetamol).

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Rare** Acute generalised exanthematous pustulosis · malaise · skin reactions · Stevens-Johnson syndrome · toxic epidermal necrolysis
- ▶ **Frequency not known** Blood disorders · leucopenia · neutropenia · thrombocytopenia

SPECIFIC SIDE-EFFECTS

- ▶ **Rare**
- ▶ **With intravenous use** flushing · tachycardia
- ▶ **Frequency not known**
- ▶ **With intravenous use** hypotension

Overdose

Important: liver damage and less frequently renal damage can occur following overdose.

Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis.

For specific details on the management of poisoning, see Paracetamol, under Emergency treatment of poisoning p. 1123

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Dose-related toxicity—avoid large doses.
- **RENAL IMPAIRMENT**
 - ▶ In adults Increase infusion dose interval to every 6 hours if eGFR less than 30 mL/minute/1.73 m².
 - ▶ In children Increase infusion dose interval to every 6 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Perfalgan®), give in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of not less than 1 mg/mL and use within an hour; may also be given undiluted. For children under 33 kg, use 50 mL-vial.
- **PRESCRIBING AND DISPENSING INFORMATION** BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed Paracetamol Oral Suspension 120 mg/5 mL should be dispensed.
- **PATIENT AND CARER ADVICE**
 - ▶ In children Medicines for Children leaflet: Paracetamol for mild-to-moderate pain www.medicinesforchildren.org.uk/paracetamol-for-mildtomoderate-pain
- **PROFESSION SPECIFIC INFORMATION**
 - Dental practitioners' formulary** Paracetamol Tablets may be prescribed. Paracetamol Soluble Tablets 500 mg may be prescribed. Paracetamol Oral Suspension may be prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** Paracetamol capsules or tablets can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

OPIOIDS

Opioids

- **CONTRA-INDICATIONS** Acute respiratory depression · comatose patients · head injury (opioid analgesics interfere with pupillary responses vital for neurological assessment) · raised intracranial pressure (opioid analgesics interfere with pupillary responses vital for neurological assessment) · risk of paralytic ileus
- **CAUTIONS** Adrenocortical insufficiency (reduced dose is recommended) · asthma (avoid during an acute attack) · convulsive disorders · debilitated patients (reduced dose is recommended) · diseases of the biliary tract · elderly (reduced dose is recommended) · hypotension · hypothyroidism (reduced dose is recommended) · impaired respiratory function (avoid in chronic obstructive pulmonary disease) · inflammatory bowel disorders · myasthenia gravis · obstructive bowel disorders · prostatic hypertrophy · shock · urethral stenosis

CAUTIONS, FURTHER INFORMATION

Dependence Repeated use of opioid analgesics is associated with the development of psychological and physical dependence; although this is rarely a problem with therapeutic use, caution is advised if prescribing for patients with a history of drug dependence.

Palliative care In the control of pain in terminal illness, the cautions listed should not necessarily be a deterrent to the use of opioid analgesics.

- **INTERACTIONS** → Appendix 1 (opioid analgesics).
- **SIDE-EFFECTS**
- **Common or very common** Biliary spasm · bradycardia · confusion · constipation · dependence · difficulty with micturition · dizziness · drowsiness · dry mouth · dysphoria · euphoria · flushing · hallucinations · headache · hypotension (larger doses) · miosis · mood changes · muscle rigidity (larger doses) · nausea (particularly in initial stages) · oedema · palpitation · postural hypotension · pruritus · rash · respiratory depression (larger doses) · sexual dysfunction · sleep disturbances ·

sweating · tachycardia · ureteric spasm · urinary retention · urticaria · vertigo · visual disturbances · vomiting (particularly in initial stages)

- **Frequency not known** Adrenal insufficiency (long-term use) · hyperalgesia (long-term use) · hypogonadism (long-term use)

SIDE-EFFECTS, FURTHER INFORMATION

Hypogonadism and adrenal insufficiency Long-term use of opioid analgesics can cause hypogonadism and adrenal insufficiency in both males and females. This is thought to be dose related and can lead to amenorrhoea, reduced libido, infertility, depression, and erectile dysfunction.

Hyperalgesia Long-term use of opioid analgesics has also been associated with a state of abnormal pain sensitivity (hyperalgesia). Pain associated with hyperalgesia is usually distinct from pain associated with disease progression or breakthrough pain, and is often more diffuse and less defined. Treatment of hyperalgesia involves reducing the dose of opioid medication or switching therapy; cases of suspected hyperalgesia should be referred to a specialist pain team.

Respiratory depression Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naloxone.

Dependence and withdrawal Psychological dependence rarely occurs when opioids are used therapeutically (e.g. for pain relief) but tolerance can develop during long-term treatment.

Overdose Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. For details on the management of poisoning, see Opioids, under Emergency treatment of poisoning p. 1123 and consider the specific antidote, naloxone hydrochloride p. 1133.

- **PREGNANCY** Respiratory depression and withdrawal symptoms can occur in the neonate if opioid analgesics are used during delivery; also gastric stasis and inhalation pneumonia has been reported in the mother if opioid analgesics are used during labour.
 - **HEPATIC IMPAIRMENT** Avoid use or reduce dose; may precipitate coma in patients with hepatic impairment.
 - **TREATMENT CESSATION** Avoid abrupt withdrawal after long-term treatment; they should be withdrawn gradually to avoid abstinence symptoms.
 - **PATIENT AND CARER ADVICE** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced. Driving at the start of therapy with opioid analgesics, and following dose changes, should be avoided.
- For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including opioids, see *Drugs and driving* under Guidance on prescribing p. 1.

Alfentanil

INDICATIONS AND DOSE

Spontaneous respiration: analgesia and enhancement of anaesthesia for short procedures

BY INTRAVENOUS INJECTION

- **Adult:** Initially up to 500 micrograms, dose to be administered over 30 seconds; supplemental doses 250 micrograms

Assisted ventilation: analgesia and enhancement of anaesthesia for short procedures

BY INTRAVENOUS INJECTION

- **Adult:** Initially 30–50 micrograms/kg, supplemental doses 15 micrograms/kg

continued →

Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia for longer procedures

BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 50–100 micrograms/kg, dose to be administered over 10 minutes or as a bolus, followed by maintenance 30–60 micrograms/kg/hour

Assisted ventilation: analgesia and suppression of respiratory activity during intensive care

BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 2 mg/hour, adjusted according to response; usual dose 0.5–10 mg/hour, alternatively initially 5 mg in divided doses, to be administered over 10 minutes; dose used for more rapid initial control, reduce rate of administration if hypotension or bradycardia occur; additional doses of 0.5–1 mg may be given by intravenous injection during short painful procedures

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal bodyweight.

PHARMACOKINETICS

Half-life is prolonged in neonates and accumulation is likely with prolonged use. Clearance may be increased in children 1 month–12 years and higher infusion doses might be needed.

● CAUTIONS

CAUTIONS, FURTHER INFORMATION

Repeated intra-operative doses Repeated intra-operative doses of alfentanil should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

● SIDE-EFFECTS

- ▶ **Common or very common** Hypertension · myoclonic movements
- ▶ **Uncommon** Arrhythmias · hiccup · laryngospasm
- ▶ **Rare** Epistaxis
- ▶ **Frequency not known** Cardiac arrest · convulsions · cough · muscle rigidity · pyrexia

SIDE-EFFECTS, FURTHER INFORMATION

Muscle rigidity Alfentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

- **BREAST FEEDING** Present in milk—withhold breast-feeding for 24 hours.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **DIRECTIONS FOR ADMINISTRATION** 5 mg/mL injection to be diluted before use. For *continuous or intermittent intravenous infusion* dilute in Glucose 5% or Sodium Chloride 0.9%.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, spray

Co-codamol

INDICATIONS AND DOSE

Mild to moderate pain (using co-codamol 8/500 preparations only)

BY MOUTH

- ▶ **Adult:** 8/500–16/1000 mg every 4–6 hours as required; maximum 64/4000 mg per day

Mild to moderate pain (using co-codamol 15/500 preparations only)

BY MOUTH

- ▶ **Adult:** 15/500–30/1000 mg every 4–6 hours as required; maximum 120/4000 mg per day

Severe pain (using co-codamol 30/500 preparations only)

BY MOUTH

- ▶ **Adult:** 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day

SOLPADOL® CAPLETS

Severe pain

BY MOUTH

- ▶ **Adult:** 2 tablets every 4–6 hours as required; maximum 8 tablets per day

KAPAKE® 15/500

Mild to moderate pain

BY MOUTH

- ▶ **Adult:** 2 tablets every 4–6 hours as required; maximum 8 tablets per day

SOLPADOL® EFFERVESCENT TABLETS

Severe pain

BY MOUTH USING EFFERVESCENT TABLETS

- ▶ **Adult:** 2 tablets every 4–6 hours as required, tablets to be dispersed in water; maximum 8 tablets per day

SOLPADOL® CAPSULES

Severe pain

BY MOUTH

- ▶ **Adult:** 2 capsules every 4–6 hours as required; maximum 8 capsules per day

Important safety information

See codeine phosphate p. 360 for MHRA/CHM advice for restrictions on the use of codeine as an analgesic in children.

- **CONTRA-INDICATIONS** Acute ulcerative colitis · antibiotic-associated colitis · children under 18 years who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea · conditions where abdominal distention develops · conditions where inhibition of peristalsis should be avoided · known ultra-rapid codeine metabolisers
- **CAUTIONS** Acute abdomen · alcohol dependence · avoid abrupt withdrawal after long-term treatment · cardiac arrhythmias · chronic alcoholism · chronic dehydration · chronic malnutrition · convulsive disorders · gallstones · hepatocellular insufficiency

CAUTIONS, FURTHER INFORMATION

Variation in metabolism The capacity to metabolise codeine to morphine can vary considerably between

individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.

- **INTERACTIONS** → Appendix 1 (paracetamol).
- **SIDE-EFFECTS** Abdominal pain · anorexia · blood disorders · depression (with larger doses) · hypothermia · leucopenia · malaise · muscle fasciculation · neutropenia · pancreatitis · seizures · thrombocytopenia
- **Overdose Important:** liver damage (and less frequently renal damage) following overdose with paracetamol.
- **BREAST FEEDING** Avoid—although amount of codeine usually too small to be harmful, mothers vary considerably in their capacity to metabolise codeine—risk of morphine overdose in infant.
- **HEPATIC IMPAIRMENT** Dose-related toxicity with paracetamol—avoid large doses.
- **RENAL IMPAIRMENT** Reduce dose or avoid codeine; increased and prolonged effect; increased cerebral sensitivity.
- **PRESCRIBING AND DISPENSING INFORMATION** Co-codamol is a mixture of codeine phosphate and paracetamol; the proportions are expressed in the form x/y, where x and y are the strengths in milligrams of codeine phosphate and paracetamol respectively. When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and **no strength is stated**, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed. The Drug Tariff allows tablets of co-codamol labelled 'dispersible' to be dispensed against an order for 'effervescent' and *vice versa*.
- **LESS SUITABLE FOR PRESCRIBING** Co-codamol is less suitable for prescribing.
- **EXCEPTIONS TO LEGAL CATEGORY** Co-codamol 8/500 can be sold to the public in certain circumstances; for exemptions see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

Co-dydramol

INDICATIONS AND DOSE

Mild to moderate pain (using co-dydramol 10/500 preparations only)

BY MOUTH

- ▶ Adult: 10/500–20/1000 mg every 4–6 hours as required; maximum 80/4000 mg per day

Severe pain (using co-dydramol 20/500 preparations only)

BY MOUTH

- ▶ Adult: 20/500–40/1000 mg every 4–6 hours as required; maximum 160/4000 mg per day

Severe pain (using co-dydramol 30/500 preparations only)

BY MOUTH

- ▶ Adult: 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day

Dose equivalence and conversion

A mixture of dihydrocodeine tartrate and paracetamol; the proportions are expressed in the form x/y, continued →

where x and y are the strengths in milligrams of dihydrocodeine and paracetamol respectively.

- **CAUTIONS** Alcohol dependence · before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours · chronic alcoholism · chronic dehydration · chronic malnutrition · hepatocellular insufficiency · pancreatitis · severe cor pulmonale
 - **INTERACTIONS** → Appendix 1 (paracetamol).
 - **SIDE-EFFECTS** Abdominal pain · acute generalised exanthematous pustulosis · blood disorders · leucopenia · malaise · neutropenia · pancreatitis · paraesthesia · paralytic ileus · skin reactions · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis
- Overdose Important:** liver damage (and less frequently renal damage) following overdosage with paracetamol.
- **BREAST FEEDING** Amount of dihydrocodeine too small to be harmful but use only if potential benefit outweighs risk.
 - **HEPATIC IMPAIRMENT** Dose-related toxicity with paracetamol—avoid large doses.
 - **RENAL IMPAIRMENT** Reduce dose or avoid dihydrocodeine; increased and prolonged effect; increased cerebral sensitivity.
 - **PRESCRIBING AND DISPENSING INFORMATION** When co-dydramol tablets are prescribed and **no strength is stated**, tablets containing dihydrocodeine tartrate 10 mg and paracetamol 500 mg should be dispensed.
 - **LESS SUITABLE FOR PRESCRIBING** Co-dydramol is less suitable for prescribing.

MEDICINAL FORMS

Codeine phosphate

INDICATIONS AND DOSE

Acute diarrhoea

BY MOUTH

- Child 12–17 years: 30 mg 3–4 times a day; usual dose 15–60 mg 3–4 times a day
- Adult: 30 mg 3–4 times a day; usual dose 15–60 mg 3–4 times a day

Mild to moderate pain

BY MOUTH

- Adult: 30–60 mg every 4 hours if required; maximum 240 mg per day

BY INTRAMUSCULAR INJECTION

- Adult: 30–60 mg every 4 hours if required

Short-term treatment of acute moderate pain

BY MOUTH OR BY INTRAMUSCULAR INJECTION

- Child 12–17 years: 30–60 mg every 6 hours if required for maximum 3 days; maximum 240 mg per day

Dry or painful cough

BY MOUTH USING LINCTUS

- Adult: 15–30 mg 3–4 times a day

Important safety information

MHRA/CHM ADVICE (JULY 2013) CODEINE FOR ANALGESIA: RESTRICTED USE IN CHILDREN DUE TO REPORTS OF MORPHINE TOXICITY

Codeine should only be used to relieve acute moderate pain in children older than 12 years and only if it cannot be relieved by other painkillers such as paracetamol or ibuprofen alone. A significant risk of serious and life-threatening adverse reactions has been identified in children with obstructive sleep apnoea who received codeine after tonsillectomy or adenoidectomy:

- in children aged 12–18 years, the maximum daily dose of codeine should not exceed 240 mg. Doses may be taken up to four times a day at intervals of no less than 6 hours. The lowest effective dose should be used and duration of treatment should be limited to 3 days
- codeine is contra-indicated in all children (under 18 years) who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea
- codeine is not recommended for use in children whose breathing may be compromised, including those with neuromuscular disorders, severe cardiac or respiratory conditions, respiratory infections, multiple trauma or extensive surgical procedures
- codeine is contra-indicated in patients of any age who are known to be ultra-rapid metabolisers of codeine (CYP2D6 ultra-rapid metabolisers)
- codeine should not be used in breast-feeding mothers because it can pass to the baby through breast milk
- parents and carers should be advised on how to recognise signs and symptoms of morphine toxicity, and to stop treatment and seek medical attention if signs or symptoms of toxicity occur (including reduced consciousness, lack of appetite, somnolence, constipation, respiratory depression, 'pin-point' pupils, nausea, vomiting)

MHRA/CHM ADVICE (APRIL 2015) CODEINE FOR COUGH AND COLD: RESTRICTED USE IN CHILDREN

Do not use codeine in children under 12 years as it is associated with a risk of respiratory side effects.

Codeine is not recommended for adolescents (12–18 years) who have problems with breathing. When prescribing or dispensing codeine-containing medicines for cough and cold, consider that codeine is contra-indicated in:

- children younger than 12 years old
- patients of any age known to be CYP2D6 ultra-rapid metabolisers
- breastfeeding mothers

- **CONTRA-INDICATIONS** Acute ulcerative colitis · antibiotic-associated colitis · children under 18 years who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea · conditions where abdominal distension develops · conditions where inhibition of peristalsis should be avoided · known ultra-rapid codeine metabolisers

- **CAUTIONS** Acute abdomen · cardiac arrhythmias · gallstones · not recommended for adolescents aged 12–18 years with breathing problems

CAUTIONS, FURTHER INFORMATION

Variation in metabolism The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine

metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.

- **SIDE-EFFECTS** Abdominal pain · anorexia · antidiuretic effect · hypothermia · malaise · muscle fasciculation · pancreatitis · seizures
- **BREAST FEEDING** Avoid—although amount usually too small to be harmful, mothers vary considerably in their capacity to metabolise codeine—risk of morphine overdose in infant.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **PRESCRIBING AND DISPENSING INFORMATION** BP directs that when Diabetic Codeine Linctus is prescribed, Codeine Linctus formulated with a vehicle appropriate for administration to diabetics, whether or not labelled 'Diabetic Codeine Linctus', shall be dispensed or supplied.
- **PATIENT AND CARER ADVICE**

Diamorphine hydrochloride

(Heroin hydrochloride)

INDICATIONS AND DOSE

Acute pain

BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION

▶ Adult: 5 mg every 4 hours if required

BY SLOW INTRAVENOUS INJECTION

▶ Adult: 1.25–2.5 mg every 4 hours if required

Acute pain (heavier, well-muscled patients)

BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION

▶ Adult: Up to 10 mg every 4 hours if required

BY SLOW INTRAVENOUS INJECTION

▶ Adult: 2.5–5 mg every 4 hours if required

Chronic pain not currently treated with a strong opioid analgesic

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

▶ Adult: Initially 2.5–5 mg every 4 hours, adjusted according to response

BY SUBCUTANEOUS INFUSION

▶ Adult: Initially 5–10 mg, adjusted according to response, dose to be administered over 24 hours

Acute pulmonary oedema

BY SLOW INTRAVENOUS INJECTION

▶ Adult: 2.5–5 mg, dose to be administered at a rate of 1 mg/minute

Myocardial infarction

BY SLOW INTRAVENOUS INJECTION

▶ Adult: 5 mg, followed by 2.5–5 mg if required, dose to be administered at a rate of 1–2 mg/minute

▶ Elderly: 2.5 mg, followed by 1.25–2.5 mg if required, dose to be administered at a rate of 1–2 mg/minute

Myocardial infarction (frail patients)

BY SLOW INTRAVENOUS INJECTION

▶ Adult: 2.5 mg, followed by 1.25–2.5 mg if required, dose to be administered at a rate of 1–2 mg/minute

- **CONTRA-INDICATIONS** Delayed gastric emptying · phaeochromocytoma
- **CAUTIONS** CNS depression · severe cor pulmonale · severe diarrhoea · toxic psychosis
- **SIDE-EFFECTS** Anorexia · asthenia · myocardial infarction · raised intracranial pressure · syncope · taste disturbance
- **BREAST FEEDING** Therapeutic doses unlikely to affect infant; withdrawal symptoms in infants of dependent mothers; breast-feeding not best method of treating dependence in offspring.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

Dihydrocodeine tartrate

INDICATIONS AND DOSE

Moderate to severe pain

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

▶ Child 4-11 years: 0.5–1 mg/kg every 4–6 hours (max. per dose 30 mg)

▶ Child 12-17 years: 30 mg every 4–6 hours

▶ Adult: 30 mg every 4–6 hours as required

BY DEEP SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

▶ Adult: Up to 50 mg every 4–6 hours if required

Chronic severe pain

BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Child 12-17 years: 60–120 mg every 12 hours

▶ Adult: 60–120 mg every 12 hours

DF118 FORTE®

Severe pain

BY MOUTH

▶ Child 12-17 years: 40–80 mg 3 times a day; maximum 240 mg per day

▶ Adult: 40–80 mg 3 times a day; maximum 240 mg per day

- **UNLICENSED USE** Most preparations not licensed for use in children under 4 years.
- **CAUTIONS** Pancreatitis · severe cor pulmonale
- **SIDE-EFFECTS** Abdominal pain · diarrhoea · paraesthesia · paralytic ileus · seizures
- **BREAST FEEDING** Use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary Dihydrocodeine tablets 30 mg may be prescribed.

Dipipanone hydrochloride with cyclizine

INDICATIONS AND DOSE

Acute pain

BY MOUTH

▶ Adult: Initially 1 tablet every 6 hours, then increased if necessary up to 3 tablets every 6 hours, dose to be increased gradually

- **CAUTIONS** Diabetes mellitus · palliative care (not recommended) · phaeochromocytoma
- **SIDE-EFFECTS** Psychosis · raised intracranial pressure · restlessness
- **BREAST FEEDING** No information available.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ DIPIPANONE HYDROCHLORIDE WITH CYCLIZINE (Non-proprietary)

Cyclizine hydrochloride 30 mg, Dipipanone hydrochloride 10 mg Dipipanone 10mg / Cyclizine 30mg tablets | 50 tablet [PoM] £181.67 DT price = £181.67 Schedule 2 (CD)

Fentanyl

INDICATIONS AND DOSE

Chronic intractable pain not currently treated with a strong opioid analgesic

BY TRANSDERMAL APPLICATION

- ▶ Child 16-17 years: Initially 12 micrograms/hour every 72 hours, alternatively initially 25 micrograms/hour every 72 hours, when starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic therapy should be phased out gradually from time of first patch application, dose should be adjusted at 48–72 hour intervals in steps of 12–25 micrograms/hour if necessary, more than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 17 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually)
- ▶ Adult: Initially 12 micrograms/hour every 72 hours, alternatively initially 25 micrograms/hour every 72 hours, when starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic

therapy should be phased out gradually from time of first patch application, dose should be adjusted at 48–72 hour intervals in steps of 12–25 micrograms/hour if necessary, more than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 17 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually)

Chronic intractable pain currently treated with a strong opioid analgesic

BY TRANSDERMAL APPLICATION

- ▶ Child 2–17 years: Initial dose based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see under *Chronic intractable pain not currently treated with a strong opioid analgesic*, for conversion from long term oral morphine to transdermal fentanyl, see *Pain management with opioids* under p. 20.
- ▶ Adult: Initial dose based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see under *Chronic intractable pain not currently treated with a strong opioid analgesic*, for conversion from long term oral morphine to transdermal fentanyl, see *Pain management with opioids* under p. 20.

Spontaneous respiration: analgesia and enhancement of anaesthesia, during operation

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: Initially 50–100 micrograms (max. per dose 200 micrograms), dose maximum on specialist advice, then 25–50 micrograms as required

BY INTRAVENOUS INFUSION

- ▶ Adult: 3–4.8 micrograms/kg/hour, adjusted according to response

Assisted ventilation: analgesia and enhancement of anaesthesia during operation

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: Initially 300–3500 micrograms, then 100–200 micrograms as required

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 10 micrograms/kg, dose to be given over 10 minutes, then 6 micrograms/kg/hour, adjusted according to response, may require up to 180 micrograms/kg/hour during cardiac surgery

Assisted ventilation: analgesia and respiratory depression in intensive care

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: Initially 300–3500 micrograms, then 100–200 micrograms as required

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 10 micrograms/kg, dose to be given over 10 minutes, then 6 micrograms/kg/hour, adjusted according to response, may require up to 180 micrograms/kg/hour during cardiac surgery

Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

INITIALLY BY BUCCAL ADMINISTRATION USING LOZENGES

- ▶ Child 16–17 years: Initially 200 micrograms, dose to be given over 15 minutes, then (by buccal administration) 200 micrograms after 15 minutes if required, no more than 2 dose units for each pain episode; if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

- ▶ Adult: Initially 200 micrograms, dose to be given over 15 minutes, then (by buccal administration) 200 micrograms after 15 minutes if required, no more than 2 dose units for each pain episode; if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

BY BUCCAL ADMINISTRATION USING BUCCAL FILMS

- ▶ Adult: Initially 200 micrograms, adjusted according to response, consult product literature for information on dose adjustments, maximum 1.2 mg per episode of breakthrough pain; leave at least 4 hours between treatment of episodes of breakthrough pain, if more than 4 episodes of breakthrough pain each day occur on more than 4 consecutive days, adjust background analgesia

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal bodyweight.

Dose equivalence and conversion

Fentanyl films are **not bioequivalent** to other fentanyl preparations.

Fentanyl preparations for the treatment of breakthrough pain are not interchangeable; if patients are switched from another fentanyl-containing preparation, a new dose titration is required.

ABSTRAL[®]

Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

BY MOUTH USING SUBLINGUAL TABLETS

- ▶ Adult: Initially 100 micrograms, then 100 micrograms after 15–30 minutes if required, dose to be adjusted according to response—consult product literature, no more than 2 dose units 15–30 minutes apart, for each pain episode; max. 800 micrograms per episode of breakthrough pain; leave at least 2 hours between treatment of episodes of breakthrough pain, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

RECIVIT[®] SUBLINGUAL TABLETS

Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

BY MOUTH

- ▶ Adult: Initially 133 micrograms, then 133 micrograms after 15–30 minutes (max. per dose 800 micrograms), dose to be repeated only if necessary. Consult product literature for dose adjustments, no more than 2 dose units, 15–30 minutes apart, for each pain episode, maximum of 800 micrograms per episode of breakthrough pain, if more than 4 episodes of breakthrough pain each day, adjust background analgesia; maximum 4 doses per day

EFFENTORA[®]

Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

BY MOUTH USING SUBLINGUAL TABLETS

- ▶ Adult: Initially 100 micrograms, then 100 micrograms after 30 minutes if required, dose to be adjusted according to response—consult product literature, no more than 2 dose units for each pain episode; max. 800 micrograms per episode of breakthrough pain; leave at least 4 hours between treatment of episodes of breakthrough pain during titration

continued →

PECFENT[®]

Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

BY INTRANASAL ADMINISTRATION

- ▶ **Adult:** Initially 100 micrograms, adjusted according to response, dose to be administered into one nostril only, maximum 2 sprays for each pain episode and minimum 4 hours between treatment of each pain episode, if more than 4 breakthrough pain episodes daily, adjust background analgesia

INSTANYL[®]

Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

BY INTRANASAL ADMINISTRATION

- ▶ **Adult:** Initially 50 micrograms, dose to be administered into one nostril, then 50 micrograms after 10 minutes if required, dose to be adjusted according to response, maximum 2 sprays for each pain episode and minimum 4 hours between treatment of each pain episode, if more than 4 breakthrough pain episodes daily, adjust background analgesia

- **UNLICENSED USE** Not licensed for use in children under 2 years; infusion not licensed for use in children under 12 years.

● CAUTIONS

GENERAL CAUTIONS Cerebral tumour · diabetes mellitus (with *Actiq[®]* lozenges) · impaired consciousness

SPECIFIC CAUTIONS

- ▶ With buccal use mucositis—absorption from oral preparations may be increased, caution during dose titration (in adults)

CAUTIONS, FURTHER INFORMATION

Transdermal preparations Transdermal fentanyl patches) are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose.

Risk of fatal respiratory depression, particularly in patients not previously treated with a strong opioid analgesic; manufacturer recommends use only in opioid tolerant patients.

Repeated intra-operative doses Repeated intra-operative doses should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

● SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · aesthenia · anorexia · anxiety · appetite changes · application-site reactions · diarrhoea · dyspepsia · dyspnoea · gastro-oesophageal reflux disease · hypertension · myoclonus · paraesthesia · pharyngitis · rhinitis · stomatitis · tremor · vasodilatation
- ▶ **Uncommon** Amnesia · arthralgia · blood disorders · chills · depressed level of consciousness · dysgeusia · flatulence · hypoventilation · ileus · impaired concentration · impaired coordination · loss of consciousness · malaise · parosmia · pyrexia · seizures · speech disorder · thirst · thrombocytopenia
- ▶ **Rare** Hiccups
- ▶ **Very rare** Apnoea · arrhythmia · ataxia · bladder pain · delusions · haemoptysis

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ **With intravenous use** myoclonic movements
- ▶ **Uncommon**
- ▶ **With intravenous use** laryngospasm

- ▶ **Rare**
- ▶ **With intravenous use** asystole · insomnia

SIDE-EFFECTS, FURTHER INFORMATION

Fever or external heat Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat, for example a hot bath or sauna (may also increase absorption).

Muscle rigidity Intravenous fentanyl can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

- **BREAST FEEDING** Monitor infant for opioid-induced side-effects.

- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

● DIRECTIONS FOR ADMINISTRATION

- ▶ **With transdermal use** For *patches*, apply to dry, non-irritated, non-irradiated, non-hairy skin on torso or upper arm, removing after 72 hours and siting replacement patch on a different area (avoid using the same area for several days).
- ▶ **With intravenous use in children** For *intravenous infusion*, injection solution may be diluted in Glucose 5% or Sodium Chloride 0.9%.
- ▶ **With intravenous use in adults** For *intravenous infusion (Sublimaze)*, give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%.
- ▶ **With buccal use** For buccal films, moisten mouth, place film on inner lining of cheek (pink side to cheek), hold for at least 5 seconds until it sticks, and leave to dissolve (15–30 minutes); if more than 1 film required do not overlap, but use another area of the mouth. Avoid liquids for 5 minutes after application; avoid food until the film has dissolved.
- ▶ **With buccal use** Patients should be advised to place the lozenge in the mouth against the cheek and move it around the mouth using the applicator; each lozenge should be sucked over a 15 minute period. In patients with a dry mouth, water may be used to moisten the buccal mucosa. Patients with diabetes should be advised each lozenge contains approximately 2 g glucose.

EFFENTORA[®]

Place tablet between cheek and gum and leave to dissolve; if more than 1 tablet required, place second tablet on the other side of the mouth; tablet may alternatively be placed under the tongue (sublingually).

INSTANYL[®]

Patient should sit or stand during administration.

● PRESCRIBING AND DISPENSING INFORMATION

Prescriptions for fentanyl patches can be written to show the strength in terms of the release rate and it is acceptable to write '*Fentanyl 25 patches*' to prescribe patches that release fentanyl 25 micrograms per hour. The dosage should be expressed in terms of the interval between applying a patch and replacing it with a new one, e.g. '*one patch to be applied every 72 hours*'. The total quantity of patches to be supplied should be written in words and figures.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Fentanyl lozenges for pain www.medicinesforchildren.org.uk/fentanyl-lozenges-for-pain
Medicines for Children leaflet: Fentanyl patches for pain www.medicinesforchildren.org.uk/fentanyl-patches-for-pain

- ▶ **With transdermal use** Patients and carers should be informed about safe use, including correct administration and disposal, strict adherence to dosage instructions, and the symptoms and signs of opioid overdose. Patches should be removed immediately in case of breathing difficulties, marked drowsiness, confusion, dizziness, or

impaired speech, and patients and carers should seek prompt medical attention.

- ▶ With buccal use Patients or carers should be given advice on how to administer fentanyl buccal films or fentanyl lozenges.
- ▶ With intranasal use Patients or carers should be given advice on how to administer fentanyl nasal spray.

ABSTRAL®

Patients should be advised not to eat or drink until the tablet is completely dissolved.

In patients with a dry mouth, the buccal mucosa may be moistened with water before administration of tablet.

RECIVIT® SUBLINGUAL TABLETS

Patients should be advised not to eat or drink until the tablet is completely dissolved; after 30 minutes, if any remnants remain, they may be swallowed. In patients with a dry mouth, the buccal mucosa may be moistened with water before administration of tablet.

EFFENTORA®

Patients or carers should be given advice on how to administer *Effentora*® buccal tablets.

Patients should be advised not to eat or drink until the tablet is completely dissolved; after 30 minutes, if any remnants remain, they may be swallowed with a glass of water. Patients with a dry mouth should be advised to drink water to moisten the buccal mucosa before administration of the tablets; if appropriate effervescence does not occur, a switch of therapy may be advised.

PECFENT® INSTANLYL®

Avoid concomitant use of other nasal preparations. Patients or carers should be given advice on how to administer the spray.

● NATIONAL FUNDING/ACCESS DECISIONS

ABSTRAL®

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2009) that *Abstral*® sublingual tablets should be restricted for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short acting opioids are unsuitable.

EFFENTORA®

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised that *Effentora*® buccal tablets should be restricted for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short acting opioids are unsuitable.

PECFENT®

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2008) that *PecFent*® nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

INSTANLYL®

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised that *Instanlyl*® nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

Hydromorphone hydrochloride**INDICATIONS AND DOSE****Severe pain in cancer**

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 12-17 years: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain
- ▶ Adult: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Child 12-17 years: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain
- ▶ Adult: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain

- **CONTRA-INDICATIONS** Acute abdomen
- **CAUTIONS** Pancreatitis · toxic psychosis
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · anorexia · anxiety
- ▶ **Uncommon** Agitation · diarrhoea · dysgeusia · dyskinesia · myoclonus · paraesthesia · paralytic ileus · peripheral oedema · seizures · tremor
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **DIRECTIONS FOR ADMINISTRATION** For *immediate-release* capsules, swallow whole capsule or sprinkle contents on soft food. For *modified-release* capsules, swallow whole or open capsule and sprinkle contents on soft cold food (swallow the pellets within the capsule whole; do not crush or chew).
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer hydromorphone hydrochloride capsules and modified-release capsules.
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, oral solution

Meptazinol**INDICATIONS AND DOSE****Moderate to severe pain, including post-operative and obstetric pain and renal colic**

BY MOUTH

- ▶ Adult: 200 mg every 3–6 hours as required

BY INTRAMUSCULAR INJECTION

- ▶ Adult: 75–100 mg every 2–4 hours if required

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 50–100 mg every 2–4 hours if required

Obstetric analgesia

BY INTRAMUSCULAR INJECTION

- ▶ Adult: 2 mg/kg, usual dose 100–150 mg

- **CONTRA-INDICATIONS** Myocardial infarction · phaeochromocytoma
- **SIDE-EFFECTS** Abdominal pain · can induce withdrawal symptoms in patients dependent on opioids · diarrhoea · dyspepsia · hypothermia
- **Overdose** Effects only partially reversed by naloxone.
- **BREAST FEEDING** Use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

BY SUBCUTANEOUS INJECTION

- ▶ Child 1-5 months: Initially 100–200 micrograms/kg every 6 hours, adjusted according to response
- ▶ Child 6 months-1 year: Initially 100–200 micrograms/kg every 4 hours, adjusted according to response
- ▶ Child 2-11 years: Initially 200 micrograms/kg every 4 hours, adjusted according to response
- ▶ Child 12-17 years: Initially 2.5–10 mg every 4 hours, adjusted according to response

INITIALLY BY INTRAVENOUS INJECTION

- ▶ Child 1-5 months: 100 micrograms/kg every 6 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 10–30 micrograms/kg/hour, adjusted according to response
 - ▶ Child 6 months-11 years: 100 micrograms/kg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response
 - ▶ Child 12-17 years: 5 mg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 5 mg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response
- BY MOUTH OR BY RECTUM
- ▶ Child 1-2 months: Initially 50–100 micrograms/kg every 4 hours, adjusted according to response
 - ▶ Child 3-5 months: 100–150 micrograms/kg every 4 hours, adjusted according to response
 - ▶ Child 6-11 months: 200 micrograms/kg every 4 hours, adjusted according to response
 - ▶ Child 1 year: Initially 200–300 micrograms/kg every 4 hours, adjusted according to response
 - ▶ Child 2-11 years: Initially 200–300 micrograms/kg every 4 hours (max. per dose 10 mg), adjusted according to response
 - ▶ Child 12-17 years: Initially 5–10 mg every 4 hours, adjusted according to response

Acute pain

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 10 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients, dose can be given more frequently during titration, use dose for elderly in frail patients
- ▶ Elderly: Initially 5 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients, dose can be given more frequently during titration

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: Initially 5 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients, dose can be adjusted more frequently during titration, reduced dose recommended in frail and elderly patients

Chronic pain

BY MOUTH OR BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 5–10 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients

BY RECTUM

- ▶ Adult: Initially 15–30 mg every 4 hours, adjusted according to response

Pain (with modified-release 12-hourly preparations)

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: Every 12 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered

continued →

Pain (with modified-release 24-hourly preparations)

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: Every 24 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered

Pain in palliative care

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: Usual dose 30–200 mg every 4 hours, for management of breakthrough pain and other general advice, see *Pain management with opioids* under p. 20.

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: Usual dose 100–600 mg every 12 hours, for management of breakthrough pain and other general advice, see *Pain management with opioids* under p. 20.

Pain management in palliative care (starting dose for opioid-naïve patients)

BY MOUTH

- ▶ Adult: 20–30 mg daily in divided doses, dose for either immediate-release or a 12-hourly modified-release preparation, for management of breakthrough pain and other general advice, see *Pain management with opioids* under p. 20.

Pain management in palliative care (starting dose for patients being switched from a regular weak opioid)

BY MOUTH

- ▶ Adult: 40–60 mg daily in divided doses, for management of breakthrough pain and other general advice, see *Pain management with opioids* under p. 20.

Cough in terminal disease

BY MOUTH

- ▶ Adult: Initially 5 mg every 4 hours

Premedication

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: Up to 10 mg, dose to be administered 60–90 minutes before operation

Patient controlled analgesia (PCA)

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult local protocol)

Myocardial infarction

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 5–10 mg, followed by 5–10 mg if required, dose to be administered at a rate of 1–2 mg/minute, use dose for elderly in frail patients
- ▶ Elderly: 2.5–5 mg, followed by 2.5–5 mg if required, dose to be administered at a rate of 1–2 mg/minute

Acute pulmonary oedema

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 5–10 mg, dose to be administered at a rate of 2 mg/minute, use dose for elderly in frail patients
- ▶ Elderly: 2.5–5 mg, dose to be administered at a rate of 2 mg/minute

Persistent cyanosis in congenital heart disease when blood glucose less than 3 mmol/litre (following glucose)

BY INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Child: 100 micrograms/kg

Dyspnoea in palliative care

BY MOUTH

- ▶ Adult: Initially 5 mg every 4 hours, to be given in carefully titrated doses

Dose equivalence and conversion

The doses stated refer equally to morphine hydrochloride and sulfate.

- **UNLICENSED USE** *Oramorph*[®] solution and *MXL*[®] capsules not licensed for use in children under 1 year. *Sevredol*[®] tablets not licensed for use in children under 3 years. *Oramorph*[®] unit dose vials and *Filnarine*[®] SR tablets not licensed for use in children under 6 years. *MST Continus*[®]

preparations licensed to treat children with cancer pain (age-range not specified by manufacturer).

Suppositories are not licensed for use in children.

- **CONTRA-INDICATIONS** Acute abdomen · delayed gastric emptying · heart failure secondary to chronic lung disease · phaeochromocytoma
- **CAUTIONS** Cardiac arrhythmias · pancreatitis · severe cor pulmonale
- **SIDE-EFFECTS** Abdominal pain · agitation · amenorrhoea · anorexia · asthenia · bronchospasm · delirium · disorientation · dyspepsia · exacerbation of pancreatitis · excitation · hypertension · hypothermia · inhibition of cough reflex · malaise · muscle fasciculation · myoclonus · nystagmus · paraesthesia · paralytic ileus · raised intracranial pressure · restlessness · rhabdomyolysis · seizures · syncope · taste disturbance
- **BREAST FEEDING** Therapeutic doses unlikely to affect infant.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use in children For *continuous intravenous infusion*, dilute with Glucose 5% or 10% or Sodium Chloride 0.9%.
 - ▶ With intravenous use in neonates *Neonatal intensive care*, dilute 2.5 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 micrograms/kg/hour.
 - ▶ With oral use For *modified release capsules*—swallow whole or open capsule and sprinkle contents on soft food.
- **PRESCRIBING AND DISPENSING INFORMATION** Prescriptions must also specify the 'form'.
- ▶ With rectal use Both the strength of the suppositories and the morphine salt contained in them must be specified by the prescriber.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Morphine for pain www.medicinesforchildren.org.uk/morphine-for-pain Patients or carers should be given advice on how to administer morphine modified-release capsules.
- **EXCEPTIONS TO LEGAL CATEGORY** Morphine Oral Solutions Prescription-only medicines or schedule 2 controlled drug. The proportion of morphine hydrochloride may be altered when specified by the prescriber; if above 13 mg per 5 mL the solution becomes a schedule 2 controlled drug. It is usual to adjust the strength so that the dose volume is 5 or 10 mL. Oral solutions of morphine can be prescribed by writing the formula: Morphine hydrochloride 5 mg Chloroform water to 5 mL
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, solution for injection, solution for infusion, oral solution, gel, capsule, nebuliser liquid, infusion

Postoperative pain | Severe pain | Moderate to severe pain in palliative care

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► Adult: Initially 5 mg every 4–6 hours, dose to be increased if necessary according to severity of pain, some patients may require higher doses than the maximum daily dose; maximum 400 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

► Adult: Initially 10 mg every 12 hours (max. per dose 200 mg every 12 hours), dose to be increased if necessary according to severity of pain, some patients might require higher doses than dose maximum

BY SLOW INTRAVENOUS INJECTION

► Adult: 1–10 mg every 4 hours as required continued →

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 2 mg/hour, adjusted according to response

BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 5 mg every 4 hours as required

BY SUBCUTANEOUS INFUSION

- ▶ Adult: Initially 7.5 mg/24 hours, adjusted according to response

Patient controlled analgesia (PCA)

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult local protocol)

Dose equivalence and conversion

2 mg oral oxycodone is approximately equivalent to 1 mg parenteral oxycodone.

- **CONTRA-INDICATIONS** Acute abdomen · chronic constipation · cor pulmonale · delayed gastric emptying
- **CAUTIONS** Pancreatitis · toxic psychosis
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anorexia · anxiety · asthenia · bronchospasm · chills · diarrhoea · dyspepsia · dyspnoea · impaired cough reflex
 - ▶ **Uncommon** Agitation · amenorrhoea · amnesia · belching · cholestasis · dehydration · disorientation · dry skin · dysphagia · flatulence · gastritis · hiccups · hypoaesthesia · hypotonia · malaise · muscle fasciculation · paraesthesia · paralytic ileus · pyrexia · restlessness · seizures · speech disorder · supraventricular tachycardia · syncope · taste disturbance · thirst · tremor · vasodilatation
- **BREAST FEEDING** Present in milk – avoid.
- **HEPATIC IMPAIRMENT** Max. initial dose 2.5 mg every 6 hours in patients not currently treated with an opioid with mild impairment. Avoid in moderate to severe impairment.
- **RENAL IMPAIRMENT** Max. initial dose 2.5 mg every 6 hours in patients not currently with an opioid with mild to moderate impairment. Avoid if eGFR less than 10 mL/minute/1.73 m². Opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*OxyNorm*®), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of 1 mg/mL.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2004 and November 2010) that *OxyNorm*® injection is restricted for use within NHS Scotland for patients with cancer who have difficulty in tolerating morphine or diamorphine.

Oxycodone with naloxone

The properties listed below are those particular to the combination only. For the properties of the components please consider, naloxone hydrochloride p. 1133, oxycodone hydrochloride p. 369.

INDICATIONS AND DOSE

Severe pain requiring opioid analgesia in patients not currently treated with opioid analgesics

BY MOUTH

- ▶ Adult: Initially 10/5 mg every 12 hours (max. per dose 40/20 mg every 12 hours), dose to be increased according to response; patients already receiving opioid analgesics can start with a higher dose

Dose equivalence and conversion

Dose quantities are expressed in the form x/y where x and y are the strengths in milligrams of oxycodone and naloxone respectively.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Modified-release tablet

Papaveretum**INDICATIONS AND DOSE**

Postoperative analgesia | Severe chronic pain

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: 7.7–15.4 mg every 4 hours if required
- ▶ Elderly: Initially 7.7 mg every 4 hours if required

BY INTRAVENOUS INJECTION

- ▶ Adult: Use 25 to 50% of the corresponding subcutaneous/intramuscular dose

Premedication

BY INTRAVENOUS INJECTION

- ▶ Adult: Use 25 to 50% of the corresponding subcutaneous/intramuscular dose

Important safety information

Do **not** confuse with papaverine.

- **CONTRA-INDICATIONS** Heart failure secondary to chronic lung disease · phaeochromocytoma
- **CAUTIONS** Supraventricular tachycardia
- **SIDE-EFFECTS** Hypothermia
- **BREAST FEEDING** Therapeutic doses unlikely to affect infant.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **PRESCRIBING AND DISPENSING INFORMATION** The name *Omnipon*[®] was formerly used for papaveretum preparations. Papaveretum is a mixture of 253 parts of morphine hydrochloride, 23 parts of papaverine hydrochloride and 20 parts of codeine hydrochloride.
- **LESS SUITABLE FOR PRESCRIBING** Papaveretum is less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

Pentazocine**INDICATIONS AND DOSE**

Moderate to severe pain

BY MOUTH

- ▶ Adult: 50 mg every 3–4 hours, dose to be taken preferably after food, usual dose 25–100 mg every 3–4 hours; maximum 600 mg per day

Moderate pain

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- ▶ Adult: 30 mg every 3–4 hours as required; maximum 360 mg per day

Severe pain

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- ▶ Adult: 45–60 mg every 3–4 hours as required; maximum 360 mg per day

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 · heart failure secondary to chronic lung disease · patients dependent on opioids (can precipitate withdrawal)
- **CAUTIONS** Arterial hypertension · cardiac arrhythmias · myocardial infarction · pancreatitis · phaeochromocytoma · pulmonary hypertension
- **SIDE-EFFECTS** Abdominal pain · blood disorders · chills · disorientation · hypertension · hypothermia · myalgia · paraesthesia · raised intracranial pressure · seizures · syncope · toxic epidermal necrolysis · tremor
- **Overdose** Effects only partially reversed by naloxone.
- **BREAST FEEDING** Use with caution—limited information available.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **LESS SUITABLE FOR PRESCRIBING** Pentazocine is less suitable for prescribing.

Pethidine hydrochloride

(Meperidine)

INDICATIONS AND DOSE

Acute pain

BY MOUTH

- ▶ Adult: 50–150 mg every 4 hours

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: 25–100 mg, then 25–100 mg after 4 hours, for debilitated patients use dose described for elderly patients

- ▶ Elderly: Initially 25 mg, then 25–100 mg after 4 hours

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 25–50 mg, then 25–50 mg after 4 hours, for debilitated patients use dose described for elderly patients

- ▶ Elderly: Initially 25 mg, then 25–50 mg after 4 hours

Obstetric analgesia

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: 50–100 mg, then 50–100 mg after 1–3 hours if required; maximum 400 mg per day

Premedication

BY INTRAMUSCULAR INJECTION

- ▶ Adult: 25–100 mg, dose to be given 1 hour before operation, for debilitated patients use dose described for elderly patients

- ▶ Elderly: 25 mg, dose to be given 1 hour before operation

Postoperative pain

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: 25–100 mg every 2–3 hours if required, for debilitated patients use dose described for elderly patients

- ▶ Elderly: Initially 25 mg every 2–3 hours if required

- **CONTRA-INDICATIONS** Pheochromocytoma
- **CAUTIONS** Accumulation of metabolites may result in neurotoxicity · cardiac arrhythmias · not suitable for severe continuing pain · severe cor pulmonale
- **SIDE-EFFECTS** Hypothermia · restlessness · tremor
- **Overdose** Convulsions reported in overdosage.
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

Tapentadol

INDICATIONS AND DOSE

Moderate to severe acute pain which can be managed only with opioid analgesics

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: Initially 50 mg every 4–6 hours, adjusted according to response, maximum 700 mg in the first 24 hours, during the first 24 hours of treatment, an additional dose of 50 mg may be taken 1 hour after the initial dose, if pain control not achieved; maximum 600 mg per day

Severe chronic pain

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: Initially 50 mg every 12 hours, adjusted according to response; maximum 500 mg per day

- **SIDE-EFFECTS** Abdominal discomfort · anxiety · ataxia · decreased appetite · diarrhoea · dysarthria · dyspepsia · hypoesthesia · malaise · muscle spasms · paraesthesia · seizures · tremor · weight loss
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** For *immediate-release tablets*, initial max. daily dose 150 mg; for *modified-release tablets*, initial max. daily dose 50 mg.
- **RENAL IMPAIRMENT** Manufacturer advises no dose adjustment needed in mild or moderate impairment. Avoid in severe impairment. Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium* has advised (May 2011) that tapentadol (*Palexia*[®] SR) is accepted for restricted use within NHS Scotland for the management of severe chronic pain in adult patients, which can be adequately managed only with opioid analgesics, when morphine sulfate modified-release has failed to provide adequate pain control or is not tolerated.

Tramadol hydrochloride**INDICATIONS AND DOSE****Moderate to severe pain**

BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes

Moderate to severe acute pain

BY MOUTH

- ▶ Child 12-17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 400 mg per day
- ▶ Adult: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 400 mg per day

Moderate to severe chronic pain

BY MOUTH

- ▶ Child 12-17 years: Initially 50 mg, then adjusted according to response to; maximum 400 mg per day
- ▶ Adult: Initially 50 mg, then adjusted according to response to; maximum 400 mg per day

Postoperative pain

BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 100 mg, then 50 mg every 10–20 minutes if required up to total maximum 250 mg (including initial dose) in first hour, then 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes; maximum 600 mg per day

Moderate to severe pain (with modified-release 12-hourly preparations)

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Child 12-17 years: 50–100 mg twice daily, increased if necessary to 150–200 mg twice daily, maximum daily dose not usually required; maximum 400 mg per day
- ▶ Adult: 50–100 mg twice daily, increased if necessary to 150–200 mg twice daily, maximum daily dose not usually required; maximum 400 mg per day

Moderate to severe pain (with modified-release 24-hourly preparations)

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Child 12-17 years: Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily
- ▶ Adult: Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily

ZYDOL® XL**Moderate to severe pain**

BY MOUTH USING MODIFIED-RELEASE TABLETS

- ▶ Child 12-17 years: Initially 150 mg once daily, increased if necessary up to 400 mg once daily
- ▶ Adult: Initially 150 mg once daily, increased if necessary up to 400 mg once daily

- **CONTRA-INDICATIONS** Acute intoxication with alcohol · acute intoxication with analgesics · acute intoxication with hypnotics · acute intoxication with opioids · not suitable for narcotic withdrawal treatment · uncontrolled epilepsy
- **CAUTIONS** Excessive bronchial secretions · history of epilepsy—use tramadol only if compelling reasons · impaired consciousness · not suitable as a substitute in opioid-dependent patients · not suitable in some types of

general anaesthesia · susceptibility to seizures—use tramadol only if compelling reasons

CAUTIONS, FURTHER INFORMATION

General anaesthesia Not recommended for analgesia during potentially light planes of general anaesthesia (possibly increased intra-operative recall reported).

● **SIDE-EFFECTS**

- ▶ **Common or very common** Malaise
- ▶ **Uncommon** Diarrhoea · flatulence · gastritis · retching
- ▶ **Rare** Abnormal coordination · anorexia · anxiety · bronchospasm · changes in appetite · delirium · dyspnoea · hypertension · muscle weakness · nightmares · paraesthesia · seizures · syncope · tremor · wheezing
- ▶ **Frequency not known** Blood disorders · hypoglycaemia · speech disorders
- **PREGNANCY** Embryotoxic in *animal studies*—manufacturers advise avoid.
- **BREAST FEEDING** Amount probably too small to be harmful, but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Caution (avoid for *oral drops*) in severe impairment.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs. Caution (avoid for *oral drops*) in severe impairment.

● **DIRECTIONS FOR ADMINISTRATION**

Tramadol hydrochloride *orodispersible tablets* should be sucked and then swallowed. May also be dispersed in water. Some tramadol hydrochloride modified-release capsule preparations may be opened and the content swallowed immediately without chewing—check individual preparations.

For *intravenous infusion*, dilute in Glucose 5% or Sodium Chloride 0.9%.

- **PRESCRIBING AND DISPENSING INFORMATION** Do not confuse modified-release 12-hourly preparations with 24-hourly preparations.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Tramadol for pain

www.medicinesforchildren.org.uk/tramadol-for-pain

Patients or carers should be given advice on how to administer tramadol hydrochloride orodispersible tablets.

5.1 Migraine

Migraine

Treatment of acute migraine

Treatment of a migraine attack should be guided by response to previous treatment and the severity of the attacks. A **simple analgesic** such as aspirin p. 104, paracetamol p. 354 (preferably in a soluble or dispersible form) or a NSAID is often effective; concomitant **antiemetic** treatment may be required. If treatment with an analgesic is inadequate, an attack may be treated with a specific antimigraine compound such as a **5HT₁-receptor agonist** ('triptan'). **Ergot alkaloids** are rarely required now; oral preparations are associated with many side-effects and should be avoided in cerebrovascular or cardiovascular disease.

Excessive use of acute treatments for migraine (opioid and non-opioid analgesics, 5HT₁-receptor agonists, and ergotamine) is associated with medication-overuse headache (analgesic-induced headache); therefore, increasing consumption of these medicines needs careful management.

Analgesics

Most migraine headaches respond to analgesics such as aspirin p. 104 or paracetamol p. 354 but because peristalsis is often reduced during migraine attacks the medication may not be sufficiently well absorbed to be effective; dispersible or effervescent preparations are therefore preferred. Compound preparations containing analgesics and antiemetics are available.

The NSAID tolfenamic acid p. 381 is licensed specifically for the treatment of an acute attack of migraine; diclofenac potassium p. 920, flurbiprofen p. 927, and ibuprofen p. 927 are also licensed for use in migraine.

5HT₁-receptor agonists

A 5HT₁-receptor agonist is of considerable value in the treatment of an acute migraine attack. The 5HT₁-receptor agonists ('triptans') act on the 5HT (serotonin) 1B/1D receptors and they are therefore sometimes referred to as 5HT_{1B/1D}-receptor agonists. A 5HT₁-receptor agonist may be used during the established headache phase of an attack and is the preferred treatment in those who fail to respond to conventional analgesics.

The 5HT₁-receptor agonists available for treating migraine are almotriptan p. 377, eletriptan p. 377, frovatriptan p. 378, naratriptan p. 378, rizatriptan p. 379, sumatriptan p. 379, and zolmitriptan p. 380. If a patient does not respond to one 5HT₁-receptor agonist, an alternative 5HT₁-receptor agonist should be tried. For patients who have prolonged attacks that frequently recur despite treatment with a 5HT₁-receptor agonist, combination therapy with a NSAID such as naproxen can be considered. Sumatriptan or zolmitriptan are also used to treat cluster headache.

Ergot Alkaloids

The value of ergotamine tartrate p. 376 for migraine is limited by difficulties in absorption and by its side-effects, particularly nausea, vomiting, abdominal pain, and

muscular cramps; it is best avoided. The recommended doses of ergotamine tartrate preparations should **not** be exceeded and treatment should **not** be repeated at intervals of less than 4 days.

To avoid habituation the frequency of administration of ergotamine tartrate should be limited to **no more than** twice a month. It should **never** be prescribed prophylactically but in the management of cluster headache a low dose is occasionally given for 1 to 2 weeks [unlicensed indication].

Antiemetics

Antiemetics, such as metoclopramide hydrochloride p. 347 or domperidone p. 346, or phenothiazine and antihistamine antiemetics, relieve the nausea associated with migraine attacks. Antiemetics may be given by intramuscular injection or rectally if vomiting is a problem.

Metoclopramide hydrochloride and domperidone have the added advantage of promoting gastric emptying and normal peristalsis; a single dose should be given at the onset of symptoms. Oral analgesic preparations containing metoclopramide hydrochloride are a convenient alternative.

Prophylaxis of migraine

Where migraine attacks are frequent, possible provoking factors such as stress, irregular life-style (e.g. lack of sleep), or chemical triggers (e.g. alcohol and nitrates) should be sought; combined oral contraceptives may also provoke migraine.

Preventive treatment for migraine should be considered for patients who:

- suffer at least two attacks a month;
- suffer an increasing frequency of headaches;
- suffer significant disability despite suitable treatment for migraine attacks;
- cannot take suitable treatment for migraine attacks.

Prophylaxis is also necessary in some rare migraine subtypes and those at risk of migrainous infarction.

The beta-blockers propranolol hydrochloride p. 146, atenolol p. 141, metoprolol tartrate p. 144, nadolol p. 145, and timolol maleate p. 147 are all effective. Propranolol hydrochloride p. 146 is the most commonly used.

Tricyclic antidepressants [unlicensed indication], topiramate p. 406, sodium valproate p. 403 [unlicensed indication], valproic acid p. 275 [unlicensed indication], and gabapentin p. 392 [unlicensed indication] are also effective for preventing migraine.

Pizotifen p. 376 is an antihistamine and a serotonin-receptor antagonist, structurally related to the tricyclic antidepressants. It is of limited value and may cause weight gain.

Botulinum toxin type A is licensed for the prophylaxis of headaches in adults with chronic migraine.

Cluster headache and the trigeminal autonomic cephalgias

Cluster headache rarely responds to standard analgesics. Sumatriptan p. 379 given by subcutaneous injection is the drug of choice for the *treatment* of cluster headache. If an injection is unsuitable, sumatriptan nasal spray or zolmitriptan p. 380 nasal spray [both unlicensed use] may be used. Alternatively, 100% oxygen at a rate of 10–15 litres/minute for 10–20 minutes is useful in aborting an attack.

Prophylaxis of cluster headache is considered if the attacks are frequent, last over 3 weeks, or if they cannot be treated effectively. Verapamil hydrochloride p. 156 or lithium [both unlicensed use] are used for prophylaxis.

Prednisolone p. 585 can be used for short-term prophylaxis of episodic cluster headache [unlicensed use] either as monotherapy, or in combination with verapamil hydrochloride p. 156 during verapamil titration.

Ergotamine tartrate p. 376, used on an intermittent basis is an alternative for patients with short bouts, but it should not be used for prolonged periods.

The other trigeminal autonomic cephalgias, paroxysmal hemicrania (sensitive to indometacin p. 929), and short-lasting unilateral neuralgiform headache attacks with conjunctival injection and tearing, are seen rarely and are best managed by a specialist.

Drugs used for Migraine not listed below; Amitriptyline hydrochloride, p. 292 · **Atenolol**, p. 141 · **Botulinum toxin type A**, p. 322 · **Clonidine hydrochloride**, p. 137 · **Diclofenac potassium**, p. 920 · **Gabapentin**, p. 392 · **Metoprolol tartrate**, p. 144 · **Nadolol**, p. 145 · **Sodium valproate**, p. 403 · **Timolol maleate**, p. 147 · **Topiramate**, p. 406 · **Trifluoperazine**, p. 310 · **Valproic acid**, p. 275

ANALGESICS

Bucizine hydrochloride with codeine phosphate and paracetamol

The properties listed below are those particular to the combination only. For the properties of the components please consider, codeine phosphate p. 360, paracetamol p. 354.

INDICATIONS AND DOSE

MIGRALEVE®

Acute migraine

BY MOUTH

- ▶ Child 12–14 years: Initially 1 pink tablet to be taken at onset of attack, or if it is imminent, followed by 1 yellow tablet every 4 hours if required; maximum 1 pink and 3 yellow tablets in 24 hours
- ▶ Child 15–17 years: Initially 2 pink tablets to be taken at onset of attack, or if it is imminent, followed by 2 yellow tablets every 4 hours if required; maximum 2 pink and 6 yellow tablets in 24 hours
- ▶ Adult: Initially 2 pink tablets to be taken at onset of attack, or if it is imminent, followed by 2 yellow tablets every 4 hours if required; maximum 2 pink and 6 yellow tablets in 24 hours

● LESS SUITABLE FOR PRESCRIBING

Migraleve® is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Prevention of vascular headache | Prevention of classical migraine | Prevention of common migraine | Prevention of cluster headache

BY MOUTH

- ▶ Adult: Initially 500 micrograms at night, increased gradually to 1.5 mg at night, alternatively increased gradually to 1.5 mg daily in 3 divided doses; further increased if necessary up to 4.5 mg daily (but rarely necessary); max. single dose 3 mg

Prophylaxis of migraine

BY MOUTH

- ▶ Child 5-17 years: Initially 500 micrograms at night, then increased gradually up to 1.5 mg daily in divided doses, max. single dose (at night) 1 mg

- **UNLICENSED USE** 1.5-mg tablets not licensed for use in children.
- **CAUTIONS** Avoid abrupt withdrawal · history of epilepsy · susceptibility to angle-closure glaucoma · urinary retention
- **INTERACTIONS** → Appendix 1 (pizotifen).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dizziness · drowsiness · dry mouth · increased appetite · nausea · weight gain
 - ▶ **Uncommon** Constipation
 - ▶ **Rare** Aggression · anxiety · arthralgia · depression · hallucination · insomnia · myalgia · paraesthesia
 - ▶ **Very rare** Rash (in adults) · seizures · urticaria (in adults)
 - ▶ **Frequency not known** Hepatitis · jaundice · muscle cramps
- **PREGNANCY** Avoid unless potential benefit outweighs risk.

- **BREAST FEEDING** Amount probably too small to be harmful, but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution.
- **PATIENT AND CARER ADVICE** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 2

- ▶ **PIZOTIFEN (Non-proprietary)**

Pizotifen (as Pizotifen hydrogen malate) 500 microgram Pizotifen 500microgram tablets | 28 tablet $\overline{\text{PoM}}$ £9.56 DT price = £7.01

Pizotifen (as Pizotifen hydrogen malate) 1.5 mg Pizotifen 1.5mg tablets | 28 tablet $\overline{\text{PoM}}$ £14.74 DT price = £8.10

- ▶ **Sanomigran** (Novartis Pharmaceuticals UK Ltd)

Pizotifen (as Pizotifen hydrogen malate) 1.5 mg Sanomigran 1.5mg tablets | 28 tablet $\overline{\text{PoM}}$ £3.42 DT price = £8.10

ERGOT ALKALOIDS**Ergotamine tartrate****INDICATIONS AND DOSE****Management of cluster headache**

BY MOUTH USING TABLETS

- ▶ Adult: 1 mg once daily for 6 nights in 7; occasionally given for 1-2 weeks, dose to be taken at night

- **UNLICENSED USE** Not licensed for the management of cluster headache.
- **CONTRA-INDICATIONS** Acute porphyrias p. 864 · coronary heart disease · hyperthyroidism · inadequately controlled hypertension · obliterative vascular disease · peripheral vascular disease · Raynaud's syndrome · sepsis · severe hypertension · temporal arteritis
- **CAUTIONS** Anaemia · cardiac disease · dependence · elderly · risk of peripheral vasospasm
- **INTERACTIONS** → Appendix 1 (ergot alkaloids).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · dizziness · nausea · vomiting
 - ▶ **Uncommon** Cyanosis · diarrhoea · hypoaesthesia · pain in extremities · paraesthesia · peripheral vasoconstriction · weakness in extremities
 - ▶ **Rare** Arrhythmias · bradycardia · dyspnoea · ergotism (including absence of pulse and numbness in extremities) · increased blood pressure · intestinal ischaemia · myalgia · rash · tachycardia · urticaria
 - ▶ **Very rare** Gangrene · heart-valve fibrosis · myocardial infarction · myocardial ischaemia
 - ▶ **Frequency not known** Anxiety · arthralgia · blood disorders · blurred vision · cerebral ischaemia · confusion · constipation · depression · drowsiness · dry mouth · extrapyramidal effects · hallucinations · renal artery spasm · seizures · sleep disturbances · thrombosis · tremor · urinary retention
- **PREGNANCY** Avoid; oxytocic effect on the uterus.
- **BREAST FEEDING** Avoid; ergotism may occur in infant; repeated doses may inhibit lactation.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment—risk of toxicity increased.
- **RENAL IMPAIRMENT** Avoid; risk of renal vasoconstriction.

● PATIENT AND CARER ADVICE

Peripheral vasospasm Warn patient to stop treatment immediately if numbness or tingling of extremities develops and to contact doctor.

- **LESS SUITABLE FOR PRESCRIBING** Ergotamine tartrate is less suitable for prescribing.

Ergotamine tartrate with caffeine hydrate and cyclizine hydrochloride

The properties listed below are those particular to the combination only. For the properties of the components please consider, cyclizine p. 343, ergotamine tartrate p. 376.

INDICATIONS AND DOSE

Treatment of acute migraine and migraine variants unresponsive to analgesics

BY MOUTH

- ▶ **Adult:** 1 tablet, to be taken at onset, followed by 0.5–1 tablet after 30 minutes, then 0.5–1 tablet every 30 minutes if required, max. 3 tablets in 24 hours, max. 4 tablets per attack, max. 6 tablets in one week

- **PATIENT AND CARER ADVICE** Patient counselling is advised for cyclizine hydrochloride with caffeine hydrate and ergotamine tartrate tablets (dosage).

- **LESS SUITABLE FOR PRESCRIBING** Cyclizine hydrochloride with caffeine hydrate and ergotamine tartrate (*Migril*[®]) is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 18

- ▶ **Migril** (Wockhardt UK Ltd)
Caffeine hydrate 100 mg, Cyclizine hydrochloride 50 mg, Ergotamine tartrate 2 mg Migril tablets | 100 tablet [PoM](#) £51.00

5HT₁ RECEPTOR AGONISTS

Almotriptan

INDICATIONS AND DOSE

Treatment of acute migraine

BY MOUTH

- ▶ **Adult:** 12.5 mg, dose to be taken as soon as possible after onset, followed by 12.5 mg after 2 hours if required, dose to be taken only if migraine recurs (patient not responding should not take second dose for same attack); maximum 25 mg per day

- **UNLICENSED USE** Not licensed for use in elderly.
- **CONTRA-INDICATIONS** Coronary vasospasm · ischaemic heart disease · peripheral vascular disease · previous cerebrovascular accident · previous myocardial infarction · previous transient ischaemic attack · Prinzmetal's angina · severe hypertension · uncontrolled hypertension
- **CAUTIONS** Conditions which predispose to coronary artery disease · elderly
- **INTERACTIONS** → Appendix 1 (5HT₁ agonists).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Drowsiness · transient increase in blood pressure
 - ▶ **Uncommon** Bone pain · chest pain · diarrhoea · dry mouth · dyspepsia · headache · myalgia · palpitation · paraesthesia · tinnitus
 - ▶ **Very rare** Myocardial infarction · tachycardia
 - ▶ **Frequency not known** Dizziness · fatigue · feeling of weakness · flushing · nausea · seizures · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis).

- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with sensitivity to sulfonamides.
- **PREGNANCY** There is limited experience of using 5HT₁-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.
- **BREAST FEEDING** Present in milk in *animal* studies—withhold breast-feeding for 24 hours.
- **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Max. 12.5 mg in 24 hours if eGFR less than 30 mL/minute/1.73 m².
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

INDICATIONS AND DOSE

Treatment of acute migraine

BY MOUTH

- ▶ **Adult:** 2.5 mg, followed by 2.5 mg after at least 2 hours if required, dose to be taken only if migraine recurs, then increased if necessary to 5 mg, dose to be taken only for subsequent attacks in patients not achieving satisfactory relief with 2.5 mg dose; maximum 10 mg per day

BY INTRANASAL ADMINISTRATION

- ▶ **Adult:** 5 mg, dose to be administered as soon as possible after onset into one nostril only, followed by 5 mg after at least 2 hours if required, dose to be administered only if migraine recurs; maximum 10 mg per day

Treatment of acute cluster headache

BY INTRANASAL ADMINISTRATION

- ▶ **Adult:** 5 mg, dose to be administered as soon as possible after onset into one nostril only, followed by 5 mg after at least 2 hours if required, dose to be administered only if migraine recurs; maximum 10 mg per day

Dose adjustments due to interactions

Max. 5 mg in 24 hours with concomitant cimetidine, fluvoxamine, moclobemide, or quinolone antibiotics.

Dose equivalence and conversion

1 spray of *Zomig*[®] nasal spray = 5 mg zolmitriptan.

- **UNLICENSED USE** Not licensed for use in elderly. Not licensed for treatment of cluster headaches.
- **CONTRA-INDICATIONS** Arrhythmias associated with accessory cardiac conduction pathways · coronary vasospasm · ischaemic heart disease · previous cerebrovascular accident · previous myocardial infarction · Prinzmetal's angina · severe hypertension · transient ischaemic attack · uncontrolled hypertension · Wolff-Parkinson-White syndrome
- **CAUTIONS** Conditions which predispose to coronary artery disease · elderly · should not be taken within 24 hours of any other 5HT₁-receptor agonist
- **INTERACTIONS** → Appendix 1 (5HT₁ agonists).

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · drowsiness · dry mouth · dysphagia · headache · muscle weakness · myalgia · palpitation · paraesthesia
- ▶ **Uncommon** Polyuria · tachycardia · transient increase in blood pressure
- ▶ **Rare** Urticaria
- ▶ **Very rare** Angina · gastro-intestinal infarction · ischaemic colitis · myocardial infarction · splenic infarction
- ▶ **Frequency not known** Dizziness · fatigue · feeling of weakness · flushing

SPECIFIC SIDE-EFFECTS

- ▶ **With intranasal use** epistaxis · taste disturbance

SIDE-EFFECTS, FURTHER INFORMATION

Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis).

- **PREGNANCY** There is limited experience of using 5HT₁-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.
- **BREAST FEEDING** Use with caution—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Max. 5 mg in 24 hours in moderate or severe impairment.
- **DIRECTIONS FOR ADMINISTRATION** Zolmitriptan orodispersible tablets should be placed on the tongue, allowed to disperse and swallowed.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer zolmitriptan orodispersible tablets.

NON-STEROIDAL ANTI-INFLAMMATORY DRUGS**Aspirin with metoclopramide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, aspirin p. 104, metoclopramide hydrochloride p. 347.

INDICATIONS AND DOSE**Acute migraine****BY MOUTH**

- ▶ **Adult:** 1 sachet, sachet to be mixed in water, and dose to be taken at the start of the attack, then 1 sachet after 2 hours if required; maximum 3 sachets per day

Important safety information

Metoclopramide can cause **severe extrapyramidal effects**, particularly in children and young adults.

- **CAUTIONS** Treatment should not exceed 3 months due to risk of tardive dyskinesia
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include lemon.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder

CAUTIONARY AND ADVISORY LABELS 13, 21, 32

EXCIPIENTS: May contain Aspartame

▶ **MigraMax (Zentiva)**

Aspirin DL-Lysine 900 mg, Metoclopramide hydrochloride

10 mg MigraMax oral powder sachets (sugar-free) | 6 sachet [PoM]

£6.61 DT price = £6.61

Tolfenamic acid**INDICATIONS AND DOSE****Treatment of acute migraine****BY MOUTH**

- ▶ **Adult:** 200 mg, dose to be taken at onset, then 200 mg after 1–2 hours if required

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal haemorrhage (two or more distinct episodes) · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1 (NSAIDs).
- **SIDE-EFFECTS**
 - ▶ **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis
 - ▶ **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · confusion · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · dysuria (most commonly in men) · euphoria · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · hallucination · headache ·

hearing disturbances · hypersensitivity reactions · insomnia · malaise · nausea · nervousness · paraesthesia · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · tremor · vertigo · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 915.

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Amount too small to be harmful. Use with caution during breast-feeding.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

5.2 Neuropathic pain

Neuropathic pain

Neuropathic pain, which occurs as a result of damage to neural tissue, includes *phantom limb pain*, *compression neuropathies*, *peripheral neuropathies* (e.g. due to Diabetes p. 588, chronic excessive alcohol intake, HIV infection p. 555, chemotherapy, idiopathic neuropathy), *trauma*, *central pain* (e.g. pain following stroke, spinal cord injury, and syringomyelia), and *postherpetic neuralgia* (peripheral nerve damage following acute herpes zoster infection (shingles)). The pain may occur in an area of sensory deficit and is sometimes accompanied by pain that is evoked by a non-noxious stimulus (allodynia).

Trigeminal neuralgia is also caused by dysfunction of neural tissue, but its management is distinct from other forms of neuropathic pain.

Neuropathic pain is generally managed with a **tricyclic antidepressant** or with certain **antiepileptic drugs**. Amitriptyline hydrochloride p. 292 [unlicensed indication] and pregabalin p. 400 are effective treatments for neuropathic pain. Amitriptyline hydrochloride p. 292 and

pregabalin can be used in combination if the patient has an inadequate response to either drug at the maximum tolerated dose.

Nortriptyline p. 298 [unlicensed indication] may be better tolerated than amitriptyline hydrochloride.

Gabapentin p. 392 is also effective for the treatment of neuropathic pain.

Neuropathic pain may respond to **opioid analgesics**. There is evidence of efficacy for tramadol hydrochloride p. 373, morphine p. 367, and oxycodone hydrochloride p. 369; however, treatment with morphine or oxycodone hydrochloride should be initiated only under specialist supervision. Tramadol hydrochloride p. 373 can be prescribed when other treatments have been unsuccessful, while the patient is waiting for assessment by a specialist.

Patients with localised pain who are unable to take oral medicines may benefit from **topical local anaesthetic preparations**, such as lidocaine hydrochloride p. 1116 medicated plasters, while awaiting specialist review.

Capsaicin p. 383 is licensed for neuropathic pain (but the intense burning sensation during initial treatment may limit use). Capsaicin p. 383 0.075% cream is licensed for the symptomatic relief of *postherpetic neuralgia*. A self-adhesive patch containing capsaicin p. 383 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients. It should be used under specialist supervision.

A corticosteroid may help to relieve pressure in compression neuropathy and thereby reduce pain.

Neuromodulation by spinal cord stimulation may be of benefit in some patients. Many patients with chronic neuropathic pain require multidisciplinary management, including physiotherapy and psychological support.

Trigeminal neuralgia

Surgery may be the treatment of choice in many patients; a neurological assessment will identify those who stand to benefit. Carbamazepine p. 387 taken during the acute stages of trigeminal neuralgia, reduces the frequency and severity of attacks. It is very effective for the severe pain associated with trigeminal neuralgia and (less commonly) glossopharyngeal neuralgia. Blood counts and electrolytes should be monitored when high doses are given. Small doses should be used initially to reduce the incidence of side-effects e.g. dizziness. Some cases respond to phenytoin p. 398; the drug may be given by intravenous infusion (possibly as fosphenytoin sodium p. 391) in a crisis (specialist use only).

Chronic facial pain

Chronic oral and facial pain including *persistent idiopathic facial pain* (also termed 'atypical facial pain') and *temporomandibular dysfunction* (previously termed temporomandibular joint pain dysfunction syndrome) may call for prolonged use of analgesics or for other drugs.

Tricyclic antidepressants may be useful for facial pain [unlicensed indication], but are not on the Dental Practitioners' List. Disorders of this type require specialist referral and psychological support to accompany drug treatment. Patients on long-term therapy need to be monitored both for progress and for side-effects.

Drugs used for Neuropathic pain not listed below;

Amantadine hydrochloride, p. 331 · *Amitriptyline hydrochloride*, p. 292 · *Capsaicin*, p. 383 · *Carbamazepine*, p. 387 · *Nortriptyline*, p. 298 · *Oxycodone hydrochloride*, p. 369 · *Phenytoin*, p. 398 · *Pregabalin*, p. 400

ALKALOID ANALGESICS

Capsaicin

INDICATIONS AND DOSE

AXSAIN[®]

Post-herpetic neuralgia

TO THE SKIN

- ▶ Adult: Apply 3–4 times a day, dose to be applied sparingly; **important**; **after** lesions have healed, not more often than every 4 hours

Painful diabetic neuropathy (under expert supervision)

TO THE SKIN

- ▶ Adult: Apply 3–4 times a day for 8 weeks then review, dose to be applied sparingly, not more often than every 4 hours

ZACIN[®]

Symptomatic relief in osteoarthritis

TO THE SKIN

- ▶ Adult: Apply 4 times a day, dose to be applied sparingly, not more often than every 4 hours

QUTENZA[®]

Peripheral neuropathic pain in non-diabetic patients (under the supervision of a physician)

TO THE SKIN

- ▶ Adult: (consult product literature)

● CAUTIONS

GENERAL CAUTIONS

Avoid contact with broken skin · avoid contact with inflamed skin

SPECIFIC CAUTIONS:

- ▶ With topical use avoid contact with eyes · avoid hot shower or bath just before or after application (burning sensation enhanced) · avoid inhalation of vapours · not to be used under tight bandages
- ▶ With transdermal use avoid contact with the face, scalp or in proximity to mucous membranes · avoid holding near eyes or mucous membranes · recent cardiovascular events · uncontrolled hypertension

● SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With topical use transient burning sensation during initial treatment (particularly if too much used or if administered less than 3–4 times daily)
- ▶ With transdermal use application site reactions · erythema · pruritus · transient burning
- ▶ **Uncommon**
- ▶ With transdermal use burning sensation · cough · dysgeusia · eye irritation · first degree AV block · hypertension · hypoaesthesia · muscle spasm · nausea · pain in extremities · palpitations · peripheral oedema · pruritus · tachycardia · throat irritation
- ▶ **Rare**
- ▶ With topical use cough · eye irritation · sneezing
- ▶ **Frequency not known**
- ▶ With topical use dyspnoea · exacerbation of asthma

● MONITORING REQUIREMENTS

- ▶ With transdermal use Monitor blood pressure during treatment procedure.

● HANDLING AND STORAGE

- ▶ With topical use Wash hands immediately after use (or wash hands 30 minutes after application if hands treated).
- ▶ With transdermal use Nitrile gloves to be worn while handling patches and cleaning treatment areas (latex gloves do not provide adequate protection).

● NATIONAL FUNDING/ACCESS DECISIONS

QUTENZA[®]

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2011) that capsaicin 179 mg (8%) patch (*Qutenza*[®]) is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who have not achieved adequate pain relief from, or who have not tolerated conventional first and second line treatments. Treatment should be under the supervision of a specialist in pain management.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream

Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol)

▶ *Axsain* (Teva UK Ltd)

Capsaicin 750 microgram per 1 gram *Axsain* 0.075% cream | 45 gram [PoM] £14.58 DT price = £14.58

▶ *Zacin* (Teva UK Ltd)

Capsaicin 250 microgram per 1 gram *Zacin* 0.025% cream | 45 gram [PoM] £17.71 DT price = £17.71

Cutaneous patch

EXCIPIENTS: May contain Butylated hydroxyanisole

▶ *Qutenza* (Astellas Pharma Ltd)

Capsaicin 179 mg *Qutenza* 179mg cutaneous patches | 1 patch [PoM] £210.00

6 Seizures

6.1 Epilepsy

Epilepsy

Control of the epilepsies

The object of treatment is to prevent the occurrence of seizures by maintaining an effective dose of one or more antiepileptic drugs. Careful adjustment of doses is necessary, starting with low doses and increasing gradually until seizures are controlled or there are significant adverse effects.

When choosing an antiepileptic drug, the presenting epilepsy syndrome should first be considered. If the syndrome is not clear, the seizure type should determine the choice of treatment. Concomitant medication, co-morbidity, age, and sex should also be taken into account.

The dosage frequency is often determined by the plasma-drug half-life, and should be kept as low as possible to encourage adherence with the prescribed regimen. Most antiepileptics, when used in the usual dosage, can be given twice daily. Lamotrigine p. 394, perampanel p. 398, phenobarbital p. 409, and phenytoin p. 398, which have long half-lives, can be given once daily at bedtime. However, with large doses, some antiepileptics may need to be given more frequently to avoid adverse effects associated with high peak plasma-drug concentration.

Management

When monotherapy with a first-line antiepileptic drug has failed, monotherapy with a second drug should be tried; the diagnosis should be checked before starting an alternative drug if the first drug showed lack of efficacy. The change from one antiepileptic drug to another should be cautious, slowly withdrawing the first drug only when the new regimen has been established. Combination therapy with two or more antiepileptic drugs may be necessary, but the concurrent use of antiepileptic drugs increases the risk of adverse effects and drug interactions. If combination

therapy does not bring about worthwhile benefits, revert to the regimen (monotherapy or combination therapy) that provided the best balance between tolerability and efficacy. A single antiepileptic drug should be prescribed wherever possible.

MHRA/CHM advice: Antiepileptic drugs: new advice on switching between different manufacturers' products for a particular drug (November 2013)

The CHM has reviewed spontaneous adverse reactions received by the MHRA and publications that reported potential harm arising from switching of antiepileptic drugs in patients previously stabilised on a branded product to a generic. The CHM concluded that reports of loss of seizure control and/or worsening of side-effects around the time of switching between products could be explained as chance associations, but that a causal role of switching could not be ruled out in all cases. The following guidance has been issued to help minimise risk:

- Different antiepileptic drugs vary considerably in their characteristics, which influences the risk of whether switching between different manufacturers' products of a particular drug may cause adverse effects or loss of seizure control;
- Antiepileptic drugs have been divided into three risk-based categories to help healthcare professionals decide whether it is necessary to maintain continuity of supply of a specific manufacturer's product. These categories are listed below;
- If it is felt desirable for a patient to be maintained on a specific manufacturer's product this should be prescribed either by specifying a brand name, or by using the generic drug name and name of the manufacturer (otherwise known as the Marketing Authorisation Holder);
- This advice relates only to antiepileptic drug use for treatment of epilepsy; it does not apply to their use in other indications (e.g. mood stabilisation, neuropathic pain);
- Please report on a Yellow Card any suspected adverse reactions to antiepileptic drugs;
- Dispensing pharmacists should ensure the continuity of supply of a particular product when the prescription specifies it. If the prescribed product is unavailable, it may be necessary to dispense a product from a different manufacturer to maintain continuity of treatment of that antiepileptic drug. Such cases should be discussed and agreed with both the prescriber and patient (or carer);
- Usual dispensing practice can be followed when a specific product is not stated.

Category 1

Phenytoin p. 398, carbamazepine p. 387, phenobarbital p. 409, primidone p. 401. For these drugs, doctors are advised to ensure that their patient is maintained on a specific manufacturer's product.

Category 2

Valproate, lamotrigine p. 394, perampanel p. 398, retigabine p. 402, rufinamide p. 402, clobazam p. 410, clonazepam p. 411, oxcarbazepine p. 397, eslicarbazepine acetate p. 390, zonisamide p. 408, topiramate p. 406. For these drugs, the need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient and/or carer taking into account factors such as seizure frequency and treatment history.

Category 3

Levetiracetam p. 396, lacosamide p. 393, tiagabine p. 406, gabapentin p. 392, pregabalin p. 400, ethosuximide p. 390, vigabatrin p. 407. For these drugs, it is usually unnecessary to ensure that patients are maintained on a specific manufacturer's product unless there are specific concerns

such as patient anxiety, and risk of confusion or dosing errors Interactions.

Antiepileptic hypersensitivity syndrome

Antiepileptic hypersensitivity syndrome is a rare but potentially fatal syndrome associated with some antiepileptic drugs (**carbamazepine, lacosamide, lamotrigine, oxcarbazepine, phenobarbital, phenytoin, primidone, and rufinamide**); rarely cross-sensitivity occurs between some of these antiepileptic drugs. Some other antiepileptics (**eslicarbazepine, stiripentol, and zonisamide**) have a theoretical risk. The symptoms usually start between 1 and 8 weeks of exposure; fever, rash, and lymphadenopathy are most commonly seen. Other systemic signs include liver dysfunction, haematological, renal, and pulmonary abnormalities, vasculitis, and multi-organ failure. If signs or symptoms of hypersensitivity syndrome occur, the drug should be withdrawn immediately, the patient must not be re-exposed, and expert advice should be sought.

Interactions

Interactions between antiepileptics are complex and may increase toxicity without a corresponding increase in antiepileptic effect. Interactions are usually caused by hepatic enzyme induction or inhibition; displacement from protein binding sites is not usually a problem. These interactions are highly variable and unpredictable.

Withdrawal

Antiepileptic drugs should be withdrawn under specialist supervision. Avoid abrupt withdrawal, particularly of barbiturates and benzodiazepines, because this can precipitate severe rebound seizures. Reduction in dosage should be gradual and, in the case of barbiturates, withdrawal of the drug may take months.

The decision to withdraw antiepileptic drugs from a seizure-free patient, and its timing, is often difficult and depends on individual circumstances. Even in patients who have been seizure-free for several years, there is a significant risk of seizure recurrence on drug withdrawal. In patients receiving several antiepileptic drugs, only one drug should be withdrawn at a time.

Driving

Patients with epilepsy may drive a motor vehicle (but not a large goods or passenger carrying vehicle) provided that they have been seizure-free for one year or, if subject to attacks only while asleep, have established a 3-year period of asleep attacks without awake attacks. Those affected by drowsiness should not drive or operate machinery.

Guidance issued by the Drivers Medical Unit of the Driver and Vehicle Licensing Agency (DVLA) recommends that patients should be advised not to drive during medication changes or withdrawal of antiepileptic drugs, and for 6 months afterwards.

Patients who have had a first or single epileptic seizure must not drive for 6 months (5 years in the case of large goods or passenger carrying vehicles) after the event; driving may then be resumed, provided the patient has been assessed by a specialist as fit to drive because no abnormality was detected on investigation.

Pregnancy

Women of child-bearing potential should discuss with a specialist the impact of both epilepsy, and its treatment, on the outcome of pregnancy.

There is an increased risk of teratogenicity associated with the use of antiepileptic drugs (especially if used during the first trimester and particularly if the patient takes two or more antiepileptic drugs). Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term neurodevelopmental effects. There is also an increased risk of teratogenicity with phenytoin, primidone, phenobarbital,

lamotrigine, and carbamazepine. Topiramate carries an increased risk of cleft palate if taken in the first trimester of pregnancy. There is not enough evidence to establish the risk of teratogenicity with other antiepileptic drugs.

Prescribers should also consider carefully the choice of antiepileptic therapy in pre-pubescent girls who may later become pregnant. Women of child-bearing potential who take antiepileptic drugs should be given contraceptive advice. Some antiepileptic drugs can reduce the efficacy of hormonal contraceptives, and the efficacy of some antiepileptics may be affected by hormonal contraceptives.

Women who want to become pregnant should be referred to a specialist for advice in advance of conception. For some women, the severity of seizure or the seizure type may not pose a serious threat, and drug withdrawal may be considered; therapy may be resumed after the first trimester. If treatment with antiepileptic drugs must continue throughout pregnancy, then monotherapy is preferable at the lowest effective dose.

Once an unplanned pregnancy is discovered it is usually too late for changes to be made to the treatment regimen; the risk of harm to the mother and fetus from convulsive seizures outweighs the risk of continued therapy. The likelihood of a woman who is taking antiepileptic drugs having a baby with no malformations is at least 90%, and it is important that women do not stop taking essential treatment because of concern over harm to the fetus. To reduce the risk of neural tube defects, folate supplementation is advised before conception and throughout the first trimester.

The concentration of antiepileptic drugs in the plasma can change during pregnancy. Doses of phenytoin, carbamazepine, and lamotrigine should be adjusted on the basis of plasma-drug concentration monitoring; the dose of other antiepileptic drugs should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. Plasma-drug concentration monitoring during pregnancy is also useful to check compliance. Additionally, in patients taking topiramate or levetiracetam, it is recommended that fetal growth should be monitored. Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol.

Routine injection of vitamin K at birth minimises the risk of neonatal haemorrhage associated with antiepileptics. Withdrawal effects in the newborn may occur with some antiepileptic drugs, in particular benzodiazepines and phenobarbital.

Epilepsy and Pregnancy Register

All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

Breast-feeding

Women taking antiepileptic monotherapy should generally be encouraged to breast-feed; if a woman is on combination therapy or if there are other risk factors, such as premature birth, specialist advice should be sought.

All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones. Infants should also be monitored for adverse effects associated with the antiepileptic drug particularly with newer antiepileptics, if the antiepileptic is readily transferred into breast-milk causing high infant serum-drug concentrations (e.g. ethosuximide, lamotrigine, primidone, and zonisamide), or if slower metabolism in the infant causes drugs to accumulate (e.g. phenobarbital and lamotrigine). Serum-drug concentration monitoring should be undertaken in breast-fed infants if suspected adverse reactions develop; if toxicity develops it may be necessary to introduce formula feeds to limit the infant's drug exposure, or to wean the infant off breast-milk altogether.

Primidone, phenobarbital, and the benzodiazepines are associated with an established risk of drowsiness in breast-fed babies and caution is required.

Withdrawal effects may occur in infants if a mother suddenly stops breast-feeding, particularly if she is taking phenobarbital, primidone, or lamotrigine.

Focal seizures with or without secondary generalisation

Carbamazepine p. 387 and lamotrigine p. 394 are first-line options for treating newly diagnosed focal seizures; oxcarbazepine p. 397, sodium valproate p. 403 and levetiracetam p. 396 may be used if carbamazepine or lamotrigine are unsuitable or not tolerated. If monotherapy is unsuccessful with two of these first-line antiepileptic drugs, adjunctive treatment may be considered. Options for adjunctive treatment include carbamazepine, clobazam p. 410, gabapentin p. 392, lamotrigine, levetiracetam, oxcarbazepine, sodium valproate, or topiramate p. 406. If adjunctive treatment is ineffective or not tolerated, a tertiary epilepsy specialist should be consulted who may consider eslicarbazepine acetate p. 390, lacosamide p. 393, phenobarbital p. 409, phenytoin p. 398, pregabalin p. 400, tiagabine p. 406, vigabatrin p. 407 and zonisamide p. 408.

Generalised seizures

Tonic-clonic seizures

Sodium valproate p. 403 is the first-line treatment for newly diagnosed generalised tonic-clonic seizures. Lamotrigine p. 394 is the alternative choice if sodium valproate is not suitable, but may exacerbate myoclonic seizures. In those with established epilepsy with generalised tonic-clonic seizures only, lamotrigine or sodium valproate may be prescribed as the first-line treatment. Carbamazepine p. 387 and oxcarbazepine p. 397 may also be considered in newly diagnosed and established tonic-clonic seizures, but may exacerbate myoclonic and absence seizures. Clobazam p. 410, lamotrigine p. 394, levetiracetam p. 396, sodium valproate or topiramate p. 406 may be used as adjunctive treatment if monotherapy is ineffective or not tolerated.

Absence seizures

Ethosuximide p. 390 or sodium valproate p. 403 are the drugs of choice in absence seizures and syndromes; lamotrigine p. 394 is a suitable alternative when ethosuximide and sodium valproate are unsuitable, ineffective or not tolerated. Sodium valproate should be used as the first choice if there is a high risk of generalised tonic-clonic seizures. A combination of any two of these drugs may be used if monotherapy is ineffective. Clobazam p. 410, clonazepam p. 411, levetiracetam p. 396, topiramate p. 406 or zonisamide p. 408 may be considered by a tertiary epilepsy specialist if adjunctive treatment fails. Carbamazepine p. 387, gabapentin p. 392, oxcarbazepine p. 397, phenytoin p. 398, pregabalin p. 400, tiagabine p. 406 and vigabatrin p. 407 are not recommended in absence seizures or syndromes.

Myoclonic seizures

Myoclonic seizures (myoclonic jerks) occur in a variety of syndromes, and response to treatment varies considerably. Sodium valproate p. 403 is the drug of choice in newly diagnosed myoclonic seizures; topiramate p. 406 and levetiracetam p. 396 are alternative options if sodium valproate is unsuitable but consideration should be given to the less favourable side-effect profile of topiramate. A combination of two of these drugs may be used if monotherapy is ineffective or not tolerated. If adjunctive treatment fails, a tertiary epilepsy specialist should be consulted and may consider clobazam p. 410, clonazepam p. 411, zonisamide p. 408 or piracetam p. 321. Carbamazepine p. 387, gabapentin p. 392, oxcarbazepine p. 397, phenytoin p. 398, pregabalin p. 400, tiagabine p. 406

and vigabatrin p. 407 are not recommended for the treatment of myoclonic seizures.

Sodium valproate and levetiracetam are effective in treating the generalised tonic-clonic seizures that coexist with myoclonic seizures in idiopathic generalised epilepsy.

Atonic and tonic seizures

Atonic and tonic seizures are usually seen in childhood, in specific epilepsy syndromes, or associated with cerebral damage or mental retardation. They may respond poorly to the traditional drugs. Sodium valproate p. 403 is the drug of choice; lamotrigine p. 394 can be added as adjunctive treatment. If adjunctive treatment is ineffective or not tolerated, a tertiary epilepsy specialist should be consulted, and may consider rufinamide p. 402 or topiramate p. 406. Carbamazepine p. 387, gabapentin p. 392, oxcarbazepine p. 397, pregabalin p. 400, tiagabine p. 406 or vigabatrin p. 407 are not recommended in atonic and tonic seizures.

Epilepsy syndromes

Some drugs are licensed for use in particular epilepsy syndromes, such as lamotrigine p. 394 and rufinamide p. 402 in Lennox-Gastaut syndrome. The epilepsy syndromes are specific types of epilepsy that are characterised according to a number of features including seizure type, age of onset, and EEG characteristics.

Antiepileptic drugs

Carbamazepine and related antiepileptics

Carbamazepine p. 387 is a drug of choice for simple and complex focal seizures and is a first-line treatment option for generalised tonic-clonic seizures. It can be used as adjunctive treatment for focal seizures when monotherapy has been ineffective. It is essential to initiate carbamazepine therapy at a low dose and build this up slowly. Carbamazepine may exacerbate tonic, atonic, myoclonic and absence seizures and is therefore not recommended if these seizures are present.

Oxcarbazepine p. 397 is licensed as monotherapy or adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures. It can also be considered for the treatment of primary generalised tonic-clonic seizures [unlicensed].

Oxcarbazepine is not recommended in tonic, atonic, absence or myoclonic seizures due to the risk of seizure exacerbation.

Eslicarbazepine acetate p. 390 is licensed for adjunctive treatment in adults with focal seizures with or without secondary generalisation.

Ethosuximide

Ethosuximide p. 390 is a first-line treatment option for absence seizures. It may also be prescribed as adjunctive treatment for absence seizures when monotherapy is ineffective. Ethosuximide is also licensed for myoclonic seizures.

Gabapentin and pregabalin

Gabapentin p. 392 and pregabalin p. 400 are used for the treatment of focal seizures with or without secondary generalisation. They are not recommended if tonic, atonic, absence or myoclonic seizures are present. Both are also licensed for the treatment of neuropathic pain. Pregabalin is licensed for the treatment of generalised anxiety disorder. Gabapentin is an effective treatment for migraine prophylaxis [unlicensed].

Lamotrigine

Lamotrigine p. 394 is an antiepileptic drug recommended as a first-line treatment for focal seizures and primary and secondary generalised tonic-clonic seizures. It is also licensed for typical absence seizures in children (but efficacy may not be maintained in all children) and is an unlicensed treatment option in adults if first-line treatments have been unsuccessful. Lamotrigine can also be used as adjunctive

treatment in atonic or tonic seizures if first-line treatment has failed [unlicensed]. Myoclonic seizures may be exacerbated by lamotrigine and it can cause serious rashes especially in children; dose recommendations should be adhered to closely.

Lamotrigine is used either as sole treatment or as an adjunct to treatment with other antiepileptic drugs. Valproate increases plasma-lamotrigine concentration, whereas the enzyme-inducing antiepileptics reduce it; care is therefore required in choosing the appropriate initial dose and subsequent titration. When the potential for interaction is not known, treatment should be initiated with lower doses, such as those used with valproate.

Levetiracetam

Levetiracetam p. 396 is used for monotherapy and adjunctive treatment of focal seizures with or without secondary generalisation, and for adjunctive treatment of myoclonic seizures in patients with juvenile myoclonic epilepsy and primary generalised tonic-clonic seizures. Levetiracetam may be prescribed alone and in combination for the treatment of myoclonic seizures, and under specialist supervision for absence seizures [both unlicensed].

Phenobarbital and primidone

Phenobarbital p. 409 is effective for tonic-clonic and focal seizures but may be sedative in adults. It may be tried for atypical absence, atonic, and tonic seizures. Rebound seizures may be a problem on withdrawal.

Primidone p. 401 is largely converted to phenobarbital and this is probably responsible for its antiepileptic action. A low initial dose of primidone is essential.

Phenytoin

Phenytoin p. 398 is licensed for tonic-clonic and focal seizures but may exacerbate absence or myoclonic seizures and should be avoided if these seizures are present. It has a narrow therapeutic index and the relationship between dose and plasma-drug concentration is non-linear; small dosage increases in some patients may produce large increases in plasma concentration with acute toxic side-effects. Similarly, a few missed doses or a small change in drug absorption may result in a marked change in plasma-drug concentration. Monitoring of plasma-drug concentration improves dosage adjustment.

When only parenteral administration is possible, fosphenytoin sodium p. 391, a pro-drug of phenytoin, may be convenient to give. Unlike phenytoin (which should only be given intravenously), fosphenytoin sodium may also be given by intramuscular injection.

Rufinamide

Rufinamide p. 402 is licensed for the adjunctive treatment of seizures in Lennox-Gastaut syndrome. It may be considered by a tertiary specialist for the treatment of refractory tonic or atonic seizures [unlicensed].

Topiramate

Topiramate p. 406 can be given alone or as adjunctive treatment in generalised tonic-clonic seizures or focal seizures with or without secondary generalisation. It can be used as adjunctive treatment for seizures associated with Lennox-Gastaut syndrome and for absence, tonic and atonic seizures under specialist supervision [unlicensed]. It can also be considered as an option in myoclonic seizures [unlicensed]. Topiramate is also licensed for prophylaxis of migraine.

Valproate

Sodium valproate p. 403 is effective in controlling tonic-clonic seizures, particularly in primary generalised epilepsy. It is a drug of choice in primary generalised tonic-clonic seizures, focal seizures, generalised absences and myoclonic seizures, and can be tried in atypical absence seizures. It is recommended as a first-line option in atonic and tonic

seizures. Sodium valproate has widespread metabolic effects and monitoring of liver function tests and full blood count is essential.

Valproic acid p. 275 (as semisodium valproate) is licensed for acute mania associated with bipolar disorder.

Zonisamide

Zonisamide p. 408 can be used alone for the treatment of focal seizures with or without secondary generalisation in adults with newly diagnosed epilepsy, and as adjunctive treatment for refractory focal seizures with or without secondary generalisation in adults and children aged 6 years and above. It can also be used under the supervision of a specialist for refractory absence and myoclonic seizures [unlicensed indications].

Benzodiazepines

Clobazam p. 410 may be used as adjunctive therapy in the treatment of generalised tonic-clonic and refractory focal seizures. It may be prescribed under the care of a specialist for refractory absence and myoclonic seizures. Clonazepam p. 411 may be prescribed by a specialist for refractory absence and myoclonic seizures, but its sedative side-effects may be prominent.

Other drugs

Acetazolamide p. 965, a carbonic anhydrase inhibitor, has a specific role in treating epilepsy associated with menstruation. Piracetam p. 321 is used as adjunctive treatment for cortical myoclonus.

Status epilepticus

Convulsive status epilepticus

Immediate measures to manage status epilepticus include positioning the patient to avoid injury, supporting respiration including the provision of oxygen, maintaining blood pressure, and the correction of any hypoglycaemia. Parenteral thiamine p. 882 should be considered if alcohol abuse is suspected; pyridoxine hydrochloride p. 882 should be given if the status epilepticus is caused by pyridoxine hydrochloride deficiency.

Seizures lasting longer than 5 minutes should be treated urgently with intravenous lorazepam p. 412 (repeated once after 10 minutes if seizures recur or fail to respond). Intravenous diazepam p. 267 is effective but it carries a high risk of thrombophlebitis (reduced by using an emulsion formulation). Absorption of diazepam p. 267 from intramuscular injection or from suppositories is too slow for treatment of status epilepticus. Patients should be monitored for respiratory depression and hypotension.

Where facilities for resuscitation are not immediately available, diazepam can be administered as a rectal solution or midazolam p. 414 oromucosal solution can be given into the buccal cavity.

Important

If, after initial treatment with benzodiazepines, seizures recur or fail to respond 25 minutes after onset, phenytoin sodium, fosphenytoin sodium p. 391, or phenobarbital sodium should be used; contact intensive care unit if seizures continue. If these measures fail to control seizures 45 minutes after onset, anaesthesia with thiopental sodium p. 412, midazolam p. 414, or a non-barbiturate anaesthetic such as propofol p. 1095 [unlicensed indication], should be instituted with full intensive care support.

Phenytoin sodium can be given by slow intravenous injection, followed by the maintenance dosage if appropriate.

Alternatively, fosphenytoin sodium p. 391 (a pro-drug of phenytoin), can be given more rapidly and when given intravenously causes fewer injection-site reactions than phenytoin sodium. Although it can also be given intramuscularly, absorption is too slow by this route for treatment of status epilepticus. Doses of fosphenytoin

sodium p. 391 should be expressed in terms of phenytoin sodium.

Non-convulsive status epilepticus

The urgency to treat non-convulsive status epilepticus depends on the severity of the patient's condition. If there is incomplete loss of awareness, usual oral antiepileptic therapy should be continued or restarted. Patients who fail to respond to oral antiepileptic therapy or have complete lack of awareness can be treated in the same way as for convulsive status epilepticus, although anaesthesia is rarely needed.

Febrile convulsions

Brief febrile convulsions need no specific treatment; antipyretic medication (e.g. paracetamol p. 354), is commonly used to reduce fever and prevent further convulsions but evidence to support this practice is lacking. *Prolonged febrile convulsions* (those lasting 5 minutes or longer), or *recurrent febrile convulsions* without recovery must be treated actively (as for convulsive status epilepticus). Long-term anticonvulsant prophylaxis for febrile convulsions is rarely indicated.

Drugs used for Seizures not listed below; Acetazolamide, p. 965 · Lidocaine hydrochloride, p. 1116 · Magnesium sulfate, p. 858

ANTIEPILEPTICS

Carbamazepine

INDICATIONS AND DOSE

Focal and secondary generalised tonic-clonic seizures |

Primary generalised tonic-clonic seizures

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: Initially 100–200 mg 1–2 times a day, increased in steps of 100–200 mg every 2 weeks; usual dose 0.8–1.2 g daily in divided doses; increased if necessary up to 1.6–2 g daily in divided doses
- ▶ Elderly: Reduce initial dose

BY RECTUM

- ▶ Adult: Up to 1 g daily in 4 divided doses for up to 7 days, for short-term use when oral therapy temporarily not possible

Trigeminal neuralgia

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: Initially 100 mg 1–2 times a day, some patients may require higher initial dose, increased in steps of 100–200 mg every 2 weeks, adjusted according to response, usual dose 200 mg 3–4 times a day; increased if necessary up to 1.6 g daily

Prophylaxis of bipolar disorder unresponsive to lithium

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: Initially 400 mg daily in divided doses, increased in steps of 100–200 mg every 2 weeks until symptoms controlled; usual dose 400–600 mg daily; maximum 1.6 g per day

Treatment of alcohol withdrawal

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: Initially 800 mg daily in divided doses, then reduced to 200 mg daily usual treatment duration 7–10 days, dose to be reduced gradually over 5 days

Diabetic neuropathy

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: Initially 100 mg 1–2 times a day, increased in steps of 100–200 mg every 2 weeks, adjusted according to response, usual dose 200 mg 3–4 times a day; increased if necessary up to 1.6 g daily continued →

Focal and generalised tonic-clonic seizures**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- ▶ Child 1 month–11 years: Initially 5 mg/kg once daily, dose to be taken at night, alternatively initially 2.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 5 mg/kg 2–3 times a day, increased if necessary up to 20 mg/kg daily
- ▶ Child 12–17 years: Initially 100–200 mg 1–2 times a day, then increased to 200–400 mg 2–3 times a day, increased if necessary up to 1.8 g daily, dose should be increased slowly

Dose equivalence and conversion

Suppositories of 125 mg may be considered to be approximately equivalent in therapeutic effect to tablets of 100 mg but final adjustment should always depend on clinical response (plasma concentration monitoring recommended).

CARBAGEN® SR**Focal and secondary generalised tonic-clonic seizures |****Primary generalised tonic-clonic seizures****BY MOUTH**

- ▶ Adult: Initially 100–400 mg daily in 1–2 divided doses, increased in steps of 100–200 mg every 2 weeks, usual dose 0.8–1.2 g daily in 1–2 divided doses; increased if necessary up to 1.6–2 g daily in 1–2 divided doses
- ▶ Elderly: Reduce initial dose

Trigeminal neuralgia**BY MOUTH**

- ▶ Adult: Initially 100–200 mg daily in 1–2 divided doses, some patients may require higher initial dose, increased in steps of 100–200 mg every 2 weeks, adjusted according to response, usual dose 600–800 mg daily in 1–2 divided doses; increased if necessary up to 1.6 g daily in 1–2 divided doses

Prophylaxis of bipolar disorder unresponsive to lithium**BY MOUTH**

- ▶ Adult: Initially 400 mg daily in 1–2 divided doses, increased in steps of 100–200 mg every 2 weeks until symptoms controlled; usual dose 400–600 mg daily in 1–2 divided doses; maximum 1.6 g per day

Focal and generalised tonic-clonic seizures | Prophylaxis of bipolar disorder**BY MOUTH**

- ▶ Child 5–11 years: Initially 5 mg/kg daily in 1–2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 10–15 mg/kg daily in 1–2 divided doses, increased if necessary up to 20 mg/kg daily in 1–2 divided doses
- ▶ Child 12–17 years: Initially 100–400 mg daily in 1–2 divided doses, then increased to 400–1200 mg daily in 1–2 divided doses, increased if necessary up to 1.8 g daily in 1–2 divided doses, dose should be increased slowly

TEGRETOL® PROLONGED RELEASE**Focal and secondary generalised tonic-clonic seizures |****Primary generalised tonic-clonic seizures****BY MOUTH**

- ▶ Adult: Initially 100–400 mg daily in 2 divided doses, increased in steps of 100–200 mg every 2 weeks, usual dose 0.8–1.2 g daily in 2 divided doses; increased if necessary up to 1.6–2 g daily in 2 divided doses
- ▶ Elderly: Reduce initial dose

Focal and generalised tonic-clonic seizures | Prophylaxis of bipolar disorder**BY MOUTH**

- ▶ Child 5–11 years: Initially 5 mg/kg daily in 2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 10–15 mg/kg daily

in 2 divided doses, increased if necessary up to 20 mg/kg daily in 2 divided doses

- ▶ Child 12–17 years: Initially 100–400 mg daily in 2 divided doses, then increased to 400–1200 mg daily in 2 divided doses, increased if necessary up to 1.8 g daily in 2 divided doses, dose should be increased slowly

Trigeminal neuralgia**BY MOUTH**

- ▶ Adult: Initially 100–200 mg daily in 2 divided doses, some patients may require higher initial dose, increased in steps of 100–200 mg every 2 weeks, adjusted according to response, usual dose 600–800 mg daily in 2 divided doses; increased if necessary up to 1.6 g daily in 2 divided doses, dose should be increased slowly

Prophylaxis of bipolar disorder unresponsive to lithium**BY MOUTH**

- ▶ Adult: Initially 400 mg daily in 2 divided doses, increased in steps of 100–200 mg every 2 weeks until symptoms controlled; usual dose 400–600 mg daily in 2 divided doses; maximum 1.6 g per day

● UNLICENSED USE

- ▶ In children *Suppositories* not licensed for use in trigeminal neuralgia or prophylaxis of bipolar disorder.
- ▶ In adults Use in the treatment of alcohol withdrawal is an unlicensed indication. Use in diabetic neuropathy is an unlicensed indication.

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 · AV conduction abnormalities (unless paced) · history of bone-marrow depression

- **CAUTIONS** Cardiac disease · history of haematological reactions to other drugs · may exacerbate absence and myoclonic seizures · skin reactions · susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION

Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

Blood, hepatic, or skin disorders Carbamazepine should be withdrawn immediately in cases of aggravated liver dysfunction or acute liver disease. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).

- **INTERACTIONS** → Appendix 1 (carbamazepine).

● SIDE-EFFECTS

- ▶ **Common or very common** Allergic skin reactions · aplastic anaemia · ataxia · blood disorders · blurring of vision · dermatitis · dizziness · drowsiness · dry mouth · eosinophilia · fatigue · haemolytic anaemia · headache · hyponatraemia (leading in rare cases to water intoxication) · leucopenia · nausea · oedema · thrombocytopenia · unsteadiness · urticaria · vomiting
- ▶ **Uncommon** Constipation · diarrhoea · involuntary movements (including nystagmus) · visual disturbances
- ▶ **Rare** Abdominal pain · aggression · agitation · anorexia · cardiac conduction disorders · confusion · delayed multi-organ hypersensitivity disorder · depression · dysarthria · hallucinations · hepatitis · hypertension · hypotension · jaundice · lymph node enlargement · muscle weakness · paraesthesia · peripheral neuropathy · restlessness · systemic lupus erythematosus · vanishing bile duct syndrome
- ▶ **Very rare** arthralgia · muscle spasm · acne · alopecia · alterations in skin pigmentation · angle-closure glaucoma · aseptic meningitis · AV block with syncope · circulatory collapse · conjunctivitis · dyspnoea · exacerbation of coronary artery disease · galactorrhoea · gynaecomastia · hearing disorders · hepatic failure · hirsutism · hypercholesterolaemia · impaired male fertility ·

interstitial nephritis · muscle pain · neuroleptic malignant syndrome · osteomalacia · osteoporosis · pancreatitis · photosensitivity · pneumonia · pneumonitis · psychosis · pulmonary hypersensitivity · purpura · renal failure · sexual dysfunction · Stevens-Johnson syndrome · stomatitis · sweating · taste disturbance · thromboembolism · thrombophlebitis · toxic epidermal necrolysis · urinary frequency · urinary retention

► **Frequency not known** Suicidal ideation

SIDE-EFFECTS, FURTHER INFORMATION

Some side-effects (such as headache, ataxia, drowsiness, nausea, vomiting, blurring of vision, dizziness, unsteadiness, and allergic skin reactions) are dose-related, and may be dose-limiting. These side-effects are more common at the start of treatment and in the elderly. Patients should be offered a modified-release preparation to reduce the risk of side-effects; altering the timing of medication may also be beneficial.

Overdose

For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 1123.

- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with carbamazepine. See under Epilepsy p. 383 for more information. Caution—cross-sensitivity reported with oxcarbazepine and with phenytoin.
- **PREGNANCY** Doses should be adjusted on the basis of plasma-drug concentration monitoring.
- **BREAST FEEDING** Amount probably too small to be harmful. Monitor infant for possible adverse reactions.
- **HEPATIC IMPAIRMENT** Metabolism impaired in advanced liver disease.
- **RENAL IMPAIRMENT** Use with caution.
- **PRE-TREATMENT SCREENING** Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).
- **MONITORING REQUIREMENTS**
 - Plasma concentration for optimum response 4–12 mg/litre (20–50 micromol/litre) measured after 1–2 weeks.
 - Manufacturer recommends blood counts and hepatic and renal function tests (but evidence of practical value uncertain).
- **TREATMENT CESSATION** When stopping treatment with carbamazepine for bipolar disorder, reduce the dose gradually over a period of at least 4 weeks.
- **DIRECTIONS FOR ADMINISTRATION**
 - In children Oral liquid has been used rectally—should be retained for at least 2 hours (but may have laxative effect).
Tegretol[®] Prolonged Release tablets can be halved but should not be chewed.
- **PRESCRIBING AND DISPENSING INFORMATION** Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer's product.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Carbamazepine (oral) for preventing seizures www.medicinesforchildren.org.uk/carbamazepine-oral-preventing-seizures-0 Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop.

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary Carbamazepine Tablets may be prescribed.

● **MEDICINAL FORMS**

Eslicarbazepine acetate

INDICATIONS AND DOSE

Adjunctive treatment in adults with focal seizures with or without secondary generalisation

BY MOUTH

- ▶ Adult: Initially 400 mg once daily for 1–2 weeks, then increased to 800 mg once daily (max. per dose 1.2 g)

- **CONTRA-INDICATIONS** Second- or third-degree AV block
- **CAUTIONS** Elderly · hyponatraemia · PR-interval prolongation
- **INTERACTIONS** → Appendix 1 (eslicarbazepine). Caution—avoid concomitant administration of drugs that prolong PR interval.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dizziness · drowsiness · fatigue · gastro-intestinal disturbances · headache · impaired coordination · rash · tremor · visual disturbances
 - ▶ **Uncommon** Agitation · alopecia · anaemia · appetite changes · bradycardia · chest pain · chills · confusion · convulsions · dehydration · dry mouth · dysaesthesia · dysarthria · dystonia · electrolyte imbalance · epistaxis · gingival hyperplasia · hyperactivity · hypertension · hyponatraemia · hypotension · hypothyroidism · impaired memory · insomnia · liver disorders · malaise · menstruation changes · mood changes · movement disorders · myalgia · nail disorder · nocturia · nystagmus · palpitation · parosmia · peripheral neuropathy · peripheral oedema · psychosis · stomatitis · sweating · taste disturbance · tinnitus · urinary tract infection · weight changes
 - ▶ **Very rare** Leucopenia · pancreatitis · thrombocytopenia
 - ▶ **Frequency not known** PR-interval prolongation · suicidal ideation
- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome theoretically associated with eslicarbazepine. See under Epilepsy p. 383 for more information.
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Reduce initial dose to 400 mg every other day for 2 weeks then 400 mg once daily if eGFR 30–60 mL/minute/1.73 m², adjusted according to response. Avoid if eGFR less than 30 mL/minute/ 1.73 m².
- **PRE-TREATMENT SCREENING** Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative— risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).
- **MONITORING REQUIREMENTS** Monitor plasma-sodium concentration in patients at risk of hyponatraemia and discontinue treatment if hyponatraemia occurs.
- **PRESCRIBING AND DISPENSING INFORMATION** Switching between formulations. Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium* has advised (October 2010) that eslicarbazepine (*Zebinix*®) is accepted for restricted use within NHS Scotland as adjunctive therapy in adults with focal seizures with or without secondary

generalisation. It is restricted for use in refractory epilepsy.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

● **DRUG ACTION** Fosphenytoin is a pro-drug of phenytoin.**INDICATIONS AND DOSE****Status epilepticus**

BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 20 mg(PE)/kg, dose to be administered at a rate of 100–150 mg(PE)/minute, then 4–5 mg(PE)/kg daily in 1–2 divided doses, dose to be administered at a rate of 50–100 mg(PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration
- ▶ **Elderly:** Consider 10–25% reduction in dose or infusion rate

Prophylaxis or treatment of seizures associated with neurosurgery or head injury

BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 10–15 mg(PE)/kg, intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute, then 4–5 mg(PE)/kg daily in 1–2 divided doses, intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration
- ▶ **Elderly:** Consider 10–25% reduction in dose or infusion rate

Temporary substitution for oral phenytoin

BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION

- ▶ **Adult:** Intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute, same dose and same dosing frequency as oral phenytoin therapy
- ▶ **Elderly:** Consider 10–25% reduction in dose or infusion rate

Dose equivalence and conversion

Doses are expressed as phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg ≡ phenytoin sodium 1 mg.

- **UNLICENSED USE** Fosphenytoin sodium doses in BNF may differ from those in product literature.
- **CONTRA-INDICATIONS** Acute porphyrias p. 864 · second-degree heart block · sino-atrial block · sinus bradycardia · Stokes-Adams syndrome · third-degree heart block
- **CAUTIONS** Heart failure · hypotension · injection solutions alkaline (irritant to tissues) · respiratory depression · resuscitation facilities must be available
- **INTERACTIONS** → Appendix 1 (fosphenytoin).

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Alterations in respiratory function · arrhythmias · asthenia · cardiovascular collapse · cardiovascular depression (particularly if injection too rapid) · chills · CNS depression (particularly if injection too rapid) · dry mouth · dysarthria · ecchymosis · euphoria · hypotension · incoordination · pruritus · respiratory arrest

· taste disturbance · tinnitus · vasodilatation · visual disturbances

- ▶ **Uncommon** Decreased reflexes · hypoacusis · hypoaesthesia · increased reflexes · muscle spasm · muscle weakness · pain · stupor
- ▶ **Frequency not known** Bradycardia · confusion · extrapyramidal disorder · heart block · hyperglycaemia · purple glove syndrome · tonic seizures · twitching

SIDE-EFFECTS, FURTHER INFORMATION

Important Intravenous infusion of fosphenytoin has been associated with severe cardiovascular reactions including asystole, ventricular fibrillation, and cardiac arrest. Hypotension, bradycardia, and heart block have also been reported. The following are recommended:

- monitor heart rate, blood pressure, and respiratory function for duration of infusion;
- observe patient for at least 30 minutes after infusion;
- if hypotension occurs, reduce infusion rate or discontinue;
- reduce dose or infusion rate in elderly, and in renal or hepatic impairment.
- **ALLERGY AND CROSS-SENSITIVITY** Cross-sensitivity reported with carbamazepine.
- **PREGNANCY** Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Small amounts present in milk, but not known to be harmful.
- **HEPATIC IMPAIRMENT** Consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus).
- **RENAL IMPAIRMENT** Consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus).
- **PRE-TREATMENT SCREENING** HLA-B* 1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).
- **MONITORING REQUIREMENTS**
 - ▶ Manufacturer recommends blood counts (but evidence of practical value uncertain).
 - ▶ ECG monitoring required.
 - ▶ Monitor heart rate, blood pressure, and respiratory function for duration of infusion.
- **DIRECTIONS FOR ADMINISTRATION** For *intermittent intravenous infusion (Pro-Epanutin®)*, give in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of 1.5–25 mg (phenytoin sodium equivalent (PE))/mL.
- **PRESCRIBING AND DISPENSING INFORMATION** Prescriptions for fosphenytoin sodium should state the dose in terms of phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg ≡ phenytoin sodium 1 mg.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

INDICATIONS AND DOSE

Adjunctive treatment of focal seizures with or without secondary generalisation

BY MOUTH

- ▶ Child 6–11 years: 10 mg/kg once daily (max. per dose 300 mg) for day 1, then 10 mg/kg twice daily (max. per dose 300 mg) for day 2, then 10 mg/kg 3 times a day (max. per dose 300 mg) for day 3; usual dose 25–35 mg/kg daily in 3 divided doses, daily dose maximum to be given in 3 divided doses, some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate; maximum 70 mg/kg per day
- ▶ Child 12–17 years: Initially 300 mg once daily for day 1, then 300 mg twice daily for day 2, then 300 mg 3 times a day for day 3, alternatively initially 300 mg 3 times a day for day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate
- ▶ Adult: Initially 300 mg once daily for day 1, then 300 mg twice daily for day 2, then 300 mg 3 times a day for day 3, alternatively initially 300 mg 3 times a day for day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate

Monotherapy for focal seizures with or without secondary generalisation

BY MOUTH

- ▶ Child 12–17 years: Initially 300 mg once daily for day 1, then 300 mg twice daily for day 2, then 300 mg 3 times a day for day 3, alternatively initially 300 mg 3 times a day for day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate
- ▶ Adult: Initially 300 mg once daily for day 1, then 300 mg twice daily for day 2, then 300 mg 3 times a day for day 3, alternatively initially 300 mg 3 times a day for day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate

Neuropathic pain

BY MOUTH

- ▶ Adult: Initially 300 mg once daily for day 1, then 300 mg twice daily for day 2, then 300 mg 3 times a day for day 3, alternatively initially 300 mg 3 times a day for day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; maximum 3.6 g per day

Migraine prophylaxis

BY MOUTH

- ▶ Adult: Initially 300 mg daily, then increased to up to 2.4 g daily in divided doses, adjusted according to response

● UNLICENSED USE

- ▶ In children Not licensed for use in children under 6 years. Not licensed at doses over 50 mg/kg daily in children under 12 years.
- ▶ In adults Not licensed for migraine prophylaxis.

Important safety information

The levels of propylene glycol, acesulfame K and saccharin sodium may exceed the recommended WHO daily intake limits if high doses of gabapentin oral solution (Rosemont brand) are given to adolescents or adults with low body-weight (39–50 kg)—consult product literature.

- **CAUTIONS** Diabetes mellitus · elderly · high doses of oral solution in adolescents and adults with low body-weight · history of psychotic illness · mixed seizures (including absences)
- **INTERACTIONS** → Appendix 1 (gabapentin).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · abnormal reflexes · abnormal thoughts · acne · amnesia · anorexia · anxiety · arthralgia · ataxia · confusion · constipation · convulsions · cough · depression · diarrhoea · dizziness · drowsiness · dry mouth · dry throat · dyspepsia · dyspnoea · emotional lability · fever · flatulence · flu syndrome · gingivitis · headache · hostility · hypertension · impotence · increased appetite · insomnia · leucopenia · malaise · movement disorders · myalgia · nausea · nervousness · nystagmus · oedema · paraesthesia · pharyngitis (in adults) · pruritus · rash · rhinitis · speech disorder · tremor · twitching · vasodilatation · vertigo · visual disturbances · vomiting · weight gain
- ▶ **Uncommon** Palpitations
- ▶ **Frequency not known** Acute renal failure · alopecia · blood glucose fluctuations in patients with diabetes · breast hypertrophy · gynaecomastia · hallucinations · hepatitis · hypersensitivity syndrome · incontinence · pancreatitis · Stevens-Johnson syndrome · suicidal ideation · thrombocytopenia · tinnitus
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Present in milk—manufacturer advises use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT**
- ▶ In adults Reduce dose to 0.6–1.8 g daily in 3 divided doses if eGFR 50–80 mL/minute/1.73 m². Reduce dose to 300–900 mg daily in 3 divided doses if eGFR 30–50 mL/minute/1.73 m². Reduce dose to 300 mg on alternate days (up to max. 600 mg daily) in 3 divided doses if eGFR 15–30 mL/minute/1.73 m². Reduce dose to 300 mg on alternate days (up to max. 300 mg daily) in 3 divided doses if eGFR less than 15 mL/minute/1.73 m²—consult product literature.
- ▶ In children Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m²; consult product literature.
- **EFFECT ON LABORATORY TESTS** False positive readings with some urinary protein tests.
- **DIRECTIONS FOR ADMINISTRATION** Capsules can be opened but the bitter taste is difficult to mask.
- **PATIENT AND CARER ADVICE**

Lacosamide**INDICATIONS AND DOSE**

Adjunctive treatment of focal seizures with or without secondary generalisation

BY MOUTH OR BY INTRAVENOUS INFUSION

- ▶ **Child 16–17 years:** Initially 50 mg twice daily, infusion to be administered over 15–60 minutes (for up to 5 days), then increased, if tolerated, in steps of 50 mg twice daily, adjusted according to response, dose to be increased in weekly intervals; maintenance 100 mg twice daily (max. per dose 200 mg twice daily)
- ▶ **Adult:** Initially 50 mg twice daily, infusion to be administered over 15–60 minutes (for up to 5 days), then increased, if tolerated, in steps of 50 mg twice daily, adjusted according to response, dose to be increased in weekly intervals; maintenance 100 mg twice daily (max. per dose 200 mg twice daily)

Adjunctive treatment of focal seizures with or without secondary generalisation (alternative loading dose regimen when it is necessary to rapidly attain therapeutic plasma concentrations) (under close medical supervision)

BY MOUTH OR BY INTRAVENOUS INFUSION

- ▶ **Child 16–17 years:** Loading dose 200 mg, infusion to be administered over 15–60 minutes (for up to 5 days), followed by maintenance 100 mg twice daily, to be given 12 hours after initial dose, then increased, if tolerated, in steps of 50 mg twice daily (max. per dose 200 mg twice daily), adjusted according to response, dose to be increased in weekly intervals
- ▶ **Adult:** Loading dose 200 mg, infusion to be administered over 15–60 minutes (for up to 5 days), followed by maintenance 100 mg twice daily, to be

given 12 hours after initial dose, then increased, if tolerated, in steps of 50 mg twice daily (max. per dose 200 mg twice daily), adjusted according to response, dose to be increased in weekly intervals

- **CONTRA-INDICATIONS** Second- or third-degree AV block
- **CAUTIONS** Conduction problems · elderly (in adults) · risk of PR-interval prolongation · severe cardiac disease
- **INTERACTIONS** → Appendix 1 (acosamide). Caution with concomitant use of drugs that prolong PR interval.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abnormal gait · blurred vision · cognitive disorder · constipation · depression · dizziness · drowsiness · fatigue · flatulence · headache · impaired coordination · nausea · nystagmus · pruritus · tremor · vomiting
 - ▶ **Rare** Multi-organ hypersensitivity reaction
 - ▶ **Frequency not known** Aggression · agitation · agranulocytosis · atrial fibrillation · atrial flutter · AV block · bradycardia · confusion · dry mouth · dysarthria · dyspepsia · euphoria · hypoesthesia · irritability · muscle spasm · PR-interval prolongation · psychosis · rash · suicidal ideation · tinnitus
- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with lacosamide. See under Epilepsy p. 383 for more information.
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Titrate with caution in mild to moderate impairment if co-existing renal impairment. Caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** Loading dose regimen can be considered in mild to moderate impairment—titrate above 200 mg with caution. Titrate with caution in severe impairment, max. 250 mg daily.
 - ▶ In adults Consult product literature for loading dose if eGFR less than 30 mL/minute/1.73 m².
 - ▶ In children Consult product literature for loading dose if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ In children For *intravenous infusion*, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9%.
 - ▶ In adults For *intravenous infusion (Vimpat®)*, give intermittently in Glucose 5% or Sodium Chloride 0.9%. May be administered undiluted.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of syrup may include strawberry.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Lacosamide for preventing seizures www.medicinesforchildren.org.uk/lacosamide-for-preventing-seizures
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium* has advised (January 2009) that lacosamide (*Vimpat®*) is accepted for restricted use within NHS Scotland as adjunctive treatment for focal seizures with or without secondary generalisation in patients from 16 years. It is restricted for specialist use in refractory epilepsy.

INDICATIONS AND DOSE**Monotherapy of focal seizures | Monotherapy of primary and secondary generalised tonic-clonic seizures | Monotherapy of seizures associated with Lennox-Gastaut syndrome**

BY MOUTH

- ▶ Child 12-17 years: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 100-200 mg daily in 1-2 divided doses; increased if necessary up to 500 mg daily, dose titration should be repeated if restarting after interval of more than 5 days
- ▶ Adult: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 100-200 mg daily in 1-2 divided doses; increased if necessary up to 500 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

Adjunctive therapy of focal seizures with valproate |**Adjunctive therapy of primary and secondary generalised tonic-clonic seizures with valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndrome with valproate**

BY MOUTH

- ▶ Child 2-11 years (body-weight up to 13 kg): Initially 2 mg once daily on alternate days for first 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7-14 days; maintenance 1-5 mg/kg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
- ▶ Child 2-11 years (body-weight 13 kg and above): Initially 150 micrograms/kg once daily for 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7-14 days; maintenance 1-5 mg/kg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
- ▶ Child 12-17 years: Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then increased in steps of up to 50 mg every 7-14 days; maintenance 100-200 mg daily in

1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

- ▶ Adult: Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then increased in steps of up to 50 mg every 7-14 days; maintenance 100-200 mg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

Adjunctive therapy of focal seizures (with enzyme inducing drugs) without valproate | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures (with enzyme inducing drugs) without valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndromes (with enzyme inducing drugs) without valproate

BY MOUTH

- ▶ Child 2-11 years: Initially 300 micrograms/kg twice daily for 14 days, then 600 micrograms/kg twice daily for further 14 days, then increased in steps of up to 1.2 mg/kg every 7-14 days; maintenance 5-15 mg/kg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 400 mg per day
- ▶ Child 12-17 years: Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 200-400 mg daily in 2 divided doses, increased if necessary up to 700 mg daily, dose titration should be repeated if restarting after interval of more than 5 days
- ▶ Adult: Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 200-400 mg daily in 2 divided doses, increased if necessary up to 700 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

Adjunctive therapy of focal seizures (without enzyme inducing drugs) without valproate | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures (without enzyme inducing drugs) without valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndromes (without enzyme inducing drugs) without valproate

BY MOUTH

- ▶ Child 2-11 years: Initially 300 micrograms/kg daily in 1-2 divided doses for 14 days, then 600 micrograms/kg daily in 1-2 divided doses for further 14 days, then increased in steps of up to 600 micrograms/kg every 7-14 days; maintenance 1-10 mg/kg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
- ▶ Child 12-17 years: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 100-200 mg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days
- ▶ Adult: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 100-200 mg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

Monotherapy or adjunctive therapy of bipolar disorder (without enzyme inducing drugs) without valproate

BY MOUTH

- ▶ Adult: Initially 25 mg once daily for 14 days, then 50 mg daily in 1-2 divided doses for further 14 days, then 100 mg daily in 1-2 divided doses for further

7 days; maintenance 200 mg daily in 1–2 divided doses, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days; maximum 400 mg per day

Adjunctive therapy of bipolar disorder with valproate

BY MOUTH

▶ **Adult:** Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then 50 mg daily in 1–2 divided doses for further 7 days; maintenance 100 mg daily in 1–2 divided doses, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day

Adjunctive therapy of bipolar disorder (with enzyme inducing drugs) without valproate

BY MOUTH

▶ **Adult:** Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased to 100 mg twice daily for further 7 days, then increased to 150 mg twice daily for further 7 days; maintenance 200 mg twice daily, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days

Important safety information

SAFE PRACTICE

Do not confuse the different combinations or indications.

- **CAUTIONS** Myoclonic seizures (may be exacerbated) · Parkinson's disease (may be exacerbated) (in adults)
- **INTERACTIONS** → Appendix 1 (lamotrigine).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** blurred vision · aggression · agitation · arthralgia · ataxia · back pain · diarrhoea · diplopia · dizziness · drowsiness · dry mouth · headache · insomnia · nausea · nystagmus · rash · tremor · vomiting
 - ▶ **Rare** Conjunctivitis
 - ▶ **Very rare** Anaemia · blood disorders · confusion · exacerbation of Parkinson's disease (in adults) · hallucination · hepatic failure · hypersensitivity syndrome · increase in seizure frequency · leucopenia · lupus erythematosus-like reactions · movement disorders · pancytopenia · thrombocytopenia · unsteadiness
 - ▶ **Frequency not known** Aseptic meningitis · suicidal ideation

SIDE-EFFECTS, FURTHER INFORMATION

Skin reactions Serious skin reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have developed (especially in children); most rashes occur in the first 8 weeks. Rash is sometimes associated with hypersensitivity syndrome and is more common in patients with history of allergy or rash from other antiepileptic drugs. Consider withdrawal if rash or signs of hypersensitivity syndrome develop. Factors associated with increased risk of serious skin reactions include concomitant use of valproate, initial lamotrigine dosing higher than recommended, and more rapid dose escalation than recommended.

- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with lamotrigine. See under Epilepsy p. 383 for more information.

- **PREGNANCY** Doses should be adjusted on the basis of plasma-drug concentration monitoring.
- **BREAST FEEDING** Present in milk, but limited data suggest no harmful effect on infant.
- **HEPATIC IMPAIRMENT** Halve dose in moderate impairment. Quarter dose in severe impairment.
- **RENAL IMPAIRMENT** Consider reducing maintenance dose in significant impairment. Caution in renal failure; metabolite may accumulate.
- **TREATMENT CESSATION** Avoid abrupt withdrawal (taper off over 2 weeks or longer) unless serious skin reaction occurs.

- **PRESCRIBING AND DISPENSING INFORMATION** Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic lamotrigine product.

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Lamotrigine for preventing seizures www.medicinesforchildren.org.uk/lamotrigine-for-preventing-seizures

Skin reactions Warn patients and carers to see their doctor immediately if rash or signs or symptoms of hypersensitivity syndrome develop.

Blood disorders Patients and their carers should be alert for symptoms and signs suggestive of bone-marrow failure, such as anaemia, bruising, or infection. Aplastic anaemia, bone-marrow depression, and pancytopenia have been associated rarely with lamotrigine.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Levetiracetam

INDICATIONS AND DOSE

Monotherapy of focal seizures with or without secondary generalisation

BY MOUTH OR BY INTRAVENOUS INFUSION

- ▶ Child 16-17 years: Initially 250 mg once daily for 1 week, then increased to 250 mg twice daily, then increased in steps of 250 mg twice daily (max. per dose 1.5 g twice daily), adjusted according to response, dose to be increased every 2 weeks
- ▶ Adult: Initially 250 mg once daily for 1-2 weeks, then increased to 250 mg twice daily, then increased in steps of 250 mg twice daily (max. per dose 1.5 g twice daily), adjusted according to response, dose to be increased every 2 weeks

Adjunctive therapy of focal seizures with or without secondary generalisation

BY MOUTH

- ▶ Child 1-5 months: Initially 7 mg/kg once daily, then increased in steps of up to 7 mg/kg twice daily (max. per dose 21 mg/kg twice daily), dose to be increased every 2 weeks
- ▶ Child 6 months-17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
- ▶ Child 12-17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2-4 weeks
- ▶ Adult: Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2-4 weeks

BY INTRAVENOUS INFUSION

- ▶ Child 4-17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
- ▶ Child 12-17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks
- ▶ Adult: Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2-4 weeks

Adjunctive therapy of myoclonic seizures and tonic-clonic seizures

BY MOUTH OR BY INTRAVENOUS INFUSION

- ▶ Child 12-17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
- ▶ Child 12-17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks
- ▶ Adult: Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2-4 weeks

● UNLICENSED USE

- ▶ In children *Granules* not licensed for use in children under 6 years, for initial treatment in children with body-weight less than 25 kg, or for the administration of doses below 250 mg.

- ▶ In adults Levetiracetam doses in BNF may differ from those in product literature.

● INTERACTIONS → Appendix 1 (levetiracetam).

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · aggression · anorexia · anxiety · ataxia · convulsion · cough · depression · diarrhoea · dizziness · drowsiness · dyspepsia · headache · insomnia · irritability · malaise · nasopharyngitis · nausea · rash · tremor · vertigo · vomiting
- ▶ **Uncommon** Agitation · alopecia · amnesia · blurred vision · confusion · diplopia · eczema · impaired attention · leucopenia · myalgia · paraesthesia · pruritus · psychosis · suicidal ideation · thrombocytopenia · weight changes
- ▶ **Rare** Agranulocytosis · choreoathetosis · drug reaction with eosinophilia and systemic symptoms (DRESS) · dyskinesia · erythema multiforme · hepatic failure · hyponatraemia · neutropenia · pancreatitis · pancytopenia · Stevens-Johnson syndrome · toxic epidermal necrolysis
- ▶ **Frequency not known** Completed suicide · pancytopenia
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. It is recommended that the fetal growth should be monitored.

- **BREAST FEEDING** Present in milk—manufacturer advises avoid.

● HEPATIC IMPAIRMENT

- ▶ In adults Halve dose in severe hepatic impairment if eGFR less than 60 mL/minute/1.73 m².
- ▶ In children Halve dose in severe hepatic impairment if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².

● RENAL IMPAIRMENT

- ▶ In children Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m² (consult product literature).
- ▶ In adults Maximum 2 g daily if eGFR 50-80 mL/minute/1.73 m². Maximum 1.5 g daily if eGFR 30-50 mL/minute/1.73 m². Maximum 1 g daily if eGFR less than 30 mL/minute/1.73 m².

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion*, dilute requisite dose with at least 100 mL Glucose 5% or Sodium Chloride 0.9%; give over 15 minutes.
- ▶ With oral use For administration of *oral solution*, requisite dose may be diluted in a glass of water.

- **PRESCRIBING AND DISPENSING INFORMATION** If switching between oral therapy and intravenous therapy (for those temporarily unable to take oral medication), the intravenous dose should be the same as the established oral dose.

Oxcarbazepine

INDICATIONS AND DOSE

Monotherapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures

BY MOUTH

- Child 6-17 years: Initially 4-5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maximum 46 mg/kg per day
- Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6-2.4 g daily in divided doses

Adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures

BY MOUTH

- Child 6-17 years: Initially 4-5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maintenance 15 mg/kg twice daily; maximum 46 mg/kg per day
- Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to

response, dose to be adjusted at weekly intervals; usual dose 0.6-2.4 g daily in divided doses

Treatment of primary generalised tonic-clonic seizures

BY MOUTH

- Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 0.6-2.4 g daily in divided doses

Dose adjustments due to interactions

In adjunctive therapy, the dose of concomitant antiepileptics may need to be reduced when using high doses of oxcarbazepine.

● **UNLICENSED USE**

► In adults Not licensed for the treatment of primary generalised tonic-clonic seizures.

● **CAUTIONS** Avoid in Acute porphyrias p. 864 · cardiac conduction disorders · heart failure · hyponatraemia

● **INTERACTIONS** → Appendix 1 (oxcarbazepine).

● **SIDE-EFFECTS**

► **Common or very common** Abdominal pain · acne · agitation · alopecia · amnesia · asthenia · ataxia · confusion · constipation · depression · diarrhoea · diplopia · dizziness · drowsiness · headache · hyponatraemia · impaired concentration · nausea · nystagmus · rash · tremor · visual disorders · vomiting

► **Uncommon** Leucopenia · urticaria

► **Very rare** Arrhythmias · atrioventricular block · hepatitis · multi-organ hypersensitivity disorders · pancreatitis · Stevens-Johnson syndrome · systemic lupus erythematosus · thrombocytopenia · toxic epidermal necrolysis

► **Frequency not known** Aplastic anaemia · bone marrow depression · hypertension · hypothyroidism · neutropenia · osteoporotic bone disorders · pancytopenia · suicidal ideation

● **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with hypersensitivity to carbamazepine. Antiepileptic hypersensitivity syndrome associated with oxcarbazepine. See under Epilepsy p. 383 for more information.

● **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

● **BREAST FEEDING** Amount probably too small to be harmful but manufacturer advises avoid.

● **HEPATIC IMPAIRMENT** Caution in severe impairment—no information available.

● **RENAL IMPAIRMENT**

► In adults Halve initial dose if eGFR less than 30 mL/minute/1.73 m²; increase according to response at intervals of at least 1 week.

► In children Halve initial dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m², increase according to response at intervals of at least 1 week.

● **PRE-TREATMENT SCREENING** Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

● **MONITORING REQUIREMENTS**

► Monitor plasma-sodium concentration in patients at risk of hyponatraemia.

► Monitor body-weight in patients with heart failure.

● **PRESCRIBING AND DISPENSING INFORMATION** Patients may need to be maintained on a specific manufacturer's branded or generic oxcarbazepine product. Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with

the patient or their carer, taking into account factors such as seizure frequency and treatment history.

● PATIENT AND CARER ADVICE

Medicines for Children: Oxcarbazepine for preventing seizures www.medicinesforchildren.org.uk/oxcarbazepine-for-preventing-seizures

Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as lethargy, confusion, muscular twitching, fever, rash, blistering, mouth ulcers, bruising, or bleeding develop.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

INDICATIONS AND DOSE

Adjunctive treatment of focal seizures with or without secondary generalised seizures

BY MOUTH

- Child 12-17 years: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at least every 2 weeks, adjusted according to response; maintenance 4-8 mg once daily; maximum 12 mg per day
- Adult: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at least every 2 weeks, adjusted according to response; maintenance 4-8 mg once daily; maximum 12 mg per day

Dose adjustments due to interactions

Titrate at intervals of at least 1 week with concomitant carbamazepine, fosphenytoin, oxcarbazepine, or phenytoin.

- **INTERACTIONS** → Appendix 1 (perampanel).
- **SIDE-EFFECTS** Aggression · anxiety · ataxia · back pain · blurred vision · changes in appetite · confusion · diplopia · dizziness · drowsiness · dysarthria · gait disturbance · irritability · malaise · nausea · suicidal behaviour · suicidal ideation · vertigo · weight increase
- **PREGNANCY** Manufacturer advises avoid. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Increase at intervals of at least 2 weeks, up to max. 8 mg daily in mild or moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid in moderate or severe impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history. Patients may need to be maintained on a specific manufacturer's branded or generic perampanel product.

Phenytoin

INDICATIONS AND DOSE

Tonic-clonic seizures | Focal seizures

BY MOUTH

- Child 1 month-11 years: Initially 1.5-2.5 mg/kg twice daily, then adjusted according to response to 2.5-5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), dose also adjusted according to plasma-phenytoin concentration; maximum 300 mg per day
- Child 12-17 years: Initially 75-150 mg twice daily, then adjusted according to response to 150-200 mg twice daily (max. per dose 300 mg twice daily), dose also adjusted according to plasma-phenytoin concentration
- Adult: Initially 3-4 mg/kg daily, alternatively 150-300 mg once daily, alternatively 150-300 mg daily in 2 divided doses, then increased to 200-500 mg daily, to be taken preferably with or after food, dose to be increased gradually as necessary (with plasma-phenytoin concentration monitoring), exceptionally, higher doses may be used

Status epilepticus | Acute symptomatic seizures associated with head trauma or neurosurgery

INITIALLY BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- Adult: Loading dose 20 mg/kg (max. per dose 2 g), to be given at a rate not exceeding 1 mg/kg/minute (max. 50 mg per minute), to be given with blood pressure and ECG monitoring, then (by intravenous infusion or by slow intravenous injection or by mouth) maintenance 100 mg every 6-8 hours adjusted according to plasma-concentration monitoring, to be given with blood pressure and ECG monitoring, adjusted according to plasma-phenytoin concentration

Status epilepticus | Acute symptomatic seizures associated with trauma or neurosurgery

BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Child 1 month–11 years: Loading dose 20 mg/kg, then 2.5–5 mg/kg twice daily, to be given with blood pressure and ECG monitoring
- ▶ Child 12–17 years: Loading dose 20 mg/kg, then up to 100 mg 3–4 times a day, to be given with blood pressure and ECG monitoring

Dose equivalence and conversion

Preparations containing phenytoin sodium are **not** bioequivalent to those containing phenytoin base (such as *Epanutin Infatabs*[®] and *Epanutin*[®] suspension); 100 mg of phenytoin sodium is approximately equivalent in therapeutic effect to 92 mg phenytoin base. The dose is the same for all phenytoin products when initiating therapy, however, if switching between these products the difference in phenytoin content may be clinically significant. Care is needed when making changes between formulations and plasma-phenytoin concentration monitoring is recommended.

● UNLICENSED USE

- ▶ With oral use Licensed for use in children (age range not specified by manufacturer).
- ▶ With intravenous use Phenytoin doses in BNF publications may differ from those in product literature.

● CONTRA-INDICATIONS**GENERAL CONTRA-INDICATIONS**

Acute porphyrias p. 864

SPECIFIC CONTRA-INDICATIONS

- ▶ With intravenous use second- and third-degree heart block · sino-atrial block · sinus bradycardia · Stokes-Adams syndrome

● CAUTIONS**GENERAL CAUTIONS**

Enteral feeding (interrupt feeding for 2 hours before and after dose; more frequent monitoring may be necessary)

SPECIFIC CAUTIONS

- ▶ With intravenous use heart failure · hypotension · injection solutions alkaline (irritant to tissues) · respiratory depression · resuscitation facilities must be available

CAUTIONS, FURTHER INFORMATION

Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium. Intramuscular phenytoin should not be used (absorption is slow and erratic).

- **INTERACTIONS** → Appendix 1 (phenytoin).

● SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Acne · anorexia · coarsening of facial appearance · constipation · dizziness · drowsiness · gingival hypertrophy and tenderness (maintain good oral hygiene) · headache · hirsutism · insomnia · nausea · paraesthesia · rash · transient nervousness · tremor · vomiting
- ▶ **Rare** Leucopenia · aplastic anaemia · blood disorders · dyskinesia · hepatotoxicity · lupus erythematosus · lymphadenopathy · megaloblastic anaemia · osteomalacia · peripheral neuropathy · polyarteritis nodosa · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis
- ▶ **Frequency not known** Hypersensitivity syndrome · interstitial nephritis · pneumonitis · polyarthropathy · suicidal ideation

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ **With intravenous use** Alterations in respiratory function · arrhythmias · cardiovascular collapse · cardiovascular depression (particularly if injection too rapid) · CNS depression (particularly if injection too rapid) · hypotension · respiratory arrest
- ▶ **Frequency not known**
- ▶ **With intravenous use** Purple glove syndrome · tonic seizures

SIDE-EFFECTS, FURTHER INFORMATION

Rash Discontinue; if mild re-introduce cautiously but discontinue immediately if recurrence.

Hepatotoxicity Discontinue immediately and do not re-administer.

- ▶ With intravenous use Reduce rate of administration if bradycardia or hypotension occurs. Phenytoin may cause coarsening of the facial appearance, acne, hirsutism, and gingival hyperplasia and so may be particularly undesirable in adolescent patients.

Overdose Symptoms of phenytoin toxicity include nystagmus, diplopia, slurred speech, ataxia, confusion, and hyperglycaemia.

- **ALLERGY AND CROSS-SENSITIVITY** Cross-sensitivity reported with carbamazepine. Antiepileptic hypersensitivity syndrome associated with phenytoin. See under Epilepsy p. 383 for more information.
- **PREGNANCY** Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction. Doses should be adjusted on the basis of plasma-drug concentration monitoring.
- **BREAST FEEDING** Small amounts present in milk, but not known to be harmful.
- **HEPATIC IMPAIRMENT** Reduce dose to avoid toxicity.
- **PRE-TREATMENT SCREENING** HLAB* 1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).
- **MONITORING REQUIREMENTS**
 - ▶ In adults The usual total plasma-phenytoin concentration for optimum response is 10–20 mg/litre (or 40–80 micromol/litre). In pregnancy, the elderly, and certain disease states where protein binding may be reduced, careful interpretation of total plasma-phenytoin concentration is necessary; it may be more appropriate to measure free plasma-phenytoin concentration.
 - ▶ In children Therapeutic plasma-phenytoin concentrations reduced in first 3 months of life because of reduced protein binding. Trough plasma concentration for optimum response: neonate–3 months, 6–15 mg/litre (25–60 micromol/litre); child 3 months–18 years, 10–20 mg/litre (40–80 micromol/litre).
 - ▶ Manufacturer recommends blood counts (but evidence of practical value uncertain).
 - ▶ Monitor ECG and blood pressure with intravenous use.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use in children Before and after administration flush intravenous line with Sodium Chloride 0.9%. For *intravenous injection*, give into a large vein at rate not exceeding 1 mg/kg/minute (max. 50 mg/minute). For *intravenous infusion*, dilute to a concentration not exceeding 10 mg/mL with Sodium Chloride 0.9% and give into a large vein through an in-line filter (0.22–0.50 micron) at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute); complete administration within 1 hour of preparation.
 - ▶ With intravenous use in adults For *intravenous infusion* (*Epanutin*[®]), give intermittently in Sodium chloride 0.9%. Flush intravenous line with Sodium chloride 0.9% before and after infusion; dilute in 50–100 mL infusion fluid (final concentration not to exceed 10 mg/mL) and give

into a large vein through an in-line filter (0.22–0.50 micron) at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute); complete administration within 1 hour of preparation. To avoid local venous irritation each injection or infusion should be preceded and followed by an injection of sterile physiological saline through the same needle or catheter.

● PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations. Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer's product.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Phenytoin for preventing seizures www.medicinesforchildren.org.uk/phenytoin-for-preventing-seizures

Blood or skin disorders. Patients or their carers should be told how to recognise signs of blood or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Pregabalin 20 mg per 1 ml Lyrica 20mg/ml oral solution (sugar-free) | 473 ml [PoM](#) £99.48

dose 750 mg twice daily), adjusted according to response

- **Adult:** Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, increased to 500 mg daily in 2 divided doses, then increased in steps of 250 mg every 3 days, adjusted according to response; maintenance 0.75–1.5 g daily in 2 divided doses

Essential tremor

BY MOUTH

- **Adult:** Initially 50 mg daily, then adjusted according to response to up to 750 mg daily, dose to be increased over 2–3 weeks

- **CAUTIONS** Avoid in acute porphyria · children · debilitated · elderly · history of alcohol abuse · history of drug abuse · respiratory depression (avoid if severe)

CAUTIONS, FURTHER INFORMATION

Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

- **INTERACTIONS** → Appendix 1 (primidone).

• SIDE-EFFECTS

- **Common or very common** Agranulocytosis · allergic skin reactions · ataxia · behavioural disturbances · cholestasis · depression · drowsiness · hallucinations · hepatitis · hyperactivity (in children) · hyperactivity particularly in the elderly · hypotension · impaired cognition · impaired memory · irritability · lethargy · megaloblastic anaemia (may be treated with folic acid) · nausea · nystagmus · osteomalacia · paradoxical excitement (in adults) · respiratory depression · thrombocytopenia · visual disturbances
- **Uncommon** Dizziness · headache · vomiting
- **Rare** Arthralgia · lupus erythematosus · psychosis
- **Very rare** Antiepileptic Hypersensitivity Syndrome · Stevens-Johnson syndrome · suicidal ideation · toxic epidermal necrolysis
- **Frequency not known** Dupuytren's contracture

- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with primidone. See under Epilepsy p. 383 for more information.

- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **HEPATIC IMPAIRMENT** Reduce dose. May precipitate coma.

- **RENAL IMPAIRMENT** Use with caution.

- **MONITORING REQUIREMENTS** Monitor plasma concentrations of derived phenobarbital; plasma concentration for optimum response is 15–40 mg/litre (60–180 micromol/litre).

- **TREATMENT CESSATION** Avoid abrupt withdrawal (dependence with prolonged use).

• PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations. Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer's product.

INDICATIONS AND DOSE

All forms of epilepsy except typical absence seizures

BY MOUTH

- **Child 1 month-1 year:** Initially 125 mg daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 125–250 mg twice daily
- **Child 2-4 years:** Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 250–375 mg twice daily
- **Child 5-8 years:** Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 375–500 mg twice daily
- **Child 9-17 years:** Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, increased to 250 mg twice daily, then increased in steps of 250 mg every 3 days (max. per

Retigabine

INDICATIONS AND DOSE

Adjunctive treatment of drug-resistant focal seizures with or without secondary generalisation when other appropriate drug combinations have proved inadequate or have not been tolerated

BY MOUTH

- ▶ Adult: Initially up to 300 mg daily in 3 divided doses, then increased in steps of up to 150 mg every 1 week, adjusted according to response; maintenance 0.6–1.2 g daily
- ▶ Elderly: Initially 150 mg daily in 3 divided doses, then increased in steps of up to 150 mg every 1 week, adjusted according to response; maximum 900 mg per day

- **CAUTIONS** Known QT-interval prolongation · risk of urinary retention

CAUTIONS, FURTHER INFORMATION

QT-interval prolongation Patients with known QT-interval prolongation, or with the following risk factors for QT interval prolongation, should be carefully monitored while taking retigabine: cardiac failure, ventricular hypertrophy, electrolyte abnormalities, or concomitant treatment with drugs that can prolong QT interval.

- **INTERACTIONS** → Appendix 1 (retigabine).

● SIDE-EFFECTS

- ▶ **Common or very common** Amnesia · anxiety · blurred vision · confusion · constipation · diplopia · discoloration of lips · discoloration of nails · discoloration of ocular tissue · discoloration of skin · dizziness · drowsiness · dry mouth · dysuria · haematuria · impaired attention · impaired coordination · impaired speech · increased appetite · malaise · myoclonus · nausea · paraesthesia · peripheral oedema · psychosis · tremor · vertigo · visual impairment · weight gain
- ▶ **Uncommon** Dyspepsia · dysphagia · hypokinesia · nephrolithiasis · rash · suicidal ideation · sweating · urinary retention
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **HEPATIC IMPAIRMENT** Reduce dose by 50% in moderate to severe impairment; increase by 50 mg every week according to response up to maximum 600 mg daily (450 mg in elderly).
- **RENAL IMPAIRMENT** Reduce dose by 50% if eGFR less than 50 mL/minute/1.73 m²; increase by 50 mg every week according to response up to maximum 600 mg daily (450 mg in elderly).
- **MONITORING REQUIREMENTS**
 - ▶ Ophthalmological monitoring A comprehensive ophthalmological examination (including visual acuity test, slit-lamp examination, and dilated fundoscopy) should be performed at initiation of treatment and at least every 6 months thereafter during treatment. Changes in vision or retinal pigment should lead to re-assessment of the benefits and risks of continuing treatment—discontinue unless no other treatment options are available. Monitoring should be increased if treatment is continued.
 - ▶ Monitor for discoloration of ocular tissue and visual impairment.
 - ▶ Monitor for blue-grey discoloration of nails, lips and skin—continue treatment only if potential benefit outweighs risk.
- **PRESCRIBING AND DISPENSING INFORMATION**
 - ▶ Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with

the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients may need to be maintained on a specific manufacturer's branded or generic retigabine product.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ Retigabine for the adjunctive treatment of partial onset seizures in epilepsy (July 2011) NICE TA232

Retigabine is recommended as an option for the adjunctive treatment of partial onset seizures with or without secondary generalisation in adults aged 18 years and older with epilepsy, only when previous treatment with carbamazepine, clobazam, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, sodium valproate, and topiramate has not provided an adequate response, or has not been tolerated. www.nice.org.uk/TA232

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2011) that retigabine (*Trobalt*®) is accepted for restricted use within NHS Scotland as adjunctive therapy in adults with focal seizures with or without secondary generalisation. It is restricted for use in refractory epilepsy.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Rufinamide

INDICATIONS AND DOSE

Adjunctive treatment of seizures in Lennox-Gastaut syndrome

BY MOUTH

- ▶ Child 4-17 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 500 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Child 4-17 years (body-weight 30-50 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 900 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Adult (body-weight 30-50 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 900 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Child 4-17 years (body-weight 50-70 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.2 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
- ▶ Adult (body-weight 50-70 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.2 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

- ▶ Adult (body-weight 70 kg and above): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.6 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

Adjunctive treatment of seizures in Lennox-Gastaut syndrome with valproate

BY MOUTH

- ▶ Child 4–17 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 300 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

- **INTERACTIONS** → Appendix 1 (rufinamide).
- **SIDE-EFFECTS** Abdominal pain · acne · anorexia · anxiety · back pain · blurred vision · constipation · diarrhoea · diplopia · dizziness · drowsiness · dyspepsia · epistaxis · fatigue · gait disturbances · headache · hyperactivity · hypersensitivity syndrome · impaired coordination · increase in seizure frequency · influenza-like symptoms · insomnia · nausea · nystagmus · oligomenorrhoea · rash · rhinitis · tremor · vomiting · weight loss
- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with rufinamide. See under Epilepsy p. 383 for more information.
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Caution and careful dose titration in mild to moderate impairment. Avoid in severe impairment.
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed and given in half a glass of water.
- **PRESCRIBING AND DISPENSING INFORMATION** Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history. Patients may need to be maintained on a specific manufacturer's branded or generic rufinamide product.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Rufinamide for preventing seizures www.medicinesforchildren.org.uk/rufinamide-for-preventing-seizures Counselling on antiepileptic hypersensitivity syndrome is advised.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions The *Scottish Medicines Consortium* has advised (October 2008) that rufinamide (*Inovelon*®) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of seizures associated with Lennox-Gastaut syndrome in patients 4 years and above. It is restricted for use when alternative traditional antiepileptic drugs are unsatisfactory.

● MEDICINAL FORMS

Sodium valproate

INDICATIONS AND DOSE

All forms of epilepsy

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 1 month–11 years: Initially 10–15 mg/kg daily in 1–2 divided doses (max. per dose 600 mg); maintenance 25–30 mg/kg daily in 2 divided doses, doses up to 60 mg/kg daily in 2 divided doses may be used in infantile spasms; monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily
- ▶ Child 12–17 years: Initially 600 mg daily in 1–2 divided doses, increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily in 2 divided doses; maximum 2.5 g per day
- ▶ Adult: Initially 600 mg daily in 1–2 divided doses, then increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily, alternatively maintenance 20–30 mg/kg daily; maximum 2.5 g per day

Initiation of valproate treatment

INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 10 mg/kg, (usually 400–800 mg), followed by (by intravenous infusion or by intravenous injection) up to 2.5 g daily in 2–4 divided doses, alternatively (by continuous intravenous infusion) up to 2.5 g daily; usual dose 1–2 g daily, (20–30 mg/kg daily), intravenous injection to be administered over 3–5 minutes

Continuation of valproate treatment

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION OR BY CONTINUOUS INTRAVENOUS INFUSION

- ▶ Adult: If switching from oral therapy to intravenous therapy give current oral daily dose, give over 3–5 minutes by intravenous injection or in 2–4 divided doses by intravenous infusion

EPILIM CHRONO®

EPILIM CHRONOSPHERE®**All forms of epilepsy****BY MOUTH**

- ▶ **Adult:** Total daily dose to be given in 1–2 divided doses (consult product literature)

Migraine prophylaxis**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- ▶ **Adult:** Initially 200 mg twice daily, then increased if necessary to 1.2–1.5 g daily in divided doses

● UNLICENSED USE

- ▶ In adults Not licensed for migraine prophylaxis.

- **CONTRA-INDICATIONS** Family history of severe hepatic dysfunction · known mitochondrial disorders (higher rate of acute liver failure and liver-related deaths) · personal or family history of severe hepatic dysfunction · porphyria · suspected mitochondrial disorders (higher rate of acute liver failure and liver-related deaths)

- **CAUTIONS** Systemic lupus erythematosus

CAUTIONS, FURTHER INFORMATION

Liver toxicity Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

Consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

- **INTERACTIONS** → Appendix 1 (sodium valproate).

● SIDE-EFFECTS

- ▶ **Common or very common** Aggression · anaemia · confusion · convulsion · deafness · diarrhoea · extrapyramidal disorders · gastric irritation · haemorrhage · headache · hyponatraemia · memory impairment · menstrual disturbance · nausea · nystagmus · somnolence · stupor · thrombocytopenia · transient hair loss (regrowth may be curly) · tremor · weight gain
- ▶ **Uncommon** Angioedema · ataxia · coma · encephalopathy · increased alertness · lethargy · leucopenia · pancytopenia · paraesthesia · peripheral oedema · rash · reduced bone mineral density · syndrome of inappropriate secretion of antidiuretic hormone · vasculitis
- ▶ **Rare** Behavioural disturbance · blood disorders · bone marrow failure · dementia (in adults) · drowsiness · drug rash with eosinophilia and systemic symptoms (DRESS) syndrome · enuresis · Fanconi's syndrome · hallucinations · hearing loss · hyperactivity · hyperammonaemia · hypothyroidism · learning disorders · male infertility · myelodysplastic syndrome · polycystic ovaries · Stevens-Johnson syndrome · systemic lupus erythematosus · toxic epidermal necrolysis

- ▶ **Very rare** Acne · gynaecomastia · hepatic dysfunction · hirsutism · increase in bleeding time · pancreatitis
- ▶ **Frequency not known** Hypersensitivity reactions · suicidal ideation

SIDE-EFFECTS, FURTHER INFORMATION

Hepatic dysfunction Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.

- **CONCEPTION AND CONTRACEPTION** Valproate is associated with teratogenic risks and should not be used in women of child-bearing potential unless there is no safer alternative—this should be fully considered and discussed before prescribing for women of child-bearing age. Effective contraception advised in women of child-bearing potential.

- **PREGNANCY** Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term neurodevelopmental effects. Valproate should not be used during pregnancy or in women of child-bearing potential unless there is no safer alternative and only after a careful discussion of the risks. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses or as modified-release tablets to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Avoid use in the treatment of epilepsy and bipolar disorder unless there is no safer alternative and only after a careful discussion of the risks—effective contraception advised in women of child-bearing potential. Avoid use for the prophylaxis of migraine [unlicensed]—exclude pregnancy before treatment and ensure effective contraception is used during treatment. Neonatal bleeding (related to hypofibrinaemia) reported. Neonatal hepatotoxicity also reported. Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Present in milk—risk of haematological disorders in breast-fed new borns and infants.

- **HEPATIC IMPAIRMENT** Avoid if possible—hepatotoxicity and hepatic failure may occasionally occur (usually in first 6 months). Avoid in active liver disease.

- **RENAL IMPAIRMENT** Reduce dose.

● MONITORING REQUIREMENTS

- ▶ Plasma-valproate concentrations are not a useful index of efficacy, therefore routine monitoring is unhelpful.
- ▶ Monitor liver function before therapy and during first 6 months especially in patients most at risk.
- ▶ Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.

- **EFFECT ON LABORATORY TESTS** False-positive urine tests for ketones.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With rectal use in children For *rectal administration*, sodium valproate oral solution may be given rectally and retained for 15 minutes (may require dilution with water to prevent rapid expulsion).
- ▶ With intravenous use in children For *intravenous injection*, may be diluted in Glucose 5% or Sodium Chloride 0.9% and given over 3–5 minutes. For *intravenous infusion*, dilute injection solution with Glucose 5% or Sodium Chloride 0.9%.
- ▶ With intravenous use in adults For *intravenous infusion* (*Epilim*®, *Episenta*®), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute *Epilim*® with solvent provided then dilute with infusion fluid.

EPIVAL®

Tablets may be halved but not crushed or chewed.

EPISENTA® CAPSULES

Contents of capsule may be mixed with cold soft food or drink and swallowed immediately without chewing.

EPISENTA® GRANULES

Granules may be mixed with cold soft food or drink and swallowed immediately without chewing.

EPIILIM CHRONOSPHERE®

Granules may be mixed with soft food or drink that is cold or at room temperature, and swallowed immediately without chewing.

EPIILIM® ORAL SOLUTION

May be diluted, preferably in Syrup BP; use within 14 days.

● PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic oral sodium valproate product.

EPIILIM CHRONOSPHERE®

Prescribe dose to nearest whole 50 mg sachet.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Sodium valproate for preventing seizures www.medicinesforchildren.org.uk/sodium-valproate-for-preventing-seizures

Blood or hepatic disorders Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.

Pancreatitis Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop; discontinue if pancreatitis is diagnosed.

Counselling advised on pregnancy.

Administration advice should be given for Epival®, Episentia® capsules and granules, and Epilim® Chronosphere and Epilim® oral Solution

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, oral suspension, oral solution

Tiagabine

INDICATIONS AND DOSE

Adjunctive treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics (with enzyme-inducing drugs)

BY MOUTH

- ▶ Child 12–17 years: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every 1 week; maintenance 30–45 mg daily in 2–3 divided doses
- ▶ Adult: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every 1 week; maintenance 30–45 mg daily in 2–3 divided doses

Adjunctive treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics (without enzyme-inducing drugs)

BY MOUTH

- ▶ Child 12–17 years: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every 1 week; maintenance 15–30 mg daily in 2–3 divided doses
- ▶ Adult: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every 1 week; maintenance 15–30 mg daily in 2–3 divided doses

- **CAUTIONS** Avoid in Acute porphyrias p. 864

CAUTIONS, FURTHER INFORMATION

Tiagabine should be avoided in absence, myoclonic, tonic and atonic seizures due to risk of seizure exacerbation.

- **INTERACTIONS** → Appendix 1 (tiagabine).

● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · dizziness · emotional lability · impaired concentration · nervousness · speech impairment · tiredness · tremor
- ▶ **Rare** Bruising · confusion · depression · drowsiness · non-convulsive status epilepticus · psychosis · suicidal ideation · visual disturbances
- ▶ **Frequency not known** Leucopenia
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **HEPATIC IMPAIRMENT** In mild to moderate impairment reduce dose, prolong the dose interval, or both. Avoid in severe impairment.

- **PATIENT AND CARER ADVICE** May impair performance of skilled tasks (e.g. driving).

Medicines for Children leaflet: Tiagabine for preventing seizures www.medicinesforchildren.org.uk/tiagabine-for-preventing-seizures

Topiramate

INDICATIONS AND DOSE

Monotherapy of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation

BY MOUTH

- ▶ Child 6–17 years: Initially 0.5–1 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 250–500 micrograms/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 50 mg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate titration regimens recommended above then smaller steps or longer interval between steps may be used; maximum 500 mg per day
- ▶ Adult: Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25–50 mg every 1–2 weeks, dose to be taken in 2 divided doses; usual dose 100–200 mg daily in 2 divided doses, adjusted according to response, doses of 1 g daily have been used in refractory epilepsy; maximum 500 mg per day

Adjunctive treatment of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation |

Adjunctive treatment for seizures associated with Lennox-Gastaut syndrome

BY MOUTH

- ▶ Child 2–17 years: Initially 1–3 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 0.5–1.5 mg/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 2.5–4.5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate recommended titration regimen then smaller steps or longer interval between steps may be used; maximum 400 mg per day
- ▶ Adult: Initially 25–50 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25–50 mg every 1–2 weeks, dose to be taken in 2 divided doses; usual dose 200–400 mg daily in 2 divided doses; maximum 400 mg per day

Migraine prophylaxis

BY MOUTH

- ▶ Adult: Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25 mg every 1 week; usual dose 50–100 mg daily in 2 divided doses; maximum 200 mg per day

- **UNLICENSED USE** Not licensed for use in children for migraine prophylaxis.

- **CAUTIONS** Avoid in Acute porphyrias p. 864 · risk of metabolic acidosis · risk of nephrolithiasis—ensure adequate hydration (especially in strenuous activity or warm environment)

- **INTERACTIONS** → Appendix 1 (topiramate).

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · aggression · agitation · alopecia · anaemia · anxiety · appetite changes · arthralgia · cognitive impairment · confusion · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · dyspnoea · epistaxis · gastritis · impaired attention · impaired coordination · irritability · malaise · mood changes · movement disorders · muscle spasm · muscular weakness · myalgia · nausea · nephrolithiasis · nystagmus · paraesthesia · pruritus · rash · seizures · sleep disturbance · speech disorder · taste disturbance · tinnitus · tremor · urinary disorders · visual disturbances · vomiting
- ▶ **Uncommon** Abdominal distension · altered sense of smell · blepharospasm · blood disorders · bradycardia · dry eye ·

flatulence · flushing · gingival bleeding · glossodynia · haematuria · halitosis · hearing loss · hypokalaemia · hypotension · increased lacrimation · influenza-like symptoms · leucopenia · metabolic acidosis · mydriasis · neutropenia · palpitation · pancreatitis · panic attack · peripheral neuropathy · photophobia · postural hypotension · psychosis · reduced sweating · salivation · sexual dysfunction · skin discoloration · suicidal ideation · thirst · thrombocytopenia · urinary calculus

- ▶ **Rare** Abnormal skin odour · calcinosis · hepatic failure · hepatitis · periorbital oedema · Raynaud's syndrome · Stevens-Johnson syndrome · unilateral blindness
- ▶ **Very rare** Angle-closure glaucoma
- ▶ **Frequency not known** Encephalopathy · hyperammonaemia · maculopathy · toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION

Acute myopia with secondary angle-closure glaucoma Topiramate has been associated with acute myopia with secondary angle-closure glaucoma, typically occurring within 1 month of starting treatment. Choroidal effusions resulting in anterior displacement of the lens and iris have also been reported. If raised intra-ocular pressure occurs:

- seek specialist ophthalmological advice;
- use appropriate measures to reduce intra-ocular pressure;
- stop topiramate as rapidly as feasible
- **PREGNANCY** Increased risk of cleft palate if taken in the first trimester of pregnancy. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. It is recommended that the fetal growth should be monitored.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk.

● **HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment—clearance may be reduced.

● RENAL IMPAIRMENT

- ▶ In adults Half usual starting and maintenance dose if eGFR less than 70 mL/minute/1.73 m²—reduced clearance and longer time to steady-state plasma concentration.
- ▶ In children Half usual starting and maintenance dose if estimated glomerular filtration less than 70 mL/minute/1.73 m²—reduced clearance and longer time to steady-state plasma concentration. Use with caution.

● **DIRECTIONS FOR ADMINISTRATION** *Topamax*[®] Sprinkle capsules can either be swallowed whole or the contents of the capsule can be sprinkled on soft food and swallowed immediately without chewing.

TOPAMAX[®] CAPSULES

Swallow whole or sprinkle contents of capsule on soft food and swallow immediately without chewing.

● PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic topiramate product.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Topiramate for preventing seizures www.medicinesforchildren.org.uk/topiramate-for-preventing-seizures

Patients should be counselled on the administration of *Topamax*[®] Sprinkle capsules.

Patients or carers should be given advice on how to administer *Topamax*[®] capsules.

● MEDICINAL FORMS

Vigabatrin

INDICATIONS AND DOSE

Adjunctive treatment of focal seizures with or without secondary generalisation not satisfactorily controlled with other antiepileptics (under expert supervision)

BY MOUTH

- ▶ Child 1 month-2 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg twice daily), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg twice daily)
- ▶ Child 2-11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg twice daily), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g twice daily)
- ▶ Child 12-17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily
- ▶ Adult: Initially 1 g once daily, alternatively initially 1 g daily in 2 divided doses, then increased in steps of 500 mg every 1 week, adjusted according to response; usual dose 2–3 g daily; maximum 3 g per day

BY RECTUM

- ▶ Child 1 month-1 year: Initially 15–20 mg/kg twice daily (max. per dose 250 mg twice daily), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg twice daily)

continued →

- ▶ Child 2-11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg twice daily), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g twice daily)
- ▶ Child 12-17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily

● **UNLICENSED USE** Granules not licensed for rectal use. Tablets not licensed to be crushed and dispersed in liquid. Vigabatrin doses in BNF publications may differ from those in product literature.

● **CONTRA-INDICATIONS** Visual field defects

● **CAUTIONS** Elderly · history of behavioural problems · history of depression · history of psychosis

CAUTIONS, FURTHER INFORMATION

Vigabatrin may worsen absence, myoclonic, tonic and atonic seizures.

Visual field defects Vigabatrin is associated with visual field defects. The onset of symptoms varies from 1 month to several years after starting. In most cases, visual field defects have persisted despite discontinuation, and further deterioration after discontinuation cannot be excluded. Product literature advises visual field testing before treatment and at 6-month intervals. Patients and their carers should be warned to report any new visual symptoms that develop and those with symptoms should be referred for an urgent ophthalmological opinion. Gradual withdrawal of vigabatrin should be considered.

● **INTERACTIONS** → Appendix 1 (vigabatrin).

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · aggression · agitation · blurred vision · depression · diplopia · dizziness · drowsiness · excitation (in children) · fatigue · headache · impaired concentration · impaired memory · irritability · nausea · nervousness · nystagmus · oedema · paraesthesia · paranoia · speech disorder · tremor · visual field defects · vomiting · weight gain
- ▶ **Uncommon** Ataxia · mania · occasional increase in seizure frequency (especially if myoclonic) · psychosis · rash
- ▶ **Rare** Peripheral retinal neuropathy · retinal disorders · suicidal ideation
- ▶ **Very rare** Hepatitis · optic atrophy · optic neuritis
- ▶ **Frequency not known** Movement disorders in infantile spasms

SIDE-EFFECTS, FURTHER INFORMATION

Visual field defects About one-third of patients treated with vigabatrin have suffered visual field defects; counselling and **careful monitoring** for this side-effect are required.

Encephalopathic symptoms including marked sedation, stupor, and confusion with non-specific slow wave EEG can occur *rarely*—reduce dose or withdraw.

● **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

● **BREAST FEEDING** Present in milk—manufacturer advises avoid.

● **RENAL IMPAIRMENT**

▶ In adults Consider reduced dose or increased dose interval if eGFR less than 60 mL/minute/1.73 m².

▶ In children Consider reduced dose or increased dose interval if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².

● **MONITORING REQUIREMENTS** Closely monitor neurological function.

● **DIRECTIONS FOR ADMINISTRATION**

▶ With rectal use Dissolve contents of sachet in small amount of water and administer rectally [unlicensed use].

The contents of a sachet should be dissolved in water or a soft drink immediately before taking.

Tablets may be crushed and dispersed in liquid.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Vigabatrin for preventing seizures www.medicinesforchildren.org.uk/vigabatrin-for-preventing-seizures

Patients and their carers should be warned to report any new visual symptoms that develop.

● **MEDICAL FORMS**

Zonisamide

INDICATIONS AND DOSE

Monotherapy for treatment of focal seizures with or without secondary generalisation in adults with newly diagnosed epilepsy

BY MOUTH

▶ **Adult:** Initially 100 mg once daily for 2 weeks, then increased in steps of 100 mg every 2 weeks, usual maintenance dose 300 mg once daily; maximum 500 mg per day

Adjunctive treatment for refractory focal seizures with or without secondary generalisation

BY MOUTH

- ▶ **Child 6-17 years (body-weight 20-54 kg):** Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days (max. per dose 500 mg once daily), usual maintenance 6–8 mg/kg once daily, dose to be increased at 2-week intervals in patients who are **not** receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4
- ▶ **Child 6-17 years (body-weight 55 kg and above):** Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 300–500 mg once daily, dose to be increased at 2-week intervals in patients who are **not** receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4
- ▶ **Adult:** Initially 50 mg daily in 2 divided doses for 7 days, then increased to 100 mg daily in 2 divided doses, then increased in steps of 100 mg every 7 days, usual maintenance 300–500 mg daily in 1–2 divided doses, dose to be increased at 2-week intervals in patients who are **not** receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4

● **CAUTIONS** Elderly · low body-weight or poor appetite—monitor weight throughout treatment (fatal cases of weight loss reported in children) · metabolic acidosis—monitor serum bicarbonate concentration in children and those with other risk factors (consider dose reduction or discontinuation if metabolic acidosis develops) · risk factors for renal stone formation (particularly predisposition to nephrolithiasis)

CAUTIONS, FURTHER INFORMATION

Avoid overheating and ensure adequate hydration especially in children, during strenuous activity or in warm environment (fatal cases of heat stroke reported in children).

- **INTERACTIONS** → Appendix 1 (zonisamide).
- ▶ In adults Caution with concomitant use of drugs that increase risk of hyperthermia, metabolic acidosis, or nephrolithiasis.
- ▶ In children Caution with concomitant use of drugs that increase risk of nephrolithiasis. Contraindicated with use of drugs that increase risk of hyperthermia or metabolic acidosis.
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · agitation · alopecia · anorexia · ataxia · confusion · constipation · depression · diarrhoea · diplopia · dizziness · drowsiness · ecchymosis · fatigue · impaired attention · impaired memory · insomnia · irritability · nausea · nystagmus · paraesthesia · peripheral oedema · pruritus · psychosis · pyrexia · rash (consider withdrawal) · speech disorder · tremor · weight loss
- ▶ **Uncommon** Aggression · cholecystitis · cholelithiasis · dyspepsia · hypokalaemia · pneumonia · seizures · suicidal ideation · urinary calculus · urinary tract infection · vomiting
- ▶ **Very rare** Amnesia · aspiration · blood disorders · coma · dyspnoea · hallucinations · heat stroke · hepatitis · hydronephrosis · impaired sweating · metabolic acidosis · myasthenic syndrome · neuroleptic malignant syndrome · pancreatitis · renal failure · renal tubular acidosis · rhabdomyolysis · Stevens-Johnson syndrome · toxic epidermal necrolysis
- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated in sulfonamide hypersensitivity. Antiepileptic hypersensitivity syndrome theoretically associated with zonisamide. See under Epilepsy p. 383 for more information.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use adequate contraception during treatment and for 4 weeks after last dose.
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Manufacturer advises avoid for 4 weeks after last dose.
- **HEPATIC IMPAIRMENT** Initially increase dose at 2-week intervals if mild or moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Initially increase dose at 2-week intervals; discontinue if renal function deteriorates.
- **TREATMENT CESSATION** Avoid abrupt withdrawal (consult product literature for recommended withdrawal regimens in children).
- **PRESCRIBING AND DISPENSING INFORMATION**
Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history. Patients may need to be maintained on a specific manufacturer's branded or generic zonisamide product.
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Zonisamide for preventing seizures www.medicinesforchildren.org.uk/zonisamide-for-preventing-seizures
Children and their carers should be made aware of how to prevent and recognise overheating and dehydration.

● NATIONAL FUNDING/ACCESS DECISIONS**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (February 2014) that zonisamide (*Zonegran*®) is accepted for restricted use within NHS Scotland as adjunctive treatment of focal seizures, with or without secondary generalisation, in adolescents and children aged 6 years and above. It is restricted to use on advice from specialists in paediatric neurology or epilepsy.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Capsule

CAUTIONARY AND ADVISORY LABELS 3, 8, 10

£62.72 DT price = £62.72

BARBITURATES**Phenobarbital
(Phenobarbitone)****INDICATIONS AND DOSE**

All forms of epilepsy except typical absence seizures

BY MOUTH

- ▶ Child 1 month-11 years: Initially 1–1.5 mg/kg twice daily, then increased in steps of 2 mg/kg daily as required; maintenance 2.5–4 mg/kg 1–2 times a day
- ▶ Child 12-17 years: 60–180 mg once daily, dose to be taken at night
- ▶ Adult: 60–180 mg once daily, dose to be taken at night

Status epilepticus**BY INTRAVENOUS INJECTION**

- ▶ Adult: 10 mg/kg (max. per dose 1 g), dose to be administered at a rate not more than 100 mg/minute, injection to be diluted 1 in 10 with water for injections

BY SLOW INTRAVENOUS INJECTION

- ▶ Neonate: Initially 20 mg/kg, dose to be administered at a rate no faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day
- ▶ Child 1 month-11 years: Initially 20 mg/kg, dose to be administered at a rate no faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day
- ▶ Child 12-17 years: Initially 20 mg/kg (max. per dose 1 g), dose to be administered at a rate no faster than 1 mg/kg/minute, then 300 mg twice daily

Dose equivalence and conversion

For therapeutic purposes phenobarbital and phenobarbital sodium may be considered equivalent in effect.

- **CAUTIONS** Avoid in Acute porphyrias p. 864 · children · debilitated · elderly · history of alcohol abuse · history of drug abuse · respiratory depression (avoid if severe)

CAUTIONS, FURTHER INFORMATION

Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

- **INTERACTIONS** → Appendix 1 (phenobarbital).

● SIDE-EFFECTS

- ▶ **Common or very common** Agranulocytosis · allergic skin reactions · ataxia · behavioural disturbances · cholestasis · depression · drowsiness · hallucinations · hepatitis · hyperactivity particularly in the elderly and in children · hypotension · impaired cognition · impaired memory ·

irritability · lethargy · megaloblastic anaemia (may be treated with folic acid) · nystagmus · osteomalacia · paradoxical excitement (in adults) · respiratory depression · thrombocytopenia

- ▶ **Very rare** Antiepileptic Hypersensitivity Syndrome · Stevens-Johnson syndrome · suicidal ideation · toxic epidermal necrolysis
- ▶ **Frequency not known** Hyperkinesia (in children)
- ▶ **Overdose** For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 1123.
- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with phenobarbital. See under Epilepsy p. 383 for more information.
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Avoid if possible; drowsiness may occur.
- **HEPATIC IMPAIRMENT** May precipitate coma. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS**
 - ▶ Plasma-phenobarbital concentration for optimum response is 15–40 mg/litre (60–180 micromol/litre); however, monitoring the plasma-drug concentration is less useful than with other drugs because tolerance occurs.
- **TREATMENT CESSATION** Avoid abrupt withdrawal (dependence with prolonged use).
- **DIRECTIONS FOR ADMINISTRATION** Solution for injection must be diluted before intravenous administration.
 - ▶ With intravenous use in children For *intravenous injection*, dilute to a concentration of 20 mg/mL with Water for Injections; give over 20 minutes (no faster than 1 mg/kg/minute).
 - ▶ With oral use in children For administration by *mouth*, tablets may be crushed.
- **PRESCRIBING AND DISPENSING INFORMATION** Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients should be maintained on a specific manufacturer's product. Some hospitals supply **alcohol-free** formulations of varying phenobarbital strengths.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Phenobarbital for preventing seizures www.medicinesforchildren.org.uk/phenobarbital-for-preventing-seizures

● MEDICAL FORMS

BENZODIAZEPINES

Clobazam

The properties listed below are those particular to the drug only. For properties common to the class, see Benzodiazepines, p. 266.

INDICATIONS AND DOSE

Adjunct in epilepsy

BY MOUTH

- ▶ **Child 6-17 years:** Initially 5 mg daily, dose to be increased if necessary at intervals of 5 days, maintenance 0.3–1 mg/kg daily, daily doses of up to 30 mg may be given as a single dose at bedtime, higher doses should be divided; maximum 60 mg per day
- ▶ **Adult:** 20–30 mg daily, then increased if necessary up to 60 mg daily

Anxiety (short-term use)

BY MOUTH

- ▶ **Adult:** 20–30 mg daily in divided doses, alternatively 20–30 mg once daily, dose to be taken at bedtime; increased if necessary up to 60 mg daily in divided doses, dose only increased in severe anxiety (in hospital patients), for debilitated patients, use elderly dose
- ▶ **Elderly:** 10–20 mg daily

- **UNLICENSED USE** Not licensed for use in children under 6 years. Not licensed as monotherapy.
- **CONTRA-INDICATIONS** Chronic psychosis (in adults) · hyperkinesia · not for use alone to treat anxiety associated with depression (in adults) · obsessive states · phobic states · respiratory depression
- **CAUTIONS** Muscle weakness · organic brain changes · personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

CAUTIONS, FURTHER INFORMATION

The effectiveness of clobazam may decrease significantly after weeks or months of continuous therapy.

● SIDE-EFFECTS

- ▶ **Common or very common** Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression
- ▶ **Uncommon** Changes in libido (in adults) · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache (in adults) · hypotension (in adults) · incontinence · salivation changes · slurred speech (in adults) · tremor · urinary retention (in adults) · vertigo (in adults) · visual disturbances
- ▶ **Rare** Apnoea · blood disorders · changes in libido (in children) · headache (in children) · hypotension (in children) · jaundice · respiratory depression · skin reactions · urinary retention (in children) · vertigo (in children)
- ▶ **Frequency not known** Delusions (in children) · excitement (in children) · hallucinations (in children) · irritability (in children) · psychosis (in children) · restlessness (in children)
- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding. All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones.
- **HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Start with small doses in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ In children Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected noncompliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should not be undertaken unless clinically indicated.
- **TREATMENT CESSATION**

Antiepileptic drugs should be withdrawn under specialist supervision. Avoid abrupt withdrawal because this can precipitate severe rebound seizures. Reduction in dosage should be gradual.

The decision to withdraw antiepileptic drugs from a seizure-free patient, and its timing, is often difficult and depends on individual circumstances. Even in patients who have been seizure-free for several years, there is a significant risk of seizure recurrence on drug withdrawal. In patients receiving several antiepileptic drugs, only one drug should be withdrawn at a time.

 - ▶ In children Drugs should be gradually withdrawn over at least 2–3 months by reducing the daily dose by 10–25% at intervals of 1–2 weeks. Benzodiazepines may need to be withdrawn over 6 months or longer.
- **PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer's product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer's branded or generic clobazam product.
- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Clobazam for preventing seizures www.medicinesforchildren.org.uk/clobazam-preventing-seizures-0
- **NATIONAL FUNDING/ACCESS DECISIONS**

NHS restrictions Clobazam is not prescribable under the NHS except for epilepsy and endorsed 'SLS'.

INDICATIONS AND DOSE

All forms of epilepsy

BY MOUTH

- ▶ Child 1-11 months: Initially 250 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 0.5–1 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
- ▶ Child 1-4 years: Initially 250 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 1–3 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
- ▶ Child 5-11 years: Initially 500 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 3–6 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
- ▶ Child 12-17 years: Initially 1 mg once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 4–8 mg daily, adjusted according to response, dose usually taken at night; may be given in 3–4 divided doses if necessary
- ▶ Adult: Initially 1 mg once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 4–8 mg daily, adjusted according to response, dose usually taken at night; may be given in 3–4 divided doses if necessary
- ▶ Elderly: Initially 500 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 4–8 mg daily, adjusted according to response, dose usually taken at night; may be given in 3–4 divided doses if necessary

● UNLICENSED USE

- In children Clonazepam doses in BNFC may differ from those in product literature.
- ▶ In adults Clonazepam doses in BNF may differ from those in product literature.
- **CONTRA-INDICATIONS** Coma · current alcohol abuse · current drug abuse · respiratory depression
- **CAUTIONS** Acute porphyrias p. 864 · airways obstruction · brain damage · cerebellar ataxia · depression · spinal ataxia · suicidal ideation

CAUTIONS, FURTHER INFORMATION

The effectiveness of clonazepam may decrease significantly after weeks or months of continuous therapy.

● SIDE-EFFECTS

- ▶ **Common or very common** Amnesia · bronchial hypersecretion in infants and small children · co-ordination disturbances · confusion · dependence · dizziness · drowsiness · fatigue · muscle hypotonia · nystagmus · poor concentration · restlessness · salivary hypersecretion in infants and small children · withdrawal symptoms (in children)
- ▶ **Rare** Aggression · anxiety · blood disorders · dysarthria · gastro-intestinal symptoms · headache · paradoxical effects · pruritus · respiratory depression · reversible hair loss · sexual dysfunction · skin pigmentation changes · suicidal ideation (in adults) · urinary incontinence · urticaria · visual disturbances on long-term treatment
- ▶ **Very rare** Increase in seizure frequency
- **BREAST FEEDING** Present in milk, and should be avoided if possible during breast-feeding. All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones.

● **HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

● **RENAL IMPAIRMENT** Start with small doses in severe impairment.

● **MONITORING REQUIREMENTS** Routine measurement of plasma concentrations of antiepileptic drugs is not

Clonazepam

6.2 Status epilepticus

Drugs used for Status epilepticus not listed below;

Diazepam, p. 267 · *Fosphenytoin sodium*, p. 391 ·

Phenobarbital, p. 409 · *Phenytoin*, p. 398

BARBITURATES

Thiopental sodium (Thiopentone sodium)

INDICATIONS AND DOSE

Status epilepticus (only if other measures fail)

BY SLOW INTRAVENOUS INJECTION

▶ Adult: 75–125 mg for 1 dose, to be administered as a 2.5% (25 mg/mL) solution

Induction of anaesthesia

BY SLOW INTRAVENOUS INJECTION

▶ Adult: Initially 100–150 mg, to be administered over 10–15 seconds usually as a 2.5% (25 mg/mL) solution, followed by 100–150 mg after 0.5–1 minute if required, dose to be given in fit and premedicated adults; debilitated patients or adults over 65 years may require a lower dose or increased administration time,

alternatively initially up to 4 mg/kg (max. per dose 500 mg)

Anaesthesia of short duration

BY SLOW INTRAVENOUS INJECTION

▶ Adult: Initially 100–150 mg, to be administered over 10–15 seconds usually as a 2.5% (25 mg/mL) solution, followed by 100–150 mg after 0.5–1 minute if required, dose to be given in fit and premedicated adults; debilitated patients or adults over 65 years may require a lower dose or increased administration time, alternatively initially up to 4 mg/kg (max. per dose 500 mg)

Reduction of raised intracranial pressure if ventilation controlled

BY SLOW INTRAVENOUS INJECTION

▶ Adult: 1.5–3 mg/kg, repeated if necessary

Important safety information

Thiopental sodium should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 · myotonic dystrophy
- **CAUTIONS** Acute circulatory failure (shock) · avoid intra-arterial injection · cardiovascular disease · elderly · fixed cardiac output · hypovolaemia · reconstituted solution is highly alkaline (extravasation causes tissue necrosis and severe pain)
- **INTERACTIONS** → Appendix 1 (anaesthetics, general).
- **SIDE-EFFECTS** Arrhythmias · cough · headache · hypersensitivity reactions · hypotension · laryngeal spasm · myocardial depression · rash · sneezing
- **PREGNANCY** May depress neonatal respiration when used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **HEPATIC IMPAIRMENT** Use with caution—reduce dose.
- **RENAL IMPAIRMENT** Caution in severe impairment.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Powder for solution for injection

▶ **THIOPENTAL SODIUM (Non-proprietary)**

Thiopental sodium 500 mg Thiopental 500mg powder for solution for injection vials | 25 vial **[PoM]** £143.75

BENZODIAZEPINES

Lorazepam

The properties listed below are those particular to the drug only. For properties common to the class, see Benzodiazepines, p. 266.

INDICATIONS AND DOSE

Status epilepticus | Febrile convulsions | Convulsions caused by poisoning

BY SLOW INTRAVENOUS INJECTION INTO LARGE VEIN

- ▶ Child 1 month–11 years: 100 micrograms/kg (max. per dose 4 mg) for 1 dose, then 100 micrograms/kg after 10 minutes (max. per dose 4 mg) if required for 1 dose
- ▶ Child 12–17 years: 4 mg for 1 dose, then 4 mg after 10 minutes if required for 1 dose
- ▶ Adult: 4 mg for 1 dose, then 4 mg after 10 minutes if required for 1 dose

Short-term use in anxiety

BY MOUTH

- ▶ Adult: 1–4 mg daily in divided doses, for debilitated patients, use elderly dose
- ▶ Elderly: 0.5–2 mg daily in divided doses

Short-term use in insomnia associated with anxiety

BY MOUTH

- ▶ Adult: 1–2 mg daily, to be taken at bedtime

Acute panic attacks

BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 25–30 micrograms/kg every 6 hours if required; usual dose 1.5–2.5 mg every 6 hours if required, intravenous injection to be administered into a large vein, only use intramuscular route when oral and intravenous routes not possible

Conscious sedation for procedures

BY MOUTH

- ▶ Adult: 2–3 mg, to be taken the night before operation; 2–4 mg, to be taken 1–2 hours before operation

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 50 micrograms/kg, to be administered 30–45 minutes before operation

BY INTRAMUSCULAR INJECTION

- ▶ Adult: 50 micrograms/kg, to be administered 60–90 minutes before operation

Premedication

BY MOUTH

- ▶ Adult: 2–3 mg, to be taken the night before operation; 2–4 mg, to be taken 1–2 hours before operation

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 50 micrograms/kg, to be administered 30–45 minutes before operation

BY INTRAMUSCULAR INJECTION

- ▶ Adult: 50 micrograms/kg, to be administered 60–90 minutes before operation

● **UNLICENSED USE**

- ▶ In children Not licensed for use in febrile convulsions. Not licensed for use in convulsions caused by poisoning. Not licensed for use as premedication in children under 12 years. Not licensed for use as premedication in children under 5 years.

Important safety information

ANAESTHESIA

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · chronic psychosis (in adults) · CNS depression · compromised airway · hyperkinesia · not for use alone to treat depression (or anxiety associated with depression) (in adults) · obsessional states · phobic states · respiratory depression
- **CAUTIONS** Muscle weakness · organic brain changes · parenteral administration · personality disorder (within

the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

CAUTIONS, FURTHER INFORMATION

Special precautions for parenteral administration When given parenterally, facilities for managing respiratory depression with mechanical ventilation must be available. Close observation required until full recovery from sedation.

Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Amnesia · ataxia (in children) · ataxia (especially in the elderly) (in adults) · confusion (in children) · confusion (especially in the elderly) (in adults) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression
- ▶ **Uncommon** Changes in libido (in adults) · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache (in adults) · hypotension (in adults) · incontinence · salivation changes · slurred speech (in adults) · tremor · urinary retention (in adults) · vertigo (in adults) · visual disturbances
- ▶ **Rare** Apnoea · blood disorders · changes in libido (in children) · headache (in children) · hypotension (in children) · jaundice · respiratory depression · skin reactions · urinary retention (in children) · vertigo (in children)
- ▶ **Frequency not known** Delusions (in children) · excitement (in children) · hallucinations (in children) · irritability (in children) · marked respiratory depression, particularly with high dose and intravenous use (facilities for its treatment are essential) · pain (on intravenous injection) · psychosis (in children) · restlessness (in children) · thrombophlebitis (on intravenous injection)
- **PREGNANCY** Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol. All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.
- **HEPATIC IMPAIRMENT** Can precipitate coma. Start with smaller initial doses or reduce dose. If treatment is necessary, benzodiazepines with shorter half-lives are safer. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Start with small doses in severe impairment.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ In children For *intravenous injection*, dilute with an equal volume of Sodium Chloride 0.9% (for neonates, dilute injection solution to a concentration of 100 micrograms/mL). Give over 3–5 minutes; max. rate 50 micrograms/kg over 3 minutes.
- ▶ In adults For intramuscular injection, solution for injection should be diluted with an equal volume of water for injections or sodium chloride 0.9% (but only use when oral and intravenous routes not possible). For slow intravenous injection, solution for injection should preferably be diluted with an equal volume of water for injections or sodium chloride 0.9%.

- PATIENT AND CARER ADVICE** May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day. Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking **alcohol** should be emphasised.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, oral solution, oral suspension

Midazolam

The properties listed below are those particular to the drug only. For properties common to the class, see Benzodiazepines, p. 266.

INDICATIONS AND DOSE

Status epilepticus | Febrile convulsions

BY BUCCAL ADMINISTRATION

- Child 1-2 months: 300 micrograms/kg (max. per dose 2.5 mg), then 300 micrograms/kg after 10 minutes (max. per dose 2.5 mg) if required
- Child 3-11 months: 2.5 mg, then 2.5 mg after 10 minutes if required
- Child 1-4 years: 5 mg, then 5 mg after 10 minutes if required
- Child 5-9 years: 7.5 mg, then 7.5 mg after 10 minutes if required
- Adult: 10 mg, then 10 mg after 10 minutes if required

Conscious sedation for procedures

BY SLOW INTRAVENOUS INJECTION

- Adult: Initially 2–2.5 mg, to be administered 5–10 minutes before procedure at a rate of approximately 2 mg/minute, increased in steps of 1 mg if required, usual total dose is 3.5–5 mg; maximum 7.5 mg per course
- Elderly: Initially 0.5–1 mg, to be administered 5–10 minutes before procedure at a rate of approximately 2 mg/minute, increased in steps of 0.5–1 mg if required; maximum 3.5 mg per course

Sedative in combined anaesthesia

INITIALLY BY INTRAVENOUS INJECTION

- Adult: 30–100 micrograms/kg, repeated if necessary, alternatively (by continuous intravenous infusion) 30–100 micrograms/kg/hour
- Elderly: Lower doses needed

Premedication

BY DEEP INTRAMUSCULAR INJECTION

- Adult: 70–100 micrograms/kg, to be administered 20–60 minutes before induction, for debilitated patients, use elderly dose
- Elderly: 25–50 micrograms/kg, to be administered 20–60 minutes before induction

BY INTRAVENOUS INJECTION

- Adult: 1–2 mg, repeated if necessary, to be administered 5–30 minutes before procedure, for debilitated patients, use elderly dose
- Elderly: 0.5 mg, repeated if necessary, to be administered 5–30 minutes before procedure, repeat dose slowly as required

Induction of anaesthesia (but rarely used)

BY SLOW INTRAVENOUS INJECTION

- Adult: 150–200 micrograms/kg daily in divided doses (max. per dose 5 mg), dose to be given at intervals of 2 minutes, maximum total dose 600 micrograms/kg, for debilitated patients, use elderly dose
- Elderly: 50–150 micrograms/kg daily in divided doses (max. per dose 5 mg), dose to be given at intervals of 2 minutes, maximum total dose 600 micrograms/kg

Sedation of patient receiving intensive care

INITIALLY BY SLOW INTRAVENOUS INJECTION

- Adult: Initially 30–300 micrograms/kg, dose to be given in steps of 1–2.5 mg every 2 minutes, then (by slow intravenous injection or by continuous intravenous infusion) 30–200 micrograms/kg/hour, reduce dose (or reduce or omit initial dose) in hypovolaemia, vasoconstriction, or hypothermia, lower doses may be adequate if opioid analgesic also used

Confusion and restlessness in palliative care

BY SUBCUTANEOUS INFUSION

- Adult: Initially 10–20 mg/24 hours, adjusted according to response; usual dose 20–60 mg/24 hours

Convulsions in palliative care

BY CONTINUOUS SUBCUTANEOUS INFUSION

- Adult: Initially 20–40 mg/24 hours

- UNLICENSED USE** Oromucosal solution not licensed for use in children under 3 months. Oromucosal solution not licensed for use in adults over 18 years. Unlicensed oromucosal formulations are also available and may have different doses—refer to product literature. Injection not licensed for use in status epilepticus or febrile convulsions.
 - In children Not licensed for use in children under 6 months for premedication and conscious sedation. Not licensed for use by mouth. Not licensed for use by buccal administration for conscious sedation.

Important safety information

ANAESTHESIA

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

PRESCRIBING OF MIDAZOLAM IN PALLIATIVE CARE

The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be considered in palliative care and other situations where a higher strength may be more appropriate to administer the prescribed dose, and where the risk of overdosage has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

- CONTRA-INDICATIONS** CNS depression • compromised airway • severe respiratory depression

- **CAUTIONS** Cardiac disease · children (particularly if cardiovascular impairment) · concentration of midazolam in children under 15 kg not to exceed 1 mg/mL · debilitated patients (reduce dose) · hypothermia · hypovolaemia (risk of severe hypotension) · neonates · risk of airways obstruction and hypoventilation in children under 6 months (monitor respiratory rate and oxygen saturation) · vasoconstriction

CAUTIONS, FURTHER INFORMATION

Recovery when used for sedation Midazolam has a fast onset of action, recovery is faster than for other benzodiazepines such as diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing.

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Amnesia · anaphylaxis · ataxia · blood disorders · bronchospasm · cardiac arrest · changes in libido (in adults) · confusion · convulsions (more common in neonates) · depression of consciousness · dizziness · drowsiness · dry mouth · dysarthria · euphoria · fatigue (in children) · gastro-intestinal disturbances · hallucinations · headache · heart rate changes · hiccups · hypotension · incontinence · increased appetite · injection-site reactions · involuntary movements · jaundice · laryngospasm · muscle weakness · paradoxical aggression (especially in children and elderly) · paradoxical excitement (especially in children and elderly) · respiratory arrest (particularly with high doses or on rapid injection) · respiratory depression (may be severe with sedative and peri-operative use—facilities for its treatment are essential) · respiratory depression (particularly with high doses or on rapid injection) · restlessness (with sedative and peri-operative use) (in children) · salivation changes · severe disinhibition (with sedative and peri-operative use) (in children) · skin reactions · thrombosis · urinary retention · vertigo · visual disturbances

SPECIFIC SIDE-EFFECTS

- ▶ With intranasal use burning sensation (in children) · lacrimation (in children) · severe irritation of nasal mucosa (in children)

SIDE-EFFECTS, FURTHER INFORMATION

Sedation Midazolam is associated with profound sedation when high doses are given or when it is used with certain other drugs. Midazolam is not recommended for prolonged sedation in neonates; drug accumulation is likely to occur.

Overdose There have been reports of overdosage when high strength midazolam has been used for conscious sedation. The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

- **PREGNANCY** Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol. All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).
- **BREAST FEEDING** Small amount present in milk—avoid breast-feeding for 24 hours after administration (although amount probably too small to be harmful after single doses).
- **HEPATIC IMPAIRMENT** Use with caution particularly in sedative doses; can precipitate coma. For status epilepticus and febrile convulsions: use with caution in

mild to moderate impairment; avoid in severe impairment.

- **RENAL IMPAIRMENT** Use with caution in chronic renal failure.
- **DIRECTIONS FOR ADMINISTRATION**
For intravenous infusion (*Hypnovel*[®]), give continuously in Glucose 5% or Sodium chloride 0.9%.
For neonate and children under 15 kg dilute to a max. concentration of 1 mg/mL.
▶ With intravenous use in children For intravenous injection in status epilepticus and febrile convulsions, dilute with Glucose 5% or Sodium Chloride 0.9%; rapid intravenous injection (less than 2 minutes) may cause seizure-like myoclonus in preterm neonate.
▶ With intravenous use in neonates *Neonatal intensive care*, dilute 15 mg/kg body-weight to a final volume of 5 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 30 micrograms/kg/hour.
▶ With oral use in children For administration *by mouth* for sedation and premedication, injection solution may be diluted with apple or black currant juice, chocolate sauce, or cola.
▶ With rectal use in children For *rectal administration* of the injection solution for sedation and premedication, attach a plastic applicator onto the end of a syringe; if the volume to be given rectally is too small, dilute with Water for Injections.
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Midazolam for stopping seizures www.medicinesforchildren.org.uk/midazolam-for-stopping-seizures
Patients or carers should be given advice on how to administer midazolam oromucosal solution.
Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking **alcohol** should be emphasised.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, solution for injection, oral suspension, solution for infusion, oral solution, oromucosal solution, infusion

Oromucosal solution

7 Sleep disorders

7.1 Insomnia

Hypnotics and anxiolytics

Most anxiolytics ('sedatives') will induce sleep when given at night and most hypnotics will sedate when given during the day. Prescribing of these drugs is widespread but dependence (both physical and psychological) and tolerance occur. This may lead to difficulty in withdrawing the drug after the patient has been taking it regularly for more than a few weeks. Hypnotics and anxiolytics should therefore be reserved for short courses to alleviate acute conditions after causal factors have been established.

Benzodiazepines are the most commonly used anxiolytics and hypnotics; they act at benzodiazepine receptors which are associated with gamma-aminobutyric acid (GABA) receptors. Older drugs such as meprobamate p. 265 and barbiturates are **not** recommended—they have more side-effects and interactions than benzodiazepines and are much more dangerous in overdose.

Benzodiazepine indications

- Benzodiazepines are indicated for the short-term relief (two to four weeks only) of anxiety that is severe, disabling, or causing the patient unacceptable distress, occurring alone or in association with insomnia or short-term psychosomatic, organic, or psychotic illness.
- The use of benzodiazepines to treat short-term 'mild' anxiety is inappropriate.
- Benzodiazepines should be used to treat insomnia only when it is severe, disabling, or causing the patient extreme distress.

Dependence and withdrawal

Withdrawal of a benzodiazepine should be gradual because abrupt withdrawal may produce confusion, toxic psychosis, convulsions, or a condition resembling delirium tremens.

The benzodiazepine withdrawal syndrome may develop at any time up to 3 weeks after stopping a long-acting benzodiazepine, but may occur within a day in the case of a short-acting one. It is characterised by insomnia, anxiety, loss of appetite and of body-weight, tremor, perspiration, tinnitus, and perceptual disturbances. Some symptoms may be similar to the original complaint and encourage further

prescribing; some symptoms may continue for weeks or months after stopping benzodiazepines.

Benzodiazepine withdrawal should be flexible and carried out at a reduction rate that is tolerable for the patient. The rate should depend on the initial dose of benzodiazepine, duration of use, and the patient's clinical response. Short-term users of benzodiazepines (2–4 weeks only) can usually taper off within 2–4 weeks. However, long-term users should be withdrawn over a much longer period of several months or more.

A suggested protocol for withdrawal for prescribed long-term benzodiazepine patients is as follows:

- Transfer patient stepwise, one dose at a time over about a week, to an equivalent daily dose of diazepam preferably taken at night.
- Reduce diazepam dose, usually by 1–2 mg every 2–4 weeks (in patients taking high doses of benzodiazepines, initially it may be appropriate to reduce the dose by up to one-tenth every 1–2 weeks). If uncomfortable withdrawal symptoms occur, maintain this dose until symptoms lessen.
- Reduce diazepam dose further, if necessary in smaller steps; steps of 500 micrograms may be appropriate towards the end of withdrawal. Then stop completely.
- For long-term patients, the period needed for complete withdrawal may vary from several months to a year or more.

Approximate equivalent doses, diazepam 5 mg

- ≡ alprazolam 250 micrograms
- ≡ clobazam 10 mg
- ≡ clonazepam 250 micrograms
- ≡ flurazepam 7.5–15 mg
- ≡ chlordiazepoxide 12.5 mg
- ≡ loprazolam 0.5–1 mg
- ≡ lorazepam 500 micrograms
- ≡ lormetazepam 0.5–1 mg
- ≡ nitrazepam 5 mg
- ≡ oxazepam 10 mg
- ≡ temazepam 10 mg

Withdrawal symptoms for long-term users usually resolve within 6–18 months of the last dose. Some patients will recover more quickly, others may take longer. The addition of beta-blockers, antidepressants and antipsychotics should be **avoided** where possible.

Counselling can be of considerable help both during and after the taper.

Hypnotics

Before a hypnotic is prescribed the cause of the insomnia should be established and, where possible, underlying factors should be treated. However, it should be noted that some patients have unrealistic sleep expectations, and others understate their alcohol consumption which is often the cause of the insomnia. Short-acting hypnotics are preferable in patients with sleep onset insomnia, when sedation the following day is undesirable, or when prescribing for elderly patients. Long-acting hypnotics are indicated in patients with poor sleep maintenance (e.g. early morning waking) that causes daytime effects, when an anxiolytic effect is needed during the day, or when sedation the following day is acceptable.

Transient insomnia may occur in those who normally sleep well and may be due to extraneous factors such as noise, shift work, and jet lag. If a hypnotic is indicated one that is rapidly eliminated should be chosen, and only one or two doses should be given.

Short-term insomnia is usually related to an emotional problem or serious medical illness. It may last for a few weeks and may recur; a hypnotic can be useful but should not be given for more than three weeks (preferably only one week). Intermittent use is desirable with omission of some doses. A short-acting drug is usually appropriate.

Chronic insomnia is rarely benefited by hypnotics and is sometimes due to mild dependence caused by injudicious prescribing of hypnotics. Psychiatric disorders such as anxiety, depression, and abuse of drugs and alcohol are common causes. Sleep disturbance is very common in depressive illness and early wakening is often a useful pointer. The underlying psychiatric complaint should be treated, adapting the drug regimen to alleviate insomnia. For example, clomipramine hydrochloride p. 294 or mirtazapine p. 291 prescribed for depression will also help to promote sleep if taken at night. Other causes of insomnia include daytime cat-napping and physical causes such as pain, pruritus, and dyspnoea.

Hypnotics should **not** be prescribed indiscriminately and routine prescribing is undesirable. They should be reserved for short courses in the acutely distressed. Tolerance to their effects develops within 3 to 14 days of continuous use and long-term efficacy cannot be assured. A major drawback of long-term use is that withdrawal can cause rebound insomnia and a withdrawal syndrome.

Where prolonged administration is unavoidable hypnotics should be discontinued as soon as feasible and the patient warned that sleep may be disturbed for a few days before normal rhythm is re-established; broken sleep with vivid dreams may persist for several weeks.

Elderly

Benzodiazepines and the Z-drugs should be avoided in the elderly, because the elderly are at greater risk of becoming ataxic and confused, leading to falls and injury.

Dental patients

Some anxious patients may benefit from the use of hypnotics during dental procedures such as temazepam p. 420 or diazepam p. 267. Temazepam p. 420 is preferred when it is important to minimise any residual effect the following day.

Benzodiazepines

Benzodiazepines used as hypnotics include nitrazepam p. 419 and flurazepam p. 418 which have a prolonged action and may give rise to residual effects on the following day; repeated doses tend to be cumulative.

Loprazolam p. 418, lormetazepam p. 419, and temazepam p. 420 act for a shorter time and they have little or no hangover effect. Withdrawal phenomena are more common with the short-acting benzodiazepines.

If insomnia is associated with daytime anxiety then the use of a long-acting benzodiazepine anxiolytic such as diazepam p. 267 given as a single dose at night may effectively treat both symptoms.

Zaleplon, zolpidem, and zopiclone

Zaleplon p. 422, zolpidem tartrate p. 423 and zopiclone p. 423 are non-benzodiazepine hypnotics (sometimes referred to as Z-drugs), but they act at the benzodiazepine receptor. They are not licensed for long-term use; dependence has been reported in a small number of patients. Zolpidem tartrate and zopiclone have a short duration of action; zaleplon is very short acting.

Chloral and derivatives

There is no convincing evidence that they are particularly useful in the elderly and their role as hypnotics is now very limited.

Clomethiazole

Clomethiazole p. 421 may be a useful hypnotic for elderly patients because of its freedom from hangover but, as with all hypnotics, routine administration is undesirable and dependence occurs.

Antihistamines

Some **antihistamines** such as promethazine hydrochloride p. 251 are on sale to the public for occasional insomnia; their prolonged duration of action can often cause drowsiness the following day. The sedative effect of

antihistamines may diminish after a few days of continued treatment; antihistamines are associated with headache, psychomotor impairment and antimuscarinic effects.

Alcohol

Alcohol is a poor hypnotic because the diuretic action interferes with sleep during the latter part of the night. Alcohol also disturbs sleep patterns, and so can worsen sleep disorders.

Melatonin

Melatonin p. 422 is a pineal hormone; it is licensed for the short-term treatment of insomnia in adults over 55 years.

Anxiolytics

Benzodiazepine anxiolytics can be effective in alleviating anxiety states. Although these drugs are sometimes prescribed for stress-related symptoms, unhappiness, or minor physical disease, their use in such conditions is inappropriate. Benzodiazepine anxiolytics should not be used as sole treatment for chronic anxiety, and they are not appropriate for treating depression or chronic psychosis. In bereavement, psychological adjustment may be inhibited by benzodiazepines.

Anxiolytic benzodiazepine treatment should be limited to the lowest possible dose for the shortest possible time.

Dependence is particularly likely in patients with a history of alcohol or drug abuse and in patients with marked personality disorders.

Some antidepressant drugs are licensed for use in anxiety and related disorders. Some antipsychotic drugs, in low doses, are also sometimes used in severe anxiety for their sedative action, but long-term use should be avoided because of the risk of adverse effects. The use of antihistamines (e.g. hydroxyzine hydrochloride p. 248) for their sedative effect in anxiety is not appropriate.

Beta-adrenoceptor blocking drugs do not affect psychological symptoms of anxiety, such as worry, tension, and fear, but they do reduce autonomic symptoms, such as palpitation and tremor; they do not reduce non-autonomic symptoms, such as muscle tension. Beta-blockers are therefore indicated for patients with predominantly somatic symptoms; this, in turn, may prevent the onset of worry and fear.

Benzodiazepines

Benzodiazepines are indicated for the *short-term relief of severe anxiety*; long-term use should be avoided. Diazepam p. 267, alprazolam p. 266, chlordiazepoxide hydrochloride p. 267, and clobazam p. 410 have a sustained action. Shorter-acting compounds such as lorazepam p. 412 and oxazepam p. 420 may be preferred in patients with hepatic impairment but they carry a greater risk of withdrawal symptoms.

In *panic disorders* (with or without agoraphobia) resistant to antidepressant therapy, a benzodiazepine may be used; alternatively, a benzodiazepine may be used as short-term adjunctive therapy at the start of antidepressant treatment to prevent the initial worsening of symptoms.

Diazepam p. 267 or lorazepam p. 412 are very occasionally administered intravenously for the *control of panic attacks*. This route is the most rapid but the procedure is not without risk and should be used only when alternative measures have failed. The intramuscular route has no advantage over the oral route.

Buspirone

Buspirone hydrochloride p. 269 is thought to act at specific serotonin (5HT_{1A}) receptors. Response to treatment may take up to 2 weeks. It does not alleviate the symptoms of benzodiazepine withdrawal. Therefore a patient taking a benzodiazepine still needs to have the benzodiazepine withdrawn gradually; it is advisable to do this before starting buspirone hydrochloride. The dependence and abuse potential of buspirone hydrochloride is low; it is,

however, licensed for short-term use only (but specialists occasionally use it for several months).

Meprobamate

Meprobamate p. 265 is **less effective** than the benzodiazepines, more hazardous in overdose, and can also induce dependence. It is **not** recommended.

Barbiturates

The intermediate-acting **barbiturates** have a place only in the treatment of severe intractable insomnia in patients **already taking** barbiturates; they should be **avoided** in the elderly. Intermediate-acting barbiturate preparations containing amobarbital sodium, butobarbital, and secobarbital sodium are available on a named patient basis.

The long-acting barbiturate phenobarbital is still sometimes used in epilepsy but its use as a sedative is unjustified.

The very short-acting barbiturate thiopental sodium p. 412 is used in anaesthesia.

Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

Drugs used for Insomnia not listed below: *Diazepam*, p. 267 · *Promethazine hydrochloride*, p. 251

BENZODIAZEPINES

Flurazepam

The properties listed below are those particular to the drug only. For properties common to the class, see Benzodiazepines, p. 266.

INDICATIONS AND DOSE

Insomnia (short-term use)

BY MOUTH

- ▶ Adult: 15–30 mg once daily, dose to be taken at bedtime, for debilitated patients, use elderly dose
- ▶ Elderly: 15 mg once daily, dose to be taken at bedtime

- **CONTRA-INDICATIONS** Not for use alone to treat chronic psychosis · not for use alone to treat depression (or anxiety associated with depression) · respiratory depression

- **CAUTIONS** Acute porphyrias p. 864 · hypoalbuminaemia · marked personality disorder · muscle weakness

CAUTIONS, FURTHER INFORMATION

Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts.

Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

● SIDE-EFFECTS

- ▶ **Common or very common** Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression
- ▶ **Uncommon** Changes in libido · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache · hypotension · incontinence · salivation changes · slurred speech · tremor · urinary retention · vertigo · visual disturbances
- ▶ **Rare** Apnoea · blood disorders · jaundice · respiratory depression · skin reactions
- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment. Start with smaller initial doses or reduce dose. Can precipitate coma. If treatment is necessary, benzodiazepines with

shorter half-lives (such as temazepam or oxazepam) are safer.

- **RENAL IMPAIRMENT** Start with small doses in severe impairment.
- **PATIENT AND CARER ADVICE** May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NHS restrictions Flurazepam capsules are not prescribable under the NHS.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

 - ▶ **Uncommon** Changes in libido · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache · hypotension · incontinence · salivation changes · slurred speech · tremor · urinary retention · vertigo · visual disturbances
 - ▶ **Rare** Apnoea · blood disorders · jaundice · respiratory depression · skin reactions
- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.
- **HEPATIC IMPAIRMENT** If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer. Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Start with small doses in severe impairment.
- **PATIENT AND CARER ADVICE** May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol.

Moreover the hangover effects of a night dose may impair driving on the following day.

MEDICINAL FORMS

Nitrazepam 5 mg Nitrazepam 5mg tablets | 28 tablet [PoM] £10.55
DT price = £1.84 Schedule 4 (CD Benz) | 500 tablet [PoM] £125.00
Schedule 4 (CD Benz)

▶ Brands may include Mogadon

Oral suspension

CAUTIONARY AND ADVISORY LABELS 19

▶ NITRAZEPAM (Non-proprietary)

Nitrazepam 500 microgram per 1 ml Nitrazepam 2.5mg/5ml oral suspension | 150 ml [PoM] £10.60 DT price = £10.60 Schedule 4 (CD Benz)

● **RENAL IMPAIRMENT** Start with small doses in severe impairment.

● **PATIENT AND CARER ADVICE** May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2

▶ OXAZEPAM (Non-proprietary)

Oxazepam 10 mg Oxazepam 10mg tablets | 28 tablet [PoM] £13.00
DT price = £1.53 Schedule 4 (CD Benz)

Oxazepam 15 mg Oxazepam 15mg tablets | 28 tablet [PoM] £14.50
DT price = £1.54 Schedule 4 (CD Benz)

Oxazepam

The properties listed below are those particular to the drug only. For properties common to the class, see Benzodiazepines, p. 266.

INDICATIONS AND DOSE

Anxiety (short-term use)

BY MOUTH

▶ Adult: 15–30 mg 3–4 times a day, for debilitated patients, use elderly dose

▶ Elderly: 10–20 mg 3–4 times a day

Insomnia associated with anxiety

BY MOUTH

▶ Adult: 15–25 mg once daily (max. per dose 50 mg), dose to be taken at bedtime

● **CONTRA-INDICATIONS** Chronic psychosis · hyperkinesia · not for use alone to treat depression (or anxiety associated with depression) · obsessive states · phobic states · respiratory depression

● **CAUTIONS** Muscle weakness · organic brain changes · personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

CAUTIONS, FURTHER INFORMATION

Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

SIDE-EFFECTS

- ▶ **Common or very common** Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression
- ▶ **Uncommon** Changes in libido · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache · hypotension · incontinence · salivation changes · slurred speech · tremor · urinary retention · vertigo · visual disturbances
- ▶ **Rare** Apnoea · blood disorders · jaundice · respiratory depression · skin reactions

● **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

● **HEPATIC IMPAIRMENT** If treatment is necessary, benzodiazepines with shorter half-lives are safer. Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

Temazepam

The properties listed below are those particular to the drug only. For properties common to the class, see Benzodiazepines, p. 266.

INDICATIONS AND DOSE

Insomnia (short-term use)

BY MOUTH

▶ Adult: 10–20 mg once daily, alternatively 30–40 mg once daily, higher dose range only to be administered in exceptional circumstances, dose to be taken at bedtime, for debilitated patients, use elderly dose

▶ Elderly: 10 mg once daily, alternatively 20 mg once daily, higher dose only to be administered in exceptional circumstances, dose to be taken at bedtime

Conscious sedation for dental procedures

BY MOUTH

▶ Adult: 15–30 mg, to be administered 30–60 minutes before procedure

Premedication before surgery or investigatory procedures

BY MOUTH

- ▶ Adult: 10–20 mg, to be taken 1–2 hours before procedure, alternatively 30 mg, to be taken 1–2 hours before procedure, higher alternate dose only administered in exceptional circumstances
- ▶ Elderly: 10 mg, to be taken 1–2 hours before procedure, alternatively 20 mg, to be taken 1–2 hours before procedure, higher alternate dose only administered in exceptional circumstances

● **UNLICENSED USE** Temazepam doses in BNF may differ from those in product literature. Not licensed for conscious sedation for dental procedures.

● **CONTRA-INDICATIONS** CNS depression · compromised airway · hyperkinesia · not for use alone to treat chronic psychosis · not for use alone to treat depression (or anxiety associated with depression) · obsessive state · phobic states · respiratory depression

● **CAUTIONS** Hypoalbuminaemia · muscle weakness · organic brain changes · personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive)—may increase risk of dependence

CAUTIONS, FURTHER INFORMATION

Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

● SIDE-EFFECTS

- ▶ **Common or very common** Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression
- ▶ **Uncommon** Changes in libido · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache · hypotension · incontinence · salivation changes · slurred speech · tremor · urinary retention · vertigo · visual disturbances
- ▶ **Rare** Apnoea · blood disorders · jaundice · skin reactions
- ▶ **Frequency not known** Respiratory depression (may be marked when used for sedation; facilities for its treatment are essential)
- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.
- **HEPATIC IMPAIRMENT** If treatment is necessary, benzodiazepines with shorter half-lives are safer. Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Start with small doses in severe impairment.
- **PATIENT AND CARER ADVICE** May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day. Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. Responsible persons should be available to take patients home afterwards. The dangers of taking **alcohol** should be emphasised.

● PROFESSIONAL SPECIFIC INFORMATION

Dental practitioners' formulary Temazepam Tablets may be prescribed. Temazepam Oral Solution may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 19

CNS DEPRESSANTS

Chloral hydrate

INDICATIONS AND DOSE

Insomnia (short-term use)

BY MOUTH USING ORAL SOLUTION

- ▶ Adult: 0.5–2 g daily, dose to be taken at bedtime

WELLDORM® ELIXIR

Insomnia (short-term use)

BY MOUTH

- ▶ Adult: 15–45 mL, alternatively 0.4–1.3 g, dose to be taken with water or milk at bedtime; maximum 70 mL per day; maximum 2 g per day

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 · gastritis · severe cardiac disease
- **CAUTIONS** Avoid contact with mucous membranes · avoid contact with skin · avoid prolonged use (and abrupt withdrawal thereafter) · reduce dose in debilitated · reduce dose in elderly
- **INTERACTIONS** → Appendix 1 (anxiolytics and hypnotics).
- **SIDE-EFFECTS** Abdominal distention · delirium (especially on abrupt withdrawal) · dependence · excitement · flatulence · gastric irritation · headache · ketonuria · nausea · rash · tolerance · vomiting
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Risk of sedation in infant—avoid.
- **HEPATIC IMPAIRMENT** Reduce dose in mild to moderate impairment. Can precipitate coma. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With oral use For administration *by mouth* dilute liquid with plenty of water or juice to mask unpleasant taste.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include black currant. When prepared extemporaneously, the BP states Chloral Mixture, BP 2000 consists of chloral hydrate 500 mg/5 mL in a suitable vehicle.
- **PATIENT AND CARER ADVICE** Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
- **LESS SUITABLE FOR PRESCRIBING** Chloral hydrate is less suitable for prescribing in insomnia.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, oral suspension, oral solution, enema

Clomethiazole (Chlormethiazole)

INDICATIONS AND DOSE

Severe insomnia (short-term use)

BY MOUTH USING CAPSULES

- ▶ Elderly: 192–384 mg daily, dose to be taken at bedtime

BY MOUTH USING ORAL SOLUTION

- ▶ Elderly: 5–10 mL daily, dose to be taken at bedtime

Restlessness and agitation

BY MOUTH USING CAPSULES

- ▶ Elderly: 192 mg 3 times a day

BY MOUTH USING ORAL SOLUTION

- ▶ Elderly: 5 mL 3 times a day

Alcohol withdrawal

INITIALLY BY MOUTH USING CAPSULES

- ▶ Adult: Initially 2–4 capsules, to be repeated if necessary after some hours, then (by mouth) continued →

9–12 capsules daily in 3–4 divided doses for day 1 (first 24 hours), then (by mouth) 6–8 capsules daily in 3–4 divided doses for day 2, then (by mouth) 4–6 capsules daily in 3–4 divided doses for day 3, dose then to be gradually reduced over days 4–6, total treatment for not more than 9 days

BY MOUTH USING ORAL SOLUTION

▶ **Adult:** Initially 10–20 mL, to be repeated if necessary after some hours, then 45–60 mL daily in 3–4 divided doses for day 1 (first 24 hours), then 30–40 mL daily in 3–4 divided doses for day 2, then 20–30 mL daily in 3–4 divided doses for day 3, dose then to be gradually reduced over days 4–6, total treatment for not more than 9 days

Dose equivalence and conversion

1 capsule contains 192 mg of clomethiazole base.

- **CONTRA-INDICATIONS** Acute pulmonary insufficiency · alcohol-dependent patients who continue to drink
- **CAUTIONS** Avoid prolonged use (and abrupt withdrawal thereafter) · cardiac disease (confusional state may indicate hypoxia) · chronic pulmonary insufficiency · elderly · excessive sedation may occur (particularly with higher doses); · history of drug abuse · marked personality disorder · respiratory disease (confusional state may indicate hypoxia) · sleep apnoea syndrome
- **INTERACTIONS** → Appendix 1 (anxiolytics and hypnotics).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Conjunctival irritation · headache · increased bronchial secretions · increased nasopharyngeal secretions · nasal congestion · nasal irritation
 - ▶ **Rare** Alterations in liver enzymes · anaphylaxis · bullous eruption · confusion · dependence · gastro-intestinal disturbances · paradoxical excitement · rash · urticaria
- **PREGNANCY** Avoid if possible—especially during the first and third trimesters.
- **BREAST FEEDING** Use only if benefit outweighs risk—present in breast milk but effects unknown.
- **HEPATIC IMPAIRMENT** Reduce dose. Can precipitate coma.
- **RENAL IMPAIRMENT** Increased cerebral sensitivity. Start with small doses in severe impairment.
- **PATIENT AND CARER ADVICE** Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

Zaleplon

INDICATIONS AND DOSE

Insomnia (short-term use)

BY MOUTH

- ▶ **Adult:** 10 mg daily for up to 2 weeks, dose to be taken at bedtime or after going to bed if difficulty falling asleep
- ▶ **Elderly:** 5 mg daily for up to 2 weeks, dose to be taken at bedtime or after going to bed if difficulty falling asleep

- **CONTRA-INDICATIONS** Marked neuromuscular respiratory weakness · sleep apnoea syndrome · unstable myasthenia gravis
- **CAUTIONS** Avoid prolonged use (risk of tolerance and withdrawal symptoms) · depression (risk of suicidal ideation) · history of alcohol abuse · history of drug abuse · muscle weakness · myasthenia gravis · respiratory insufficiency (avoid if severe)
- **INTERACTIONS** → Appendix 1 (anxiolytics and hypnotics).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Amnesia · drowsiness · dysmenorrhoea · paraesthesia
 - ▶ **Uncommon** Anorexia · asthenia · confusion · depersonalisation · depression · disturbances of hearing · disturbances of smell · disturbances of speech · disturbances of vision · dizziness · hallucinations · impaired concentration · incoordination · nausea · photosensitivity
 - ▶ **Frequency not known** Paradoxical effects · sleep-walking
- **SIDE-EFFECTS, FURTHER INFORMATION**

Paradoxical effects A paradoxical increase in hostility and aggression may be reported. The effects range from

talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

- **PREGNANCY** Use only if necessary and restrict to occasional short-term use. Risk of withdrawal symptoms in neonate if used in late pregnancy.
- **BREAST FEEDING** Present in milk but amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Reduce dose to 5 mg. Can precipitate coma. Avoid if severe impairment.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
- **PATIENT AND CARER ADVICE** Patients should be advised not to take a second dose during a single night.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ **Zaleplon, zolpidem, and zopiclone for the short-term management of insomnia (April 2004) NICE TA77**

Narcolepsy with cataplexy (under expert supervision)

BY MOUTH

► **Adult:** Initially 2.25 g daily, dose to be taken on retiring and 2.25 g after 2.5–4 hours, then increased in steps of 1.5 g daily in 2 divided doses, dose adjusted according to response at intervals of 1–2 weeks; dose titration should be repeated if restarting after interval of more than 14 days, maximum 9 g daily in 2 divided doses

- **CONTRA-INDICATIONS** Major depression · succinic semi-aldehyde dehydrogenase deficiency
- **CAUTIONS** Body mass index of 40 kg/m² or greater (higher risk of sleep apnoea) · elderly · epilepsy · heart failure (high sodium content) · history of depression · history of drug abuse · hypertension (high sodium content) · respiratory disorders · risk of discontinuation effects including rebound cataplexy and withdrawal symptoms
- **INTERACTIONS** → Appendix 1 (sodium oxybate).
If sodium oxybate and sodium valproate or valproic acid used concomitantly, reduce initial dose of sodium oxybate to 1.8 g on retiring and repeat 2.5–4 hours later.
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · anorexia · anxiety · arthralgia · asthenia · back pain · blurred vision · confusion · depression · diarrhoea · disorientation · dizziness · drowsiness · dyspnoea · headache · hypertension · hypoesthesia · impaired attention · muscle spasm · nasal congestion · nausea · nocturnal enuresis · palpitation · paraesthesia · peripheral oedema · rash · sleep disorders · sleep paralysis · sleep walking · sweating · taste disturbance · tremor · urinary incontinence · vertigo · vomiting
 - **Uncommon** Agitation · amnesia · faecal incontinence · hallucination · myoclonus · paranoia · psychosis · restless legs syndrome · suicidal behaviour
 - **Frequency not known** Dependence · euphoria · respiratory depression · seizures · sleep apnoea · suicidal ideation · urticaria
- **PREGNANCY** Avoid.
- **BREAST FEEDING** No information available.
- **HEPATIC IMPAIRMENT** Halve initial dose.
- **RENAL IMPAIRMENT** Caution—contains 3.96 mmol Na⁺ per mL.
- **DIRECTIONS FOR ADMINISTRATION** Dilute each dose with 60 mL water; prepare both doses before retiring. Observe the same time interval (2–3 hours) each night between the last meal and the first dose.
- **PATIENT AND CARER ADVICE** Leave at least 6 hours between taking sodium oxybate and performing skilled tasks (e.g. driving or operating machinery); effects of alcohol and other CNS depressants enhanced.

Patients or carers should be given advice on how to administer sodium oxybate oral solution.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

8 Substance dependence**Substance dependence**

The UK health departments have produced guidance on the treatment of drug misuse in the UK. *Drug Misuse and Dependence: UK Guidelines on Clinical Management* (2007) is available at www.nta.nhs.uk/uploads/clinical_guidelines_2007.pdf.

Alcohol dependence

Excessive drinking of alcoholic beverages over a prolonged period of time can result in an alcohol withdrawal syndrome on abrupt cessation of, or marked reduction in, drinking. The presence and severity of alcohol dependence can be assessed by *The Severity of Alcohol Dependence Questionnaire (SADQ)*; other assessment questionnaires are also available.

Acute alcohol withdrawal

People with moderate dependence can generally be treated in a community setting unless they are under 18 years of age, or are at high-risk of severe reactions or treatment failure. People with severe dependence should undergo withdrawal in an inpatient setting; withdrawal in severely dependent patients without medical support may lead to seizures, delirium tremens, and death. Long-acting benzodiazepines, usually chlordiazepoxide hydrochloride p. 267, are used to attenuate alcohol withdrawal symptoms. In primary care, fixed-dose reducing regimens are usually used, whilst a symptom-triggered flexible regimen is used in hospital or other settings where continued assessment and monitoring is carried out for 24–48 hours, usually followed by a fixed 5-day reducing dose schedule (sometimes it may be necessary to continue treatment for up to 10 days). Patients with decompensated liver disease should be treated under specialist supervision.

Carbamazepine p. 387 [unlicensed indication] is sometimes used as an alternative treatment in acute alcohol withdrawal when benzodiazepines are contra-indicated or not tolerated. Clomethiazole p. 421 is licensed for use in acute alcohol withdrawal, but benzodiazepines are preferred. It should only be used in an inpatient setting and should not be prescribed if the patient is liable to continue drinking alcohol.

Patients with marked agitation or hallucinations and those at risk of delirium tremens (characterised by delirium, hallucinations, tremor, and disorientation) may be prescribed antipsychotic drugs, such as haloperidol p. 306 or olanzapine p. 315 [unlicensed indication], as adjunctive therapy to benzodiazepines; antipsychotics should not be used alone because they do not treat alcohol withdrawal and may lower the seizure threshold. Delirium tremens is a medical emergency that requires specialist inpatient care.

If a patient taking a benzodiazepine as part of a withdrawal regimen develops alcohol withdrawal seizures, a fast-acting benzodiazepine (such as intravenous lorazepam p. 412 [unlicensed indication] or rectal diazepam p. 267) should be prescribed; thereafter an increase in the dose of

oral benzodiazepine should be considered to prevent further seizures from occurring.

Alcohol dependence

Acamprosate calcium p. 429 and naltrexone hydrochloride p. 430 are effective treatments for relapse prevention in patients with alcohol dependence; disulfiram p. 428 is an alternative. Disulfiram should only be used in patients in whom acamprosate calcium and naltrexone hydrochloride are not suitable, or if the patient prefers disulfiram. Nalmefene p. 429 is licensed for the reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level, without physical withdrawal symptoms, and who do not require immediate detoxification.

Patients with alcohol dependence are at risk of developing Wernicke's encephalopathy; patients at high-risk are those who are malnourished, at risk of malnourishment, or have decompensated liver disease. Parenteral thiamine p. 882 (as *Pabrinex*[®]) should be prescribed for treatment of suspected or confirmed Wernicke's encephalopathy, and for prophylaxis in alcohol dependent patients attending hospital for acute treatment (including treatment unrelated to alcohol dependence); parenteral prophylaxis may also be considered for high-risk patients being treated in primary care. High-dose oral thiamine p. 882 should be prescribed following parenteral treatment until cognitive function is maximised. In primary care, prophylactic high-dose oral thiamine should be prescribed during acute withdrawal of alcohol, before planned withdrawal, and for patients not undergoing withdrawal but who are at high-risk of developing Wernicke's encephalopathy.

Patients with chronic alcohol-related pancreatitis who have symptoms of steatorrhea or who have poor nutritional status due to exocrine pancreatic insufficiency should be prescribed **pancreatic enzyme supplements**; supplements are not indicated when pain is the only symptom.

Corticosteroids are used in patients with severe acute alcohol-related hepatitis.

Drugs used in alcohol dependence

Acamprosate

Acamprosate calcium p. 429, in combination with counselling, may be helpful for maintaining abstinence in alcohol-dependent patients. It is useful for patients who are concerned that strong cravings will result in relapse. It should be initiated as soon as possible *after* abstinence has been achieved and continued for 1 year; treatment should be maintained if the patient has a temporary relapse but stopped if the patient returns to regular or excessive drinking that persists 4–6 weeks after starting treatment. Acamprosate calcium p. 429 is not effective in all patients, so efficacy should be regularly assessed.

Disulfiram

Disulfiram p. 428 gives rise to an extremely unpleasant systemic reaction after the ingestion of even a small amount of alcohol because it causes accumulation of acetaldehyde in the body; it is only effective if taken daily. Symptoms can occur within 10 minutes of ingesting alcohol and include flushing of the face, throbbing headache, palpitation, tachycardia, nausea, vomiting, and, with large doses of alcohol, arrhythmias, hypotension, and collapse; these reactions can last several hours. Small amounts of alcohol such as those included in many oral medicines may be sufficient to precipitate a reaction—even toiletries and mouthwashes that contain alcohol should be avoided.

Nalmefene

Nalmefene p. 429 should only be prescribed in conjunction with continuous psychosocial support focused on treatment adherence and reducing alcohol consumption. Nalmefene p. 429 is not recommended for patients aiming to achieve immediate abstinence.

Naltrexone

Naltrexone hydrochloride p. 430 is an opioid-receptor antagonist, but is useful as an adjunct in the treatment of alcohol dependence after a successful withdrawal. Treatment should be initiated by a specialist and continued under specialist supervision. Naltrexone hydrochloride p. 430 should be stopped if drinking continues for 4–6 weeks after starting treatment.

Nicotine dependence

Smoking cessation interventions are a cost-effective way of reducing ill health and prolonging life. Smokers should be advised to stop and offered help with follow-up when appropriate. If possible, smokers should have access to smoking cessation services for behavioural support.

Therapy to aid smoking cessation is chosen according to the smoker's likely adherence, availability of counselling and support, previous experience of smoking-cessation aids, contra-indications and adverse effects of the preparations, and the smoker's preferences. **Nicotine replacement therapy**, bupropion hydrochloride p. 433, and varenicline p. 432 are effective aids to smoking cessation. The use of nicotine replacement therapy in an individual who is already accustomed to nicotine introduces few new risks and it is widely accepted that there are no circumstances in which it is safer to smoke than to use nicotine replacement therapy.

Some patients benefit from having more than one type of nicotine replacement therapy prescribed, such as a combination of transdermal and oral preparations. The combination of nicotine replacement therapy with varenicline or bupropion hydrochloride is not recommended.

Concomitant medication

Cigarette smoking increases the metabolism of some medicines by stimulating the hepatic enzyme CYP1A2. When smoking is discontinued, the dose of these drugs, in particular theophylline, cinacalcet, ropinirole, and some antipsychotics (including clozapine, olanzapine, chlorpromazine hydrochloride, and haloperidol, may need to be reduced. Regular monitoring for adverse effects is advised.

Bupropion hydrochloride p. 433 has been used as an antidepressant. Its mode of action in smoking cessation is not clear and may involve an effect on noradrenergic and dopamine neurotransmission.

Nicotine replacement therapy

Nicotine replacement therapy can be used in place of cigarettes after abrupt cessation of smoking, or alternatively to reduce the amount of cigarettes used in advance of making a quit attempt. Nicotine replacement therapy can also be used to minimise passive smoking, and to treat cravings and reduce compensatory smoking after enforced abstinence in smoke-free environments. Smokers who find it difficult to achieve abstinence should consult a healthcare professional for advice.

Choice

Nicotine patches are a prolonged-release formulation and are applied for 16 hours (with the patch removed overnight) or for 24 hours. If patients experience strong cravings for cigarettes on waking, a 24-hour patch may be more suitable. Immediate-release nicotine preparations (gum, lozenges, sublingual tablets, inhalator, nasal spray, and oral spray) are used whenever the urge to smoke occurs or to prevent cravings.

The choice of nicotine replacement preparation depends largely on patient preference, and should take into account what preparations, if any, have been tried before. Patients with a high level of nicotine dependence, or who have failed with nicotine replacement therapy previously, may benefit

from using a combination of an immediate-release preparation and patches to achieve abstinence.

Side-effects of specific nicotine preparations

Mild local reactions at the beginning of treatment are common because of the irritant effect of nicotine. Oral preparations and *inhalation cartridges* can cause irritation of the throat, *gum, lozenges, and oral spray* can cause increased salivation, and *patches* can cause minor skin irritation. The *nasal spray* commonly causes coughing, nasal irritation, epistaxis, sneezing, and watery eyes; the *oral spray* can cause watery eyes and blurred vision.

Gastro-intestinal disturbances are common and may be caused by swallowed nicotine. Nausea, vomiting, dyspepsia, and hiccup occur most frequently. Ulcerative stomatitis has also been reported. Dry mouth is a common side-effect of *lozenges, patches, oral spray, and sublingual tablets*. *Lozenges* cause diarrhoea, constipation, dysphagia, oesophagitis, gastritis, mouth ulcers, bloating, flatulence, and less commonly, taste disturbance, thirst, gingival bleeding, and halitosis. The *oral spray* may also cause abdominal pain, flatulence, and taste disturbance.

Palpitations may occur with nicotine replacement therapy and rarely *patches and oral spray* can cause arrhythmia. *Patches, lozenges, and oral spray* can cause chest pain. The *inhalator* can very rarely cause reversible atrial fibrillation.

Paraesthesia is a common side-effect of *oral spray*. Abnormal dreams can occur with *patches*; removal of the patch before bed may help. *Lozenges and oral spray* may cause rash and hot flushes. Sweating and myalgia can occur with *patches and oral spray*; the *patches* can also cause arthralgia.

Opioid dependence

The management of opioid dependence requires medical, social, and psychological treatment; access to a multidisciplinary team is recommended. Treatment for opioid dependence should be initiated under the supervision of an appropriately qualified prescriber.

Untreated heroin dependence shows early withdrawal symptoms within 8 hours, with peak symptoms at 36–72 hours; symptoms subside substantially after 5 days. Methadone hydrochloride p. 436 or buprenorphine p. 434 withdrawal occurs later, with longer-lasting symptoms.

Opioid substitution therapy

Methadone hydrochloride and buprenorphine are used as substitution therapy in opioid dependence. Substitute medication should be commenced with a short period of stabilisation, followed by either a withdrawal regimen or by maintenance treatment. Maintenance treatment enables patients to achieve stability, reduces drug use and crime, and improves health; it should be regularly reviewed to ensure the patient continues to derive benefit. The prescriber should monitor for signs of toxicity, and the patient should be told to be aware of warning signs of toxicity on initiation and during titration.

A withdrawal regimen after stabilisation with methadone hydrochloride or buprenorphine should be attempted only after careful consideration. Enforced withdrawal is ineffective for sustained abstinence, and it increases the risk of patients relapsing and subsequently overdosing because of loss of tolerance. Complete withdrawal from opioids usually takes up to 4 weeks in an inpatient or residential setting, and up to 12 weeks in a community setting. If abstinence is not achieved, illicit drug use is resumed, or the patient cannot tolerate withdrawal, the withdrawal regimen should be stopped and maintenance therapy should be resumed at the optimal dose. Following successful withdrawal treatment, further support and monitoring to maintain abstinence should be provided for a period of at least 6 months.

Missed doses

Patients who miss 3 days or more of their regular prescribed dose of opioid maintenance therapy are at risk of overdose because of loss of tolerance. Consider reducing the dose in these patients.

If the patient misses 5 or more days of treatment, an assessment of illicit drug use is also recommended before restarting substitution therapy; this is particularly important for patients taking buprenorphine p. 434 because of the risk of precipitated withdrawal.

Buprenorphine

Buprenorphine p. 434 is preferred by some patients because it is less sedating than methadone hydrochloride p. 436; for this reason it may be more suitable for employed patients or those undertaking other skilled tasks such as driving. Buprenorphine is safer than methadone hydrochloride when used in conjunction with other sedating drugs, and has fewer drug interactions. Dose reductions may be easier than with methadone hydrochloride because the withdrawal symptoms are milder, and patients generally require fewer adjunctive medications; there is also a lower risk of overdose. Buprenorphine can be given on alternate days in higher doses and it requires a shorter drug-free period than methadone hydrochloride before induction with naltrexone hydrochloride p. 430 for prevention of relapse.

Patients dependent on high doses of opioids may be at increased risk of precipitated withdrawal. Precipitated withdrawal can occur in any patient if buprenorphine is administered when other opioid agonist drugs are in circulation. Precipitated opioid withdrawal, if it occurs, starts within 1–3 hours of the first buprenorphine dose and peaks at around 6 hours. Non-opioid adjunctive therapy, such as lofexidine hydrochloride, may be required if symptoms are severe.

To reduce the risk of precipitated withdrawal, the first dose of buprenorphine should be given when the patient is exhibiting signs of withdrawal, or 6–12 hours after the last use of heroin (or other short-acting opioid), or 24–48 hours after the last dose of methadone hydrochloride. It is possible to titrate the dose of buprenorphine within one week—more rapidly than with methadone hydrochloride therapy—but care is still needed to avoid toxicity or precipitated withdrawal; dividing the dose on the first day may be useful.

A combination preparation containing buprenorphine with naloxone p. 436 (Suboxone[®]) can be prescribed for patients when there is a risk of dose diversion for parenteral administration; the naloxone hydrochloride p. 1133 component precipitates withdrawal if the preparation is injected, but it has little effect when the preparation is taken sublingually.

Methadone

Methadone hydrochloride p. 436, a long-acting opioid agonist, is usually administered in a single daily dose as methadone hydrochloride oral solution 1 mg/mL. Patients with a long history of opioid misuse, those who typically abuse a variety of sedative drugs and alcohol, and those who experience increased anxiety during withdrawal of opioids may prefer methadone hydrochloride to buprenorphine because it has a more pronounced sedative effect.

Methadone hydrochloride is initiated at least 8 hours after the last heroin dose, provided that there is objective evidence of withdrawal symptoms. A supplementary dose on the first day may be considered if there is evidence of persistent opioid withdrawal symptoms. Because of the long half-life, plasma concentrations progressively rise during initial treatment even if the patient remains on the same daily dose (it takes 3–10 days for plasma concentrations to reach steady-state in patients on a stable dose); a dose tolerated on the first day of treatment may become a toxic dose on the third day as cumulative toxicity develops. Thus,

titration to the optimal dose in methadone hydrochloride maintenance treatment may take several weeks.

Opioid substitution during pregnancy

Acute withdrawal of opioids should be avoided in pregnancy because it can cause fetal death. Opioid substitution therapy is recommended during pregnancy because it carries a lower risk to the fetus than continued use of illicit drugs. If a woman who is stabilised on methadone hydrochloride or buprenorphine for treatment of opioid dependence becomes pregnant, therapy should be continued [buprenorphine is not licensed for use in pregnancy]. Many pregnant patients choose a withdrawal regimen, but withdrawal during the first trimester should be avoided because it is associated with an increased risk of spontaneous miscarriage. Withdrawal of methadone hydrochloride or buprenorphine should be undertaken gradually during the second trimester, with dose reductions made every 3–5 days. If illicit drug use occurs, the patient should be re-stabilised at the optimal maintenance dose and consideration should be given to stopping the withdrawal regimen.

Further withdrawal of methadone hydrochloride or buprenorphine in the third trimester is not recommended because maternal withdrawal, even if mild, is associated with fetal distress, stillbirth, and the risk of neonatal mortality. Drug metabolism can be increased in the third trimester; it may be necessary to either increase the dose of methadone hydrochloride or change to twice-daily consumption (or a combination of both strategies) to prevent withdrawal symptoms from developing.

The neonate should be monitored for respiratory depression and signs of withdrawal if the mother is prescribed high doses of opioid substitute.

Signs of neonatal withdrawal from opioids usually develop 24–72 hours after delivery but symptoms may be delayed for up to 14 days, so monitoring may be required for several weeks. Symptoms include a high-pitched cry, rapid breathing, hungry but ineffective suckling, and excessive wakefulness; severe, but rare symptoms include hypertonicity and convulsions.

Opioid substitution during breastfeeding

Doses of methadone and buprenorphine should be kept as low as possible in breast-feeding mothers. Increased sleepiness, breathing difficulties, or limpness in breast-fed babies of mothers taking opioid substitutes should be reported urgently to a healthcare professional.

Adjunctive therapy and symptomatic treatment

Adjunctive therapy may be required for the management of opioid withdrawal symptoms. Loperamide hydrochloride p. 56 may be used for the control of diarrhoea; mebeverine hydrochloride p. 75 for controlling stomach cramps; paracetamol p. 354 and **non-steroidal anti-inflammatory drugs** for muscular pains and headaches; metoclopramide hydrochloride p. 347 or prochlorperazine p. 309 may be useful for nausea or vomiting. Topical **rubefaciants** can be helpful for relieving muscle pain associated with methadone hydrochloride p. 436 withdrawal. If a patient is suffering from insomnia, short-acting **benzodiazepines** or zopiclone p. 423 may be prescribed, but because of the potential for abuse, prescriptions should be limited to a short course of a few days only. If anxiety or agitation is severe, specialist advice should be sought.

Lofexidine

Lofexidine hydrochloride p. 434 may alleviate some of the physical symptoms of opioid withdrawal by attenuating the increase in adrenergic neurotransmission that occurs during opioid withdrawal. Lofexidine hydrochloride can be prescribed as an adjuvant to opioid substitution therapy, initiated either at the same time as the opioid substitute or during withdrawal of the opioid substitute. Alternatively, lofexidine hydrochloride may be prescribed instead of an

opioid substitute in patients who have mild or uncertain dependence (including young people), and those with a short history of illicit drug use.

Opioid-receptor antagonists

Patients dependant on opioids can be given a supply of naloxone hydrochloride p. 1133 to be used in case of accidental overdose.

Naltrexone hydrochloride p. 430 precipitates withdrawal symptoms in opioid-dependent subjects. Because the effects of opioid-receptor agonists are blocked by naltrexone hydrochloride, it is prescribed as an aid to prevent relapse in formerly opioid-dependent patients.

Opioid dependence in children

In younger patients (under 18 years), the harmful effects of drug misuse are more often related to acute intoxication than to dependence, so substitution therapy is usually inappropriate. Maintenance treatment with opioid substitution therapy is therefore controversial in young people; however, it may be useful for the older adolescent who has a history of opioid use to undergo a period of stabilisation with buprenorphine or methadone hydrochloride before starting a withdrawal regimen.

8.1 Alcohol dependence

ALDEHYDE DEHYDROGENASE INHIBITORS

Disulfiram

INDICATIONS AND DOSE

Adjunct in the treatment of alcohol dependence (under expert supervision)

BY MOUTH

▶ Adult: 200 mg daily, increased if necessary up to max. 500 mg daily

- **UNLICENSED USE** Disulfiram doses in BNF may differ from those in product literature.
- **CONTRA-INDICATIONS** Cardiac failure · coronary artery disease · history of cerebrovascular accident · hypertension · psychosis · severe personality disorder · suicide risk
- **CAUTIONS** Alcohol challenge **not** recommended on routine basis (if considered essential—specialist units only with resuscitation facilities) · avoid in Acute porphyrias p. 864 · diabetes mellitus · epilepsy · respiratory disease
- **INTERACTIONS** → Appendix 1 (disulfiram). Disulfiram gives rise to an extremely unpleasant systemic reaction after the ingestion of even a small amount of alcohol. Ensure that alcohol is not consumed for at least 24 hours before initiating treatment and should be avoided for at least 1 week after stopping treatment.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Drowsiness · fatigue · halitosis · nausea · reduced libido · vomiting
 - ▶ **Rare** Allergic dermatitis · depression · hepatic cell damage · mania · paranoia · peripheral neuritis · psychotic reactions · schizophrenia
- **PREGNANCY** High concentrations of acetaldehyde which occur in presence of alcohol may be teratogenic; avoid in first trimester.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution.

- **PRE-TREATMENT SCREENING** Before initiating disulfiram, prescribers should evaluate the patient's suitability for treatment, because some patient factors, for example memory impairment or social circumstances, make compliance to treatment or abstinence from alcohol difficult.
- **MONITORING REQUIREMENTS** During treatment with disulfiram, patients should be monitored at least every 2 weeks for the first 2 months, then each month for the following 4 months, and at least every 6 months thereafter.
- **PATIENT AND CARER ADVICE** Patient counselling is advised (alcohol reaction).

OPIOID RECEPTOR ANTAGONISTS

Nalmefene

INDICATIONS AND DOSE

Reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level without physical withdrawal symptoms, and who do not require immediate detoxification

BY MOUTH

- ▶ **Adult:** 18 mg daily if required, taken on each day there is a risk of drinking alcohol, preferably taken 1–2 hours before the anticipated time of drinking, if a dose has not been taken before drinking alcohol, 1 dose should be taken as soon as possible; maximum 18 mg per day

- **CONTRA-INDICATIONS** Recent history of acute alcohol withdrawal syndrome · recent or current opioid use
- **CAUTIONS** Continued treatment for more than 1 year · history of seizure disorders (including alcohol withdrawal seizures) · psychiatric illness
- **INTERACTIONS** → Appendix 1 (nalmefene). Avoid concomitant use of opioids—discontinue treatment 1 week before anticipated use of opioids; if emergency analgesia is required during treatment, an increased dose of opioid analgesic may be necessary (monitor for opioid intoxication).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Confusion · decreased appetite · decreased libido · disturbance in attention · dizziness · dry mouth · headache · hyperhidrosis · hypoaesthesia · malaise · muscle spasms · nausea · palpitation · paraesthesia · restlessness · sleep disorders · somnolence · tachycardia · tremor · vomiting · weight loss
 - ▶ **Frequency not known** Dissociation · hallucinations
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Use with caution—avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution—avoid in severe impairment.
- **PRE-TREATMENT SCREENING** Before initiating treatment, prescribers should evaluate the patient's clinical status, alcohol dependence, and level of alcohol consumption. Nalmefene should only be prescribed for patients who continue to have a high drinking risk level two weeks after the initial assessment.
- **MONITORING REQUIREMENTS** During treatment, patients should be monitored regularly and the need for continued treatment assessed.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

 - ▶ **Nalmefene for reducing alcohol consumption in people with alcohol dependence (November 2014)** NICE TA325 Nalmefene is recommended within its marketing authorisation, as an option for reducing alcohol consumption, for patients with alcohol dependence:
 - who have a high drinking risk level (defined as alcohol consumption of more than 60 g per day for men and more than 40 g per day for women, according to the World Health Organization's drinking risk levels) without physical withdrawal symptoms, **and**
 - who do not require immediate detoxification.
 The marketing authorisation states that nalmefene should:

- only be prescribed in conjunction with continuous psychosocial support focused on treatment adherence and reducing alcohol consumption, **and**
- be initiated only in patients who continue to have a high drinking risk level 2 weeks after initial assessment. www.nice.org.uk/TA325

8.2 Nicotine dependence

NICOTINIC RECEPTOR AGONISTS

Nicotine

INDICATIONS AND DOSE

Nicotine replacement therapy in individuals who smoke fewer than 20 cigarettes each day

BY MOUTH USING CHEWING GUM

- ▶ **Adult:** 2 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, if attempting smoking cessation, treatment should continue for 3 months before reducing the dose

BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS

- ▶ **Adult:** 1 tablet every 1 hour, increased to 2 tablets every 1 hour if required, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose; maximum 40 tablets per day

Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day or who require more than 15 pieces of 2-mg strength gum each day

BY MOUTH USING CHEWING GUM

- ▶ **Adult:** 4 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, patients should not exceed 15 pieces of 4-mg strength gum daily, if attempting smoking cessation, treatment should continue for 3 months before reducing the dose

Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day

BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS

- ▶ **Adult:** 2 tablets every 1 hour, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose; maximum 40 tablets per day

Nicotine replacement therapy

BY INHALATION USING INHALATOR

- ▶ **Adult:** As required, the cartridges can be used when the urge to smoke occurs or to prevent cravings, patients should not exceed 12 cartridges of the 10-mg

strength daily, or 6 cartridges of the 15-mg strength daily

BY MOUTH USING LOZENGES

▶ **Adult:** 1 lozenge every 1–2 hours as required, one lozenge should be used when the urge to smoke occurs, individuals who smoke less than 20 cigarettes each day should usually use the lower-strength lozenges; individuals who smoke more than 20 cigarettes each day and those who fail to stop smoking with the low-strength lozenges should use the higher-strength lozenges; If attempting smoking cessation, treatment should continue for 6–12 weeks before attempting a reduction in dose; maximum 15 lozenges per day

BY MOUTH USING OROMUCOSAL SPRAY

▶ **Adult:** 1–2 sprays as required, patients can spray in the mouth when the urge to smoke occurs or to prevent cravings, individuals should not exceed 2 sprays per episode (up to 4 sprays every hour); maximum 64 sprays per day

BY INTRANASAL ADMINISTRATION USING NASAL SPRAY

▶ **Adult:** 1 spray as required, patients can spray into each nostril when the urge to smoke occurs, up to twice every hour for 16 hours daily, if attempting smoking cessation, treatment should continue for 8 weeks before reducing the dose; maximum 64 sprays per day

BY TRANSDERMAL APPLICATION USING PATCHES

▶ **Adult:** Individuals who smoke more than 10 cigarettes daily should apply a high-strength patch daily for 6–8 weeks, followed by the medium-strength patch for 2 weeks, and then the low-strength patch for the final 2 weeks; individuals who smoke fewer than 10 cigarettes daily can usually start with the medium-strength patch for 6–8 weeks, followed by the low-strength patch for 2–4 weeks; a slower titration schedule can be used in patients who are not ready to quit but want to reduce cigarette consumption before a quit attempt; if abstinence is not achieved, or if withdrawal symptoms are experienced, the strength of the patch used should be maintained or increased until the patient is stabilised; patients using the high-strength patch who experience excessive side-effects, that do not resolve within a few days, should change to a medium-strength patch for the remainder of the initial period and then use the low-strength patch for 2–4 weeks

- **UNLICENSED USE** All preparations are licensed for adults and children over 12 years (with the exception of *Nicotinell*[®] lozenges which are licensed for children under 18 years only when recommended by a doctor).

● CAUTIONS

GENERAL CAUTIONS

Diabetes mellitus—blood-glucose concentration should be monitored closely when initiating treatment · haemodynamically unstable patients hospitalised with cerebrovascular accident · haemodynamically unstable patients hospitalised with myocardial infarction · haemodynamically unstable patients hospitalised with severe arrhythmias · phaeochromocytoma · uncontrolled hyperthyroidism

SPECIFIC CAUTIONS

- ▶ With oral (topical) use *gum* may also stick to and damage dentures
- ▶ With intranasal use bronchial asthma (may exacerbate)
- ▶ With oral use gastritis (can be aggravated by swallowed nicotine) · oesophagitis (can be aggravated by swallowed nicotine) · peptic ulcers (can be aggravated by swallowed nicotine)
- ▶ With transdermal use *patches* should not be placed on broken skin · patients with skin disorders

- ▶ When used by inhalation bronchospastic disease · chronic throat disease · obstructive lung disease

CAUTIONS, FURTHER INFORMATION

Most warnings for nicotine replacement therapy also apply to continued cigarette smoking, but the risk of continued smoking outweighs any risks of using nicotine preparations.

Specific cautions for individual preparations are usually related to the local effect of nicotine.

- **INTERACTIONS** → Appendix 1 (nicotine).

● SIDE-EFFECTS

- ▶ **Common or very common** Bloating · blurred vision · constipation · coughing · diarrhoea · dry mouth · dyspepsia · dysphagia · epistaxis · flatulence · gastritis · gastrointestinal disturbances (may be caused by swallowed nicotine) · hiccup · increased salivation · irritation of the throat · mild local reactions at the beginning of treatment are common because of the irritant effect of nicotine · minor skin irritation · mouth ulcers · nasal irritation · nausea · oesophagitis · paraesthesia · sneezing · vomiting · watery eyes
- ▶ **Uncommon** Gingival bleeding · halitosis · thirst
- ▶ **Rare** Arrhythmia
- ▶ **Very rare** Reversible atrial fibrillation
- ▶ **Frequency not known** Abdominal pain · abnormal dreams (may occur with patches, removal of the patch before bed may help) · arthralgia · chest pain · flatulence · hot flushes · myalgia · palpitations · rash · sweating · taste disturbance · ulcerative stomatitis

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects listed have been reported with use of various nicotine replacement therapy preparations. See Substance dependence p. 425, Nicotine replacement therapy for specific side-effects of individual preparations.

Nicotine withdrawal Some systemic effects occur on initiation of therapy, particularly if the patient is using high-strength preparations; however, the patient may confuse side-effects of the nicotine-replacement preparation with nicotine withdrawal symptoms. Common symptoms of nicotine withdrawal include malaise, headache, dizziness, sleep disturbance, coughing, influenza-like symptoms, depression, irritability, increased appetite, weight gain, restlessness, anxiety, drowsiness, aphthous ulcers, decreased heart rate, and impaired concentration.

- **PREGNANCY** The use of nicotine replacement therapy in pregnancy is preferable to the continuation of smoking, but should be used only if smoking cessation without nicotine replacement fails. Intermittent therapy is preferable to patches but avoid liquorice-flavoured nicotine products. Patches are useful, however, if the patient is experiencing pregnancy-related nausea and vomiting. If patches are used, they should be removed before bed.
- **BREAST FEEDING** Nicotine is present in milk; however, the amount to which the infant is exposed is small and less hazardous than second-hand smoke. Intermittent therapy is preferred.
- **HEPATIC IMPAIRMENT** Use with caution in moderate to severe hepatic impairment.
- **RENAL IMPAIRMENT** Use with caution in severe renal impairment.
- **DIRECTIONS FOR ADMINISTRATION** Acidic beverages, such as coffee or fruit juice, may decrease the absorption of nicotine through the buccal mucosa and should be avoided for 15 minutes before the use of oral nicotine replacement therapy. Administration by transdermal patch Patches should be applied on waking to dry, non-hairy skin on the hip, trunk, or upper arm and held in position for 10–20 seconds to ensure

adhesion; place next patch on a different area and avoid using the same site for several days.

Administration by nasal spray Initially 1 spray should be used in both nostrils but when withdrawing from therapy, the dose can be gradually reduced to 1 spray in 1 nostril.

Administration by oral spray The oral spray should be released into the mouth, holding the spray as close to the mouth as possible and avoiding the lips. The patient should not inhale while spraying and avoid swallowing for a few seconds after use. If using the oral spray for the first time, or if unit not used for 2 or more days, prime the unit before administration.

Administration by sublingual tablet Each tablet should be placed under the tongue and allowed to dissolve.

Administration by lozenge Slowly allow each lozenge to dissolve in the mouth; periodically move the lozenge from one side of the mouth to the other. Lozenges last for 10–30 minutes, depending on their size.

Administration by inhalation Insert the cartridge into the device and draw in air through the mouthpiece; each session can last for approximately 5 minutes. The amount of nicotine from 1 puff of the cartridge is less than that from a cigarette, therefore it is necessary to inhale more often than when smoking a cigarette. A single 10 mg cartridge lasts for approximately 20 minutes of intense use; a single 15 mg cartridge lasts for approximately 40 minutes of intense use. Administration by medicated chewing gum Chew the gum until the taste becomes strong, then rest it between the cheek and gum; when the taste starts to fade, repeat this process. One piece of gum lasts for approximately 30 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of chewing gum and lozenges may include mint, freshfruit, freshmint, icy white, or cherry.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer nicotine chewing gum, inhalators, lozenges, sublingual tablets, oral spray, nasal spray and patches.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Sublingual tablet

CAUTIONARY AND ADVISORY LABELS 26

Varenicline

- **DRUG ACTION** Varenicline is a selective nicotine-receptor partial agonist.

INDICATIONS AND DOSE

To aid smoking cessation

BY MOUTH

- ▶ **Adult:** Initially 500 micrograms once daily for 3 days, increased to 500 micrograms twice daily for 4 days, then 1 mg twice daily for 11 weeks; reduced if not tolerated to 500 micrograms twice daily, usually to be started 1–2 weeks before target stop date but can be started up to a maximum of 5 weeks before target stop date, 12-week course can be repeated in abstinent individuals to reduce risk of relapse

Important safety information

MHRA/CHM ADVICE: SUICIDAL BEHAVIOUR AND VARENICLINE

Patients should be advised to discontinue treatment and seek prompt medical advice if they develop agitation,

depressed mood, or suicidal thoughts. Patients with a history of psychiatric illness should be monitored closely while taking varenicline.

- **CAUTIONS** Conditions that may lower seizure threshold · history of cardiovascular disease · history of psychiatric illness (may exacerbate underlying illness including depression) · predisposition to seizures
- **SIDE-EFFECTS**
 - ▶ **Common or very common** taste disturbance · abnormal dreams · appetite changes · dizziness · drowsiness · dry mouth · gastro-intestinal disturbances · headache · sleep disorders
 - ▶ **Uncommon** Acne · anxiety · aphthous stomatitis · arthralgia · asthenia · atrial fibrillation · chest pain · depression · dysarthria · dysuria · eye pain · gingival pain · hallucinations · hypertension · hypertonia · hypoaesthesia · impaired temperature regulation · incoordination · lacrimation · menorrhagia · mood swings · muscle spasm · palpitation · panic attack · pruritus · rash · restlessness · seizure · sexual dysfunction · sweating · tachycardia · thirst · tinnitus · tremor · vaginal discharge · visual disturbances · weight gain
 - ▶ **Rare** Cerebrovascular accident
 - ▶ **Frequency not known** Aggression · diabetes mellitus · hyperglycaemia · irrational behaviour · myocardial infarction · psychosis · sleep-walking · Stevens-Johnson syndrome · suicidal ideation
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** If eGFR less than 30 mL/minute/1.73 m², initial dose 500 micrograms once daily, increased after 3 days to 1 mg once daily.
- **TREATMENT CESSATION** Risk of relapse, irritability, depression, and insomnia on discontinuation; consider dose tapering on completion of 12-week course.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
 - ▶ **Varenicline for smoking cessation (July 2007) NICE TA123**
Varenicline is recommended, within its licensed indications, as an option for smokers who have expressed a desire to quit smoking; it should normally be prescribed only as part of a programme of behavioural support.
www.nice.org.uk/TA123

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Champix titration pack | 25 tablet [PoM] £27.30

SEROTONIN AND NORADRENALINE RE-UPTAKE INHIBITORS

Bupropion hydrochloride (Amfebutamone hydrochloride)

INDICATIONS AND DOSE

To aid smoking cessation in combination with motivational support in nicotine-dependent patients

BY MOUTH

- ▶ **Adult:** Initially 150 mg daily for 6 days, then 150 mg twice daily (max. per dose 150 mg), minimum 8 hours between doses; period of treatment 7–9 weeks, start treatment 1–2 weeks before target stop date, discontinue if abstinence not achieved at 7 weeks, consider maximum 150 mg daily in patients with risk factors for seizures; maximum 300 mg per day
- ▶ **Elderly:** 150 mg daily for 7–9 weeks, start treatment 1–2 weeks before target stop date, discontinue if abstinence not achieved at 7 weeks; maximum 150 mg per day

- **CONTRA-INDICATIONS** Acute alcohol withdrawal · acute benzodiazepine withdrawal · bipolar disorder · CNS tumour · eating disorders · history of seizures · severe hepatic cirrhosis
- **CAUTIONS** Alcohol abuse · diabetes · elderly · history of head trauma · predisposition to seizures (prescribe only if benefit clearly outweighs risk)
- **INTERACTIONS** → Appendix 1 (bupropion). Caution with concomitant use of drugs that lower seizure threshold.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Agitation · anxiety · depression · dizziness · dry mouth · fever · gastro-intestinal disturbances · headache · impaired concentration · insomnia (reduced by avoiding dose at bedtime) · pruritus · rash · sweating · taste disturbance · tremor
 - ▶ **Uncommon** Anorexia · asthenia · chest pain · confusion · flushing · hypertension · tachycardia · tinnitus · visual disturbances
 - ▶ **Rare** Abnormal dreams · ataxia · blood-glucose changes · depersonalisation · dystonia · exacerbation of psoriasis · hallucinations · hepatitis · hostility · impaired memory · incoordination · irritability · jaundice · palpitation · paraesthesia · postural hypotension · seizures · Stevens-Johnson syndrome · twitching · urinary frequency · urinary retention · vasodilatation
 - ▶ **Very rare** Aggression · delusions · paranoid ideation · restlessness
 - ▶ **Frequency not known** Suicidal ideation
- **PREGNANCY** Avoid—no information available.
- **BREAST FEEDING** Present in milk—avoid.
- **HEPATIC IMPAIRMENT** Reduce dose to 150 mg daily. Avoid in severe hepatic cirrhosis.
- **RENAL IMPAIRMENT** Reduce dose to 150 mg daily.
- **MONITORING REQUIREMENTS** Measure blood pressure before and during treatment.
- **PATIENT AND CARER ADVICE** May impair performance of skilled tasks (e.g. driving).

Bupropion hydrochloride 150 mg Zyban 150mg modified-release tablets | 60 tablet [PoM] £41.76 DT price = £41.76

8.3 Opioid dependence

ALPHA₂ ADRENOCEPTOR AGONISTS

Lofexidine hydrochloride

● **DRUG ACTION** Lofexidine is an alpha₂-adrenergic agonist.

INDICATIONS AND DOSE

Management of symptoms of opioid withdrawal

BY MOUTH

▶ Adult: Initially 800 micrograms daily in divided doses, increased in steps of 400–800 micrograms daily (max. per dose 800 micrograms) as required for 7–10 days if no opioid use (but longer may be required); maximum 2.4 mg per day

- **CAUTIONS** Bradycardia · cerebrovascular disease · depression · history of QT prolongation · hypotension (monitor pulse rate and blood pressure) · metabolic disturbances · recent myocardial infarction · severe coronary insufficiency
- **INTERACTIONS** → Appendix 1 (lofexidine). Caution with concomitant administration of drugs that prolong QT interval.
- **SIDE-EFFECTS** Bradycardia · dizziness · drowsiness · dry mucous membranes · hypotension · QT-interval prolongation
- **PREGNANCY** Use only if benefit outweighs risk—no information available.
- **BREAST FEEDING** Use only if benefit outweighs risk—no information available.
- **RENAL IMPAIRMENT** Caution in chronic impairment.
- **MONITORING REQUIREMENTS** Monitoring of blood pressure and pulse rate is recommended on initiation, for at least 72 hours or until a stable dose is achieved, and on discontinuation.
- **PRESCRIBING AND DISPENSING INFORMATION** Lofexidine has been used in children over 12 years for the management of symptoms of opioid withdrawal
- **TREATMENT CESSATION** Treatment should be withdrawn gradually over 2–4 days (or longer) to reduce the risk of rebound hypertension and associated symptoms.
- **PATIENT AND CARER ADVICE** The patient should take part of the dose at bedtime to offset insomnia associated with opioid withdrawal.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 2

▶ **BritLofex** (Britannia Pharmaceuticals Ltd)

Lofexidine hydrochloride 200 microgram BritLofex 200microgram tablets | 60 tablet [PoM] £61.79

OPIOIDS

Buprenorphine

The properties listed below are those particular to the drug only. For properties common to the class, see opioids, p. 357.

- **DRUG ACTION** Buprenorphine is an opioid-receptor partial agonist (it has opioid agonist and antagonist properties).

INDICATIONS AND DOSE

Moderate to severe pain

BY SUBLINGUAL ADMINISTRATION

- ▶ Child (body-weight 16–25 kg): 100 micrograms every 6–8 hours
- ▶ Child (body-weight 25–37.5 kg): 100–200 micrograms every 6–8 hours

- ▶ Child (body-weight 37.5–50 kg): 200–300 micrograms every 6–8 hours
 - ▶ Child (body-weight 50 kg and above): 200–400 micrograms every 6–8 hours
 - ▶ Adult: 200–400 micrograms every 6–8 hours
- BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION
- ▶ Child 6 months–11 years: 3–6 micrograms/kg every 6–8 hours (max. per dose 9 micrograms/kg)
 - ▶ Child 12–17 years: 300–600 micrograms every 6–8 hours
 - ▶ Adult: 300–600 micrograms every 6–8 hours

Premedication

BY SUBLINGUAL ADMINISTRATION

▶ Adult: 400 micrograms

BY INTRAMUSCULAR INJECTION

▶ Adult: 300 micrograms

Intra-operative analgesia

BY SLOW INTRAVENOUS INJECTION

▶ Adult: 300–450 micrograms

Adjunct in the treatment of opioid dependence

BY SUBLINGUAL ADMINISTRATION

▶ Adult: Initially 0.8–4 mg for 1 dose on the first day, adjusted in steps of 2–4 mg daily if required; usual dose 12–24 mg daily; maximum 32 mg per day

Dose equivalence and conversion

For opioid substitution therapy, in patients taking methadone who want to switch to buprenorphine, the dose of methadone should be reduced to a maximum of 30 mg daily before starting buprenorphine treatment. If the dose of methadone is over 10 mg daily, buprenorphine can be started at a dose of 4 mg daily and titrated according to requirements; if the methadone dose is below 10 mg daily, Buprenorphine can be started at a dose of 2 mg daily.

HAPDOXTASIN®

Moderate to severe chronic cancer pain | Severe pain unresponsive to non-opioid analgesics

BY TRANSDERMAL APPLICATION USING PATCHES

▶ Adult: Patients who have not previously received strong opioid analgesics initially 35 micrograms/hour up to every 72 hours; patients who have received strong opioid analgesic, initial dose based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

PHARMACOKINETICS

It may take approximately 25 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

TRANSTEC®

Moderate to severe chronic cancer pain | Severe pain unresponsive to non-opioid analgesics

BY TRANSDERMAL APPLICATION USING PATCHES

▶ Adult: Patients who have not previously received strong opioid analgesics, initially 35 micrograms/hour up to every 96 hours; patients who have received strong opioid analgesic, initial dose based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase

in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

PHARMACOKINETICS

It may take approximately 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

BUTRANS®

Moderate, non-malignant pain unresponsive to non-opioid analgesics

BY TRANSDERMAL APPLICATION USING PATCHES

▶ **Adult:** Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

- **UNLICENSED USE** Sublingual tablets not licensed for use in children under 6 years. Injection not licensed for use in children under 6 months.

● CAUTIONS

GENERAL CAUTIONS

Impaired consciousness

SPECIFIC CAUTIONS

- ▶ With transdermal use other opioids should not be administered within 24 hours of patch removal (long duration of action) (in adults)
- ▶ When used for adjunct in the treatment of opioid dependence hepatitis B infection (in adults) · hepatitis C infection (in adults) · pre-existing liver enzyme abnormalities (in adults)
- **INTERACTIONS** Caution with concomitant use of hepatotoxic drugs.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · agitation · anorexia · anxiety · asthenia · diarrhoea · dyspepsia · dyspnoea · fatigue · mild withdrawal symptoms in patients dependent on opioids · paraesthesia · vasodilatation
 - ▶ **Uncommon** Angina (in adults) · cough · depersonalisation · dry eye · dry skin · dysarthria · flatulence · hypertension · hypoesthesia · hypoxia · impaired memory · influenza-like symptoms · muscle cramp · myalgia · pyrexia · restlessness · rhinitis · rigors · syncope · taste disturbance · tinnitus · tremor · wheezing
 - ▶ **Rare** Diverticulitis (in children) · dysphagia · impaired concentration · paralytic ileus · psychosis
 - ▶ **Very rare** Hiccups · hyperventilation · muscle fasciculation · retching
 - ▶ **Frequency not known** Hepatic necrosis · hepatitis

SIDE-EFFECTS, FURTHER INFORMATION

Fever or external heat Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat (may also increase absorption).

Overdose The effects of buprenorphine are only partially reversed by naloxone.

HAPTOASIN®

In view of the long duration of action, patients who have severe side-effects should be monitored for up to 25 hours after removing patch.

TRANSTEC®

In view of the long duration of action, patients who have severe side-effects should be monitored for up to 30 hours after removing patch.

- **BREAST FEEDING** Present in low levels in breast milk. Neonates should be monitored for drowsiness, adequate weight gain, and developmental milestones.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **PRE-TREATMENT SCREENING** Documentation of viral hepatitis status is recommended before commencing therapy for opioid dependence.
- **MONITORING REQUIREMENTS** Monitor liver function; when used in opioid dependence baseline liver function test is recommended before commencing therapy, and regular liver function tests should be performed throughout treatment.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With sublingual use in children For administration by *mouth*, tablets may be halved.

HAPTOASIN®

Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 72 hours and siting replacement patch on a different area (avoid same area for at least 7 days).

TRANSTEC®

Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 96 hours and siting replacement patch on a different area (avoid same area for at least 6 days).

BUTRANS®

Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after 7 days and siting replacement patch on a different area (avoid same area for at least 3 weeks).

- **PRESCRIBING AND DISPENSING INFORMATION** Transdermal buprenorphine patches are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose.
- **PATIENT AND CARER ADVICE**
 - ▶ **HAPTOASIN® TRANSTEC® BUTRANS®** Patients or carers should be given advice on how to administer buprenorphine transdermal patches.
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - ▶ **NICE technology appraisals (TAs)**
 - ▶ **Methadone and buprenorphine for the management of opioid dependence (January 2007) NICE TA114** Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable. www.nice.org.uk/TA114

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Sublingual tablet

CAUTIONARY AND ADVISORY LABELS 2, 26

▶ BUPRENORPHINE (Non-proprietary)

Buprenorphine (as Buprenorphine hydrochloride) 200

microgram Buprenorphine 200microgram sublingual tablets sugar free (sugar-free) | 50 tablet **[PoM]** £5.04 DT price = £5.04 Schedule 3 (CD No Register)

Buprenorphine (as Buprenorphine hydrochloride) 400

microgram Buprenorphine 400microgram sublingual tablets sugar free (sugar-free) | 7 tablet **[PoM]** £5.00 DT price = £1.60 Schedule 3 (CD No Register) (sugar-free) | 50 tablet **[PoM]** £10.07 DT price = £10.07 Schedule 3 (CD No Register)

Buprenorphine (as Buprenorphine hydrochloride)

2 mg Buprenorphine 2mg sublingual tablets sugar free (sugar-free) | 7 tablet [PoM] £18.50 DT price = £2.14 Schedule 3 (CD No Register)

Buprenorphine (as Buprenorphine hydrochloride)

8 mg Buprenorphine 8mg sublingual tablets sugar free (sugar-free) | 7 tablet [PoM] £52.00 DT price = £3.85 Schedule 3 (CD No Register)

▶ **Gabup** (Martindale Pharmaceuticals Ltd)**Buprenorphine (as Buprenorphine hydrochloride) 400**

microgram Gabup 0.4mg sublingual tablets (sugar-free) | 7 tablet [PoM] £1.60 DT price = £1.60 Schedule 3 (CD No Register)

Buprenorphine (as Buprenorphine hydrochloride) 1 mg

Buprenorphine with naloxone

The properties listed below are those particular to the combination only. For the properties of the components please consider, buprenorphine p. 434, naloxone hydrochloride p. 1133.

INDICATIONS AND DOSE**Adjunct in the treatment of opioid dependence (dose expressed as buprenorphine)**

BY SUBLINGUAL ADMINISTRATION

▶ **Adult:** Initially 2–4 mg once daily, an additional dose of 2–4 mg may be administered on day 1 depending on the individual patient's requirement, increased in steps of 2–8 mg, adjusted according to response, total weekly dose may be divided and given on alternate days or 3 times weekly; maximum 24 mg per day

● **NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (February 2007) that Suboxone® should be restricted for use in patients in whom methadone is not suitable.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Sublingual tablet

CAUTIONARY AND ADVISORY LABELS 2, 26

▶ **Suboxone** (RB Pharmaceuticals Ltd)

Buprenorphine (as Buprenorphine hydrochloride) 2 mg, Naloxone (as Naloxone hydrochloride) 500 microgram Suboxone 2mg/500microgram sublingual tablets (sugar-free) | 28 tablet [PoM] £25.40 DT price = £25.40 Schedule 3 (CD No Register)

Buprenorphine (as Buprenorphine hydrochloride) 8 mg, Naloxone (as Naloxone hydrochloride) 2 mg Suboxone 8mg/2mg sublingual tablets (sugar-free) | 28 tablet [PoM] £76.19 DT price = £76.19 Schedule 3 (CD No Register)

Methadone hydrochloride

The properties listed below are those particular to the drug only. For properties common to the class, see opioids, p. 357.

INDICATIONS AND DOSE**Severe pain**

BY MOUTH OR BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

▶ **Adult:** 5–10 mg every 6–8 hours, adjusted according to response, on prolonged use not to be given more frequently than every 12 hours

Adjunct in treatment of opioid dependence

BY MOUTH USING ORAL SOLUTION

▶ **Adult:** Initially 10–30 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily

Adjunct in treatment of opioid dependence if tolerance low or not known

BY MOUTH USING ORAL SOLUTION

▶ **Adult:** Initially 10–20 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in

the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily

Adjunct in treatment of opioid dependence if tolerance high (under expert supervision)

BY MOUTH USING ORAL SOLUTION

- ▶ Adult: Initially up to 40 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily

Cough in terminal disease

INITIALLY BY MOUTH USING LINCTUS

- ▶ Adult: 1–2 mg every 4–6 hours, (by mouth) reduced to 1–2 mg twice daily, use twice daily frequency if prolonged use

Dose equivalence and conversion

See p. 434 for dose adjustments in opioid substitution therapy, for patients taking methadone who want to switch to buprenorphine.

- **UNLICENSED USE** Methadone hydrochloride doses for opioid dependence in the BNF may differ from those in the product literature.

Important safety information

Methadone oral solution 1 mg/mL is 2½ times the strength of Methadone Linctus (2 mg/5mL). Many preparations of Methadone oral solution are licensed for opioid drug addiction only but some are also licensed for analgesia in severe pain.

- **CONTRA-INDICATIONS** Pheochromocytoma
- **CAUTIONS** Family history of sudden death (ECG monitoring recommended) · history of cardiac conduction abnormalities

CAUTIONS, FURTHER INFORMATION

QT-interval prolongation Patients with the following risk factors for QT-interval prolongation should be carefully monitored while taking methadone: heart or liver disease, electrolyte abnormalities, or concomitant treatment with drugs that can prolong QT interval; patients requiring more than 100 mg daily should also be monitored.

- **SIDE-EFFECTS** Dry eyes · dysmenorrhoea · hyperprolactinaemia · hypothermia · QT-interval prolongation · raised intracranial pressure · restlessness · torsade de pointes

SIDE-EFFECTS, FURTHER INFORMATION

Methadone is a long-acting opioid therefore effects may be cumulative. Methadone, even in low doses is a **special hazard** for children; non-dependent adults are also at risk of toxicity; dependent adults are at risk if tolerance is incorrectly assessed during induction.

Overdose Methadone has a very long duration of action; patients may need to be monitored for long periods following large overdoses.

- **BREAST FEEDING** Withdrawal symptoms in infant; breast-feeding permissible during maintenance but dose should be as low as possible and infant monitored to avoid sedation (high doses of methadone carry an increased risk of sedation and respiratory depression in the neonate).
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.
- **DIRECTIONS FOR ADMINISTRATION** Syrup preserved with hydroxybenzoate (parabens) esters may be incompatible with methadone hydrochloride.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tolu.

METHADOSE® ORAL SOLUTION

The final strength of the methadone mixture to be dispensed to the patient must be specified on the prescription.

Important—care is required in prescribing and dispensing the **correct strength** since any confusion could lead to an overdose; this preparation should be dispensed **only after dilution** as appropriate with *Methadose*® Diluent (life of diluted solution 3 months) and is for drug dependent persons.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- ▶ **Methadone and buprenorphine for the management of opioid dependence (January 2007) NICE TA114**
Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable. www.nice.org.uk/TA114
- **LESS SUITABLE FOR PRESCRIBING** Methadone linctus is less suitable for prescribing for cough in terminal disease (has a tendency to accumulate).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, suppository, solution for injection, oral suspension, oral solution, capsule, impregnated cigarette

Tablet

Tablet

CAUTIONARY AND ADVISORY LABELS 9

▶ DILOXANIDE FUROATE (Non-proprietary)

Diloxanide furoate 500 mg Diloxanide 500mg tablets | 30 tablet (POM) £93.50

Mepacrine hydrochloride

INDICATIONS AND DOSE

Giardiasis

BY MOUTH

- ▶ Adult: 100 mg every 8 hours for 5–7 days

- **UNLICENSED USE** Not licensed for use in giardiasis.
- **CAUTIONS** Avoid in psoriasis · elderly · history of psychosis
- **INTERACTIONS** → Appendix 1 (mepacrine).
- **SIDE-EFFECTS** Aplastic anaemia (on prolonged treatment) · blue/black discoloration of nails · blue/black

discoloration of palate · chronic dermatoses (on prolonged treatment) · CNS stimulation (with large doses) · corneal deposits with visual disturbances · dizziness · gastrointestinal disturbances · headache · hepatitis (on prolonged treatment) · nausea (with large doses) · severe exfoliative dermatitis (on prolonged treatment) · transient acute toxic psychosis (with large doses) · vomiting (with large doses) · yellow discoloration of skin (on prolonged treatment) · yellow discoloration of urine (on prolonged treatment)

- **HEPATIC IMPAIRMENT** Use with caution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

2 Bacterial infection

Antibacterials, principles of therapy

Choice of a suitable drug

Before selecting an antibacterial the clinician must first consider two factors— the patient and the known or likely causative organism. Factors related to the patient which must be considered include history of allergy, renal and hepatic function, susceptibility to infection (i.e. whether immunocompromised), ability to tolerate drugs by mouth, severity of illness, ethnic origin, age, whether taking other medication and, if female, whether pregnant, breast-feeding or taking an oral contraceptive.

The known or likely organism and its antibacterial sensitivity, in association with the above factors, will suggest one or more antibacterials, the final choice depending on the microbiological, pharmacological, and toxicological properties.

An example of a rational approach to the selection of an antibacterial is treatment of a urinary-tract infection in a patient complaining of nausea and symptoms of a urinary-tract infection in early pregnancy. The organism is reported as being resistant to ampicillin p. 483 but sensitive to

nitrofurantoin p. 512 (can cause nausea), gentamicin p. 450 (can be given only by injection and best avoided in pregnancy), tetracycline p. 498 (causes dental discoloration) and trimethoprim p. 462 (folate antagonist therefore theoretical teratogenic risk), and cefalexin p. 456. The safest antibiotics in pregnancy are the penicillins and cephalosporins; therefore, cefalexin p. 456 would be indicated for this patient.

The principles involved in selection of an antibacterial must allow for a number of variables including changing renal and hepatic function, increasing bacterial resistance, and information on side-effects. Duration of therapy, dosage, and route of administration depend on site, type and severity of infection and response.

Antibacterial policies

Local policies often limit the antibacterials that may be used to achieve reasonable economy consistent with adequate cover, and to reduce the development of resistant organisms. A policy may indicate a range of drugs for general use, and permit other drugs only on the advice of the microbiologist or physician responsible for the control of infectious diseases.

Before starting therapy

The following precepts should be considered before starting:

- Viral infections should not be treated with antibacterials. However, antibacterials may be used to treat secondary bacterial infection (e.g. bacterial pneumonia secondary to influenza);
- Samples should be taken for culture and sensitivity testing; **'blind'** antibacterial prescribing for unexplained pyrexia usually leads to further difficulty in establishing the diagnosis;
- Knowledge of **prevalent organisms** and their current sensitivity is of great help in choosing an antibacterial before bacteriological confirmation is available. Generally, narrow-spectrum antibacterials are preferred to broad-spectrum antibacterials unless there is a clear clinical indication (e.g. life-threatening sepsis);
- The **dose** of an antibacterial varies according to a number of factors including age, weight, hepatic function, renal function, and severity of infection. The prescribing of the so-called 'standard' dose in serious infections may result in failure of treatment or even death of the patient; therefore it is important to prescribe a dose appropriate to the condition. An inadequate dose may also increase the likelihood of antibacterial resistance. On the other hand, for an antibacterial with a narrow margin between the toxic and therapeutic dose (e.g. an aminoglycoside) it is also important to avoid an excessive dose and the concentration of the drug in the plasma may need to be monitored;
- The **route** of administration of an antibacterial often depends on the severity of the infection. Life-threatening infections require intravenous therapy. Antibacterials that are well absorbed may be given by mouth even for some serious infections. Parenteral administration is also appropriate when the oral route cannot be used (e.g. because of vomiting) or if absorption is inadequate. Whenever possible, painful intramuscular injections should be avoided in children;
- **Duration** of therapy depends on the nature of the infection and the response to treatment. Courses should not be unduly prolonged because they encourage resistance, they may lead to side-effects and they are costly. However, in certain infections such as tuberculosis or osteomyelitis it may be necessary to treat for prolonged periods. Conversely a single dose of an antibacterial may cure uncomplicated urinary-tract

infections. The prescription for an antibacterial should specify the duration of treatment or the date when treatment is to be reviewed.

Superinfection

In general, broad-spectrum antibacterial drugs such as the cephalosporins are more likely to be associated with adverse reactions related to the selection of resistant organisms e.g. *fungal infections* or *antibiotic-associated colitis* (pseudomembranous colitis); other problems associated with superinfection include vaginitis and pruritus ani.

Therapy

When the pathogen has been isolated treatment may be changed to a more appropriate antibacterial if necessary. If no bacterium is cultured the antibacterial can be continued or stopped on clinical grounds.

Notifiable diseases

Doctors must notify the Proper Officer of the local authority (usually the consultant in communicable disease control) when attending a patient suspected of suffering from any of the diseases listed below; a form is available from the Proper Officer.

Anthrax	Mumps
Botulism	Paratyphoid fever
Brucellosis	Plague
Cholera	Poliomyelitis, acute
Diarrhoea (infectious bloody)	Rabies
Diphtheria	Rubella
Encephalitis, acute	SARS
Food poisoning	Scarlet fever
Haemolytic uraemic syndrome	Smallpox
Haemorrhagic fever (viral)	Streptococcal disease (Group A, invasive)
Hepatitis, viral	Tetanus
Legionnaires' disease	Tuberculosis
Leprosy	Typhoid fever
Malaria	Typhus
Measles	Whooping cough
Meningitis	Yellow fever
Meningococcal septicaemia	

It is good practice for doctors to also inform the consultant in communicable disease control of instances of other infections (e.g. psittacosis) where there could be a public health risk.

Antibacterials, use for prophylaxis

Prevention of recurrence of rheumatic fever

Phenoxymethylpenicillin p. 481 or sulfadiazine p. 495.

Prevention of secondary case of invasive group A streptococcal infection

Phenoxymethylpenicillin p. 481.

Patients who are penicillin allergic, *either* erythromycin p. 471 or azithromycin p. 469 [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England Laboratory).

Prevention of secondary case of meningococcal meningitis

Ciprofloxacin p. 490 or rifampicin p. 508 or i/m ceftriaxone p. 459 [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health

England laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

Prevention of secondary case of *Haemophilus influenzae* type b disease

Rifampicin p. 508 *or* (if rifampicin cannot be used) i/m *or* i/v ceftriaxone p. 459 [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

Within 4 weeks of illness onset in an index case with confirmed or suspected invasive *Haemophilus influenzae* type b disease, give antibacterial prophylaxis to all household contacts if there is a vulnerable individual in the household. Also, give antibacterial prophylaxis to the index case if they are in contact with vulnerable household contacts or if they are under 10 years of age. Vulnerable individuals include the immunocompromised, those with asplenia, or children under 10 years of age. If there are 2 or more cases of invasive *Haemophilus influenzae* type b disease within 120 days in a pre-school or primary school, antibacterial prophylaxis should also be given to all room contacts (including staff).

Prevention of secondary case of diphtheria in non-immune patient

Erythromycin p. 471 (or azithromycin p. 469 or clarithromycin p. 470).

Treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment.

Prevention of pertussis

Clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471).

Within 3 weeks of onset of cough in the index case, give antibacterial prophylaxis to all close contacts if amongst them there is at least one unimmunised or partially immunised child under 1 year of age, *or* if there is at least one individual who has not received a pertussis-containing vaccine more than 1 week and less than 5 years ago (so long as that individual lives or works with children under 4 months of age, is pregnant at over 32 weeks gestation, or is a healthcare worker who works with children under 1 year of age or with pregnant women).

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease

Phenoxymethylpenicillin p. 481.

If penicillin-allergic, erythromycin p. 471.

Antibacterial prophylaxis is not fully reliable. Antibacterial prophylaxis may be discontinued in children over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection.

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive

Isoniazid p. 506 *or* isoniazid + rifampicin p. 508 *or* (if isoniazid-resistant tuberculosis in patients under 35 years) rifampicin.

For details of those who should receive chemoprophylaxis contact the lead clinician for local tuberculosis services (or a consultant in communicable disease control).

Prevention of infection from animal and human bites

Co-amoxiclav p. 484 alone (or doxycycline p. 496 + metronidazole p. 475 if penicillin-allergic).

Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 1065 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection).

Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.

Antibacterial prophylaxis recommended for wounds less than 48–72 hours old when the risk of infection is high (e.g. bites from humans or cats; bites to the hand, foot, face, or genital area; bites involving oedema, crush or puncture injury, or other moderate to severe injury; wounds that cannot be debrided adequately; patients with diabetes mellitus, cirrhosis, asplenia, prosthetic joints or valves, or those who are immunocompromised). Give antibacterial prophylaxis for up to 5 days.

Prevention of early-onset neonatal infection

i/v benzylpenicillin sodium p. 480 (or i/v clindamycin p. 467 if history of allergy to penicillins).

Give intrapartum prophylaxis to women with group B streptococcal colonisation, bacteriuria, or infection in the current pregnancy, or to women who had a previous baby with an invasive group B streptococcal infection. Consider prophylaxis for women in preterm labour if there is prelabour rupture of membranes or if intrapartum rupture of membranes lasting more than 18 hours is suspected.

Prevention of infection in gastro-intestinal procedures

Operations on stomach or oesophagus

Single dose of i/v gentamicin p. 450 or i/v cefuroxime p. 460 *or* i/v co-amoxiclav p. 484 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add i/v teicoplanin p. 464 (or vancomycin p. 465) if high risk of methicillin-resistant *Staphylococcus aureus*.

Open biliary surgery

Single dose of i/v cefuroxime p. 460 + i/v metronidazole p. 475 *or* i/v gentamicin p. 450 + i/v metronidazole *or* i/v co-amoxiclav p. 484 alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin p. 464 (or vancomycin p. 465) if high risk of methicillin-resistant *Staphylococcus aureus*.

Resections of colon and rectum for carcinoma, and resections in inflammatory bowel disease, and appendicectomy

Single dose of i/v gentamicin p. 450 + i/v metronidazole p. 475 *or* i/v cefuroxime p. 460 + i/v metronidazole *or* i/v co-amoxiclav p. 484 alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where *i/v* metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add *i/v* teicoplanin p. 464 (or vancomycin p. 465) if high risk of meticillin-resistant *Staphylococcus aureus*.

Endoscopic retrograde cholangiopancreatography

Single dose of *i/v* gentamicin p. 450 or oral or *i/v* ciprofloxacin p. 490.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Prophylaxis recommended if pancreatic pseudocyst, immunocompromised, history of liver transplantation, or risk of incomplete biliary drainage. For biliary complications following liver transplantation, add *i/v* amoxicillin p. 482 or *i/v* teicoplanin p. 464 (or vancomycin p. 465).

Percutaneous endoscopic gastrostomy or jejunostomy

Single dose of *i/v* co-amoxiclav p. 484 or *i/v* cefuroxime p. 460.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of *i/v* teicoplanin p. 464 (or vancomycin p. 465) if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus*.

Prevention of infection in orthopaedic surgery

Joint replacement including hip and knee

Single dose of *i/v* cefuroxime p. 460 alone or *i/v* flucloxacillin p. 486 + *i/v* gentamicin p. 450 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant *Staphylococcus aureus*, use single dose of *i/v* teicoplanin p. 464 (or vancomycin p. 465) + *i/v* gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Closed fractures

Single dose of *i/v* cefuroxime p. 460 or *i/v* flucloxacillin p. 486 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant *Staphylococcus aureus*, use single dose of *i/v* teicoplanin p. 464 (or vancomycin p. 465) (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Open fractures

Use *i/v* co-amoxiclav p. 484 alone or *i/v* cefuroxime p. 460 + *i/v* metronidazole p. 475 (or *i/v* clindamycin p. 467 alone if history of allergy to penicillins or to cephalosporins).

Add *i/v* teicoplanin p. 464 (or vancomycin p. 465) if high risk of meticillin-resistant *Staphylococcus aureus*. Start prophylaxis within 3 hours of injury and continue until soft tissue closure (max. 72 hours).

At first debridement also use a single dose of *i/v* cefuroxime + *i/v* metronidazole + *i/v* gentamicin or *i/v* co-amoxiclav + *i/v* gentamicin (or *i/v* clindamycin + *i/v* gentamicin if history of allergy to penicillins or to cephalosporins).

At time of skeletal stabilisation and definitive soft tissue closure use a single dose of *i/v* gentamicin + *i/v* teicoplanin (or vancomycin) (intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure).

High lower-limb amputation

Use *i/v* co-amoxiclav p. 484 alone or *i/v* cefuroxime p. 460 + *i/v* metronidazole p. 475.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Continue antibacterial prophylaxis for at least 2 doses after procedure (max. duration of prophylaxis 5 days). If history of allergy to penicillin or to cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus*, use *i/v* teicoplanin p. 464 (or vancomycin p. 465) + *i/v* gentamicin p. 450 + *i/v* metronidazole.

Where *i/v* metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Prevention of infection in urological procedures

Transrectal prostate biopsy

Single dose of oral ciprofloxacin p. 490 + oral metronidazole p. 475 or *i/v* gentamicin p. 450 + *i/v* metronidazole (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of *i/v* gentamicin + *i/v* metronidazole if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses of antibacterial may be given for prolonged procedures or if there is major blood loss).

Where *i/v* metronidazole p. 475 is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Transurethral resection of prostate

Single dose of oral ciprofloxacin p. 490 or *i/v* gentamicin p. 450 or *i/v* cefuroxime p. 460 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of *i/v* gentamicin p. 450 if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Prevention of infection in obstetric and gynaecological surgery

Caesarean section

Single dose of *i/v* cefuroxime p. 460 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Substitute *i/v* clindamycin p. 467 if history of allergy to penicillins or cephalosporins. Add *i/v* teicoplanin p. 464 (or vancomycin p. 465) if high risk of meticillin-resistant *Staphylococcus aureus*.

Hysterectomy

Single dose of *i/v* cefuroxime p. 460 + *i/v* metronidazole p. 475 or *i/v* gentamicin p. 450 + *i/v* metronidazole or *i/v* co-amoxiclav p. 484 alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of *i/v* gentamicin + *i/v* metronidazole or add *i/v* teicoplanin p. 464 (or vancomycin p. 465) to other regimens if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Where *i/v* metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Termination of pregnancy

Single dose of oral metronidazole p. 475 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

If genital chlamydial infection cannot be ruled out, give doxycycline p. 496 postoperatively.

Prevention of infection in cardiology procedures

Cardiac pacemaker insertion

Single dose of *i/v* cefuroxime p. 460 alone or *i/v* flucloxacillin p. 486 + *i/v* gentamicin p. 450 or *i/v* teicoplanin p. 464 (or vancomycin p. 465) + *i/v* gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of *i/v* teicoplanin (or vancomycin) + *i/v* cefuroxime or *i/v* teicoplanin (or vancomycin) + *i/v* gentamicin if high risk of methicillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Prevention of infection in vascular surgery

Reconstructive arterial surgery of abdomen, pelvis or legs

Single dose of *i/v* cefuroxime p. 460 alone or *i/v* flucloxacillin p. 486 + *i/v* gentamicin p. 450 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add *i/v* metronidazole p. 475 for patients at risk from anaerobic infections including those with diabetes, gangrene, or undergoing amputation. Use single dose of *i/v* teicoplanin p. 464 (or vancomycin p. 465) + *i/v* gentamicin if history of allergy to penicillins or cephalosporins, or if high risk of methicillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Prevention of endocarditis

NICE guidance: Antimicrobial prophylaxis against infective endocarditis in adults and children undergoing interventional procedures (March 2008)

Antibacterial prophylaxis and chlorhexidine mouthwash are **not** recommended for the prevention of endocarditis in patients undergoing dental procedures.

Antibacterial prophylaxis is **not** recommended for the prevention of endocarditis in patients undergoing procedures of the:

- upper and lower respiratory tract (including ear, nose, and throat procedures and bronchoscopy);
- genito-urinary tract (including urological, gynaecological, and obstetric procedures);
- upper and lower gastro-intestinal tract.

Whilst these procedures can cause bacteraemia, there is no clear association with the development of infective endocarditis. Prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

If patients at risk of endocarditis are undergoing a gastro-intestinal or genito-urinary tract procedure at a site where infection is suspected, they should receive appropriate antibacterial therapy that includes cover against organisms that cause endocarditis.

Patients at risk of endocarditis should be:

- advised to maintain good oral hygiene;
- told how to recognise signs of infective endocarditis, and advised when to seek expert advice.

Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus), and closure devices considered to be endothelialised, hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.

Dermatological procedures

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who undergo dermatological procedures do not require antibacterial prophylaxis against endocarditis.

The British Association of Dermatologists Therapy Guidelines and Audit Subcommittee advise that such dermatological procedures include skin biopsies and excision of moles or of malignant lesions.

Joint prostheses and dental treatment

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

Immunosuppression and indwelling intraperitoneal catheters

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

Blood infections, bacterial

Antibacterial therapy for septicaemia: community-acquired

- A broad-spectrum antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 479, ticarcillin with clavulanic acid p. 480) or a broad-spectrum cephalosporin (e.g. cefuroxime p. 460)
 - If methicillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 465 (or teicoplanin p. 464).
 - If anaerobic infection suspected, add metronidazole p. 475 to broad-spectrum cephalosporin.
 - If other resistant micro-organisms suspected, use a more broad-spectrum beta-lactam antibacterial (e.g. meropenem p. 454).

Antibacterial therapy for septicaemia: hospital-acquired

- A broad-spectrum antipseudomonal beta-lactam antibacterial (e.g. piperacillin with tazobactam p. 479, ticarcillin with clavulanic acid p. 480, ceftazidime p. 458, imipenem with cilastatin p. 454, or meropenem p. 454)
If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 465 (or teicoplanin p. 464).
If anaerobic infection suspected, add metronidazole p. 475 to broad-spectrum cephalosporin

Septicaemia related to vascular catheter

- Vancomycin p. 465 (or teicoplanin p. 464)
If Gram-negative sepsis suspected, especially in the immunocompromised, add a broad-spectrum antipseudomonal beta-lactam.
Consider removing vascular catheter, particularly if infection caused by *Staphylococcus aureus*, pseudomonas, or *Candida* species.

Meningococcal septicaemia

If meningococcal disease suspected, a single dose of benzylpenicillin sodium p. 480 should be given before urgent transfer to hospital, so long as this does not delay the transfer; cefotaxime p. 457 may be an alternative in penicillin allergy; chloramphenicol p. 452 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.

- Benzylpenicillin sodium or cefotaxime (or ceftriaxone p. 459)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol
To eliminate nasopharyngeal carriage, ciprofloxacin p. 490, or rifampicin p. 508, or ceftriaxone may be used.

Cardiovascular system infections, bacterial

Antibacterial therapy for endocarditis: initial 'blind' therapy

- *Native valve endocarditis*, amoxicillin p. 482 (or ampicillin p. 483)
Consider adding low-dose gentamicin p. 450
If penicillin-allergic, or if meticillin-resistant *Staphylococcus aureus* suspected, or if severe sepsis, use vancomycin p. 465 + low-dose gentamicin
If severe sepsis with risk factors for Gram-negative infection, use vancomycin + meropenem p. 454
- *If prosthetic valve endocarditis*, vancomycin + rifampicin p. 508 + low-dose gentamicin

Antibacterial therapy for native-valve endocarditis caused by staphylococci

- Flucloxacillin p. 486
Suggested duration of treatment 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)
- *If penicillin-allergic or if meticillin-resistant Staphylococcus aureus*, vancomycin p. 465 + rifampicin
Suggested duration of treatment 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)

Antibacterial therapy for prosthetic valve endocarditis caused by staphylococci

- Flucloxacillin p. 486 + rifampicin p. 508 + low-dose gentamicin
Suggested duration of treatment at least 6 weeks; review need to continue gentamicin p. 450 at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- *If penicillin-allergic or if meticillin-resistant Staphylococcus aureus*, vancomycin p. 465 + rifampicin + low-dose gentamicin
Suggested duration of treatment at least 6 weeks; review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks

Antibacterial therapy for endocarditis caused by fully-sensitive streptococci

- Benzylpenicillin sodium p. 480
Suggested duration of treatment 4–6 weeks (6 weeks for prosthetic valve endocarditis)
- *If penicillin-allergic*, vancomycin p. 465 (or teicoplanin p. 464) + low-dose gentamicin
Suggested duration of treatment 4–6 weeks (stop gentamicin p. 450 after 2 weeks)

Antibacterial therapy for endocarditis caused by less-sensitive streptococci

- Benzylpenicillin sodium p. 480 + low-dose gentamicin
Suggested duration of treatment 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin p. 450 at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin
- *If penicillin-allergic or highly penicillin-resistant*, vancomycin p. 465 (or teicoplanin p. 464) + low-dose gentamicin
Suggested duration of treatment 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin

Antibacterial therapy for endocarditis caused by enterococci

- Amoxicillin p. 482 (or ampicillin p. 483) + low dose gentamicin p. 450 or benzylpenicillin sodium p. 480 + low-dose gentamicin
Suggested duration of treatment 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- *If penicillin-allergic or penicillin-resistant*, vancomycin p. 465 (or teicoplanin p. 464) + low-dose gentamicin
Suggested duration of treatment 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- *If gentamicin resistant*, amoxicillin (or ampicillin) Add streptomycin p. 451 (if susceptible) for 2 weeks
Suggested duration of treatment at least 6 weeks

Antibacterial therapy for endocarditis caused by *Haemophilus*, *Actinobacillus*, *Cardiobacterium*, *Eikenella*, and *Kingella* species ('HACEK' micro-organisms)

- Amoxicillin p. 482 (or ampicillin p. 483) + low-dose gentamicin
Suggested duration of treatment 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin p. 450 after 2 weeks
- If amoxicillin-resistant, ceftriaxone p. 459 (or cefotaxime p. 457) + low-dose gentamicin
Suggested duration of treatment 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks

Central nervous system infections, bacterial

Antibacterial therapy for meningitis: initial empirical therapy

- Transfer patient to hospital urgently.
- If *meningococcal disease* (meningitis with non-blanching rash or meningococcal septicaemia) suspected, benzylpenicillin sodium p. 480 should be given before transfer to hospital, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently, benzylpenicillin sodium should be given before the transfer. Cefotaxime p. 457 may be an alternative in penicillin allergy; chloramphenicol p. 452 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.
- In hospital, consider adjunctive treatment with dexamethasone p. 581 (particularly if pneumococcal meningitis suspected in adults), preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial; avoid dexamethasone in septic shock, meningococcal septicaemia, or if immunocompromised, or in meningitis following surgery.

In hospital, if aetiology unknown

- *Adult and child 3 months–50 years*, cefotaxime (or ceftriaxone p. 459)
Consider adding vancomycin p. 465 if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
Suggested duration of treatment at least 10 days
- *Adult over 50 years* cefotaxime (or ceftriaxone) + amoxicillin p. 482 (or ampicillin p. 483)
Consider adding vancomycin if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
Suggested duration of treatment at least 10 days

Antibacterial therapy for meningitis caused by meningococci

- Benzylpenicillin sodium p. 480 or cefotaxime p. 457 (or ceftriaxone p. 459)
Suggested duration of treatment 7 days.
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol
Suggested duration of treatment 7 days.

Antibacterial therapy for meningitis caused by pneumococci

- Cefotaxime p. 457 (or ceftriaxone p. 459)
Consider adjunctive treatment with dexamethasone p. 581, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial (may reduce penetration of vancomycin p. 465 into cerebrospinal fluid).
If micro-organism penicillin-sensitive, replace cefotaxime with benzylpenicillin sodium p. 480.
If micro-organism highly penicillin- and cephalosporin-resistant, add vancomycin and if necessary rifampicin p. 508.
Suggested duration of antibacterial treatment 14 days

Antibacterial therapy for meningitis caused by *Haemophilus influenzae*

- Cefotaxime p. 457 (or ceftriaxone p. 459)
Consider adjunctive treatment with dexamethasone p. 581, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
Suggested duration of antibacterial treatment 10 days.
For *H. influenzae* type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, or if micro-organism resistant to cefotaxime, chloramphenicol
Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
Suggested duration of antibacterial treatment 10 days.
For *H. influenzae* type b give rifampicin p. 508 for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts

Antibacterial therapy for meningitis caused by *Listeria*

- Amoxicillin p. 482 (or ampicillin p. 483) + gentamicin
Suggested duration of treatment 21 days.
Consider stopping gentamicin p. 450 after 7 days.
- If history of immediate hypersensitivity reaction to penicillin, co-trimoxazole
Suggested duration of treatment 21 days.

Ear infections, bacterial

Antibacterial therapy for otitis externa

For topical treatments, consider *Otitis externa*, under Ear p. 976.

Consider systemic antibacterial if spreading cellulitis or patient systemically unwell.

- Flucloxacillin
If penicillin-allergic, clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
If *pseudomonas* suspected, ciprofloxacin p. 490 (or an aminoglycoside)

Antibacterial therapy for otitis media

Many infections caused by viruses. Most uncomplicated cases resolve without antibacterial treatment. In children without systemic features, antibacterial treatment may be started after 72 hours if no improvement. Consider earlier treatment if deterioration, if systemically unwell, if at high risk of serious complications (e.g. in immunosuppression,

cystic fibrosis), if mastoiditis present, or in children under 2 years of age with bilateral otitis media.

- Amoxicillin p. 482 (or ampicillin p. 483)
Consider co-amoxiclav p. 484 if no improvement after 48 hours.
In severe infection, initial parenteral therapy with co-amoxiclav or cefuroxime p. 460.
Suggested duration of treatment 5 days (longer if severely ill).
- If penicillin-allergic, clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
Suggested duration of treatment 5 days (longer if severely ill)

Eye infections, bacterial

Antibacterial therapy for purulent conjunctivitis

- Chloramphenicol eye drops p. 955.

Gastro-intestinal system infections, bacterial

Antibacterial therapy for gastro-enteritis

Frequently self-limiting and may not be bacterial.

- Antibacterial not usually indicated

Antibacterial therapy for campylobacter enteritis

Frequently self-limiting; treat if immunocompromised or if severe infection.

- Clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
- *Alternative*, ciprofloxacin
Strains with decreased sensitivity to ciprofloxacin p. 490 isolated frequently

Antibacterial therapy for salmonella (non-typhoid)

Treat invasive or severe infection. Do not treat less severe infection unless there is a risk of developing invasive infection (e.g. immunocompromised patients, those with haemoglobinopathy, or children under 6 months of age).

- Ciprofloxacin p. 490 or cefotaxime p. 457

Antibacterial therapy for shigellosis

Antibacterial not indicated for mild cases.

- Ciprofloxacin p. 490 or azithromycin p. 469
- *Alternatives if micro-organism sensitive*, amoxicillin p. 482 or trimethoprim p. 462

Antibacterial therapy for typhoid fever

Infections from Middle-East, South Asia, and South-East Asia may be multiple-antibacterial-resistant and sensitivity should be tested.

- Cefotaxime p. 457 (or ceftriaxone p. 459)
Azithromycin p. 469 may be an alternative in mild or moderate disease caused by multiple-antibacterial-resistant organisms.
- *Alternative if micro-organism sensitive*, ciprofloxacin p. 490

Antibacterial therapy for Clostridium difficile infection

- For first episode of mild to moderate infection, oral metronidazole
Suggested duration of treatment 10–14 days
- For second or subsequent episode of infection, for severe infection, for infection not responding to metronidazole p.

475, or in patients intolerant of metronidazole, oral vancomycin

For severe infection in patients with multiple comorbidities who are receiving treatment with other antibacterials, or for second or subsequent episode of infection, fidaxomicin p. 468 can replace vancomycin p. 465

Suggested duration of treatment 10–14 days

- For infection not responding to vancomycin or fidaxomicin, for life-threatening infection, or in patients with ileus, oral vancomycin + i/v metronidazole
For infection not responding to vancomycin in patients without life-threatening infection or ileus, fidaxomicin can be used instead of vancomycin + metronidazole
Suggested duration of treatment 10–14 days

Antibacterial therapy for biliary-tract infection

- Ciprofloxacin p. 490 or gentamicin p. 450 or a cephalosporin

Antibacterial therapy for peritonitis

- A cephalosporin + metronidazole p. 1008 or gentamicin p. 450 + metronidazole or gentamicin + clindamycin p. 467 or piperacillin with tazobactam p. 479 alone

Antibacterial therapy for peritonitis: peritoneal dialysis-associated

- Vancomycin p. 465 (or teicoplanin p. 464) + ceftazidime p. 458 added to dialysis fluid or vancomycin added to dialysis fluid + ciprofloxacin p. 490 by mouth
Suggested duration of treatment 14 days or longer

Genital system infections, bacterial

Antibacterial therapy for bacterial vaginosis

- Oral metronidazole
Suggested duration of treatment 5–7 days (or high-dose metronidazole p. 475 as a single dose)
- *Alternatively*, topical metronidazole for 5 days or topical clindamycin p. 467 for 7 days

Antibacterial therapy for uncomplicated genital chlamydial infection, non-gonococcal urethritis, and non-specific genital infection

Contact tracing recommended.

- Azithromycin or doxycycline
Suggested duration of treatment azithromycin p. 469 as a single dose or doxycycline p. 496 for 7 days
- *Alternatively*, erythromycin p. 471.
Suggested duration of treatment 14 days

Antibacterial therapy for gonorrhoea: uncomplicated

Contact tracing recommended. Consider chlamydia co-infection. Choice of alternative antibacterial regimen depends on locality where infection acquired.

- Azithromycin p. 469 + i/m ceftriaxone
Suggested duration of treatment is a single-dose of each antibacterial
- *Alternatively, when parenteral administration is not possible*, cefixime p. 457 + azithromycin
Suggested duration of treatment is a single-dose of each antibacterial
- *Alternatively, if micro-organism is sensitive to a quinolone*, ciprofloxacin p. 490 + azithromycin
Suggested duration of treatment is a single-dose of each antibacterial

- *Pharyngeal infection*, azithromycin p. 469 + i/m ceftriaxone
Suggested duration of treatment is a single-dose of each antibacterial

Antibacterial therapy for pelvic inflammatory disease

Contact tracing recommended.

- Doxycycline p. 496 + metronidazole p. 475 + single-dose of i/m ceftriaxone p. 459 or ofloxacin p. 494 + metronidazole
Suggested duration of treatment 14 days (except i/m ceftriaxone p. 459).
In severely ill patients initial treatment with doxycycline p. 496 + i/v ceftriaxone p. 459 + i/v metronidazole p. 475, then switch to oral treatment with doxycycline + metronidazole to complete 14 days' treatment

Antibacterial therapy for early syphilis (infection of less than 2 years)

Contact tracing recommended.

- Benzathine benzylpenicillin [unlicensed]
Suggested duration of treatment single-dose (repeat dose after 7 days for women in the third trimester of pregnancy)
- Alternatively, doxycycline p. 496 or erythromycin
Suggested duration of treatment 14 days

Antibacterial therapy for late latent syphilis (asymptomatic infection of more than 2 years)

Contact tracing recommended.

- Benzathine benzylpenicillin [unlicensed]
Suggested duration of treatment once weekly for 2 weeks
- Alternatively, doxycycline p. 496
Suggested duration of treatment 28 days

Asymptomatic contacts of patients with infectious syphilis

- Doxycycline p. 496
Suggested duration of treatment 14 days

Musculoskeletal system infections, bacterial

Antibacterial therapy for osteomyelitis

Seek specialist advice if chronic infection or prostheses present.

- Flucloxacillin p. 486
Consider adding fusidic acid p. 463 or rifampicin p. 508 for initial 2 weeks.
Suggested duration of treatment 6 weeks for acute infection
- If *penicillin-allergic*, clindamycin p. 467
Consider adding fusidic acid or rifampicin for initial 2 weeks.
Suggested duration of treatment 6 weeks for acute infection
- If *meticillin-resistant Staphylococcus aureus suspected*, vancomycin p. 465 (or teicoplanin p. 464)
Consider adding fusidic acid or rifampicin for initial 2 weeks.
Suggested duration of treatment 6 weeks for acute infection

Antibacterial therapy for septic arthritis

Seek specialist advice if prostheses present.

- Flucloxacillin p. 486
Suggested duration of treatment 4–6 weeks (longer if infection complicated).
- If *penicillin-allergic*, clindamycin p. 467
Suggested duration of treatment 4–6 weeks (longer if infection complicated).
- If *meticillin-resistant Staphylococcus aureus suspected*, vancomycin p. 465 (or teicoplanin p. 464)
Suggested duration of treatment 4–6 weeks (longer if infection complicated).
- If *gonococcal arthritis or Gram-negative infection suspected*, cefotaxime p. 457 (or ceftriaxone p. 459)
Suggested duration of treatment 4–6 weeks (longer if infection complicated; treat gonococcal infection for 2 weeks).

Nose infections, bacterial

Antibacterial therapy for sinusitis

Antibacterial should usually be used only for persistent symptoms and purulent discharge lasting at least 7 days or if severe symptoms. Also, consider antibacterial for those at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis).

- Amoxicillin p. 482 (or ampicillin p. 483) or doxycycline p. 496 or clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
Suggested duration of treatment 7 days.
Consider oral co-amoxiclav p. 484 if no improvement after 48 hours.
In severe infection, initial parenteral therapy with co-amoxiclav or cefuroxime p. 460 may be required.

Oral bacterial infections

Antibacterial drugs should only be prescribed for the *treatment* of oral infections on the basis of defined need. They may be used in conjunction with (but not as an alternative to) other appropriate measures, such as providing drainage or extracting a tooth.

The 'blind' prescribing of an antibacterial for unexplained pyrexia, cervical lymphadenopathy, or facial swelling can lead to difficulty in establishing the diagnosis. In severe oral infections, a sample should always be taken for bacteriology.

Oral infections which may require antibacterial treatment include acute periapical or periodontal abscess, cellulitis, acutely created oral-antral communication (and acute sinusitis), severe pericoronitis, localised osteitis, acute necrotising ulcerative gingivitis, and destructive forms of chronic periodontal disease. Most of these infections are readily resolved by the early establishment of drainage and removal of the cause (typically an infected necrotic pulp). Antibacterials may be required if treatment has to be delayed, in immunocompromised patients, or in those with conditions such as diabetes or Paget's disease. Certain rarer infections including bacterial sialadenitis, osteomyelitis, actinomycosis, and infections involving fascial spaces such as Ludwig's angina, require antibiotics and specialist hospital care.

Antibacterial drugs may also be useful after dental surgery in some cases of spreading infection. Infection may spread to involve local lymph nodes, to fascial spaces (where it can cause airway obstruction), or into the bloodstream (where it can lead to cavernous sinus thrombosis and other serious complications). Extension of an infection can also lead to

maxillary sinusitis; osteomyelitis is a complication, which usually arises when host resistance is reduced.

If the oral infection fails to respond to antibacterial treatment within 48 hours the antibacterial should be changed, preferably on the basis of bacteriological investigation. Failure to respond may also suggest an incorrect diagnosis, lack of essential additional measures (such as drainage), poor host resistance, or poor patient compliance.

Combination of a penicillin (or a macrolide) with metronidazole p. 475 may sometimes be helpful for the treatment of severe oral infections or oral infections that have not responded to initial antibacterial treatment.

Penicillins

Phenoxymethylpenicillin p. 481 is effective for dentoalveolar abscess.

Broad-spectrum penicillins

Amoxicillin p. 482 is as effective as phenoxymethylpenicillin p. 481 but is better absorbed; however, it may encourage emergence of resistant organisms.

Like phenoxymethylpenicillin, amoxicillin is ineffective against bacteria that produce beta-lactamases.

Amoxicillin may be useful for short course oral regimens.

Co-amoxiclav p. 484 is active against beta-lactamase-producing bacteria that are resistant to amoxicillin. Co-amoxiclav may be used for severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial treatment.

Cephalosporins

The cephalosporins offer little advantage over the penicillins in dental infections, often being less active against anaerobes. Infections due to oral streptococci (often termed viridans streptococci) which become resistant to penicillin are usually also resistant to cephalosporins. This is of importance in the case of patients who have had rheumatic fever and are on long-term penicillin therapy. Cefalexin p. 456 and cefradine p. 458 have been used in the treatment of oral infections.

Tetracyclines

In adults, tetracyclines can be effective against oral anaerobes but the development of resistance (especially by oral streptococci) has reduced their usefulness for the treatment of acute oral infections; they may still have a role in the treatment of destructive (refractory) forms of periodontal disease. Doxycycline p. 496 has a longer duration of action than tetracycline p. 498 or oxytetracycline p. 498 and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.

Doxycycline may have a role in the treatment of recurrent aphthous ulceration, or as an adjunct to gingival scaling and root planing for periodontitis.

Macrolides

The macrolides are an alternative for oral infections in penicillin-allergic patients or where a beta-lactamase producing organism is involved. However, many organisms are now resistant to macrolides or rapidly develop resistance; their use should therefore be limited to short courses.

Clindamycin

Clindamycin p. 467 should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin-resistant bacteria. Clindamycin can be used for the treatment of dentoalveolar

abscess that has not responded to penicillin or to metronidazole p. 475.

Metronidazole and tinidazole

Metronidazole p. 475 is an alternative to a penicillin for the treatment of many oral infections where the patient is allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes. It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent's infection) and pericoronitis; amoxicillin p. 482 is a suitable alternative. For these purposes metronidazole for 3 days is sufficient, but the duration of treatment may need to be longer in pericoronitis. Tinidazole p. 476 is licensed for the treatment of acute ulcerative gingivitis.

Respiratory system infections, bacterial

Antibacterial therapy for haemophilus influenzae epiglottitis

- Cefotaxime p. 457 (or ceftriaxone p. 459)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol p. 452

Antibacterial therapy for chronic bronchitis: acute exacerbations

Treat if increase in sputum purulence accompanied by an increase in sputum volume or increase in dyspnoea.

- Amoxicillin p. 482 (or ampicillin p. 483) or a tetracycline p. 496
 - Some pneumococci and *Haemophilus influenzae* strains tetracycline-resistant; approx. 20% *H. influenzae* strains amoxicillin-resistant
 - Suggested duration of treatment 5 days; longer treatment may be necessary in severely ill patients
- Alternative, clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
 - Suggested duration of treatment 5 days; longer treatment may be necessary in severely ill patients

Antibacterial therapy for pneumonia: low-severity community-acquired

- Amoxicillin p. 482 (or ampicillin p. 483)
 - Pneumococci with decreased penicillin sensitivity being isolated, but not yet common in UK.
 - If atypical pathogens suspected, add clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471).
 - If staphylococci suspected (e. g. in influenza or measles), add flucloxacillin p. 486.
 - Suggested duration of treatment 7 days (14–21 days for infections caused by staphylococci)
- Alternatives, doxycycline p. 496 or clarithromycin (or azithromycin or erythromycin)
 - Suggested duration of treatment 7 days (14–21 days for infections caused by staphylococci)

Antibacterial therapy for pneumonia: moderate-severity community-acquired

- Amoxicillin p. 482 (or ampicillin p. 483) + clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471) or doxycycline p. 496 alone
 - Pneumococci with decreased penicillin sensitivity being isolated, but not yet common in UK.
 - If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 465 (or teicoplanin p. 464).
 - Suggested duration of treatment 7 days (14–21 days for infections caused by staphylococci)

Antibacterial therapy for pneumonia: high-severity community-acquired

- Benzylpenicillin sodium p. 480 + clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471) or benzylpenicillin sodium + doxycycline
If methicillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 465 (or teicoplanin p. 464).
Suggested duration of treatment 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci suspected)
- *If life-threatening infection, or if Gram-negative infection suspected, or if co-morbidities present, or if living in long-term residential or nursing home, co-amoxiclav p. 484 + clarithromycin (or azithromycin or erythromycin)*
If methicillin-resistant *Staphylococcus aureus* suspected, add vancomycin (or teicoplanin)
Suggested duration of treatment 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)
- *Alternatives if life-threatening infection, or if Gram-negative infection suspected, or if co-morbidities present, or if living in long-term residential or nursing home, cefuroxime p. 460 + clarithromycin (or azithromycin or erythromycin) or cefotaxime (or ceftriaxone p. 459) + clarithromycin (or azithromycin or erythromycin)*
If methicillin-resistant *Staphylococcus aureus* suspected, add vancomycin (or teicoplanin).
Suggested duration of treatment 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)

Antibacterial therapy for pneumonia possibly caused by atypical pathogens

- Clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
If high-severity *Legionella* infection, add rifampicin p. 508 for the first few days.
Suggested duration of treatment 14 days (usually 7–10 days for *Legionella*)
- *Alternative if Legionella infection suspected, a quinolone*
If high-severity *Legionella* infection, add clarithromycin (or azithromycin or erythromycin) or rifampicin for the first few days.
Suggested duration of treatment usually 7–10 days
- *Alternative for chlamydial or mycoplasma infections, doxycycline p. 496*
Suggested duration of treatment 14 days

Antibacterial therapy for pneumonia: hospital-acquired

- *Early-onset infection* less than 5 days after admission to hospital), co-amoxiclav p. 484 or cefuroxime
If life-threatening infection, or if history of antibacterial treatment in the last 3 months, or if resistant micro-organisms suspected, treat as for late-onset hospital-acquired pneumonia.
Suggested duration of treatment 7 days
- *Late-onset infection* (more than 5 days after admission to hospital), an antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 479) or a broad-spectrum cephalosporin (e.g. ceftazidime p. 458) or another antipseudomonal beta-lactam or a quinolone (e.g. ciprofloxacin p. 490)
If methicillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 465.

For severe illness caused by *Pseudomonas aeruginosa*, consider adding an aminoglycoside.
Suggested duration of treatment 7 days (longer if *Pseudomonas aeruginosa* confirmed)

Skin infections, bacterial**Antibacterial therapy for impetigo: small areas of skin infected**

Seek local microbiology advice before using topical treatment in hospital.

- Topical fusidic acid p. 1008
Suggested duration of treatment 7 days is usually adequate (max. 10 days).
- *Alternatively, if methicillin-resistant Staphylococcus aureus, topical mupirocin p. 1009*
Suggested duration of treatment 7 days is usually adequate (max. 10 days).

Impetigo: widespread infection

- Oral flucloxacillin p. 486
If streptococci suspected in severe infection, add phenoxymethylpenicillin p. 481.
Suggested duration of treatment 7 days.
- *If penicillin-allergic, oral clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)*
Suggested duration of treatment 7 days.

Antibacterial therapy for erysipelas

- Phenoxymethylpenicillin p. 481 or benzylpenicillin sodium
If severe infection, replace phenoxymethylpenicillin or benzylpenicillin sodium with high-dose flucloxacillin p. 486
Suggested duration of treatment at least 7 days.
- *If penicillin-allergic, clindamycin p. 467 or clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)*
Suggested duration of treatment at least 7 days

Antibacterial therapy for cellulitis

- Flucloxacillin p. 486 (high-dose)
If streptococcal infection confirmed, replace flucloxacillin with phenoxymethylpenicillin p. 481 or benzylpenicillin sodium p. 480
If Gram-negative bacteria or anaerobes suspected, use broad-spectrum antibacterials.
- *If penicillin-allergic, clindamycin p. 467 or clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471) or vancomycin p. 465 (or teicoplanin p. 464)*
If Gram-negative bacteria suspected, use broad-spectrum antibacterials.

Antibacterial therapy for animal and human bites

Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 1065 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection). Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.
Co-amoxiclav p. 484.

- *If penicillin-allergic, doxycycline p. 496 + metronidazole p. 475*

Antibacterial therapy for mastitis during breast-feeding

Treat if severe, if systemically unwell, if nipple fissure present, if symptoms do not improve after 12–24 hours of effective milk removal, or if culture indicates infection.

- Fluclxacillin p. 486, if penicillin-allergic, erythromycin
Continue breast-feeding or expressing milk during treatment.
Suggested duration of treatment 10–14 days.

AMINOGLYCOSIDES

Aminoglycosides

These include amikacin p. 450, gentamicin p. 450, neomycin sulfate p. 451, streptomycin p. 451, and tobramycin p. 452. All are bactericidal and active against some Gram-positive and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against *Pseudomonas aeruginosa*; streptomycin is active against *Mycobacterium tuberculosis* and is now almost entirely reserved for tuberculosis.

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections.

Gentamicin is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the 'blind' therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole p. 475 (or both). Gentamicin is used together with another antibiotic for the treatment of endocarditis. Streptomycin may be used as an alternative in gentamicin-resistant enterococcal endocarditis.

Loading and maintenance doses of gentamicin may be calculated on the basis of the patient's weight and renal function (e.g. using a nomogram); adjustments are then made according to serum-gentamicin concentrations. High doses are occasionally indicated for serious infections, especially in the neonate, in the patient with cystic fibrosis, or in the immunocompromised patient. Whenever possible treatment should not exceed 7 days.

Amikacin is more stable than gentamicin to enzyme inactivation. Amikacin is used in the treatment of serious infections caused by gentamicin-resistant Gram-negative bacilli.

Tobramycin has similar activity to gentamicin. It is slightly more active against *Ps. aeruginosa* but shows less activity against certain other Gram-negative bacteria. Tobramycin can be administered by nebuliser or by inhalation of powder on a cyclical basis (28 days of tobramycin followed by a 28-day tobramycin-free interval) for the treatment of chronic pulmonary *Ps. aeruginosa* infection in cystic fibrosis; however, resistance may develop and some patients do not respond to treatment.

Neomycin sulfate is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin sulfate may be absorbed from the gut in patients with hepatic failure and, as these patients may also be uraemic, cumulation may occur with resultant ototoxicity.

Once daily dosage

Once daily administration of aminoglycosides is more convenient, provides adequate serum concentrations, and in many cases has largely superseded *multiple daily dose regimens* (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with endocarditis due to Gram-positive bacteria, HACEK endocarditis, burns of more than 20% of the total body surface area, or creatinine clearance less than 20 mL/minute. There is insufficient evidence to recommend a once daily, high-dose regimen of an aminoglycoside in pregnancy.

Serum concentrations

Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. Serum-aminoglycoside concentrations should be monitored in patients receiving parenteral aminoglycosides and **must** be determined in the elderly, in obesity, and in cystic fibrosis, or if high doses are being given, or if there is renal impairment.

Aminoglycosides (by injection)

- **CONTRA-INDICATIONS** Myasthenia gravis (aminoglycosides may impair neuromuscular transmission)

● CAUTIONS

GENERAL CAUTIONS

Care must be taken with dosage (the main side-effects of the aminoglycosides are dose-related) · conditions characterised by muscular weakness (aminoglycosides may impair neuromuscular transmission) · if possible, dehydration should be corrected before starting an aminoglycoside

SPECIFIC CAUTIONS

Whenever possible, parenteral treatment should not exceed 7 days

- **INTERACTIONS** → Appendix 1 (aminoglycosides).

If possible, aminoglycosides should not be given with potentially ototoxic drugs (e.g. cisplatin). Administration of an aminoglycoside and of an ototoxic diuretic (e.g. furosemide) should be separated by as long a period as practicable.

● SIDE-EFFECTS

- ▶ **Rare** Antibiotic-associated colitis · electrolyte disturbances · hypocalcaemia · hypokalaemia · hypomagnesaemia on prolonged therapy · nausea · peripheral neuropathy · stomatitis · vomiting
- ▶ **Very rare** Blood disorders · CNS effects · convulsions · encephalopathy · headache
- ▶ **Frequency not known** Auditory damage · impaired neuromuscular transmission · impaired neuromuscular transmission · irreversible ototoxicity · nephrotoxicity · transient myasthenic syndrome in patients with normal neuromuscular function with large doses given during surgery · vestibular damage

SIDE-EFFECTS, FURTHER INFORMATION

Nephrotoxicity Occurs most commonly in the elderly; therefore, monitoring is particularly important in these patients, who may require reduced doses.

- **PREGNANCY** There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy. The risk is greatest with streptomycin. The risk is probably very small with gentamicin and tobramycin, but their use should be avoided unless essential.

If given during pregnancy, serum-aminoglycoside concentration monitoring is essential.

- **RENAL IMPAIRMENT** If there is impairment of renal function, the interval between doses must be increased; if the renal impairment is severe, the dose itself should be reduced as well. Excretion of aminoglycosides is principally via the kidney and accumulation occurs in renal impairment. Ototoxicity and nephrotoxicity occur commonly in patients with renal failure. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with a creatinine clearance less than 20 mL/minute. Serum-aminoglycoside concentrations **must** be monitored in patients with renal impairment; earlier and more frequent measurement of aminoglycoside concentration may be required.

- **MONITORING REQUIREMENTS**

- ▶ Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy.
- ▶ Serum-aminoglycoside concentrations should be measured in all patients receiving parenteral aminoglycosides and **must** be determined in the elderly, obesity, if high doses are being given and in cystic fibrosis.
- ▶ In patients with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen and after a dose change. For multiple daily dose regimens, blood samples should be taken approximately 1 hour after intramuscular or intravenous administration ('peak' concentration) and also just before the next dose ('trough' concentration). If the pre-dose ('trough') concentration is high, the interval between doses must be increased. If the post-dose ('peak') concentration is high, the dose must be decreased. For once daily dose regimens, consult local guidelines on serum concentration monitoring.
- ▶ Renal function should be assessed before starting an aminoglycoside and during treatment.
- ▶ Auditory and vestibular function should also be monitored during treatment.

Amikacin

INDICATIONS AND DOSE

Serious Gram-negative infections resistant to gentamicin (multiple daily dose regimen)

BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 15 mg/kg daily in 2 divided doses, increased to 22.5 mg/kg daily in 3 divided doses for up to 10 days, higher dose to be used in severe infections; maximum 1.5 g per day; maximum 15 g per course

Serious Gram-negative infections resistant to gentamicin (once daily dose regimen)

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 15 mg/kg (max. per dose 1.5 g once daily), dose to be adjusted according to serum-amikacin concentration; maximum 15 g per course

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-amikacin concentration closely

- **SIDE-EFFECTS**

- ▶ **Uncommon** Rash

- **MONITORING REQUIREMENTS**

- ▶ *Multiple daily dose regimen*: one-hour ('peak') serum concentration should not exceed 30 mg/litre; pre-dose ('trough') concentration should be less than 10 mg/litre.

- ▶ *Once daily dose regimen*: pre-dose ('trough') concentration should be less than 5 mg/litre.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Amikin®); intermittent in Glucose 5% or Sodium chloride 0.9%. To be given over 30 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION**

Once daily dose regime not to be used for endocarditis, febrile neutropenia, or meningitis. Consult local guidelines.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **AMIKACIN (Non-proprietary)**

Amikacin (as Amikacin sulfate) 250 mg per 1 ml Amikacin 500mg/2ml solution for injection vials | 5 vial [PoM](#) £60.00

- ▶ Amikin (Bristol-Myers Squibb Pharmaceuticals Ltd)

Amikacin (as Amikacin sulfate) 50 mg per 1 ml Amikin 100mg/2ml solution for injection vials | 5 vial [PoM](#) £10.33

Gentamicin

INDICATIONS AND DOSE

Gram-positive bacterial endocarditis or HACEK endocarditis (in combination with other antibacterials)

BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 1 mg/kg every 12 hours, intravenous injection to be administered over at least 3 minutes, to be given in a multiple daily dose regimen

Septicaemia | Meningitis and other CNS infections | Biliary tract infection | Acute pyelonephritis | Endocarditis | Pneumonia in hospital patients | Adjunct in listerial meningitis | Prostatitis

BY INTRAVENOUS INFUSION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: 3–5 mg/kg daily in 3 divided doses, to be given in a multiple daily dose regimen, divided doses to be given every 8 hours, intravenous injection to be administered over at least 3 minutes

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 5–7 mg/kg, subsequent doses adjusted according to serum-gentamicin concentration, to be given in a once daily dose regimen

CNS infections (administered on expert advice)

BY INTRATHECAL INJECTION

- ▶ Adult: 1 mg daily, increased if necessary to 5 mg daily, seek specialist advice

Surgical prophylaxis (including joint replacement surgery)

BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 1.5 mg/kg, intravenous injection to be administered over at least 3 minutes, administer dose up to 30 minutes before the procedure, dose may be repeated every 8 hours for high-risk procedures and joint replacement surgery; up to 3 further doses may be given

BY INTRAVENOUS INFUSION

- ▶ Adult: 5 mg/kg for 1 dose, administer dose up to 30 minutes before the procedure

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-gentamicin concentration closely.

- **SIDE-EFFECTS**

- ▶ **Uncommon** Rash

- **MONITORING REQUIREMENTS**

- ▶ *Multiple daily dose regimen*, one-hour ('peak') serum concentration should be 5–10 mg/litre; pre-dose ('trough') concentration

should be less than 2 mg/litre. For multiple daily dose regimen in endocarditis, one-hour ('peak') serum concentration should be 3–5 mg/litre; pre-dose ('trough') concentration should be less than 1 mg/litre. Serum-gentamicin concentration should be measured after 3 or 4 doses, then at least every 3 days and after a dose change (more frequently in renal impairment). For once-daily dose regimen, consult local guidelines on monitoring serum-gentamicin concentration.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Cidomycin*®); *Gentamicin paediatric injection*, Beacon; *Gentamicin injection* Hospira), give intermittently or via drip tubing in Glucose 5% or Sodium Chloride 0.9%. Suggested volume for intermittent infusion 50–100 ml given over 20–30 minutes (given over 60 minutes for once daily dose regimen).

- **PRESCRIBING AND DISPENSING INFORMATION** Local guidelines may vary in the dosing advice provided for once daily administration.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, oral suspension, oral solution, cream

Solution for injection

▶ GENTAMICIN (Non-proprietary)

Gentamicin (as Gentamicin sulfate) 5 mg per 1 ml Gentamicin Intrathecal 5mg/1ml solution for injection ampoules | 5 ampoule [PoM] £22.50 (Hospital only)
Gentamicin (as Gentamicin sulfate) 10 mg per 1 ml Gentamicin Paediatric 20mg/2ml solution for injection vials | 5 vial [PoM] £11.25
Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Gentamicin 80mg/2ml solution for injection vials | 5 vial [PoM] £20.00
 Gentamicin 80mg/2ml solution for injection ampoules | 10 ampoule [PoM] £10.00

▶ Cidomycin (Sanofi)

Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Cidomycin Adult Injectable 80mg/2ml solution for injection vials | 5 vial [PoM] £6.88
 Cidomycin Adult Injectable 80mg/2ml solution for injection ampoules | 5 ampoule [PoM] £6.88

Neomycin sulfate

INDICATIONS AND DOSE

Bowel sterilisation before surgery

BY MOUTH

- ▶ Adult: 1 g every 1 hour for 4 hours, then 1 g every 4 hours for 2–3 days

Hepatic coma

BY MOUTH

- ▶ Adult: Up to 4 g daily in divided doses usually for 5–7 days

- **CONTRA-INDICATIONS** Intestinal obstruction · myasthenia gravis (aminoglycosides may impair neuromuscular transmission)

- **CAUTIONS** Avoid prolonged use

CAUTIONS, FURTHER INFORMATION

Although neomycin is associated with the same cautions as other aminoglycosides it is generally considered too toxic for systemic use.

- **INTERACTIONS** → Appendix 1 (aminoglycosides).

● SIDE-EFFECTS

- ▶ **Uncommon** Rash
- ▶ **Frequency not known** Impaired intestinal absorption with steatorrhoea and diarrhoea · increased salivation

SIDE-EFFECTS, FURTHER INFORMATION

Although neomycin is associated with the same side effects as other aminoglycosides it is generally considered

too toxic for systemic use and is poorly absorbed after oral administration.

- **PREGNANCY** There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy.

- **HEPATIC IMPAIRMENT** Absorbed from gastro-intestinal tract in liver disease—increased risk of ototoxicity.

- **RENAL IMPAIRMENT** Adjust dose according to individual patient monitoring. Increased potential for systemic side effects, notably ototoxicity and nephrotoxicity in renal impairment.

● MONITORING REQUIREMENTS

- ▶ Renal function should be assessed before starting an aminoglycoside and during treatment.
- ▶ Auditory and vestibular function should also be monitored during treatment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, cream

Tablet

▶ NEOMYCIN SULFATE (Non-proprietary)

Neomycin sulfate 500 mg Neomycin 500mg tablets | 100 tablet [PoM] £34.69

Streptomycin

INDICATIONS AND DOSE

Tuberculosis, resistant to other treatment, in combination with other drugs

BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 15 mg/kg daily (max. per dose 1 g), reduce dose in those under 50 kg and those over 40 years

Adjunct to doxycycline in brucellosis (administered on expert advice)

BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: (consult local protocol)

Enterococcal endocarditis

- ▶ Adult: (consult local protocol)

- **UNLICENSED USE** Use in tuberculosis is an unlicensed indication.

Important safety information

Side-effects increase after a cumulative dose of 100 g, which should only be exceeded in exceptional circumstances.

● SIDE-EFFECTS

- ▶ **Common or very common** Rash
- ▶ **Frequency not known** Hypersensitivity reactions · paraesthesia of mouth
- **RENAL IMPAIRMENT** Should preferably be avoided. If essential, use with great care and consider dose reduction.

● MONITORING REQUIREMENTS

- ▶ One-hour ('peak') concentration should be 15–40 mg/litre; pre-dose ('trough') concentration should be less than 5 mg/litre (less than 1 mg/litre in renal impairment or in those over 50 years).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder for solution for injection

Tobramycin

INDICATIONS AND DOSE

Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Acute pyelonephritis or prostatitis | Pneumonia in hospital patients

BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 3 mg/kg daily in 3 divided doses; increased if necessary up to 5 mg/kg daily in 3–4 divided doses, increased dose used in severe infection; dose to be reduced back to 3 mg/kg as soon as clinically indicated

Urinary-tract infection

BY INTRAMUSCULAR INJECTION

- ▶ Adult: 2–3 mg/kg for 1 dose

Chronic *Pseudomonas aeruginosa* infection in patients with cystic fibrosis

BY INHALATION OF NEBULISED SOLUTION

- ▶ Adult: 300 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution

BY INHALATION OF POWDER

- ▶ Adult: 112 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin inhalation powder

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, use ideal weight for height to calculate parental dose and monitor serum-tobramycin concentration closely.

● CAUTIONS

- ▶ When used by inhalation Severe haemoptysis—risk of further haemorrhage

● SIDE-EFFECTS

- ▶ Uncommon
- ▶ With intramuscular use Rash
- ▶ With intravenous use Rash
- ▶ Frequency not known
- ▶ When used by inhalation Bronchospasm · cough (more frequent by inhalation of powder) · dysphonia · epistaxis · haemoptysis · laryngitis · mouth ulcers · pharyngitis · salivary hypersecretion · taste disturbances

● MONITORING REQUIREMENTS

- ▶ With intramuscular use or intravenous use One-hour ('peak') serum concentration should not exceed 10 mg/litre; pre-dose ('trough') concentration should be less than 2 mg/litre.
- ▶ When used by inhalation Measure lung function before and after initial dose of tobramycin and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using bronchodilator. Monitor renal function before treatment and then annually.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For intravenous infusion (Nebcin®); intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%. For adult intermittent infusion suggested volume 50–100 mL given over 20–60 minutes.
- ▶ When used by inhalation Other inhaled drugs should be administered before tobramycin.

- PATIENT AND CARER ADVICE Patient counselling is advised for Tobramycin dry powder for inhalation (administration).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ Tobramycin by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013) NICE TA276
Tobramycin dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis only if there is

an inadequate response to colistimethate sodium, or if colistimethate sodium cannot be used because of contraindications or intolerance. The manufacturer must provide tobramycin dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS.

Patients currently receiving tobramycin dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA276

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Solution for injection

▶ TOBRAMYCIN (Non-proprietary)

Tobramycin (as Tobramycin sulfate) 40 mg per 1 ml Tobramycin 40mg/1ml solution for injection vials | 10 vial [PoM] £37.00 | 10 vial [PoM] £37.00 (Hospital only)
Tobramycin 80mg/2ml solution for injection vials | 5 vial [PoM] £20.80 | 10 vial [PoM] £37.72 | 10 vial [PoM] £47.00 (Hospital only)

- ▶ Brands may include Nebcin

Inhalation powder

▶ Tobipodhaler (Novartis Pharmaceuticals UK Ltd)

Tobramycin 28 mg Tobipodhaler 28mg inhalation powder capsules with device | 56 capsule [PoM] £447.50 | 224 capsule [PoM] £1,790.00

Nebuliser liquid

▶ Bramitob (Chiesi Ltd)

Tobramycin 75 mg per 1 ml Bramitob 300mg/4ml nebuliser solution 4ml ampoules | 56 ampoule [PoM] £1,187.00

▶ TOBI (Novartis Pharmaceuticals UK Ltd)

Tobramycin 60 mg per 1 ml Tobi 300mg/5ml nebuliser solution 5ml ampoules | 56 ampoule [PoM] £1,187.20 DT price = £1,187.20

- ▶ Brands may include Tymbrineb

BACTERIAL TRANSPEPTIDATION INHIBITORS

Chloramphenicol

- DRUG ACTION Chloramphenicol is a potent broad-spectrum antibiotic.

INDICATIONS AND DOSE

Life threatening infections particularly those caused by *Haemophilus influenzae* | Typhoid fever

BY MOUTH OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 12.5 mg/kg every 6 hours, in exceptional cases dose can be doubled for severe infections such as septicaemia and meningitis, providing high doses reduced as soon as clinically indicated

- CONTRA-INDICATIONS Acute porphyrias p. 864

- CAUTIONS Avoid repeated courses and prolonged treatment

- INTERACTIONS → Appendix 1 (chloramphenicol).

- SIDE-EFFECTS Blood disorders · depression · diarrhoea · dry mouth · erythema multiforme · glossitis · headache · nausea · nocturnal haemoglobinuria · optic neuritis · peripheral neuritis · reversible and irreversible aplastic anaemia (with reports of resulting leukaemia) · stomatitis · urticaria · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections.

- PREGNANCY Manufacturer advises avoid; neonatal 'grey-baby syndrome' if used in third trimester.
- BREAST FEEDING Manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant;

concentration in milk usually insufficient to cause 'grey syndrome'.

● HEPATIC IMPAIRMENT

Avoid if possible—increased risk of bone-marrow depression.

Reduce dose and monitor plasma-chloramphenicol concentration in hepatic impairment.

● RENAL IMPAIRMENT

Avoid in severe renal impairment unless no alternative; dose-related depression of haematopoiesis.

● MONITORING REQUIREMENTS

Plasma concentration monitoring preferred in the elderly.

▶ Recommended peak plasma concentration (approx. 2 hours after administration by mouth, intravenous injection or infusion) 10–25 mg/litre; pre-dose ('trough') concentration should not exceed 15 mg/litre.

▶ Blood counts required before and periodically during treatment.

● DIRECTIONS FOR ADMINISTRATION

For *intravenous infusion* (*Kemicetine*®), give intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

▶ CHLORAMPHENICOL (Non-proprietary)

Chloramphenicol 250 mg Chloramphenicol 250mg capsules | 60 capsule [PoM] £377.00

Powder for solution for injection

ELECTROLYTES: May contain Sodium

▶ Kemicetine (Pfizer Ltd)

Chloramphenicol (as Chloramphenicol sodium succinate) 1 gram Kemicetine 1g powder for solution for injection vials | 1 vial [PoM] £1.39

CARBAPENEMS

Carbapenems

The carbapenems are beta-lactam antibacterials with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; **imipenem** (imipenem with cilastatin p. 454) and meropenem p. 454 have good activity against *Pseudomonas aeruginosa*. The carbapenems are not active against methicillin-resistant *Staphylococcus aureus* and *Enterococcus faecium*.

Imipenem (imipenem with cilastatin) and meropenem are used for the treatment of severe hospital-acquired infections and polymicrobial infections including septicæmia, hospital-acquired pneumonia, intra-abdominal infections, skin and soft-tissue infections, and complicated urinary-tract infections.

Ertapenem below is licensed for treating abdominal and gynaecological infections and for community-acquired pneumonia, but it is not active against atypical respiratory pathogens and it has limited activity against penicillin-resistant pneumococci. It is also licensed for treating foot infections of the skin and soft tissue in patients with diabetes. Unlike the other carbapenems, ertapenem is not active against *Pseudomonas* or against *Acinetobacter spp.*

Imipenem is partially inactivated in the kidney by enzymatic activity and is therefore administered in combination with **cilastatin** (imipenem with cilastatin), a specific enzyme inhibitor, which blocks its renal metabolism. Meropenem and ertapenem are stable to the renal enzyme which inactivates imipenem and therefore can be given without cilastatin.

Side-effects of imipenem with cilastatin are similar to those of other beta-lactam antibiotics. Meropenem has less

seizure-inducing potential and can be used to treat central nervous system infection.

Ertapenem

INDICATIONS AND DOSE

Abdominal infections | Acute gynaecological infections | Community-acquired pneumonia

BY INTRAVENOUS INFUSION

▶ Adult: 1 g once daily

Diabetic foot infections of the skin and soft tissue

BY INTRAVENOUS INFUSION

▶ Adult: 1 g once daily

Surgical prophylaxis, colorectal surgery

BY INTRAVENOUS INFUSION

▶ Adult: 1 g for 1 dose, dose to be completed within 1 hour before surgery

● CAUTIONS

CNS disorders—risk of seizures · elderly

● INTERACTIONS

→ Appendix 1 (ertapenem).

● SIDE-EFFECTS

▶ **Common or very common** Diarrhoea · headache · injection-site reactions · nausea · pruritus · raised platelet count · rash (also reported with eosinophilia and systemic symptoms) · vomiting

▶ **Uncommon** Abdominal pain · anorexia · antibiotic-associated colitis · asthenia · bradycardia · chest pain · confusion · constipation · dizziness · dry mouth · dyspepsia · dyspnoea · hypotension · melaena · oedema · petechiae · pharyngeal discomfort · raised glucose · seizures · sleep disturbances · taste disturbances

▶ **Rare** Agitation · anxiety · arrhythmia · blood disorders · cholecystitis · cough · depression · dysphagia · electrolyte disturbances · haemorrhage · hypoglycaemia · increase in blood pressure · jaundice · liver disorder · muscle cramp · nasal congestion · neutropenia · pelvic peritonitis · renal impairment · scleral disorder · syncope · thrombocytopenia · tremor · wheezing

▶ **Frequency not known** Dyskinesia · hallucinations

● ALLERGY AND CROSS-SENSITIVITY

Avoid if history of **immediate hypersensitivity** reaction to beta-lactam antibacterials. Use with caution in patients with sensitivity to beta-lactam antibacterials.

● PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk.

● BREAST FEEDING

Present in milk—manufacturer advises avoid.

● RENAL IMPAIRMENT

Risk of seizures; max. 500 mg daily if eGFR less than 30 mL/minute/1.73 m².

● DIRECTIONS FOR ADMINISTRATION

For *intravenous infusion* (*Invanz*®), give intermittently in Sodium chloride 0.9%. Reconstitute 1 g with 10 mL Water for injections or Sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration not exceeding 20 mg/mL; give over 30 minutes; incompatible with glucose solutions.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

▶ Invanz (Merck Sharp & Dohme Ltd)

Ertapenem (as Ertapenem sodium) 1 gram Invanz 1g powder for solution for infusion vials | 1 vial [PoM] £31.65

Imipenem with cilastatin

INDICATIONS AND DOSE

Aerobic and anaerobic Gram-positive and Gram-negative infections (not indicated for CNS infections) | Hospital-acquired septicæmia

BY INTRAVENOUS INFUSION

- ▶ Adult: 500 mg every 6 hours, alternatively 1 g every 8 hours

Infection caused by *Pseudomonas* or other less sensitive organisms

Empirical treatment of infection in febrile patients with neutropenia | Life-threatening infection

BY INTRAVENOUS INFUSION

- ▶ Adult: 1 g every 6 hours

- **CAUTIONS** CNS disorders · epilepsy
- **INTERACTIONS** → Appendix 1 (imipenem with cilastatin).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Diarrhoea · eosinophilia · nausea (may reduce rate of infusion) · rash · vomiting
 - ▶ **Uncommon** Confusion · dizziness · drowsiness · hallucinations · hypotension · leucopenia · myoclonic activity · seizures · thrombocytopenia · thrombocytosis
 - ▶ **Rare** Acute renal failure · anaphylactic reactions · antibiotic-associated colitis · encephalopathy · hearing loss · hepatitis · paraesthesia · polyuria · Stevens-Johnson syndrome · taste disturbances · tooth, tongue or urine discoloration · toxic epidermal necrolysis · tremor
 - ▶ **Very rare** Abdominal pain · aggravation of myasthenia gravis · asthenia · cyanosis · dyspnoea · flushing · glossitis · haemolytic anaemia · headache · heartburn · hyperhidrosis · hypersalivation · hyperventilation · palpitation · polyarthralgia · tachycardia · tinnitus
 - ▶ **Frequency not known** Neurotoxicity (at high dose, renal failure, CNS disease)
- **ALLERGY AND CROSS-SENSITIVITY** Avoid if history of **immediate hypersensitivity** reaction to beta-lactam antibacterials. Use with caution in patients with sensitivity to beta-lactam antibacterials.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in *animal* studies).
- **BREAST FEEDING** Present in milk but unlikely to be absorbed.
- **RENAL IMPAIRMENT** Risk of CNS side-effects; reduce dose if eGFR less than 70 mL/minute/1.73 m²—consult product literature.
- **EFFECT ON LABORATORY TESTS** Positive Coombs' test.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* dilute to a concentration of 5 mg (as imipenem)/mL in Sodium chloride 0.9%; give up to 500 mg (as imipenem) over 20–30 minutes, give dose greater than 500 mg (as imipenem) over 40–60 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Dose expressed in terms of imipenem.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

▶ IMPENEM WITH CILASTATIN (Non-proprietary)

- ▶ **Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg** Imipenem 500mg / Cilastatin 500mg powder for solution for infusion vials | 1 vial [PoM] £10.00 | 5 vial [PoM] £60.00 (Hospital only) | 10 vial [PoM] £55.45–£65.45
- ▶ **Primaxin i.v.** (Merck Sharp & Dohme Ltd)
Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg Primaxin IV 500mg powder for solution for infusion vials | 1 vial [PoM] £12.00

Meropenem

INDICATIONS AND DOSE

Aerobic and anaerobic Gram-positive and Gram-negative infections | Hospital acquired septicæmia

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION

- ▶ Adult: 0.5–1 g every 8 hours

Exacerbations of chronic lower respiratory-tract infection in cystic fibrosis

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION

- ▶ Adult: 2 g every 8 hours

Meningitis

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION

- ▶ Adult: 2 g every 8 hours

Endocarditis (in combination with another antibacterial)

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION

- ▶ Adult: 2 g every 8 hours

- **UNLICENSED USE** Not licensed for use in endocarditis.
- **INTERACTIONS** → Appendix 1 (meropenem).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · diarrhoea · disturbances in liver function tests · headache · nausea · pruritus · rash · thrombocythaemia · vomiting
 - ▶ **Uncommon** Eosinophilia · leucopenia · paraesthesia · thrombocytopenia
 - ▶ **Rare** Convulsions
 - ▶ **Frequency not known** Antibiotic-associated colitis · haemolytic anaemia · Stevens-Johnson syndrome · toxic epidermal necrolysis
- **ALLERGY AND CROSS-SENSITIVITY** Avoid if history of **immediate hypersensitivity** reaction to beta-lactam antibacterials. Use with caution in patients with sensitivity to beta-lactam antibacterials.
- **PREGNANCY** Use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Unlikely to be absorbed (however, manufacturer advises avoid).
- **HEPATIC IMPAIRMENT** Monitor liver function in hepatic impairment.
- **RENAL IMPAIRMENT** Use normal dose every 12 hours if eGFR 26–50 mL/minute/1.73 m². Use half normal dose every 12 hours if eGFR 10–25 mL/minute/1.73 m². Use half normal dose every 24 hours if eGFR less than 10 mL/minute/1.73 m².
- **EFFECT ON LABORATORY TESTS** Positive Coombs' test.
- **DIRECTIONS FOR ADMINISTRATION** *Intravenous injection* to be administered over 5 minutes. For *intravenous infusion* (Meropenem[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute dose in infusion fluid to a final concentration of 1–20 mg/mL; give over 15–30 minutes.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

CEPHALOSPORINS

Cephalosporins

The cephalosporins are broad-spectrum antibiotics which are used for the treatment of septicæmia, pneumonia, meningitis, biliary-tract infections, peritonitis, and urinary-tract infections. The pharmacology of the cephalosporins is similar to that of the penicillins, excretion being principally renal. Cephalosporins penetrate the cerebrospinal fluid poorly unless the meninges are inflamed; cefotaxime p. 457 and ceftriaxone p. 459 are suitable cephalosporins for infections of the CNS (e.g. meningitis).

The principal side-effect of the cephalosporins is hypersensitivity and about 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. If a cephalosporin is essential in patients with a history of immediate hypersensitivity to penicillin, because a suitable alternative antibacterial is not available, then cefixime p. 457, cefotaxime, ceftazidime p. 458, ceftriaxone, or cefuroxime p. 460 can be used with caution; cefaclor below, cefadroxil p. 456, cefalexin p. 456, cefradine p. 458, and ceftaroline fosamil p. 458 should be avoided.

The orally active 'first generation' cephalosporins, cefalexin, cefradine, and cefadroxil and the 'second generation' cephalosporin, cefaclor below, have a similar antimicrobial spectrum. They are useful for urinary-tract infections which do not respond to other drugs or which occur in pregnancy, respiratory-tract infections, otitis media, sinusitis, and skin and soft-tissue infections. Cefaclor below has good activity against *H. influenzae*. Cefadroxil has a long duration of action and can be given twice daily; it has poor activity against *H. influenzae*. **Cefuroxime axetil**, an ester of the 'second generation' cephalosporin cefuroxime, has the same antibacterial spectrum as the parent compound; it is poorly absorbed and needs to be given with food to maximise absorption.

Cefixime is an orally active 'third generation' cephalosporin. It has a longer duration of action than the other cephalosporins that are active by mouth. It is only licensed for acute infections.

Cefuroxime is a 'second generation' cephalosporin that is less susceptible than the earlier cephalosporins to inactivation by beta-lactamases. It is, therefore, active against certain bacteria which are resistant to the other drugs and has greater activity against *Haemophilus influenzae*.

Cefotaxime, ceftazidime and ceftriaxone are 'third generation' cephalosporins with greater activity than the 'second generation' cephalosporins against certain Gram-negative bacteria. However, they are less active than cefuroxime against Gram-positive bacteria, most notably *Staphylococcus aureus*. Their broad antibacterial spectrum may encourage superinfection with resistant bacteria or fungi.

Ceftazidime has good activity against pseudomonas. It is also active against other Gram-negative bacteria.

Ceftriaxone has a longer half-life and therefore needs to be given only once daily. Indications include serious infections such as septicaemia, pneumonia, and meningitis. The calcium salt of ceftriaxone forms a precipitate in the gall bladder which may rarely cause symptoms but these usually resolve when the antibiotic is stopped.

Ceftaroline fosamil is a 'fifth generation' cephalosporin with bactericidal activity similar to cefotaxime; however, ceftaroline fosamil has an extended spectrum of activity against Gram-positive bacteria that includes methicillin-resistant *Staphylococcus aureus* and multi-drug resistant *Streptococcus pneumoniae*. Ceftaroline fosamil is licensed for the treatment of community-acquired pneumonia and complicated skin and soft-tissue infections, but there is no

experience of its use in pneumonia caused by methicillin-resistant *S. aureus*.

Cephalosporins

● **INTERACTIONS** → Appendix 1 (cephalosporins).

● **SIDE-EFFECTS**

- ▶ **Rare** Antibiotic-associated colitis
- ▶ **Frequency not known** Abdominal discomfort · agranulocytosis · allergic reactions · anaphylaxis · aplastic anaemia · blood disorders · confusion · diarrhoea · disturbances in liver enzymes · dizziness · eosinophilia · haemolytic anaemia · hallucinations · headache · hyperactivity · hypertonia · leucopenia · nausea · nervousness · pruritus · rashes · reversible interstitial nephritis · serum sickness-like reactions with rashes, fever and arthralgia · sleep disturbances · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis · transient cholestatic jaundice · transient hepatitis · urticaria · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Antibiotic-associated colitis Antibiotic-associated colitis may occur more commonly with second- and third-generation cephalosporins.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with cephalosporin hypersensitivity.

Cross-sensitivity with other beta-lactam

antibacterials About 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. Patients with a history of **immediate hypersensitivity** to penicillin and other beta-lactams should not receive a cephalosporin. Cephalosporins should be used with caution in patients with sensitivity to penicillin and other beta-lactams.

- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances). False positive Coombs' test.

Cefaclor

INDICATIONS AND DOSE

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

INITIALLY BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 1-11 months: 20 mg/kg daily in 3 divided doses, alternatively (by mouth) 62.5 mg 3 times a day
- ▶ Child 1-4 years: 20 mg/kg daily in 3 divided doses, alternatively (by mouth) 125 mg 3 times a day
- ▶ Child 5-11 years: 20 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively (by mouth) 250 mg 3 times a day
- ▶ Child 12-17 years: 250 mg 3 times a day; maximum 4 g per day
- ▶ Adult: 250 mg 3 times a day; maximum 4 g per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Child 12-17 years: 375 mg every 12 hours, dose to be taken with food
- ▶ Adult: 375 mg every 12 hours, dose to be taken with food

Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

BY MOUTH

- ▶ Child 1-11 months: 40 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 125 mg 3 times a day
- ▶ Child 1-4 years: 40 mg/kg daily in 3 divided doses,, usual max. 1 g daily, alternatively 250 mg 3 times a day

continued →

- ▶ Child 5-11 years: 40 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 500 mg 3 times a day
- ▶ Child 12-17 years: 500 mg 3 times a day; maximum 4 g per day
- ▶ Adult: 500 mg 3 times a day; maximum 4 g per day

Pneumonia

BY MOUTH USING MODIFIED-RELEASE TABLETS

- ▶ Child 12-17 years: 750 mg every 12 hours, dose to be taken with food
- ▶ Adult: 750 mg every 12 hours, dose to be taken with food

Lower urinary-tract infections

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Child 12-17 years: 375 mg every 12 hours, dose to be taken with food
- ▶ Adult: 375 mg every 12 hours, dose to be taken with food

Asymptomatic carriage of *Haemophilus influenzae* or mild exacerbations in cystic fibrosis

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 1-11 months: 125 mg every 8 hours
- ▶ Child 1-6 years: 250 mg 3 times a day
- ▶ Child 7-17 years: 500 mg 3 times a day

● SIDE-EFFECTS**SIDE-EFFECTS, FURTHER INFORMATION**

Skin reactions Cefaclor is associated with protracted skin reactions, especially in children.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT** No dose adjustment required. Renal adviser advises caution.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Cefadroxil**INDICATIONS AND DOSE**

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

BY MOUTH

- ▶ Child 6-17 years (body-weight up to 40 kg): 0.5 g twice daily
- ▶ Child 6-17 years (body-weight 40 kg and above): 0.5–1 g twice daily
- ▶ Adult: 0.5–1 g twice daily

Skin infections | Soft-tissue infections | Uncomplicated urinary-tract infections

BY MOUTH

- ▶ Child 6-17 years (body-weight 40 kg and above): 1 g once daily
- ▶ Adult: 1 g daily

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT**
- ▶ In adults 1 g initially, then 500 mg every 12 hours if eGFR 26–50 mL/minute/1.73 m². 1 g initially, then 500 mg every 24 hours if eGFR 11–26 mL/minute/1.73 m². 1 g initially, then 500 mg every 36 hours if eGFR less than 11 mL/minute/1.73 m².
- ▶ In children Reduce dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

Cefalexin
(Cephalexin)**INDICATIONS AND DOSE**

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

BY MOUTH

- ▶ Child 1-11 months: 12.5 mg/kg twice daily, alternatively 125 mg twice daily
- ▶ Child 1-4 years: 12.5 mg/kg twice daily, alternatively 125 mg 3 times a day
- ▶ Child 5-11 years: 12.5 mg/kg twice daily, alternatively 250 mg 3 times a day
- ▶ Child 12-17 years: 500 mg 2–3 times a day
- ▶ Adult: 250 mg every 6 hours, alternatively 500 mg every 8–12 hours; increased to 1–1.5 g every 6–8 hours, increased dose to be used for severe infections

Serious susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

BY MOUTH

- ▶ Child 1 month-11 years: 25 mg/kg 2–4 times a day (max. per dose 1 g 4 times a day)
- ▶ Child 12-17 years: 1–1.5 g 3–4 times a day

Prophylaxis of recurrent urinary-tract infection

BY MOUTH

- ▶ Child: 12.5 mg/kg once daily (max. per dose 125 mg), dose to be taken at night
- ▶ Adult: 125 mg once daily, dose to be taken at night

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT**
 - ▶ In adults Max. 3 g daily if eGFR 40–50 mL/minute/1.73 m². Max. 1.5 g daily if eGFR 10–40 mL/minute/1.73 m². Max. 750 mg daily if eGFR less than 10 mL/minute/1.73 m².
 - ▶ In children Reduce dose in moderate impairment.

Cefixime

INDICATIONS AND DOSE

Acute infections due to sensitive Gram-positive and Gram-negative bacteria

BY MOUTH

- ▶ Child 6–11 months: 75 mg daily
- ▶ Child 1–4 years: 100 mg daily
- ▶ Child 5–9 years: 200 mg daily
- ▶ Child 10–17 years: 200–400 mg daily, alternatively 100–200 mg twice daily
- ▶ Adult: 200–400 mg daily in 1–2 divided doses

Uncomplicated gonorrhoea

BY MOUTH

- ▶ Adult: 400 mg for 1 dose

- **UNLICENSED USE** Use of cefixime for uncomplicated gonorrhoea is an unlicensed indication.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.

● RENAL IMPAIRMENT

- ▶ In adults Reduce dose if eGFR less than 20 mL/minute/1.73 m² (max. 200 mg once daily).
- ▶ In children Reduce dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9

▶ Suprax (Sanofi)

Cefixime 200 mg Suprax 200mg tablets | 7 tablet [PoM] £13.23
DT price = £13.23

Cefotaxime

INDICATIONS AND DOSE

Uncomplicated gonorrhoea

BY INTRAMUSCULAR INJECTION

- ▶ Adult: 500 mg for 1 dose

Infections due to sensitive Gram-positive and Gram-negative bacteria | Surgical prophylaxis | Haemophilus epiglottitis

BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

OR BY INTRAVENOUS INFUSION

- ▶ Adult: 1 g every 12 hours

Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria | Meningitis

BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

OR BY INTRAVENOUS INFUSION

- ▶ Adult: 8 g daily in 4 divided doses, increased if necessary to 12 g daily in 3–4 divided doses, intramuscular doses over 1 g should be divided between more than one site

Emergency treatment of suspected bacterial meningitis or meningococcal disease, before urgent transfer to hospital, in patients who cannot be given benzylpenicillin (e.g. because of an allergy)

BY INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Child 1 month–11 years: 50 mg/kg for 1 dose
- ▶ Child 12–17 years: 1 g for 1 dose
- ▶ Adult: 1 g for 1 dose

● SIDE-EFFECTS

- ▶ **Rare** Arrhythmias (following rapid injection)
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT**
 - ▶ In adults If eGFR less than 5 mL/minute/1.73 m², initial dose of 1 g then use half normal dose.
 - ▶ In children Usual initial dose, then use half normal dose if estimated glomerular filtration rate less than 5 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use in children Displacement value may be significant, consult local guidelines. For intermittent intravenous infusion dilute in glucose 5% or sodium chloride 0.9%; administer over 20–60 minutes; incompatible with alkaline solutions.
 - ▶ With intravenous use in adults For intravenous infusion, give intermittently in Glucose 5% or Sodium chloride 0.9%. Suggested volume 40–100 mL given over 20–60 minutes; incompatible with alkaline solutions.

Cefradine (Cephadrine)

INDICATIONS AND DOSE

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria | Surgical prophylaxis

BY MOUTH

- ▶ Child 7–11 years: 25–50 mg/kg daily in 2–4 divided doses
- ▶ Child 12–17 years: 250–500 mg 4 times a day, alternatively 0.5–1 g twice daily; increased if necessary up to 1 g 4 times a day, increased dose may be used in severe infections
- ▶ Adult: 250–500 mg 4 times a day, alternatively 0.5–1 g twice daily; increased if necessary up to 1 g 4 times a day, increased dose may be used in severe infections

- **UNLICENSED USE** Not licensed for use in children for prevention of *Staphylococcus aureus* lung infection in cystic fibrosis.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT**
 - ▶ In adults Use half normal dose if eGFR 5–20 mL/minute/1.73 m². Use one-quarter normal dose if eGFR less than 5 mL/minute/1.73 m².
 - ▶ In children Reduce dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².
- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary Cefradine Capsules may be prescribed.

- ▶ Brands may include Nefic

Ceftaroline fosamil

INDICATIONS AND DOSE

Community-acquired pneumonia

BY INTRAVENOUS INFUSION

- ▶ Adult: 600 mg every 12 hours for 5–7 days

Complicated skin and soft-tissue infections

BY INTRAVENOUS INFUSION

- ▶ Adult: 600 mg every 12 hours for 5–14 days

- **CAUTIONS** Seizure disorders
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** 400 mg every 12 hours if eGFR 30–50 mL/minute/1.73 m². Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute 600 mg with 20 mL water for injections, then dilute with 250 mL infusion fluid (in fluid restriction, may be diluted with 50–100 mL infusion fluid); give over 60 minutes.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium*, has advised (Dec 2012) that ceftaroline fosamil (Zinforo[®]) is accepted for restricted use within NHS Scotland when meticillin-resistant *S. aureus* is suspected in complicated skin and soft-tissue infection and vancomycin cannot be used.

Ceftazidime

INDICATIONS AND DOSE

Prophylaxis for transurethral resection of prostate

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION OR BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 1 g, single dose to be administered up to 30 minutes before procedure and may be repeated if necessary when catheter removed

Complicated urinary-tract infection

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION OR BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult 18–79 years: 1–2 g every 8–12 hours
- ▶ Adult 80 years and over: 1–2 g every 8–12 hours; usual maximum 3 g per day

Pseudomonal lung infection in cystic fibrosis

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION OR BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 100–150 mg/kg daily in 3 divided doses; maximum 9 g per day

Septicaemia | Hospital-acquired pneumonia

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION OR BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult 18-79 years: 2 g every 8 hours
- ▶ Adult 80 years and over: 2 g every 8 hours; usual maximum 3 g per day

Febrile neutropenia

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION OR BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult 18-79 years: 2 g every 8 hours
- ▶ Adult 80 years and over: 2 g every 8 hours; usual maximum 3 g per day

Meningitis

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION OR BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult 18-79 years: 2 g every 8 hours
- ▶ Adult 80 years and over: 2 g every 8 hours; usual maximum 3 g per day

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION OR BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult 18-79 years: 1–2 g every 8 hours
- ▶ Adult 80 years and over: 1–2 g every 8 hours; usual maximum 3 g per day

- **SIDE-EFFECTS** Paraesthesia · taste disturbances
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Reduce dose if eGFR less than 50 mL/minute/1.73 m²—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Intramuscular administration used when intravenous administration not possible; single doses over 1 g by intravenous route only. For *intravenous infusion* give intermittently or *via drip tubing* in Glucose 5% or 10% or Sodium chloride 0.9%. Dissolve 2 g initially in 10 mL (3 g in 15 mL) infusion fluid. For *Fortum*[®] dilute further to a concentration of 40 mg/mL. For *Kefadim*[®] dilute further to a concentration of 20 mg/mL. Give over up to 30 minutes.

Ceftriaxone**INDICATIONS AND DOSE****Surgical prophylaxis**

BY DEEP INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- ▶ Adult: 1 g for 1 dose, dose to be administered up to 30 minutes before procedure

Prophylaxis before colorectal surgery

BY DEEP INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 2 g for 1 dose, dose to be administered up to 30 minutes before procedure, intramuscular doses over 1 g divided between more than one site

Uncomplicated gonorrhoea | Pelvic inflammatory disease

BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 500 mg for 1 dose

Early syphilis

BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 500 mg daily for 10 days

Endocarditis caused by haemophilus, actinobacillus, cardiobacterium, eikenella, and kingella species ('HACEK organisms') (in combination with another antibacterial)

BY INTRAVENOUS INFUSION

- ▶ Adult: 2–4 g daily

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

BY DEEP INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 1 g daily; increased to 2–4 g daily, increased dose to be used for severe infections, intramuscular doses over 1 g divided between more than one site, single intravenous doses above 1 g to be administered by intravenous infusion only

Meningitis

BY INTRAVENOUS INFUSION

- ▶ Child 1 month-11 years (body-weight up to 50 kg): 50–80 mg/kg daily, doses of 50 mg/kg and over to be administered by intravenous infusion only

BY DEEP INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Child 1 month-11 years (body-weight 50 kg and above): 2–4 g daily, intramuscular doses over 1 g divided between more than one site, single intravenous doses above 1 g to be administered by intravenous infusion only

- ▶ Child 12-17 years: 2–4 g daily, intramuscular doses over 1 g divided between more than one site, single intravenous doses above 1 g to be administered by intravenous infusion only

Prevention of secondary case of meningococcal meningitis

BY INTRAMUSCULAR INJECTION

- ▶ Adult: 250 mg for 1 dose

Prevention of secondary case of Haemophilus influenzae type b disease

BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- ▶ Adult: 1 g daily for 2 days

- **UNLICENSED USE** Not licensed for prophylaxis of meningococcal meningitis or *Haemophilus influenzae* type b disease.

- ▶ In adults Not licensed for early syphilis. Not licensed for endocarditis caused by haemophilus, actinobacillus, cardiobacterium, eikenella, and kingella species ('HACEK organisms') (in combination with another antibacterial). Dose not licensed for treatment of uncomplicated gonorrhoea or pelvic inflammatory disease.
- **CONTRA-INDICATIONS** Concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium) in neonates over 41 weeks corrected gestational age—risk of precipitation in urine and lungs · neonates less than 41 weeks corrected gestational age · neonates over 41 weeks corrected gestational age with jaundice, hypoalbuminaemia, acidosis, unconjugated hyperbilirubinaemia, or impaired bilirubin binding
- **CAUTIONS** Dehydration (risk of ceftriaxone precipitation in gall bladder) · may displace bilirubin from serum albumin, administer over 60 minutes in neonates · treatment longer than 14 days · use with caution in neonates
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Calcium ceftriaxone precipitates in gall bladder—consider discontinuation if symptomatic · calcium ceftriaxone precipitates in urine (particularly in very young, dehydrated or those who are immobilised)—consider discontinuation if symptomatic
 - ▶ **Rare** Pancreatitis · prolongation of prothrombin time
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **HEPATIC IMPAIRMENT** Reduce dose if both hepatic and severe renal impairment. Monitor plasma concentration if both hepatic and severe renal impairment.
- **RENAL IMPAIRMENT** Use with caution in renal failure. Monitor plasma concentration if both hepatic and severe renal impairment.
 - ▶ In adults Reduce dose if eGFR less than 10 mL/minute/1.73 m² (max. 2 g daily).
 - ▶ In children Max. 50 mg/kg daily (max. 2 g daily) in severe renal impairment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, give over at least 2–4 minutes.
 - ▶ With intravenous use in children For *intravenous infusion*, dilute reconstituted solution with Glucose 5% or 10% or Sodium Chloride 0.9%; give over at least 30 minutes (60 minutes in neonates). Not to be given simultaneously with parenteral nutrition or infusion fluids containing calcium, even by different infusion lines; may be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites. Displacement value may be significant, consult local guidelines.
 - ▶ With intramuscular use in children For *intramuscular injection* ceftriaxone may be mixed with 1% Lidocaine Hydrochloride Injection to reduce pain at intramuscular injection site; final concentration 250–350 mg/mL. Displacement value may be significant, consult local guidelines.
 - ▶ With intravenous use in adults For *intravenous infusion* (Rocephin[®]; Ceftriaxone Injection, Genus), give intermittently or via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%. Reconstitute 2-g vial with 40 mL infusion fluid. Give by intermittent infusion over at least 30 minutes (60 minutes in neonates). Not to be given simultaneously with total parenteral nutrition or infusion fluids containing calcium, even by different infusion lines. May be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites.

INDICATIONS AND DOSE

Susceptible infections due to Gram-positive and Gram-negative bacteria

BY MOUTH

- ▶ Child 3 months-1 year: 10 mg/kg twice daily (max. per dose 125 mg)
- ▶ Child 2-11 years: 15 mg/kg twice daily (max. per dose 250 mg)
- ▶ Child 12-17 years: 250 mg twice daily, dose may be doubled in severe lower respiratory-tract infections or if pneumonia is suspected
- ▶ Adult: 250 mg twice daily, dose may be doubled in severe lower respiratory-tract infections or if pneumonia is suspected

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Child: 20 mg/kg every 8 hours (max. per dose 750 mg); increased to 50–60 mg/kg every 6–8 hours (max. per dose 1.5 g), increased dose used for severe infection and cystic fibrosis
- ▶ Adult: 750 mg every 6–8 hours; increased if necessary up to 1.5 g every 6–8 hours, increased dose used for severe infections

Lyme disease

BY MOUTH

- ▶ Adult: 500 mg twice daily for 14–21 days (for 28 days in Lyme arthritis)

Lower urinary-tract infection

BY MOUTH

- ▶ Child 12-17 years: 125 mg twice daily
- ▶ Adult: 125 mg twice daily

Pyelonephritis

BY MOUTH

- ▶ Adult: 250 mg twice daily

Surgical prophylaxis

INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: 1.5 g, to be administered up to 30 minutes before the procedure, then (by intravenous injection or by intramuscular injection) 750 mg every 8 hours if required for up to 3 doses (in high risk procedures)

Open fractures, prophylaxis

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION

- ▶ Adult: 1.5 g every 8 hours until soft tissue closure (maximum duration 72 hours)

- **UNLICENSED USE** Duration of treatment in Lyme disease is unlicensed.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT**
 - ▶ In adults Use parenteral dose of 750 mg twice daily if eGFR 10–20 mL/minute/1.73 m². Use parenteral dose of 750 mg once daily if eGFR less than 10 mL/minute/1.73 m².
 - ▶ In children Reduce parenteral dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION** Single doses over 750 mg should be administered by the intravenous route only.
 - ▶ With intravenous use in children Displacement value may be significant when reconstituting injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%; give over 30 minutes.
 - ▶ With intravenous use in adults For *intravenous infusion (Zinacef[®])*, give intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Dissolve initially in water for injections (at least 2 mL for each 250 mg, 15 mL for 1.5 g); suggested volume 50–100 mL given over 30 minutes.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion

Tablet

Cefuroxime (as Cefuroxime sodium) 750 mg Zinacef 750mg powder for injection vials | 5 vial [PoM] £11.72 (Hospital only)

Cefuroxime (as Cefuroxime sodium) 1.5 gram Zinacef 1.5g powder for injection vials | 1 vial [PoM] £4.70

DIAMINOPYRIMIDINES**Co-trimoxazole**

- **DRUG ACTION** Sulfamethoxazole and trimethoprim are used in combination (as co-trimoxazole) because of their synergistic activity (the importance of the sulfonamides

has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic).

INDICATIONS AND DOSE**Treatment of susceptible infections**

BY MOUTH

- ▶ Child 6 weeks-5 months: 120 mg twice daily, alternatively 24 mg/kg twice daily
- ▶ Child 6 months-5 years: 240 mg twice daily, alternatively 24 mg/kg twice daily
- ▶ Child 6-11 years: 480 mg twice daily, alternatively 24 mg/kg twice daily
- ▶ Child 12-17 years: 960 mg twice daily
- ▶ Adult: 960 mg twice daily

BY INTRAVENOUS INFUSION

- ▶ Adult: 960 mg every 12 hours, increased to 1.44 g every 12 hours, increased dose used in severe infection

Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature)

BY MOUTH OR BY INTRAVENOUS INFUSION

- ▶ Child: 120 mg/kg daily in 2–4 divided doses for 14–21 days, oral route preferred for children
- ▶ Adult: 120 mg/kg daily in 2–4 divided doses for 14–21 days, oral route preferred for children

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections

BY MOUTH

- ▶ Child: 450 mg/m² twice daily (max. per dose 960 mg twice daily) for 3 days of the week (either consecutively or on alternate days), dose regimens may vary, consult local guidelines
- ▶ Adult: 960 mg once daily, reduced if not tolerated to 480 mg once daily, alternatively 960 mg once daily on alternate days, alternate day dose to be given 3 times weekly, alternatively 960 mg twice a day on alternate days, alternate day dose to be given 3 times weekly

Dose equivalence and conversion

480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg.

Important safety information

RESTRICTIONS ON THE USE OF CO-TRIMOXAZOLE

Co-trimoxazole is the drug of choice in the prophylaxis and treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia; it is also indicated for nocardiasis, *Stenotrophomonas maltophilia* infection [unlicensed indication], and toxoplasmosis. It should only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract when there is bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in acute otitis media in children when there is good reason to prefer it. Co-trimoxazole is also used for the treatment of infections caused by *Burkholderia cepacia* in cystic fibrosis [unlicensed indication].

- **CONTRA-INDICATIONS** Acute porphyrias p. 864
- **CAUTIONS** Asthma · avoid in blood disorders (unless under specialist supervision) · avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus · elderly (increased risk of serious side-effects) (in adults) · G6PD deficiency (risk of haemolytic anaemia) · maintain adequate fluid intake · predisposition to folate deficiency · predisposition to hyperkalaemia (in adults)
- **INTERACTIONS** → Appendix 1 (trimethoprim, sulfamethoxazole).

● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea • headache • hyperkalaemia • nausea • rash
- ▶ **Uncommon** Vomiting
- ▶ **Rare** Agranulocytosis • bone marrow depression
- ▶ **Very rare** Anorexia • antibiotic-associated colitis • arthralgia • aseptic meningitis • ataxia • blood disorders • convulsions • cough • depression • eosinophilia • glossitis • hallucinations • hepatic necrosis • hypoglycaemia • hyponatraemia • interstitial nephritis • jaundice • leucopenia • liver damage • megaloblastic anaemia • myalgia • myocarditis • pancreatitis • peripheral neuropathy • photosensitivity • pulmonary infiltrates • renal disorders • shortness of breath • Stevens-Johnson syndrome • stomatitis • systemic lupus erythematosus • thrombocytopenia • tinnitus • toxic epidermal necrolysis • uveitis • vasculitis • vertigo
- ▶ **Frequency not known** Rhabdomyolysis reported in HIV-infected patients

SIDE-EFFECTS, FURTHER INFORMATION

Blood disorders or rash Co-trimoxazole is associated with rare but serious side effects. Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity) develop.

- **PREGNANCY** Teratogenic risk in first trimester (trimethoprim a folate antagonist). Neonatal haemolysis and methaemoglobinemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole).
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe liver disease.
- **RENAL IMPAIRMENT** Use half normal dose if eGFR 15–30 mL/minute/1.73 m². Avoid if eGFR less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor blood counts on prolonged treatment.
 - ▶ In children Plasma concentration monitoring may be required with high doses; seek expert advice.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use in children For intermittent *intravenous infusion*, may be further diluted in glucose 5% and 10% or sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and the required dose infused over max. 60 minutes; check container for haze or precipitant during administration. In severe fluid restriction may be given undiluted via a central venous line.
 - ▶ With intravenous use in adults For *intravenous infusion* (Septrin® for infusion), give intermittently in Glucose 5% or 10% or Sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and infused over max. 60 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Co-trimoxazole is a mixture of trimethoprim and sulfamethoxazole (sulphamethoxazole) in the proportions of 1 part to 5 parts.

Flavours of oral liquid formulations may include banana, or vanilla.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

INDICATIONS AND DOSE

Urinary-tract infections | Respiratory tract infections

BY MOUTH

- ▶ Child 4–5 weeks: 4 mg/kg twice daily (max. per dose 200 mg)
- ▶ Child 6 weeks–5 months: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 25 mg twice daily
- ▶ Child 6 months–5 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 50 mg twice daily
- ▶ Child 6–11 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 100 mg twice daily
- ▶ Child 12–17 years: 200 mg twice daily
- ▶ Adult: 200 mg twice daily

Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)

BY MOUTH

- ▶ Child 4–5 weeks: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night
- ▶ Child 6 weeks–5 months: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 12.5 mg once daily, dose to be taken at night
- ▶ Child 6 months–5 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 25 mg once daily, dose to be taken at night
- ▶ Child 6–11 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 50 mg once daily, dose to be taken at night
- ▶ Child 12–17 years: 100 mg once daily, dose to be taken at night
- ▶ Adult: 100 mg once daily, dose to be taken at night

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients who cannot tolerate co-trimoxazole (in combination with dapsone)

BY MOUTH

- ▶ Child: 5 mg/kg every 6–8 hours
- ▶ Adult: 5 mg/kg every 6–8 hours

Acne resistant to other antibacterials

BY MOUTH

- ▶ Adult: 300 mg twice daily

Prostatitis

BY MOUTH

- ▶ Adult: (consult product literature)

Shigellosis | Invasive salmonella infection

BY MOUTH

- ▶ Adult: (consult product literature)

- **UNLICENSED USE** Not licensed for treatment of pneumocystis pneumonia. Not licensed for treatment of acne resistant to other antibacterials. Not licensed for use in children under 6 weeks.

- **CONTRA-INDICATIONS** Blood dyscrasias

- **CAUTIONS** Elderly · acute porphyrias p. 864 · neonates (specialist supervision required) · predisposition to folate deficiency

- **INTERACTIONS** → Appendix 1 (trimethoprim).

● **SIDE-EFFECTS**

- ▶ **Rare** Allergic reactions · anaphylaxis · angioedema · erythema multiforme · photosensitivity · toxic epidermal necrolysis
- ▶ **Frequency not known** Aseptic meningitis · depression of haematopoiesis · gastro-intestinal disturbances · hyperkalaemia · nausea · pruritus · rashes · uveitis (in adults) · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Trimethoprim has side-effects similar to co-trimoxazole but they are less severe and occur less frequently.

- **PREGNANCY** Teratogenic risk in first trimester (folate antagonist); manufacturers advise avoid.
- **BREAST FEEDING** Present in milk—short-term use not known to be harmful.
- **RENAL IMPAIRMENT**
Monitor plasma-trimethoprim concentration if eGFR less than 10 mL/minute/1.73 m².
▶ In adults Use half normal dose after 3 days if eGFR 15–30 mL/minute/1.73 m². Use half normal dose if eGFR less than 15 mL/minute/1.73 m².
▶ In children Use half normal dose after 3 days if estimated glomerular filtration rate 15–30 mL/minute/1.73 m². Use half normal dose if estimated glomerular filtration rate less than 15 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Manufacturer recommends blood counts on long-term therapy (but evidence of practical value unsatisfactory).

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Trimethoprim for bacterial infections www.medicinesforchildren.org.uk/trimethoprim-for-bacterial-infections

Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

- ▶ Brands may include Monotrim

FUSIDATES

Fusidic acid

- **DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

INDICATIONS AND DOSE

Staphylococcal skin infection

BY MOUTH USING TABLETS

- ▶ Child 12-17 years: 250 mg every 12 hours for 5-10 days
- ▶ Adult: 250 mg every 12 hours for 5-10 days

Penicillin-resistant staphylococcal infection including osteomyelitis | Staphylococcal endocarditis in combination with other antibacterials

BY MOUTH USING ORAL SUSPENSION

- ▶ Child 1-11 months: 15 mg/kg 3 times a day
- ▶ Child 1-4 years: 250 mg 3 times a day
- ▶ Child 5-11 years: 500 mg 3 times a day
- ▶ Child 12-17 years: 750 mg 3 times a day
- ▶ Adult: 750 mg 3 times a day

BY MOUTH USING TABLETS

- ▶ Child 12-17 years: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections
- ▶ Adult: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections

Dose equivalence and conversion

Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets.

- **INTERACTIONS** → Appendix 1 (fusidic acid).

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · diarrhoea · dizziness · drowsiness · dyspepsia · nausea · vomiting
- ▶ **Uncommon** Anorexia · headache · malaise · pruritus · rash
- ▶ **Frequency not known** Acute renal failure (usually with jaundice) · blood disorders · reversible jaundice especially after high dosage (withdraw therapy if persistent)

- **PREGNANCY** Not known to be harmful; manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Present in milk—manufacturer advises caution.
- **HEPATIC IMPAIRMENT** Impaired biliary excretion; possibly increased risk of hepatotoxicity; avoid or reduce dose; monitor liver function in hepatic impairment.
- **MONITORING REQUIREMENTS** Monitor liver function with high doses or on prolonged therapy.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana and orange.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Fusidic acid 50 mg per 1 ml Fucidin 250mg/5ml oral suspension | 50 ml **POm** £6.73

GLYPEPTIDE ANTIBACTERIALS**Teicoplanin**

- **DRUG ACTION** The glycopeptide antibiotic teicoplanin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides and increasing reports of glycopeptide-resistant enterococci. Teicoplanin is similar to vancomycin, but has a significantly longer duration of action, allowing once daily administration after the loading dose.

INDICATIONS AND DOSE**Clostridium difficile infection**

BY MOUTH

▶ Adult: 100–200 mg twice daily for 10–14 days

Serious infections caused by Gram-positive bacteria (e.g. complicated skin and soft tissue infections, pneumonia)

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION OR BY INTRAMUSCULAR INJECTION

▶ Adult (body-weight up to 70 kg): Initially 400 mg every 12 hours for 3 doses, followed by 400 mg once daily

▶ Adult (body-weight 70 kg and above): Initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily

Streptococcal or enterococcal endocarditis (in combination with another antibacterial)

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

▶ Adult: Initially 10 mg/kg every 12 hours for 3–5 doses, then 10 mg/kg once daily, subsequent doses can be given by intramuscular injection

Bone and joint infections

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION

▶ Adult: Initially 12 mg/kg every 12 hours for 3–5 doses, then 12 mg/kg once daily subsequent doses can be given by intramuscular injection, increased risk of fever and rash with doses of 12 mg/kg

Surgical prophylaxis

BY INTRAVENOUS INJECTION

▶ Adult: 400 mg, to be administered up to 30 minutes before the procedure

Surgical prophylaxis in open fractures

BY INTRAVENOUS INFUSION

▶ Adult: 800 mg, to be administered up to 30 minutes before skeletal stabilisation and definitive soft-tissue closure

Peritonitis associated with peritoneal dialysis (added to dialysis fluid)

BY INTRAPERITONEAL INFUSION

▶ Adult: (consult local protocol)

PHARMACOKINETICS

Teicoplanin should **not** be given by mouth for systemic infections because it is not absorbed significantly.

- **UNLICENSED USE** Teicoplanin doses in BNF may differ from those in product literature. Not licensed for surgical prophylaxis.
- **INTERACTIONS** → Appendix 1 (teicoplanin).

If other nephrotoxic or neurotoxic drugs given, monitor renal and auditory function on prolonged administration.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Pruritus · rash
- ▶ **Uncommon** Bronchospasm · diarrhoea · dizziness · eosinophilia · fever · headache · leucopenia · mild hearing loss · nausea · thrombocytopenia · thrombophlebitis · tinnitus · vestibular disorders · vomiting
- ▶ **Frequency not known** Exfoliative dermatitis · nephrotoxicity · renal failure · Stevens-Johnson syndrome · toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION

Nephrotoxicity Teicoplanin is associated with a lower incidence of nephrotoxicity than vancomycin.

- **ALLERGY AND CROSS-SENSITIVITY** Caution if history of vancomycin sensitivity.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** No information available.
- **RENAL IMPAIRMENT** Use normal dose regimen on days 1–4, then use normal maintenance dose every 48 hours if eGFR 30–80 mL/minute/1.73 m² and use normal maintenance dose every 72 hours if eGFR less than 30 mL/minute/1.73 m². Plasma-teicoplanin concentration should be monitored during parenteral maintenance treatment. Also monitor renal and auditory function during prolonged treatment in renal impairment.

● **MONITORING REQUIREMENTS**

- ▶ Blood counts and liver and kidney function tests required.
- ▶ With intramuscular use or intravenous use Plasma-teicoplanin concentration is not measured routinely because a relationship between plasma concentration and toxicity has not been established. However, the plasma-teicoplanin concentration can be used to optimise parenteral treatment in severe sepsis or burns, deep-seated staphylococcal infection (including bone and joint infection), endocarditis and in intravenous drug abusers. Pre-dose ('trough') concentrations should be greater than 15 mg/litre (greater than 20 mg/litre in endocarditis or deep-seated infection such as bone and joint infection), but less than 60 mg/litre. Plasma-teicoplanin concentration should be measured in elderly patients.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use For intravenous infusion (*Targocid*®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute initially with water for injections provided; infuse over 30 minutes. Continuous infusion not usually recommended.
- ▶ With oral use Injection can be used to prepare solution for oral administration.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Powder and solvent for solution for injection

ELECTROLYTES: May contain Sodium

▶ **Targocid** (Sanofi) ▼

Teicoplanin 200 mg Targocid 200mg powder and solvent for solution for injection vials | 1 vial **POm** £3.93

Teicoplanin 400 mg Targocid 400mg powder and solvent for solution for injection vials | 1 vial **POm** £7.32

Telavancin

- **DRUG ACTION** Telavancin is a glycopeptide antibacterial; it has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to

glycopeptides. There are increasing reports of glycopeptide-resistant enterococci.

INDICATIONS AND DOSE

Hospital-acquired pneumonia, known or suspected to be caused by *meticillin-resistant Staphylococcus aureus* when other antibacterials cannot be used

BY INTRAVENOUS INFUSION

▶ Adult: 10 mg/kg daily for 7–21 days

- **CAUTIONS** Conditions that predispose to renal impairment · predisposition to QT interval prolongation (including electrolyte disturbances, congenital long QT syndrome, uncompensated heart failure, severe left ventricular hypertrophy)
- **INTERACTIONS** → Appendix 1 (telavancin). Use with caution if concomitant use with nephrotoxic drugs, drugs that prolong the QT interval or potentially ototoxic drugs.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Acute renal failure · chills · constipation · diarrhoea · dizziness · fungal infection · headache · insomnia · malaise · nausea · pruritus · rash · taste disturbances · vomiting
 - ▶ **Uncommon** Abdominal pain · agitation · altered sense of smell · angina · antibiotic-associated colitis · anxiety · arthralgia · atrial fibrillation · back pain · blood disorders · blurred vision · bradycardia · confusion · congestive cardiac failure · decreased appetite · depression · dry mouth · dyspepsia · dyspnoea · dysuria · electrolyte disturbances · erythema · eye irritation · flatulence · flushing · haematuria · hepatitis · hiccup · hyperhidrosis · hypertension · hypotension · increased INR · microalbuminuria · myalgia · nasal congestion · oedema · oliguria · oral hypoaesthesia · palpitation · paraesthesia · pharyngolaryngeal pain · phlebitis · pollakiuria · pyrexia · QT interval prolongation · sinus tachycardia · somnolence · supraventricular extrasystoles · tinnitus · tremor · urinary tract infection · urticaria · ventricular extrasystoles
 - ▶ **Rare** Deafness
 - ▶ **Frequency not known** Flushing of the upper body ('red man' syndrome) · non-cardiac chest pain
- **ALLERGY AND CROSS-SENSITIVITY** Use with caution in patients with vancomycin or teicoplanin sensitivity.
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Avoid (teratogenic in *animal* studies).
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** In chronic renal failure, use 7.5 mg/kg once daily if eGFR 30–50 mL/minute/1.73 m². Avoid in acute renal failure—risk of mortality increased. In chronic renal failure, avoid if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor renal function daily for at least the first 3–5 days, then every 2–3 days thereafter.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Vibativ*[®]). Avoid rapid infusion (can cause 'red man' syndrome). Give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute each 750 mg with 45 mL glucose 5%, sodium chloride 0.9%, or water for injections to produce a 15 mg/mL solution; for doses of 150–800 mg, dilute requisite dose in 100 to 250 mL infusion fluid; for doses outside this range, dilute to a final concentration of 0.6–8 mg/mL; give over at least 60 minutes.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Vibativ** (Clinigen Healthcare Ltd) ▼

Telavancin (as Telavancin hydrochloride) 750 mg Vibativ 750mg powder for solution for infusion vials | 1 vial [POM] £645.00 (Hospital only)

Vancomycin

- **DRUG ACTION** The glycopeptide antibiotic vancomycin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci. Penetration into cerebrospinal fluid is poor.
- ▶ With intravenous use Vancomycin has a long duration of action and can therefore be given every 12 hours.

INDICATIONS AND DOSE

Clostridium difficile infection

BY MOUTH

- ▶ Adult: 125 mg 4 times a day for 10–14 days, dose may be increased if infection fails to respond or is life-threatening, increased if necessary up to 500 mg 4 times a day

Infections due to Gram-positive bacteria including endocarditis, osteomyelitis, septicæmia and soft-tissue infections

BY INTRAVENOUS INFUSION

- ▶ Adult: 1–1.5 g every 12 hours
- ▶ Elderly: 500 mg every 12 hours, alternatively 1 g once daily

Surgical prophylaxis (when high risk of MRSA)

BY INTRAVENOUS INFUSION

- ▶ Adult: 1 g

Peritonitis associated with peritoneal dialysis

BY INTRAPERITONEAL ADMINISTRATION

- ▶ Adult: (consult local protocol)

PHARMACOKINETICS

Vancomycin should **not** be given by mouth for systemic infections because it is not absorbed significantly.

- **UNLICENSED USE** Vancomycin doses in BNF publications may differ from those in product literature. Use of vancomycin (added to dialysis fluid) for the treatment of peritonitis associated with peritoneal dialysis is an unlicensed route.
- **CAUTIONS**
 - **GENERAL CAUTIONS** Avoid if history of deafness · elderly
 - **SPECIFIC CAUTIONS**
 - ▶ With oral use Systemic absorption may follow oral administration especially in inflammatory bowel disorders or following multiple doses
 - **INTERACTIONS** → Appendix 1 (vancomycin).
 - **SIDE-EFFECTS**
 - ▶ **Common or very common**
 - ▶ With intravenous use Blood disorders, including neutropenia (usually after 1 week or cumulative dose of 25 g) · interstitial nephritis · nephrotoxicity · ototoxicity (discontinue if tinnitus occurs) · renal failure
 - ▶ **Rare**
 - ▶ With intravenous use Agranulocytosis · thrombocytopenia
 - ▶ **Frequency not known**
 - ▶ With intravenous use Anaphylaxis · cardiac arrest on rapid infusion · chills · dyspnoea · eosinophilia · exfoliative

dermatitis · fever · flushing of the upper body ('red man' syndrome) · nausea · pain and muscle spasm of back and chest · phlebitis (irritant to tissue) · pruritus · rashes · severe hypotension on rapid infusion · shock on rapid infusion · Stevens-Johnson syndrome · toxic epidermal necrolysis · urticaria · vasculitis · wheezing

SIDE-EFFECTS, FURTHER INFORMATION

Nephrotoxicity Vancomycin is associated with a higher incidence of nephrotoxicity than teicoplanin.

- **ALLERGY AND CROSS-SENSITIVITY** Caution if teicoplanin sensitivity.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk. Plasma-vancomycin concentration monitoring essential to reduce risk of fetal toxicity.
- **BREAST FEEDING** Present in milk—significant absorption following oral administration unlikely.
- **RENAL IMPAIRMENT** Reduce dose. In renal impairment monitor plasma-vancomycin concentration and renal function regularly. Also monitor auditory function.
- **MONITORING REQUIREMENTS**
 - ▶ All patients require plasma-vancomycin measurement (after 3 or 4 doses if renal function normal, earlier if renal impairment).
 - ▶ Pre-dose ('trough') concentration should be 10–15 mg/litre (15–20 mg/litre for endocarditis or less sensitive strains of meticillin-resistant *Staphylococcus aureus* or for complicated infections caused by *S. aureus*). An initial loading dose, by intravenous infusion, may be considered—consult local guidelines.
 - ▶ All patients require blood counts, urinalysis, and renal function tests.
 - ▶ Monitor auditory function in elderly.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use Avoid rapid infusion (risk of anaphylactoid reactions) and rotate infusion sites. For *intravenous infusion* (Vancocin[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute each 500 mg with 10 mL water for injections and dilute with infusion fluid to a concentration of up to 5 mg/mL (10 mg/mL in fluid restriction but increased risk of infusion-related effects); give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not feasible.
 - ▶ With oral use Injection can be used to prepare solution for oral administration; flavouring syrups may be added to the solution at the time of administration.

● MEDICINAL FORMS

GLYCYLCYCLINE ANTIBACTERIALS

Tigecycline

- **DRUG ACTION** Tigecycline is a glycylyccline antibacterial structurally related to the tetracyclines. Tigecycline is active against Gram-positive and Gram-negative bacteria, including tetracycline-resistant organisms, and some anaerobes. It is also active against meticillin-resistant *Staphylococcus aureus* and vancomycin-resistant enterococci, but *Pseudomonas aeruginosa* and many strains of *Proteus spp* are resistant to tigecycline.

INDICATIONS AND DOSE

Treatment of complicated skin and soft-tissue infections and complicated abdominal infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used

BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 100 mg, then 50 mg every 12 hours for 5–14 days, not recommended for the treatment of foot infections in patients with diabetes

- **CAUTIONS** Cholestasis
- **INTERACTIONS** → Appendix 1 (tigecycline).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anorexia · bilirubinaemia · diarrhoea · dizziness · dyspepsia · headache · hypoglycaemia · injection-site reactions · nausea · prolonged activated partial thromboplastin time · prolonged prothrombin time · pruritus · rash · vomiting
 - ▶ **Uncommon** Cholestatic jaundice · hypoproteinaemia · pancreatitis
 - ▶ **Frequency not known** Antibiotic-associated colitis · hepatic failure · Stevens-Johnson syndrome · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects similar to those of the tetracyclines can potentially occur.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to tetracyclines.
- **PREGNANCY** Tetracyclines should **not** be given to pregnant women; effects on skeletal development have been documented in the first trimester in *animal* studies. Administration during the second or third trimester may cause discoloration of the child's teeth, and maternal hepatotoxicity has been reported with large parenteral doses.
- **BREAST FEEDING** Manufacturer advises caution—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Initially 100 mg then 25 mg every 12 hours in severe hepatic impairment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Tygacil[®]), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute each vial with 5.3 mL infusion fluid to produce a 10 mg/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 30–60 minutes.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

▶ Powder for solution for infusion

▶ Tygacil (Pfizer Ltd) ▼

Tigecycline 50 mg Tygacil 50mg powder for solution for infusion vials | 10 vial [PoM] £323.10

LINCOSAMIDE ANTIBACTERIALS

Clindamycin

- **DRUG ACTION** Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially *Bacteroides fragilis*. It is well concentrated in bone and excreted in bile and urine.

INDICATIONS AND DOSE

Staphylococcal bone and joint infections such as osteomyelitis | Peritonitis | Intra-abdominal sepsis | Meticillin-resistant *Staphylococcus aureus* (MRSA) in bronchiectasis, bone and joint infections, and skin and soft-tissue infections

Erysipelas or cellulitis in penicillin-allergic patients (alternative to macrolides)

BY MOUTH

- ▶ Child: 3–6 mg/kg 4 times a day (max. per dose 450 mg)
- ▶ Adult: 150–300 mg every 6 hours; increased if necessary up to 450 mg every 6 hours if required, increased dose used in severe infection

BY DEEP INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 0.6–2.7 g daily in 2–4 divided doses; increased if necessary up to 4.8 g daily, increased dose used in life-threatening infection, single doses above 600 mg to be administered by intravenous infusion only, single doses by intravenous infusion not to exceed 1.2 g

Treatment of mild to moderate pneumocystis pneumonia (in combination with primaquine)

BY MOUTH

- ▶ Adult: 600 mg every 8 hours

Treatment of falciparum malaria (to be given with or following quinine)

BY MOUTH

- ▶ Child: 7–13 mg/kg every 8 hours (max. per dose 450 mg) for 7 days
- ▶ Adult: 450 mg every 8 hours for 7 days

DALACIN T[®] PREPARATIONS

Acne vulgaris

TO THE SKIN

- ▶ Adult: Apply twice daily, to be applied thinly

ZINDACLIN[®] GEL

Acne vulgaris

TO THE SKIN

- ▶ Adult: Apply once daily, to be applied thinly

- **UNLICENSED USE** Not licensed for treatment of falciparum malaria. Not licensed for treatment of mild to moderate pneumocystis infection.
- **CONTRA-INDICATIONS** Diarrhoeal states · avoid injections containing benzyl alcohol in neonates
- **CAUTIONS** Avoid in Acute porphyrias p. 864 · middle-aged and elderly women, especially after an operation (antibiotic-associated colitis more common)
- **INTERACTIONS** → Appendix 1 (clindamycin).
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

Abdominal discomfort · anaphylactoid reactions · antibiotic-associated colitis · diarrhoea (discontinue treatment) · eosinophilia · exfoliative dermatitis · jaundice · leucopenia · nausea · oesophageal ulcers · oesophagitis · polyarthritides · pruritus · rash · Stevens-Johnson syndrome · taste disturbances · thrombocytopenia · toxic epidermal necrolysis · urticaria · vesiculobullous dermatitis · vomiting

SPECIFIC SIDE-EFFECTS

- ▶ With intramuscular use Induration (after intramuscular

injection) · abscess (after intramuscular injection) · pain (after intramuscular injection)

- ▶ With intravenous use Thrombophlebitis (after intravenous injection)

SIDE-EFFECTS, FURTHER INFORMATION

Antibiotic-associated colitis Clindamycin has been associated with antibiotic-associated colitis, which may be fatal. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin. Patients should therefore discontinue treatment immediately if diarrhoea develops.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Amount probably too small to be harmful but bloody diarrhoea reported in 1 infant.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor liver and renal function if treatment exceeds 10 days.
 - ▶ In children Monitor liver and renal function in infants.
- **DIRECTIONS FOR ADMINISTRATION** Avoid rapid intravenous administration.
 - ▶ With intravenous use in children For intravenous infusion, dilute to a concentration of not more than 18 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 10–60 minutes at a max. rate of 20 mg/kg/hour.
 - ▶ With intravenous use in adults For intravenous infusion (Dalacin[®] C Phosphate), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute to not more than 18 mg/mL and give over 10–60 minutes at a rate not exceeding 30 mg/minute (1.2 g over at least 60 minutes; higher doses by continuous infusion).
- **PATIENT AND CARER ADVICE** Patients and their carers should be advised to discontinue immediately and contact doctor if diarrhoea develops. Capsules should be swallowed with a glass of water.
- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary Clindamycin Capsules may be prescribed.

LIPOPEPTIDE ANTIBACTERIALS**Daptomycin**

- **DRUG ACTION** Daptomycin is a lipopeptide antibacterial with a spectrum of activity similar to vancomycin but its efficacy against enterococci has not been established. It needs to be given with other antibacterials for mixed infections involving Gram-negative bacteria and some anaerobes.

INDICATIONS AND DOSE

Complicated skin and soft-tissue infections caused by Gram-positive bacteria, including methicillin-resistant *Staphylococcus aureus* (MRSA)

BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ **Adult:** 4 mg/kg once daily; increased to 6 mg/kg once daily, increase dose only if associated with *Staphylococcus aureus* bacteraemia

Staphylococcal endocarditis caused by organisms resistant to vancomycin or in patients intolerant of vancomycin (in combination with other antibacterials)

BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ **Adult:** 6 mg/kg once daily

- **UNLICENSED USE** Not licensed for use in left-sided endocarditis.
- **INTERACTIONS** → Appendix 1 (daptomycin). Monitor creatine kinase more frequently than weekly during treatment if receiving another drug known to cause myopathy (preferably avoid concomitant use).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anaemia · anxiety · arthralgia · asthenia · constipation · diarrhoea · dizziness · flatulence · headache · hypertension · hypotension · injection-site reactions · insomnia · nausea · pruritus · rash · vomiting
 - ▶ **Uncommon** Anorexia · arrhythmias · dyspepsia · electrolyte disturbances · eosinophilia · flushing · glossitis · hyperglycaemia · muscle effects · muscle weakness · myalgia · myositis · paraesthesia · renal failure · taste disturbance · thrombocythaemia · tremor
 - ▶ **Rare** Jaundice · rhabdomyolysis
 - ▶ **Frequency not known** Antibiotic-associated colitis · elevated creatine kinase · eosinophilic pneumonia · peripheral neuropathy · syncope · wheezing

SIDE-EFFECTS, FURTHER INFORMATION

Muscle effects If unexplained muscle pain, tenderness, weakness, or cramps develop during treatment, measure creatine kinase every 2 days; discontinue if unexplained muscular symptoms and creatine elevated markedly.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Present in milk in small amounts, but absorption from gastrointestinal tract negligible.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe hepatic impairment—no information available.
- **RENAL IMPAIRMENT** Use normal dose every 48 hours if eGFR less than 30 mL/minute/1.73 m². If eGFR less than

80 mL/minute/1.73 m², monitor renal function, and monitor creatine kinase before treatment and then at least weekly during treatment.

- **MONITORING REQUIREMENTS** Monitor creatine kinase before treatment and then weekly during treatment (more frequently if creatine kinase elevated more than 5 times upper limit of normal before treatment).
- **EFFECT ON LABORATORY TESTS** Interference with assay for prothrombin time and INR—take blood sample immediately before daptomycin dose.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Cubicin[®]), give intermittently in Sodium chloride 0.9%; reconstitute with sodium chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve; dilute requisite dose in 50 mL infusion fluid and give over 30 minutes. For *intravenous injection*, give over 2 minutes.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
 The *Scottish Medicines Consortium* has advised (February 2008) that daptomycin (Cubicin[®]) is accepted for restricted use within NHS Scotland for the treatment of MRSA bacteraemia associated with right-sided endocarditis or with complicated skin and soft-tissue infections.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Cubicin** (Novartis Pharmaceuticals UK Ltd)

Daptomycin 350 mg Cubicin 350mg powder for concentrate for solution for infusion vials | 1 vial [POM] £62.00

Daptomycin 500 mg Cubicin 500mg powder for concentrate for solution for infusion vials | 1 vial [POM] £88.57 (Hospital only)

MACROCYCLIC ANTIBACTERIALS**Fidaxomicin**

- **DRUG ACTION** Fidaxomicin is a macrocyclic antibacterial that is poorly absorbed from the gastro-intestinal tract, and, therefore, it should not be used to treat systemic infections.

INDICATIONS AND DOSE

***Clostridium difficile* infection**

BY MOUTH

- ▶ **Adult:** 200 mg every 12 hours for 10 days, limited clinical data is available on the use of fidaxomicin in severe or life-threatening *Clostridium difficile* infection

- **CAUTIONS** Inflammatory bowel disease · severe or life-threatening *C. difficile* infection
- **INTERACTIONS** → Appendix 1 (fidaxomicin).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Constipation · nausea · vomiting
 - ▶ **Uncommon** Abdominal distension · decreased appetite · dizziness · dry mouth · flatulence · headache · taste disturbance
- **ALLERGY AND CROSS-SENSITIVITY** Use with caution in macrolide hypersensitivity.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2012) that fidaxomicin (*Dificlir*[®]) is accepted for restricted use within NHS Scotland to treat the first recurrence of *C. difficile* infection, on the advice of a microbiologist or specialist in infectious diseases.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

MACROLIDES AND RELATED DRUGS

Macrolides

The macrolides have an antibacterial spectrum that is similar but not identical to that of penicillin; they are thus an alternative in penicillin-allergic patients. They are active against many penicillin-resistant staphylococci, but some are now also resistant to the macrolides.

Indications for the macrolides include campylobacter enteritis, respiratory infections (including pneumonia, whooping cough, Legionella, chlamydia, and mycoplasma infection), and skin infections.

Erythromycin p. 471 is also used in the treatment of early syphilis, uncomplicated genital chlamydial infection, and non-gonococcal urethritis. Erythromycin has poor activity against *Haemophilus influenzae*. Erythromycin causes nausea, vomiting, and diarrhoea in some patients; in mild to moderate infections this can be avoided by giving a lower dose, but if a more serious infection, such as Legionella pneumonia, is suspected higher doses are needed.

Azithromycin below is a macrolide with slightly less activity than erythromycin against Gram-positive bacteria, but enhanced activity against some Gram-negative organisms including *H. influenzae*. Plasma concentrations are very low, but tissue concentrations are much higher. It has a long tissue half-life and once daily dosage is recommended. Azithromycin is also used in the treatment of uncomplicated genital chlamydial infection, non-gonococcal urethritis, uncomplicated gonorrhoea, typhoid [unlicensed indication], and trachoma [unlicensed indication].

Clarithromycin p. 470 is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. It is given twice daily. Clarithromycin is also used in regimens for *Helicobacter pylori* eradication.

Telithromycin p. 473 is a ketolide derivative of erythromycin with an antibacterial spectrum similar to that of other macrolides and it is also active against penicillin- and erythromycin-resistant *Streptococcus pneumoniae*.

Erythromycin, azithromycin, and clarithromycin have a role in the treatment of Lyme disease p. 500.

Spiramycin is also a macrolide which is used for the treatment of toxoplasmosis.

Macrolides

- **CAUTIONS** Electrolyte disturbances (predisposition to QT interval prolongation) · may aggravate myasthenia gravis · predisposition to QT interval prolongation

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Abdominal discomfort · diarrhoea · nausea · vomiting
- ▶ **Uncommon** Cholestatic jaundice · hepatotoxicity · rash
- ▶ **Rare** Antibiotic-associated colitis · arrhythmias · pancreatitis · QT interval prolongation · Stevens-Johnson syndrome · toxic epidermal necrolysis
- ▶ **Frequency not known** Reversible hearing loss (sometimes with tinnitus) can occur after large doses

SPECIFIC SIDE-EFFECTS

- ▶ **With intravenous use** Local tenderness · phlebitis

SIDE-EFFECTS, FURTHER INFORMATION

Gastro-intestinal side-effects are mild and less frequent with azithromycin and clarithromycin than with erythromycin.

Azithromycin

INDICATIONS AND DOSE

Prevention of secondary case of invasive group A streptococcal infection in patients who are allergic to penicillin

BY MOUTH

- ▶ Child 6 months-11 years: 12 mg/kg once daily (max. per dose 500 mg) for 5 days
- ▶ Child 12-17 years: 500 mg once daily for 5 days
- ▶ Adult: 500 mg once daily for 5 days

Respiratory-tract infections, otitis media, skin and soft-tissue infections

BY MOUTH

- ▶ Child 6 months-17 years: 10 mg/kg once daily (max. per dose 500 mg) for 3 days
- ▶ Child 6 months-17 years (body-weight 15-25 kg): 200 mg once daily for 3 days
- ▶ Child 6 months-17 years (body-weight 26-35 kg): 300 mg once daily for 3 days
- ▶ Child 6 months-17 years (body-weight 36-45 kg): 400 mg once daily for 3 days
- ▶ Child 6 months-17 years (body-weight 46 kg and above): 500 mg once daily for 3 days
- ▶ Adult: 500 mg once daily for 3 days, alternatively initially 500 mg once daily for 1 day, then 250 mg once daily for 4 days

Uncomplicated genital chlamydial infections | Non-gonococcal urethritis

BY MOUTH

- ▶ Child 12-17 years: 1 g for 1 dose
- ▶ Adult: 1 g for 1 dose

Uncomplicated gonorrhoea

BY MOUTH

- ▶ Adult: 1 g for 1 dose

Lyme disease

BY MOUTH

- ▶ Adult: 500 mg daily for 7-10 days

Mild to moderate typhoid due to multiple-antibacterial resistant organisms

BY MOUTH

- ▶ Adult: 500 mg daily for 7 days

Community-acquired pneumonia, low to moderate severity

BY MOUTH

- ▶ Adult: 500 mg once daily for 3 days, alternatively initially 500 mg once daily for 1 day, then 250 mg once daily for 4 days

continued →

Community-acquired pneumonia, high severity

INITIALLY BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 500 mg once daily for at least 2 days, then (by mouth) 500 mg once daily for a total duration of 7–10 days

Antibacterial prophylaxis for insertion of intra-uterine device

BY MOUTH

- ▶ Adult: 1 g for 1 dose

- **UNLICENSED USE** Not licensed for uncomplicated gonorrhoea, mild or moderate typhoid due to multiple-antibacterial-resistant organisms, Lyme disease, or prophylaxis of group A streptococcal infection. Not licensed for community-acquired pneumonia (high severity) when oral treatment continues for more than 3 days.
- **INTERACTIONS** → Appendix 1 (macrolides). Caution with concomitant use of drugs that prolong the QT interval.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anorexia · arthralgia · arthralgia · disturbances in taste · disturbances in vision · dizziness · dyspepsia · flatulence · headache · malaise · paraesthesia · reversible hearing loss (sometimes with tinnitus) after long-term therapy ·
 - ▶ **Uncommon** Anxiety · chest pain · constipation · gastritis · hypoaesthesia · leucopenia · oedema · photosensitivity · sleep disturbances
 - ▶ **Rare** Agitation
 - ▶ **Frequency not known** Acute renal failure · convulsions · haemolytic anaemia · interstitial nephritis · smell disturbances · syncope · thrombocytopenia · tongue discoloration
- **PREGNANCY** Manufacturers advise use only if adequate alternatives not available.
- **BREAST FEEDING** Present in milk; use only if no suitable alternatives.
- **HEPATIC IMPAIRMENT** Manufacturers advise avoid in severe liver disease—no information available.
- **RENAL IMPAIRMENT**
 - ▶ In adults Use with caution if eGFR less than 10 mL/minute/1.73 m².
 - ▶ In children Use with caution if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Zedbac*®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute 500 mg with 4.8 mL water for injections to produce a 100 mg/mL solution, then dilute 5 mL of solution with infusion fluid to a final concentration of 1 or 2 mg/mL; give the 1 mg/mL solution over 3 hours or give the 2 mg/mL solution over 1 hour.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry or banana.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Azithromycin for bacterial infections www.medicinesforchildren.org.uk/azithromycin-bacterial-infections-0
- **PROFESSION SPECIFIC INFORMATION**
 - ▶ **Dental practitioners' formulary** Azithromycin Capsules may be prescribed. Azithromycin Tablets may be prescribed. Azithromycin Oral Suspension 200 mg/5 mL may be prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** Azithromycin tablets can be sold to the public for the treatment of confirmed, asymptomatic *Chlamydia trachomatis* genital infection in those over 16 years of age, and for the epidemiological treatment of their sexual partners, subject to maximum single dose of 1 g, maximum daily dose 1 g, and a pack size of 1 g.

MEDICINAL FORMS

Respiratory-tract infections | Mild to moderate skin and soft-tissue infections | Otitis media

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily
- ▶ Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily
- ▶ Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily
- ▶ Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily
- ▶ Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily
- ▶ Child 12–17 years: 250 mg twice daily usually for 7–14 days, increased to 500 mg twice daily, if required in severe infections (e.g. pneumonia)
- ▶ Adult: 250 mg twice daily usually for 7–14 days, increased to 500 mg twice daily, if required in severe infections (e.g. pneumonia)

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Child 12–17 years: 500 mg once daily usually for 7–14 days, increased to 1 g once daily, if required in severe infections (e.g. pneumonia)
- ▶ Adult: 500 mg once daily usually for 7–14 days, increased to 1 g once daily, if required in severe infections (e.g. pneumonia)

BY INTRAVENOUS INFUSION

- ▶ Adult: 500 mg every 12 hours maximum duration 5 days, switch to oral route when appropriate, to be administered into a large proximal vein

Lyme disease

BY MOUTH

- ▶ Child 12-17 years: 500 mg twice daily for 14–21 days
- ▶ Adult: 500 mg twice daily for 14–21 days

Prevention of pertussis

BY MOUTH

- ▶ Child 1 month-11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 7 days
- ▶ Child 1 month-11 years (body-weight 8-11 kg): 62.5 mg twice daily for 7 days
- ▶ Child 1 month-11 years (body-weight 12-19 kg): 125 mg twice daily for 7 days
- ▶ Child 1 month-11 years (body-weight 20-29 kg): 187.5 mg twice daily for 7 days
- ▶ Child 1 month-11 years (body-weight 30-40 kg): 250 mg twice daily for 7 days
- ▶ Child 12-17 years: 500 mg twice daily for 7 days
- ▶ Adult: 500 mg twice daily for 7 days

Helicobacter pylori eradication in combination with a proton pump inhibitor and amoxicillin

BY MOUTH

- ▶ Adult: 500 mg twice daily

Helicobacter pylori eradication in combination with a proton pump inhibitor and metronidazole

BY MOUTH

- ▶ Adult: 250 mg twice daily

- **UNLICENSED USE** Tablets not licensed for use in children under 12 years; oral suspension not licensed for use in infants under 6 months. Intravenous infusion not licensed for use in children under 12 years.

- **INTERACTIONS** → Appendix 1 (macrolides). Caution with concomitant use of drugs that prolong the QT interval.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Dyspepsia · headache · hyperhidrosis · insomnia · taste disturbances
- ▶ **Uncommon** Anorexia · anxiety · blood disorders · chest pain · constipation · dizziness · dry mouth · flatulence · gastritis · glossitis · hepatic dysfunction including jaundice · leucopenia · malaise · myalgia · stomatitis · tinnitus · tremor
- ▶ **Frequency not known** Abnormal dreams · confusion · convulsions · depression · hypoglycaemia · interstitial nephritis · myopathy · paraesthesia · psychotic disorders · renal failure · smell disturbances · tongue discoloration · tooth discoloration

- **PREGNANCY** Manufacturer advises avoid, particularly in the first trimester, unless potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment if renal impairment also present.

- **RENAL IMPAIRMENT** Avoid if severe hepatic impairment also present.

- ▶ In adults Use half normal dose if eGFR less than 30 mL/minute/1.73 m², max. duration 14 days. Avoid *Klaricid XL*[®] or clarithromycin m/r preparations if eGFR less than 30 mL/minute/1.73 m².
- ▶ In children Use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m², max. duration 14 days. Avoid *Klaricid XL*[®] or clarithromycin m/r preparations if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use in children For intermittent intravenous infusion dilute reconstituted solution further in Glucose 5% or Sodium chloride 0.9% to a concentration of 2 mg/mL; give into large proximal vein over 60 minutes.

- ▶ With intravenous use in adults For *intravenous infusion* (*Klaricid*[®] I.V.), give intermittently in Glucose 5% or Sodium Chloride 0.9%; dissolve initially in water for injections (500 mg in 10 mL) then dilute to a concentration of 2 mg/mL; give over 60 minutes.

Erythromycin**INDICATIONS AND DOSE**

Susceptible infections in patients with penicillin hypersensitivity (e.g. respiratory-tract infections (including Legionella infection), skin and oral infections, and campylobacter enteritis)

BY MOUTH

- ▶ Child 1 month-1 year: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses. Increased to 250 mg 4 times a day in severe infections
- ▶ Child 2-7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses. Increased to 500 mg 4 times a day in severe infections

continued →

- ▶ Child 8-17 years: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses. Increased to 500–1000 mg 4 times a day in severe infections
- ▶ Adult: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses. Increased to 500–1000 mg 4 times a day in severe infections

BY INTRAVENOUS INFUSION

- ▶ Child: 12.5 mg/kg every 6 hours (max. per dose 1 g)
- ▶ Adult: 6.25 mg/kg every 6 hours, for mild infections when oral treatment not possible; increased to 12.5 mg/kg every 6 hours in severe infections

Lyme disease**BY MOUTH**

- ▶ Adult: 500 mg 4 times a day for 14–21 days

Early syphilis**BY MOUTH**

- ▶ Adult: 500 mg 4 times a day for 14 days

Uncomplicated genital chlamydia | Non-gonococcal urethritis**BY MOUTH**

- ▶ Adult: 500 mg twice daily for 14 days

Chronic prostatitis**BY MOUTH**

- ▶ Adult: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses. Increased to 4 g daily in divided doses in severe infections

BY INTRAVENOUS INFUSION

- ▶ Adult: 6.25 mg/kg every 6 hours, for mild infections when oral treatment is not possible. Increased to 12.5 mg/kg every 6 hours in severe infections

Prevention and treatment of pertussis**BY MOUTH**

- ▶ Child 1 month-1 year: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses. Increased to 250 mg 4 times a day in severe infections
- ▶ Child 2-7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses. Increased to 500 mg 4 times a day in severe infections
- ▶ Child 8-17 years: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses. Increased to 500–1000 mg 4 times a day in severe infections
- ▶ Adult: (consult local protocol)

Prevention of secondary case of diphtheria in non-immune patient**BY MOUTH**

- ▶ Child 1 month-1 year: 125 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment
- ▶ Child 2-7 years: 250 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment
- ▶ Child 8-17 years: 500 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment
- ▶ Adult: 500 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment

Prevention of secondary case of invasive group A streptococcal infection in penicillin allergic patients**BY MOUTH**

- ▶ Child 1 month-1 year: 125 mg every 6 hours for 10 days
- ▶ Child 2-7 years: 250 mg every 6 hours for 10 days
- ▶ Child 8-17 years: 250–500 mg every 6 hours for 10 days
- ▶ Adult: 250–500 mg every 6 hours for 10 days

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease, and who are penicillin allergic**BY MOUTH**

- ▶ Child 1 month-1 year: 125 mg twice daily, antibiotic prophylaxis is not fully reliable
- ▶ Child 2-7 years: 125 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection
- ▶ Child 8-17 years: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection
- ▶ Adult: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection

Prevention of recurrence of rheumatic fever**BY MOUTH**

- ▶ Child 1 month-1 year: 125 mg twice daily
- ▶ Child 2-17 years: 250 mg twice daily

Rosacea**BY MOUTH**

- ▶ Adult: 500 mg twice daily courses usually last 6–12 weeks and are repeated intermittently

Acne**BY MOUTH**

- ▶ Adult: 500 mg twice daily

● UNLICENSED USE

- ▶ With intravenous use or oral use in children Not licensed for use in gastro-intestinal stasis.

- **CAUTIONS** Avoid in Acute porphyrias p. 864 · neonate under 2 weeks (risk of hypertrophic pyloric stenosis) (in neonates)

STIEMYCIN®

Some manufacturers advise preparations containing alcohol are not suitable for use with benzoyl peroxide

- **INTERACTIONS** → See Appendix 1 (macrolides). Caution with concomitant use of drugs that prolong the QT interval.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Only small amounts in milk—not known to be harmful.
- **HEPATIC IMPAIRMENT** May cause idiosyncratic hepatotoxicity.
- **RENAL IMPAIRMENT**
 - ▶ In adults Max. 1.5 g daily in severe renal impairment (ototoxicity).
 - ▶ In children Reduce dose in severe renal impairment (ototoxicity).
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use in children Dilute reconstituted solution further in glucose 5% (neutralised with Sodium bicarbonate) or sodium chloride 0.9% to a concentration of 1–5 mg/mL; give over 20–60 minutes. Concentration of up to 10 mg/mL may be used in fluid-restriction if administered via a central venous catheter.
 - ▶ With intravenous use in adults For *intravenous infusion* (as lactobionate), give intermittently in Glucose 5% (neutralised with sodium bicarbonate) or Sodium chloride 0.9%; dissolve initially in water for injections (1 g in 20 mL) then dilute to a concentration of 1–5 mg/mL; give over 20–60 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana.
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Erythromycin for bacterial infections www.medicinesforchildren.org.uk/erythromycin-for-bacterial-infections
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary Erythromycin tablets e/c may be prescribed. Erythromycin ethyl succinate oral suspension may be prescribed. Erythromycin stearate tablets may be prescribed. Erythromycin ethyl succinate tablets may be prescribed.

Telithromycin

- **DRUG ACTION** The ketolide telithromycin is a derivative of erythromycin. The antibacterial spectrum of telithromycin is similar to that of macrolides and it is also active against penicillin- and erythromycin-resistant *Streptococcus pneumoniae*.

INDICATIONS AND DOSE

Treatment of sinusitis or exacerbations of chronic bronchitis if caused by organisms resistant to beta-lactam antibacterials and other macrolides, or if conventional treatment is contra-indicated

BY MOUTH

► Adult: 800 mg once daily for 5 days

Treatment of community-acquired pneumonia if caused by organisms resistant to beta-lactam antibacterials and other macrolides, or if conventional treatment is contra-indicated

BY MOUTH

► Adult: 800 mg once daily for 7–10 days

Treatment of beta-haemolytic streptococcal pharyngitis if caused by organisms resistant to beta-lactam antibacterials and other macrolides, or if conventional treatment is contra-indicated | Treatment of beta-haemolytic streptococcal tonsillitis if caused by organisms resistant to beta-lactam antibacterials and other macrolides, or if conventional treatment is contra-indicated

BY MOUTH

► Child 12–17 years: 800 mg once daily for 5 days

► Adult: 800 mg once daily for 5 days

- **CONTRA-INDICATIONS** Congenital history of QT interval prolongation (if not excluded by ECG) · family history of QT interval prolongation (if not excluded by ECG) · history of telithromycin-associated hepatitis · history of telithromycin-associated jaundice · myasthenia gravis · prolongation of QT interval
- **CAUTIONS** Avoid in Acute porphyrias p. 864 · bradycardia—risk of QT interval prolongation · coronary heart disease—risk of QT interval prolongation · hypokalaemia—risk of QT interval prolongation · hypomagnesaemia—risk of QT interval prolongation · ventricular arrhythmias—risk of QT interval prolongation
- **INTERACTIONS** → Appendix 1 (telithromycin). Caution with concomitant use of drugs that prolong the QT interval.
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · diarrhoea · dizziness · flatulence · headache · nausea · taste disturbances · vomiting
 - **Uncommon** Anorexia · blurred vision · constipation · drowsiness · eosinophilia · flushing · hepatitis · insomnia · nervousness · palpitations · pruritus · rash · stomatitis · urticaria
 - **Rare** Arrhythmias · cholestatic jaundice · diplopia · hypotension · paraesthesia · transient loss of consciousness
 - **Very rare** Altered sense of smell · antibiotic-associated colitis · erythema multiforme · muscle cramp
 - **Frequency not known** Arthralgia · confusion · hallucinations · pancreatitis
- **PREGNANCY** Toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if possible if eGFR less than 30 mL/minute/1.73 m²—if no

alternative, use alternating daily doses of 800 mg and 400 mg, starting with 800 mg dose.

- **PATIENT AND CARER ADVICE** Visual disturbances or transient loss of consciousness may affect performance of skilled tasks (e.g. driving); effects may occur after the first dose. Administration at bedtime may reduce these side-effects. Patients should be advised not to drive or operate machinery if affected. Hepatic disorders Counselling on hepatic disorders is advised. Patients should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, abdominal pain, jaundice, or dark urine develop.

- **MEDICINAL FORMS**
Medicines not identified.

MONOCYCLIC BETA-LACTAM ANTIBACTERIALS

Aztreonam

- **DRUG ACTION** Aztreonam is a monocyclic beta-lactam ('monobactam') antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudomonas aeruginosa*, *Neisseria meningitidis*, and *Haemophilus influenzae*; it should not be used alone for 'blind' treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydia infection).

INDICATIONS AND DOSE

Gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis*

BY DEEP INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION

- ▶ Adult: 1 g every 8 hours, alternatively 2 g every 12 hours, single doses over 1 g by intravenous route only

Severe gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, *Neisseria meningitidis*, and lung infections in cystic fibrosis

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION

- ▶ Adult: 2 g every 6–8 hours

Gonorrhoea | Cystitis

BY INTRAMUSCULAR INJECTION

- ▶ Adult: 1 g for 1 single dose

Urinary-tract infections

BY DEEP INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION

- ▶ Adult: 0.5–1 g every 8–12 hours

Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis

BY INHALATION OF NEBULISED SOLUTION

- ▶ Adult: 75 mg 3 times a day for 28 days, doses to be administered at least 4 hours apart, subsequent courses repeated after 28-day interval without aztreonam nebuliser solution

- **CAUTIONS**

- ▶ When used by inhalation Haemoptysis— risk of further haemorrhage

- **INTERACTIONS** → Appendix 1 (aztreonam).

- **SIDE-EFFECTS**

- **SPECIFIC SIDE-EFFECTS**

- ▶ Rare
- ▶ **With systemic use** Antibiotic-associated colitis · asthenia · blood disorders · breast tenderness · chest pain · confusion · diplopia · dizziness · dyspnoea · gastro-intestinal

bleeding · halitosis · headache · hepatitis · hypotension · insomnia · jaundice · myalgia · neutropenia · paraesthesia · seizures · thrombocytopenia · tinnitus

- ▶ **Frequency not known** Bronchospasm · rash
- ▶ **When used by inhalation** Arthralgia · cough · haemoptysis · pharyngolaryngeal pain · pyrexia · rhinorrhoea · wheezing
- ▶ **With systemic use** Abdominal pain · diarrhoea · erythema multiforme · flushing · mouth ulcers · nausea · taste disturbances · toxic epidermal necrolysis · vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in aztreonam hypersensitivity. Use with caution in patients with hypersensitivity to other beta-lactam antibiotics (although aztreonam may be less likely than other beta-lactams to cause hypersensitivity in penicillin-sensitive patients).

- **PREGNANCY**

- ▶ With systemic use No information available; manufacturer of injection advises avoid.

- ▶ When used by inhalation No information available; manufacturer of powder for nebuliser solution advises avoid unless essential.

- **BREAST FEEDING** Amount in milk probably too small to be harmful.

- **HEPATIC IMPAIRMENT**

- ▶ With systemic use Use injection with caution. Monitor liver function.

- **RENAL IMPAIRMENT**

- ▶ With systemic use If eGFR 10–30 mL/minute/1.73 m², usual initial dose of injection, then half normal dose. If eGFR less than 10 mL/minute/1.73 m², usual initial dose of injection, then one-quarter normal dose.

- **MONITORING REQUIREMENTS**

- ▶ When used by inhalation Measure lung function before and after initial dose of aztreonam and monitor for bronchospasm.

- **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use For *intravenous injection*, give over 3–5 minutes. For *intravenous infusion* (Azactam[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%. Dissolve initially in water for injections (1 g per 3 mL) then dilute to a concentration of less than 20 mg/mL; to be given over 20–60 minutes.
- ▶ When used by inhalation Other inhaled drugs should be administered before aztreonam; a bronchodilator should be administered before each dose.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (December 2014) that aztreonam powder for nebuliser solution (Cayston[®]) is accepted for restricted use within NHS Scotland when inhaled colistimethate sodium and inhaled tobramycin are not tolerated or are not providing satisfactory therapeutic benefit (measured as ≥2% decline in forced expiratory volume in 1 second).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for injection**

- ▶ **Azactam** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Aztreonam 1 gram Azactam 1g powder for solution for injection vials | 1 vial [PoM] £9.40 (Hospital only)

Aztreonam 2 gram Azactam 2g powder for solution for injection vials | 1 vial [PoM] £18.82 (Hospital only)

- **Powder and solvent for nebuliser solution**

- ▶ **Cayston** (Gilead Sciences International Ltd)

Aztreonam (as Aztreonam lysine) 75 mg Cayston 75mg powder and solvent for nebuliser solution vials with Altera Nebuliser Handset | 84 vial [PoM] £2,181.53

5-NITROIMIDAZOLE DERIVATIVES

Metronidazole

- **DRUG ACTION** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

INDICATIONS AND DOSE

Anaerobic infections

BY MOUTH

- ▶ Child 1 month: 7.5 mg/kg every 12 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
- ▶ Child 2 months–11 years: 7.5 mg/kg every 8 hours (max. per dose 400 mg) usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
- ▶ Child 12–17 years: 400 mg every 8 hours
- ▶ Adult: 400 mg every 8 hours, alternatively 500 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)

BY RECTUM

- ▶ Child 1–11 months: 125 mg 3 times a day for 3 days, then 125 mg twice daily, for usual total treatment duration of 7 days
- ▶ Child 1–4 years: 250 mg 3 times a day for 3 days, then 250 mg twice daily, for usual total treatment duration of 7 days
- ▶ Child 5–9 years: 500 mg 3 times a day for 3 days, then 500 mg twice daily, for usual total treatment duration of 7 days
- ▶ Child 10–17 years: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days
- ▶ Adult: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days

BY INTRAVENOUS INFUSION

- ▶ Adult: 500 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection), to be given over 20 minutes

Helicobacter pylori eradication; in combination with clarithromycin and esomeprazole; or in combination with clarithromycin and lansoprazole; or in combination with amoxicillin and lansoprazole; or in combination with clarithromycin and omeprazole; or in combination with clarithromycin and pantoprazole; or in combination with clarithromycin and rabeprazole

BY MOUTH

- ▶ Adult: 400 mg twice daily

Helicobacter pylori eradication; in combination with amoxicillin and omeprazole

BY MOUTH

- ▶ Adult: 400 mg 3 times a day

Helicobacter pylori eradication failure (two-week regimen comprising a proton pump inhibitor plus tripotassium dicitratobismuthate plus tetracycline)

BY MOUTH

- ▶ Adult: 400–500 mg 3 times a day for 2 weeks

Fistulating Crohn's disease

BY MOUTH

- ▶ Adult: 10–20 mg/kg daily in divided doses, usual dose 400–500 mg 3 times a day usually given for 1 month but no longer than 3 months because of concerns about peripheral neuropathy

Leg ulcers and pressure sores

BY MOUTH

- ▶ Adult: 400 mg every 8 hours for 7 days

Bacterial vaginosis (notably *Gardnerella vaginalis* infection)

BY MOUTH

- ▶ Adult: 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

Bacterial vaginosis

BY VAGINA USING VAGINAL GEL

- ▶ Adult: 1 applicatorful daily for 5 days, dose to be administered at night

Pelvic inflammatory disease

BY MOUTH

- ▶ Adult: 400 mg twice daily for 14 days

Acute ulcerative gingivitis

BY MOUTH

- ▶ Child 1–2 years: 50 mg every 8 hours for 3 days
- ▶ Child 3–6 years: 100 mg every 12 hours for 3 days
- ▶ Child 7–9 years: 100 mg every 8 hours for 3 days
- ▶ Child 10–17 years: 200–250 mg every 8 hours for 3 days
- ▶ Adult: 200–250 mg every 8 hours for 3 days

Acute oral infections

BY MOUTH

- ▶ Child 1–2 years: 50 mg every 8 hours for 3–7 days
- ▶ Child 3–6 years: 100 mg every 12 hours for 3–7 days
- ▶ Child 7–9 years: 100 mg every 8 hours for 3–7 days
- ▶ Adult: 200 mg every 8 hours for 3–7 days

Surgical prophylaxis

BY MOUTH

- ▶ Adult: 400–500 mg, to be administered 2 hours before surgery, then 400–500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)

BY RECTUM

- ▶ Adult: 1 g, to be administered 2 hours before surgery, then 1 g every 8 hours if required for up to 3 doses (in high-risk procedures)

BY INTRAVENOUS INFUSION

- ▶ Adult: 500 mg, to be administered up to 30 minutes before the procedure (if rectal administration inappropriate), then 500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)

Invasive intestinal amoebiasis | Extra-intestinal amoebiasis (including liver abscess)

BY MOUTH

- ▶ Child 1–2 years: 200 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- ▶ Child 3–6 years: 200 mg 4 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- ▶ Child 7–9 years: 400 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- ▶ Child 10–17 years: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- ▶ Adult: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)

Urogenital trichomoniasis

BY MOUTH

- ▶ Child 1–2 years: 50 mg 3 times a day for 7 days
- ▶ Child 3–6 years: 100 mg twice daily for 7 days
- ▶ Child 7–9 years: 100 mg 3 times a day for 7 days
- ▶ Child 10–17 years: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose
- ▶ Adult: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

Giardiasis

BY MOUTH

- ▶ Child 1–2 years: 500 mg once daily for 3 days continued →

- ▶ Child 3-6 years: 600–800 mg once daily for 3 days
- ▶ Child 7-9 years: 1 g once daily for 3 days
- ▶ Child 10-17 years: 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days
- ▶ Adult: 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days

Established case of tetanus**BY INTRAVENOUS INFUSION**

- ▶ Adult: (consult product literature)

● **UNLICENSED USE** Metronidazole doses in the BNF may differ from those in product literature.

● CAUTIONS

- ▶ With vaginal use Not recommended during menstruation · some systemic absorption may occur with vaginal gel

● INTERACTIONS

- ▶ With systemic use → Appendix 1 (metronidazole). Caution—disulfiram-like reaction with alcohol.

● SIDE-EFFECTS**▶ Very rare**

- ▶ With systemic use Arthralgia · ataxia · darkening of urine · dizziness · drowsiness · erythema multiforme · headache · hepatitis · jaundice · leucopenia (on prolonged or intensive therapy) · myalgia · pancreatitis · pancytopenia · peripheral neuropathy (on prolonged or intensive therapy) · pruritus · psychotic disorders · rash · thrombocytopenia · transient epileptiform seizures (on prolonged or intensive therapy) · visual disturbances

▶ Frequency not known

- ▶ With systemic use Anorexia · aseptic meningitis · furred tongue · gastro-intestinal disturbances · nausea · optic neuropathy · oral mucositis · taste disturbances · vomiting
- ▶ With vaginal use Abnormal vaginal discharge · local irritation · pelvic discomfort · vaginal candidiasis

● PREGNANCY

- ▶ With systemic use Manufacturer advises avoidance of high-dose regimens; use only if potential benefit outweighs risk.

● BREAST FEEDING

- ▶ With systemic use Significant amount in milk; manufacturer advises avoid large single doses though otherwise compatible; may give milk a bitter taste.

● HEPATIC IMPAIRMENT

- ▶ With systemic use In severe liver disease reduce total daily dose to one-third, and give once daily. Use with caution in hepatic encephalopathy.

● MONITORING REQUIREMENTS

- ▶ With systemic use Clinical and laboratory monitoring advised if treatment exceeds 10 days.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give over 20–30 minutes.

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ With systemic use Metronidazole is well absorbed orally and the intravenous route is normally reserved for severe infections. Metronidazole by the rectal route is an effective alternative to the intravenous route when oral administration is not possible.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Metronidazole for bacterial infections www.medicinesforchildren.org.uk/metronidazole-for-bacterial-infections

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Metronidazole Tablets may be prescribed. Metronidazole Oral Suspension may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, gel, cream

Tinidazole

- **DRUG ACTION** Tinidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; it has a longer duration of action than metronidazole.

INDICATIONS AND DOSE**Anaerobic infections****BY MOUTH**

- ▶ Adult: Initially 2 g, followed by 1 g daily usually for 5–6 days, alternatively 500 mg twice daily usually for 5–6 days

Bacterial vaginosis | Acute ulcerative gingivitis**BY MOUTH**

- ▶ Adult: 2 g for 1 single dose

Abdominal surgery prophylaxis**BY MOUTH**

- ▶ Adult: 2 g for 1 single dose, to be administered approximately 12 hours before surgery

Intestinal amoebiasis**BY MOUTH**

- ▶ Child 1 month-11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 3 days
- ▶ Child 12-17 years: 2 g once daily for 2–3 days
- ▶ Adult: 2 g once daily for 2–3 days

Amoebic involvement of liver

BY MOUTH

- ▶ Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 5 days
- ▶ Child 12–17 years: 1.5–2 g once daily for 3–6 days
- ▶ Adult: 1.5–2 g once daily for 3–6 days

Urogenital trichomoniasis | Giardiasis

BY MOUTH

- ▶ Child 1 month–11 years: 50–75 mg/kg (max. per dose 2 g) for 1 single dose, dose may be repeated once if necessary
- ▶ Child 12–17 years: 2 g for 1 single dose, dose may be repeated once if necessary
- ▶ Adult: 2 g for 1 single dose

Helicobacter pylori eradication

BY MOUTH

- ▶ Adult: (consult local protocol)

- **CAUTIONS** Avoid in Acute porphyrias p. 864
- **INTERACTIONS** → Appendix 1 (tinidazole).
Caution—disulfiram-like reaction with alcohol.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anorexia · furred tongue · gastro-intestinal disturbances · nausea · oral mucositis · taste disturbances · vomiting
 - ▶ **Very rare** Arthralgia · ataxia · darkening of urine · dizziness · drowsiness · erythema multiforme · headache · hepatitis · jaundice · leucopenia (on prolonged or intensive therapy) · myalgia · pancreatitis · pancytopenia · peripheral neuropathy (on prolonged or intensive therapy) · pruritus · psychotic disorders · rash · thrombocytopenia · transient epileptiform seizures (on prolonged or intensive therapy) · visual disturbances
 - ▶ **Frequency not known** Aseptic meningitis · optic neuropathy
- **PREGNANCY** Manufacturer advises avoid in first trimester.
- **BREAST FEEDING** Present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment.
- **MONITORING REQUIREMENTS** Clinical and laboratory monitoring advised if treatment exceeds 10 days.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 4, 9, 21, 25

▶ **Fasigyn** (Pfizer Ltd)

Tinidazole 500 mg Fasigyn 500mg tablets | 16 tablet PoM £11.04
DT price = £11.04

OXAZOLIDINONE ANTIBACTERIALS**Linezolid**

- **DRUG ACTION** Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including methicillin-resistant *Staphylococcus aureus* (MRSA), and glycopeptide-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is **not** active against common Gram-negative organisms; it must be given in combination with other antibacterials for mixed infections that also involve Gram-negative organisms.

INDICATIONS AND DOSE

Pneumonia (when other antibacterials e.g. a glycopeptide, such as vancomycin, cannot be used) (initiated under specialist supervision) | Complicated skin and soft-tissue infections caused by Gram-positive bacteria, when other antibacterials cannot be used (initiated under specialist supervision)

BY MOUTH

- ▶ Adult: 600 mg every 12 hours usually for 10–14 days (maximum duration of treatment 28 days)

BY INTRAVENOUS INFUSION

- ▶ Adult: 600 mg every 12 hours

Important safety information**CHM ADVICE (OPTIC NEUROPATHY)**

Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

BLOOD DISORDERS

Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:

- receive treatment for more than 10–14 days;
- have pre-existing myelosuppression;
- are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
- have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

- **CAUTIONS** Acute confusional states · bipolar depression · carcinoid tumour · elderly (increased risk of blood disorders) · history of seizures · phaeochromocytoma · schizophrenia · thyrotoxicosis · uncontrolled hypertension

CAUTIONS, FURTHER INFORMATION

Close observation Unless close observation and blood pressure monitoring possible, linezolid should be avoided in uncontrolled hypertension, phaeochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states.

- **INTERACTIONS** → Appendix 1 (linezolid, MAOIs).
- ▶ **Monoamine oxidase inhibition** Linezolid is a reversible, non-selective monoamine oxidase inhibitor (MAOI). Patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, yeast extracts, undistilled alcoholic beverages, and fermented soya bean products). In addition, linezolid should not be given with another MAOI or within 2 weeks of stopping another MAOI. Unless close observation and blood-pressure monitoring is possible, avoid in those receiving SSRIs, 5HT₂ agonists ('triptans'), tricyclic antidepressants, sympathomimetics, dopaminergics, buspirone, pethidine and possibly other opioid analgesics.

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · eosinophilia · headache · nausea · taste disturbances · vomiting
- ▶ **Uncommon** Abdominal pain · blurred vision · constipation · diaphoresis · dizziness · dry mouth · dyspepsia · electrolyte disturbances · fatigue · fever · gastritis · glossitis · hypertension · hypoaesthesia · insomnia · leucopenia · pancreatitis · paraesthesia · polyuria · pruritus · rash · stomatitis · thirst · thrombocytopenia · tinnitus · tongue discoloration
- ▶ **Rare** Renal failure · tachycardia · transient ischaemic attacks
- ▶ **Frequency not known** Anaemia · antibiotic-associated colitis · convulsions · hyponatraemia · lactic acidosis · optic neuropathy reported on prolonged therapy · pancytopenia · peripheral neuropathy reported on prolonged therapy · Stevens-Johnson syndrome · tooth discoloration · toxic epidermal necrolysis

SPECIFIC SIDE-EFFECTS

- ▶ **Uncommon**
- ▶ **With intravenous use** injection-site reactions
- ▶ **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** In severe hepatic impairment manufacturer advises use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** Manufacturer advises metabolites may accumulate if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor full blood count (including platelet count) weekly.
- **DIRECTIONS FOR ADMINISTRATION** Infusion to be administered over 30–120 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.
- **PATIENT AND CARER ADVICE** Patients should be advised to read the patient information leaflet given with linezolid.

Penicillins

Benzylpenicillin and phenoxymethylpenicillin

Benzylpenicillin sodium p. 480 (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamases. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also for anthrax, diphtheria, gas-gangrene, leptospirosis, and treatment of Lyme disease.

Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; benzylpenicillin sodium is no longer the drug of first choice for pneumococcal meningitis. Although benzylpenicillin sodium is effective in the treatment of tetanus, metronidazole p. 1008 is preferred. Benzylpenicillin is inactivated by gastric acid and absorption from the gastrointestinal tract is low; therefore it must be given by injection.

Benzathine benzylpenicillin is used for the treatment of early syphilis and late latent syphilis; it is given by intramuscular injection.

Phenoxymethylpenicillin p. 481 (Penicillin V) has a similar antibacterial spectrum to benzylpenicillin sodium, but is less active. It is gastric acid-stable, so is suitable for oral administration. It should not be used for serious infections because absorption can be unpredictable and plasma concentrations variable. It is indicated principally for respiratory-tract infections in children, for streptococcal tonsillitis, and for continuing treatment after one or more injections of benzylpenicillin sodium when clinical response has begun. It should not be used for meningococcal or gonococcal infections. Phenoxymethylpenicillin is used for prophylaxis against streptococcal infections following rheumatic fever and against pneumococcal infections following splenectomy or in sickle-cell disease.

Penicillinase-resistant penicillins

Most staphylococci are now resistant to benzylpenicillin because they produce penicillinases. Flucloxacillin p. 486, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the sole indication for its use. Flucloxacillin is acid-stable and can, therefore, be given by mouth as well as by injection. Flucloxacillin is well absorbed from the gut.

Temocillin p. 487 is active against Gram-negative bacteria and is stable against a wide range of beta-lactamases. It should be reserved for the treatment of infections caused by beta-lactamase-producing strains of Gram-negative bacteria, including those resistant to third-generation cephalosporins. Temocillin is not active against *Pseudomonas aeruginosa* or *Acinetobacter* spp.

Broad-spectrum penicillins

Ampicillin p. 483 is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinases including those produced by *Staphylococcus aureus* and by common Gram-negative bacilli such as *Escherichia coli*. Almost all staphylococci, approx. 60% of *E. coli* strains and approx. 20% of *Haemophilus influenzae* strains are now resistant. The likelihood of resistance should therefore be considered before using ampicillin for the 'blind' treatment of infections; in particular, it should not be used for hospital patients without checking sensitivity.

Ampicillin is well excreted in the bile and urine. It is principally indicated for the treatment of exacerbations of chronic bronchitis and middle ear infections, both of which may be due to *Streptococcus pneumoniae* and *H. influenzae*, and for urinary-tract infections.

Ampicillin can be given by mouth but less than half the dose is absorbed, and absorption is further decreased by the presence of food in the gut.

Maculopapular rashes commonly occur with ampicillin (and amoxicillin p. 482) but are not usually related to true penicillin allergy. They almost always occur in patients with glandular fever; broad-spectrum penicillins should not therefore be used for 'blind' treatment of a sore throat. The risk of rash is also increased in patients with acute or chronic lymphocytic leukaemia or in cytomegalovirus infection.

Amoxicillin is a derivative of ampicillin and has a similar antibacterial spectrum. It is better absorbed than ampicillin when given by mouth, producing higher plasma and tissue concentrations; unlike ampicillin, absorption is not affected by the presence of food in the stomach. Amoxicillin may also be used for the treatment of Lyme disease [not licensed].

Co-amoxiclav p. 484 consists of amoxicillin with the beta-lactamase inhibitor clavulanic acid. Clavulanic acid itself has no significant antibacterial activity but, by inactivating beta-lactamases, it makes the combination active against beta-lactamase-producing bacteria that are resistant to amoxicillin. These include resistant strains of *Staph. aureus*, *E. coli*, and *H. influenzae*, as well as many *Bacteroides* and *Klebsiella* spp. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase-producing strains.

A combination of ampicillin with flucloxacillin p. 486 (as co-fluampicil p. 485 is available to treat infections involving either streptococci or staphylococci (e.g. cellulitis).

Antipseudomonal penicillins

Piperacillin, a ureidopenicillin, is only available in combination with the beta-lactamase inhibitor tazobactam.

Ticarcillin, a carboxypenicillin, is only available in combination with the beta-lactamase inhibitor clavulanic acid. Both preparations have a broad spectrum of activity against a range of Gram-positive and Gram-negative bacteria, and anaerobes. Piperacillin with tazobactam below has activity against a wider range of Gram-negative organisms than ticarcillin with clavulanic acid p. 480 and it is more active against *Pseudomonas aeruginosa*. These antibacterials are not active against MRSA. They are used in the treatment of septicaemia, hospital-acquired pneumonia, and complicated infections involving the urinary tract, skin and soft tissues, or intra-abdomen. For severe pseudomonas infections these antipseudomonal penicillins can be given with an aminoglycoside (e.g. gentamicin p. 450) since they have a synergistic effect.

Mecillinams

Pivmecillinam hydrochloride p. 486 has significant activity against many Gram-negative bacteria including *Escherichia coli*, klebsiella, enterobacter, and salmonellae. It is not active against *Pseudomonas aeruginosa* or enterococci. Pivmecillinam hydrochloride p. 486 is hydrolysed to mecillinam, which is the active drug.

Penicillins

● **DRUG ACTION** The penicillins are bactericidal and act by interfering with bacterial cell wall synthesis. They diffuse well into body tissues and fluids, but penetration into the cerebrospinal fluid is poor except when the meninges are inflamed. They are excreted in the urine in therapeutic concentrations.

● **CAUTIONS** History of allergy

● **INTERACTIONS** → Appendix 1 (penicillins).

● SIDE-EFFECTS

▶ **Common or very common** Anaphylaxis · angioedema · diarrhoea · fever · hypersensitivity reactions · joint pains · rashes · serum sickness-like reaction · urticaria

▶ **Rare** Cerebral irritation · CNS toxicity (including convulsions) · coagulation disorders · encephalopathy · haemolytic anaemia · interstitial nephritis · leucopenia · thrombocytopenia

▶ **Frequency not known** Antibiotic-associated colitis

SIDE-EFFECTS, FURTHER INFORMATION

CNS toxicity A rare but serious toxic effect of the penicillins is encephalopathy due to cerebral irritation.

This may result from excessively high doses or in patients with severe renal failure. The penicillins should **not** be given by intrathecal injection because they can cause encephalopathy which may be fatal.

Diarrhoea Diarrhoea frequently occurs during oral penicillin therapy. It is most common with broad-spectrum penicillins, which can also cause antibiotic-associated colitis.

- **ALLERGY AND CROSS-SENSITIVITY** The most important side-effect of the penicillins is hypersensitivity which causes rashes and anaphylaxis and can be fatal. Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactic reactions occur in fewer than 0.05% of treated patients. Patients with a history of atopic allergy (e.g. asthma, eczema, hay fever) are at a higher risk of anaphylactic reactions to penicillins. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should not receive a penicillin. Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients.

Patients who are allergic to one penicillin will be allergic to all because the hypersensitivity is related to the basic penicillin structure. Patients with a history of immediate hypersensitivity to penicillins may also react to the cephalosporins and other beta-lactam antibiotics, they should not receive these antibiotics. If a penicillin (or another beta-lactam antibiotic) is essential in an individual with immediate hypersensitivity to penicillin then specialist advice should be sought on hypersensitivity testing or using a beta-lactam antibiotic with a different structure to the penicillin that caused the hypersensitivity.

PENICILLINS (ANTIPSEUDOMONAL)

Piperacillin with tazobactam

INDICATIONS AND DOSE

Hospital-acquired pneumonia | Septicaemia | Complicated infections involving the urinary-tract or skin and soft tissues

BY INTRAVENOUS INFUSION

▶ **Adult:** 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections

Complicated intra-abdominal infections

BY INTRAVENOUS INFUSION

▶ **Adult 18 years:** 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections

Infections in neutropenic patients

BY INTRAVENOUS INFUSION

▶ **Adult:** 4.5 g every 6 hours

- **CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations)

● SIDE-EFFECTS

- ▶ **Common or very common** Nausea · vomiting
- ▶ **Uncommon** Constipation · dyspepsia · headache · hypotension · injection-site reactions · insomnia · jaundice · stomatitis
- ▶ **Rare** Abdominal pain · eosinophilia · hepatitis

- ▶ **Very rare** Hypoglycaemia · hypokalaemia · pancytopenia · Steven-Johnson syndrome · toxic epidermal necrolysis
- **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **RENAL IMPAIRMENT** Max. 4.5 g every 8 hours if eGFR 20–40 mL/minute/1.73 m². Max. 4.5 g every 12 hours if eGFR less than 20 mL/minute/1.73 m².
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially (2.25 g in 10 mL, 4.5 g in 20 mL) with water for injections, or glucose 5% (*Tazocin*[®] brand only), or sodium chloride 0.9%, then dilute to 50–150 mL with infusion fluid; give over 30 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Dose expressed as a combination of piperacillin and tazobactam (both as sodium salts).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

Powder for solution for injection

ELECTROLYTES: May contain Sodium

▶ **PIPERACILLIN WITH TAZOBACTAM (Non-proprietary)**

Piperacillin (as Piperacillin sodium) 2 gram, Tazobactam (as Tazobactam sodium) 250 mg Piperacillin 2g / Tazobactam 250mg powder for solution for injection vials | 1 vial [PoM] £7.96 DT price = £7.91 (Hospital only) | 1 vial [PoM] £6.50-£7.91 DT price = £7.91 | 10 vial [PoM] £10.31-£60.80

Piperacillin (as Piperacillin sodium) 4 gram, Tazobactam (as Tazobactam sodium) 500 mg Piperacillin 4g / Tazobactam 500mg powder for solution for injection vials | 1 vial [PoM] £15.77-£15.79 (Hospital only) | 1 vial [PoM] £12.90

▶ **Tazocin (Pfizer Ltd)**

Piperacillin (as Piperacillin sodium) 2 gram, Tazobactam (as Tazobactam sodium) 250 mg Tazocin 2.25g powder for solution for injection vials | 1 vial [PoM] £7.65 DT price = £7.91

Piperacillin (as Piperacillin sodium) 4 gram, Tazobactam (as Tazobactam sodium) 500 mg Tazocin 4.5g powder for solution for injection vials | 1 vial [PoM] £15.17 (Hospital only)

Ticarcillin with clavulanic acid

INDICATIONS AND DOSE

Infections due to *Pseudomonas* and *Proteus* spp

BY INTRAVENOUS INFUSION

- ▶ Adult: 3.2 g every 6–8 hours; increased if necessary to 3.2 g every 4 hours, increased frequency used for more severe infections

- **CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations)

CAUTIONS, FURTHER INFORMATION

Cholestatic jaundice Cholestatic jaundice is possibly associated with clavulanic acid. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav (amoxicillin, clavulanic acid) than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

- **SIDE-EFFECTS** Eosinophilia · haemorrhagic cystitis (more frequent in children) · hypokalaemia · injection-site reactions · nausea · Stevens-Johnson syndrome · toxic epidermal necrolysis · vomiting

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Reduce dose to 3.2 g every eight hours if eGFR 30–60 mL/minute/1.73 m²; 1.6 g every eight hours if eGFR 10–30 mL/minute/1.73 m²; 1.6 g every twelve hours if eGFR less than 10 mL/minute/1.73 m². Accumulation of electrolytes contained in preparation can occur in patients with renal failure.
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Timentin*[®]), give intermittently in Glucose 5%. Suggested volume (depending on dose) 100–150 mL; give over 30–40 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Dose is expressed as a combination of ticarcillin (as sodium salt) and clavulanic acid (as potassium salt) in a ratio of 15:1.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Potassium, sodium

▶ **Timentin (GlaxoSmithKline UK Ltd)**

Clavulanic acid (as Potassium clavulanate) 200 mg, Ticarcillin (as Ticarcillin sodium) 3 gram Timentin 3.2g powder for solution for infusion vials | 4 vial [PoM] £21.32

PENICILLINS (BETA-LACTAMASE SENSITIVE)

Benzylpenicillin sodium (Penicillin G)

INDICATIONS AND DOSE

Mild to moderate susceptible infections | Throat infections | Otitis media | Cellulitis | Pneumonia

BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 0.6–1.2 g every 6 hours, dose may be increased if necessary in more serious infections (consult product literature), single doses over 1.2 g to be given by intravenous route only

Endocarditis (in combination with other antibacterial if necessary)

BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 1.2 g every 4 hours, increased if necessary to 2.4 g every 4 hours, dose may be increased in infections such as enterococcal endocarditis

Anthrax (in combination with other antibacterials)

BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 2.4 g every 4 hours

Intrapartum prophylaxis against group B streptococcal infection

BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 3 g for 1 dose, then 1.5 g every 4 hours until delivery

Meningitis | Meningococcal disease

BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 2.4 g every 4 hours

BY INTRAVENOUS INFUSION

- ▶ Neonate up to 6 days: 50 mg/kg every 12 hours.
- ▶ Neonate 7–28 days: 50 mg/kg every 8 hours.

- ▶ Child: 50 mg/kg every 4–6 hours (max. per dose 2.4 g every 4 hours)

Suspected meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) prior to urgent transfer to hospital

BY INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Child 1–11 months: 300 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
- ▶ Child 1–9 years: 600 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
- ▶ Child 10–17 years: 1.2 g, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
- ▶ Adult: 1.2 g, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer

Suspected bacterial meningitis without non-blanching rash where patient cannot be transferred to hospital urgently

BY INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Child 1–11 months: 300 mg, administer as single dose prior to transfer to hospital
- ▶ Child 1–9 years: 600 mg, administer as single dose prior to transfer to hospital
- ▶ Child 10–17 years: 1.2 g, administer as single dose prior to transfer to hospital
- ▶ Adult: 1.2 g, administer as single dose prior to transfer to hospital

- **UNLICENSED USE** Benzylpenicillin doses in the BNF may differ from those in product literature.

Important safety information

Intrathecal injection of benzylpenicillin is **not** recommended.

- **CAUTIONS** Accumulation of sodium from injection can occur with high doses
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.
- **RENAL IMPAIRMENT** Accumulation of sodium from injection can occur in renal failure. High doses may cause neurotoxicity, including cerebral irritation, convulsions, or coma.
 - ▶ In adults Reduce dose—consult product literature.
 - ▶ In children Estimated glomerular filtration rate 10–50 mL/minute/1.73 m², use normal dose every 8–12 hours. Estimated glomerular filtration rate less than 10 mL/minute/1.73 m² use normal dose every 12 hours.
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use in children Intravenous route recommended in neonates and infants. For *intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–30 minutes. Longer administration time is particularly important when using doses of 50 mg/kg (or greater) to avoid CNS toxicity.
 - ▶ With intravenous use in adults For *intravenous infusion (Crystapen®)*, give intermittently in Glucose 5% or Sodium chloride 0.9%; suggested volume 100 mL given over 30–60 minutes. Continuous infusion not usually recommended.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, eye drops

Powder for solution for injection

ELECTROLYTES: May contain Sodium

▶ **BENZYLPENICILLIN SODIUM (Non-proprietary)**

Benzylpenicillin sodium 600 mg Benzylpenicillin 600mg powder for solution for injection vials | 2 vial [POM] £4.67 DT price = £4.67 | 25 vial [PoM] £58.37–£58.38

Benzylpenicillin sodium 1.2 gram Benzylpenicillin 1.2g powder for solution for injection vials | 25 vial [POM] £78.64 DT price = £78.64

Phenoxymethylpenicillin (Penicillin V)

INDICATIONS AND DOSE

Oral infections | Tonsillitis | Otitis media | Erysipelas | Cellulitis

BY MOUTH

- ▶ Child 1–11 months: 62.5 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
- ▶ Child 1–5 years: 125 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
- ▶ Child 6–11 years: 250 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
- ▶ Child 12–17 years: 500 mg 4 times a day; increased if necessary up to 1 g 4 times a day
- ▶ Adult: 500 mg every 6 hours, increased if necessary up to 1 g every 6 hours

Prevention of recurrence of rheumatic fever

BY MOUTH

- ▶ Child 1 month–5 years: 125 mg twice daily
- ▶ Child 6–17 years: 250 mg twice daily
- ▶ Adult: 250 mg twice daily

Prevention of secondary case of invasive group A streptococcal infection

BY MOUTH

- ▶ Child 1–11 months: 62.5 mg every 6 hours for 10 days
- ▶ Child 1–5 years: 125 mg every 6 hours for 10 days
- ▶ Child 6–11 years: 250 mg every 6 hours for 10 days
- ▶ Child 12–17 years: 250–500 mg every 6 hours for 10 days
- ▶ Adult: 250–500 mg every 6 hours for 10 days

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease

BY MOUTH

- ▶ Child 1–11 months: 62.5 mg twice daily
- ▶ Child 1–4 years: 125 mg twice daily
- ▶ Child 5–17 years: 250 mg twice daily
- ▶ Adult: 250 mg twice daily

- **UNLICENSED USE** Phenoxymethylpenicillin doses in the BNF may differ from product literature.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

- ▶ Child 12-17 years: 500 mg 3 times a day; increased if necessary up to 1 g 3 times a day, use increased dose in severe infections
- ▶ Adult: 500 mg every 8 hours, increased if necessary to 1 g every 8 hours, increased dose used in severe infections

BY INTRAMUSCULAR INJECTION

- ▶ Adult: 500 mg every 8 hours

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 500 mg every 8 hours, increased to 1 g every 6 hours, use increased dose in severe infections

Lyme disease (under expert supervision)

BY MOUTH

- ▶ Child 5-17 years: 500 mg 3 times a day for 14–21 days (for 28 days in Lyme arthritis)
- ▶ Adult: 500 mg 3 times a day for 14–21 days (for 28 days in Lyme arthritis)

Anthrax (treatment and post-exposure prophylaxis)

BY MOUTH

- ▶ Child (body-weight up to 20 kg): 80 mg/kg daily in 3 divided doses
- ▶ Child (body-weight 20 kg and above): 500 mg 3 times a day
- ▶ Adult: 500 mg 3 times a day

Dental abscess (short course)

BY MOUTH

- ▶ Adult: 3 g, then 3 g after 8 hours

Urinary-tract infections (short course)

BY MOUTH

- ▶ Adult: 3 g, then 3 g after 10–12 hours

Listerial meningitis (in combination with another antibiotic)

BY INTRAVENOUS INFUSION

- ▶ Adult: 2 g every 4 hours

Endocarditis (in combination with another antibiotic if necessary)

BY INTRAVENOUS INFUSION

- ▶ Adult: 2 g every 4 hours

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease—if cover also needed for Haemophilus influenzae

BY MOUTH

- ▶ Child 1 month-4 years: 125 mg twice daily
- ▶ Child 5-11 years: 250 mg twice daily
- ▶ Child 12-17 years: 500 mg twice daily

Helicobacter pylori eradication in combination with metronidazole and omeprazole

BY MOUTH

- ▶ Adult: 500 mg 3 times a day

Helicobacter pylori eradication; in combination with clarithromycin and esomeprazole; or in combination with clarithromycin and lansoprazole; or in combination with metronidazole and lansoprazole; or in combination with clarithromycin and omeprazole; or in combination with clarithromycin and pantoprazole; or in combination with clarithromycin and rabeprazole

BY MOUTH

- ▶ Adult: 1 g twice daily

- **UNLICENSED USE** Amoxicillin doses in BNF Publications may differ from those in product literature. Amoxicillin is not licensed for use for treatment of Lyme disease.

● **CAUTIONS****GENERAL CAUTIONS**

Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common) · maintain adequate hydration with high doses (particularly during parenteral therapy)

SPECIFIC CAUTIONS

- ▶ With intravenous use Accumulation of sodium can occur with high parenteral doses
- **SIDE-EFFECTS**
- ▶ Common or very common Nausea · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
- If rash occurs, discontinue treatment.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **RENAL IMPAIRMENT** Reduce dose in severe impairment; rashes more common. Risk of crystalluria with high doses (particularly during parenteral therapy). Accumulation of sodium from injection can occur in patients with renal failure.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use in children Displacement value may be significant when reconstituting injection, consult local guidelines. Dilute intravenous injection to a concentration of 50 mg/mL (100 mg/mL for neonates). May be further diluted with Glucose 5% or Glucose 10% or Sodium chloride 0.9% or 0.45% for intravenous infusion. Give intravenous infusion over 30 minutes when using doses over 30 mg/kg.
- ▶ With intravenous use in adults For intravenous infusion (Amoxil[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes or give via drip tubing in Glucose 5% or Sodium chloride 0.9%; continuous infusion not usually recommended.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations and sachets may include peach, strawberry, or lemon.
- **PATIENT AND CARER ADVICE**
Patient counselling is advised for Amoxicillin (*Amoxil*[®]) paediatric suspension (use of pipette).
Medicines for Children leaflet: Amoxicillin for bacterial infections www.medicinesforchildren.org.uk/amoxicillin-bacterial-infections-0
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary Amoxicillin capsules may be prescribed. Amoxicillin sachets may be prescribed as Amoxicillin Oral Powder. Amoxicillin Oral Suspension may be prescribed.

INDICATIONS AND DOSE

Susceptible infections (including urinary-tract infections, otitis media, sinusitis, uncomplicated community-acquired pneumonia, salmonellosis)

BY MOUTH

- ▶ Child 1-11 months: 125 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day
- ▶ Child 1-4 years: 250 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day
- ▶ Child 5-11 years: 500 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day (max. per dose 1 g)

- ▶ Child 12-17 years: 500 mg 4 times a day; increased if necessary to 1 g 4 times a day, use increased dose in severe infection

▶ Adult: 0.5-1 g every 6 hours

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

▶ Adult: 500 mg every 4-6 hours

BY INTRAMUSCULAR INJECTION

▶ Adult: 500 mg every 4-6 hours

Endocarditis (in combination with another antibiotic if necessary) | Listerial meningitis (in combination with another antibiotic)

BY INTRAVENOUS INFUSION

▶ Adult: 2 g every 4 hours

- **UNLICENSED USE** Ampicillin doses in BNF may differ from those in product literature.

● CAUTIONS

GENERAL CAUTIONS

Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common)

SPECIFIC CAUTIONS

- ▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses
- **SIDE-EFFECTS**
- ▶ Common or very common Nausea · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
If rash occurs, discontinue treatment.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.

● RENAL IMPAIRMENT

Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

- ▶ In adults Reduce dose if eGFR less than 10 mL/minute/1.73 m²; rashes more common.
- ▶ In children If estimated glomerular filtration rate less than 10 mL/minute/1.73 m² reduce dose or frequency; rashes more common.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With oral use Administer at least 30 minutes before food.
- ▶ With intravenous use in children Displacement value may be significant when reconstituting injection, consult local guidelines. Dilute intravenous injection to a concentration of 50-100 mg/mL. May be further diluted with glucose 5% or 10% or sodium chloride 0.9% or 0.45% for infusion. Give over 30 minutes when using doses of greater than 50 mg/kg to avoid CNS toxicity including convulsions.
- ▶ With intravenous use in adults For *intravenous infusion* (*Penbritin*[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30-60 minutes *via* drip tubing in Glucose 5% or Sodium

chloride 0.9%. Continuous infusion not usually recommended.

● CAUTIONS

GENERAL CAUTIONS

Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common) · maintain adequate hydration with high doses (particularly during parental therapy)

SPECIFIC CAUTIONS

- ▶ With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses

CAUTIONS, FURTHER INFORMATION

Cholestatic jaundice Cholestatic jaundice can occur either during or shortly after the use of co-amoxiclav. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Cholestatic jaundice · hepatitis · nausea · vomiting
- ▶ **Rare** Dizziness · headache · prolongation of bleeding time
- ▶ **Frequency not known** Exfoliative dermatitis · Steven-Johnson syndrome · toxic epidermal necrolysis · vasculitis

SPECIFIC SIDE-EFFECTS

- ▶ **Rare**
 - ▶ With intravenous use phlebitis at injection site
 - ▶ With oral use superficial staining of teeth with suspension
- SIDE-EFFECTS, FURTHER INFORMATION**
Rash | If rash occurs, discontinue treatment.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **HEPATIC IMPAIRMENT** Monitor liver function in liver disease.
- **RENAL IMPAIRMENT** Risk of crystalluria with high doses (particularly during parental therapy).

- ▶ With oral use in adults *Co-amoxiclav 250/125 tablets or 500/125 tablets*: if eGFR 10–30 mL/minute/1.73 m², one 250/125 strength tablet every 12 hours or one 500/125 strength tablet every 12 hours; if eGFR less than 10 mL/minute/1.73 m², one 250/125 strength tablet every 24 hours or one 500/125 strength tablet every 24 hours. *Co-amoxiclav 400/57 suspension*: avoid if eGFR less than 30 mL/minute/1.73 m².
- ▶ With intravenous use in adults *Co-amoxiclav injection* (expressed as co-amoxiclav): if eGFR 10–30 mL/minute/1.73 m², 1.2 g initially, then 600 mg every 12 hours; if eGFR less than 10 mL/minute/1.73 m², 1.2 g initially, then 600 mg every 24 hours. Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.
- ▶ With oral use in children *Co-amoxiclav 125/31 suspension, 250/62 suspension, 250/125 tablets, or 500/125 tablets*: use normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Use the normal dose recommended for mild or moderate infections every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m². *Co-amoxiclav 400/57 suspension*: avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

Co-amoxiclav

INDICATIONS AND DOSE

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate), including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis and animal bites

INITIALLY BY MOUTH USING TABLETS

- ▶ Child 12–17 years: 250/125 mg every 8 hours; (by mouth) increased to 500/125 mg every 8 hours, increased dose used for severe infection
- ▶ Adult: 250/125 mg every 8 hours; (by mouth) increased to 500/125 mg every 8 hours, increased dose used for severe infection

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 1.2 g every 8 hours, intravenous injection to be administered over 3–4 minutes

Severe dental infection with spreading cellulitis | Dental infection not responding to first-line bacterial

BY MOUTH USING TABLETS

- ▶ Child 12–17 years: 250/125 mg every 8 hours for 5 days
- ▶ Adult: 250/125 mg every 8 hours for 5 days

Surgical prophylaxis

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 1.2 g, to be administered up to 30 minutes before the procedure, then 1.2 g every 8 hours for up to 2–3 further doses in high risk procedures

Dose equivalence and conversion

Doses are expressed as co-amoxiclav.

A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

- **CONTRA-INDICATIONS** History of co-amoxiclav-associated jaundice or hepatic dysfunction · history of penicillin-associated jaundice or hepatic dysfunction

- ▶ With intravenous use in children *Co-amoxiclav injection*: use normal initial dose and then use half normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; use normal initial dose and then use half normal dose every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m². Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use in adults For *intravenous infusion (Augmentin®)*, give intermittently in Sodium chloride 0.9%. Reconstitute 600 mg initially with 10 mL water for injections, then dilute with 50 mL infusion fluid; reconstitute 1.2 g initially with 20 mL water for injections, then dilute with 100 mL infusion fluid; give over 30–40 minutes *via* drip tubing in Sodium chloride 0.9%.
- ▶ With intravenous use in children For *intravenous infusion*, dilute reconstituted solution to a concentration of 10 mg/mL with Sodium Chloride 0.9%; give intermittently over 30–40 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Doses are expressed as co-amoxiclav: a mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively. Flavours of oral liquid formulations may include raspberry and orange.

Co-fluampicil

INDICATIONS AND DOSE

Mixed infections involving beta-lactamase-producing staphylococci

BY MOUTH

▶ Child 1 month–9 years: 125/125 mg every 6 hours

▶ Child 10–17 years: 250/250 mg every 6 hours

▶ Adult: 250/250 mg every 6 hours

BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

▶ Adult: 250/250 mg every 6 hours

Severe mixed infections involving beta-lactamase-producing staphylococci

BY MOUTH

▶ Child 1 month–9 years: 250/250 mg every 6 hours

▶ Child 10–17 years: 500/500 mg every 6 hours

▶ Adult: 500/500 mg every 6 hours

BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

▶ Adult: 500/500 mg every 6 hours

Important safety information

HEPATIC DISORDERS

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:

- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin;
- flucloxacillin should be used with caution in patients with hepatic impairment;

- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials.

CAUTIONS**GENERAL CAUTIONS**

Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common)

SPECIFIC CAUTIONS

- With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses

SIDE-EFFECTS

- Common or very common** Gastro-intestinal disturbances · nausea · vomiting
- Very rare** Cholestatic jaundice · hepatitis

SIDE-EFFECTS, FURTHER INFORMATION

If rash occurs, discontinue treatment.

- PREGNANCY** Not known to be harmful.
- BREAST FEEDING** Trace amount in milk, but appropriate to use.
- HEPATIC IMPAIRMENT** Use with caution.
- RENAL IMPAIRMENT**
 - In adults Reduce dose if eGFR less than 10 mL/minute/1.73 m²; rashes more common. Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.
 - In children Reduce dose or frequency if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; rashes more common.
- EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Magnapen*[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes. *Via* drip tubing in Glucose 5% or Sodium chloride 0.9%.
- PRESCRIBING AND DISPENSING INFORMATION** Dose expressed as a combination of equal parts by mass of flucloxacillin and ampicillin.

Temocillin (as Temocillin sodium) 1 gram Negaban 1g powder for solution for injection vials | 1 vial [PoM] no price available

PHOSPHONIC ACID ANTIBACTERIALS

Fosfomycin

- **DRUG ACTION** Fosfomycin, a phosphonic acid antibacterial, is active against a range of Gram-positive and Gram-negative bacteria including *Staphylococcus aureus* and Enterobacteriaceae.

INDICATIONS AND DOSE

Uncomplicated lower urinary-tract infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used

BY MOUTH

- ▶ Adult (female): 3 g for 1 dose.
- ▶ Adult (male): 3 g for 1 dose, then 3 g after 3 days.

Osteomyelitis when first-line treatments are inappropriate or ineffective | Hospital-acquired lower respiratory-tract infections when first-line treatments are inappropriate or ineffective

BY INTRAVENOUS INFUSION

- ▶ Adult: 12–24 g once daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

Complicated urinary-tract infections when first-line treatment ineffective or inappropriate

BY INTRAVENOUS INFUSION

- ▶ Adult: 12–16 g daily in 2–3 divided doses (max. per dose 8 g)

Bacterial meningitis when first-line treatment ineffective or inappropriate

BY INTRAVENOUS INFUSION

- ▶ Adult: 16–24 g daily in 3–4 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

- **UNLICENSED USE** Oral preparations containing fosfomycin are not marketed in the UK and use of these preparations is unlicensed.
- **CAUTIONS**
 - ▶ With intravenous use Cardiac insufficiency · elderly (high doses) · hyperaldosteronism · hypernatraemia · hypertension · pulmonary oedema
- **INTERACTIONS** → Appendix 1 (fosfomycin).

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Gastro-intestinal disturbances · rash
- ▶ **Uncommon** Diarrhoea · nausea · vomiting
- ▶ **Frequency not known** Abdominal pain

SPECIFIC SIDE-EFFECTS

- ▶ **With intravenous use** Decreased appetite · dyspnoea · fatigue · headache · hypernatraemia · hypokalaemia · taste disturbances · vertigo
- ▶ **Rare**
- ▶ **With intravenous use** Aplastic anaemia · blood disorders · eosinophilia
- ▶ **Very rare**
- ▶ **With intravenous use** Fatty liver · visual impairment
- ▶ **Frequency not known**
- ▶ **With intravenous use** Antibiotic-associated colitis · bronchospasm · confusion · hepatitis · jaundice · tachycardia
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk.

● RENAL IMPAIRMENT

- ▶ With oral use Avoid if eGFR less than 10 mL/minute/1.73 m².
- ▶ With intravenous use Use with caution if eGFR 40–80 mL/minute/1.73 m² and consult product literature for dose if eGFR less than 40 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- ▶ With intravenous use Monitor electrolytes and fluid balance.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Fomicyt*®), give intermittently in Glucose 5% or 10% or Water for Injections; reconstitute each 2-g vial with 50 mL infusion fluid; give 2 g over 15 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Although oral preparations containing fosfomycin are not marketed in the UK, they can be used, on the advice of a microbiologist, for the treatment of uncomplicated lower urinary tract infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used.

Doses expressed as fosfomycin base.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2015) that Fosfomycin (*Fomicyt*®) is accepted for restricted use within NHS Scotland; initiation should be restricted to microbiologists or infectious disease specialists.

Colistimethate sodium

(Colistin sulfomethate sodium)

- **DRUG ACTION** The polymyxin antibiotic, colistimethate sodium (colistin sulfomethate sodium), is active against Gram-negative organisms including *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, and *Klebsiella pneumoniae*. It is not absorbed by mouth and thus needs to be given by injection for a systemic effect.

INDICATIONS AND DOSE

Gram-negative infections resistant to other antibacterials, including those caused by *Pseudomonas aeruginosa*, *Acinetobacter baumannii* and *Klebsiella pneumoniae*

BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult (body-weight up to 59 kg): 50 000–75 000 units/kg daily in 3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection
- ▶ Adult (body-weight 60 kg and above): 1–2 million units every 8 hours, to be administered into a totally implantable venous access device when giving via slow intravenous injection

Adjunct to standard antibacterial therapy for *Pseudomonas aeruginosa* infection in cystic fibrosis

BY INHALATION OF NEBULISED SOLUTION

- ▶ Adult: 1–2 million units twice daily; increased to 2 million units 3 times a day, dose only to be increased for subsequent respiratory isolates of *Pseudomonas aeruginosa*

BY INHALATION OF POWDER

- ▶ Adult: 1.66 million units twice daily

- **CONTRA-INDICATIONS** Myasthenia gravis

● CAUTIONS

GENERAL CAUTIONS

Acute porphyrias p. 864

SPECIFIC CAUTIONS

- ▶ When used by inhalation Severe haemoptysis—risk of further haemorrhage

- **INTERACTIONS** → Appendix 1 (polymyxins).

● SIDE-EFFECTS

- ▶ **Common or very common**

When used by inhalation Bronchospasm · cough · dysphonia · nausea · sore mouth · sore throat · taste disturbances · vomiting

- ▶ **Uncommon**

When used by inhalation Hypersalivation · thirst

- ▶ **Rare**

With intravenous use Vasomotor instability

- ▶ **Frequency not known**

- ▶ **With intravenous use** Apnoea · confusion · headache · muscle weakness · nephrotoxicity · neurotoxicity reported especially with excessive doses · perioral paraesthesia · peripheral paraesthesia · psychosis · rash · slurred speech · vertigo · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Dose-related side-effects The major adverse effects are dose-related neurotoxicity and nephrotoxicity.

● PREGNANCY

- ▶ When used by inhalation Clinical use suggests probably safe.
- ▶ With intravenous use Use only if potential benefit outweighs risk.

- **BREAST FEEDING** Present in milk but poorly absorbed from gut; manufacturers advise avoid (or use only if potential benefit outweighs risk).

● RENAL IMPAIRMENT

- ▶ With intravenous use Reduce dose. In renal impairment, monitor plasma colistimethate sodium concentration during parenteral treatment—consult product literature. Recommended 'peak' plasma colistimethate sodium concentration (approx. 1 hour after intravenous injection or infusion) 5–15 mg/litre; pre-dose ('trough') concentration 2–6 mg/litre.

● MONITORING REQUIREMENTS

- ▶ With intravenous use Monitor renal function.
- ▶ When used by inhalation Measure lung function before and after initial dose of colistimethate sodium and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using a bronchodilator before the dose of colistimethate sodium.

● DIRECTIONS FOR ADMINISTRATION

- ▶ When used by inhalation Other inhaled drugs should be administered before colistimethate sodium. For nebulisation administer required dose in 2–4 mL of sodium chloride 0.9% (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection
- ▶ With intravenous use For intravenous infusion (Colomycin[®], Promixin[®]), give intermittently in Sodium chloride 0.9% (or Glucose 5% for Promixin[®] brand only); dilute with 50 mL infusion fluid and give over 30 minutes.

COLOMYCIN[®] POWDER FOR SOLUTION FOR INJECTION

Colomycin[®] Injection may be used for nebulisation; administer required dose in 2–4 mL of sodium chloride 0.9%, (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection.

● PRESCRIBING AND DISPENSING INFORMATION

Colistimethate sodium is included in some preparations for topical application.

- **PATIENT AND CARER ADVICE** Patient should be advised to rinse mouth with water after each dose of dry powder inhalation.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ Colistimethate sodium by dry powder inhalation for pseudomonad lung infection in cystic fibrosis (March 2013) NICE TA276

Colistimethate sodium dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis who would benefit from continued treatment, but do not tolerate the drug in its nebulised form. The manufacturer must provide colistimethate sodium dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving colistimethate sodium dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA276

QUINOLONES**Quinolones**

Nalidixic acid p. 493 and norfloxacin p. 493 are effective in uncomplicated urinary-tract infections.

Ciprofloxacin below is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including salmonella, shigella, campylobacter, neisseria, and pseudomonas. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as *Streptococcus pneumoniae* and *Enterococcus faecalis*; it should not be used for pneumococcal pneumonia. It is active against chlamydia and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin can be used for respiratory tract infections (but not for pneumococcal pneumonia), urinary-tract infections, infections of the gastro-intestinal system (including typhoid fever), bone and joint infections, gonorrhoea and septicæmia caused by sensitive organisms.

Ofloxacin p. 494 is used for urinary-tract infections, lower respiratory-tract infections, gonorrhoea, and non-gonococcal urethritis and cervicitis.

Levofloxacin p. 492 is active against Gram-positive and Gram-negative organisms. It has greater activity against pneumococci than ciprofloxacin below. Levofloxacin is licensed for the treatment of acute sinusitis, acute exacerbations of chronic bronchitis, and community-acquired pneumonia, but it should only be considered for these infections when first-line treatment cannot be used or is ineffective. Levofloxacin is also licensed for the treatment of urinary-tract infections.

Although ciprofloxacin, levofloxacin, moxifloxacin p. 492, and ofloxacin are licensed for skin and soft-tissue infections, many staphylococci are resistant to the quinolones and their use should be avoided in MRSA infections.

Moxifloxacin should be reserved for the treatment of sinusitis, community-acquired pneumonia, exacerbations of chronic bronchitis, mild to moderate pelvic inflammatory disease, or complicated skin and soft-tissue infections which have failed to respond to other antibacterials or for patients who cannot be treated with other antibacterials. It has been associated with QT interval prolongation and life-threatening hepatotoxicity. Moxifloxacin is active against Gram-positive and Gram-negative organisms. It has greater activity against Gram-positive organisms, including pneumococci, than ciprofloxacin. Moxifloxacin is not active against *Pseudomonas aeruginosa* or methicillin-resistant *Staphylococcus aureus* (MRSA).

Quinolones**Important safety information**

The CSM has warned that quinolones may induce **convulsions** in patients with or without a history of

convulsions; taking NSAIDs at the same time may also induce them.

TENDON DAMAGE

Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:

- quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use;
- patients over 60 years of age are more prone to tendon damage;
- the risk of tendon damage is increased by the concomitant use of corticosteroids;
- if tendinitis is suspected, the quinolone should be discontinued immediately.

- **CONTRA-INDICATIONS** History of tendon disorders related to quinolone use
- **CAUTIONS** Can prolong the QT interval - conditions that predispose to seizures - exposure to excessive sunlight should be avoided (discontinue if photosensitivity occurs) - G6PD deficiency - history of epilepsy - myasthenia gravis (risk of exacerbation)

- **INTERACTIONS** → Appendix 1 (quinolones).

SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · dizziness · headache · nausea · vomiting
- ▶ **Uncommon** Abdominal pain · anorexia · anxiety · arthralgia · asthenia · blood disorders · confusion · depression · disturbances in taste · disturbances in vision · dyspepsia · eosinophilia · hallucinations · leucopenia · myalgia · rash · sleep disturbances · thrombocytopenia · tremor
- ▶ **Rare** Antibiotic-associated colitis · convulsions · disturbances in hearing · disturbances in smell · dyspnoea · hepatic dysfunction · hepatitis · hypotension · interstitial nephritis · jaundice · photosensitivity · psychoses · renal failure · symptoms of peripheral neuropathy (sometimes irreversible) · tendon damage · tendon inflammation · vasculitis
- ▶ **Very rare** Stevens-Johnson syndrome · toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION

The drug should be **discontinued** if psychiatric, neurological, or hypersensitivity reactions (including severe rash) occur.

- **ALLERGY AND CROSS-SENSITIVITY** Use of quinolones contraindicated in quinolone hypersensitivity.
- **PREGNANCY** Avoid in pregnancy—shown to cause arthropathy in *animal* studies; safer alternatives are available.

Ciprofloxacin**INDICATIONS AND DOSE**

Fistulating Crohn's disease

BY MOUTH

- ▶ Adult: 500 mg twice daily

Respiratory-tract infections

BY MOUTH

- ▶ Adult: 500–750 mg twice daily

BY INTRAVENOUS INFUSION

- ▶ Adult: 400 mg every 8–12 hours, dose to be administered over 60 minutes

Pseudomonas lower respiratory-tract infection in cystic fibrosis

BY MOUTH

- ▶ Adult: 750 mg twice daily

Urinary-tract infections

BY MOUTH

- ▶ Adult: 250–750 mg twice daily

BY INTRAVENOUS INFUSION

- ▶ Adult: 400 mg every 8–12 hours, dose to be administered over 60 minutes

Acute uncomplicated cystitis in women

BY MOUTH

- ▶ Adult: 250 mg twice daily for 3 days

Acute or chronic prostatitis

BY MOUTH

- ▶ Adult: 500 mg twice daily for 28 days

BY INTRAVENOUS INFUSION

- ▶ Adult: 400 mg every 8–12 hours, dose to be administered over 60 minutes

Gonorrhoea

BY MOUTH

- ▶ Adult: 500 mg for 1 dose

Most other infections

BY MOUTH

- ▶ Adult: Initially 500 mg twice daily; increased to 750 mg twice daily, in severe or deep-seated infection

BY INTRAVENOUS INFUSION

- ▶ Adult: 400 mg every 8–12 hours, dose to be administered over 60 minutes

Surgical prophylaxis

BY MOUTH

- ▶ Adult: 750 mg, to be taken 60 minutes before procedure

Anthrax (treatment and post-exposure prophylaxis)

BY MOUTH

- ▶ Adult: 500 mg twice daily

BY INTRAVENOUS INFUSION

- ▶ Adult: 400 mg every 12 hours, to be given over 60 minutes

Prevention of secondary case of meningococcal meningitis

BY MOUTH

- ▶ Child 1 month–4 years: 30 mg/kg (max. per dose 125 mg) for 1 dose
- ▶ Child 5–11 years: 250 mg for 1 dose
- ▶ Child 12–17 years: 500 mg for 1 dose
- ▶ Adult: 500 mg for 1 dose

- **UNLICENSED USE** Not licensed for use in children under 1 year of age. Not licensed for use in children for prophylaxis of meningococcal meningitis
- **CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation) · avoid excessive alkalinity of urine (risk of crystalluria) · bradycardia (risk factor for QT interval prolongation) · congenital long QT syndrome (risk factor for QT interval prolongation) · electrolyte disturbances (risk factor for QT interval prolongation) · ensure adequate fluid intake (risk of crystalluria) · heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) · history of symptomatic arrhythmias (risk factor for QT interval prolongation)
- **INTERACTIONS** Caution if concomitant use with other drugs known to prolong the QT interval.
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Rare** Abnormal dreams · chest pain · dysphagia · dyspnoea · erythema nodosum · hot flushes · hyperglycaemia · hypoglycaemia · oedema · pancreatitis · sweating · syncope · tachycardia

- ▶ **Very rare** Intracranial hypertension · movement disorders · tenosynovitis · tinnitus · vasculitis (in children)
- ▶ **Frequency not known** Peripheral neuropathy · polyneuropathy

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ **With intravenous use** Flatulence · pain at injection site · phlebitis at injection site
- ▶ **With oral use** Flatulence
- **PREGNANCY** A single dose of ciprofloxacin may be used for the prevention of a secondary case of meningococcal meningitis.
- **BREAST FEEDING** Amount too small to be harmful but manufacturer advises avoid.
- **RENAL IMPAIRMENT**
- ▶ With oral use in adults Give 250–500 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m² (every 24 hours if eGFR less than 30 mL/minute/1.73 m²).
- ▶ With intravenous use in adults Give (200 mg over 30 minutes), 200–400 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m² (every 24 hours if eGFR less than 30 mL/minute/1.73 m²).
- ▶ With intravenous use or oral use in children Reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—consult product literature.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.
- **PATIENT AND CARER ADVICE** May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol. Medicines for Children leaflet: Ciprofloxacin for bacterial infections www.medicinesforchildren.org.uk/ciprofloxacin-bacterial-infections-0

 - ▶ **Very rare** Arrhythmias
 - ▶ **Frequency not known** Exfoliative dermatitis · polyneuropathy
- **BREAST FEEDING** No information available—manufacturer advises avoid.
- **RENAL IMPAIRMENT** Use 400 mg once daily if eGFR less than 30 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE** May impair performance of skilled tasks (e.g. driving).

Tablet

CAUTIONARY AND ADVISORY LABELS 7, 9, 23

▶ NORFLOXACIN (Non-proprietary)

Norfloxacin 400 mg Norfloxacin 400mg tablets | 6 tablet [PoM] £5.40 | 14 tablet [PoM] £8.90

Ofloxacin

INDICATIONS AND DOSE

Urinary-tract infections

BY MOUTH

- ▶ **Adult:** 200–400 mg daily, preferably taken in the morning; increased if necessary to 400 mg twice daily, in upper urinary tract infections

Complicated urinary-tract infection

BY INTRAVENOUS INFUSION

- ▶ **Adult:** 200 mg daily Increased to 400 mg twice daily, for severe or complicated infections, to be given over at least 30 minutes for each 200 mg

Acute or chronic prostatitis

BY MOUTH

- ▶ **Adult:** 200 mg twice daily for 28 days

Lower respiratory-tract infections

BY MOUTH

- ▶ **Adult:** 400 mg daily, dose preferably taken in the morning, then increased if necessary to 400 mg twice daily

BY INTRAVENOUS INFUSION

- ▶ **Adult:** 200 mg twice daily, increased to 400 mg twice daily, for severe or complicated infections. To be given over at least 30 minutes for each 200 mg

Skin and soft-tissue infections

BY MOUTH

- ▶ **Adult:** 400 mg twice daily

BY INTRAVENOUS INFUSION

- ▶ **Adult:** 400 mg twice daily, to be given over at least 30 minutes for each 200 mg

Uncomplicated gonorrhoea

BY MOUTH

- ▶ **Adult:** 400 mg once daily as a single dose

Uncomplicated genital chlamydial infection | Non-gonococcal urethritis

BY MOUTH

- ▶ **Adult:** 400 mg daily for 7 days, dose may be taken as a single daily dose or in divided doses

Pelvic inflammatory disease

BY MOUTH

- ▶ **Adult:** 400 mg twice daily for 14 days

Septicaemia

BY INTRAVENOUS INFUSION

- ▶ **Adult:** 200 mg twice daily, increased to 400 mg twice daily, for severe or complicated infections. To be given over at least 30 minutes for each 200 mg

- **CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation) · bradycardia (risk factor for QT interval prolongation) · congenital long QT syndrome (risk factor for QT interval prolongation) · electrolyte disturbances (risk factor for QT interval prolongation) · heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) · history of psychiatric illness · history of symptomatic arrhythmias (risk factor for QT interval prolongation)
- **INTERACTIONS** Caution if concomitant use with other drugs known to prolong the QT interval.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Cough · eye irritation · nasopharyngitis
 - ▶ **Rare** ▶ **With intravenous use** Abnormal dreams · arrhythmias · bronchospasm · dyspnoea · hot flushes · hyperhidrosis
 - ▶ **Very rare** Extrapyramidal symptoms · neuropathy · tinnitus
 - ▶ **Frequency not known** Changes in blood sugar · pneumonitis · rhabdomyolysis
- **BREAST FEEDING** Amount probably too small to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution; elimination may be reduced in severe impairment.
- **RENAL IMPAIRMENT** Usual initial dose, then use half normal dose if eGFR 20–50 mL/minute/1.73 m²; 100 mg every 24 hours if eGFR less than 20 mL/minute/1.73 m²
- **PATIENT AND CARER ADVICE** May affect performance of skilled tasks (e.g. driving); effects enhanced by alcohol.

Rifaximin

- **DRUG ACTION** Rifaximin is a rifamycin that is poorly absorbed from the gastro-intestinal tract, and, therefore, should not be used to treat systemic infections.

INDICATIONS AND DOSE

Travellers' diarrhoea that is not associated with fever, bloody diarrhoea, blood or leucocytes in the stool, or 8 or more unformed stools in the previous 24 hours

BY MOUTH

- ▶ Adult: 200 mg every 8 hours for 3 days

Reduction in recurrence of hepatic encephalopathy

BY MOUTH

- ▶ Adult: 550 mg twice daily

- **CONTRA-INDICATIONS** Intestinal obstruction
 - **INTERACTIONS** Rifamycins interactions in Appendix 1 do not apply to rifaximin.
 - **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · depression · diarrhoea · dizziness · dyspnoea · flatulence · headache · muscle spasm · nausea · pruritus · rash · vomiting
 - ▶ **Uncommon** Anorexia · antibiotic-associated colitis · anxiety · blood disorders · convulsions · dry mouth · dysuria · glycosuria · hyperkalaemia · hypoaesthesia · influenza-like symptoms · memory impairment · paraesthesia · peripheral oedema · polymenorrhoea · polyuria · sleep disturbances · taste disturbances
 - ▶ **Rare** Blood pressure changes · constipation
 - ▶ **Frequency not known** Syncope
 - **ALLERGY AND CROSS-SENSITIVITY** Contraindicated if history of rifamycin hypersensitivity.
 - **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
 - **BREAST FEEDING** Unlikely to be present in milk in significant amounts, but manufacturer advises avoid.
 - **HEPATIC IMPAIRMENT** Manufacturer advises caution when used for hepatic encephalopathy in patients with severe hepatic impairment.
 - **PRESCRIBING AND DISPENSING INFORMATION** Not recommended for diarrhoea associated with invasive organisms such as *Campylobacter* and *Shigella*.
 - **NATIONAL FUNDING/ACCESS DECISIONS**
 - **NICE technology appraisals (TAs)**
 - ▶ Rifaximin for preventing episodes of overt hepatic encephalopathy (March 2015) NICE TA337
- Rifaximin is recommended, within its marketing authorisation, as an option for reducing the recurrence of episodes of overt hepatic encephalopathy in adults. www.nice.org.uk/TA337

Rifaximin 200 mg Xifaxanta 200mg tablets | 9 tablet (PoM) £15.15
DT price = £15.15

SULFONAMIDES

Sulfadiazine (Sulphadiazine)

- **DRUG ACTION** Sulfadiazine is a short-acting sulphonamide with bacteriostatic activity against a broad

spectrum of organisms. The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

INDICATIONS AND DOSE

Prevention of rheumatic fever recurrence

BY MOUTH

- ▶ Adult (body-weight up to 30 kg): 500 mg daily
- ▶ Adult (body-weight 30 kg and above): 1 g daily

- **UNLICENSED USE** Not licensed for use in toxoplasmosis.
- **CONTRA-INDICATIONS** Acute porphyrias p. 864
- **CAUTIONS** Asthma · avoid in blood disorders (unless under specialist supervision) · avoid in infants under 6 weeks (except for treatment or prophylaxis of *pneumocystis pneumonia*) because of the risk of kernicterus · elderly · G6PD deficiency (risk of haemolytic anaemia) · maintain adequate fluid intake · predisposition to folate deficiency · predisposition to hyperkalaemia
- **INTERACTIONS** → Appendix 1 (sulfonamides).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Diarrhoea · headache · hyperkalaemia · nausea · rash
 - ▶ **Uncommon** Vomiting
 - ▶ **Rare** Agranulocytosis · bone marrow depression
 - ▶ **Very rare** Anorexia · antibiotic-associated colitis · arthralgia · aseptic meningitis · ataxia · blood disorders · convulsions · cough · depression · eosinophilia · glossitis · hallucinations · hepatic necrosis · hypoglycaemia · hyponatraemia · interstitial nephritis · jaundice · leucopenia · liver damage · megaloblastic anaemia · myalgia · myocarditis · pancreatitis · peripheral neuropathy · photosensitivity · pulmonary infiltrates · renal disorders · shortness of breath · Stevens-Johnson syndrome · stomatitis · systemic lupus erythematosus · thrombocytopenia · tinnitus · toxic epidermal necrolysis · uveitis · vasculitis · vertigo
 - ▶ **Frequency not known** Benign intracranial hypertension · hypothyroidism · optic neuropathy · rhabdomyolysis reported in HIV-infected patients

SIDE-EFFECTS, FURTHER INFORMATION

Blood disorders or rash Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity) develop.

- **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment; high risk of crystalluria.
- **MONITORING REQUIREMENTS** Monitor blood counts on prolonged treatment.

£78.59

TETRACYCLINES AND RELATED DRUGS

Tetracyclines

5
infection

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. They remain, however, the treatment of choice for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline below with either streptomycin p. 451 or rifampicin p. 508), and the spirochaete, *Borrelia burgdorferi* (See Lyme disease). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic bronchitis (because of their activity against *Haemophilus influenzae*), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin p. 471).

Tetracyclines have a role in the management of methicillin-resistant *Staphylococcus aureus* (MRSA) infection.

Microbiologically, there is little to choose between the various tetracyclines, the only exception being minocycline p. 498 which has a broader spectrum; it is active against *Neisseria meningitidis* and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo. Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

Tetracyclines

- **CONTRA-INDICATIONS** Children under 12 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia)
- **CAUTIONS** Myasthenia gravis (muscle weakness may be increased) · systemic lupus erythematosus (may be exacerbated)
- **INTERACTIONS** → Appendix 1 (tetracyclines). Antacids, and aluminium, calcium, iron, magnesium and zinc salts decrease the absorption of tetracyclines. Use with caution in those receiving potentially hepatotoxic drugs.
- **SIDE-EFFECTS**
 - ▶ **Rare** Anaphylaxis · angioedema · blood disorders · exfoliative dermatitis · hepatotoxicity · hypersensitivity reactions · pancreatitis · pericarditis · photosensitivity (particularly with demeclocycline) · rash · Stevens-Johnson syndrome · urticaria
 - ▶ **Frequency not known** Antibiotic-associated colitis · benign intracranial hypertension · diarrhoea · dysphagia · headache · nausea · oesophageal irritation · visual disturbances · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**

Benign intracranial hypertension Headache and visual disturbances may indicate benign intracranial hypertension (discontinue treatment).
- **PREGNANCY** Should **not** be given to pregnant women; effects on skeletal development have been documented in the first trimester in *animal* studies. Administration during the second or third trimester may cause discoloration of the child's teeth, and maternal hepatotoxicity has been reported with large parenteral doses.
- **BREAST FEEDING** Should **not** be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).

- **HEPATIC IMPAIRMENT** Should be avoided or used with caution in patients with hepatic impairment.

Demeclocycline hydrochloride

INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

BY MOUTH

- ▶ Adult: 150 mg 4 times a day, alternatively 300 mg twice daily

Treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable

BY MOUTH

- ▶ Adult: Initially 0.9–1.2 g daily in divided doses, maintenance 600–900 mg daily

- **CAUTIONS** Photosensitivity more common than with other tetracyclines
- **INTERACTIONS** Milk reduces absorption.
- **SIDE-EFFECTS** Acute renal failure · reversible nephrogenic diabetes insipidus
- **HEPATIC IMPAIRMENT** Max. 1 g daily in divided doses.
- **RENAL IMPAIRMENT** May exacerbate renal failure and should **not** be given to patients with renal impairment.
- **PATIENT AND CARER ADVICE** Patients should be advised to avoid exposure to sunlight or sun lamps.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Capsule

CAUTIONARY AND ADVISORY LABELS 7, 9, 11, 23

Demeclocycline hydrochloride 150 mg Demeclocycline 150mg capsules | 28 capsule [PoM] £81.49 DT price = £81.49

Doxycycline

INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

BY MOUTH

- ▶ Child 12–17 years: Initially 200 mg daily for 1 dose, then 100 mg daily; 200 mg daily, increased dose used for severe infections including refractory urinary-tract infections
- ▶ Adult: Initially 200 mg daily for 1 dose, then 100 mg daily; 200 mg daily, increased dose used for severe infections including refractory urinary-tract infections

Acne

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 12–17 years: 100 mg daily
- ▶ Adult: 100 mg daily

Rosacea

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 100 mg daily

Papulopustular facial rosacea (without ocular involvement)

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 40 mg once daily for 16 weeks, dose to be taken in the morning, consider discontinuing treatment if no response after 6 weeks

Early syphilis

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 12–17 years: 100 mg twice daily for 14 days
- ▶ Adult: 100 mg twice daily for 14 days

Late latent syphilis

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 12-17 years: 100 mg twice daily for 28 days
- ▶ Adult: 100 mg twice daily for 28 days

Neurosyphilis

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 200 mg twice daily for 28 days

Uncomplicated genital chlamydia | Non-gonococcal urethritis

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 12-17 years: 100 mg twice daily for 7 days
- ▶ Adult: 100 mg twice daily for 7 days

Pelvic inflammatory disease

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 12-17 years: 100 mg twice daily for 14 days
- ▶ Adult: 100 mg twice daily for 14 days

Lyme disease

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 12-17 years: 100 mg twice daily for 10–14 days (for 28 days in Lyme arthritis)
- ▶ Adult: 100 mg twice daily for 10–14 days (for 28 days in Lyme arthritis)

Anthrax (treatment or post-exposure prophylaxis)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 12-17 years: 100 mg twice daily
- ▶ Adult: 100 mg twice daily

Prophylaxis of malaria

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 12-17 years: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years
- ▶ Adult: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years

Adjunct to quinine in treatment of Plasmodium falciparum malaria

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 12-17 years: 200 mg daily for 7 days
- ▶ Adult: 200 mg daily for 7 days

Periodontitis (as an adjunct to gingival scaling and root planing)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 12-17 years: 20 mg twice daily for 3 months
- ▶ Adult: 20 mg twice daily for 3 months

- **UNLICENSED USE** Doxycycline doses in BNF Publications may differ from those in product literature. Not licensed for malaria prophylaxis during pregnancy. Immediate-release doxycycline not licensed for treatment of rosacea.

- **CAUTIONS** Alcohol dependence
- **INTERACTIONS** The metabolism of doxycycline may be influenced by antiepileptics.
- **SIDE-EFFECTS** Anorexia · anxiety · dry mouth · flushing · fungal superinfection (when used for periodontitis) · tinnitus
- **PREGNANCY** When travel to malarious areas is unavoidable during pregnancy, doxycycline can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks' gestation.
- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).
- **MONITORING REQUIREMENTS** When used for periodontitis, monitor for superficial fungal infection, particularly if predisposition to oral candidiasis.
- **DIRECTIONS FOR ADMINISTRATION** Capsules and tablets should be swallowed whole with plenty of fluid, while

sitting or standing. Capsules should be taken during meals.

- **PATIENT AND CARER ADVICE** Counselling on administration advised (posture). Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary Doxycycline Capsules 100 mg may be prescribed. Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets. Tablets may be prescribed as Doxycycline Tablets 20 mg.

Minocycline

INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 12-17 years: 100 mg twice daily
- ▶ Adult: 100 mg twice daily

Acne vulgaris

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 12-17 years: 100 mg once daily, alternatively 50 mg twice daily
- ▶ Adult: 100 mg once daily, alternatively 50 mg twice daily

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Child 12-17 years: 100 mg daily
- ▶ Adult: 100 mg daily

Prophylaxis of asymptomatic meningococcal carrier state (but no longer recommended)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 100 mg twice daily for 5 days, minocycline treatment is usually followed by administration of rifampicin

- **CAUTIONS** Systemic lupus erythematosus
- **SIDE-EFFECTS**
 - ▶ **Rare** Acute renal failure · alopecia · anorexia · hyperaesthesia · impaired hearing · paraesthesia · pigmentation (sometimes irreversible) · tinnitus
 - ▶ **Very rare** Discoloration of conjunctiva · discoloration of sweat · discoloration of tears · systemic lupus erythematosus
 - ▶ **Frequency not known** Dizziness (more common in women) · vertigo (more common in women)
- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).
- **MONITORING REQUIREMENTS** If treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens.
- **DIRECTIONS FOR ADMINISTRATION** Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing.
- **PATIENT AND CARER ADVICE** Counselling on administration advised (posture).
- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing (compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome; it sometimes causes irreversible pigmentation).

Tetracycline hydrochloride 250 mg Tetracycline 250mg tablets | 28 tablet **[PoM]** £25.65 DT price = £2.44

2.1 Anthrax

Anthrax

Inhalation or gastro-intestinal anthrax should be treated initially with either ciprofloxacin p. 490 or, in patients over 12 years, doxycycline p. 496 [unlicensed indication] combined with one or two other antibacterials (such as amoxicillin p. 482, benzylpenicillin sodium p. 480, chloramphenicol p. 452, clarithromycin p. 470, clindamycin p. 467, imipenem with cilastatin p. 454, rifampicin p. 508 [unlicensed indication], and vancomycin p. 465). When the

condition improves and the sensitivity of the *Bacillus anthracis* strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

Cutaneous anthrax should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] for 7 days. Treatment may be switched to amoxicillin if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for *post-exposure prophylaxis*. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10-14 days if the strain of *B. anthracis* is susceptible. Vaccination against anthrax may allow the duration of antibacterial prophylaxis to be shortened.

2.2 Leprosy

Leprosy

Advice from a member of the Panel of Leprosy Opinion is essential for the treatment of leprosy (Hansen's disease). Details can be obtained from the Hospital for Tropical Diseases, London (telephone (020) 3456 7890).

The World Health Organization has made recommendations to overcome the problem of dapsone p. 500 resistance and to prevent the emergence of resistance to other antileprotic drugs. Drugs recommended are dapsone, rifampicin p. 508, and clofazimine p. 500. Other drugs with significant activity against *Mycobacterium leprae* include ofloxacin p. 494, minocycline p. 498 and clarithromycin p. 470, but none of these are as active as rifampicin; at present they should be reserved as second-line drugs for leprosy.

A three-drug regimen is recommended for *multibacillary leprosy* (lepromatous, borderline-lepromatous, and borderline leprosy) and a two-drug regimen for *paucibacillary leprosy* (borderline-tuberculoid, tuberculoid, and indeterminate).

Multibacillary leprosy should be treated with a combination of rifampicin, dapsone and clofazimine p. 500 for at least 2 years. Treatment should be continued unchanged during both type I (reversal) or type II (erythema nodosum leprosum) reactions. During reversal reactions neuritic pain or weakness can herald the rapid onset of permanent nerve damage. Treatment with prednisolone p. 585 should be instituted at once. Mild type II reactions may respond to aspirin. Severe type II reactions may require corticosteroids; thalidomide p. 798 [unlicensed] is also useful in patients who have become corticosteroid dependent, but it should be used only under **specialist supervision**. Thalidomide is teratogenic and, therefore, contra-indicated in pregnancy; it must **not** be given to women of child-bearing potential unless they comply with a pregnancy prevention programme. Increased doses of clofazimine are also useful.

Paucibacillary leprosy should be treated with rifampicin and dapsone for 6 months. If treatment is interrupted the regimen should be recommenced where it was left off to complete the full course.

Neither the multibacillary nor the paucibacillary antileprosy regimen is sufficient to treat tuberculosis.

ANTIMYCOBACTERIALS

Clofazimine

INDICATIONS AND DOSE

Multibacillary leprosy in combination with rifampicin and dapsone (3-drug regimen)

BY MOUTH

- ▶ Adult: 300 mg once a month, (supervised administration) and 50 mg daily, (self-administered), alternatively 100 mg once daily on alternate days, (self-administered)

Lepromatous lepra reactions

BY MOUTH

- ▶ Adult: Increased to 300 mg daily for max. 3 months

Severe type II (erythema nodosum leprosum) reactions

BY MOUTH

- ▶ Adult: Increased to 100 mg 3 times a day for the first month (with subsequent reductions), may take 4–6 weeks to attain full effect

- **CAUTIONS** Avoid if persistent abdominal pain and diarrhoea · may discolour soft contact lenses
- **SIDE-EFFECTS** Abdominal pain · acne-like eruptions · anorexia · bowel obstruction · brownish-black discoloration of lesions and skin including areas exposed to light · dimmed vision · dry eyes · dry skin · elevation of blood sugar · eosinophilic enteropathy · headache · lymphadenopathy · macular corneal pigmentation · nausea · photosensitivity · pruritus · rash · red discoloration of body fluids · red discoloration of faeces · red discoloration of urine · reversible hair discoloration · splenic infarction · subepithelial corneal pigmentation · tiredness · vomiting (hospitalise if persistent) · weight loss
- **PREGNANCY** Use with caution.
- **BREAST FEEDING** May alter colour of milk; skin discoloration of infant.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution.

● **MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

- **UNLICENSED USE** Not licensed for treatment of pneumocystis (*P. jirovecii*) pneumonia.
- **CAUTIONS** Anaemia (treat severe anaemia before starting) · avoid in Acute porphyrias p. 864 · cardiac disease · G6PD deficiency · pulmonary disease · susceptibility to haemolysis
- **INTERACTIONS** → Appendix 1 (dapsone).
- **SIDE-EFFECTS**
 - ▶ **Rare** Stevens-Johnson syndrome · toxic epidermal necrolysis
 - ▶ **Frequency not known** Agranulocytosis · allergic dermatitis · anorexia · dapsone syndrome · haemolysis · headache · hepatitis · insomnia · methaemoglobinemia · nausea · neuropathy · psychosis · tachycardia · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
Side-effects are dose-related and uncommon at doses used for leprosy.
Dapsone syndrome If dapsone syndrome occurs (rash with fever and eosinophilia)—discontinue immediately (may progress to exfoliative dermatitis, hepatitis, hypoalbuminaemia, psychosis and death).
- **PREGNANCY** Folic acid p. 836 (higher dose) should be given to mother throughout pregnancy; neonatal haemolysis and methaemoglobinemia reported in third trimester.
- **BREAST FEEDING** Haemolytic anaemia; although significant amount in milk, risk to infant very small unless infant is G6PD deficient.
- **PATIENT AND CARER ADVICE**
Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

BY MOUTH

- ▶ Adult (body-weight up to 35 kg): 50 mg daily, alternatively 1–2 mg/kg daily, may be self-administered
- ▶ Adult (body-weight 35 kg and above): 100 mg daily, may be self-administered

Dermatitis herpetiformis

BY MOUTH

- ▶ Adult: (consult product literature or local protocols)

Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (in combination with trimethoprim)

BY MOUTH

- ▶ Adult: 100 mg once daily

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia

BY MOUTH

- ▶ Adult: 100 mg daily

2.3 Lyme disease

Lyme disease

Lyme disease should generally be treated by those experienced in its management. Doxycycline p. 496, amoxicillin p. 482 [unlicensed indication] or cefuroxime p. 460 (as cefuroxime axetil) are the antibacterials of choice for early Lyme disease or Lyme arthritis. If these antibacterials are contra-indicated, a **macrolide** (e.g. clarithromycin p. 470) can be used for early Lyme disease. Intravenous administration of ceftriaxone p. 459, cefotaxime p. 457, or benzylpenicillin sodium p. 480 is recommended for Lyme disease associated with cardiac or neurological complications. The duration of treatment is usually 2–4 weeks; Lyme arthritis may require further treatment.

2.4 Methicillin-resistant staphylococcus aureus

MRSA

Infection from *Staphylococcus aureus* strains resistant to methicillin [now discontinued] (methicillin-resistant *Staph. aureus*, MRSA) and to flucloxacillin p. 486 can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

Rifampicin p. 508 or fusidic acid p. 463 should **not** be used alone because resistance may develop rapidly. A **tetracycline** alone or a combination of rifampicin and fusidic acid can be used for *skin* and *soft-tissue infections* caused by MRSA; clindamycin p. 467 alone is an alternative. A **glycopeptide** (e.g. vancomycin p. 465) can be used for severe skin and soft-tissue infections associated with MRSA; if a glycopeptide is unsuitable, linezolid p. 477 can be used on expert advice. As linezolid is **not** active against Gram-negative organisms, it can be used for mixed skin and soft-tissue infections only when other treatments are not available; linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms. A combination of a glycopeptide and fusidic acid or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial.

Tigecycline p. 466 and daptomycin p. 468 are licensed for the treatment of complicated skin and soft-tissue infections involving MRSA.

A **tetracycline** or clindamycin can be used for *bronchiectasis* caused by MRSA. A **glycopeptide** can be used for *pneumonia* associated with MRSA; if a glycopeptide is unsuitable, linezolid can be used on expert advice. Linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms.

A **tetracycline** can be used for *urinary-tract infections* caused by MRSA; trimethoprim p. 462 or nitrofurantoin p. 512 are alternatives. A **glycopeptide** can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A **glycopeptide** can be used for *septicaemia* associated with MRSA.

See the management of *endocarditis*, *osteomyelitis*, or *septic arthritis* associated with MRSA.

Prophylaxis with vancomycin p. 465 or teicoplanin p. 464 (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection without documented eradication;
- there is a risk that the patient's MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

See eradication of nasal carriage of MRSA in Nose p. 980.

2.5 Tuberculosis

Tuberculosis

Tuberculosis is treated in two phases—an *initial phase* using 4 drugs and a *continuation phase* using 2 drugs in fully sensitive cases. Treatment requires specialised knowledge and supervision, particularly where the disease involves resistant organisms or non-respiratory organs.

There are two regimens recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen should be used; the two regimens should **not** be used concurrently. Compliance with therapy is a major determinant of its success.

Initial phase

The concurrent use of 4 drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as combination preparations unless one of the components cannot be given because of resistance or intolerance. The treatment of choice for the initial phase is the daily use of isoniazid p. 506, rifampicin p. 508, pyrazinamide p. 506 and ethambutol hydrochloride p. 505. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for 2 months. Where a positive culture for *M. tuberculosis* has been obtained, but susceptibility results are not available after 2 months, treatment with rifampicin, isoniazid, pyrazinamide and ethambutol hydrochloride should be continued until full susceptibility is confirmed, even if this is for longer than 2 months.

Streptomycin p. 451 is rarely used in the UK but it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced.

Continuation phase

After the initial phase, treatment is continued for a further 4 months with isoniazid with rifampicin p. 510 (preferably given as a combination preparation). Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

Unsupervised treatment

The unsupervised treatment regimen should be used for patients who are likely to take antituberculous drugs reliably **without supervision**. Patients who are unlikely to comply with daily administration of antituberculous drugs should be treated with the regimen described under Supervised Treatment.

Pregnancy and breast-feeding

The standard unsupervised 6-month treatment regimen may be used during pregnancy. Streptomycin should not be given in pregnancy.

The standard unsupervised 6-month treatment regimen may be used during breast-feeding.

Supervised treatment

Drug administration needs to be **fully supervised** (directly observed therapy, DOT) in patients who cannot comply reliably with the treatment regimen. These patients are given isoniazid, rifampicin, pyrazinamide and ethambutol hydrochloride (or streptomycin) 3 times a week under supervision for the first 2 months followed by isoniazid and rifampicin 3 times a week for a further 4 months.

Immunocompromised patients

Multi-resistant *Mycobacterium tuberculosis* may be present in immunocompromised patients. The organism should always be cultured to confirm its type and drug sensitivity. Confirmed *M. tuberculosis* infection sensitive to first-line drugs should be treated with a standard 6-month regimen; after completing treatment, patients should be closely monitored. The regimen may need to be modified if

Recommended dosage for standard unsupervised 6-month treatment*2-month initial phase*

---	--

infection is caused by resistant organisms, and specialist advice is needed.

Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis in a HIV-positive individual; care is required in choosing the regimen and in avoiding potentially serious interactions. Starting antiretroviral treatment in the first 2 months of antituberculosis treatment increases the risk of immune reconstitution syndrome.

Infection may also be caused by other mycobacteria e.g. *M. avium* complex in which case specialist advice on management is needed.

Corticosteroids

In meningeal or pericardial tuberculosis, a corticosteroid should be started at the same time as antituberculosis therapy.

Prevention of tuberculosis

Some individuals may develop tuberculosis owing to reactivation of previously latent disease. Chemoprophylaxis may be required in those who have evidence of latent tuberculosis and are receiving treatment with immunosuppressants (including cytotoxics and possibly long-term treatment with systemic corticosteroids). In these cases, chemoprophylaxis involves use of either isoniazid alone for 6 months or of isoniazid and rifampicin for 3 months; longer chemoprophylaxis is not recommended.

See prevention of tuberculosis in susceptible close contacts or those who have become tuberculin-positive. See advice on immunisation against tuberculosis.

Treatment failure

Major causes of treatment failure are incorrect prescribing by the physician and inadequate compliance by the patient. Monthly tablet counts and urine examination (rifampicin imparts an orange-red coloration) may be useful indicators of compliance with treatment. Avoid both excessive and inadequate dosage. Treatment should be supervised by a specialist physician.

Antituberculosis drugs

Isoniazid is cheap and highly effective. Like rifampicin it should always be included in any antituberculous regimen unless there is a specific contra-indication.

Rifampicin, a rifamycin, is a key component of any antituberculous regimen. Like isoniazid it should always be included unless there is a specific contra-indication.

During the first two months ('initial phase') of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease.

On intermittent treatment six toxicity syndromes have been recognised—influenza-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in 20 to 30% of patients.

Rifabutin, another rifamycin, is indicated for *prophylaxis* against *M. avium* complex infections in patients with a low CD4 count; it is also licensed for the *treatment* of non-tuberculous mycobacterial disease and pulmonary tuberculosis.

Pyrazinamide is a bactericidal drug only active against intracellular dividing forms of *Mycobacterium tuberculosis*; it exerts its main effect only in the first two or three months. It is particularly useful in tuberculous meningitis because of good meningeal penetration. It is not active against *M. bovis*.

Ethambutol hydrochloride is included in a treatment regimen if isoniazid resistance is suspected; it can be omitted if the risk of resistance is low.

Streptomycin [unlicensed] is now rarely used in the UK except for resistant organisms.

Drug-resistant tuberculosis should be treated by a specialist physician with experience in such cases, and where appropriate facilities for infection-control exist. Second-line drugs available for infections caused by resistant organisms, or when first-line drugs cause unacceptable side-effects, include **aminosalicylic acid below**, **amikacin p. 450**, **capreomycin p. 504**, **cycloserine p. 504**, newer macrolides (e.g. **azithromycin p. 469** and **clarithromycin p. 470**), **moxifloxacin p. 492** and protonamide (prothionamide; no longer on UK market). **Bedaquiline below** and **delamanid p. 504** are licensed for the treatment of multiple-drug resistant pulmonary tuberculosis. Bedaquiline has a long half-life.

Management of tuberculosis in children

Children are given isoniazid, rifampicin, pyrazinamide, and ethambutol hydrochloride for the first 2 months followed by isoniazid and rifampicin during the next 4 months. However, care is needed in young children receiving ethambutol hydrochloride because of the difficulty in testing eyesight and in obtaining reports of visual symptoms.

Drugs used for Tuberculosis not listed below;
Streptomycin, p. 451

ANTIMYCOBACTERIALS

Aminosalicylic acid

INDICATIONS AND DOSE

Multiple-drug resistant tuberculosis, in combination with other drugs

BY MOUTH

- ▶ Adult: 4 g every 8 hours for a usual treatment duration of 24 months; maximum 12 g per day

Desensitisation regimen

BY MOUTH

- ▶ Adult: (consult product literature)

- **CAUTIONS** Peptic ulcer
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · bloating · diarrhoea · nausea · rash · vestibular syndrome · vomiting
- ▶ **Uncommon** Anorexia
- ▶ **Rare** Gastrointestinal bleeding · hypothyroidism · jaundice · malabsorption syndrome · metallic taste · peptic ulcer · urticaria
- ▶ **Very rare** Agranulocytosis · anaemia · crystalluria · dizziness · headache · hypoglycaemia · leucopenia · methemoglobinaemia · peripheral neuropathy · purpura · tendon pain · thrombocytopenia · visual abnormalities · weight loss
- ▶ **Frequency not known** Hepatitis · hypersensitivity

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies (highest risk during first trimester).
- **BREAST FEEDING** Present in milk—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment due to accumulation of inactive metabolites.
- **MONITORING REQUIREMENTS**
- ▶ Monitor for hypersensitivity reaction during the first 3 months of treatment—for desensitisation dosing regimen consult product literature.
- ▶ Monitor liver function—discontinue immediately if signs or symptoms of hepatic toxicity (including rash, fever and gastrointestinal disturbance).
- **DIRECTIONS FOR ADMINISTRATION** Disperse granules in orange or tomato juice and take immediately (granules will not dissolve, ensure all granules are swallowed). Granules can be sprinkled on apple sauce or yoghurt for administration.
- **PATIENT AND CARER ADVICE** Patients should be advised that the skeletons of the granules may be seen in the stools. Counselling advised on administration.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant granules

CAUTIONARY AND ADVISORY LABELS 9, 25

▶ Granupas (Lucane Pharma Ltd)

Aminosalicylic acid 1 gram per 1 gram Granupas gastro-resistant granules 4g sachets (sugar-free) | 30 sachet (PoM) £331.00

Bedaquiline

INDICATIONS AND DOSE

Multiple-drug resistant pulmonary tuberculosis, in combination with other drugs

BY MOUTH

- ▶ Adult: Initially 400 mg once daily for 2 weeks, then 200 mg 3 times a week for 22 weeks, intervals of at least 48 hours between each dose, continue appropriate combination therapy after bedaquiline

- **CONTRA-INDICATIONS** QTc interval more than 500 milliseconds (derived using Fridericia's formula) · ventricular arrhythmia
- **CAUTIONS** Hypothyroidism · QTc interval (derived using Fridericia's formula) 450–500 milliseconds—discontinue if QTc interval more than 500 milliseconds · risk factors for QT interval prolongation (e.g. electrolyte disturbances, heart failure with reduced left ventricular ejection fraction, history of symptomatic arrhythmias (avoid if ventricular arrhythmia present), bradycardia, congenital long QT syndrome)
- **INTERACTIONS** → Appendix 1 (bedaquiline). Caution with concomitant use of hepatotoxic drugs.
- **SIDE-EFFECTS** Arthralgia · diarrhoea · dizziness · headache · myalgia · nausea · QT interval prolongation · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
- Syncope** If syncope occurs, obtain ECG.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment—no

information available. Avoid concomitant use of hepatotoxic drugs unless essential.

- **RENAL IMPAIRMENT** Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**

- ▶ Determine serum potassium, calcium, and magnesium before starting treatment (correct if abnormal)—remeasure if QT prolongation occurs during treatment.
- ▶ Obtain ECG before starting treatment, and then at least monthly during treatment or more frequently if concomitant use with other drugs known to prolong the QT interval.
- ▶ Monitor liver function before starting treatment and then at least monthly during treatment—discontinue treatment if severe abnormalities in liver function tests.

- **PATIENT AND CARER ADVICE** Dizziness may affect performance of skilled tasks (e.g. driving)

Missed doses If a dose is missed during the first two weeks of treatment, the missed dose should not be taken and the next dose should be taken at the usual time; if a dose is missed during weeks 3–24 of treatment, the missed dose should be taken as soon as possible and then the usual regimen resumed.

Delamanid

INDICATIONS AND DOSE

Multiple-drug resistant pulmonary tuberculosis, in combination with other drugs

BY MOUTH

- ▶ Adult: 100 mg twice daily for 24 weeks, continue appropriate combination therapy after delamanid

- **CONTRA-INDICATIONS** QTc interval more than 500 milliseconds (derived using Fridericia's formula) · serum albumin less than 28 g/litre
- **CAUTIONS** Risk factors for QT interval prolongation (e.g. electrolyte disturbances, acute myocardial infarction, heart failure with reduced left ventricular ejection fraction, severe hypertension, left ventricular hypertrophy, bradycardia, congenital long QT syndrome, history of symptomatic arrhythmias)
- **INTERACTIONS** → Appendix 1 (delamanid).

Caution when concomitant use with other drugs known to prolong the QT interval. Contra-indicated with concomitant use of potent CYP3A4 inducers.

● SIDE-EFFECTS

▶ **Common or very common** Abdominal pain · acne · agitation · anxiety · chest pain · cough · decreased appetite · depression · dermatitis · dyspepsia · dyspnoea · earache · haemoptysis · headache · hyperhidrosis · hyperlipidaemia · hypertension · hypokalaemia · hypotension · insomnia · malaise · nausea · oropharyngeal pain · osteochondrosis · palpitation · peripheral neuropathy · photophobia · psychiatric disorder · QT interval prolongation · reticulocytosis · tinnitus · tremor · vomiting

▶ **Uncommon** Arrhythmias · balance disorder · dehydration · dysphagia · herpes zoster · hypocalcaemia · leucopenia · nocturia · rash · thrombocytopenia · urinary retention

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

● **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.

● **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

● MONITORING REQUIREMENTS

▶ Monitor serum albumin and electrolytes before starting treatment and then during treatment—discontinue treatment if serum albumin less than 28 g/litre.

▶ Obtain ECG before starting treatment and then monthly during treatment (more frequently if serum albumin 28–34 g/litre, or if concomitant use of potent CYP3A4 inhibitors, or if risk factors for QT interval prolongation, or if QTc interval 450–500 milliseconds in men or 470–500 milliseconds in women)—discontinue treatment if QTc interval more than 500 milliseconds (derived using Fridericia's formula).

● **HANDLING AND STORAGE** Dispense in original container (contains desiccant).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 8, 21

▶ **Deltyba** (Otsuka Novel Products GmbH) ▼
Delamanid 50 mg Deltyba 50mg tablets | 48 tablet PoM £1,250.00

CAUTIONS, FURTHER INFORMATION

Understanding warnings Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.

● **INTERACTIONS** → Appendix 1 (ethambutol).

● SIDE-EFFECTS

▶ **Rare** Pruritus · rash · thrombocytopenia · urticaria

▶ **Frequency not known** Colour blindness · loss of visual acuity · optic neuritis · peripheral neuritis · red/green colour blindness · restriction of visual fields · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Ocular toxicity Ocular toxicity is more common where excessive dosage is used or if the patient's renal function is impaired. Early discontinuation of the drug is almost always followed by recovery of eyesight.

● **PREGNANCY** Not known to be harmful.

● **BREAST FEEDING** Amount too small to be harmful.

● RENAL IMPAIRMENT

Risk of optic nerve damage. Should preferably be avoided in patients with renal impairment.

If creatinine clearance less than 30 mL/minute, monitor plasma-ethambutol concentration.

▶ In adults If creatinine clearance less than 30 mL/minute, use 15–25 mg/kg (max. 2.5 g) 3 times a week.

▶ In children If creatinine clearance less than 30 mL/minute/1.73 m², use 15–25 mg/kg (max. 2.5 g) 3 times a week.

● MONITORING REQUIREMENTS

▶ 'Peak' concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre); 'trough' (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre).

▶ Renal function should be checked before treatment.

▶ Visual acuity should be tested by Snellen chart before treatment with ethambutol.

▶ In young children, routine ophthalmological monitoring recommended.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Ethambutol for the treatment of tuberculosis www.medicinesforchildren.org.uk/ethambutol-for-the-treatment-of-tuberculosis

Ocular toxicity The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice.

● MEDICINAL FORMS

Ethambutol hydrochloride

INDICATIONS AND DOSE

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

BY MOUTH

▶ Child: 20 mg/kg once daily for 2 months (initial phase)

▶ Adult: 15 mg/kg once daily for 2 months (initial phase)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

BY MOUTH

▶ Child: 30 mg/kg 3 times a week for 2 months (initial phase)

▶ Adult: 30 mg/kg 3 times a week for 2 months (initial phase)

● **CONTRA-INDICATIONS** Optic neuritis · poor vision

● **CAUTIONS** Elderly · young children

Isoniazid

INDICATIONS AND DOSE

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

BY MOUTH OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- ▶ Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)
- ▶ Adult: 300 mg daily for 6 months (initial and continuation phases)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

BY MOUTH OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- ▶ Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
- ▶ Adult: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive

BY MOUTH OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- ▶ Child 1 month-11 years: 10 mg/kg daily (max. per dose 300 mg) for 6 months, alternatively 10 mg/kg daily (max. per dose 300 mg) for 3 months, to be taken in combination with rifampicin
- ▶ Child 12-17 years: 300 mg daily for 6 months, alternatively 300 mg daily for 3 months, to be taken in combination with rifampicin
- ▶ Adult: 300 mg daily for 6 months, alternatively 300 mg daily for 3 months, to be taken in combination with rifampicin

- **CONTRA-INDICATIONS** Drug-induced liver disease

- **CAUTIONS** Acute porphyrias p. 864 · alcohol dependence · diabetes mellitus · epilepsy · history of psychosis · HIV infection · malnutrition · slow acetylator status (increased risk of side-effects)

CAUTIONS, FURTHER INFORMATION

Peripheral neuropathy Peripheral neuropathy is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection. In patients at increased risk of peripheral neuropathy, pyridoxine hydrochloride p. 882 should be given prophylactically from the start of treatment.

- **INTERACTIONS** → Appendix 1 (isoniazid).

When used with tyramine or histamine rich foods, tachycardia, palpitation, hypotension, flushing, headache, dizziness, and sweating reported.

● SIDE-EFFECTS

- ▶ **Common or very common** Peripheral neuropathy
- ▶ **Rare** Hepatitis · psychotic episodes
- ▶ **Frequency not known** Agranulocytosis · aplastic anaemia · blood disorders · constipation · convulsions · difficulty with micturition · dry mouth · fever · gynaecomastia · haemolytic anaemia · hearing loss (in patients with end-stage renal impairment) · hyperglycaemia · hyperreflexia · hypersensitivity reactions · interstitial pneumonitis · nausea · optic neuritis · pancreatitis · pellagra · peripheral neuritis with high doses · purpura · Stevens-Johnson syndrome · systemic lupus erythematosus-like syndrome · tinnitus (in patients with end-stage renal impairment) · vertigo · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Hepatitis Hepatitis more common in those aged over 35 years.

- **PREGNANCY** Not known to be harmful; prophylactic pyridoxine recommended.

- **BREAST FEEDING** Theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother. In breast-feeding, monitor infant for possible toxicity.

- **HEPATIC IMPAIRMENT** Use with caution. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months.

- **RENAL IMPAIRMENT** Risk of ototoxicity and peripheral neuropathy; prophylactic pyridoxine hydrochloride p. 882 recommended.

● MONITORING REQUIREMENTS

- ▶ Renal function should be checked before treatment.
- ▶ Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.
- ▶ Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months.

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ In children In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may need to be recalculated to allow for weight gain in younger children.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Isoniazid for latent tuberculosis www.medicinesforchildren.org.uk/isoniazid-for-latent-tuberculosis

Medicines for Children leaflet: Isoniazid for treatment of tuberculosis www.medicinesforchildren.org.uk/isoniazid-for-the-treatment-of-tuberculosis

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

INDICATIONS AND DOSE

Tuberculosis in combination with other drugs (standard unsupervised 6-month treatment)

BY MOUTH

- ▶ Child (body-weight up to 50 kg): 35 mg/kg once daily for 2 months (initial phase); maximum 1.5 g per day
- ▶ Child (body-weight 50 kg and above): 35 mg/kg once daily for 2 months (initial phase); maximum 2 g per day
- ▶ Adult (body-weight up to 50 kg): 1.5 g once daily for 2 months (initial phase)
- ▶ Adult (body-weight 50 kg and above): 2 g once daily for 2 months (initial phase)

Tuberculosis in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

BY MOUTH

- ▶ Child (body-weight up to 50 kg): 50 mg/kg 3 times a week (max. per dose 2 g 3 times a week) for 2 months (initial phase)
- ▶ Child (body-weight 50 kg and above): 50 mg/kg 3 times a week (max. per dose 2.5 g 3 times a week) for 2 months (initial phase)
- ▶ Adult (body-weight up to 50 kg): 2 g 3 times a week for 2 months (initial phase)
- ▶ Adult (body-weight 50 kg and above): 2.5 g 3 times a week for 2 months (initial phase)

- **CONTRA-INDICATIONS** Acute attack of gout
- **CAUTIONS** Diabetes · gout
- **INTERACTIONS** → Appendix 1 (pyrazinamide).
- **SIDE-EFFECTS** Anorexia · arthralgia · dysuria · fever · flushing · hepatomegaly · hepatotoxicity · jaundice · liver failure · nausea · photosensitivity · rash · sideroblastic anaemia · splenomegaly · thrombocytopenia · vomiting
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Idiosyncratic hepatotoxicity more common; avoid in severe hepatic impairment. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months.
- **RENAL IMPAIRMENT**
Monitor for gout in renal impairment.
 - ▶ In adults 25–30 mg/kg 3 times a week if eGFR less than 30 mL/minute/1.73 m².
 - ▶ In children If estimated glomerular filtration rate less than 30 mL/minute/1.73 m², use 25–30 mg/kg 3 times a week.
- **MONITORING REQUIREMENTS**
 - ▶ Renal function should be checked before treatment.
 - ▶ Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.
 - ▶ Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months.

NITROIMIDAZO-OXAZOLE ANTIBACTERIALS**RIFAMYCINS****Rifabutin****INDICATIONS AND DOSE**

Prophylaxis of *Mycobacterium avium* complex infections in immunosuppressed patients with low CD4 count

BY MOUTH

- ▶ Adult: 300 mg once daily, also consult product literature

Treatment of non-tuberculous mycobacterial disease, in combination with other drugs

BY MOUTH

- ▶ Adult: 450–600 mg once daily for up to 6 months after cultures negative

Treatment of pulmonary tuberculosis, in combination with other drugs

BY MOUTH

- ▶ Adult: 150–450 mg once daily for at least 6 months

- **CAUTIONS** Acute porphyrias p. 864 · discolours soft contact lenses
- **INTERACTIONS** → Appendix 1 (rifamycins).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · blood disorders · leucopenia · myalgia · nausea · pyrexia · rash · thrombocytopenia
 - ▶ **Uncommon** Arthralgia · body secretions coloured orange-red · bronchospasm · corneal deposits · eosinophilia · hypersensitivity reactions · jaundice · raised liver enzymes · saliva coloured orange-red · skin coloured orange-red · urine coloured orange-red · uveitis (especially following high doses or concomitant use with drugs that increase plasma concentration) · vomiting
 - ▶ **Rare** Haemolysis
 - ▶ **Frequency not known** Chest pain · dyspnoea · hepatitis · influenza-like symptoms
- **SIDE-EFFECTS, FURTHER INFORMATION**
Discontinue permanently if serious side-effects develop.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifamycin hypersensitivity.
- **CONCEPTION AND CONTRACEPTION**
Important Rifabutin induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced; alternative family planning advice should be offered.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Reduce dose in severe impairment. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.
- **RENAL IMPAIRMENT** Use half normal dose if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - ▶ Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months. Blood counts should also be monitored in these patients.

- ▶ Renal function should be checked before treatment.
- ▶ Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, hepatic function should be monitored on prolonged therapy.
- ▶ Blood counts should be monitored on prolonged therapy.
- **PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.
- **PATIENT AND CARER ADVICE**
Soft contact lenses Patients or their carers should be advised that rifabutin discolours soft contact lenses.
Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

- ▶ Adult (body-weight 50 kg and above): 600 mg daily for 3 months

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant

BY MOUTH

- ▶ Child 1 month-11 years (body-weight up to 50 kg): 15 mg/kg daily for 6 months; maximum 450 mg per day
- ▶ Child 1 month-11 years (body-weight 50 kg and above): 15 mg/kg daily for 6 months; maximum 600 mg per day
- ▶ Child 12-17 years (body-weight up to 50 kg): 450 mg daily for 6 months
- ▶ Child 12-17 years (body-weight 50 kg and above): 600 mg daily for 6 months

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant and under 35 years

BY MOUTH

- ▶ Adult 18-34 years (body-weight up to 50 kg): 450 mg daily for 6 months
- ▶ Adult 18-34 years (body-weight 50 kg and above): 600 mg daily for 6 months

Prevention of secondary case of Haemophilus influenzae type b disease

BY MOUTH

- ▶ Child 1-2 months: 10 mg/kg once daily for 4 days
- ▶ Child 3 months-11 years: 20 mg/kg once daily (max. per dose 600 mg) for 4 days
- ▶ Child 12-17 years: 600 mg once daily for 4 days
- ▶ Adult: 600 mg once daily for 4 days

Prevention of secondary case of meningococcal meningitis

BY MOUTH

- ▶ Child 1-11 months: 5 mg/kg every 12 hours for 2 days
- ▶ Child 1-11 years: 10 mg/kg every 12 hours (max. per dose 600 mg), for 2 days
- ▶ Child 12-17 years: 600 mg every 12 hours for 2 days
- ▶ Adult: 600 mg every 12 hours for 2 days

Multibacillary leprosy in combination with dapsone and clofazimine (3-drug regimen) | Paucibacillary leprosy in combination with dapsone (2-drug regimen)

BY MOUTH

- ▶ Adult (body-weight up to 35 kg): 450 mg once a month, supervised administration
- ▶ Adult (body-weight 35 kg and above): 600 mg once a month, supervised administration

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 · jaundice

- **CAUTIONS** Discolours soft contact lenses

- **INTERACTIONS** → Appendix 1 (rifamycins).

Rifampicin induces hepatic enzymes which accelerate the metabolism of several drugs including oestrogens,

corticosteroids, phenytoin, sulfonyleureas, and anticoagulants.

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Acute renal failure · adrenal insufficiency · alterations of liver function · anorexia · antibiotic-associated colitis · body secretions coloured orange-red · collapse and shock · diarrhoea · disseminated intravascular coagulation · drowsiness · eosinophilia · exfoliative dermatitis · flushing · gastro-intestinal symptoms · haemolytic anaemia · headache · influenza-like symptoms (with chills, fever, dizziness, bone pain) · jaundice · leucopenia · menstrual disturbances · muscular weakness · myopathy · nausea · oedema · pemphigoid reactions · psychoses · rashes · respiratory symptoms · saliva coloured orange-red · shortness of breath · Stevens-Johnson syndrome · thrombocytopenic purpura · toxic epidermal necrolysis · urine coloured orange-red · urticaria · vomiting

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Thrombophlebitis reported if infusion used for prolonged period

SIDE-EFFECTS, FURTHER INFORMATION

Discontinue permanently if serious side-effects develop. Intermittent therapy Side-effects that mainly occur with intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifamycin hypersensitivity.

● CONCEPTION AND CONTRACEPTION

Important Effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered.

- **PREGNANCY** Manufacturers advise very high doses teratogenic in *animal* studies in first trimester; risk of neonatal bleeding may be increased in third trimester.

- **BREAST FEEDING** Amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Impaired elimination. Avoid or do not exceed 8 mg/kg daily. In patients with pre-existing liver disease or hepatic impairment, monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.

● RENAL IMPAIRMENT

- ▶ In children Use with caution if doses above 10 mg/kg daily.
- ▶ In adults Use with caution if dose above 600 mg daily.

● MONITORING REQUIREMENTS

- ▶ Renal function should be checked before treatment.
- ▶ Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, liver function should be monitored on prolonged therapy.
- ▶ Blood counts should be monitored in patients on prolonged therapy.
- ▶ Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months. Blood counts should also be monitored in these patients.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use in adults For *intravenous infusion* (*Rifadin*[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute with solvent provided then dilute with 500 mL infusion fluid; give over 2–3 hours.

- ▶ With intravenous use in children Displacement value may be significant, consult local reconstitution guidelines; reconstitute with solvent provided. May be further diluted with Glucose 5% or Sodium chloride 0.9% to a final concentration of 1.2 mg/mL. Infuse over 2–3 hours.

- **PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.

- ▶ With oral use in children In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children. Flavours of syrup may include raspberry.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Rifampicin for meningococcal prophylaxis www.medicinesforchildren.org.uk/rifampicin-for-meningococcal-prophylaxis

Medicines for Children leaflet: Rifampicin for the treatment of tuberculosis www.medicinesforchildren.org.uk/rifampicin-for-treatment-of-tuberculosis

Soft contact lenses Patients or their carers should be advised that rifampicin discolours soft contact lenses.

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

2.6 Urinary tract infections

Urinary-tract infections

Urinary-tract infection is more common in women than in men; when it occurs in men there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage.

Escherichia coli is the most common cause of urinary-tract infection; *Staphylococcus saprophyticus* is also common in sexually active young women. Less common causes include *Proteus* and *Klebsiella* spp. *Pseudomonas aeruginosa* infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. *Staphylococcus epidermidis* and *Enterococcus faecalis* infection may complicate catheterisation or instrumentation.

A specimen of urine should be collected for culture and sensitivity testing before starting antibacterial therapy;

- in men;
- in pregnant women;
- in children under 3 years of age;
- in patients with suspected upper urinary-tract infection;
- complicated infection, or recurrent infection;
- if resistant organisms are suspected;
- if urine dipstick testing gives a single positive result for leucocyte esterase or nitrite;
- if clinical symptoms are not consistent with results of dipstick testing.

Treatment should not be delayed while waiting for results. The antibacterial chosen should reflect current local bacterial sensitivity to antibacterials.

Antibacterial therapy for lower urinary-tract infections

Uncomplicated lower urinary-tract infections often respond to trimethoprim p. 462 or nitrofurantoin p. 512, or alternatively, amoxicillin p. 482, ampicillin p. 483 or oral cephalosporin.

Suggested duration of treatment is 7 days, but a short course (e.g. 3 days) is usually adequate for uncomplicated urinary-tract infections in women.

Infections caused by fully sensitive bacteria respond to amoxicillin.

Widespread bacterial resistance to ampicillin, amoxicillin, and trimethoprim has been reported. Alternatives for resistant organisms include co-amoxiclav p. 484 (amoxicillin with clavulanic acid), an oral cephalosporin, nitrofurantoin, pivmecillinam hydrochloride p. 486, or a quinolone.

Fosfomycin [unlicensed] can be used, on the advice of a microbiologist, for the treatment of uncomplicated lower urinary-tract infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used.

Long-term low dose therapy may be required in selected patients to prevent *recurrence of infection*; indications include frequent relapses and significant kidney damage. Trimethoprim, nitrofurantoin and cefalexin p. 456 have been recommended for long-term therapy.

Methenamine hippurate below (hexamine hippurate) should **not** generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections.

Antibacterial therapy for upper urinary-tract infections

Acute pyelonephritis can lead to septicaemia and is treated initially by injection of a broad-spectrum antibacterial such as a cephalosporin (e.g. cefuroxime p. 460) or a quinolone if the patient is severely ill; gentamicin p. 450 can also be used.

Suggested duration of treatment is 10–14 days (longer treatment may be necessary in complicated pyelonephritis).

Prostatitis can be difficult to cure and requires treatment for several weeks with an antibacterial which penetrates prostatic tissue such as some of the quinolones (ciprofloxacin p. 490 or ofloxacin p. 494), or alternatively, trimethoprim.

Suggested duration of treatment is 28 days.

Where infection is localised and associated with an indwelling *catheter*, a bladder instillation is often effective.

Pregnancy

Urinary-tract infection in pregnancy may be asymptomatic and requires prompt treatment to prevent progression to acute pyelonephritis. Penicillins and cephalosporins are suitable for treating urinary-tract infection during pregnancy. Nitrofurantoin may also be used but it should be avoided at term. Sulfonamides and quinolones should be avoided during pregnancy; trimethoprim should also preferably be avoided particularly in the first trimester.

Renal impairment

In renal failure antibacterials normally excreted by the kidney accumulate with resultant toxicity unless the dose is reduced. This applies especially to the aminoglycosides which should be used with great caution; tetracyclines,

methenamine hippurate, and nitrofurantoin should be avoided altogether.

Urinary-tract infections in children

Urinary-tract infections in children require prompt antibacterial treatment to minimise the risk of renal scarring. Uncomplicated 'lower' urinary-tract infections in *children over 3 months of age* can be treated with trimethoprim, nitrofurantoin, a first generation cephalosporin (e.g. cefalexin), or amoxicillin for 3 days; children should be reassessed if they continue to be unwell 24–48 hours after the initial assessment. Amoxicillin should only be used if the organism causing the infection is sensitive to it.

Acute pyelonephritis in children over 3 months of age can be treated with a first generation cephalosporin or co-amoxiclav for 7–10 days. If the patient is severely ill, then the infection is best treated initially by injection of a broad-spectrum antibacterial such as cefotaxime or co-amoxiclav; gentamicin is an alternative.

Children under 3 months of age should be transferred to hospital and treated initially with intravenous antibacterial drugs such as ampicillin with gentamicin, or cefotaxime alone, until the infection responds; full doses of oral antibacterials are then given for a further period.

Recurrent episodes of infection are an indication for imaging tests. *Antibacterial prophylaxis* with low doses of trimethoprim or nitrofurantoin may be considered for children with recurrent infection, significant urinary-tract anomalies, or significant kidney damage.

Methenamine hippurate (Hexamine hippurate)

INDICATIONS AND DOSE

Prophylaxis and long-term treatment of chronic or recurrent uncomplicated lower urinary-tract infections

BY MOUTH

▶ Adult: 1 g every 12 hours

Prophylaxis and long-term treatment of chronic or recurrent uncomplicated lower urinary-tract infections in patients with catheters

BY MOUTH

▶ Adult: 1 g every 8–12 hours

- **CONTRA-INDICATIONS** Gout · metabolic acidosis · severe dehydration
- **INTERACTIONS** → Appendix 1 (methenamine). Caution—avoid concurrent administration with sulfonamides (risk of crystalluria) or urinary alkalinising agents.
- **SIDE-EFFECTS** Bladder irritation · gastro-intestinal disturbances · rash
- **PREGNANCY** Use with caution.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 10 mL/minute/1.73 m²—risk of hippurate crystalluria.
- **LESS SUITABLE FOR PRESCRIBING** Methenamine (hexamine) hippurate should **not** generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections. It is considered less suitable for prescribing.
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9

▶ **Hiprex** (Meda Pharmaceuticals Ltd)

Methenamine hippurate 1 gram Hiprex 1g tablets | 60 tablet [P]
 £19.74 DT price = £19.74

Nitrofurantoin**INDICATIONS AND DOSE****Acute uncomplicated urinary-tract infections**

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 3 months–11 years: 750 micrograms/kg 4 times a day for 3–7 days
- ▶ Child 12–17 years: 50 mg 4 times a day for 3–7 days
- ▶ Adult: 50 mg 4 times a day for 3–7 days

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Child 12–17 years: 100 mg twice daily, dose to be taken with food
- ▶ Adult: 100 mg twice daily, dose to be taken with food

Severe chronic recurrent urinary-tract infections

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 12–17 years: 100 mg 4 times a day for 3–7 days
- ▶ Adult: 100 mg 4 times a day for 7 days, dose to be taken with food, reduce dose or discontinue treatment if severe nausea occurs

Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 3 months–11 years: 1 mg/kg once daily, dose to be taken at night
- ▶ Child 12–17 years: 50–100 mg once daily, dose to be taken at night
- ▶ Adult: 50–100 mg once daily, dose to be taken at night

Genito-urinary surgical prophylaxis

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 100 mg twice daily on day of procedure and for 3 days after

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 · G6PD deficiency · infants less than 3 months old
- **CAUTIONS** Anaemia · diabetes mellitus · electrolyte imbalance · folate deficiency · pulmonary disease · susceptibility to peripheral neuropathy · urine may be coloured yellow or brown · vitamin B deficiency
- **INTERACTIONS** → Appendix 1 (nitrofurantoin).
- **SIDE-EFFECTS**
- ▶ **Rare** Agranulocytosis · aplastic anaemia · arthralgia · benign intracranial hypertension · blood disorders · cholestatic jaundice · erythema multiforme · exfoliative dermatitis · hepatitis · pancreatitis · thrombocytopenia · transient alopecia
- ▶ **Frequency not known** Acute pulmonary reactions · anaphylaxis · angioedema · anorexia · chronic pulmonary reactions (pulmonary fibrosis reported; possible association with lupus erythematosus-like syndrome) · diarrhoea · hypersensitivity reactions · nausea · peripheral neuropathy · pruritus · rash · sialadenitis · urticaria · vomiting
- **PREGNANCY** Avoid at term—may produce neonatal haemolysis.
- **BREAST FEEDING** Avoid; only small amounts in milk but enough to produce haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Use with caution; cholestatic jaundice and chronic active hepatitis reported.
- **RENAL IMPAIRMENT** Risk of peripheral neuropathy; antibacterial efficacy depends on renal secretion of the drug into urinary tract.

- ▶ In adults Avoid if eGFR less than 45 mL/minute/1.73 m²; may be used with caution if eGFR 30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.

- ▶ In children Avoid if estimated glomerular filtration rate less than 45 mL/minute/1.73 m²; may be used with caution if estimated glomerular filtration rate 30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.

- **MONITORING REQUIREMENTS** On long-term therapy, monitor liver function and monitor for pulmonary symptoms, especially in the elderly (discontinue if deterioration in lung function).

- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances).

3 Fungal infection**Antifungals, systemic use**

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. Local treatment is suitable for a number of fungal infections (genital, bladder, eye, ear, oropharynx, and skin).

Aspergillosis

Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole p. 521 is the treatment of choice for aspergillosis; liposomal amphotericin p. 517 is an alternative first-line treatment

when voriconazole cannot be used. Caspofungin p. 515, itraconazole p. 519, or posaconazole p. 521 can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication].

Candidiasis

Many superficial candidal infections including infections of the skin are treated locally; widespread or intractable infection requires systemic antifungal treatment. Vaginal candidiasis may be treated with locally acting antifungals or with fluconazole p. 518 given by mouth; for resistant organisms in adults, itraconazole can be given by mouth.

Oropharyngeal candidiasis generally responds to topical therapy; fluconazole is given by mouth for unresponsive infections; it is effective and is reliably absorbed. Itraconazole may be used for infections that do not respond to fluconazole. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

For *invasive or disseminated candidiasis*, an **echinocandin** can be used. Fluconazole is an alternative for *Candida albicans* infection in clinically stable patients who have not received an azole antifungal recently. Amphotericin p. 517 is an alternative when an echinocandin or fluconazole cannot be used, however, amphotericin should be considered for the initial treatment of CNS candidiasis. Voriconazole can be used for infections caused by fluconazole-resistant *Candida* spp. when oral therapy is required, or in patients intolerant of amphotericin or an echinocandin. In refractory cases, flucytosine p. 516 can be used with intravenous amphotericin.

Cryptococcosis

Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is amphotericin by intravenous infusion and flucytosine by intravenous infusion for 2 weeks, followed by fluconazole by mouth for 8 weeks or until cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

Histoplasmosis

Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons. Itraconazole can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. Amphotericin by intravenous infusion is used for the initial treatment of fulminant or severe infections, followed by a course of itraconazole by mouth. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

Skin and nail infections

Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy. Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis). Oral imidazole or triazole antifungals (particularly itraconazole) and terbinafine p. 514 are used more frequently than griseofulvin p. 514 because they have a broader spectrum of activity and require a shorter duration of treatment.

Tinea capitis is treated systemically; additional topical application of an antifungal may reduce transmission.

Griseofulvin is used for tinea capitis in adults and children; it is effective against infections caused by *Trichophyton tonsurans* and *Microsporum* spp. Terbinafine is used for tinea capitis caused by *T. tonsurans* [unlicensed indication]. The role of terbinafine in the management of *Microsporum* infections is uncertain.

Pityriasis versicolor may be treated with itraconazole by mouth if topical therapy is ineffective; fluconazole by mouth is an alternative. Oral terbinafine is **not** effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. Terbinafine and itraconazole have largely replaced griseofulvin for the systemic treatment of *onychomycosis*, particularly of the toenail; terbinafine is considered to be the drug of choice. Itraconazole can be administered as intermittent 'pulse' therapy. Topical antifungals also have a role in the treatment of onychomycosis.

Immunocompromised patients

Immunocompromised patients are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. Fluconazole is more reliably absorbed than itraconazole p. 519, but fluconazole is not effective against *Aspergillus* spp. Itraconazole is preferred in patients at risk of invasive aspergillosis. Posaconazole p. 521 can be used for prophylaxis in patients who are undergoing haematopoietic stem cell transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome, if they are intolerant of fluconazole or itraconazole. Micafungin p. 516 can be used for prophylaxis of candidiasis in patients undergoing haematopoietic stem cell transplantation when fluconazole, itraconazole or posaconazole cannot be used.

Amphotericin p. 517 by intravenous infusion or caspofungin p. 515 is used for the empirical *treatment* of serious fungal infections; caspofungin is not effective against fungal infections of the CNS.

Triazole antifungals

Triazole antifungal drugs have a role in the prevention and systemic treatment of fungal infections.

Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria.

Itraconazole is active against a wide range of dermatophytes. Itraconazole capsules require an acid environment in the stomach for optimal absorption. Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

Posaconazole is licensed for the treatment of invasive fungal infections unresponsive to conventional treatment.

Voriconazole p. 521 is a broad-spectrum antifungal drug which is licensed for use in life-threatening infections.

Imidazole antifungals

The imidazole antifungals include clotrimazole p. 712, econazole nitrate p. 712, ketoconazole p. 713, and tioconazole p. 1012. They are used for the local treatment of vaginal candidiasis and for dermatophyte infections. Miconazole p. 997 can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

Polyene antifungals

The polyene antifungals include amphotericin p. 517 and nystatin p. 997; neither drug is absorbed when given by mouth. Nystatin is used for oral, oropharyngeal, and perioral infections by local application in the mouth. Nystatin is also used for *Candida albicans* infection of the skin.

Amphotericin by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (*Abelcet*[®] and *AmBisome*[®]) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

Echinocandin antifungals

The echinocandin antifungals include anidulafungin p. 515, caspofungin p. 515 and micafungin p. 516. They are only active against *Aspergillus* spp. and *Candida* spp.; however, anidulafungin and micafungin are not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS.

Other antifungals

Flucytosine p. 516 is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. Flucytosine has a role in the treatment of systemic candidiasis and cryptococcal meningitis.

Griseofulvin below is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. It is the drug of choice for trichophyton infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months.

Terbinafine below is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate.

ANTIFUNGALS

Griseofulvin

INDICATIONS AND DOSE

Dermatophyte infections where topical therapy has failed or is inappropriate

BY MOUTH

- ▶ Child 1 month–11 years: Usual dose 10 mg/kg daily (max. per dose 500 mg), alternatively 20 mg/kg daily, higher dose for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses
- ▶ Child 12–17 years: 500 mg daily, alternatively 1 g daily, higher dose for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses
- ▶ Adult: 500 mg daily, alternatively 1 g daily, higher dose for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses

Tinea capitis caused by *Trichophyton tonsurans*

BY MOUTH

- ▶ Child 1 month–11 years: 15–20 mg/kg once daily (max. per dose 1 g), alternatively 15–20 mg/kg daily in divided doses
- ▶ Child 12–17 years: 1 g once daily, alternatively 1 g daily in divided doses
- ▶ Adult: 1 g once daily, alternatively 1 g daily in divided doses

- **UNLICENSED USE** Griseofulvin doses in BNF may differ from those in product literature.
- **CONTRA-INDICATIONS** Acute porphyrias p. 864 · systemic lupus erythematosus (risk of exacerbation)
- **INTERACTIONS** → Appendix 1 (griseofulvin).
- **SIDE-EFFECTS**
 - ▶ **Rare** Erythema multiforme · toxic epidermal necrolysis
 - ▶ **Very rare** Headache
 - ▶ **Frequency not known** Abdominal pain · agitation · confusion · depression · diarrhoea · dizziness · dyspepsia · fatigue · glossitis · hepatotoxicity · impaired coordination · impaired hearing · leucopenia · menstrual disturbances · nausea · peripheral neuropathy · photosensitivity · rash · renal failure · sleep disturbances · systemic lupus erythematosus · taste disturbances · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 1 month after administration to women (important: effectiveness of oral contraceptives may be reduced, additional contraceptive precautions e.g. barrier method, required). Men should avoid fathering a child during and for at least 6 months after administration
- **PREGNANCY** Avoid (fetotoxicity and teratogenicity in animals).
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid in severe liver disease.
- **PATIENT AND CARER ADVICE** May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced. Medicines for Children leaflet: Griseofulvin for fungal infections www.medicinesforchildren.org.uk/griseofulvin-for-fungal-infections

Terbinafine (as Terbinafine hydrochloride) 250 mg Lamisil 250mg tablets | 14 tablet [PoM] £21.30 DT price = £1.64 | 28 tablet [PoM] £41.09

ECHINOCANDIN ANTIFUNGALS**Anidulafungin****INDICATIONS AND DOSE****Invasive candidiasis**

BY INTRAVENOUS INFUSION

- ▶ **Adult:** Initially 200 mg once daily for 1 day, then 100 mg once daily

● **SIDE-EFFECTS**

- ▶ **Common or very common** Coagulopathy · convulsion · diarrhoea · flushing · headache · hypokalaemia · nausea · pruritus · raised serum creatinine · rash · vomiting
- ▶ **Uncommon** Abdominal pain · cholestasis · hyperglycaemia · hypertension · injection-site pain · urticaria

- ▶ **Frequency not known** Bronchospasm · dyspnoea · hepatitis · hypotension

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in animal studies.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Ecalta[®]), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute each 100 mg with 30 mL water for injections and allow up to 5 minutes for reconstitution; dilute dose in infusion fluid to a concentration of 770 micrograms/mL; give at a rate not exceeding 1.1 mg/minute. Follow product information if using stock supplied with ethanol solvent.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Power for solution for infusion▶ **Ecalta** (Pfizer Ltd)

Anidulafungin 100 mg Ecalta 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £299.99

Caspofungin**INDICATIONS AND DOSE**

Invasive aspergillosis | Invasive candidiasis | Empirical treatment of systemic fungal infections in patients with neutropenia

BY INTRAVENOUS INFUSION

- ▶ **Adult** (body-weight up to 81 kg): 70 mg once daily for 1 day, then 50 mg once daily
- ▶ **Adult** (body-weight 81 kg and above): 70 mg once daily

- **INTERACTIONS** → Appendix 1 (caspofungin).

● **SIDE-EFFECTS**

- ▶ **Common or very common** Arthralgia · diarrhoea · dyspnoea · headache · hypokalaemia · injection-site reactions · nausea · pruritus · rash · sweating · vomiting
- ▶ **Uncommon** Abdominal pain · anaemia · anorexia · anxiety · arrhythmia · ascites · blurred vision · bronchospasm · chest pain · cholestasis · constipation · cough · disorientation · dizziness · dry mouth · dyspepsia · dysphagia · erythema multiforme · fatigue · flatulence · flushing · heart failure · hepatic dysfunction · hyperglycaemia · hypertension · hypoaesthesia · hypocalcaemia · hypomagnesaemia · hypotension · leucopenia · metabolic acidosis · muscular weakness · myalgia · palpitation · paraesthesia · renal failure · sleep disturbances · taste disturbances · thrombocytopenia · thrombophlebitis · tremor
- ▶ **Frequency not known** Adult respiratory distress syndrome · anaphylaxis

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies.

- **BREAST FEEDING** Present in milk in animal studies—manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** 70 mg on first day then 35 mg once daily in moderate impairment. No information available for severe impairment.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Cancidas[®]), give intermittently in Sodium chloride 0.9%. Allow vial to reach room temperature; initially reconstitute each vial with 10.5 mL water for injections, mixing gently to dissolve then dilute requisite dose in 250 mL infusion fluid (35- or 50-mg doses may be diluted in 100 mL infusion fluid if necessary); give over 60 minutes; incompatible with glucose solutions.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► **Candidas** (Merck Sharp & Dohme Ltd)

Caspofungin (as Caspofungin acetate) 50 mg Candidas 50mg powder for solution for infusion vials | 1 vial **[PoM]** £327.67

Caspofungin (as Caspofungin acetate) 70 mg Candidas 70mg powder for solution for infusion vials | 1 vial **[PoM]** £416.78

Micafungin**INDICATIONS AND DOSE****Invasive candidiasis**

BY INTRAVENOUS INFUSION

► Adult (body-weight up to 40 kg): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate

► Adult (body-weight 40 kg and above): 100 mg once daily for at least 14 days; increased if necessary to 200 mg once daily, increase dose if response inadequate

Oesophageal candidiasis

BY INTRAVENOUS INFUSION

► Adult (body-weight up to 40 kg): 3 mg/kg once daily

► Adult (body-weight 40 kg and above): 150 mg once daily

Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days

BY INTRAVENOUS INFUSION

► Adult (body-weight up to 40 kg): 1 mg/kg once daily continue for at least 7 days after neutrophil count is desirable range

► Adult (body-weight 40 kg and above): 50 mg once daily continue for at least 7 days after neutrophil count is desirable range

● **INTERACTIONS** → Appendix 1 (micafungin).

Caution with concomitant use of other hepatotoxic drugs.

● SIDE-EFFECTS

► **Common or very common** Abdominal pain · anaemia · diarrhoea · fever · headache · hypocalcaemia · hypokalaemia · hypomagnesaemia · leucopenia · nausea · phlebitis · rash · vomiting

► **Uncommon** Anorexia · anxiety · blood pressure changes · bradycardia · cholestasis · confusion · constipation · dizziness · dyspepsia · dyspnoea · eosinophilia · flushing · hepatitis · hepatomegaly · hyperhidrosis · hyperkalaemia · hyponatraemia · hypophosphataemia · palpitation · pancytopenia · pruritus · sleep disturbances · tachycardia · taste disturbances · thrombocytopenia · tremor

► **Rare** Haemolytic anaemia

► **Frequency not known** Disseminated intravascular coagulation · hepatotoxicity (potentially life-threatening) · renal failure · Stevens-Johnson syndrome · toxic epidermal necrolysis

● **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.

● **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.

● **RENAL IMPAIRMENT** Use with caution; renal function may deteriorate.

● MONITORING REQUIREMENTS

► Monitor renal function.

► Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Mycamine*®), give intermittently in Glucose 5% or Sodium

chloride 0.9%. Reconstitute each vial with 5 mL infusion fluid; gently rotate vial, without shaking, to dissolve; dilute requisite dose with infusion fluid to 100 mL (final concentration of 0.5–2 mg/mL); protect infusion from light; give over 60 minutes.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► **Mycamine** (Astellas Pharma Ltd)

Micafungin (as Micafungin sodium) 50 mg Mycamine 50mg powder for solution for infusion vials | 1 vial **[PoM]** £196.08

Micafungin (as Micafungin sodium) 100 mg Mycamine 100mg powder for solution for infusion vials | 1 vial **[PoM]** £341.00

FLUORONATED PYRIMIDINE ANTIFUNGALS**Flucytosine****INDICATIONS AND DOSE**

Systemic yeast and fungal infections | Adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections

BY INTRAVENOUS INFUSION

► **Adult:** Usual dose 200 mg/kg daily in 4 divided doses usually for not more than 7 days, alternatively 100–150 mg/kg daily in 4 divided doses, lower dose may be sufficient for sensitive organisms

Cryptococcal meningitis (adjunct to amphotericin)

BY INTRAVENOUS INFUSION

► **Adult:** 100 mg/kg daily in 4 divided doses for 2 weeks

● **UNLICENSED USE** Use in cryptococcal meningitis for 2 weeks is an unlicensed duration.

● **CAUTIONS** Blood disorders · elderly

● **INTERACTIONS** → Appendix 1 (flucytosine).

● SIDE-EFFECTS

► **Common or very common** Diarrhoea · nausea · rashes · vomiting

► **Uncommon** Alterations in liver function tests · cardiotoxicity · confusion · convulsions · hallucinations · headache · sedation · toxic epidermal necrolysis · vertigo

► **Frequency not known** Aplastic anaemia · blood disorders · hepatic necrosis · hepatitis · leucopenia · thrombocytopenia

● **PREGNANCY** Teratogenic in *animal* studies; manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises avoid.

● **RENAL IMPAIRMENT** Use 50 mg/kg every 12 hours if creatinine clearance 20–40 mL/minute; use 50 mg/kg every 24 hours if creatinine clearance 10–20 mL/minute; use initial dose of 50 mg/kg if creatinine clearance less than 10 mL/minute and then adjust dose according to plasma-flucytosine concentration. In renal impairment liver- and kidney-function tests and blood counts required weekly.

● MONITORING REQUIREMENTS

► For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre).

► Liver- and kidney-function tests and blood counts required (weekly in blood disorders).

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give over 20–40 minutes.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Solution for infusion

ELECTROLYTES: May contain Sodium

► **Ancotil** (Meda Pharmaceuticals Ltd)Flucytosine 10 mg per 1 mL Ancotil 2.5g/250mL solution for infusion bottles | 5 bottle **PoM** £151.67 (Hospital only)**POLYENE ANTIFUNGALS****Amphotericin
(Amphotericin B)****INDICATIONS AND DOSE****AMBISOME®**

Severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin | Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials

BY INTRAVENOUS INFUSION

► Adult: Test dose 1 mg, to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

Aspergillus

BY INTRAVENOUS INFUSION

► Adult: Test dose 1 mg, to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

Visceral leishmaniasis (unresponsive to the antimonial alone)

BY INTRAVENOUS INFUSION

► Adult: 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg, alternatively 3 mg/kg for 5 consecutive days, followed by 3 mg/kg after 6 days for 1 dose

FUNGIZONE®**Systemic fungal infections**

BY INTRAVENOUS INFUSION

► Adult: Test dose 1 mg, to be given over 20–30 minutes, then 250 micrograms/kg daily, gradually increased over 2–4 days, increased if tolerated to 1 mg/kg daily, max. (severe infection) 1.5 mg/kg daily or on alternate days. Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

ABELCET®

Severe invasive candidiasis | Severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillus, cryptococcal meningitis and disseminated cryptococcosis in HIV patients

BY INTRAVENOUS INFUSION

► Adult: Test dose 1 mg, to be given over 15 minutes, then 5 mg/kg once daily for at least 14 days

• UNLICENSED USE**AMBISOME®** Use at the maximum dose of 5 mg/kg once daily is an unlicensed dose.

- **CAUTIONS** Avoid rapid infusion (risk of arrhythmias) · when given parenterally, toxicity common (close supervision necessary and close observation required for at least 30 minutes after test dose)

CAUTIONS, FURTHER INFORMATION

Anaphylaxis Anaphylaxis can occur with any intravenous amphotericin product and a test dose is advisable before the first infusion; the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic antipyretics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential).

- **INTERACTIONS** → Appendix 1 (amphotericin).

Caution—corticosteroids (avoid except to control reactions).

• SIDE-EFFECTS

- **Common or very common** Abdominal pain · abnormal liver function (discontinue treatment) · anaemia · arrhythmias · blood disorders · blood pressure changes · cardiovascular effects · chest pain · diarrhoea · disturbances in renal function · dyspnoea · electrolyte disturbances · febrile reactions · headache · hypokalaemia · hypomagnesaemia · nausea · rash · renal tubular acidosis · thrombocytopenia · vomiting
- **Uncommon** Anaphylactoid reactions · bronchospasm · convulsions · diplopia · encephalopathy · hearing loss · neurological disorders · peripheral neuropathy · tremor
- **Frequency not known** Anorexia · arthralgia · myalgia · Stevens-Johnson syndrome · toxic epidermal necrolysis
- **PREGNANCY** Not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** No information available.
- **RENAL IMPAIRMENT** Use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation.
- **MONITORING REQUIREMENTS** Hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required.
- **DIRECTIONS FOR ADMINISTRATION**

AMBISOME®**Amphotericin (liposomal)**

For *intravenous infusion* (*AmBisome*®), give intermittently in Glucose 5% or 10%. Reconstitute each vial with 12 mL water for injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into infusion fluid through the 5 micron filter provided to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose of 1 mg over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or 10%, or use separate line.

FUNGIZONE®**Amphotericin (as sodium deoxycholate complex)**

For *intravenous infusion* (*Fungizone*®), give intermittently in Glucose 5%. Reconstitute each vial with 10 mL water of injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in infusion fluid to a concentration of 100 micrograms/mL; pH of the glucose must not be below 4.2 (check each container—consult product literature for details of the buffer); infuse over 2–4 hours, or longer if not tolerated (initial test dose of 1 mg over 20–30 minutes); begin infusion immediately after dilution; protect from light; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used.

ABELCET®**Amphotericin (lipid complex)**

For *intravenous infusion*, give intermittently in Glucose 5%. Allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20-mL syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute to a concentration of 1 mg/mL (2 mg/mL can be used in fluid restriction and in children); preferably give *via* an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose of 1 mg over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium

chloride or other electrolyte solutions, flush existing intravenous line with glucose 5% or use separate line.

- **PRESCRIBING AND DISPENSING INFORMATION** Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should **not** be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, oral solution, lozenge

TRIAZOLE ANTIFUNGALS

Fluconazole

INDICATIONS AND DOSE

Candidal balanitis

BY MOUTH

- ▶ Child 16-17 years: 150 mg for 1 dose
- ▶ Adult: 150 mg for 1 dose

Vaginal candidiasis

BY MOUTH

- ▶ Child 16-17 years: 150 mg for 1 dose
- ▶ Adult: 150 mg for 1 dose

Vulvovaginal candidiasis (recurrent)

BY MOUTH

- ▶ Adult: Initially 150 mg every 72 hours for 3 doses, then 150 mg once weekly for 6 months

Mucosal candidiasis (except genital)

BY MOUTH OR BY INTRAVENOUS INFUSION

- ▶ Child 1 month-11 years: 3-6 mg/kg, dose to be given on first day, then 3 mg/kg daily (max. per dose 100 mg) for 7-14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14-30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections)
- ▶ Child 12-17 years: 50 mg for 7-14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14-30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections

BY MOUTH

- ▶ Adult: 50 mg daily given for 7-14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14 days in atrophic oral candidiasis associated with dentures; for 14-30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections

Tinea pedis, corporis, cruris, pityriasis versicolor | Dermal candidiasis

BY MOUTH

- ▶ Adult: 50 mg daily for 2-4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks

Invasive candidal infections (including candidaemia and disseminated candidiasis) and cryptococcal infections (including meningitis)

BY MOUTH OR BY INTRAVENOUS INFUSION

- ▶ Child: 6-12 mg/kg daily (max. per dose 800 mg) treatment continued according to response (at least 8 weeks for cryptococcal meningitis)
- ▶ Adult: 400 mg, dose to be given on first day, then 200-400 mg daily (max. per dose 800 mg daily) treatment continued according to response (at least 8 weeks for cryptococcal meningitis), maximum dose for use in severe infections

Prevention of fungal infections in immunocompromised patients

BY MOUTH OR BY INTRAVENOUS INFUSION

- ▶ Child: 3-12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose given according to extent and duration of neutropenia
- ▶ Adult: 50-400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose adjusted according to risk

Prevention of fungal infections in immunocompromised patients (for patients with high risk of systemic infections e.g. following bone-marrow transplantation)

BY MOUTH OR BY INTRAVENOUS INFUSION

- ▶ Adult: 400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range

Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy

BY MOUTH OR BY INTRAVENOUS INFUSION

- ▶ Adult: 200 mg daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 864
- **CAUTIONS** Susceptibility to QT interval prolongation
- **INTERACTIONS** → Appendix 1 (antifungals, triazole); in general, fluconazole interactions in Appendix 1 relate to multiple-dose treatment. Caution with concomitant use of hepatotoxic drugs.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal discomfort · diarrhoea · flatulence · headache · nausea · rash
 - ▶ **Uncommon** Alopecia · anaphylaxis · angioedema (in children) · dizziness · dyspepsia · hepatic disorders · hyperlipidaemia · hypersensitivity reactions (in adults) · pruritus · seizures · Stevens-Johnson syndrome · taste disturbance · toxic epidermal necrolysis · vomiting
 - ▶ **Frequency not known** Hypokalaemia · leucopenia · thrombocytopenia
- **SIDE-EFFECTS, FURTHER INFORMATION** If rash occurs, discontinue treatment (or monitor closely if infection invasive or systemic); severe cutaneous reactions are more likely in patients with AIDS.
- **PREGNANCY** Manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses.
- **BREAST FEEDING** Present in milk but amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Toxicity with related drugs.

● RENAL IMPAIRMENT

- ▶ In adults Usual initial dose then halve subsequent doses if eGFR less than 50 mL/minute/1.73 m².
- ▶ In children Usual initial dose then halve subsequent doses if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor liver function with high doses or extended courses—discontinue if signs or symptoms of hepatic disease (risk of hepatic necrosis).

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use in children For *intravenous infusion*, give over 10–30 minutes; do not exceed an infusion rate of 5–10 mL/minute.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.

● PROFESSION SPECIFIC INFORMATION

- **Dental practitioners' formulary** Fluconazole Capsules 50 mg may be prescribed. Fluconazole Oral Suspension 50 mg/5 mL may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** Fluconazole capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Itraconazole**INDICATIONS AND DOSE****Vulvovaginal candidiasis**

BY MOUTH

- ▶ Adult: 200 mg twice daily for 1 day

Vulvovaginal candidiasis (recurrent)

BY MOUTH

- ▶ Adult: 50–100 mg daily for 6 months

Oral or oesophageal candidiasis that has not responded to fluconazole

BY MOUTH USING ORAL SOLUTION

- ▶ Adult: 100–200 mg twice daily for 2 weeks (continue for another 2 weeks if no response; the higher dose should not be used for longer than 2 weeks if no signs of improvement)

Oral or oesophageal candidiasis in HIV-positive or other immunocompromised patients

BY MOUTH USING ORAL SOLUTION

- ▶ Adult: 200 mg daily in 1–2 divided doses for 1 week (continue for another week if no response)

Systemic candidiasis where other antifungal drugs inappropriate or ineffective

BY MOUTH

- ▶ Adult: 100–200 mg once daily

BY INTRAVENOUS INFUSION

- ▶ Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

Pityriasis versicolor

BY MOUTH

- ▶ Adult: 200 mg once daily for 7 days

Tinea pedis | Tinea manuum

BY MOUTH

- ▶ Adult: 100 mg once daily for 30 days, alternatively 200 mg twice daily for 7 days

Tinea corporis | Tinea cruris

BY MOUTH

- ▶ Adult: 100 mg once daily for 15 days, alternatively 200 mg once daily for 7 days

Onychomycosis

BY MOUTH

- ▶ Adult: 200 mg once daily for 3 months, alternatively 200 mg twice daily for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses

Aspergillosis

BY MOUTH

- ▶ Adult: 200 mg twice daily

Systemic aspergillosis where other antifungal drugs inappropriate or ineffective

BY INTRAVENOUS INFUSION

- ▶ Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

Histoplasmosis

BY MOUTH

- ▶ Adult: 200 mg 3 times a day for 3 days, then 200 mg 1–2 times a day

BY INTRAVENOUS INFUSION

- ▶ Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

Systemic cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective

BY MOUTH

- ▶ Adult: 200 mg once daily, dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 200 mg twice daily

continued →

BY INTRAVENOUS INFUSION

- ▶ Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate

BY MOUTH

- ▶ Adult: 200 mg once daily, then increased to 200 mg twice daily, dose increased only if low plasma-itraconazole concentration

Prophylaxis of deep fungal infections (when standard therapy inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic

BY MOUTH USING ORAL SOLUTION

- ▶ Adult: 5 mg/kg daily in 2 divided doses, to be started before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers, safety and efficacy not established in elderly patients

- **UNLICENSED USE** Itraconazole doses in BNF may differ from those in product literature.

Important safety information

HEART FAILURE

Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:

- patients receiving high doses and longer treatment courses;
- older adults and those with cardiac disease;
- patients with chronic lung disease (including chronic obstructive pulmonary disease) associated with pulmonary hypertension;
- patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers.

Itraconazole should be avoided in patients with ventricular dysfunction or a history of heart failure unless the infection is serious.

- **CONTRA-INDICATIONS** Acute porphyrias p. 864
- **CAUTIONS** Active liver disease · history of hepatotoxicity with other drugs · susceptibility to congestive heart failure
- **INTERACTIONS** → Appendix 1 (antifungals, triazole).

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · diarrhoea · dyspnoea · headache · hepatitis · hypokalaemia · nausea · rash · taste disturbances · vomiting
- ▶ **Uncommon** Constipation · dizziness · dyspepsia · flatulence · menstrual disorder · myalgia · oedema · peripheral neuropathy (discontinue treatment)
- ▶ **Rare** Alopecia · deafness · erectile dysfunction · heart failure · hypertriglyceridaemia · leucopenia · pancreatitis · photosensitivity · Stevens-Johnson syndrome · tinnitus · toxic epidermal necrolysis · urinary frequency · visual disturbances
- ▶ **Frequency not known** Arthralgia · blood pressure changes · confusion · drowsiness · hepatotoxicity · renal impairment · thrombocytopenia · tremor

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Hyperglycaemia

SIDE-EFFECTS, FURTHER INFORMATION

Hepatotoxicity Potentially life-threatening hepatotoxicity reported very rarely—discontinue if signs of hepatitis develop.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and until the next menstrual period following end of treatment.

- **PREGNANCY** Manufacturer advises use only in life-threatening situations (toxicity at high doses in *animal* studies).

- **BREAST FEEDING** Small amounts present in milk—may accumulate; manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Dose reduction may be necessary. Use only if potential benefit outweighs risk of hepatotoxicity.

- **RENAL IMPAIRMENT** Risk of congestive heart failure.

- ▶ With oral use Bioavailability of oral formulations possibly reduced.

- ▶ With intravenous use Use intravenous infusion with caution if eGFR 30–80 mL/minute/1.73 m²; avoid intravenous infusion if eGFR less than 30 mL/minute/1.73 m².

● **MONITORING REQUIREMENTS**

- ▶ Absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary).

- ▶ Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, if history of hepatotoxicity with other drugs, or in hepatic impairment.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use For *intravenous infusion (Sporanox[®])*, give intermittently in Sodium Chloride 0.9%; dilute 250 mg in 50 mL infusion fluid and infuse only 60 mL through an in-line filter (0.2 micron) over 60 minutes.

- ▶ With oral use For *oral liquid*, do not take with food; swish around mouth and swallow, do not rinse afterwards.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.

- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop. Patients or carers should be given advice on how to administer itraconazole oral liquid.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Capsule

CAUTIONARY AND ADVISORY LABELS 5, 9, 21, 25

▶ **ITRACONAZOLE (Non-proprietary)**

Itraconazole 100 mg Itraconazole 100mg capsules | 4 capsule [PoM](#) £3.75 | 15 capsule [PoM](#) £21.50 DT price = £4.57 | 60 capsule [PoM](#) £17.74-£56.21

Solution for infusion

EXCIPIENTS: May contain Propylene glycol

▶ **Sporanox** (Janssen-Cilag Ltd)

Itraconazole 10 mg per 1 mL Sporanox I.V. 250mg/25ml solution for infusion ampoules and diluent | 1 ampoule [PoM](#) £79.71

Posaconazole

INDICATIONS AND DOSE

Invasive aspergillosis in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin | Fusariosis either unresponsive to, or in patients intolerant of, amphotericin | Chromoblastomycosis and mycetoma either unresponsive to, or in patients intolerant of, itraconazole | Coccidioidomycosis either unresponsive to, or in patients intolerant of, amphotericin, itraconazole, or fluconazole

BY MOUTH USING ORAL SUSPENSION

- ▶ Adult: 400 mg twice daily, to be taken with food, alternatively 200 mg 4 times a day, dose if food not tolerated

BY MOUTH USING TABLETS

- ▶ Adult: 300 mg twice daily on first day, then 300 mg once daily

Oropharyngeal candidiasis (severe infection or in immunocompromised patients only)

BY MOUTH USING ORAL SUSPENSION

- ▶ Adult: 200 mg on first day, then 100 mg once daily for 13 days, dose to be taken with food

Prophylaxis of invasive fungal infections in patients undergoing bone-marrow transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome who are expected to become neutropenic, and who are intolerant of fluconazole or itraconazole

BY MOUTH USING ORAL SUSPENSION

- ▶ Adult: 200 mg 3 times a day start before transplantation or before chemotherapy and continued until neutrophil count recovers, dose to be taken with food

BY MOUTH USING TABLETS

- ▶ Adult: 300 mg twice daily on first day, then 300 mg once daily start before transplantation or before chemotherapy and continued until neutrophil count recovers

- **UNLICENSED USE** Tablets not licensed for oropharyngeal candidiasis.
- **CONTRA-INDICATIONS** Acute porphyrias p. 864
- **CAUTIONS** Body-weight over 120 kg—risk of treatment failure possibly increased · body-weight under 60 kg—risk of side effects increased · bradycardia · cardiomyopathy · history of QT interval prolongation · symptomatic arrhythmias
- **INTERACTIONS** → Appendix 1 (antifungals, triazole). Caution with concomitant use with other drugs known to cause QT-interval prolongation.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anaemia · anorexia · blood disorders · constipation · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · electrolyte disturbances · fatigue · fever · flatulence · gastro-intestinal disturbances · headache · nausea · neutropenia · paraesthesia · pruritus · rash · thrombocytopenia · vomiting
 - ▶ **Uncommon** Alopecia · aphasia · arrhythmias · bradycardia · changes in blood pressure · convulsions · cough · gastro-oesophageal reflux · hepatic disorders · hiccups · hyperglycaemia · insomnia · menstrual disorders · mouth ulcers · musculoskeletal pain · neuropathy · oedema · palpitation · pancreatitis · renal failure · tachycardia · tremor · vasculitis · visual disturbances
 - ▶ **Rare** Adrenal insufficiency · breast pain · cardiac failure · depression · encephalopathy · hearing impairment · ileus · myocardial infarction · pneumonitis · psychosis · Stevens-Johnson syndrome · stroke · syncope · thrombosis

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk; toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. Monitor liver function in hepatic impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor electrolytes (including potassium, magnesium, and calcium) before and during therapy.
 - ▶ Monitor liver function before and during therapy.
- **PRESCRIBING AND DISPENSING INFORMATION** Where possible, *Noxafil*® tablets should be used in preference to the suspension because the tablets have a higher bioavailability; the suspension is not interchangeable with the tablets on a milligram-for-milligram basis. Flavours of oral liquid formulations may include cherry.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 3, 9, 25

- ▶ **Noxafil** (Merck Sharp & Dohme Ltd)

Posaconazole 100 mg Noxafil 100mg gastro-resistant tablets | 24 tablet (P_{oM}) £596.96 | 96 tablet (P_{oM}) £2,387.85

Oral suspension

CAUTIONARY AND ADVISORY LABELS 3, 9, 21

- ▶ **Noxafil** (Merck Sharp & Dohme Ltd)

Posaconazole 40 mg per 1 ml Noxafil 40mg/ml oral suspension | 105 ml (P_{oM}) £491.20 (Hospital only)

Voriconazole

INDICATIONS AND DOSE

Invasive aspergillosis | Serious infections caused by *Scedosporium* spp., *Fusarium* spp., or invasive fluconazole-resistant *Candida* spp. (including *C. krusei*)

BY MOUTH

- ▶ Adult (body-weight up to 40 kg): 200 mg every 12 hours for 2 doses, then 100 mg every 12 hours, (by mouth) increased if necessary to 150 mg every 12 hours
- ▶ Adult (body-weight 40 kg and above): 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours for max. 6 months; reduced if not tolerated to 3 mg/kg every 12 hours

- **CONTRA-INDICATIONS** Acute porphyrias p. 864
- **CAUTIONS** Avoid exposure to sunlight · bradycardia · cardiomyopathy · electrolyte disturbances · history of QT interval prolongation · patient at risk of pancreatitis · symptomatic arrhythmias
- **INTERACTIONS** → Appendix 1 (antifungals, triazole). Caution with concomitant use with other drugs that prolong QT interval.
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

 - ▶ **Common or very common** Abdominal pain · acute renal failure · agitation · alopecia · altered perception · anaemia · anxiety · asthenia · blood disorders · blurred vision · cheilitis · chest pain · confusion · depression · diarrhoea · dizziness · haematuria · hallucinations · headache · hypoglycaemia · hypokalaemia · hypotension · influenza-like symptoms · jaundice · leucopenia · nausea · oedema · pancytopenia · paraesthesia · photophobia · photosensitivity · pruritus · rash · respiratory distress

syndrome · sinusitis · thrombocytopenia · tremor · visual disturbances · vomiting

- ▶ **Uncommon** Adrenocortical insufficiency · arrhythmias · arthritis · ataxia · blepharitis · cholecystitis · constipation · duodenitis · dyspepsia · flushing · fulminant hepatic failure · gingivitis · glossitis · hepatitis · hypersensitivity reactions · hypoaesthesia · hyponatraemia · nystagmus · optic neuritis · pancreatitis · psoriasis · QT interval prolongation · raised serum cholesterol · scleritis · Stevens-Johnson syndrome · syncope
- ▶ **Rare** Convulsions · discoid lupus erythematosus · extrapyramidal effects · hearing disturbances · hyperthyroidism · hypertonia · hypothyroidism · insomnia · optic atrophy · pseudomembranous colitis · pseudoporphyria · retinal haemorrhage · taste disturbances (more common with oral suspension) · tinnitus · toxic epidermal necrolysis
- ▶ **Frequency not known** On long term treatment, squamous cell carcinoma of skin (particularly in presence of phototoxicity) · periostitis (particularly in transplant patients)

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ **With intravenous use** Injection-site reactions

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Hepatotoxicity** Hepatitis, cholestasis, and fulminant hepatic failure usually occur in the first 10 days; risk of hepatotoxicity increased in patients with haematological malignancy. Consider treatment discontinuation if severe abnormalities in liver function tests.
- ▶ **Phototoxicity** Phototoxicity occurs commonly. If phototoxicity occurs, consider treatment discontinuation; if treatment is continued, monitor for pre-malignant skin lesions and squamous cell carcinoma, and discontinue treatment if they occur.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Toxicity in *animal* studies—manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** In mild to moderate hepatic cirrhosis use usual initial dose then halve maintenance dose. No information available for severe hepatic cirrhosis—manufacturer advises use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** Intravenous vehicle may accumulate if eGFR less than 50 mL/minute/1.73 m²—use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required).
- **MONITORING REQUIREMENTS**
 - ▶ Monitor renal function.
 - ▶ Monitor liver function before starting treatment, then at least weekly for 1 month, and then monthly during treatment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, reconstitute each 200 mg with 19 mL Water for Injections or Sodium Chloride 0.9% to produce a 10 mg/mL solution; dilute dose to concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give at a rate not exceeding 3 mg/kg/hour.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.
- **PATIENT AND CARER ADVICE** Patients and their carers should be advised to keep the Alert Card with them at all times. Patients and their carers should be told how to recognise symptoms of liver disorder, and advised to seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

Patients and their carers should be advised that patients should avoid intense or prolonged exposure to direct sunlight, and to avoid the use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a sunscreen with a high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun.

3.1 *Pneumocystis pneumonia*

Pneumocystis pneumonia

Pneumonia caused by *Pneumocystis jirovecii* (*Pneumocystis carinii*) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. *Pneumocystis pneumonia* should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

Treatment

Mild to moderate disease

Co-trimoxazole p. 461 in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone p. 523 is licensed for the treatment of mild to moderate pneumocystis infection in patients who cannot tolerate co-trimoxazole. A combination of dapsone p. 500 with trimethoprim p. 462 is given by mouth for the treatment of mild to moderate disease [unlicensed indication].

A combination of clindamycin p. 467 and primaquine p. 538 by mouth is used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

Severe disease

Co-trimoxazole in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate p. 523 given by intravenous infusion is an alternative for patients who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion.

Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia.

Adjunctive therapy

In moderate to severe infections associated with HIV infection, prednisolone p. 585 is given by mouth for 5 days (alternatively, hydrocortisone p. 583 may be given parenterally); the dose is then reduced to complete 21 days of treatment. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

Prophylaxis

Prophylaxis against pneumocystis pneumonia should be given to all patients with a history of the infection. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised patients. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the patient has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

Co-trimoxazole p. 461 by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. It is given daily or on alternate days (3 times a week); the dose may be reduced to improve tolerance.

Inhaled pentamidine isetionate is better tolerated than parenteral pentamidine isetionate. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in patients unable to tolerate co-trimoxazole. It is effective but patients may be prone to extrapulmonary infection. Alternatively, dapsone p. 500 can be used. Atovaquone below has also been used for prophylaxis [unlicensed indication].

Atovaquone

INDICATIONS AND DOSE

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients intolerant of co-trimoxazole

BY MOUTH

- ▶ Adult: 750 mg twice daily for 21 days, dose to be taken with food, particularly high fat food

Prophylaxis against pneumocystis pneumonia

BY MOUTH

- ▶ Adult: 750 mg twice daily

- **UNLICENSED USE** Not licensed for prophylaxis against pneumocystis pneumonia.
- **CAUTIONS** Other causes of pulmonary disease should be sought and treated · elderly · initial diarrhoea and difficulty in taking with food may reduce absorption (and require alternative therapy)
- **INTERACTIONS** → Appendix 1 (atovaquone).
- **SIDE-EFFECTS** Anaemia · diarrhoea · fever · headache · hyponatraemia · insomnia · nausea · neutropenia · pruritus · rash · Stevens-Johnson syndrome · vomiting
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. Monitor more closely in hepatic impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution. Monitor more closely in renal impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 21

▶ **Wellvone** (GlaxoSmithKline UK Ltd)

▶ **Atovaquone 150 mg per 1 ml** Wellvone 750mg/5ml oral suspension (sugar-free) | 226 ml [POM](#) £486.37

Pentamidine isetionate

INDICATIONS AND DOSE

Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)

BY INTRAVENOUS INFUSION

- ▶ Adult: 4 mg/kg once daily for at least 14 days

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)

BY INHALATION OF NEBULISED SOLUTION

- ▶ Adult: 300 mg every 4 weeks, alternatively 150 mg every 2 weeks, using suitable equipment—consult product literature

Visceral leishmaniasis

BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 3–4 mg/kg once daily on alternate days, maximum total of 10 injections, course may be repeated if necessary

Cutaneous leishmaniasis

BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 3–4 mg/kg 1–2 times a week until condition resolves

Trypanosomiasis

BY DEEP INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 4 mg/kg once daily or on alternate days for a total of 7–10 injections

- **UNLICENSED USE** Not licensed for primary prevention of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia by inhalation of nebulised solution.
- **CAUTIONS** Anaemia · bradycardia · coronary heart disease · history of ventricular arrhythmias · hyperglycaemia · hypertension · hypoglycaemia · hypokalaemia · hypomagnesaemia · hypotension · leucopenia · risk of severe hypotension following administration · thrombocytopenia
- **INTERACTIONS** → Appendix 1 (pentamidine isetionate). Caution with concomitant use of other drugs that prolong the QT interval.
- **SIDE-EFFECTS**
- **GENERAL SIDE-EFFECTS** Abnormal liver-function tests · acute renal failure · anaemia · arrhythmias (can be severe and sometimes fatal) · azotaemia · dizziness · flushing · hyperglycaemia · hyperkalaemia · hypocalcaemia · hypoglycaemia (can be severe and sometimes fatal) · hypotension (can be severe and sometimes fatal) · leucopenia · nausea · pancreatitis (can be severe and sometimes fatal) · rash · Stevens-Johnson syndrome · syncope · taste disturbances · thrombocytopenia · vomiting
- **SPECIFIC SIDE-EFFECTS**
 - ▶ **When used by inhalation** Bronchoconstriction (may be prevented by prior use of bronchodilators) · cough · shortness of breath
 - ▶ **With intramuscular use** Injection site reactions (muscle necrosis, discomfort, pain, induration, abscess formation)
 - ▶ **With intravenous use** Injection site reactions (muscle necrosis, discomfort, pain, induration, abscess formation)
- **PREGNANCY** Manufacturer advises avoid unless essential.

- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Reduce intravenous dose for pneumocystis pneumonia if creatinine clearance less than 10 mL/minute: in *life-threatening infection*, use 4 mg/kg once daily for 7–10 days, then 4 mg/kg on alternate days to complete course of at least 14 doses; in *less severe infection*, use 4 mg/kg on alternate days for at least 14 doses.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor blood pressure before starting treatment, during administration, and at regular intervals, until treatment concluded.
 - ▶ Carry out laboratory monitoring according to product literature.
- **DIRECTIONS FOR ADMINISTRATION** Patient should be lying down when receiving drug parenterally. Direct intravenous injection should be avoided whenever possible and **never** given rapidly; intramuscular injections should be deep and preferably given into the buttock. For *intravenous infusion*, reconstitute 300 mg with 3–5 mL Water for Injections (displacement value may be significant), then dilute required dose with 50–250 mL Glucose 5% or Sodium Chloride 0.9%; give over at least 60 minutes. Powder for injection (dissolved in water for injection) may be used for nebulisation.
- **HANDLING AND STORAGE** Pentamidine isetionate is toxic and personnel should be adequately protected during handling and administration—consult product literature.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ **Pentacarinat** (Sanofi)

Pentamidine isetionate 300 mg Pentacarinat 300mg powder for solution for injection vials | 5 vial **[PoM]** £158.86

4 Helminth infection

Helminth infections

Advice on prophylaxis and treatment of helminth infections is available from the following specialist centres:

Birmingham	(0121) 424 0357
Scotland	Contact local Infectious Diseases Unit
Liverpool	(0151) 705 3100
London	0845 155 5000 (treatment)

Drugs for threadworms

Anthelmintics are effective in threadworm (pinworms, *Enterobius vermicularis*) infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each

visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole p. 526 is the drug of choice for treating threadworm infection in patients of all ages over 6 months. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

Ascaricides (common roundworm infections)

Mebendazole is effective against *Ascaris lumbricoides* and is generally considered to be the drug of choice.

Levamisole p. 525 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative when mebendazole cannot be used. It is very well tolerated.

Drugs for tapeworm infections

Taeniacides

Niclosamide [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in *Taenia solium* infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel p. 526 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is as effective as niclosamide.

Hydatid disease

Cysts caused by *Echinococcus granulosus* grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. Albendazole p. 525 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to *E. multilocularis* is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

Drugs for hookworms

Hookworms (ancylostomiasis, necatoriasis) live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole p. 526 has a useful broad-spectrum activity, and is effective against hookworms. Albendazole p. 525 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative. Levamisole p. 525 is also effective in children.

Schistosomides (bilharziasis)

Adult *Schistosoma haematobium* worms live in the genitourinary veins and adult *S. mansoni* in those of the colon and mesentery. *S. japonicum* is more widely distributed in veins of the alimentary tract and portal system.

Praziquantel p. 526 [unlicensed] is available from Merck Serono (*Cysticide*®) and is effective against all human schistosomes. No serious adverse effects have been reported. Of all the available schistosomides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

Filaricides

Diethylcarbamazine [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is

effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions, treatment in adults and children over 1 month, is commenced with a dose of diethylcarbamazine citrate on the first day and increased gradually over 3 days. Length of treatment varies according to infection type, and usually gives a radical cure for these infections. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin below [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is very effective in *onchocerciasis* and it is now the drug of choice; reactions are usually slight. Diethylcarbamazine or suramin should no longer be used for *onchocerciasis* because of their toxicity.

Drugs for cutaneous larva migrans (creeping eruption)

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical tiabendazole (no commercial preparation available). Multiple infections respond to ivermectin, albendazole or **tiabendazole** (tiabendazole) by mouth [all unlicensed] (available from 'special-order' manufacturers or specialist importing companies).

Drugs for strongyloidiasis

Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the treatment of choice for chronic *Strongyloides* infection in adults and children over 5 years. Albendazole [unlicensed] (available from 'special order' manufacturers or specialist importing companies) is an alternative given to adults and children over 2 years.

ANTHELMINTICS

Albendazole

INDICATIONS AND DOSE

Chronic *Strongyloides* infection

BY MOUTH

- ▶ Adult: 400 mg twice daily for 3 days, dose may be repeated after 3 weeks if necessary

Hydatid disease, in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases

BY MOUTH

- ▶ Adult: (consult product literature)

Hookworm infections

BY MOUTH

- ▶ Adult: 400 mg for 1 dose

- **UNLICENSED USE** Albendazole is an unlicensed drug.

- **INTERACTIONS** → Appendix 1 (albendazole).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet

Diethylcarbamazine

INDICATIONS AND DOSE

Wuchereria bancrofti infections | *Brugia malayi* infections

BY MOUTH

- ▶ Adult: Initially 1 mg/kg daily in divided doses on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days

Loa loa infections

BY MOUTH

- ▶ Adult: Initially 1 mg/kg daily in divided doses on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days; maximum 9 mg/kg per day

- **INTERACTIONS** → Appendix 1 (diethylcarbamazine).

- **MEDICINAL FORMS**

Medicines are available from importing manufacturers.

Ivermectin

INDICATIONS AND DOSE

Chronic *Strongyloides* infection

BY MOUTH

- ▶ Adult: 200 micrograms/kg daily for 2 days

Onchocerciasis

BY MOUTH

- ▶ Adult: 150 micrograms/kg for 1 dose, retreatment at intervals of 6 to 12 months may be required depending on symptoms

Scabies, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or 'Norwegian') scabies that does not respond to topical treatment alone

BY MOUTH

- ▶ Adult: 200 micrograms/kg for 1 dose, further doses of 200 micrograms/kg may be required

- **UNLICENSED USE** Ivermectin is an unlicensed drug.

- **INTERACTIONS** → Appendix 1 (ivermectin).

- **SIDE-EFFECTS** Aggravation of itching · aggravation of rash

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Levamisole

INDICATIONS AND DOSE

Roundworm infections

BY MOUTH

- ▶ Adult: 120–150 mg for 1 dose

- **UNLICENSED USE** Not licensed.

- **CONTRA-INDICATIONS** Blood disorders

- **CAUTIONS** Epilepsy · Sjögren's syndrome

- **INTERACTIONS** → Appendix 1 (levamisole).

- **SIDE-EFFECTS** Arthralgia (on prolonged treatment) · blood disorders (on prolonged treatment) · convulsions (on prolonged treatment) · diarrhoea · dizziness · headache · influenza-like syndrome (on prolonged treatment) · insomnia (on prolonged treatment) · myalgia (on prolonged treatment) · nausea · rash (on prolonged treatment) · taste disturbances (on prolonged treatment) · vasculitis (on prolonged treatment) · vomiting

- **PREGNANCY** Embryotoxic in *animal* studies, avoid if possible.

- **BREAST FEEDING** No information available.
- **HEPATIC IMPAIRMENT** Use with caution—dose adjustment may be necessary.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Mebendazole

INDICATIONS AND DOSE

Threadworm infections

BY MOUTH

- ▶ Child 6 months-17 years: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks
- ▶ Adult: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks

Whipworm infections | Hookworm infections

BY MOUTH

- ▶ Child 1-17 years: 100 mg twice daily for 3 days
- ▶ Adult: 100 mg twice daily for 3 days

Roundworm infections

BY MOUTH

- ▶ Child 1 year: 100 mg twice daily for 3 days
- ▶ Child 2-17 years: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose
- ▶ Adult: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose

- **UNLICENSED USE** Not licensed for use in children under 2 years.

Treatment of roundworm infections with mebendazole 500 mg as a single dose is an unlicensed dose.

- **INTERACTIONS** → Appendix 1 (mebendazole).

SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain
- ▶ **Uncommon** Diarrhoea · flatulence
- ▶ **Rare** Alopecia · convulsions · dizziness · hepatitis · neutropenia · rash · Stevens · Johnson syndrome · toxic epidermal necrolysis · urticaria

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Amount present in milk too small to be harmful but manufacturer advises avoid.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Mebendazole for worm infections www.medicinesforchildren.org.uk/mebendazole-for-worm-infections

- **EXCEPTIONS TO LEGAL CATEGORY** Mebendazole tablets can be sold to the public if supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Chewable tablet

▶ **MEBENDAZOLE (Non-proprietary)**

Mebendazole 100 mg

▶ **Vermox** (Janssen-Cilag Ltd)

Mebendazole 100 mg Vermox 100mg chewable tablets (sugar-free) | 6 tablet **[PoM]** £1.36 DT price = £1.36

- ▶ Brands may include Ovox

Oral suspension

▶ **Vermox** (Janssen-Cilag Ltd)

Mebendazole 20 mg per 1 ml Vermox 100mg/5ml oral suspension | 30 ml **[PoM]** £1.59 DT price = £1.59

- ▶ Brands may include Ovox

Praziquantel

INDICATIONS AND DOSE

Tapeworm infections (*Taenia solium*)

BY MOUTH

- ▶ Adult: 5–10 mg/kg for 1 dose, to be taken after a light breakfast

Tapeworm infections (*Hymenolepis nana*)

BY MOUTH

- ▶ Adult: 25 mg/kg for 1 dose, to be taken after a light breakfast

Schistosoma haematobium worm infections | *Schistosoma mansoni* worm infections

BY MOUTH

- ▶ Adult: 20 mg/kg, followed by 20 mg/kg after 4–6 hours

Schistosoma japonicum worm infections

BY MOUTH

- ▶ Adult: 20 mg/kg 3 times a day for 1 day

- **UNLICENSED USE** Praziquantel is an unlicensed drug.

- **INTERACTIONS** → Appendix 1 (praziquantel).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

5 Protozoal infection

Antiprotozoal drugs

Amoebicides

Metronidazole p. 475 is the drug of choice for *acute invasive amoebic dysentery* since it is very effective against vegetative forms of *Entamoeba histolytica* in ulcers. Tinidazole p. 476 is also effective. Metronidazole and tinidazole p. 476 are also active against amoebae which may have migrated to the liver. Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate p. 438.

Diloxanide furoate is the drug of choice for asymptomatic patients with *E. histolytica* cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For *amoebic abscesses* of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with more than 100 mL of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate p. 438 is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

Trichomonacides

Metronidazole is the treatment of choice for *Trichomonas vaginalis* infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole may be tried.

Antigiardial drugs

Metronidazole is the treatment of choice for *Giardia lamblia* infections. Alternative treatments are tinidazole or mepacrine hydrochloride p. 438.

Leishmaniocides

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate below, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dosage varies with different geographical regions and expert advice should be obtained. Some early non-inflamed lesions of cutaneous leishmaniasis can be treated with intralesional injections of sodium stibogluconate below under specialist supervision.

Amphotericin p. 517 is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (*AmBisome*[®]). *Abelcet*[®], a lipid formulation of amphotericin is also likely to be effective but less information is available.

Pentamidine isetionate p. 523 has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies).

Trypanocides

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

Drugs for toxoplasmosis

Most infections caused by *Toxoplasma gondii* are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma chorioretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine p. 539 and sulfadiazine p. 495, given for several weeks (expert advice **essential**). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine p. 539 with clindamycin p. 467 or clarithromycin p. 470 or azithromycin p. 469. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus; specialist advice should be sought on management. Spiramycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) may reduce the risk of transmission of maternal infection to the fetus.

5.1 Leishmaniasis

Sodium stibogluconate

INDICATIONS AND DOSE

Visceral leishmaniasis (specialist use only)

BY INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION

▶ Adult: 20 mg/kg daily for 28 days

Cutaneous leishmaniasis (specialist use only)

BY INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION

▶ Adult: 20 mg/kg daily for 20 days

- **CAUTIONS** Heart disease (withdraw if conduction disturbances occur) · mucocutaneous disease · predisposition to QT interval prolongation · treat intercurrent infection (e.g. pneumonia)

CAUTIONS, FURTHER INFORMATION

Mucocutaneous disease Successful treatment of mucocutaneous leishmaniasis may induce severe inflammation around the lesions (may be life-threatening if pharyngeal or tracheal involvement)—may require corticosteroid.

- **INTERACTIONS** → Appendix 1 (sodium stibogluconate). Caution with concomitant use of drugs that prolong QT interval.
- **SIDE-EFFECTS**
 - ▶ **Rare** Bleeding from gums · bleeding from nose · fever · flushing · jaundice · rash · substernal pain · sweating · vertigo
 - ▶ **Frequency not known** Abdominal pain · anaphylaxis · anorexia · arthralgia · coughing · diarrhoea · ECG changes · headache · lethargy · myalgia · nausea · pain on intramuscular injection · pain on intravenous administration · pancreatitis · thrombosis on intravenous administration · vomiting
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Avoid in significant impairment.
- **MONITORING REQUIREMENTS** Monitor ECG before and during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain occur. Injection should be filtered immediately before administration using a filter of 5 microns or less.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Pentostam** (GlaxoSmithKline UK Ltd)

Antimony pentavalent (as Sodium stibogluconate) 100 mg per 1 ml Pentostam 10g/100ml solution for injection vials | 1 vial **PoM** £66.43

5.2 Malaria

Antimalarials

Artemether with lumefantrine

Artemether with lumefantrine p. 534 is licensed for the treatment of acute non-complicated falciparum malaria.

Chloroquine

Chloroquine p. 536 is used for the *prophylaxis of malaria* in areas of the world where the *risk of chloroquine-resistant falciparum malaria is still low*. It is also used with proguanil hydrochloride p. 539 when chloroquine-resistant falciparum malaria is present but this regimen may not give optimal protection (see recommended regimens for prophylaxis against malaria in Malaria, prophylaxis below).

Chloroquine is **no longer recommended** for the *treatment of falciparum malaria* owing to widespread resistance, nor is it recommended if the infective species is *not known* or if the infection is *mixed*; in these cases treatment should be with quinine p. 540, *Malarone*®, or *Riamet*®. It is still recommended for the *treatment of non-falciparum malaria*.

Mefloquine

Mefloquine p. 537 is used for the *prophylaxis of malaria* in areas of the world where there is a *high risk of chloroquine-resistant falciparum malaria* (for details, see recommended regimens for prophylaxis against malaria in Malaria, prophylaxis below).

Mefloquine is now rarely used for the *treatment of falciparum malaria* because of increased resistance. It is rarely used for the *treatment of non-falciparum malaria* because better tolerated alternatives are available. Mefloquine should not be used for treatment if it has been used for prophylaxis.

Piperavaquine with arteminol

Arteminol with piperavaquine phosphate p. 535 is not recommended for the first-line treatment of acute uncomplicated falciparum malaria because there is limited experience of its use in travellers who usually reside in areas where malaria is not endemic. Piperavaquine has a long half-life.

Primaquine

Primaquine p. 538 is used to eliminate the liver stages of *P. vivax* or *P. ovale* following chloroquine treatment.

Proguanil

Proguanil hydrochloride p. 539 is used (usually with chloroquine, but occasionally alone) for the *prophylaxis of malaria*, (for details, see Recommended regimens for prophylaxis against malaria p. 530).

Proguanil hydrochloride used alone is not suitable for the *treatment of malaria*; however, *Malarone*® (a combination of atovaquone with proguanil hydrochloride p. 536) is licensed for the treatment of acute uncomplicated falciparum malaria. *Malarone*® is also used for the *prophylaxis of falciparum malaria* in areas of *widespread mefloquine or chloroquine resistance*. *Malarone*® is also used as an alternative to mefloquine or doxycycline p. 496. *Malarone*® is particularly suitable for short trips to highly chloroquine-resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

Pyrimethamine

Pyrimethamine p. 539 should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine is not recommended for the *prophylaxis of malaria*, but can be used in the *treatment of falciparum malaria with (or following) quinine*.

Quinine

Quinine is not suitable for the *prophylaxis of malaria*.

Quinine is used for the *treatment of falciparum malaria* or if the infective species is *not known* or if the infection is *mixed* (for details see Malaria, treatment p. 529).

Tetracyclines

Doxycycline p. 496 is used in adults and children over 12 years for the *prophylaxis of malaria* in areas of *widespread mefloquine or chloroquine resistance*. Doxycycline is also used as an alternative to mefloquine or *Malarone*® (for details,

see Recommended regimens for prophylaxis against malaria p. 530).

Malaria, prophylaxis

Prophylaxis

The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists; the advice is aimed at residents of the UK who travel to endemic areas. The choice of drug for a particular individual should take into account:

- risk of exposure to malaria
- extent of drug resistance
- efficacy of the recommended drugs
- side-effects of the drugs
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen)

Protection against bites

Prophylaxis is not absolute, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important. Mosquito nets impregnated with permethrin p. 1015 provide the most effective barrier protection against insects; mats and vaporised insecticides are also useful. Diethyltoluamide (DEET) 20–50% in lotions, sprays, or roll-on formulations is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. When sunscreen is also required, DEET should be applied after the sunscreen. Long sleeves and trousers worn after dusk also provide protection against bites.

Length of prophylaxis

In order to determine tolerance and to establish habit, prophylaxis should generally be started one week (2–3 weeks in the case of mefloquine p. 537) before travel into an endemic area; *Malarone*® or doxycycline p. 496 prophylaxis should be started 1–2 days before travel. Prophylaxis should be continued for **4 weeks after leaving** (except for *Malarone*® prophylaxis which should be stopped 1 week after leaving).

In those requiring long-term prophylaxis, chloroquine p. 536 and proguanil hydrochloride p. 539 may be used for periods of over 5 years. Mefloquine is licensed for up to 1 year (although, if it is tolerated in the short term, there is no evidence of harm when it is used for up to 3 years). Doxycycline can be used for up to 2 years. *Malarone*® can be used for up to 1 year. Prophylaxis with mefloquine, doxycycline, or *Malarone*® may be considered for longer durations if it is justified by the risk of exposure to malaria. Specialist advice should be sought for long-term prophylaxis.

Return from malarial region

It is important to be aware that **any illness** that occurs within 1 year and **especially within 3 months of return might be malaria** even if all recommended precautions against malaria were taken. Travellers should be **warned** of this and told that if they develop any illness **particularly within 3 months** of their return they should go **immediately** to a doctor and specifically mention their exposure to malaria.

Epilepsy

Both chloroquine p. 536 and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In areas *without chloroquine resistance* proguanil alone is recommended; in areas *with chloroquine resistance*, doxycycline or *Malarone*® may be considered.

Asplenia

Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

Renal impairment

Avoidance (or dosage reduction) of proguanil hydrochloride p. 539 is recommended since it is excreted by the kidneys. *Malarone*[®] should not be used for prophylaxis in patients with estimated glomerular filtration rate less than 30 mL/minute/1.73m². Chloroquine p. 536 is only partially excreted by the kidneys and reduction of the dose for prophylaxis is not required except in severe impairment. Mefloquine is considered to be appropriate to use in renal impairment and does not require dosage reduction. Doxycycline is also considered to be appropriate.

Pregnancy

Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil hydrochloride can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined, particularly in Sub-Saharan Africa; in the case of proguanil hydrochloride, folic acid p. 836 (dosed as a pregnancy at 'high-risk' of neural tube defects) should be given for at least the first trimester. The centres listed (see Malaria, treatment below) should be consulted for advice on prophylaxis in chloroquine-resistant areas. Although the manufacturer advises that mefloquine should not be used during pregnancy, particularly in the first trimester, unless the potential benefit outweighs the risk, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas. Doxycycline p. 496 is contra-indicated during pregnancy; however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks' gestation [unlicensed]. *Malarone*[®] should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative.

Breast-feeding

Prophylaxis is required in **breast-fed infants**; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

Anticoagulants

Travellers taking warfarin sodium p. 121 should begin chemoprophylaxis 2–3 weeks before departure. The INR should be stable before departure. It should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

Standby treatment

Travellers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be **avoided** if medical help is accessible.

In order to avoid excessive self-medication, the traveller should be provided with **written instructions** that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

Specific recommendations

Where a journey requires two regimens, the regimen for the higher risk area should be used for the whole journey. Those travelling to remote or little-visited areas may require expert advice. See also Recommended regimens for prophylaxis against malaria p. 530

Important

Settled immigrants (or long-term visitors) to the UK may be unaware that **any immunity they may have acquired while living in malarious areas is lost rapidly** after migration to the UK, or that any non-malarious areas where they lived previously **may now be malarious**.

Malaria, treatment

A number of specialist centres are able to provide advice on specific problems.

Treatment of malaria

Recommendations on the treatment of malaria reflect guidelines agreed by UK malaria specialists.

If the infective species is **not known**, or if the infection is **mixed**, initial treatment should be as for **falciparum malaria** with quinine p. 540, *Malarone*[®] (atovaquone with proguanil hydrochloride p. 536), or *Riamet*[®] (artemether with lumefantrine p. 534). Falciparum malaria can progress rapidly in unprotected individuals and antimalarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.

Falciparum malaria (treatment)

Falciparum malaria (malignant malaria) is caused by *Plasmodium falciparum*. In most parts of the world *P. falciparum* is now resistant to chloroquine p. 536 which should not therefore be given for treatment.

Quinine, *Malarone*[®] (atovaquone with proguanil hydrochloride p. 536), or *Riamet*[®] (artemether with lumefantrine) can be given *by mouth* if the patient can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given *by intravenous infusion* if the patient is seriously ill or unable to take tablets. Mefloquine p. 537 is now rarely used for treatment because of concerns about resistance.

Oral quinine is given by mouth for 5–7 days, together with or followed by either doxycycline p. 496 for 7 days or

Key to recommended regimens for prophylaxis against malaria

Codes for regimens	Details of regimens for prophylaxis against malaria
1	Chemoprophylaxis not recommended, but avoid mosquito bites and consider malaria if fever presents
2	Chloroquine only
3	Chloroquine with proguanil
4	Atovaquone with proguanil hydrochloride or doxycycline or mefloquine
5	Atovaquone with proguanil hydrochloride or doxycycline

Specific recommendations

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Afghanistan	Risk below 2000 m from May–November	3
	Low risk below 2000 m from December–April	1
Algeria	Very low risk in Illizi department only	1
Andaman and Nicobar Islands (India)	Risk present	1
Angola	High risk	4
Argentina	Low risk in low altitude areas of Salta provinces bordering Bolivia and in Chaco, Corrientes, and Misiones provinces close to border with Paraguay and Brazil	2
	No risk in Iguazu Falls and areas other than those above	1
Armenia	No risk	1
Azerbaijan	Low to no risk	1
Bangladesh	High risk in Chittagong Hill Tract districts (but not Chittagong city)	4
	Low to no risk in Chittagong city and other areas, except Chittagong Hill Tract districts	1
Belize	Low risk in rural areas	2
	No risk in Belize district (including Belize city and islands)	1
Benin	High risk	4
Bhutan	Risk in southern belt districts, along border with India: Chukha, Geyleg-phug, Samchi, Samdrup Jonkhar, and Shemgang	3
	Low to no risk in areas other than those above	1
Bolivia	High risk in Amazon basin	4
	Risk in rural areas below 2500 m (other than above)	2
	No risk above 2500 m	1
Botswana	High risk from November–June in northern half, including Okavango Delta area	4
	Low risk from July–October in northern half; low to no risk all year in southern half	1
Brazil	Risk in Amazon basin, including city of Manaus	4
	Very low risk in areas other than those above, and no risk in Iguazu Falls	1
Brunei Darussalam	Very low risk	1
Burkina Faso	High risk	4
Burundi	High risk	4
Cambodia	High risk, with widespread chloroquine and mefloquine resistance, in western provinces bordering Thailand	5
	High risk in areas other than those above and below	4
	Very low risk in Angkor Wat and Lake Tonle Sap, including Siem Reap; no risk in Phnom Penh	1
Cameroon	High risk	4
Cape Verde	Very low risk on island of Santiago (Sao Tiago) and Boa Vista	1
Central African Republic	High risk	4
Chad	High risk	4
China	High risk in Yunnan and Hainan provinces	4
	Very low risk in areas other than those above and below	1
	No risk in Hong Kong	-
Colombia	High risk in rural areas below 1600 m	4
	Low to no risk above 1600 m and in Cartagena	1

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Comoros	High risk	4
Congo	High risk	4
Costa Rica	Risk in Limon province (but not city of Limon)	2
	Very low risk in areas other than those above	1
Cote d'Ivoire (Ivory Coast)	High risk	4
Democratic Republic of the Congo	High risk	4
Djibouti	High risk	4
Dominican Republic	Risk in all areas except cities of Santiago and Santo Domingo	2
	Cities of Santiago and Santo Domingo	1
East Timor (Timor-Leste)	High risk	4
Ecuador	Risk in areas below 1500 m including coastal provinces and Amazon basin (no risk in Galapagos islands or city of Guayaquil)	4
Egypt	No risk	1
El Salvador	Low risk in rural areas of Santa Ana, Ahuachapán, and La Unión provinces in western part of country; low to no risk in other areas	1
Equatorial Guinea	High risk	4
Eritrea	High risk below 2200 m	4
Ethiopia	High risk below 2000 m	4
French Guiana	High risk (particularly in border areas) except city of Cayenne or Devil's Island (Ile du Diable)	4
	No risk in city of Cayenne or Devil's Island (Ile du Diable)	1
Gabon	High risk	4
Gambia	High risk	4
Georgia	Very low risk in rural south east from June–October	1
Ghana	High risk	4
Guatemala	Low risk below 1500 m	2
	No risk in Guatemala City, Antigua, or Lake Atitlan	-
Guinea	High risk	4
Guinea-Bissau	High risk	4
Guyana	High risk in all interior regions	4
	Very low risk in Georgetown and coastal region	1
Haiti	Risk present	2
Honduras	Risk below 1000 m and in Roatán and other Bay Islands (no risk in San Pedro Sula or Tegucigalpa)	2
India	High risk in states of Assam and Orissa, districts of East Godavari, Srikakulam, Vishakhapatnam, and Vizianagaram in the state of Andhra Pradesh, and districts of Balaghat, Dindori, Mandla, and Seoni in the state of Madhya Pradesh	4
	Risk in areas other than those above or below (including Goa, Andaman and Nicobar islands)	1
	No risk in Lakshadweep islands	-
Indonesia	High risk in Lombok and Irian Jaya (Papua)	4
	Risk in areas other than those above or below	3
	Very low risk in Bali, and cities on islands of Java and Sumatra	1
	No risk in city of Jakarta	-
Indonesia (Borneo)	High risk	4
Iran	Risk from March–November in rural south eastern provinces and in north, along Azerbaijan border in Ardabil, and near Turkmenistan border in North Khorasan	3
	Low to no risk in areas other than those above	1
Iraq	Very low risk from May–November in rural northern area below 1500 m	1
Kenya	High risk below 2500 m (except city of Nairobi)	4
	Very low risk in the highlands above 2500 m and in city of Nairobi	1
Kyrgyzstan	Very low risk from June–October in southwest areas bordering Tajikistan and Uzbekistan	1

5	Atovaquone with proguanil hydrochloride or doxycycline

Specific recommendations

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Laos	High risk along the border with Myanmar in the provinces of Bokeo and Louang Namtha, and along the border with Thailand in the province of Champasak and Saravan	5
	High risk in areas other than those above or below	4
	Low to no risk in city of Vientiane	1
Liberia	High risk	4
Libya	No risk	1
Madagascar	High risk	4
Malawi	High risk	4
Malaysia	Risk in inland forested areas of peninsular Malaysia	4
	Very low risk in rest of peninsular Malaysia, including Cameron Highlands and city of Kuala Lumpur	1
Malaysia (Borneo)	High risk in inland areas of eastern Sabah and in inland, forested areas of Sarawak	4
	Very low risk in areas other than those above, including coastal areas of Sabah and Sarawak	1
Mali	High risk	4
Mauritania	High risk all year in southern provinces, and from July–October in the north	4
	Low risk from November–June in north	1
Mauritius	No risk	1
Mayotte	Risk present	4
Mexico	Low risk in Oaxaca and Chiapas	2
	Very low risk in areas other than those above	1
Mozambique	High risk	4
Myanmar	High risk (but not in cities of Mandalay and Yangon)	5
	No risk in cities of Mandalay and Yangon	1
Namibia	High risk all year in regions of Caprivi Strip, Kavango, and Kunene river, and from November–June in northern third of country	4
	Low to no risk in areas other than those above; low risk from July–October in northern third of country	1
Nepal	Risk below 1500 m, particularly in Terai district	3
	No risk in city of Kathmandu and on typical Himalayan treks	1
Nicaragua	Low risk (except Managua)	2
	Very low risk in Managua	1
Niger	High risk	4
Nigeria	High risk	4
North Korea	Very low risk in some southern areas	1
Pakistan	Risk below 2000 m	3
	Low to no risk above 2000 m	1
Panama	Risk east of Canal Zone	3
	Low risk west of Canal Zone	2
	No risk in Panama City or Canal Zone itself	1
Papua New Guinea	High risk below 1800 m	4
	Low to no risk above 1800 m	1
Paraguay	Low risk in departments of Alto Paraná and Caaguazú	2
	Very low risk in areas other than those above	1

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Peru	High risk in Amazon basin along border with Brazil, particularly in Loreto province	4
	Risk in rural areas below 2000 m (other than those above and below) and in part of the Amazon basin that borders Bolivia	2
	No risk in city of Lima and coastal region south of Chiclayo	1
Philippines	Risk in rural areas below 600 m and on islands of Luzon, Mindanao, Mindoro, and Palawan	3
	No risk in cities or on islands of Boracay, Bohol, Catanduanes, Cebu, or Leyte	1
Rwanda	High risk	4
São Tomé and Príncipe	High risk	4
Saudi Arabia	Risk in south-western provinces along border with Yemen, including below 2000 m in Asir province	3
	No risk in cities of Jeddah, Makkah (Mecca), Medina, Riyadh, or Ta'if, or above 2000 m in Asir province	1
Senegal	High risk	4
Sierra Leone	High risk	4
Solomon Islands	High risk	4
Somalia	High risk	4
South Africa	Moderate risk from September–May in low altitude areas of Mpumalanga and Limpopo, which border Mozambique and Zimbabwe (including Kruger National Park)	4
	Low risk in north-east KwaZulu-Natal	1
	Low risk in areas bordering those above	1
South Korea	Very low risk in northern areas, in Gangwon-do and Gyeonggi-do provinces, and Incheon city (towards Demilitarized Zone)	1
South Sudan	High risk	4
Sri Lanka	Low risk north of Vavuniya	1
	Very low risk in areas other than those above and below	1
	No risk in Colombo or Kandy	-
Sudan	High risk in central and southern areas; risk also present in rest of country (except Khartoum)	4
	Very low risk in Khartoum	1
Suriname	High risk (except coastal districts or city of Paramaribo)	4
	Very low risk in coastal districts; no risk in city of Paramaribo	1
Swaziland	High risk in northern and eastern regions bordering Mozambique and South Africa, including all of Lubombo district and Big Bend, Mhlume, Simunye, and Tshaneni regions	4
	Very low risk in the areas other than those above	1
Syria	Very low risk in small, remote foci of El Hasakah	1
Tajikistan	Risk below 2000 m from June–October	3
	Low risk below 2000 m from November–May	1
Tanzania	High risk below 1800 m; risk also in Zanzibar	4
Thailand	High risk, with chloroquine and mefloquine resistance, in rural forested borders with Cambodia, Laos, and Myanmar	5
	Very low risk in areas other than those above, including Kanchanaburi (Kwai Bridge); no risk in cities of Bangkok, Chiang Mai, Chiang Rai, Koh Phangan, Koh Samui, and Pattaya	1
Togo	High risk	4
Turkey	Low risk from May–October along the border plain with Syria, around Adana and east of Adana	2
	Very low risk from November–April along the border plain with Syria, around Adana and east of Adana; very low risk all year in rest of country	1
Uganda	High risk	4
Uzbekistan	Very low risk in extreme south-east	1
Vanuatu	Risk present	4
Venezuela	High risk in all areas south of, and including, the Orinoco river and Angel Falls	4
	Risk in rural areas of Apure, Monagas, Sucre, and Zulia states	3
	No risk in city of Caracas or on Margarita Island	1

Key to recommended regimens for prophylaxis against malaria

Codes for regimens	Details of regimens for prophylaxis against malaria
1	Chemoprophylaxis not recommended, but avoid mosquito bites and consider malaria if fever presents
2	Chloroquine only
3	Chloroquine with proguanil
4	Atovaquone with proguanil hydrochloride or doxycycline or mefloquine
5	Atovaquone with proguanil hydrochloride or doxycycline

Specific recommendations

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Vietnam	Risk in rural areas, and in southern provinces of Tay Ninh, Lam Dong, Dac Lac, Gia Lai, and Kon Tum	5
	Very low risk in Mekong river delta until border area with Cambodia; no risk in large cities (including Ho Chi Minh (Saigon) and Hanoi), Red river delta, and coastal areas north of Nha Trang	1
Western Sahara	No risk	1
Yemen	Risk below 2000 m	3
	Very low risk on Socotra Island; no risk above 2000 m, including Sana'a city	1
Zambia	High risk	4
Zimbabwe	High risk all year in Zambezi valley, and from November–June in areas below 1200 m	4
	Low risk from July–October in areas below 1200 m; very low risk all year in Harare and Bulawayo	1

clindamycin p. 467 for 7 days [unlicensed].

If the parasite is likely to be sensitive, pyrimethamine with sulfadoxine p. 540 as a single dose [unlicensed] may be given (instead of either clindamycin p. 467 or doxycycline p. 496) together with, or after, a course of quinine.

Alternatively, *Malarone*[®], or *Riamet*[®] may be given instead of quinine. It is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after *Malarone*[®] or *Riamet*[®] treatment.

If the patient is seriously ill or unable to take tablets, or if more than 2% of red blood cell are parasitized, quinine should be given by *intravenous infusion* [unlicensed] (until patient can swallow tablets to complete the 7-day course *together with* or *followed by either* doxycycline p. 496 or clindamycin p. 467).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine p. 540, infection acquired in quinine-resistant areas of south east Asia) because intravenous *artesunate* may be available for 'named-patient' use.

Pregnancy

Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The adult treatment doses or oral and intravenous quinine (including the loading dose) can safely be given to pregnant women. Clinamycin should be given after quinine [unlicensed indication]. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development); pyrimethamine with sulfadoxine, *Malarone*[®], and *Riamet*[®] are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for 'named patient' use.

Non-falciparum malaria (treatment)

Non-falciparum malaria is usually caused by *Plasmodium vivax* and less commonly by *P. ovale* and *P. malariae*. *P. knowlesi* is also present in the Asia-Pacific region. Chloroquine p. 536 is the drug of choice for the treatment of non-falciparum malaria (but chloroquine-resistant *P. vivax* has been reported in the Indonesian archipelago, the Malay

Peninsula, including Myanmar, and eastward to Southern Vietnam).

For the treatment of chloroquine-resistant non-falciparum malaria, *Malarone*[®] [unlicensed indication], quinine, or *Riamet*[®] [unlicensed indication] can be used; as with chloroquine p. 536, primaquine p. 538 should be given for radical cure.

Chloroquine p. 536 alone is adequate for *P. malariae* and *P. knowlesi* infections but in the case of *P. vivax* and *P. ovale*, a *radical cure* (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with primaquine p. 538 [unlicensed] given after chloroquine, with the dose dependent on the infecting organism. For a radical cure, primaquine [unlicensed] is then given for 14 days, with the dose also dependent on the infecting organism.

Parenteral

Parenteral If the patient is unable to take oral therapy, quinine p. 540 can be given by intravenous infusion [unlicensed], changed to oral chloroquine p. 536 as soon as the patient's condition permits.

Pregnancy

The adult treatment doses of chloroquine p. 536 can be given for non-falciparum malaria. In the case of *P. vivax* or *P. ovale*, however, the radical cure with primaquine p. 538 should be **postponed** until the pregnancy is over; instead chloroquine p. 536 should be continued, given weekly during the pregnancy.

Artemether with lumefantrine

INDICATIONS AND DOSE

Treatment of acute uncomplicated falciparum malaria | Treatment of chloroquine-resistant non-falciparum malaria

BY MOUTH

- Adult (body-weight 35 kg and above): Initially 4 tablets, followed by 4 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 24 tablets over 60 hours)

- **UNLICENSED USE** Use in treatment of non-falciparum malaria is an unlicensed indication.
- **CONTRA-INDICATIONS** Family history of congenital QT interval prolongation · family history of sudden death · history of arrhythmias · history of clinically relevant bradycardia · history of congestive heart failure accompanied by reduced left ventricular ejection fraction
- **CAUTIONS** Avoid in Acute porphyrias p. 864 · electrolyte disturbances
- **INTERACTIONS** → Appendix 1 (artemether with lumefantrine). Caution if concomitant use with other drugs known to cause QT-interval prolongation.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anorexia · arthralgia · asthenia · cough · diarrhoea · dizziness · headache · myalgia · nausea · palpitation · paraesthesia · prolonged QT interval · pruritus · rash · sleep disturbances · vomiting
 - ▶ **Uncommon** Ataxia · clonus · hypoaesthesia
- **PREGNANCY** Toxicity in *animal* studies with artemether. Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid breastfeeding for at least 1 week after last dose. Present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment. In severe renal impairment monitor ECG and plasma potassium concentration.
- **MONITORING REQUIREMENTS** Monitor patients unable to take food (greater risk of recrudescence).
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed just before administration.
- **PATIENT AND CARER ADVICE** Dizziness may affect performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Riamet** (Novartis Pharmaceuticals UK Ltd)
Artemether 20 mg, Lumefantrine 120 mg Riamet tablets | 24 tablet [PoM] £22.50

Arteminol with piperazine phosphate (Piperazine tetraphosphate with dihydroartemisinin)

INDICATIONS AND DOSE

Treatment of uncomplicated falciparum malaria

BY MOUTH

- ▶ Child 6 months–17 years (body-weight 7–12 kg): 0.5 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- ▶ Child 6 months–17 years (body-weight 13–23 kg): 1 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- ▶ Child 6 months–17 years (body-weight 24–35 kg): 2 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- ▶ Child 6 months–17 years (body-weight 36–74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months;

second course given at least 2 months after first course

- ▶ Adult (body-weight 36–74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- ▶ Adult (body-weight 75 kg and over): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

- **CONTRA-INDICATIONS** Acute myocardial infarction · bradycardia · congenital long QT syndrome · electrolyte disturbances · family history of sudden death · heart failure with reduced left ventricular ejection fraction · history of symptomatic arrhythmias · left ventricular hypertrophy · risk factors for QT interval prolongation · severe hypertension
- **INTERACTIONS** → Appendix 1 (artemimol with piperazine). Piperazine has a long half-life; there is a potential for drug interactions to occur for up to 3 months after treatment has been stopped. Concomitant use with other drugs known to prolong the QT interval contra-indicated.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain (in children) · anaemia · blood disorders (in children) · conjunctivitis (in children) · cough (in children) · diarrhoea (in children) · headache (in adults) · irregular heart rate (in children) · leucopenia (in children) · malaise · QT interval prolonged · rash (in children) · tachycardia (in adults) · thrombocytopenia (in children) · vomiting (in children)
 - ▶ **Uncommon** Abdominal pain (in adults) · acanthosis (in children) · anorexia (in adults) · arrhythmias · arthralgia · bradycardia (in adults) · convulsions · cough (in adults) · diarrhoea (in adults) · dizziness (in adults) · headache (in children) · heart murmur (in children) · hepatitis · hepatomegaly · influenza-like symptoms · jaundice (in children) · myalgia (in adults) · nausea · pruritus (in adults) · stomatitis (in children) · vomiting (in adults)
- **PREGNANCY** Teratogenic in *animal* studies—manufacturer advises use only if other antimalarials cannot be used.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** No information available in moderate to severe impairment. Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe hepatic impairment.
- **RENAL IMPAIRMENT** No information available in moderate to severe impairment. Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe renal impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Obtain ECG as soon as possible after starting treatment then continue monitoring in those taking medicines that increase plasma-piperazine concentration, in children who are vomiting, in females, or in the elderly.
 - ▶ Consider obtaining ECG in all patients before third dose and 4–6 hours after third dose.
 - ▶ If QT_c interval more than 500 milliseconds, discontinue treatment and monitor ECG for a further 24–48 hours.
- **DIRECTIONS FOR ADMINISTRATION** Tablets to be taken at least 3 hours before and at least 3 hours after food. Tablets may be crushed and mixed with water immediately before administration.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tablets containing piperazine phosphate with arteminol.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Eurartesim** (Sigma-Tau Pharma Ltd) ▼
Arteminol 40 mg, Piperaquine phosphate 320 mg Eurartesim 320mg/40mg tablets | 12 tablet [PoM] £40.00

Atovaquone with proguanil hydrochloride

INDICATIONS AND DOSE**MALARONE®**

Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected

BY MOUTH

- ▶ Adult (body-weight 40 kg and above): 1 tablet daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving

Treatment of acute uncomplicated falciparum malaria | Treatment of non-falciparum malaria

BY MOUTH

- ▶ Adult (body-weight 11–20 kg): 1 tablet once daily for 3 days
- ▶ Adult (body-weight 21–30 kg): 2 tablets once daily for 3 days
- ▶ Adult (body-weight 31–40 kg): 3 tablets once daily for 3 days
- ▶ Adult (body-weight 41 kg and above): 4 tablets once daily for 3 days

- **UNLICENSED USE** Not licensed for treatment of non-falciparum malaria.
- **CAUTIONS** Diarrhoea or vomiting (reduced absorption of atovaquone) · efficacy not evaluated in cerebral or complicated malaria (including hyperparasitaemia, pulmonary oedema or renal failure)
- **INTERACTIONS** → Appendix 1 (proguanil, atovaquone).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · abnormal dreams · anorexia · cough · depression · diarrhoea · dizziness · fever · headache · insomnia · nausea · pruritus · rash · vomiting
 - ▶ **Uncommon** Anxiety · blood disorders · hair loss · hyponatraemia · palpitation · stomatitis
 - ▶ **Frequency not known** Cholestasis · hallucinations · hepatitis · mouth ulcers · photosensitivity · seizures · Stevens-Johnson syndrome · tachycardia · vasculitis
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Use only if no suitable alternative available.
- **RENAL IMPAIRMENT** Avoid for malaria prophylaxis (and if possible for malaria treatment) if eGFR less than 30 mL/minute/1.73m².
- **PATIENT AND CARER ADVICE** Warn travellers about importance of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NHS restrictions Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed.
- **MEDICAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Chloroquine

INDICATIONS AND DOSE

Active rheumatoid arthritis (administered on expert advice) | Systemic and discoid lupus erythematosus (administered on expert advice)

BY MOUTH

- ▶ Adult: 150 mg daily; maximum 2.5 mg/kg per day

Prophylaxis of malaria**INITIALLY BY MOUTH USING SYRUP**

- ▶ Child 6 weeks–5 months (body-weight 4.5–8 kg): 50 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 6–11 months (body-weight 8–11 kg): 75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 1–2 years (body-weight 11–15 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 3–4 years (body-weight 15–16.5 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 4–7 years (body-weight 16.5–25 kg): 150 mg once weekly, alternatively (by mouth using tablets) 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 8–12 years (body-weight 25–45 kg): 225 mg once weekly, alternatively (by mouth using tablets) 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 13–17 years (body-weight 45 kg and above): 310 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Adult (body-weight 45 kg and above): 310 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

Treatment of non-falciparum malaria**BY MOUTH**

- ▶ Child: Initially 10 mg/kg (max. per dose 620 mg), then 5 mg/kg after 6–8 hours (max. per dose 310 mg), then 5 mg/kg daily (max. per dose 310 mg) for 2 days
- ▶ Adult: Initially 620 mg, then 310 mg after 6–8 hours, then 310 mg daily for 2 days, approximate total cumulative dose of 25 mg/kg of base

P. vivax or *P. ovale* infection during pregnancy while radical cure is postponed

BY MOUTH

- ▶ Adult: 310 mg once weekly

Doses at extremes of body-weight

In active rheumatoid arthritis and systemic and discoid lupus erythematosus, to avoid excessive dosage in obese patients, the daily maximum dose should be calculated on the basis of ideal body weight.

Dose equivalence and conversion

Doses expressed as chloroquine base. Chloroquine base 150 mg = chloroquine sulfate 200 mg = chloroquine phosphate 250 mg (approx).

- **UNLICENSED USE** Chloroquine doses for the treatment and prophylaxis of malaria in BNF publications may differ from those in product literature.

Important safety information

Ocular toxicity is unlikely if the adult dose of chloroquine phosphate does not exceed 4 mg/kg daily (equivalent to chloroquine base approx. 2.5 mg/kg daily).

- **CAUTIONS** Acute porphyrias p. 864 · elderly · G6PD deficiency · long-term therapy (regular ophthalmic examination recommended by manufacturers) · may aggravate myasthenia gravis · may exacerbate psoriasis · neurological disorders, especially epilepsy (avoid for prophylaxis of malaria if history of epilepsy) · severe gastro-intestinal disorders

CAUTIONS, FURTHER INFORMATION

Screening for ocular toxicity A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening adults to prevent ocular toxicity on long-term treatment with chloroquine and hydroxychloroquine (*Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening 2009*). Chloroquine should be considered (for treating chronic inflammatory conditions) **only** if other drugs have failed. All patients taking chloroquine should receive ocular examination according to a protocol arranged locally between the prescriber and the ophthalmologist.

- **INTERACTIONS** → Appendix 1 (chloroquine, hydroxychloroquine).
Avoid concurrent therapy with hepatotoxic drugs.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Gastro-intestinal disturbances · headache · pruritus · rashes · skin reactions
 - ▶ **Uncommon** Convulsions · discoloration of mucous membranes · discoloration of nails · discoloration of skin · ECG changes · hair depigmentation · hair loss · keratopathy · ototoxicity · retinal damage · visual changes
 - ▶ **Rare** Acute generalised exanthematous pustulosis · agranulocytosis · angioedema · aplastic anaemia · blood disorders · bone marrow suppression · cardiomyopathy · emotional disturbances · exfoliative dermatitis · hepatic damage · hypersensitivity reactions · mental changes · myopathy · neuromyopathy · photosensitivity · psychosis · Stevens-Johnson syndrome · thrombocytopenia · urticaria
 - ▶ **Frequency not known** Diffuse parenchymal lung disease · drug rash with eosinophilia and systemic symptoms · extrapyramidal symptoms (associated with use in malaria) · hypotension · visual disturbances · bronchospasm (in children)

SIDE-EFFECTS, FURTHER INFORMATION

Malaria prophylaxis and treatment Serious skin reactions, ECG changes, visual effects, ototoxicity, blood disorders, mental changes, myopathies and hepatic damage are not usually associated with malaria prophylaxis or treatment.

Overdose Chloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

- **PREGNANCY** Benefit of use in prophylaxis and treatment in malaria outweighs risk. For rheumatoid disease, it is not necessary to withdraw an antimalarial drug during pregnancy if the disease is well controlled.
- **BREAST FEEDING** Present in breast milk and breast-feeding should be avoided when used to treat rheumatic disease. Amount in milk probably too small to be harmful when used for malaria.

- **HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment.
- **RENAL IMPAIRMENT** Only partially excreted by the kidneys and reduction of the dose is not required for prophylaxis of malaria except in severe impairment. For rheumatoid arthritis and lupus erythematosus, reduce dose. Manufacturers advise caution.
- **MONITORING REQUIREMENTS**
 - ▶ In adults Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory.
 - ▶ In children Ophthalmic examination with long-term therapy.
- **PATIENT AND CARER ADVICE** Warn travellers going to malarious areas about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NHS restrictions Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

INDICATIONS AND DOSE

Treatment of malaria

BY MOUTH

- ▶ Adult: (consult product literature)

continued →

Prophylaxis of malaria**BY MOUTH**

- ▶ Child (body-weight 5–15 kg): 62.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 16–24 kg): 125 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 25–44 kg): 187.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 1–17 years (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Adult (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving

- **UNLICENSED USE** Mefloquine doses in BNF Publications may differ from those in product literature. Not licensed for use in children under 5 kg body-weight and under 3 months.
- **CONTRA-INDICATIONS** Avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions · avoid for standby treatment if history of convulsions · history of blackwater fever
- **CAUTIONS** Cardiac conduction disorders · epilepsy (avoid for prophylaxis) · not recommended in infants under 3 months (5 kg) · traumatic brain injury

CAUTIONS, FURTHER INFORMATION

Neuropsychiatric reactions Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodromal for a more serious event. If neuropsychiatric symptoms occur, patients should be advised to discontinue mefloquine and to seek immediate medical attention so that mefloquine can be replaced with an alternative antimalarial. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life. Mefloquine is contraindicated for malaria prophylaxis in those with a history of psychiatric disorders or convulsions.

- **INTERACTIONS** → Appendix 1 (mefloquine).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · diarrhoea · dizziness · headache · nausea · neuropsychiatric reactions · pruritus · visual disturbances · vomiting
 - ▶ **Very rare** Optic neuropathy
 - ▶ **Frequency not known** Alopecia · amnesia · anorexia · arrhythmias · arthralgia · ataxia · blood disorders · bradycardia · cataract · chest pain · confusion · drowsiness · dyspepsia · dyspnoea · encephalopathy · fever · flushing · hepatic failure · hyperhidrosis · hypertension · hypotension · leucocytosis · leucopenia · malaise · motor neuropathies · muscle weakness · myalgia · oedema · palpitation · panic attacks · pneumonitis · rash · seizures · sensory neuropathies · speech disturbances · Stevens-Johnson syndrome · syncope · tachycardia · thrombocytopenia · tremor · vestibular disorders
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to quinine.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in *animal* studies).
- **PREGNANCY** Manufacturer advises avoid (particularly in the first trimester) unless the potential benefit outweighs

the risk; however, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas.

- **BREAST FEEDING** Present in milk but risk to infant minimal.
- **HEPATIC IMPAIRMENT** Elimination may be prolonged; avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **DIRECTIONS FOR ADMINISTRATION** Tablet may be crushed and mixed with food such as jam or honey just before administration.
- **PATIENT AND CARER ADVICE** Inform travellers about adverse reactions of mefloquine and, if they occur, to seek medical advice on alternative antimalarials before the next dose is due. Also warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and especially within 3 months of return. Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping mefloquine.
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - **NHS restrictions** Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 27

▶ **Lariam** (Roche Products Ltd)

Mefloquine (as Mefloquine hydrochloride) 250 mg Lariam 250mg tablets | 8 tablet (POM) £14.53

Primaquine**INDICATIONS AND DOSE**

Adjunct in the treatment of non-falciparum malaria caused by *P.vivax* infection

BY MOUTH

- ▶ Adult: 30 mg daily for 14 days

Adjunct in the treatment of non-falciparum malaria caused by *P.ovale* infection

BY MOUTH

- ▶ Adult: 15 mg daily for 14 days

Adjunct in the treatment of non-falciparum malaria caused by *P.vivax* infection in patients with mild G6PD deficiency (administered on expert advice)

Adjunct in the treatment of non-falciparum malaria caused by *P.ovale* infection in patients with mild G6PD deficiency (administered on expert advice)

BY MOUTH

- ▶ Adult: 45 mg once weekly for 8 weeks

Treatment of mild to moderate pneumocystis infection (in combination with clindamycin)

BY MOUTH

- ▶ Adult: 30 mg daily, this combination is associated with considerable toxicity

- **UNLICENSED USE** Not licensed.
- **CAUTIONS** G6PD deficiency · systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)
- **INTERACTIONS** → Appendix 1 (primaquine).

● SIDE-EFFECTS

► **Common or very common** Abdominal pain · anorexia · nausea · vomiting

► **Uncommon** Haemolytic anaemia especially in G6PD deficiency · leucopenia · methaemoglobinaemia

● **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinaemia in third trimester.

● **BREAST FEEDING** No information available; theoretical risk of haemolysis in G6PD-deficient infants.

● **PRE-TREATMENT SCREENING** Before starting primaquine, blood should be tested for glucose-6-phosphate dehydrogenase (G6PD) activity since the drug can cause haemolysis in G6PD-deficient patients. Specialist advice should be obtained in G6PD deficiency.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

► PRIMAQUINE (Non-proprietary)

Primaquine (as Primaquine phosphate) 7.5 mg Primaquine 7.5mg tablets | 100 tablet no price available

Proguanil hydrochloride

INDICATIONS AND DOSE

Prophylaxis of malaria

BY MOUTH

- Child up to 11 weeks (body-weight up to 6 kg): 25 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 3–11 months (body-weight 6–9 kg): 50 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 1–3 years (body-weight 10–16 kg): 75 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 4–7 years (body-weight 16–25 kg): 100 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 8–12 years (body-weight 25–45 kg): 150 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 13–17 years (body-weight 46 kg and above): 200 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
- Adult: 200 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

● **UNLICENSED USE** Proguanil doses in BNF Publications may differ from those in product literature.

● **INTERACTIONS** → Appendix 1 (proguanil).

● SIDE-EFFECTS

► **Common or very common** Constipation · diarrhoea · mild gastric intolerance

► **Very rare** Cholestasis · hair loss · skin reactions · vasculitis

► **Frequency not known** Mouth ulcers · stomatitis

● **PREGNANCY** Benefit of prophylaxis in malaria outweighs risk. Adequate folate supplements should be given to mother.

● **BREAST FEEDING** Amount in milk probably too small to be harmful when used for malaria prophylaxis.

● RENAL IMPAIRMENT

► In children Use half normal dose if estimated glomerular filtration rate 20–60 mL/minute/1.73m². Use one-quarter normal dose on alternate days if estimated glomerular filtration rate 10–20 mL/minute/1.73m². Use one-quarter normal dose once weekly if estimated glomerular

filtration rate less than 10 mL/minute/1.73m². Increased risk of haematological toxicity.

► In adults 100 mg once daily if eGFR

20–60 mL/minute/1.73m². 50 mg on alternate days if eGFR 10–20 mL/minute/1.73m². 50 mg once weekly if eGFR less than 10 mL/minute/1.73m². Increased risk of haematological toxicity.

● **DIRECTIONS FOR ADMINISTRATION** Tablet may be crushed and mixed with food such as milk, jam, or honey just before administration.

● **PATIENT AND CARER ADVICE** Warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return.

● NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed.

● **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 21

► **Paludrine** (Alliance Pharmaceuticals Ltd)

Proguanil hydrochloride 100 mg Paludrine 100mg tablets | 98 tablet [P] £10.45 DT price = £10.45

Also available in combination with *chloroquine*, p. 537

Pyrimethamine

INDICATIONS AND DOSE

Toxoplasmosis in pregnancy (in combination with sulfadiazine and folinic acid)

BY MOUTH

► Adult: 50 mg once daily until delivery

Congenital toxoplasmosis (in combination with sulfadiazine and folinic acid)

BY MOUTH

► Adult 18–28 years: 1 mg/kg twice daily for 2 days, then 1 mg/kg once daily for 6 months, then 1 mg/kg 3 times a week for 6 months

Malaria

► Adult: No dose stated because not recommended alone

● **CAUTIONS** History of seizures—avoid large loading doses · predisposition to folate deficiency

● **INTERACTIONS** → Appendix 1 (pyrimethamine).

● SIDE-EFFECTS

► **Common or very common** Anaemia (with high doses) · blood disorders (with high doses) · diarrhoea · dizziness · headache · leucopenia (with high doses) · nausea · rash · thrombocytopenia (with high doses) · vomiting

► **Uncommon** Abnormal skin pigmentation · fever

► **Very rare** Buccal ulceration · colic · convulsions

● **PREGNANCY** Theoretical teratogenic risk in *first trimester* (folate antagonist). Adequate folate supplements should be given to the mother.

● **BREAST FEEDING** Significant amount in milk—avoid administration of other folate antagonists to infant. Avoid breast-feeding during toxoplasmosis treatment.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution.

● **RENAL IMPAIRMENT** Manufacturer advises caution.

- **MONITORING REQUIREMENTS** Blood counts required with prolonged treatment.
- **LESS SUITABLE FOR PRESCRIBING** Pyrimethamine should not be used alone for malaria, but is used with sulfadoxine.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

- ▶ **Daraprim** (GlaxoSmithKline UK Ltd)
Pyrimethamine 25 mg Daraprim 25mg tablets | 30 tablet [PoM]
£13.00

Pyrimethamine with sulfadoxine

INDICATIONS AND DOSE

Adjunct to quinine in treatment of Plasmodium falciparum malaria

BY MOUTH

- ▶ Child 1 month–4 years (body-weight 5 kg and above): 12.5/250 mg for 1 dose
- ▶ Child 5–6 years: 25/500 mg for 1 dose
- ▶ Child 7–9 years: 37.5/750 mg for 1 dose
- ▶ Child 10–13 years: 50/1000 mg for 1 dose
- ▶ Child 14–17 years: 75/1500 mg for 1 dose
- ▶ Adult: 75/1500 mg for 1 dose

Malaria prophylaxis

BY MOUTH

- ▶ Adult: Not recommended by UK malaria experts

Dose equivalence and conversion

Dose quantities are expressed in the form x/y where x and y are the strengths in milligrams of pyrimethamine and sulfadoxine respectively.

- **UNLICENSED USE** Not licensed for use in children of body-weight under 5 kg.
- **CONTRA-INDICATIONS** Acute porphyrias p. 864
- **CAUTIONS** Asthma · avoid in blood disorders (unless under specialist supervision) · avoid in infants under 6 weeks · elderly · G6PD deficiency · history of seizures—avoid large loading doses · not recommended for prophylaxis (severe side-effects on long-term use) · predisposition to folate deficiency · predisposition to hyperkalaemia (in adults)
- **INTERACTIONS** → Appendix 1 (pyrimethamine, sulfonamides).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Diarrhoea · headache · hyperkalaemia · nausea · rash
 - ▶ **Uncommon** Vomiting
 - ▶ **Very rare** Anorexia · antibiotic-associated colitis · arthralgia · aseptic meningitis · ataxia · blood disorders · convulsions · cough · depression · eosinophilia · glossitis · hallucinations · hepatic necrosis · hypoglycaemia · hyponatraemia · interstitial nephritis · jaundice · leucopenia · liver damage · megaloblastic anaemia · myalgia · myocarditis · pancreatitis · peripheral neuropathy · photosensitivity · renal disorders · rhabdomyolysis reported in HIV-infected patients · shortness of breath · Stevens-Johnson syndrome · stomatitis · systemic lupus erythematosus · thrombocytopenia · tinnitus · toxic epidermal necrolysis · uveitis · vasculitis · vertigo
 - ▶ **Frequency not known** Allergic alveolitis · eosinophilic alveolitis · pulmonary infiltrates

SIDE-EFFECTS, FURTHER INFORMATION

Discontinue immediately if blood disorders or rash occur. Discontinue if cough or shortness of breath occur.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with sulfonamide allergy.
- **PREGNANCY** Possible teratogenic risk in *first trimester* (pyrimethamine a folate antagonist); in *third trimester*—risk of neonatal haemolysis and methaemoglobinemia. Fear of increased risk of kernicterus in neonates appears to be unfounded.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants; risk of haemolysis in G6PD-deficient infants (due to sulfadoxine).
- **MONITORING REQUIREMENTS** Monitor blood counts on prolonged treatment.
- **PATIENT AND CARER ADVICE** Patients should be advised to maintain adequate fluid intake.
- **MEDICINAL FORMS**
Medicines not identified.

Quinine

INDICATIONS AND DOSE

Nocturnal leg cramps

BY MOUTH

- ▶ Adult: 200–300 mg once daily, to be taken at bedtime

Non-falciparum malaria

BY INTRAVENOUS INFUSION

- ▶ Adult: 10 mg/kg every 8 hours (max. per dose 700 mg), infused over 4 hours, given if patient is unable to take oral therapy. Changed to oral chloroquine as soon as the patient's condition permits

Falciparum malaria

BY MOUTH

- ▶ Child: 10 mg/kg every 8 hours (max. per dose 600 mg) for 7 days together with or followed by either clindamycin or, in children over 12 years, doxycycline
- ▶ Adult: 600 mg every 8 hours for 5–7 days, the quinine should be given together with or followed by either doxycycline or clindamycin

BY INTRAVENOUS INFUSION

- ▶ Adult: Loading dose 20 mg/kg (max. per dose 1.4 g), infused over 4 hours, the loading dose of 20 mg/kg should **not** be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by either doxycycline or clindamycin

Falciparum malaria (in intensive care unit)

BY INTRAVENOUS INFUSION

- ▶ Adult: Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by either doxycycline or clindamycin

Dose equivalence and conversion

When using quinine for malaria, doses are valid for quinine hydrochloride, dihydrochloride, and sulfate; they are **not valid** for quinine bisulfate which contains a correspondingly smaller amount of quinine. Quinine (anhydrous base) 100 mg = quinine bisulfate 169 mg; quinine dihydrochloride 122 mg; quinine hydrochloride 122 mg; and quinine sulfate 121 mg. Quinine bisulfate 300 mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulfate.

- **UNLICENSED USE** Injection not licensed.
- **CONTRA-INDICATIONS** Haemoglobinuria · myasthenia gravis · optic neuritis · tinnitus
- **CAUTIONS** Atrial fibrillation (monitor ECG during parenteral treatment) · cardiac disease (monitor ECG during parenteral treatment) · conduction defects (monitor ECG during parenteral treatment) · elderly (monitor ECG during parenteral treatment) (in adults) · G6PD deficiency · heart block (monitor ECG during parenteral treatment)
- **INTERACTIONS** → Appendix 1 (quinine).
- **SIDE-EFFECTS** Agitation · tinnitus · abdominal pain · acute renal failure · angioedema · blood disorders · cardiovascular effects · cinchonism · confusion · diarrhoea · dyspnoea · flushed skin · headache · hearing impairment · hot skin · hypersensitivity reactions · hypoglycaemia (especially after parenteral administration) · intravascular coagulation · muscle weakness · nausea · photosensitivity · rashes · temporary blindness · thrombocytopenia · vertigo · visual disturbances · vomiting
- Overdose** Quinine is very toxic in overdose; life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).
For details on the management of poisoning, see Emergency treatment of poisoning p. 1123.
- **PREGNANCY** High doses are teratogenic in *first trimester*, but in malaria benefit of treatment outweighs risk.
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **HEPATIC IMPAIRMENT**
 - ▶ With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.
- **RENAL IMPAIRMENT**
 - ▶ With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.
- **MONITORING REQUIREMENTS**
 - ▶ With intravenous use Monitor blood glucose and electrolyte concentration during parenteral treatment.
 - ▶ Patients taking quinine for nocturnal leg cramps should be monitored closely during the early stages for adverse effects as well as for benefit.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use in children For *intravenous infusion*, dilute to a concentration of 2 mg/mL (max. 30 mg/mL in fluid restriction) with Glucose 5% or Sodium Chloride 0.9% and give over 4 hours.
 - ▶ With intravenous use in adults For *intravenous infusion*, give continuously in Glucose 5% or Sodium Chloride 0.9%. To be given over 4 hours.
- **PRESCRIBING AND DISPENSING INFORMATION** Intravenous injection of quinine is so hazardous that it has been superseded by infusion.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, solution for infusion, oral solution, capsule

Tablet

▶ QUININE (Non-proprietary)

Quinine sulfate 200 mg Quinine sulfate 200mg tablets | 28 tablet **[PoM]** £5.05 DT price = £2.09

6 Viral infection

6.1 Hepatitis

Hepatitis

Treatment for viral hepatitis should be initiated by a specialist. The management of uncomplicated acute viral hepatitis is largely symptomatic. Early treatment of acute hepatitis C with interferon alpha p. 794 [unlicensed indication] may reduce the risk of chronic infection. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. Active or passive immunisation against hepatitis A and B infections can be given.

Hepatitis B, chronic

Peginterferon alpha p. 542 is an option for the initial treatment of chronic hepatitis B and may be preferable to interferon alpha. The use of peginterferon alpha and interferon alpha is limited by a response rate of 30–40% and relapse is frequent. Treatment should be discontinued if no improvement occurs after 4 months. The manufacturers of peginterferon alpha-2a and interferon alpha contraindicate use in decompensated liver disease, but low doses can be used with great caution in these patients. Although interferon alpha is contra-indicated in patients receiving immunosuppressant treatment (or who have received it recently), cautious use of peginterferon alpha-2a may be justified in some cases.

Entecavir p. 543 or tenofovir disoproxil p. 564 are options for the initial treatment of chronic hepatitis B. If the response is inadequate after 6–9 months of treatment, a change in treatment should be considered. Other drugs that are licensed for the treatment of chronic hepatitis B include adefovir dipivoxil p. 544, lamivudine p. 563, or telbivudine p. 544.

Entecavir p. 543 alone, tenofovir disoproxil p. 564 alone, or a combination of lamivudine with either adefovir dipivoxil or tenofovir disoproxil can be used in patients with decompensated liver disease.

If drug-resistant hepatitis B virus emerges during treatment, another antiviral drug to which the virus is sensitive should be added. Hepatitis B viruses with reduced susceptibility to lamivudine have emerged following extended therapy. Adefovir dipivoxil or tenofovir disoproxil can be given with lamivudine in lamivudine-resistant chronic hepatitis B; telbivudine p. 544 or entecavir p. 543 should not be used because cross-resistance can occur.

If there is no toxicity or loss in efficacy, treatment with adefovir dipivoxil, entecavir, lamivudine, telbivudine, or tenofovir disoproxil is usually continued until 6 months after adequate seroconversion has occurred. Treatment is usually continued long-term in patients with decompensated liver disease.

Tenofovir disoproxil, or a combination of tenofovir disoproxil with either emtricitabine p. 563 or lamivudine may be used with other antiretrovirals, as part of 'highly active antiretroviral therapy' in patients who require treatment for both HIV and chronic hepatitis B. If patients infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV, such as peginterferon alpha p. 542 or adefovir dipivoxil. Treatment may be continued long-term, even if adequate seroconversion occurs. Management of these patients should be coordinated between HIV and hepatology specialists.

Hepatitis C, chronic

Before starting treatment, the genotype of the infecting hepatitis C virus should be determined and the viral load

measured as this may affect the choice and duration of treatment. A combination of ribavirin p. 545 and peginterferon alfa below is used for the treatment of chronic hepatitis C. The combination of ribavirin and interferon alfa is less effective than the combination of peginterferon alfa and ribavirin. Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Ribavirin monotherapy is ineffective.

Boceprevir p. 547 and telaprevir p. 548 are protease inhibitors that inhibit the replication of hepatitis C virus genotype 1, but they are less effective against other genotypes of the virus. Monotherapy is not recommended because there is a high likelihood of resistance developing. Either boceprevir or telaprevir is licensed for use in combination with ribavirin and peginterferon alfa for the treatment of chronic hepatitis C infection of genotype 1 in patients with compensated liver disease; these combinations are more effective than dual therapy with ribavirin and peginterferon alfa. However, triple therapy is associated with a higher incidence and greater severity of anaemia than dual therapy. Neutropenia seems to be more frequent during treatment with regimens containing boceprevir than with those containing telaprevir. Rash is a particular concern with telaprevir, and to a lesser extent with boceprevir.

Daclatasvir p. 544 is licensed for use in combination with sofosbuvir p. 546 for the treatment of chronic hepatitis C infection of genotypes 1 or 4, with or without compensated cirrhosis; the addition of ribavirin should be considered for patients with advanced liver disease or with other negative prognostic factors, such as prior treatment experience. It is also licensed in combination with sofosbuvir and ribavirin for the treatment of chronic hepatitis C infection of genotype 3 in patients who are treatment experienced, with or without compensated cirrhosis, and in combination with peginterferon alfa and ribavirin for the treatment of chronic hepatitis C infection of genotype 4. Daclatasvir p. 544 must not be given as monotherapy.

Sofosbuvir is a pro-drug of a nucleoside inhibitor that is effective against hepatitis C virus polymerase NS5B. It is licensed for use in combination with ribavirin, with or without peginterferon alfa, for the treatment of chronic hepatitis C infection of genotypes 1, 2, 3, 4, 5, or 6 in patients with compensated liver disease. Sofosbuvir monotherapy is not recommended because it is less effective than combination therapy.

Simeprevir p. 548 is licensed for use in combination with ribavirin and peginterferon alfa for the treatment of chronic hepatitis C infection of genotype 1 or 4; regimens containing peginterferon alfa-2b are less effective than those containing peginterferon alfa-2a. Simeprevir may also be used in combination with sofosbuvir, with or without ribavirin p. 545, for the urgent treatment of chronic hepatitis C infection of genotypes 1 or 4 only when peginterferon alfa cannot be used because of intolerance or contra-indications. Simeprevir monotherapy is not recommended.

6.2 Hepatitis B, chronic

INTERFERONS

Peginterferon alfa

- **DRUG ACTION** Polyethylene glycol-conjugated ('pegylated') derivatives of interferon alfa (**peginterferon alfa-2a** and **peginterferon alfa-2b**) are available; pegylation increases the persistence of the interferon in the blood.

INDICATIONS AND DOSE

PEGASYS®

Combined with ribavirin for chronic hepatitis C | Monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated | Monotherapy for chronic hepatitis B

BY SUBCUTANEOUS INJECTION

- ▶ Adult: (consult product literature)

VIRAFERONPEG®

Combined with ribavirin for chronic hepatitis C | Combined with ribavirin and boceprevir for chronic hepatitis C infection of genotype 1 in patients with compensated liver disease | Monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated

BY SUBCUTANEOUS INJECTION

- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** For contra-indications consult product literature.
- **CAUTIONS** For cautions consult product literature.
- **INTERACTIONS** → Appendix 1 (interferons).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anorexia · diarrhoea · influenza-like symptoms · lethargy · nausea
 - ▶ **Frequency not known** Alopecia · arrhythmias · cardiovascular problems · coma (usually with high doses in the elderly) · confusion · depression · hepatotoxicity · hyperglycaemia · hypersensitivity reactions · hypertension · hypertriglyceridaemia (sometimes severe) · hypotension · myelosuppression (particularly affecting granulocyte counts) · nephrotoxicity · ocular side-effects · palpitation · psoriasisiform rash · seizures (usually with high doses in the elderly) · suicidal behaviour · thyroid abnormalities
- **SIDE-EFFECTS, FURTHER INFORMATION** For information on side effects consult product literature.
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.
- **PREGNANCY** Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in *animal* studies).
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment. Close monitoring required in mild to moderate hepatic impairment.
- **RENAL IMPAIRMENT** Reduce dose in moderate to severe impairment. For information on peginterferon alfa use in renal impairment consult product literature. Close monitoring required in renal impairment.
- **MONITORING REQUIREMENTS** Monitoring of lipid concentration is recommended.
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - **NICE technology appraisals (TAs)**
 - ▶ **Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010)** NICE TA200
The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the disease has reached a moderate stage ('watchful waiting'). Peginterferon alfa alone can be used if ribavirin is contra-indicated or not tolerated. www.nice.org.uk/TA200
 - ▶ **Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010)** NICE TA200
The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years:
 - not previously treated with interferon alfa or peginterferon alfa;

- treated previously with interferon alfa alone or in combination with ribavirin;
 - whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed;
 - co-infected with HIV.
- Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa. www.nice.org.uk/TA200

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

▶ Pegasys (Roche Products Ltd)

NUCLEOSIDE ANALOGUES

Entecavir

INDICATIONS AND DOSE

Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) not previously treated with nucleoside analogues

BY MOUTH

- ▶ Adult: 500 micrograms once daily

Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) and lamivudine-resistance

BY MOUTH

- ▶ Adult: 1 mg once daily, consider other treatment if inadequate response after 6 months

Chronic hepatitis B in patients with decompensated liver disease

BY MOUTH

- ▶ Adult: 1 mg once daily

- **CAUTIONS** HIV infection—risk of HIV resistance in patients not receiving ‘highly active antiretroviral therapy’. lamivudine-resistant chronic hepatitis B—risk of entecavir resistance

CAUTIONS, FURTHER INFORMATION

Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

● SIDE-EFFECTS

- **Common or very common** Diarrhoea · dizziness · dyspepsia · fatigue · headache · nausea · raised serum amylase · raised serum lipase · sleep disturbances · vomiting
- ▶ **Uncommon** Alopecia · rash · thrombocytopenia
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Toxicity in *animal studies*—manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal studies*.
- **RENAL IMPAIRMENT** Reduce dose if eGFR less than 50 mL/minute/1.73 m². Consult product literature.
- **MONITORING REQUIREMENTS** Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).
- **DIRECTIONS FOR ADMINISTRATION** To be taken at least 2 hours before or 2 hours after food.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.
- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on the administration of entecavir tablets and oral solution.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
▶ Entecavir for chronic hepatitis B (August 2008) NICE TA153
Entecavir is an option for the treatment of chronic hepatitis B. www.nice.org.uk/TA153

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ Baraclude (Bristol-Myers Squibb Pharmaceuticals Ltd)

Entecavir (as Entecavir monohydrate) 500 microgram Baraclude 0.5mg tablets | 30 tablet [PoM] £363.26

Entecavir (as Entecavir monohydrate) 1 mg Baraclude 1mg tablets | 30 tablet [PoM] £363.26

Oral solution

▶ Baraclude (Bristol-Myers Squibb Pharmaceuticals Ltd)

Entecavir (as Entecavir monohydrate) 50 microgram per 1 ml Baraclude 0.05mg/ml oral solution (sugar-free) | 210 ml [PoM] £423.80

Telbivudine

INDICATIONS AND DOSE

Chronic hepatitis B infection with compensated liver disease, evidence of viral replication, and histologically documented active liver inflammation or fibrosis, when other treatment is not appropriate

BY MOUTH

▶ Adult: 600 mg once daily

- **CAUTIONS** Lamivudine-resistant chronic hepatitis B—risk of telbivudine resistance

CAUTIONS, FURTHER INFORMATION

Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

- **INTERACTIONS** → Appendix 1 (telbivudine).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · cough · diarrhoea · dizziness · fatigue · headache · nausea · raised serum amylase · raised serum lipase · rash
 - ▶ **Uncommon** Arthralgia · myalgia · myopathy (discontinue treatment) · peripheral neuropathy · taste disturbance
 - ▶ **Rare** Lactic acidosis · rhabdomyolysis
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** 600 mg every 48 hours if eGFR 30–49 mL/minute/1.73 m²; 600 mg every 72 hours if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor liver function tests every 3 months and viral markers of hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).
- **PATIENT AND CARER ADVICE**

Muscle effects and peripheral neuropathy. Patients should be advised to promptly report unexplained muscle pain, tenderness, or weakness, or numbness, tingling or burning sensations.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- ▶ **Telbivudine for chronic hepatitis B (August 2008)** NICE TA154
Telbivudine is not recommended for the treatment of chronic hepatitis B. Patients currently receiving telbivudine can continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA154

MEDICINAL FORMS

Telbivudine 600 mg Sebivo 600mg tablets | 28 tablet [PoM]
£290.33

NUCLEOTIDE ANALOGUES

Adefovir dipivoxil

INDICATIONS AND DOSE

Chronic hepatitis B infection with either compensated liver disease with evidence of viral replication, and histologically documented active liver inflammation and fibrosis, when other treatment not appropriate or decompensated liver disease in combination with another antiviral for chronic hepatitis B that has no cross-resistance to adefovir

BY MOUTH

▶ Adult: 10 mg once daily

- **CAUTIONS** Elderly

CAUTIONS, FURTHER INFORMATION

- Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.
- **SIDE-EFFECTS** Abdominal pain · asthenia · diarrhoea · dyspepsia · flatulence · headache · hypophosphataemia · nausea · pancreatitis · pruritus · rash · renal failure · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** 10 mg every 48 hours if eGFR 30–50 mL/minute/1.73 m²; 10 mg every 72 hours if eGFR 10–30 mL/minute/1.73 m².
No information available if eGFR less than 10 mL/minute/1.73 m². Monitor renal function more frequently in patients with renal impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).
 - ▶ Monitor renal function before treatment then every 3 months, more frequently in patients receiving nephrotoxic drugs.

MEDICINAL FORMS

6.3 Hepatitis C, chronic

NON-STRUCTURAL PROTEIN 5A INHIBITORS

Daclatasvir

- **DRUG ACTION** Daclatasvir is an inhibitor of the multifunctional protein NS5A, which is an essential component of the hepatitis C virus replication process.

INDICATIONS AND DOSE

In combination with sofosbuvir for the treatment of chronic hepatitis C infection of genotypes 1 or 4, with or without compensated cirrhosis | In combination with sofosbuvir and ribavirin for the treatment of chronic hepatitis C infection of genotype 3 in patients who are treatment experienced, with or without compensated cirrhosis | In combination with peginterferon alfa and ribavirin for the treatment of chronic hepatitis C infection of genotype 4

BY MOUTH

- ▶ Adult: Usual dose 60 mg once daily (for duration of treatment consult product literature)

Dose adjustments due to interactions

Reduce dose to 30 mg once daily with concomitant use of potent CYP3A4 inhibitors (e.g. atazanavir boosted with ritonavir, boceprevir, clarithromycin, cobicistat, itraconazole, ketoconazole, posaconazole, telaprevir, telithromycin, and voriconazole).
Increase dose to 90 mg once daily with concomitant use of moderate CYP3A4 inducers (e.g. efavirenz).

● **CAUTIONS** Decompensated liver disease · hepatitis B virus co-infection · human immunodeficiency virus co-infection · organ transplant patients · retreatment—efficacy not established in patients with prior exposure to a NS5A inhibitor

● **INTERACTIONS** → Appendix 1 (daclatasvir).

● **SIDE-EFFECTS**

▶ **Common or very common** Abdominal pain · alopecia · anaemia · anxiety · arthralgia · blurred vision · constipation · cough · decreased appetite depression · diarrhoea · disturbance in attention · dizziness · dry mouth · dry skin · dyspnoea · flatulence · gastro-oesophageal reflux · headache · hot flush · insomnia · irritability · lymphopenia · malaise · migraine · myalgia · nasal congestion · nausea · neutropenia · pruritus · pyrexia · rash · reduced visual acuity · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects listed are reported when daclatasvir is used in combination with sofosbuvir with or without ribavirin or with ribavirin and peginterferon alfa

● **CONCEPTION AND CONTRACEPTION** Highly effective contraception required during and for 5 weeks after treatment.

● **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies).

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

● **PATIENT AND CARER ADVICE**

Missed doses If a dose is more than 20 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
May affect performance of skilled tasks (e.g. driving)

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

NUCLEOSIDE ANALOGUES

Ribavirin (Tribavirin)

INDICATIONS AND DOSE

COPEGUS® TABLETS

Chronic hepatitis C (in combination with direct acting antivirals, or interferon alfa 2a, or peginterferon alfa 2a with or without direct acting antivirals)

BY MOUTH

▶ Adult (body-weight up to 74 kg): 400 mg, dose to be taken in the morning and 600 mg, dose to be taken in the evening
▶ Adult (body-weight 75 kg and above): 600 mg twice daily

Chronic hepatitis C (in combination with peginterferon alfa 2b with or without direct acting antivirals)

BY MOUTH

▶ Adult (body-weight up to 64 kg): 400 mg twice daily
▶ Adult (body-weight 65–80 kg): 400 mg, to be taken in the morning and 600 mg, to be taken in the evening
▶ Adult (body-weight 81–105 kg): 600 mg twice daily
▶ Adult (body-weight 106 kg and above): 600 mg, to be taken in the morning and 800 mg, to be taken in the evening

Chronic hepatitis C genotype 2 or 3 (not previously treated), or patients infected with HIV and hepatitis C (in combination with peginterferon alfa)

BY MOUTH

▶ Adult: Usual dose 400 mg twice daily

REBETOL® CAPSULES

Chronic hepatitis C (in combination with interferon alfa 2b, or peginterferon alfa 2b with or without boceprevir)

BY MOUTH

▶ Adult (body-weight up to 64 kg): 400 mg twice daily
▶ Adult (body-weight 65–80 kg): 400 mg, dose to be given in the morning and 600 mg, dose to be given in the evening
▶ Adult (body-weight 81–104 kg): 600 mg twice daily
▶ Adult (body-weight 105 kg and above): 600 mg, dose to be given in the morning and 800 mg, dose to be given in the evening

REBETOL® ORAL SOLUTION

Chronic hepatitis C (in combination with interferon alfa or peginterferon alfa)

BY MOUTH

▶ Adult (body-weight up to 64 kg): 400 mg twice daily
▶ Adult (body-weight 65–80 kg): 400 mg daily, dose to be given in the morning and 600 mg daily, dose to be given in the evening
▶ Adult (body-weight 81–104 kg): 600 mg twice daily
▶ Adult (body-weight 105 kg and above): 600 mg daily, dose to be given in the morning and 800 mg daily, dose to be given in the evening

● **CONTRA-INDICATIONS** Consult product literature for specific contra-indications when ribavirin used in combination with other medicinal products · haemoglobinopathies · severe cardiac disease · severe debilitating medical conditions · unstable or uncontrolled cardiac disease in previous 6 months

● **CAUTIONS** Anaemia (haemoglobin concentration should be monitored during the treatment and corrective action taken) · cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration) · consult product literature for specific cautions when ribavirin used in combination with other medicinal products · gout · haemolysis (haemoglobin concentration should be monitored during the treatment and corrective action taken) · patients with a transplant—risk of rejection · severe dental disorders · severe ocular disorders · severe periodontal disorders · severe psychiatric effects

● **INTERACTIONS** → Appendix 1 (ribavirin).

● **SIDE-EFFECTS** Abdominal pain · abnormal dreams · acne · alopecia · angina · anorexia · anxiety · aplastic anaemia · arrhythmias · arthralgia · ataxia · bipolar disorders · breast pain · cardiomyopathy · cerebral haemorrhage · cerebral ischaemia · changes in blood pressure · chelitis · chest pain · colitis · constipation · cough · dehydration · depression · diabetes · diarrhoea · dizziness · dry eyes · dry mouth · dry skin · dyspepsia · dysphagia · dyspnoea · earache · endocarditis · eye pain · flatulence · flushing · gastro-intestinal bleeding · gingival bleeding · gingivitis · glossitis/haemolytic anaemia (anaemia may be improved by epoetin); headache · hearing impairment · hearing loss · hyperaesthesia · hyperglycaemia · hyperkinesia · hypertonia · hypertriglyceridaemia · hyperuricaemia · hypoaesthesia · hypocalcaemia · impaired concentration and memory · increased sweating · influenza-like symptoms · interstitial pneumonitis · leucopenia · lymphadenopathy · malaise · mania · menstrual disturbance · micturition disorders · mouth ulcers · musculoskeletal pain · myalgia · myocardial infarction · myositis · nasal congestion · nausea · neutropenia · optic neuropathy · oral candidiasis · palpitation · pancreatitis ·

paraesthesia · peptic ulcer · pericarditis · peripheral neuropathy · peripheral oedema · photosensitivity · prostaticitis · pruritus · psoriasis · psychotic disorders · pulmonary embolism · rash · renal failure · respiratory infections · retinal detachment · retinal haemorrhage · rhabdomyolysis · rheumatoid arthritis · sarcoidosis · seizures · sexual dysfunction · sinus congestion · skin discoloration · sleep disturbances · sore throat · Stevens-Johnson syndrome · stomatitis · suicidal ideation (more frequent in children) · syncope · systemic lupus erythematosus · tachycardia · taste disturbance · thrombocytopenia · thrombocytopenia purpura · thyroid disorders · tinnitus · tongue pigmentation · toxic epidermal necrolysis; tremor · urinary tract infections · vaculitis · vision loss · visual disturbances · vomiting · weight loss · wheezing

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects listed are reported when oral ribavirin is used in combination with peginterferon alfa or interferon alfa, consult product literature for details.

- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment in females of childbearing age. Effective contraception essential during treatment and for 4 months after treatment in females and for 7 months after treatment in males of childbearing age. Routine monthly pregnancy tests recommended. Condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen).
- **PREGNANCY** Avoid; teratogenicity in *animal* studies.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** No dosage adjustment required. Avoid oral ribavirin in severe hepatic dysfunction or decompensated cirrhosis.
- **RENAL IMPAIRMENT** Plasma-ribavirin concentration increased. Manufacturer advises avoid oral ribavirin unless essential if eGFR less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely.
- **MONITORING REQUIREMENTS** Determine full blood count, platelets, electrolytes, glucose, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature).
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include bubble-gum.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- ▶ **Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010)** NICE TA200
The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the disease has reached a moderate stage ('watchful waiting'). www.nice.org.uk/TA200
- ▶ **Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010)** NICE TA200
The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years:
 - not previously treated with interferon alfa or peginterferon alfa;
 - treated previously with interferon alfa alone or in combination with ribavirin;
 - whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed;
 - co-infected with HIV.

Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa. www.nice.org.uk/TA200

NUCLEOTIDE ANALOGUES

Sofosbuvir

INDICATIONS AND DOSE

In combination with ribavirin (Copegus[®]), with or without peginterferon alfa, for chronic hepatitis C infection of genotypes 1, 3, 4, 5, or 6 in patients with compensated liver disease | In combination with ribavirin (Copegus[®]) for chronic hepatitis C infection of genotype 2 in patients with compensated liver disease | In combination with daclatasvir for chronic hepatitis C infection of genotype 1, 3, or 4

BY MOUTH

- ▶ Adult: 400 mg once daily, for duration of treatment consult product literature

● CAUTIONS

CAUTIONS, FURTHER INFORMATION

In chronic hepatitis C of genotype 1, 4, 5, or 6, only use sofosbuvir with ribavirin in those with intolerance or contra-indications to peginterferon alfa who require urgent treatment.

- **INTERACTIONS** → Appendix 1 (sofosbuvir).

- **SIDE-EFFECTS** Abdominal discomfort · agitation · alopecia · anaemia · anxiety · arthralgia · asthenia · blurred vision · chest pain · constipation · cough · decreased appetite · depression · diarrhoea · disturbance in attention · dizziness · dry mouth · dyspnoea · gastro-oesophageal reflux · headache · influenza-like symptoms · insomnia · irritability · memory impairment · migraine · myalgia · nausea · neutropenia · rash · vomiting · weight loss

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects listed are reported when sofosbuvir is used in combination with ribavirin *or* with ribavirin and peginterferon alfa

- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid—metabolites present in milk in *animal* studies.

● **RENAL IMPAIRMENT** Safety and efficacy not established if eGFR less than 30 mL/minute/1.73 m²—accumulation may occur.

● **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

● **PATIENT AND CARER ADVICE**

Missed doses If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

▶ **Sofosbuvir for treating chronic hepatitis C (February 2015)**
NICE TA330

Sofosbuvir in combination with peginterferon alfa and ribavirin is an option for treating adults with chronic hepatitis C infection:

- of genotype 1
 - of genotype 3 with cirrhosis (treatment naive patients)
 - of genotype 3 that has not adequately responded to interferon-based treatment
 - of genotype 4, 5, or 6 with cirrhosis
- Sofosbuvir in combination with ribavirin is an option for treating adults with chronic hepatitis C infection:
- of genotype 2 who are intolerant to or ineligible for interferon (treatment naive patients)
 - of genotype 2 that has not adequately responded to interferon-based treatment
 - of genotype 3 with cirrhosis who are intolerant to or ineligible for interferon (treatment naive patients)
 - of genotype 3 with cirrhosis that has not adequately responded to interferon-based treatment www.nice.org.uk/TA330

▶ **Sofosbuvir for treating chronic hepatitis C (February 2015)**
NICE TA330

Sofosbuvir in combination with ribavirin is not recommended for the treatment of adults with chronic hepatitis C infection of genotypes 1, 4, 5, or 6. www.nice.org.uk/TA330

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2014) that sofosbuvir (*Sovaldi*®) is accepted for use within NHS Scotland for the treatment of chronic hepatitis C infection of genotypes 1 to 6; its use in combination with ribavirin as dual therapy for chronic hepatitis C infection of either genotype 2 (in treatment naive patients) or genotype 3 is restricted to those who cannot use peginterferon alfa because of intolerance or contra-indications.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

PROTEASE INHIBITORS (HEPATITIS)

Boceprevir

INDICATIONS AND DOSE

Chronic hepatitis C infection of genotype 1 in patients with compensated liver disease

BY MOUTH

▶ **Adult:** 800 mg 3 times a day, for duration of treatment consult product literature

● **CONTRA-INDICATIONS** Autoimmune hepatitis

● **CAUTIONS** Coagulopathy · hypoalbuminaemia · low platelets · predisposition to QT interval prolongation

CAUTIONS, FURTHER INFORMATION

Low platelets, hypoalbuminaemia, or coagulopathy Not recommended in patients with low platelets, hypoalbuminaemia, or coagulopathy—if initiated in these patients monitor closely for signs of infection, worsening liver impairment and anaemia (increased risk of severe morbidity and mortality).

● **INTERACTIONS** → Appendix 1 (boceprevir).

Caution with concomitant use of other drugs known to prolong QT interval.

● **SIDE-EFFECTS**

▶ **Common or very common** Abdominal pain · agitation · alopecia · amnesia · anaemia · anxiety · arthralgia · asthenia · blood pressure changes · changes in libido · constipation · cough · decreased appetite · depression · diarrhoea · disturbances in smell · disturbances in taste · dizziness · dry eyes · dry mouth · dyspnoea · erectile dysfunction · flatulence · gastro-oesophageal reflux · haemorrhoids · headache · hyperglycaemia · hyperhidrosis · hypertriglyceridaemia · hyperuricaemia · hypoaesthesia · hypothyroidism · influenza-like symptoms · insomnia · leucopenia · mouth ulcers · muscle spasms · myalgia · nausea · palpitation · pancytopenia · paraesthesia · peripheral oedema · polyuria · pruritus · psoriasis · rash · stomatitis · syncope · thrombocytopenia · tinnitus · tooth disorder · tremor · visual disturbances · vomiting · weight loss

▶ **Uncommon** Amenorrhoea · arrhythmias · colitis · conjunctival haemorrhage · dysphagia · dysphonia · dysuria · eye pain · flushing · gingivitis · gout · hearing impairment · homicidal ideation · hyperaesthesia · hyperbilirubinaemia · hypercalcaemia · hypersalivation · hyperthyroidism · hypokalaemia · increased lacrimation · menorrhagia · pallor · pancreatitis · photophobia · photosensitivity · retinal ischaemia · retinopathy · skin ulceration · suicidal ideation · tongue discoloration · venous thromboembolism

▶ **Rare** Acute myocardial infarction · aspermia · bipolar disorder · cholecystitis · coronary artery disease · encephalopathy · hallucinations · pericarditis · pleural fibrosis · respiratory failure · sarcoidosis · thyroid neoplasms

▶ **Frequency not known** Rash with eosinophilia and systemic symptoms · Stevens-Johnson syndrome

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects listed are reported when boceprevir is used in combination with ribavirin and peginterferon alfa

● **PREGNANCY** Manufacturer advises avoid.

● **BREAST FEEDING** Manufacturer advises avoid; present in milk in *animal* studies.

● **MONITORING REQUIREMENTS** Monitor full blood count before starting treatment and then on weeks 2, 4, 8, and 12 of treatment, then as indicated clinically.

● **PATIENT AND CARER ADVICE**

Missed doses If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

▶ **Boceprevir for chronic hepatitis C infection of genotype 1 (April 2012)** NICE TA253

Boceprevir in combination with ribavirin and peginterferon alfa is an option for the treatment of chronic hepatitis C infection of genotype 1 in adults with compensated liver disease:

- who have not been treated previously;
- in whom previous treatment (e.g. with peginterferon alfa in combination with ribavirin) has failed. www.nice.org.uk/TA253

- ▶ **Soimeprevir (as Soimeprevir sodium) 150 mg** Olysio 150mg capsules | 7 capsule [PoM] £1,866.50

Telaprevir**INDICATIONS AND DOSE**

In combination with ribavirin and peginterferon alfa for chronic hepatitis C infection of genotype 1 in patients with compensated liver disease

BY MOUTH

- ▶ Adult: 1.125 g every 12 hours, alternatively 750 mg every 8 hours, for duration of treatment consult product literature

- **CAUTIONS** Bradycardia · congenital or family history of QT interval prolongation · electrolyte disturbances · family history of sudden death · heart failure with reduced left ventricular ejection fraction · hypoalbuminaemia · low platelets · prolongation of QT interval
- **CAUTIONS, FURTHER INFORMATION**
Low platelets or hypoalbuminaemia Not recommended in patients with low platelets or hypoalbuminaemia—if initiated in these patients monitor closely for signs of infection, worsening liver impairment, and anaemia (increased risk of severe morbidity and mortality).
- **INTERACTIONS** → Appendix 1 (telaprevir).
Caution in concomitant use with other drugs known to prolong QT interval.
- **SIDE-EFFECTS**
▶ **Common or very common** Anaemia · anal fissure · diarrhoea · eczema · haemorrhoids · hyperbilirubinaemia · hyperuricaemia · hypokalaemia · hypothyroidism · lymphopenia · nausea · peripheral oedema · pruritus · rash · syncope · taste disturbances · thrombocytopenia · vomiting
- ▶ **Uncommon** Gout · proctitis · retinopathy · urticaria
- ▶ **Rare** Stevens-Johnson syndrome · toxic epidermal necrolysis
- **SIDE-EFFECTS, FURTHER INFORMATION**
Side-effects listed are reported when telaprevir is used in combination with ribavirin and peginterferon alfa
- **SIDE-EFFECTS, FURTHER INFORMATION**
Rash Rash occurs very commonly. If rash mild or moderate, may continue without interruption, but monitor for deterioration. If moderate rash deteriorates, consider permanent discontinuation of telaprevir; if rash does not improve within 7 days of discontinuation, suspend ribavirin. If severe rash or if rash accompanied by blistering or mucosal ulceration, discontinue telaprevir permanently; if rash does not improve within 7 days of discontinuation, consider discontinuation of ribavirin and peginterferon alfa. If serious rash, or if severe rash deteriorates, or if rash accompanied by systemic symptoms, discontinue telaprevir, ribavirin, and peginterferon alfa permanently.
- **CONCEPTION AND CONTRACEPTION** Effectiveness of hormonal contraceptives reduced during treatment and for 2 months after stopping telaprevir—effective non-hormonal methods of contraception necessary during this time.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.
- **MONITORING REQUIREMENTS** Monitor full blood count, platelets, electrolytes, serum creatinine, uric acid, and liver and thyroid function tests before starting treatment and then on weeks 2, 4, 8, and 12 of treatment, then as indicated clinically.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).
- **PATIENT AND CARER ADVICE**
Missed doses If a dose is more than 6 hours late with the 12 hourly regimen (or more than 4 hours late with the 8 hourly regimen), the missed dose should not be taken and the next dose should be taken at the normal time. Patients should be told to seek immediate medical attention if a rash develops or if an existing rash worsens.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
 ▶ **Telaprevir for chronic hepatitis C infection of genotype 1 (April 2012)** NICE TA252
 Telaprevir in combination with ribavirin and peginterferon alfa is an option for the treatment of chronic hepatitis C infection of genotype 1 in adults with compensated liver disease:
 - who have not been treated previously;
 - in whom previous treatment (e.g. with peginterferon alfa in combination with ribavirin) has failed. www.nice.org.uk/TA252

6.4 Herpesvirus infections

Herpesvirus infections

Herpes simplex and varicella-zoster infection

The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella-zoster virus.

Herpes simplex infections

Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection.

In individuals with good immune function, mild infection of the eye (ocular herpes) and of the lips (herpes labialis or cold sores) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics. Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance.

Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

Varicella-zoster infections

Regardless of immune function and the use of any immunoglobulins, neonates with *chickenpox* should be treated with a parenteral antiviral to reduce the risk of severe disease. Oral therapy in children is not recommended as absorption is variable. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents and adults than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adults and adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

Pregnant women who develop severe chickenpox may be at risk of complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Those who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella-zoster immunoglobulin (see under Disease Specific Immunoglobulins).

In *herpes zoster* (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days. Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management.

Choice

Aciclovir p. 550 is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella-zoster and the systemic and topical treatment of herpes simplex infections of the skin and mucous membranes. It is used by mouth for severe herpetic stomatitis. Aciclovir eye ointment is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

Famciclovir p. 552, a prodrug of penciclovir, is similar to aciclovir and is licensed for use in herpes zoster and genital herpes.

Valaciclovir p. 552 is an ester of aciclovir, licensed for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed for preventing cytomegalovirus disease following solid organ transplantation. Famciclovir or valaciclovir are suitable alternatives to aciclovir for oral lesions associated with herpes zoster. Valaciclovir once daily may reduce the risk of transmitting genital herpes to heterosexual partners—specialist advice should be sought.

Foscarnet sodium p. 553 is used for mucocutaneous herpes simplex virus infection unresponsive to aciclovir in immunocompromised patients; it is toxic and can cause renal impairment.

Inosine pranobex p. 550 has been used by mouth for herpes simplex infections; its effectiveness remains unproven.

Cytomegalovirus infection

Ganciclovir p. 554 is related to aciclovir but it is more active against cytomegalovirus (CMV); it is also much more toxic than aciclovir and should therefore be prescribed only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the *initial treatment* of CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine p. 566; the

two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration.

Valaciclovir is licensed for prevention of cytomegalovirus disease following renal transplantation.

Valganciclovir is an ester of ganciclovir which is licensed for the *initial treatment* and *maintenance treatment* of CMV retinitis in AIDS patients. Valganciclovir is also licensed for preventing CMV disease following solid organ transplantation from a cytomegalovirus-positive donor.

Foscarnet sodium is also active against cytomegalovirus; it is toxic and can cause renal impairment.

See local treatment of CMV retinitis.

INOSINE COMPLEXES

Inosine pranobex

(Inosine acedoben dimepranol)

INDICATIONS AND DOSE

Mucocutaneous herpes simplex

BY MOUTH

- ▶ Adult: 1 g 4 times a day for 7–14 days

Adjunctive treatment of genital warts

BY MOUTH

- ▶ Adult: 1 g 3 times a day for 14–28 days

Subacute sclerosing panencephalitis

BY MOUTH

- ▶ Adult: 50–100 mg/kg daily in 6 divided doses

- **CAUTIONS** History of gout · history of hyperuricaemia
- **SIDE-EFFECTS**
- ▶ **Common or very common** Reversible increase in serum uric acid · reversible increase in urinary uric acid
- ▶ **Uncommon** Arthralgia · epigastric discomfort · fatigue · headache · itching · nausea · rashes · vertigo · vomiting
- ▶ **Rare** Anxiety · constipation · diarrhoea · polyuria · sleep disturbances
- **PREGNANCY** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Manufacturer advises caution; metabolised to uric acid.
- **LESS SUITABLE FOR PRESCRIBING** Inosine pranobex is less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9

- ▶ **Imunovir** (KoRa Healthcare)

Inosine acedoben dimepranol 500 mg Imunovir 500mg tablets | 100 tablet **PoM** £39.50

NUCLEOSIDE ANALOGUES

Aciclovir

(Acyclovir)

INDICATIONS AND DOSE

Herpes simplex, suppression

BY MOUTH

- ▶ Child 12–17 years: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

- ▶ Adult: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Herpes simplex, prophylaxis in the immunocompromised

BY MOUTH

- ▶ Child 1 month–1 year: 100–200 mg 4 times a day
- ▶ Child 2–17 years: 200–400 mg 4 times a day
- ▶ Adult: 200–400 mg 4 times a day

BY INTRAVENOUS INFUSION

- ▶ Adult: 5 mg/kg every 8 hours

Herpes simplex, treatment (non-genital)

BY MOUTH

- ▶ Child 1 month–1 year: 100 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
- ▶ Child 2–17 years: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
- ▶ Adult: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Herpes simplex, treatment (non-genital) in simplex encephalitis, immunocompromised patients or if absorption impaired

BY MOUTH

- ▶ Child 1 month–1 year: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
- ▶ Child 2–17 years: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
- ▶ Adult: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Genital herpes simplex, treatment of first episode

BY MOUTH

- ▶ Adult: 200 mg 5 times a day, alternatively 400 mg 3 times a day both courses usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Genital herpes simplex, treatment of severe, initial infection

BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 5 mg/kg every 8 hours usually for 5 days; increased to 10 mg/kg every 8 hours for at least 14 days in encephalitis (at least 21 days if also immunocompromised)—confirm cerebrospinal fluid negative for herpes simplex virus before stop-ping treatment, to be increased only if resistant organisms suspected or in simplex encephalitis

Genital herpes simplex, treatment of first episode in immunocompromised or HIV-positive patients

BY MOUTH

- ▶ Adult: 400 mg 5 times a day for 7–10 days

Genital herpes simplex, treatment of recurrent infection

BY MOUTH

- ▶ Adult: 800 mg 3 times a day for 2 days, alternatively 200 mg 5 times a day for 5 days, alternatively 400 mg 3 times a day for 3–5 days

Genital herpes simplex, treatment of recurrent infection in immunocompromised or HIV-positive patients

BY MOUTH

- ▶ Adult: 400 mg 3 times a day for 5–10 days

Varicella zoster (chickenpox), treatment | Herpes zoster, treatment**BY MOUTH**

- ▶ Child 1 month-1 year: 200 mg 4 times a day for 5 days
- ▶ Child 2-5 years: 400 mg 4 times a day for 5 days
- ▶ Child 6-11 years: 800 mg 4 times a day for 5 days
- ▶ Child 12-17 years: 800 mg 5 times a day for 7 days
- ▶ Adult: 800 mg 5 times a day for 7 days

BY INTRAVENOUS INFUSION

- ▶ Adult: 5 mg/kg every 8 hours usually for 5 days

Herpes zoster, treatment in immunocompromised**BY MOUTH**

- ▶ Child 1 month-1 year: 200 mg 4 times a day continue for 2 days after crusting of lesions
- ▶ Child 2-5 years: 400 mg 4 times a day continue for 2 days after crusting of lesions
- ▶ Child 6-12 years: 800 mg 4 times a day continue for 2 days after crusting of lesions
- ▶ Child 12-17 years: 800 mg 5 times a day continue for 2 days after crusting of lesions
- ▶ Adult: 800 mg 5 times a day continue for 2 days after crusting of lesions

BY INTRAVENOUS INFUSION

- ▶ Adult: 10 mg/kg every 8 hours given for 10-14 days in encephalitis, possibly longer if also immunocompromised

Varicella zoster (chickenpox) attenuation of infection if varicella-zoster immunoglobulin not indicated**BY MOUTH**

- ▶ Child: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure
- ▶ Adult: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure

Doses at extremes of body-weight

To avoid excessive dosage in obese patients parenteral dose should be calculated on the basis of ideal weight for height.

- **UNLICENSED USE** Attenuation of chickenpox is an unlicensed indication. Tablets and suspension not licensed for suppression of herpes simplex or for treatment of herpes zoster in children (age range not specified by manufacturer)
- **CAUTIONS** Elderly (risk of neurological reactions) (in adults) · maintain adequate hydration (especially with infusion or high doses)
- **INTERACTIONS** → Appendix 1 (aciclovir).
- **SIDE-EFFECTS**
GENERAL SIDE-EFFECTS
▶ **Common or very common** Abdominal pain · diarrhoea · fatigue · headache · nausea · photosensitivity · pruritus · rash · urticaria · vomiting
- ▶ **Very rare** Acute renal failure · anaemia · ataxia · confusion · convulsions · dizziness · drowsiness · dysarthria · dyspnoea · hallucinations · hepatitis · jaundice · leucopenia · neurological reactions · thrombocytopenia
- **SPECIFIC SIDE-EFFECTS**
▶ **Very rare**
▶ **With intravenous use** Agitation · fever · psychosis · severe local inflammation (sometimes leading to ulceration) · tremors
- **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.
- **RENAL IMPAIRMENT**
Risk of neurological reactions increased. Maintain adequate hydration (especially during renal impairment).

- ▶ With intravenous use in adults Use normal intravenous dose every 12 hours if eGFR 25–50 mL/minute/1.73 m² (every 24 hours if eGFR 10–25 mL/minute/1.73 m²). Consult product literature for intravenous dose if eGFR less than 10 mL/minute/1.73 m².
- ▶ With oral use in adults For *herpes zoster*, use normal oral dose every 8 hours if eGFR 10–25 mL/minute/1.73 m² (every 12 hours if eGFR less than 10 mL/minute/1.73 m²). For *herpes simplex*, use normal oral dose every 12 hours if eGFR less than 10 mL/minute/1.73 m².
- ▶ With oral use in children For *herpes zoster*, use normal oral dose every 8 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m² (every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²). For *herpes simplex*, use normal dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion Zovirax IV*[®], *Aciclovir IV* (Genus), give intermittently in Sodium chloride 0.9% or Sodium chloride and glucose; initially reconstitute to 25 mg/mL in water for injection or sodium chloride 0.9% then dilute to not more than 5 mg/mL with the infusion fluid; to be given over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and given over 1 hour; for *Aciclovir IV* (Hospira) dilute to not more than 5 mg/mL with infusion fluid; give over 1 hour.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid preparations may include banana, or orange.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Aciclovir (oral) for viral infections www.medicinesforchildren.org.uk/aciclovir-for-viral-infections

PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Aciclovir Tablets 200 mg or 800 mg may be prescribed. Aciclovir Oral Suspension 200 mg/5mL may be prescribed. Aciclovir Cream may be prescribed.

SIDE-EFFECTS, FURTHER INFORMATION

Neurological reactions Neurological reactions (including dizziness, confusion, hallucinations, convulsions, ataxia, dysarthria, and drowsiness) more frequent with higher doses.

- **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.
- **HEPATIC IMPAIRMENT**
 - ▶ In adults Manufacturer advises caution with high doses used for herpes labialis and prevention of cytomegalovirus disease—no information available.
- **RENAL IMPAIRMENT** Maintain adequate hydration.
 - ▶ In adults For *herpes zoster*, 1 g every 12 hours if eGFR 30–50 mL/minute/1.73 m² (1 g every 24 hours if eGFR 10–30 mL/minute/1.73 m²); 500 mg every 24 hours if eGFR less than 10 mL/minute/1.73 m². For *treatment of herpes simplex*, 500 mg (1 g in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m². For *treatment of herpes labialis*, if eGFR 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if eGFR 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose); if eGFR less than 10 mL/minute/1.73 m², 500 mg as a single dose). For *suppression of herpes simplex*, 250 mg (500 mg in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m². For *reduction of genital herpes transmission*, 250 mg every 24

hours if eGFR less than 15 mL/minute/1.73 m². Reduce dose according to eGFR for *cytomegalovirus prophylaxis* following solid organ transplantation (consult product literature).

- ▶ In children For *herpes zoster*, 1 g every 12 hours if estimated glomerular filtration rate 30–50 mL/minute/1.73 m² (1 g every 24 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²); 500 mg every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m². For *treatment of herpes simplex*, 500 mg (1 g in immunocompromised or HIV-positive children) every 24 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m². For *treatment of herpes labialis*, if estimated glomerular filtration rate 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if estimated glomerular filtration rate 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose); if estimated glomerular filtration rate less than 10 mL/minute/1.73 m², 500 mg as a single dose). For *suppression of herpes simplex*, 250 mg (500 mg in immunocompromised or HIV-positive children) every 24 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m². Reduce dose according to estimated glomerular filtration rate for *cytomegalovirus prophylaxis* following solid organ transplantation (consult product literature).

- **PRESCRIBING AND DISPENSING INFORMATION** Valaciclovir is a pro-drug of aciclovir.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet**CAUTIONARY AND ADVISORY LABELS 9**▶ **VALACICLOVIR (Non-proprietary)**

6.5 Herpesvirus infections, cytomegalovirus

NON-NUCLEOSIDE PYROPHOSPHATE ANALOGUES

Foscarnet sodium

INDICATIONS AND DOSE**Cytomegalovirus disease****BY INTRAVENOUS INFUSION**

- ▶ Adult: Initially 60 mg/kg every 8 hours for 2–3 weeks, alternatively initially 90 mg/kg every 12 hours for 2–3 weeks, then maintenance 60 mg/kg daily, then increased if tolerated to 90–120 mg/kg daily, if disease progresses on maintenance dose, repeat induction regimen

Mucocutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients**BY INTRAVENOUS INFUSION**

- ▶ Adult: 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal

- **UNLICENSED USE** Licensed for CMV retinitis in AIDS patients only. Foscarnet doses in BNF may differ from those in product literature.
- **CAUTIONS** Ensure adequate hydration
- **INTERACTIONS** → Appendix 1 (foscarnet).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · acute renal failure · aggression · agitation · anaemia · anorexia · anxiety · changes in blood pressure · changes in ECG · confusion · constipation · convulsions · depression · diarrhoea · dizziness · dyspepsia · dysuria · electrolyte disturbances · genital irritation and ulceration (due to high concentrations excreted in urine) · granulocytopenia · headache · hepatic dysfunction · hypocalcaemia · hypokalaemia · hypomagnesaemia · leucopenia · malaise · myalgia · nausea (reduce infusion rate) · neurological disorders · oedema · palpitation · pancreatitis · paraesthesia (reduce infusion rate) · polyuria · pruritus · rash · renal impairment · thrombocytopenia · thrombophlebitis if given undiluted by peripheral vein · tremor · vomiting
 - ▶ **Uncommon** Acidosis
 - ▶ **Frequency not known** Diabetes insipidus · myasthenia · myositis · oesophageal ulceration · rhabdomyolysis · ventricular arrhythmias
- **CONCEPTION AND CONTRACEPTION** Men should avoid fathering a child during and for 6 months after treatment.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** Reduce dose; consult product literature.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor electrolytes, particularly calcium and magnesium.
 - ▶ Monitor serum creatinine every second day during induction and every week during maintenance.
- **DIRECTIONS FOR ADMINISTRATION** Avoid rapid infusion. For *intravenous infusion* (Foscavir[®]), give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 12 mg/mL for infusion into peripheral vein (undiluted solution via central venous line only); infuse over at least 1 hour (infuse doses greater than 60 mg/kg over 2 hours).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

▶ **Foscavir** (Clintgen Healthcare Ltd)

Foscarnet sodium 24 mg per 1 ml Foscavir 6g/250ml solution for infusion bottles | 1 bottle [PoM] £119.85 (Hospital only)

NUCLEOSIDE ANALOGUES

Ganciclovir

INDICATIONS AND DOSE

Prevention of cytomegalovirus disease during immunosuppressive therapy following organ transplantation

BY INTRAVENOUS INFUSION

▶ Adult: 5 mg/kg every 12 hours for 7–14 days

Treatment of life-threatening or sight-threatening cytomegalovirus infections in immunocompromised patients only

BY INTRAVENOUS INFUSION

▶ Adult: 5 mg/kg every 12 hours for 14–21 days, followed by maintenance 6 mg/kg daily on 5 days of the week,

alternatively 5 mg/kg daily until adequate recovery of immunity, maintenance only for patients at risk of relapse of retinitis, if retinitis progresses initial induction treatment may be repeated

- **CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) · abnormally low neutrophil count (consult product literature) · abnormally low platelet count (consult product literature)
- **CAUTIONS** Children (possible risk of long-term carcinogenic or reproductive toxicity) · ensure adequate hydration · history of cytopenia · potential carcinogen · potential teratogen · radiotherapy · vesicant
- **INTERACTIONS** → Appendix 1 (ganciclovir). Increased risk of myelosuppression with other myelosuppressive drugs—consult product literature.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · abnormal thinking · anaemia · anorexia · anxiety · arthralgia · chest pain · confusion · constipation · convulsions · cough · depression · dermatitis · diarrhoea · dizziness · dyspepsia · dysphagia · dyspnoea · ear pain · eye pain · fatigue · flatulence · headache · hepatic dysfunction · infection · injection-site reactions · insomnia · leucopenia · macular oedema · myalgia · nausea · night sweats · pancytopenia · peripheral neuropathy · pruritus · pyrexia · renal impairment · retinal detachment · taste disturbance · thrombocytopenia · vitreous floaters · vomiting · weight loss
 - ▶ **Uncommon** Alopecia · anaphylactic reactions · arrhythmias · disturbances in hearing and vision · haematuria · hypotension · male infertility · mouth ulcers · pancreatitis · psychosis · tremor
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to valganciclovir, aciclovir, or valaciclovir.
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment.
- **PREGNANCY** Avoid—teratogenic risk.
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** Reduce dose if eGFR less than 70 mL/minute/1.73 m²; consult product literature.
- **MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).
- **DIRECTIONS FOR ADMINISTRATION** Infuse into vein with adequate flow preferably using plastic cannula. For *intravenous infusion* (Cymevene[®]) give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially in water for injections (500 mg/10 mL then dilute to not more than 10 mg/mL with infusion fluid (usually 100 mL); give over 1 hour.
- **HANDLING AND STORAGE** Caution in handling Ganciclovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with soap and water.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion
ELECTROLYTES: May contain Sodium

▶ **Cymevene** (Roche Products Ltd)
Ganciclovir (as Ganciclovir sodium) 500 mg Cymevene 500mg powder for solution for infusion vials | 5 vial [PoM] £148.83

Valganciclovir

INDICATIONS AND DOSE

Cytomegalovirus retinitis, induction

BY MOUTH

- ▶ Adult: Initially 900 mg twice daily for 21 days, then 900 mg daily, induction regimen may be repeated if retinitis progresses

Prevention of cytomegalovirus disease following solid organ transplantation

BY MOUTH

- ▶ Adult: 900 mg daily for 100 days (for 100–200 days following kidney transplantation), to be started within 10 days of transplantation

Dose equivalence and conversion

Oral valganciclovir 900 mg twice daily is equivalent to intravenous ganciclovir 5 mg/kg twice daily.

- **CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) · abnormally low neutrophil count (consult product literature) · abnormally low platelet count (consult product literature)
- **CAUTIONS** Children (possible risk of long-term carcinogenic or reproductive toxicity) · history of cytopenia · potential carcinogen · potential teratogen · radiotherapy
- **INTERACTIONS** → Appendix 1 (valganciclovir).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · abnormal thinking · anaemia · anorexia · anxiety · arthralgia · chest pain · confusion · constipation · convulsions · cough · depression · dermatitis · diarrhoea · dizziness · dyspepsia · dysphagia · dyspnoea · ear pain · eye pain · fatigue · flatulence · headache · hepatic dysfunction · infection · insomnia · leucopenia · macular oedema · myalgia · nausea · night sweats · pancytopenia · peripheral neuropathy · pruritus · pyrexia · renal impairment · retinal detachment · taste disturbance · thrombocytopenia · vitreous floaters · vomiting · weight loss
 - ▶ **Uncommon** Alopecia · anaphylactic reactions · arrhythmias · disturbances in hearing · disturbances in vision · haematuria · hypotension · male infertility · mouth ulcers · pancreatitis · psychosis · tremor
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to ganciclovir, aciclovir, or valaciclovir.
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment.
- **PREGNANCY** Avoid—teratogenic risk.
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** Reduce dose, consult product literature.
- **MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).
- **PRESCRIBING AND DISPENSING INFORMATION** Valganciclovir is a pro-drug of ganciclovir. Flavours of oral liquid formulations may include tutti-frutti.
- **HANDLING AND STORAGE** Caution in handling Valganciclovir is a potential teratogen and carcinogen and caution is advised when handling the powder, reconstituted solution, or broken tablets; if these come into contact with skin or mucosa, wash off immediately with water; avoid inhalation of powder.

6.6 HIV infection

HIV infection

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection (antiretrovirals) may be associated with serious side-effects. Although antiretrovirals increase life expectancy considerably and decrease the risk of complications associated with premature ageing, mortality and morbidity remain slightly higher than in uninfected individuals. Treatment should be undertaken only by those experienced in their use.

Principles of treatment

Treatment aims to prevent the mortality and morbidity associated with chronic HIV infection whilst minimising drug toxicity. Although it should be started before the immune system is irreversibly damaged, the need for early drug treatment should be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and patient tolerance. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

Treatment also reduces the risk of HIV transmission to sexual partners, but the risk is not eliminated completely; this risk and strategies to reduce HIV transmission should be discussed with patients and their sexual partners.

Initiation of treatment

The optimum time for initiating antiretroviral treatment depends primarily on the CD4 cell count. The timing and choice of treatment should also take account of clinical symptoms, comorbidities, and the possible effect of antiretroviral drugs on factors such as the risk of cardiovascular events. Treatment includes a combination of drugs known as 'highly active antiretroviral therapy'. Treatment of HIV-1 infection is initiated with 2 nucleoside reverse transcriptase inhibitors and *either* a non-nucleoside reverse transcriptase inhibitor, *or* a boosted protease inhibitor, *or* an integrase inhibitor; the regimens of choice contain tenofovir disoproxil and emtricitabine with *either* efavirenz *or* ritonavir-boosted atazanavir, *or* ritonavir-boosted darunavir, *or* raltegravir. Alternative regimens contain abacavir and lamivudine with *either* lopinavir with ritonavir, *or* ritonavir-boosted fosamprenavir, *or* nevirapine, *or* rilpivirine. Patients who require treatment for both HIV

and chronic hepatitis B should be treated with antivirals active against both diseases.

Switching therapy

Deterioration of the condition (including clinical and virological changes) may require a change in therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance and the possibility of cross-resistance.

Pregnancy

Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although information on the teratogenic potential of most antiretroviral drugs is limited), to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. **All treatment options require careful assessment by a specialist.** Combination antiretroviral therapy maximises the chance of preventing transmission and represents optimal therapy for the mother. However, it may be associated with a greater risk of preterm delivery. Pregnancies in HIV-positive women and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childhood at www.ucl.ac.uk/nshpc/ and to the Antiretroviral Pregnancy Registry at www.apregistry.com.

Breast-feeding

Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

Post-exposure prophylaxis

Prophylaxis with antiretroviral drugs [unlicensed indication] may be appropriate following exposure to HIV-contaminated material. Immediate expert advice should be sought in such cases; national guidelines on post-exposure prophylaxis for healthcare workers have been developed (by the Chief Medical Officer's Expert Advisory Group on AIDS), www.gov.uk/dh and local ones may also be available. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Prompt prophylaxis with antiretroviral drugs [unlicensed indication] is also appropriate following potential sexual exposure to HIV; recommendations have been developed by the British Association for Sexual Health and HIV, www.bashh.org.

Drugs for HIV infection

Zidovudine p. 566, a nucleoside reverse transcriptase inhibitor (or 'nucleoside analogue'), was the first anti-HIV drug to be introduced. Other nucleoside reverse transcriptase inhibitors include abacavir p. 561, didanosine p. 562, emtricitabine p. 563, lamivudine p. 563, stavudine p. 564, and tenofovir disoproxil p. 564.

The protease inhibitors include atazanavir p. 567, darunavir p. 568, fosamprenavir p. 568 (a pro-drug of amprenavir), indinavir p. 569, lopinavir (available as lopinavir with ritonavir), ritonavir p. 570, saquinavir p. 570, and tipranavir p. 571. Indinavir is rarely used in the treatment of HIV-infection because it is associated with nephrolithiasis. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, indinavir, lopinavir (available as lopinavir with ritonavir), saquinavir, and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects.

The non-nucleoside reverse transcriptase inhibitors efavirenz p. 558, etravirine p. 559, nevirapine p. 560, and rilpivirine p. 561 are used in the treatment of HIV-1

infection, but not against the subtype HIV-2, a subtype that is rare in the UK. Nevirapine is associated with a high incidence of rash (including Stevens-Johnson syndrome) and occasionally fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz; CNS disturbances are often self-limiting and can be reduced by taking the dose at bedtime (especially in the first 2–4 weeks of treatment). Efavirenz has also been associated with an increased plasma-cholesterol concentration. Etravirine is used in regimens containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.

Enfuvirtide p. 557, which inhibits the fusion of HIV to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs; enfuvirtide should be combined with other potentially active antiretroviral drugs.

Maraviroc p. 557 is an antagonist of the CCR5 chemokine receptor. It is licensed for patients exclusively infected with CCR5-tropic HIV.

Dolutegravir p. 557 and raltegravir p. 558 are inhibitors of HIV integrase. They are licensed for the treatment of HIV infection in combination with other antiretroviral drugs.

Elvitegravir is also an inhibitor of HIV integrase that is only available as a component of a fixed-dose combination product (cobicistat with elvitegravir, emtricitabine and tenofovir). Cobicistat p. 567 is a pharmacokinetic enhancer that boosts the concentrations of other antiretrovirals, but it has no antiretroviral activity itself.

Immune reconstitution syndrome

Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms; these reactions may occur within the first few weeks or months of initiating treatment. Autoimmune disorders (such as Graves' disease) have also been reported many months after initiation of treatment.

Lipodystrophy syndrome

Metabolic effects associated with antiretroviral treatment include *fat redistribution*, *insulin resistance*, and *dyslipidaemia*; collectively these have been termed *lipodystrophy syndrome*. The usual risk factors for cardiovascular disease should be taken into account before starting antiretroviral therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting antiretroviral therapy, after 3–6 months of treatment, and then annually.

Fat redistribution (with loss of subcutaneous fat, increased abdominal fat, 'buffalo hump' and breast enlargement) is associated with regimens containing protease inhibitors and nucleoside reverse transcriptase inhibitors. Stavudine (especially in combination with didanosine), and to a lesser extent zidovudine, are associated with a higher risk of lipodystrophy and should be used only if alternative regimens are not suitable.

Dyslipidaemia is associated with antiretroviral treatment, particularly with protease inhibitors. Protease inhibitors and some nucleoside reverse transcriptase inhibitors are associated with insulin resistance and hyperglycaemia. Of the protease inhibitors, atazanavir and darunavir may be less likely to cause dyslipidaemia, while saquinavir and atazanavir may be less likely to impair glucose tolerance.

Osteonecrosis

Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

HIV infection in children

HIV disease in children has a different natural progression to adults. Children infected with HIV should be managed within a formal paediatric HIV clinical network by specialists with access to guidelines and information on antiretroviral drugs for children.

CCR5 CHEMOKINE RECEPTOR ANTAGONISTS

Maraviroc

● **DRUG ACTION** Maraviroc is an antagonist of the CCR5 chemokine receptor.

INDICATIONS AND DOSE

CCR5-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

BY MOUTH

► Adult: 300 mg twice daily

- **CAUTIONS** Cardiovascular disease
- **INTERACTIONS** → Appendix 1 (maraviroc).
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · anaemia · anorexia · depression · diarrhoea · flatulence · headache · insomnia · malaise · nausea · rash
 - **Uncommon** Myositis · proteinuria · renal failure · seizures
 - **Rare** Angina · granulocytopenia · hepatitis · pancytopenia · Stevens-Johnson syndrome · toxic epidermal necrolysis
 - **Frequency not known** Eosinophilia · fever · hepatic reactions · hypersensitivity reactions · osteonecrosis · rash

SIDE-EFFECTS, FURTHER INFORMATION

Osteonecrosis For further information see HIV infection p. 555.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in hepatic impairment, including patients with chronic hepatitis B or C.
- **RENAL IMPAIRMENT** If eGFR less than 80 mL/minute/1.73 m², consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2008) that maraviroc (*Celsentri*[®]) is **not** recommended for use within NHS Scotland.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► *Celsentri* (ViiV Healthcare UK Ltd)

Maraviroc 150 mg *Celsentri* 150mg tablets | 60 tablet [PoM]
£441.27

Maraviroc 300 mg *Celsentri* 300mg tablets | 60 tablet [PoM]
£441.27

HIV-FUSION INHIBITORS

Enfuvirtide

● **DRUG ACTION** Enfuvirtide inhibits the fusion of HIV to the host cell.

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens

BY SUBCUTANEOUS INJECTION

► Adult: 90 mg twice daily

● **INTERACTIONS** → Appendix 1 (enfuvirtide).

SIDE-EFFECTS

- **Common or very common** Acne · anorexia · anxiety · asthenia · conjunctivitis · diabetes mellitus · dry skin · erythema · gastro-oesophageal reflux disease · haematuria · hypertriglyceridaemia · impaired concentration · influenza-like illness · injection-site reactions · irritability · lymphadenopathy · myalgia · nightmares · pancreatitis · peripheral neuropathy · pneumonia · renal calculi · sinusitis · skin papilloma · tremor · vertigo · weight loss
- **Uncommon** Hypersensitivity reactions
- **Frequency not known** Osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION

Hypersensitivity reactions Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge.

Osteonecrosis For further information see HIV infection p. 555.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects).
- **DIRECTIONS FOR ADMINISTRATION** For *subcutaneous injection*, reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; do **not** shake or invert vial.
- **PATIENT AND CARER ADVICE** Hypersensitivity reactions Patients or carers should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

ELECTROLYTES: May contain Sodium

► **Fuzeon** (Roche Products Ltd)

Enfuvirtide 108 mg Fuzeon 108mg powder and solvent for solution for injection vials | 60 vial [PoM] £1,081.57

HIV-INTEGRASE INHIBITORS

Dolutegravir

● **DRUG ACTION** Dolutegravir is an inhibitor of HIV integrase.

INDICATIONS AND DOSE

HIV infection without resistance to other inhibitors of HIV integrase, in combination with other antiretroviral drugs

BY MOUTH

► Adult: 50 mg once daily

HIV infection in patients where resistance to other inhibitors of HIV integrase suspected, in combination with other antiretroviral drugs

BY MOUTH

► Adult: 50 mg twice daily, dose to be taken with food

HIV infection in combination with other antiretroviral drugs (with concomitant efavirenz, nevirapine, tipranavir, or rifampicin)

BY MOUTH

► Adult: 50 mg twice daily, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected

● **INTERACTIONS** → Appendix 1 (dolutegravir).

Caution—avoid concomitant use with etravirine, unless used in combination with atazanavir, darunavir, or lopinavir.

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · abnormal dreams · diarrhoea · dizziness · fatigue · flatulence · headache · insomnia · nausea · pruritus · raised creatine kinase · rash · vomiting
- ▶ **Uncommon** Hepatitis · hypersensitivity reactions
- ▶ **Frequency not known** Osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION

Hypersensitivity reactions Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop.

Osteonecrosis For further information see HIV infection p. 555.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **DIRECTIONS FOR ADMINISTRATION** Avoid antacids 6 hours before or 2 hours after taking dolutegravir.
- **PATIENT AND CARER ADVICE**
Missed doses If a dose is more than 20 hours late on the once daily regimen (or more than 8 hours late on the twice daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time. Patients or carers should be given advice on how to administer dolutegravir tablets.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium* has advised (April 2010) that raltegravir (*Isentress*[®]) is accepted for restricted use within NHS Scotland for the treatment of HIV infection when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Isentress** (Merck Sharp & Dohme Ltd)
Raltegravir 400 mg Isentress 400mg tablets | 60 tablet [PoM](#) £471.41

Chewable tablet

CAUTIONARY AND ADVISORY LABELS 24

- EXCIPIENTS: May contain Aspartame
- ▶ **Isentress** (Merck Sharp & Dohme Ltd)
Raltegravir 25 mg Isentress 25mg chewable tablets | 60 tablet [PoM](#) £29.46 DT price = £29.46

Granules

- ▶ **RALTEGRAVIR (Non-proprietary)**

Raltegravir 100 mg Isentress 100mg granules sachets | 60 sachet [PoM](#) £213.02

NON-NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

Efavirenz

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

BY MOUTH USING CAPSULES

- ▶ Adult: 600 mg once daily

BY MOUTH USING TABLETS

► Adult: 600 mg once daily

BY MOUTH USING ORAL SOLUTION

► Adult: 720 mg once daily

Dose equivalence and conversion

The bioavailability of *Sustiva*[®] oral solution is lower than that of the capsules and tablets; the oral solution is **not** interchangeable with either capsules or tablets on a milligram-for-milligram basis.

- **UNLICENSED USE** Opening capsules and adding contents to food is an unlicensed method of administration.
- **CONTRA-INDICATIONS** Acute porphyrias p. 864
- **CAUTIONS** Elderly · history of mental illness · history of seizures
- **INTERACTIONS** → Appendix 1 (efavirenz).
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · abnormal dreams · anxiety · depression · diarrhoea · dizziness · fatigue · headache · impaired concentration · nausea · pruritus · rash · sleep disturbances · Stevens-Johnson syndrome · vomiting
 - **Uncommon** Amnesia · ataxia · blurred vision · convulsions · flushing · gynaecomastia · hepatitis · mania · pancreatitis · psychosis · suicidal ideation · tinnitus · tremor
 - **Rare** Hepatic failure · photosensitivity · suicide
 - **Frequency not known** Lipodystrophy Syndrome · osteonecrosis · raised serum cholesterol

SIDE-EFFECTS, FURTHER INFORMATION

Rash Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month.

CNS effects Administration at bedtime especially in first 2–4 weeks reduces CNS effects.

Lipodystrophy Syndrome For further information see HIV infection p. 555.

Osteonecrosis For further information see HIV infection p. 555.

- **PREGNANCY** Reports of neural tube defects when used in first trimester.
- **HEPATIC IMPAIRMENT** Greater risk of hepatic side-effects in chronic hepatitis B or C. Avoid in moderate to severe impairment. In mild liver disease, monitor for dose related side-effects (e.g. CNS effects) and monitor liver function.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe renal failure—no information available.
- **MONITORING REQUIREMENTS** Monitor liver function if receiving other hepatotoxic drugs.
- **DIRECTIONS FOR ADMINISTRATION** Capsules may be opened and contents added to food (contents have a peppery taste).
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry and mint.
- **PATIENT AND CARER ADVICE** Psychiatric disorders Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Also available in combination with *efavirenz with emtricitabine and tenofovir*, p. 565

Etravirine

INDICATIONS AND DOSE

HIV infection resistant to other non-nucleoside reverse transcriptase inhibitor and protease inhibitors in combination with other antiretroviral drugs (including a boosted protease inhibitor)

BY MOUTH

► Adult: 200 mg twice daily, to be taken after food

- **CONTRA-INDICATIONS** Acute porphyrias p. 864
- **INTERACTIONS** → Appendix 1 (etravirine).
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · anaemia · diabetes · flatulence · gastritis · gastro-oesophageal reflux · hyperlipidaemia · hypertension · Lipodystrophy Syndrome · myocardial infarction · nausea · peripheral neuropathy · rash · renal failure
 - **Uncommon** Angina · blurred vision · bronchospasm · drowsiness · dry mouth · gynaecomastia · haematemesis · hepatitis · malaise · pancreatitis · sweating
 - **Rare** Stevens-Johnson syndrome
 - **Very rare** Toxic epidermal necrolysis
 - **Frequency not known** Haemorrhagic stroke · hypersensitivity reactions · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION

Hypersensitivity reactions Rash, usually in the second week, is the most common side-effect and appears more frequently in females. Life-threatening hypersensitivity reactions reported usually during week 3–6 of treatment and characterised by rash, eosinophilia, and systemic symptoms (including fever, general malaise, myalgia, arthralgia, blistering, oral lesions, conjunctivitis, and hepatitis). Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks.

Lipodystrophy For further information see HIV infection p. 555.

Osteonecrosis For further information see HIV infection p. 555.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available; greater risk of hepatic side-effects in chronic hepatitis B or C.
- **DIRECTIONS FOR ADMINISTRATION** Patients with swallowing difficulties may disperse tablets in a glass of water just before administration.
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

● PATIENT AND CARER ADVICE

Missed doses If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

► **Intence** (Janssen-Cilag Ltd)

Etravirine 25 mg Intence 25mg tablets | 120 tablet [PoM](#) £75.32

Etravirine 100 mg Intence 100mg tablets | 120 tablet [PoM](#) £301.27

Etravirine 200 mg Intence 200mg tablets | 60 tablet [PoM](#) £301.27

Nevirapine

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (initial dose)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► **Adult:** Initially 200 mg once daily for first 14 days, initial dose titration using 'immediate-release' preparation should not exceed 28 days; if rash occurs and is not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the lower dose of the 'immediate-release' preparation for the first 14 days as for new treatment

HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► **Adult:** 200 mg twice daily

BY MOUTH USING MODIFIED-RELEASE MEDICINES

► **Adult:** 400 mg once daily

● **CONTRA-INDICATIONS** Acute porphyrias p. 864 · post-exposure prophylaxis

● **CAUTIONS** Females (at greater risk of hepatic side effects) · high CD4 cell count (at greater risk of hepatic side effects)

CAUTIONS, FURTHER INFORMATION

Hepatic effects Patients with chronic hepatitis B or C, high CD4 cell count, and women are at increased risk of hepatic side effects—if plasma HIV-1 RNA detectable, manufacturer advises avoid in women with CD4 cell count greater than 250 cells/mm³ or in men with CD4 cell count greater than 400 cells/mm³ unless potential benefit outweighs risk.

● **INTERACTIONS** → Appendix 1 (nevirapine).

● SIDE-EFFECTS

► **Common or very common** Abdominal pain · diarrhoea · fatigue · fever · granulocytopenia · headache · hepatitis · hypersensitivity reactions (may involve hepatic reactions and rash) · nausea · rash · Stevens-Johnson syndrome · toxic epidermal necrolysis · vomiting

► **Uncommon** Anaemia · arthralgia · myalgia

► **Frequency not known** Osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION

Hepatic effects Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia,

lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction.

Rash Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually (after 14 days); Discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves.

Osteonecrosis For more information see HIV infection p. 555.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid modified-release preparation—no information available; use 'immediate-release' preparation with caution in moderate impairment and avoid in severe impairment. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side effects).
- **RENAL IMPAIRMENT** Manufacturer advises avoid modified-release preparation—no information available.
- **MONITORING REQUIREMENTS**
 - Hepatic disease Close monitoring of liver function required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly.
 - Rash Monitor closely for skin reactions during first 18 weeks.
- **PATIENT AND CARER ADVICE**

Missed doses If a dose is more than 8 hours late with the 'immediate-release' preparation (or more than 12 hours late with the modified-release preparation), the missed dose should not be taken and the next dose should be taken at the usual time.

Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop.

● MEDICINAL FORMS

Rilpivirine

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy and if plasma HIV-1 RNA concentration less than 100 000 copies/mL

BY MOUTH

▶ Adult: 25 mg once daily

- **INTERACTIONS** → Appendix 1 (rilpivirine). Caution if concomitant use with drugs that prolong QT interval.
- **SIDE-EFFECTS** Abdominal pain · abnormal dreams · anorexia · depression · dizziness · dry mouth · headache · hyperlipidaemia · Lipodystrophy Syndrome · malaise · nausea · osteonecrosis · raised serum amylase · raised serum lipase · rash · sleep disturbances · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
Lipodystrophy For further information see HIV infection p. 555.
Osteonecrosis For further information see HIV infection p. 555.
- **PREGNANCY** Manufacturer advises avoid unless essential— no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment— no information available; greater risk of hepatic side-effects in chronic hepatitis B or C.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **DIRECTIONS FOR ADMINISTRATION** Avoid antacids 2 hours before or 4 hours after taking rilpivirine.
- **PATIENT AND CARER ADVICE**
Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. Patients or carers should be given advice on how to administer rilpivirine tablets.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

▶ **Edurant** (Janssen-Cilag Ltd) ▼

Rilpivirine (as Rilpivirine hydrochloride) 25 mg Edurant 25mg tablets | 30 tablet **[PoM]** £200.27

Also available in combination with *emtricitabine* and *tenofovir*, p. 565

NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

Nucleoside reverse transcriptase inhibitors

- **CAUTIONS** Alcohol abuse (increased risk of lactic acidosis) · obese women (increased risk of lactic acidosis) · patients at risk of lactic acidosis

CAUTIONS, FURTHER INFORMATION

Lactic acidosis Life-threatening lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with nucleoside reverse transcriptase inhibitors. They should be used with caution in patients with hepatomegaly, hepatitis (especially hepatitis C treated with interferon alfa and ribavirin), liver-enzyme abnormalities and with other risk factors for liver disease and hepatic steatosis. Treatment with the nucleoside

reverse transcriptase inhibitor should be **discontinued** in case of symptomatic hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function.

- **SIDE-EFFECTS** Abdominal pain · anaemia · anorexia · arthralgia · blood disorders · cough · diarrhoea · dizziness · dyspnoea · fatigue · fever · flatulence · gastro-intestinal disturbances · headache · insomnia · lactic acidosis · lipodystrophy (Lipodystrophy Syndrome) · liver damage · metabolic effects · myalgia · nausea · neutropenia · osteonecrosis · pancreatitis · rash · thrombocytopenia · urticaria · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Lipodystrophy syndrome For further information see HIV infection p. 555.

Osteonecrosis For further information see HIV infection p. 555.

- **PREGNANCY** Mitochondrial dysfunction has been reported in infants exposed to nucleoside reverse transcriptase inhibitors in utero; the main effects include haematological, metabolic, and neurological disorders; all infants whose mothers received nucleoside reverse transcriptase inhibitors during pregnancy should be monitored for relevant signs or symptoms.
- **HEPATIC IMPAIRMENT** Use with caution in patients with chronic hepatitis B or C (greater risk of hepatic side-effects).

Abacavir

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

BY MOUTH

▶ Adult: 600 mg daily in 1–2 divided doses

- **CAUTIONS** HIV load greater than 100 000 copies/mL · patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%)
- **INTERACTIONS** → Appendix 1 (abacavir).
- **SIDE-EFFECTS**
- ▶ **Very rare** Stevens-Johnson syndrome · toxic epidermal necrolysis
- ▶ **Frequency not known** Hypersensitivity reactions

SIDE-EFFECTS, FURTHER INFORMATION

Hypersensitivity reactions Life-threatening hypersensitivity reactions reported—characterised by fever or rash and possibly nausea, vomiting, diarrhoea, abdominal pain, dyspnoea, cough, lethargy, malaise, headache, and myalgia; less frequently mouth ulceration, oedema, hypotension, sore throat, acute respiratory distress syndrome, anaphylaxis, paraesthesia, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure; rarely myolysis; laboratory abnormalities may include raised liver function tests and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time. Discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction); discontinue if hypersensitivity cannot be ruled out, even when other diagnoses possible—if rechallenge necessary it must be carried out in hospital setting; if abacavir is stopped for any reason other than hypersensitivity, exclude hypersensitivity reaction as the cause and rechallenge only if medical assistance is readily available; care needed with concomitant use of drugs which cause skin toxicity.

Gastro-intestinal disturbances More common in children.

Rash More common in children.

- **ALLERGY AND CROSS-SENSITIVITY** Caution—increased risk of hypersensitivity reaction in presence of HLA-B*5701 allele.
- **HEPATIC IMPAIRMENT** Monitor closely in mild impairment (combination preparations not recommended as reduced abacavir dose may be required). Avoid in moderate impairment unless essential—close monitoring recommended. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in end-stage renal disease.
- **PRE-TREATMENT SCREENING** Test for HLA-B*5701 allele before treatment or if restarting treatment and HLA-B*5701 status not known.
- **MONITORING REQUIREMENTS** Monitor for symptoms of hypersensitivity reaction every 2 weeks for 2 months.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana, or strawberry.
- **PATIENT AND CARER ADVICE** Patients should be provided with an alert card and advised to keep it with them at all times. Patients and their carers should be told the importance of regular dosing (intermittent therapy may increase the risk of sensitisation), how to recognise signs of hypersensitivity, and advised to seek immediate medical attention if symptoms develop or before re-starting treatment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Abacavir with dolutegravir and lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 561, lamivudine p. 563, dolutegravir p. 557.

INDICATIONS AND DOSE

HIV infection

BY MOUTH

- ▶ Adult (body-weight 40 kg and above): 1 tablet once daily

- **RENAL IMPAIRMENT** Avoid *Triumeq*® if eGFR less than 50 mL/minute/1.73 m² (consult product literature).

● PATIENT AND CARER ADVICE

Missed doses If a dose is more than 20 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Triumeq** (ViiV Healthcare UK Ltd) ▼
Abacavir (as Abacavir sulfate) 600 mg, Dolutegravir (as Dolutegravir sodium) 50 mg, Lamivudine 300 mg Triumeq 50mg/600mg/300mg tablets | 30 tablet [PoM] £798.16

Abacavir with lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 561, lamivudine p. 563.

INDICATIONS AND DOSE

HIV infection in combination with other antiretrovirals

BY MOUTH

- ▶ Adult (body-weight 40 kg and above): 1 tablet once daily

- **RENAL IMPAIRMENT** Avoid *Kivexa*® if eGFR less than 50 mL/minute/1.73 m² (consult product literature).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Kivexa** (ViiV Healthcare UK Ltd)
Abacavir (as Abacavir sulfate) 600 mg, Lamivudine 300 mg Kivexa 600mg/300mg tablets | 30 tablet [PoM] £299.41

Abacavir with lamivudine and zidovudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 561, lamivudine p. 563, zidovudine p. 566.

INDICATIONS AND DOSE

HIV infection (use only if patient is stabilised for 6–8 weeks on the individual components in the same proportions)

BY MOUTH

- ▶ Adult: 1 tablet twice daily

- **RENAL IMPAIRMENT** Avoid *Trizivir*® if eGFR less than 50 mL/minute/1.73 m² (consult product literature). Avoid *Trizivir*® if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Trizivir** (ViiV Healthcare UK Ltd)
Abacavir (as Abacavir sulfate) 300 mg, Lamivudine 150 mg, Zidovudine 300 mg Trizivir tablets | 60 tablet [PoM] £432.70

Didanosine (ddi; DDI)

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

BY MOUTH

- ▶ Adult (body-weight up to 60 kg): 250 mg daily in 1–2 divided doses
- ▶ Adult (body-weight 60 kg and above): 400 mg daily in 1–2 divided doses

- **CAUTIONS** History of pancreatitis (preferably avoid, otherwise extreme caution) · hyperuricaemia · peripheral neuropathy
- **INTERACTIONS** → Appendix 1 (didanosine). Antacids in tablet formulation might affect absorption of other drugs—give at least 2 hours apart.
- **SIDE-EFFECTS** Acute renal failure · alopecia · anaphylactic reactions · diabetes mellitus · dry eyes · dry mouth · hyperuricaemia (suspend if raised significantly) · hypoglycaemia · liver failure · non-cirrhotic portal hypertension · optic nerve changes · pancreatitis (less

common in children) · parotid gland enlargement · peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) · retinal changes · rhabdomyolysis · sialadenitis

SIDE-EFFECTS, FURTHER INFORMATION

Pancreatitis Suspend treatment if serum lipase raised (even if asymptomatic) or if symptoms of pancreatitis develop; discontinue if pancreatitis confirmed. Whenever possible avoid concomitant treatment with other drugs known to cause pancreatic toxicity (e.g. intravenous pentamidine isetonate); monitor closely if concomitant therapy unavoidable. Since significant elevations of triglycerides cause pancreatitis monitor closely if elevated.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Insufficient information. In hepatic impairment, monitor for toxicity.
- **RENAL IMPAIRMENT** Reduce dose if eGFR less than 60 mL/minute/1.73 m²; consult product literature.
- **MONITORING REQUIREMENTS** Ophthalmological examination (including visual acuity, colour vision, and dilated fundus examination) recommended annually or if visual changes occur.
- **DIRECTIONS FOR ADMINISTRATION** With chewable tablets, to ensure sufficient antacid, each dose to be taken as at least 2 tablets (child under 1 year 1 tablet) chewed thoroughly, crushed or dispersed in water; clear apple juice may be added for flavouring; tablets to be taken 2 hours after lopinavir with ritonavir capsules and oral solution or atazanavir with ritonavir. Capsules should be swallowed whole and taken at least 2 hours before or 2 hours after food.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer didanosine capsules and chewable tablets.

Emtricitabine 10 mg per 1 ml Emtriva 10mg/ml oral solution (sugar-free) | 170 ml [PoM] £39.53

Also available in combination with *cobicistat with elvitegravir, tenofovir*, p. 565 · *efavirenz with tenofovir*, p. 565 · *rilpivirine and tenofovir*, p. 565 · *tenofovir*, p. 566

Lamivudine

(3TC)

INDICATIONS AND DOSE

ZEFFIX[®]

Chronic hepatitis B infection either with compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis) when first-line treatments cannot be used, or (in combination with another antiviral drug without cross-resistance to lamivudine) with decompensated liver disease

BY MOUTH

► Adult: 100 mg once daily, patients receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

EPIVIR[®] TABLETS

HIV infection in combination with other antiretroviral drugs

BY MOUTH

► Adult: 150 mg every 12 hours, alternatively 300 mg once daily

EPIVIR[®] ORAL SOLUTION

HIV infection in combination with other antiretroviral drugs

BY MOUTH

► Adult: 150 mg every 12 hours, alternatively 300 mg once daily

● **CAUTIONS** Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine

● **INTERACTIONS** → Appendix 1 (lamivudine).

● **SIDE-EFFECTS** Alopecia · muscle disorders · nasal symptoms · peripheral neuropathy · rhabdomyolysis

● **BREAST FEEDING** Can be used with caution in women infected with chronic hepatitis B alone, providing that adequate measures are taken to prevent hepatitis B infection in infants.

● **RENAL IMPAIRMENT** Reduce dose if eGFR less than 50 mL/minute/1.73 m²; consult product literature.

- **MONITORING REQUIREMENTS** When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral markers of hepatitis B every 3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana and strawberry.

Stavudine (d4T)

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs when no suitable alternative available and when prescribed for shortest period possible

BY MOUTH

- ▶ Adult (body-weight up to 60 kg): 30 mg every 12 hours, to be taken preferably at least 1 hour before food
- ▶ Adult (body-weight 60 kg and above): 40 mg every 12 hours, to be taken preferably at least 1 hour before food

- **CAUTIONS** Excessive alcohol intake · higher risk of lactic acidosis than other nucleoside reverse transcriptase inhibitors (especially when used in combination with didanosine)—use only if alternative regimens are not suitable · history of pancreatitis · history of peripheral neuropathy

- **INTERACTIONS** → Appendix 1 (stavudine). Caution with concomitant use of isoniazid—risk of peripheral neuropathy. Caution with concomitant use with other drugs associated with pancreatitis.

● SIDE-EFFECTS

- ▶ **Common or very common** Abnormal dreams · cognitive dysfunction · depression · drowsiness · peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) · pruritus
- ▶ **Uncommon** Anxiety · gynaecomastia

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **RENAL IMPAIRMENT** Use half normal dose every 12 hours if eGFR 25–50 mL/minute/1.73 m². Use half normal dose every 24 hours if eGFR less than 25 mL/minute/1.73 m².

Risk of peripheral neuropathy.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.

- **LESS SUITABLE FOR PRESCRIBING** Stavudine (especially in combination with didanosine) is associated with a higher risk of lipodystrophy and should be used only if alternative regimens are not suitable; it is considered to be less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Stavudine 1 mg per 1 ml Zerit 1mg/ml oral solution | 200 ml [PoM](#) £22.94 (Hospital only)

Tenofovir disoproxil

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs | Chronic hepatitis B infection with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) | Chronic hepatitis B infection with decompensated liver disease

BY MOUTH

- ▶ Adult: 245 mg once daily

Dose equivalence and conversion

7.5 scoops of granules contains approx. 245 mg tenofovir disoproxil (as fumarate).

- **INTERACTIONS** → Appendix 1 (tenofovir). Use with caution if concomitant or recent use of nephrotoxic drugs.
- **SIDE-EFFECTS**
 - ▶ **Rare** Nephrogenic diabetes insipidus · proximal renal tubulopathy · renal failure
 - ▶ **Frequency not known** Hypophosphataemia · reduced bone density
- **RENAL IMPAIRMENT** *Granules*: 132 mg once daily if eGFR 30–50 mL/minute/1.73 m²; 66 mg once daily if eGFR 20–30 mL/minute/1.73 m²; 33 mg once daily if eGFR 10–20 mL/minute/1.73 m². *Tablets*: 245 mg every 2 days if eGFR 30–50 mL/minute/1.73 m²; 245 mg every 3–4 days if eGFR 10–30 mL/minute/1.73 m². Monitor renal function—interrupt treatment if further deterioration.
- **MONITORING REQUIREMENTS**
 - ▶ Test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases.
 - ▶ When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).
- **DIRECTIONS FOR ADMINISTRATION** *Granules*: mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do **not** mix granules with liquids.

● PATIENT AND CARER ADVICE

Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. Patients or carers should be given advice on how to administer tenofovir granules.

Zidovudine

(Azidothymidine; AZT)

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs
BY MOUTH

► Adult: 250–300 mg twice daily

Prevention of maternal-fetal HIV transmission

BY MOUTH OR BY INTRAVENOUS INFUSION

► Adult: Seek specialist advice (combination therapy preferred) (consult local protocol)

HIV infection in combination with other antiretroviral drugs in patients temporarily unable to take zidovudine by mouth

BY INTRAVENOUS INFUSION

► Adult: 0.8–1 mg/kg every 4 hours usually for not more than 2 weeks, dose approximating to 1.2–1.5 mg/kg every 4 hours by mouth

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 · abnormally low haemoglobin concentration (consult product literature) · abnormally low neutrophil counts (consult product literature)
- **CAUTIONS** Elderly · risk of haematological toxicity particularly with high dose and advanced disease · vitamin B₁₂ deficiency (increased risk of neutropenia)
- **INTERACTIONS** → Appendix 1 (zidovudine).
Increased risk of toxicity with nephrotoxic and myelosuppressive drugs—for further details consult product literature.
- **SIDE-EFFECTS** Anaemia (may require transfusion) · anxiety · chest pain · convulsions · depression · dizziness · drowsiness · gynaecomastia · influenza-like symptoms · loss of mental acuity · myopathy · neuropathy · paraesthesia · pigmentation of nails · pigmentation of oral mucosa · pigmentation of skin · pruritus · sweating · taste disturbance · urinary frequency
- **SIDE-EFFECTS, FURTHER INFORMATION**
Anaemia and myelosuppression If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment
Lipoatrophy Zidovudine is associated with a higher risk of lipoatrophy than other antiretrovirals and should be used only if alternative regimens are not suitable.
- **HEPATIC IMPAIRMENT** Accumulation may occur.
- **RENAL IMPAIRMENT** Reduce oral dose to 300–400 mg daily in divided doses or intravenous dose to 1 mg/kg 3–4 times daily if eGFR is less than 10 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor full blood count after 4 weeks of treatment, then every 3 months.
- **DIRECTIONS FOR ADMINISTRATION** For *intermittent intravenous infusion*, dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give over 1 hour.
- **PRESCRIBING AND DISPENSING INFORMATION** The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug.

PHARMACOKINETIC ENHANCERS

Cobicistat

INDICATIONS AND DOSE

Pharmacokinetic enhancer used to increase the effect of atazanavir or darunavir

BY MOUTH

► Adult: 150 mg once daily

- **INTERACTIONS** → Appendix 1 (cobicistat).
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** No dose adjustment required; inhibits tubular secretion of creatinine; when any co-administered drug requires dose adjustment based on

renal function, avoid initiating cobicistat if eGFR less than 70 mL/minute/1.73 m².

- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

PATIENT AND CARER ADVICE

Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

PROTEASE INHIBITORS (HIV)

Protease inhibitors

- **CONTRA-INDICATIONS** Acute porphyrias p. 864
- **CAUTIONS** Diabetes · haemophilia (increased risk of bleeding)
- **SIDE-EFFECTS** Abdominal pain · anaemia · anaphylaxis · anorexia · blood disorders · diarrhoea · dizziness · fatigue · flatulence · gastro-intestinal disturbances · headache · hepatic dysfunction · hypersensitivity reactions · lipodystrophy · Lipodystrophy Syndrome · metabolic effects · myalgia · myositis · nausea · neutropenia · osteonecrosis · pancreatitis · paraesthesia · pruritus · rash · rhabdomyolysis · sleep disturbances · Stevens-Johnson syndrome · taste disturbances · thrombocytopenia · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
Lipodystrophy Syndrome For further information see HIV infection p. 555.
Osteonecrosis For further information see HIV infection p. 555.
- **HEPATIC IMPAIRMENT** Use with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

Atazanavir

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir

BY MOUTH

► Adult: 300 mg once daily

HIV infection in combination with other antiretroviral drugs—with cobicistat

BY MOUTH

► Adult: 300 mg daily

- **CAUTIONS** Cardiac conduction disorders · electrolyte disturbances · predisposition to QT interval prolongation
- **INTERACTIONS** → Appendix 1 (atazanavir). Caution if concomitant use with drugs that prolong PR interval. Caution with concomitant use of drugs that prolong QT interval.
- **SIDE-EFFECTS**
► **Uncommon** Abnormal dreams · alopecia · amnesia · anxiety · arthralgia · chest pain · cholelithiasis · depression · disorientation · dry mouth · dyspnoea · gynaecomastia · haematuria · hypertension · increased appetite · mouth

ulcers · nephrolithiasis · peripheral neuropathy · proteinuria · syncope · torsade de pointes · urinary frequency · weight changes

- ▶ **Rare** Abnormal gait · cholecystitis · hepatosplenomegaly · oedema · palpitation

SIDE-EFFECTS, FURTHER INFORMATION

Rash Mild to moderate rash occurs commonly, usually within the first 3 weeks of therapy. Severe rash occurs less frequently and may be accompanied by systemic symptoms. Discontinue if severe rash develops.

- **PREGNANCY** Theoretical risk of hyperbilirubinaemia in neonate if used at term. In pregnancy, monitor viral load and plasma-atazanavir concentration during third trimester.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Darunavir

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy— with low-dose ritonavir

BY MOUTH

- ▶ Adult: 600 mg twice daily, alternatively 800 mg once daily if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells × 10⁶/litre

HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy— with cobicistat

BY MOUTH

- ▶ Adult: 800 mg once daily, if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells × 10⁶/litre

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy— with low-dose ritonavir

BY MOUTH

- ▶ Adult: 800 mg once daily

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy— with cobicistat

BY MOUTH

- ▶ Adult: 800 mg once daily

- **INTERACTIONS** → Appendix 1 (darunavir).

SIDE-EFFECTS

- ▶ **Common or very common** Peripheral neuropathy · rash
- ▶ **Uncommon** Abnormal dreams · acne · alopecia · angina · anxiety · arthralgia · conjunctival hyperaemia · cough · depression · dry eyes · dry mouth · dyspnoea · dysuria · eczema · erectile dysfunction · flushing · gynaecomastia · hypertension · hypothyroidism · increased appetite · increased sweating · memory impairment · myocardial infarction · nail discoloration · nephrolithiasis ·

osteoporosis · peripheral oedema · polyuria · pyrexia · QT interval prolongation · reduced libido · renal failure · severe skin rash · Stevens-Johnson syndrome · stomatitis · tachycardia · throat irritation · toxic epidermal necrolysis · weight changes

- ▶ **Rare** Bradycardia · confusion · convulsions · haematemesis · palpitation · rhinorrhoea · seborrhoeic dermatitis · syncope · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Rash Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if severe rash develops.

- **ALLERGY AND CROSS-SENSITIVITY** Use with caution in patients with sulfonamide sensitivity.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Monitor liver function before and during treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.
- **PATIENT AND CARER ADVICE**

Missed doses

If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Fosamprenavir

- **DRUG ACTION** Fosamprenavir is a pro-drug of amprenavir.

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs— with low-dose ritonavir

BY MOUTH

- ▶ Adult: 700 mg twice daily

Dose equivalence and conversion

700 mg fosamprenavir is equivalent to approximately 600 mg amprenavir.

- **INTERACTIONS** → Appendix 1 (fosamprenavir).

● SIDE-EFFECTS

- ▶ **Rare** Stevens-Johnson syndrome
- ▶ **Frequency not known** Rash

SIDE-EFFECTS, FURTHER INFORMATION

- Rash** Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—usually resolves within 2 weeks and may respond to antihistamines.
- **PREGNANCY** Toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Reduce dose to 450 mg twice daily in moderate impairment; reduce dose to 300 mg twice daily in severe impairment. Manufacturer advises caution in mild impairment.
- **DIRECTIONS FOR ADMINISTRATION** Oral suspension should be taken on an empty stomach.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include grape, bubblegum, or peppermint.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer fosamprenavir oral suspension.

Fosamprenavir (as Fosamprenavir calcium) 50 mg per 1 mL Telzir 50mg/mL oral suspension | 225 mL **[PoM]** £58.70

Indinavir

INDICATIONS AND DOSE

HIV infection in combination with nucleoside reverse transcriptase inhibitors

BY MOUTH

- ▶ **Adult:** Seek specialist advice

- **CAUTIONS** Ensure adequate hydration (risk of nephrolithiasis) · patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%) · patients at risk of nephrolithiasis (monitor for nephrolithiasis)
- **INTERACTIONS** → Appendix 1 (indinavir).
- **SIDE-EFFECTS** Alopecia · crystalluria · dry mouth · dry skin · dysuria · haematuria · haemolytic anaemia · hyperpigmentation · hypoesthesia · interstitial nephritis (with medullary calcification and cortical atrophy in asymptomatic severe leucocyturia) · nephrolithiasis (may require interruption or discontinuation) · paronychia · proteinuria · pyelonephritis
- **PREGNANCY** Toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk; theoretical risk of hyperbilirubinaemia and renal stones in neonate if used at term.
- **HEPATIC IMPAIRMENT** Reduce dose in mild to moderate impairment. Not studied in severe impairment. Increased risk of nephrolithiasis.
- **RENAL IMPAIRMENT** Use with caution. In patients with renal impairment, monitor for nephrolithiasis.
- **DIRECTIONS FOR ADMINISTRATION** Administer 1 hour before or 2 hours after a meal; may be administered with

a low-fat light meal; in combination with didanosine tablets, allow 1 hour between each drug (antacids in didanosine tablets reduce absorption of indinavir); in combination with low-dose ritonavir, give with food.

- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer indinavir capsules.
- **LESS SUITABLE FOR PRESCRIBING** Indinavir is rarely used in the treatment of HIV-infection because it is associated with nephrolithiasis; it is considered to be less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 27

- ▶ **Crixivan** (Merck Sharp & Dohme Ltd)
Indinavir (as Indinavir sulfate) 200 mg Crixivan 200mg capsules | 360 capsule **[PoM]** £181.02

Lopinavir with ritonavir

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

INITIALLY BY MOUTH USING TABLETS

- ▶ **Adult:** 400/100 mg twice daily, alternatively (by mouth) 800/200 mg once daily in adults with a HIV strain that has less than 3 mutations to protease inhibitors

BY MOUTH USING ORAL SOLUTION

- ▶ **Adult:** 5 mL twice daily, to be taken with food, oral solution contains 400 mg lopinavir, 100 mg ritonavir/5 mL

Dose equivalence and conversion

The proportions are expressed in the form x/y where x and y are the strengths in milligrams of lopinavir and ritonavir respectively.

- **CAUTIONS** Cardiac conduction disorders · pancreatitis · patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%) · structural heart disease
- **INTERACTIONS** → Appendix 1 (lopinavir, ritonavir). Caution if concomitant use with drugs that prolong QT or PR interval.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Amenorrhoea · anxiety · arthralgia · colitis · hypertension · menorrhagia · neuropathy · night sweats · sexual dysfunction · weight changes
 - ▶ **Uncommon** Abnormal dreams · alopecia · AV block · cerebrovascular accident · convulsions · deep vein thrombosis · dry mouth · gastro-intestinal ulcer · haematuria · myocardial infarction · nephritis · rectal bleeding · stomatitis · tinnitus · tremor · visual disturbances
- **SIDE-EFFECTS, FURTHER INFORMATION**

Pancreatitis Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed
- **PREGNANCY** Avoid oral solution due to high propylene glycol content; use tablets only if potential benefit outweighs risk (toxicity in *animal* studies).
- **HEPATIC IMPAIRMENT** Avoid oral solution due to propylene glycol content; manufacturer advises avoid tablets in severe impairment.

- **RENAL IMPAIRMENT** Avoid oral solution due to high propylene glycol content. Use tablets with caution in severe impairment.
- **MONITORING REQUIREMENTS** Monitor liver function before and during treatment.
- **PATIENT AND CARER ADVICE** Oral solution tastes bitter.

Ritonavir

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (high-dose ritonavir)

BY MOUTH

- Adult: Initially 300 mg every 12 hours for 3 days, increased in steps of 100 mg every 12 hours over not longer than 14 days; increased to 600 mg every 12 hours

Low-dose booster to increase effect of other protease inhibitors

BY MOUTH

- Adult: 100–200 mg 1–2 times a day

- **CAUTIONS** Cardiac conduction disorders · pancreatitis · structural heart disease
- **INTERACTIONS** → Appendix 1 (ritonavir). Caution if concomitant use with drugs that prolong PR interval.
- **SIDE-EFFECTS**
 - **Common or very common** Acne · anxiety · arthralgia · blood pressure changes · blurred vision · confusion · cough · decreased blood thyroxine concentration · fever · flushing · gastro-intestinal haemorrhage · menorrhagia · mouth ulcers · oedema · peripheral neuropathy · pharyngitis · renal impairment · seizures · syncope
 - **Uncommon** Electrolyte disturbances · myocardial infarction
 - **Rare** Toxic epidermal necrolysis
- SIDE-EFFECTS, FURTHER INFORMATION**
- Pancreatitis** Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed.
- **PREGNANCY** Only use low-dose booster to increase the effect of other protease inhibitors.
- **HEPATIC IMPAIRMENT** Avoid in decompensated liver disease; in severe impairment without decompensation, use ‘booster’ doses with caution (avoid treatment doses).
- **DIRECTIONS FOR ADMINISTRATION** Bitter taste of oral solution can be masked by mixing with chocolate milk; do not mix with water, measuring cup must be dry.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer ritonavir oral solution.

MEDICINAL FORMS

Ritonavir 80 mg per 1 ml Norvir 80mg/ml oral solution (sugar-free) | 450 ml [PoM] £403.20

Saquinavir

INDICATIONS AND DOSE

HIV infection in combination with other antiretrovirals in patients previously treated with antiretroviral therapy—with low-dose ritonavir

BY MOUTH

- Adult: 1 g every 12 hours

HIV infection in combination with other antiretrovirals in patients not previously treated with antiretroviral therapy—with low-dose ritonavir

BY MOUTH

- Adult: 500 mg every 12 hours for 7 days, then increased to 1 g every 12 hours

- **CONTRA-INDICATIONS** Bradycardia · congenital QT prolongation · electrolyte disturbances · heart failure with reduced left ventricular ejection fraction · history of symptomatic arrhythmias · predisposition to cardiac arrhythmias
- **INTERACTIONS** → Appendix 1 (saquinavir). Caution with concomitant use of garlic (avoid garlic capsules—reduces plasma-saquinavir concentration). Contra-indicated if concomitant use of drugs that prolong QT or PR interval. Contra-indicated if concomitant use of drugs that increase plasma-saquinavir concentration (avoid unless no alternative treatment available).
- **SIDE-EFFECTS**
 - **Common or very common** Alopecia · changes in libido · dry mouth · dyspnoea · increased appetite · peripheral neuropathy
 - **Uncommon** Convulsions · mucosal ulceration · renal impairment · visual impairment
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in decompensated liver disease.
- **RENAL IMPAIRMENT** Use with caution if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor ECG before starting treatment (do not initiate treatment if QT interval over 450 milliseconds); if baseline QT interval less than 450 milliseconds, monitor ECG during treatment (particularly 10 days after starting treatment in patients not previously treated with antiretroviral therapy)—discontinue if QT interval increases over 480 milliseconds, if QT interval more than 20 milliseconds above baseline, if prolongation of PR interval, or if arrhythmias occur.
- **PATIENT AND CARER ADVICE**
- Arrhythmias** Patients should be told how to recognise signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncope develop.
- **MEDICINAL FORMS**

CAUTIONARY AND ADVISORY LABELS 5, 21

EXCIPIENTS: May contain Vitamin e

▶ **Aptivus** (Boehringer Ingelheim Ltd)**Tipranavir 100 mg per 1 ml** Aptivus 100mg/ml oral solution (sugar-free) | 95 ml **[PoM]** £129.65**6.7 Influenza****Influenza**

Oseltamivir below and zanamivir p. 573 are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; they are licensed for use within 48 hours of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days. Oseltamivir or zanamivir can reduce the risk of complications from influenza in the elderly and in patients with chronic disease.

Oseltamivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza. However, in patients with severe influenza or in those who are immunocompromised, antivirals may still be effective after this time if viral shedding continues [unlicensed use]. Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

There is evidence that some strains of influenza A virus have reduced susceptibility to oseltamivir, but may retain susceptibility to zanamivir. Resistance to oseltamivir may be greater in severely immunocompromised patients.

Zanamivir should be reserved for patients who are severely immunocompromised, or when oseltamivir below cannot be used, or when resistance to oseltamivir is suspected. For those unable to use the dry powder for inhalation, zanamivir is available as a solution that can be administered by nebuliser or intravenously [unlicensed].

Amantadine hydrochloride p. 331 is licensed for prophylaxis and treatment of influenza A but it is no longer recommended.

Information on pandemic influenza, avian influenza, and swine influenza may be found at www.gov.uk/phe.

Immunisation against influenza is recommended for persons at high risk, and to reduce transmission of infection.

Oseltamivir in children under 1 year of age

Data on the use of oseltamivir in children under 1 year of age is limited. Furthermore, oseltamivir may be ineffective in neonates because they may not be able to metabolise oseltamivir to its active form. However, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that during a pandemic, treatment with oseltamivir can be overseen by healthcare professionals experienced in assessing children.

NEUROMINIDASE INHIBITORS**Oseltamivir**

- **DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

INDICATIONS AND DOSE**Prevention of influenza**

BY MOUTH

▶ **Child 1-2 months:** 2.5 mg/kg once daily for 10 days for post-exposure prophylaxis▶ **Child 3-11 months:** 3 mg/kg once daily for 10 days for post-exposure prophylaxis

continued →

- ▶ Child 1-12 years (body-weight 10-15 kg): 30 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- ▶ Child 1-12 years (body-weight 15-23 kg): 45 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- ▶ Child 1-12 years (body-weight 23-40 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- ▶ Child 1-12 years (body-weight 40 kg and above): 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- ▶ Child 13-17 years: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- ▶ Adult: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

Treatment of influenza**BY MOUTH**

- ▶ Child 1-2 months: 2.5 mg/kg twice daily for 5 days
 - ▶ Child 3-11 months: 3 mg/kg twice daily for 5 days
 - ▶ Child 1-12 years (body-weight 10-15 kg): 30 mg twice daily for 5 days
 - ▶ Child 1-12 years (body-weight 15-23 kg): 45 mg twice daily for 5 days
 - ▶ Child 1-12 years (body-weight 23-40 kg): 60 mg twice daily for 5 days
 - ▶ Child 1-12 years (body-weight 40 kg and above): 75 mg twice daily for 5 days
 - ▶ Child 13-17 years: 75 mg twice daily for 5 days
 - ▶ Adult: 75 mg twice daily for 5 days
- **UNLICENSED USE** Not licensed for use in children under 1 year of age unless there is a pandemic.
 - **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · dyspepsia · headache · nausea · vomiting
 - ▶ **Uncommon** Altered consciousness (usually in children and adolescents); arrhythmias · convulsions · eczema · rash
 - ▶ **Rare** Gastro-intestinal bleeding · hepatitis · neuropsychiatric disorders (usually in children and adolescents) · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis · visual disturbances
 - **PREGNANCY** Although safety data are limited, oseltamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).
 - **BREAST FEEDING** Although safety data are limited, oseltamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding. Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).
 - **RENAL IMPAIRMENT**
 - ▶ In adults For *treatment*, use 30 mg twice daily if eGFR 30–60 mL/minute/1.73 m² (30 mg once daily if eGFR 10–30 mL/minute/1.73 m²). For *prevention*, use 30 mg once daily if eGFR 30–60 mL/minute/1.73 m² (30 mg every 48 hours if eGFR 10–30 mL/minute/1.73 m²). Avoid for *treatment* and *prevention* if eGFR less than 10 mL/minute/1.73 m².
 - ▶ In children For *treatment*, use 40% of normal dose twice daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose once daily if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²). For *prevention*, use 40% of normal dose once daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose every

48 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²). Avoid for *treatment* and *prevention* if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION** If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration.
 - **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.
 - **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Oseltamivir for influenza (flu) www.medicinesforchildren.org.uk/oseltamivir-for-influenza
 - **NATIONAL FUNDING/ACCESS DECISIONS**
 - **NICE technology appraisals (TAs)**
 - ▶ **Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008)** [NICE TA158] The drugs described here are not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
 - Amantadine is not recommended for prophylaxis of influenza.
 - Oseltamivir is **not** recommended for seasonal prophylaxis against influenza.
 - When influenza is circulating in the community, either oseltamivir or zanamivir is recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza. National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.
 - During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, either oseltamivir or zanamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.
- At risk patients include those aged over 65 years or those who have one or more of the following conditions:
- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
 - chronic heart disease;
 - chronic renal disease;
 - chronic liver disease;
 - chronic neurological disease;
 - immunosuppression;
 - diabetes mellitus.
- The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant. This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community. www.nice.org.uk/TA158
- ▶ **Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (February 2009)** [NICE TA168] The drugs described here are not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
 - Amantadine is not recommended for prophylaxis of influenza.

- When influenza is circulating in the community, either oseltamivir or zanamivir is recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 48 hours of the onset of symptoms. National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, either oseltamivir or zanamivir may be used for treatment at-risk patients living in long-term residential or nursing homes.

At risk patients include those aged over 65 years or those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community. www.nice.org.uk/TA168

NHS restrictions Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription 'SLS'.

Zanamivir

- **DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

INDICATIONS AND DOSE

Post-exposure prophylaxis of influenza

BY INHALATION OF POWDER

- Child 5-17 years: 10 mg once daily for 10 days
- Adult: 10 mg once daily for 10 days

Prevention of influenza during an epidemic

BY INHALATION OF POWDER

- Child 5-17 years: 10 mg once daily for up to 28 days
- Adult: 10 mg once daily for up to 28 days

Treatment of influenza

BY INHALATION OF POWDER

- Child 5-17 years: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)
- Adult: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)

- **UNLICENSED USE** Use of zanamivir for up to 10 days if resistance to oseltamivir suspected is an unlicensed duration.

- **CAUTIONS** Asthma · chronic pulmonary disease · uncontrolled chronic illness

CAUTIONS, FURTHER INFORMATION

Asthma and chronic pulmonary disease Risk of bronchospasm—short-acting bronchodilator should be available. Avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm.

● SIDE-EFFECTS

- **Common or very common** Rash
- **Uncommon** Angioedema · bronchospasm · dyspnoea · urticaria
- **Rare** Neuropsychiatric disorders (in children) · neuropsychiatric disorders (especially in children and adolescents) (in adults) · Stevens-Johnson syndrome · toxic epidermal necrolysis

- **PREGNANCY** Although safety data are limited, zanamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).
- **BREAST FEEDING** Although safety data are limited, zanamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

- **DIRECTIONS FOR ADMINISTRATION** Other inhaled drugs should be administered before zanamivir.

- **PRESCRIBING AND DISPENSING INFORMATION** Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription 'SLS'.

1 Antidiuretic hormone disorders

Posterior pituitary hormones and antagonists

Posterior pituitary hormones

Diabetes insipidus

Vasopressin p. 576 (antidiuretic hormone, ADH) is used in the treatment of *pituitary* ('cranial') *diabetes insipidus* as its analogue desmopressin. Dosage is tailored to produce a slight diuresis every 24 hours to avoid water intoxication. Treatment may be required for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus. Following a dose intramuscularly or intranasally, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of cranial diabetes insipidus. Failure to respond occurs in nephrogenic diabetes insipidus.

In *nephrogenic* and *partial pituitary diabetes insipidus* benefit may be gained from the paradoxical antidiuretic effect of thiazides.

Carbamazepine p. 387 is sometimes useful in partial pituitary diabetes insipidus [unlicensed]; it may act by sensitising the renal tubules to the action of remaining endogenous vasopressin.

Other uses

Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand's disease; it is also used to test fibrinolytic response. Desmopressin may also have a role in nocturnal enuresis.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, prior to more definitive treatment and with variable results. Terlipressin acetate p. 77, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, is used similarly.

Oxytocin p. 705, another posterior pituitary hormone, is indicated in obstetrics.

Antidiuretic hormone antagonists

Demeclocycline hydrochloride p. 496 can be used in the treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable. Demeclocycline hydrochloride is thought to act by directly blocking the renal tubular effect of antidiuretic hormone.

Tolvaptan p. 577 is a vasopressin V₂-receptor antagonist licensed for the treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion; treatment duration with tolvaptan is determined by the underlying disease and its treatment.

Rapid correction of hyponatraemia during tolvaptan therapy can cause osmotic demyelination, leading to serious neurological events; close monitoring of serum sodium concentration and fluid balance is essential.

1.1 Diabetes insipidus

Drugs used for Diabetes insipidus not listed below;
Chlortalidon, p. 204

VASOPRESSIN AND ANALOGUES

Desmopressin

- **DRUG ACTION** Desmopressin is an analogue of vasopressin.

INDICATIONS AND DOSE**Diabetes insipidus, diagnosis (water deprivation test)****BY INTRANASAL ADMINISTRATION**

- ▶ Adult: 20 micrograms, limit fluid intake to 500 mL from 1 hour before to 8 hours after administration

BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION

- ▶ Adult: 2 micrograms for 1 dose, limit fluid intake to 500 mL from 1 hour before to 8 hours after administration

Diabetes insipidus, treatment**BY MOUTH**

- ▶ Child 1 month-1 year: Initially 10 micrograms 2–3 times a day, adjusted according to response; usual dose 30–150 micrograms daily
- ▶ Child 2-11 years: Initially 50 micrograms 2–3 times a day, adjusted according to response; usual dose 100–800 micrograms daily
- ▶ Child 12-17 years: Initially 100 micrograms 2–3 times a day, adjusted according to response; usual dose 0.2–1.2 mg daily
- ▶ Adult: Initially 100 micrograms 3 times a day; maintenance 100–200 micrograms 3 times a day; usual dose 0.2–1.2 mg daily

BY SUBLINGUAL ADMINISTRATION

- ▶ Child 2-17 years: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day
- ▶ Adult: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day

BY INTRANASAL ADMINISTRATION

- ▶ Child 1 month-1 year: Initially 2.5–5 micrograms 1–2 times a day, adjusted according to response
- ▶ Child 2-11 years: Initially 5–20 micrograms 1–2 times a day, adjusted according to response
- ▶ Child 12-17 years: Initially 10–20 micrograms 1–2 times a day, adjusted according to response
- ▶ Adult: 10–40 micrograms daily in 1–2 divided doses

BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INJECTION**OR BY INTRAMUSCULAR INJECTION**

- ▶ Adult: 1–4 micrograms daily

Primary nocturnal enuresis**BY MOUTH**

- ▶ Child 5-17 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration
- ▶ Adult 18-65 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration

BY SUBLINGUAL ADMINISTRATION

- ▶ Child 5-17 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week
- ▶ Adult 18-65 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week

Postoperative polyuria or polydipsia**BY MOUTH**

- ▶ Adult: Dose to be adjusted according to urine osmolality

Polyuria or polydipsia after hypophysectomy**BY SUBLINGUAL ADMINISTRATION**

- ▶ Adult: Dose to be adjusted according to urine osmolality

Nocturia associated with multiple sclerosis (when other treatments have failed)**BY INTRANASAL ADMINISTRATION**

- ▶ Adult 18-65 years: 10–20 micrograms once daily, to be taken at bedtime, dose not to be repeated within 24 hours, limit fluid intake from 1 hour before to 8 hours after administration

Renal function testing**BY INTRANASAL ADMINISTRATION**

- ▶ Adult: 40 micrograms, empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: 2 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

Mild to moderate haemophilia and von Willebrand's disease**BY INTRANASAL ADMINISTRATION**

- ▶ Adult: 300 micrograms every 12 hours if required, one 150 microgram spray into each nostril, 30 minutes before surgery or when bleeding, dose may alternatively be repeated at intervals of at least 3 days, if self-administered

BY INTRAVENOUS INFUSION OR BY SUBCUTANEOUS INJECTION

- ▶ Adult: 300 nanograms/kg for 1 dose, to be administered immediately before surgery or after trauma; may be repeated at intervals of 12 hours if no tachycardia

Fibrinolytic response testing**BY INTRANASAL ADMINISTRATION**

- ▶ Adult: 300 micrograms, blood to be sampled after 1 hour for fibrinolytic activity, one 150 microgram spray to be administered into each nostril

BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INJECTION

- ▶ Adult: 300 nanograms/kg for 1 dose, blood to be sampled after 20 minutes for fibrinolytic activity

Lumbar-puncture-associated headache**BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION**

- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Cardiac insufficiency · conditions treated with diuretics · polydipsia in alcohol dependence · psychogenic polydipsia

● **CAUTIONS****GENERAL CAUTIONS**

- Asthma · avoid fluid overload · cardiovascular disease (not indicated for nocturnal enuresis or nocturia) · conditions which might be aggravated by water retention · cystic fibrosis · elderly (avoid for nocturnal enuresis and nocturia in those over 65 years) · epilepsy · heart failure · hypertension (not indicated for nocturnal enuresis or nocturia) · migraine · nocturia—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards · nocturnal enuresis—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards

SPECIFIC CAUTIONS

- ▶ With intranasal use should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects

- **INTERACTIONS** → Appendix 1 (desmopressin).

- **SIDE-EFFECTS**

- GENERAL SIDE-EFFECTS**

Allergic reactions · emotional disturbance in children · epistaxis · fluid retention · headache · hyponatraemia (in more serious cases with convulsions) on administration without restricting fluid intake · nasal congestion · nausea · stomach pain · vomiting

- SPECIFIC SIDE-EFFECTS**

- ▶ With intranasal use Rhinitis

- SIDE-EFFECTS, FURTHER INFORMATION**

Hyponatraemic convulsions The risk of hyponatraemic convulsions can be minimised by keeping to the recommended starting doses and by avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants).

- **PREGNANCY** Small oxytocic effect in third trimester; increased risk of pre-eclampsia.
- **BREAST FEEDING** Amount too small to be harmful.
- **RENAL IMPAIRMENT** Use with caution; antidiuretic effect may be reduced.
- **MONITORING REQUIREMENTS** In *nocturia*, periodic blood pressure and weight checks are needed to monitor for fluid overload.
- **DIRECTIONS FOR ADMINISTRATION** *DDVAP*[®] and *Desmotabs*[®] tablets may be crushed. *DDAVP*[®] intranasal solution may be diluted with Sodium Chloride 0.9% to a concentration of 10 micrograms/mL.
- ▶ In adults For *intravenous infusion* (*DDVAP*[®], *Octim*[®]), give intermittently in Sodium chloride 0.9%; dilute with 50 mL and give over 20 minutes. Desmopressin oral lyophilisates are for sublingual administration.
- **PRESCRIBING AND DISPENSING INFORMATION** Oral, intranasal, intravenous, subcutaneous and intramuscular doses are expressed as desmopressin acetate; sublingual doses are expressed as desmopressin base. Children requiring an intranasal dose of less than 10 micrograms should be given *DDAVP*[®] intranasal solution.

- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Desmopressin for bedwetting www.medicinesforchildren.org.uk/desmopressin-bedwetting-0

Hyponatraemic convulsions Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, spray, oral solution, capsule, nasal drops

Tablet

- ▶ **DESMOPRESSIN (Non-proprietary)**

Desmopressin acetate 100 microgram Desmopressin 100microgram tablets | 90 tablet [PoM] £61.43 DT price = £61.43
DDAVP 0.1mg tablets | 90 tablet [PoM] £44.12 DT price = £61.43
Desmopressin acetate 200 microgram DDAVP 0.2mg tablets | 90 tablet [PoM] £88.23

Desmopressin 200microgram tablets | 30 tablet [PoM] £35.23 DT price = £9.26 | 90 tablet [PoM] £87.50

- ▶ **Desmotabs** (Ferring Pharmaceuticals Ltd)

Desmopressin acetate 200 microgram Desmotabs 0.2mg tablets | 30 tablet [PoM] £29.43 DT price = £9.26

Oral solution

- ▶ **DESMOPRESSIN (Non-proprietary)**

Desmopressin (as Desmopressin acetate) 360 microgram per 1 ml Desmopressin 360micrograms/ml oral solution | 15 ml [PoM] £30.00

Oral lyophilisate

CAUTIONARY AND ADVISORY LABELS 26

- ▶ **DESMOPRESSIN (Non-proprietary)**

Desmopressin (as Desmopressin acetate) 60 microgram DDAVP Melt 60microgram oral lyophilisates (sugar-free) | 100 tablet [PoM] £50.53

Desmopressin (as Desmopressin acetate) 120 microgram Desmopressin 120microgram oral lyophilisates sugar free (sugar-free) | 30 tablet [PoM] no price available
 DDAVP Melt 120microgram oral lyophilisates (sugar-free) | 100 tablet [PoM] £101.07

Desmopressin (as Desmopressin acetate) 240 microgram DDAVP Melt 240microgram oral lyophilisates (sugar-free) | 100 tablet [PoM] £202.14

Desmopressin 240microgram oral lyophilisates sugar free (sugar-free) | 30 tablet [PoM] no price available

- ▶ **DesmoMelt** (Ferring Pharmaceuticals Ltd)

Desmopressin (as Desmopressin acetate) 120 microgram DesmoMelt 120microgram oral lyophilisates (sugar-free) | 30 tablet [PoM] £30.34

Desmopressin (as Desmopressin acetate) 240 microgram DesmoMelt 240microgram oral lyophilisates (sugar-free) | 30 tablet [PoM] £60.68

Solution for injection

Desmopressin acetate 10 microgram per 1 dose Desmopressin 10micrograms/dose nasal spray | 60 dose [PoM] £23.04 DT price = £8.18

- ▶ **Desmospray** (Ferring Pharmaceuticals Ltd)

Desmopressin acetate 2.5 microgram per 1 dose Desmospray 2.5micrograms/dose nasal spray | 50 dose no price available

Desmopressin acetate 10 microgram per 1 dose Desmospray 10micrograms/dose nasal spray | 60 dose [PoM] £25.02 DT price = £8.18

- ▶ **Octim** (Ferring Pharmaceuticals Ltd)

Desmopressin acetate 150 microgram per 1 dose Octim 150micrograms/dose nasal spray | 25 dose [PoM] £576.60

Vasopressin

INDICATIONS AND DOSE

Pituitary diabetes insipidus

BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION

- ▶ Adult: 5–20 units every 4 hours

Initial control of oesophageal variceal bleeding

BY INTRAVENOUS INFUSION

- ▶ Adult: 20 units, dose to be administered over 15 minutes

- **CONTRA-INDICATIONS** Chronic nephritis (until reasonable blood nitrogen concentrations attained) · vascular disease (especially disease of coronary arteries) unless extreme caution
- **CAUTIONS** Asthma · avoid fluid overload · conditions which might be aggravated by water retention · epilepsy · heart failure · hypertension · migraine
- **SIDE-EFFECTS**
- ▶ **Rare** Gangrene
- ▶ **Frequency not known** Abdominal cramps · anaphylaxis · angular attacks · belching · constriction of coronary arteries · desire to defaecate · fluid retention · headache · hypersensitivity reactions · myocardial ischaemia · nausea · pallor · peripheral ischaemia · sweating · tremor · vertigo · vomiting
- **PREGNANCY** Oxytocic effect in third trimester.

- **BREAST FEEDING** Not known to be harmful.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (argipressin), give intermittently in Glucose 5%; suggested concentration 20 units/100mL given over 15 minutes.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ VASOPRESSIN (Non-proprietary)

Argipressin 20 unit per 1 ml Argipressin 20units/1ml solution for injection ampoules | 10 ampoule [PoM](#) £800.00 (Hospital only)

1.2 Syndrome of inappropriate antidiuretic hormone secretion

Drugs used for Syndrome of inappropriate antidiuretic hormone secretion not listed below; Demeclocycline hydrochloride, p. 496

SELECTIVE VASOPRESSIN V₂-RECEPTOR ANTAGONISTS

Tolvaptan

- **DRUG ACTION** Tolvaptan is a vasopressin V₂-receptor antagonist.

INDICATIONS AND DOSE

Treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion
BY MOUTH

- ▶ **Adult:** 15 mg once daily, increased if necessary up to 60 mg daily treatment duration is determined by the underlying disease and its treatment

- **CONTRA-INDICATIONS** Anuria · hypernatraemia · hypovolaemic hyponatraemia · impaired perception of thirst · volume depletion
- **CAUTIONS** Alcoholism (increased risk of demyelination syndrome if rapid correction of hyponatraemia) · diabetes mellitus · ensure adequate fluid intake · hypoxia (increased risk of demyelination syndrome if rapid correction of hyponatraemia) · malnutrition (increased risk of demyelination syndrome if rapid correction of hyponatraemia) · pseudohyponatraemia associated with diabetes mellitus (exclude before treatment)
- **INTERACTIONS** → Appendix 1 (tolvaptan). Avoid concomitant drugs that increase serum-sodium concentration.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Constipation · decreased appetite · dehydration · dry mouth · ecchymosis · fever · hyperglycaemia · hyperkalaemia · increased blood creatinine · malaise · nausea · neurological disturbance (following rapid correction of hyponatraemia) · postural hypotension · pruritus · thirst · urinary frequency
 - ▶ **Uncommon** Renal impairment · taste disturbance
 - ▶ **Frequency not known** Dizziness · hepatic impairment (discontinue) · hypernatraemia · hyperuricaemia · hypoglycaemia · syncope

SIDE-EFFECTS, FURTHER INFORMATION

Hepatic impairment Discontinue and perform liver-function tests promptly if symptoms of hepatic impairment (anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, pruritus).

- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Use with caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** No information available in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor for dehydration in patients who are fluid-restricted.
 - ▶ Monitor serum-sodium concentration and fluid balance no later than 6 hours after initiating treatment and every 6 hours during the first 1–2 days of treatment and until dose stabilised. Discontinue if rapid rise in serum-sodium concentration (greater than 12 mmol/litre in 24 hours or 18 mmol/litre in 48 hours).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

2 Corticosteroid responsive conditions

CORTICOSTEROIDS

Corticosteroids, general use

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin. Corticosteroids should be avoided or used only under specialist supervision in psoriasis.

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn's disease. They are also included in locally applied creams for haemorrhoids.

Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 582 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, there is evidence that administration of lower doses of hydrocortisone p. 583 and fludrocortisone acetate is of benefit in adrenocortical insufficiency resulting from septic shock.

Dexamethasone p. 581 and betamethasone p. 581 have little if any mineralocorticoid action and their long duration of action makes them particularly suitable for suppressing corticotropin secretion in congenital adrenal hyperplasia where the dose should be tailored to clinical response and

by measurement of adrenal androgens and 17-hydroxyprogesterone. In common with all glucocorticoids their suppressive action on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most individuals a single dose of dexamethasone at night, is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the 'overnight dexamethasone suppression test' for diagnosing Cushing's syndrome.

Betamethasone and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see Prescribing in palliative care p. 20); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should not be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions, such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline/epinephrine p. 196. In such cases hydrocortisone (as sodium succinate) by intravenous injection may be required.

Corticosteroids are preferably used by inhalation in the management of asthma but systemic therapy in association with bronchodilators is required for the emergency treatment of severe acute asthma.

Corticosteroids may also be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia, and some cases of the nephrotic syndrome (particularly in children) and thrombocytopenic purpura.

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus, temporal arteritis, and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose, and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see: Prescribing in Palliative Care, immunosuppression, rheumatic diseases, eye, otitis externa allergic rhinitis, and aphthous ulcers.

Side-effects

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

Mineralocorticoid side effects

- hypertension
- sodium retention
- water retention
- potassium loss
- calcium loss

Mineralocorticoid side effects are most marked with fludrocortisone, but are significant with hydrocortisone, corticotropin, and tetracosactide. Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone, prednisolone, and triamcinolone.

Glucocorticoid side effects

- diabetes
- osteoporosis, which is a danger, particularly in the elderly, as it can result in osteoporotic fractures for example of the hip or vertebrae;
- in addition high doses are associated with avascular necrosis of the femoral head.
- Muscle wasting (proximal myopathy) can also occur.

- Corticosteroid therapy is also weakly linked with peptic ulceration and perforation.
- Psychiatric reactions may also occur.

Managing side-effects

Side-effects can be minimised by using lowest effective dose for minimum period possible. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma. Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug.

Whenever possible *local treatment* with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to *systemic treatment*.

Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids, but adverse effects including adrenal suppression have been reported. Use of other corticosteroid therapy (including topical) or concurrent use of drugs which inhibit corticosteroid metabolism should be taken into account when assessing systemic risk. In children, growth restriction associated with systemic corticosteroid therapy does not seem to occur with recommended doses of inhaled therapy; although initial growth velocity may be reduced, there appears to be no effect on achieving normal adult height. Large-volume spacer devices should be used for administering inhaled corticosteroids in children under 15 years; they are also useful in older children and adults, particularly if high doses are required. Spacer devices increase airway deposition and reduce oropharyngeal deposition.

Corticosteroids, replacement therapy

The adrenal cortex normally secretes hydrocortisone p. 583 (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of hydrocortisone and the mineralocorticoid fludrocortisone acetate p. 582; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In *Addison's disease* or following adrenalectomy, hydrocortisone by mouth is usually required. This is given in 2 doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone acetate.

In *acute adrenocortical insufficiency*, hydrocortisone is given intravenously (preferably as sodium succinate) every 6 to 8 hours in sodium chloride p. 953 intravenous infusion 0.9%.

In *hypopituitarism*, glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levothyroxine sodium p. 665 and sex hormones should be given as indicated by the pattern of hormone deficiency.

Glucocorticoid therapy

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids). The mineralocorticoid activity of fludrocortisone acetate p. 582 is so high that its anti-inflammatory activity is of no clinical relevance.

Equivalent anti-inflammatory doses of corticosteroids

This table takes no account of mineralocorticoid effects, nor does it take account of variations in duration of action

Prednisolone 5 mg
≡ Betamethasone 750 micrograms
≡ Deflazacort 6 mg
≡ Dexamethasone 750 micrograms
≡ Hydrocortisone 20 mg
≡ Methylprednisolone 4 mg
≡ Prednisone 5 mg
≡ Triamcinolone 4 mg

The relatively high mineralocorticoid activity of hydrocortisone p. 583, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked.

Prednisolone p. 585 and prednisone p. 586 have predominantly glucocorticoid activity. Prednisolone is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone p. 581 and dexamethasone p. 581 have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotrophin (corticotrophin) secretion (e.g. congenital adrenal hyperplasia).

Some esters of betamethasone and of beclomethasone dipropionate p. 38 (beclomethasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort p. 581 has a high glucocorticoid activity; it is derived from prednisolone.

Corticosteroids (systemic)

- **CONTRA-INDICATIONS** Avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished) · systemic infection (unless specific therapy given)

CONTRA-INDICATIONS, FURTHER INFORMATION

For further information on contra-indications associated with intra-articular, intradermal and intralesional preparations, consult product literature.

- **CAUTIONS** Congestive heart failure · diabetes mellitus (including a family history of) · diverticulitis · epilepsy · glaucoma (including a family history of or susceptibility to) · history of steroid myopathy · history of tuberculosis or X-ray changes (frequent monitoring required) · hypertension · hypothyroidism · infection (particularly untreated) · myasthenia gravis · ocular herpes simplex (risk of corneal perforation) · osteoporosis (post-menopausal women and the elderly at special risk) · peptic ulcer · psychiatric reactions · recent intestinal anastomoses · recent myocardial infarction (rupture reported) · severe affective disorders (particularly if history of steroid-induced psychosis) · should not be used long-term · thromboembolic disorders · ulcerative colitis

CAUTIONS, FURTHER INFORMATION

For further information on cautions associated with intra-articular, intradermal and intralesional preparations, consult product literature.

- **INTERACTIONS** → Appendix 1 (corticosteroids).

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Abdominal distension · acute pancreatitis · aggravation of epilepsy · aggravation of schizophrenia · amenorrhoea · bruising · candidiasis · congestive heart failure · corneal thinning · Cushing's syndrome (with moon face, striae and acne) · dyspepsia · ecchymoses · exacerbation of ophthalmic fungal disease · exacerbation of ophthalmic viral disease · exophthalmos · facial erythema · glaucoma · headache · hiccups · hirsutism · hypercholesterolaemia · hyperglycaemia · hyperhidrosis · hyperlipidaemia · impaired healing · increased appetite · increased intra-ocular pressure · increased susceptibility to and severity of infection · insomnia · leucocytosis · long bone fractures · malaise · menstrual irregularities · muscle weakness · myocardial rupture following recent myocardial infarction · nausea · negative calcium balance · negative nitrogen balance · oesophageal ulceration · papilloedema · petechiae · posterior subcapsular cataracts · potassium loss · psychological dependence · reactivation of dormant tuberculosis · scleral thinning · skin atrophy · sodium retention · telangiectasia · tendon rupture · thromboembolism · urticaria · vertebral fractures · vertigo · water retention · weight gain

SPECIFIC SIDE-EFFECTS

- ▶ **With intra-articular use** Flushing · may affect the hyaline cartilage

SIDE-EFFECTS, FURTHER INFORMATION

For further information on side-effects associated with intra-articular, intradermal and intralesional preparations, consult product literature.

Side effects can be managed by choice of route and duration of course. For further detail see Corticosteroids, general use p. 577

Adrenal suppression During prolonged therapy with corticosteroids, particularly with systemic use, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension, or death. To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment. To avoid a precipitous fall in blood pressure during anaesthesia or in the immediate postoperative period, anaesthetists **must** know whether a patient is taking or has been taking a corticosteroid. A

suitable regimen for corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of surgery, is:

- Minor surgery under general anaesthesia—usual oral corticosteroid dose on the morning of surgery or hydrocortisone (usually the sodium succinate) intravenously at induction; the usual oral corticosteroid dose is recommenced after surgery.
- Moderate or major surgery—usual oral corticosteroid dose on the morning of surgery and hydrocortisone intravenously at induction, followed by hydrocortisone 3 times a day by intravenous injection for 24 hours after moderate surgery or for 48–72 hours after major surgery; the usual pre-operative oral corticosteroid dose is recommenced on stopping hydrocortisone injections.

Patients on long-term corticosteroid treatment should carry a steroid treatment card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

Infections Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. *septicaemia* and *tuberculosis* may reach an advanced stage before being recognised, and *amoebiasis* or *strongyloidiasis* may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral *ocular infections* may also be exacerbated.

Chickenpox Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being *at risk of severe chickenpox* (see Steroid Treatment Card). Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature.

Passive immunisation with varicella–zoster immunoglobulin is needed for exposed non-immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment. Corticosteroids should not be stopped and dosage may need to be increased.

Topical, inhaled or rectal corticosteroids are less likely to be associated with an increased risk of severe chickenpox.

Measles Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs.

Prophylaxis with intramuscular normal immunoglobulin may be needed.

Psychiatric reactions Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, nightmares, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. A serious paranoid state or depression with risk of suicide can be induced, particularly in patients with a history of mental disorder. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment.

Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

- **PREGNANCY** The benefit of treatment with corticosteroids during pregnancy outweighs the risk. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in

pregnancy and breast-feeding the CSM (May 1998) concluded that corticosteroids vary in their ability to cross the placenta but there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip. When administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome). Any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important.

Pregnant women with fluid retention should be monitored closely when given systemic corticosteroids.

- **BREAST FEEDING** The benefit of treatment with corticosteroids during breast-feeding outweighs the risk.
- **HEPATIC IMPAIRMENT** The plasma-drug concentration may be increased (particularly on systemic use). Oral and parenteral use should be undertaken with caution.
- **RENAL IMPAIRMENT** Use by oral and injectable routes should be undertaken with caution.
- **EFFECT ON LABORATORY TESTS** Suppression of skin test reactions.
- **TREATMENT CESSATION**

Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension or death. Withdrawal can also be associated with fever, myalgia, arthralgia, rhinitis, conjunctivitis, painful itchy skin nodules and weight loss.

The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. *Gradual* withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:

- received more than 40 mg prednisolone (or equivalent) daily for more than 1 week;
 - been given repeat doses in the evening;
 - received more than 3 weeks' treatment;
 - recently received repeated courses (particularly if taken for longer than 3 weeks);
 - taken a short course within 1 year of stopping long-term therapy;
 - other possible causes of adrenal suppression.
- Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse *and* who have received treatment for 3 weeks or less *and* who are not included in the patient groups described above. During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 7.5 mg daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

- **PATIENT AND CARER ADVICE**

Advice for patients Patients on long-term corticosteroid treatment should carry a Steroid Treatment Card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed. Patients should especially be advised of the following:

- **Immunosuppression** Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognised. Unless already immune, patients are at risk of severe **chickenpox** and should avoid close contact with people who have chickenpox or shingles. Similarly,

precautions should also be taken against contracting measles;

- **Adrenal suppression** If the corticosteroid is given for longer than 3 weeks, treatment must not be stopped abruptly. Adrenal suppression can last for a year or more after stopping treatment and the patient must mention the course of corticosteroid when receiving treatment for any illness or injury;
- **Mood and behaviour changes** Corticosteroid treatment, especially with high doses, can alter mood and behaviour early in treatment—the patient can become confused, irritable and suffer from delusion and suicidal thoughts. These effects can also occur when corticosteroid treatment is being withdrawn. Medical advice should be sought if worrying psychological changes occur;
- **Other serious effects** Serious gastro-intestinal, musculoskeletal, and ophthalmic effects which require medical help can also occur.

Steroid treatment cards Steroid treatment cards should be issued where appropriate. Consider giving a 'steroid card' to support communication of the risks associated with treatment, and specific written advice to consider corticosteroid replacement during an episode of stress, such as severe intercurrent illness or an operation, to patients using greater than maximum licensed doses of inhaled corticosteroids. Steroid treatment cards are available for purchase from:

3M Security Print and Systems Limited, Gorse Street, Chadderton, Oldham OL9 9QH Tel: 0845 610 1112
GP practices can obtain supplies through their Local Area Team Stores. NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com. In Scotland, steroid treatment cards can be obtained from APS Group Scotland by emailing stockorders.dpps@theapsgroup.com or by fax on 0131 629 9967.

Betamethasone

INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders | Congenital adrenal hyperplasia

BY MOUTH

- ▶ Adult: Usual dose 0.5–5 mg daily

BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 4–20 mg, repeated up to 4 times in 24 hours

- **PREGNANCY** Readily crosses the placenta. Transient effect on fetal movements and heart rate.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (as sodium phosphate) (*Betnesol*®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.
- **PATIENT AND CARER ADVICE**
 - ▶ With oral use Patient counselling is advised for betamethasone soluble tablets (steroid card).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Soluble tablet

CAUTIONARY AND ADVISORY LABELS 10, 13, 21

▶ BETAMETHASONE (Non-proprietary)

Betamethasone (as Betamethasone sodium phosphate) 500 microgram Betamethasone 500microgram soluble tablets sugar free (sugar-free) | 100 tablet (PoM) £29.85 DT price = £29.70

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

▶ Betnesol (Focus Pharmaceuticals Ltd)

Betamethasone (as Betamethasone sodium phosphate) 4 mg per 1 ml Betnesol 4mg/1ml solution for injection ampoules | 5 ampoule (PoM) £6.11

Deflazacort

INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders

BY MOUTH

- ▶ Adult: Maintenance 3–18 mg daily

Suppression of inflammatory and allergic disorders (acute disorders)

BY MOUTH

- ▶ Adult: Initially up to 120 mg daily

Inflammatory and allergic disorders

BY MOUTH

- ▶ Child 1 month-11 years: Maintenance 0.25–1.5 mg/kg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations
- ▶ Child 12-17 years: Initially 3–18 mg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations

- **RENAL IMPAIRMENT** Use with caution.
- **PATIENT AND CARER ADVICE** Patient counselling is advised for deflazacort tablets (steroid card).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

CAUTIONARY AND ADVISORY LABELS 5, 10

▶ Calcort (Sanofi)

Deflazacort 6 mg Calcort 6mg tablets | 60 tablet (PoM) £15.82

Dexamethasone

INDICATIONS AND DOSE

Diagnosis of Cushing's disease | Congenital adrenal hyperplasia

BY MOUTH

- ▶ Adult: 0.5–10 mg daily

BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 0.4–20 mg

Overnight dexamethasone suppression test

BY MOUTH

- ▶ Adult: 1 mg for 1 dose, to be given at night

Suppression of inflammatory and allergic disorders

BY MOUTH

- ▶ Adult: 0.5–10 mg daily

Mild croup

BY MOUTH

- ▶ Child: 150 micrograms/kg for 1 dose
- ▶ Adult: 150 micrograms/kg for 1 dose

Severe croup (or mild croup that might cause complications)

INITIALLY BY MOUTH

- ▶ Child: Initially 150 micrograms/kg for 1 dose, to be given before transfer to hospital, then (by mouth or by intravenous injection) 150 micrograms/kg, then (by mouth or by intravenous injection) 150 micrograms/kg after 12 hours if required

continued →

- ▶ Adult: Initially 150 micrograms/kg for 1 dose, to be given before transfer to hospital, then (by mouth or by intravenous injection) 150 micrograms/kg, then (by mouth or by intravenous injection) 150 micrograms/kg after 12 hours if required

Adjunctive treatment of bacterial meningitis (starting before or with first dose of antibacterial)

BY INTRAVENOUS INJECTION

- ▶ Adult: 8.3 mg every 6 hours for 4 days

Cerebral oedema associated with malignancy

BY MOUTH

- ▶ Adult: 0.5–10 mg daily

Cerebral oedema (with dexamethasone as sodium phosphate 3.8 mg/mL injection)

INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 8–16 mg, then (by intramuscular injection or by intravenous injection) 5 mg every 6 hours until adequate response achieved then taper-off gradually

Cerebral oedema associated with malignancy (with dexamethasone as sodium phosphate 3.3 mg/mL injection)

INITIALLY BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 8.3 mg, then (by intramuscular injection) 3.3 mg every 6 hours as required for 2–4 days, subsequently, reduce dose gradually and stop over 5–7 days

Local inflammation of joints (with dexamethasone as sodium phosphate 3.8 mg/mL injection)

BY INTRA-ARTICULAR INJECTION

- ▶ Adult: 0.3–3 mg, dose given according to size, where appropriate may be repeated at intervals of 3–21 days according to response

Local inflammation of joints (with dexamethasone as sodium phosphate 3.3 mg/mL injection)

BY INTRA-ARTICULAR INJECTION

- ▶ Adult: 0.33–3.3 mg, dose given according to size, where appropriate may be repeated at intervals of 3–21 days

Local inflammation of soft tissues (with dexamethasone as sodium phosphate 3.3 mg/mL injection)

BY LOCAL INFILTRATION

- ▶ Adult: 1.7–5 mg, dose given according to size, where appropriate may be repeated at intervals of 3–21 days

Symptom control of anorexia (in palliative care)

- ▶ Adult: 2–4 mg daily

Obstruction due to tumour (dysphagia in palliative care)

- ▶ Adult: 8 mg daily

Bronchospasm or partial obstruction (dyspnoea in palliative care)

- ▶ Adult: 4–8 mg daily

Nausea and vomiting (adjunct in palliative care)

BY MOUTH

- ▶ Adult: 8–16 mg daily

Headaches due to raised intracranial pressure (in palliative care)

- ▶ Adult: 16 mg daily for 4–5 days, then reduced to 4–6 mg daily, reduce dose if possible. To be given before 6pm to reduce the risk of insomnia

Pain due to nerve compression (in palliative care)

- ▶ Adult: 8 mg daily

- **UNLICENSED USE** Consult product literature; not licensed for use in bacterial meningitis.

● **SIDE-EFFECTS**

- ▶ With intravenous use Perineal irritation may follow intravenous administration of the phosphate ester

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With oral use in children For administration *by mouth* tablets may be dispersed in water or injection solution given by mouth.
- ▶ With intravenous use in children For *intravenous infusion* dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–20 minutes.
- ▶ With intravenous use in adults For *intravenous infusion* (Dexamethasone, Hospira) give continuously or intermittently or via drip tubing in Glucose 5% or Sodium Chloride 0.9%.

● **PRESCRIBING AND DISPENSING INFORMATION**

Dexamethasone 3.8 mg/mL Injection has replaced Dexamethasone 4 mg/mL Injection.

● **PATIENT AND CARER ADVICE**

Fludrocortisone acetate

INDICATIONS AND DOSE

Mineralocorticoid replacement in adrenocortical insufficiency

BY MOUTH

- ▶ Adult: 50–300 micrograms daily

Adrenocortical insufficiency resulting from septic shock (in combination with hydrocortisone)

BY MOUTH

- ▶ Adult: 50 micrograms daily

Neuropathic postural hypotension

BY MOUTH

- ▶ Adult: 100–400 micrograms daily

- **UNLICENSED USE** Not licensed for use in neuropathic postural hypotension.

- **HEPATIC IMPAIRMENT** Monitor patient closely in hepatic impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, capsule

Tablet

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Florinef** (Aspen Pharma Trading Ltd)

Fludrocortisone acetate 100 microgram Florinef 100microgram tablets | 100 tablet **[PoM]** £5.05 DT price = £5.05

Hydrocortisone**INDICATIONS AND DOSE****Thyrotoxic crisis (thyroid storm)**

BY INTRAVENOUS INJECTION

- ▶ Adult: 100 mg every 6 hours, to be administered as sodium succinate

Adrenocortical insufficiency in Addison's disease or following adrenalectomy

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 20–30 mg daily in 2 divided doses, the larger dose to be given in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion, the optimum daily dose is determined on the basis of clinical response

Adrenocortical insufficiency

BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 100–500 mg 3–4 times a day or when required

Replacement in adrenocortical insufficiency

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 20–30 mg once daily, adjusted according to response, dose to be taken in the morning

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 20–30 mg daily in divided doses, adjusted according to response

Adrenocortical insufficiency resulting from septic shock

BY INTRAVENOUS INJECTION

- ▶ Adult: 50 mg every 6 hours, given in combination with fludrocortisone

Acute hypersensitivity reactions such as angioedema of the upper respiratory tract and anaphylaxis (adjunct to adrenaline)

BY INTRAVENOUS INJECTION

- ▶ Adult: 100–300 mg, to be administered as sodium succinate

Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of minor surgery under general anaesthesia

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 25–50 mg, to be administered at induction of surgery, the patient's usual oral corticosteroid dose is recommenced after surgery

Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of moderate or major surgery

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 25–50 mg, to be administered at induction of surgery (following usual oral corticosteroid dose on the morning of surgery),

followed by 25–50 mg 3 times a day for 24 hours after moderate surgery and for 48–72 hours after major surgery

Severe inflammatory bowel disease

BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: 100–500 mg 3–4 times a day or when required

Ulcerative colitis | Proctitis | Proctosigmoiditis

BY RECTUM USING RECTAL FOAM

- ▶ Adult: Initially 1 metered application 1–2 times a day for 2–3 weeks, then reduced to 1 metered application once daily on alternate days, to be inserted into the rectum

Acute hypersensitivity reactions | Angioedema

BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- ▶ Child 1–5 months: Initially 25 mg 3 times a day, adjusted according to response
- ▶ Child 6 months–5 years: Initially 50 mg 3 times a day, adjusted according to response
- ▶ Child 6–11 years: Initially 100 mg 3 times a day, adjusted according to response
- ▶ Child 12–17 years: Initially 200 mg 3 times a day, adjusted according to response

Severe acute asthma | Life-threatening acute asthma

BY INTRAVENOUS INJECTION

- ▶ Child 1 month–1 year: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 25 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- ▶ Child 2–4 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 50 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- ▶ Child 5–11 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- ▶ Adult: 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

HYDROCORTISTAB®**Local inflammation of joints and soft tissues**

BY INTRA-ARTICULAR INJECTION

- ▶ Adult: 5–50 mg, select dose according to size of patient and joint; where appropriate dose may be repeated at intervals of 21 days. Not more than 3 joints should be treated on any one day, for details consult product literature

Dose equivalence and conversion

When switching from immediate-release hydrocortisone tablets to modified release *Plenadren*® use same total daily dose. Bioavailability of *Plenadren*® lower than immediate release tablets—monitor clinical response.

CONTRA-INDICATIONS

- ▶ With rectal use Bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

CAUTIONS

- ▶ With rectal use Systemic absorption may occur

SIDE-EFFECTS**SPECIFIC SIDE-EFFECTS**

- ▶ With intravenous use Phosphate ester associated with pain and paraesthesia (particularly in the perineal region)
- ▶ With rectal use Local irritation
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use in children For *intravenous administration*, dilute with Glucose 5% or Sodium Chloride 0.9%. For *intermittent infusion* give over 20–30 minutes.
- ▶ With intravenous use in adults For *intravenous infusion* (*SoluCortef*® or *Efcortisol*®), give continuously or

intermittently *or via* drip tubing in Glucose 5% *or* Sodium chloride 0.9%.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for hydrocortisone tablets and injections (steroid card).
- **LESS SUITABLE FOR PRESCRIBING** Hydrocortisone as the sodium phosphate is less suitable for prescribing as paraesthesia and pain (particularly in the perineal region) may follow intravenous injection. *Efcortisol*[®] is less suitable for prescribing.
- **EXCEPTIONS TO LEGAL CATEGORY**
 - ▶ With intramuscular use *or* intravenous use Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- Child 12–17 years: 40–50 mg daily for at least 5 days
- Adult: 40–50 mg daily for at least 5 days

Suppression of inflammatory and allergic disorders

BY MOUTH

- Adult: Initially 10–20 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months; maintenance 2.5–15 mg daily, higher doses may be needed; cushingoid side-effects increasingly likely with doses above 7.5 mg daily

BY INTRAMUSCULAR INJECTION

- Adult: 25–100 mg 1–2 times a week, as prednisolone acetate

Suppression of inflammatory and allergic disorders (initial dose in severe disease)

BY MOUTH

- Adult: Initially up to 60 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months

Idiopathic thrombocytopenic purpura

BY MOUTH

- Adult: 1 mg/kg daily, gradually reduce dose over several weeks

Ulcerative colitis | Crohn's disease

BY MOUTH

- Adult: Initially 20–40 mg daily until remission occurs, followed by reducing doses, up to 60 mg daily, may be used in some cases, doses preferably taken in the morning after breakfast

Distal ulcerative colitis

BY RECTUM USING RECTAL FOAM

- Adult: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good

response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

Rectal complications of Crohn's disease

BY RECTUM USING SUPPOSITORIES

- Adult: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

Rectal and rectosigmoidal ulcerative colitis | Rectal and rectosigmoidal Crohn's disease

BY RECTUM USING ENEMA

- Adult: 20 mg daily for 2–4 weeks, continued if response good, to be used at bedtime

Proctitis

BY RECTUM USING RECTAL FOAM

- Adult: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

BY RECTUM USING SUPPOSITORIES

- Adult: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

Neuritic pain or weakness heralding rapid onset of permanent nerve damage (during reversal reactions multibacillary leprosy)

BY MOUTH

- Adult: Initially 40–60 mg daily, dose to be instituted at once

Generalised myasthenia gravis (when given on alternate days)

INITIALLY BY MOUTH

- Adult: Initially 10 mg once daily on alternate days, then increased in steps of 10 mg once daily on alternate days, increased to 1–1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

Generalised myasthenia gravis in ventilated patients (when given on alternate days)

BY MOUTH

- Adult: Initially 1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

Generalised myasthenia gravis (when giving daily)

BY MOUTH

- Adult: Initially 5 mg daily, increased in steps of 5 mg daily, maintenance 60–80 mg daily, alternatively maintenance 0.75–1 mg/kg daily, ventilated patients may be started on 1.5 mg/kg (max. 100 mg) on alternate days

Ocular myasthenia

BY MOUTH

- Adult: Usual dose 10–40 mg once daily on alternate days, reduce to minimum effective dose

Reduction in rate of joint destruction in moderate to severe rheumatoid arthritis of less than 2 years' duration

BY MOUTH

- Adult: 7.5 mg daily

Polymyalgia rheumatica

BY MOUTH

- Adult: 10–15 mg daily until remission of disease activity; maintenance 7.5–10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long term low-dose corticosteroid treatment

Giant cell (temporal) arteritis

BY MOUTH

- Adult: 40–60 mg daily until remission of disease activity, the higher dose being used if visual symptoms occur; maintenance 7.5–10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in continued →

some patients it may be necessary to continue long term low-dose corticosteroid treatment

Polymyositis | Polymyositis | Systemic lupus erythematosus

BY MOUTH

- ▶ Adult: Initially 60 mg daily, then maintenance 10–15 mg daily

Pneumocystis pneumonia in moderate to severe infections associated with HIV infection

BY MOUTH

- ▶ Adult: 50–80 mg daily for 5 days, the dose is then reduced to complete 21 days of treatment, corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete

Short-term prophylaxis of episodic cluster headache as monotherapy or in combination with verapamil during verapamil titration

BY MOUTH

- ▶ Adult: 60–100 mg once daily for 2–5 days, then reduced in steps of 10 mg every 2–3 days until prednisolone is discontinued

Anorexia (symptom control in palliative care)

BY MOUTH

- ▶ Adult: 15–30 mg daily

DELTA STAB®

Local inflammation of joints

BY INTRA-ARTICULAR INJECTION

- ▶ Adult: 5–25 mg, dose according to size; not more than 3 joints should be treated on any one day; where appropriate may be repeated when relapse occurs, for details consult product literature

● CONTRA-INDICATIONS

- ▶ With rectal use Bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

● CAUTIONS

- ▶ With rectal use Systemic absorption may occur with rectal preparations
- ▶ With systemic use Duchenne's muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity)

- **PREGNANCY** As it crosses the placenta 88% of prednisolone is inactivated.

- ▶ With systemic use Pregnant women with fluid retention should be monitored closely.

- **BREAST FEEDING** Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.

- ▶ With systemic use Infant should be monitored for adrenal suppression if mother is taking a dose higher than 40 mg.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Prednisolone for asthma www.medicinesforchildren.org.uk/prednisolone-for-asthma and Prednisolone (oral) for nephrotic syndrome www.medicinesforchildren.org.uk/prednisolone-oral-for-nephrotic-syndrome

Patient counselling is advised for prednisolone tablets (steroid card).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, enema **Tablet**

CAUTIONARY AND ADVISORY LABELS 10, 21

Triamcinolone acetonide

INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders

BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 40 mg (max. per dose 100 mg), repeated if necessary, dose given for depot effect, to be administered into gluteal muscle; repeated at intervals according to patient's response

KENALOG® VIALS

Local inflammation of joints and soft tissues

BY INTRA-ARTICULAR INJECTION

- ▶ Adult: 5–40 mg (max. per dose 80 mg), for further details consult product literature, select dose according to size. For doses below 5 mg use *Adcortyl*® Intra-articular/Intradermal injection, where appropriate dose may be repeated when relapse occurs.

ADCORTYL® INTRA-ARTICULAR/INTRADERMAL

Local inflammation of joints and soft tissues

BY INTRA-ARTICULAR INJECTION

- ▶ Adult: 2.5–15 mg, adjusted according to size (for larger doses use *Kenalog*®). Where appropriate dose may be repeated when relapse occurs, for details consult product literature.

BY INTRADERMAL INJECTION

- ▶ Adult: 2–3 mg, max. 5 mg at any one site (total max. 30 mg). Where appropriate may be repeated at intervals of 1–2 weeks, for details consult product literature

● CAUTIONS

- ▶ With intramuscular use High dosage (may cause proximal myopathy), avoid in chronic therapy
- **PATIENT AND CARER ADVICE** Patient counselling is advised for triamcinolone acetonide injection (steroid card).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

2.1 Cushing's syndrome and disease

Cushing's Syndrome

Most types of *Cushing's syndrome* are treated surgically, that which occasionally accompanies carcinoma of the bronchus is not usually amenable to surgery. Metyrapone p. 588 has been found helpful in controlling the symptoms of the disease; it is also used in other forms of Cushing's syndrome to prepare the patient for surgery.

The dosages of metyrapone used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

IMIDAZOLE ANTIFUNGALS

Ketoconazole

- **DRUG ACTION** An imidazole derivative which acts as a potent inhibitor of cortisol and aldosterone synthesis by inhibiting the activity of 17 α -hydroxylase, 11-hydroxylation steps and at higher doses the cholesterol side-chain cleavage enzyme. It also inhibits the activity of adrenal C17-20 lyase enzymes resulting in androgen synthesis inhibition, and may have a direct effect on corticotropic tumour cells in patients with Cushing's disease.

INDICATIONS AND DOSE

Endogenous Cushing's syndrome (specialist use only)

BY MOUTH

- ▶ Adult: Initially 400–600 mg daily in 2–3 divided doses, increased to 800–1200 mg daily; maintenance 400–800 mg daily in 2–3 divided doses, for dose titrations in patients with established dose, adjustments in adrenal insufficiency, or concomitant corticosteroid replacement therapy, consult product literature; maximum 1200 mg per day

Important safety information

CHMP ADVICE: KETOCONAZOLE (JULY 2013)

The CHMP has recommended that the marketing authorisation for oral ketoconazole to treat fungal infections should be suspended. The CHMP concluded that the risk of hepatotoxicity associated with oral ketoconazole is greater than the benefit in treating fungal infections. Doctors should review patients who are being treated with oral ketoconazole for fungal infections, with a view to stopping treatment or choosing an alternative treatment. Patients with a prescription of oral ketoconazole for fungal infections should be referred back to their doctors. Oral ketoconazole for Cushing's syndrome and topical products containing ketoconazole are not affected by this advice.

- **CONTRA-INDICATIONS** Acquired QTc prolongation • avoid concomitant use of hepatotoxic drugs • congenital QTc prolongation
- **CAUTIONS** Risk of adrenal insufficiency
- **INTERACTIONS** → Appendix 1 (antifungals, imidazole).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain • adrenal insufficiency • diarrhoea • hepatic enzymes increased • nausea • pruritus • rash • vomiting
 - ▶ **Uncommon** Alopecia • dizziness • headache • malaise • somnolence • thrombocytopenia • urticaria
 - ▶ **Rare** Hepatic failure • hepatitis • jaundice • liver damage
 - ▶ **Very rare** Pyrexia
 - ▶ **Frequency not known** Alcohol intolerance • anorexia • arthralgia • azoospermia • dermatitis • dry mouth • dysgeusia • dyspepsia • epistaxis • erectile dysfunction • erythema • flatulence • gynaecomastia • hot flush • increased appetite • insomnia • menstrual disorder • myalgia • nervousness • paraesthesia • peripheral oedema • photophobia • photosensitivity • raised intracranial pressure • reduced testosterone concentrations • tongue discoloration • xeroderma

SIDE-EFFECTS, FURTHER INFORMATION

Hepatotoxicity Potentially life-threatening hepatotoxicity reported rarely.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used in women of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid—teratogenic in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in breast milk.
- **HEPATIC IMPAIRMENT** Avoid in acute or chronic impairment. Do not initiate treatment if liver enzymes greater than 2 times the normal upper limit.
- **MONITORING REQUIREMENTS** Monitor ECG before and one week after initiation, and then as clinically indicated thereafter.
Adrenal insufficiency Monitor adrenal function within one week of initiation, then regularly thereafter. When cortisol levels are normalised or close to target and effective dose established, monitor every 3–6 months as there is a risk of autoimmune disease development or exacerbation after normalisation of cortisol levels. If symptoms suggestive of adrenal insufficiency such as fatigue, anorexia, nausea, vomiting, hypotension, hyponatraemia, hyperkalaemia, and/or hypoglycaemia occur, measure cortisol levels and discontinue treatment temporarily (can be resumed thereafter at lower dose) or reduce dose and if necessary, initiate corticosteroid substitution.
Hepatotoxicity Monitor liver function before initiation of treatment, then weekly for 1 month after initiation, then monthly for 6 months—more frequently if dose adjusted or abnormal liver function detected. Reduce dose if liver enzymes increase less than 3 times the normal upper limit—consult product literature; if liver enzymes are raised to 3 times or greater the normal upper limit, discontinue treatment permanently.
- **PATIENT AND CARER ADVICE** Dizziness and somnolence may affect the performance of skilled tasks (e.g. driving). Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, jaundice, abdominal pain, or dark urine develop. Patients or their carers should also be told how to recognise signs of adrenal insufficiency.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 5, 21

► KETOCONAZOLE (Non-proprietary) ▼

Ketoconazole 200 mg Ketoconazole 200mg tablets | 60 tablet **[POM]** £480.00

11 β -HYDROXYLASE INHIBITORS

Metyrapone

- **DRUG ACTION** Metyrapone is a competitive inhibitor of 11 β -hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. Metyrapone may be used as a test of anterior pituitary function.

INDICATIONS AND DOSE

Differential diagnosis of ACTH-dependent Cushing's syndrome (specialist supervision in hospital)

BY MOUTH

- Adult: 750 mg every 4 hours for 6 doses

Management of Cushing's syndrome (specialist supervision in hospital)

BY MOUTH

- Adult: Usual dose 0.25–6 g daily, dose to be tailored to cortisol production, dose is either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed

Resistant oedema due to increased aldosterone secretion in cirrhosis, nephrotic syndrome, and congestive heart failure (with glucocorticoid replacement therapy) (specialist supervision in hospital)

BY MOUTH

- Adult: 3 g daily in divided doses

- **CONTRA-INDICATIONS** Adrenocortical insufficiency
- **CAUTIONS** Avoid in Acute porphyrias p. 864 · gross hypopituitarism (risk of precipitating acute adrenal failure) · hypertension on long-term administration · hypothyroidism (delayed response)
- **INTERACTIONS** Many drugs interfere with diagnostic estimation of steroids.
- **SIDE-EFFECTS**
 - Rare Abdominal pain · allergic skin reactions · hirsutism · hypoadrenalism
 - Frequency not known Dizziness · headache · hypotension · nausea · sedation · vomiting
- **PREGNANCY** Avoid (may impair biosynthesis of fetal-placental steroids).
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution in hepatic impairment (delayed response).
- **PATIENT AND CARER ADVICE** Drowsiness may affect the performance of skilled tasks (e.g. driving).
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

3 Diabetes mellitus and hypoglycaemia

3.1 Diabetes mellitus

Diabetes

Diabetes mellitus occurs because of a lack of insulin or resistance to its action. It is diagnosed by measuring fasting or random blood-glucose concentration (and occasionally by oral glucose tolerance test). Although there are many subtypes, the two principal classes of diabetes are type 1 diabetes and type 2 diabetes.

Type 1 diabetes, (formerly referred to as insulin-dependent diabetes mellitus (IDDM)), occurs as a result of a deficiency of insulin following autoimmune destruction of pancreatic beta cells. Patients with type 1 diabetes require administration of insulin.

Type 2 diabetes, (formerly referred to as non-insulin-dependent diabetes (NIDDM)), is due to reduced secretion of insulin or to peripheral resistance to the action of insulin or to a combination of both. Although patients may be controlled on diet alone, many also require oral antidiabetic

drugs or insulin (or both) to maintain satisfactory control. In overweight individuals, type 2 diabetes may be prevented by losing weight and increasing physical activity; use of the anti-obesity drug orlistat p. 78 may be considered in obese patients.

Treatment of diabetes

Treatment of all forms of diabetes should be aimed at alleviating symptoms and minimising the risk of long-term complications; tight control of diabetes is essential.

Diabetes is a strong risk factor for cardiovascular disease. Other risk factors for cardiovascular disease such as smoking, hypertension, obesity, and hyperlipidaemia should be addressed. Cardiovascular risk in patients with diabetes can be further reduced by the use of an ACE inhibitor, low-dose aspirin p. 104 and a lipid-regulating drug.

Prevention of diabetic complications

Optimal glycaemic control in both type 1 diabetes and type 2 diabetes reduces, in the long term, the risk of microvascular complications including retinopathy, development of proteinuria and to some extent neuropathy. However, a temporary deterioration in established diabetic retinopathy may occur when normalising blood-glucose concentration. ACE inhibitors and angiotensin-II receptor antagonists may also have a role in the management of diabetic nephropathy.

A measure of the total glycosylated (or glycated) haemoglobin (HbA_{1c}) or a specific fraction (HbA_{1c}) provides a good indication of glycaemic control over the previous 2–3 months. Overall it is ideal to aim for an HbA_{1c} (glycosylated haemoglobin) concentration of 48–59 mmol/mol or less (reference range 20–42 mmol/mol) but this cannot always be achieved and for those using insulin there is a significantly increased risk of disabling hypoglycaemia; in those at risk of arterial disease, the aim should be to maintain the HbA_{1c} concentration at 48 mmol/mol or less. HbA_{1c} should be measured every 3–6 months.

Measurement of HbA_{1c}

HbA_{1c} values are expressed in *mmol of glycosylated haemoglobin per mol of haemoglobin (mmol/mol)*, a standardised unit specific for HbA_{1c} created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA_{1c} values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

Equivalent values IFCC-HbA _{1c} (mmol/mol)	DCCT-HbA _{1c} (%)
42	6.0
48	6.5
53	7.0
59	7.5
64	8.0
75	9.0

Laboratory measurement of serum-fructosamine concentration is technically simpler and cheaper than the measurement of HbA_{1c} and can be used to assess control over short periods of time, particularly when HbA_{1c} monitoring is invalid (e.g. disturbed erythrocyte turnover or abnormal haemoglobin type).

Tight control of blood pressure in hypertensive patients with type 2 diabetes reduces mortality and protects visual acuity (by reducing considerably the risks of maculopathy and retinal photocoagulation).

Driving

Drivers with diabetes may be required to notify the Driver and Vehicle Licensing Agency (DVLA) of their condition depending on their treatment, the type of licence, and

whether they have diabetic complications. Detailed guidance on eligibility to drive, and precautions required, is available from the DVLA (www.gov.uk/government/publications/at-a-glance).

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems. Drivers treated with insulin should normally check their blood-glucose concentration before driving and, on long journeys, at 2-hour intervals as specified by DVLA guidance; depending on the type of licence, monitoring may also be necessary for drivers taking oral antidiabetic drugs which carry a risk of hypoglycaemia (e.g. sulfonylureas, nateglinide p. 607, repaglinide p. 608). Drivers treated with insulin should ensure that a supply of sugar is always available in the vehicle and they should avoid driving if their meal is delayed. If hypoglycaemia occurs, or warning signs develop, the driver should:

- stop the vehicle in a safe place;
- switch off the ignition and move from the driver's seat;
- eat or drink a suitable source of sugar;
- wait until 45 minutes after blood glucose has returned to normal, before continuing journey.

Diabetic nephropathy

Regular review of diabetic patients should include an annual test for urinary protein (using *Albustix*[®]) and serum creatinine measurement. If the urinary protein test is negative, the urine should be test for microalbuminuria (the earliest sign of nephropathy). If reagent strip tests (*Micral-Test II*[®] or *Microalbumintest*[®]) are used and prove positive, the result should be confirmed by laboratory analysis of a urine sample. Provided there are no contra-indications, all diabetic patients with nephropathy causing proteinuria or with established microalbuminuria (at least 3 positive tests) should be treated with an ACE inhibitor or an angiotensin-II receptor antagonist even if the blood pressure is normal; in any case, to minimise the risk of renal deterioration, blood pressure should be carefully controlled. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor together with an angiotensin-II receptor antagonist.

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in patients with renal impairment.

See also treatment of hypertension in diabetes.

Diabetic neuropathy

Optimal diabetic control is beneficial for the management of *painful neuropathy* in patients with type 1 diabetes. Paracetamol p. 354 or a non-steroidal anti-inflammatory drug such as ibuprofen p. 927 may relieve *mild to moderate pain*.

Duloxetine p. 288 is effective for the treatment of painful diabetic neuropathy; amitriptyline hydrochloride p. 292 [unlicensed use] can be used if duloxetine is ineffective or unsuitable. Nortriptyline p. 298 [unlicensed use] may be better tolerated than amitriptyline hydrochloride. If treatment with amitriptyline hydrochloride or duloxetine is inadequate, treatment with pregabalin p. 400 should be tried. Combination therapy of duloxetine or amitriptyline hydrochloride with pregabalin can be used if monotherapy at the maximum tolerated dose does not control symptoms.

Neuropathic pain may respond to opioid analgesics. There is evidence of efficacy for tramadol hydrochloride p. 373, morphine p. 367, and oxycodone hydrochloride p. 369; however treatment with morphine or oxycodone hydrochloride should be initiated only under specialist supervision. Tramadol hydrochloride can be prescribed while the patient is waiting for assessment by a specialist if other treatments have been unsuccessful.

Gabapentin p. 392 and carbamazepine p. 387 are sometimes used for the treatment of neuropathic pain. Capsaicin p. 383 cream 0.075% is licensed for painful diabetic neuropathy and may have some effect, but it produces an intense burning sensation during the initial treatment period.

In *autonomic neuropathy* diabetic diarrhoea can often be managed by **tetracycline** [unlicensed use], otherwise codeine phosphate p. 360 is the best drug, but other antidiarrhoeal preparations can be tried. Erythromycin p. 471 (especially when given intravenously) may be beneficial for gastroparesis [unlicensed use] but this needs confirmation.

In *neuropathic postural hypotension* increased salt intake and the use of the mineralocorticoid fludrocortisone acetate p. 582 [unlicensed use] may help by increasing plasma volume, but uncomfortable oedema is a common side-effect. Fludrocortisone can also be combined with flurbiprofen p. 927 and ephedrine hydrochloride p. 236 [both unlicensed]. Midazolam p. 414 [unlicensed], an alpha agonist, may also be useful in postural hypotension.

Gustatory sweating can be treated with an antimuscarinic such as propantheline bromide p. 74; side-effects are common. See also the management of hyperhidrosis (Antiperspirants, p. 1038).

In some patients with *neuropathic oedema*, ephedrine hydrochloride p. 236 [unlicensed use] offers effective relief. See also the management of erectile dysfunction.

Diabetic ketoacidosis, management

The management of diabetic ketoacidosis involves the replacement of fluid and electrolytes and the administration of insulin. Guidelines for the Management of Diabetic Ketoacidosis in Adults, published by the Joint British Diabetes Societies Inpatient Care Group (available at www.diabetes.org.uk/About_us/What_wesay/Improving-diabetes-healthcare/The-Management-of-Diabetic-Ketoacidosis-in-Adults), should be followed.

- To restore circulating volume if systolic blood pressure is below 90 mmHg (adjusted for age, sex, and medication as appropriate), give 500 mL **sodium chloride** 0.9% by intravenous infusion over 10–15 minutes; repeat if blood pressure remains below 90 mmHg and seek senior medical advice.
- When blood pressure is over 90 mmHg, **sodium chloride** 0.9% should be given by intravenous infusion at a rate that replaces deficit and provides maintenance; see guideline or suggested regimen.
- Include **potassium chloride** in the fluids unless anuria is suspected; adjust according to plasma-potassium concentration (measure at 60 minutes, 2 hours, and 2 hourly thereafter; measure hourly if outside the normal range).
- Start an intravenous insulin infusion: **soluble insulin** should be diluted (and **mixed thoroughly**) with **sodium chloride** 0.9% intravenous infusion to a concentration of 1 unit/mL; infuse at a fixed rate of 0.1 units/kg/hour.
- Established subcutaneous therapy with long-acting insulin analogues (insulin detemir or insulin glargine) should be continued during treatment of diabetic ketoacidosis.
- Monitor blood-ketone and blood-glucose concentrations hourly and adjust the insulin infusion rate accordingly. Blood-ketone concentration should fall by at least 0.5 mmol/litre/hour and blood-glucose concentration should fall by at least 3 mmol/litre/hour.
- Once blood-glucose concentration falls below 14 mmol/litre, **glucose** 10% should be given by intravenous infusion (into a large vein through a large-

gauge needle) at a rate of 125 mL/hour, in addition to the **sodium chloride** 0.9% infusion.

- Continue insulin infusion until blood-ketone concentration is below 0.3 mmol/litre, blood pH is above 7.3 and the patient is able to eat and drink; ideally give subcutaneous fast-acting insulin and a meal, and stop the insulin infusion 1 hour later.

The management of hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion are usually necessary and slower rehydration may be required.

Insulins and anti-diabetic drugs

Insulins

Insulin plays a key role in the regulation of carbohydrate, fat, and protein metabolism. It is a polypeptide hormone of complex structure. There are differences in the amino-acid sequence of animal insulins, human insulins and the human insulin analogues. Insulin may be extracted from pork pancreas and purified by crystallisation; it may also be extracted from beef pancreas, but beef insulins are now rarely used. Human sequence insulin may be produced semisynthetically by enzymatic modification of porcine insulin (emp) or biosynthetically by recombinant DNA technology using bacteria (crb, prb) or yeast (pyr).

All insulin preparations are to a greater or lesser extent immunogenic in man but immunological resistance to insulin action is uncommon. Preparations of human sequence insulin should theoretically be less immunogenic, but no real advantage has been shown in trials.

Insulin is inactivated by gastro-intestinal enzymes, and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin is usually injected into the upper arms, thighs, buttocks, or abdomen; absorption from a limb site may be increased if the limb is used in strenuous exercise after the injection. Generally subcutaneous insulin injections cause few problems; lipodystrophy may occur but can be minimised by using different injection sites in rotation. Local allergic reactions are rare.

Insulin is needed by all patients with ketoacidosis, and it is likely to be needed by most patients with:

- rapid onset of symptoms;
- substantial loss of weight;
- weakness;
- ketonuria;
- a first-degree relative who has type 1 diabetes.

Insulin is also needed for type 2 diabetes when other methods have failed to achieve good control, and temporarily in the presence of intercurrent illness or peri-operatively. Pregnant women with type 2 diabetes may be treated with insulin when diet alone fails. Antidiabetic drugs have a role in the management of diabetes in pregnancy.

Safe and Effective Use of Insulin in Hospitalised Patients (March 2010)

NHS diabetes guidance available at www.diabetes.nhs.uk.

Management of diabetes with insulin

The aim of treatment is to achieve the best possible control of blood-glucose concentration without making the patient obsessive and to avoid disabling hypoglycaemia; close co-operation is needed between the patient and the medical team because good control reduces the risk of complications.

Insulin preparations can be divided into 3 types:

- those of **short** duration which have a relatively rapid onset of action, namely soluble insulin and the rapid-

acting insulin analogues, insulin aspart p. 604, insulin glulisine p. 605, and insulin lispro p. 606;

- those with an **intermediate** action, e.g. isophane insulin p. 607; and
- those whose action is slower in onset and lasts for **long** periods, e.g. protamine zinc insulin p. 607, insulin detemir p. 605, and insulin glargine p. 605.

The duration of action of a particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

Mixtures of insulin preparations may be required and appropriate combinations have to be determined for the individual patient. Treatment should be started with a short-acting insulin (e.g. soluble insulin) or a rapid-acting insulin analogue (e.g. insulin aspart) given before meals with intermediate-acting or long-acting insulin once or twice daily. Alternatively, for those who have difficulty with, or prefer not to use, multiple injection regimens, a mixture of premixed short-acting insulin or rapid-acting insulin analogue with an intermediate-acting or long-acting insulin (most commonly in a proportion of 30% soluble insulin and 70% isophane insulin) can be given once or twice daily. The dose of short-acting or rapid-acting insulin (or the proportion of the short-acting soluble insulin component in premixed insulin) can be increased in those with excessive postprandial hyperglycaemia. The dose of insulin is increased gradually according to the patient's individual requirements, taking care to avoid troublesome hypoglycaemic reactions.

Insulin requirements may be increased by infection, stress, accidental or surgical trauma, and during puberty. Requirements may be decreased in those with certain endocrine disorders (e.g. Addison's disease, hypopituitarism), or in coeliac disease.

Examples of recommended insulin regimens

- Multiple injection regimen: short-acting insulin or rapid-acting insulin analogue, before meals. With intermediate-acting or long-acting insulin, once or twice daily;
- Short-acting insulin or rapid-acting insulin analogue mixed with intermediate-acting or long-acting insulin, once or twice daily (before meals);
- Intermediate-acting or long-acting insulin, once or twice daily. With or without short-acting insulin or rapid-acting insulin before meals;
- Continuous subcutaneous insulin infusion.

Hypoglycaemia

Loss of warning of hypoglycaemia among insulin-treated patients can be a serious hazard, especially for drivers and those in dangerous occupations. Very tight control of diabetes lowers the blood-glucose concentration needed to trigger hypoglycaemic symptoms; an increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the patient. Beta-blockers can also blunt hypoglycaemic awareness (and also delay recovery).

To restore the warning signs, episodes of hypoglycaemia must be minimised; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

Some patients have reported loss of hypoglycaemia warning after transfer to human insulin. Clinical studies do not confirm that human insulin decreases hypoglycaemia awareness. If a patient believes that human insulin is responsible for the loss of warning it is reasonable to revert to animal insulin and essential to educate the patient about avoiding hypoglycaemia. Great care should be taken to specify whether a human or an animal preparation is required.

Few patients are now treated with beef insulins; when undertaking conversion from beef to human insulin, the total dose should be reduced by about 10% with careful

monitoring for the first few days. When changing between pork and human-sequence insulins, a dose change is not usually needed, but careful monitoring is still advised.

Diabetes and surgery

Perioperative control of blood-glucose concentrations in patients with type 1 diabetes is achieved via an adjustable, continuous, intravenous infusion of insulin. Detailed local protocols should be available to all healthcare professionals involved in the treatment of these patients; in general, the following steps should be followed:

- give an injection of the patient's usual insulin on the night before the operation;
- early on the day of the operation, start an intravenous infusion of glucose containing potassium chloride (provided that the patient is not hyperkalaemic) and infuse at a constant rate appropriate to the patient's fluid requirements (usually 125 mL per hour); make up a solution of soluble insulin in sodium chloride 0.9% and infuse intravenously using a syringe pump piggy-backed to the intravenous infusion. Glucose and potassium infusions, and insulin infusions should be made up according to locally agreed protocols;
- the rate of the insulin infusion should be adjusted according to blood-glucose concentration (frequent monitoring necessary) in line with locally agreed protocols. Other factors affecting the rate of infusion include the patient's volume depletion, cardiac function, and age.

Protocols should include specific instructions on how to manage resistant cases (such as patients who are in shock or severely ill or those receiving corticosteroids or sympathomimetics) and those with hypoglycaemia.

If a syringe pump is not available, soluble insulin should be added to the intravenous infusion of glucose and potassium chloride (provided the patient is not hyperkalaemic), and the infusion run at the rate appropriate to the patient's fluid requirements (usually 125 mL per hour) with the insulin dose adjusted according to blood-glucose concentration in line with locally agreed protocols.

Once the patient starts to eat and drink, give subcutaneous insulin before breakfast and stop intravenous insulin 30 minutes later; the dose may need to be 10–20% more than usual if the patient is still in bed or unwell. If the patient was not previously receiving insulin, an appropriate initial dose is 30–40 units daily in four divided doses using soluble insulin before meals and intermediate-acting insulin at bedtime and the dose adjusted from day to day. Patients with hyperglycaemia often relapse after conversion back to subcutaneous insulin calling for one of the following approaches:

- additional doses of soluble insulin at any of the four injection times (before meals or bedtime) *or*
- temporary addition of intravenous insulin infusion (while continuing the subcutaneous regimen) until blood-glucose concentration is satisfactory *or*
- complete reversion to the intravenous regimen (especially if the patient is unwell).

Short-acting insulins

Soluble insulin is a short-acting form of insulin. For maintenance regimens it is usual to inject it 15 to 30 minutes before meals.

Soluble insulin is the most appropriate form of insulin for use in diabetic emergencies e.g. diabetic ketoacidosis (see Diabetic ketoacidosis, management p. 590) and at the time of surgery. It can be given intravenously and intramuscularly, as well as subcutaneously.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 2 and 4 hours, and a duration of action of up to 8 hours.

When injected intravenously, soluble insulin has a very short half-life of only about 5 minutes and its effect disappears within 30 minutes.

The rapid-acting human insulin analogues, insulin aspart, insulin glulisine, and insulin lispro have a faster onset and shorter duration of action than soluble insulin; as a result, compared to soluble insulin, fasting and preprandial blood-glucose concentrations are a little higher, postprandial blood-glucose concentration is a little lower, and hypoglycaemia occurs slightly less frequently. Subcutaneous injection of insulin analogues may be convenient for those who wish to inject shortly before or, when necessary, shortly after a meal. They can also help those susceptible to hypoglycaemia before lunch and those who eat late in the evening and are prone to nocturnal hypoglycaemia. They can also be administered by subcutaneous infusion. Insulin aspart and insulin lispro can be administered intravenously and can be used as alternatives to soluble insulin for diabetic emergencies and at the time of surgery.

Intermediate- and long-acting insulins

When given by subcutaneous injection, intermediate- and long-acting insulins have an onset of action of approximately 1–2 hours, a maximal effect at 4–12 hours, and a duration of 16–42 hours. Some are given twice daily in conjunction with short-acting (soluble) insulin, and others are given once daily, particularly in elderly patients. Soluble insulin can be mixed with intermediate and long-acting insulins (except insulin detemir, insulin glargine, and insulin degludec) in the syringe, essentially retaining the properties of the two components, although there may be some blunting of the initial effect of the soluble insulin component (especially on mixing with protamine zinc insulin).

Isothane insulin is a suspension of insulin with protamine; it is of particular value for initiation of twice-daily insulin regimens. Patients usually mix isophane with soluble insulin but ready-mixed preparations may be appropriate (biphasic isophane insulin, biphasic insulin aspart, or biphasic insulin lispro).

Insulin zinc suspension (30% amorphous, 70% crystalline) has a more prolonged duration of action.

Protamine zinc insulin is usually given once daily with short-acting (soluble) insulin. It has the drawback of binding with the soluble insulin when mixed in the same syringe and is now rarely used.

Insulin glargine and insulin detemir are both long-acting human insulin analogues with a prolonged duration of action; insulin glargine is given once daily and insulin detemir is given once or twice daily. NICE (December 2002) has recommended that insulin glargine should be available as an option for patients with type 1 diabetes.

NICE (May 2009) has recommended that, if insulin is required in patients with type 2 diabetes, insulin detemir or insulin glargine may be considered for those:

- who require assistance with injecting insulin *or*
- whose lifestyle is significantly restricted by recurrent symptomatic hypoglycaemia *or*
- who would otherwise need twice-daily basal insulin injections in combination with oral antidiabetic drugs *or*
- who cannot use the device needed to inject isophane insulin.

Insulin detemir is also licensed as add-on therapy in patients receiving treatment with liraglutide.

Insulin degludec is a long-acting human insulin analogue for once daily subcutaneous administration.

Hypodermic equipment

Patients should be advised on the safe disposal of lancets, single-use syringes, and needles. Suitable arrangements for the safe disposal of contaminated waste must be made before these products are prescribed for patients who are carriers of infectious diseases.

Lancets, needles, syringes, and accessories are listed under Hypodermic Equipment in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 of the

Scottish Drug Tariff). The drug Tariffs can be accessed online at:

- National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
- Health and Personal Social Services for Northern Ireland Drug Tariff: www.dhsspsni.gov.uk/pas-tariff
- Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

Antidiabetic drugs

Oral antidiabetic drugs are used for the treatment of type 2 diabetes mellitus. They should be prescribed only if the patient fails to respond adequately to at least 3 months' restriction of energy and carbohydrate intake and an increase in physical activity. They should be used to augment the effect of diet and exercise, and not to replace them.

For patients not adequately controlled by diet and oral hypoglycaemic drugs, insulin may be added to the treatment regimen or substituted for oral therapy. When insulin is added to oral therapy, it is generally given at bedtime as isophane or long-acting insulin, and when insulin replaces an oral regimen it may be given as twice-daily injections of a biphasic insulin (or isophane insulin p. 607 mixed with soluble insulin), or a multiple injection regimen. Weight gain and hypoglycaemia may be complications of insulin therapy but weight gain may be reduced if the insulin is given in combination with metformin hydrochloride p. 594.

Pregnancy and breast-feeding

During pregnancy, women with *pre-existing diabetes* can be treated with metformin hydrochloride [unlicensed use], either alone or in combination with insulin. Metformin hydrochloride can be continued, or glibenclamide p. 611 resumed, during breast-feeding for those with *pre-existing diabetes*. Women with *gestational diabetes* may be treated, with or without concomitant insulin, with glibenclamide from 11 weeks gestation (after organogenesis) [unlicensed use] or with metformin [unlicensed use]. Women with gestational diabetes should discontinue hypoglycaemic treatment after giving birth.

Sulfonylureas

The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action. All may cause hypoglycaemia but this is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.

Sulfonylureas are considered for patients who are not overweight, or in whom metformin hydrochloride is contra-indicated or not tolerated. Several sulfonylureas are available and choice is determined by side-effects and the duration of action as well as the patient's age and renal function. Glibenclamide, a long-acting sulfonylurea, is associated with a greater risk of hypoglycaemia; for this reason it should be avoided in the elderly, and shorter-acting alternatives, such as gliclazide p. 611 or tolbutamide p. 613, should be used instead.

When the combination of strict diet and sulfonylurea treatment fails, other options include:

- combining with metformin;
- combining with pioglitazone;
- combining with alogliptin, linagliptin, saxagliptin, sitagliptin, or vildagliptin;
- combining with canagliflozin, dapagliflozin or empagliflozin;
- combining with exenatide, liraglutide, or lixisenatide;
- combining with acarbose, which may have a small beneficial effect, but flatulence can be a problem;

- combining with bedtime isophane insulin but weight gain and hypoglycaemia can occur.

Insulin therapy should be instituted temporarily during intercurrent illness (such as myocardial infarction, coma, infection, and trauma). Sulfonylureas should be omitted on the morning of surgery; insulin is required because of the ensuing hyperglycaemia in these circumstances.

Biguanides

Metformin hydrochloride, the only available biguanide, has a different mode of action from the sulfonylureas, and is not interchangeable with them.

Metformin hydrochloride is the drug of first choice in overweight patients in whom strict dieting has failed to control diabetes, if appropriate it may also be considered as an option in patients who are not overweight. It is also used when diabetes is inadequately controlled with sulfonylurea treatment. When the combination of strict diet and metformin hydrochloride treatment fails, other options include:

- combining with a sulfonylurea;
- combining with pioglitazone;
- combining with repaglinide or nateglinide;
- combining with alogliptin, linagliptin, saxagliptin, sitagliptin, or vildagliptin;
- combining with canagliflozin, dapagliflozin or empagliflozin;
- combining with exenatide, liraglutide, or lixisenatide;
- combining with acarbose, which may have a small beneficial effect, but flatulence can be a problem;
- combining with insulin but weight gain and hypoglycaemia can be problems (weight gain minimised if insulin given at night).

Insulin treatment is almost always required in medical and surgical emergencies; insulin should also be substituted before elective surgery (omit metformin hydrochloride on the morning of surgery and give insulin if required).

Hypoglycaemia does not usually occur with metformin hydrochloride; other advantages are the lower incidence of weight gain and lower plasma-insulin concentration. It does not exert a hypoglycaemic action in non-diabetic subjects unless given in overdose.

Metformin hydrochloride is used for the symptomatic management of polycystic ovary syndrome (unlicensed indication); however, treatment should be initiated by a specialist. Metformin hydrochloride improves insulin sensitivity, may aid weight reduction, helps to normalise menstrual cycle (increasing the rate of spontaneous ovulation), and may improve hirsutism.

Other antidiabetic drugs

Use of acarbose p. 594 is usually reserved for when other oral hypoglycaemics are not tolerated or are contra-indicated. Postprandial hyperglycaemia in type 1 diabetes can be reduced by acarbose, but it has been little used for this purpose. Flatulence deters some from using acarbose although this side-effect tends to decrease with time.

Nateglinide p. 607 and repaglinide p. 608 stimulate insulin secretion. Both drugs have a rapid onset of action and short duration of activity, and should be administered shortly before each main meal. Repaglinide may be given as monotherapy for patients who are not overweight or for those in whom metformin hydrochloride is contra-indicated or not tolerated, or it may be given in combination with metformin hydrochloride. Nateglinide is licensed only for use with metformin hydrochloride.

Pioglitazone p. 613 can be used alone or in combination with metformin hydrochloride or with a sulfonylurea (if metformin hydrochloride inappropriate), or with both; the combination of pioglitazone plus metformin hydrochloride is preferred to pioglitazone plus sulfonylurea, particularly for obese patients. Inadequate response to a combination of metformin hydrochloride and sulfonylurea may indicate failing insulin release; the introduction of pioglitazone has

a limited role in these circumstances and the initiation of insulin is often more appropriate. Pioglitazone is also licensed in combination with insulin, in patients who have not achieved adequate glycaemic control with insulin alone, when metformin hydrochloride is inappropriate. Blood-glucose control may deteriorate temporarily when pioglitazone is substituted for an oral antidiabetic drug that is being used in combination with another. Long-term benefits of pioglitazone have not yet been demonstrated. NICE (May 2009) has recommended that, when glycaemic control is inadequate with existing treatment, pioglitazone can be added to:

- a sulfonylurea, if metformin hydrochloride is contra-indicated or not tolerated;
- metformin, if risks of hypoglycaemia with sulfonylurea are unacceptable or a sulfonylurea is contraindicated or not tolerated;
- a combination of metformin hydrochloride and a sulfonylurea, if insulin is unacceptable because of lifestyle or other personal issues, or because the patient is obese.

NICE has recommended that treatment with pioglitazone is continued only if HbA_{1c} concentration is reduced by at least 0.5 percentage points within 6 months of starting treatment.

Linagliptin p. 596 is licensed for use in type 2 diabetes as monotherapy (if metformin hydrochloride inappropriate), or in combination with metformin hydrochloride (when treatment with metformin hydrochloride alone fails to achieve adequate glycaemic control), or both metformin hydrochloride and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). Linagliptin may also be used in combination with insulin (with or without metformin hydrochloride p. 594) when a stable dose of insulin has not provided adequate glycaemic control.

Saxagliptin p. 597 and vildagliptin p. 598 are licensed for use in type 2 diabetes as monotherapy (if metformin hydrochloride inappropriate), or in combination with metformin hydrochloride or a sulfonylurea (if metformin hydrochloride inappropriate), or pioglitazone (when treatment with either metformin hydrochloride or a sulfonylurea or pioglitazone fails to achieve adequate glycaemic control), and also in combination with both metformin hydrochloride and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). The combination of either saxagliptin or vildagliptin, and insulin (with or without metformin hydrochloride) is also licensed for use when a stable dose of insulin has not provided adequate glycaemic control.

Alogliptin p. 596 is also licensed for use as triple therapy in combination with metformin hydrochloride and either pioglitazone or insulin.

NICE (May 2009) has recommended that, when glycaemic control is inadequate with existing treatment:

- sitagliptin or vildagliptin (instead of a sulfonylurea) can be added to metformin, if there is a significant risk of hypoglycaemia or if a sulfonylurea is contraindicated or not tolerated;
- sitagliptin or vildagliptin can be added to a sulfonylurea, if metformin is contra-indicated or not tolerated;
- sitagliptin can be added to both metformin and a sulfonylurea, if insulin is unacceptable because of lifestyle or other personal issues, or because the patient is obese.

NICE has recommended that treatment with sitagliptin or vildagliptin is continued only if HbA_{1c} concentration is reduced by at least 0.5 percentage points within 6 months of starting treatment.

Treatment with exenatide p. 599, liraglutide p. 600, and lixisenatide p. 601 is associated with the prevention of

weight gain and possible promotion of weight loss which can be beneficial in overweight patients. They are given by subcutaneous injection for the treatment of type 2 diabetes mellitus.

Exenatide is licensed in combination with metformin hydrochloride or a sulfonylurea, or both, or with pioglitazone, or with both metformin hydrochloride and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination; standard-release exenatide is also licensed in combination with basal insulin alone or with metformin hydrochloride or pioglitazone (or both).

NICE (May 2009) has recommended that, when glycaemic control is inadequate with metformin hydrochloride and sulfonylurea treatment, the addition of standard-release exenatide may be considered if the patient has:

- a body mass index of 35 kg/m² or over and is of European descent (with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems *or*
- a body mass index less than 35 kg/m², and insulin would be unacceptable for occupational reasons or weight loss would benefit other significant obesity-related comorbidities.

NICE has recommended that treatment with standard release exenatide is continued only if HbA_{1c} concentration is reduced by at least 1 percentage point and a weight loss of at least 3% is achieved within 6 months of starting treatment.

Liraglutide is licensed for the treatment of type 2 diabetes mellitus in combination with metformin hydrochloride or a sulfonylurea, or both, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination. Liraglutide is also licensed for use in combination with basal insulin or both metformin hydrochloride and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control.

Lixisenatide is licensed for the treatment of type 2 diabetes mellitus in combination with oral antidiabetic drugs (e.g. metformin hydrochloride, pioglitazone, or a sulfonylurea) or basal insulin, or both, when adequate glycaemic control has not been achieved with these drugs; lixisenatide should not be used in combination with both basal insulin and a sulfonylurea because of an increased risk of hypoglycaemia.

Canagliflozin p. 608 and dapagliflozin p. 609, and empagliflozin p. 610 are licensed for use in type 2 diabetes as monotherapy (if metformin hydrochloride inappropriate), or in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control). Dapagliflozin is not recommended in combination with pioglitazone.

ALPHA GLUCOSIDASE INHIBITORS

Acarbose

- **DRUG ACTION** Acarbose, an inhibitor of intestinal alpha glucosidases, delays the digestion and absorption of starch and sucrose; it has a small but significant effect in lowering blood glucose.

INDICATIONS AND DOSE

Diabetes mellitus inadequately controlled by diet or by diet with oral antidiabetic drugs

BY MOUTH

- ▶ Adult: Initially 50 mg daily, then increased to 50 mg 3 times a day for 6–8 weeks, then increased if necessary to 100 mg 3 times a day (max. per dose 200 mg 3 times a day)

- **CONTRA-INDICATIONS** Hernia · inflammatory bowel disease · predisposition to partial intestinal obstruction · previous abdominal surgery
- **CAUTIONS** May enhance hypoglycaemic effects of insulin and sulfonylureas (hypoglycaemic episodes may be treated with oral glucose but not with sucrose)
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal distention and pain · diarrhoea (may need to reduce dose or withdraw) · flatulence · soft stools
 - ▶ **Rare** Abnormal liver function tests · nausea · skin reactions
 - ▶ **Very rare** Hepatitis · ileus · jaundice · oedema
- **SIDE-EFFECTS, FURTHER INFORMATION**

Antacids unlikely to be beneficial for treating side effects.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 25 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor liver function.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be chewed with first mouthful of food or swallowed whole with a little liquid immediately before food.
- **PATIENT AND CARER ADVICE** Antacids unlikely to be beneficial for treating side-effects. To counteract possible hypoglycaemia, patients receiving insulin or a sulfonylurea as well as acarbose need to carry glucose (not sucrose—acarbose interferes with sucrose absorption). Patients should be given advice on how to administer acarbose tablets.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ ACARBOSE (Non-proprietary)

Acarbose 50 mg Acarbose 50mg tablets | 90 tablet **PoM** £9.65 DT price = £9.65

Acarbose 100 mg Acarbose 100mg tablets | 90 tablet **PoM** £16.42 DT price = £16.42

▶ Glucobay (Bayer Plc)

Acarbose 50 mg Glucobay 50mg tablets | 90 tablet **PoM** £7.35 DT price = £9.65

Acarbose 100 mg Glucobay 100mg tablets | 90 tablet **PoM** £13.50 DT price = £16.42

BIGUANIDES

Metformin hydrochloride

- **DRUG ACTION** Metformin exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

INDICATIONS AND DOSE

Diabetes mellitus

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: Initially 500 mg once daily for at least 1 week, dose to be taken with breakfast, then 500 mg twice daily for at least 1 week, dose to be taken with breakfast and evening meal, then 500 mg 3 times a day, dose to be taken with breakfast, lunch and evening meal; maximum 2 g per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: Initially 500 mg once daily, then increased if necessary up to 2 g once daily, dose increased

gradually, every 10–15 days, dose to be taken with evening meal, alternatively increased to 1 g twice daily, dose to be taken with meals, alternative dose only to be used if control not achieved with once daily dose regimen. If control still not achieved then change to standard release tablets

Polycystic ovary syndrome

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

► **Adult:** Initially 500 mg once daily for 1 week, dose to be taken with breakfast, then 500 mg twice daily for 1 week, dose to be taken with breakfast and evening meal, then 1.5–1.7 g daily in 2–3 divided doses

● **UNLICENSED USE** Doses in the BNF may differ from those in the product literature. Not licensed for polycystic ovary syndrome.

● **CONTRA-INDICATIONS** Ketoacidosis · use of general anaesthesia (suspend metformin on the morning of surgery and restart when renal function returns to baseline)

CONTRA-INDICATIONS, FURTHER INFORMATION
Iodine-containing X-ray contrast media Intravascular administration of iodinated contrast agents can cause renal failure, which can increase the risk of lactic acidosis with metformin. Suspend metformin prior to the test; restart no earlier than 48 hours after the test if renal function has returned to baseline.

● **CAUTIONS** Can provoke lactic acidosis

● **INTERACTIONS** → Appendix 1 (antidiabetics).

● **SIDE-EFFECTS**

► **Common or very common** Abdominal pain · anorexia · diarrhoea (usually transient) · nausea · taste disturbance · vomiting

► **Rare** Decreased vitamin-B₁₂ absorption · erythema · lactic acidosis (withdraw treatment) · pruritus · urticaria

► **Frequency not known** Hepatitis

SIDE-EFFECTS, FURTHER INFORMATION

Gastro-intestinal effects Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses are given. A slow increase in dose may improve tolerability.

● **PREGNANCY** Can be used in pregnancy for both pre-existing and gestational diabetes. Women with gestational diabetes should discontinue treatment after giving birth.

● **BREAST FEEDING** May be used during breast-feeding in women with pre-existing diabetes.

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2009) that *Glucophage*® SR is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in adult patients who are intolerant of standard-release metformin, and in whom the prolonged-release tablet allows the use of a dose of metformin not previously tolerated, or in patients for whom a once daily preparation offers a clinically significant benefit.

● **HEPATIC IMPAIRMENT** Withdraw if tissue hypoxia likely.

● **RENAL IMPAIRMENT** Use with caution in renal impairment—increased risk of lactic acidosis. Lactic acidosis Withdraw or interrupt treatment in those at risk of tissue hypoxia or sudden deterioration in renal function, such as those with dehydration, severe infection, shock, sepsis, acute heart failure, respiratory failure or hepatic impairment, or those who have recently had a myocardial infarction.

NICE (clinical guideline 87 (May 2009): Type 2 diabetes: The management of type 2 diabetes) recommends that the dose should be reviewed if eGFR less than

45 mL/minute/1.73 m² and to avoid if eGFR less than 30 mL/minute/1.73 m².

● **MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected).

● **PRESCRIBING AND DISPENSING INFORMATION** Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of metformin modified release; not suitable if dose of standard-release tablets more than 2 g daily.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, capsule

Tablet

CAUTIONARY AND ADVISORY LABELS 21

DIPEPTIDYLPEPTIDASE-4 INHIBITORS (GLIPTINS)

Alogliptin

- **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

INDICATIONS AND DOSE

Type 2 diabetes as dual therapy in combination with either metformin, pioglitazone, a sulfonylurea, or insulin (when treatment with these drugs alone fails to achieve adequate glycaemic control), or as triple therapy in combination with metformin and either pioglitazone or insulin

BY MOUTH

► Adult: 25 mg once daily

Dose adjustments due to interactions

Dose of concomitant sulfonylurea or insulin may need to be reduced.

Caution with use in combination with both metformin and pioglitazone—risk of hypoglycaemia (dose of metformin or pioglitazone may need to be reduced).

- **CONTRA-INDICATIONS** Ketoacidosis
- **CAUTIONS** History of pancreatitis · not recommended in moderate to severe heart failure (limited experience)
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · gastro-oesophageal reflux · headache · nasopharyngitis · pruritis · rash · upper respiratory-tract infection
 - **Frequency not known** Angiodema · hepatic impairment · pancreatitis · Stevens-Johnson syndrome · urticaria
- **SIDE-EFFECTS, FURTHER INFORMATION**

Pancreatitis Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).
- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated if history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Reduce dose to 12.5 mg once daily if eGFR 30–50 mL/minute/1.73 m². Reduce dose to 6.25 mg once daily if eGFR less than 30 mL/minute/1.73 m². Use with caution if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Determine renal function before treatment and periodically thereafter.

GLUCAGON-LIKE PEPTIDE-1 RECEPTOR AGONISTS**Exenatide**

- **DRUG ACTION** Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

INDICATIONS AND DOSE

Type 2 diabetes mellitus in combination with metformin or a sulfonylurea, or both, or with pioglitazone, or with both metformin and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination

BY SUBCUTANEOUS INJECTION USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)

BY SUBCUTANEOUS INJECTION USING MODIFIED-RELEASE MEDICINES

- ▶ Adult: 2 mg once weekly

Type 2 diabetes mellitus in combination with basal insulin alone or with metformin or pioglitazone (or both)

BY SUBCUTANEOUS INJECTION USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)

Dose adjustments due to interactions

Dose of concomitant sulfonylurea may need to be reduced.

PHARMACOKINETICS

Effect of *modified-release* exenatide injection (*Bydureon*®) may persist for 10 weeks after discontinuation.

- **CONTRA-INDICATIONS** Ketoacidosis · severe gastrointestinal disease
- **CAUTIONS** Elderly · may cause weight loss greater than 1.5 kg weekly · pancreatitis
- **INTERACTIONS** → Appendix 1 (antidiabetics).
Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after exenatide injection, or taken with a meal when exenatide is not administered, to minimise possible interference with absorption.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain and distension · agitation · antibody formation · asthenia · decreased appetite · diarrhoea · dizziness · dyspepsia · gastrointestinal disturbances · gastro-oesophageal reflux disease · headache · hypoglycaemia · increased sweating · injection-site reactions · nausea · vomiting · weight loss
 - ▶ **Uncommon** Pancreatitis
 - ▶ **Rare** Alopecia
 - ▶ **Very rare** Anaphylactic reactions
 - ▶ **Frequency not known** Angioedema · constipation · dehydration · drowsiness · eruption · flatulence · pruritus · rash · renal impairment · taste disturbance · urticaria

SIDE-EFFECTS, FURTHER INFORMATION

Pancreatitis Severe pancreatitis (sometimes fatal), including haemorrhagic or necrotising pancreatitis, has been reported rarely; discontinue permanently if pancreatitis is diagnosed.

- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should use effective contraception during treatment with modified-release exenatide and for 12 weeks after discontinuation.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** For *standard-release* injection, use with caution if eGFR 30–50 mL/minute/1.73 m². For *standard-release* injection, avoid if eGFR less than 30 mL/minute/1.73 m². For *modified-release* injection, avoid if eGFR less than 50 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE**

Missed doses If a dose of the immediate-release medicine is missed, continue with the next scheduled dose—do not administer **after** a meal.

Patients changing from standard-release to modified-release exenatide formulation may experience initial transient increase in blood glucose.

Some oral medications should be taken at least 1 hour before or 4 hours after exenatide injection—consult product literature for details.

Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek prompt medical attention if symptoms such as abdominal pain, nausea, and vomiting develop.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- ▶ **Exenatide modified-release for the treatment of type 2 diabetes mellitus (February 2012)** NICE TA248
Modified-release exenatide in triple therapy regimens (in combination with metformin and a sulphonylurea, or metformin and a thiazolidinedione) is recommended for the treatment of type 2 diabetes, only when glycaemic control is inadequate and the patient has:
 - a body mass index (BMI) ≥ 35 kg/m² (in those of European descent, with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems, or
 - a BMI < 35 kg/m², and insulin would be unacceptable for occupational reasons, or weight loss would benefit other significant obesity-related comorbidities.

Treatment with modified-release exenatide in a triple therapy regimen should be continued only if HbA_{1c} concentration is reduced by at least 1 percentage point and a weight loss of at least 3% is achieved within 6 months of starting treatment.

Modified-release exenatide in dual therapy regimens (in combination with metformin or a sulphonylurea) is recommended only if:

- treatment with metformin or a sulphonylurea is contra-indicated or not tolerated, *and*
- treatment with thiazolidinediones and dipeptidylpeptidase-4 inhibitors is contra-indicated or not tolerated.

Modified-release exenatide in a dual therapy regimen should be continued only if HbA_{1c} concentration is reduced by at least 1 percentage point within 6 months of starting treatment. www.nice.org.uk/TA248

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2007) that standard-release exenatide (*Byetta*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin or sulphonylurea (or both), as an alternative to treatment with insulin in patients where treatment with metformin or sulphonylurea (or both) at maximally tolerated doses has

been inadequate, and treatment with insulin would be the next option.

The *Scottish Medicines Consortium* has also advised (February 2011) that standard-release exenatide (*Byetta*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin and pioglitazone as a third-line pre-insulin treatment option.

The *Scottish Medicines Consortium* has advised (December 2011) that modified-release exenatide (*Bydureon*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes as a third-line treatment option.

- **DRUG ACTION** Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

INDICATIONS AND DOSE

Type 2 diabetes mellitus in combination with metformin or a sulphonylurea, or both, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination | Type 2 diabetes mellitus in combination with basal insulin or both metformin and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 0.6 mg once daily for at least 1 week, then increased to 1.2 mg once daily for at least 1 week, then increased if necessary up to 1.8 mg once daily

Dose adjustments due to interactions

Dose of concomitant insulin or sulphonylurea may need to be reduced.

- **CONTRA-INDICATIONS** Diabetic gastroparesis · inflammatory bowel disease · ketoacidosis · moderate to severe congestive heart failure—no information available
- **CAUTIONS** Asymptomatic left ventricular dysfunction · history of pancreatitis · mild congestive heart failure—limited experience · thyroid disease
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain and distension · bronchitis · constipation · decreased appetite · diarrhoea · dizziness · dyspepsia · flatulence · gastritis · gastro-intestinal disturbances · gastro-oesophageal reflux disease · headache · hypoglycaemia · injection site reactions · malaise · nasopharyngitis · nausea · tachycardia · vomiting
- ▶ **Uncommon** Acute renal failure · dehydration · renal impairment

- ▶ **Very rare** Acute pancreatitis
- ▶ **Frequency not known** Goitre · increased blood calcitonin · thyroid neoplasm

SIDE-EFFECTS, FURTHER INFORMATION

Pancreatitis Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).

- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid—limited experience.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer liraglutide injection. Acute pancreatitis Patients should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek immediate medical attention if symptoms such as persistent, severe abdominal pain develop.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ **Liraglutide for the treatment of type 2 diabetes mellitus (October 2010)** NICE TA203

Liraglutide in triple therapy regimens (in combination with metformin and a sulfonylurea, or metformin and a thiazolidinedione) is recommended for the treatment of type 2 diabetes, only when glycaemic control is inadequate, and the patient has:

- a body mass index of 35 kg/m² or over and is of European descent (with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems, *or*
- a body mass index of less than 35 kg/m², and insulin would be unacceptable for occupational reasons *or* weight loss would benefit other significant obesity-related comorbidities.

Treatment with liraglutide in a triple therapy regimen should be continued only if HbA_{1c} concentration is reduced by at least 1 percentage point and a weight loss of at least 3% is achieved within 6 months of starting treatment.

Liraglutide in dual therapy regimens (in combination with metformin or a sulfonylurea) is recommended only if:

- treatment with metformin or a sulfonylurea is contraindicated or not tolerated, *and*
- treatment with thiazolidinediones and dipeptidylpeptidase-4 inhibitors is contra-indicated or not tolerated.

Liraglutide, in combination with metformin or a sulfonylurea should be continued only if HbA_{1c} concentration is reduced by at least 1 percentage point within 6 months of starting treatment.

Liraglutide 1.8 mg daily is not recommended.

www.nice.org.uk/TA203

MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ LIRAGLUTIDE (Non-proprietary)

Liraglutide 6 mg per 1 ml Liraglutide 6mg/ml solution for injection 3ml pre-filled disposable devices | 2 pre-filled disposable injection [PoM] no price available | 3 pre-filled disposable injection [PoM] no price available

▶ Victoza (Novo Nordisk Ltd)

Liraglutide 6 mg per 1 ml Victoza 6mg/ml solution for injection 3ml pre-filled pen | 2 pre-filled disposable injection [PoM] £78.48 | 3 pre-filled disposable injection [PoM] £117.72

Lixisenatide

- **DRUG ACTION** Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin

secretion, suppresses glucagon secretion, and slows gastric emptying.

INDICATIONS AND DOSE

Type 2 diabetes mellitus in combination with oral antidiabetic drugs (e.g. metformin, pioglitazone, or a sulfonylurea) or basal insulin, or both, when adequate glycaemic control has not been achieved with these drugs

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 10 micrograms once daily for 14 days, then increased to 20 micrograms once daily, dose to be taken within 1 hour before the first meal of the day or the evening meal

Dose adjustments due to interactions

Dose of concomitant sulfonylurea or insulin may need to be reduced.

- **CONTRA-INDICATIONS** Ketoacidosis · severe gastrointestinal disease
- **INTERACTIONS** → Appendix 1 (antidiabetics). Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after lixisenatide injection, or taken with a meal when lixisenatide is not administered, to minimise possible interference with absorption.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Diarrhoea · dizziness · drowsiness · dyspepsia · headache · hypoglycaemia · injection-site reactions · nausea · palpitation · vomiting
 - ▶ **Uncommon** Tachycardia · urticaria

SIDE-EFFECTS, FURTHER INFORMATION

Pancreatitis Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).

- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should use effective contraception.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** Use with caution if eGFR 30–50 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m²—no information available.
- **PATIENT AND CARER ADVICE**

Missed doses If a dose is missed, inject within 1 hour before the next meal—do not administer **after** a meal. Some oral medications should be taken at least 1 hour before or 4 hours after lixisenatide injection—consult product literature for details.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2013) that lixisenatide (*Lyxumia*[®]) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with oral antidiabetic drugs or basal insulin (or both), when adequate glycaemic control has not been achieved with these drugs; use is restricted to patients in whom a GLP-1 agonist is appropriate, as an alternative to an existing GLP-1 agonist (exenatide or liraglutide).

MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Lixisenatide 100 microgram per 1 ml Lyxumia 20micrograms/0.2ml solution for injection 3ml pre-filled pen | 1 pre-filled disposable injection [PoM] no price available | 2 pre-filled disposable injection [PoM] £54.14 DT price = £54.14

INSULINS

Insulins

● SIDE-EFFECTS

● **Common or very common** Fat hypertrophy at injection site
 • local reactions at injection site • transient oedema

▶ **Rare** Hypersensitivity reactions • rash • urticaria

Overdose Overdose causes hypoglycaemia.

● **PREGNANCY** During pregnancy, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician. The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy.

● **BREAST FEEDING** During breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

● **HEPATIC IMPAIRMENT** Insulin requirements may be decreased in patients with hepatic impairment.

● **RENAL IMPAIRMENT** Insulin requirements may decrease in patients with renal impairment and therefore dose reduction may be necessary. The compensatory response to hypoglycaemia is impaired in renal impairment.

● **MONITORING REQUIREMENTS**

▶ Many patients now monitor their own blood-glucose concentrations; all carers and children need to be trained to do this.

▶ Since blood-glucose concentration varies substantially throughout the day, 'normoglycaemia' cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia.

▶ It is therefore best to recommend that patients should maintain a blood-glucose concentration of between 4 and 9 mmol/litre for most of the time (4–7 mmol/litre before meals and less than 9 mmol/litre after meals).

▶ While accepting that on occasions, for brief periods, the blood-glucose concentration will be above these values; strenuous efforts should be made to prevent it from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.

● **DIRECTIONS FOR ADMINISTRATION** Insulin is generally given by *subcutaneous injection*; the injection site should be rotated to prevent lipodystrophy. Injection devices ('pens'), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form, but are less popular with children and carers. For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

● **PRESCRIBING AND DISPENSING INFORMATION**

Units The word 'unit' should **not** be abbreviated. Show container to patient or carer and confirm the expected version is dispensed.

● **PATIENT AND CARER ADVICE** Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

Insulin Passport Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient's current insulin preparations and contains a section for emergency information. The patient information booklet provides

advice on the safe use of insulin. They are available for purchase from:

3M Security Print and Systems Limited
 Gorse Street, Chadderton
 Oldham OL9 9QH
 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores.

NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com. Further information is available at www.npsa.nhs.uk.

Hypoglycaemia Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

Biphasic insulin aspart
(Intermediate-acting insulin)

INDICATIONS AND DOSE

Diabetes mellitus

BY SUBCUTANEOUS INJECTION

▶ **Child:** Administer dose up to 10 minutes before or soon after a meal, according to requirements

▶ **Adult:** Administer dose up to 10 minutes before or soon after a meal, according to requirements

● **INTERACTIONS** → Appendix 1 (antidiabetics).

● **SIDE-EFFECTS** Protamine may cause allergic reactions

● **PRESCRIBING AND DISPENSING INFORMATION** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

● **MEDICINAL FORMS**

Insulin

(Insulin Injection; Neutral Insulin; Soluble Insulin)

INDICATIONS AND DOSE

Diabetes mellitus

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- ▶ Adult: According to requirements

Diabetic ketoacidosis | Diabetes during surgery

BY INTRAVENOUS INFUSION

- ▶ Adult: (consult local protocol)

- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team. Some insulin preparations are not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle—consult product literature. For *intravenous infusion* give continuously in Sodium chloride 0.9%. Adsorbed to some extent by plastic infusion set; ensure insulin is not injected into 'dead space' of injection port of the infusion bag.
- **PRESCRIBING AND DISPENSING INFORMATION** A sterile solution of insulin (i.e. bovine or porcine) or of human insulin; pH 6.6–8.0.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
▶ Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151
Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:
 - who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or
 - whose glycaemic control remains inadequate (HbA_{1c} over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).
 Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of

multiple-injection therapy between the ages of 12 and 18 years. www.nice.org.uk/TA151

 - **NATIONAL FUNDING/ACCESS DECISIONS**
 - **Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (March 2013) that insulin glargine is accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:

 - in those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins
 - as a once daily insulin therapy for patients who require a carer to administer their insulin
- It is **not** recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent episodes of hypoglycaemia or require assistance with their insulin injections.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Lantus** (Sanofi)

Insulin human (as Insulin glargine) 100 unit per 1 ml Lantus 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £41.50 | Lantus 100units/ml solution for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection [PoM] £41.50 | Lantus 100units/ml solution for injection 10ml vials | 1 vial [PoM] £30.68

Insulin glulisine

(Recombinant human insulin analogue)

INDICATIONS AND DOSE

Diabetes mellitus

BY SUBCUTANEOUS INJECTION

- ▶ Child 6-17 years: Administer immediately before meals or when necessary shortly after meals, according to requirements
- ▶ Adult: Administer immediately before meals or when necessary shortly after meals, according to requirements

BY SUBCUTANEOUS INFUSION OR BY INTRAVENOUS INFUSION

- ▶ Child 6-17 years: According to requirements
- ▶ Adult: According to requirements

- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device

delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.

- ▶ In adults For *intravenous infusion (Apidra®)*, give continuously in Sodium chloride 0.9%; dilute to 1 unit/mL with infusion fluid; use a co-extruded polyolefin/polyamide plastic infusion bag with a dedicated infusion line.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151 Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:

- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, **or**
- whose glycaemic control remains inadequate (HbA_{1c} over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years. www.nice.org.uk/TA151

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2008) that *Apidra®* is accepted for restricted use within NHS Scotland for the treatment of adults and children over 6 years with diabetes mellitus in whom the use of a short-acting insulin analogue is appropriate.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ *Apidra* (Sanofi)

Insulin glulisine 100 unit per 1 ml *Apidra* 100units/ml solution for injection 10ml vials | 1 vial [PoM] £16.00

Apidra 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £28.30

- ▶ *Apidra SoloStar* (Sanofi)

Insulin glulisine 100 unit per 1 ml *Apidra* 100units/ml solution for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection [PoM] £28.30

- ▶ Adult: According to requirements

- **CAUTIONS** Children (use only if benefit likely compared to soluble insulin)

- **INTERACTIONS** → Appendix 1 (antidiabetics).

- **PREGNANCY** Not known to be harmful—may be used during pregnancy.

- **BREAST FEEDING** Not known to be harmful—may be used during lactation.

- **DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens (see also NICE guidance, below). Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.

- ▶ In adults For *intravenous infusion* give continuously in Glucose 5% or Sodium chloride 0.9%. Adsorbed to some extent by plastics of infusion set.

- ▶ In children For *intravenous infusion*, dilute to a concentration of 0.1–1 unit/mL with Glucose 5% or Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151 Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:

- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, **or**
- whose glycaemic control remains inadequate (HbA_{1c} over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years. www.nice.org.uk/TA151

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ *Humalog* (Eli Lilly and Company Ltd)

Insulin lispro 100 unit per 1 ml *Humalog* 100units/ml solution for injection 10ml vials | 1 vial [PoM] £16.61

Humalog 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £28.31

- ▶ *Humalog KwikPen* (Eli Lilly and Company Ltd)

Insulin lispro 100 unit per 1 ml *Humalog KwikPen* 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £29.46

Insulin lispro 200 unit per 1 ml *Humalog KwikPen* 200units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £58.92

Insulin lispro

(Recombinant human insulin analogue)

INDICATIONS AND DOSE

Diabetes mellitus

BY SUBCUTANEOUS INJECTION

- ▶ Child 2-17 years: Administer shortly before meals or when necessary shortly after meals, according to requirements
- ▶ Adult: Administer shortly before meals or when necessary shortly after meals, according to requirements

BY SUBCUTANEOUS INFUSION OR BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION

- ▶ Child 2-17 years: According to requirements

Insulin zinc suspension

(Insulin Zinc Suspension (Mixed)—long acting)

INDICATIONS AND DOSE

Diabetes mellitus

BY SUBCUTANEOUS INJECTION

- ▶ Child: According to requirements
- ▶ Adult: According to requirements

- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin below is recommended where longer-acting insulins are needed; insulin detemir p. 605 may also be considered.
- **PRESCRIBING AND DISPENSING INFORMATION** A sterile neutral suspension of bovine and/or porcine insulin or of human insulin in the form of a complex obtained by the addition of a suitable zinc salt; consists of rhombohedral crystals (10–40 microns) and of particles of no uniform shape (not exceeding 2 microns).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Hypurin Bovine Lente** (Wockhardt UK Ltd)
Insulin bovine (as Insulin zinc suspension mixed bovine) 100 unit per 1 ml | Hypurin Bovine Lente 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £27.72

Isophane insulin

(Isophane Insulin Injection; Isophane Protamine Insulin Injection; Isophane Insulin (NPH)—intermediate acting)

INDICATIONS AND DOSE

Diabetes mellitus

BY SUBCUTANEOUS INJECTION

- ▶ Child: According to requirements
- ▶ Adult: According to requirements

- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS** Protamine may cause allergic reactions
- **PREGNANCY** Recommended where longer-acting insulins are needed.
- **PRESCRIBING AND DISPENSING INFORMATION** A sterile suspension of bovine or porcine insulin or of human insulin in the form of a complex obtained by the addition of protamine sulfate or another suitable protamine.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Humulin I** (Eli Lilly and Company Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml | Humulin I 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £15.68
Humulin I 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £19.08
- ▶ **Humulin I KwikPen** (Eli Lilly and Company Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml | Humulin I KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £21.70
- ▶ **Hypurin Bovine Isophane** (Wockhardt UK Ltd)
Insulin bovine (as Insulin isophane bovine) 100 unit per 1 ml | Hypurin Bovine Isophane 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £27.72
Hypurin Bovine Isophane 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £41.58

- ▶ **Hypurin Porcine Isophane** (Wockhardt UK Ltd)
Insulin porcine (as Insulin isophane porcine) 100 unit per 1 ml | Hypurin Porcine Isophane 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £37.80
Hypurin Porcine Isophane 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £25.20
- ▶ **Insulatard** (Novo Nordisk Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml | Insulatard 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £7.48
- ▶ **Insulatard InnoLet** (Novo Nordisk Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml | Insulatard InnoLet 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £20.40
- ▶ **Insulatard Penfill** (Novo Nordisk Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml | Insulatard Penfill 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £22.90
- ▶ **Insuman Basal** (Sanofi)
Insulin human (as Insulin isophane human) 100 unit per 1 ml | Insuman Basal 100units/ml suspension for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection [PoM] £19.80
Insuman Basal 100units/ml suspension for injection 5ml vials | 1 vial [PoM] £5.61
Insuman Basal 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50

Protamine zinc insulin

(Protamine Zinc Insulin Injection—long acting)

INDICATIONS AND DOSE

Diabetes mellitus

BY SUBCUTANEOUS INJECTION

- ▶ Child: According to requirements
- ▶ Adult: According to requirements

- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS** Protamine may cause allergic reactions
- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin above is recommended where longer-acting insulins are needed; insulin detemir p. 605 may also be considered.
- **PRESCRIBING AND DISPENSING INFORMATION** A sterile suspension of insulin in the form of a complex obtained by the addition of a suitable protamine and zinc chloride; this preparation was included in BP 1980 but is not included in BP 1988.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Hypurin Bovine Protamine Zinc** (Wockhardt UK Ltd)
Insulin bovine (as Insulin protamine zinc bovine) 100 unit per 1 ml | Hypurin Bovine Protamine Zinc 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £27.72

MEGLITINIDES

Nateglinide

- **DRUG ACTION** Nateglinide stimulates insulin secretion.

INDICATIONS AND DOSE

Type 2 diabetes mellitus in combination with metformin when metformin alone inadequate

BY MOUTH

- ▶ Adult: Initially 60 mg 3 times a day (max. per dose 180 mg), adjusted according to response, to be taken within 30 minutes before main meals

- **CONTRA-INDICATIONS** Ketoacidosis

- **CAUTIONS** Debilitated patients · elderly · malnourished patients

CAUTIONS, FURTHER INFORMATION

Substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit nateglinide on morning of surgery and recommence when eating and drinking normally).

- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS** Hypersensitivity reactions · hypoglycaemia · pruritus · rashes · urticaria
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Caution in moderate hepatic impairment. Avoid in severe impairment—no information available.
- **PATIENT AND CARER ADVICE** Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Starlix** (Novartis Pharmaceuticals UK Ltd)

Nateglinide 60 mg Starlix 60mg tablets | 84 tablet [PoM] £22.71 DT price = £22.71

Nateglinide 120 mg Starlix 120mg tablets | 84 tablet [PoM] £25.88 DT price = £25.88

Nateglinide 180 mg Starlix 180mg tablets | 84 tablet [PoM] £25.88 DT price = £25.88

Repaglinide

- **DRUG ACTION** Repaglinide stimulates insulin secretion.

INDICATIONS AND DOSE

Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate)

BY MOUTH

- ▶ Adult 18–74 years: Initially 500 micrograms (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day
- ▶ Adult 75 years and over: Not recommended

Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate), if transferring from another oral hypoglycaemic drug

BY MOUTH

- ▶ Adult 18–74 years: Initially 1 mg (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day
- ▶ Adult 75 years and over: Not recommended

- **CONTRA-INDICATIONS** Ketoacidosis

- **CAUTIONS** Debilitated patients · malnourished patients

CAUTIONS, FURTHER INFORMATION

Substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit repaglinide on morning of surgery and recommence when eating and drinking normally).

- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · constipation · diarrhoea · nausea · vomiting
 - ▶ **Rare** Hypersensitivity reactions · hypoglycaemia · pruritus · rashes · urticaria · vasculitis · visual disturbances
- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease.

- **RENAL IMPAIRMENT** Use with caution.

- **PATIENT AND CARER ADVICE** Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

SODIUM GLUCOSE CO-TRANSPORTER 2 INHIBITORS

Canagliflozin

- **DRUG ACTION** Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

INDICATIONS AND DOSE

Type 2 diabetes mellitus as monotherapy if metformin inappropriate | Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)

BY MOUTH

- ▶ Adult: 100 mg once daily; increased if tolerated to 300 mg once daily if required, dose to be taken preferably before breakfast

Dose adjustments due to interactions

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

- **CONTRA-INDICATIONS** Ketoacidosis
- **CAUTIONS** Cardiovascular disease (risk of hypotension) · elderly (risk of hypotension) · elevated haematocrit · history of hypotension

CAUTIONS, FURTHER INFORMATION

Volume depletion Correct hypovolaemia before starting treatment.

- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Constipation · dyslipidaemia · genital infection · hypoglycaemia (in combination with insulin or sulfonyleurea) · nausea · polyuria · raised haematocrit · thirst · urinary frequency · urinary-tract infection
 - ▶ **Uncommon** Dehydration · dizziness · hypovolaemia · postural hypotension · raised serum creatinine · raised serum urea · rash · syncope
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - Volume depletion** Consider interrupting treatment if volume depletion occurs.
- **PREGNANCY** Avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Reduce dose to 100 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m² and existing canagliflozin treatment tolerated. Avoid initiation if eGFR less than 60 mL/minute/1.73 m². Avoid if eGFR less than 45 mL/minute/1.73 m². Monitor renal function at least twice a year in moderate impairment.
- **MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually thereafter, and before initiation of concomitant drugs that reduce renal function and periodically thereafter.
- **PATIENT AND CARER ADVICE** Patients or carers should be advised to report symptoms of volume depletion including postural hypotension and dizziness.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
 ▶ **Canagliflozin in combination therapy for treating type 2 diabetes (June 2014) NICE TA315**
 Canagliflozin in a dual therapy regimen in combination with metformin is recommended for the treatment of type 2 diabetes, only if a sulfonylurea is contra-indicated or not tolerated or the patient has a significant risk of hypoglycaemia.
 Canagliflozin in a triple therapy regimen is an option for the treatment of type 2 diabetes in combination with metformin and a sulfonylurea or metformin and a thiazolidinedione.
 Canagliflozin in combination with insulin (alone or with other antidiabetic drugs) is an option for the treatment of type 2 diabetes.
 Patients currently receiving canagliflozin in a dual or triple therapy regimen that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA315

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2014) that canagliflozin (*Invokana*[®]) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin as dual therapy, or in combination with metformin and standard of care as triple therapy, or in combination with insulin and standard of care.

- **MEDICINAL FORMS**
 There can be variation in the licensing of different medicines containing the same drug.

- ▶ Adult 18–84 years: 10 mg once daily, increased to 25 mg once daily if necessary and if tolerated
- ▶ Adult 85 years and over: Initiation not recommended

Dose adjustments due to interactions

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

- **CONTRA-INDICATIONS** Diabetic ketoacidosis
- **CAUTIONS** Cardiovascular disease (increased risk of volume depletion) · complicated urinary tract infections—consider temporarily interrupting treatment · concomitant antihypertensive therapy (increased risk of volume depletion) · elderly patients aged over 75 years (increased risk of volume depletion) · heart failure · history of hypotension (increased risk of volume depletion) · patients at increased risk of volume depletion · predisposition to fluid disturbances e.g. gastro-intestinal illness, concomitant use of diuretics (increased risk of volume depletion)

CAUTIONS, FURTHER INFORMATION

Volume depletion Correct hypovolaemia before starting treatment. Consider interrupting treatment if volume depletion occurs.

- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Genital infection · hypoglycaemia (in combination with insulin or sulfonylurea) · polyuria · pruritus · urinary tract infection
 - ▶ **Uncommon** Dysuria · volume depletion
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
 - **RENAL IMPAIRMENT** Reduce dose to 10 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m². Avoid initiation if eGFR below 60 mL/minute/1.73 m². Avoid if eGFR is persistently below 45 mL/minute/1.73 m².
 - **MONITORING REQUIREMENTS** Determine renal function before treatment and before initiation of concomitant drugs that may reduce renal function, then at least annually thereafter.
 - **NATIONAL FUNDING/ACCESS DECISIONS**
 - **NICE technology appraisals (TAs)**
 - ▶ **Empagliflozin in combination therapy for treating type 2 diabetes (March 2015) NICE TA336**
- Empagliflozin in a dual therapy regimen in combination with metformin is an option for the treatment of type 2 diabetes, only if:
- a sulfonylurea is contraindicated or not tolerated, or
 - the patient is at significant risk of hypoglycaemia or its consequences.
- Empagliflozin in a triple therapy regimen is an option for the treatment of type 2 diabetes in combination with:
- metformin and a sulfonylurea or
 - metformin and a thiazolidinedione.
- Empagliflozin in combination with insulin with or without other antidiabetic drugs is an option for the treatment of type 2 diabetes.
- Patients currently receiving empagliflozin whose disease does not meet the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA336

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

 £36.59 DT price = £36.59

SULFONYLUREAS

Sulfonylureas

- **DRUG ACTION** The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action.
- **CONTRA-INDICATIONS** Presence of ketoacidosis
- **CAUTIONS** Can encourage weight gain (should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting) · elderly · G6PD deficiency
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Hypoglycaemia
 - ▶ **Rare** Agranulocytosis · aplastic anaemia · Blood disorders · cholestatic jaundice · haemolytic anaemia · hepatic failure · hepatitis · leucopenia · pancytopenia · thrombocytopenia
 - ▶ **Frequency not known** Allergic skin reactions (usually in the first 6–8 weeks of therapy) · constipation · diarrhoea · disturbance in liver function · erythema multiforme (usually in the first 6–8 weeks of therapy) · exfoliative dermatitis (usually in the first 6–8 weeks of therapy) · fever (usually in the first 6–8 weeks of therapy) · gastro-intestinal disturbances · Hypersensitivity reactions (usually in the first 6–8 weeks of therapy) · jaundice

(usually in the first 6–8 weeks of therapy) · nausea · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Hypoglycaemia This is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.

- **HEPATIC IMPAIRMENT** Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia. Jaundice may occur.
- **RENAL IMPAIRMENT** Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia. Care is required to use the lowest dose that adequately controls blood glucose. Avoid where possible in severe renal impairment.
- **PATIENT AND CARER ADVICE** Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems. The risk of hypoglycaemia associated with sulfonylureas should be discussed with the patient, especially when concomitant glucose-lowering drugs are prescribed.

Glibenclamide

INDICATIONS AND DOSE

Type 2 diabetes mellitus

BY MOUTH

- ▶ **Adult:** Initially 5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

- **UNLICENSED USE** Not licensed for use in breast feeding women with pre-existing diabetes. Not licensed for use in gestational diabetes.
- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 864
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes.
- **BREAST FEEDING** Glibenclamide can be used during breast-feeding in women with pre-existing diabetes.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

- ▶ **GLIBENCLAMIDE (Non-proprietary)**

Glibenclamide 2.5 mg Glibenclamide 2.5mg tablets | 28 tablet PoM £15.48 DT price = £9.22

Glibenclamide 5 mg Glibenclamide 5mg tablets | 28 tablet PoM
 £19.99 DT price = £1.09

Gliclazide

INDICATIONS AND DOSE

Type 2 diabetes mellitus

INITIALLY BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ **Adult:** Initially 40–80 mg daily, adjusted according to response, (by mouth) increased if necessary up to 160 mg once daily, dose to be taken with breakfast, doses higher than 160 mg to be given in divided doses; maximum 320 mg per day continued →

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ **Adult:** Initially 30 mg daily, dose to be taken with breakfast, adjust dose according to response every 4 weeks (after 2 weeks if no decrease in blood glucose); maximum 120 mg per day

Dose equivalence and conversion

Glizalide modified release 30 mg may be considered to be approximately equivalent in therapeutic effect to standard formulation glizalide 80 mg.

- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 864
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** Avoid—theoretical possibility of hypoglycaemia in the infant.
- **RENAL IMPAIRMENT** If necessary, glizalide which is principally metabolised in the liver, can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tolbutamide

INDICATIONS AND DOSE

Type 2 diabetes mellitus

BY MOUTH

- ▶ **Adult:** 0.5–1.5 g daily in divided doses (max. per dose 2 g), dose to be taken with or immediately after meals, alternatively 0.5–1.5 g once daily (max. per dose 2 g), dose to be taken with or immediately after breakfast

- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 864
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS** Headache · tinnitus
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** The use of sulfonylureas in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.
- **RENAL IMPAIRMENT** If necessary, the short-acting drug tolbutamide can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

▶ TOLBUTAMIDE (Non-proprietary)

Tolbutamide 500 mg Tolbutamide 500mg tablets | 28 tablet POM
 £42.50 DT price = £20.50 | 112 tablet POM £82.00-£94.48

THIAZOLIDINEDIONES

Pioglitazone

- **DRUG ACTION** The thiazolidinedione, pioglitazone, reduces peripheral insulin resistance, leading to a reduction of blood-glucose concentration.

INDICATIONS AND DOSE

Type 2 diabetes mellitus (alone or combined with metformin or a sulfonylurea, or with both, or with insulin)

BY MOUTH

- ▶ **Adult:** Initially 15–30 mg once daily, adjusted according to response to 45 mg once daily, in elderly patients, initiate with lowest possible dose and increase gradually; review treatment after 3–6 months and regularly thereafter

Dose adjustments due to interactions

Dose of concomitant sulfonylurea or insulin may need to be reduced.

Important safety information

MHRA/CHM ADVICE: PIOGLITAZONE CARDIOVASCULAR SAFETY (DECEMBER 2007 AND JANUARY 2011)

Incidence of heart failure is increased when pioglitazone is combined with insulin especially in patients with predisposing factors e.g. previous myocardial infarction. Patients who take pioglitazone should be closely monitored for signs of heart failure; treatment should be discontinued if any deterioration in cardiac status occurs.

Pioglitazone should not be used in patients with heart failure or a history of heart failure.

PIOGLITAZONE: RISK OF BLADDER CANCER (JULY 2011)

The European Medicines Agency has advised that there is a small increased risk of bladder cancer associated with pioglitazone use. However, in patients who

respond adequately to treatment, the benefits of pioglitazone continue to outweigh the risks.

Pioglitazone should not be used in patients with active bladder cancer or a past history of bladder cancer, or in those who have uninvestigated macroscopic haematuria. Pioglitazone should be used with caution in elderly patients as the risk of bladder cancer increases with age.

Before initiating treatment with pioglitazone, patients should be assessed for risk factors of bladder cancer (including age, smoking status, exposure to certain occupational or chemotherapy agents, or previous radiation therapy to the pelvic region) and any macroscopic haematuria should be investigated. The safety and efficacy of pioglitazone should be reviewed after 3–6 months and pioglitazone should be stopped in patients who do not respond adequately to treatment. Patients already receiving treatment with pioglitazone should be assessed for risk factors of bladder cancer and treatment should be reviewed after 3–6 months, as above.

Patients should be advised to report promptly any haematuria, dysuria, or urinary urgency during treatment.

- **CONTRA-INDICATIONS** History of heart failure · previous or active bladder cancer · uninvestigated macroscopic haematuria
- **CAUTIONS** Avoid in Acute porphyrias p. 864 · cardiovascular disease or in combination with insulin (risk of heart failure) · elderly (increased risk of heart failure, fractures, and bladder cancer) · increased risk of bone fractures, particularly in women · risk factors for bladder cancer

CAUTIONS, FURTHER INFORMATION

Substitute insulin during peri-operative period (omit pioglitazone on morning of surgery and recommence when eating and drinking normally).

- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · arthralgia · dizziness · gastro-intestinal disturbances · haematuria · headache · hypoaesthesia · impotence · oedema · vertigo · visual disturbances · weight gain
 - ▶ **Uncommon** Altered blood lipids · bladder cancer · fatigue · hypoglycaemia · insomnia · proteinuria · sweating
 - ▶ **Rare** Liver dysfunction

SIDE-EFFECTS, FURTHER INFORMATION

Liver toxicity Rare reports of liver dysfunction; discontinue if jaundice occurs.

- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Avoid.
- **MONITORING REQUIREMENTS** Monitor liver function before treatment and periodically thereafter.
- **PATIENT AND CARER ADVICE** Liver toxicity Patients should be advised to seek immediate medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue and dark urine develop.
- **NATIONAL FUNDING/ACCESS DECISIONS**
 - **Scottish Medicines Consortium (SMC) Decisions** The *Scottish Medicines Consortium* accepts use of pioglitazone (February 2007) with metformin and a sulfonylurea, for patients (especially if overweight) whose glycaemic control is inadequate despite the use of 2 oral hypoglycaemic drugs and who are unable or unwilling to take insulin; treatment should be initiated and monitored by an experienced diabetes physician.

MEDICINAL FORMS

The properties listed below are those particular to the combination only. For the properties of the components please consider, metformin hydrochloride p. 594, pioglitazone p. 613.

INDICATIONS AND DOSE

Type 2 diabetes not controlled by metformin alone

BY MOUTH

- ▶ **Adult:** 1 tablet twice daily, titration with the individual components (pioglitazone and metformin) desirable before initiation

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet**CAUTIONARY AND ADVISORY LABELS 21****▶ Competact (Takeda UK Ltd)**

Metformin hydrochloride 850 mg, Pioglitazone (as Pioglitazone hydrochloride) 15 mg Competact 15mg/850mg tablets | 56 tablet [PoM] £35.89 DT price = £35.89

3.2 Diabetes mellitus, diagnosis and monitoring**Diabetes mellitus, diagnostic and monitoring devices****Urinalysis**

Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely required unless they become unwell—see Blood Monitoring.

Microalbuminuria can be detected with *Micral-Test II*® but this should be followed by confirmation in the laboratory, since false positive results are common.

Blood monitoring

Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Patients should be properly trained in the use of blood glucose monitoring systems and to take appropriate action on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen.

Self-monitoring of blood-glucose concentration is appropriate for patients with type 2 diabetes:

- who are treated with insulin;
- who are treated with oral hypoglycaemic drugs e.g. sulfonylureas, to provide information on hypoglycaemia;
- to monitor changes in blood-glucose concentration resulting from changes in lifestyle or medication, and during intercurrent illness;
- to ensure safe blood-glucose concentration during activities, including driving.

In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the patient is unwell and diabetic ketoacidosis is suspected, blood **ketones** should be measured according to local guidelines. Patients and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

Oral glucose tolerance test

The oral glucose p. 852 tolerance test is used mainly for diagnosis of impaired glucose p. 852 tolerance; it is not recommended or necessary for routine diagnostic use when severe symptoms of hyperglycaemia are present. In patients who have less severe symptoms and blood glucose levels that do not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose p. 852 tolerance test may be required. It is also used to establish the presence of gestational diabetes. The oral glucose p. 852 tolerance test generally involves giving anhydrous glucose p. 852 by mouth to the fasting patient, and measuring blood-glucose concentrations at intervals.

The appropriate amount of glucose p. 852 should be given with 200–300 mL fluid. Anhydrous glucose p. 852 may alternatively be given as 113 mL *Polycal*® with extra fluid to administer a total volume of 200–300 mL, or as *Rapilose*® OGTT oral solution.

50 strip · NHS indicative price = £2.50 · Drug Tariff (Part IXr)

3.3 Hypoglycaemia

Hypoglycaemia

Treatment of hypoglycaemia

Initially glucose p. 852 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from non-diet versions of *Lucozade*[®] *Energy Original* 55 mL, *Coca-Cola*[®] 100 mL, *Ribena*[®] *Blackcurrant* 19 mL (to be diluted), 2 teaspoons of sugar, and also from 3 sugar lumps. Proprietary products of quick-acting carbohydrate (e.g. *Glucogel*[®], *DextroGel*[®], *GSF-Syrup*[®], *Rapilose*[®] gel) are available on prescription for the patient to keep to hand in case of hypoglycaemia. If necessary this may be repeated in 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal, if it is due, can prevent blood-glucose concentration from falling again.

Hypoglycaemia which causes unconsciousness is an emergency. Glucagon, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases plasma-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon may be issued to close relatives of insulin-treated patients for emergency use in hypoglycaemic attacks. It is often advisable to prescribe on an 'if necessary' basis to hospitalised insulin-treated patients, so that it may be given rapidly by the nurses

during an hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, glucose **intravenous infusion 20%** may be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Glucose intravenous infusion 10% may also be used but larger volumes are needed. Glucose intravenous infusion 50% is not recommended because of the higher risk of extravasation injury and because administration is difficult. Close monitoring is necessary in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Patients whose hypoglycaemia is caused by an oral antidiabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs may persist for many hours.

See also emergency management of hypoglycaemia in dental practice for further advice.

Chronic hypoglycaemia

Diazoxide p. 619, administered by mouth, is useful in the management of patients with chronic hypoglycaemia from excess endogenous insulin secretion, either from an islet cell tumour or islet cell hyperplasia. It has no place in the management of acute hypoglycaemia.

GLYCOGENOLYTIC HORMONES

Glucagon

INDICATIONS AND DOSE

Insulin-induced hypoglycaemia

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Child 1 month–1 year: 500 micrograms
- ▶ Child 2–17 years (body-weight up to 25 kg): 500 micrograms, if no response within 10 minutes intravenous glucose must be given
- ▶ Child 2–17 years (body-weight 25 kg and above): 1 mg, if no response within 10 minutes intravenous glucose must be given
- ▶ Adult: 1 mg, if no response within 10 minutes intravenous glucose must be given

Beta-blocker poisoning (cardiogenic shock unresponsive to atropine)

INITIALLY BY INTRAVENOUS INJECTION

- ▶ Child: 50–150 micrograms/kg (max. per dose 10 mg), to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour
- ▶ Adult: 2–10 mg, to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour

Dose equivalence and conversion

1 unit of glucagon = 1 mg of glucagon.

● UNLICENSED USE

Dose and indication for cardiogenic shock unresponsive to atropine in beta-blocker overdose not licensed.

- ▶ In children Unlicensed for growth hormone test and hyperinsulinism.

● CONTRA-INDICATIONS Phaeochromocytoma

- **CAUTIONS** Glucagonoma · ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency · insulinoma · when used in the diagnosis of growth hormone secretion, delayed hypoglycaemia may result—deaths reported (ensure a meal is eaten before discharge)

● SIDE-EFFECTS

- ▶ **Rare** Hypersensitivity reactions

- ▶ **Frequency not known** Abdominal pain (in adults) · diarrhoea (in children) · hypokalaemia · hypotension (in adults) · nausea · vomiting
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use in children When administered by *continuous intravenous infusion*, do not add to infusion fluids containing calcium—precipitation may occur.
- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Glucagon for hypoglycaemia www.medicinesforchildren.org.uk/glucagon-for-hypoglycaemia
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription-only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

 - ▶ **Glucagen Hypokit** (Novo Nordisk Ltd)
Glucagon hydrochloride 1 mg Glucagen Hypokit 1mg powder and solvent for solution for injection | 1 vial (POM) £11.52 DT price = £11.52

3.4 Hypoglycaemia, chronic

THIAZIDES AND RELATED DIURETICS

Diazoxide

INDICATIONS AND DOSE

Chronic intractable hypoglycaemia

BY MOUTH

- ▶ **Adult:** Initially 5 mg/kg daily in 2–3 divided doses, adjusted according to response; maintenance 3–8 mg/kg daily in 2–3 divided doses

- **CAUTIONS** Aortic coarctation · aortic stenosis · arteriovenous shunt · heart failure · hyperuricaemia · impaired cardiac circulation · impaired cerebral circulation
- **INTERACTIONS** → Appendix 1 (diazoxide).
- **SIDE-EFFECTS** abdominal pain · anaemia · anorexia (prolonged use) · bleeding · constipation · decreased libido · dermatitis · diarrhoea · dizziness · dyspnoea · eosinophilia · extrapyramidal effects · galactorrhoea · headache · heart failure · hyperglycaemia · hyperosmolar non-ketotic coma · hypertrichosis · hyperuricaemia (prolonged use) · hypotension · ileus · lacrimation · leucopenia · lichenoid eruption · musculoskeletal pain · nausea · pancreatitis · pruritus · pulmonary hypertension · raised serum creatinine · raised serum urea · reversible nephritic syndrome · sodium and fluid retention · taste disturbance · thrombocytopenia · tinnitus · transient cataracts · visual disturbances · vomiting
- **PREGNANCY** Use only if essential; alopecia and hypertrichosis reported in neonates with prolonged use; may inhibit uterine activity during labour.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Dose reduction may be required.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor blood pressure.
 - ▶ Monitor white cell and platelet count during prolonged use.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, capsule

Tablet

- ▶ **Eudemine** (Focus Pharmaceuticals Ltd)
Diazoxide 50 mg Eudemine 50mg tablets | 100 tablet (POM) £46.45

4 Disorders of bone metabolism

Bone metabolism

Osteoporosis

Osteoporosis occurs most commonly in postmenopausal women and in those taking long-term oral corticosteroids (glucocorticosteroids). Other risk factors for osteoporosis include low body weight, cigarette smoking, excess alcohol intake, lack of physical activity, family history of osteoporosis, and early menopause.

Those at risk of osteoporosis should maintain an adequate intake of **calcium and vitamin D** and any deficiency should be corrected by increasing dietary intake or taking supplements.

Elderly patients, especially those who are housebound or live in residential or nursing homes, are at increased risk of calcium and vitamin D deficiency and may benefit from supplements. Reversible secondary causes of osteoporosis such as hyperthyroidism, hyperparathyroidism, osteomalacia or hypogonadism should be excluded, in both men and women, before treatment for osteoporosis is initiated.

Postmenopausal osteoporosis

The **bisphosphonates** (alendronic acid and risedronate) are effective for preventing postmenopausal osteoporosis.

Hormone replacement therapy (HRT) is an option where other therapies are contra-indicated, cannot be tolerated, or if there is a lack of response. The CSM has advised that HRT should **not** be considered first-line therapy for long-term prevention of osteoporosis in women over 50 years of age. HRT is of most benefit for the prophylaxis of postmenopausal osteoporosis if started early in menopause and continued for up to 5 years, but bone loss resumes (possibly at an accelerated rate) on stopping HRT. Women of Afro-Caribbean origin appear to be less susceptible to osteoporosis than those who are white or of Asian origin.

Postmenopausal osteoporosis may be treated with a **bisphosphonate**. The bisphosphonates (such as alendronate and risedronate) decrease the risk of vertebral fracture; alendronate and risedronate have also been shown to reduce non-vertebral fractures. If bisphosphonates are unsuitable calcitriol p. 885 or **strontium ranelate** may be considered. Calcitonin (salmon)/salcatonin is no longer recommended for the treatment of postmenopausal osteoporosis as the benefits are outweighed by the risk of malignancy associated with long-term use. Calcitonin (salmon)/salcatonin [unlicensed indication] has been used for pain relief for up to 3 months after a vertebral fracture when other analgesics were ineffective, but the benefits of treatment should be balanced against the risks.

Parathyroid hormone, and **teriparatide** have been introduced for the treatment of postmenopausal osteoporosis.

Raloxifene hydrochloride p. 659 is licensed for the *prophylaxis* and *treatment* of vertebral fractures in postmenopausal women.

Corticosteroid-induced osteoporosis

To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible. The risk of osteoporosis may be related to cumulative dose of corticosteroids; even

intermittent courses can therefore increase the risk. The greatest rate of bone loss occurs during the first 6–12 months of corticosteroid use and so early steps to prevent the development of osteoporosis are important. Long-term use of high-dose inhaled corticosteroids may also contribute to corticosteroid-induced osteoporosis.

Patients taking (or who are likely to take) an oral corticosteroid for 3 months or longer should be assessed and where necessary given prophylactic treatment; those aged over 65 years are at greater risk. Patients taking oral corticosteroids who have sustained a low trauma fracture should receive treatment for osteoporosis. The therapeutic options for *prophylaxis* and *treatment* of corticosteroid-induced osteoporosis are the same:

- a bisphosphonate;
- calcitriol [unlicensed indication];
- hormone replacement (HRT) in women, testosterone in men [unlicensed indication].

Calcitonin and parathyroid hormone

Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homeostasis. Calcitonin (salmon)/salcatonin (synthetic or recombinant salmon calcitonin) is used to lower the plasma-calcium concentration in patients with hypercalcaemia associated with malignancy.

Calcitonin (salmon)/salcatonin is also licensed for treatment of Paget's disease of bone when other treatments are ineffective or inappropriate; it is also licensed for the prevention of acute bone loss due to sudden immobility. Calcitonin (salmon)/salcatonin is no longer recommended for the prevention or treatment of postmenopausal osteoporosis because the benefits are outweighed by the risk of malignancy associated with long-term use.

Recombinant **parathyroid hormone** is used for the treatment of postmenopausal osteoporosis. Teriparatide p. 629 (a recombinant fragment of parathyroid hormone) is used for the treatment of postmenopausal osteoporosis, osteoporosis in men at increased risk of fracture, and corticosteroid-induced osteoporosis.

Cinacalcet p. 855 is licensed for the treatment of hypercalcaemia in parathyroid carcinoma.

Bisphosphonates

Bisphosphonates have an important role in the prophylaxis and treatment of osteoporosis and corticosteroid-induced osteoporosis; alendronic acid p. 621 or risedronate sodium p. 624 are considered the drugs of choice for these conditions.

Bisphosphonates are also used in the treatment of *Paget's disease*, hypercalcaemia of malignancy, and in bone metastases in breast cancer.

Strontium ranelate

Strontium ranelate treatment has been associated with an increased risk of serious cardiovascular disease, including myocardial infarction, and the risk should be assessed before treatment and regularly during treatment. Strontium ranelate should be initiated only by specialists for the treatment of severe osteoporosis in postmenopausal women or men at high risk of fracture for whom other treatments are contra-indicated or not tolerated.

See also calcium, phosphorus, vitamin D and oestrogens in postmenopausal osteoporosis.

Drugs used for Disorders of bone metabolism not listed below; *Calcitriol*, p. 885

ANABOLIC STEROIDS

Nandrolone

INDICATIONS AND DOSE

Osteoporosis in postmenopausal women (but not recommended)

BY DEEP INTRAMUSCULAR INJECTION

► Adult: 50 mg every 3 weeks.

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 · male breast cancer · prostate cancer
- **CAUTIONS** Cardiac impairment · diabetes mellitus · epilepsy · hypertension · migraine · skeletal metastases (risk of hypercalcaemia)
- **INTERACTIONS** → Appendix 1 (anabolic steroids).
- **SIDE-EFFECTS** Abnormal liver-function tests (with high doses) · acne · amenorrhoea · inhibition of spermatogenesis · liver tumours (with prolonged treatment with anabolic steroids) · premature epiphyseal closure · sodium retention with oedema · virilisation (with high doses including voice changes—sometimes irreversible)
- **HEPATIC IMPAIRMENT** Use in severe hepatic impairment only if benefit outweighs risk.
- **RENAL IMPAIRMENT** Use with caution—may cause sodium and water retention.
- **MONITORING REQUIREMENTS** Monitor skeletal maturation in young patients.
- **LESS SUITABLE FOR PRESCRIBING** Nandrolone injection is less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Arachis (peanut) oil, benzyl alcohol

► **Deca-Durabolin** (Aspen Pharma Trading Ltd)

Nandrolone decanoate 50 mg per 1 ml Deca-Durabolin 50mg/1ml (solution for injection ampoules | 1 ampoule [P6M] £3.17 Schedule 4 (CD Anab)

BISPHOSPHONATES

Bisphosphonates

- **DRUG ACTION** Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover.

Important safety information

MHRA/CHM ADVICE: BISPHOSPHONATES: ATYPICAL FEMORAL FRACTURES (JUNE 2011)

Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis.

The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.

Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

BISPHOSPHONATES: OSTEONECROSIS OF THE JAW

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous

bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget's disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease.

All patients should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment.

During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms.

Guidance for dentists in primary care is included in *Oral Health Management of Patients Prescribed Bisphosphonates: Dental Clinical Guidance*, Scottish Dental Clinical Effectiveness Programme, April 2011 (available at www.sdcep.org.uk).

● PATIENT AND CARER ADVICE

Atypical femoral fractures Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Osteonecrosis of the jaw During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms.

Alendronic acid (Alendronate)

INDICATIONS AND DOSE

Treatment of postmenopausal osteoporosis

BY MOUTH

▶ Adult: 10 mg daily, alternatively 70 mg once weekly.

Treatment of osteoporosis in men

BY MOUTH

▶ Adult: 10 mg daily.

Prevention and treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving hormone replacement therapy

BY MOUTH

▶ Adult: 10 mg daily.

- **CONTRA-INDICATIONS** Abnormalities of oesophagus · hypocalcaemia · other factors which delay emptying (e.g. stricture or achalasia)
- **CAUTIONS** Active gastro-intestinal bleeding · atypical femoral fractures · duodenitis · dysphagia · exclude other causes of osteoporosis · gastritis · history (within 1 year) of ulcers · surgery of the upper gastro-intestinal tract · symptomatic oesophageal disease · ulcers · upper gastro-intestinal disorders
- **INTERACTIONS** → Appendix 1 (bisphosphonates).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal distension · abdominal pain · alopecia · asthenia · constipation · diarrhoea · dizziness · dyspepsia · flatulence · headache · joint swelling · musculoskeletal pain · oesophageal reactions · peripheral oedema · pruritus · regurgitation · vertigo
 - ▶ **Uncommon** Dysgeusia · episcleritis · erythema · gastritis · malaise (on initiation) · melena · myalgia (on initiation) · nausea · rash · scleritis · uveitis · vomiting
 - ▶ **Rare** Atypical femoral fractures with long-term use · fever (on initiation) · hypocalcaemia · osteonecrosis of the jaw · photosensitivity · severe skin reactions · Stevens-Johnson syndrome · toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION

Oesophageal reactions Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

- **PREGNANCY** Avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 35 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting treatment. Monitor serum-calcium concentration during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole and oral solution should be swallowed as a single 100 mL dose. Doses should be taken with plenty of water while sitting or standing, on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after administration.
- **PATIENT AND CARER ADVICE** Patients or their carers should be given advice on how to administer alendronic acid tablets and oral solution. Oesophageal reactions Patients (or their carers) should be advised to stop taking alendronic acid and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA160
Alendronate is recommended as a treatment option for the primary prevention of osteoporotic fractures in the following susceptible postmenopausal women:
 - Women over 70 years who have an independent risk factor for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis) or an indicator of low bone mineral density (body mass index under 22 kg/m², ankylosing spondylitis, Crohn's disease, prolonged immobility, untreated premature menopause, or rheumatoid arthritis) and confirmed osteoporosis.
 - Women aged 65–69 years who have an independent risk factor for fracture and confirmed osteoporosis.
 - Women under 65 years who have an independent risk factor for fracture and at least one additional indicator of low bone mineral density and confirmed osteoporosis. www.nice.org.uk/TA160
- ▶ Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161
This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.
Alendronate is recommended as a treatment option for the secondary prevention of osteoporotic fractures in susceptible postmenopausal women. www.nice.org.uk/TA161

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet▶ **ALENDRONIC ACID (Non-proprietary)**

Alendronic acid (as Alendronate sodium) 10 mg Alendronic acid 10mg tablets | 28 tablet [PoM] £3.75 DT price = £1.64

Alendronic acid (as Alendronate sodium) 70 mg Alendronic acid 70mg tablets | 4 tablet [PoM] £22.80 DT price = £1.03

▶ **Fosamax (Merck Sharp & Dohme Ltd)**

Alendronic acid (as Alendronate sodium) 10 mg Fosamax 10mg tablets | 28 tablet [PoM] £23.12 DT price = £1.64

Alendronic acid (as Alendronate sodium) 70 mg Fosamax Once Weekly 70mg tablets | 4 tablet [PoM] £22.80 DT price = £1.03

Oral solution▶ **ALENDRONIC ACID (Non-proprietary)**

Alendronic acid 700 microgram per 1 ml Alendronic acid 70mg/100ml oral solution unit dose sugar free (sugar-free) | 4 unit dose [PoM] £22.80 DT price = £22.80

Alendronic acid with colecalciferol

The properties listed below are those particular to the combination only. For the properties of the components please consider, alendronic acid p. 621, colecalciferol p. 886.

INDICATIONS AND DOSE

Treatment of postmenopausal osteoporosis in women at risk of vitamin D deficiency

BY MOUTH

▶ Adult: 1 tablet once weekly.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer alendronic acid with colecalciferol tablets.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet▶ **Fosavance (Merck Sharp & Dohme Ltd)**

Alendronic acid (as Alendronate sodium) 70 mg, Colecalciferol 70 microgram Fosavance tablets | 4 tablet [PoM] £22.80 DT price = £22.80

Ibandronic acid**INDICATIONS AND DOSE**

Reduction in bone damage in bone metastases in breast cancer

INITIALLY BY MOUTH

▶ Adult: 50 mg daily, alternatively (by intravenous infusion) 6 mg every 3–4 weeks

Hypercalcaemia of malignancy**BY INTRAVENOUS INFUSION**

▶ Adult: 2–4 mg as a single infusion, dose to be adjusted according to serum calcium concentration

Treatment of postmenopausal osteoporosis**INITIALLY BY MOUTH**

▶ Adult: 150 mg once a month, alternatively (by intravenous injection) 3 mg every 3 months, to be administered over 15–30 seconds.

CONTRA-INDICATIONS**GENERAL CONTRA-INDICATIONS:**

Hypocalcaemia

SPECIFIC CONTRA-INDICATIONS:

- ▶ With oral use Abnormalities of the oesophagus · other factors which delay emptying (e.g. stricture or achalasia)
- **CAUTIONS** Atypical femoral fractures · cardiac disease (avoid fluid overload)
- **INTERACTIONS** → Appendix 1 (bisphosphonates).
- **SIDE-EFFECTS**
- **GENERAL SIDE-EFFECTS**
- ▶ **Common or very common**
Abdominal pain · asthenia · bone pain · chills · diarrhoea · dyspepsia · fever · gastritis · headache · hypocalcaemia · hypophosphataemia · influenza-like symptoms · muscle pain · nausea · pharyngitis · rash · vomiting
- ▶ **Rare** Anaemia · angioedema · atypical femoral fractures · bronchospasm · hypersensitivity reactions · injection-site reactions · pruritus · urticaria
- ▶ **Very rare** Osteonecrosis of the jaw

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ **With oral use** Severe oesophageal reactions (discontinue)
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

RENAL IMPAIRMENT

- ▶ **With intravenous use** When used for bone metastases, if eGFR 30–50 mL/minute/1.73 m² reduce dose to 4 mg and infuse over 1 hour; if eGFR less than 30 mL/minute/1.73 m² reduce dose to 2 mg and infuse over 1 hour.
- ▶ **With oral use** When used for bone metastases, if eGFR 30–50 mL/minute/1.73 m² reduce dose to 50 mg on alternative days; if eGFR less than 30 mL/minute/1.73 m² reduce dose to 50 mg once weekly. When used for postmenopausal osteoporosis, avoid if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS Monitor renal function and serum calcium, phosphate and magnesium.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes (for most ibandronic acid tablets, 50 mg) or 1 hour (for *Bonviva*® tablets, 150 mg) before first food or drink (other than water) of the day, or another oral medicine; patient should stand or sit upright for at least 1 hour after taking tablet.

For *intravenous infusion (Bondronat*®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute requisite dose in 500 mL infusion fluid and give over 1–2 hours.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer ibandronic acid tablets. Oesophageal reactions Patients and carers should be advised to stop tablets and seek medical attention for symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet▶ **IBANDRONIC ACID (Non-proprietary)**

Ibandronic acid (as Ibandronic sodium monohydrate)

50 mg Ibandronic acid 50mg tablets | 28 tablet [PoM] £174.51 DT price = £10.76

Ibandronic acid (as Ibandronic sodium monohydrate)

150 mg Ibandronic acid 150mg tablets | 1 tablet [PoM] £18.40 DT price = £1.68 | 3 tablet [PoM] £55.21

- ▶ **Bondronat** (Roche Products Ltd)
Ibandronic acid (as Ibandronic sodium monohydrate)
50 mg Bondronat 50mg tablets | 28 tablet [PoM] £183.69 DT price = £10.76
- ▶ **Bonviva** (Roche Products Ltd)
Ibandronic acid (as Ibandronic sodium monohydrate)
150 mg Bonviva 150mg tablets | 1 tablet [PoM] £18.40 DT price = £1.68
- ▶ Brands may include lasibon; Quodixor
- Solution for injection**
- ▶ **IBANDRONIC ACID (Non-proprietary)**
Ibandronic acid (as Ibandronic sodium monohydrate) 1 mg per 1 ml Ibandronic acid 3mg/3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £65.20-£68.00
- ▶ **Bonviva** (Roche Products Ltd)
Ibandronic acid (as Ibandronic sodium monohydrate) 1 mg per 1 ml Bonviva 3mg/3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £68.64

Solution for infusion

- ▶ **IBANDRONIC ACID (Non-proprietary)**
Ibandronic acid (as Ibandronic sodium monohydrate) 1 mg per 1 ml Ibandronic acid 2mg/2ml solution for infusion vials | 1 vial [PoM] £89.36 (Hospital only)
Ibandronic acid 6mg/6ml solution for infusion vials | 1 vial [PoM] £183.68 (Hospital only) | 1 vial [PoM] £174.51
- ▶ **Bondronat** (Roche Products Ltd)
Ibandronic acid (as Ibandronic sodium monohydrate) 1 mg per 1 ml Bondronat 2mg/2ml concentrate for solution for infusion vials | 1 vial [PoM] £89.36 (Hospital only)
Bondronat 6mg/6ml concentrate for solution for infusion vials | 1 vial [PoM] £183.69

Pamidronate disodium

(Formerly called aminohydroxypropylidenediphosphonate disodium (APD))

INDICATIONS AND DOSE**Hypercalcaemia of malignancy****BY INTRAVENOUS INFUSION**

- ▶ Adult: 15–60 mg, to be given (via cannula in a relatively large vein) as a single infusion or in divided doses over 2–4 days, dose adjusted according to serum calcium concentration; maximum 90 mg per course

Osteolytic lesions and bone pain in bone metastases associated with breast cancer or multiple myeloma**BY INTRAVENOUS INFUSION**

- ▶ Adult: 90 mg every 4 weeks, to be administered via cannula in a relatively large vein, dose may alternatively be administered every 3 weeks, to coincide with chemotherapy in breast cancer

Paget's disease of bone**BY INTRAVENOUS INFUSION**

- ▶ Adult: 30 mg every 1 week for a 6 week course (total dose 180 mg), alternatively initially 30 mg once weekly for 1 week, then increased to 60 mg every 2 weeks (max. per dose 60 mg) for a 6 week course (total dose 210 mg), to be administered via cannula in a relatively large vein, course may be repeated every 6 months; maximum 360 mg per course

- **CAUTIONS** Atypical femoral fractures · cardiac disease (especially in elderly) · ensure adequate hydration · previous thyroid surgery (risk of hypocalcaemia)
- **INTERACTIONS** → Appendix 1 (bisphosphonates). Avoid concurrent use with other bisphosphonates.
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · anaemia · anorexia · arthralgia · bone pain · constipation · diarrhoea · drowsiness · fever · headache · hypertension · hypomagnesaemia · hypophosphataemia · influenza-like symptoms (sometimes accompanied by malaise, rigors, fatigue and flushes) · insomnia · lymphocytopenia ·

- myalgia · nausea · paraesthesia · rash · symptomatic hypocalcaemia · tetany · thrombocytopenia · vomiting
- ▶ **Rare** Acute renal failure · agitation · atypical femoral fractures · confusion · conjunctivitis · deterioration of renal disease · dizziness · dyspepsia · haematuria · hallucinations · hyperkalaemia · hypernatraemia · hypokalaemia · hypotension · isolated cases of seizures · lethargy · leucopenia · muscle cramps · osteonecrosis of the jaw · other ocular symptoms · pruritus
- ▶ **Frequency not known** Atrial fibrillation · injection-site reactions · reactivation of herpes simplex · reactivation of herpes zoster

SIDE-EFFECTS, FURTHER INFORMATION

Calcium and vitamin D supplements Oral supplements are advised to minimise potential risk of hypocalcaemia for those with mainly lytic bone metastases or multiple myeloma at risk of calcium or vitamin D deficiency (e.g. through malabsorption or lack of exposure to sunlight) and in those with Paget's disease.

- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Caution in severe hepatic impairment—no information available.
- **RENAL IMPAIRMENT** Max. infusion rate 20 mg/hour. Avoid if eGFR less than 30 mL/minute/1.73 m², except in life-threatening hypercalcaemia if benefit outweighs risk. If renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value.
- **MONITORING REQUIREMENTS**
- ▶ Monitor serum electrolytes, calcium and phosphate—possibility of convulsions due to electrolyte changes.
- ▶ Assess renal function before each dose.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use For slow intravenous infusion (*Aredia*[®]; *Pamidronate disodium*, Hospira, Medac, Wockhardt), give intermittently in Glucose 5% or Sodium chloride 0.9%; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium. For *Aredia*[®], reconstitute initially with water for injections (15 mg in 5 mL, 30 mg or 90 mg in 10 mL), then dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL. For *Pamidronate disodium* (Wockhardt), dilute with infusion fluid to a concentration of not more than 60 mg in 250 mL or for *Pamidronate disodium* (Medac, Hospira) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL
- **PATIENT AND CARER ADVICE** Patients should be warned against performing skilled tasks (e.g. cycling, driving or operating machinery) immediately after treatment (somnolence or dizziness can occur).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion▶ **PAMIDRONATE DISODIUM (Non-proprietary)**

- Pamidronate disodium 3 mg per 1 ml** Pamidronate disodium 15mg/5ml solution for infusion vials | 1 vial [PoM] £27.50 (Hospital only) | 5 vial [PoM] £149.15 Pamidronate disodium 30mg/10ml solution for infusion vials | 1 vial [PoM] £55.00 (Hospital only) | 1 vial [PoM] £59.66 Pamidronate disodium 60mg/20ml solution for infusion vials | 1 vial [PoM] £110.00 (Hospital only) Pamidronate disodium 90mg/30ml solution for infusion vials | 1 vial [PoM] £165.00 (Hospital only)
- Pamidronate disodium 6 mg per 1 ml** Pamidronate disodium 60mg/10ml solution for infusion vials | 1 vial [PoM] £115.25
- Pamidronate disodium 9 mg per 1 ml** Pamidronate disodium 90mg/10ml solution for infusion vials | 1 vial [PoM] £170.45
- Pamidronate disodium 15 mg per 1 ml** Pamidronate disodium 60mg/4ml solution for infusion ampoules | 1 ampoule [PoM] £119.32 Pamidronate disodium 15mg/1ml solution for infusion ampoules | 4 ampoule [PoM] £119.32 Pamidronate disodium 90mg/6ml solution

for infusion ampoules | 1 ampoule (PoM) £170.46 Pamidronate disodium 30mg/2ml solution for infusion ampoules | 2 ampoules (PoM) £119.32

Powder and solvent for solution for infusion

- ▶ **Aredia** (Novartis Pharmaceuticals UK Ltd)
 - ▶ **Pamidronate disodium 15 mg** Aredia Dry Powder 15mg powder and solvent for solution for infusion vials | 4 vial (PoM) £119.31
 - ▶ **Pamidronate disodium 30 mg** Aredia Dry Powder 30mg powder and solvent for solution for infusion vials | 2 vial (PoM) £119.31
 - ▶ **Pamidronate disodium 90 mg** Aredia Dry Powder 90mg powder and solvent for solution for infusion vials | 1 vial (PoM) £170.45

Risedronate sodium

INDICATIONS AND DOSE

Paget's disease of bone

BY MOUTH

- ▶ Adult: 30 mg daily for 2 months, course may be repeated if necessary after at least 2 months

Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures

BY MOUTH

- ▶ Adult: 5 mg daily, alternatively 35 mg once weekly.

Prevention of osteoporosis (including corticosteroid-induced osteoporosis) in postmenopausal women

BY MOUTH

- ▶ Adult: 5 mg daily.

Treatment of osteoporosis in men at high risk of fractures

BY MOUTH

- ▶ Adult: 35 mg once weekly.

- **CONTRA-INDICATIONS** Hypocalcaemia
- **CAUTIONS** Atypical femoral fractures · oesophageal abnormalities · other factors which delay transit or emptying (e.g. stricture or achalasia)
- **INTERACTIONS** → Appendix 1 (bisphosphonates).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · constipation · diarrhoea · dyspepsia · headache · musculoskeletal pain · nausea
 - ▶ **Uncommon** Duodenitis · dysphagia · gastritis · oesophageal ulcer · oesophagitis · uveitis
 - ▶ **Rare** Atypical femoral fractures · glossitis · oesophageal stricture
 - ▶ **Frequency not known** Cutaneous vasculitis · gastroduodenal ulceration · hair loss · hepatic disorders · osteonecrosis of the jaw · Stevens-Johnson syndrome · toxic epidermal necrolysis
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - ▶ Correct hypocalcaemia before starting.
 - ▶ Correct other disturbances of bone and mineral metabolism (e.g. vitamin-D deficiency) at onset of treatment.
- **DIRECTIONS FOR ADMINISTRATION** Swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day **or**, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer risedronate sodium tablets.

Oesophageal reactions Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- ▶ **Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008)** NICE TA160

Risedronate is recommended as an alternative for women:

- in whom alendronate is contra-indicated or not tolerated **and**
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance. www.nice.org.uk/TA160

- ▶ **Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008)** NICE TA161

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

Risedronate is also recommended as an alternative for women:

- in whom alendronate is contra-indicated or not tolerated **and**
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis, as indicated in the full NICE guidance. www.nice.org.uk/TA161

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

- ▶ **RISEDRONATE SODIUM (Non-proprietary)**

Risedronate sodium 5 mg Risedronate sodium 5mg tablets | 28 tablet (PoM) £16.52 DT price = £14.95

Risedronate sodium 30 mg Risedronate sodium 30mg tablets | 28 tablet (PoM) £132.17 DT price = £112.48

Risedronate sodium 35 mg Risedronate sodium 35mg tablets | 4 tablet (PoM) £19.12 DT price = £1.27

- ▶ **Actonel** (Warner Chilcott UK Ltd)

Risedronate sodium 5 mg Actonel 5mg tablets | 28 tablet (PoM) £17.99 DT price = £14.95

Risedronate sodium 35 mg Actonel Once a Week 35mg tablets | 4 tablet (PoM) £19.12 DT price = £1.27 Actonel 35mg tablets | 4 tablet (PoM) no price available DT price = £1.27

Risedronate with calcium carbonate and colecalciferol

The properties listed below are those particular to the combination only. For the properties of the components please consider, calcium carbonate p. 856, colecalciferol p. 886, risedronate sodium above.

INDICATIONS AND DOSE

Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures

BY MOUTH

- ▶ Adult: 1 tablet once weekly on day 1 of the weekly cycle, followed by 1 sachet daily on days 2–6 of the weekly cycle

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet. Granules should be stirred into a glass of water and after dissolution complete taken immediately.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer calcium carbonate with colecalciferol and risedronate tablets and granules.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Granules

- ▶ **Actonel Combi** (Warner Chilcott UK Ltd)
Actonel Combi 35mg tablets and 1000mg/880unit effervescent granules sachets | 4 week supply [PoM] £19.12

Sodium clodronate

INDICATIONS AND DOSE

Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma

BY MOUTH

- ▶ Adult: 1.6 g daily in 1–2 divided doses, then increased if necessary up to 3.2 g daily in 2 divided doses

LORON 520[®]

Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma

BY MOUTH

- ▶ Adult: Initially 2 tablets daily in 1–2 divided doses, increased if necessary up to 4 tablets daily

- **CONTRA-INDICATIONS** Acute gastro-intestinal inflammatory conditions
- **CAUTIONS** Atypical femoral fractures · maintain adequate fluid intake during treatment
- **INTERACTIONS** → Appendix 1 (bisphosphonates). Renal dysfunction reported in patients receiving concomitant NSAIDs.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Bronchospasm · diarrhoea · nausea · skin reactions · vomiting
 - ▶ **Rare** Atypical femoral fractures
 - ▶ **Very rare** Osteonecrosis of the jaw
 - ▶ **Frequency not known** Renal impairment · uveitis
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Max. initial dose 1200 mg daily if eGFR 30–50 mL/minute/1.73m². Use half normal dose if eGFR 10–30 mL/minute/1.73 m². Avoid if eGFR less than 10 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor renal function, serum calcium and serum phosphate before and during treatment.

- **DIRECTIONS FOR ADMINISTRATION** Avoid food for 2 hours before and 1 hour after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer sodium clodronate capsules and tablets.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Zoledronic acid

INDICATIONS AND DOSE**ZOMETA[®] INFUSION**

Reduction of bone damage in advanced malignancies involving bone

BY INTRAVENOUS INFUSION

- ▶ Adult: 4 mg every 3–4 weeks, to be administered over at least 15 minutes, calcium 500 mg daily and vitamin D 400 units daily should also be taken

Hypercalcaemia of malignancy

BY INTRAVENOUS INFUSION

- ▶ Adult: 4 mg for 1 dose, to be administered over at least 15 minutes

ACLASTA[®]

Treatment of Paget's disease of bone

BY INTRAVENOUS INFUSION

- ▶ Adult: 5 mg 1 times yearly, to be administered over at least 15 minutes, at least 500 mg elemental calcium twice daily (with vitamin D) for at least 10 days is recommended following infusion

Treatment of postmenopausal osteoporosis and osteoporosis in men (including corticosteroid-induced osteoporosis)

BY INTRAVENOUS INFUSION

- ▶ Adult: 5 mg 1 times yearly, to be administered over at least 15 minutes, in patients with a recent low-trauma hip fracture, the dose should be given 2 or more weeks following hip fracture repair; before first infusion give 50000–125000 units of vitamin D

- **CAUTIONS** Atypical femoral fractures · cardiac disease (avoid fluid overload) · concomitant medicines that affect renal function
- **INTERACTIONS** → Appendix 1 (bisphosphonates).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · arthralgia · atrial fibrillation · bone pain · conjunctivitis · dizziness · fever · gastro-intestinal disturbances · headache ·

hypophosphataemia · influenza- like symptoms · myalgia · renal impairment · rigors

- ▶ **Uncommon** Angioedema · anorexia · anxiety · asthenia · blurred vision · chest pain · cough · dry mouth · dyspnoea · haematuria · hypersensitivity reactions · hypertension · hypokalaemia · hypomagnesaemia · hypotension · injection-site reactions · lethargy · leucopenia · muscle cramps · paraesthesia · peripheral oedema · proteinuria · pruritus · rash · sleep disturbance · stomatitis · sweating · taste disturbance · thrombocytopenia · tremor · urinary frequency · weight gain
- ▶ **Rare** Acute renal failure · atypical femoral fractures · bradycardia · confusion · hyperkalaemia · hypernatraemia · osteonecrosis of the jaw · pancytopenia
- ▶ **Very rare** Episcleritis · uveitis

SIDE-EFFECTS, FURTHER INFORMATION

Renal function Renal impairment and renal failure have been reported; ensure patient is hydrated before each dose and assess renal function.

- **CONCEPTION AND CONTRACEPTION** Contra-indicated in women of child-bearing potential.

● **PREGNANCY** Avoid—toxicity in *animal* studies.

● **BREAST FEEDING** Avoid—no information available.

● **HEPATIC IMPAIRMENT** Caution in severe hepatic impairment—limited information available.

● **RENAL IMPAIRMENT** In advanced malignancies involving bone, if eGFR 50–60 mL/minute/1.73 m² reduce dose to 3.5 mg every 3–4 weeks; if eGFR 40–50 mL/minute/1.73 m² reduce dose to 3.3 mg every 3–4 weeks; if eGFR 30–40 mL/minute/1.73 m² reduce dose to 3 mg every 3–4 weeks; if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value.

Avoid in tumour-induced hypercalcaemia if serum creatinine above 400 micromol/litre. Avoid in advanced malignancies involving bone if eGFR less than 30 mL/minute/1.73 m² (or if serum creatinine greater than 265 micromol/litre).

Avoid in Paget's disease, treatment of postmenopausal osteoporosis and osteoporosis in men if eGFR less than 35 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- ▶ Correct disturbances of calcium metabolism (e.g. vitamin D deficiency, hypocalcaemia) before starting. Monitor serum electrolytes, calcium, phosphate and magnesium.
- ▶ Monitor renal function in patients at risk, such as those with pre-existing renal impairment, those of advanced age, those taking concomitant nephrotoxic drugs or diuretics, or those who are dehydrated.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Zometa*®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute requisite dose according to product literature; infuse over at least 15 minutes; administer as a single intravenous solution in a separate infusion line.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2003) that for the prevention of skeletal related events *Zometa*® is accepted for restricted use within NHS Scotland for the treatment of patients with breast cancer and multiple myeloma if prescribed by an oncologist.

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2008) that in postmenopausal women *Aclasta*® is accepted for restricted use within the NHS Scotland for the treatment of osteoporosis in those for whom oral treatment options for osteoporosis are inappropriate and when initiated by a specialist.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Infusion

▶ ZOLEDRONIC ACID (Non-proprietary)

Zoledronic acid (as Zoledronic acid monohydrate) 40 microgram per 1 ml Zoledronic acid 4mg/100ml infusion bags | 1 bag [PoM] £174.14 (Hospital only) | 1 bag [PoM] £150.00

BONE FORMATION STIMULANTS

Strontium ranelate

- **DRUG ACTION** Stimulates bone formation and reduces bone resorption.

INDICATIONS AND DOSE

Treatment of severe osteoporosis in postmenopausal women or men at high risk of fracture for whom other treatments are contra-indicated or not tolerated (initiated under specialist supervision)

BY MOUTH

- ▶ **Adult:** 2 g once daily, dose to be taken in water, preferably at bedtime

- **CONTRA-INDICATIONS** Cerebrovascular disease · current or previous venous thromboembolic event · ischaemic heart disease · peripheral arterial disease · temporary or prolonged immobilisation · uncontrolled hypertension

- **CAUTIONS** Predisposition to cardiovascular disease—assess risk before and every 6–12 months during treatment

- **INTERACTIONS** → Appendix 1 (strontium ranelate).

● SIDE-EFFECTS

- ▶ **Common or very common** Dermatitis · diarrhoea · eczema · headache · myocardial infarction · nausea · venous thromboembolism
- ▶ **Very rare** Angioedema · hypersensitivity reactions · pruritus · rash · urticaria
- ▶ **Frequency not known** Abdominal pain · alopecia · bone marrow suppression · constipation · dyspepsia · flatulence · gastro-oesophageal reflux · peripheral oedema · stomatitis · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Severe allergic reactions Severe allergic reactions, including drug rash with eosinophilia and systemic symptoms (DRESS), have been reported in patients taking strontium ranelate. DRESS starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal. Treatment with strontium ranelate should not be restarted.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
- **EFFECT ON LABORATORY TESTS** Interferes with colorimetric measurements of calcium in blood and urine.
- **DIRECTIONS FOR ADMINISTRATION** Avoid food for 2 hours before and after taking granules, particularly calcium-containing products e.g. milk; also preferably avoid concomitant antacids containing aluminium and magnesium hydroxides for 2 hours after taking granules.
- **PATIENT AND CARER ADVICE**
Severe allergic reactions Patients should be advised to stop taking strontium ranelate and consult their doctor immediately if skin rash develops.
Patients or carers should be given advice on how to administer strontium ranelate granules.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE technology appraisals (TAs)**

- ▶ **Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008)** NICE TA160

Strontium ranelate is recommended as an alternative for women:

- in whom alendronate and risedronate are contra-indicated or not tolerated **and**
 - who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance. www.nice.org.uk/TA160
 - ▶ **Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008)** NICE TA161
- This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

Strontium ranelate is recommended as an alternative for women:

- in whom alendronate and risedronate are contra-indicated or not tolerated **and**
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance. www.nice.org.uk/TA161

CALCITONINS**Calcitonin salmon (Salcatonin)****INDICATIONS AND DOSE****Hypercalcaemia of malignancy**

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: 100 units every 6–8 hours (max. per dose 400 units every 6–8 hours), adjusted according to response

BY INTRAVENOUS INFUSION

- ▶ Adult: Up to 10 units/kg, in severe or emergency cases, to be administered by slow intravenous infusion over at least 6 hours

Paget's disease of bone

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: 100 units daily, adjusted according to response for maximum 3 months (6 months in exceptional circumstances), a minimum dosage regimen of 50 units three times a week has been shown to achieve clinical and biochemical improvement

Prevention of acute bone loss due to sudden immobility

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 100 units daily in 1–2 divided doses, then reduced to 50 units daily at the start of mobilisation, usual duration of treatment is 2 weeks; maximum 4 weeks

- **CONTRA-INDICATIONS** Hypocalcaemia
- **CAUTIONS** Heart failure · history of allergy (skin test advised) · risk of malignancy—avoid prolonged use (use lowest effective dose for shortest possible time)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · diarrhoea · dizziness · fatigue · flushing · headache · malignancy (with long-term use) · musculoskeletal pain · nausea · taste disturbances · vomiting
 - ▶ **Uncommon** Cough · hypersensitivity reactions · hypertension · injection-site reactions · oedema · polyuria · pruritus · rash · visual disturbances
 - ▶ **Frequency not known** Tremor
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in *animal* studies).
- **BREAST FEEDING** Avoid; inhibits lactation in *animals*.
- **RENAL IMPAIRMENT** Use with caution.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Miacalcic*®), give intermittently in Sodium chloride 0.9%. Diluted solution given without delay. Dilute in 500 mL give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

MONOCLONAL ANTIBODIES

Denosumab

- **DRUG ACTION** Denosumab is a human monoclonal antibody that inhibits osteoclast formation, function, and survival, thereby decreasing bone resorption.

INDICATIONS AND DOSE

XGEVA®

Prevention of skeletal related events in patients with bone metastases from solid tumours

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 120 mg every 4 weeks, supplementation of at least Calcium 500 mg and vitamin D 400 units daily should also be taken unless hypercalcaemia is present

Treatment of giant cell tumour of bone that is unresectable or where surgical resection is likely to result in severe morbidity in adults and skeletally mature adolescent

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 120 mg every 4 weeks, give additional dose on days 8 and 15 of the first month of treatment only, supplementation of at least Calcium 500 mg and vitamin D 400 units daily should also be taken unless hypercalcaemia is present

PROLIA®

Treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures | Treatment of bone loss associated with hormone ablation in men with prostate cancer at increased risk of fractures

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 60 mg every 6 months, supplement with calcium and vitamin D

Important safety information

MHRA/CHM ADVICE: DENOSUMAB: ATYPICAL FEMORAL FRACTURES (FEBRUARY 2013)

Atypical femoral fractures have been reported rarely in patients receiving denosumab for the long-term treatment (2.5 or more years) of postmenopausal osteoporosis.

Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.

Discontinuation of denosumab in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

MHRA/CHM ADVICE: DENOSUMAB: MINIMISING THE RISK OF OSTEONECROSIS OF THE JAW; MONITORING FOR HYPOCALCAEMIA—UPDATED RECOMMENDATIONS (SEPTEMBER 2014)

Denosumab is associated with a risk of osteonecrosis of the jaw (ONJ) and with a risk of hypocalcaemia.

Osteonecrosis of the jaw

Osteonecrosis of the jaw is a well-known and common side-effect in patients receiving denosumab 120 mg for cancer. Risk factors include smoking, old age, poor oral hygiene, invasive dental procedures (including tooth extractions, dental implants, oral surgery), comorbidity (including dental disease, anaemia, coagulopathy, infection), advanced cancer, previous treatment with bisphosphonates, and concomitant treatments (including chemotherapy, anti-angiogenic biologics, corticosteroids, and radiotherapy to head and neck). The following precautions are now recommended to reduce the risk of ONJ:

Denosumab 120 mg (cancer indication)

- A dental examination and appropriate preventative dentistry before starting treatment are now recommended for all patients

- Do not start denosumab in patients with a dental or jaw condition requiring surgery, or in patients who have not recovered following oral surgery
- Denosumab 60 mg (osteoporosis indication)
- Check for ONJ risk factors before starting treatment. A dental examination and appropriate preventative dentistry are now recommended for patients with risk factors

All patients should be informed to maintain good oral hygiene, receive routine dental check-ups, and immediately report any oral symptoms such as dental mobility, pain, or swelling to a doctor and dentist.

Hypocalcaemia

Denosumab is associated with a risk of hypocalcaemia. This risk increases with the degree of renal impairment. Hypocalcaemia usually occurs in the first weeks of denosumab treatment, but it can also occur later in treatment.

Plasma-calcium concentration monitoring is recommended for denosumab 120 mg (cancer indication):

- before the first dose
- within two weeks after the initial dose
- if suspected symptoms of hypocalcaemia occur
- consider monitoring more frequently in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)

Plasma-calcium concentration monitoring is recommended for denosumab 60 mg (osteoporosis indication):

- before each dose
 - within two weeks after the initial dose in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)
 - if suspected symptoms of hypocalcaemia occur
- All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

- **CONTRA-INDICATIONS** Hypocalcaemia
- **CAUTIONS** Atypical femoral fractures · hypocalcaemia · osteonecrosis of the jaw—consider temporary interruption of treatment if occurs
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal discomfort · cataracts · constipation · diarrhoea · dyspnoea · eczema · hypocalcaemia (fatal cases reported) · hypophosphataemia · musculoskeletal pain · osteonecrosis of the jaw · pain in extremity · rash · sciatica · sweating · upper respiratory tract infection · urinary tract infection
 - ▶ **Uncommon** Cellulitis (seek prompt medical attention) · diverticulitis · ear infection · skin infections (seek prompt medical attention)
 - ▶ **Rare** Atypical femoral fractures · osteonecrosis of the jaw
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception in women of child-bearing potential, during treatment and for at least 5 months after stopping treatment.
- **PREGNANCY** Avoid—toxicity in *animal* studies; risk of toxicity increases with each trimester—advise women who become pregnant during treatment to enrol in the manufacturer's Pregnancy Surveillance Programme (consult product literature).
- **BREAST FEEDING** Avoid (if women do decide to breast-feed during treatment, they should enrol in the manufacturer's Lactation Surveillance Programme—consult product literature).

- **RENAL IMPAIRMENT** Increased risk of hypocalcaemia if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Correct hypocalcaemia and vitamin D deficiency before starting. Monitor plasma-calcium concentration during therapy.
- **PATIENT AND CARER ADVICE**
Atypical femoral fractures Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.
Osteonecrosis of the jaw All patients should be informed to maintain good oral hygiene, receive routine dental check-ups, and immediately report any oral symptoms such as dental mobility, pain, or swelling to a doctor and dentist.
Hypocalcaemia All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ **Denosumab for the prevention of osteoporotic fractures in postmenopausal women (October 2010) NICE TA204**
Denosumab is recommended as a treatment option for the *primary prevention* of osteoporotic fragility fractures in postmenopausal women at increased risk of fractures:
 - who are unable to comply with the special instructions for administering alendronate and risedronate, or have an intolerance of, or a contra-indication to, those treatments **and**
 - who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance.

Denosumab is recommended as a treatment option for the *secondary prevention* of osteoporotic fragility fractures only in postmenopausal women at increased risk of fractures who are unable to comply with the special instructions for administering alendronate and risedronate, or have an intolerance of, or a contra-indication to, those treatments. www.nice.org.uk/TA204

- ▶ **Denosumab for the prevention of skeletal-related events in adults with bone metastases from solid tumours (October 2012) NICE TA265**
Denosumab is recommended for the prevention of skeletal-related events in adults with bone metastases from breast cancer and from solid tumours other than prostate if:
 - bisphosphonates would otherwise be prescribed, **and**
 - the manufacturer provides denosumab with the discount agreed in the patient access scheme.

Denosumab is **not** recommended for preventing skeletal-related events in adults with bone metastases from prostate cancer.

Patients with bone metastases from solid tumours currently receiving denosumab whose disease does not meet the above criteria can continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA265

PROLIA®

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2010) that denosumab (*Prolia*®) is accepted for restricted use within NHS Scotland for the treatment of osteoporosis in postmenopausal women at increased risk of fractures who have a bone mineral density T-score <-2.5 and ≥-4.0 and for whom bisphosphonates are unsuitable.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

PARATHYROID HORMONES AND ANALOGUES

Parathyroid hormone

(Human recombinant parathyroid hormone)

INDICATIONS AND DOSE

Treatment of osteoporosis in postmenopausal women at high risk of fractures (to reduce the risk of vertebral fractures)

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 100 micrograms daily for maximum duration of treatment 24 months

- **CONTRA-INDICATIONS** Hyperparathyroidism · metabolic bone disease · Paget's disease · pre-existing hypercalcaemia · previous radiation therapy to skeleton · unexplained raised levels of alkaline phosphatase
- **CAUTIONS** Active urolithiasis · previous urolithiasis
- **INTERACTIONS** Use with caution with concomitant cardiac glycosides.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Asthenia · back pain · constipation · diarrhoea · dizziness · dyspepsia · fatigue · headache · hypercalciuria · injection-site reactions · muscle cramp · nausea · pain in extremities · palpitation · transient hypercalcaemia · vomiting
 - ▶ **Uncommon** Abdominal pain · altered sense of smell · anorexia · hyperuricaemia · influenza · taste disturbance
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor serum or urinary calcium concentration at 1, 3 and 6 months after initiation of treatment (consult product literature for guidance if serum-calcium concentration raised).
- **PRESCRIBING AND DISPENSING INFORMATION** *Preatact*® cartridges are for use with *Preatact*® pen device.
- **NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
The *Scottish Medicines Consortium*, has advised (February 2007) that parathyroid hormone (*Preatact*®) should be initiated by specialists experienced in the treatment of osteoporosis.

● MEDICINAL FORMS

Medicines not identified.

Teriparatide

INDICATIONS AND DOSE

Treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures | Treatment of corticosteroid-induced osteoporosis

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 20 micrograms daily for maximum duration of treatment 24 months (course not to be repeated)

- **CONTRA-INDICATIONS** Bone metastases · hyperparathyroidism · metabolic bone diseases · Paget's

disease · pre-existing hypercalcaemia · previous radiation therapy to the skeleton · skeletal malignancies · unexplained raised alkaline phosphatase

● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · arthralgia · asthenia · depression · dizziness · dyspnoea · fatigue · gastrointestinal disorders · haemorrhoids · headache · increased sweating · muscle cramps · myalgia · nausea · palpitation · reflux · sciatica · vertigo

- ▶ **Uncommon** Hypercalcaemia · injection-site reactions · urinary disorders

- ▶ **Rare** Hypersensitivity reactions

- ▶ **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **RENAL IMPAIRMENT** Caution in moderate impairment; avoid if severe.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

Teriparatide is recommended as an alternative for women:

- in whom alendronate or risedronate, *or* strontium ranelate are contra-indicated or not tolerated, **or** where treatment with alendronate or risedronate has been unsatisfactory (indicated by another fragility fracture and a decline in bone mineral density despite treatment for 1 year) **and**

- who comply with particular combinations of bone mineral density measurement, age, and number of fractures, as indicated in the full NICE guidance.

www.nice.org.uk/TA161

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2003) that the use of teriparatide (*Forsteo*®) in postmenopausal women should be restricted to the treatment of established (severe) osteoporosis and should be initiated by specialists experienced in the treatment of osteoporosis.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Forsteo** (Eli Lilly and Company Ltd)

Teriparatide 250 microgram per ml Forsteo
20micrograms/80microlitres solution for injection 2.4ml pre-filled disposable devices | 1 pre-filled disposable injection [POM] £271.88

5 Dopamine responsive conditions

DOPAMINE RECEPTOR AGONISTS

Dopamine-receptor agonists

Bromocriptine p. 333 is used for the treatment of galactorrhoea, and for the treatment of prolactinomas (when it reduces both plasma prolactin concentration and tumour size). Bromocriptine also inhibits the release of

growth hormone and is sometimes used in the treatment of acromegaly, but somatostatin analogues (such as octreotide p. 789) are more effective.

Cabergoline p. 334 has similar side-effects to bromocriptine, however patients intolerant of bromocriptine may be able to tolerate cabergoline (and *vice versa*).

Quinagolide has actions and uses similar to those of ergot-derived dopamine agonists, but its side-effects differ slightly.

Suppression of lactation

Although bromocriptine and cabergoline are licensed to suppress lactation, they are **not** recommended for routine suppression (or for the relief of symptoms of postpartum pain and engorgement) that can be adequately treated with simple analgesics and breast support. If a dopamine-receptor agonist is required, cabergoline is preferred. Quinagolide is not licensed for the suppression of lactation.

Drugs used for Dopamine responsive conditions not listed below; *Bromocriptine*, p. 333 · *Cabergoline*, p. 334

Quinagolide

- **DRUG ACTION** Quinagolide is a non-ergot dopamine D₂ agonist.

INDICATIONS AND DOSE

Hyperprolactinaemia

BY MOUTH

- ▶ **Adult:** Initially 25 micrograms once daily for 3 days, dose to be taken at bedtime, increased in steps of 25 micrograms every 3 days; usual dose 75–150 micrograms daily, for doses higher than 300 micrograms daily increase in steps of 75–150 micrograms at intervals of not less than 4 weeks

- **UNLICENSED USE** Not licensed for the suppression of lactation.
- **CAUTIONS** Acute porphyrias p. 864 · history of psychotic illness · history of serious mental disorders
- **CAUTIONS, FURTHER INFORMATION**
Hyperprolactinemic patients In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).
- **INTERACTIONS** → Appendix 1 (quinagolide). Tolerance may be reduced by alcohol.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · anorexia · constipation or diarrhoea · dizziness · fatigue · flushing · headache · hypotension · insomnia · nasal congestion · nausea · oedema · syncope · vomiting
 - ▶ **Very rare** Psychosis
- **SIDE-EFFECTS, FURTHER INFORMATION**
Gastro-intestinal bleeding Treatment should be withdrawn if gastro-intestinal bleeding occurs.
- **ALLERGY AND CROSS-SENSITIVITY** Quinagolide should not be used in patients with hypersensitivity to quinagolide (does not apply to hypersensitivity to ergot alkaloids).
- **CONCEPTION AND CONTRACEPTION** Advise non-hormonal contraception if pregnancy not desired.
- **PREGNANCY** Discontinue when pregnancy confirmed unless medical reason for continuing (specialist advice needed).
- **BREAST FEEDING** Suppresses lactation.
- **HEPATIC IMPAIRMENT** Avoid—no information available.

- **RENAL IMPAIRMENT** Avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor blood pressure for a few days after starting treatment and following dosage increase.
- **PATIENT AND CARER ADVICE**

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring. Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can be disturbing in some patients during the first few days of treatment with dopamine-receptor agonists, particular care should be exercised when driving or operating machinery.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

6 Gonadotrophin responsive conditions

Gonadotrophins

Drugs affecting gonadotrophins

Danazol p. 636 is licensed for the treatment of *endometriosis* and for the relief of severe pain and tenderness in *benign fibrocystic breast disease* where other measures have proved unsatisfactory. It may also be effective in the long-term management of *hereditary angioedema* [unlicensed indication].

Cetrorelix p. 636 and ganirelix p. 636 are luteinising hormone releasing hormone antagonists, which inhibit the release of gonadotrophins (luteinising hormone and follicle stimulating hormone). They are used in the treatment of infertility by assisted reproductive techniques.

Gonadorelin analogues

Gonadorelin analogues are used in the treatment of endometriosis, precocious puberty, infertility, male hypersexuality with severe sexual deviation, anaemia due to uterine fibroids (together with iron supplementation), breast cancer, prostate cancer and before intra-uterine surgery. Use of leuprorelin acetate p. 633 and triptorelin

p. 635 for 3 to 4 months before surgery reduces the uterine volume, fibroid size and associated bleeding. For women undergoing hysterectomy or myomectomy, a vaginal procedure is made more feasible following the use of a gonadorelin analogue.

Breast pain (mastalgia)

Once any serious underlying cause for breast pain has been ruled out, most women will respond to reassurance and reduction in dietary fat; withdrawal of an oral contraceptive or of hormone replacement therapy may help to resolve the pain.

Mild, non-cyclical breast pain is treated with simple analgesics; moderate to severe pain, cyclical pain or symptoms that persist for longer than 6 months may require specific drug treatment.

Danazol is licensed for the relief of severe pain and tenderness in benign fibrocystic breast disease which has not responded to other treatment.

Tamoxifen p. 791 may be a useful adjunct in the treatment of mastalgia [unlicensed indication] especially when symptoms can definitely be related to cyclic oestrogen production; it may be given on the days of the cycle when symptoms are predicted.

Treatment for breast pain should be reviewed after 6 months and continued if necessary. Symptoms recur in about 50% of women within 2 years of withdrawal of therapy but may be less severe.

GONADOTROPHIN-RELEASING HORMONE ANALOGUES

Buserelin

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

INDICATIONS AND DOSE

Endometriosis

BY INTRANASAL ADMINISTRATION

- Adult: 300 micrograms 3 times a day maximum duration of treatment 6 months (do not repeat), to be started on days 1 or 2 of menstruation; administer one 150 microgram spray into each nostril

Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under expert supervision)

BY SUBCUTANEOUS INJECTION

- Adult: 200–500 micrograms once daily, increased if necessary up to 500 micrograms twice daily, starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

BY INTRANASAL ADMINISTRATION

- Adult: 150–300 micrograms 4 times a day, (150 micrograms equivalent to one spray), to be administered during waking hours. Start in early follicular phase (day 1) or, after exclusion of pregnancy, in the midluteal phase (day 21) and continued until down-regulation achieved (usually about 2–3 weeks) then maintained during gonadotrophin administration (stopping continued →

gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

Advanced prostate cancer

INITIALLY BY SUBCUTANEOUS INJECTION

- ▶ Adult: 500 micrograms every 8 hours for 7 days, then (by intranasal administration) 200 micrograms 6 times a day, (a single 100 microgram spray to be administered into each nostril)

● CONTRA-INDICATIONS

- ▶ When used for endometriosis. Hormone dependent tumours · undiagnosed vaginal bleeding · use longer than 6 months (do not repeat)
- ▶ When used for pituitary desensitisation. Hormone dependent tumours · undiagnosed vaginal bleeding
- **CAUTIONS** Depression · diabetes · hypertension · patients with metabolic bone disease (decrease in bone mineral density can occur) · polycystic ovarian disease

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Abdominal pain · acne · altered blood lipids · anaphylaxis · anxiety · arthralgia · asthma · bleeding associated with fibroid degeneration (when treating uterine fibroids) · breakthrough bleeding · breast tenderness · changes in appetite · changes in breast size · changes in scalp and body hair · concentration disturbances · constipation · decrease in trabecular bone density · depression · diarrhoea · dizziness · drowsiness · dry eyes · dry skin · dyspareunia · fatigue · gynaecomastia · hair loss · headache · hearing disturbances · hot flushes · hypersensitivity reactions · hypertension · increased sweating · increased thirst · initially withdrawal bleeding · lactation · leucopenia · leucorrhoea · local reactions at injection site · loss of libido · memory disturbances · menopausal-like symptoms · migraine · mood changes · musculoskeletal pain · musculoskeletal weakness · myalgia · nausea · nervousness · oedema of the face and extremities · ovarian cysts (may require withdrawal) · palpitation · paraesthesia · pruritus · rash · reduced glucose tolerance · sexual dysfunction · sleep disturbances · splitting nails · thrombocytopenia · urticaria · vaginal dryness · visual disturbances · vomiting · weight changes

SPECIFIC SIDE-EFFECTS

- ▶ **With intranasal use** Altered sense of taste and smell · nasal irritation · nose bleeds

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ When used for Advanced prostate cancer
- ▶ **Tumour flare** During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour 'flare' may cause spinal cord compression, ureteric obstruction or increased bone pain. When such problems are anticipated, alternative treatments (e.g. orchidectomy) or concomitant use of an anti-androgen such as cyproterone acetate or flutamide are recommended; anti-androgen treatment should be started before the gonadorelin analogue.
- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intranasal use. Avoid use of nasal decongestants before and for at least 30 minutes after treatment.

- ▶ With subcutaneous use. Rotate injection site to prevent atrophy and nodule formation.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer buserelin nasal spray.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Suprecur** (Sanofi)

Buserelin (as Buserelin acetate) 1 mg per 1 ml Suprecur 5.5mg/5.5ml solution for injection vials | 2 vial [PoM](#) £27.52

- ▶ **Suprefact** (Sanofi)

Buserelin (as Buserelin acetate) 1 mg per 1 ml Suprefact 5.5mg/5.5ml solution for injection vials | 2 vial [PoM](#) £28.64

Spray

- ▶ **Suprecur** (Sanofi)

Buserelin (as Buserelin acetate) 150 microgram per 1 dose Suprecur 150micrograms/dose nasal spray | 168 dose [PoM](#) £87.63

- ▶ **Suprefact** (Sanofi)

Buserelin (as Buserelin acetate) 100 microgram per 1 dose Suprefact 100micrograms/dose nasal spray | 336 dose [PoM](#) £101.87

Goserelin

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

INDICATIONS AND DOSE

ZOLADEX®

Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer | Advanced breast cancer | Oestrogen-receptor-positive early breast cancer

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 3.6 mg every 28 days, to be administered into the anterior abdominal wall

Endometriosis

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 3.6 mg every 28 days maximum duration of treatment 6 months (do not repeat), to be administered into the anterior abdominal wall

Endometrial thinning before intra-uterine surgery

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 3.6 mg, dose may be repeated after 28 days if uterus is large or to allow flexible surgical timing, to be administered into the anterior abdominal wall

Before surgery in women who have anaemia due to uterine fibroids

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 3.6 mg every 28 days maximum duration of treatment 3 months, to be given with supplementary iron, to be administered into the anterior abdominal wall

Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (after exclusion of pregnancy) (under expert supervision)

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 3.6 mg, dose given to achieve pituitary down-regulation (usually 1–3 weeks) then gonadotrophin is administered (stopping gonadotrophin on

administration of chorionic gonadotrophin at appropriate stage of follicular development), to be administered into the anterior abdominal wall

ZOLADEX LA®

Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer

BY SUBCUTANEOUS INJECTION

▶ Adult: 10.8 mg every 12 weeks, to be administered into the anterior abdominal wall

- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding · use longer than 6 months in endometriosis (do not repeat)
- **CAUTIONS** Depression · diabetes · hypertension · patients with metabolic bone disease (decrease in bone mineral density can occur) · polycystic ovarian disease · risk of spinal cord compression in men · risk of ureteric obstruction in men
- **SIDE-EFFECTS**
 - ▶ **Rare** Hypercalcaemia (in women)
 - ▶ **Frequency not known** Anaphylaxis · arthralgia · asthma · breast tenderness · changes in blood pressure · changes in breast size · changes in scalp and body hair · decrease in trabecular bone density · depression · dizziness · dyspareunia (when used for gynaecological conditions) · gastro-intestinal disturbances · gynaecomastia · headache · heart failure (when used for prostate or breast cancer) · hot flushes · hypersensitivity reactions · increased sweating · local reactions at injection site · loss of libido · menopausal-like symptoms · migraine · mood changes · musculoskeletal pain (when used for gynaecological conditions) · musculoskeletal weakness (when used for gynaecological conditions) · myalgia · myocardial infarction (when used for prostate or breast cancer) · oedema of the face and extremities (when used for gynaecological conditions) · ovarian cysts (may require withdrawal) · palpitation (when used for gynaecological conditions) · paraesthesia · paraesthesia · pruritus · rash · sexual dysfunction · sleep disorders · urticaria · vaginal bleeding · vaginal dryness · visual disturbances · weight change · withdrawal bleeding

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ When used for prostate cancer

Tumour flare During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain. When such problems are anticipated, alternative treatments (e.g. orchidectomy) or concomitant use of an anti-androgen such as cyproterone acetate or flutamide are recommended; anti-androgen treatment should be started before the gonadorelin analogue.
- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS** Men at risk of tumour ‘flare’ should be monitored closely during the first month of therapy for prostate cancer.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Implant

▶ **Zoladex** (AstraZeneca UK Ltd)

Goserelin (as Goserelin acetate) 3.6 mg Zoladex 3.6mg implant SafeSystem pre-filled syringes | 1 pre-filled disposable injection [POM] £65.00 DT price = £65.00

▶ **Zoladex LA** (AstraZeneca UK Ltd)

Goserelin (as Goserelin acetate) 10.8 mg Zoladex LA 10.8mg implant SafeSystem pre-filled syringes | 1 pre-filled disposable injection [POM] £235.00 DT price = £235.00

Leuprorelin acetate

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

INDICATIONS AND DOSE

PROSTAP 3 DCS®

Endometriosis

BY INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 11.25 mg for 1 dose, dose to be given as a single dose in first 5 days of menstrual cycle, then 11.25 mg every 3 months for maximum 6 months (course not to be repeated)

Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer

BY SUBCUTANEOUS INJECTION

- ▶ Adult: 11.25 mg every 3 months

PROSTAP SR DCS®

Endometriosis

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 3.75 mg for 1 dose, dose to be given as a single dose in first 5 days of menstrual cycle, then 3.75 mg every 1 month for maximum 6 months (course not to be repeated)

Endometrial thinning before intra-uterine surgery

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 3.75 mg for 1 dose, dose to be given as a single dose between day 3 and 5 of menstrual cycle, 5–6 weeks before surgery

Reduction of size of uterine fibroids and of associated bleeding before surgery

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: Initially 3.75 mg every 1 month usually for 3–4 months (maximum 6 months)

Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

- ▶ Adult: 3.75 mg every 1 month

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS

Undiagnosed vaginal bleeding

SPECIFIC CONTRA-INDICATIONS

- ▶ When used for endometriosis Use longer than 6 months (do not repeat)

- **CAUTIONS** Diabetes · family history of osteoporosis · patients with metabolic bone disease (decrease in bone mineral density can occur) · risk of spinal cord compression in men with prostate cancer · risk of ureteric obstruction in men with prostate cancer
- **INTERACTIONS** Caution with chronic use of other drugs which reduce bone density including alcohol and tobacco.
- **SIDE-EFFECTS** Alteration of glucose tolerance (in malignant disease) · altered blood lipids · anaphylaxis · anorexia · asthma · breast tenderness (males and females) · changes in blood pressure · changes in breast size · changes in scalp and body hair · chills · decrease in trabecular bone density · depression · diarrhoea · dizziness · dyspareunia · fatigue · fever · gastro-intestinal disturbances · headache · hot flushes · hypersensitivity reactions · increased sweating · jaundice (in malignant disease) · leucopenia · local reactions at injection site · loss of libido · menopausal-like symptoms · migraine · mood changes · musculoskeletal pain · musculoskeletal weakness · nausea · palpitation · paraesthesia · paralysis · pruritus · pulmonary embolism · rash · sexual dysfunction (in malignant disease) · sleep disturbances · spinal fracture · thrombocytopenia · urticaria · vaginal bleeding · vaginal dryness · visual disturbances · vomiting · weight changes

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ When used for prostate cancer
 - **Tumour flare** In prostate cancer, during the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain. When such problems are anticipated, alternative treatments (e.g. orchidectomy) or concomitant use of an anti-androgen such as cyproterone acetate or flutamide are recommended; anti-androgen treatment should be started before the gonadorelin analogue.
 - **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
 - **PREGNANCY** Avoid—teratogenic in *animal* studies.
 - **BREAST FEEDING** Avoid.
 - **MONITORING REQUIREMENTS**
 - ▶ Monitor liver function.
 - ▶ Men at risk of tumour ‘flare’ should be monitored closely during the first month of therapy.
 - **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

- ▶ **Prostap 3 DCS** (Takeda UK Ltd)
 - **Leuporelin acetate 11.25 mg** Prostap 3 DCS 11.25mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £225.72 DT price = £225.72
- ▶ **Prostap SR DCS** (Takeda UK Ltd)
 - **Leuporelin acetate 3.75 mg** Prostap SR DCS 3.75mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £75.24 DT price = £75.24

Nafarelin

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle

stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

INDICATIONS AND DOSE**Endometriosis****BY INTRANASAL ADMINISTRATION**

- ▶ **Adult:** 200 micrograms twice daily for maximum 6 months (do not repeat), one spray in one nostril in the morning, and one spray in the other nostril in the evening (starting on days 2–4 of menstruation).

Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under expert supervision)**BY INTRANASAL ADMINISTRATION**

- ▶ **Adult:** 400 micrograms twice daily, one spray in each nostril, to be started in early follicular phase (day 2) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down regulation achieved (usually within 4 weeks) then maintained (usually for 8–12 days) during gonadotrophin administration (stopping gonadotrophin and nafarelin on administration of chorionic gonadotrophin at follicular maturity), discontinue if down-regulation not achieved within 12 weeks

- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding · use longer than 6 months in the treatment of endometriosis (do not repeat)
- **CAUTIONS** Patients with metabolic bone disease (decrease in bone mineral density can occur)
- **SIDE-EFFECTS** Acne · anaphylaxis · asthma · changes in breast size · changes in scalp and body hair · decrease in trabecular bone density · depression · dyspareunia · headache · hot flushes · hypersensitivity reactions · hypertension · increased sweating · irritation of the nasal mucosa · loss of libido · menopausal-like symptoms · migraine · mood changes · musculoskeletal pain · musculoskeletal weakness · oedema of the face and extremities · ovarian cysts (may require withdrawal) · palpitation · paraesthesia · pruritus · rash · urticaria · vaginal dryness · visual disturbances · weight changes
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - **Menopausal-like symptoms** These effects can be reduced by hormone replacement (e.g. with an oestrogen and a progestogen or with tibolone).
- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first dose should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **DIRECTIONS FOR ADMINISTRATION** Avoid use of nasal decongestants before and for at least 30 minutes after treatment; repeat dose if sneezing occurs during or immediately after administration.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer nafarelin nasal spray.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray**CAUTIONARY AND ADVISORY LABELS 10**

- ▶ **Synarel** (Pfizer Ltd)

Nafarelin (as Nafarelin acetate) 200 microgram per 1 dose Synarel 200micrograms/dose nasal spray | 60 dose [PoM] £52.43

Triptorelin

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

INDICATIONS AND DOSE

DECAPEPTYL® SR 3MG

Endometriosis

BY INTRAMUSCULAR INJECTION

- ▶ Adult: 3 mg every 4 weeks maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

Reduction in size of fibroids

BY INTRAMUSCULAR INJECTION

- ▶ Adult: 3 mg every 4 weeks for at least 3 months, maximum duration of treatment 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

Locally advanced non-metastatic prostate cancer as an alternative to surgical castration | Metastatic prostate cancer | Adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression

BY INTRAMUSCULAR INJECTION

- ▶ Adult: 3 mg every 4 weeks

DECAPEPTYL® SR 11.25MG

Endometriosis

BY INTRAMUSCULAR INJECTION

- ▶ Adult: 11.25 mg every 3 months for maximum 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

Locally advanced non-metastatic prostate cancer as an alternative to surgical castration | Metastatic prostate cancer | Adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression

BY INTRAMUSCULAR INJECTION

- ▶ Adult: 11.25 mg every 3 months

DECAPEPTYL® SR 22.5MG

Locally advanced non-metastatic prostate cancer as an alternative to surgical castration | Metastatic prostate cancer | Adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression

BY INTRAMUSCULAR INJECTION

- ▶ Adult: 22.5 mg every 6 months

SALVACYL®

Male hypersexuality with severe sexual deviation

BY INTRAMUSCULAR INJECTION

- ▶ Adult: 11.25 mg every 12 weeks

GONAPEPTYL DEPOT®

Endometriosis | Reduction in size of fibroids

BY SUBCUTANEOUS INJECTION OR BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 3.75 mg every 4 weeks maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

Advanced prostate cancer

BY SUBCUTANEOUS INJECTION OR BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 3.75 mg every 4 weeks

- **CONTRA-INDICATIONS** In endometriosis do not use for longer than 6 months (do not repeat) · undiagnosed vaginal bleeding

SALVACYL® Severe osteoporosis

● CAUTIONS

GENERAL CAUTIONS

Patients with metabolic bone disease (decrease in bone mineral density can occur)

SPECIFIC CAUTIONS

- ▶ When used for prostate cancer · risk factors for osteoporosis · risk of spinal cord compression in men · risk of ureteric obstruction in men
- ▶ **SALVACYL®** Increased risk of sensitivity to restored testosterone if treatment interrupted—consider administration of an antiandrogen before stopping treatment · transient increase in serum testosterone occurs on initiation—consider administration of an anti-androgen

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Anaphylaxis · arthralgia · asthenia · asthma · breast tenderness (males and females) · changes in blood pressure · changes in breast size · changes in scalp and body hair · depression · gastro-intestinal disturbances · headache · hot flushes · hypersensitivity reactions · increased sweating · local reactions at injection site · mood changes · ovarian cysts (may require withdrawal) · paraesthesia · pruritus · rash · urticaria · visual disturbances · weight changes

SPECIFIC SIDE-EFFECTS

- ▶ When used for prostate cancer · Dizziness · dry mouth · hair loss · increased dysuria · myalgia · peripheral oedema · sexual dysfunction · sleep disorders
- ▶ When used for reduction in size of uterine fibroids · Bleeding associated with fibroid degeneration · decrease in trabecular bone density · dyspareunia · loss of libido · menopausal-like symptoms · migraine · musculoskeletal pain · musculoskeletal weakness · oedema of the face and extremities · palpitation · vaginal dryness · withdrawal bleeding (may occur in the first month of treatment)
- ▶ When used for endometriosis · Decrease in trabecular bone density · dyspareunia · loss of libido · menopausal-like symptoms · migraine · musculoskeletal pain · musculoskeletal weakness · oedema of the face and extremities · palpitation · vaginal dryness · withdrawal bleeding (may occur in the first month of treatment)
- ▶ When used for male hypersexuality with severe sexual deviation · Decrease in trabecular bone density · dyspareunia · loss of libido · migraine · musculoskeletal pain · musculoskeletal weakness · oedema of the face and extremities · palpitation
- ▶ When used for gonadotrophin-dependent precocious puberty · Decrease in trabecular bone density · dyspareunia · loss of libido · menopausal-like symptoms · migraine · musculoskeletal pain · musculoskeletal weakness · oedema of the face and extremities · palpitation · vaginal dryness · withdrawal bleeding (may occur in the first month of treatment)

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ When used for prostate cancer
 - Tumour flare in prostate cancer** During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain. When such problems are anticipated, alternative treatments (e.g. orchidectomy) or concomitant use of an anti-androgen such as cyproterone acetate or flutamide are recommended; anti-androgen treatment should be started before the gonadorelin analogue.
- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS**
 - ▶ When used for Prostate cancer Men at risk of tumour ‘flare’ should be monitored closely during the first month of therapy.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.
- **PRESCRIBING AND DISPENSING INFORMATION**
 - DECAPEPTYL® PREPARATIONS** Each strength of vial includes an overage to allow accurate administration of the required dose.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

- ▶ **Decapeptyl SR** (Ipsen Ltd)
 - Triptorelin (as Triptorelin acetate) 3 mg** Decapeptyl SR 3mg powder and solvent for suspension for injection vials | 1 vial [PoM](#) £69.00
 - Triptorelin (as Triptorelin acetate) 11.25 mg** Decapeptyl SR 11.25mg powder and solvent for suspension for injection vials | 1 vial [PoM](#) £207.00
 - Triptorelin (as Triptorelin embonate) 22.5 mg** Decapeptyl SR 22.5mg powder and solvent for suspension for injection vials | 1 vial [PoM](#) £414.00
- ▶ **Gonapeptyl Depot** (Ferring Pharmaceuticals Ltd)
 - Triptorelin (as Triptorelin acetate) 3.75 mg** Gonapeptyl Depot 3.75mg powder and solvent for suspension for injection pre-filled disposable devices | 1 pre-filled disposable injection [PoM](#) £81.69
- ▶ **Salvacyl** (Ipsen Ltd)
 - Triptorelin (as Triptorelin embonate) 11.25 mg** Salvacyl 11.25mg powder and solvent for suspension for injection vials | 1 vial [PoM](#) £248.00

GONADOTROPHIN-RELEASING HORMONE ANTAGONISTS**Cetorelix****INDICATIONS AND DOSE**

Adjunct in the treatment of female infertility (initiated under specialist supervision)

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 250 micrograms once daily, dose to be administered in the morning, starting on day 5 or 6 of ovarian stimulation with gonadotrophins (or each evening starting on day 5 of ovarian stimulation), continue throughout administration of gonadotrophin including day of ovulation induction (or evening before ovulation induction), dose to be injected into the lower abdominal wall.

● SIDE-EFFECTS

- ▶ **Common or very common** Headache · injection site reactions · nausea
- ▶ **Rare** Hypersensitivity reactions
- **PREGNANCY** Avoid in confirmed pregnancy.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid in moderate or severe liver impairment.
- **RENAL IMPAIRMENT** Avoid in moderate or severe renal impairment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- ▶ **Cetrotide** (Merck Serono Ltd)
 - Cetorelix (as Cetorelix acetate) 250 microgram** Cetrotide 250microgram powder and solvent for solution for injection vials | 1 vial [PoM](#) £22.61 | 7 vial [PoM](#) £158.26

Ganirelix**INDICATIONS AND DOSE**

Adjunct in the treatment of female infertility (under expert supervision)

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 250 micrograms daily, dose to be injected preferably into the upper leg (rotate injection sites to prevent lipoatrophy), dose to be administered in the morning (or each afternoon) starting on day 5 or day 6 of ovarian stimulation with gonadotrophins, continue throughout administration of gonadotrophins including day of ovulation induction (if administering in afternoon, give last dose in afternoon before ovulation induction)

● SIDE-EFFECTS

- ▶ **Very rare** Facial oedema · hypersensitivity reactions · rash
- ▶ **Frequently not known** Dyspnoea · headache · injection-site reactions · malaise · nausea
- **PREGNANCY** Avoid in confirmed pregnancy—*toxicity in animal studies.*
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid in moderate or severe hepatic impairment.
- **RENAL IMPAIRMENT** Avoid in moderate to severe renal impairment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Orgalutran** (Merck Sharp & Dohme Ltd)
 - Ganirelix 500 microgram per 1 ml** Orgalutran 250micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM](#) £21.48

6.1 Hereditary angioedema**GONADOTROPHIN-RELEASING HORMONE ANTAGONISTS****Danazol**

- **DRUG ACTION** Danazol inhibits pituitary gonadotrophins; it combines androgenic activity with antioestrogenic and antiprogesterogenic activity.

INDICATIONS AND DOSE**Endometriosis**

BY MOUTH

- ▶ **Adult:** 200–800 mg daily in up to 4 divided doses usually for 3–6 months, dose to be adjusted to achieve amenorrhoea, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

Severe pain and tenderness in benign fibrocystic breast disease not responding to other treatment

BY MOUTH

- ▶ **Adult:** 300 mg daily in divided doses usually for 3–6 months, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

Hereditary angioedema

BY MOUTH

- ▶ **Adult:** Initially 100–200 mg daily, dose to be reduced according to response, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

- **UNLICENSED USE** Not licensed for use in hereditary angioedema.
- **CONTRA-INDICATIONS** Acute porphyrias p. 864 · androgen-dependent tumours · thromboembolic disease · undiagnosed genital bleeding
- **CAUTIONS** Cardiac impairment (avoid if severe) · diabetes mellitus · elderly · epilepsy · history of thrombosis or thromboembolic disease · hypertension · lipoprotein disorder · migraine · polycythaemia
- **INTERACTIONS** → Appendix 1 (danazol).
- **SIDE-EFFECTS**
- ▶ **Rare** Benign hepatic adenomata · cholestatic jaundice · clitoral hypertrophy · pancreatitis · peliosis hepatis
- ▶ **Frequency not known** Acne · androgenic effects · anxiety · backache · changes in libido · dizziness · eosinophilia · epigastric pain · exfoliative dermatitis · fatigue · fever · flushing and reduction in breast size · hair loss · headache · headache (may indicate benign intracranial hypertension) · hirsutism · insulin resistance · joint pain · joint swelling · leucopenia · menstrual disturbances · mood changes · musculo-skeletal spasm · nausea · nervousness · oedema · oily skin · pleuritic pain · rashes · reversible erythrocytosis · reversible polycythaemia · skin reactions · temporary alteration in lipoproteins and other metabolic changes · thrombocytopenia · thrombotic events · vaginal dryness · vaginal irritation · vertigo · visual disturbances (may indicate benign intracranial hypertension) · voice changes · weight gain
- **SIDE-EFFECTS, FURTHER INFORMATION**
- **Virilisation** Withdraw if virilisation effects occur—may be irreversible on continued use.
- **CONCEPTION AND CONTRACEPTION** Ensure patients with amenorrhoea are not pregnant. Non-hormonal contraceptive methods should be used, if appropriate.
- **PREGNANCY** Avoid; has weak androgenic effects and virilisation of female fetus reported.
- **BREAST FEEDING** No data available but avoid because of possible androgenic effects in infant.
- **HEPATIC IMPAIRMENT** Caution in hepatic impairment (avoid if severe).
- **RENAL IMPAIRMENT** Caution in renal impairment (avoid if severe).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Capsule▶ **DANAZOL (Non-proprietary)**

Danazol 100 mg Danazol 100mg capsules | 28 capsule [PoM] £18.40
Schedule 4 (CD Anab)

Danazol 200 mg Danazol 200mg capsules | 56 capsule [PoM]
£30.27–£66.20 Schedule 4 (CD Anab)

▶ **Danol (Sanofi)**

Danazol 100 mg Danol 100mg capsules | 60 capsule [PoM] £16.38
DT price = £16.38 Schedule 4 (CD Anab)

Danazol 200 mg Danol 200mg capsules | 60 capsule [PoM] £32.43
DT price = £32.43 Schedule 4 (CD Anab)

7 Hypothalamic and anterior pituitary hormone related disorders

Hypothalamic and anterior pituitary hormones

Anterior pituitary hormones

Tetracosactide (tetracosactrin), an analogue of corticotropin (ACTH), is used to test adrenocortical function; failure of the plasma cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency.

Both corticotropin and tetracosactide were formerly used as alternatives to corticosteroids in conditions such as Crohn's disease or rheumatoid arthritis; their value was limited by the variable and unpredictable therapeutic response and by the waning of their effect with time.

Gonadotrophins

Follicle-stimulating hormone (FSH) and luteinising hormone (LH) together, follicle-stimulating hormone alone (as in **folitropin**), or chorionic gonadotrophin p. 639, are used in the treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene citrate p. 659, or in superovulation treatment for assisted conception (such as *in vitro* fertilisation).

The gonadotrophins are also occasionally used in the treatment of hypogonadotrophic hypogonadism and associated oligospermia. There is no justification for their use in primary gonadal failure.

Chorionic gonadotrophin has also been used in delayed puberty in the male to stimulate endogenous testosterone production, but has little advantage over testosterone.

Growth hormone

Growth hormone is used to treat deficiency of the hormone in children and in adults. In children it is used in Prader-Willi syndrome, Turner syndrome, chronic renal insufficiency, short children considered small for gestational age at birth, and short stature homeobox-containing gene (SHOX) deficiency.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, somatotropin p. 642, produced using recombinant DNA technology.

Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency.

Hypothalamic hormones

Gonadorelin p. 639 when injected intravenously in normal subjects leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating

hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. **Gonadorelin analogues** are indicated in endometriosis and infertility and in breast and prostate cancer.

7.1 Adrenocortical function testing

CORTICOTROPHINS

Tetracosactide (Tetracosactrin)

INDICATIONS AND DOSE

Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test)

BY INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION

▶ Adult: 250 micrograms for 1 dose

Diagnosis of adrenocortical insufficiency (diagnostic 5-hour test)

BY INTRAMUSCULAR INJECTION USING DEPOT INJECTION

▶ Adult: 1 mg for 1 dose

Alternative to corticosteroids in conditions such as Crohn's disease or rheumatoid arthritis (formerly used but value was limited by the variable and unpredictable therapeutic response and by the waning of effect with time)

INITIALLY BY INTRAMUSCULAR INJECTION USING DEPOT INJECTION

▶ Adult: Initially 1 mg daily, alternatively (by intramuscular injection) initially 1 mg every 12 hours, (in acute cases), then (by intramuscular injection) reduced to 1 mg every 2–3 days, followed by (by intramuscular injection) 1 mg once weekly, alternatively (by intramuscular injection) 500 micrograms every 2–3 days

- **CONTRA-INDICATIONS** Acute psychosis · adrenogenital syndrome · allergic disorders · asthma · avoid injections containing benzyl alcohol in neonates · Cushing's syndrome · infectious diseases · peptic ulcer · primary adrenocortical insufficiency · refractory heart failure
- **CAUTIONS** Active infectious diseases (should not be used unless adequate disease-specific therapy is being given) · active systemic diseases (should not be used unless adequate disease-specific therapy is being given) · diabetes mellitus · diverticulitis · history of asthma · history of atopic allergy · history of eczema · history of hayfever · history of hypersensitivity · hypertension · latent amoebiasis (may become activated) · latent tuberculosis (may become activated) · myasthenia gravis · ocular herpes simplex · osteoporosis · predisposition to thromboembolic · psychological disturbances may be triggered · recent intestinal anastomosis · reduced immune response (should not be used unless adequate disease-specific therapy is being given) · ulcerative colitis
- CAUTIONS, FURTHER INFORMATION**

Risk of anaphylaxis Should only be administered under medical supervision. Consult product literature.

Hypertension Patients already receiving medication for moderate to severe hypertension must have their dosage adjusted if treatment started.

Diabetes mellitus Patients already receiving medication for diabetes mellitus must have their dosage adjusted if treatment started.
- **INTERACTIONS** → Appendix 1 (corticosteroids).

- **SIDE-EFFECTS** Abdominal distention · abscess · acne · anaphylactic shock · angioneurotic oedema · aseptic necrosis of femoral and humeral heads · benign intracranial pressure increased with papilloedema · calcium deficiency · cardiac disorders · convulsions · Cushing's syndrome · decreased carbohydrate tolerance · dizziness · dyspnoea · ecchymosis · erythema · euphoria · fluid retention · flushing · glaucoma · growth retardation · headache · hirsutism · hyperglycaemia · hyperhidrosis · hypersensitivity reactions (tend to be more severe in patients susceptible to allergies, especially asthma) · hypertension · hypokalaemia · hypokalaemic alkalosis · impaired healing · increased appetite · increased intraocular pressure · infection susceptibility increased · insomnia · irregular menstruation · leukocytosis · malaise · manifestations of latent diabetes mellitus · mood swings · muscle atrophy · muscular weakness · myopathy · nausea · necrotising vasculitis · negative nitrogen balance · osteoporosis · pancreatitis · pathological fracture of long bones · peptic ulcer · personality changes · petechiae · posterior subcapsular cataracts · pruritis · psychotic manifestations · Quincke's oedema · secondary adrenocortical unresponsiveness · secondary pituitary unresponsiveness · severe depression · skin atrophy · skin hyperpigmentation · skin reactions at injection site · sodium retention · spinal compression fractures · tendon rupture · thromboembolism · ulcerative oesophagitis · urticaria · vertigo · vomiting · weight increase
- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated in patients with history of hypersensitivity to tetracosactide/corticotrophins or excipients.
- **PREGNANCY** Avoid (but may be used diagnostically if essential).
- **BREAST FEEDING** Avoid (but may be used diagnostically if essential).
- **HEPATIC IMPAIRMENT** An enhanced effect of tetracosactide therapy may occur in patients with cirrhosis of the liver. Use with caution in hepatic impairment. Monitor hepatic function closely during treatment.
- **RENAL IMPAIRMENT** Use with caution in patients with renal impairment.
- **EFFECT ON LABORATORY TESTS** May suppress skin test reactions. Post administration total plasma cortisol levels during 30-minute test for diagnosis of adrenocortical insufficiency might be misleading due to altered cortisol binding globulin levels in some special clinical situations including, patients on oral contraceptives, post-operative patients, critical illness, severe liver disease and nephrotic syndrome.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Synacthen** (Questcor Operations Ltd)

Tetracosactide acetate 250 microgram per 1 ml Synacthen 250micrograms/1ml solution for injection ampoules | 5 ampoule (POM) £190.00

Suspension for injection

EXCIPIENTS: May contain Benzyl alcohol

▶ **Synacthen Depot** (Questcor Operations Ltd)

Tetracosactide acetate 1 mg per 1 ml Synacthen Depot 1mg/1ml suspension for injection ampoules | 10 ampoule (POM) £41.83

7.2 Assessment of pituitary function

GONADOTROPHIN-RELEASING HORMONE ANALOGUES

Gonadorelin

(Gonadotrophin-releasing hormone; GnRH; LH-RH)

INDICATIONS AND DOSE

Assessment of pituitary function

BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INJECTION

▶ Adult: 100 micrograms for 1 dose

- **CAUTIONS** Pituitary adenoma
- **SIDE-EFFECTS** Abdominal pain · headache · hypersensitivity reaction on repeated administration of large doses · increased menstrual bleeding · irritation at injection site · nausea
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

EXCIPIENTS: May contain Benzyl alcohol

▶ GONADORELIN (Non-proprietary)

Gonadorelin (as Gonadorelin hydrochloride) 100 microgram Gonadorelin 100microgram powder and solvent for solution for injection vials | 1 vial [POM] £75.00 (Hospital only)

7.3 Gonadotrophin replacement therapy

GONADOTROPHINS

Choriogonadotropin alfa

(Human chorionic gonadotropin)

INDICATIONS AND DOSE

Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)

BY SUBCUTANEOUS INJECTION

▶ Adult: Adjusted according to response.

- **CONTRA-INDICATIONS** Active thromboembolic disorders · ectopic pregnancy in previous 3 months · hypothalamus malignancy · mammary malignancy · ovarian enlargement or cyst (unless caused by polycystic ovarian disease) · ovarian malignancy · pituitary malignancy · uterine malignancy
 - **CAUTIONS** Acute porphyrias p. 864
 - **SIDE-EFFECTS** Abdominal pain · breast pain · depression · diarrhoea · ectopic pregnancy · headache · injection-site reactions · irritability · nausea · ovarian hyperstimulation syndrome · ovarian torsion · tiredness · vomiting
 - **MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Ovitrelle (Merck Serono Ltd)

Choriogonadotropin alfa 500 microgram per 1 ml Ovitrelle 250micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [POM] £31.38 Schedule 4 (CD Anab) Ovitrelle 250micrograms/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection [POM] £31.38 Schedule 4 (CD Anab)

Chorionic gonadotrophin

(Human Chorionic Gonadotropin; HCG)

- **DRUG ACTION** A preparation of a glycoprotein fraction secreted by the placenta and obtained from the urine of pregnant women having the action of the pituitary luteinising hormone.

INDICATIONS AND DOSE

Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)

BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION

▶ Adult: Adjusted according to response.

- **CONTRA-INDICATIONS** Androgen-dependent tumours
 - **CAUTIONS** Asthma · cardiac impairment · epilepsy · migraine · prepubertal boys (risk of premature epiphyseal closure or precocious puberty)
 - **SIDE-EFFECTS** Gynaecomastia · headache · local reactions · may aggravate ovarian hyperstimulation · mood changes · multiple pregnancy · oedema (particularly in males—reduce dose) · tiredness
 - **RENAL IMPAIRMENT** Use with caution.
 - **MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- Powder and solvent for solution for injection**
- ▶ **Choragon** (Ferring Pharmaceuticals Ltd)
- Chorionic gonadotrophin human 5000 unit Choragon 5,000unit powder and solvent for solution for injection ampoules | 3 ampoule [POM] £9.77 Schedule 4 (CD Anab)
- ▶ **Pregnyl** (Merck Sharp & Dohme Ltd)
- Chorionic gonadotrophin human 1500 unit Pregnyl 1,500unit powder and solvent for solution for injection ampoules | 1 ampoule [POM] £2.12 Schedule 4 (CD Anab)
- Chorionic gonadotrophin human 5000 unit Pregnyl 5,000unit powder and solvent for solution for injection ampoules | 1 ampoule [POM] £3.15 Schedule 4 (CD Anab)

Corifollitropin alfa

INDICATIONS AND DOSE

Controlled ovarian stimulation in combination with a gonadotrophin-releasing hormone antagonist

BY SUBCUTANEOUS INJECTION

▶ Adult (body-weight up to 60 kg): 100 micrograms

▶ Adult (body-weight 60 kg and above): 150 micrograms

- **CONTRA-INDICATIONS** History of ovarian hyperstimulation syndrome · ovarian enlargement or cyst · polycystic ovarian syndrome · tumours of breast · tumours of hypothalamus · tumours of ovaries · tumours of pituitary · tumours of uterus · vaginal bleeding of unknown cause
 - **CAUTIONS** Acute porphyrias p. 864 · risk factors for thromboembolism · risk of ovarian hyperstimulation syndrome
 - **SIDE-EFFECTS**
- ▶ **Common or very common** Breast pain · fatigue · headache · nausea · ovarian hyperstimulation · pelvic pain

- ▶ **Uncommon** Abdominal distension and pain · constipation · diarrhoea · dizziness · ovarian torsion · vomiting
- ▶ **Frequency not known** Ectopic pregnancy · miscarriage · multiple pregnancies
- **BREAST FEEDING** Avoid.
- **RENAL IMPAIRMENT** Avoid.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Elonva** (Merck Sharp & Dohme Ltd)

Corifollitropin alfa 200 microgram per 1 ml Elonva
100micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £638.00

Corifollitropin alfa 300 microgram per 1 ml Elonva
150micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £638.00

Follitropin alfa

(Recombinant human follicle stimulating hormone)

INDICATIONS AND DOSE

Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Adjusted according to response.

Hypogonadotrophic hypogonadism

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** (consult product literature).

- **CONTRA-INDICATIONS** Ovarian cysts (not caused by polycystic ovarian syndrome) · tumours of breast · tumours of hypothalamus · tumours of ovaries · tumours of pituitary · tumours of prostate · tumours of testes · tumours of uterus · vaginal bleeding of unknown cause

- **CAUTIONS** Acute porphyrias p. 864

● SIDE-EFFECTS

- ▶ **Common or very common** Fever · gastro-intestinal disturbances · headache · hypersensitivity reactions · injection site reactions · joint pain · ovarian hyperstimulation
- ▶ **Very rare** Thromboembolism
- ▶ **Frequency not known** Acne · gynaecomastia · increased risk of miscarriage · increased risk of multiple pregnancy · weight gain

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **PATIENT AND CARER ADVICE** Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

7.4 Growth hormone disorders

GROWTH HORMONE RECEPTOR ANTAGONISTS

Pegvisomant

- **DRUG ACTION** Pegvisomant is a genetically modified analogue of human growth hormone and is a highly selective growth hormone receptor antagonist.

INDICATIONS AND DOSE

Treatment of acromegaly in patients with inadequate response to surgery, radiation, or both, and to treatment with somatostatin analogues (initiated by a specialist)

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 80 mg for 1 dose, followed by 10 mg daily, then increased in steps of 5 mg daily, adjusted according to response; maximum 30 mg per day

- **CAUTIONS** Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) · liver disease
- **SIDE-EFFECTS**
- ▶ **Uncommon** Bleeding tendency · leucocytosis · leucopenia · thrombocytopenia
- ▶ **Frequency not known** Abdominal distension · arthralgia · asthma · constipation · diarrhoea · dizziness · drowsiness · dyspepsia · elevated liver enzymes · fatigue · flatulence · headache · hypercholesterolaemia · hyperglycaemia · hypertension · hypoglycaemia · influenza-like syndrome · injection-site reactions · myalgia · nausea · pruritus · rash · sleep disturbances · sweating · tremor · vomiting · weight gain
- SIDE-EFFECTS, FURTHER INFORMATION**
- Injection-site reactions** Rotate injection sites to avoid lipohypertrophy.
- **CONCEPTION AND CONTRACEPTION** Possible increase in female fertility.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS** Monitor liver enzymes every 4–6 weeks for 6 months or if symptoms of hepatitis develop.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- ▶ **Somavert** (Pfizer Ltd)
Pegvisomant 10 mg Somavert 10mg powder and solvent for solution for injection vials | 30 vial [PoM] £1,500.00
- Pegvisomant 15 mg** Somavert 15mg powder and solvent for solution for injection vials | 30 vial [PoM] £2,250.00
- Pegvisomant 20 mg** Somavert 20mg powder and solvent for solution for injection vials | 1 vial [PoM] £100.00 | 30 vial [PoM] £3,000.00

HUMAN GROWTH HORMONES

Somatropin

(Recombinant Human Growth Hormone)

INDICATIONS AND DOSE

Gonadal dysgenesis (Turner syndrome)

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 1.4 mg/m² daily, alternatively 45–50 micrograms/kg daily

Deficiency of growth hormone

BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 150–300 micrograms daily, then increased if necessary up to 1 mg daily, dose to be increased gradually, use minimum effective dose (requirements may decrease with age)

Dose equivalence and conversion

Dose formerly expressed in units; somatropin 1 mg equivalent to 3 units.

- **CONTRA-INDICATIONS** Evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting) · not to be used after renal transplantation · not to be used for growth promotion in children with closed epiphyses (or near closure in Prader-Willi syndrome) · severe obesity in Prader-Willi syndrome · severe respiratory impairment in Prader-Willi syndrome
- **CAUTIONS** Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) · disorders of the epiphysis of the hip (monitor for limping) · history of malignant disease · hypothyroidism—manufacturers recommend periodic thyroid function tests but limited evidence of clinical value · initiation of treatment close to puberty not recommended in child born small for corrected gestational age · papilloedema · relative deficiencies of other pituitary hormones · resolved intracranial hypertension (monitor closely) · Silver-Russell syndrome
- **INTERACTIONS** → Appendix 1 (somatropin).
- **SIDE-EFFECTS** Antibody formation · arthralgia · benign intracranial hypertension · carpal tunnel syndrome · fluid retention (peripheral oedema) · headache · hyperglycaemia · hypoglycaemia · hypothyroidism · insulin resistance · leukaemia in children with growth hormone deficiency · myalgia · nausea · papilloedema · paraesthesia · reactions at injection site · visual problems · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
- Papilloedema** Funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).
- **PREGNANCY** Discontinue if pregnancy occurs—no information available.
- **BREAST FEEDING** No information available. Absorption from milk unlikely.
- **DIRECTIONS FOR ADMINISTRATION** Rotate subcutaneous injection sites to prevent lipatrophy.

Genotropin[®], Humatrope cartridges, Norditropin[®], NutropinAq[®], Omnitrope[®], Saizen[®] and Zomacton[®] preparations

For use by subcutaneous injection.

HUMATROPE[®] POWDER FOR RECONSTITUTION

For use by subcutaneous or intramuscular injection.

- **PRESCRIBING AND DISPENSING INFORMATION** Medicinal products containing somatropin are not identical and although there should be no important differences in terms of safety and efficacy, when prescribing biological products it is good practice to use the brand name.

GENOTROPIN[®] PREPARATIONS

Cartridges are for use with Genotropin[®] Pen device (non-NHS but available free of charge from clinics).

NORDITROPIN[®] PREPARATIONS

Cartridges are for use with appropriate NordiPen[®] device (non-NHS but available free of charge from clinics).

Multidose disposable pre-filled pens for use with Novofine[®] or NovoTwist[®] needles.

NUTROPINAQ[®]

For use with NutropinAq[®] Pen device (non-NHS but available free of charge from clinics).

OMNITROPE[®]

For use with Omnitrope Pen 5[®] and Omnitrope Pen 10[®] devices (non-NHS but available free of charge from clinics).

SAIZEN[®] POWDER AND SOLVENT FOR SOLUTION FOR INJECTION

For use with one.click[®] autoinjector device or cool.click[®] needle-free autoinjector device or easypod[®] autoinjector device (non-NHS but available free of charge from clinics).

SAIZEN[®] SOLUTION FOR INJECTION

For use with cool.click[®] needle-free autoinjector device or easypod[®] autoinjector device (non-NHS but available free of charge from clinics).

ZOMACTON[®]

4mg vial for use with Zomajet 2[®] Vision needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes. 10mg vial for use with Zomajet Vision X[®] needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

NICE technology appraisals (TAs)

- ▶ **Somatropin for adults with growth hormone deficiency (August 2003) NICE TA64**
Somatropin is recommended in adults **only** if the following 3 criteria are fulfilled:

- Severe growth hormone deficiency, established by an appropriate method,
- Impaired quality of life, measured by means of a specific questionnaire,
- Already receiving treatment for another pituitary hormone deficiency.

Somatropin treatment should be discontinued if the quality of life has not improved sufficiently by 9 months. Severe growth hormone deficiency developing after linear growth is complete but before the age of 25 years should be treated with growth hormone; treatment should continue until adult peak bone mass has been achieved. Treatment for adult-onset growth hormone deficiency should be stopped only when the patient and the patient's physician consider it appropriate. Treatment with somatropin should be initiated and managed by a physician with expertise in growth hormone disorders; maintenance treatment can be prescribed in the community under a shared-care protocol. www.nice.org.uk/TA64

- ▶ **Somatropin for the treatment of growth failure in children (May 2010) NICE TA188**

Somatropin is recommended for children with growth failure who:

- have growth-hormone deficiency
- have Turner syndrome
- have Prader-Willi syndrome
- have chronic renal insufficiency
- are born small for gestational age with subsequent growth failure at 4 years of age or later
- have short stature homeobox-containing gene (SHOX) deficiency.

Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment. www.nice.org.uk/TA188

mestranol). Tibolone p. 646 has oestrogenic, progestogenic and weak androgenic activity.

Oestrogen therapy is given cyclically or continuously for a number of gynaecological conditions. If long-term therapy is required in women with a uterus, a progestogen should normally be added to reduce the risk of cystic hyperplasia of the endometrium (or of endometriotic foci in women who have had a hysterectomy) and possible transformation to cancer.

Oestrogens are no longer used to suppress lactation because of their association with thromboembolism.

Hormone replacement therapy

Hormone replacement therapy (HRT) with small doses of an oestrogen (together with a progestogen in women with a uterus) is appropriate for alleviating menopausal symptoms such as vaginal atrophy or vasomotor instability. Oestrogen given systemically in the perimenopausal and postmenopausal period or tibolone given in the postmenopausal period also diminish postmenopausal osteoporosis but other drugs are preferred. Menopausal atrophic vaginitis may respond to a short course of a topical vaginal oestrogen preparation used for a few weeks and repeated if necessary.

Systemic therapy with an oestrogen or drugs with oestrogenic properties alleviates the symptoms of oestrogen deficiency such as vasomotor symptoms. Tibolone combines oestrogenic and progestogenic activity with weak androgenic activity; it is given continuously, without cyclical progestogen.

HRT may be used in women with early natural or surgical menopause (before age 45 years), since they are at high risk of osteoporosis. For early menopause, HRT can be given until the approximate age of natural menopause (i.e. until age 50 years). Alternatives to HRT should be considered if osteoporosis is the main concern.

Clonidine hydrochloride p. 137 may be used to reduce vasomotor symptoms in women who cannot take an oestrogen, but clonidine hydrochloride may cause unacceptable side-effects.

HRT increases the risk of venous thromboembolism, stroke, endometrial cancer (reduced by a progestogen), breast cancer, and ovarian cancer; there is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. For details of these risks see HRT Risk table.

The minimum effective dose of HRT should be used for the shortest duration. Treatment should be reviewed at least annually and for osteoporosis alternative treatments considered. HRT does not prevent coronary heart disease or protect against a decline in cognitive function and it should not be prescribed for these purposes. Experience of treating women over 65 years with HRT is limited.

For the treatment of menopausal symptoms the benefits of short-term HRT outweigh the risks in the majority of women, especially in those aged under 60 years.

Risk of breast cancer

It is estimated that using all types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use; tibolone has only a limited effect on mammographic density.

Risk of endometrial cancer

The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a

8 Sex hormone responsive conditions

Sex hormones

Oestrogens and HRT

Oestrogens are necessary for the development of female secondary sexual characteristics; they also stimulate myometrial hypertrophy with endometrial hyperplasia.

In terms of oestrogenic activity *natural oestrogens* (estradiol p. 649 (oestradiol), estrone (oestrone), and estriol p. 713 (oestriol)) have a more appropriate profile for hormone replacement therapy (HRT) than *synthetic oestrogens* (ethinylestradiol p. 655 (ethinyloestradiol)) and

HRT Risks

Risk	Age range (years)	Background incidence per 1000 women in Europe not using HRT		Additional cases per 1000 women using oestrogen only HRT (estimated)		Additional cases per 1000 women using combined (oestrogen-progesterone) HRT (estimated)	
		Over 5 years	Over 10 years	For 5 years' use	For 10 years' use	For 5 years' use	For 10 years' use
Breast cancer ¹	50-59	10	20	2	6	6	24
	60-69	15	30	3	9	9	36
Endometrial cancer ^{2,3}	50-59	2	4	4	32	NS	NS
	60-69	3	6	6	48	NS	NS
Ovarian cancer	50-59	2	4	<1	1	<1	1
	60-69	3	6	<1	2	<1	2
Venous thromboembolism ^{4,5}	50-59	5	–	2	–	7	–
	60-69	8	–	2	–	10	–
Stroke ⁶	50-59	4	–	1	–	1	–
	60-69	9	–	3	–	3	–
Coronary heart disease ^{7,8}	70-79	29-44	–	NS	–	15	–

Where background incidence or additional cases have not been included in the table, this indicates a lack of available data. NS indicates a non-significant difference. Taken from MHRA/CHM (Drug Safety 2007; 1 (2): 2-6) available at <http://www.gov.uk/drug-safety-update>

- 1 Tibolone increases the risk of breast cancer but to a lesser extent than with combined HRT.
- 2 Evidence suggests an increased risk of endometrial cancer with tibolone. After 2.7 years of use (in women of average age 68 years), 1 extra case of endometrial hyperplasia and 4 extra cases of endometrial cancer were diagnosed compared with placebo users.
- 3 The risk of endometrial cancer cannot be reliably estimated in those using combined HRT because the addition of progesterone for at least 10 days per 28-day cycle greatly reduces the additional risk, and addition of a daily progesterone eliminates the additional risk. The risk of endometrial cancer in women who have not used HRT increases with body mass index (BMI); the increased risk of endometrial cancer in users of oestrogen-only HRT or tibolone is more apparent in women who are not overweight.
- 4 Limited data does not suggest an increased risk of thromboembolism with tibolone compared with combined HRT or women not taking HRT.
- 5 Although the level of risk of thromboembolism associated with non-oral routes of administration of HRT has not been established, it may be lower for the transdermal route.
- 6 Tibolone increases the risk of stroke about 2.2 times from the first year of treatment; risk of stroke is age-dependent and therefore the absolute risk of stroke with tibolone increases with age.
- 7 Increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause.
- 8 There is insufficient data to draw a conclusion on the risk of coronary heart disease with tibolone.

progesterone is given continuously. However, this should be weighed against the increased risk of breast cancer.

Risk of ovarian cancer

Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer; this excess risk disappears within a few years of stopping.

Risk of venous thromboembolism

Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use. In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

Risk of stroke

Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment.

Risk of coronary heart disease

HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the

menopause, studies suggest a lower relative risk compared with older women.

Choice

The choice of HRT for an individual depends on an overall balance of indication, risk, and convenience. A woman with a uterus normally requires oestrogen with cyclical progesterone for the last 12 to 14 days of the cycle or a preparation which involves continuous administration of an oestrogen and a progesterone (or one which provides both oestrogenic and progesterogenic activity in a single preparation). Continuous combined preparations or tibolone are **not suitable** for use in the perimenopause or within 12 months of the last menstrual period; women who use such preparations may bleed irregularly in the early stages of treatment—if bleeding continues endometrial abnormality should be ruled out and consideration given to changing to cyclical HRT.

An oestrogen alone is suitable for continuous use in women without a uterus. However, in endometriosis, endometrial foci may remain despite hysterectomy and the addition of a progesterone should be considered in these circumstances.

An oestrogen may be given by mouth or by transdermal administration, which avoids first-pass metabolism.

Surgery

Major surgery under general anaesthesia, including orthopaedic and vascular leg surgery, is a predisposing factor for venous thromboembolism and it may be prudent to stop HRT 4–6 weeks before surgery; it should be restarted only after full mobilisation. If HRT is continued or if discontinuation is not possible (e.g. in non-elective

surgery), prophylaxis with unfractionated or low molecular weight heparin and graduated compression hosiery is advised.

Reasons to stop HRT

Hormone replacement therapy should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg;
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment

Ethinylestradiol

Ethinylestradiol p. 655 (ethinylestradiol) is licensed for short-term treatment of symptoms of oestrogen deficiency, for osteoporosis prophylaxis if other drugs cannot be used and for the treatment of female hypogonadism and menstrual disorders.

Ethinylestradiol is occasionally used under **specialist supervision** for the management of *hereditary haemorrhagic telangiectasia* (but evidence of benefit is limited). It is also used licensed for the palliative treatment of prostate cancer.

Raloxifene

Raloxifene hydrochloride p. 659 is licensed for the treatment and prevention of *postmenopausal osteoporosis*; unlike hormone replacement therapy, raloxifene hydrochloride does not reduce menopausal vasomotor symptoms.

Raloxifene hydrochloride may reduce the incidence of oestrogen-receptor-positive breast cancer but its role in established breast cancer is not yet clear. The manufacturer advises avoiding its use during treatment for breast cancer.

Progestogens and progesterone receptor modulators

There are two main groups of progestogen, progesterone and its analogues (dydrogesterone and medroxyprogesterone acetate p. 695) and testosterone analogues (norethisterone p. 656 and norgestrel). The newer progestogens (desogestrel p. 691, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel p. 692 is the active isomer of norgestrel and has twice its potency. Progesterone p. 658 and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

Where endometriosis requires drug treatment, it may respond to a progestogen, e.g. norethisterone, administered on a continuous basis. Danazol p. 636 and gonadorelin analogues are also available.

Although oral progestogens have been used widely for menorrhagia they are relatively ineffective compared with tranexamic acid p. 95 or, particularly where dysmenorrhoea is also a factor, mefenamic acid p. 932; the levonorgestrel-releasing intra-uterine system may be particularly useful for women also requiring contraception. Oral progestogens have also been used for severe dysmenorrhoea, but where

contraception is also required in younger women the best choice is a combined oral contraceptive.

Progestogens have also been advocated for the alleviation of premenstrual symptoms, but no convincing physiological basis for such treatment has been shown.

Progestogens have been used for the prevention of miscarriage in women with a history of recurrent miscarriage but there is no evidence of benefit and they are **not** recommended for this purpose. In pregnant women with antiphospholipid antibody syndrome who have suffered recurrent miscarriage, administration of low-dose aspirin p. 104 and a prophylactic dose of a low molecular weight heparin may decrease the risk of fetal loss (use under specialist supervision only).

Hormone replacement therapy

In women with a uterus a progestogen needs to be added to long-term oestrogen therapy for hormone replacement, to prevent cystic hyperplasia of the endometrium and possible transformation to cancer; it can be added on a cyclical or a continuous basis. Combined packs incorporating suitable progestogen tablets are available.

Oral contraception

Desogestrel, gestodene, levonorgestrel, norethisterone, and norgestimate are used in combined oral contraceptives and in progestogen-only contraceptives.

Cancer

Progestogens also have a role in neoplastic disease.

Progesterone receptor modulators

Ulipristal acetate p. 691 is a progesterone receptor modulator with a partial progesterone antagonist effect. Ulipristal acetate is used in the pre-operative treatment of moderate to severe symptoms of uterine fibroids; it is also used as an hormonal emergency contraceptive.

8.1 Female sex hormone responsive conditions

Drugs used for Female sex hormones responsive conditions not listed below; Medroxyprogesterone acetate, p. 695; Clonidine hydrochloride, p. 137

NORETYNODREL DERIVATIVES

Tibolone

INDICATIONS AND DOSE

Short-term treatment of symptoms of oestrogen deficiency (including women being treated with gonadotrophin releasing hormone analogues) | Osteoporosis prophylaxis in women at high risk of fractures when other prophylaxis contra-indicated or not tolerated

BY MOUTH

▶ Adult: 2.5 mg daily

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 • active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) • active thrombophlebitis • Dubin-Johnson and Rotor syndrome (or monitor closely) • history of breast cancer • history of cardiovascular disease • history of cerebrovascular disease • history of recurrent venous thromboembolism (unless already on anticoagulant treatment) • history of thromboembolism • history of thrombophlebitis • hormone-dependent tumours • liver disease (where liver function tests have failed to return to normal) • oestrogen-dependent cancer • thrombophilic disorder • uninvestigated or undiagnosed

vaginal bleeding · untreated endometrial hyperplasia · venous thromboembolism

- **CAUTIONS** Acute porphyrias p. 864 · diabetes (increased risk of heart disease) · epilepsy · factors predisposing to thromboembolism · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · history of liver disease · hypertriglyceridaemia · hypophyseal tumours · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · risk of stroke

CAUTIONS, FURTHER INFORMATION

Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **INTERACTIONS** → Appendix 1 (tibolone).

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · facial hair · leucorrhoea · vaginal bleeding · weight changes
- ▶ **Rare** Amnesia
- ▶ **Frequency not known** Arthralgia · breast cancer · depression · dizziness · gastro-intestinal disturbances · headache · increased risk of gall-bladder disease · migraine · myalgia · oedema · pruritus · rash · seborrhoeic dermatitis · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Vaginal bleeding Investigate for endometrial cancer if bleeding continues beyond 6 months or after stopping treatment.

Reasons to withdraw treatment Withdraw treatment if signs of thromboembolic disease, abnormal liver function tests, or signs of cholestatic jaundice.

- **PREGNANCY** Avoid; toxicity in *animal studies*.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid in acute liver disease or if history of liver disease and liver function tests not returned to normal.
- **RENAL IMPAIRMENT** Patients with renal impairment should be closely monitored (risk of fluid retention).
- **PRESCRIBING AND DISPENSING INFORMATION** Unsuitable for use in the premenopause (unless being treated with gonadotrophin-releasing hormone analogue) and as (or with) an oral contraceptive. Also unsuitable for use within 12 months of last menstrual period (may cause irregular bleeding). If transferring from cyclical HRT, start at end of regimen; if transferring from continuous-combined HRT, start at any time.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

CAUTIONS, FURTHER INFORMATION

Risk of breast cancer It is estimated that using *all* types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.

Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use. In *women who have predisposing factors* (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is

prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. *Travel* involving prolonged immobility further increases the risk of deep vein thrombosis.

Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **INTERACTIONS** → Appendix 1 (oestrogens).
- **SIDE-EFFECTS** Abdominal bloating · abdominal cramps · altered blood lipids (may lead to pancreatitis, rashes and chloasma) · breast enlargement · breast tenderness · changes in libido · cholestatic jaundice · contact lenses may irritate · depression · dizziness · fluid retention · glucose intolerance · headache · headache (on vigorous exercise) · leg cramps (rule out venous thrombosis) · migraine · mood changes · nausea · premenstrual-like syndrome · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · sodium retention · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size · vaginal candidiasis · vomiting · weight changes

SIDE-EFFECTS, FURTHER INFORMATION

Withdrawal bleeding Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in *regular withdrawal bleeding* towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but *irregular bleeding* may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

- **CONCEPTION AND CONTRACEPTION** HRT does **not** provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).

- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

MEDICINAL FORMS

Estradiol

INDICATIONS AND DOSE

BEDOL[®]

Menopausal symptoms | Osteoporosis prophylaxis

BY MOUTH

- ▶ Adult: 2 mg daily, started on day 1–5 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

CLIMAVAL[®]

Menopausal symptoms (if patient has had a hysterectomy)

BY MOUTH

- ▶ Adult: 1–2 mg daily

ELLESTE-SOLO[®] 1-MG

Menopausal symptoms

BY MOUTH

- ▶ Adult: 1 mg daily, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

ELLESTE-SOLO[®] 2-MG

Menopausal symptoms not controlled with lower strength | Osteoporosis prophylaxis

BY MOUTH

- ▶ Adult: 2 mg daily, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be given with cyclical progestogen for 12–14 days of each cycle in women with a uterus

PROGYNOVA[®]

Menopausal symptoms

BY MOUTH

- ▶ Adult: 1–2 mg daily continuously, to be started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

Osteoporosis prophylaxis

BY MOUTH

- ▶ Adult: 2 mg daily continuously, to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

ZUMENON[®]

Menopausal symptoms

BY MOUTH

- ▶ Adult: Initially 1 mg daily, to be started within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), increased if necessary to 2 mg daily, to be taken with a cyclical progestogen for 12–14 days of each cycle in women with a uterus

Osteoporosis prophylaxis

BY MOUTH

- ▶ Adult: 2 mg daily, to be taken with a cyclical progestogen for 12–14 days of each cycle in women with a uterus

ELLESTE SOLO[®] MX

Menopausal symptoms

BY TRANSDERMAL APPLICATION

- ▶ Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *MX 40*, subsequently adjust according to response

Osteoporosis prophylaxis

BY TRANSDERMAL APPLICATION

- ▶ Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *MX 80*, subsequently adjust according to response

ESTRADERM MX[®]

Menopausal symptoms

BY TRANSDERMAL APPLICATION

- ▶ Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus, initiate therapy with *MX25* for first 3 months; subsequently adjust according to response

Osteoporosis prophylaxis

BY TRANSDERMAL APPLICATION

- ▶ Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus, initiate therapy with *MX50*; subsequently adjust according to response

ESTRADOT[®]

Menopausal symptoms

BY TRANSDERMAL APPLICATION

- ▶ Adult: Apply 1 patch twice weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *25 patch* for 3 months; subsequently adjust according to response

Osteoporosis prophylaxis

BY TRANSDERMAL APPLICATION

- ▶ Adult: Apply 1 patch twice weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *50 patch*; subsequently adjust according to response

EVOREL[®]

Menopausal symptoms | Osteoporosis prophylaxis

BY TRANSDERMAL APPLICATION

- ▶ Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), continued →

to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, therapy should be initiated with *Evorel* 50 patch; subsequently adjust according to response; dose may be reduced to *Evorel* 25 patch after first month if necessary for menopausal symptoms **only**

FEMSEVEN®**Menopausal symptoms | Osteoporosis prophylaxis**

BY TRANSDERMAL APPLICATION

▶ Adult: Apply 1 patch once weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *FemSeven* 50 patches for the first few months, subsequently adjust according to response

PROGYNVA® TS**Menopausal symptoms | Osteoporosis prophylaxis**

BY TRANSDERMAL APPLICATION

▶ Adult: Apply 1 patch once weekly continuously, alternatively apply 1 patch once weekly for 3 weeks, followed by a 7-day patch-free interval (cyclical), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *Prognova* TS 50, subsequently adjust according to response, women receiving *Prognova* TS 100 patches for menopausal symptoms may continue with this strength for osteoporosis prophylaxis

ESTROGEL®**Menopausal symptoms**

TO THE SKIN

▶ Adult: Apply 1.5 mg once daily continuously, increased if necessary up to 3 mg after 1 month continuously, to be applied over an area twice that of the template provided, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus

Osteoporosis prophylaxis

TO THE SKIN

▶ Adult: Apply 1.5 mg once daily continuously, to be applied over an area twice that of the template provided, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus

Dose equivalence and conversion

2 measures is equivalent to estradiol 1.5 mg.

SANDRENA®**Menopausal symptoms**

TO THE SKIN

▶ Adult: Apply 1 mg once daily, to be applied over area 1–2 times size of hand; with cyclical progestogen for 12–14 days of each cycle in women with a uterus, dose may be adjusted after 2–3 cycles to lowest effective dose; usual dose 0.5–1.5 mg daily

ESTRING®**Postmenopausal urogenital conditions (not suitable for vasomotor symptoms or osteoporosis prophylaxis)**

BY VAGINA

▶ Adult: To be inserted into upper third of vagina and worn continuously; replace after 3 months; max. duration of continuous treatment 2 years

VAGIFEM®**Improve the vaginal epithelium in menopausal atrophic vaginitis**

BY VAGINA

▶ Adult: 1 tablet daily for 2 weeks, then reduced to 1 tablet twice weekly

● **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) · active thrombophlebitis · Dubin-Johnson syndrome (or monitor closely) · history of breast cancer · history of recurrent venous thromboembolism (unless already on anticoagulant treatment) · oestrogen-dependent cancer · recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · Rotor syndrome (or monitor closely) · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia · venous thromboembolism

● **CAUTIONS****GENERAL CAUTIONS**

Acute porphyrias p. 864 · diabetes (increased risk of heart disease) · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia; factors predisposing to thromboembolism · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · hypophyseal tumours · increased risk of gall-bladder disease · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size

SPECIFIC CAUTIONS

▶ With vaginal use Interrupt treatment periodically to assess need for continued treatment

CAUTIONS, FURTHER INFORMATION

Risk of breast cancer It is estimated that using *all* types of HRT increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.

Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use. In *women who have predisposing factors* (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. *Travel* involving prolonged immobility further increases the risk of deep vein thrombosis.

Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little

information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **INTERACTIONS** → Appendix 1 (oestrogens).

- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

Abdominal bloating · abdominal cramps · altered blood lipids (may lead to pancreatitis, rashes and chloasma) · breast enlargement · breast tenderness · changes in libido · cholestatic jaundice · contact lenses may irritate · depression · dizziness · fluid retention · glucose intolerance · headache · headache (on vigorous exercise) · leg cramps (rule out venous thrombosis) · migraine · mood changes · nausea · premenstrual-like syndrome · sodium retention · vaginal candidiasis · vomiting · weight changes

SPECIFIC SIDE-EFFECTS

- ▶ **With transdermal use** Cause contact sensitisation (possible severe hypersensitivity reaction on continued exposure)
- ▶ **With vaginal use** Local irritation

SIDE-EFFECTS, FURTHER INFORMATION

Withdrawal bleeding Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in *regular withdrawal bleeding* towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but *irregular bleeding* may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

- **CONCEPTION AND CONTRACEPTION** HRT does **not** provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

VAGIFEM® No evidence of damage to latex condoms and diaphragms.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid; adverse effects on lactation.
- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.
- **MONITORING REQUIREMENTS**
 - ▶ History of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer).
 - ▶ The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration

given to any symptoms of endometrial hyperplasia or carcinoma.

- **DIRECTIONS FOR ADMINISTRATION**

- ▶ With transdermal use Patch should be removed after 3–4 days (or once a week in case of 7-day patch) and replaced with fresh patch on slightly different site; recommended sites: clean, dry, unbroken areas of skin on trunk below waistline; not to be applied on or near breasts or under waistband. If patch falls off in bath allow skin to cool before applying new patch.

- **PATIENT AND CARER ADVICE**

- ▶ With transdermal use Patient counselling is advised for estradiol patches (administration).
- ▶ With topical use Patient counselling is advised for estradiol gels (administration).

ESTROGEL® Apply gel to clean, dry, intact skin such as arms, shoulders or inner thighs and allow to dry for 5 minutes before covering with clothing. Not to be applied on or near breasts or on vulval region. Avoid skin contact with another person (particularly male) and avoid other skin products or washing the area for at least 1 hour after application.

SANDRENA® Apply gel to intact areas of skin such as lower trunk or thighs, using right and left sides on alternate days. Wash hands after application. Not to be applied on the breasts or face and avoid contact with eyes. Allow area of application to dry for 5 minutes and do not wash area for at least 1 hour.

FEMOSTON® 2 MG/10 MG**Menopausal symptoms in women with a uterus**

BY MOUTH

- ▶ **Adult:** 1 tablet daily for 14 days, red tablet to be taken and started within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), then 1 tablet daily for 14 days, yellow tablet to be taken, subsequent courses repeated without interval, *Femoston® 1 mg/10 mg* given initially and *Femoston® 2 mg/10 mg* substituted if symptoms not controlled

Osteoporosis prophylaxis in women with a uterus

BY MOUTH

- ▶ **Adult:** 1 tablet daily for 14 days, red tablet to be taken and started within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), then 1 tablet daily for 14 days, yellow tablet to be taken, subsequent courses repeated without interval

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 · genital or breast cancer · history during pregnancy of idiopathic jaundice, severe pruritus, or pemphigoid gestationis · history of liver tumours · severe arterial disease · undiagnosed vaginal bleeding
- **CAUTIONS** Conditions that may worsen with fluid retention e.g. epilepsy, hypertension, migraine, asthma, or cardiac dysfunction · diabetes (progestogens can decrease glucose tolerance) · history of depression · in those susceptible to thromboembolism (particular caution with high dose)
- **INTERACTIONS** → Appendix 1 (progestogens).
- **SIDE-EFFECTS** Acne · alopecia · anaphylactoid reactions · bloating · breast tenderness · change in libido · depression · dizziness · drowsiness · fluid retention · headache · hirsutism · insomnia · jaundice · menstrual disturbances · nausea · premenstrual-like syndrome · pruritus · rash · skin reactions · urticaria · weight change
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Use with caution.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet▶ **DYDROGESTERONE WITH ESTRADIOL (Non-proprietary)**

Dydrogesterone 10 mg, Estradiol 2 mg Estradiol 2mg / Dydrogesterone 10mg tablets | 42 tablet [PoM] no price available
Dydrogesterone 10 mg, Estradiol 1 mg Estradiol 1mg / Dydrogesterone 10mg tablets | 42 tablet [PoM] no price available

▶ **Femoston-conti** (BGP Products Ltd)

Dydrogesterone 2.5 microgram, Estradiol 500 microgram Femoston-conti 0.5mg/2.5mg tablets | 84 tablet [PoM] £24.43

Dydrogesterone 5 mg, Estradiol 1 mg Femoston-conti 1mg/5mg tablets | 84 tablet [PoM] £24.43 DT price = £24.43

Femoston 2/10mg tablets | 84 tablet [PoM] £16.16

Estradiol with estril and estrone

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 649, estril p. 713.

INDICATIONS AND DOSE**Menopausal symptoms | Osteoporosis prophylaxis**

BY MOUTH

- ▶ **Adult:** 1–2 tablets daily continuously or cyclically (21 days out of 28), started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet▶ **Hormonin** (AMCo)

Estradiol 600 microgram, Estriol 270 microgram, Estrone 1.4 mg Hormonin tablets | 84 tablet [PoM] £7.93

Estradiol with levonorgestrel

The properties listed below are those particular to the combination only. For the properties of the components please consider, levonorgestrel p. 692, estradiol p. 649.

INDICATIONS AND DOSE**FEMSEVEN CONTI®****Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously**

BY TRANSDERMAL APPLICATION

- ▶ **Adult:** Apply 1 patch once weekly continuously

FEMSEVEN SEQUI®**Menopausal symptoms in women with a uterus**

BY TRANSDERMAL APPLICATION

- ▶ **Adult:** Apply 1 phase 1 patch once weekly for 2 weeks, then apply 1 phase 2 patch once weekly for 2 weeks, subsequent courses are repeated without interval

- **PATIENT AND CARER ADVICE** Patient counselling is advised for estradiol with levonorgestrel patches (application).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Transdermal patch▶ **FemSeven Conti** (Teva UK Ltd)

Estradiol 50 microgram per 24 hour, Levonorgestrel 7 microgram per 24 hour FemSeven Conti patches | 4 patch [PoM] £15.48 | 12 patch [PoM] £44.12

▶ **FemSeven Sequi** (Teva UK Ltd)

FemSeven Sequi patches | 4 patch [PoM] £13.18 | 12 patch [PoM] £37.54

Estradiol with medroxyprogesterone

The properties listed below are those particular to the combination only. For the properties of the components please consider, medroxyprogesterone acetate p. 695, estradiol p. 649.

INDICATIONS AND DOSE**INDIVINA® TABLETS****Menopausal symptoms in women with a uterus whose last menstrual period occurred over 3 years previously |****Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 3 years previously**

BY MOUTH

- ▶ **Adult:** Initially 1/2.5 mg daily taken continuously, adjusted according to response, to be started at end of scheduled bleed if changing from cyclical HRT

TRIDESTRA®**Menopausal symptoms in women with a uterus |****Osteoporosis prophylaxis in women with a uterus**

BY MOUTH

- ▶ **Adult:** 1 white tablet daily for 70 days, then 1 blue tablet daily for 14 days, then 1 yellow tablet daily for 7 days, subsequent courses are repeated without interval

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

▶ **Tridestra** (Orion Pharma (UK) Ltd)

Tridestra tablets | 91 tablet [PoM] £20.49

Estradiol with norethisterone

The properties listed below are those particular to the combination only. For the properties of the components please consider, norethisterone p. 656, estradiol p. 649.

INDICATIONS AND DOSE**CLIMAGEST® 1-MG****Menopausal symptoms****BY MOUTH**

- ▶ Adult: 1 grey tablet daily for 16 days, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 white tablet daily for 12 days, subsequent courses are repeated without interval

CLIMAGEST® 2-MG**Menopausal symptoms (if symptoms not controlled with lower strength)****BY MOUTH**

- ▶ Adult: 1 blue tablet daily for 16 days, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 white tablet daily for 12 days, subsequent courses are repeated without interval

CLIMESSE®

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

BY MOUTH

- ▶ Adult: 1 tablet daily continuously

CLINORETTE®

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

BY MOUTH

- ▶ Adult: 1 white tablet daily for 16 days, starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 pink tablet daily for 12 days, subsequent courses repeated without interval

ELLESTE-DUET® CONTI

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

BY MOUTH

- ▶ Adult: 1 tablet daily continuous basis, if changing from cyclical HRT begin treatment at the end of scheduled bleed

ELLESTE-DUET® 1-MG**Menopausal symptoms****BY MOUTH**

- ▶ Adult: 1 white tablet daily for 16 days, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 green tablet daily for 12 days, subsequent courses are repeated without interval

ELLESTE-DUET® 2-MG**Menopausal symptoms | Osteoporosis prophylaxis****BY MOUTH**

- ▶ Adult: 1 orange tablet daily for 16 days, to be started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 grey tablet daily for 12 days, subsequent courses are repeated without interval

EVOREL® CONTI

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

BY TRANSDERMAL APPLICATION

- ▶ Adult: Apply 1 patch twice weekly continuously

EVOREL® SEQUI

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

BY TRANSDERMAL APPLICATION

- ▶ Adult: Apply 1 Evorel® 50 patch twice weekly for 2 weeks, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), followed by 1 Evorel® Conti patch twice weekly, subsequent courses are repeated without interval.

KLIOFEM®

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

BY MOUTH

- ▶ Adult: 1 tablet daily continuously, to be started at end of scheduled bleed if changing from cyclical HRT

KLIOVANCE®

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

BY MOUTH

- ▶ Adult: 1 tablet daily continuously, to be started at end of scheduled bleed if changing from cyclical HRT

NOVOFEM®

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

BY MOUTH

- ▶ Adult: 1 red tablet daily for 16 days, then 1 white tablet daily for 12 days, subsequent courses are repeated without interval; start treatment with red tablet at any time or if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase

NUVELLE® CONTINUOUS

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

BY MOUTH

- ▶ Adult: 1 tablet daily continuously, if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase

TRISEQUENS®

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

BY MOUTH

- ▶ Adult: 1 blue tablet daily for 12 days, followed by 1 white tablet daily for 10 days, then 1 red tablet daily for 6 days, subsequent courses are repeated without interval

● PATIENT AND CARER ADVICE

EVOREL® SEQUI

Patients and carers should be advised on the application of Evorel® Sequi patches.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Estradiol with norgestrel

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 649.

INDICATIONS AND DOSE

CYCLO-PROGYNOVA® 2MG TABLETS

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

BY MOUTH

- ▶ Adult: 1 white tablet daily for 11 days; started on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 brown tablet daily for 10 days, followed by a 7-day tablet free interval

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Cyclo-Progynova** (Meda Pharmaceuticals Ltd)
Cyclo-Progynova 2mg tablets | 21 tablet [PoM] £3.11

Ethinylestradiol

(Ethinylloestradiol)

INDICATIONS AND DOSE

Short-term treatment of symptoms of oestrogen deficiency | Osteoporosis prophylaxis if other drugs cannot be used

BY MOUTH

- ▶ Adult: 10–50 micrograms daily for 21 days, repeated after 7-day tablet-free period, to be given with progestogen for 12–14 days per cycle in women with intact uterus.

Female hypogonadism

BY MOUTH

- ▶ Adult: 10–50 micrograms daily usually on cyclical basis, initial oestrogen therapy should be followed by combined oestrogen and progestogen therapy.

Menstrual disorders

BY MOUTH

- ▶ Adult: 20–50 micrograms daily from day 5 to 25 of each cycle, to be given with progestogen, added either throughout the cycle or from day 15 to 25.

Palliative treatment of prostate cancer

BY MOUTH

- ▶ Adult: 0.15–1.5 mg daily.

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 · active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · active thrombophlebitis · Dubin-Johnson and Rotor syndromes (or monitor closely) · gallstones · heart disease associated with pulmonary hypertension · heart disease associated with risk of embolus · history during pregnancy of cholestatic jaundice · history during pregnancy of chorea · history during pregnancy of pemphigoid gestationis · history during pregnancy of pruritus · history of breast cancer · history of haemolytic uraemic syndrome · liver disease (where liver function tests have failed to return to normal) · migraine with aura · oestrogen-dependent cancer · sclerosing treatment for varicose veins · severe or multiple risk factors for arterial disease · severe or multiple risk factors for venous thromboembolism · systemic lupus erythematosus with (or unknown) antiphospholipid antibodies · thrombophilic disorder · transient cerebral ischaemic attacks without headaches · undiagnosed vaginal bleeding · untreated endometrial hyperplasia · venous thromboembolism, or history of recurrent venous thromboembolism (unless already on anticoagulant treatment)
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · cardiovascular disease (sodium retention with oedema, thromboembolism) · Crohn's disease · diabetes (increased risk of heart disease) · gene mutations associated with breast cancer (e.g. BRCA 1) · history of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of severe depression (especially if induced by hormonal contraceptive) · hyperprolactinaemia (seek specialist advice) · hypophyseal tumours · increased risk of gall-bladder disease · inflammatory bowel disease · migraine (migraine-like headaches) · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for arterial disease · risk factors for migraine · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed breast mass

CAUTIONS, FURTHER INFORMATION

Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present, see above). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

Risk of venous thromboembolism Use with **caution** if any of following factors present but **avoid** if two or more factors present:

- **family history of venous thromboembolism** in first-degree relative aged under 45 years (avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
- **obesity**—body mass index ≥ 30 kg/m² (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
- **long-term immobilisation** e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
- **history of superficial thrombophlebitis**;
- **age over 35 years** (avoid if over 50 years);
- **smoking**.

Risk factors for arterial disease Use with **caution** if any one of following factors present but **avoid** if two or more factors present:

- **family history of arterial disease** in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
- **diabetes mellitus** (avoid if diabetes complications present);
- **hypertension**—blood pressure above **systolic 140 mmHg or diastolic 90 mmHg** (avoid if blood pressure above **systolic 160 mmHg or diastolic 95 mmHg**); (In adolescents, avoid if blood pressure very high);
- **smoking** (avoid if smoking 40 or more cigarettes daily);
- **age over 35 years** (avoid if over 50 years);
- **obesity** (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
- **migraine without aura** (avoid if **migraine with aura** (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

Migraine Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

- **INTERACTIONS** → Appendix 1 (oestrogens).

● SIDE-EFFECTS

- ▶ **Rare** Gallstones · systemic lupus erythematosus
- ▶ **Frequency not known** Abdominal bloating · abdominal cramps · absence of withdrawal bleeding · altered blood lipids (may lead to pancreatitis) · amenorrhoea after discontinuation · breast enlargement · breast secretion · breast tenderness · cervical erosion · changes in libido · changes in lipid metabolism · changes in vaginal discharge · chloasma · cholestatic jaundice · chorea · contact lenses may irritate · depression · dizziness · feminising effects · fluid retention · glucose intolerance · headache · hepatic tumours · hypertension · irritability · leg cramps (rule out venous thrombosis) · liver impairment · migraine · mood changes · nausea · nervousness · photosensitivity · premenstrual-like syndrome · rashes · reduced menstrual loss · skin reactions · sodium retention · symptoms of endometriosis may be exacerbated · thrombosis (more

common when factor V Leiden present or in blood groups A, B, and AB) · uterine fibroids may increase in size · vaginal candidiasis · visual disturbances · vomiting · weight changes · 'spotting' in early cycles

SIDE-EFFECTS, FURTHER INFORMATION

Withdrawal bleeding Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **HEPATIC IMPAIRMENT** Avoid.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, capsule

Tablet▶ **ETHINYLESTRADIOL (Non-proprietary)**

Ethinylestradiol 2 microgram Ethinylestradiol 2microgram tablets | 100 tablet [POM] £200.00

Ethinylestradiol 10 microgram Ethinylestradiol 10microgram tablets | 21 tablet [POM] £200.00 DT price = £200.00

Ethinylestradiol 50 mg Ethinylestradiol 50microgram tablets | 21 tablet [POM] £200.00 DT price = £200.00

PROGESTOGENS**Norethisterone****INDICATIONS AND DOSE****Endometriosis****BY MOUTH**

- ▶ **Adult:** 10–15 mg daily for 4–6 months or longer, to be started on day 5 of cycle; increased to 20–25 mg daily if required, dose only increased if spotting occurs and reduced once bleeding has stopped

Dysfunctional uterine bleeding (to arrest bleeding) |**Menorrhagia (to arrest bleeding)****BY MOUTH**

- ▶ **Adult:** 5 mg 3 times a day for 10 days

Dysfunctional uterine bleeding (to prevent bleeding) |**Menorrhagia (to prevent bleeding)****BY MOUTH**

- ▶ **Adult:** 5 mg twice daily, to be taken from day 19 to day 26 of cycle

Dysmenorrhoea**BY MOUTH**

- ▶ **Adult:** 5 mg 3 times a day for 3–4 cycles, to be taken from day 5–24 of cycle

Premenstrual syndrome (but not recommended)**BY MOUTH**

- ▶ **Adult:** 5 mg 2–3 times a day for several cycles, to be taken from day 19–26 of cycle

Postponement of menstruation**BY MOUTH**

- ▶ **Females of childbearing potential:** 5 mg 3 times a day, to be started 3 days before expected onset (menstruation occurs 2–3 days after stopping)

Breast cancer

BY MOUTH

- ▶ Adult: 40 mg daily, increased if necessary to 60 mg daily

Short-term contraception

BY DEEP INTRAMUSCULAR INJECTION

- ▶ Females of childbearing potential: 200 mg, to be administered within first 5 days of cycle or immediately after parturition (duration 8 weeks), then 200 mg after 8 weeks if required

Contraception

BY MOUTH

- ▶ Females of childbearing potential: 350 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 3 hours or more it should be regarded as a 'missed pill'

● CONTRA-INDICATIONS**GENERAL CONTRA-INDICATIONS**

Avoid in patients with a history of liver tumours · breast cancer (unless progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history during pregnancy of idiopathic jaundice · history during pregnancy of pemphigoid gestationis (non-contraceptive indications) · history during pregnancy of severe pruritus (non-contraceptive indications) · when used as a contraceptive, history of breast cancer (can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable)

SPECIFIC CONTRA-INDICATIONS

- ▶ With oral use Acute porphyrias p. 864 · severe arterial disease · undiagnosed vaginal bleeding

● CAUTIONS**GENERAL CAUTIONS**

Asthma · cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · epilepsy · history of depression · hypertension · migraine · susceptibility to thromboembolism (particular caution with high dose)

SPECIFIC CAUTIONS

- ▶ When used for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) anti-phospholipid antibodies with intramuscular use for contraception disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus · possible risk of breast cancer

CAUTIONS, FURTHER INFORMATION

Use as a contraceptive in co-morbidities The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

Breast cancer risk with contraceptive use There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess

risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

● INTERACTIONS → Appendix 1 (progestogens).

- ▶ With intramuscular use Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of norethisterone intramuscular injection is not affected by enzyme-inducing drugs and may be continued as normal during courses of these drugs.

● SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

Acne · alopecia · anaphylactoid reactions · breast tenderness · change in libido · depression · disturbance of appetite · dizziness · fluid retention · headache · hirsutism · insomnia (non-contraceptive indications) · jaundice · menstrual disturbances · nausea · premenstrual-like syndrome · pruritus · rash · skin reactions · urticaria · vomiting · weight change

SPECIFIC SIDE-EFFECTS

- ▶ With intramuscular use Injection-site reactions

SIDE-EFFECTS, FURTHER INFORMATION

Cervical cancer Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives (use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years). The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

- **PREGNANCY** Masculinisation of female fetuses and other defects reported with non-contraceptive use.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation. Higher doses (used in malignant conditions) may suppress lactation and alter milk composition—use lowest effective dose.
- ▶ With intramuscular use Withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment.
- **HEPATIC IMPAIRMENT** When used as a contraceptive; caution in severe liver disease and recurrent cholestatic jaundice, avoid in liver tumour. Avoid in non-contraceptive indications.
- **RENAL IMPAIRMENT** Use with caution in non-contraceptive indications.
- **PATIENT AND CARER ADVICE**

Missed oral contraceptive pill The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.'

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Diarrhoea and vomiting with oral contraceptives Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Starting routine for oral contraceptives One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not necessary when initiating treatment.

Changing from a combined oral contraceptive: start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth: oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

Contraceptives by injection Full counselling backed by *patient information leaflet* required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

Progesterone

INDICATIONS AND DOSE

UTROGESTAN® CAPSULES

Progestogenic opposition of oestrogen HRT

BY MOUTH

▶ Adult: 200 mg once daily on days 15–26 of each 28-day oestrogen HRT cycle, alternatively 100 mg once daily on days 1–25 of each 28-day oestrogen HRT cycle

GESTONE® SOLUTION FOR INJECTION

Dysfunctional uterine bleeding

BY DEEP INTRAMUSCULAR INJECTION

▶ Adult: 5–10 mg daily for 5–10 days until 2 days before expected onset of menstruation, to be administered into buttocks

Recurrent miscarriage due to inadequate luteal phase (but not recommended) or following in vitro fertilisation or gamete intra-fallopian transfer

BY DEEP INTRAMUSCULAR INJECTION

▶ Adult: 25–100 mg 2–7 times a week from day 15, or day of embryo or gamete transfer, until 8–16 weeks of

pregnancy, to be administered into buttocks; maximum 200 mg per day

LUBION® SOLUTION FOR INJECTION

Supplementation of luteal phase during assisted reproductive technology (ART) treatment in women for whom vaginal preparations are inappropriate

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

▶ Adult: 25 mg once daily from day of oocyte retrieval up to week 12 of pregnancy

CYCLOGEST® PESSARIES

Premenstrual syndrome | Post-natal depression

BY VAGINA OR BY RECTUM

▶ Adult: 200–800 mg daily, doses above 200 mg to be given in 2 divided doses, for premenstrual syndrome start on day 12–14 and continue until onset of menstruation (but not recommended); rectally if barrier methods of contraception are used, in patients who have recently given birth or in those who suffer from vaginal infection or recurrent cystitis

UTROGESTAN® VAGINAL CAPSULES

Supplementation of luteal phase during assisted reproductive technology (ART) cycles

BY VAGINA

▶ Adult: 1 capsule 3 times a day from day of embryo transfer until at least week 7 of pregnancy up to week 12 of pregnancy

● **CONTRA-INDICATIONS** Acute porphyrias p. 864 · avoid in patients with a history of liver tumours · breast cancer (unless progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history during pregnancy of idiopathic jaundice · history during pregnancy of pemphigoid gestationis · history during pregnancy of severe pruritus · incomplete miscarriage · missed miscarriage · severe arterial disease · undiagnosed vaginal bleeding

● **CAUTIONS** Asthma · cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · epilepsy · history of depression · hypertension · migraine · susceptibility to thromboembolism (particular caution with high dose)

● **INTERACTIONS** → Appendix 1 (progestogens).

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Acne · alopecia · anaphylactoid reactions · bloating · breast tenderness · change in libido · depression · dizziness · drowsiness · fluid retention · headache · hirsutism · insomnia · jaundice · menstrual disturbances · nausea · premenstrual-like syndrome · pruritus · rash · skin reactions · urticaria · weight change

SPECIFIC SIDE-EFFECTS

▶ With intramuscular use or subcutaneous use Injection-site reactions

▶ With rectal use Diarrhoea · flatulence · pain

▶ With vaginal use Local irritation

● **PREGNANCY** Not known to be harmful.

● **BREAST FEEDING** Avoid—present in milk.

● **HEPATIC IMPAIRMENT** Avoid in hepatic impairment. Avoid in active liver disease including disorders of hepatic excretion (e.g. Dublin-Johnson or Rotor Syndromes), infective hepatitis (until liver function returns to normal) and liver tumours.

● **RENAL IMPAIRMENT** Use with caution.

● **DIRECTIONS FOR ADMINISTRATION** Capsules should be taken at bedtime on an empty stomach.

● **PATIENT AND CARER ADVICE** Patient counselling is advised for progesterone capsules (administration).

- **LESS SUITABLE FOR PRESCRIBING** Progesterone pessaries are less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream

Capsule

SELECTIVE OESTROGEN RECEPTOR MODULATORS

Raloxifene hydrochloride

INDICATIONS AND DOSE

Treatment and prevention of postmenopausal osteoporosis

BY MOUTH

▶ Adult: 60 mg once daily

- **CONTRA-INDICATIONS** Cholestasis · endometrial cancer · history of venous thromboembolism · undiagnosed uterine bleeding
- **CAUTIONS** Avoid in Acute porphyrias p. 864 · breast cancer (manufacturer advises avoid during treatment for breast cancer) · history of oestrogen-induced hypertriglyceridaemia (monitor serum triglycerides) · risk factors for stroke · risk factors for venous thromboembolism (discontinue if prolonged immobilisation)
- **INTERACTIONS** → Appendix 1 (raloxifene).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Hot flushes · influenza-like symptoms · leg cramps · peripheral oedema
 - ▶ **Uncommon** Thrombophlebitis · venous thromboembolism
 - ▶ **Rare** Arterial thromboembolism · breast discomfort · gastro-intestinal disturbances · headache · hypertension · migraine · rashes · thrombocytopenia
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

 - ▶ Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of

osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA160

Raloxifene is **not** recommended as a treatment option in postmenopausal women for primary prevention of osteoporotic fractures. www.nice.org.uk/TA160

- ▶ **Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008)** NICE TA161

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

Raloxifene is recommended as an alternative treatment option for women:

- in whom alendronate and risedronate are contra-indicated or not tolerated **and**
 - who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance (available at www.nice.org.uk/TA161).
- www.nice.org.uk/TA161

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ **RALOXIFENE HYDROCHLORIDE (Non-proprietary)**

Raloxifene hydrochloride 60 mg Raloxifene 60mg tablets | 28 tablet [PoM] £6.02-£17.06 DT price = £6.02 | 84 tablet [PoM] £14.63-£56.61

▶ **Evista** (Daiichi Sankyo UK Ltd)

Raloxifene hydrochloride 60 mg Evista 60mg tablets | 28 tablet [PoM] £17.06 DT price = £6.02 | 84 tablet [PoM] £59.59

▶ Brands may include Ostiral; Razylan

8.2 Anti-oestrogens

OVULATION STIMULANTS

Clomifene citrate (Clomiphene citrate)

- **DRUG ACTION** Anti-oestrogen which induces gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used as an adjunct.

INDICATIONS AND DOSE

Treatment of female infertility due to oligomenorrhoea or secondary amenorrhoea (e.g. associated with polycystic ovarian disease)

BY MOUTH

- ▶ Adult: 50 mg daily for 5 days, to be started within about 5 days of onset of menstruation (preferably on 2nd day) or at any time (normally preceded by a progestogen induced withdrawal bleed) if cycles have ceased, followed by 100 mg daily if required for a further 5 days, this second course may be given in absence of ovulation; most patients who are going to respond will do so to first course, 3 courses should constitute adequate therapeutic trial; long-term cyclical therapy not recommended.

Important safety information

The CSM has recommended that clomifene should not normally be used for longer than 6 cycles (possibly increased risk of ovarian cancer).

- **CONTRA-INDICATIONS** Abnormal uterine bleeding of undetermined cause · hormone-dependent tumours · ovarian cysts
- **CAUTIONS** Ectopic pregnancy · incidence of multiple births increased (consider ultrasound monitoring) · ovarian hyperstimulation syndrome · polycystic ovary syndrome (cysts may enlarge during treatment, also risk of exaggerated response to usual doses) · uterine fibroids
- **SIDE-EFFECTS** Abdominal discomfort · breast tenderness · convulsions · depression · dizziness · endometriosis · hair loss · headache · hot flushes · insomnia · intermenstrual spotting · menorrhagia · nausea · ovarian hyperstimulation (withdraw) · rashes · visual disturbances (withdraw and initiate ophthalmological examination) · vomiting · weight gain
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment.
- **PREGNANCY** Possible effects on fetal development.
- **BREAST FEEDING** May inhibit lactation.
- **HEPATIC IMPAIRMENT** Avoid in severe liver disease.
- **PATIENT AND CARER ADVICE** Patients planning to conceive should be warned that there is a risk of multiple pregnancy (rarely more than twins).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ CLOMIFENE CITRATE (Non-proprietary)

Clomifene citrate 50 mg Clomifene 50mg tablets | 30 tablet [PoM]
£21.74 DT price = £21.74

▶ Clomid (Sanofi)

Clomifene citrate 50 mg Clomid 50mg tablets | 30 tablet [PoM]
£8.46 DT price = £21.74

8.3 Male sex hormone responsive conditions

Androgens, anti-androgens and anabolic steroids

Androgens

Androgens cause masculinisation; they may be used as replacement therapy in castrated adults and in those who are hypogonadal due to either pituitary or testicular disease. In the normal male they inhibit pituitary gonadotrophin secretion and depress spermatogenesis. Androgens also have an anabolic action which led to the development of anabolic steroids.

Androgens are useless as a treatment of impotence and impaired spermatogenesis unless there is associated hypogonadism; they should not be given until the hypogonadism has been properly investigated. Treatment should be under expert supervision.

When given to patients with hypopituitarism they can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone which will stimulate spermatogenesis as well as androgen production.

Intramuscular depot preparations of **testosterone esters** are preferred for replacement therapy. Testosterone enantate, propionate or undecanoate, or alternatively *Sustanon*[®], which consists of a mixture of testosterone esters and has a longer duration of action, may be used.

Anti-androgens

Cyproterone acetate

Cyproterone acetate p. 662 is an anti-androgen used in the treatment of severe hypersexuality and sexual deviation in the male. It inhibits spermatogenesis and produces reversible infertility (but is not a male contraceptive); abnormal sperm forms are produced. Fully informed consent is recommended and an initial spermatogram. As hepatic tumours have been produced in *animal* studies, careful consideration should be given to the risk/benefit ratio before treatment. Cyproterone acetate is also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy and has been used as an adjunct in prostatic cancer and in the treatment of acne and hirsutism in women.

Dutasteride and finasteride

Dutasteride p. 676 and finasteride p. 676 are alternatives to alpha-blockers particularly in men with a significantly enlarged prostate. Finasteride is also licensed for use with doxazosin in the management of benign prostatic hyperplasia.

A low strength of finasteride is licensed for treating male-pattern baldness in men.

Anabolic steroids

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in women. They are used in the treatment of some *aplastic anaemias*. Anabolic steroids have been given for osteoporosis in women but they are no longer advocated for this purpose.

The protein-building properties of anabolic steroids have not proved beneficial in the clinical setting. Their use as body builders or tonics is unjustified; some athletes abuse them.

ANDROGENS

Androgens

- **CONTRA-INDICATIONS** Breast cancer in males · history of liver tumours · hypercalcaemia · prostate cancer
- **CAUTIONS** Cardiac impairment · diabetes mellitus · elderly · epilepsy · hypertension · ischaemic heart disease · migraine · pre-pubertal boys (fusion of epiphyses is hastened and may result in short stature)—statural growth and sexual development should be monitored · skeletal metastases—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored) · sleep apnoea · stop treatment or reduce dose if severe polycythaemia occurs · tumours—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)
- **INTERACTIONS** → Appendix 1 (testosterone).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Acne · androgenic effects (to be assessed regularly in women) · anxiety · arthralgia · asthenia · changes in libido · cholestatic jaundice · depression · electrolyte disturbances · excessive duration of penile erection · excessive frequency of penile erection · gastro-intestinal bleeding · gynaecomastia · headache · hirsutism · hypercalcaemia · hypertension · increased bone growth · irritability · male-pattern baldness · muscle cramps · nausea · nervousness · oedema · paraesthesia · polycythaemia · precocious sexual development in pre-pubertal males · premature closure of epiphyses in pre-pubertal males · prostate abnormalities · prostate cancer · pruritus · seborrhoea · sodium retention · suppression of virilism in women · vomiting · weight gain

- ▶ **Rare** Liver tumours
- ▶ **Frequency not known** Sleep apnoea
- SIDE-EFFECTS, FURTHER INFORMATION**
Polycythaemia Stop treatment or reduce dose if severe polycythaemia occurs.
- **PREGNANCY** Avoid—causes masculinisation of female fetus.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid if possible—fluid retention and dose-related toxicity.
- **RENAL IMPAIRMENT** Caution—potential for fluid retention.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor prostate and PSA in men over 45 years.
 - ▶ Monitor haematocrit and haemoglobin before treatment, every three months for the first year, and yearly thereafter.
- **PATIENT AND CARER ADVICE** Women should be advised to report any signs of virilisation e.g. deepening of the voice or hirsutism.

Mesterolone

INDICATIONS AND DOSE

Androgen deficiency | Male infertility associated with hypogonadism

BY MOUTH

- ▶ **Adult:** 25 mg 3–4 times a day for several months, then maintenance 50–75 mg daily in divided doses

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Pro-Viron** (Bayer Plc)
Mesterolone 25 mg Pro-Viron 25mg tablets | 30 tablet **[PoM]** £4.19
Schedule 4 (CD Anab)

Testosterone

INDICATIONS AND DOSE

TESTIM[®]

Hypogonadism due to testosterone deficiency in men

BY TRANSDERMAL APPLICATION

- ▶ **Adult:** Apply 50 mg once daily, subsequent application adjusted according to response; maximum 100 mg per day

Dose equivalence and conversion

One tube of 5 g contains 50 mg testosterone.

TESTOGEL[®]

Hypogonadism due to androgen deficiency in men

BY TRANSDERMAL APPLICATION

- ▶ **Adult:** Apply 50 mg once daily; increased in steps of 25 mg, adjusted according to response; maximum 100 mg per day

Dose equivalence and conversion

One sachet of 5 g contains 50 mg of testosterone.

TOSTRAN[®]

Hypogonadism due to testosterone deficiency in men

BY TRANSDERMAL APPLICATION

- ▶ **Adult:** Apply 60 mg once daily, subsequent application adjusted according to response; maximum 80 mg per day

Dose equivalence and conversion

1 g of gel contains 20 mg testosterone.

- **SIDE-EFFECTS** Suppression of spermatogenesis · allergic reactions · local irritation
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With topical use Avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature.

TESTIM[®]

Squeeze entire content of tube on to one palm and apply as a thin layer on clean, dry, healthy skin of shoulder or upper arm, preferably in the morning after washing or bathing (if 2 tubes required use 1 per shoulder or upper arm); rub in and allow to dry before putting on clothing to cover site; wash hands with soap after application; avoid washing application site for at least 6 hours.

TESTOGEL[®]

Apply thin layer of gel on clean, dry, healthy skin such as shoulders, arms or abdomen, immediately after sachet is opened. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel, avoid shower or bath for at least 6 hours.

TOSTRAN[®]

Apply gel on clean, dry, intact skin of abdomen or both inner thighs, preferably in the morning. Gently rub in with a finger until dry before dressing. Wash hands with soap and water after applying gel; avoid washing application site for at least 2 hours. Not to be applied on genital area.

- **PATIENT AND CARER ADVICE** Patient or carer should be given advice on how to administer testosterone gel.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

8.4 Male sex hormone antagonist

ANTI-ANDROGENS

Cyproterone acetate

INDICATIONS AND DOSE

Hypersexuality | Sexual deviation

BY MOUTH

- ▶ Adult: 50 mg twice daily, to be taken after food.

Prevention of tumour flare with initial gonadorelin analogue therapy

BY MOUTH

- ▶ Adult: 200 mg daily in 2–3 divided doses for 5–7 days before initiation of gonadorelin analogue, followed by 200 mg daily in 2–3 divided doses for 3–4 weeks after initiation of gonadorelin analogue; maximum 300 mg per day.

Long-term palliative therapy where gonadorelin analogues or orchidectomy contra-indicated, not tolerated, or where oral therapy preferred

BY MOUTH

- ▶ Adult: 200–300 mg daily in 2–3 divided doses.

Hot flushes with gonadorelin analogue therapy or after orchidectomy

BY MOUTH

- ▶ Adult: Initially 50 mg daily, then adjusted according to response to 50–150 mg daily in 1–3 divided doses.

- **CONTRA-INDICATIONS** In hypersexuality, Dubin-Johnson syndrome · in hypersexuality, history of thromboembolic disorders · in hypersexuality, liver-disease · in hypersexuality, malignant diseases · in hypersexuality, previous or existing liver tumours · in hypersexuality, Rotor syndrome · in hypersexuality, severe depression · in hypersexuality, severe diabetes (with vascular changes) · in hypersexuality, sickle-cell anaemia · in hypersexuality, wasting diseases · meningioma or history of meningioma · youths under 18 years (may arrest bone maturation and testicular development)
- **CAUTIONS** Diabetes mellitus · in prostate cancer, severe depression · in prostate cancer, sickle-cell anaemia · ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known)

- **SIDE-EFFECTS**

- ▶ **Rare** Hypersensitivity reactions · osteoporosis · rash
- ▶ **Frequency not known** Breathlessness · changes in hair pattern · fatigue · gynaecomastia (rarely leading to galactorrhoea and benign breast nodules) · hepatic failure · hepatitis · hepatotoxicity · inhibition of spermatogenesis · jaundice · lassitude · reduced sebum production (may clear acne) · risk of recurrence of thromboembolic disease · weight changes

SIDE-EFFECTS, FURTHER INFORMATION

Hepatotoxicity Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (fatalities reported, usually after several months, at dosages of 100 mg and above). If hepatotoxicity is confirmed, cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as

metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk).

- **HEPATIC IMPAIRMENT** Avoid (unless used for prostate cancer)—dose-related toxicity.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor blood counts initially and throughout treatment.
 - ▶ Monitor adrenocortical function regularly.
 - ▶ Monitor hepatic function regularly—liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur.
- **PATIENT AND CARER ADVICE** Fatigue and lassitude may impair performance of skilled tasks (e.g. driving).

9 Thyroid disorders

THYROID STIMULATING HORMONES

Thyrotropin alfa

(Recombinant human thyroid stimulating hormone; rhTSH)

- **DRUG ACTION** Thyrotropin alfa is a recombinant form of thyrotrophin (thyroid stimulating hormone).

INDICATIONS AND DOSE

Detection of thyroid remnants and thyroid cancer in post-thyroidectomy patients, together with serum thyroglobulin testing (with or without radioiodine imaging) | To increase radio-iodine uptake for the ablation of thyroid remnant tissue in suitable post-thyroidectomy patients

BY INTRAMUSCULAR INJECTION

- ▶ **Adult:** 900 micrograms every 24 hours for 2 doses, dose to be administered into the gluteal muscle, consult product literature for further information on indications and dose
- **CAUTIONS** Presence of thyroglobulin autoantibodies may give false negative results
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dizziness · fatigue · headache · nausea · vomiting
 - ▶ **Uncommon** Asthenia · back pain · influenza-like symptoms · paraesthesia · rash · urticaria
 - ▶ **Rare** Diarrhoea
 - ▶ **Very rare** Arthralgia · dyspnoea · flushing · hyperhidrosis · injection-site pain · injection-site pruritus · injection-site rash · injection-site reactions · myalgia · pain at site of metastases · palpitation · tremor

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated if previous hypersensitivity to bovine or human thyrotrophin.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.

9.1 Hyperthyroidism

Antithyroid drugs

Antithyroid drugs are used for hyperthyroidism either to prepare patients for thyroidectomy or for long-term management. In the UK carbimazole is the most commonly used drug. Propylthiouracil p. 664 should be reserved for patients who are intolerant of carbimazole or for those who experience sensitivity reactions to carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

Over-treatment with antithyroid drugs can result in the rapid development of hypothyroidism and should be avoided particularly during pregnancy because it can cause fetal goitre.

A combination of carbimazole with levothyroxine sodium daily p. 665, may be used in a *blocking-replacement regimen*; therapy is usually given for 18 months. The blocking-replacement regimen is **not** suitable during pregnancy.

Iodine has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide (¹³¹I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

Propranolol hydrochloride p. 146 is useful for rapid relief of thyrotoxic symptoms and may be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol hydrochloride p. 146 has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol hydrochloride but nadolol p. 145 is also used.

Thyrotoxic crisis ('thyroid storm') requires emergency treatment with intravenous administration of fluids, propranolol hydrochloride and hydrocortisone p. 583 (as sodium succinate), as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

Pregnancy

Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen is **not** suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate, therefore

propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatotoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).

Drugs used for Hyperthyroidism not listed below;
Metoprolol tartrate, p. 144; *Nadolol*, p. 145; *Propranolol hydrochloride*, p. 146

ANTITHYROID

Carbimazole

INDICATIONS AND DOSE

Hyperthyroidism

BY MOUTH

- ▶ **Adult:** 15–40 mg daily continue until the patient becomes euthyroid, usually after 4 to 8 weeks, higher doses should be prescribed under specialist supervision only, then reduced to 5–15 mg daily, reduce dose gradually, therapy usually given for 12 to 18 months

Hyperthyroidism (blocking-replacement regimen) in combination with levothyroxine

BY MOUTH

- ▶ **Adult:** 40–60 mg daily, therapy usually given for 18 months

Dose equivalence and conversion

When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

Important safety information

NEUTROPENIA AND AGRANULOCYTOSIS

Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

- Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.
- A white blood cell count should be performed if there is any clinical evidence of infection.
- Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

- **CONTRA-INDICATIONS** Severe blood disorders

● SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · fever · headache · jaundice · malaise · mild gastro-intestinal disturbances · nausea · pruritus · rash · taste disturbance
- ▶ **Rare** Agranulocytosis · alopecia · bone marrow suppression · jaundice · myopathy · pancytopenia

SIDE-EFFECTS, FURTHER INFORMATION

Rashes and pruritus are common with carbimazole but they can be treated with antihistamines without discontinuing therapy; alternatively propylthiouracil can be substituted.

- **PREGNANCY** Carbimazole can be given but the blocking-replacement regimen is **not** suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate. Carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).

- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used.

- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.

- **PATIENT AND CARER ADVICE** Warn patient or carers to tell doctor **immediately** if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, capsule

Tablet

▶ CARBIMAZOLE (Non-proprietary)

Carbimazole 5 mg Carbimazole 5mg tablets | 100 tablet **[PoM]**

£111.08 DT price = £84.80

Carbimazole 20 mg Carbimazole 20mg tablets | 100 tablet **[PoM]**

£272.93 DT price = £208.17

Propylthiouracil

INDICATIONS AND DOSE

Hyperthyroidism

BY MOUTH

- ▶ **Adult:** Initially 200–400 mg daily in divided doses until the patient becomes euthyroid, then reduced to 50–150 mg daily in divided doses, initial dose should be gradually reduced to the maintenance dose

Dose equivalence and conversion

When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

● SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · fever · headache · jaundice · leucopenia · malaise · mild gastro-intestinal disturbances · nausea · pruritus · rash · taste disturbance
- ▶ **Rare** Agranulocytosis · alopecia · aplastic anaemia · bone marrow suppression · cutaneous vasculitis · encephalopathy · hepatic disorders · hepatic failure · hepatic necrosis · hepatitis · hypoproteinaemia · jaundice · lupus erythematosus-like syndromes · myopathy · nephritis · pancytopenia · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION

Hepatotoxicity Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop.

- **PREGNANCY** Propylthiouracil can be given but the blocking-replacement regimen is **not** suitable. Propylthiouracil crosses the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).
- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function. Monitor infant's thyroid status.
- **HEPATIC IMPAIRMENT** Reduce dose.
- **RENAL IMPAIRMENT** Use three-quarters normal dose if eGFR 10–50 mL/minute/1.73 m². Use half normal dose if eGFR less than 10 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor for hepatotoxicity.

- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, or pruritus develop.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

► PROPYLTHIOURACIL (Non-proprietary)

Propylthiouracil 50 mg Propylthiouracil 50mg tablets | 56 tablet [PoM] £61.25-£73.50 DT price = £69.72 | 100 tablet [PoM] £131.25

ESSENTIAL TRACE ELEMENTS

Iodide with iodine

INDICATIONS AND DOSE

Thyrotoxicosis (pre-operative)

BY MOUTH USING ORAL SOLUTION

- Adult: 0.1–0.3 mL 3 times a day

- **CAUTIONS** Children · not for long-term treatment
- **SIDE-EFFECTS** Bronchitis · conjunctivitis · coryza-like symptoms · depression (on prolonged treatment) · goitre in infants of mothers taking iodides · headache · hypersensitivity reactions · impotence (on prolonged treatment) · insomnia (on prolonged treatment) · lacrimation · laryngitis · pain in salivary glands · rashes
- **PREGNANCY** Neonatal goitre and hypothyroidism.
- **BREAST FEEDING** Stop breast-feeding. Danger of neonatal hypothyroidism or goitre. Appears to be concentrated in milk.
- **DIRECTIONS FOR ADMINISTRATION** For oral solution, dilute well with milk or water.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 27

► IODIDE WITH IODINE (Non-proprietary)

Iodine 50 mg per 1 mL, Potassium iodide 100 mg per 1 mL Iodine aqueous oral solution | 500 mL [P] £9.58

9.2 Hypothyroidism

Thyroid hormones

Thyroid hormones are used in hypothyroidism (myxoedema), and also in diffuse non-toxic goitre, Hashimoto's thyroiditis (lymphadenoid goitre), and thyroid carcinoma. Neonatal hypothyroidism requires prompt treatment for normal development. Levothyroxine sodium below (thyroxine sodium) below is the treatment of choice for *maintenance* therapy.

In infants and children with congenital hypothyroidism and juvenile myxoedema, the dose of levothyroxine sodium should be titrated according to clinical response, growth assessment, and measurements of plasma thyroxine and thyroid-stimulating hormone.

Liothyronine sodium p. 666 has a similar action to levothyroxine sodium but is more rapidly metabolised and has a more rapid effect. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in *severe hypothyroid states* when a rapid response is desired.

Liothyronine sodium by intravenous injection is the treatment of choice in *hypothyroid coma*. Adjunctive therapy includes intravenous fluids, hydrocortisone p. 583, and treatment of infection; assisted ventilation is often required.

THYROID HORMONES

Levothyroxine sodium (Thyroxine sodium)

INDICATIONS AND DOSE

Hypothyroidism

BY MOUTH

- Adult 18–49 years: Initially 50–100 micrograms once daily; adjusted in steps of 25–50 micrograms every 3–4 weeks, adjusted according to response; maintenance 100–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication
- Adult 50 years and over: Initially 25 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication

Hypothyroidism in patients with cardiac disease | Severe hypothyroidism

BY MOUTH

- Adult: Initially 25 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication

Hyperthyroidism (blocking-replacement regimen) in combination with carbimazole

BY MOUTH

- Adult: 50–150 micrograms daily therapy usually given for 18 months

- **CONTRA-INDICATIONS** Thyrotoxicosis
- **CAUTIONS** Cardiovascular disorders · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · elderly · hypertension · long-standing hypothyroidism · myocardial infarction · myocardial insufficiency · panhypopituitarism (initiate corticosteroid therapy before starting levothyroxine) · predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine)
- **CAUTIONS, FURTHER INFORMATION**
Cardiovascular disorders Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia.
- **INTERACTIONS** → Appendix 1 (thyroid hormones).
- **SIDE-EFFECTS** Anginal pain (usually at excessive dosage) · arrhythmias (usually at excessive dosage) · diarrhoea (usually at excessive dosage) · excitability (usually at excessive dosage) · fever · flushing · headache · heat intolerance · hypersensitivity reactions · insomnia (usually at excessive dosage) · muscle cramp · muscular weakness · oedema · palpitation (usually at excessive dosage) · pruritus · rash · restlessness (usually at excessive dosage) · sweating · tachycardia (usually at excessive dosage) · transient hair loss in children · tremor (usually at excessive dosage) · vomiting (usually at excessive dosage) · weight-loss

SIDE-EFFECTS, FURTHER INFORMATION

Initial dosage in patients with cardiovascular disorders If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose.

- **PREGNANCY** Levothyroxine requirement may increase during pregnancy. Levothyroxine may cross the placenta. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus. Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).
- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder for solution for injection, oral suspension, oral solution, powder, capsule

Tablet▶ **LEVOthyroxine sodium (Non-proprietary)**

Levothyroxine sodium anhydrous 25 microgram Levothyroxine sodium 25microgram tablets | 28 tablet [PoM] £4.00 DT price = £2.95 | 500 tablet [PoM] £42.32-£52.68

Levothyroxine sodium anhydrous 50 microgram Levothyroxine sodium 50microgram tablets | 28 tablet [PoM] £3.00 DT price = £2.02 | 1000 tablet [PoM] £93.49

Levothyroxine sodium anhydrous 100 microgram Levothyroxine sodium 100microgram tablets | 28 tablet [PoM] £3.00 DT price = £2.02 | 1000 tablet [PoM] £92.51

Oral solution▶ **LEVOthyroxine sodium (Non-proprietary)**

Levothyroxine sodium anhydrous 5 microgram per 1 ml Levothyroxine sodium 25micrograms/5ml oral solution sugar free (sugar-free) | 100 ml [PoM] £90.92 DT price = £79.55

Levothyroxine sodium anhydrous 10 microgram per 1 ml Levothyroxine sodium 50micrograms/5ml oral solution sugar free (sugar-free) | 100 ml [PoM] £101.79 DT price = £96.16

Levothyroxine sodium anhydrous 20 microgram per 1 ml Levothyroxine sodium 100micrograms/5ml oral solution sugar free (sugar-free) | 100 ml [PoM] £142.94 DT price = £123.56

Liothyronine sodium (L-Tri-iodothyronine sodium)

INDICATIONS AND DOSE**Hypothyroidism****BY MOUTH**

- ▶ **Adult:** Initially 10–20 micrograms daily; increased to 60 micrograms daily in 2–3 divided doses, dose should be increased gradually, smaller initial doses given for the elderly

Hypothyroid coma**BY SLOW INTRAVENOUS INJECTION**

- ▶ **Adult:** 5–20 micrograms every 12 hours, increased to 5–20 micrograms every 4 hours if required, alternatively initially 50 micrograms for 1 dose, then 25 micrograms every 8 hours, reduced to 25 micrograms twice daily

Dose equivalence and conversion

20–25 micrograms of liothyronine sodium is equivalent to approximately 100 micrograms of levothyroxine sodium.

Brands without a UK licence may not be bioequivalent and dose adjustment may be necessary.

- **CONTRA-INDICATIONS** Thyrotoxicosis

- **CAUTIONS** Cardiovascular disorders · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · elderly · hypertension · long-standing hypothyroidism · myocardial infarction · myocardial insufficiency · panhypopituitarism (initiate corticosteroid therapy before starting levothyroxine) · predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine)

CAUTIONS, FURTHER INFORMATION

Cardiovascular disorders Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia.

- **INTERACTIONS** → Appendix 1 (thyroid hormones).
- **SIDE-EFFECTS** Anginal pain (usually at excessive dosage) · arrhythmias (usually at excessive dosage) · diarrhoea (usually at excessive dosage) · excitability (usually at excessive dosage) · fever · flushing · headache · heat intolerance · hypersensitivity reactions · insomnia (usually at excessive dosage) · muscle cramp · muscular weakness · oedema · palpitation (usually at excessive dosage) · pruritus · rash · restlessness (usually at excessive dosage) · sweating · tachycardia (usually at excessive dosage) · tremor (usually at excessive dosage) · vomiting (usually at excessive dosage) · weight-loss

SIDE-EFFECTS, FURTHER INFORMATION

Initial dosage in patients with cardiovascular disorders If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose.

- **PREGNANCY** Liothyronine requirement may increase during pregnancy. Does not cross the placenta in significant amounts. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus. Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine).
- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.
- **PRESCRIBING AND DISPENSING INFORMATION** Switching to a different brand Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent. Pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, solution for injection, oral suspension, oral solution, capsule

1 Bladder and urinary disorders

1.1 Urinary frequency, enuresis, and incontinence

Urinary frequency, enuresis and incontinence

Urinary frequency and incontinence

Incontinence in adults which arises from detrusor instability is managed by combining drug therapy with conservative methods for managing urge incontinence such as pelvic floor exercises and bladder training; stress incontinence is generally managed by non-drug methods. Duloxetine p. 288 can be added and is licensed for the treatment of moderate to severe stress incontinence in women; it may be more effective when used as an adjunct to pelvic floor exercises.

Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity. Oxybutynin hydrochloride p. 669 also has a direct relaxant effect on urinary smooth muscle. Side-effects limit the use of oxybutynin hydrochloride, but they may be reduced by starting at a lower dose. A modified-release preparation of oxybutynin hydrochloride is effective and has fewer side-effects; a transdermal patch is also available. The efficacy and side-effects of tolterodine tartrate p. 671 are comparable to those of modified-release oxybutynin hydrochloride. Flavoxate hydrochloride p. 669 has less marked side-effects but it is also less effective. Darifenacin p. 668, fesoterodine fumarate p. 668, propiverine hydrochloride p. 670, solifenacin succinate p. 670, and trospium chloride p. 671 are newer antimuscarinic drugs licensed for urinary frequency, urgency, and incontinence. The need for continuing antimuscarinic drug therapy should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

Propantheline bromide p. 74 and tricyclic antidepressants were used for urge incontinence but they are little used now because of their side-effects. The use of imipramine

hydrochloride p. 296 is limited by its potential to cause cardiac side-effects.

Mirabegron p. 671, a selective beta₃ agonist, is licensed for the treatment of urinary frequency, urgency, and urge incontinence associated with overactive bladder syndrome.

Purified bovine collagen implant (*Contigen*[®], Bard) is indicated for *urinary incontinence* caused by intrinsic sphincter deficiency (poor or non-functioning bladder outlet mechanism). The implant should be inserted only by surgeons or physicians trained in the technique for injection of the implant.

Nocturnal enuresis in children

Nocturnal enuresis is common in young children, but persists in a small proportion by 10 years of age. For children under 5 years, reassurance and advice on the management of nocturnal enuresis can be useful for some families. Treatment may be considered in children over 5 years depending on their maturity and motivation, the frequency of nocturnal enuresis, and the needs of the child and their family.

Initially, advice should be given on fluid intake, diet, toileting behaviour, and reward systems; for children who do not respond to this advice, further treatment may be necessary. An **enuresis alarm** should be first line treatment for motivated, well-supported children; alarms have a lower relapse rate than drug treatment when discontinued. Treatment should be reviewed after 4 weeks, and, if there are early signs of response, continued until a minimum of 2 weeks' uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months, only continue if the condition is still improving and the child remains motivated to use the alarm. If initial alarm treatment is unsuccessful, consider combination treatment with **desmopressin** p. 574, or desmopressin alone if the alarm is no longer appropriate or desirable.

Desmopressin is given by oral or by sublingual administration. Desmopressin alone can be offered to children over 5 years of age if an alarm is inappropriate or undesirable, or when rapid or short-term results are the priority (for example to cover periods away from home); desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm. Treatment should be assessed after 4 weeks and continued for

3 months if there are signs of response. Desmopressin should be withdrawn at regular intervals (for 1 week every 3 months) for full reassessment. When stopping treatment with desmopressin, gradual withdrawal should be considered.

Nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed with antimuscarinic drugs (see Urinary incontinence) in combination with desmopressin. Treatment should be prescribed only after specialist assessment and should be continued for 3 months; the course can be repeated if necessary.

The tricyclic antidepressant imipramine hydrochloride p. 296 may be considered for children who have not responded to all other treatments and have undergone specialist assessment, however, behavioural disturbances can occur and relapse is common after withdrawal. Treatment should not normally exceed 3 months unless a physical examination is made and the child is fully reassessed; toxicity following overdosage with tricyclics is of particular concern.

ANTIMUSCARINICS

Antimuscarinics (systemic)

- **CONTRA-INDICATIONS** Gastro-intestinal obstruction · intestinal atony · myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) · paralytic ileus · prostatic enlargement · pyloric stenosis · severe ulcerative colitis · significant bladder outflow obstruction · toxic megacolon · urinary retention
- **CAUTIONS** Acute myocardial infarction · arrhythmias (may be worsened) · autonomic neuropathy · cardiac insufficiency (due to association with tachycardia) · cardiac surgery (due to association with tachycardia) · conditions characterised by tachycardia · congestive heart failure (may be worsened) · coronary artery disease (may be worsened) · diarrhoea · elderly (especially if frail) · gastro-oesophageal reflux disease · hiatus hernia with reflux oesophagitis · hypertension · hyperthyroidism (due to association with tachycardia) · individuals susceptible to angle-closure glaucoma · prostatic hyperplasia · pyrexia · ulcerative colitis
- **INTERACTIONS** → Appendix 1 (antimuscarinics). Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urine retention, and constipation. Concomitant use of other drugs with antimuscarinic effects can also lead to confusion in the elderly.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Constipation · dilation of pupils with loss of accommodation · dry mouth · photophobia · reduced bronchial secretions · skin dryness · skin flushing · transient bradycardia (followed by tachycardia, palpitation and arrhythmias) · urinary retention · urinary urgency
 - ▶ **Uncommon** Confusion (particularly in the elderly) · giddiness · nausea · vomiting
 - ▶ **Very rare** Angle-closure glaucoma
 - ▶ **Frequency not known** Angioedema · blurred vision · blurred vision · central nervous system stimulation · convulsion · diarrhoea · difficulty in micturition · disorientation · dizziness · drowsiness · dry eyes · euphoria · fatigue · flatulence · hallucinations · headache · impaired memory · palpitation · photosensitivity · rash · reduced sweating (may lead to heat sensations and fainting in hot environments or patients with fever) · restlessness · taste disturbances
- **PATIENT AND CARER ADVICE** Antimuscarinics can affect the performance of skilled tasks (e.g. driving).

Darifenacin

INDICATIONS AND DOSE

Urinary frequency | Urinary urgency | Incontinence

BY MOUTH

- ▶ **Adult:** Initially 7.5 mg once daily, increased if necessary to 15 mg after 2 weeks

- **SIDE-EFFECTS**
 - ▶ **Uncommon** Cough · dyspnoea · hypertension · impotence · insomnia · oedema · rhinitis · ulcerative stomatitis · vaginitis · weakness
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises caution.
- **HEPATIC IMPAIRMENT** Max. 7.5 mg daily in moderate impairment. Avoid in severe impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 3, 25

- ▶ **Emselex** (Merus Labs Luxco S.a R.L.)

Darifenacin (as Darifenacin hydrobromide) 7.5 mg Emselex 7.5mg modified-release tablets | 28 tablet **[POM]** £25.48 DT price = £25.48

Darifenacin (as Darifenacin hydrobromide) 15 mg Emselex 15mg modified-release tablets | 28 tablet **[POM]** £25.48

Fesoterodine fumarate

INDICATIONS AND DOSE

Urinary frequency | Urinary urgency | Urge incontinence

BY MOUTH

- ▶ **Adult:** 4 mg once daily, increased if necessary up to 8 mg once daily

Dose adjustments due to interactions

Max. 4 mg daily with concomitant atazanavir, clarithromycin, indinavir, itraconazole, ritonavir, saquinavir, or telithromycin

In patients with hepatic or renal impairment, consult product literature before concomitant use with amprenavir, aprepitant, atazanavir, clarithromycin, diltiazem, erythromycin, fluconazole, fosamprenavir, indinavir, itraconazole, ritonavir, saquinavir, telithromycin, verapamil, or grapefruit juice

- **SIDE-EFFECTS**
 - ▶ **Common or very common** Insomnia
 - ▶ **Uncommon** Cough · nasal dryness · pharyngolaryngeal pain · vertigo
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises increase dose cautiously; max. 4 mg daily in moderate impairment. Avoid in severe impairment. Consult product literature before concomitant use of cytochrome P450 enzyme inhibitors.
- **RENAL IMPAIRMENT** Increase dose cautiously if eGFR 30–80 mL/minute/1.73m²; max. 4 mg daily if eGFR less than 30 mL/minute/1.73m². Consult product literature before concomitant use of cytochrome P450 enzyme inhibitors.

- **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2008) that fesoterodine (*Toviaz*[®]) is accepted for restricted use within NHS Scotland as a second-line treatment for overactive bladder syndrome.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 3, 25

- ▶ **Toviaz** (Pfizer Ltd)

Fesoterodine fumarate 4 mg Toviaz 4mg modified-release tablets | 28 tablet [PoM] £25.78 DT price = £25.78

Fesoterodine fumarate 8 mg Toviaz 8mg modified-release tablets | 28 tablet [PoM] £25.78 DT price = £25.78

Flavoxate hydrochloride

INDICATIONS AND DOSE

Urinary frequency | Urinary incontinence | Dysuria | Urinary urgency | Bladder spasm due to catheterisation, cystoscopy, or surgery

BY MOUTH

- ▶ Adult: 200 mg 3 times a day

- **CONTRA-INDICATIONS** Gastro-intestinal haemorrhage
- **SIDE-EFFECTS** Eosinophilia · erythema · leucopenia · pruritus · urticaria · vertigo
- **PREGNANCY** Manufacturer advises avoid unless no safer alternative.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 3

- ▶ **Urispas** (Recordati Pharmaceuticals Ltd)

Flavoxate hydrochloride 200 mg Urispas 200 tablets | 90 tablet [PoM] £11.67 DT price = £11.67

Oxybutynin hydrochloride

INDICATIONS AND DOSE

Urinary frequency | Urinary urgency | Urinary incontinence | Neurogenic bladder instability

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 5–11 years: Initially 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day
- ▶ Child 12–17 years: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day
- ▶ Adult: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day
- ▶ Elderly: Initially 2.5–3 mg twice daily, increased if tolerated to 5 mg twice daily, adjusted according to response

BY MOUTH USING MODIFIED-RELEASE TABLETS

- ▶ Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every 1 week, adjusted according to response; maximum 15 mg per day
- ▶ Adult: Initially 5 mg once daily, increased in steps of 5 mg every 1 week, adjusted according to response; maximum 20 mg per day

BY TRANSDERMAL APPLICATION USING PATCHES

- ▶ Adult: Apply 1 patch twice weekly, patch is to be applied to clean, dry unbroken skin on abdomen, hip or buttock. Patch should be removed every 3–4 days and site replacement patch on a different area. The same area should be avoided for 7 days

Nocturnal enuresis associated with overactive bladder

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 5–17 years: 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day, last dose to be taken before bedtime

BY MOUTH USING MODIFIED-RELEASE TABLETS

- ▶ Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every 1 week, adjusted according to response; maximum 15 mg per day

Dose equivalence and conversion

Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of *Lyrinel*[®] XL

- **UNLICENSED USE** Not licensed for use in children under 5 years. Intravesical instillation not licensed for use in children.
- **CAUTIONS** Acute porphyrias p. 864
- **SIDE-EFFECTS**
- **GENERAL SIDE-EFFECTS**
- ▶ **Uncommon** Anorexia · facial flushing
- ▶ **Rare** Night terrors
- ▶ **Frequency not known** Cognitive impairment
- **SPECIFIC SIDE-EFFECTS**
- ▶ **Rare**
- ▶ **With transdermal use** Application site reactions with patches
- **PREGNANCY** Manufacturers advise avoid unless essential—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturers advise avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With transdermal use Apply patches to clean, dry, unbroken skin on abdomen, hip or buttock, remove after every 3–4 days and site replacement patch on a different area (avoid using same area for 7 days).
- **PRESCRIBING AND DISPENSING INFORMATION**
- ▶ In adults The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.
- ▶ In children The need for therapy for urinary indications should be reviewed soon after it has been commenced and then at regular intervals; a response usually occurs within 6 months but may take longer.
- **PATIENT AND CARER ADVICE**
- Medicines for Children leaflet: Oxybutynin for daytime urinary symptoms www.medicinesforchildren.org.uk/oxybutynin-for-daytime-urinary-symptoms
- Patients or carers should be given advice on how to administer oxybutynin transdermal patches.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- Scottish Medicines Consortium (SMC) Decisions**
- The *Scottish Medicines Consortium* has advised (July 2005) that *Kentera*[®] should be restricted for use in adults who

benefit from oral oxybutynin but cannot tolerate its side-effects.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solifenacin succinate

INDICATIONS AND DOSE

Urinary frequency | Urinary urgency | Urinary incontinence BY MOUTH

► Adult: 5 mg once daily, increased if necessary to 10 mg once daily

Dose adjustments due to interactions

Max. 5 mg daily with concomitant potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole, ketoconazole, or ritonavir)

- **CAUTIONS** Neurogenic bladder disorder · susceptibility to QT-interval prolongation
- **SIDE-EFFECTS**
 - **Uncommon** Gastro-oesophageal reflux · oedema
 - **Frequency not known** Dysphonia · hepatic impairment · hyperkalaemia · muscle weakness · reduced appetite · torsade de pointes
- **PREGNANCY** Manufacturer advises caution—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Max. 5 mg daily in moderate impairment, avoid in moderate impairment in those already taking potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole or ritonavir). Avoid in severe impairment.
- **RENAL IMPAIRMENT** Max. 5 mg daily if eGFR less than 30 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m² in those already taking potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole or ritonavir).
- **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

Tolterodine tartrate

INDICATIONS AND DOSE

Urinary frequency | Urinary urgency | Urinary incontinence

INITIALLY BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Adult: 2 mg twice daily, reduced if not tolerated to 1 mg twice daily

BY MOUTH USING MODIFIED-RELEASE CAPSULES

- ▶ Adult: 4 mg once daily

- **CAUTIONS** History of QT-interval prolongation
- **INTERACTIONS** Caution with concomitant use with other drugs known to prolong QT interval.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Bronchitis · chest pain · fatigue · paraesthesia · peripheral oedema · sinusitis · vertigo · weight gain
 - ▶ **Uncommon** Memory impairment
 - ▶ **Frequency not known** Flushing
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Reduce dose to 1 mg twice daily. Avoid modified-release preparations.
- **RENAL IMPAIRMENT** Reduce dose to 1 mg twice daily if eGFR less than 30 mL/minute/1.73m². Avoid modified-release preparations if eGFR less than 30 mL/minute/1.73m².
- **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

BETA₃-ADRENOCEPTOR AGONISTS

Mirabegron

INDICATIONS AND DOSE

Urinary frequency, urgency, and urge incontinence

BY MOUTH

- ▶ Adult: 50 mg once daily

● CONTRA-INDICATIONS

Severe hypertension

● CAUTIONS

History of QT-interval prolongation

● INTERACTIONS

→ Appendix 1 (mirabegron). Caution with concomitant use with drugs that prolong the QT interval.

● HEPATIC IMPAIRMENT

With concomitant use of strong cytochrome P450 inhibitors such as itraconazole, ketoconazole, ritonavir, or clarithromycin reduce dose to 25 mg once daily in mild impairment, and avoid in moderate impairment.

● RENAL IMPAIRMENT

With concomitant use of strong cytochrome P450 inhibitors such as itraconazole, ketoconazole, ritonavir, or clarithromycin reduce dose to 25 mg once daily if eGFR less than 30–89 mL/minute/1.73 m², and avoid if eGFR less than 30 mL/minute/1.73 m².

● SIDE-EFFECTS

- ▶ **Common or very common** Tachycardia · urinary-tract infection
- ▶ **Uncommon** Atrial fibrillation · dyspepsia · gastritis · hypertension · joint swelling · palpitation · pruritus · rash · vulvovaginal infection · vulvovaginal pruritus

- **CONCEPTION AND CONTRACEPTION** Contraception advised in women of child-bearing potential.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
