**GI:** nausea, vomiting, diarrhea, constipation, flatulence, dyspepsia, epigastric pain, stomatitis

**Hematologic:** thrombocytopenia

**Skin:** rash, pruritus, diaphoresis

**Other:** excessive thirst, edema, injection site pain

**Interactions**

**Drug-drug.** *Angiotensin-converting enzyme inhibitors, beta-adrenergic blockers:* decreased antihypertensive effect

*Anticoagulants:* prolonged prothrombin time

*Aspirin:* altered ketorolac distribution, metabolism, and excretion; increased risk of serious adverse reactions

*Cholestyramine:* decreased ketorolac absorption

*Corticosteroids, other NSAIDs:* additive adverse GI effects

*Diuretics:* decreased diuretic effect

*Hydantoins, lithium:* increased blood levels and greater risk of toxicity of these drugs

*Methotrexate:* increased risk of methotrexate toxicity

*Probenecid:* increased risk of ketorolac toxicity

**Drug-diagnostic tests.** *Bleeding time:* prolonged for 24 to 48 hours after therapy ends

**Drug-herbs.** *Anise, arnica, chamomile, clove, dong quai, feverfew, garlic, ginger, ginkgo, ginseng:* increased risk of bleeding

## Patient monitoring

- Monitor for adverse reactions, especially prolonged bleeding time and CNS reactions.
- Check I.M. injection site for hematoma and bleeding.
- Monitor fluid intake and output.

## Patient teaching

- Inform patient that drug is meant only for short-term pain management.
-  Tell patient to immediately report bleeding and adverse CNS reactions.
- Advise patient to minimize GI upset by eating small, frequent servings of healthy foods.
- Instruct patient to avoid aspirin products and herbs during therapy.
- Teach patient how to use eye drops, if prescribed.
- Caution female patient not to take drug if she is breastfeeding.
- Advise patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

# I

## labetalol hydrochloride

Trandate

**Pharmacologic class:** Beta-adrenergic blocker (nonselective), alpha-adrenergic blocker (selective)

**Therapeutic class:** Antihypertensive

**Pregnancy risk category** C

## Action

Blocks stimulation of beta<sub>1</sub>- and beta<sub>2</sub>-adrenergic receptor sites and alpha<sub>1</sub>-adrenergic receptors, decreasing myocardial contractile force and enhancing coronary artery blood flow and myocardial perfusion. Net effect is decreased heart rate and blood pressure.

## Availability

*Injection:* 5 mg/ml

*Tablets:* 100 mg, 200 mg, 300 mg

## Indications and dosages

➤ Hypertension

**Adults:** Initially, 100 mg P.O. b.i.d., alone or combined with a diuretic; may increase by 100 mg b.i.d. q 2 to 3 days as needed. Usual range is 400 to 800 mg/day in two divided doses; up to 2.4 g/day have been given.

➤ Hypertensive crisis

**Adults:** Initially, 20 mg I.V. bolus over 2 minutes, then I.V. injection of 40 to 80 mg q 10 minutes until blood pressure falls to desired level; maximum dosage is 300 mg. Alternatively, 50 to 200 mg by continuous I.V. infusion at 2 mg/minute; continue infusion until desired blood pressure is reached. Follow I.V. dosing with P.O. dosing.

➤ Conversion from I.V. to P.O. dosing

**Hospitalized adults:** Discontinue I.V. therapy when desired blood pressure is reached; start P.O. dosing when supine diastolic pressure begins to rise. Initial P.O. dosage is 200 mg, followed 6 to 12 hours later with additional dose of 200 to 400 mg P.O., depending on blood pressure response. Then titrate at 1-day intervals to dosage ranging from 400 to 2,400 mg/day P.O. in two or three divided doses.

## Dosage adjustment

- Chronic hepatic disease
- Elderly patients

**Off-label uses**

- Hypertension secondary to pheochromocytoma or clonidine withdrawal

**Contraindications**

- Hypersensitivity to drug
- Bronchospastic disease
- Overt heart failure, cardiogenic shock
- Second- or third-degree atrioventricular block
- Severe bradycardia
- Conditions associated with severe and prolonged hypotension

**Precautions**

Use cautiously in:

- hepatic impairment, pulmonary disease, diabetes mellitus, hyperthyroidism, thyrotoxicosis
- elderly patients
- pregnant or breastfeeding patients
- children.

**Administration**

- Know that drug may be given as I.V. bolus or continuous infusion.
- Be aware that drug may be given undiluted for I.V. bolus injection. For continuous infusion, dilute in dextrose 5% in water or normal saline solution, and deliver with infusion control pump.
- Don't mix with 5% sodium bicarbonate injection.
- Give direct I.V. injection over 2 minutes at 10-minute intervals.

Route	Onset	Peak	Duration
P.O.	20 min-2 hr	1-4 hr	8-12 hr
I.V.	2-5 min	5 min	16-18 hr

**Adverse reactions**

**CNS:** fatigue, asthenia, anxiety, depression, dizziness, paresthesia, drowsiness, insomnia, memory loss, nightmares, mental status changes

**CV:** orthostatic hypotension, peripheral vasoconstriction, bradycardia, **arrhythmias, heart failure**

**EENT:** blurred vision, dry eyes, nasal congestion

**GI:** nausea, diarrhea, constipation

**GU:** erectile dysfunction, decreased libido

**Hematologic:** purpura, **agranulocytosis, thrombocytopenia**

**Metabolic:** hyperglycemia, **hypoglycemia**

**Musculoskeletal:** joint pain, back pain, muscle cramps

**Respiratory:** wheezing, **bronchospasm, pulmonary edema**

**Skin:** rash, pruritus

**Interactions**

**Drug-drug.** *Adrenergic bronchodilators, theophylline:* decreased efficacy of these drugs

*Antihypertensives, nitrates:* additive hypotension

*Cimetidine, propranolol:* increased labetalol effects

*Digoxin:* additive bradycardia

*Dobutamine, dopamine:* reduced beneficial cardiovascular effects of these drugs

*General anesthetics, verapamil:* additive myocardial depression

*Insulin, oral hypoglycemics:* altered hypoglycemic efficacy

*MAO inhibitors:* hypertension

*Nonsteroidal anti-inflammatory drugs:* decreased antihypertensive action

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, anti-nuclear antibodies, aspartate aminotransferase, blood urea nitrogen, glucose, liver function tests, low-density lipoproteins, potassium, triglycerides, uric acid:* increased values

**Patient monitoring**

- Monitor ECG and vital signs, especially blood pressure.

- Assess cardiovascular, respiratory, and neurologic status closely to detect adverse reactions.

- Monitor CBC, blood glucose level, and liver function tests.

## Patient teaching

-  Instruct patient to immediately report adverse reactions, such as easy bruising or bleeding or respiratory problems.
- Tell patient he may feel dizzy when starting therapy, especially if he's also taking a diuretic.
- Advise patient to move slowly when sitting up or standing, to avoid dizziness or light-headedness from sudden blood pressure decrease.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, vision, and alertness.
- Emphasize need for follow-up care and regular blood pressure monitoring.
-  Caution patient not to stop taking drug abruptly, because this may cause myocardial infarction or worsen angina.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## lactulose

Apo-Lactulose<sup>✳</sup>, Constulose, Duphalac<sup>⊕</sup>, Enulose, Euro-Lac<sup>✳</sup>, Generlac, Gen-Lac<sup>✳</sup>, GPI-Lactulose<sup>✳</sup>, Kristalose, Lactugal<sup>⊕</sup>, Lactulax<sup>✳</sup>, Lelmix<sup>⊕</sup>, PMS-Lactulose<sup>✳</sup>, Ratio-Lactulose<sup>✳</sup>, Regulose<sup>⊕</sup>

**Pharmacologic class:** Osmotic

**Therapeutic class:** Laxative

**Pregnancy risk category B**

## Action

Produces osmotic effect, which increases water content in colon and enhances peristalsis. Breakdown products in colon lead to acidification of colonic contents, softening of

feces, and decreased ammonia absorption from colon to systemic circulation. These effects reduce blood ammonia level in portal-system encephalopathy.

## Availability

*Powder (single-use packets):* 10 g, 20 g  
*Syrup:* 10 g/15 ml

## Indications and dosages

➤ Constipation

**Adults:** 10 to 20 g (15 to 30 ml) P.O. daily; may increase to 60 ml daily p.r.n.

➤ Portal-system encephalopathy

**Adults:** 20 to 30 g (30 to 45 ml) P.O. three or four times daily until two or three soft stools are produced daily. Therapy may continue over long term. Or, 300 ml P.O. with 700 ml of water or normal saline solution. Or, as retention enema by rectal balloon catheter, repeated q 4 to 6 hours.

## Contraindications

- Patients requiring low-galactose diet

## Precautions

Use cautiously in:

- diabetes mellitus
- elderly patients
- pregnant or breastfeeding patients
- children.

## Administration

- Don't give concurrently with other laxatives.
- Dissolve contents of single-use packet in 4 oz of water or juice.
- Dilute syrup with water or fruit juice to mask taste.

Route	Onset	Peak	Duration
P.O.	24-48 hr	Unknown	Unknown

## Adverse reactions

**GI:** nausea, vomiting, diarrhea, intestinal cramps, abdominal distention, flatulence

**Metabolic:** hyperglycemia (in diabetic patients), hypokalemia, hypernatremia

### Interactions

**Drug-drug.** *Anti-infectives:* decreased lactulose efficacy

*Other laxatives:* interference with response to lactulose (in patients with hepatic encephalopathy)

**Drug-diagnostic tests.** *Blood ammonia:* 25% to 50% decrease

*Glucose:* increased level (in diabetic patients)

*Potassium:* decreased level

*Sodium:* increased level

### Patient monitoring

- Watch for adverse GI reactions.
- Check stool consistency and frequency.
- Monitor electrolyte levels, especially in elderly patients.
- Check blood glucose level in diabetic patients.

### Patient teaching

- Instruct patient to dissolve contents of single-use packet in 4 oz of water or juice.
- Suggest that patient dilute syrup with water or juice to mask taste.
- Tell patient drug may cause flatulence and intestinal cramps at first, but these symptoms usually subside.
- Inform patient that excessive use may cause diarrhea and excessive fluid loss.
- Encourage patient to drink adequate fluids and to report signs and symptoms of dehydration.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## lamivudine

Epivir, Epivir-HBV, 3TC<sup>✳</sup>, Heptovir<sup>✳</sup>, Zeffix<sup>✳</sup>

**Pharmacologic class:** Nucleoside reverse transcriptase inhibitor

**Therapeutic class:** Antiretroviral

**Pregnancy risk category C**

### FDA BOXED WARNING

- Lactic acidosis and severe hepatomegaly with steatosis (including fatal cases) have occurred when drug was used alone or in combination with other nucleoside analogues.
- Epivir tablets and oral solution (used to treat human immunodeficiency virus [HIV] infection) contain higher dose of active ingredient (lamivudine) than Epivir-HBV tablets and oral solution (used to treat chronic hepatitis B). Patients with HIV should receive only dosing forms appropriate for HIV treatment.
- After Epivir discontinuation, severe acute hepatitis B exacerbations have occurred in patients co-infected with hepatitis B virus (HBV) and HIV. Monitor hepatic function closely for at least several months in these patients. If appropriate, begin anti-hepatitis B therapy.

### Action

Inhibits HIV reverse transcription by viral DNA chain termination. Impedes RNA- and DNA-dependent DNA polymerase activities.

### Availability

*Oral solution:* 5 mg/ml and 10 mg/ml in 240-ml bottles

*Tablets:* 100 mg, 150 mg, 300 mg

## Indications and dosages

➤ HIV infection (given with other antiretrovirals)

**Adults and children older than age 16:** 150 mg P.O. b.i.d. or 300 mg P.O. daily

**Children ages 3 months to 16 years:** 4 mg/kg P.O. b.i.d. to a maximum of 150 mg P.O. b.i.d.

➤ Chronic HBV

**Adults:** 100 mg (Epivir-HBV) P.O. once daily

**Children ages 2 to 17:** 3 mg/kg (Epivir-HBV) P.O. once daily, to a maximum of 100 mg P.O. daily

## Dosage adjustment

- Renal impairment

## Contraindications

- Hypersensitivity to drug or its components

## Precautions

Use cautiously in:

- impaired renal function, history of hepatic disease, obesity, granulocyte count below 1,000/mm<sup>3</sup>
- long-term therapy
- elderly patients
- women (especially if pregnant)
- children.

## Administration

- Give with or without food.

 Be aware that Epivir contains 150 mg lamivudine and Epivir-HBV contains 100 mg lamivudine. Strengths are not interchangeable.

 Know that when given to patients with unrecognized or untreated HIV, Epivir-HBV is likely to cause rapid emergence of HIV resistance.

Route	Onset	Peak	Duration
P.O.	Unknown	0.9 hr	12 hr

## Adverse reactions

**CNS:** fatigue, headache, insomnia, malaise, asthenia, depression, dizziness,

paresthesia, peripheral neuropathy, **seizures**

**GI:** nausea, vomiting, diarrhea, anorexia, abdominal discomfort, dyspepsia, splenomegaly, **pancreatitis**

**Hematologic:** anemia, **neutropenia**

**Hepatic:** **hepatomegaly with steatosis**

**Metabolic:** hyperglycemia, **lactic acidosis**

**Musculoskeletal:** muscle, joint, or bone pain; muscle weakness; myalgia; **rhabdomyolysis**

**Respiratory:** cough, abnormal breath sounds, wheezing

**Skin:** alopecia, rash, urticaria, **erythema multiforme, Stevens-Johnson syndrome**

**Other:** lymphadenopathy, body fat redistribution, hypersensitivity reactions including **anaphylaxis; immune reconstitution syndrome**

## Interactions

**Drug-drug.** *Co-trimoxazole:* increased lamivudine blood level

*Zalcitabine:* interference with effects of both drugs

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, creatine kinase, liver function tests:* increased levels

*Hemoglobin, hematocrit, neutrophils:* decreased levels

## Patient monitoring

- Check vital signs regularly.
- Monitor CBC and platelet count frequently. Watch for evidence of bone marrow toxicity.
- Monitor blood glucose level and kidney and liver function test results.
- Assess neurologic and mental status. Report signs or symptoms of depression.
- Closely monitor obese patients, women, and patients with a history of hepatic disease; they're at increased risk for lactic acidosis and severe hepatomegaly with steatosis.

- Monitor HIV patients for co-infection with HBV (which may recur when drug is withdrawn).

 Monitor patients for signs and symptoms of immune reconstitution syndrome.

### Patient teaching

- Tell patient he may take with or without food.
- Advise patient to minimize GI upset by eating small, frequent servings of healthy food and drinking plenty of fluids.
- Tell HIV patient that drug doesn't cure virus or prevent its transmission and that opportunistic infections may occur. Advise him to take appropriate precautions during sex.
- Teach patient how to recognize and immediately report signs and symptoms of immune reconstitution syndrome.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Caution HIV patient not to breast-feed, because of risk of passing infection to infant.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## lamotrigine

Apo-Lamotrigine<sup>✳</sup>, Gen-Lamotrigine<sup>✳</sup>, Lamictal, Lamictal Chewable Dispersible, Lamictal ODT, Lamictal XR, Novo-Lamotrigine<sup>✳</sup>, PMS-Lamotrigine<sup>✳</sup>, Ratio-Lamotrigine<sup>✳</sup>

**Pharmacologic class:** Phenyltriazine

**Therapeutic class:** Anticonvulsant

**Pregnancy risk category** C

### FDA BOXED WARNING

- Lamotrigine has caused life-threatening serious rashes, including Stevens-Johnson syndrome, toxic epidermal necrolysis, and rash-related death. Rate of serious rash is greater in children than in adults. Additional factors that may increase risk of rash include concurrent use with valproate, exceeding lamotrigine recommended initial dose, or exceeding lamotrigine recommended dosage escalation.
- Drug also causes benign rashes; however, it's impossible to predict which rashes will prove to be serious or life-threatening. Discontinue drug at first sign of rash, unless rash is clearly not drug-related.

### Action

Unknown. Thought to block sodium channel membranes, which in turn inhibits release of the neurotransmitters glutamate and aspartate in brain.

### Availability

*Tablets:* 25 mg, 100 mg, 150 mg, 200 mg  
*Tablets (chewable):* 2 mg, 5 mg, 25 mg  
*Tablets (extended-release):* 25 mg, 50 mg, 100 mg, 200 mg, 250 mg, 300 mg  
*Tablets (orally disintegrating):* 25 mg, 50 mg, 100 mg, 200 mg

### Indications and dosages

**>** Partial seizures, generalized seizures of Lennox-Gastaut syndrome, and primary generalized tonic-clonic seizures in patients receiving valproate

#### **Adults and children ages 12 and older:**

25 mg immediate-release P.O. every other day during weeks 1 and 2; then 25 mg daily during weeks 3 and 4. Then week 5 onwards to maintenance, increase dosage by 25 to 50 mg/day every 1 to 2 weeks. Usual maintenance dosage is 100 to 400 mg/ day in one or two divided doses. For those taking

valproate alone, maximum dosage is 200 mg/day.

**Children ages 2 to 12:** 0.15 mg/kg/day immediate-release P.O. (rounded down to nearest whole tablet) in one or two divided doses during weeks 1 and 2; then 0.3 mg/kg/day P.O. (rounded down to nearest whole tablet) in one or two divided doses during weeks 3 and 4. Then week 5 onwards to maintenance, increase every 1 to 2 weeks as 0.3 mg/kg/day (rounded down to nearest whole tablet) added to previously administered daily dose. Usual maintenance dosage is 1 to 5 mg/kg/day. Maximum dosage is 200 mg/day in one or two divided doses. For patients taking valproate alone, maintenance dosage is 1 to 3 mg/kg/day. May need to increase maintenance dose by as much as 50% in patients weighing less than 30 kg (66 lb), based on clinical response.

➤ Partial seizures, generalized seizures of Lennox-Gastaut syndrome, and primary generalized tonic-clonic seizures in patients receiving antiepileptic drugs (AEDs) other than carbamazepine, phenytoin, phenobarbital, primidone, or valproate

**Adults and children ages 12 and older:** 25 mg immediate-release P.O. every day during weeks 1 and 2; then 50 mg daily during weeks 3 and 4. Increase by 50 mg/day every 1 to 2 weeks. Usual maintenance dosage is 225 to 375 mg/day in two divided doses.

**Children ages 2 to 12:** 0.3 mg/kg/day immediate-release P.O. in one or two divided doses (rounded down to nearest whole tablet) during weeks 1 and 2; then 0.6 mg/kg/day P.O. in two divided doses (rounded down to nearest whole tablet) during weeks 3 and 4. Then week 5 onwards to maintenance, increase every 1 to 2 weeks as 0.6 mg/kg/day (rounded down to nearest whole tablet) added to previously administered daily dose. Usual maintenance dosage is 4.5 to 7.5 mg/kg/day (maximum, 300 mg/day) in two

divided doses. May need to increase maintenance dose by as much as 50% in patients weighing less than 30 kg, based on clinical response.

➤ Partial seizures, generalized seizures of Lennox-Gastaut syndrome, and primary generalized tonic-clonic seizures in patients receiving carbamazepine, phenytoin, phenobarbital, or primidone, but not receiving valproate

**Adults and children ages 12 and older:** 50 mg/day immediate-release P.O. during weeks 1 and 2; then 100 mg/day in two divided doses during weeks 3 and 4. Then week 5 onwards to maintenance, increase by 100 mg/day every 1 to 2 weeks. Usual maintenance dosage is 300 to 500 mg/day in two divided doses.

**Children ages 2 to 12:** 0.6 mg/kg/day immediate-release P.O. in two divided doses (rounded down to nearest whole tablet) during weeks 1 and 2; then 1.2 mg/kg/day in two divided doses (rounded down to nearest whole tablet) during weeks 3 and 4. Then week 5 onwards to maintenance, increase every 1 to 2 weeks as 1.2 mg/kg/day (rounded down to nearest whole tablet) added to previously administered daily dose. Usual maintenance dosage is 5 to 15 mg/kg/day (maximum, 400 mg/day) in two divided doses. May need to increase maintenance dose by as much as 50% in patients weighing less than 30 kg, based on clinical response.

➤ Adjunctive therapy for primary generalized tonic-clonic seizures and partial-onset seizures with or without secondary generalization in patients receiving valproate

**Adults and children ages 13 and older:** 25 mg P.O. (Lamictal XR) every other day during weeks 1 and 2; 25 mg daily during weeks 3 and 4; 50 mg daily week 5; 100 mg daily week 6; then 150 mg daily week 7. Usual

maintenance dose starting week 8 and onward is 200 to 250 mg every day.

➤ Adjunctive therapy for primary generalized tonic-clonic seizures and partial-onset seizures with or without secondary generalization in patients not receiving carbamazepine, phenytoin, phenobarbital, primidone, or valproate

**Adults and children ages 13 and older:** 25 mg P.O. (Lamictal XR) daily during weeks 1 and 2; 50 mg daily during weeks 3 and 4; 100 mg daily week 5; 150 mg daily week 6; then 200 mg daily week 7. Usual maintenance dose starting week 8 and onward is 300 to 400 mg every day.

➤ Adjunctive therapy for primary generalized tonic-clonic seizures and partial-onset seizures with or without secondary generalization in patients receiving carbamazepine, phenytoin, phenobarbital, or primidone, but *not* receiving valproate

**Adults and children ages 13 and older:** 50 mg P.O. (Lamictal XR) daily during weeks 1 and 2; 100 mg daily during weeks 3 and 4; 200 mg daily week 5; 300 mg daily week 6; then 400 mg daily week 7. Usual maintenance dose starting week 8 and onward is 400 to 600 mg every day.

➤ Conversion to monotherapy for partial-onset seizures in patients receiving valproate

**Adults and children ages 13 and older:** 25 mg P.O. (Lamictal XR) every other day during weeks 1 and 2; 25 mg daily during weeks 3 and 4; 50 mg daily week 5; 100 mg daily week 6; then 150 mg daily week 7 while maintaining established valproate dose. Then maintain Lamictal XR at 150 mg daily while decreasing valproate dosage by decrements no greater than 500 mg/day/week and then maintain valproate for 1 week. Increase Lamictal XR to 200 mg/day and simultaneously decrease valproate to 250 mg/day and maintain for 1 week. Increase Lamictal

XR to 250 or 300 mg/day and discontinue valproate.

➤ Conversion from adjunctive therapy of carbamazepine, phenytoin, phenobarbital, or primidone to monotherapy with Lamictal XR in patients with primary generalized tonic-clonic seizures and partial-onset seizures with or without secondary generalization

**Adults and children ages 13 and older:** After achieving a dosage of 500 mg/day P.O. of Lamictal XR, the concomitant enzyme-inducing antiepileptic drug (AED) should be withdrawn by 20% decrements each week over 4-week period. Two weeks after completion of withdrawal of the enzyme-inducing AED, the dosage of Lamictal XR may be decreased no faster than 100 mg/day each week to achieve the monotherapy maintenance dosage range of 250 to 300 mg/day.

➤ Conversion from adjunctive therapy with AEDs other than carbamazepine, phenytoin, phenobarbital, primidone, or valproate to monotherapy with Lamictal XR

**Adults and children ages 13 and older:** After achieving a dosage of 250 to 300 mg/day P.O. of Lamictal XR, the concomitant AED should be withdrawn by 20% decrements each week over 4-week period.

➤ Conversion to monotherapy for seizures in patients receiving carbamazepine, phenytoin, phenobarbital, primidone, or valproate as a single agent

**Adults and children ages 16 and older:** Usual maintenance dosage is 500 mg/day immediate-release P.O. in two divided doses.

➤ Conversion from carbamazepine, phenytoin, phenobarbital, or primidone to monotherapy with lamotrigine for seizures

**Adults and children ages 16 and older:** 50 mg/day immediate-release P.O. during weeks 1 and 2; then 100 mg/day in two divided doses during weeks 3 and 4.

Then week 5 onwards to maintenance, increase by 100 mg/day every 1 to 2 weeks. Usual maintenance dosage is 300 to 500 mg/day in two divided doses. After achieving lamotrigine maintenance dosage of 500 mg/day P.O., withdraw concomitant AED by 20% decrements each week over 4-week period.

➤ Conversion from adjunctive therapy with valproate to monotherapy with lamotrigine for seizures

#### **Adults and children ages 16 and older:**

Achieve lamotrigine dosage of 200 mg/day immediate-release P.O. and maintain previous stable valproate dosage. Maintain lamotrigine dosage of 200 mg/day and decrease valproate dosage to 500 mg/day by decrements no greater than 500 mg/day; maintain regimen for 1 week. Then increase lamotrigine dosage to 300 mg/day while simultaneously decreasing valproate to 250 mg/day; maintain regimen for 1 week. Then discontinue valproate completely and increase lamotrigine dosage by 100 mg/day every week to 500 mg/day.

➤ Maintenance treatment of bipolar I disorder to delay time to occurrence of mood episodes in patients treated with standard therapy for acute mood episodes

**Adults:** Target dosage is 200 mg immediate-release P.O. daily titrated over 7 weeks (or 100 mg daily in patients taking valproate, or 400 mg daily in patients not taking valproate who are receiving carbamazepine, rifampin, phenytoin, phenobarbital, or primidone). If other psychotropic drugs are withdrawn following stabilization, adjust lamotrigine dosage as indicated.

### **Dosage adjustment**

- Moderate to severe hepatic dysfunction
- Renal impairment
- Heart disease

- Starting or stopping estrogen-containing oral hormonal contraceptives
- Concurrent use of valproate

### **Off-label uses**

- Drug-resistant seizures
- Mood stabilization in rapid-cycling bipolar II disorder

### **Contraindications**

- Hypersensitivity to drug or its components

### **Precautions**

Use cautiously in:

- renal or hepatic impairment or other diseases or conditions that affect metabolism or elimination
- concurrent use of other anticonvulsants or estrogen-containing oral contraceptives
- history of allergy to or rash from other AEDs
- clinical worsening, emergence of new symptoms, and suicidal ideation or behaviors
- aseptic meningitis, multiorgan hypersensitivity reactions, blood dyscrasias, ophthalmologic effects
- pregnant or breastfeeding patients
- children younger than age 2; children younger than age 13 (extended-release form); children younger than age 18 with mood disorders (safety and efficacy not established).

### **Administration**

- Give with or without food.
- Don't crush or break regular tablets; make sure patient swallows them whole.
- Crush chewable tablets or mix in diluted fruit juice if patient can't chew them.
- Know that patients may be converted directly from immediate-release form to extended-release form, with the initial extended-release dose matching the total daily immediate-release dose.

- Be aware that effectiveness of drug in treating acute mood episodes hasn't been established.

🔊 Be aware that abrupt drug withdrawal may induce seizures. If drug must be discontinued, decrease dosage by 50% per week over at least 2 weeks.

🔊 Don't confuse Lamictal with other drugs having sound-alike names (such as Lamisil, Lomotil, and Ludiomil).

Route	Onset	Peak	Duration
P.O.	Unknown	1.4-4.8 hr	Unknown

### Adverse reactions

**CNS:** dizziness, vertigo, headache, drowsiness, ataxia, incoordination, insomnia, sleep disorders, tremor, depression, anxiety, irritability, impaired memory, poor concentration, emotional lability, racing thoughts, dysarthria, malaise, asthenia, somnolence, amnesia, hypoesthesia, decreased or increased reflexes, fatigue, migraine, dream abnormality, **suicidal ideation, seizures, aseptic meningitis**

**CV:** palpitations, **hemorrhage**

**EENT:** diplopia, nystagmus, blurred vision, possible long-term ophthalmologic effects, ear disorder, rhinitis, epis-taxis, sinusitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, dry mouth, anorexia, peptic ulcer, flatulence, **rectal hemorrhage**

**GU:** dysmenorrhea, amenorrhea, vaginitis, increased libido, urinary tract infection, urinary frequency, penis disorder

**Hematologic:** blood dyscrasias (such as neutropenia, thrombocytopenia, pancytopenia)

**Musculoskeletal:** muscle spasm, neck pain, back pain, arthralgia, myalgia

**Respiratory:** cough, dyspnea, bronchitis, bronchospasm

**Skin:** pruritus, contact dermatitis, dry skin, sweating, photosensitivity, eczema, alopecia, rash, urticaria, **ery-thema multiforme, toxic epidermal**

### necrolysis, Stevens-Johnson syndrome

**Other:** infection, pain, weight changes, chest pain, accidental injury, lym-phadenopathy, flulike syndrome, fever, tooth disorder, edema, peripheral edema, facial edema, hypersensitivity reactions (rare) including **anaphylaxis; multiorgan hypersensitivity reactions**

### Interactions

**Drug-drug.** *Carbamazepine, phenobar-bital, phenytoin, primidone:* decreased lamotrigine steady-state level

*Estrogen-containing oral contraceptives, rifampin:* increased lamotrigine clearance

*Folate inhibitors (such as methotrexate, co-trimoxazole):* additive effects of lamotrigine

*Topiramate:* increased topiramate concentrations

*Valproate:* decreased lamotrigine clear-ance, increased steady-state level

**Drug-diagnostic tests.** *All blood cells:* decreased levels

*Liver function tests:* abnormal

**Drug-behaviors.** *Sun exposure:* photosensitivity

### Patient monitoring

- Monitor renal and hepatic function.

🔊 Watch for signs and symptoms of hypersensitivity reaction (Stevens-Johnson syndrome or anaphylaxis) and potentially fatal or life-threatening multiorgan hypersensitivity reactions (early signs may include rash, fever, and lymphadenopathy); discontinue drug if alternative etiology for this reaction isn't found.

🔊 Monitor patient with bipolar disorder closely for clinical worsening and suicidality.

- Monitor vital signs regularly.
- Monitor CNS status carefully, noting adverse reactions and changes in sei-zure pattern.

- Monitor patient for signs and symptoms of anemia, unexpected infection, or bleeding.
- Be aware that because drug binds to melanin, it could accumulate over time in the eye and other melanin-containing tissues.
- Monitor lamotrigine blood levels, especially during dosage adjustments.

### Patient teaching

- Tell patient or caregiver that drug may be taken with or without food.
- Instruct patient or caregiver that immediate- and extended-release tablets must be swallowed whole without crushing or breaking.
- Instruct patient or caregiver that orally disintegrating tablets should be placed on the tongue and moved around in the mouth; the tablets will disintegrate rapidly. Then they can be swallowed with or without water, and can be taken with or without food.
- Instruct patient or caregiver to crush chewable tablets or mix them in diluted fruit juice if patient can't chew them. Tell patient to add dispersed tablets to approximately 1 teaspoon of liquid in glass or spoon, mix solution when tablets are completely dispersed, and then take entire amount immediately.
- Inform patient or caregiver not to stop drug abruptly and that dosage is adjusted slowly, as indicated.
- 🚨 Advise patient or caregiver to stop drug and notify prescriber immediately at first sign of rash or enlarged lymph nodes.
- Instruct patient or caregiver to immediately report unexpected infection, unusual fatigue, bleeding, headache, fever, nausea, vomiting, or nuchal rigidity.
- Tell patient or caregiver to report vision changes.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## lansoprazole

Prevacid, Prevacid SoluTab, Prevacid 24HR, Zoton 

**Pharmacologic class:** Gastric acid pump inhibitor

**Therapeutic class:** Antiulcer drug

**Pregnancy risk category B**

### Action

Inhibits activity of proton pump in gastric parietal cells, decreasing gastric acid production

### Availability

*Capsules (delayed-release):* 15 mg, 30 mg

*Granules for oral suspension (delayed-release, enteric-coated):* 15 mg, 30 mg  
*Prevpac (combination product for Helicobacter pylori infection):* daily pack containing two 30-mg lansoprazole capsules, four 500-mg amoxicillin capsules, and two 500-mg clarithromycin tablets

*Prevacid NapraPAC 375 (combination product for reducing risk of ulcers from nonsteroidal anti-inflammatory drugs [NSAIDs]):* weekly pack containing seven 15-mg Prevacid capsules and fourteen 375-mg Naprosyn tablets

*Prevacid NapraPAC 500 (combination product for reducing risk of ulcers from NSAIDs):* weekly pack containing seven 15-mg Prevacid capsules and fourteen 500-mg Naprosyn tablets  
*Prevacid SoluTab (delayed-release, orally disintegrating tablet):* 15 mg, 30 mg

## Indications and dosages

➤ Active duodenal ulcer

**Adults:** 15 mg P.O. daily for 4 weeks

➤ Maintenance of healed duodenal ulcer

**Adults:** 15 mg P.O. daily

➤ *H. pylori* eradication, to reduce risk of duodenal ulcer recurrence

**Adults:** In triple therapy, 30 mg lansoprazole P.O., 1 g amoxicillin P.O., and 500 mg clarithromycin P.O. q 12 hours for 10 or 14 days. In dual therapy, 30 mg lansoprazole P.O. and 1 g amoxicillin P.O. q 8 hours for 14 days.

➤ Benign gastric ulcer

**Adults:** 30 mg P.O. daily for up to 8 weeks

➤ Gastric ulcer associated with NSAIDs

**Adults:** 30 mg P.O. once daily for up to 8 weeks

➤ To reduce risk of NSAID-associated gastric ulcer

**Adults:** 15 mg P.O. daily for up to 12 weeks

➤ Gastroesophageal reflux disease

**Adults and children ages 12 to 17:**

15 mg P.O. daily for up to 8 weeks

**Children ages 1 to 11 weighing more than 30 kg (66 lb):** 30 mg P.O. daily for up to 12 weeks

**Children ages 1 to 11 weighing 30 kg (66 lb) or less:** 15 mg P.O. daily for up to 12 weeks

➤ Erosive esophagitis

**Adults and children ages 12 to 17:** 30 mg P.O. daily for up to 8 weeks. Some patients may require 8 additional weeks.

**Children ages 1 to 11 weighing more than 30 kg (66 lb):** 30 mg P.O. daily for up to 12 weeks

**Children ages 1 to 11 weighing 30 kg (66 lb) or less:** 15 mg P.O. daily for up to 12 weeks

➤ To maintain healing of erosive esophagitis

**Adults:** 15 mg P.O. daily

➤ Pathologic hypersecretory conditions (including Zollinger-Ellison syndrome)

**Adults:** Initially, 60 mg P.O. daily, to a maximum of 90 mg P.O. b.i.d. Divide daily dosages over 120 mg.

➤ Frequent heartburn (two or more times a week)

**Adults:** 15 mg P.O. (delayed-release capsule) daily up to 14 days

## Dosage adjustment

- Significant hepatic insufficiency

## Contraindications

- Hypersensitivity to drug or its components

## Precautions

Use cautiously in:

- phenylketonuria (orally disintegrating tablets), severe hepatic impairment
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 18.

## Administration

- Give oral form before meals.
- If patient has difficulty swallowing delayed-release capsule, open it and sprinkle contents onto small amount of soft food, such as applesauce or pudding. Don't crush or let patient chew drug.
- When giving orally disintegrating tablet, place tablet on patient's tongue and let it disintegrate until particles can be swallowed.
- Know that orally disintegrating tablet contains phenylalanine.
- When giving oral suspension, empty packet contents into container with 2 tbsp water. Stir contents well, and have patient drink immediately. Don't give oral suspension through nasogastric (NG) tube.
- When injecting contents of delayed-release capsule through NG tube, open capsule and mix granules with 40 ml

apple juice. Then rinse tube with additional apple juice to clear.

Route	Onset	Peak	Duration
P.O.	Rapid	Unknown	>24 hr

### Adverse reactions

**CNS:** headache, confusion, anxiety, malaise, paresthesia, abnormal thinking, depression, dizziness, syncope,

#### **cerebrovascular accident**

**CV:** chest pain, hypertension, hypotension, **myocardial infarction, shock**

**EENT:** visual field deficits, otitis media, tinnitus, epistaxis

**GI:** nausea, diarrhea, abdominal pain, cholelithiasis, ulcerative colitis, esophageal ulcer, hematemesis, stomatitis, dysphagia, **GI hemorrhage**

**GU:** renal calculi, erectile dysfunction, abnormal menses, breast tenderness, gynecomastia

**Hematology:** anemia

**Musculoskeletal:** hip, wrist, spine fractures (with long-term daily use)

**Respiratory:** cough, bronchitis, **asthma**

**Skin:** urticaria, alopecia, acne, pruritus, photosensitivity

### Interactions

**Drug-drug.** *Drugs requiring acidic pH (such as ampicillin esters, digoxin, iron salts, itraconazole, ketoconazole):* decreased absorption of these drugs

*Sucralfate:* decreased lansoprazole absorption

*Theophylline:* increased theophylline clearance

**Drug-food.** *Any food:* decreased rate and extent of GI drug absorption

**Drug-herbs.** *Male fern:* inactivation of herb

*St. John's wort:* increased risk of photosensitivity

### Patient monitoring

- Monitor for GI adverse reactions.
- Assess nutritional status and fluid balance to identify significant problems.

### Patient teaching

- Instruct patient to take before meals.
- If patient has difficulty swallowing, tell him to open delayed-release capsule and sprinkle contents onto small amount of soft food (such as applesauce or pudding). Emphasize that he must not crush or chew drug.
- Tell patient to take orally disintegrating tablet by placing it on tongue and letting it disintegrate.
- Instruct patient to take oral suspension by emptying packet contents into container with 2 tbsp water. Tell him to stir contents well and drink immediately.
- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, foods, and herbs mentioned above.

## lanthanum carbonate

Fosrenol

**Pharmacologic class:** Phosphate binder

**Therapeutic class:** Renal and genitourinary agent

**Pregnancy risk category C**

### Action

Dissociates in acidic environment of upper GI tract to release lanthanum ions, which bind dietary phosphate released from food during digestion and inhibit phosphate absorption by forming highly insoluble lanthanum phosphate complexes

### Availability

*Tablets (chewable):* 500 mg, 750 mg, 1,000 mg

## Indications and dosages

➤ To reduce serum phosphate level in patients with end-stage renal disease

**Adults:** Initially, 1,500 mg P.O. (chewed) daily in divided doses with meals; titrate every 2 to 3 weeks until serum phosphate falls to acceptable level.

## Contraindications

- Bowel obstruction, ileus, or fecal impaction

## Precautions

Use cautiously in:

- acute peptic ulcer, Crohn's disease, ulcerative colitis
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

## Administration

- Give before meals; ensure that patient chews tablets completely before swallowing to reduce risk of serious adverse GI events.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** headache

**CV:** hypotension

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain

**Metabolic:** hypercalcemia

**Respiratory:** bronchitis, rhinitis

**Other:** dialysis graft complication or occlusion

## Interactions

**Drug-diagnostic tests.** *Serum calcium:* increased

## Patient monitoring

- Monitor serum calcium and phosphorus levels periodically.

## Patient teaching

- Instruct patient to take drug with or immediately after meals and to chew tablets completely before swallowing.
- Advise patient to discuss any planned dietary changes with prescriber.
- Inform female patient with child-bearing potential that drug isn't recommended during pregnancy.
- Instruct female patient to tell prescriber if she's breastfeeding.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the tests mentioned above.

## lapatinib

Tykerb

**Pharmacologic class:** 4-Anilinoquinazoline kinase inhibitor

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

## Action

Lapatinib is a 4-anilinoquinazoline kinase inhibitor of the intracellular tyrosine kinase domains of both Epidermal Growth Factor Receptor (EGFR [ErbB1]) and of Human Epidermal Receptor Type 2 (HER2 [ErbB2]) receptors (estimated  $K_i^{APP}$  values of 3nM and 13nM, respectively) with a dissociation half-life of  $\geq 300$  minutes. Lapatinib inhibits ErbB-driven tumor cell growth in vitro and in various animal models.

## Availability

*Tablets:* 250 mg

## Indications and dosages

➤ Advanced or metastatic breast cancer in patients whose tumors over-express HER2 and who have received

prior therapy, including an anthracycline, a taxane, and trastuzumab

**Adults:** 1,250 mg P.O. daily on days 1 to 21 continuously in combination with capecitabine on days 1 to 14 in repeating 21-day cycle

➤ Postmenopausal women with hormone receptor-positive metastatic breast cancer that overexpresses HER2 receptor, for whom hormonal therapy is indicated

**Adults:** 1,500 mg P.O. daily continuously in combination with letrozole

### Dosage adjustment

- Severe hepatic impairment
- Cardiac toxicity
- Grade 2 or greater NCI CTCAE toxicity
- Concurrent use of strong CYP3A4 inducers/inhibitors

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- severe hepatic impairment (Child-Pugh Class C)
- decreased left ventricular ejection fraction (LVEF), patients who have or may develop prolongation of QT interval (including patients with hypokalemia, hypomagnesemia, congenital long QT syndrome; patients taking antiarrhythmics or other products leading to QT-interval prolongation; and cumulative high-dose anthracycline therapy)
- Grade 2 or greater NCI CTCAE toxicity
- interstitial lung disease and pneumonitis, diarrhea
- strong CYP3A4 inducers including St. John's wort, strong CYP3A4 inhibitors (avoid use)
- concurrent use of CYP3A4, CYP2C8, and P-glycoprotein (PgP) substrates
- grapefruit, grapefruit products (avoid use)

- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Administer at least 1 hour before or 1 hour after a meal, but give capecitabine with food or within 30 minutes after food. Don't give with grapefruit or grapefruit juice. Don't divide daily doses.
- Correct hypokalemia or hypomagnesemia before lapatinib administration.
- Assess serum digoxin concentration before starting drug. If digoxin serum concentration is greater than 1.2 ng/ml, reduce digoxin dosage as prescribed.
- Evaluate LVEF before starting lapatinib treatment to ensure patient has baseline LVEF within institution's normal limits. Be aware that drug should be discontinued in patients with decreased LVEF that is Grade 2 or greater NCI CTCAE toxicity and in patients with LVEF that drops below institution's lower limit of normal. Lapatinib in combination with capecitabine may be restarted at reduced dosage of 1,000 mg/day and in combination with letrozole may be restarted at reduced dosage of 1,250 mg/day after minimum of 2 weeks if LVEF recovers to normal and patient is asymptomatic.
- 🔊 Obtain liver function test results (transaminases, bilirubin, and ALP) before starting treatment. Consider reducing dosage in patients with severe hepatic impairment from 1,250 mg/day to 750 mg/day (HER2-positive metastatic breast cancer indication) or from 1,500 mg/day to 1,000 mg/day (hormone receptor-positive, HER2-positive breast cancer indication) to adjust area under the curve (AUC) to normal range. In patients who develop severe hepatotoxicity during therapy, discontinue drug and don't restart.
- 🔊 Discontinue drug in patients who experience pulmonary signs and

symptoms indicative of interstitial lung disease/pneumonitis that are Grade 3 or greater (NCI CTCAE).

- If patient must receive a strong CYP3A4 inhibitor concurrently, consider reducing lapatinib dosage to 500 mg/day. This dosage is predicted to adjust lapatinib AUC to the range observed without inhibitors. If the strong inhibitor is discontinued, a washout period of approximately 1 week should be allowed before lapatinib dosage is adjusted upward to indicated dosage.
- If patient must receive a strong CYP3A4 inducer concurrently, consider titrating lapatinib dosage gradually from 1,250 mg/day up to 4,500 mg/day (HER2-positive metastatic breast cancer indication) or from 1,500 mg/day up to 5,500 mg/day (hormone receptor-positive, HER2-positive breast cancer indication) based on tolerability. This dosage is predicted to adjust lapatinib AUC to the range observed without inducers. If the strong inducer is discontinued, lapatinib dosage should be reduced to indicated dosage.
- Be aware that severe diarrhea may require administration of oral or I.V. electrolytes and fluids and interruption or discontinuation of therapy.

Route	Onset	Peak	Duration
P.O.	Unknown	4 hr	Unknown

### Adverse reactions

**CNS:** headache, fatigue, insomnia, asthenia

**CV: prolonged QT interval**

**EENT:** epistaxis

**GI:** nausea, vomiting, diarrhea, anorexia, dyspepsia, stomatitis

**Hepatic: hepatotoxicity**

**Musculoskeletal:** extremity pain, back pain

**Respiratory:** dyspnea, interstitial lung disease, pneumonitis

**Skin:** rash, dry skin, alopecia, pruritus, nail disorder, palmar-plantar erythrodysesthesia

**Other:** mucosal inflammation

### Interactions

**Drug-drug.** *CYP3A4 substrates (midazolam), CYP2C8 and Pgp substrates (paclitaxel), Pgp substrates (digoxin):* increased exposure of these drugs  
**Strong CYP3A4 inducers (such as carbamazepine, dexamethasone, phenobarbital, phenytoin, rifabutin, rifampin, rifapentin):** decreased lapatinib systemic exposure  
**Strong CYP3A4 inhibitors (such as atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, voriconazole):** increased lapatinib systemic exposure and half-life

**Drug-diagnostic tests.** *ALT, AST, total bilirubin:* increased levels  
*Hemoglobin, neutrophils, platelets:* decreased levels

**Drug-food.** *Any food:* increased lapatinib systemic exposure

*Grapefruit:* increased lapatinib plasma concentration

*High-fat meal:* increased AUC value

**Drug-herbs.** *St. John's Wort:* decreased lapatinib systemic exposure

### Patient monitoring

- Monitor CBC with differential and hepatic function tests closely.
- Monitor serum digoxin concentration throughout coadministration with lapatinib.

⚠ Continue to monitor patient for prolonged QT interval, interstitial lung disease, and pneumonitis.

### Patient teaching

- Tell patient to take lapatinib at least 1 hour before or 1 hour after a meal but if capecitabine is also prescribed to take capecitabine with food or within 30 minutes after food. Advise patient

not to take lapatinib with grapefruit or grapefruit juice or divide daily doses.

 Instruct patient to immediately report tiredness, dizziness, shortness of breath, pounding or racing heartbeats, itching, yellowing of skin or eyes, dark urine, right upper abdominal pain or discomfort, or red, painful hands and feet.

- Teach patient how to prevent and manage diarrhea, which may be severe; instruct patient to inform prescriber of changes in bowel pattern or severe diarrhea.
- Instruct patient to tell prescriber about all drugs he's taking, because some drugs have potential for serious drug interactions and shouldn't be taken with lapatinib.
- Advise patient not to use St. John's wort or other herbal supplements without consulting prescriber.
- Advise female patient of childbearing age to avoid becoming pregnant during therapy.
- Advise breastfeeding patient that she should decide whether to discontinue breastfeeding or discontinue drug, taking into account importance of drug for her treatment.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## leflunomide

Apo-Leflunomide<sup>★</sup>, Arava, Novo-Leflunomide<sup>★</sup>, PMS-Leflunomide<sup>★</sup>, Sandoz Leflunomide<sup>★</sup>

**Pharmacologic class:** Immune modulator

**Therapeutic class:** Antirheumatic

**Pregnancy risk category X**

## FDA BOXED WARNING

- Rule out pregnancy before starting therapy. Drug is contraindicated in pregnant women and in women of childbearing age who don't use reliable contraception. Caution patient to avoid pregnancy during therapy or before completing drug elimination procedure after treatment.
- Be aware that severe liver injury, including fatal liver failure, has been reported in some patients treated with leflunomide. Know that patients with preexisting acute or chronic liver disease, or those with serum alanine aminotransferase (ALT) level of more than two times the upper limit of normal (ULN) before initiating treatment, shouldn't be treated with leflunomide. Use caution when giving drug with other potentially hepatotoxic drugs. Monitor ALT level at least monthly for first 6 months of therapy, and every 6 to 8 weeks thereafter. If ALT elevation is more than three times ULN, interrupt therapy while investigating the probable cause of the ALT elevation by close observation and additional tests. If ALT elevation is likely leflunomide-induced, start cholestyramine washout and monitor liver tests weekly until normalized. If leflunomide-induced liver injury is unlikely (because another probable cause has been found), resumption of therapy may be considered.

## Action

Inhibits T-cell pyrimidine biosynthesis, tyrosine kinases, and dihydroorotate dehydrogenase, blocking structural damage caused by inflammatory response to autoimmune process. Also shows analgesic, antipyretic, and histamine-blocking activity.

## Availability

Tablets: 10 mg, 20 mg, 100 mg

## Indications and dosages

➤ Active rheumatoid arthritis

**Adults:** 100 mg P.O. daily for 3 days, then a maintenance dosage of 20 mg daily. If intolerance occurs, decrease to 10 mg daily.

## Dosage adjustment

- Hepatic enzyme elevations

## Contraindications

- Hypersensitivity to drug or its components
- Women who are or may become pregnant

## Precautions

Use cautiously in:

- renal insufficiency
- patients with severe immunodeficiency, bone marrow dysplasia, or severe, uncontrolled infections (not recommended)
- new-onset or worsening pulmonary symptoms
- concurrent use of potentially hepatotoxic drugs
- concurrent use of live-virus vaccines (not recommended)
- men attempting to father a child
- breastfeeding patients
- children younger than age 18.

## Administration

- Before starting drug, screen patients for latent tuberculosis (TB) infection with a tuberculin skin test. Treat patients who test positive for TB with standard medical practice before starting leflunomide.
- Obtain baseline platelet and white blood cell (WBC) counts, and hemoglobin or hematocrit.
- Check patient's blood pressure before starting leflunomide
- Give with or without food.
- Be aware that drug has a long half-life. To eliminate from bloodstream, give 8 g cholestyramine P.O. t.i.d. for 11 days.

Route	Onset	Peak	Duration
P.O.	1 mo	3-6 mo	Unknown

## Adverse reactions

**CNS:** headache, dizziness, asthenia

**CV:** chest pain, hypertension

**EENT:** rhinitis, sinusitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, abdominal pain, dyspepsia, gastroenteritis, mouth ulcers, anorexia

**GU:** urinary tract infection

**Hematologic:** pancytopenia, agranulocytosis, thrombocytopenia (rare)

**Hepatic:** hepatotoxicity

**Metabolic:** hypokalemia

**Musculoskeletal:** joint pain or disorders, back pain, leg cramps, synovitis, tenosynovitis

**Respiratory:** bronchitis, increased cough, pneumonia, respiratory infection, **fatal interstitial lung disease**

**Skin:** alopecia, rash, dry skin, eczema, pruritus, **Stevens-Johnson syndrome, toxic epidermal necrolysis**

**Other:** weight loss, pain, infection, allergic reactions, flulike symptoms

## Interactions

**Drug-drug.** *Activated charcoal, cholestyramine:* rapid, steep drop in blood level of leflunomide's active metabolite  
*Methotrexate, other hepatotoxic drugs:*

increased risk of hepatotoxicity  
*Rifampin:* increased blood level of leflunomide's active metabolite

**Drug-diagnostic tests.** *Alanine aminotransferase (ALT), aspartate aminotransferase:* increased levels  
*Hematocrit, hemoglobin, platelets, WBCs:* decreased levels

## Patient monitoring

- Check vital signs closely.
- Monitor platelet and WBC counts and hemoglobin or hematocrit monthly for 6 months after initiation of therapy and every 6 to 8 weeks thereafter. If evidence of bone marrow suppression occurs, discontinue drug

and treat as indicated to reduce plasma concentration of leflunomide's active metabolite.

 Watch for signs and symptoms of hepatotoxicity.

 Be aware that rare cases of Stevens-Johnson syndrome and toxic epidermal necrolysis have been reported in patients receiving leflunomide. If patient develops either condition, discontinue drug by using the recommended drug elimination procedure.

- Periodically assess cardiovascular status, including blood pressure, carefully to detect adverse reactions.
- Be aware that interstitial lung disease has been reported during leflunomide therapy and has been associated with fatal outcomes. New-onset or worsening pulmonary symptoms, such as cough and dyspnea with or without associated fever, may be cause for discontinuing drug and for further investigation as appropriate. If stopping drug is necessary, consider initiation of wash-out procedures.
- Monitor electrolyte levels.
- Monitor ALT level at least monthly for 6 months after starting drug, and every 6 to 8 weeks thereafter. If ALT level is more than three times the upper limit of normal, interrupt therapy while investigating the probable cause of the ALT elevation by close observation and additional tests. If leflunomide therapy is likely cause, start cholestyramine washout and monitor liver tests weekly until normalized. If leflunomide-induced liver injury is unlikely because another probable cause has been found, consider resuming drug therapy.
- Stay alert for signs and symptoms of infection. If a serious infection occurs, it may be necessary to interrupt therapy and administer cholestyramine or charcoal, as indicated.

- Observe patient closely after dosage reduction. Metabolite levels may take several weeks to fall.

### Patient teaching

- Tell patient he may take with or without food.
-  Advise patient to immediately report unusual tiredness or yellowing of skin or eyes.
-  Instruct patient to recognize and report signs or symptoms of infection, respiratory problems, Stevens-Johnson syndrome, and toxic epidermal necrolysis.
- Advise patient to avoid vaccination with live-virus vaccines.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
-  Inform female of childbearing age that drug may harm fetus. Tell her to contact prescriber immediately if she suspects pregnancy.
- Caution female not to breastfeed without consulting prescriber.
- Advise male planning to father a child to consult prescriber, because drug may harm fetus.
- Tell patient he'll undergo regular blood testing to check liver function.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## lenalidomide

Revlimid

**Pharmacologic class:** Thalidomide analogue

**Therapeutic class:** Antineoplastic, immunomodulator

**Pregnancy risk category** X

**FDA BOXED WARNING**

- If taken during pregnancy, drug may cause fetal death or severe, life-threatening birth defects. Advise females to avoid pregnancy. Drug is available only under RevAssist distribution program, in which only registered prescribers and pharmacists can prescribe and dispense it to registered patients who meet certain conditions. For information, visit [www.REVLIMID.com](http://www.REVLIMID.com) or call 1-888-423-5436.
- Drug has been linked to hematologic toxicity (including significant neutropenia and thrombocytopenia); 80% of patients with myelodysplastic syndrome (MDS) associated with deletion 5q cytogenetic abnormality have required dose delays or dosage reductions. For patients with these syndromes, monitor complete blood count (CBC) weekly for first 8 weeks of therapy and at least monthly thereafter. Patients may require dose delay, dosage reduction, or both and require blood product support, growth factors, or both.
- Drug may increase risk of deep vein thrombosis and pulmonary embolism in patients with multiple myeloma who receive it in combination with dexamethasone. Stay alert for signs and symptoms, such as shortness of breath, chest pain, and arm or leg swelling. Prescriber must consider patient's risk factors when deciding whether to use prophylaxis.

**Action**

Inhibits secretion of proinflammatory cytokines and increases secretion of anti-inflammatory cytokines from peripheral mononuclear cells

**Availability**

*Capsules:* 5 mg, 10 mg, 15 mg, 25 mg

**Indications and dosages**

➤ Transfusion-dependent anemia caused by low- or intermediate-1-risk MDS associated with deletion 5q cytogenetic abnormality (with or without additional cytogenetic abnormalities)

**Adults:** 10 mg P.O. daily

➤ Multiple myeloma, in patients who have received at least one prior therapy given with dexamethasone

**Adults:** 25 mg P.O. daily with water given as single 25-mg capsule on days 1 to 21 of repeated 28-day cycles. Recommended dexamethasone dosage is 40 mg/day on days 1 to 4, 9 to 12, and 17 to 20 of each 28-day cycle for first four cycles of therapy, then 40 mg P.O. daily on days 1 to 4 every 28 days.

**Dosage adjustment**

- Thrombocytopenia
- Neutropenia
- Moderate to severe renal impairment and patients on dialysis

**Contraindications**

- Hypersensitivity to drug or its components
- Pregnancy

**Precautions**

Use cautiously in:

- renal impairment
- history of Grade 4 rash associated with thalidomide treatment (use not recommended)
- elderly patients
- patients with childbearing potential
- breastfeeding patients
- children (safety and efficacy not established).

**Administration**

- Be aware that patient must be able to reliably follow instructions and must understand conditions of RevAssist program to be eligible for drug.
- Administer drug with water.
- Know that before drug is prescribed, female patient should have two

negative pregnancy tests (with sensitivity of at least 50 mIU/ml).

 Be aware that patients with history of Grade 4 rash associated with thalidomide treatment shouldn't receive drug.

Route	Onset	Peak	Duration
P.O.	Unknown	40 min	-1.5 hr Unknown

### Adverse reactions

**CNS:** dizziness, headache, hypoesthesia, peripheral neuropathy, insomnia, depression, rigors, fatigue

**CV:** hypertension, palpitations, **deep vein thrombosis**

**EENT:** epistaxis, rhinitis, pharyngitis, nasopharyngitis, sinusitis

**GI:** diarrhea, loose stools, constipation, nausea, vomiting, abdominal pain, anorexia, dry mouth, dysgeusia

**GU:** urinary tract infection, dysuria

**Hematologic:** anemia, **thrombocytopenia, neutropenia, leukopenia, febrile neutropenia, granulocytopenia, pancytopenia**

**Metabolic:** hypokalemia, hypomagnesemia, hypothyroidism

**Musculoskeletal:** arthralgia, back pain, muscle cramps, limb pain, myalgia

**Respiratory:** cough, dyspnea, exertional dyspnea, bronchitis, upper respiratory tract infection, pneumonia, **respiratory distress, pulmonary embolism**

**Skin:** pruritus, rash, dry skin, contusion, ecchymosis, erythema,

**angioedema, Stevens-Johnson syndrome, toxic epidermal necrolysis**

**Other:** fever, peripheral edema, pain, chest pain, cellulitis, night sweats, increased sweating, sepsis, **tumor lysis syndrome**

### Interactions

**Drug-drug.** *Digoxin:* increased digoxin level

**Drug-diagnostic tests.** *Magnesium, potassium, thyroid function:* decrease in levels or function

### Patient monitoring

- Monitor CBC weekly for first 3 months, then at least monthly.
- Watch carefully for electrolyte disorders and abnormal thyroid function tests.

 Monitor patient closely for signs and symptoms of serious dermatologic reactions; interrupt therapy for Grade 2 to 3 rash. Discontinue drug for angioedema, Grade 4 rash, or exfoliative or bullous rash, or if Stevens-Johnson syndrome or toxic epidermal necrolysis is suspected; don't resume drug in these patients.

 Monitor patient closely for signs and symptoms of tumor lysis syndrome (irregular heartbeat, shortness of breath, high potassium or uric acid levels, impairment of mental ability, renal failure) and take appropriate measures.

### Patient teaching

- Instruct patient to swallow capsules whole with water and not to open, chew, or crush them.
- Advise patient to report unusual symptoms or persistence or worsening of known symptoms.
- Urge female patient to use two effective contraceptive methods simultaneously for at least 4 weeks before starting therapy, during therapy, during dosage interruptions, and for 4 weeks after therapy ends. Emphasize that she must use contraception even if she has a history of infertility (unless she has had a hysterectomy).
- Instruct female patient to stop taking drug if she misses a period, has unusual menstrual bleeding, stops using contraception, or suspects pregnancy.
- Advise patient to immediately report unprotected sexual contact or suspected pregnancy.
- Instruct male patient to use latex condom during sexual contact with female of childbearing potential.

- Inform patients they can't donate blood during therapy.
- Tell male patients they can't donate sperm or semen during therapy.
- As appropriate, review all other significant or life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## letrozole

Femara

**Pharmacologic class:** Aromatase inhibitor

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### Action

Inhibits aromatase, an enzyme that promotes conversion of estrogen precursors to estrogen. This inhibition reduces circulating estrogen levels and stops progression of breast cancer.

### Availability

Tablets: 2.5 mg

### Indications and dosages

➤ Metastatic or advanced breast cancer in postmenopausal women; early breast cancer in postmenopausal women who have received 5 years of anti-estrogen therapy

**Adults:** 2.5 mg P.O. daily

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- severe hepatic impairment
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Give with or without meals.

Route	Onset	Peak	Duration
P.O.	Unknown	2-3 days	Unknown

### Adverse reactions

**CNS:** anxiety, depression, dizziness, drowsiness, fatigue, headache, vertigo, asthenia

**CV:** chest pain, hypertension

**EENT:** blurred vision

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, anorexia

**Metabolic:** hypercalcemia

**Musculoskeletal:** musculoskeletal or joint pain, fractures

**Respiratory:** cough, dyspnea, **pleural effusion**

**Skin:** alopecia, pruritus, rash, diaphoresis

**Other:** hot flashes, edema, weight gain, **angioedema, anaphylactic reactions**

### Interactions

**Drug-diagnostic tests.** *Cholesterol, gamma-glutamyltransferase:* increased levels

### Patient monitoring

- Check vital signs and assess cardiovascular and respiratory status.
- Monitor renal and hepatic function, electrolyte levels, and lipid panels.
- Assess for adverse CNS effects, including depression. Institute safety measures as needed to prevent injury.

### Patient teaching

- Tell patient she can take with or without food.
- Instruct patient to weigh herself regularly and report significant changes.
- Advise patient and family to watch for signs and symptoms of depression.
- Tell patient to minimize GI upset by eating small, frequent servings of healthy food and drinking plenty of fluids.
- Caution patient to avoid driving and other hazardous activities until she

knows how drug affects concentration and alertness.

- Inform patient that treatment is long term. Urge her to keep follow-up appointments with prescriber.
- Tell patient to inform prescriber if she is pregnant or breastfeeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## leucovorin calcium (citrovorum factor, folinic acid)

Calcium Folate<sup>Ⓢ</sup>, Lederfolin<sup>Ⓢ</sup>,  
Refolinon<sup>Ⓢ</sup>

**Pharmacologic class:** Water-soluble vitamin

**Therapeutic class:** Vitamin, antidote to folic acid antagonist, antianemic, antineoplastic adjunct

**Pregnancy risk category C**

### Action

Counteracts therapeutic and toxic effects of folic acid antagonists; may enhance therapeutic and toxic effects of fluoropyrimidines used in cancer therapy. Also supplements folic acid in folic acid deficiency.

### Availability

*Injection (expressed as base):* 10 mg/vial, 50 mg/vial, 100 mg/vial, 200 mg/vial, 350 mg/vial, 500 mg/vial

*Injection, preservative-free (expressed as base):* 10 mg/vial, 50 mg/vial, 200 mg/vial, 350 mg/vial, 500 mg/vial

*Tablets:* 5 mg, 15 mg, 25 mg

### Indications and dosages

➤ Leucovorin rescue after high-dose methotrexate therapy

**Adults:** 15 mg (approximately 10 mg/m<sup>2</sup>) P.O., I.M., or I.V. q 6 hours, starting 24 hours after methotrexate infusion begins and continuing until serum methotrexate level drops below 10<sup>-8</sup> M. If 24-hour serum creatinine level rises 50% over baseline or if 24-hour methotrexate level exceeds 5 × 10<sup>-6</sup> M or 48-hour level exceeds 9 × 10<sup>-7</sup> M, increase leucovorin dosage to 100 mg/m<sup>2</sup> I.V. q 3 hours and continue hydration and urinary alkalization until methotrexate level drops below 10<sup>-8</sup> M.

➤ To reduce toxicity and counteract effects of impaired methotrexate elimination or inadvertent overdose of folic acid antagonist

**Adults:** 15 mg (roughly 10 mg/m<sup>2</sup>) I.M., I.V., or P.O. q 6 hours until serum methotrexate level drops below 10<sup>-8</sup> M. If 24-hour serum creatinine level rises 50% over baseline or if 24-hour methotrexate level exceeds 5 × 10<sup>-6</sup> M or 48-hour level exceeds 9 × 10<sup>-7</sup> M, increase leucovorin dosage to 100 mg/m<sup>2</sup> I.V. q 3 hours and continue hydration and urinary alkalization until methotrexate level drops below 10<sup>-8</sup> M.

➤ Advanced colorectal cancer

**Adults:** Usually given in one of the following regimens: 200 mg/m<sup>2</sup> slow I.V. injection over at least 3 minutes, followed by I.V. injection of 5-fluorouracil (5-FU); or 20 mg/m<sup>2</sup> I.V. injection, followed by I.V. injection of 5-FU. Treatment is repeated daily for 5 days, and may then be repeated at 28-day intervals for two courses and then at 4- to 5-week intervals, as prescribed.

➤ Megaloblastic anemia secondary to folic acid deficiency

**Adults:** Up to 1 mg I.M. daily

### Dosage adjustment

- In leucovorin rescue after high-dose methotrexate therapy: delayed early or late methotrexate elimination (serum methotrexate level still above 0.2 μM

at 72 hours and above 0.05  $\mu\text{M}$  [ $5 \times 10^{-8}$ ] at 96 hours after administration)

- Evidence of acute renal injury

### Contraindications

- Treatment of pernicious anemia and other megaloblastic anemias caused by vitamin B<sub>12</sub> deficiency

### Precautions

Use cautiously in:

- anemia (when vitamin B<sub>12</sub> deficiency has been ruled out)
- patients receiving 5-FU concomitantly
- pregnant or breastfeeding patients
- children.

### Administration

☞ Recheck leucovorin dosage in current published protocols before giving as methotrexate rescue.

- Give parenterally in patients with GI toxicity, nausea, or vomiting.
- Reconstitute leucovorin injection with sterile or bacteriostatic water for injection containing benzyl alcohol. (When giving with 5-FU for colorectal cancer in dosages above 10 mg/m<sup>2</sup>, reconstitute only with sterile water for injection.)

☞ Don't mix leucovorin injection with 5-FU, because precipitation will occur.

☞ Give I.V. leucovorin slowly (no faster than 160 mg/minute) because of calcium content. Large doses may be infused over 1 to 6 hours as directed.

☞ Don't give intrathecally; drug may be harmful or fatal by this route.

- Be aware that P.O. dosages above 25 mg are not recommended.

Route	Onset	Peak	Duration
P.O.	20-30 min	6-90 min	3-6 hr
I.V.	<5 min	Unknown	3-6 hr
I.M.	10-20 min	35-60 min	3-6 hr

### Adverse reactions

**Skin:** urticaria

**Other:** allergic sensitization reactions, anaphylactoid reactions

### Interactions

**Drug-drug.** 5-FU: enhanced fluorouracil toxicity

*Methotrexate, other folic acid antagonists:* negated therapeutic and toxic effects of these drugs

*Phenobarbital, phenytoin, primidone:* negated anticonvulsant effect, increased frequency of seizures in susceptible children

### Patient monitoring

☞ Monitor serum creatinine and methotrexate levels every 24 hours.

☞ Monitor closely for adverse reactions. Continue leucovorin therapy, hydration, and urinary alkalization until serum methotrexate level drops below  $10^{-8}$  M.

☞ Monitor CBC with white cell differential and platelet count before leucovorin/5-FU therapy starts. Repeat weekly during first two courses and then once each cycle at anticipated white blood cell nadir.

- Check electrolyte levels and liver function tests before each treatment for first three cycles. Thereafter, check before every other cycle.
- Assess for adequate hydration when giving with 5-FU or high-dose methotrexate.
- Watch for hypersensitivity reactions, especially anaphylactoid reactions.

### Patient teaching

• Teach patient about drug and protocol.

☞ Stress importance of taking leucovorin as prescribed with high-dose methotrexate therapy. Emphasize that it's not just a vitamin.

• Tell patient to immediately report signs or symptoms of allergic reaction, such as hives.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## leuprolide acetate (leuprorelin)

Eligard, Lupron, Lupron Depot, Lupron Depot-Ped, Lupron Depot-3 Month, Lupron Depot-4 Month, Lupron-3 Month SR Depot, Prostag 

**Pharmacologic class:** Gonadotropin-releasing hormone (GnRH) analog

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** X

### Action

Inhibits and desensitizes GnRH receptors, thus inhibiting gonadotropin secretion when given continuously. This inhibition causes initial increase and then profound decrease in luteinizing hormone and follicle-stimulating hormone levels and, ultimately, reduces testosterone and estrogen sex hormones.

### Availability

*Eligard Depot:* 7.5 mg, 22.5 mg, 30 mg, 45 mg

*Injection:* 1 mg/0.2 ml

*Lupron Depot injection:* 3.75 mg/ml, 7.5 mg/ml

*Lupron Depot-3 month injection:* 11.25 mg, 22.5 mg

*Lupron Depot-4 month injection:* 30 mg

*Lupron Depot-Ped injection:* 7.5 mg, 11.25 mg, 15 mg

### Indications and dosages

- Advanced prostate cancer

**Adults:** 1 mg subcutaneously daily (1 mg/0.2-ml formulation). For

Lupron Depot formulation, 7.5 mg I.M. monthly, 22.5 mg I.M. q 3 months, or 30 mg I.M. q 4 months. For Eligard formulation, 7.5 mg subcutaneously monthly, 22.5 mg subcutaneously q 3 months, 30 mg subcutaneously q 4 months, or 45 mg subcutaneously q 6 months.

- Endometriosis

**Adults:** 3.75 mg I.M. (depot injection) as a single injection once monthly, or 11.25 mg I.M. q 3 months. Duration is up to 6 months.

- Adjunct to iron therapy in anemia caused by uterine leiomyomas

**Adults:** 3.75 mg I.M. monthly or 11.25 mg I.M. q 3 months as a single dose. Recommended duration is 6 months or less.

- Central precocious puberty

**Children:** 50 mcg/kg/day subcutaneously as a single injection, increased in increments of 10 mcg/kg/day as needed

**Children weighing more than 37.5 kg (82.5 lb):** Initially, 15 mg of Depot-Ped I.M. q 4 weeks, increased in increments of 3.75 mg q 4 weeks as needed

**Children weighing 25 to 37.5 kg (55 to 82.5 lb):** Initially, 11.25 mg of Depot-Ped I.M. q 4 weeks, increased in increments of 3.75 mg q 4 weeks as needed

**Children weighing less than 25 kg (55 lb):** Initially, 7.5 mg of Depot-Ped I.M. q 4 weeks, increased in increments of 3.75 mg q 4 weeks as needed

### Contraindications

- Hypersensitivity to drug, its components, GnRH, or other GnRH analogs
- Undiagnosed abnormal vaginal bleeding
- Pregnancy or breastfeeding

### Precautions

Use cautiously in:

- renal, hepatic, or cardiac impairment.

## Administration

- Give Eligard within 30 minutes of mixing. After this time, discard.
- Administer Lupron injection immediately after mixing. Otherwise, discard.
- Administer Lupron Depot-Ped only under prescriber's supervision.

Route	Onset	Peak	Duration
I.M. depot	4 hr	Variable	1, 3, 4 mo
Subcut. (prec. puberty)	1 wk	Unknown	4-12 wk after therapy
Subcut. (endo- metriosis, cancer)	2-4 wk	After 1-2 mo	2-3 mo after therapy

## Adverse reactions

**CNS:** anxiety, depression, dizziness, drowsiness, asthenia, fatigue, headache, vertigo, syncope, mood changes

**CV:** palpitations, angina, **arrhythmias, myocardial infarction**

**EENT:** blurred vision

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, anorexia

**GU:** urinary frequency, hematuria, decreased testes size, erectile dysfunction, decreased libido, gynecomastia

**Hematologic:** anemia, **thrombocytopenia**

**Respiratory:** dyspnea, pleural rub, **worsening of pulmonary fibrosis, pulmonary embolism**

**Skin:** alopecia, pruritus, rash, diaphoresis

**Other:** sour taste, edema, hot flashes, **anaphylaxis**

## Interactions

**Drug-diagnostic tests.** *Blood urea nitrogen, creatinine:* increased levels

*Pituitary-gonadal system tests:* misleading results during and for up to 3 months after therapy

## Patient monitoring

- Observe injection site for local reactions.
- 🗣️ Monitor cardiovascular and respiratory status carefully to detect serious adverse reactions.
- Evaluate neurologic status. Institute safety measures as needed to prevent injury.
- Periodically monitor serum testosterone and prostate-specific antigen levels.

## Patient teaching

- Inform patient that localized reaction may occur at injection site. Tell him to contact prescriber if symptoms don't resolve.
- Advise patient and family to watch for and report signs or symptoms of depression.
- Tell patient drug may cause libido changes or erectile dysfunction. Encourage him to discuss these problems with prescriber.
- Teach patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- 🗣️ Instruct female of childbearing age to use reliable contraception during therapy. Tell her to stop drug immediately and contact prescriber if she suspects pregnancy.
- 🗣️ Tell female patient not to breast-feed.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## levalbuterol hydrochloride

Xopenex HFA

**Pharmacologic class:** Adrenergic beta<sub>2</sub> agonist

**Therapeutic class:** Bronchodilator

**Pregnancy risk category** C

### Action

Binds to beta<sub>2</sub>-adrenergic receptors on bronchial cell membrane, stimulating the intracellular enzyme adenylate cyclase to convert adenosine triphosphate to cyclic-3',5'-adenosine monophosphate. This action relaxes smooth muscles, dilates bronchioles, and increases diuresis.

### Availability

*Solution for inhalation:* 0.31 mg/3 ml, 0.63 mg/3 ml, 1.25 mg/3 ml

### Indications and dosages

➤ Prevention and treatment of bronchospasm

**Adults and children ages 12 and older:** 0.63 to 1.25 mg by oral inhalation via nebulizer q 6 to 8 hours

**Children ages 6 to 11:** 0.31 to 0.63 mg by oral inhalation via nebulizer t.i.d.

### Contraindications

• Hypersensitivity to drug or racemic albuterol

### Precautions

Use cautiously in:

- renal, hepatic, or cardiac impairment; hyperthyroidism; diabetes mellitus; hypertension; prostatic hypertrophy; angle-closure glaucoma; seizures
- pregnant patients.

### Administration

• Use only with nebulizer system designed for this drug.

- Keep unopened vials in foil pouch. Once pouch is opened, use within 2 weeks.
- If vial is removed from pouch, protect from light and use within 1 week.

Route	Onset	Peak	Duration
Inhalation	10-17 min	1.5 hr	5-6 hr

### Adverse reactions

**CNS:** anxiety, dizziness, hypertonia, insomnia, migraine, headache, nervousness, paresthesia, syncope, tremor  
**CV:** chest pain, hypertension, hypotension, tachycardia

**EENT:** rhinitis, sinusitis, dry throat

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, anorexia, dry mouth

**Metabolic:** hypokalemia

**Musculoskeletal:** muscle cramps, myalgia

**Respiratory:** cough, dyspnea, **asthma exacerbation, paradoxical bronchospasm**

**Other:** sour taste, flulike symptoms, lymphadenopathy, chills

### Interactions

**Drug-drug.** *Aerosol bronchodilators:* increased action of both drugs

*Antidepressants:* increased risk of adverse cardiovascular effects

*Beta-adrenergic blockers:* inhibition of levalbuterol effect

*Digoxin:* decreased digoxin blood level

*Loop and thiazide diuretics:* increased risk of hypokalemia

**Drug-food.** *Caffeine-containing foods and beverages:* increased stimulation

**Drug-herbs.** *Cola nut, ephedra (ma huang), guarana, yerba maté:* increased stimulation

### Patient monitoring

- Monitor vital signs and ECG closely.
- Assess cardiovascular and neurologic status. Institute safety measures as needed to prevent injury.

📢 Monitor for paradoxical bronchospasm. If it occurs, stop drug therapy and notify prescriber immediately.

- Check electrolyte levels for hypokalemia.
- Assess patient's response to drug. Contact prescriber if patient needs more frequent doses for same effect.

### Patient teaching

- Teach patient how to prepare drug, administer it with nebulizer, and maintain and clean nebulizer.
- Advise patient to continue treatment for about 5 to 15 minutes or until mist no longer forms in nebulizer reservoir.
- 📢 Tell patient to immediately report increased difficulty breathing or tightness in chest.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, foods, and herbs mentioned above.

## levetiracetam

Apo-Levetiracetam<sup>✳</sup>, Co  
Levetiracetam<sup>✳</sup>, Dom-  
Levetiracetam<sup>✳</sup>, Keppra, Keppra XR,  
PHL-Levetiracetam,  
PMS-Levetiracetam<sup>✳</sup>

**Pharmacologic class:** Pyrrolidine derivative

**Therapeutic class:** Anticonvulsant

**Pregnancy risk category C**

### Action

Unknown. Thought to prevent seizures by inhibiting nerve impulses in

hippocampus of brain. Chemically unrelated to other anticonvulsants.

### Availability

*Oral solution:* 100 mg/ml

*Solution for injection:* 500 mg/5 ml in single-use 5-ml vial

*Tablets:* 250 mg, 500 mg, 750 mg, 1,000 mg

*Tablets (extended-release):* 500 mg

### Indications and dosages

➤ Adjunctive treatment of partial-onset seizures in patients with epilepsy  
**Adults and children ages 16 and older:**

Initially, 500 mg P.O. (immediate-release preparations) b.i.d. May increase by 1,000 mg/day q 2 weeks to a maximum daily dosage of 3,000 mg, as needed. Or, initially 1,000 mg P.O. (extended-release tablets) once daily. Adjust in increments of 1,000 mg q 2 weeks to a maximum daily dosage of 3,000 mg, as appropriate. Or, when oral administration is temporarily not feasible, give initial daily I.V. dosage equivalent to total daily dosage and frequency of oral drug.

**Children ages 4 to 15:** Initially, 20 mg/kg/day P.O. (immediate-release preparations) in two divided doses (10 mg/kg b.i.d.). Increase daily dosage every 2 weeks by increments of 20 mg/kg to recommended daily dosage of 60 mg/kg (30 mg/kg b.i.d.). If patient can't tolerate daily dosage of 60 mg/kg, reduce daily dosage.

➤ Myoclonic seizures in patients with juvenile myoclonic epilepsy

**Children ages 16 and older:** Initially, 500 mg I.V. b.i.d. Increase dosage by 1,000 mg/day every 2 weeks to recommended total daily dosage of 3,000 mg.

**Children ages 12 and older:** Initially, 500 mg P.O. (immediate-release tablets or oral solution) b.i.d. Increase dosage by 1,000 mg/day every 2 weeks to the recommended total daily dose of 3,000 mg.

➤ Primary generalized tonic-clonic seizures

**Adults and children ages 16 and older:**

Initially, 1,000 mg P.O. b.i.d. Increase dosage by 1,000 mg/day every 2 weeks to the recommended total daily dose of 3,000 mg.

**Children ages 6 to 15:** Initially, 10 mg/kg P.O. b.i.d. Increase daily dosage every 2 weeks by increments of 20 mg/kg to recommended total daily dosage of 60 mg/kg (30 mg/kg b.i.d.).

**Dosage adjustment**

• Renal impairment (especially in dialysis patients)

**Contraindications**

• Hypersensitivity to drug or its components

**Precautions**

Use cautiously in:

- renal, hepatic, or cardiac impairment
- psychosis
- pregnant or breastfeeding patients
- children younger than age 16 (safety and efficacy not established).

**Administration**

- Give oral form with or without food.
- Know that patients weighing 44 lb (20 kg) or less should be given oral solution.

• Be aware that injection form is intended for temporary use when oral route isn't feasible.

⚠ Be aware that injection form is for I.V. use only and must be diluted before administering.

- Dilute 500 mg/ml in 100 ml 0.9% normal saline injection, lactated Ringer's injection, or dextrose 5% injection. Withdraw 5 ml, 10 ml, or 15 ml for 500-mg, 1,000-mg, or 1,500-mg dose, respectively.

• Administer as a 15-minute I.V. infusion.

⚠ Don't discontinue suddenly. Instead, taper dosage gradually.

Route	Onset	Peak	Duration
P.O.	Rapid	1 hr	Unknown
P.O. (ext-rel.)	Unknown	4 hr	Unknown
I.V.	Rapid	Unknown	Unknown

**Adverse reactions**

**CNS:** aggression, anger, irritability, mental or mood changes, asthenia, ataxia, dizziness, drowsiness, somnolence, fatigue, nervousness, depression, anxiety, amnesia, hostility, coordination difficulties, headache, paresthesia, vertigo

**EENT:** diplopia, pharyngitis, rhinitis, sinusitis

**GI:** nausea, vomiting, anorexia

**Hematologic:** neutropenia, leukopenia

**Respiratory:** cough

**Other:** infection, pain

**Interactions**

**Drug-herbs.** *Evening primrose oil:* lowered seizure threshold

**Patient monitoring**

- Measure temperature and watch for signs and symptoms of infection.
- ⚠ Monitor neurologic status. Report signs that patient is dangerous to himself or others.
- Evaluate nutritional status. Report signs of anorexia.

**Patient teaching**

- Tell patient to take with or without food.
- Instruct patient to swallow extended-release tablets whole and not to chew, break, or crush them.
- ⚠ Advise family to contact prescriber if patient poses a danger to himself or others.
- ⚠ Caution patient not to stop taking drug abruptly, because doing so may increase seizure activity.
- Teach patient and family about adverse CNS reactions, and tell them to report these promptly. Urge them

to take safety measures to prevent injury.

- Instruct patient to avoid activities that require mental alertness until CNS reactions are known.
- Inform patient that he'll undergo periodic blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the herbs mentioned above.

## levocetirizine

### levocetirizine dihydrochloride

Xyzal

#### Pharmacologic class:

Histamine<sub>1</sub> (H<sub>1</sub>)-receptor antagonist

**Therapeutic class:** Antihistamine

**Pregnancy risk category B**

#### Action

Exerts principal antihistaminic effects via selective inhibition of H<sub>1</sub> receptors

#### Availability

*Oral solution:* 2.5 mg/5 ml (0.5 mg/ml)

*Tablets:* 5 mg

#### Indications and dosages

➤ Symptoms of allergic rhinitis (seasonal and perennial); uncomplicated skin manifestations of chronic idiopathic urticaria

**Adults and children ages 12 and older:** 5 mg P.O. daily in evening

**Children ages 6 to 11:** 2.5 mg P.O. daily in evening; don't exceed recommended dosage.

#### Dosage adjustment

- Renal impairment.
- Hepatic impairment

#### Contraindications

- Hypersensitivity to drug, its components, or cetirizine
- End-stage renal disease
- Hemodialysis
- Renal impairment (children ages 6 to 11)

#### Precautions

Use cautiously in:

- renal impairment
- pregnant patients
- elderly patients
- breastfeeding patients (use not recommended)
- children younger than age 6 (safety and efficacy not established).

#### Administration

- Give with or without food.

Route	Onset	Peak	Duration
P.O.	Unknown	0.5 hr	Unknown

#### Adverse reactions

**CNS:** somnolence, fatigue, asthenia

**EENT:** epistaxis (children), nasopharyngitis, pharyngitis

**GI:** dry mouth

**Respiratory:** cough (children)

**Other:** pyrexia (children)

#### Interactions

**Drug-drug.** *Ritonavir:* increased levocetirizine blood level and half-life, decreased clearance

**Drug-behaviors.** *Alcohol use:* increased risk of impaired CNS function

#### Patient monitoring

- Stay alert for excessive CNS depression.
- Closely monitor renal function tests in patients with renal impairment.

#### Patient teaching

- Tell patient drug can be taken with or without food.

- Instruct patient to avoid alcohol and other depressants, such as sleeping pills, unless prescriber approves.
- Caution patient to avoid hazardous activities until drug's effects on concentration and alertness are known.
- Advise female patient to notify prescriber if she is pregnant or intends to become pregnant.
- Tell breastfeeding patient to discontinue breastfeeding during therapy.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and behaviors mentioned above.

## levofloxacin

Iquix, Levaquin, Novo-Levofloxacin\*, Oftaquix<sup>Ⓢ</sup>, Quixin, Tavanic<sup>Ⓢ</sup>

**Pharmacologic class:** Fluoroquinolone

**Therapeutic class:** Anti-infective

**Pregnancy risk category** C

### FDA BOXED WARNING

Fluoroquinolones for systemic use are associated with an increased risk of tendinitis and tendon rupture in all ages. This risk is further increased in patients usually over age 60, with concomitant use of corticosteroids, and in kidney, heart, and lung transplant recipients.

### Action

Inhibits the enzyme DNA gyrase in susceptible gram-negative and gram-positive aerobic and anaerobic bacteria, interfering with bacterial DNA synthesis

### Availability

**Ophthalmic solution:** Quixin—0.5%

(5 mg/ml), Iquix—1.5%

**Premixed solution for injection:** 250 mg/50 ml, 500 mg/100 ml, 750 mg/150 ml

**Solution for injection (concentrated):** 500 mg/20 ml

**Tablets:** 250 mg, 500 mg, 750 mg

### Indications and dosages

➤ Acute bacterial exacerbation of chronic bronchitis

**Adults:** 500 mg I.V. or P.O. q 24 hours for 7 days

➤ Community-acquired pneumonia  
**Adults:** 500 mg I.V. or P.O. q 24 hours for 7 to 14 days, or 750 mg I.V. or P.O. q 24 hours for 5 days

➤ Nosocomial pneumonia caused by methicillin-susceptible strains of *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Serratia marcescens*, *Escherichia coli*, *Klebsiella pneumoniae*, *Haemophilus influenzae*, or *Streptococcus pneumoniae*; complicated skin and skin-structure infections

**Adults:** 750 mg I.V. or P.O. q 24 hours for 7 to 14 days

➤ Acute bacterial sinusitis caused by *S. pneumoniae*, *H. influenzae*, or *Moraxella catarrhalis*

**Adults:** 500 mg I.V. or P.O. q 24 hours for 10 to 14 days or 750 mg P.O. or I.V. q 24 hours for 5 days

➤ Uncomplicated skin and skin-structure infections

**Adults:** 500 mg I.V. or P.O. q 24 hours for 7 to 10 days

➤ Complicated urinary tract infections; acute pyelonephritis caused by *E. coli*

**Adults:** 250 mg I.V. or P.O. q 24 hours for 10 days or 750 mg P.O. or I.V. q 24 hours for 5 days

➤ Uncomplicated urinary tract infections

**Adults:** 250 mg I.V. or P.O. q 24 hours for 3 days

➤ Chronic bacterial prostatitis

**Adults:** 500 mg I.V. or P.O. q 24 hours for 28 days.

➤ Conjunctivitis

**Adults and children ages 1 and older:**

One or two drops of 0.5% ophthalmic solution into affected eye q 2 hours while awake on days 1 and 2 (up to eight times daily); then one or two drops q 4 hours while awake on days 3 through 7 (up to four times daily)

➤ Corneal ulcers

**Adults and children ages 6 and older:**

On days 1 to 3, one or two drops of 1.5% ophthalmic solution instilled into affected eye(s) q 30 minutes to 1 hour while awake and q 4 to 6 hours after retiring; thereafter, one or two drops q 1 to 4 hours while awake until treatment completion

➤ Inhalational anthrax (postexposure)

**Adults and children ages 6 months and older weighing more than 50 kg (110 lb):** 500 mg P.O. or I.V. q 24 hours for 60 days

**Children ages 6 months and older weighing less than 50 kg (110 lb):** 8 mg/kg P.O. or I.V., not to exceed 250 mg/dose q 12 hours for 60 days

**Children ages 6 months and older weighing less than 50 kg (110 lb):** 8 mg/kg P.O. or I.V., not to exceed 250 mg/dose q 12 hours for 60 days

## Dosage adjustment

- Renal impairment

## Contraindications

- Hypersensitivity to drug, its components, or other quinolones

## Precautions

Use cautiously in:

- bradycardia, acute myocardial ischemia, prolonged QTc interval, cirrhosis, renal impairment, underlying CNS disease, uncorrected hypocalcemia
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 18 (except in ophthalmic use).

## Administration

- Be aware that oral and I.V. dosages are identical.
- Give parenteral form by I.V. route only. Drug isn't for I.M., subcutaneous, intrathecal, or intraperitoneal use.
- To prepare I.V. infusion, use compatible solution, such as 0.9% sodium chloride injection, dextrose 5% and 0.9% sodium chloride injection, dextrose 5% in water, or dextrose 5% in lactated Ringer's solution.
- Infuse over 60 to 90 minutes, depending on dosage. Don't infuse with other drugs.
- ⚠️ Avoid rapid or bolus I.V. administration, because this may cause severe hypotension
- Flush I.V. line before and after infusion.
- Give oral doses 2 hours before or after sucralfate, iron, antacids containing magnesium or aluminum, or multivitamins with zinc.
- Give oral form without regard to food, but don't give with milk or yogurt alone.
- Be aware that the two ophthalmic preparations have different indications.

Route	Onset	Peak	Duration
P.O.	Rapid	1-2 hr	24 hr
I.V.	Rapid	End of infusion	24 hr
Ophth.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** dizziness, headache, insomnia, seizures

**CV:** chest pain, palpitations, hypotension

**EENT:** photophobia, sinusitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, flatulence, **pseudomembranous colitis**

**GU:** vaginitis

**Hematologic:** lymphocytopenia

**Metabolic:** hyperglycemia, hypoglycemia

**Musculoskeletal:** back pain, tendon rupture, tendinitis

**Skin:** photosensitivity

**Other:** altered taste, reaction and pain at I.V. site, hypersensitivity reactions including **Stevens-Johnson syndrome**

### Interactions

**Drug-drug.** *Antacids containing aluminum or magnesium, didanosine (tablets), iron salts, sucralfate, zinc salts:* decreased levofloxacin absorption

*Cimetidine:* interference with levofloxacin elimination

*Nonsteroidal anti-inflammatory drugs:* increased risk of CNS stimulation and seizures

**Drug-diagnostic tests.** *Glucose:* increased or decreased level

*Lymphocytes:* decreased count

*EEG:* abnormal findings

**Drug-food.** *Concurrent tube feedings, milk, yogurt:* impaired levofloxacin absorption

**Drug-herbs.** *Dong quai, St. John's wort:* phototoxicity

*Fennel:* decreased levofloxacin absorption

**Drug-behaviors.** *Sun exposure:* phototoxicity

### Patient monitoring

- Check vital signs, especially blood pressure. Too-rapid infusion can cause hypotension.

- Closely monitor patients with renal insufficiency.

- Monitor blood glucose level closely in diabetic patients.

- ☚ Assess for severe diarrhea, which may indicate pseudomembranous colitis.

- ☚ Watch for hypersensitivity reaction. Discontinue drug immediately if rash or other signs or symptoms occur.

- ☚ Watch for signs and symptoms of tendinitis or tendon rupture.

### Patient teaching

- ☚ Tell patient to stop taking drug and contact prescriber if he experiences signs or symptoms of hypersensitivity reaction (rash, hives, or other skin reactions) or severe diarrhea (which may indicate pseudomembranous colitis).

- ☚ Instruct patient to stop taking drug and notify prescriber immediately if tendon pain, swelling, or inflammation occurs.

- Instruct patient not to take with milk, yogurt, multivitamins containing zinc or iron, or antacids containing aluminum or magnesium.

- Teach patient proper use of eye drops. Tell him to avoid touching applicator tip to eye, finger, or any other object.

- Caution patient to avoid driving and other activities that require mental alertness until CNS effects of drug are known.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## levonorgestrel

Levonelle<sup>®</sup>, Mirena, Plan B

One-Step

**Pharmacologic class:** Contraceptive, intrauterine device (Mirena); oral contraceptive, progestin-only pill (Plan B)

**Therapeutic class:** Contraceptive

**Pregnancy risk category X** (Mirena), **NR** (Plan B)

### Action

Unclear. Mirena may enhance local contraceptive efficacy by thickening the cervical mucus (which prevents

passage of sperm into uterus), inhibiting sperm capacitation or survival, and altering the endometrium. Plan B is thought to prevent ovulation or fertilization.

### Availability

*Intrauterine system (Mirena):* 52 mg levonorgestrel

*Tablets (Plan B):* 1.5 mg

### Indications and dosages

➤ Intrauterine contraception for up to 5 years; heavy menstrual bleeding for women who choose to use intrauterine contraception

**Adults:** One intrauterine system (Mirena) inserted into uterus for up to 5 years

➤ Emergency contraception to prevent pregnancy

**Adults:** 1.5 mg (Plan B) P.O. as soon as possible within 72 hours after unprotected intercourse

### Contraindications

**Mirena—**

- Hypersensitivity to drug or its components
- Known or suspected pregnancy
- Congenital or acquired uterine anomaly
- Acute pelvic inflammatory disease (PID) or history of PID (unless patient had subsequent intrauterine pregnancy)
- Postpartum endometritis or infected abortion within past 3 months
- Known or suspected uterine or cervical neoplasia or unresolved abnormal Papanicolaou (Pap) test
- Untreated acute cervicitis or vaginitis
- Acute hepatic disease or hepatic tumor (benign or malignant)
- Genital bleeding of unknown cause
- Conditions associated with increased risk of infection
- Genital actinomycosis
- Previously inserted intrauterine device that has not been removed
- Known or suspected breast cancer

- History of ectopic pregnancy or conditions that predispose to it

**Plan B —**

- Hypersensitivity to drug or its components
- Known or suspected pregnancy
- Undiagnosed abnormal genital bleeding

### Precautions

Use Mirena cautiously in:

- diabetes mellitus
- breastfeeding patients.

Use Plan B cautiously in:

- coagulopathy
- diabetes mellitus
- patients receiving anticoagulants concurrently.

### Administration

- Know that Mirena should be inserted under aseptic conditions by health care professional familiar with procedure.
- Verify that patient isn't pregnant before Mirena insertion.
- Know that Plan B should be given as soon as possible within 72 hours of unprotected sexual intercourse. Drug isn't suitable as long-term contraceptive.

Route	Onset	Peak	Duration
P.O.	Unknown	1.6 ± 0.7 hr	Unknown
Intra-uterine	No peaks or troughs		

### Adverse reactions

**CNS:** headache (Mirena, Plan B), fatigue, dizziness (Plan B), severe headache, migraine, nervousness, depression (Mirena)

**CV:** hypertension (Mirena)

**EENT:** sinusitis (Mirena)

**GI:** nausea, vomiting, abdominal pain (Mirena, Plan B), diarrhea (Plan B), **intestinal perforation or obstruction** (Mirena)

**GU:** breast tenderness (Mirena, Plan B); lighter or heavier menstrual bleeding (Plan B); breast pain; increased

progesterone levels; ovarian cysts; dysmenorrhea; amenorrhea; spotting; erratic or prolonged menstrual bleeding; pelvic infection; vaginitis; cervicitis; dyspareunia; leukorrhea; decreased libido; abnormal Pap smear; expulsion, embedment in myometrium, adhesions, **cervical or ureteral perforation** (Mirena)

**Hematologic:** anemia (Mirena)

**Hepatic:** jaundice (Mirena)

**Musculoskeletal:** back pain (Mirena)

**Respiratory:** upper respiratory tract infection (Mirena)

**Skin:** skin disorder, acne, eczema, hair loss (Mirena)

**Other:** water retention, weight gain, sepsis (Mirena)

### Interactions

**Drug-drug.** *Hepatic enzyme-inducing drugs (such as barbiturates, carbamazepine, phenytoin, rifampin):* decreased Plan B efficacy

**Drug-diagnostic tests.** *Glucose:* altered level (Mirena)

### Patient monitoring

- Monitor blood pressure.
- Watch for adverse reactions, especially changes in menstrual bleeding.
- Monitor blood glucose level in diabetic patients.
- Check liver function tests frequently.

### Patient teaching

- Tell patient taking either product that drug does not prevent HIV or other sexually transmitted diseases.
- Teach patient using Mirena how to check (after menstrual period) to make sure thread still protrudes from cervix. Caution her not to pull on thread, because this could cause displacement.

📢 Instruct patient using Mirena to immediately report fever, chills, unusual vaginal discharge, or abdominal or pelvic pain or tenderness.

- Explain that for maximum efficacy, patient should take Plan B as soon as possible after unprotected sex.
- Inform patient that Plan B isn't intended for routine contraception and doesn't terminate existing pregnancy.
- Tell patient to report adverse reactions.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## levorphanol tartrate

**Pharmacologic class:** Synthetic opioid agonist

**Therapeutic class:** Opioid analgesic

**Controlled substance schedule II**

**Pregnancy risk category C**

### Action

Inhibits adenylate cyclase, which regulates release of pain neurotransmitters (acetylcholine, dopamine, substance P, and gamma-aminobutyric acid). Also stimulates mu and kappa opioid receptors, altering perception of and emotional response to pain.

### Availability

*Tablets:* 2 mg

### 🔴 Indications and dosages

➤ Moderate to severe pain

**Adults:** 2 mg P.O. q 6 to 8 hours p.r.n., provided patient is assessed for hypoventilation and excessive sedation. If necessary, may increase dosage to up to 3 mg q 6 to 8 hours, after adequate evaluation of patient response. Higher doses may be appropriate in opioid-tolerant patients. Adjust dosage

according to patient's severity of pain, age, weight, physical status, underlying diseases, and use of concomitant medications. Total oral daily doses of more than 6 to 12 mg in 24 hours are generally not recommended as starting doses in nonopioid-tolerant patients.

### Dosage adjustment

- Hepatic or renal insufficiency
- Elderly patients

### Contraindications

- Hypersensitivity to drug or other opioid agonists
- Bronchial asthma
- Increased intracranial pressure
- Respiratory depression
- Acute alcoholism

### Precautions

Use cautiously in:

- renal or hepatic dysfunction, chronic obstructive pulmonary disease, acute abdominal conditions, cardiovascular disease, seizure disorders, cerebral arteriosclerosis, Addison's disease, prostatic hypertrophy, toxic psychosis
- pregnant or breastfeeding patients
- children.

### Administration

 Make sure resuscitation equipment is available before starting therapy.

Route	Onset	Peak	Duration
P.O.	10-60 min	90-120 min	4-5 hr

### Adverse reactions

**CNS:** personality disorders, nervousness, insomnia, hypokinesia, dyskinesia, drowsiness, light-headedness, dizziness, depression, delusions, confusion, amnesia, sedation, euphoria, delirium, mood changes, **coma, seizures**

**CV:** palpitations, hypotension, tachycardia, bradycardia, **shock, peripheral circulatory collapse, cardiac arrest**

**EENT:** diplopia, abnormal vision

**GI:** nausea, vomiting, constipation, abdominal pain, dyspepsia, increased colonic motility (in patients with chronic ulcerative colitis), dry mouth

**GU:** dysuria, urinary retention or hesitancy, ureteral or vesicle sphincter spasms, decreased libido, **oliguria**

**Hepatic:** biliary tract spasms, **hepatic failure**

**Respiratory:** suppressed cough reflex, hyperventilation, **periodic apnea**

**Skin:** urticaria, rash, pruritus, cyanosis, facial flushing

**Other:** physical or psychological drug dependence

### Interactions

**Drug-drug.** *Alfentanil, fentanyl, sufentanil, other CNS depressants:* increased CNS and respiratory depression, increased risk of hypotension

*Anticholinergics:* increased risk of severe constipation

*Antidiarrheals (such as atropine, difenoxin, kaolin, loperamide), antihypertensives:* increased risk of hypotension

*Buprenorphine, naloxone, naltrexone:* decreased levorphanol efficacy

*Metoclopramide:* antagonism of metoclopramide effects

*Neuromuscular blockers:* increased risk of prolonged CNS and respiratory depression

**Drug-diagnostic tests.** *Amylase, lipase:* increased levels

**Drug-behaviors.** *Alcohol use:* increased CNS depression

### Patient monitoring

- Check vital signs and respiratory status, and monitor ECG carefully.

- Evaluate fluid intake and output.

- Assess neurologic status. Institute safety precautions as needed to prevent injury.

- Watch for signs and symptoms of depression.

- Monitor liver and kidney function tests.

## Patient teaching

 Instruct patient or caregiver to report adverse reactions immediately.

- Tell patient or caregiver to use safety measures as needed to prevent injury and to report significant problems.
- Advise patient to avoid alcohol while taking this drug.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## levothyroxine sodium (L-thyroxine, T<sub>4</sub>)

Eltroxin  , Euthyrox , Evotrox , Levo-T, Levolet, Levotheroid, Levoxyl, Nu-Thyro , Soloxine, Synthroid, Unithroid

**Pharmacologic class:** Synthetic thyroxine hormone

**Therapeutic class:** Thyroid hormone replacement

**Pregnancy risk category** A

### FDA **BOXED WARNING**

- Drug shouldn't be used alone or with other agents to treat obesity or weight loss. In euthyroid patients, doses within range of daily hormonal requirements are ineffective for weight loss. Larger doses may cause serious or life-threatening toxicity, particularly when given with sympathomimetic amines (such as those used for anorectic effects).

## Action

Synthetic form of thyroxine that replaces endogenous thyroxine, increasing thyroid hormone levels. Thyroid hormones help regulate cell growth and differentiation and increase metabolism of lipids, protein, and carbohydrates.

## Availability

**Powder for injection:** 200 mcg/vial in 6- and 10-ml vials, 500 mcg/vial in 6- and 10-ml vials

**Tablets:** 25 mcg, 50 mcg, 75 mcg, 88 mcg, 100 mcg, 112 mcg, 125 mcg, 137 mcg, 150 mcg, 175 mcg, 200 mcg, 300 mcg

## Indications and dosages

 Hypothyroidism; treatment or prevention of euthyroid goiter

**Adults:** For healthy adults younger than age 50 and those over age 50 who have recently been treated or undergone short-term therapy, start at full replacement dosage of 1.7 mcg/kg P.O. daily, given 30 minutes to 1 hour before breakfast. For patients older than age 50 or younger than age 50 with heart disease, 25 to 50 mcg P.O. daily, increased q 4 to 6 weeks. In severe hypothyroidism, initial dosage is 12.5 to 25 mcg P.O. daily, adjusted by 25 mcg daily q 2 to 4 weeks. For patients who can't tolerate oral doses, adjust I.M. or I.V. dosage to roughly half of oral dosage.

 Congenital hypothyroidism

**Children older than age 12 who have completed puberty and growth:** 1.7 mcg/kg P.O. daily

**Children older than age 12 who have not completed puberty and growth:** Up to 150 mcg or 2 to 3 mcg/kg P.O. daily

**Children ages 6 to 12:** 4 to 5 mcg/kg P.O. daily

**Children ages 1 to 5:** 5 to 6 mcg/kg P.O. daily

**Infants ages 6 to 12 months:** 6 to 8 mcg/kg P.O. daily

**Infants ages 3 to 6 months:** 8 to 10 mcg/kg P.O. daily

**Infants up to 3 months old:** 10 to 15 mcg/kg P.O. daily

➤ Myxedema coma or stupor

**Adults:** 200 to 500 mcg I.V. as a solution containing 100 mcg/ml. Additional 100 to 300 mcg may be given on day 2 if significant improvement has not occurred. Convert to P.O. therapy when patient is clinically stable.

➤ Thyroid-stimulating hormone suppression in well-differentiated thyroid cancers and thyroid nodules

**Adults:** Dosage individualized based on disease and patient

### Dosage adjustment

- Cardiovascular disease
- Psychosis or agitation
- Elderly patients

### Contraindications

- Hypersensitivity to drug, its components, or tartrazine
- Acute myocardial infarction
- Thyrotoxicosis
- Adrenal insufficiency

### Precautions

Use cautiously in:

- cardiovascular disease, severe renal insufficiency, diabetes mellitus
- elderly patients
- pregnant or breastfeeding patients.

### Administration

- Be aware that all dosages are highly individualized.
- Give tablets on an empty stomach 30 minutes to 1 hour before first meal of day.
- If patient can't swallow tablets, crush them and sprinkle onto small amount of food, such as applesauce. For infants and children, dissolve tablets in small amount of water, nonsoybean formula, or breast milk and administer immediately.

- Don't give oral form within 4 hours of bile acid sequestrants or antacids.

- Reconstitute Synthroid powder for injection with 5 ml of 0.9% sodium chloride injection. Shake until clear and use immediately.

- For I.V. administration, give each 100 mcg over at least 1 minute.

- Be aware that the various levothyroxine preparations aren't bioequivalent. Patient should consistently use same brand or generic product, with dosing based on weight, age, physical condition, and symptom duration.

- When drug is given for thyroid-stimulating hormone (TSH) suppression test, TSH suppression level is not well established and radioactive iodine (<sup>131</sup>I) is given before and after treatment course.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown
I.V.	6-8 hr	24 hr	Unknown
I.M.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** insomnia, irritability, nervousness, headache

**CV:** tachycardia, angina pectoris, hypotension, hypertension, increased cardiac output, **arrhythmias, cardiovascular collapse**

**GI:** vomiting, diarrhea, abdominal cramps

**GU:** menstrual irregularities

**Metabolic:** hyperthyroidism

**Musculoskeletal:** accelerated bone maturation (in children), decreased bone density (in women on long-term therapy)

**Skin:** alopecia (in children), diaphoresis

**Other:** heat intolerance, weight loss

### Interactions

**Drug-drug.** *Aminoglutethimide, amiodarone, anabolic steroids, antithyroid drugs, asparaginase, barbiturates, carbamazepine, chloral hydrate, cholestyramine, clofibrate, colestipol, corticosteroids,*

danazol, diazepam, estrogens, ethionamide, fluorouracil, heparin (with I.V. use), insulin, lithium, methadone, mitotane, nitroprusside, oxyphenbutazone, perphenazine, phenylbutazone, phenytoin, propranolol, salicylates (large doses), sulfonyleureas, thiazides: altered thyroid function test results  
**Antacids, bile acid sequestrants:** interference with levothyroxine absorption  
**Anticoagulants:** increased anticoagulant action

**Beta-adrenergic blockers (selected):** decreased beta blocker action

**Cardiac glycosides:** decreased cardiac glycoside blood level

**Cholestyramine, colestipol:** levothyroxine inefficacy

**Theophyllines:** decreased theophylline clearance

**Drug-diagnostic tests.** *Thyroid function tests:* decreased values

**Drug-food.** *Foods high in iron or fiber, soybeans:* decreased drug absorption

### Patient monitoring

- Check vital signs and ECG routinely.
- Monitor thyroid and liver function tests.

 Evaluate for signs and symptoms of overdose, including those of hyperthyroidism (weight loss, cardiac symptoms, abdominal cramps).

- Monitor closely for drug efficacy.
- Check patients with Addison's disease or diabetes mellitus for worsening of these conditions.

 Watch for signs and symptoms of bleeding tendency, especially in patients receiving anticoagulants concurrently.

### Patient teaching

- Explain that patient may require lifelong therapy and must undergo regular blood testing.
- Tell patient or parent to report adverse effects, including signs or symptoms of hyperthyroidism or hypothyroidism.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- Advise patient to avoid getting overheated, as in hot environments or during vigorous exercise.

- Tell parents that child being treated may lose hair during first few months of therapy. Reassure them that this effect usually is transient.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## lidocaine hydrochloride

Anestaine, Anesticon, Laryng-O-Jet<sup>®</sup>, Lidodan<sup>®</sup>, Lidoderm, Lidomax<sup>®</sup>, LidoPen Auto-Injector, LTA Pediatric, Lurocaine<sup>®</sup>, Xylocaine, Xylocaine-MPF, Xylocard<sup>®</sup>

**Pharmacologic class:** Amide

**Therapeutic class:** Antiarrhythmic (class IB), local anesthetic

**Pregnancy risk category B**

### Action

Suppresses automaticity of ventricular cells, decreasing diastolic depolarization and increasing ventricular fibrillation threshold. Produces local anesthesia by reducing sodium permeability of sensory nerves, which blocks impulse generation and conduction.

### Availability

*Injection for I.M. use:* 300 mg/3 ml (automatic injection device)

*Injection for direct I.V. use:* 1% and 2% in syringes and vials

*Injection for I.V. infusion:* 2 mg/ml, 4 mg/ml, 8 mg/ml

*Injection for I.V. injection admixtures:*

40 mg/ml, 100 mg/ml, 200 mg/ml

*Patch:* 5%

*Topical cream:* 0.5%, 4%

*Topical gel:* 0.5%, 2.5%

*Topical jelly:* 2%

*Topical liquid, ointment:* 2.5%, 5%

*Topical solution:* 4%

*Topical solution (viscous):* 2%

*Topical spray:* 0.5%

## Indications and dosages

➤ Ventricular arrhythmias

**Adults:** Initially, 50 to 100 mg I.V. bolus given at rate of 25 to 50 mg/minute. If desired response doesn't occur after 5 minutes, give repeat dose at 25 to 50 mg/minute; maximum dosage is 300 mg given over 1 hour. Maintenance dosage is 1 to 4 mg/minute by continuous I.V. infusion for no more than 24 hours.

**Children:** Initially, 1 mg/kg I.V. bolus, then repeated based on patient response; don't exceed 5 mg/kg. Maintenance dosage is 30 mcg/kg/minute by continuous I.V. infusion.

➤ Caudal anesthesia (without epinephrine)

**Adults:** For obstetric analgesia, 200 to 300 mg caudally as 1% solution. For surgical anesthesia, 225 to 300 mg as 1.5% solution. For continuous caudal anesthesia, don't repeat maximum dosage at intervals of less than 90 minutes.

➤ Epidural anesthesia (without epinephrine)

**Adults:** For lumbar analgesia, 250 to 300 mg epidurally as 1% solution, 225 to 300 mg as 1.5% solution, or 200 to 300 mg as 2% solution. For thoracic anesthesia, 200 to 300 mg as 1% solution. For continuous epidural anesthesia, don't repeat maximum dosage at intervals of less than 90 minutes.

➤ I.V. regional infiltration (without epinephrine)

**Adults:** 50 to 300 mg I.V. as 0.5% solution. For I.V. regional anesthesia, maximum dosage is 4 mg/kg.

➤ I.V. local infiltration (without epinephrine)

**Children:** Up to 4.5 mg/kg I.V. as 0.25% to 1% solution

➤ Spinal anesthesia (without epinephrine)

**Adults:** For obstetric low-spinal or saddle-block anesthesia (normal vaginal delivery), 50 mg of 5% Xylocaine-MPF with glucose 7.5%, or 9 to 15 mg of 1.5% Xylocaine-MPF with dextrose 7.5%. For cesarean section, 75 mg of 5% Xylocaine-MPF with glucose 7.5%. For surgical anesthesia, 75 to 100 mg of 5% Xylocaine-MPF with glucose 7.5%.

➤ Paracervical anesthesia (without epinephrine)

**Adults:** For obstetric analgesia, 100 mg paracervically as 1% solution (each side). For paracervical block, maximum dosage is 200 mg over each 90-minute period (half administered on each side).

➤ Peripheral nerve block

**Adults:** For brachial nerve block, 225 to 300 mg as 1.5% solution. For dental nerve block, 20 to 100 mg as 2% solution with epinephrine 1:100,000 or 1:50,000. For intercostal nerve block, 30 mg as 1% solution. For pudendal nerve block, 100 mg as 1% solution. For paravertebral nerve block, 30 mg to 50 mg as 1% solution.

➤ Sympathetic nerve block (without epinephrine)

**Adults:** For cervical nerve block, 50 mg as 1% solution. For lumbar nerve block, 50 to 100 mg as 1% solution.

➤ Dental anesthesia

**Adults:** 1 to 5 ml of lidocaine 2% with epinephrine 1:50,000 or 1:100,000. Maximum dosage is less than 500 mg (7 mg/kg).

**Children:** 20 to 30 mg as 2% solution with epinephrine 1:100,000

➤ Topical anesthesia for skin or mucous membranes

**Adults:** Apply thin layer of gel, jelly, or ointment to skin or mucous membranes as needed before procedure; or apply 5% patch to most painful areas and intact skin (up to three patches at a time for up to 12 hours within a 24-hour period). For new denture fittings, use 5-g ointment (250 mg) per single dose or 20 g/day. For oropharyngeal use, apply to desired area or to instrument before insertion.

**Children:** Apply thin layer of ointment to skin or mucous membranes p.r.n. before procedure. Maximum dosage is 2.5 g ointment per 6 hours or 4.5 mg/kg.

➤ Prevention or treatment of pain during procedures involving male or female urethra

**Adults:** For female urethral examination, apply 3 to 5 ml of 2% jelly topically several minutes before exam. For male sounding or cystoscopy, apply 5 to 10 ml of 2% jelly topically before procedure, or apply 30 ml to fill or dilate urethra in divided doses using penile clamp for several minutes between doses. For male catheterization, apply 5 to 10 ml of 2% jelly to anterior urethra before procedure. Don't use more than 600 mg/12 hours.

➤ Oral cavity disorders; pharyngeal disorders

**Adults:** For oral cavity disorders, 300 mg (15 ml) of viscous oral topical solution swished and then expelled, or applied with cotton swab q 3 hours p.r.n. For pharyngeal disorders, use same dosage, but solution may be swallowed.

**Children older than age 3:** Dosage individualized based on age, weight, and physical condition. Maximum dosage is 4.5 mg/kg q 3 hours.

**Children up to age 3:** 1.25 ml applied with swab q 3 hours

➤ Local anesthesia (oral or nasal mucosa)

**Adults:** 0.6 to 3 mg/kg or 40 to 200 mg of 4% topical solution, not to exceed 4.5 mg/kg or 300 mg (7.5 ml)

**Children:** Dosage individualized

### Off-label uses

- Pediatric patients with cardiac arrest who develop frequent premature ventricular contractions
- Status epilepticus

### Contraindications

- Hypersensitivity to drug, its components, or other amide local anesthetics
- Heart failure, cardiogenic shock, second- or third-degree heart block, intraventricular block in absence of a pacemaker
- Wolff-Parkinson-White or Adams-Stokes syndrome
- Severe hemorrhage, shock, or heart block (lidocaine with dextrose)
- Local infection at puncture site (lidocaine with dextrose)
- Septicemia (lidocaine with dextrose)

### Precautions

Use cautiously in:

- renal or hepatic disorders, inflammation or sepsis in injection area
- labor or delivery
- breastfeeding patients.

### Administration

⚠ Know that I.V. lidocaine is a high-alert drug.

⚠ Make sure resuscitation equipment and oxygen are available before giving I.V. lidocaine.

- Dilute injection in additive syringe and single-use vial according to manufacturer's instructions before administering as I.V. infusion.
- Add 1 g lidocaine to 1 L dextrose 5% in water to yield a solution of 1 mg/ml.
- For I.V. bolus injection, give doses of 25 to 50 mg over at least 1 minute. Deliver continuous infusion by infusion pump no faster than 4 mg/minute.

⚠️ Know that too-rapid infusion may cause seizures.

- Be aware that drug can be given I.M. using 10% parenteral solution only.

Route	Onset	Peak	Duration
I.V.	45-90 sec	Immediate	10-20 min
I.M.	5-15 min	Unknown	60-90 min
Topical	2-5 min	Unknown	30-60 min

### Adverse reactions

**CNS:** anxiety; confusion; difficulty speaking; dizziness; hallucinations; lethargy; paresthesia; light-headedness; fatigue; drowsiness; headache; persistent sensory, motor, or **autonomic deficit of lower spinal segment; septic meningitis; seizures**

**CV:** bradycardia, hypotension, new or worsening **arrhythmias, cardiac arrest**

**EENT:** diplopia, abnormal vision

**GI:** nausea, vomiting, dry mouth

**GU:** urinary retention

**Metabolic:** **methemoglobinemia**

**Respiratory:** suppressed cough reflex, **respiratory depression, respiratory arrest**

**Skin:** rash; urticaria; pruritus; erythema; contact dermatitis; cutaneous lesions; tissue irritation, sloughing, and necrosis

**Other:** fever; edema; infection, burning, stinging, tenderness, and swelling at injection site; **anaphylaxis**

### Interactions

**Drug-drug.** *Beta-adrenergic blockers, cimetidine:* increased lidocaine blood level

*MAO inhibitors, tricyclic antidepressants:* prolonged hypertension

*Mexiletine, tocainide:* additive cardiac effects

*Phenytoin, procainamide:* increased cardiac depression

**Drug-diagnostic tests.** *Creatine kinase:* increased level (with I.M. use)

### Patient monitoring

⚠️ Monitor vital signs and ECG continuously. Watch for cardiac depression.

⚠️ Evaluate level of consciousness closely.

⚠️ Watch for adverse reactions, particularly anaphylaxis.

⚠️ Stay alert for seizures.

⚠️ Monitor neurologic status for lower spinal segment deficits.

- Give supportive oxygen therapy, as indicated and prescribed.

- Monitor electrolyte, blood urea nitrogen, and creatinine levels.

- Assess topical site for adverse reactions.

### Patient teaching

- Discuss reason for drug therapy with patient and family, when appropriate.

- Explain that patient will be monitored continuously during therapy.

⚠️ Instruct patient to promptly report discomfort at I.V. site as well as adverse effects, especially cardiovascular, respiratory, or neurologic problems or allergic reactions.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## lindane

Hexit Lotion<sup>✳</sup>, Hexit Shampoo 1<sup>✳</sup>, PMS-Lindane LOT 1<sup>✳</sup>, PMS-Lindane SHP 1<sup>✳</sup>

**Pharmacologic class:** Chlorinated hydrocarbon

**Therapeutic class:** Scabicide, pediculicide

**Pregnancy risk category C**

**FDA BOXED WARNING**

- Use only in patients who can't tolerate or have failed first-line treatment with safer drugs.
- Seizures and deaths have occurred with repeat or prolonged application, and in rare cases after a single application used as directed. Use cautiously in infants, children, elderly patients, persons with other skin conditions, and in those weighing less than 110 lb (50 kg).
- Drug is contraindicated in premature infants and patients with uncontrolled seizure disorders.
- Instruct patient about proper drug use, amount to apply, how long to leave it on, and importance of avoiding retreatment.

**Action**

Absorbed through parasitic ova and arthropods, which stimulates parasitic nervous system and results in seizures and death of parasite

**Availability**

Lotion: 1%

Shampoo: 1%

**Indications and dosages**

➤ Secondary treatment of scabies

**Adults and children:** Apply enough lotion on dry skin to cover entire surface from neck down. Rub in well, and leave in place 12 hours. Then wash skin thoroughly.

➤ Secondary treatment of *Pediculosis capitis* (head lice) or *Pediculosis pubis* (pubic lice)

**Adults and children:** Apply enough shampoo to dry hair (1 oz or less for short hair, 1½ oz for medium length hair, up to 2 oz for long hair) to thoroughly wet hair and skin or scalp of affected and surrounding hairy areas. Leave in place 12 hours. Then wash hair thoroughly.

**Contraindications**

- Hypersensitivity to drug or its components
- Seizure disorder
- Crusted (Norwegian) scabies and other conditions that may increase systemic drug absorption
- Premature neonates

**Precautions**

Use cautiously in:

- conditions that increase seizure risk (such as history of seizures, head injury, AIDS)
- skin conditions
- concurrent use of skin creams, oils, or ointments
- patients weighing less than 50 kg (110 lb)
- elderly patients
- breastfeeding patients
- infants or children.

**Administration**

- To apply, wear gloves made of nitrile, latex with neoprene, or sheer vinyl.
- Before applying lindane shampoo, use regular shampoo without conditioner; rinse and dry hair completely. Wait 1 hour before using lindane shampoo.
- Don't use lindane lotion or shampoo with other lotions, creams, or oils.
- Thoroughly wash skin after lotion has been in place for 12 hours.

Route	Onset	Peak	Duration
Topical	Unknown	6 hr	Unknown

**Adverse reactions**

**CNS:** dizziness, seizures, headache, anxiety, paresthesia

**EENT:** irritation of eyes, nose, and throat (from vapor inhalation)

**GI:** nausea and vomiting (from vapor inhalation)

**Hematologic:** aplastic anemia (with prolonged use)

**Skin:** dermatitis, urticaria, pruritus, alopecia

**Other:** pain

## Interactions

**Drug-drug.** *Drugs that lower seizure threshold, antidepressants:* increased seizure activity

## Patient monitoring

- Monitor drug efficacy.

## Patient teaching

 Emphasize that drug is for external use only, and that ingesting even small amounts can be fatal.

- If drug will be applied by another person, tell patient that this person must wear gloves made of nitrile, latex with neoprene, or sheer vinyl.
- Instruct patient using lindane lotion to wash, rinse, and dry skin well before applying lindane if skin has cream, lotion, ointment, or oil on it. If he takes a warm bath or shower before applying lindane, instruct him to let skin dry and cool down. Then tell him to apply lindane to dry skin, rub in well, leave on skin for 8 to 12 hours, and then remove it by washing thoroughly.
- Instruct patient using lindane shampoo to apply enough shampoo to dry hair to thoroughly wet the hair and skin or scalp of affected and surrounding hairy areas, and then rub shampoo thoroughly into hair and skin or scalp and let it sit for 4 minutes. Then tell him to add just enough water to work up a good lather, then rinse thoroughly and dry hair with clean towel. When hair is completely dry, instruct him to comb it with a fine-toothed comb to remove any remaining nits or nit shells. Tell him not to use shampoo in combination with oils, lotions, or creams.
- To avoid reinfestation, instruct patient to launder all recently worn or used clothing, bed linens, and towels in hot water.
- Caution patient to avoid contact with eyes when applying lotion or shampoo.
- Tell patient with scabies that sexual contacts and other close personal

contacts should be examined and, if necessary, treated.

- Advise female patient to inform prescriber if she plans to breastfeed.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## linezolid

Zyvox, Zyvoxam<sup>®</sup>

**Pharmacologic class:** Oxazolidinone

**Therapeutic class:** Anti-infective

**Pregnancy risk category C**

## Action

Selectively binds to bacterial 23S ribosomal RNA of 50S subunit, preventing formation of essential component of bacterial protein synthesis. Bacteriostatic or bactericidal against gram-positive and some gram-negative bacteria.

## Availability

*Injection:* 2 mg/ml

*Powder for oral suspension:* 100 mg/5 ml

*Tablets:* 400 mg, 600 mg

## Indications and dosages

 Vancomycin-resistant *Enterococcus faecium* infections

**Adults and children ages 12 and older:** 600 mg P.O. or I.V. infusion q 12 hours for 14 to 28 days

**Children from birth to age 11:** 10 mg/kg I.V. q 8 hours for 14 to 28 days

 Nosocomial pneumonia; community-acquired pneumonia; complicated skin and skin-structure infections

**Adults and children ages 12 and older:** 600 mg P.O. or I.V. infusion q 12 hours for 10 to 14 days

**Children from birth to age 11:** 10 mg/kg P.O. or I.V. q 8 hours for 10 to 14 days

➤ Uncomplicated skin and soft-tissue infections

**Adults:** 400 mg P.O. q 12 hours for 10 to 14 days

**Adolescents:** 600 mg P.O. or I.V. q 12 hours for 10 to 14 days

**Children ages 5 to 11:** 10 mg/kg P.O. or I.V. q 12 hours for 10 to 14 days

**Children younger than age 5:** 10 mg/kg P.O. or I.V. q 8 hours for 10 to 14 days

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- hepatic dysfunction, hypertension, hyperthyroidism, pheochromocytoma, bone marrow depression, pseudomembranous colitis
- phenylketonuria (oral suspension only)
- pregnant or breastfeeding patients.

### Administration

- Give oral drug with or without food.
- For I.V. injection, use single-use, ready-to-use infusion bag. Check for particulate matter before giving. Infuse over 30 minutes to 2 hours.
- For I.V. infusion, mix with dextrose 5% in water, normal saline solution, or lactated Ringer's injection.
- Flush I.V. line before and after administering, to avoid incompatibilities.

Route	Onset	Peak	Duration
P.O.	Rapid	1-2 hr	Unknown
I.V.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** anxiety, confusion, difficulty speaking, dizziness, hallucinations,

lethargy, paresthesia, light-headedness, fatigue, drowsiness, headache, **seizures**

**GI:** nausea, vomiting, diarrhea, gastritis, anorexia, dry mouth, **pseudomembranous colitis**

**Hematologic: thrombocytopenia**

**Skin:** rash, photosensitivity, diaphoresis

**Other:** fever, fungal infections

### Interactions

**Drug-drug.** *Antiplatelet drugs (such as aspirin, dipyridamole, nonsteroidal anti-inflammatory drugs):* increased bleeding risk

*MAO inhibitors, pseudoephedrine:* increased risk of hypertension and associated adverse effects

*Serotonergics:* serotonin syndrome

**Drug-diagnostic tests.** *Prothrombin time:* altered

**Drug-food.** *Tyramine-containing foods and beverages (such as beer; Chianti and certain other red wines; aged cheese; bananas; aged, cured, or spoiled meats; salted herring and other dried fish; avocado; bean curd; red plums; soy sauce; spinach; tofu, tomatoes; yeast):* hypertension

### Patient monitoring

- Monitor neurologic status. Institute safety measures as needed to prevent injury.
- Check I.V. site for infiltration.
-  Watch for bleeding and signs and symptoms of other adverse reactions (especially pseudomembranous colitis).
- Monitor CBC, coagulation studies, and culture and sensitivity tests.

### Patient teaching

- Tell patient he may take with or without food, but should avoid foods containing tyramine.
-  Tell patient to promptly report bleeding or severe diarrhea.
- Instruct patient to minimize adverse GI effects by eating small, frequent servings of healthy food.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## liothyronine sodium (T<sub>3</sub>)

Cytomel, Tertroxin<sup>®</sup>, Triostat

**Pharmacologic class:** Synthetic thyroxine hormone

**Therapeutic class:** Thyroid hormone replacement

**Pregnancy risk category** A

### FDA BOXED WARNING

- Drug has been used (alone or with other agents) to treat obesity. In euthyroid patients, doses within range of daily hormonal requirements are ineffective for weight loss. Larger doses may cause serious or life-threatening toxicity, particularly when given with sympathomimetic amines (such as those used for anorectic effects).

### Action

Synthetic form of triiodothyronine (T<sub>3</sub>). Regulates cell growth and differentiation; increases metabolism of lipids, proteins, and carbohydrates; and enhances aerobic mitochondrial function. Also reduces tissue lactic acidosis.

### Availability

**Injection:** 10 mcg/ml in 1-ml vials

**Tablets:** 5 mcg, 25 mcg, 50 mcg

### Indications and dosages

➤ Thyroid hormone replacement in mild hypothyroidism

**Adults:** All dosages individualized. Initially, 25 mcg P.O. daily; may increase in increments of 12.5 to 25 mcg/day q 1 to 2 weeks. Usual maintenance dosage is 25 to 75 mcg P.O. daily.

➤ Myxedema

**Adults:** All dosages individualized. Initially, 5 mcg P.O. daily; increase in increments of 5 to 10 mcg/day q 1 to 2 weeks, up to 25 mcg/day. If response still isn't adequate, increase by 5 mcg to 25 mcg P.O. daily q 1 to 2 weeks until desired response occurs. Usual maintenance dosage is 50 to 100 mcg/day P.O.

➤ Myxedema coma

**Adults:** Initially, 25 to 50 mcg I.V.; after 4 hours, reassess patient's need for subsequent doses (up to 65 mcg in 24 hours). In cardiovascular disease, initial dosage is 10 to 20 mcg I.V.

➤ Simple goiter

**Adults:** All dosages individualized. Initially, 5 mcg P.O. daily. Increase by 5 to 10 mcg/day q 1 to 2 weeks, up to 25 mcg/day; then increase by 12.5 to 25 mcg P.O. daily q week until desired effect occurs. Usual maintenance dosage is 75 mcg P.O. daily.

**Children or elderly adults:** Initially, 5 mcg P.O. once daily. Increase by 5 mcg q 1 to 2 weeks until desired effect occurs.

➤ T<sub>3</sub> suppression test to distinguish hyperthyroidism from thyroid gland autonomy

**Adults:** 75 to 100 mcg P.O. daily for 7 days in conjunction with radioactive iodine

### Dosage adjustment

- Severe, long-standing hypothyroidism
- Cardiovascular disease
- Psychosis or agitation
- Elderly patients

## Contraindications

- Hypersensitivity to drug or its components
- Acute myocardial infarction
- Untreated thyrotoxicosis
- Uncorrected adrenal insufficiency and coexisting hypothyroidism
- Artificial rewarming (I.V. form only)

## Precautions

Use cautiously in:

- cardiovascular disease, severe renal insufficiency, uncorrected adrenocortical disorders, diabetes mellitus
- elderly patients
- pregnant or breastfeeding patients.

## Administration

- Know that all dosages are highly individualized.
- Administer single oral dose in morning with or without food.
- Injectable form is for I.V. use only. Don't give I.M.
- Infuse each 10-mcg dose over 1 minute.
- Give repeat I.V. doses more than 4 hours but less than 12 hours apart.
- Be aware that in T<sub>3</sub> suppression test, radioactive iodine (<sup>131</sup>I) is given before and after 7-day liothyronine course.

Route	Onset	Peak	Duration
P.O.	Unknown	24-72 hr	72 hr
I.V.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** insomnia, irritability, nervousness, headache

**CV:** tachycardia, angina pectoris, hypertension, hypertension, increased cardiac output, **arrhythmias, cardiovascular collapse**

**GI:** vomiting, diarrhea, cramps

**GU:** menstrual irregularities

**Metabolic:** hyperthyroidism, hyperglycemia

**Musculoskeletal:** accelerated bone maturation (in children), decreased

bone density (with long-term use in women)

**Skin:** alopecia (in children), diaphoresis

**Other:** weight loss, heat intolerance

## Interactions

**Drug-drug.** *Anabolic steroids, antithyroid drugs, asparaginase, barbiturates, carbamazepine, chloral hydrate, clofibrate, corticosteroids, danazol, estrogens, fluorouracil, heparin (with I.V. use), lithium, methadone, mitotane, oxyphenbutazone, perphenazine, phenylbutazone, phenytoin, propranolol, salicylates (large doses), sulfonyleureas:* altered thyroid function test results

*Anticoagulants:* increased anticoagulant action

*Beta-adrenergic blockers (selected):* impaired beta blocker action

*Cardiac glycosides:* decreased cardiac glycoside blood level

*Cholestyramine, colestipol:* liothyronine inefficacy

*Theophyllines:* decreased theophylline clearance

**Drug-diagnostic tests.** *Thyroid function tests:* altered values

**Drug-food.** *Foods high in iron or fiber, soybeans:* decreased drug absorption

## Patient monitoring

🚨 Monitor for evidence of overdose, including signs and symptoms of hyperthyroidism (weight loss, cardiac symptoms, and abdominal cramps).

- In patients with Addison's disease or diabetes mellitus, assess for evidence that these conditions are worsening. In diabetic patients, also monitor blood glucose level.

- Monitor vital signs and ECG routinely.

- Check thyroid and liver function tests.

## Patient teaching

- Teach patient to take in morning with or without food.

- Explain that patient may require life-long therapy and will need to undergo regular blood testing.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Inform parents that hair loss may occur in children during first few months but that this effect is usually transient.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## liotrix

Thyrolar

**Pharmacologic class:** Synthetic thyroid hormone

**Therapeutic class:** Thyroid hormone replacement

**Pregnancy risk category** A

### FDA BOXED WARNING

- Drug has been used (alone or with other agents) to treat obesity. In euthyroid patients, doses within range of daily hormonal requirements are ineffective for weight loss. Larger doses may produce serious or even life-threatening toxicity, particularly when given with sympathomimetic amines (such as those used for anorectic effects).

### Action

Increases basal metabolic rate, helps regulate cell growth and differentiation, and enhances metabolism of lipids, proteins, and carbohydrates

### Availability

**Tablets:** 12.5 mcg levothyroxine sodium and 3.1 mcg liothyronine sodium (Thyrolar-¼); 25 mcg levothyroxine sodium and 6.25 mcg liothyronine sodium (Thyrolar-½); 50 mcg levothyroxine sodium and 12.5 mcg liothyronine sodium (Thyrolar-1); 100 mcg levothyroxine sodium and 25 mcg liothyronine sodium (Thyrolar-2); 150 mcg levothyroxine sodium and 37.5 mcg liothyronine sodium (Thyrolar-3)

### Indications and dosages

➤ Hypothyroidism

**Adults:** All dosages individualized. Initially, one tablet Thyrolar-½ P.O., increased by one tablet Thyrolar-¼ P.O. daily until desired effect occurs. Usual maintenance dosage is one tablet Thyrolar-1 or Thyrolar-2 P.O. daily, adjusted within first 4 weeks based on laboratory results.

➤ Congenital hypothyroidism

**Children older than age 12:** 18.75/75 mcg P.O. daily

**Children ages 6 to 11:** 12.5/50 to 18.75/75 mcg P.O. daily

**Children ages 1 to 5:** 9.35/37.5 to 12.5/50 mcg P.O. daily

**Children ages 6 to 12 months:** 6.25/25 to 9.35/37.5 mcg P.O. daily

**Children up to 6 months:** 3.1/12.5 to 6.25/25 mcg (Thyrolar-¼) P.O. daily

### Dosage adjustment

- Severe, long-standing hypothyroidism
- Cardiovascular disease
- Psychosis or agitation
- Elderly patients

### Contraindications

- Hypersensitivity to drug or its components
- Acute myocardial infarction
- Uncorrected thyrotoxicosis
- Uncorrected adrenal insufficiency and coexisting hypothyroidism

## Precautions

Use cautiously in:

- cardiovascular disease, severe renal insufficiency, diabetes mellitus, uncorrected adrenocortical disorders
- elderly patients
- pregnant or breastfeeding patients.

## Administration

- Know that all dosages are highly individualized.
- Administer single daily dose in morning with or without food.

Route	Onset	Peak	Duration
P.O. (levothyroxine)	Unknown	Unknown	Unknown
P.O. (liothyronine)	Unknown	24-72 hr	72 hr

## Adverse reactions

**Theophyllines:** decreased theophylline clearance

**Drug-diagnostic tests.** *Thyroid function tests:* decreased values

**Drug-food.** *Foods high in iron or fiber, soybeans:* decreased drug absorption

## Patient monitoring

- Monitor for evidence of overdose, such as signs and symptoms of hyperthyroidism (weight loss, cardiac symptoms, abdominal cramps).

- Watch closely for signs and symptoms of undertreatment.

- In patients with Addison's disease or diabetes mellitus, assess for signs that these conditions are worsening. In diabetic patients, monitor blood glucose level.

- Check vital signs and ECG routinely.
- Monitor thyroid and liver function tests.

- Assess for signs and symptoms of bleeding tendency, especially if patient's taking anticoagulants.

## Patient teaching

- Inform patient or parents that drug should be taken in morning with or without food.

- Explain that patient may require lifelong therapy and will need to undergo regular blood testing.

- Advise diabetic patient (or his parents) to monitor patient's blood glucose level closely.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Inform parents that hair loss may occur in children during first few months of therapy but that this effect is usually transient.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## liraglutide

Victoza

**Pharmacologic class:** Glucagon-like peptide-1 (GLP-1) receptor agonist

**Therapeutic class:** Hypoglycemic

**Pregnancy risk category C**

### FDA BOXED WARNING

- Liraglutide causes dose-dependent and treatment-duration-dependent thyroid C-cell tumors at clinically relevant exposures in both genders of rats and mice. It's unknown whether drug causes thyroid C-cell tumors, including medullary thyroid carcinoma (MTC), in humans, as human relevance couldn't be ruled out by clinical or nonclinical studies.
- Drug is contraindicated in patients with personal or family history of MTC and in patients with multiple endocrine neoplasia syndrome type 2 (MEN 2).

### Action

Activates GLP-1 receptor, a membrane-bound cell-surface receptor coupled to adenylyl cyclase by the stimulatory G-protein, G<sub>s</sub>, in pancreatic beta cells and increases intracellular cyclic AMP, leading to insulin release in the

presence of elevated glucose levels; also decreases glucagon secretion in a glucose-dependent manner. Mechanism of blood-glucose lowering also involves a delay in gastric emptying.

### Availability

**Injection:** 0.6 mg, 1.2 mg, 1.8 mg (6 mg/ml, 3 ml) in prefilled, multidose pens

### Indications and dosages

➤ Adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes mellitus

**Adults:** Initially, 0.6 mg subcutaneously daily for 1 week. After 1 week, increase dosage to 1.2 mg daily. If 1.2-mg dose doesn't result in acceptable glycemic control, dosage can be increased to 1.8 mg daily.

### Contraindications

- Personal or family history of medullary thyroid carcinoma
- MEN 2

### Precautions

Use cautiously in:

- hepatic or renal impairment
- history of pancreatitis
- concomitant use of oral hypoglycemics
- breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Administer without regard to meals.
- Be aware that initial dose is intended to reduce GI symptoms and isn't effective for glycemic control.
- When initiating drug, consider reducing dosage of concomitantly administered oral hypoglycemics to reduce risk of hypoglycemia.

Route	Onset	Peak	Duration
Subcut.	Unknown	Unknown	Unknown

**Adverse reactions****CNS:** dizziness, headache**CV:** hypertension**EENT:** sinusitis, nasopharyngitis**GI:** nausea, vomiting, diarrhea, constipation, **pancreatitis****GU:** urinary tract infection**Metabolic:** hypoglycemia, **hyperosmolar coma, death****Musculoskeletal:** back pain**Respiratory:** upper respiratory tract infection**Other:** influenza**Interactions****Drug-drug.** *Insulin secretagogues (such as sulfonylureas):* increased risk of hypoglycemia*Oral drugs:* decreased absorption of these drugs**Drug-diagnostic tests.** *Blood glucose:* decreased level**Patient monitoring**

 If pancreatitis is suspected, discontinue drug promptly, perform confirmatory tests, and treat appropriately. If pancreatitis is confirmed, don't restart drug.

 Monitor patient for signs and symptoms of thyroid tumor.

**Patient teaching**

- Instruct patient to take drug without regard to meals.

 Instruct patient to discontinue drug and immediately notify prescriber if persistent severe abdominal pain occurs that may radiate to the back and may or may not be accompanied by vomiting.

 Instruct patient to immediately notify prescriber if signs and symptoms of thyroid tumor occur (such as persistent hoarseness, mass in the neck, difficulty swallowing, or difficulty breathing).

- As appropriate, review all other significant and life-threatening adverse

reactions and interactions, especially those related to the drugs and tests mentioned above.

## lisdexamfetamine dimesylate

Vyvanse

**Pharmacologic class:** Amphetamine prodrug**Therapeutic class:** CNS stimulant**Controlled substance schedule II****Pregnancy risk category C****FDA BOXED WARNING**

- Drug has high abuse potential. Prolonged use may lead to drug dependence. Stay alert for possibility of persons obtaining it for nontherapeutic use or distribution. Drug should be prescribed or dispensed sparingly.
- Drug misuse may cause sudden death and serious cardiovascular adverse events.

**Action**

Rapidly absorbed and converted to dextroamphetamine, which is responsible for CNS activity. Therapeutic action in attention deficit hyperactivity disorder (ADHD) is unknown.

**Availability**

*Capsules:* 20 mg, 30 mg, 40 mg, 50 mg, 60 mg, 70 mg

 **Indications and dosages**

 ADHD

**Adults and Children ages 6 to 12:**

Individualize dosage based on therapeutic needs and response. For child starting treatment for first time or switching from another drug,

recommended dosage is 30 mg P.O. once daily in morning. If daily dosage will be increased above 30 mg, adjust in increments of 10 to 20 mg/day at approximately weekly intervals. Maximum recommended dosage is 70 mg/day.

### Contraindications

- Hypersensitivity or idiosyncratic reaction to sympathomimetic amines
- Advanced arteriosclerosis, symptomatic cardiovascular disease, moderate to severe hypertension, hyperthyroidism, glaucoma, agitated state
- History of drug abuse
- During or within 14 days of MAO inhibitor therapy

### Precautions

Use cautiously in:

- concurrent use of other sympathomimetics
- tics, Tourette syndrome, hypertension or other cardiovascular conditions, preexisting psychosis (such as bipolar disorder)
- electroencephalogram (EEG) abnormalities or seizures
- pregnant and breastfeeding patients
- adults
- children younger than age 6 or older than age 12 (safety and efficacy not established).

### Administration

- Administer with or without food.
- Give in morning to avoid insomnia.
- Give capsules whole, or open and dissolve entire contents in glass of water. When using solution method, don't divide single-capsule dose; make sure patient consumes solution immediately.

 Don't give within 14 days of MAO inhibitors.

Route	Onset	Peak	Duration
P.O.	Unknown	1 hr	Unknown

### Adverse reactions

**CNS:** dizziness, headache, somnolence, insomnia, irritability, labile affect, manic symptoms, dysphoria, euphoria, aggression, restlessness, tics, dyskinesia, psychomotor hyperactivity, psychotic episodes, depression, tremor, **seizure, stroke**

**CV:** palpitations, tachycardia, hypertension, **ventricular hypertrophy, myocardial infarction, cardiomyopathy, sudden death**

**EENT:** visual disturbances

**GI:** abdominal pain, nausea, vomiting, diarrhea, constipation, dry mouth, unpleasant taste

**GU:** libido changes, erectile dysfunction

**Skin:** rash, toxic epidermal necrolysis, urticaria, **Stevens-Johnson syndrome**

**Other:** decreased appetite, weight loss, growth suppression, fever, amphetamine tolerance and dependency, hypersensitivity reactions including **angioedema and anaphylaxis**

### Interactions

**Drug-drug.** *Adrenergic blockers:* inhibited adrenergic blocker action

*Antihistamines:* decreased sedative effect of antihistamine

*Antihypertensives:* antagonism of antihypertensive effect

*Chlorpromazine:* inhibited stimulant effect

*Desipramine, protriptyline (and possibly other tricyclic antidepressants):* enhanced antidepressant activity, causing sustained rise in d-amphetamine concentration in brain

*Ethosuximide:* delayed intestinal absorption of this drug

*Haloperidol:* inhibited central stimulant effects

*Lithium carbonate:* inhibited anorectic and stimulatory effects of lisdexamfetamine

**MAO inhibitors:** slowed lisdexamfetamine metabolism, possibly leading to hypertensive crises

**Meperidine:** potentiated analgesic effect of meperidine

**Methamphetamine therapy:** increased amphetamine urinary excretion, causing reduced lisdexamfetamine blood level and efficacy

**Norepinephrine:** enhanced norepinephrine adrenergic effect

**Phenobarbital, phenytoin:** possible delayed intestinal absorption of these drugs, possible synergistic anticonvulsant action

**Propoxyphene:** increased risk of potentiated CNS stimulation (leading to life-threatening seizures in propoxyphene overdose)

**Drug-diagnostic tests.** *Plasma corticosteroids:* increased levels

*Urinary steroids:* interference with results

**Drug-herbs.** *Veratrum alkaloids, such as Veratrum album (white hellebore), V. eschscholtzii (American hellebore), and V. luteum (false unicorn):* inhibited hypotensive effect of these herbs

### Patient monitoring

- Before initiating therapy, evaluate patient and family for history of cardiovascular abnormalities, tics or Tourette syndrome (or exacerbation of these), EEG abnormalities, and seizures. Drug may lower seizure threshold.
- During early treatment phase, stay alert for worsening of aggressive behavior or hostility.
- Monitor blood pressure and pulse.
- Know that when possible, drug therapy should be interrupted occasionally to determine if behavioral symptoms recur to extent that necessitates continued therapy.
- Monitor patient for appropriate growth and weight gain.

- Watch for signs and symptoms of drug tolerance, dependence, and abuse.

### Patient teaching

- Inform patient or caregiver that drug can be taken with or without food. Advise them that it should be taken in morning to help avoid insomnia.
- Instruct patient to take capsule whole, or to open it and dissolve entire contents in glass of water, and consume solution immediately.
- Advise patient or caregiver to watch for and report seizures, worsening of aggressive behavior, tics, or inappropriate growth or weight gain.
- Instruct patient to avoid using herbs unless prescriber approves.
- Caution patient to avoid hazardous activities until drug's effects on concentration, coordination, and vision are known.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## lisinopril

Apo-Lisinopril<sup>⚡</sup>, Carace<sup>⚡</sup>,  
Co-Lisinopril<sup>⚡</sup>, Dom-Lisinopril<sup>⚡</sup>,  
Gen-Lisinopril<sup>⚡</sup>, Novo-Lisinopril<sup>⚡</sup>,  
PHL-Lisinopril<sup>⚡</sup>, Prinivil, Ratio-  
Lisinopril<sup>⚡</sup>, Riva-Lisinopril<sup>⚡</sup>, Zestril

**Pharmacologic class:** Angiotensin-converting enzyme (ACE) inhibitor

**Therapeutic class:** Antihypertensive

**Pregnancy risk category C** (first trimester), **D** (second and third trimesters)

**FDA BOXED WARNING**

- When used during second or third trimester of pregnancy, drug may cause fetal harm or death. Discontinue as soon as pregnancy is detected.

**Action**

Inhibits conversion of angiotensin I to angiotensin II (a potent vasoconstrictor), decreasing systemic vascular resistance, blood pressure, preload, and afterload. Also inactivates bradykinin and other vasodilatory prostaglandins, increases plasma renin levels, and reduces aldosterone levels.

**Availability**

Tablets: 2.5 mg, 5 mg, 10 mg, 20 mg, 30 mg, 40 mg

**Indications and dosages**

➤ Hypertension

**Adults:** Initially, 10 mg P.O. daily, increased to a maintenance dosage of 20 to 40 mg/day. Maximum daily dosage is 80 mg. In patients on diuretics, start with 5 mg/day P.O.

➤ Heart failure

**Adults:** 5 mg/day P.O. (Prinivil), increased in increments, as ordered, to a maximum of 20 mg/day as a single dose. Or 5 to 40 mg P.O. (Zestril) as a single daily dose given with digitalis and diuretics, increased in increments of no more than 10 mg at intervals of at least 2 weeks, to highest dosage tolerated; maximum dosage is 40 mg/day P.O.

➤ Adjunctive therapy after acute myocardial infarction

**Adults:** Initially, 5 mg P.O., followed by 5 mg after 24 hours, 10 mg after 48 hours, and then 10 mg daily for 6 weeks (given with standard thrombolytic, aspirin, or beta-adrenergic blocker therapy). If systolic pressure is 120 mm Hg or lower, initial dosage is 2.5 mg for 2 days, then 2.5 to 5 mg/day.

**Dosage adjustment**

- Impaired renal function
- Heart failure with hyponatremia

**Contraindications**

- Hypersensitivity to drug or other ACE inhibitors
- Angioedema (hereditary, idiopathic, or ACE-inhibitor induced)
- Pregnancy (second and third trimesters)

**Precautions**

Use cautiously in:

- renal impairment, hypertension, cerebrovascular or cardiac insufficiency
- family history of angioedema
- concurrent diuretic therapy
- black patients (in whom drug may be less effective in treating hypertension)
- elderly patients
- pregnant patients in first trimester
- breastfeeding patients
- children (safety not established).

**Administration**

• Give once a day in morning, with or without food.

- ⚠ Measure blood pressure before administering. Withhold drug, if appropriate, according to prescriber's blood pressure parameters. Adjust dosage according to blood pressure response.
- Expect prescriber to add low-dose diuretic if lisinopril alone doesn't control blood pressure.

Route	Onset	Peak	Duration
P.O.	1 hr	6 hr	24 hr

**Adverse reactions**

**CNS:** dizziness, fatigue, headache, asthenia

**CV:** hypotension, orthostatic hypotension, syncope, chest pain, angina pectoris

**GI:** nausea, diarrhea, abdominal pain, anorexia

**GU:** erectile dysfunction, decreased libido, **renal dysfunction**

**Metabolic:** hyponatremia, **hyperkalemia**

**Musculoskeletal:** myalgia

**Respiratory:** cough, upper respiratory tract infection, bronchitis, dyspnea, **asthma**

**Skin:** rash, pruritus, angioedema

**Other:** altered taste, fever, **anaphylaxis**

## Interactions

**Drug-drug.** *Cyclosporine, potassium-sparing diuretics, potassium supplements:* hyperkalemia

*Diuretics, other antihypertensives:* excessive hypotension

*Indomethacin:* reduced antihypertensive effect

*Lithium:* increased lithium blood level, greater risk of lithium toxicity

*Nonsteroidal anti-inflammatory drugs:* further deterioration in patients with renal compromise, decreased antihypertensive effects

*Thiazides:* hypokalemia

**Drug-diagnostic tests.** *Blood urea nitrogen, creatinine, hematocrit, hemoglobin:* slightly increased levels

*Liver function tests, potassium:* increased levels

*Sodium:* decreased level

**Drug-food.** *Salt substitutes containing potassium:* hyperkalemia

**Drug-herbs.** *Capsaicin:* cough

*Ephedra (ma huang), licorice, yohimbine:* antagonistic effects

**Drug-behaviors.** *Acute alcohol ingestion:* excessive hypotension

## Patient monitoring

- Before and periodically during therapy, monitor CBC with white cell differential and kidney and liver function tests.

📣 Monitor for signs and symptoms of angioedema or anaphylaxis. If these occur, discontinue drug and contact prescriber immediately.

- Check blood pressure frequently to assess drug efficacy. Monitor closely for hypotension, especially in patients also taking diuretics.

- Check vital signs and ECG regularly. Assess cardiovascular status carefully.

- Monitor respiratory and neurologic status.

- Assess potassium intake and blood potassium level.

## Patient teaching

- Advise patient to take once a day in morning, with or without food.

📣 Tell patient to immediately report fainting, continuing cough, rash, itching, swelling (especially of face, lips, tongue, or throat), severe dizziness, difficulty breathing, extreme tiredness, or continuing nausea.

📣 Instruct female patient to notify prescriber if she becomes pregnant.

- Tell patient that drug may cause temporary blood pressure decrease if he stands up suddenly. Advise him to rise slowly and carefully.

- Explain that drug may cause muscle aches or headache. Encourage patient to discuss activity recommendations and pain relief with prescriber.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- Instruct patient to avoid potassium-based salt substitutes or potassium supplements.

- Tell patient he'll undergo regular blood testing during therapy.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## lithium carbonate

Apo-Lithium Camcolit<sup>Ⓢ</sup>, Apo-Lithium Carbonate<sup>Ⓢ</sup>, Carbolith<sup>Ⓢ</sup>, Duralith<sup>Ⓢ</sup>, Euro-Lithium<sup>Ⓢ</sup>, Liskonum<sup>Ⓢ</sup>, Lithane, Lithobid, Lithonate<sup>Ⓢ</sup>, PHL-Lithium Carbonate<sup>Ⓢ</sup>, PMS-Lithium Carbonate<sup>Ⓢ</sup>, Priadel<sup>Ⓢ</sup>

**lithium citrate**

PMS-Lithium Citrate\*

**Pharmacologic class:** Miscellaneous CNS drug**Therapeutic class:** Antimanic drug**Pregnancy risk category** D**FDA BOXED WARNING**

• Lithium toxicity is closely related to lithium blood level and can occur at doses close to therapeutic levels. Before starting therapy, ensure that resources for prompt, accurate blood lithium testing are available.

**Action**

Unknown. Thought to disrupt sodium exchange and transport in nerves and muscles and control reuptake of neurotransmitters.

**Availability**

*Capsules:* 150 mg, 300 mg, 600 mg

*Syrup (citrate):* 300 mg (8 mEq lithium)/5 ml

*Tablets:* 300 mg

*Tablets (extended-release):* 300 mg, 450 mg

*Tablets (slow-release):* 300 mg

**Indications and dosages**

➤ Manic episodes of bipolar disorder

**Adults and children ages 12 and older:**

900 to 1,800 mg P.O. daily in divided doses (for example, 300 to 600 mg t.i.d. or 450 to 900 mg b.i.d. of controlled- or slow-release form) to achieve blood level of 1 to 1.5 mEq/L; measure blood level twice weekly until patient stabilizes. Maintenance dosage is 900 to 1,200 mg/day in divided doses (for example, 300 to 400 mg t.i.d. or 450 to 600 mg b.i.d. of controlled- or slow-release form) to maintain blood level of 0.6 to 1.2 mEq/L. Monitor blood level at least q 2 months.

**Dosage adjustment**

- Impaired renal function
- Elderly patients

**Off-label uses**

- Acute manic episodes in children
- Corticosteroid-induced psychosis
- Neutropenia secondary to antineoplastic therapy
- Tardive dyskinesia
- Alcoholism
- Bulimia

**Contraindications**

None

**Precautions**

Use cautiously in:

- hepatic or thyroid disease, severe cardiovascular or renal disease, diabetes mellitus, seizure disorders, systemic infections, brain trauma, organic brain syndrome, urinary retention, severe sodium depletion
- elderly patients
- pregnant or breastfeeding patients
- children (safety not established).

**Administration**

⚠ Be aware that dosages are individualized according to lithium blood level and response.

- Give with food or milk to minimize GI upset.
- Make sure patient swallows slow-release tablet whole without chewing or crushing.
- When switching patient from immediate-release to controlled- or slow-release form, give same total daily dosage.

Route	Onset	Peak	Duration
P.O.	Unknown	0.5-3 hr	Unknown
P.O. (controlled, slow-release)	Unknown	3-12 hr	Unknown

**Adverse reactions**

**CNS:** dizziness, drowsiness, headache, tremor, tics, EEG changes, ataxia, choreoathetotic movements, abnormal

tongue movements, extrapyramidal reactions, cogwheel rigidity, blackout spells, psychomotor retardation, slow mental functioning, slurred speech, startled response, restlessness, agitation, confusion, hallucinations, poor memory, worsening of organic brain syndrome, stupor, **coma**, **epileptiform seizures**

**CV:** bradycardia, ECG changes, hypotension, **sinus node dysfunction with severe bradycardia and syncope**, **arrhythmias**, **peripheral circulatory collapse**

**EENT:** blurred vision, nystagmus, tinnitus

**GI:** nausea, vomiting, diarrhea, abdominal pain, fecal incontinence, gastritis, flatulence, dyspepsia, anorexia, increased salivation, salivary gland swelling, dry mouth

**GU:** urinary incontinence, glycosuria, albuminuria, erectile or other sexual dysfunction, polyuria or other signs of nephrogenic diabetes insipidus, **oliguria**

**Hematologic:** **leukocytosis**

**Metabolic:** hypothyroidism or hyperthyroidism, goiter, hyperglycemia, hypercalcemia, hyponatremia, hyperparathyroidism

**Musculoskeletal:** swollen or painful joints, muscle weakness, muscle fasciculations and twitching, clonic arm or leg movements, hypertonicity, hyperactive deep tendon reflexes, polyarthralgia

**Skin:** dry thin hair, alopecia, diminished or absent skin sensations, chronic folliculitis, eczema with dry skin, new onset or exacerbation of psoriasis, pruritus (with or without rash), cutaneous ulcers, angioedema

**Other:** altered, metallic, or salty taste; dental caries; weight gain; excessive thirst; polydipsia; fever; edema of lips, ankles, and wrists

## Interactions

**Drug-drug.** *Acetazolamide, alkalinizing agents (such as sodium bicarbonate),*

*urea, verapamil, xanthines:* decreased lithium blood level

*Calcium channel blockers, carbamazepine, haloperidol, methyl dopa:* increased risk of neurotoxicity

*Diuretics:* increased sodium loss, increased risk of lithium toxicity

*Fluoxetine, loop diuretics, metronidazole, nonsteroidal anti-inflammatory drugs:* increased risk of lithium toxicity

*Iodide salts:* synergistic effects, increased risk of hypothyroidism

*Neuromuscular blockers:* prolonged neuromuscular blockade, severe respiratory depression

*Phenothiazines:* decreased phenothiazine blood level or increased lithium blood level, greater risk of neurotoxicity

*Selective serotonin reuptake inhibitors:* increased risk of tremor, confusion, dizziness, agitation, and diarrhea

*Sympathomimetics:* decreased pressor sensitivity

*Tricyclic antidepressants:* increased antidepressant effects

**Drug-diagnostic tests.** *Albumin, creatinine, sodium, thyroxine, triiodothyronine:* decreased levels

*Calcium, glucose, <sup>131</sup>I uptake, white blood cells (WBCs):* increased levels

**Drug-food.** *Caffeine-containing foods and beverages:* decreased lithium blood level and efficacy

**Drug-herbs.** *Caffeine-containing herbs (cola nut, guarana, yerba maté):* decreased lithium blood level and efficacy

## Patient monitoring

- Obtain baseline ECG and electrolyte levels before and periodically during therapy.
- Assess neurologic and psychiatric status. Institute safety measures as needed to prevent injury.
- Monitor lithium blood level, WBC count, and thyroid and kidney function tests.
- Assess cardiovascular status regularly.

- Monitor fluid intake and output. Watch for edema and weight gain.

### Patient teaching

- Advise patient to take with food or milk to minimize GI upset.
- Instruct patient to swallow slow-release tablet whole without chewing or crushing.
- Tell patient that beneficial effects may take 1 to 3 weeks to appear.
- Advise patient to limit foods and beverages containing caffeine, because they may interfere with drug action.
- Tell patient to maintain adequate fluid intake.
- Explain that drug may cause adverse CNS effects. Advise patient to avoid activities requiring mental alertness until effects are known.
- 📢 Emphasize importance of having regular blood tests, to help detect and prevent serious adverse reactions.
- Instruct patient to carry appropriate medical identification at all times.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## lomustine

CeeNU

**Pharmacologic class:** Alkylating drug (nitrosourea)

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

- Give under supervision of physician experienced in cancer chemotherapy, in facility with adequate diagnostic and treatment resources. Most common and

severe toxic effect is bone marrow suppression, which may contribute to bleeding and overwhelming infections in already compromised patients. Delayed bone marrow suppression is major toxicity, so monitor blood counts weekly for at least 6 weeks after dose. At recommended dosage, don't give courses more often than every 6 weeks. Bone marrow toxicity is cumulative; consider adjusting dosage based on nadir blood counts from previous dose.

### Action

Inactivates neoplastic cells by alkylating DNA, causing DNA structural modification and fragmentation. Thought to act in late G1 or early S phase of cell cycle.

### Availability

**Capsules:** 10 mg, 40 mg, 100 mg  
**Dose pack:** two 10-mg capsules, two 40-mg capsules, and 100-mg capsules

### Indications and dosages

➤ Adjunctive therapy in primary and metastatic brain tumors; secondary therapy in Hodgkin's disease

**Adults and children:** As monotherapy, 130 mg/m<sup>2</sup> P.O. as a single dose q 6 weeks in previously untreated patients. In bone marrow suppression, initial dosage is 100 mg/m<sup>2</sup> P.O. q 6 weeks; don't repeat dose until platelet count exceeds 100,000/mm<sup>3</sup> and white blood cell (WBC) count exceeds 4,000/mm<sup>3</sup>. When given with other myelosuppressive drugs, adjust dosage accordingly.

### Dosage adjustment

- Bone marrow depression (based on WBC and platelet counts)

### Contraindications

- Hypersensitivity to drug

## Precautions

Use cautiously in:

- renal or hepatic dysfunction, bone marrow depression
- pregnant or breastfeeding patients.

## Administration

- Obtain CBC with white cell differential before starting therapy.
- Administer antiemetic before giving drug, as prescribed, to minimize nausea.
- Give 2 to 4 hours after meals to enhance absorption.
- If vomiting occurs shortly after administration, notify prescriber.

Route	Onset	Peak	Duration
P.O.	10 min	3 hr	48 hr

## Adverse reactions

**CNS:** anxiety, confusion, dizziness, hallucinations, lethargy, headache, paresthesia, light-headedness, drowsiness, fatigue, **seizures**

**GI:** nausea; vomiting; anorexia; sore mouth, lips, and throat; **GI bleeding**

**GU:** amenorrhea, azoospermia, progressive azotemia, **nephrotoxicity, renal failure**

**Hematologic:** anemia, **leukopenia, thrombocytopenia, bone marrow depression**

**Hepatic:** **hepatotoxicity**

**Skin:** alopecia

**Other:** **secondary cancers**

## Interactions

**Drug-drug.** *Anticoagulants, non-steroidal anti-inflammatory drugs:* increased bleeding risk

*Myelosuppressants:* increased bone marrow depression

**Drug-diagnostic tests.** *Hemoglobin, platelets, red blood cells, WBCs:* decreased values

*Liver function tests, nitrogenous compounds:* increased values

## Patient monitoring

⚠ Watch for evidence of overdose, including bone marrow depression, nausea, and vomiting.

⚠ Monitor CBC and platelet counts closely. Watch for signs and symptoms of bleeding and bruising.

• Avoid I.M. injections if platelet count is below 100,000/mm<sup>3</sup>.

• Check kidney, liver, and pulmonary function tests frequently.

• Assess neurologic status carefully.

Institute safety measures as needed to prevent injury.

⚠ Watch for signs and symptoms of secondary cancers.

## Patient teaching

• Instruct patient to contact prescriber if he vomits shortly after taking drug.

⚠ Tell patient to immediately report easy bruising or bleeding, which may signal low platelet count.

• Advise patient to report changes in urination pattern.

• Instruct patient to avoid exposure to people with infections, because drug may make him more susceptible to infection.

⚠ Caution female of childbearing age to use reliable contraception and to immediately report suspected or confirmed pregnancy.

• Advise female patient to inform prescriber if she is breastfeeding.

• Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

• Advise patient to minimize GI side effects by eating small, frequent servings of healthy food.

• Inform patient that drug may cause hair loss.

• Tell patient he'll undergo frequent blood testing during therapy.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## loperamide hydrochloride

Apo-Loperamide<sup>☼</sup>, Arret<sup>☼</sup>,  
 Diah-Limit<sup>☼</sup>, Diamode, Diaquette<sup>☼</sup>,  
 Diareze<sup>☼</sup>, Diarr-Eze<sup>☼</sup>, Diarrhea  
 Relief<sup>☼</sup>, Diocalm Ultra<sup>☼</sup>, Diocaps<sup>☼</sup>,  
 Dom-Loperamide<sup>☼</sup>, Entocalm<sup>☼</sup>,  
 Imodium, Imodium A-D, K-Pek II,  
 Loperacap<sup>☼</sup>, Norimode<sup>☼</sup>,  
 Normaloe<sup>☼</sup>, Novo-Loperamide<sup>☼</sup>,  
 PHL-Loperamide<sup>☼</sup>, PMS-  
 Loperamine<sup>☼</sup>, Riva-Loperamine<sup>☼</sup>,  
 Sandoz Loperamide

**Pharmacologic class:** Piperidine derivative

**Therapeutic class:** Antidiarrheal

**Pregnancy risk category B**

### Action

Inhibits peristalsis of intestinal wall musculature and intestinal contents. Also reduces fecal volume, increases fecal bulk, and minimizes fluid and electrolyte loss.

### Availability

**Capsules:** 2 mg

**Solution:** 1 mg/5 ml

**Tablets:** 2 mg

**Tablets (chewable):** 2 mg

### Indications and dosages

➤ Acute diarrhea

**Adults:** Initially, 4 mg P.O., then 2 mg after each loose stool. Usual maintenance dosage is 4 to 8 mg P.O. daily in divided doses, not to exceed 16 mg daily.

**Children ages 8 to 12 or weighing more than 30 kg (66 lb):** Initially, 2 mg P.O. t.i.d., then 1 mg/10 kg after each loose stool, not to exceed 6 mg daily

**Children ages 6 to 8 or weighing 20 to 30 kg (44 to 66 lb):** Initially, 2 mg P.O.

b.i.d., then 1 mg/10 kg after each loose stool, not to exceed 4 mg daily

**Children ages 2 to 5 or weighing 13 to 20 kg (29 to 44 lb):** Initially, 1 mg P.O. t.i.d., then 1 mg/10 kg after each loose stool, not to exceed 3 mg daily

➤ Acute diarrhea (treated with over-the-counter loperamide)

**Adults and children ages 12 and older:**

Two caplets with 4 to 8 oz water after first loose stool, then one caplet (with 4 to 8 oz water) after each subsequent loose stool. Don't exceed four caplets in 24 hours. Or give equivalent dosage in liquid form.

**Children ages 9 to 11 who weigh 27 to 43 kg (60 to 95 lbs):** One caplet with 4 to 8 oz water after first loose stool, then ½ caplet (with 4 to 8 oz water) after each subsequent loose stool. Don't exceed three caplets in 24 hours. Or give equivalent dosage in liquid form.

**Children ages 6 to 8 who weigh 22 to 27 kg (48 to 59 lbs):** One caplet with 4 to 8 oz water after first loose stool, then ½ caplet with 4 to 8 oz water after each subsequent loose stool. Don't exceed two caplets in 24 hours. Or give equivalent dosage in liquid form.

**Children younger than age 6:** Consult physician.

➤ Chronic diarrhea

**Adults:** Initially, 4 mg P.O., then 2 mg after each loose stool; reduce dosage as tolerated. Don't exceed 16 mg daily for more than 10 days.

### Contraindications

- Hypersensitivity to drug
- Abdominal pain of unknown cause (especially with fever)
- Acute diarrhea caused by enteroinvasive *Escherichia coli*, *Salmonella*, or *Shigella*
- Acute ulcerative colitis
- Bloody diarrhea with temperature above 38.3 °C (101 °F) (with OTC product)

- Pseudomembranous colitis associated with broad-spectrum anti-infectives
- Children younger than age 6

### Precautions

Use cautiously in:

- hepatic disease
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

- Use patient's weight to determine appropriate dosage (especially in children).

Route	Onset	Peak	Duration
P.O.	1 hr	2.5-5 hr	10 hr

### Adverse reactions

**CNS:** drowsiness, dizziness

**GI:** nausea; vomiting; constipation; abdominal pain, distention, or discomfort; dry mouth; **toxic megacolon** (in patients with acute ulcerative colitis)

**Other:** allergic reactions

### Interactions

**Drug-drug.** *Antidepressants, antihistamines, other anticholinergics:* additive anticholinergic effects

*CNS depressants (including antihistamines, opioid analgesics, sedative-hypnotics):* additive CNS depression

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

### Patient monitoring

🔊 Watch for signs and symptoms of abdominal distention, which may signal toxic megacolon in patient with ulcerative colitis.

- Assess bowel movements to evaluate drug efficacy and determine need for repeat doses.

- Monitor stool cultures as indicated.
- Check stool for occult blood as indicated.
- Evaluate fluid intake and output.
- Stay alert for CNS effects, especially in children.

### Patient teaching

- Stress importance of maintaining high fluid intake to prevent dehydration.

🔊 Instruct patient or parents to report fever, mucus in stool, or history of hepatic disease before using drug.

🔊 Caution patient or parents to discontinue drug if symptoms worsen or diarrhea lasts longer than 2 days.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, herbs, and behaviors mentioned above.

## loratadine

Aerius<sup>✳</sup>, Alavert, Allertin, Claritin, Claritin RediTabs, Clarityn<sup>Ⓢ</sup>

**Pharmacologic class:** Histamine<sub>1</sub>-receptor antagonist (second-generation)

**Therapeutic class:** Antihistamine (nonsedating)

**Pregnancy risk category B**

### Action

Selective histamine<sub>1</sub>-receptor antagonist. Blocks peripheral effects of histamine release during allergic reactions, decreasing or preventing allergy symptoms.

### Availability

*Syrup:* 1 mg/ml

*Tablets:* 10 mg

*Tablets (rapidly disintegrating):* 10 mg

## Indications and dosages

➤ Seasonal allergies; chronic idiopathic urticaria

**Adults and children ages 6 and older:**

10 mg P.O. daily

**Children ages 2 to 5:** 5 mg P.O. daily

## Dosage adjustment

- Renal or hepatic impairment

## Contraindications

- Hypersensitivity to drug

## Precautions

Use cautiously in:

- renal or hepatic impairment
- elderly patients
- pregnant patients
- children younger than age 2 (safety not established).

## Administration

- Give once a day on empty stomach.
- Place rapidly disintegrating tablet on tongue; give with or without water.
- Use rapidly disintegrating tablets within 6 months of opening foil pouch and immediately after opening individual tablet blister.

Route	Onset	Peak	Duration
P.O.	1-3 hr	8-12 hr	>24 hr

## Adverse reactions

**CNS:** headache, nervousness, insomnia

**EENT:** conjunctivitis, earache, epistaxis, pharyngitis

**GI:** abdominal pain; dry mouth; diarrhea, stomatitis (in children)

**Skin:** rash, photosensitivity, angioedema

**Other:** tooth disorder (in children), fever, flulike symptoms, viral infections

## Interactions

**Drug-food.** *Any food:* increased drug absorption

## Patient monitoring

- Watch for adverse reactions, especially in children.
- Assess patient's response to drug.
- Watch for new symptoms or exacerbation of existing symptoms.

## Patient teaching

- Advise patient to take exactly as prescribed, once a day on empty stomach.
- Tell patient to report persistent or worsening symptoms.
- Instruct patient to report adverse reactions, such as headache or nervousness.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the foods mentioned above.

## lorazepam

Apo-Lorazepam<sup>✳</sup>, Ativan, Dom-Lorazepam<sup>✳</sup>, Novo-Lorazem<sup>✳</sup>, Nu-Loraz<sup>✳</sup>, PHL-Lorazepam<sup>✳</sup>, PMS-Lorazepam<sup>✳</sup>, Pro-Lorazepam<sup>✳</sup>

**Pharmacologic class:** Benzodiazepine

**Therapeutic class:** Anxiolytic

**Controlled substance schedule IV**

**Pregnancy risk category D**

## Action

Unknown. Thought to depress CNS at limbic system and disrupt neurotransmission in reticular activating system.

## Availability

**Injection:** 2 mg/ml, 4 mg/ml

**Solution (concentrated):** 2 mg/ml

**Tablets:** 0.5 mg, 1 mg, 2 mg

## Indications and dosages

### > Anxiety

**Adults:** 2 to 3 mg P.O. daily in two or three divided doses. Maximum dosage is 10 mg daily.

### > Insomnia

**Adults:** 2 to 4 mg P.O. at bedtime

> Premedication before surgery (as antianxiety agent, sedative-hypnotic, or amnestic)

**Adults:** 0.05 mg/kg (not to exceed 4 mg) deep I.M. injection at least 2 hours before surgery, or 0.044 mg/kg (not to exceed 2 mg) I.V. 15 to 20 minutes before surgery. For greater amnestic effect, give up to 0.05 mg/kg (not to exceed 4 mg) I.V. 15 to 20 minutes before surgery.

### > Status epilepticus

**Adults:** 4 mg I.V. given slowly (no faster than 2 mg/minute). If seizures continue or recur after 10 to 15 minutes, repeat dose. If seizure control isn't established after second dose, other measures should be used. Don't exceed 8 mg in 12 hours.

## Dosage adjustment

- Elderly or debilitated patients

## Off-label uses

- Acute alcohol withdrawal syndrome

## Contraindications

- Hypersensitivity to drug, other benzodiazepines, polyethylene or propylene glycol, or benzyl alcohol
- Acute angle-closure glaucoma
- Coma or CNS depression
- Hepatic or renal failure

## Precautions

Use cautiously in:

- hepatic or renal impairment
- history of suicide attempt, drug abuse, depressive disorder, or psychosis
- elderly patients
- pregnant or breastfeeding patients.

## Administration

- For I.V. use, dilute with equal volume of compatible diluent, such as normal saline solution or dextrose 5% in water. Keep resuscitation equipment and oxygen at hand.

⚠ Give each 2 mg of I.V. dose slowly, over 2 to 5 minutes. Don't exceed rate of 2 mg/minute.

- Don't give parenteral form to children younger than age 18.

Route	Onset	Peak	Duration
P.O.	15-45 min	1-6 hr	Up to 48 hr
I.V.	Rapid	15-20 min	Up to 48 hr
I.M.	15-30 min	1-2 hr	Up to 48 hr

## Adverse reactions

**CNS:** amnesia, agitation, ataxia, depression, disorientation, dizziness, drowsiness, headache, incoordination, asthenia

**CV** (with too rapid I.V. administration): hypotension, bradycardia, tachycardia, apnea, **cardiac arrest, cardiovascular collapse**

**EENT:** blurred vision, diplopia, nystagmus

**GI:** nausea, abdominal discomfort

**Other:** increased or decreased appetite

## Interactions

**Drug-drug.** *CNS depressants (including antidepressants, antihistamines, benzodiazepines, sedative-hypnotics):* additive CNS depression

*Hormonal contraceptives:* increased lorazepam clearance

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

*Smoking:* increased metabolism and decreased efficacy of lorazepam

## Patient monitoring

⚠ During I.V. administration, monitor ECG and cardiovascular and respiratory status.

- Monitor vital signs closely.
- Evaluate for amnesia.
- Watch closely for CNS depression. Institute safety precautions as needed to prevent injury.
- 📢 Monitor for signs and symptoms of overdose (such as confusion, hypotension, coma, and labored breathing).
- Assess liver function tests and CBC.

### Patient teaching

- Tell patient and family about drug's possible CNS effects. Recommend appropriate safety precautions.
- Explain that with long-term use, drug must be discontinued slowly (typically over 8 to 12 weeks).
- Instruct patient to avoid alcohol, because it increases drowsiness and other CNS effects.
- Caution patient to avoid smoking, because it speeds drug breakdown in body.
- Advise female patient to inform prescriber if she is pregnant or breastfeeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, herbs, and behaviors mentioned above.

## losartan potassium

Cozaar

**Pharmacologic class:** Angiotensin II receptor antagonist

**Therapeutic class:** Antihypertensive

**Pregnancy risk category C** (first trimester), **D** (second and third trimesters)

### FDA BOXED WARNING

- When used during second or third trimester of pregnancy, drug may cause fetal harm or death. Discontinue as soon as pregnancy is detected.

### Action

Blocks vasoconstricting and aldosterone-secreting effects of angiotensin II at various receptor sites, including vascular smooth muscle and adrenal glands. Also increases urinary flow and enhances excretion of chloride, magnesium, calcium, and phosphate.

### Availability

Tablets: 25 mg, 50 mg, 100 mg

### Indications and dosages

➤ Hypertension

**Adults:** Initially, 50 mg/day P.O.; range is 25 to 100 mg/day as a single dose or in two divided doses. May be used alone or with other drugs.

**Children ages 6 and older:** 0.7 mg/kg P.O. daily, up to total of 50 mg

➤ To prevent cerebrovascular accident (stroke) in hypertensive patients with left ventricular hypertrophy (LVH)  
**Adults:** Initially, 50 mg P.O. daily, increased to 100 mg P.O. daily. May be given concurrently with hydrochlorothiazide.

➤ Nephropathy in patients with type 2 diabetes

**Adults:** 50 mg/day P.O.; increase to 100 mg/day based on blood pressure response.

### Dosage adjustment

- Hepatic impairment
- Concurrent diuretic therapy

### Contraindications

- Hypersensitivity to drug or its components
- Pregnancy (second and third trimesters)

## Precautions

Use cautiously in:

- heart failure, renal or hepatic impairment, obstructive biliary disorders
- high-dose diuretic therapy
- black patients
- pregnant patients (first trimester) or breastfeeding patients
- children younger than age 6 (safety not established).

## Administration

- Administer with or without food.
- Know that if drug efficacy (measured at trough) is inadequate with once-daily dosing, prescriber may switch to twice-daily regimen using same or higher daily dosage.
- Be aware that drug may take 3 to 6 weeks to reach maximal efficacy.

Route	Onset	Peak	Duration
P.O.	Unknown	1 hr	Unknown

## Adverse reactions

**CNS:** dizziness, insomnia, headache, asthenia, fatigue

**CV:** hypotension

**EENT:** sinus disorders

**GI:** nausea, vomiting, diarrhea, dyspepsia, abdominal pain

**Metabolic: hyperkalemia**

**Musculoskeletal:** joint pain, back pain, muscle cramps

**Respiratory:** symptoms of upper respiratory infection, dry cough

**Other:** hypersensitivity reactions including **angioedema**

## Interactions

**Drug-drug.** *Diuretics, other antihypertensives:* increased risk of hypotension  
*Fluconazole:* inhibited losartan metabolism, increased antihypertensive effects  
*Indomethacin:* decreased losartan effects  
*Lithium:* decreased lithium metabolism  
*Nonsteroidal anti-inflammatory drugs:* decreased renal function  
*Potassium-sparing diuretics, potassium supplements:* hyperkalemia

*Rifamycins:* enhanced losartan metabolism, decreased antihypertensive effects

**Drug-diagnostic tests.** *Albumin:* increased level

**Drug-food.** *Salt substitutes containing potassium:* hyperkalemia

## Patient monitoring

 Watch for angioedema and other hypersensitivity reactions.

- Monitor blood pressure to evaluate drug efficacy.
- Assess liver and kidney function tests and electrolyte levels.
- Stay alert for oliguria, progressive azotemia, and renal failure in patients with severe heart failure whose renal function depends on the renin-angiotensin-aldosterone system.
- Know that in black patients, losartan and other ACE inhibitors may be ineffective when used alone. Drug isn't indicated for stroke prevention in black hypertensive patients with LVH.
- Be aware that drug may cause fetal injury or death when used during second or third trimester of pregnancy.

## Patient teaching

- Instruct patient to avoid potassium supplements and salt substitutes containing potassium, unless directed by prescriber.
-  Caution female patient not to take drug during second or third trimester of pregnancy. Advise her to contact prescriber immediately if she suspects pregnancy.
- Tell female patient to discuss breastfeeding with prescriber before taking.
-  Instruct patient to immediately report hypersensitivity reactions, especially lip or eyelid swelling, throat tightness, and difficulty breathing.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## lovastatin

Altoprev, Apo-Lovastatin<sup>✳</sup>, Co Lovastatin<sup>✳</sup>, Dom-Lovastatin<sup>✳</sup>, Gen-Lovastatin<sup>✳</sup>, Mevacor, Novo-Lovastatin<sup>✳</sup>, Nu-Lovastatin<sup>✳</sup>, PHL-Lovastatin<sup>✳</sup>, PMS-Lovastatin<sup>✳</sup>, Ran-Lovastatin<sup>✳</sup>, Ratio-Lovastatin<sup>✳</sup>, Sandoz Lovastatin<sup>✳</sup>

**Pharmacologic class:** HMG-CoA reductase inhibitor

**Therapeutic class:** Antihyperlipidemic

**Pregnancy risk category X**

### Action

Inhibits HMG-CoA reductase, an enzyme crucial to cholesterol synthesis. Decreases total cholesterol and low-density lipoprotein (LDL) levels and increases high-density lipoprotein level.

### Availability

Tablets: 10 mg, 20 mg, 40 mg

Tablets (extended-release): 10 mg, 20 mg, 40 mg, 60 mg

### Indications and dosages

➤ To reduce LDL, total cholesterol, triglyceride, and apolipoprotein B levels

**Adults:** Initially, 20 mg P.O. daily. May be increased, as needed, at 4-week intervals to a maximum of 80 mg/day as a single dose or in divided doses. Or 20 mg P.O. (extended-release) daily. May be increased, as needed, at 4-week intervals to a maximum daily dosage of 60 mg.

➤ Heterozygous familial hypercholesterolemia in boys and postmenarchal girls ages 10 and older who have high LDL and cholesterol levels despite adequate trial of diet therapy

**Adolescents ages 10 to 17:** 10 to 40 mg P.O. daily, with adjustments made at 4-week intervals

### Dosage adjustment

- Severe renal insufficiency

### Off-label uses

- High-risk patients with diabetic dyslipidemia, familial dysbetalipoproteinemia, familial combined hyperlipidemia, or nephrotic hyperlipidemia

### Contraindications

- Hypersensitivity to drug, its components, or angiotensin-converting enzyme inhibitors
- Active hepatic disease or unexplained persistent hepatic enzyme elevation
- Concurrent gemfibrozil or azole antifungal therapy
- Pregnancy or breastfeeding

### Precautions

Use cautiously in:

- cerebral arteriosclerosis, heart disease, renal impairment, severe acute infection, severe hypotension or hypertension, uncontrolled seizures, myopathy, visual disturbances, major surgery, trauma, alcoholism
- severe metabolic, endocrine, or electrolyte problems
- women of childbearing age
- children.

### Administration

- Give daily dose with evening meal.
- Increase dosage at intervals of 4 weeks or longer, as ordered.
- Don't give with grapefruit juice (may increase drug blood level).
- ⚠ Discontinue if alanine aminotransferase (ALT) or aspartate aminotransferase (AST) level exceeds three times the upper limit of normal.

Route	Onset	Peak	Duration
P.O.	Unknown	2 hr	Unknown
P.O. (extended)	Unknown	Unknown	Unknown

**Adverse reactions****CNS:** headache, dizziness, asthenia**EENT:** blurred vision, eye irritation**GI:** nausea, vomiting, constipation, diarrhea, abdominal pain or cramps, dyspepsia, flatulence**Hepatic: hepatotoxicity****Musculoskeletal:** myalgia, cramps, rhabdomyolysis**Skin:** pruritus, rash, photosensitivity**Other:** hypersensitivity reaction**Interactions****Drug-drug.** *Azole antifungals, cyclosporine, erythromycin, folic acid derivatives, gemfibrozil, niacin:* increased risk of myopathy and rhabdomyolysis  
*Bile acid sequestrants:* decreased lovastatin blood level*Isradipine:* increased lovastatin clearance*Warfarin:* increased prothrombin time, bleeding**Drug-diagnostic tests.** *ALT, AST:* increased levels**Drug-food.** *Grapefruit juice:* increased lovastatin blood level**Drug-herbs.** *Red yeast rice:* increased risk of adverse reactions*Chaparral, comfrey, germander, jin bu huan, kava, pennyroyal, St. John's wort:* increased risk of hepatotoxicity**Patient monitoring**

- Obtain liver function tests before starting therapy, 6 and 12 weeks after therapy begins or dosage is increased, and periodically thereafter.

**Patient teaching**

- Tell patient to take immediate-release tablets with evening meal or extended-release tablets at bedtime.
- Instruct patient not to break, crush, or chew extended-release tablets.
- Emphasize importance of cholesterol-lowering diet and other therapies, such as exercise and weight control.
-  Instruct patient to report unexplained muscle pain, tenderness, or

weakness, as well as signs or symptoms of hepatotoxicity (fever, malaise, abdominal pain, yellowing of skin or eyes, clay-colored stools, or tea-colored urine).

 Advise patient to contact prescriber immediately if she is breastfeeding or suspects pregnancy.

- Tell patient not to use herbs without consulting prescriber.
- Inform patient that drug may cause photosensitivity. Caution him to avoid excessive sun or heat lamp light.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

**loxapine succinate**

Apo-Loxapine<sup>✳</sup>, Dom-Loxapine<sup>✳</sup>, Loxapac<sup>✳</sup>, Nu-Loxapine<sup>✳</sup>, PHL-Loxapine<sup>✳</sup>, PMS-Loxapine<sup>✳</sup>

**Pharmacologic class:** Tricyclic dibenzoxazepine derivative

**Therapeutic class:** Antipsychotic

**Pregnancy risk category C**

**Action**

Unknown. Thought to block neurotransmission of postsynaptic dopamine receptors in brain, alleviating psychotic symptoms.

**Availability**

*Capsules:* 5 mg, 10 mg, 25 mg, 50 mg

**Indications and dosages**

 Schizophrenia

**Adults:** 10 mg P.O. b.i.d. Dosage may be increased over first 7 to 10 days, up to 100 mg/day P.O. in two to four divided doses. Maximum dosage is 250 mg/day.

**Dosage adjustment**

- Elderly patients

**Contraindications**

- Hypersensitivity to drug or other dibenzoxazepines
- Coma or severe drug-induced CNS depression

**Precautions**

Use cautiously in:

- seizures, cerebral arteriosclerosis, severe hypotension, hypertension, glaucoma, breast cancer, hepatic disease, bone marrow depression, Parkinson's disease, blood dyscrasias, urinary retention, concurrent use of other CNS active drugs or anticholinergics
- pregnant or breastfeeding patients
- children younger than age 16.

**Administration**

- Give with or without food.

Route	Onset	Peak	Duration
P.O.	30 min	1.5-3 hr	12 hr

**Adverse reactions**

**CNS:** drowsiness, insomnia, vertigo, headache, dizziness, weakness, akinesia, staggering or shuffling gait, slurred speech, agitation, extrapyramidal reactions, sedation, syncope, tardive dyskinesia, numbness, confusion, pseudo-parkinsonism, EEG changes, **seizures, neuroleptic malignant syndrome**

**CV:** orthostatic hypotension, hypertension, ECG changes

**EENT:** blurred vision, ptosis, nasal congestion

**GI:** nausea, vomiting, constipation, dry mouth, **paralytic ileus**

**GU:** urinary retention

**Hematologic:** **leukopenia, agranulocytosis, thrombocytopenia**

**Hepatic:** hepatocellular injury with hepatic enzyme elevations

**Metabolic:** polydipsia

**Musculoskeletal:** muscle twitching

**Skin:** rash, pruritus, seborrhea, photosensitivity, alopecia

**Other:** weight gain or loss, hyperpyrexia, facial edema, hypersensitivity reactions

**Interactions**

**Drug-drug.** *Anticholinergics, CNS depressants:* additive effects

*Epinephrine:* severe hypotension, tachycardia, decreased epinephrine effects

**Drug-diagnostic tests.** *Granulocytes, platelets, white blood cells:* decreased counts

*Liver function tests:* increased values

**Drug-behaviors.** *Alcohol use:* increased CNS depression

**Patient monitoring**

- Measure blood pressure before and periodically during therapy.
- Monitor hematologic studies and liver function tests.

 Stay alert for evidence of neuroleptic malignant syndrome (extrapyramidal symptoms, hyperpyrexia, muscle rigidity, altered mental status, irregular pulse or blood pressure, tachycardia, arrhythmias, diaphoresis).

- Assess for tardive dyskinesia (involuntary jerky movements of face, tongue, jaws, trunk, arms, and legs), especially in elderly women.

**Patient teaching**

- Tell patient to take with or without food.
- Inform patient that drug may cause tardive dyskinesia. Describe symptoms.
- Caution patient to avoid activities requiring mental concentration until drug's effects are known.
-  Teach patient to immediately report sore throat, fever, rash, impaired vision, tremors, involuntary muscle twitching, muscle stiffness, or yellowing of eyes or skin.

- Instruct patient to move slowly when sitting up or standing, to avoid dizziness from sudden blood pressure decrease.
- Caution patient to avoid alcohol use.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## lubiprostone

Amitiza

**Pharmacologic class:** Chloride channel activator

**Therapeutic class:** GI motility enhancer

**Pregnancy risk category** C

### Action

Enhances chloride-rich intestinal fluid secretion without altering sodium and potassium serum concentrations; increases intestinal fluid secretion and intestinal motility, which promotes stool passage and relieves symptoms of chronic idiopathic constipation

### Availability

*Soft gelatin capsules:* 8 mcg, 24 mcg

### Indications and dosages

➤ Chronic idiopathic constipation

**Adults:** 24 mcg P.O. twice daily

➤ Treatment of irritable bowel syndrome with constipation in women

**Adults ages 18 and older:** 8 mcg P.O. b.i.d.

### Dosage adjustment

- Moderate to severe hepatic impairment

### Contraindications

- Hypersensitivity to drug or its components
- History of mechanical GI obstruction

### Precautions

Use cautiously in:

- severe diarrhea, hepatic or renal dysfunction
- pregnant or breastfeeding patients.

### Administration

- Administer with food and water.

Route	Onset	Peak	Duration
P.O.	Unknown	1.14 hr	Unknown

### Adverse reactions

**CNS:** headache, dizziness, hypoesthesia,

fatigue, depression, anxiety, insomnia

**CV:** chest discomfort or pain, hypertension

**EENT:** sinusitis, nasopharyngitis,

pharyngolaryngeal pain

**GI:** nausea, vomiting, diarrhea, constipation, abdominal distention, abdominal pain or discomfort, flatulence, dyspepsia, gastroesophageal reflux disease, gastroenteritis, dry mouth

**GU:** urinary tract infection

**Musculoskeletal:** arthralgia, back pain, extremity pain, muscle cramp

**Respiratory:** upper respiratory tract infection, influenza, bronchitis, dyspnea, cough

**Other:** weight gain, peripheral edema, fever, viral infection

### Interactions

None

### Patient monitoring

- Evaluate patient for signs and symptoms of mechanical obstruction before therapy begins.

- Assess patient periodically for continuing need for therapy.

### Patient teaching

- Instruct patient not to break or chew capsule.

- Instruct patient not to take drug during episodes of severe diarrhea.

- Advise patient to report side effects, such as severe nausea, diarrhea, and dyspnea, to prescriber.
- Caution female patient with child-bearing potential that drug may pose hazard to fetus.
- Advise breastfeeding patient that she should decide whether to discontinue breastfeeding or stop taking drug.
- As appropriate, review all other significant adverse reactions.

## lymphocyte immune globulin (antithymocyte globulin equine, ATG, ATG equine, LIG)

Atgam

**Pharmacologic class:** Immunoglobulin

**Therapeutic class:** Immunosuppressant

**Pregnancy risk category** C

### FDA BOXED WARNING

- Give drug under supervision of physician experienced in immunosuppressive therapy for treatment of renal transplant or aplastic anemia patients, in facility with adequate laboratory and supportive resources

### Action

Unknown. Thought to inhibit cell-mediated immune response by altering function of or eliminating T lymphocytes in circulation.

### Availability

**Injection:** 50 mg/ml in 5-ml ampules

### Indications and dosages

- To prevent acute renal allograft rejection

**Adults and children:** 15 mg/kg/day I.V. for 14 days, then switch to alternate-day dosing for 14 days (for a total of 21 doses in 28 days). Give first dose within 24 hours of transplantation.

➤ Acute renal allograft rejection

**Adults and children:** 10 to 15 mg/kg/day I.V. for 14 days, then may switch to alternate-day dosing for 14 days (for a total of 21 doses in 28 days). Start therapy at first sign of rejection.

➤ Aplastic anemia in patients ineligible for bone marrow transplantation

**Adults and children:** 10 to 20 mg/kg/day I.V. for 8 to 14 days; then may give additional alternate-day doses for a total of up to 21 doses in 28 days

### Off-label uses

- Bone marrow, liver, and heart transplantation
- Multiple sclerosis
- Myasthenia gravis
- Scleroderma

### Contraindications

- History of severe systemic reaction to lymphocyte immune globulin or other equine preparation

### Precautions

Use cautiously in:

- severe renal or hepatic disease
- pregnant or breastfeeding patients
- children.

### Administration

⚠ Know that drug should be given only by health care professionals experienced in immunosuppressive therapy for treating aplastic anemia or renal transplant patients, in facilities equipped and staffed with adequate laboratory and supportive resources.

⚠ Because of high risk of anaphylaxis, perform intradermal skin test before first dose. Inject 0.1-ml dose of 1:1,000 dilution of LIG intradermally; a control test using 0.9% sodium chloride injection is injected

contralaterally. Observe site every 15 to 20 minutes during first hour after injection, and monitor patient for systemic manifestations. Local reaction of 10 mm or greater with wheal, erythema, or both (with or without pseudopod formation and itching or marked local swelling) indicates positive test (which warrants consideration of alternate therapy). Systemic reaction (such as tachycardia, dyspnea, hypotension, or anaphylaxis) precludes LIG therapy.

- Premedicate with antipyretic, antihistamine, or corticosteroid, as prescribed, to minimize reactions.
- For I.V. infusion, dilute prescribed dose in 250 to 1,000 ml of 0.45% or 0.9% sodium chloride injection. (Don't dilute in dextrose solutions or highly acidic solutions.) Final concentration shouldn't exceed 4 mg/ml. Infuse total daily dose over at least 4 hours.
- When adding drug to infusion container, invert container so air doesn't enter. Gently swirl or rotate container to mix solution.
- Using in-line filter with pore size of 0.2 to 1 micron, infuse into central vein, shunt, or arteriovenous fistula over at least 4 hours.
- Be aware that drug is usually given concurrently with azathioprine and corticosteroids when used for allograft rejection.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** malaise, agitation, headache, dizziness, weakness, syncope, **encephalitis, seizures**

**CV:** hypotension, hypertension, chest pain, bradycardia, tachycardia, cardiac irregularities, phlebitis, **myocarditis, thrombophlebitis, heart failure**

**EENT:** periorbital edema

**GI:** nausea, vomiting, diarrhea, stomatitis

**Hematologic:** leukopenia, agranulocytosis, thrombocytopenia, aplastic anemia

**Hepatic:** hepatosplenomegaly

**Metabolic:** hyperglycemia

**Musculoskeletal:** joint pain or stiffness, myalgia, back pain

**Respiratory:** dyspnea, **pleural effusion**

**Skin:** rash, pruritus, urticaria, diaphoresis, night sweats

**Other:** burning soles and palms, fever, chills, pain at infusion site, edema, lymphadenopathy, hypersensitivity reactions including **serum sickness** and **anaphylaxis**

### Interactions

**Drug-diagnostic tests.** *Creatinine, glucose, hepatic enzymes:* increased values  
*Hemoglobin, platelets, white blood cells:* decreased values

*Kidney and liver function tests:* abnormal results

### Patient monitoring

⚠ During infusion, watch for signs and symptoms of hypersensitivity reaction, such as rash, respiratory distress, or chest, flank, or back pain. Be aware that this reaction may occur even with a negative skin test.

⚠ Discontinue drug if renal transplant patient develops signs or symptoms of anaphylaxis or severe thrombocytopenia or leukopenia.

• Be aware that product derives from equine and human blood components and may transmit infections.

• Monitor for signs and symptoms of infection, such as fever, malaise, and sore throat (caused by immunosuppression).

### Patient teaching

⚠ Tell patient to immediately report adverse reactions during infusion (such as pain at infusion site) as well as

systemic complaints (such as easy bruising or bleeding or signs of hypersensitivity reaction).

- Instruct patient to avoid sources of infection, such as people with known infections. Tell him to promptly report signs or symptoms of infection.

🔊 Advise patient to immediately report evidence of serum sickness, including fever, joint pain, nausea, vomiting, lymphadenopathy, and rash.

🔊 Caution female patient not to take drug if she is pregnant.

- Tell female patient to inform prescriber if she is breastfeeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## magnesium chloride

### magnesium citrate

Citramag<sup>⚡</sup>, Citro-Mag<sup>⚡</sup>, Citroma

### magnesium gluconate

Mag G, Magonate

### magnesium hydroxide

Dulcolax Milk of Magnesia, Phillips Milk of Magnesia, Phillips Milk of Magnesia Concentrate

### magnesium oxide

Mag-ox, Uro-Mag

## magnesium sulfate

Epsom Salts

**Pharmacologic class:** Mineral

**Therapeutic class:** Electrolyte replacement, laxative, antacid, anticonvulsant

**Pregnancy risk category A** (magnesium sulfate), **NR** (magnesium citrate, hydroxide, oxide), **unknown** (magnesium chloride, gluconate)

### Action

Increases osmotic gradient in small intestine, which draws water into intestines and causes distention. These effects stimulate peristalsis and bowel evacuation. In antacid action, reacts with hydrochloric acid in stomach to form water and increase gastric pH. In anticonvulsant action, depresses CNS and blocks transmission of peripheral neuromuscular impulses.

### Availability

**magnesium chloride**

*Injection:* 20%

**magnesium citrate**

*Oral solution:* 240-ml, 296-ml, and 300-ml bottles

**magnesium gluconate**

*Liquid:* 1,000 mg/5 ml

*Tablets:* 500 mg

**magnesium hydroxide**

*Liquid:* 400 mg/5 ml

*Liquid concentrate:* 800 mg/5 ml

*Tablets (chewable):* 300 mg

**magnesium oxide**

*Capsules:* 140 mg

*Tablets:* 250 mg, 400 mg, 420 mg, 500 mg

**magnesium sulfate**

*Granules (for oral use):* 120 g, 4 lb

*Injection:* 10%, 12.5%, 25%, 50%

### Indications and dosages

➤ Mild magnesium deficiency

**Adults:** 1 g (2 ml of 50% sulfate solution) I.M. q 6 hours for four doses

➤ Severe hypomagnesemia

**Adults:** 250 mg (2 mEq)/kg (sulfate) I.M. within 4-hour period, or 5 g (approximately 40 mEq) in 1 liter 5% dextrose injection or 0.9% sodium chloride solution by I.V. infusion over 3 hours

➤ Hypomagnesemia treatment

**Adults and children:** Dosage individualized based on severity of deficiency; may give citrate, gluconate, hydroxide, oxide, or sulfate.

➤ Hypomagnesemia prophylaxis

**Adults and children:** Dosage based on normal recommended daily magnesium intake; may give citrate, gluconate, hydroxide, oxide, or sulfate.

➤ Supplemental magnesium in total parenteral nutrition (TPN)

**Adults:** 8 to 24 mEq/day (sulfate) by I.V. infusion, added to TPN solution

➤ Constipation

**Adults and children ages 12 and older:** 15 g (sulfate granules) in 240 ml water; or 30 to 60 ml/day P.O. (hydroxide) given with water; or a single dose of 10 to 30 ml P.O. (hydroxide concentrate); or one bottle of oral solution (citrate), as directed

**Children ages 6 to 11:** 5 to 10 g (sulfate granules) in 120 ml water; or a single dose of 2.5 to 5 ml P.O. (sulfate) in a half-glass of water; or 15 to 30 ml P.O. daily (hydroxide) given with water; or a single dose of 7.5 to 15 ml P.O. (hydroxide concentrate); or three to four tablets (hydroxide); or 50 to 100 ml, as directed, of oral solution (citrate)

**Children ages 2 to 5:** Single dose of 5 to 15 ml P.O. (hydroxide); or 2.5 to 7.5 ml P.O. daily (hydroxide concentrate); or one to two tablets (hydroxide); or 4 to 12 ml oral solution (citrate), as directed

➤ Indigestion

**Adults and children ages 12 and older:** 5 to 15 ml P.O. (hydroxide liquid) up to q.i.d. with water; or 2.5 to 7.5 ml P.O. (hydroxide liquid concentrate) up to q.i.d. with water; or 622 to 1,244 mg

P.O. (hydroxide tablets) up to q.i.d.; or 400 to 800 mg P.O. (oxide tablets) daily

➤ To prevent and control seizures in preeclampsia or eclampsia

**Adults:** 4 to 5 g 50% sulfate solution I.M. q 4 hours, as necessary; or 4 g 10% to 20% sulfate solution I.V., not to exceed 1.5 ml/minute of 10% solution; or 4 to 5 g I.V. infusion in 250 ml of 5% dextrose or sodium chloride solution, not to exceed 3 ml/minute

➤ Acute nephritis to control hypertension, encephalopathy, and seizures in children

**Children:** 100 mg/kg 50% sulfate solution I.M. q 4 to 6 hours as needed; or 20 to 40 mg/kg 20% solution I.M., repeated as necessary

### Off-label uses

- Bronchodilation in some asthmatic patients
- Post–myocardial infarction hypomagnesemia

### Contraindications

- Hypermagnesemia
- Heart block
- Myocardial damage
- Active labor or within 2 hours of delivery

### Precautions

Use cautiously in:

- renal insufficiency, abdominal pain, nausea and vomiting, rectal bleeding, anuria, hypocalcemia
- pregnant patients.

### Administration

⚠ Be aware that magnesium sulfate injection is a high-alert drug.

- Know that I.V. use is reserved for life-threatening seizures.
- When giving magnesium sulfate I.V., don't exceed concentration of 20% or infusion rate of 150 mg/minute, except in seizures caused by severe eclampsia. Too-rapid I.V. infusion may cause hypotension and asystole.

- When giving magnesium sulfate I.M. to adults, use concentration of 25% to 50%; when giving to infants and children, don't exceed 20%.

Route	Onset	Peak	Duration
P.O.	3-6 hr	4 hr	Unknown
I.V.	Immediate	Unknown	30 min
I.M.	60 min	Unknown	3-4 hr

### Adverse reactions

**CNS** (with I.V. use): confusion, decreased reflexes, dizziness, syncope, sedation, hypothermia, **paralysis**

**CV** (with I.V. use): hypotension, **arrhythmias, circulatory collapse**

**GI**: nausea, vomiting, cramps, flatulence, anorexia

**Metabolic**: hypermagnesemia, hypocalcemia

**Musculoskeletal** (with I.V. use): muscle weakness, flaccidity

**Respiratory**: **respiratory paralysis**

**Skin**: diaphoresis

**Other**: allergic reaction, injection site reaction, laxative dependence (with repeated or prolonged use)

### Interactions

**Drug-drug**. *Aminoquinolones, nitrofurantoin, penicillamine, tetracyclines*: decreased absorption of these drugs (with oral magnesium)

*CNS depressants*: additive effects

*Digoxin*: heart block, conduction changes (with I.V. use)

*Enteric-coated drugs*: faster dissolution of these drugs

*Neuromuscular blockers*: increased effects of these drugs (with I.V. use)

**Drug-diagnostic tests**. *Calcium, magnesium*: increased levels (with I.V. use)

### Patient monitoring

🔊 When giving prolonged or repeated I.V. infusions, assess patellar reflex and monitor for respiratory rate of 16 breaths/minute or more.

🔊 With I.V. use, monitor blood magnesium level (desired level is 3 to 6 mg/dl or 2.5 to 5 mEq/L). Check for signs

and symptoms of magnesium toxicity (hypotension, nausea, vomiting, ECG changes, muscle weakness, mental or respiratory depression, coma). Keep injectable calcium on hand to counteract magnesium toxicity.

- Monitor urine output, which should measure 100 ml or more every 4 hours.

🔊 If I.V. magnesium was given before delivery, assess neonate for signs and symptoms of magnesium toxicity, such as neuromuscular or respiratory depression.

- Monitor electrolyte levels and liver function tests.

### Patient teaching

🔊 Teach patient about adverse reactions. Instruct him to report symptoms that occur during I.V. administration.

- Advise patient to consult prescriber before using magnesium if he's taking other drugs. Magnesium may delay or enhance absorption of other drugs.

- Inform patient that repeated or prolonged use of magnesium citrate, hydroxide, or sulfate may cause laxative dependence. Inform him that healthy diet and exercise can reduce need for laxatives.

- Tell pregnant female to make sure prescriber knows she is pregnant before taking drug.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## mannitol

Osmitol, Polyfusor<sup>®</sup>, Resectisol

**Pharmacologic class**: Osmotic diuretic

**Therapeutic class**: Diuretic

**Pregnancy risk category** C

## Action

Increases osmotic pressure of plasma in glomerular filtrate, inhibiting tubular reabsorption of water and electrolytes (including sodium and potassium). These actions enhance water flow from various tissues and ultimately decrease intracranial and intraocular pressures; serum sodium level rises while potassium and blood urea levels fall. Also protects kidneys by preventing toxins from forming and blocking tubules.

## Availability

*Injection:* 5%, 10%, 15%, 20%, 25%  
*Solution:* 5 g/100 ml

## Indications and dosages

➤ Test dose for marked oliguria or suspected inadequate renal function  
**Adults:** 0.2 g/kg I.V. infusion (approximately 50 ml of 25% solution, 75 ml of 20% solution, or 100 ml of 15% solution) over 3 to 5 minutes. If urine flow doesn't increase, second dose may be given; if response is inadequate after second dose, reevaluate patient.

➤ To prevent oliguria during cardiovascular and other surgeries

**Adults:** 50 to 100 g I.V. infusion as 5% to 15% solution

➤ Acute oliguria

**Adults:** Up to 100 g I.V. infusion as 15% to 25% solution

**Children:** 0.25 to 2 g/kg I.V. or 60 mg/m<sup>2</sup> as 15% to 20% solution over 2 to 6 hours

➤ To reduce intracranial pressure and brain mass

**Adults:** 0.5 to 2 g/kg I.V. infusion as 15% to 25% solution given over 30 to 60 minutes

**Children:** 1 to 2 g/kg I.V. or 30 to 60 g/m<sup>2</sup> over 30 to 60 minutes. Small or debilitated patients may require smaller dose of 500 mg/kg.

➤ To reduce intraocular pressure

**Adults:** 0.5 to 2 g/kg I.V. infusion as 15% to 25% solution given over 30 to 60 minutes. For preoperative use, give 60 to 90 minutes before surgery.

**Children:** 1 to 2 g/kg I.V. or 30 to 60 g/m<sup>2</sup> over 30 to 60 minutes. Small or debilitated patients may require smaller dose of 500 mg/kg.

➤ To promote diuresis in drug toxicity

**Adults:** 5% to 25% solution by I.V. infusion given continuously to maintain high urine output

**Children:** 2 g/kg I.V. of 5% to 10% solution given continuously to maintain high urine output

➤ Irrigation during transurethral resection of prostate

**Adults:** 2.5% to 5% solution instilled into bladder via indwelling urethral catheter, as needed

## Contraindications

- Active intracranial bleeding (except during craniotomy)
- Anuria secondary to severe renal disease
- Progressive heart failure, pulmonary congestion, renal damage, or renal dysfunction after mannitol therapy begins
- Severe pulmonary congestion or pulmonary edema
- Severe dehydration

## Precautions

Use cautiously in:

- severe renal disease, heart failure, mild to moderate dehydration
- pregnant or breastfeeding patients.

## Administration

⚠ Withhold drug until adequate renal function and urinary output are established.

- When administering for drug toxicity, give fluids and electrolytes to match fluid loss.
- Be aware that at low temperatures, solution may crystallize (especially concentrations above 15%). If crystals form, warm bottle in hot-water bath or dry-heat oven or autoclave, then cool to body temperature or lower before giving.
- Don't give electrolyte-free mannitol solutions with blood; when giving blood with mannitol, add 20 mEq or

more of sodium chloride solution to each liter of mannitol solution to avoid pseudoagglutination.

- Know that drug may be given as continuous or intermittent I.V. infusion. Infuse at prescribed rate using infusion device and in-line filter. Give single I.V. dose over 30 to 90 minutes in adults.

⚠️ Avoid extravasation, because it may cause local edema and tissue necrosis.

Route	Onset	Peak	Duration
I.V. (diuresis)	1-3 hr	Unknown	Up to 8 hr
I.V. (intraocular press.)	Unknown	Unknown	4-8 hr
I.V. (intracranial press.)	30 min	Unknown	3-8 hr

### Adverse reactions

**CNS:** dizziness, headache, **seizures**

**CV:** chest pain, hypotension, hypertension, tachycardia, **thrombophlebitis, heart failure, vascular overload**

**EENT:** blurred vision, rhinitis

**GI:** nausea, vomiting, diarrhea, dry mouth

**GU:** polyuria, urinary retention, **osmotic nephrosis**

**Metabolic:** dehydration, water intoxication, hypernatremia, hyponatremia, hypovolemia, hypokalemia, **hyperkalemia, metabolic acidosis**

**Respiratory:** pulmonary congestion

**Skin:** rash, urticaria

**Other:** chills, fever, thirst, edema, extravasation with edema and tissue necrosis

### Interactions

**Drug-drug.** *Digoxin:* increased risk of digoxin toxicity

*Diuretics:* increased therapeutic effects of mannitol

*Lithium:* increased urinary excretion of lithium

**Drug-diagnostic tests.** *Electrolytes:* increased or decreased levels

### Patient monitoring

⚠️ Monitor I.V. site carefully to avoid extravasation and tissue necrosis.

- In comatose patient, insert indwelling urinary catheter as ordered to monitor urine output.

- Monitor renal function tests, urinary output, fluid balance, central venous pressure, and electrolyte levels (especially sodium and potassium).

⚠️ Watch for excessive fluid loss and signs and symptoms of hypovolemia and dehydration.

⚠️ Assess for evidence of circulatory overload, including pulmonary edema, water intoxication, and heart failure.

### Patient teaching

- Teach patient about importance of monitoring exact urinary output.

⚠️ Advise patient to report pain at infusion site as well as adverse reactions, such as increased shortness of breath or pain in back, legs, or chest.

- Tell patient drug may cause thirst or dry mouth. Emphasize that fluid restrictions are necessary, but that frequent mouth care should ease these symptoms.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## meclizine hydrochloride (meclozine ⚠️)

Antivert, Bonamine\*, Bonine, Dramamine Less Drowsy Formula, Sea-Legs ⚠️, Traveleeze ⚠️

**Pharmacologic class:** Anticholinergic

**Therapeutic class:** Antiemetic, anti-vertigo drug

**Pregnancy risk category B**

**Action**

Decreases excitability of middle-ear labyrinth and depresses conduction in vestibular-cerebellar pathways

**Availability**

Tablets: 12.5 mg, 25 mg, 50 mg

Tablets (chewable): 25 mg

**Indications and dosages**

➤ Motion sickness

**Adults:** 25 to 50 mg P.O. 1 hour before travel. May repeat q 24 hours for duration of travel.

➤ Vertigo associated with diseases affecting the vestibular system

**Adults:** 25 to 100 mg P.O. daily in divided doses

**Contraindications**

- Hypersensitivity to drug

**Precautions**

Use cautiously in:

- prostatic hypertrophy, stenosing peptic ulcer, bladder neck obstruction, pyloroduodenal obstruction, arrhythmias, angle-closure glaucoma, bronchial asthma
- pregnant or breastfeeding patients
- children (younger than age 12).

**Administration**

- Know that tablets may be chewed or swallowed whole.

Route	Onset	Peak	Duration
P.O.	1 hr	Unknown	8-24 hr

**Adverse reactions**

**CNS:** drowsiness, fatigue, confusion, excitement, euphoria, nervousness, restlessness, insomnia, vertigo, visual and auditory hallucinations, **seizures**

**CV:** hypotension, palpitations, tachycardia

**EENT:** blurred vision, diplopia, tinnitus, dry nose, dry throat

**GI:** nausea, vomiting, diarrhea, constipation, dry mouth, anorexia

**GU:** difficulty urinating, urinary retention, urinary frequency

**Skin:** rash, urticaria

**Interactions**

**Drug-drug.** *Anticholinergics (including some antihistamines, antidepressants, atropine, haloperidol, phenothiazines):* additive anticholinergic effects

*Antihistamines, CNS depressants (such as opioids, sedative-hypnotics):* additive CNS depression

**Drug-diagnostic tests.** *Skin tests using allergen extracts:* false-negative results

**Drug-behaviors.** *Alcohol use:* additive CNS depression

**Patient monitoring**

- Discontinue drug, as ordered, at least 4 days before skin testing.
- Know that drug has anticholinergic effects.

**Patient teaching**

- Tell patient to take as prescribed to minimize adverse effects.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Advise patient to relieve dry mouth with hard candy or frequent sips of fluids.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## medroxyprogesterone acetate

Apo-Medroxy\*, Climanor\*, Depo-Provera, Depo-SUBQ-Provera 104, Dom-Medroxyprogesterone\*, Gen-Medroxy\*, Novo-Medrone\*, PMS-Medroxyprogesterone\*, Provera, Ratio-MPA

**Pharmacologic class:** Hormone

**Therapeutic class:** Progestin

**Pregnancy risk category** X

### FDA BOXED WARNING

- Injection form may cause significant bone density loss. Loss increases with duration of use and may not be completely reversible. It is unknown if use during adolescence or early adulthood reduces peak bone mass and increases risk for osteoporotic fracture later in life.
- Injection form should be used as long-term contraceptive (more than 2 years) only if other contraceptive methods are inadequate.

### Action

Inhibits pituitary gonadotropin secretion, preventing follicular maturation, ovulation, and pregnancy

### Availability

*Suspension for depot injection:* 150 mg/ml, 400 mg/ml

*Suspension for depot subcutaneous injection:* 104 mg/0.65 ml in prefilled single-use syringes

*Tablets:* 2.5 mg, 5 mg, 10 mg

### Indications and dosages

- Secondary amenorrhea

**Adults:** 5 to 10 mg/day P.O. for 5 to 10 days, starting at any time during menstrual cycle

- Dysfunctional uterine bleeding; menses induction

**Adults:** 5 to 10 mg/day P.O. for 5 to 10 days, starting on day 16 or 21 of menstrual cycle

- To prevent estrogen-related endometrial changes in postmenopausal women

**Adults:** 2.5 to 5 mg/day P.O. given with 0.625 mg conjugated estrogens P.O. (monophasic regimen); or 5 mg/day P.O. on days 15 to 28 of cycle, given with 0.625 mg conjugated estrogens P.O. daily throughout cycle (biphasic regimen)

- Management of endometriosis-associated pain

**Adults:** 104 mg (Depot-subcutaneous-Provera) in anterior thigh or abdomen q 12 to 14 weeks

- To prevent pregnancy
- Adults:** 150 mg (Depo-Provera) deep I.M. injection q 13 weeks or 104 mg (Depot-subcutaneous-Provera) in anterior thigh or abdomen q 12 to 14 weeks. Give first injection during first 5 days of normal menstrual period or first 5 postpartal days if patient isn't breastfeeding, or during sixth postpartal week if patient is breastfeeding exclusively.
- Renal or endometrial cancer

**Adults:** 400 to 1,000 mg I.M.; may repeat weekly. If improvement occurs, decrease to 400 mg q month.

### Off-label uses

- Advanced breast cancer

### Contraindications

- Hypersensitivity to drug or its components
- Cerebrovascular or thromboembolic disease
- Hepatic dysfunction or disease
- Breast or genital cancer
- Undiagnosed vaginal bleeding
- Known or suspected pregnancy

**Precautions**

Use cautiously in:

- seizure disorder, renal or cardiovascular disease, asthma, diabetes mellitus, depression, migraine
- history of hepatic disease.

**Administration**

- Before starting therapy, obtain thorough history and physical examination, with emphasis on breast and pelvic organs. Also obtain Pap smear, and repeat annually during therapy.
- With contraceptive use, rule out pregnancy before first dose and when more than 14 weeks have passed since previous dose.
- For I.M. injection, inject deep into gluteal, deltoid, or anterior thigh muscle. Rotate injection sites.
- Be aware that when drug is used to prevent estrogen-related endometrial changes in postmenopausal women, lowest dosage should be used for shortest time, because treatment exceeding 1 year correlates with cancer. (Some combination products have 0.3 mg estrogen/1.5 mg progesterone or 0.45 mg estrogen/1.5 mg progesterone.)

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown
I.M.	Wks-1 mo	1 mo	Unknown
Subcut.	Unknown	Unknown	Unknown

**Adverse reactions**

**CNS:** insomnia, migraine, nervousness, drowsiness, dizziness, fatigue, depression, mood changes  
**CV: thrombophlebitis, thromboembolism**  
**EENT:** diplopia, proptosis, retinal vascular lesions, **papilledema**  
**GI:** abdominal pain, bloating  
**GU:** amenorrhea, leukorrhea, spotting, cervical secretions, galactorrhea, breast tenderness and secretion, cervical erosions, pelvic pain, infertility  
**Hepatic:** jaundice

**Metabolic:** fluid retention, hyperglycemia

**Musculoskeletal:** leg cramps, back pain

**Respiratory: pulmonary embolism**

**Skin:** pruritus, urticaria, rash, acne, alopecia, hirsutism, chloasma, melasma, sterile abscesses, induration at I.M. site

**Other:** weight and appetite changes, edema, angioedema, allergic reactions including **anaphylaxis**

**Interactions**

**Drug-drug.** *Bromocriptine:* decreased bromocriptine efficacy

*Carbamazepine, phenobarbital, phenytoin, rifampin:* decreased contraceptive efficacy

**Drug-diagnostic tests.** *Alkaline phosphatase, low-density lipoproteins:* increased levels

*High-density lipoproteins, pregnanediol excretion:* decreased levels

*Thyroid hormone assays:* altered results

**Drug-behaviors.** *Alcohol use:* additive CNS depression

**Patient monitoring**

- Monitor patient for fluid retention and for signs and symptoms of thrombophlebitis, including pain, swelling, and redness of lower legs.

🚨 Assess for visual disturbances and headache. If ocular exam shows papilledema or retinal vascular lesions, drug should be discontinued.

- Evaluate liver function tests.

🚨 Watch for abdominal pain, fever, malaise, jaundice, darkened urine, and clay-colored stools.

**Patient teaching**

- Advise patient that drug may cause nausea, vomiting, headache, abdominal pain, painful breast swelling, and abnormal bleeding pattern. Instruct her to report these effects if pronounced.

🚨 Tell patient to promptly report bloating, swelling, appetite loss, rash,

yellowed skin, mood changes or depression, nervousness, dizziness, chest pain, shortness of breath, visual disturbances, or severe headache.

- Teach patient how to perform breast self-exams.
- Tell patient she must undergo yearly physical examinations with Pap smear.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## mefloquine hydrochloride

Apo-Mefloquine<sup>✳</sup>, Lariam

**Pharmacologic class:** 4-quinoline-methanol derivative, quinine analog

**Therapeutic class:** Antimalarial

**Pregnancy risk category C**

### Action

Unknown. Thought to increase intravesicular pH in parasite acid vesicles and form complexes with hemin, inhibiting parasite development.

### Availability

Tablets: 250 mg

### Indications and dosages

➤ Acute malarial infection

**Adults:** 1,250 mg P.O. as a single dose

**Children:** 20 to 25 mg/kg P.O. in two divided doses given 6 to 8 hours apart

➤ Malaria prophylaxis

**Adults and children weighing more than 45 kg (99 lb):** 250 mg P.O. once weekly on same day each week, starting 1 week before entering endemic area and continuing for 4 weeks after leaving area

**Children weighing 30 to 45 kg (66 to 99 lb):** 187.5 mg P.O. q week

**Children weighing 20 to 30 kg (44 to 66 lb):** 125 mg P.O. q week

**Children weighing 10 to 20 kg (22 to 44 lb):** 62.5 mg P.O. q week

**Children weighing 5 to 10 kg (11 to 22 lb):** 31.25 mg P.O. q week

### Contraindications

- Hypersensitivity to drug, related agents (quinine, quinidine), or excipients
- Prophylactic use in patients with active depression, recent history of depression, generalized anxiety disorder, psychosis, schizophrenia, other psychiatric disorders, or history of seizures

### Precautions

Use cautiously in:

- cardiac disorders, seizure disorders
- pregnant or breastfeeding patients
- children.

### Administration

- Don't give on empty stomach.

Administer with at least 240 ml of water.

- Know that after completing mefloquine therapy for acute malarial infection, patient should receive primaquine (or other 8-aminoquinolone) to prevent relapse.

Route	Onset	Peak	Duration
P.O.	Unknown	7-24 hr	Unknown

### Adverse reactions

**CNS:** dizziness, syncope, headache, psychotic changes, depression, hallucinations, confusion, anxiety, fatigue, vertigo, **seizures**

**EENT:** blurred vision, tinnitus

**GI:** nausea, vomiting, diarrhea, loose stools, abdominal discomfort, anorexia

**Hematologic:** **leukopenia, thrombocytopenia**

**Musculoskeletal:** myalgia

**Skin:** rash

**Other:** fever, chills

## Interactions

**Drug-drug.** *Beta-adrenergic blockers, quinidine, quinine:* ECG abnormalities, cardiac arrest

*Chloroquine, quinine:* increased risk of seizures

*Valproic acid:* decreased valproic acid blood level, loss of seizure control

**Drug-diagnostic tests.** *Hematocrit, platelets, white blood cells:* decreased values

*Transaminases:* transient increases

## Patient monitoring

📣 Monitor patient with acute *Plasmodium vivax* malaria who is at high risk for relapse. Because drug doesn't eliminate exoerythrocytic (hepatic-phase) parasites, patient should receive primaquine after mefloquine therapy.

📣 Watch for psychiatric symptoms, such as acute anxiety, depression, restlessness, or confusion. These may precede more serious psychiatric events.

- Evaluate hepatic function during prolonged prophylactic therapy.

📣 In patients receiving related drugs (such as quinine, quinidine, or chloroquine) concurrently, be alert for ECG abnormalities and seizures. Separate administration times by at least 12 hours.

📣 Closely monitor patients with serious or life-threatening *Plasmodium falciparum* infection. Be aware that they should receive I.V. antimalarial drugs and that mefloquine may be used to complete course of therapy.

## Patient teaching

- Tell patient to take with full glass of water and not on empty stomach.
- In prophylactic use, instruct patient to take first dose 1 week before departure and to continue therapy as prescribed upon return. Tell him to take drug on same day each week.
- Advise patient to report fever after returning from malarious area.

- Inform patient that malaria prophylaxis should include protective clothing, insect repellent, and bed netting.

📣 Tell patient to immediately report psychiatric symptoms (such as acute anxiety, depression, restlessness, or confusion) and to stop taking drug.

- Caution patient to avoid driving and other hazardous activities because drug may cause dizziness.

- Instruct patient to have periodic ophthalmic exams, because drug may cause eye damage.

- Tell female patient to inform prescriber if she is pregnant.

- Advise female patient not to breast-feed while taking drug.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

m

## megestrol acetate

Apo-Megestrol<sup>®</sup>, Megace, Megace ES, Megace-OS<sup>®</sup>, Nu-Megestrol

**Pharmacologic class:** Hormone

**Therapeutic class:** Progestin, antineoplastic, appetite stimulant

**Pregnancy risk category D** (tablets), X (suspension)

## Action

Unknown. Thought to suppress growth of progestin-sensitive breast and endometrial tumors by inhibiting pituitary and adrenal function.

## Availability

*Oral suspension:* 40 mg/ml

*Oral suspension (concentrate):* 625 mg/5 ml

*Tablets:* 20 mg, 40 mg

## Indications and dosages

➤ Breast cancer

**Adults:** 160 mg/day P.O. given as 40 mg P.O. q.i.d.

➤ Endometrial cancer

**Adults:** 40 to 320 mg/day P.O. in divided doses

➤ Anorexia, cachexia, or unexplained significant weight loss in AIDS patients

**Adults:** 800 mg (oral suspension only) P.O. daily, or 625 mg (oral suspension concentrate) P.O. daily

## Off-label uses

- Endometriosis, endometrial hyperplasia
- Prostatic hypertrophy
- Contraception

## Contraindications

- Hypersensitivity to drug or its components
- Known or suspected pregnancy (suspension only)

## Precautions

Use cautiously in:

- diabetes mellitus, severe hepatic disease, renal disease, cardiovascular disease, seizure disorders, cerebral hemorrhage, migraine, asthma, undiagnosed vaginal bleeding, depression
- history of thrombophlebitis
- breastfeeding.

## Administration

- Give with meals if GI upset occurs.

Route	Onset	Peak	Duration
P.O.	Unknown	3-5 hr	Unknown

## Adverse reactions

**CNS:** headache, insomnia, drowsiness, asthenia, confusion, neuropathy, hyperesthesia, abnormal thinking, paresthesias, depression, **seizures**

**CV:** hypertension, chest pain, **thrombophlebitis, deep vein thrombosis**

**EENT:** amblyopia, retinal thrombosis, pharyngitis

**GI:** nausea, vomiting, constipation, abdominal pain, flatulence, dyspepsia, dry mouth, increased salivation, oral candidiasis

**GU:** breast tenderness, breakthrough bleeding, decreased libido

**Hematologic:** anemia, **leukopenia**

**Hepatic:** **hepatomegaly**

**Metabolic:** hyperglycemia

**Musculoskeletal:** carpal tunnel syndrome, back pain

**Respiratory:** dyspnea, cough, pneumonia, **pulmonary embolism**

**Skin:** alopecia, rash, pruritus, sweating

**Other:** edema, fever, weight gain, herpes infection

## Interactions

**Drug-diagnostic tests.** *Lactate dehydrogenase:* increased level

## Patient monitoring

 Watch for signs and symptoms of thromboembolic disorders.

 Stay alert for visual disturbances, headache, abdominal pain, and hepatomegaly.

- Monitor glucose level in diabetic patients.

## Patient teaching

- Inform patient that drug may cause back or abdominal pain, headache, nausea, vomiting, or breast tenderness.

 Tell patient to immediately report pain, swelling or redness of lower legs, chest or back pain, or shortness of breath.

- Advise patient to contact prescriber if adverse effects become pronounced or if other troublesome signs or symptoms occur.

- Urge patient to use reliable contraception.

 Instruct patient to immediately report suspected pregnancy.

- Caution female patient to avoid breastfeeding.

- Advise diabetic patient to monitor blood glucose level.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## meloxicam

Apo-Meloxicam<sup>★</sup>, Co Meloxicam<sup>★</sup>, Dom-Meloxicam<sup>★</sup>, Gen-Meloxicam<sup>★</sup>, Mobic, Mobicox<sup>★</sup>, Novo-Meloxicam<sup>★</sup>, PHL-Meloxicam<sup>★</sup>, Ratio-Meloxicam<sup>★</sup>

**Pharmacologic class:** Nonopioid analgesic, nonsteroidal anti-inflammatory drug (NSAID)

**Therapeutic class:** Analgesic, anti-inflammatory drug

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug may increase risk of serious cardiovascular thrombotic events, myocardial infarction (MI), and stroke. Risk may increase with duration of use. Patients with cardiovascular disease or risk factors for it may be at greater risk.
- Drug increases risk of serious GI adverse events, including bleeding, ulcers, and stomach or intestinal perforation. These events can occur at any time during use and without warning. Elderly patients are at greater risk.
- Drug is contraindicated for treatment of perioperative pain in setting of coronary artery bypass graft surgery.

### Action

Unknown. Thought to reduce inflammation and pain by inhibiting prostaglandin synthesis of the enzyme cyclooxygenase.

### Availability

*Oral suspension:* 7.5 mg/5 ml

*Tablets:* 7.5 mg, 15 mg

### Indications and dosages

➤ Osteoarthritis; rheumatoid arthritis

**Adults:** 7.5 mg P.O. once daily; may increase to 15 mg/day

➤ Juvenile arthritis

**Children ages 2 and older:** 0.125 mg/kg P.O. once daily, up to a maximum of 7.5 mg

### Contraindications

- Hypersensitivity to drug, its components, or other NSAIDs

### Precautions

Use cautiously in:

- bleeding disorders, GI or cardiac disorders, severe renal impairment, severe hepatic disease, asthma, peptic ulcer disease
- concurrent aspirin, oral anticoagulant, or corticosteroid therapy
- elderly or debilitated patients
- pregnant or breastfeeding patients.

### Administration

- Before starting therapy, ask patient about aspirin sensitivity and allergies to other NSAIDs. If patient is dehydrated, provide adequate fluids.

Route	Onset	Peak	Duration
P.O.	Unknown	5-6 hr	24 hr

### Adverse reactions

**CNS:** headache, dizziness, syncope, malaise, fatigue, asthenia, depression, confusion, nervousness, drowsiness, insomnia, vertigo, tremor, paresthesia, anxiety, **seizures**

**CV:** hypertension, hypotension, palpitations, angina, vasculitis, **heart failure, arrhythmias, MI**

**EENT:** abnormal vision, conjunctivitis, hearing loss, tinnitus, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, colitis, GI ulcers with

perforation, abdominal pain, dyspepsia, gastroesophageal reflux, esophagitis, flatulence, ulcerative stomatitis, dry mouth, **pancreatitis, GI hemorrhage**

**GU:** urinary frequency, urinary tract infection, albuminuria, hematuria,

**renal failure**

**Hematologic:** anemia, purpura, **leukopenia, thrombocytopenia**

**Hepatic:** hepatitis

**Musculoskeletal:** joint pain, back pain

**Metabolic:** dehydration

**Respiratory:** upper respiratory infection, dyspnea, coughing, asthma, **bronchospasm**

**Skin:** rash, urticaria, pruritus, bullous eruption, sweating, alopecia, photosensitivity, angioedema

**Other:** altered taste, increased appetite, weight gain or loss, hot flashes, fluid retention and edema, masking of infection symptoms, hypersensitivity reactions including **anaphylaxis**

## Interactions

**Drug-drug.** *Angiotensin-converting enzyme inhibitors:* decreased antihypertensive effect

*Anticoagulants:* increased risk of bleeding

*Aspirin:* increased meloxicam blood level, increased risk of toxicity

*Cholestyramine:* decreased meloxicam blood level

*Furosemide, thiazides:* decreased diuretic effect

*Lithium:* increased lithium blood level

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, gamma-glutamyl transferase:* increased levels

*Hemoglobin, platelets, white blood cells:* decreased values

**Drug-behaviors.** *Alcohol use, smoking:* increased risk of GI irritation and bleeding

## Patient monitoring

 Closely monitor patient with aspirin-sensitivity asthma, because of risk of severe bronchospasm.

- In prolonged therapy, monitor CBC and kidney and liver function tests.

 Assess for cardiovascular disorders and hepatotoxicity.

- Monitor patient for fluid retention and weight gain.

## Patient teaching

 Instruct patient to immediately report signs and symptoms of hepatotoxicity, including right upper quadrant pain, nausea, fatigue, lethargy, pruritus, and jaundice.

- Tell patient to report abdominal pain, blood in stool or emesis, or black tarry stools.

- Instruct patient to avoid alcohol and smoking.

- Caution pregnant patient to avoid drug, especially during third trimester.

- Tell patient to consult prescriber before taking over-the-counter preparations.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## melphalan (L-PAM, L-phenylalanine mustard, L-sarcolysin)

Alkeran

## melphalan hydrochloride

Alkeran

**Pharmacologic class:** Alkylator

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

**FDA BOXED WARNING**

- Give under supervision of physician experienced in cancer chemotherapy, in facility with adequate diagnostic and treatment resources.
- Drug may cause severe bone marrow suppression leading to infection or bleeding. I.V. use causes greater myelosuppression than oral use, and also may lead to hypersensitivity reactions (including anaphylaxis).
- Drug may cause leukemia and is potentially mutagenic.

**Action**

Forms cross-links between strands of cellular DNA, disrupting DNA and RNA transcription and causing cell death

**Availability**

*Powder for injection (melphalan hydrochloride):* 50 mg

*Tablets:* 2 mg

**Indications and dosages**

➤ Multiple myeloma

**Adults:** Initially, 6 mg P.O. daily for 2 to 3 weeks, then discontinue drug for up to 4 weeks or until white blood cell (WBC) and platelet counts increase; then give maintenance dosage of 2 or 10 mg/day for 7 to 10 days, then withhold until WBC recovery followed by 2 mg/day maintenance or 0.15 mg/kg/day P.O. for 7 days or 0.25 mg/kg for 4 days, repeated q 4 to 6 weeks. For those who can't tolerate oral therapy, 16 mg/m<sup>2</sup> by I.V. infusion over 15 to 20 minutes at 2-week intervals for four doses (usually with prednisone); I.V. dose can be repeated q 4 weeks after recovery from toxicity.

➤ Nonresectable advanced ovarian cancer

**Adults:** 0.2 mg/kg/day P.O. for 5 days q 4 to 5 weeks

**Dosage adjustment**

- Renal impairment

**Contraindications**

- Hypersensitivity to drug
- Patients whose disease has shown previous drug resistance

**Precautions**

Use cautiously in:

- bone marrow depression, infection, renal disease
- previous radiation therapy
- patients with childbearing potential
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

**Administration**

- Before starting therapy, obtain CBC with white cell differential and platelet count. Repeat periodically before each course.
- For I.V. use, reconstitute by rapidly injecting 10 ml of supplied diluent into vial with lyophilized powder. Shake until solution is clear (yields a concentration of 5 mg/ml).
- Dilute desired dosage in 0.9% sodium chloride injection to a concentration no greater than 0.45 mg/ml. Administer over 15 minutes, being sure to give entire dose within 60 minutes of reconstitution.
- ⚠ Minimize time between reconstitution, dilution, and administration, because solution is unstable.

Route	Onset	Peak	Duration
P.O.	5 days	2-3 wk	5-6 wk
I.V.	Unknown	Unknown	Unknown

**Adverse reactions**

**CV:** hypotension, tachycardia, vasculitis

**GI:** nausea, vomiting, diarrhea, oral ulcers, stomatitis

**GU:** hyperuricemia, amenorrhea, gonadal suppression, infertility

**Hematologic:** anemia, purpura, **bone marrow depression, leukopenia, thrombocytopenia**

**Hepatic:** **hepatotoxicity**

**Metabolic:** hyperuricemia

**Respiratory:** dyspnea, **interstitial pneumonitis, bronchospasm, fibrosis**

**Skin:** rash, urticaria, pruritus, alopecia, sweating

**Other:** edema, extravasation at I.V. site, allergic reactions including **anaphylaxis**

### Interactions

**Drug-drug.** *Carmustine:* increased pulmonary toxicity

*Cimetidine:* decreased GI absorption of melphalan

*Cisplatin:* increased risk of renal dysfunction, decreased melphalan clearance

*Cyclosporine:* increased risk of nephrotoxicity, severe renal failure

*Interferon alfa:* decreased melphalan blood level

*Live-virus vaccines:* decreased antibody response to vaccine

*Myelosuppressants:* additive toxicity

*Nalidixic acid:* increased risk of severe hemorrhagic necrotic enterocolitis (in children)

**Drug-diagnostic tests.** *Hemoglobin, platelets, red blood cells, WBCs:* decreased values

*Nitrogenous compounds:* increased levels

**Drug-food.** *Any food:* decreased absorption of oral melphalan

### Patient monitoring

🚨 Monitor patient for thrombocytopenia and leukopenia. If platelet count exceeds 100,000/mm<sup>3</sup> or WBC count is below 3,000/mm<sup>3</sup>, discontinue drug until peripheral blood counts recover.

🚨 Watch closely for indications of bone marrow depression, including infection, anemia, and bleeding.

🚨 After multiple courses, watch for acute hypersensitivity reaction. If it

occurs, discontinue drug and administer volume expanders, corticosteroids, or antihistamines, as prescribed.

- Watch for signs and symptoms of GI or pulmonary toxicity.

- Evaluate renal and hepatic function.

### Patient teaching

- Tell patient to take oral tablets without food, because food may decrease drug absorption.

- Instruct patient to take entire daily oral dose at one time on empty stomach.

🚨 Advise patient to immediately report unusual bleeding or bruising, fever, chills, sore throat, shortness of breath, yellowing of skin or eyes, persistent cough, flank or stomach pain, joint pain, black tarry stools, rash, or unusual lumps or masses.

- Tell patient to consult prescriber before using over-the-counter medications.

- Advise patient to use reliable contraception.

- Caution patient to avoid breastfeeding.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## memantine

Ebixa<sup>☼</sup>🌐, Namenda

**Pharmacologic class:** N-methyl-D-aspartate receptor antagonist (NMDA)

**Therapeutic class:** Anti-Alzheimer's agent

**Pregnancy risk category B**

### Action

Unclear. Thought to act as a low- to moderate-affinity NMDA receptor antagonist, binding to NMDA receptor-operated channels. (Activation of these

channels is thought to contribute to Alzheimer's symptoms.)

### Availability

*Oral solution:* 2 mg/ml

*Tablets:* 5 mg, 10 mg

*Tablets (titration pack):* 28 tablets of 5 mg and 21 tablets of 10 mg

### Indications and dosages

➤ Moderate to severe Alzheimer's-type dementia

**Adults:** Initially, 5 mg P.O. daily. Then titrate at intervals of at least 1 week in 5-mg increments, to a maximum of 10 mg P.O. b.i.d.

### Dosage adjustment

- Moderate renal impairment

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- neurologic conditions, moderate to severe renal impairment, genitourinary conditions that increase pH
- pregnant or breastfeeding patients.

### Administration

- Give with or without food.

Route	Onset	Peak	Duration
P.O.	Unknown	3-7 hr	Unknown

### Adverse reactions

**CNS:** dizziness, headache, syncope, aggressive reaction, confusion, somnolence, hallucinations, agitation, insomnia, vertigo, ataxia, abnormal gait, hypokinesia, anxiety, **transient ischemic attack, cerebrovascular accident (CVA)**

**CV:** hypertension, **cardiac failure**

**EENT:** cataract, conjunctivitis

**GI:** nausea, vomiting, diarrhea, constipation, anorexia

**GU:** frequent voiding, urinary incontinence, urinary tract infection

**Hematologic:** anemia

**Musculoskeletal:** back pain, arthralgia

**Respiratory:** cough, dyspnea, bronchitis, pneumonia

**Skin:** rash

**Other:** weight loss, fatigue, pain, falls, flulike symptoms, peripheral edema

### Interactions

**Drug-drug.** *Cimetidine, hydrochlorothiazide, nicotine, quinidine, ranitidine, triamterene:* altered blood levels of both drugs

*Urine-alkalizing drugs (carbonic anhydrase inhibitors, sodium bicarbonate):* decreased memantine elimination

**Drug-diagnostic tests.** *Alkaline phosphatase:* increased level

### Patient monitoring

- 🔊 Check for heart failure and signs and symptoms of CVA.
- Monitor kidney function tests.

### Patient teaching

- Tell patient to take with or without food.
- Instruct patient or caregiver not to mix solution with other liquids and to take or give oral solution only with included dosing device.
- Make sure patient or caregiver understands dose escalation.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

m

## menotropins

Menopur, Repronex

**Pharmacologic class:** Hormone

**Therapeutic class:** Exogenous gonadotropin

**Pregnancy risk category** X

**Action**

Simulates action of follicle-stimulating hormone (FSH) by promoting follicular growth and maturation

**Availability**

*Injection (powder or pellet for reconstitution):* 75 international units luteinizing hormone (LH); 150 international units LH and 150 international units FSH activity/vial

**Indications and dosages**

➤ Controlled ovarian stimulation in patients with oligoanovulation

**Women:** Dosage individualized. Recommended dosage is 150 international units I.M. or subcutaneously daily during first 5 days of treatment, with subsequent dosages adjusted based on response. Adjust dosage no more often than every 2 days, and don't exceed 75 to 150 international units per adjustment. Maximum daily dosage is 450 international units. Dosing beyond 12 days is not recommended. If response is appropriate, human chorionic gonadotropin (hCG) should be given I.M. 1 day after last menotropins dose.

➤ Assisted reproductive technologies

**Women:** In patients who've received gonadotropin-releasing hormone agonists or antagonist pituitary suppression, recommended initial dosage is 225 international units I.M. or subcutaneously, with subsequent dosage adjustments based on response. Adjust dosage no more often than every 2 days, and don't exceed 75 to 150 international units per adjustment. Maximum daily dosage is 450 international units. Dosing beyond 12 days isn't recommended. Once adequate follicular development appears, hCG is given to induce follicular maturation in preparation for oocyte retrieval.

**Contraindications**

- Hypersensitivity to drug
- High FSH levels (indicating primary ovarian failure)
- Abnormal bleeding of undetermined origin
- Uncontrolled thyroid or adrenal dysfunction
- Organic intracranial lesion (such as pituitary tumor)
- Causes of infertility other than anovulation (unless patient is candidate for in vitro fertilization)
- Ovarian cysts or enlargement not caused by polycystic ovarian syndrome
- Pregnancy

**Precautions**

Use cautiously in:

- renal or hepatic insufficiency (safety and efficacy not established)
- breastfeeding patients.

**Administration**

- Know that drug may be given either I.M. or subcutaneously.
- To reconstitute powder or pellet for injection, add accompanying 2 ml of 0.9% sodium chloride injection to vial.
- Inject immediately after reconstitution. Discard unused portion.
- Rotate injection sites.
- Use lower abdomen for subcutaneous injection.
- Withhold hCG if serum estradiol level exceeds 2,000 pg/ml or abdominal pain occurs.

Route	Onset	Peak	Duration
I.M.	Unknown	Unknown	Unknown
Subcut.	Unknown	Unknown	Unknown

**Adverse reactions**

**CNS:** headache, malaise, dizziness, **cerebrovascular accident**

**CV:** tachycardia, **venous thrombophlebitis, arterial occlusion, arterial thromboembolism**

**GI:** nausea, vomiting, diarrhea, abdominal cramps and distention, **hemoperitoneum**

**GU:** ovarian enlargement with pain, gynecomastia, ovarian cysts, multiple births, **ovarian hyperstimulation syndrome (OHSS), ectopic pregnancy syndrome**

**Metabolic:** electrolyte imbalances

**Musculoskeletal:** muscle aches, joint pain

**Respiratory:** dyspnea, tachypnea, atelectasis, **adult respiratory distress syndrome, pulmonary embolism, pulmonary infarction**

**Skin:** rash

**Other:** fever, hypersensitivity reaction, **anaphylaxis**

### Interactions

None significant

### Patient monitoring

- Know that before starting menotropins/hCG therapy to induce ovulation and pregnancy, patient should undergo gynecologic and endocrine evaluation with hysterosalpingogram to rule out pregnancy and neoplastic lesions.
- Assess patient to confirm anovulation. Obtain urinary gonadotropin levels as ordered to rule out primary ovarian failure. (Male partner's fertility should be evaluated, also).
- In older females (who have greater risk of anovulatory disorders and endometrial cancer), assess cervical dilation and curettage results.
- Evaluate patient for expected ovarian stimulation without hyperstimulation.
-  Monitor for early indications of OHSS—severe pelvic pain, nausea, vomiting, and weight gain. OHSS usually occurs 2 weeks after treatment ends, peaks 7 to 10 days after ovulation, and resolves with menses onset.
-  If OHSS occurs, drug is withdrawn and patient is hospitalized for bed rest, fluid and electrolyte management, and analgesics. Monitor daily fluid intake and output, weight,

abdominal girth, hematocrit, serum and urinary electrolytes, urine specific gravity, blood urea nitrogen, and creatinine. Watch for hemoconcentration caused by fluid loss into peritoneal, pleural, and pericardial cavities.

 Stay alert for pulmonary and thromboembolic complications.

- Assess male patient for pituitary insufficiency as possible cause of infertility.

### Patient teaching

- Before therapy, teach patient about duration of treatment and necessary monitoring.
- Inform patient about risk of multiple births with menotropins and hCG use.
- For infertile females, encourage daily intercourse starting on day before hCG administration.
- As appropriate, review all other significant and life-threatening adverse reactions.

m

## meperidine hydrochloride (pethidine hydrochloride)

Demerol, Meperitab

**Pharmacologic class:** Opioid agonist

**Therapeutic class:** Analgesic, adjunct to anesthesia

**Controlled substance schedule II**

**Pregnancy risk category C**

### Action

Binds to and depresses opiate receptors in spinal cord and CNS, altering perception of and response to pain

### Availability

**Injection:** 10 mg/ml, 25 mg/ml, 50 mg/ml, 75 mg/ml, 100 mg/ml

**Oral solution:** 500 mg/5 ml

**Syrup:** 50 mg/5 ml

**Tablets:** 50 mg, 100 mg

## Indications and dosages

➤ Moderate to severe pain

**Adults:** 50 to 150 mg P.O., I.M., or subcutaneously q 3 to 4 hours as needed

**Children:** 1.1 to 1.8 mg/kg P.O., I.M., or subcutaneously q 3 to 4 hours, not to exceed 100 mg/dose

➤ Preoperative sedation

**Adults:** 50 to 100 mg I.M. or subcutaneously 30 to 90 minutes before anesthesia

**Children:** 1 to 2.2 mg/kg I.M. or subcutaneously 30 to 90 minutes before anesthesia. Don't exceed adult dosage.

➤ Support of anesthesia

**Adults:** Fractional doses (such as 10 mg/ml) by repeated slow I.V. injections or continuous I.V. infusion of a more dilute solution (such as 1 mg/ml). Dosages should be individualized.

➤ Analgesia during labor

**Adults:** 50 to 100 mg I.M. or subcutaneously when contractions are regular. May repeat q 1 to 3 hours.

## Contraindications

- Hypersensitivity to drug or bisulfites (with some injectable products)
- MAO inhibitor use within past 14 days

## Precautions

Use cautiously in:

- head trauma; increased intracranial pressure (ICP); severe renal, hepatic, or pulmonary disease; hypothyroidism; adrenal insufficiency; extensive burns; alcoholism; supraventricular tachycardia; seizure disorders
- undiagnosed abdominal pain or prostatic hyperplasia
- elderly or debilitated patients
- pregnant patients (not recommended before labor)
- labor (drug may cause respiratory depression in neonate)
- breastfeeding patients
- children.

## Administration

- Give I.M. injection slowly into large muscle. Preferably, use diluted solution.
- Give oral solution or syrup in a half-glass of water to avoid topical anesthetic effect on mucous membranes.
- Be aware that drug is compatible with 5% dextrose and lactated Ringer's solution, dextrose-saline solution combinations, and 2.5%, 5%, or 10% dextrose in water.
- ⚠ Know that drug is not compatible with soluble barbiturates, aminophylline, heparin, morphine sulfate, methicillin, phenytoin, sodium bicarbonate, iodide, sulfadiazine, or sulfoxazole.
- Don't give for chronic pain control, because of potential toxicity and dependence.

Route	Onset	Peak	Duration
P.O.	15 min	60 min	2-4 hr
I.V.	Immediate	5-7 min	2-4 hr
I.M.	10-15 min	30-50 min	2-4 hr
Subcut.	10-15 min	40-60 min	2-4 hr

## Adverse reactions

**CNS:** confusion, sedation, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams, seizures

**CV:** hypotension, **bradycardia, cardiac arrest, shock**

**EENT:** blurred vision, diplopia, miosis

**GI:** nausea, vomiting, constipation, ileus, biliary tract spasms

**GU:** urinary retention

**Respiratory:** respiratory depression, respiratory arrest

**Skin:** flushing, sweating, induration

**Other:** pain at injection site, local irritation, physical or psychological drug dependence, drug tolerance

## Interactions

**Drug-drug.** *Antihistamines, sedative-hypnotics:* additive CNS depression

*Barbiturates, cimetidine, protease inhibitor antiretrovirals*: increased respiratory and CNS depression

*Chlorpromazine, thioridazine*: increased risk of meperidine toxicity  
*MAO inhibitors, procabazine*: potentially fatal reaction

*Opioid agonist-antagonists*: precipitation of opioid withdrawal in physically dependent patients

*Phenytoin*: increased meperidine metabolism and decreased effects

**Drug-diagnostic tests.** *Amylase, lipase*: increased levels

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian*: increased CNS depression

**Drug-behaviors.** *Alcohol use*: increased CNS depression

## Patient monitoring

 Monitor vital signs. Don't give drug if patient has significant respiratory or CNS depression.

- Reassess patient's pain level after administration.

 Watch for seizures, agitation, irritability, nervousness, tremors, twitches, and myoclonus in patients at risk for normeperidine accumulation (such as those with renal or hepatic impairment).

 Use with extreme caution in patients with head injury. Drug may increase ICP and cause adverse reactions that obscure clinical course.

- Closely monitor patients with acute abdominal pain. Drug may obscure diagnosis and clinical course of GI condition.
- Evaluate bowel and bladder function.
- With long-term or repeated use, watch for psychological and physical drug dependence and tolerance.

 With pediatric patients, stay alert for increased risk of seizures.

## Patient teaching

- Tell patient using oral solution or syrup to take drug with a half-glass of

water to minimize local anesthetic effect.

- Caution patient to avoid driving and other hazardous activities, because drug may cause dizziness or drowsiness.
- Advise patient to avoid alcohol.
- Instruct ambulatory patient to change position slowly to avoid orthostatic hypotension.
- Tell female patient to inform prescriber if she is pregnant or breastfeeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## mercaptapurine (6-mercaptopurine, 6-MP)

Purinethol, Puri-Nethol<sup>®</sup>

m

**Pharmacologic class:** Antimetabolite

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

- Don't give drug unless diagnosis of acute lymphatic leukemia is confirmed and responsible physician knows how to assess response to chemotherapy.

## Action

Inhibits DNA and RNA synthesis, suppressing growth of certain cancer cells

## Availability

*Tablets:* 50 mg

## Indications and dosages

 Maintenance therapy for acute lymphatic (lymphocytic, lymphoblastic) leukemia

**Adults and children:** On complete hematologic remission, 1.5 to 2.5 mg/kg/day P.O. as a single dose (combined with other agents as prescribed).

### Contraindications

- Hypersensitivity to drug or its components
- Prior resistance to drug or thioguanine
- Breastfeeding

### Precautions

Use cautiously if:

- renal or hepatic impairment
- decreased platelet or neutrophil counts after chemotherapy or radiation
- inherited thiopurine methyltransferase deficiency
- pregnant patients.

### Administration

- Follow facility protocols regarding proper handling and disposal of drug.
- ☞ Don't handle drug if you are pregnant.
- Be aware that total daily dosage is calculated to nearest multiple of 25 mg and given once daily.
- ☞ Be aware that when mercaptopurine is given with allopurinol, mercaptopurine dosage must be reduced to one-third to one-fourth of usual dosage to avoid severe toxicity.
- ☞ Withdraw drug immediately if white blood cell (WBC) or platelet count falls rapidly or steeply.

Route	Onset	Peak	Duration
P.O.	Unknown	2 hr	Unknown

### Adverse reactions

**GI:** nausea, vomiting, anorexia, diarrhea, GI ulcers, painful oral ulcers, **pancreatitis**  
**Hematologic:** anemia, **leukopenia**, **thrombocytopenia**  
**Hepatic:** jaundice, **hepatotoxicity**

**Metabolic:** hyperuricemia

**Skin:** rash, hyperpigmentation

### Interactions

**Drug-drug.** *Allopurinol* (more than 300 mg), *aminosalicylate derivatives* (*mesalazine*, *olsalazine*, *sulfasalazine*): increased bone marrow depression  
*Warfarin*: decreased anticoagulant effect

**Drug-diagnostic tests.** *Hemoglobin*, *platelets*, *red blood cells*, *uric acid*, *WBCs*: increased values

### Patient monitoring

- ☞ Watch for signs and symptoms of hepatotoxicity.
- Monitor weekly CBC with white cell differential and platelet count.
- Assess bone marrow aspiration and biopsy results, as necessary, to aid assessment of disease progression, resistance to therapy, and drug-induced marrow hypoplasia.
- Monitor serum uric acid level.
- Evaluate fluid intake and output.
- Monitor liver function tests and bilirubin level weekly at start of therapy, then monthly.

### Patient teaching

- ☞ Instruct patient to immediately report fever, sore throat, increased bleeding or bruising, or signs or symptoms of liver problems (right-sided abdominal pain, yellowing of skin or eyes, nausea, vomiting, clay-colored stools, or dark urine).
- Advise both male and female patients to use reliable contraception.
- Encourage patient to maintain adequate fluid intake.
- Caution patient not to get vaccinations without consulting prescriber.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## meropenem

Meronom , Merrem I.V.

**Pharmacologic class:** Carbapenem

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

### Action

Inhibits bacterial cell-wall synthesis and penetrates gram-negative and gram-positive bacteria

### Availability

*Powder for injection:* 500-mg and 1-g vials

### Indications and dosages

➤ Intra-abdominal infections

**Adults:** 1 g I.V. q 8 hours over 15 to 30 minutes by infusion or over 3 to 5 minutes as a bolus injection

**Children weighing 50 kg (110 lb) or more:** 1 g I.V. q 8 hours over 15 to 30 minutes by infusion or over 3 to 5 minutes as a bolus injection

**Children ages 3 months and older weighing less than 50 kg (110 lb):** 20 mg/kg q 8 hours over 15 to 30 minutes by infusion or over 3 to 5 minutes as a bolus injection

➤ Bacterial meningitis

**Children weighing 50 kg (110 lb) or more:** 2 g I.V. q 8 hours over 15 to 30 minutes by infusion or over 3 to 5 minutes as a bolus injection

**Children ages 3 month and older weighing less than 50 kg (110 lb):** 40 mg/kg q 8 hours over 15 to 30 minutes by infusion or over 3 to 5 minutes as a bolus injection, to a maximum of 2 g q 8 hours

➤ Complicated skin and skin-structure infections

**Adults:** 500 mg I.V. q 8 hours

### Dosage adjustment

- Renal impairment

### Off-label uses

- Acute pulmonary exacerbation caused by respiratory tract infection with susceptible organisms in cystic fibrosis patients

### Contraindications

- Hypersensitivity to drug, its components, or other beta-lactams

### Precautions

Use cautiously in:

- sulfite sensitivity, renal disease, seizure disorder
- pregnant or breastfeeding patients
- children.

### Administration

• For I.V. bolus, add 10 or 20 ml of sterile water to 500-mg or 1-g vial, respectively, to yield a concentration of 50 mg/ml. Shake until clear. Administer single dose over 3 to 5 minutes.

• For intermittent I.V. infusion, piggy-back vials can be reconstituted with compatible I.V. solution (0.9% sodium chloride or 5% dextrose) to yield a concentration of 2.5 to 50 mg/ml. Or vials can be reconstituted as for direct I.V. injection and added to compatible I.V. solution for further dilution. To reconstitute and administer ADD-Vantage systems, follow manufacturer's instructions. Infuse drug over 15 to 30 minutes.

- Use diluted solution immediately, if possible.

Route	Onset	Peak	Duration
I.V.	Unknown	1 hr	Unknown

### Adverse reactions

**CNS:** headache, insomnia, dizziness, drowsiness, weakness, **seizures**

**CV:** hypotension, phlebitis, palpitations, **heart failure, cardiac arrest, myocardial infarction**

**GI:** nausea, vomiting, diarrhea, constipation, tongue discoloration, oral candidiasis, glossitis, **pseudomembranous colitis**

m

GU: vaginal candidiasis

**Hematologic:** anemia, eosinophilia, leukopenia, bone marrow depression, thrombocytopenia, neutropenia

**Musculoskeletal:** myoclonus

**Respiratory:** chest discomfort, dyspnea, hyperventilation

**Skin:** rash, urticaria, pruritus, erythema at injection site

**Other:** altered taste, fever, pain, fungal infection, anaphylaxis

## Interactions

**Drug-drug.** *Probenecid:* increased meropenem blood level

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, amylase, aspartate aminotransferase, bilirubin, blood urea nitrogen, eosinophils, gamma-glutamyl transpeptidase, lactate dehydrogenase, lipase:* increased values  
*Hematocrit, hemoglobin, platelets, neutrophils, white blood cells:* decreased values

*International Normalized Ratio, partial thromboplastin time, prothrombin time:* increased or decreased values

## Patient monitoring

- Collect specimens for culture and sensitivity testing as needed. However, be aware that drug therapy may start pending results.

 Monitor patient for hypersensitivity reaction or anaphylaxis. If either occurs, stop infusion immediately and initiate emergency treatment.

- Monitor for CNS irritability and seizures.
- In prolonged therapy, evaluate hematopoietic, renal, and hepatic function and watch for overgrowth of nonsusceptible organisms.
- If diarrhea occurs, check for pseudomembranous colitis and obtain stool cultures.
- Obtain hearing tests in child being treated for bacterial meningitis.

## Patient teaching

- Advise patient to report such adverse reactions as CNS irritability, diarrhea, rash, shortness of breath, or pain at infusion site.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## mesalamine (5-aminosalicylic acid, 5-ASA, mesalazine, mesalazine )

Apriso, Asacol, Asacol HD, Canasa, Ipcol , Lialda, Mesasal , Mesren , Mezavant , Novo-5-ASA-Ect , Pentasa, Rowasa, Salofalk 

**Pharmacologic class:** 5-amino-2-hydroxybenzoic acid

**Therapeutic class:** GI anti-inflammatory drug

**Pregnancy risk category B**

## Action

Unknown. Thought to act in colon, where it blocks cyclooxygenase and inhibits prostaglandin synthesis.

## Availability

*Capsules (extended-release):* 250 mg, 500 mg, 0.375 g (Apriso)

*Rectal suspension:* 4 g/60 ml

*Suppositories:* 1,000 mg

*Tablets (delayed-release):* 400 mg (Pentasa), 800 mg (Asacol HD), 1.2 g (Lialda)

## Indications and dosages

 Active ulcerative colitis

**Adults:** 800 mg P.O. (Asacol delayed-release tablets) t.i.d. for 6 weeks

➤ To induce remission in mildly to moderately active ulcerative colitis  
**Adults:** 1 g P.O. (Pentasa extended-release capsules) q.i.d. for a total dosage of 4 g daily for up to 8 weeks. Or, two to four 1.2 g (Lialda) extended-release tablets P.O. once daily for total daily dose of 2.4 or 4.8 g for up to 8 weeks.

➤ Active distal ulcerative colitis, proctosigmoiditis, or proctitis

**Adults:** 4-g enema (Rowasa 60 ml) P.R. daily at bedtime, retained for 8 hours. Continue for 3 to 6 weeks.

➤ Active ulcerative proctitis

**Adults:** 500 mg (Canasa suppository) P.R. b.i.d., increased to t.i.d. if response inadequate after 2 weeks. Or 1,000 mg (suppository) P.R. at bedtime, continued for 3 to 6 weeks.

➤ To maintain remission of ulcerative colitis

**Adults:** 1.6 g (Asacol) P.O. daily in divided doses. Or, 1.5 g (Apriso) P.O. daily in the morning.

### Contraindications

- Hypersensitivity to drug, its components, or salicylates

### Precautions

Use cautiously in:

- severe hepatic or renal impairment
- allergy to sulfasalazine
- pyloric stenosis (delayed-release tablets)
- conditions predisposing to development of myocarditis or pericarditis
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

### Administration

- Give Apriso capsules with or without food. Don't give concurrently with antacids.
- Give Lialda tablets with meal.
- Make sure patient swallows tablets whole without crushing or chewing.

- For best effect, have patient retain suppository for 1 to 3 hours.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	6-8 hr
P.R.	Unknown	Unknown	24 hr

### Adverse reactions

**CNS:** headache, dizziness, malaise, weakness

**CV:** chest pain, **mesalamine-induced cardiac hypersensitivity reactions (myocarditis and pericarditis)**

**EENT:** rhinitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, eructation, flatulence, anal irritation (with rectal use), **pancreatitis**

**GU:** **interstitial nephritis, renal failure**

**Musculoskeletal:** back pain

**Skin:** alopecia, rash

**Other:** fever, acute intolerance syndrome, **anaphylaxis, acute intolerance syndrome**

### Interactions

**Drug-drug.** *Antacids:* increased risk of dissolution of coating of Apriso granules  
*Azathioprine, 6-mercaptopurine:* increased potential for blood disorders  
*Nephrotoxic drugs (including nonsteroidal anti-inflammatory agents):* increased risk of renal adverse reactions

### Patient monitoring

🔊 Monitor carefully for mesalamine-induced cardiac hypersensitivity reactions (myocarditis and pericarditis).

🔊 Closely monitor patients with history of allergic reactions to sulfasalazine or sulfite sensitivity (if using enema).

- Assess kidney and liver function before and periodically during therapy.

- Monitor for suppository efficacy, which should appear in 3 to 21 days. However, know that treatment usually continues for 3 to 6 weeks.

🔊 Watch for signs and symptoms of intolerance syndrome, such as

cramping, acute abdominal pain, bloody diarrhea, fever, headache, and rash. If these occur, discontinue drug and notify prescriber.

 Watch for signs and symptoms of intolerance syndrome, such as cramping, acute abdominal pain, bloody diarrhea, fever, headache, and rash. If these occur, discontinue drug. Drug may be restarted later only if clearly needed, under close medical supervision and at reduced dosage.

### Patient teaching

- Instruct patient to swallow tablets or capsules whole.
- Tell patient to contact prescriber if partially intact tablets repeatedly appear in stools.
- Advise patient using suppository to avoid excessive handling and to retain suppository for 1 to 3 hours or longer for maximum benefit.
- Teach patient about proper enema administration. Tell him to stay in position for at least 30 minutes and, if possible, retain medication overnight.

 Advise patient to immediately report breathing difficulties, allergic symptoms, cramping, acute abdominal pain, bloody diarrhea, fever, headache, or rash.

- As appropriate, review all other significant and life-threatening adverse reactions, especially those related to the drugs mentioned above.

## mesna

Mesnex, Uromitexan  

**Pharmacologic class:** Detoxifying agent

**Therapeutic class:** Hemorrhagic cystitis inhibitor

**Pregnancy risk category B**

### Action

Reacts in kidney with urotoxic ifosfamide metabolites (acrolein and 4-hydroxy-ifosfamide), resulting in their detoxification. Also binds to double bonds of acrolein and to other urotoxic metabolites.

### Availability

*Injection:* 100 mg/ml in 10-ml vials

*Tablets (coated):* 400 mg

### Indications and dosages

 To prevent hemorrhagic cystitis in patients receiving ifosfamide

**Adults:** *Combination I.V. and P.O.*

*regimen*—Single I.V. bolus dose of mesna at 20% of ifosfamide dosage, given at same time as ifosfamide, followed by two doses of mesna tablets P.O. at 40% of ifosfamide dosage given 2 and 6 hours after ifosfamide dose. *I.V. regimen*—I.V. bolus of mesna at 20% of ifosfamide dosage given at same time as ifosfamide, repeated 4 and 8 hours after each ifosfamide dose.

### Dosage adjustment

- Children

### Contraindications

- Hypersensitivity to drug or other thiol compounds

### Precautions

Use cautiously in:

- autoimmune disorders
- pregnant or breastfeeding patients.

### Administration

- Dilute with dextrose 5% in water, dextrose 5% in normal saline solution, dextrose 5% in 0.2% sodium chloride solution, dextrose 5% in 0.33% sodium chloride solution, dextrose 5% in 0.45% sodium chloride solution, normal saline solution, or lactated Ringer's solution for injection.

- Give I.V. bolus over at least 1 minute with ifosfamide dose and at prescribed intervals after ifosfamide doses.

 Don't use multidose vial (contains benzyl alcohol) in neonates or infants. In older children, use with caution.

- If patient vomits within 2 hours of oral mesna dose, repeat oral dose or switch to I.V. route.

Route	Onset	Peak	Duration
P.O.	Unknown	4-8 hr	24 hr
I.V.	Unknown	1 hr	24 hr

### Adverse reactions

**CNS:** fatigue, malaise, irritability, headache, dizziness, drowsiness, hyperesthesia, rigors

**CV:** hypertension, hypotension, ST-segment elevation, tachycardia

**EENT:** conjunctivitis, pharyngitis, rhinitis

**GI:** nausea, vomiting, diarrhea, constipation, anorexia, flatulence

**Hematologic:** hematuria

**Musculoskeletal:** back pain, joint pain, myalgia

**Respiratory:** coughing, tachypnea, bronchospasm

**Skin:** flushing, rash

**Other:** arm or leg pain, injection site reactions, fever, flulike symptoms, allergic reactions

### Interactions

**Drug-diagnostic tests.** *Hepatic enzymes:* increased levels

*Urinary erythrocytes:* false-positive or false-negative results

*Urine tests using Ames Multistix:* false-positive for ketonuria

### Patient monitoring

- Monitor nutritional and hydration status.
- Monitor vital signs and ECG. Watch closely for blood pressure changes and tachycardia.

- Assess body temperature. Stay alert for fever, flulike symptoms, and EENT infections.

- Monitor respiratory status carefully. Watch closely for cough, bronchospasm, and tachypnea.

### Patient teaching

- Inform patient that drug may cause significant adverse effects. Reassure him that he will be monitored closely.

- Encourage patient to request analgesics or other pain-relief measures for headache, back or joint pain, hyperesthesia, or muscle ache.

 Advise patient to immediately report breathing difficulties and allergic symptoms.

- Inform patient about drug's adverse CNS effects. Explain safety measures used to prevent injury.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

m

## metformin hydrochloride

Apo-Metformin<sup>✳</sup>, Co Metformin<sup>✳</sup>, Dom-Metformin<sup>✳</sup>, Fortamet, Gen-Metformin<sup>✳</sup>, Glucophage, Glucophage XR, Glumetza, Glycon<sup>✳</sup>, Med Metformin<sup>✳</sup>, Metsol<sup>⚠</sup>, Novo-Metformin<sup>✳</sup>, Nu-Metformin<sup>✳</sup>, PHL-Metformin<sup>✳</sup>, PMS-Metformin<sup>✳</sup>, Ran-Metformin<sup>✳</sup>, Ratio-Metformin<sup>✳</sup>, Rhoxal-Metformin<sup>✳</sup>, Riomet, Riva-Metformin<sup>✳</sup>, Sandoz Metformin<sup>✳</sup>

**Pharmacologic class:** Biguanide

**Therapeutic class:** Hypoglycemic

**Pregnancy risk category B**

**FDA BOXED WARNING**

- Lactic acidosis is rare but serious (50% mortality) metabolic complication that can result from drug accumulation. Lactic acidosis is also linked to such conditions as diabetes mellitus and significant tissue hypoperfusion and hypoxemia. Lactic acidosis incidence in patients receiving drug is low; cases have occurred mainly in diabetics with significant renal insufficiency. Patients with unstable or acute heart failure at risk of hypoperfusion and hypoxemia are at increased lactic acidosis risk.
- Lactic acidosis risk rises with age and degree of renal dysfunction, and may decrease significantly through regular renal monitoring and by using lowest effective dosage. Perform careful renal monitoring, especially in elderly patients. Withhold drug promptly if patient develops condition linked to hypoxemia, dehydration, or sepsis. Avoid giving drug to patients with hepatic disease, as hepatic impairment may significantly limit lactate clearance. Caution patient against excessive alcohol use during therapy, as alcohol potentiates drug effects on lactate metabolism. Temporarily withdraw drug before intravascular radiocontrast study or surgical procedure.
- Lactic acidosis onset commonly is subtle and accompanied only by non-specific symptoms. Instruct patient to notify physician immediately if symptoms occur; withdraw drug until situation is clarified.
- Suspect lactic acidosis in diabetic patient with metabolic acidosis who lacks evidence of ketoacidosis.
- Lactic acidosis requires emergency treatment. Discontinue metformin immediately and begin general supportive measures promptly. Prompt hemodialysis is recommended to correct acidosis and remove accumulated drug, and can lead to prompt symptom reversal and recovery.

**Action**

Increases insulin sensitivity by decreasing glucose production and absorption in liver and intestines and enhancing glucose uptake and utilization

**Availability**

*Oral solution:* 100 mg/ml, 500 mg/5 ml  
*Tablets:* 500 mg, 850 mg, 1,000 mg  
*Tablets (extended-release):* 500 mg, 750 mg

**Indications and dosages**

➤ Adjunct to diet and exercise to improve glycemic control in type 2 (non-insulin-dependent) diabetes mellitus

**Adults and children ages 17 and older:**

Initially, 500 mg P.O. b.i.d.; may increase by 500 mg/week, up to 2,000 mg/day. If patient needs more than 2,000 mg/day, give in three divided doses (not to exceed 2,500 mg/day). Alternatively, 850 mg P.O. daily, increased by 850 mg q 2 weeks, up to 2,550 mg/day in divided doses (850 mg t.i.d.). *Extended-release tablets*—500 mg/day P.O. with evening meal; may increase by 500 mg weekly, up to 2,000 mg/day. If 2,000 mg once daily is inadequate, 1,000 mg may be given b.i.d.

**Children ages 10 to 16:** 500 mg P.O. b.i.d. Increase in increments of 500 mg weekly to a maximum of 2,000 mg daily in divided doses.

➤ Concurrent use with sulfonylurea or insulin in type 2 diabetes mellitus

**Adults and children ages 17 and older:**

If patient hasn't responded to maximum metformin dosage of 2,000 mg/day in 4 weeks, sulfonylurea may be added while metformin therapy continues at highest dosage (even if patient experienced primary or secondary failure on sulfonylurea). Adjust dosages of both drugs until glycemic control adequate. If response inadequate within 1 to 3 months of concurrent therapy, consider alternatives.

➤ Concurrent use with insulin in type 2 diabetes mellitus

**Adults ages 17 and older:** Continue current insulin dosage while starting metformin at 500 mg P.O. once daily. If response inadequate, increase metformin dosage by 500 mg after approximately 1 week and then by 500 mg weekly until glycemic control is achieved. Maximum metformin dosage is 2,500 mg. Optimally, decrease insulin dosage 10% to 25% when fasting plasma glucose level is below 120 mg/dl. Individualize dosage adjustments based on glycemic response.

### Dosage adjustment

- Elderly or debilitated patients

### Contraindications

- Hypersensitivity to drug
- Acute or chronic metabolic acidosis (including diabetic ketoacidosis) with or without coma
- Underlying renal dysfunction
- Heart failure requiring drug therapy

### Precautions

Use cautiously in:

- renal impairment, myocardial infarction, cerebrovascular accident, hypoxia, sepsis, pituitary deficiency or hyperthyroidism, dehydration, hypoxemia, chronic alcohol use
- elderly or debilitated patients
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Administer with a meal.
- Make sure patient swallows extended-release tablets whole without crushing or chewing.
- Don't administer extended-release tablets to children.
- Know that drug is given with diet therapy, sulfonylureas, or both.

Route	Onset	Peak	Duration
P.O.	Unknown	2-4 hr	12 hr
P.O. (extended)	Unknown	4-8 hr	24 hr

### Adverse reactions

**GI:** diarrhea, nausea, vomiting, abdominal bloating

**Metabolic:** lactic acidosis

**Other:** unpleasant metallic taste, decreased vitamin B<sub>12</sub> level

### Interactions

**Drug-drug.** *Amiloride, calcium channel blockers, digoxin, morphine, procainamide, quinidine, ranitidine, triamterene, trimethoprim, vancomycin:* altered response to metformin  
*Cimetidine, furosemide, nifedipine:* increased metformin effects

*Iodinated contrast media:* increased risk of lactic acidosis

**Drug-diagnostic tests.** *Urine ketones:* false-positive results

**Drug-herbs.** *Glucosamine:* decreased glycemic control

*Chromium, coenzyme Q10, fenugreek:* additive hypoglycemic effects

**Drug-behaviors.** *Alcohol use:* increased metformin effects

### Patient monitoring

- When switching from chlorpropamide, stay alert for hypoglycemia during first 2 weeks of metformin therapy; chlorpropamide may stay in body for prolonged time. Conversion from other standard oral hypoglycemics requires no transition period.

- Monitor blood glucose level closely. If it isn't controlled after 4 weeks at maximum dosage, oral sulfonylurea may be added.

- Monitor kidney and liver function tests, particularly in elderly patients.

- Assess hematologic parameters and vitamin B<sub>12</sub> levels at start of therapy and periodically thereafter.

🚨 Watch for signs and symptoms of lactic acidosis. Stop drug if acidosis occurs. To aid differential diagnosis, check electrolyte, ketone, glucose, blood pH, lactate, and metformin blood levels.

- Periodically monitor glucose and glycosylated hemoglobin levels to evaluate drug efficacy.

### Patient teaching

- Teach patient about diabetes and importance of proper diet, exercise, weight control, and blood glucose monitoring.
- Inform patient that drug may cause diarrhea, nausea, and upset stomach. Advise him to take it with meals to reduce these effects, and tell him that adverse effects often subside over time.
- 📢 Teach patient to recognize and immediately report signs and symptoms of acidosis, such as weakness, fatigue, muscle pain, dyspnea, abdominal pain, dizziness, light-headedness, and slow or irregular heartbeat.
- Advise patient to report changes in health status (such as infection, persistent vomiting and diarrhea, or need for surgery). These may warrant dosage decrease or drug withdrawal.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## methadone hydrochloride eptadone

Dolophine, Metadol, Methadone HCl Intensol, Methadose, Physeptone, Synastone

**Pharmacologic class:** Opioid agonist

**Therapeutic class:** Analgesic, opioid detoxification adjunct

**Controlled substance schedule II**

**Pregnancy risk category C**

### FDA BOXED WARNING

- Deaths have occurred during drug initiation for opioid dependence. In some cases, deaths apparently resulted from respiratory or cardiac effects of methadone and too-rapid titration without considering drug accumulation. Make sure you understand drug's pharmacokinetics, and be vigilant during treatment initiation and dosage titration. Caution patients against self-medicating with CNS depressants at start of therapy.
- Prolonged QT intervals and serious arrhythmia (torsades de pointes) have occurred. Most cases involved patients being treated for pain with large, multiple daily doses.
- Federal law requires that when drug is used to treat opioid addiction in detoxification or maintenance programs, it can be dispensed only by treatment programs certified by the Substance Abuse and Mental Health Services Administration and approved by designated state authority. Certified treatment programs must dispense and use drug in oral form only and according to treatment requirements stipulated in Federal Opioid Treatment Standards. Failure to abide by regulations may lead to criminal prosecution, drug seizure, revocation of program approval, and injunction precluding program operation.

### Action

Binds to and depresses opiate receptors in spinal cord and CNS, altering perception of and response to pain

### Availability

**Injection:** 10 mg/ml

**Oral solution:** 5 mg/5 ml, 10 mg/5 ml, 10 mg/ml (concentrate)

**Tablets:** 5 mg, 10 mg

**Tablets (dispersible diskettes):** 40 mg

## Indications and dosages

### ➤ Opioid detoxification

**Adults:** Initially, 15 to 20 mg/day P.O. to suppress withdrawal. Additional

doses may be necessary if symptoms aren't suppressed or if they reappear.

Most patients are adequately stabilized on total daily dosage of 40 mg given in single or divided doses; however, some may need higher dosages. When patient is stable for 2 to 3 days, decrease dosage gradually at 2-day intervals. If patient can't tolerate oral doses, give I.M. or subcutaneously (usually at about 25% of total daily P.O. dosage) in two injections.

### ➤ To maintain opioid abstinence

**Adults:** Oral dosage highly individualized based on control of abstinence symptoms without respiratory depression or marked sedation. If patient can't tolerate oral doses, give I.M. or subcutaneously (usually at about 25% of total daily P.O. dosage) in two injections.

### ➤ Chronic and severe pain

**Adults:** For chronic pain, 2.5 to 10 mg P.O., I.M., or subcutaneously q 3 to 4 hours as needed; adjust dosage and dosing interval as needed. For severe chronic pain (as in terminal illness), 5 to 20 mg P.O. q 6 to 8 hours.

**Children:** Dosage individualized.

## Contraindications

- Hypersensitivity to drug or other opioid agonists

## Precautions

Use cautiously in:

- head trauma; severe renal, hepatic, or pulmonary disease; hypothyroidism; adrenal insufficiency; undiagnosed abdominal pain; prostatic hypertrophy; urethral stricture; toxic psychosis; Addison's disease; cor pulmonale; increased intracranial pressure; severe inflammatory bowel disease; severe CNS depression; hypercapnia; seizures; fever; alcoholism

- recent renal or hepatic surgery
- elderly or debilitated patients
- pregnant patients, patients in labor, or breastfeeding patients.

## Administration

- Mix dispersible tablets with 120 ml of water or orange juice, citrus Tang, or other acidic fruit beverage.

- Dilute 10 mg/ml of oral solution with water or other liquid to at least 30 ml. In detoxification and maintenance of opioid withdrawal, dilute solution in at least 90 ml of fluid.

- When used parenterally, I.M. route is preferred. Rotate injection sites.

- For detoxification and maintenance, give oral solution only, to reduce potential for parenteral abuse, hoarding, and accidental ingestion.

- Know that patients who can't take oral drugs because of nausea or vomiting during detoxification or maintenance should be hospitalized and given methadone parenterally.

Route	Onset	Peak	Duration
P.O.	30-60 min	1.5-2 hr	4-6 hr
I.M., subcut.	10-20 min	1-2 hr	4-5 hr

## Adverse reactions

**CNS:** amnesia, anxiety, confusion, poor concentration, delirium, delusions, depression, dizziness, drowsiness, euphoria, fever, hallucinations, headache, insomnia, lethargy, light-headedness, malaise, psychosis, restlessness, sedation, clouded sensorium, syncope, tremor, **seizures, coma**

**CV:** hypotension, palpitations, edema, bradycardia, **shock, cardiac arrest**

**EENT:** visual disturbances

**GI:** nausea, vomiting, constipation, ileus, biliary tract spasm, gastroesophageal reflux, indigestion, dysphagia, dry mouth, anorexia

**GU:** urinary hesitancy, urinary retention, prolonged labor, difficult ejaculation, erectile dysfunction

**Hematologic:** anemia, leukopenia, thrombocytopenia

**Musculoskeletal:** joint pain

**Respiratory:** depressed cough reflex, hypoventilation, wheezing, asthma exacerbation, atelectasis, pulmonary edema, bronchospasm, respiratory depression or arrest, apnea

**Skin:** urticaria, pruritus, flushing, pallor, diaphoresis

**Other:** allergic reaction, hiccups, facial or injection site edema, pain, physical or psychological drug dependence, withdrawal symptoms

### Interactions

**Drug-drug.** *Amitriptyline, antihistamines, chloral hydrate, clomipramine, glutethimide, methocarbamol, MAO inhibitors, nortriptyline:* increased CNS and respiratory depression

*Anticholinergics:* increased risk of severe constipation leading to ileus

*Antiemetics, general anesthetics, phenothiazines, sedative-hypnotics, tranquilizers:* coma, hypotension, respiratory depression, severe sedation

*Ascorbic acid, phenytoin, phosphate, potassium, rifampin:* decreased methadone blood level

*Cimetidine, fluvoxamine, protease inhibitors:* increased analgesia, CNS and respiratory depression

*Diuretics:* increased diuresis

*Hydroxyzine:* increased analgesia, CNS depression, and hypotension

*Paregoric, loperamide:* increased CNS depression, severe constipation

*Naloxone:* antagonism of methadone's analgesic, CNS, and respiratory effects  
*Naltrexone:* induction or worsening of withdrawal symptoms (when given within 7 days of methadone)

*Neuromuscular blockers:* increased or prolonged respiratory depression

**Drug-diagnostic tests.** *Amylase, liver function tests:* increased levels

**Drug-behaviors.** *Alcohol use:* increased CNS and respiratory depression

### Patient monitoring

- Assess patient for relief of severe, chronic pain requiring around-the-clock dosing. Tailor dosage to patient's pain level and drug tolerance.

- Monitor CNS, respiratory, and cardiovascular status.

- Watch for deepening sedation, which may increase with successive doses.

- Evaluate bowel and bladder function. Give laxatives if appropriate.

- Monitor detoxification treatment closely. Short-term detoxification shouldn't exceed 30 days; long-term detoxification, 180 days.

- Assess patient on maintenance therapy for successful rehabilitation. Know that maintenance therapy should be part of comprehensive treatment plan that includes medical, vocational rehabilitative, employment, educational, and counseling services.

### Patient teaching

 Instruct patient to promptly report severe adverse reactions.

- Tell patient he may take drug with food if GI upset occurs.

- Tell ambulatory patient to change positions slowly to avoid orthostatic hypotension.

 Caution patient not to discontinue drug abruptly.

- Advise patient to avoid driving and other hazardous activities, because drug may cause drowsiness or dizziness.

- Tell female patient to inform prescriber if she's pregnant or breastfeeding.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## methimazole

Apo-Methimazole<sup>®</sup>, Tapazole

**Pharmacologic class:** Thiomidazole derivative

**Therapeutic class:** Antithyroid drug

**Pregnancy risk category D**

### Action

Directly interferes with thyroid synthesis by preventing iodine from combining with thyroglobulin, leading to decreased thyroid hormone levels

### Availability

Tablets: 5 mg, 10 mg

### Indications and dosages

➤ Mild hyperthyroidism

**Adults and adolescents:** Initially, 15 mg P.O. daily in three equally divided doses at approximately 8-hour intervals. For maintenance, 5 to 15 mg/day in equally divided doses at approximately 8-hour intervals.

**Children:** Initially, 0.4 mg/kg/day in three divided doses at 8-hour intervals. For maintenance, approximately 0.2 mg/kg/day in three divided doses at 8-hour intervals.

➤ Moderate hyperthyroidism

**Adults and adolescents:** Initially, 30 to 40 mg P.O. daily in three equally divided doses at approximately 8-hour intervals. For maintenance, 5 to 15 mg/day in three equally divided doses at approximately 8-hour intervals.

**Children:** 0.4 mg/kg/day P.O. as a single dose or in divided doses at 8-hour intervals. For maintenance, approximately 0.2 mg/kg/day as a single dose or in three divided doses at 8-hour intervals.

➤ Severe hyperthyroidism

**Adults and adolescents:** Initially, 60 mg/day P.O. in three equally divided

doses at approximately 8-hour intervals. For maintenance, 5 to 15 mg/day in three equally divided doses at approximately 8-hour intervals.

**Children:** Initially, 0.4 mg/kg/day P.O. as a single dose or in three divided doses at 8-hour intervals. For maintenance, approximately 0.2 mg/kg/day as a single dose or in three divided doses at 8-hour intervals.

### Contraindications

- Hypersensitivity to drug
- Breastfeeding

### Precautions

Use cautiously in:

- bone marrow depression
- patients older than age 40
- pregnant patients.

### Administration

- Give with meals as needed to reduce GI upset.

Route	Onset	Peak	Duration
P.O.	30-40 min	60 min	2-4 hr

### Adverse reactions

**CNS:** headache, vertigo, paresthesia, neuritis, depression, neuropathy, CNS stimulation

**GI:** nausea, vomiting, constipation, epigastric distress, ileus, salivary gland enlargement, dry mouth, anorexia

**GU:** nephritis

**Hematologic:** thrombocytopenia, agranulocytosis, leukopenia, aplastic anemia

**Hepatic:** jaundice, hepatic dysfunction, hepatitis

**Metabolic:** hypothyroidism

**Musculoskeletal:** joint pain, myalgia

**Skin:** rash, urticaria, skin discoloration, pruritus, erythema nodosum, exfoliative dermatitis, abnormal hair loss

**Other:** fever, lymphadenopathy, lupus-like syndrome

## Interactions

**Drug-drug.** *Aminophylline, oxtriphylline, theophylline:* decreased clearance of both drugs

*Amiodarone, iodine, potassium iodide:* decreased response to methimazole

**Anticoagulants:** altered requirements for both drugs

**Beta-adrenergic blockers:** altered beta blocker clearance

*Digoxin:* increased digoxin blood level

**Drug-diagnostic tests.** *Granulocytes, hemoglobin, platelets, white blood cells:* decreased values

## Patient monitoring

- Check for agranulocytosis in patients older than age 40 and in those receiving more than 40 mg/day.
- Assess hematologic studies. Agranulocytosis usually occurs within first 2 months of therapy and is rare after 4 months.
- Monitor thyroid function tests periodically. Once hyperthyroidism is controlled, elevated thyroid-stimulating factor indicates need for dosage decrease.
- Assess liver function tests and check for signs and symptoms of hepatic dysfunction.
- Monitor patient for fever, sore throat, and other evidence of infection as well as for unusual bleeding or bruising.
- Assess patient for signs and symptoms of hypothyroidism, such as hard edema of subcutaneous tissue, drowsiness, slow mentation, dryness or loss of hair, decreased temperature, hoarseness, and muscle weakness.

## Patient teaching

- Tell patient to take with meals if GI upset occurs.
- Advise patient to take exactly as prescribed to maintain constant blood level.
- Tell patient to report rash, fever, sore throat, unusual bleeding or bruising, headache, rash, yellowing of skin or eyes, abdominal pain, vomiting, or flu-like symptoms.

- Caution female patient not to breast-feed while taking drug.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## methocarbamol

PMS-Methocarbamol<sup>†</sup>, Robaxin

**Pharmacologic class:** Autonomic nervous system agent

**Therapeutic class:** Skeletal muscle relaxant (centrally acting)

**Pregnancy risk category C**

## Action

Unknown. Thought to depress central perception of pain without directly relaxing skeletal muscles or directly affecting motor endplate or motor nerves.

## Availability

**Injection:** 100 mg/ml in 10-ml ampules, 100 mg/ml in 10-ml vials

**Tablets:** 500 mg, 750 mg

## Indications and dosages

➤ Adjunct in muscle spasms caused by acute, painful musculoskeletal conditions

**Adults:** Initially, 1.5 g P.O. q.i.d. (up to 8 g/day) for 2 to 3 days, then 4 to 4.5 g/day P.O. in three to six divided doses; or 750 mg P.O. q 4 hours or 1 g P.O. q.i.d. or 1.5 g P.O. t.i.d. If oral dosing isn't feasible or if condition is severe, give 1 to 3 g/day I.M. or I.V. for maximum of 3 days.

## Off-label uses

- Tetanus

## Contraindications

- Hypersensitivity to drug, its components, or polyethylene glycol (with parenteral form)
- Renal impairment (with parenteral form)

## Precautions

Use cautiously in:

- seizure disorders (with parenteral use)
- pregnant or breastfeeding patients
- children (safety not established).

## Administration

- For direct I.V. injection, administer slowly. Keep patient supine for 10 to 15 minutes afterward.
- For I.V. infusion, dilute 1 g with up to 250 ml 5% dextrose or 0.9% sodium chloride injection.
- Avoid extravasation; drug is hypertonic.
- Don't give subcutaneously.
- For I.M. use, inject no more than 500 mg (5 ml of 10% injection) into each gluteal area.
- Don't use parenteral form in patients with renal impairment. Polyethylene glycol vehicle may irritate kidneys.
- When giving for tetanus, crush and suspend tablets in water or saline solution, and give via nasogastric tube, if necessary.
- Be aware that drug is usually given as part of regimen that includes rest and physical therapy.

Route	Onset	Peak	Duration
P.O.	30 min	2 hr	Unknown
I.V.	Immediate	End of infusion	Unknown
I.M.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** dizziness, light-headedness, drowsiness, syncope, **seizures** (with I.V. use)

**CV:** bradycardia or hypotension (with I.V. use)

**EENT:** blurred vision, conjunctivitis, nasal congestion

**GI:** nausea, GI upset, anorexia

**GU:** brown, black, or green urine

**Musculoskeletal:** mild muscle incoordination (with I.V. or I.M. use)

**Skin:** flushing (with I.V. use), pruritus, rash, urticaria

**Other:** fever, pain at I.M. injection site, phlebitis at I.V. site, allergic reactions including **anaphylaxis** (with I.M. or I.V. use)

## Interactions

**Drug-drug.** *Antihistamines, CNS depressants (such as opioids, sedative-hypnotics):* additive CNS depression

**Drug-diagnostic tests.** *Urinary 5-hydroxyindoleacetic acid, urine vanillyl-mandelic acid:* false elevations

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

## Patient monitoring

- Assess for orthostatic hypotension, especially with parenteral use. Keep patient supine for 10 to 15 minutes after I.V. administration.

🚨 Watch for anaphylaxis after I.M. or I.V. administration.

🚨 Stay alert for bradycardia and syncope after I.V. or I.M. dose. As needed and prescribed, give epinephrine, corticosteroids, or antihistamines.

- Monitor I.V. site frequently to prevent sloughing and thrombophlebitis.

## Patient teaching

- Tell patient that drug may turn urine brown, black, or green.

• Caution patient to avoid driving and other hazardous activities, because drug may cause drowsiness or dizziness.

- Instruct patient to move slowly when changing position, to avoid dizziness from sudden blood pressure decrease.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## methotrexate (amethopterin, MTX)

Apo-Methotrexate<sup>☼</sup>, Maxtrex<sup>☼</sup>,  
Trexall

### methotrexate sodium

Metoject<sup>☼</sup><sup>☼</sup>, Ratio-Methotrexate  
Sodium

**Pharmacologic class:** Antimetabolite,  
folic acid antagonist

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** X

#### FDA BOXED WARNING

- Give drug under supervision of physician experienced in antimetabolite use.
- Use drug only in life-threatening neoplastic diseases or in patients with severe, recalcitrant, disabling psoriasis that responds inadequately to other therapies.
- Deaths have occurred when drug was used to treat cancer and psoriasis.
- Monitor patient closely for bone marrow, liver, lung, and kidney toxicities. Explain risks involved, and stress importance of adequate follow-up.
- Use caution when giving high-dose regimen for osteosarcoma. (High-dose regimens for other cancers are investigational.)
- Don't use preserved forms and diluents containing preservatives for intrathecal or high-dose therapy.
- Don't give to pregnant women or women with childbearing potential unless medical evidence suggests benefits may outweigh risks. Drug has caused fetal death and congenital anomalies.
- Drug elimination is reduced in patients with renal impairment, ascites, or pleural effusions. Monitor them carefully for toxicity; dosage may need to be reduced or drug may need to be stopped.
- Unexpectedly severe (sometimes fatal) bone marrow suppression and GI toxicity have occurred in patients receiving drug (usually in high doses) concurrently with nonsteroidal anti-inflammatory drugs (NSAIDs).
- Drug causes hepatotoxicity, fibrosis, and cirrhosis, but generally only after prolonged use. Acute liver enzyme elevations are common but usually transient and asymptomatic. Perform periodic liver biopsies in psoriasis patients receiving long-term therapy.
- Potentially dangerous lung disease may arise acutely at any time during therapy. Not always fully reversible, it has occurred at dosages as low as 7.5 mg/week.
- Interrupt therapy for diarrhea and ulcerative stomatitis; otherwise, hemorrhagic enteritis and death from intestinal perforation may occur.
- Malignant lymphomas may occur at low dosages and may not require cytotoxic treatment. Discontinue drug first; if lymphoma doesn't regress, begin appropriate treatment.
- Drug may induce tumor lysis syndrome in patients with rapidly growing tumors.
- Severe and occasionally fatal skin reactions have occurred within days of single or multiple P.O., I.M., I.V., or intrathecal doses. Drug withdrawal has led to recovery.
- Potentially fatal opportunistic infections may occur.
- When given concomitantly with radiation therapy, drug may increase risk of soft-tissue necrosis and osteonecrosis.

## Action

Binds to dihydrofolate reductase, interfering with folic acid metabolism and inhibiting DNA synthesis and cellular replication

## Availability

**Injection:** 20-mg, 25-mg, 50-mg, 100-mg, 250-mg, and 1,000-mg vials (*lyophilized powder, preservative-free*)  
**Tablets:** 2.5 mg, 5 mg, 7.5 mg, 10 mg, 15 mg

## Indications and dosages

➤ Acute lymphoblastic leukemia  
**Adults and children:** 3.3 mg/m<sup>2</sup> P.O. or I.M. daily for 4 to 6 weeks, then 20 to 30 mg/m<sup>2</sup> P.O. or I.M. weekly in two divided doses; given with corticosteroid. Alternatively, 2.5 mg/kg I.V. q 14 days.

➤ Meningeal leukemia  
**Adult and children:** 12 mg/m<sup>2</sup> (maximum of 15 mg) intrathecally at intervals of 2 to 5 days, repeated until cerebrospinal fluid cell count is normal

➤ Burkitt's lymphoma  
**Adults:** In stages I and II, 10 to 25 mg P.O. daily for 4 to 8 days; in stage III, combined with other neoplastic drugs. Patients in all stages usually require several courses of therapy, with 7- to 10-day rest periods between courses.

➤ Mycosis fungoides  
**Adults:** 2.5 to 10 mg/day P.O. or 50 mg I.M. q week or 25 mg I.M. twice weekly

➤ Osteosarcoma  
**Adults:** As part of adjunctive regimen with other antineoplastics, initially 12 g/m<sup>2</sup> I.V. as 4-hour infusion, then 12 to 15 g/m<sup>2</sup> I.V. in subsequent 4-hour infusions given at weeks 4, 5, 6, 7, 11, 12, 15, 16, 29, 30, 44, and 45 until peak blood level reaches 1,000 micromoles. Leucovorin rescue must start 24 hours after methotrexate infusion begins; if patient can't tolerate oral leucovorin, dose must be given I.M. or I.V. on same schedule.

➤ Trophoblastic tumors (choriocarcinoma, hydatidiform mole)

**Adults:** 15 to 30 mg P.O. or I.M. daily for 5 days. Repeat course three to five times as required, with rest periods of at least 1 week between courses, until toxic symptoms subside.

➤ Lymphosarcoma (stage III)  
**Adults:** 0.625 to 2.5 mg/kg/day P.O., I.M., or I.V.

➤ Psoriasis  
**Adults:** After test dose, 2.5 mg P.O. at 12-hour intervals for three doses weekly, to a maximum of 30 mg weekly. Alternatively, 10 to 25 mg P.O., I.M., or I.V. as a single weekly dose, to a maximum of 30 mg weekly; decrease dosage when adequate response occurs.

➤ Rheumatoid arthritis  
**Adults:** 7.5 mg P.O. weekly as a single dose or divided as 2.5 mg q 12 hours for three doses weekly. May gradually increase, if needed, up to 20 mg/week; decrease when adequate response occurs.

## Dosage adjustment

- Renal or hepatic impairment
- Elderly patients

## Off-label uses

- Relapsing-remitting multiple sclerosis
- Refractory Crohn's disease

## Contraindications

- Hypersensitivity to drug
- Psoriasis or rheumatoid arthritis in pregnant patients
- Breastfeeding

## Precautions

- Use cautiously in:
- severe myocardial, hepatic, or renal disease; decreased bone marrow reserve; active infection; hypotension; coma
  - elderly patients
  - patients with childbearing potential
  - young children.

## Administration

 Be aware that methotrexate is a high-alert drug when used orally for nonchemotherapeutic use.

 Know that patient must be adequately hydrated before therapy and urine must be alkalinized using sodium bicarbonate.

- Follow facility policy for handling, preparing, and administering carcinogenic, mutagenic, and teratogenic drugs.
- Be aware that oral administration is preferred. Give oral dose 1 hour before or 2 hours after meals. (Food decreases absorption of tablets and reduces peak blood level.)
- Reconstitute powder for injection with preservative-free solution, such as 5% dextrose solution or 0.9% sodium chloride injection. Reconstitute 20-mg and 50-mg vials to yield a concentration no greater than 25 mg/ml. Reconstitute 1-g vial with 19.4 ml to yield a concentration of 50 mg/ml.
- For high-dose I.V. infusion, dilute in 5% dextrose solution. Administer each 10 mg over 1 minute or by infusion over 30 minutes to 4 hours as directed.
- For intrathecal use, reconstitute immediately before administration, using preservative-free solution (such as 0.9% sodium chloride for injection), to a concentration of 1 mg/ml.
-  For intrathecal or high-dose therapy, use preservative-free injection form.
- Avoid I.M. injections if platelet count is below 50,000/mm<sup>3</sup>.
-  For osteosarcoma, make sure leucovorin rescue is used appropriately in patients receiving high methotrexate doses. Rescue usually starts 24 hours after methotrexate infusion begins.

Route	Onset	Peak	Duration
P.O.	Unknown	1-2 hr	Unknown
I.V.	Immediate	Immediate	Unknown
I.M.	Unknown	0.5-1 hr	Unknown
Intrathecal	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** malaise, fatigue, drowsiness, dizziness, headache, aphasia, hemiparesis, demyelination, **seizures**,

**leukoencephalopathy**, **chemical arachnoiditis** (with intrathecal use)  
**EENT:** blurred vision, pharyngitis

**GI:** nausea, vomiting, stomatitis, hematemesis, melena, GI ulcers, enteritis, gingivitis, pharyngitis, anorexia, **GI bleeding**

**GU:** hematuria, cystitis, infertility, menstrual dysfunction, defective spermatogenesis, abortion, **tubular necrosis**, **severe nephropathy**, **renal failure**

**Hematologic:** anemia, **leukopenia**, **thrombocytopenia**, **severe bone marrow depression**

**Hepatic:** **hepatotoxicity**

**Metabolic:** hyperuricemia, diabetes mellitus

**Musculoskeletal:** joint pain, myalgia, osteonecrosis, osteoporosis (with long-term use in children)

**Respiratory:** dry nonproductive cough, **pneumonitis**, **pulmonary fibrosis**, **pulmonary interstitial infiltrates**

**Skin:** pruritus, rash, urticaria, alopecia, painful plaque erosions, photosensitivity

**Other:** chills, fever, increased susceptibility to infection, **septicemia**, **anaphylaxis**, **sudden death**

## Interactions

**Drug-drug.** *Activated charcoal:* decreased blood level of oral or I.V. methotrexate

*Folic acid derivatives:* antagonism of methotrexate effects

*Fosphenytoin, phenytoin:* decreased blood levels of these drugs

*Hepatotoxic drugs:* increased risk of hepatotoxicity

*NSAIDs, phenylbutazone, probenecid, salicylates, sulfonamides:* increased methotrexate toxicity

**Oral antibiotics:** decreased methotrexate absorption

**Penicillin, sulfonamide:** increased methotrexate blood level

**Procarbazine:** increased nephrotoxicity

**Theophylline:** increased theophylline level

**Vaccines:** vaccine inefficacy

**Drug-diagnostic tests.** *Hemoglobin, platelets, red blood cells, white blood cells:* decreased values

**Pregnancy tests:** false-positive result

**Protein-bound iodine, transaminases, uric acid:** increased levels

**Drug-food.** *Any food:* delayed methotrexate absorption and decreased peak blood level

**Drug-herbs.** *Astragalus, echinacea, melatonin:* interference with methotrexate-induced immunosuppression

**Drug-behaviors.** *Alcohol use:* increased hepatotoxicity

**Sun exposure:** photosensitivity

## Patient monitoring

- Watch for vomiting, diarrhea, or stomatitis, which may cause dehydration.

- 🔊 Know that high-dose therapy may cause nephrotoxicity. Monitor renal function, hydration status, urine alkalization (for pH above 6.5), and methotrexate blood level.

- 🔊 Assess for fever, sore throat, bleeding, increased bruising, and other signs and symptoms of hematologic compromise or infection.

- With high-dose or intrathecal therapy, watch for CNS toxicity.

- 🔊 Monitor creatinine and methotrexate blood levels 24 hours after therapy starts and then daily. Adjust leucovorin dosage as prescribed.

- Check hematologic studies at least monthly; blood or platelet transfusions may be necessary.

- Monitor liver and kidney function studies every 1 to 3 months. Evaluate uric acid levels.

- 🔊 Watch for signs and symptoms of pulmonary toxicity, such as fever, dry nonproductive cough, dyspnea, hypoxemia, and infiltrates on chest X-ray.

- Know that methotrexate exits slowly from third-space compartments (ascites, pleural effusions). Before therapy starts, fluid should be evacuated; during therapy, monitor drug blood level.

## Patient teaching

- 🔊 Review dosing instructions carefully with patient to avoid toxicity. Tell patient with rheumatoid arthritis or psoriasis to take doses weekly.

- Advise patient to take oral doses 1 hour before or 2 hours after meals.

- Instruct patient to report diarrhea, abdominal pain, clay-colored or black tarry stools, fever, chills, sore throat, unusual bleeding or bruising, sores in or around mouth, cough or shortness of breath, yellowing of skin or eyes, dark or bloody urine, swelling of feet or legs, or joint pain.

- Tell patient to take temperature daily and to report fever or other signs or symptoms of infection.

- Instruct patient to drink 2 to 3 L of fluid each day.

- Advise male patients to use reliable contraception during and for at least 3 months after therapy. Advise female patients to use reliable contraception during and for one ovulatory cycle after therapy; also caution them not to breastfeed.

- Advise patient to avoid sun exposure and to use sunscreen and protective clothing (especially if he has psoriasis).

- Instruct patient to avoid alcohol.

- Tell patient he'll need to undergo blood tests during therapy.

- As appropriate, review all other significant and life-threatening adverse

reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## methylcellulose

Celevac<sup>⚡</sup>, Citrucel, Entrocel<sup>⚡</sup>

**Pharmacologic class:** Semisynthetic cellulose derivative

**Therapeutic class:** Bulk laxative

**Pregnancy risk category** NR

### Action

Stimulates peristalsis by promoting water absorption into fecal matter and increasing bulk, resulting in bowel evacuation

### Availability

*Powder:* 105 mg/g, 196 mg/g

### Indications and dosages

➤ Chronic constipation

**Adults and children ages 12 and older:**

Up to 6 g P.O. daily in divided doses of 0.45 to 3 g

**Children ages 6 to 11:** Up to 3 g P.O. daily in divided doses of 0.45 to 1.5 g

### Contraindications

- Signs or symptoms of appendicitis or undiagnosed abdominal pain
- Partial bowel obstruction
- Dysphagia

### Precautions

Use cautiously in:

- hepatitis
- intestinal ulcers
- laxative-dependent patients.

### Administration

- Give with 8 oz of fluid.
- If patient is receiving maximum daily dosage, give in divided doses to reduce risk of esophageal obstruction.

Route	Onset	Peak	Duration
P.O.	12-24 hr	<3 days	Unknown

### Adverse reactions

**GI:** nausea; vomiting; diarrhea; severe constipation; abdominal distention; cramps; esophageal, gastric, small-intestine, or colonic strictures (with dry form); **GI obstruction**  
**Other:** laxative dependence (with long-term use)

### Interactions

**Drug-drug.** *Antibiotics, digitalis, nitrofurantoin, oral anticoagulants, salicylates, tetracyclines:* decreased absorption and action of these drugs

### Patient monitoring

- Assess patient's dietary habits. Consider factors that promote constipation, such as certain diseases and medications.
- Monitor patient for signs and symptoms of esophageal obstruction.
- Evaluate fluid and electrolyte balance in patients using laxatives excessively.

### Patient teaching

- Instruct patient to take with a full glass (8 oz) of water.
- Advise patient to prevent or minimize constipation through adequate fluid intake (four to six glasses of water daily), proper diet, increased fiber intake, daily exercise, and prompt response to urge to defecate.
-  Instruct patient to report chest pain or pressure, vomiting, and difficulty breathing (possible symptoms of GI obstruction).
- Caution patient not to use drug for more than 1 week without prescriber's approval.
- Inform patient that chronic laxative use may lead to dependence.
- Tell patient to contact prescriber if constipation persists or if rectal bleeding or symptoms of electrolyte

imbalance (muscle cramps, weakness, dizziness) occur.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## methyl dopa

Aldomet<sup>®</sup>, Apo-Methyl dopa<sup>™</sup>, Novomedopa<sup>™</sup>, Nu-Medopa<sup>™</sup>

## methyl dopate hydrochloride

**Pharmacologic class:** Centrally acting antiadrenergic

**Therapeutic class:** Antihypertensive

**Pregnancy risk category B**

### Action

Stimulates CNS alpha-adrenergic receptors, decreasing sympathetic stimulation to heart and blood vessels. Also reduces arterial pressure and plasma renin.

### Availability

**Injection:** 50 mg/ml in 5- and 10-ml vials

**Oral suspension (contains bisulfites):** 250 mg/5 ml

**Tablets:** 125 mg, 250 mg, 500 mg

### Indications and dosages

- Hypertension

**Adults:** 250 mg P.O. two to three times daily for 2 days (not to exceed 500 mg/day in divided doses if used with other agents); may increase q 2 days as needed. Usual maintenance dosage is 500 mg to 2 g/day (not to exceed 3 g/day) P.O. in two to four divided doses or 250 to 500 mg I.V. q 6 hours (up to 1 g q 6 hours).

**Children:** 10 mg/kg/day (300 mg/m<sup>2</sup>/day) P.O. in two to four divided doses. May increase q 2 days up to 65 mg/kg/day (2 g/m<sup>2</sup>/day), or 3 g/day in divided doses (whichever is lower) or 5 to 10 mg/kg I.V. q 6 hours; up to 65 mg/kg/day (2 g/m<sup>2</sup>/day), or 3 g/day in divided doses (whichever is lower).

### Contraindications

- Hypersensitivity to drug or its components
- Pheochromocytoma
- Active hepatic disease or history of methyl dopa-associated hepatic disorders
- MAO inhibitor use within past 14 days

### Precautions

Use cautiously in:

- heart failure, edema, hemolytic anemia, hypotension, severe bilateral cerebrovascular disease
- dialysis patients
- elderly patients
- pregnant or breastfeeding patients.

### Administration

⚠ Don't give within 14 days of MAO inhibitors.

- To prepare I.V. infusion, add prescribed dosage to 100 ml 5% dextrose injection. Or administer in 5% dextrose injection in a concentration of 100 mg/10 ml. Give each dose over 30 to 60 minutes.
- Dilute and administer ADD-Vantage vials containing 50 mg/ml according to manufacturer's instructions.

⚠ Don't stop drug therapy abruptly.

Route	Onset	Peak	Duration
P.O.	Unknown	4-6 hr	24-48 hr
I.V.	Unknown	4-6 hr	10-16 hr

### Adverse reactions

**CNS:** headache, asthenia, weakness, dizziness, sedation, decreased mental acuity, depression, paresthesia,

parkinsonism, Bell's palsy, involuntary choreoathetotic movements

**CV:** bradycardia, edema, orthostatic hypotension, **myocarditis**

**EENT:** nasal congestion

**GI:** nausea, vomiting, diarrhea, constipation, abdominal distention, colitis, dry mouth, sialadenitis, sore or black tongue, **pancreatitis**

**GU:** breast enlargement, gynecomastia, failure to ejaculate, erectile dysfunction

**Hematologic:** eosinophilia, **hemolytic anemia**

**Hepatic:** hepatitis

**Other:** fever

### Interactions

**Drug-drug.** *Adrenergics, MAO inhibitors:* excessive sympathetic stimulation

*Amphetamines, barbiturates, non-steroidal anti-inflammatory drugs, phenothiazines, tricyclic antidepressants:* decreased antihypertensive effect

*Anesthetics, antihypertensives, nitrates:* additive hypotension

*Ferrous gluconate, ferrous sulfate:* decreased methyl dopa blood level

*Haloperidol:* increased haloperidol effects, increased risk of psychoses

*Levodopa:* additive hypotension and CNS toxicity

*Lithium:* increased risk of lithium toxicity

*Nonselective beta-adrenergic blockers:* paradoxical hypertension

*Tolbutamide:* increased tolbutamide effects

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, potassium, prolactin, sodium, uric acid:* increased levels

*Direct Coombs' test:* positive result

*Liver function tests:* abnormal results

*Prothrombin time:* prolonged

**Drug-herbs.** *Capsicum:* reduced antihypertensive effects

**Drug-behaviors.** *Alcohol use:* increased hypotension

### Patient monitoring

- Obtain direct Coombs' test before therapy starts and 6 and 12 months later.
- Monitor periodic blood counts to detect adverse hematologic reactions.
- Monitor liver function tests and check for signs and symptoms of hepatic dysfunction (particularly during first 6 to 12 weeks of therapy).
- Check for edema or weight gain to help determine if diuretic should be added to regimen.
- Monitor blood pressure. Drug tolerance may occur during second and third months of therapy.

### Patient teaching

- Tell patient that sedation usually occurs when therapy starts and during dosage titration. To lessen this effect, advise him to begin dosage titration in evening.
- 🚫 Tell patient not to stop taking drug abruptly.
- 🚫 Instruct patient to report fever, yellowing of skin or eyes, fatigue, abdominal pain, flulike symptoms, swelling, or significant weight gain.
- Inform patient that urine may darken after exposure to air.
- Advise patient to move slowly when changing position, to avoid dizziness from sudden blood pressure decrease.
- Caution patient to avoid driving and other hazardous activities until effects of drug are known or dosage titration is completed.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## methylergonovine maleate

Methergine

**Pharmacologic class:** Ergot alkaloid

**Therapeutic class:** Oxytocic

**Pregnancy risk category** C

### Action

Directly stimulates vascular smooth-muscle contractions in uterus and cervix and decreases bleeding after delivery

### Availability

**Injection:** 0.2 mg/ml

**Tablets:** 0.2 mg

### Indications and dosages

➤ Prevention and treatment of postpartum hemorrhage

**Adults:** 0.2 mg I.M.; repeat q 2 to 4 hours as needed to a total of five doses. In emergencies, 0.2 mg I.V. over 1 minute. After initial I.M. or I.V. dose, 0.2 mg P.O. q 6 to 8 hours for 2 to 7 days; decrease dosage if cramping occurs.

### Contraindications

- Hypersensitivity to drug
- Hypertension
- Toxemia
- Pregnancy (except during third stage of labor)

### Precautions

Use cautiously in:

- severe hepatic or renal disease, vascular disease, jaundice, sepsis
- patients in second stage of labor.

### Administration

- Be aware that drug isn't routinely given I.V. because of risk of severe hypertension and cerebrovascular accident (CVA). Monitor blood pressure and uterine contractions during administration.

- If I.V. use is necessary, give dose over 1 minute. Dose may be diluted in 5 ml of 0.9% sodium chloride injection.
- Be aware that prolonged therapy should be avoided because of ergotism risk.

Route	Onset	Peak	Duration
P.O.	5-10 min	30 min	3 hr
I.V.	Immediate	Unknown	45 min
I.M.	2-5 min	Unknown	3 hr

### Adverse reactions

**CNS:** dizziness, headache, hallucination, **seizures**, CVA (with I.V. use)

**CV:** hypertension, hypotension, transient chest pain, palpitations, **thrombophlebitis**

**EENT:** tinnitus, nasal congestion

**GI:** nausea, vomiting, diarrhea

**GU:** hematuria

**Musculoskeletal:** leg cramps

**Respiratory:** dyspnea

**Skin:** diaphoresis, rash, allergic reactions

**Other:** foul taste

### Interactions

**Drug-drug.** *Dopamine, ergot alkaloids, oxytocin, regional anesthetics, vasoconstrictors:* excessive vasoconstriction

**Drug-diagnostic tests.** *Prolactin:* increased level

### Patient monitoring

🚨 Know that if used during third stage of labor, drug increases risk of hemorrhage and infection.

- When giving I.V., closely monitor blood pressure, pulse, uterine contractions, and bleeding.
- Monitor patient for adverse effects.

### Patient teaching

- Inform patient and family of reason for using drug, and provide reassurance.
- Tell patient drug may cause nausea, vomiting, dizziness, increased blood pressure, headache, ringing in ears,

chest pain, or shortness of breath. Advise her to report severe or troublesome symptoms.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## methylnaltrexone bromide

Relistor

**Pharmacologic class:** Mu-opioid receptor antagonist (peripherally acting)

**Therapeutic class:** Opioid

**Pregnancy risk category B**

### Action

Selectively antagonizes opioid binding at mu-opioid receptors (such as those in GI tract) while having restricted ability to cross blood-brain barrier, thereby decreasing constipating effects of opioids without altering analgesic effects on CNS

### Availability

*Solution for injection:* 12 mg/0.6 ml in single-use vials

### Indications and dosages

➤ Opioid-induced constipation in patients with advanced illness who are receiving palliative care and haven't responded adequately to laxatives

**Adults weighing 62 to less than 114 kg (136 to less than 251 lb):** 12 mg subcutaneously every other day as needed, but no more frequently than one dose in 24 hours

**Adults weighing 38 to less than 62 kg (84 to less than 136 lb):** 8 mg subcutaneously every other day as needed, but no more frequently than one dose in 24 hours

### Adults weighing outside above

**ranges:** 0.15 mg/kg subcutaneously every other day as needed, but no more frequently than one dose in 24 hours

### Dosage adjustment

- Severe renal impairment (creatinine clearance less than 30 ml/minute)

### Contraindications

- Known or suspected mechanical GI obstruction

### Precautions

Use cautiously in:

- renal impairment
- severe or persistent diarrhea, known or suspected GI tract lesions
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Once drawn into syringe, if drug won't be given immediately, store at ambient room temperature and administer within 24 hours.

Route	Onset	Peak	Duration
P.O.	Rapid	0.5 hr	Unknown

### Adverse reactions

**CNS:** dizziness, malaise

**GI:** nausea, abdominal pain, diarrhea, flatulence abdominal cramping, GI perforation

**Other:** flushing, pain, diaphoresis

### Interactions

None

### Patient monitoring

🔊 Monitor patient for severe or persistent diarrhea and signs and symptoms of GI perforation. Discontinue drug if either occurs.

### Patient teaching

- Teach patient who will take drug at home how to prepare and administer it and discard supplies properly.

- Tell patient that if drug won't be administered immediately after it's drawn into syringe, it should be stored at ambient room temperature and administered within 24 hours.
- Inform patient that solution should be clear and colorless to pale yellow.
- Advise patient to stay near toilet facilities after receiving drug.
- 🔊 Instruct patient to stop taking drug if severe or persistent diarrhea or severe, persistent, or worsening abdominal signs or symptoms occur.
- Tell patient that common side effects include transient abdominal pain, nausea, and vomiting. Advise patient to contact prescriber if these symptoms persist or worsen.
- Instruct patient to stop taking drug if opioid pain medication is discontinued.
- As appropriate, review all other significant adverse reactions mentioned above.

## methylphenidate hydrochloride

Apo-Methylphenidate<sup>✳</sup>, Biphentin<sup>✳</sup>, Concerta, Concerta XL<sup>⚡</sup>, Daytrana, Equasym<sup>⚡</sup>, Equasym XL<sup>⚡</sup>, Medikinet<sup>⚡</sup>, Medikinet XL<sup>⚡</sup>, Metadate CD, Metadate ER, PHL-Methylphenidate<sup>✳</sup>, PMS-Methylphenidate<sup>✳</sup>, Ratio-Methylphenidate<sup>✳</sup>, Ritalin, Ritalin LA, Ritalin-SR

**Pharmacologic class:** Piperidine derivative

**Therapeutic class:** CNS stimulant

**Controlled substance schedule II**

**Pregnancy risk category C**

### FDA BOXED WARNING

- Give cautiously to patients with history of drug dependence or alcoholism. Chronic abuse can cause marked tolerance and psychological dependence with abnormal behavior. Frank psychotic episodes may occur, especially with parenteral abuse. Supervise carefully during withdrawal from abusive use, as severe depression may occur. Withdrawal after prolonged therapeutic use may unmask symptoms of underlying disorder, possibly requiring follow-up.

### Action

Increases release of norepinephrine, which stimulates impulse transmission in respiratory system and CNS. Net effect is increased mental alertness.

### Availability

*Capsules (extended-release):* 10 mg, 20 mg, 30 mg, 40 mg, 50 mg, 60 mg

*Solution (oral):* 5 mg/5 ml, 10 mg/10 ml

*Tablets (chewable):* 2.5 mg, 5 mg, 10 mg

*Tablets (extended-release):* 10 mg, 18 mg, 20 mg, 27 mg, 36 mg, 54 mg

*Tablets (prompt-release):* 5 mg, 10 mg, 20 mg

*Tablets (sustained-release):* 20 mg

*Transdermal patch:* 10 mg/9 hours, 15 mg/9 hours, 20 mg/9 hours, 30 mg/9 hours

### Indications and dosages

➤ Adjunctive treatment of attention deficit hyperactivity disorder (ADHD)  
**Adults:** 5 to 20 mg P.O. (prompt-release tablets) two to three times daily. Or, 20 to 30 mg (oral solution) P.O. daily. Once maintenance dosage is determined, may switch to extended-release.

**Children older than age 6:** Initially, 5 mg P.O. (prompt-release tablets or oral solution) before breakfast and

lunch; increase by 5 to 10 mg at weekly intervals, not to exceed 60 mg/day. Once maintenance dosage is determined, may switch to extended-release.

If previous methylphenidate dosage was 10 mg b.i.d. or 20 mg sustained-release, give Ritalin LA 20 mg P.O. once daily. If previous dosage was 15 mg b.i.d., give Ritalin LA 30 mg P.O. once daily. If previous dosage was 20 mg b.i.d. or 40 mg sustained-release, give Ritalin LA 40 mg P.O. once daily. If previous dosage was 30 mg b.i.d. or 60 mg sustained-release, give Ritalin LA 60 mg P.O. once daily.

In all patients, Ritalin-SR or Metadate ER may be prescribed instead of prompt-release tablets when 8-hour dosage of those forms corresponds to titrated 8-hour dosage of prompt-release tablets.

*Concerta*—

**Adults:** If new to methylphenidate, initially 18 or 36 mg/day. Increase dosage by 18 mg/day at weekly intervals, not to exceed 72 mg/day. For patients currently using methylphenidate, dosing is based on current dosage regimen and clinical judgment.

**Children ages 6 and older who haven't used methylphenidate previously:**

Initially, 18 mg P.O. once daily in morning; may be titrated weekly up to 54 mg/day

**Children ages 6 and older using other methylphenidate forms:** 18 mg P.O.

once daily in morning if previous dosage was 5 mg two to three times daily, or 20 mg P.O. daily (sustained-release); 36 mg once daily in morning if previous dosage was 10 mg two to three times daily or 40 mg daily (sustained-release); or 54 mg once daily in morning if previous dosage was 15 mg two to three times daily or 60 mg once daily (sustained-release)

*Metadate CD*—

**Children ages 6 and older:** Initially, 20 mg once daily; may adjust in weekly

increments of 10 to 20 mg, to a maximum of 60 mg/day taken in morning

➤ Adjunctive treatment of attention deficit hyperactivity disorder (ADHD) *Daytrana*—

**Children ages 6 and older:** Apply patch to hip area 2 hours before effect is needed; remove 9 hours after application; titrate dosages as needed.

➤ Narcolepsy

**Adults:** 10 mg P.O. (Ritalin, Ritalin SR, or Metadate ER) two to three times daily, 30 to 45 minutes before a meal. Some patients may require up to 60 mg daily.

### Off-label uses

- Depression in ill, elderly patients (such as those with cerebrovascular accident)
- To enhance analgesia and sedation in patients receiving opioids

### Contraindications

- Hypersensitivity to drug or its components, including sucrose (Metadate CD)
- Glaucoma
- Motor tics, Tourette syndrome (or family history of syndrome)
- Marked anxiety, tension, agitation
- Severe hypertension, angina, arrhythmias, heart failure, recent myocardial infarction, hyperthyroidism, thyrotoxicosis
- Concurrent use of halogenated anesthetics
- MAO inhibitor use within past 14 days

### Precautions

Use cautiously in:

- hypertension, seizure disorders
- psychosis
- suicidal or homicidal tendencies
- slow growth (children)
- elderly or debilitated patients
- pregnant or breastfeeding patients
- children younger than age 6.

## Administration

 Be aware that Metadate CD contains sucrose. Don't give to patients with rare hereditary problems of fructose intolerance, glucose-galactose malabsorption, or sucrase-isomaltase insufficiency.

- Don't give Metadate CD on day of surgery.
  - Don't crush extended-release tablets or extended-release trilayer core tablets (Concerta).
  - Have patient swallow extended-release capsules (Metadate CD, Ritalin LA) intact; or, if desired, sprinkle entire contents onto small amount (1 tbsp) of applesauce immediately before administration. (However, don't sprinkle Ritalin LA onto warm applesauce because its release properties may be affected.) Give water after patient swallows dose.
  - Don't give extended-release tablets to initiate therapy or for daily use until dosage has been titrated using conventional tablets.
  - Apply patch immediately after opening pouch to a clean, dry hip area and alternate hips daily.
-  Don't give within 14 days of MAO inhibitor use.
- To help prevent insomnia, give last daily dose of conventional tablets several hours before bedtime.
  - Discontinue drug periodically in children who have responded to therapy, to assess patient's condition. After withdrawal, improvement may be temporary or permanent.
  - Be aware that therapy shouldn't continue indefinitely.

Route	Onset	Peak	Duration
P.O.	Unknown	1-3 hr	4-6 hr
P.O. (extended)	Unknown	Unknown	Up to 8 hr
Transdermal	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** restlessness, tremor, dizziness, headache, irritability, hyperactivity, insomnia, akathisia, dyskinesia, reversible ischemic neurologic deficit, **toxic psychosis**

**CV:** hypertension, hypotension, palpitations, tachycardia, Raynaud's phenomenon, **sudden death** (patients with structural cardiac abnormalities or other serious heart problems)

**EENT:** blurred vision

**GI:** nausea, vomiting, diarrhea, constipation, cramps, dry mouth, anorexia

**Skin:** rash, contact sensitization

**Other:** metallic taste, fever, suppression of weight gain (in children), hypersensitivity reactions, physical or psychological drug dependence, drug tolerance, peripheral coldness

## Interactions

**Drug-drug.** *Anticonvulsants, phenylbutazone, selective serotonin reuptake inhibitors, tricyclic antidepressants, warfarin:* inhibited metabolism and increased effects of these drugs

*Guanethidine:* antagonism of hypotensive effect

*Halogenated anesthetics:* sudden blood pressure increase

*MAO inhibitors, vasopressors:* hypertensive crisis

**Drug-food.** *Caffeine-containing foods and beverages (such as coffee, cola, chocolate):* increased CNS stimulation

**Drug-herbs.** *Ephedra (ma huang), caffeine-containing herbs (such as cola nut, guarana, maté):* increased CNS stimulation

**Drug-behaviors.** *Alcohol use:* additive hypotension

## Patient monitoring

- Monitor patient periodically for drug tolerance and psychological dependence.
- Watch for adverse effects. Know that these usually can be controlled by adjusting schedule or dosage.

- Monitor for contact sensitization (erythema accompanied by edema, papules, vesicles) that does not significantly improve within 48 hours or spreads beyond the patch site. Discontinue drug if this occurs.
- Stay alert for tachycardia, abdominal pain, insomnia, anorexia, and weight loss (more common in children).
- Consider periodic hematologic and liver function tests, especially during prolonged therapy.
- Monitor blood pressure, especially in patients with history of hypertension.
- Evaluate child's weight and growth patterns.
- Assess child for tics, which may develop in 15% to 30% of children using drug.

### Patient teaching

- Inform patient or parent that last daily dose should be taken several hours before bedtime to avoid insomnia.
- Make sure patient or parent understands how drug should be taken.
- Tell patient taking Concerta not to be concerned if tablet-like substance appears in stool.
- Teach caregiver how to use patch and to make sure that skin is clean, dry, and free of cuts or irritation.
- Tell caregiver not to allow child to use heat sources, such as heating pads or electric blankets, while wearing the patch.
- Instruct caregiver to report redness accompanied by swelling or solid bumps or blisters on the skin that do not significantly improve within 48 hours or spread beyond the patch site.
- Tell caregiver to replace the patch if it falls off, but total wear time for the day should remain 9 hours.
- Advise patient or parent to report insomnia, palpitations, vomiting, fever, or rash.
- Caution patient or parent that continual use may lead to psychological or physical dependence.

- Instruct patient to avoid driving and other hazardous tasks until drug effects are known.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, foods, herbs, and behaviors mentioned above.

## methylprednisolone

Medrol, Medrone 

## methylprednisolone acetate

Depo-Medrol, Depo-Medrone , Unimed 

## methylprednisolone sodium succinate

A-Methapred, Solu-Medrol, Solu-Medrone 

**Pharmacologic class:** Glucocorticoid

**Therapeutic class:** Antiasthmatic, anti-inflammatory (steroidal), immunosuppressant

**Pregnancy risk category C**

### Action

Unclear. Reduces inflammation and prevents edema by stabilizing membranes and reducing permeability of leukocytic cells. Suppresses immune system by interfering with antigen-antibody interactions of macrophages and T cells.

### Availability

**Solution for injection:** 40 mg, 125 mg, 500 mg, 1 g, 2 g

**Suspension for injection:** 20 mg/ml, 40 mg/ml, 80 mg/ml

**Tablets:** 2 mg, 4 mg, 8 mg, 16 mg, 24 mg, 32 mg

## Indications and dosages

➤ Diseases and disorders of endocrine system, collagen, skin, eye, GI tract, respiratory system, or hematologic system; neoplastic diseases; allergies; edema; multiple sclerosis; tuberculous meningitis; trichinosis; rheumatic disorders; osteoarthritis; bursitis; localized inflammatory lesions

**Adults:** *Methylprednisolone*—4 to 160 mg P.O. daily in four divided doses, depending on disease or disorder.

*Acetate*—40 to 120 mg I.M., or 4 to 80 mg by intra-articular or soft-tissue injection, or 20 to 60 mg by intraleisional injection (depending on type, size, and location of inflammation); may be repeated at 1 to 5 weeks.

*Sodium succinate high-dose therapy*—30 mg/kg I.V. over at least 30 minutes. May be repeated q 4 to 6 hours for 48 hours.

## Off-label uses

- Lupus nephritis
- *Pneumocystis jiroveci* pneumonia in AIDS patients

## Contraindications

- Hypersensitivity to drug or its component
- Systemic fungal infections
- Use in premature infants (with sodium succinate form, which contains benzyl alcohol)

## Precautions

Use cautiously in:

- cardiovascular, hepatic, renal, or GI disease; active untreated infections; thromboembolic tendency; idiopathic thrombocytopenic purpura; osteoporosis; myasthenia gravis; hypothyroidism; glaucoma; ocular herpes simplex; vaccinia or varicella; seizure disorders; metastatic cancer
- pregnant or breastfeeding patients
- children.

## Administration

- As needed and prescribed, give prophylactic antacids to prevent peptic ulcers in patients receiving high doses.
- When methylprednisolone acetate is substituted for oral form, know that I.M. dosage should equal oral dosage and should be given once daily.
- Know that methylprednisolone acetate is not for I.V. use. It may be given I.M. or by intra-articular, intraleisional, or soft-tissue injection.
- Be aware that methylprednisolone sodium succinate may be given I.M. or I.V. Reconstitute with bacteriostatic water for injection containing 0.9% benzyl alcohol, per manufacturer's instructions.
- In long-term methylprednisolone therapy, alternate-day therapy should be considered.
- For direct I.V. injection, inject each 500-mg dose over 2 to 3 minutes or more. For I.V. infusion, further dilute in compatible I.V. solution (such as 5% dextrose, 0.9% sodium chloride, or 5% dextrose in 0.9% sodium chloride injection) and give over 10 to 20 minutes.
- Maintain patient on lowest effective dosage, to minimize adverse effects.

Route	Onset	Peak	Duration
P.O.	Rapid	2-3 hr	30-36 hr
I.M., I.V. (succinate)	Rapid	Unknown	Unknown
I.M. (acetate)	6-48 hr	4-8 days	1-4 wk

## Adverse reactions

**CNS:** headache, restlessness, nervousness, depression, euphoria, personality changes, psychoses, vertigo, paresthesias, insomnia, adhesive arachnoiditis, conus medullaris syndrome, **increased intracranial pressure, seizures, meningitis**

**CV:** hypotension, hypertension, **arrhythmias, heart failure, shock,**

**fat embolism, thrombophlebitis, thromboembolism**

**EENT:** cataracts, glaucoma, increased intraocular pressure, nasal irritation, nasal septum perforation, sneezing, epistaxis, nasopharyngeal or oropharyngeal fungal infection, dysphonia, hoarseness, throat irritation

**GI:** nausea, vomiting, abdominal distention, rectal bleeding, dry mouth, anorexia, esophageal candidiasis,

**esophageal ulcer, peptic ulcer, pancreatitis**

**GU:** amenorrhea, irregular menses

**Respiratory:** cough, wheezing,

**bronchospasm**

**Metabolic:** decreased growth (in children), reduced carbohydrate tolerance, diabetes mellitus, hyperglycemia, sodium and fluid retention, hypokalemia, hypocalcemia, cushingoid state (with long-term use), **hypothalamic-pituitary-adrenal suppression** (with systemic use beyond 5 days), **adrenal suppression** (with long-term, high-dose use), **acute adrenal insufficiency** (with abrupt withdrawal)

**Musculoskeletal:** muscle wasting, osteoporosis, osteonecrosis, tendon rupture, aseptic joint necrosis, muscle pain and weakness, steroid myopathy, spontaneous fractures (with long-term use)

**Skin:** facial edema, rash, pruritus, urticaria, contact dermatitis, acne, decreased wound healing, bruising, hirsutism, thin and fragile skin, petechiae, purpura, striae, subcutaneous fat atrophy, skin atrophy, acneiform lesions, angioedema

**Other:** anosmia, bad taste, increased appetite, weight gain (with long-term use), Churg-Strauss syndrome, increased susceptibility to infection, aggravation or masking of infections, impaired wound healing, atrophy at injection site, local pain and burning, irritation, hypersensitivity reaction

**Interactions**

**Drug-drug.** *Amphotericin B, mezlocillin, piperacillin, thiazide and loop diuretics, ticarcillin:* additive hypokalemia

*Fluoroquinolones:* increased risk of tendon rupture

*Isoniazid, phenobarbital, phenytoin, rifampin:* decreased methylprednisolone efficacy

*Ketoconazole:* decreased methylprednisolone clearance

*Live-virus vaccines:* decreased antibody response to vaccine, increased risk of adverse reactions

*Nonsteroidal anti-inflammatory drugs:* increased risk of adverse GI effects

*Oral anticoagulants:* altered anticoagulant requirement

**Drug-diagnostic tests.** *Calcium, potassium, thyroxine, triiodothyronine:* decreased levels

*Cholesterol, glucose:* increased levels

*Nitroblue tetrazolium test for bacterial infection:* false-negative result

**Drug-herbs.** *Echinacea:* increased immune stimulation

*Ginseng:* immunomodulation

**Drug-behaviors.** *Alcohol use:* increased risk of gastric irritation and ulcers

**Patient monitoring**

- Monitor fluid and electrolyte balance, weight, and blood pressure.
- With long-term or high-dose use, assess for cushingoid effects, such as moon face, central obesity, acne, abdominal striae, hypertension, osteoporosis, myopathy, hyperglycemia, fluid and electrolyte imbalances, and increased susceptibility to infection.
- Check for signs and symptoms of steroid-induced psychosis (delirium, euphoria, insomnia, mood swings, personality changes, and depression).
- Monitor growth and development in children on prolonged therapy.
- Know that therapy beyond 6 months increases risk of osteoporosis. Obtain

baseline bone density mass, and provide teaching about lifestyle factors (such as weight-bearing exercise, proper diet, moderation of alcohol intake, and smoking cessation) and possible need for calcium, vitamin D, or bisphosphonate therapy.

- With long-term use, withdraw drug gradually.

🔊 After dosage reduction or drug withdrawal, monitor patient for signs and symptoms of adrenal insufficiency.

### Patient teaching

- Tell patient to take with food to minimize GI upset.

- Advise patient on chronic therapy to have periodic eye exams and to carry medical identification that states he's taking drug.

- Inform patient that drug increases risk for infection. Urge him to avoid exposure to people with infections such as measles and chickenpox. Tell him to contact prescriber if exposure occurs.

- Advise patient to report unusual weight gain, swelling, muscle weakness, black tarry stools, vomiting of blood, menstrual irregularities, sore throat, fever, or infection.

🔊 Tell patient to immediately report signs or symptoms of adrenal insufficiency (including fatigue, appetite loss, nausea, vomiting, diarrhea, weight loss, weakness, and dizziness) after dosage reduction or drug withdrawal.

- Advise diabetic patient to monitor blood glucose level carefully.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## metoclopramide hydrochloride

Apo-Metoclop<sup>®</sup>, Gastrobid<sup>®</sup>, Gastromax<sup>®</sup>, Maxeran<sup>®</sup>, Maxolon<sup>®</sup>, Maxolon SR<sup>®</sup>, Metozolv ODT, Nu-Metoclopramide<sup>®</sup>, Paramax<sup>®</sup>, PMS-Metoclopramide, Reglan

**Pharmacologic class:** Dopamine antagonist

**Therapeutic class:** Antiemetic, GI stimulant

**Pregnancy risk category B**

### FDA BOXED WARNING

- Drug can cause tardive dyskinesia, a serious movement disorder that's often irreversible. Risk of developing tardive dyskinesia increases with duration of treatment and total cumulative dose.

- Discontinue drug in patients who develop signs or symptoms of tardive dyskinesia, which has no known treatment. In some patients, signs and symptoms may lessen or resolve after drug is stopped.

- Avoid using metoclopramide for longer than 12 weeks except in rare cases in which potential benefit outweighs risk of developing tardive dyskinesia.

### Action

Blocks dopamine receptors by disrupting CNS chemoreceptor trigger zone, increasing peristalsis and promoting gastric emptying

### Availability

*Injection:* 5 mg/ml

*Solution:* 5 mg/5 ml

*Solution (concentrated):* 10 mg/ml

*Tablets:* 5 mg, 10 mg

Tablets (orally disintegrating): 5 mg, 10 mg

### Indications and dosages

➤ To prevent chemotherapy-induced vomiting

**Adults:** 1 to 2 mg/kg I.V. 30 minutes before chemotherapy, then q 2 hours for two doses, then q 3 hours for three additional doses

➤ To facilitate small-bowel intubation; radiologic examination when delayed gastric emptying interferes

**Adults and children older than age 14:** 10 mg I.V. as a single dose

**Children ages 6 to 14:** 2.5 to 5 mg I.V. as a single dose

**Children younger than age 6:** 0.1 mg/kg I.V. as a single dose

➤ Diabetic gastroparesis

**Adults:** 10 mg P.O. 30 minutes before meals and at bedtime for 2 to 8 weeks. If patient can't tolerate P.O. doses, give same dosage I.V. or I.M.

➤ Gastroesophageal reflux

**Adults:** 10 to 15 mg P.O. 30 minutes before meals and at bedtime for up to 12 weeks. For prevention, single dose of 20 mg (some patients may respond to doses as small as 5 mg).

➤ Prevention of postoperative nausea and vomiting

**Adults:** 10 to 20 mg I.M. near end of surgical procedure. Repeat dose q 4 to 6 hours, as needed.

### Dosage adjustment

- Renal impairment

### Off-label uses

- Hiccups

### Contraindications

- Hypersensitivity to drug
- Pheochromocytoma
- Parkinson's disease
- Suspected GI obstruction, perforation, or hemorrhage
- History of seizure disorders

### Precautions

Use cautiously in:

- diabetes mellitus, renal dysfunction
- history of depression
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

- Mix oral solution with water, juice, carbonated beverage, or semisolid food (such as applesauce or pudding) just before administration.

- Remove orally disintegrating tablets with dry hands immediately before administering. After removing, place tablet on patient's tongue, where it will dissolve in approximately 1 minute. Tell patient to swallow saliva.

- Give I.M. or direct I.V. without further dilution.

- Administer low doses (10 mg or less) by direct I.V. injection slowly over 2 minutes. (Rapid injection may cause intense anxiety and restlessness followed by drowsiness.)

- For I.V. infusion, dilute with 50 ml of 5% dextrose in 0.9% sodium chloride solution, 5% dextrose in 0.45% sodium chloride solution, or lactated Ringer's solution. Infuse over at least 15 minutes.

Route	Onset	Peak	Duration
P.O.	30-60 min	Unknown	1-2 hr
I.V.	1-3 min	Immediate	1-2 hr
I.M.	10-15 min	Unknown	1-2 hr

### Adverse reactions

**CNS:** drowsiness, restlessness, anxiety, depression, irritability, fatigue, lassitude, insomnia, tardive dyskinesia, parkinsonian-like reactions, extrapyramidal reactions, akathisia, dystonia  
**CV:** hypertension, hypotension,  
**arrhythmias, neuroleptic malignant syndrome**

**GI:** nausea, constipation, diarrhea, dry mouth

**GU:** gynecomastia

## Interactions

**Drug-drug.** *Anticholinergics, opioids:* antagonism of metoclopramide's GI motility effect

*Antidepressants, antihistamines, other CNS depressants (such as opioids, sedative-hypnotics):* additive CNS depression  
*Cimetidine, digoxin:* decreased blood levels of these drugs

*General anesthetics:* exaggerated hypotension

*Haloperidol, phenothiazines:* increased risk of extrapyramidal reactions

*Levodopa:* decreased metoclopramide efficacy

*MAO inhibitors:* increased catecholamine release

**Drug-diagnostic tests.** *Aldosterone, prolactin:* increased levels

**Drug-behaviors.** *Alcohol use:* increased blood alcohol level, increased CNS depression

## Patient monitoring

- Monitor blood pressure during I.V. administration.
- Stay alert for depression and other adverse CNS effects.
- ⚠ Watch for extrapyramidal reactions, which usually occur within first 24 to 48 hours of therapy. To reverse these symptoms, give diphenhydramine 50 mg I.M. or benztropine 1 to 2 mg I.M., as prescribed.
- Check for development of parkinsonian-like symptoms, which may occur within first 6 months of therapy and usually subside within 2 to 3 months after withdrawal.

⚠ With long-term use, assess patient for tardive dyskinesia and discontinue drug if signs or symptoms of tardive dyskinesia develop. Avoid treatment for longer than 12 weeks in all but rare cases in which therapeutic benefit outweighs risk of developing tardive dyskinesia.

⚠ Monitor patient closely for signs and symptoms of neuroleptic malignant syndrome (hyperthermia, muscle

rigidity, altered consciousness, and evidence of autonomic instability [irregular pulse or blood pressure, tachycardia, diaphoresis, and cardiac arrhythmias]); immediately discontinue drug if these symptoms occur.

- In diabetic patient, stay alert for gastric stasis. Insulin dosage may need to be adjusted.

## Patient teaching

- Tell patient to take 30 minutes before meals.
- Tell patient taking orally disintegrating tablets to remove tablet with dry hands immediately before use. Instruct patient to place tablet on tongue, where it will dissolve in approximately 1 minute, and then swallow saliva.
- ⚠ Instruct patient to report involuntary movements of face, eyes, or limbs; muscle rigidity; altered consciousness; irregular pulse or blood pressure; rapid or irregular heartbeats; or excessive sweating.
- Caution patient to avoid driving and other hazardous activities until drug's effects are known.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## metolazone

Metenix<sup>®</sup>, Zaroxolyn

**Pharmacologic class:** Thiazide-like diuretic

**Therapeutic class:** Diuretic, antihypertensive

**Pregnancy risk category B**

## Action

Inhibits electrolyte reabsorption from ascending loop of Henle and decreases

reabsorption of sodium and potassium in distal renal tubules, increasing plasma osmotic pressure and promoting diuresis

### Availability

Tablets: 2.5 mg, 5 mg, 10 mg

### Indications and dosages

➤ Hypertension

**Adult:** 2.5 to 5 mg P.O. daily.

➤ Edema caused by heart failure or renal disease

**Adults:** 5 to 20 mg P.O. daily

### Contraindications

- Hypersensitivity to drug
- Hepatic coma or precoma
- Anuria

### Precautions

Use cautiously in:

- severe hepatic or renal impairment, gout, hyperparathyroidism, glucose tolerance abnormalities, fluid or electrolyte imbalances, bipolar disorders
- elderly patients
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Give in morning to avoid frequent nighttime urination.
- Discontinue drug before parathyroid function tests are performed.
- Be aware that metolazone is the only thiazide-like diuretic that may cause diuresis in patients with glomerular filtration rates below 20 ml/minute.

Route	Onset	Peak	Duration
P.O.	1 hr	2 hr	12-24 hr

### Adverse reactions

**CNS:** drowsiness, lethargy, vertigo, paresthesia, weakness, headache, fatigue  
**CV:** chest pain, hypotension, palpitations, **venous thrombosis, arrhythmias**  
**GI:** nausea, vomiting, bloating, cramping, anorexia, **pancreatitis**

**GU:** polyuria, nocturia, erectile dysfunction, decreased libido

**Hematologic:** **aplastic anemia, leukopenia, agranulocytosis**

**Hepatic:** **hepatitis**

**Metabolic:** dehydration, hypercalcemia, hypomagnesemia, hyponatremia, hypophosphatemia, hypovolemia, hyperglycemia, hyperuricemia, **hypokalemia, hypochloremic alkalosis**

**Musculoskeletal:** muscle cramps

**Skin:** photosensitivity, rashes

**Other:** chills

### Interactions

**Drug-drug.** *Amphotericin B, corticosteroids, mezlocillin, piperacillin, ticarcillin:* additive hypokalemia

*Antigout drugs:* increased uric acid level

*Antihypertensives, nitrates:* additive hypotension

*Digoxin:* increased risk of digoxin toxicity

*Lithium:* decreased lithium excretion, increased risk of lithium toxicity

**Drug-diagnostic tests.** *Bilirubin, calcium, cholesterol, creatinine, low-density lipoproteins, triglycerides, uric acid:* increased levels

*Blood glucose, urine glucose:* increased levels in diabetic patients

*Magnesium, potassium, protein-bound iodine, sodium, urinary calcium:* decreased levels

**Drug-food.** *Any food:* increased metolazone absorption

**Drug-herbs.** *Aloe, cascara sagrada, senna:* increased risk of hypokalemia

**Drug-behaviors.** *Sun exposure:* increased risk of photosensitivity

### Patient monitoring

• Monitor baseline and periodic electrolyte, blood urea nitrogen, glucose, and uric acid levels.

• Evaluate blood pressure regularly.

⚠ Watch for signs and symptoms of hypokalemia, which may necessitate potassium supplements, potassium-rich diet, or potassium-sparing diuretic. Hypokalemia is particularly

dangerous to patients who are on digitalis or have had ventricular arrhythmias.

- Assess patient for fluid and electrolyte imbalances.

### Patient teaching

- Advise patient to take in morning to avoid frequent nighttime urination.
- Tell patient he may take with food or milk to prevent GI upset.
-  Instruct patient to report muscle pain, weakness, or cramps; nausea; vomiting; diarrhea; dizziness; restlessness; excessive thirst; fatigue; drowsiness; increased pulse; or irregular heart beats.
- Inform patient that drug may cause gout attacks. Advise him to report sudden joint pain.
- Instruct patient to use sunscreen and protective clothing to avoid photosensitivity.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## metoprolol succinate

Toprol-XL

## metoprolol tartrate

Apo-Metoprolol<sup>⚡</sup>, Betaloc<sup>⚡</sup>, Betaloc Durules<sup>⚡</sup>, Dom-Metoprolol<sup>⚡</sup>, Gen-Metoprolol<sup>⚡</sup>, Lopresor<sup>⚡</sup>, Lopresor SR<sup>⚡</sup>, Lopressor, Novo-Metoprol<sup>⚡</sup>, Nu-Metop<sup>⚡</sup>, PHL-Metoprolol, PMS-Metoprolol-L<sup>⚡</sup>, Sandoz Metoprolol<sup>⚡</sup>

**Pharmacologic class:** Beta-adrenergic blocker (selective)

**Therapeutic class:** Antihypertensive, antianginal

**Pregnancy risk category** C

### FDA BOXED WARNING

- Exacerbations of angina pectoris and myocardial infarction (MI) may follow abrupt withdrawal of some beta blockers. When discontinuing long-term therapy, particularly in patients with ischemic heart disease, reduce dosage gradually over 1 to 2 weeks and monitor patient carefully. If angina worsens markedly or acute coronary insufficiency develops, reinstate drug promptly (at least temporarily) and take other appropriate measures to manage unstable angina. Caution patient not to interrupt or discontinue therapy without prescriber's advice. Because coronary artery disease is common and may be unrecognized, it may be prudent not to discontinue drug abruptly even in patients treated only for hypertension.

### Action

Blocks stimulation of beta<sub>1</sub> (myocardial) adrenergic receptors, usually without affecting beta<sub>2</sub> (pulmonary, vascular, uterine) adrenergic receptor sites

### Availability

*Injection (tartrate):* 1 mg/ml

*Tablets:* 50 mg, 100 mg

*Tablets (extended-release, succinate):* 25 mg, 50 mg, 100 mg, 200 mg

### Indications and dosages

➤ Hypertension

**Adults:** 50 to 100 mg P.O. daily as a single dose or in two divided doses (conventional tablets) or once daily (extended-release tablets). May be increased q 7 days as needed, up to 450 mg/day (tartrate) or 400 mg (succinate extended-release).

➤ Angina pectoris

**Adults:** 100 mg P.O. daily as a single dose or in two divided doses (conventional tablets) or once daily

(extended-release tablets). May be increased q 7 days as needed, up to 400 mg.

➤ MI

**Adults:** Three bolus injections of 5 mg I.V. given at 2-minute intervals. If patient tolerates I.V. dose, give 50 mg P.O. 15 minutes after last I.V. dose, and continue P.O. doses q 6 hours for 48 hours. For maintenance, 100 mg P.O. b.i.d. If patient doesn't tolerate full I.V. dose, give 25 to 50 mg P.O. (depending on degree of intolerance), starting 15 minutes after last I.V. dose or when clinical condition allows; discontinue drug if patient shows severe intolerance. As late treatment, 100 mg P.O. b.i.d. when clinical condition allows, continued for at least 3 months.

➤ Symptomatic heart failure

**Adults:** 25 mg P.O. daily (extended-release tablets) in patients with NYHA Class II heart failure. Dosage may be doubled q 2 weeks, up to 200 mg/day or until highest tolerated dosage is reached. For more severe heart failure, start with 12.5 mg P.O. daily.

### Off-label uses

- Ventricular arrhythmias, tachycardia
- Tremors
- Anxiety

### Contraindications

- Sinus bradycardia, heart block greater than first degree, cardiogenic shock, overt cardiac failure (with Lopressor used for hypertension or angina)
- Heart rate below 45 beats/minute, second- or third-degree heart block, significant first-degree heart block; systolic pressure below 100 mm Hg; or moderate-to-severe cardiac failure (when Lopressor is used for MI)
- Hypersensitivity to drug or its components, severe bradycardia, heart block greater than first degree, cardiogenic shock, decompensated cardiac failure, sick sinus syndrome (unless permanent pacemaker is in place) (with Toprol-XL)

### Precautions

Use cautiously in:

- renal or hepatic impairment, pulmonary disease, diabetes mellitus, thyrotoxicosis
- MAO inhibitor use within past 14 days
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Give metoprolol tartrate with or immediately after meals, because food enhances its absorption.
- Know that succinate extended-release tablets are scored and can be divided. However, tablet or half-tablet should be swallowed whole and not crushed or chewed.
- For I.V. administration, give each dose undiluted by direct injection over at least 1 minute.

Route	Onset	Peak	Duration
P.O.	15 min	1 hr	6-12 hr
P.O. (extended)	15 min	6-12 hr	24 hr
I.V.	Immediate	20 min	5-8 hr

### Adverse reactions

- CNS:** fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nervousness, nightmares
- CV:** orthostatic hypotension, peripheral vasoconstriction, bradycardia, **heart failure, pulmonary edema**
- EENT:** blurred vision, stuffy nose
- GI:** nausea, vomiting, constipation, diarrhea, flatulence, gastric pain, heartburn, dry mouth
- GU:** urinary frequency, erectile dysfunction, decreased libido
- Hepatic: hepatitis**
- Metabolic:** hyperglycemia, **hypoglycemia**
- Respiratory:** wheezing, **bronchospasm**
- Musculoskeletal:** back pain, joint pain
- Skin:** rash
- Other:** drug-induced lupus syndrome

## Interactions

**Drug-drug.** *Amphetamines, ephedrine, epinephrine, norepinephrine, phenylephrine, pseudoephedrine:* unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia)

*Antihypertensives, nitrates:* additive hypotension

*Digoxin:* additive bradycardia

*Dobutamine, dopamine:* reduced cardiovascular benefits of these drugs

*General anesthetics, phenytoin (I.V.), verapamil:* additive myocardial depression

*Insulin, oral hypoglycemics:* altered efficacy of these drugs

*MAO inhibitors:* hypertension

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, blood urea nitrogen, glucose, lactate dehydrogenase, lipoproteins, potassium, triglycerides, uric acid:* increased levels

**Drug-food.** *Any food:* enhanced drug absorption

**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension

*Cocaine use:* unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia)

## Patient monitoring

- Measure blood pressure closely when starting therapy and titrating dosage. Once patient stabilizes, measure blood pressure every 3 to 6 months.
- Monitor blood pressure and pulse before I.V. administration. If patient is hypotensive or has bradycardia, consult prescriber before giving dose.
- Watch for orthostatic hypotension in at-risk patients, particularly the elderly.
- Assess glucose levels in diabetic patient. Be aware that drug may mask signs and symptoms of hypoglycemia.
- Monitor for signs and symptoms of hyperthyroidism. Know that drug may mask these. Reduce dosage gradually in hyperthyroid patients.

📣 When discontinuing drug, reduce dosage gradually over 1 to 2 weeks.

## Patient teaching

- Advise patient to take with or immediately after meals.

- Tell patient that extended-release tablets are scored and can be divided, but that he should swallow tablets or half-tablets whole and not crush or chew them.

📣 Advise patient with heart failure to report signs or symptoms of worsening condition, including weight gain and increasing shortness of breath.

- Caution patient to avoid driving and other hazardous activities until drug effects are known.

- Instruct patient to notify health care providers (including dentists) that he is taking drug before having surgery.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

m

## metronidazole

Acea<sup>⚡</sup>, Anabact<sup>⚡</sup>, Apo-Metronidazole<sup>⚡</sup>, Elyzol<sup>⚡</sup>, Flagyl, Flagyl ER, Flagystatin<sup>⚡</sup>, Florazole ER, MetroCream, MetroGel, MetroGel-Vaginal, MetroLotion, Metrolyl<sup>⚡</sup>, Metrosoa<sup>⚡</sup>, Metrotop<sup>⚡</sup>, Metrozol<sup>⚡</sup>, Neutratop<sup>⚡</sup>, Nidagel<sup>⚡</sup>, Noritate, Novo-Nidazol<sup>⚡</sup>, PMS-Metronidazole<sup>⚡</sup>, Rosasol<sup>⚡</sup>, Rozex, Zidoval<sup>⚡</sup>, Zyomet<sup>⚡</sup>

## metronidazole hydrochloride

Flagyl IV

**Pharmacologic class:** Nitroimidazole derivative

**Therapeutic class:** Anti-infective, antiprotozoal

**Pregnancy risk category B**

### FDA BOXED WARNING

- Drug is carcinogenic in mice and rats. Avoid unnecessary use; reserve drug for indicated conditions.

### Action

Disturbs DNA synthesis in susceptible bacterial organisms

### Availability

*Capsules:* 375 mg

*Powder for injection:* 5 mg/ml, 500-mg vials

*Premixed injection:* 500 mg/100 ml

*Tablets:* 250 mg, 500 mg

*Tablets (extended-release):* 750 mg

*Topical cream, topical gel:* 0.75% in 28.4-g tubes

*Topical lotion:* 0.75% in 59-ml bottle

*Vaginal gel:* 0.75% (37.5 mg/5-g applicator) in 70-g tubes

### Indications and dosages

- Trichomoniasis

**Adults:** 2 g P.O. as a single dose or in two 1-g doses given on same day. Alternatively, 500 mg P.O. b.i.d. for 7 days.

- Bacterial infections

**Adults:** Initially, 15 mg/kg I.V., followed by 7.5 mg/kg I.V. q 6 hours, not to exceed 4 g/day for 7 to 10 days

- Amebiasis

**Adults:** 750 mg P.O. q 8 hours for 5 to 10 days

- Amebic liver abscess

**Adults:** 500 to 750 mg P.O. t.i.d. for 5 to 10 days. If drug can't be given orally, administer 500 mg I.V. q 6 hours for 10 days.

**Children:** 35 to 50 mg/kg/day P.O. in three divided doses for 10 days, to a maximum of 750 mg/dose

- Bacterial vaginosis

**Adults:** In nonpregnant patients, 750 mg/day P.O. (extended-release) for 7 days or 5 g of 0.75% vaginal gel b.i.d. for 5 days. In pregnant patients, 250 mg P.O. t.i.d. for 7 days.

- Perioperative prophylaxis in colorectal surgery

**Adults:** Initially, 15 mg/kg I.V. infusion over 30 to 60 minutes, completed 1 hour before surgery; if necessary, 7.5 mg/kg I.V. infusion over 30 to 60 minutes at 6 and 12 hours after initial dose

- Rosacea

**Adults:** Rub a thin layer of topical lotion, gel, or cream onto entire affected area morning and evening. Improvement should occur within 3 weeks.

### Contraindications

- Hypersensitivity to drug, other nitroimidazole derivatives, or parabens (topical form only)
- First-trimester pregnancy in patients with trichomoniasis

### Precautions

Use cautiously in:

- severe hepatic impairment
- history of blood dyscrasias, seizures, or other neurologic problems
- breastfeeding patients
- children.

### Administration

- Reconstitute powder for injection by adding 4.4 ml of sterile or bacteriostatic water for injection, 0.9% sodium chloride injection, or bacteriostatic sodium chloride injection to 500-mg vial. Further dilute resulting

concentration (100 mg/ml) in 0.9% sodium chloride injection, 5% dextrose injection, or lactated Ringer's injection solution to a concentration of 8 mg/ml or less. Infuse each I.V. dose over 1 hour.

- Be aware that for I.V. injection, drug need not be diluted or neutralized.
- Don't use equipment containing aluminum to reconstitute or transfer reconstituted solution to diluent; solution may turn reddish-brown.
- Don't interchange vaginal gel with topical gel, cream, or lotion.

Route	Onset	Peak	Duration
P.O.	Rapid	1-3 hr	8 hr
P.O. (extended)	Rapid	Unknown	Up to 24 hr
I.V.	Rapid	End of infusion	6-8 hr
Topical	Unknown	6-12 hr	Unknown
Vaginal	Unknown	6-12 hr	12 hr

### Adverse reactions

**CNS:** dizziness, headache, ataxia, vertigo, incoordination, insomnia, fatigue

**EENT:** rhinitis, sinusitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, abdominal pain, furry tongue, glossitis, dry mouth, anorexia

**GU:** dysuria, dark urine, incontinence

**Hematologic: leukopenia**

**Skin:** rash, urticaria, burning, mild skin dryness, skin irritation, transient redness (with topical forms)

**Other:** unpleasant or metallic taste, superinfection, phlebitis at I.V. site

### Interactions

**Drug-drug.** *Azathioprine, fluorouracil:* increased risk of leukopenia

*Cimetidine:* decreased metronidazole metabolism, increased risk of toxicity  
*Disulfiram:* acute psychosis and confusion

*Lithium:* increased lithium blood level

*Phenobarbital:* increased metronidazole metabolism, decreased efficacy

*Warfarin:* increased warfarin effects

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, lactate dehydrogenase:* altered levels

**Drug-behaviors.** *Alcohol use:* disulfiram-like reaction

### Patient monitoring

- Monitor I.V. site. Avoid prolonged use of indwelling catheter.
- Evaluate hematologic studies, especially in patients with history of blood dyscrasias.

### Patient teaching

• Advise patient to take drug with food if it causes GI upset. However, instruct him to take extended-release tablets 1 hour before or 2 hours after meals.

• Tell patient with trichomoniasis to refrain from sexual intercourse or to have male partner wear a condom to prevent reinfection. Explain that asymptomatic sex partners should be treated simultaneously.

• Advise patient to report fever, sore throat, bleeding, or bruising.

• Inform patient that drug may cause metallic taste and may discolor urine deep brownish-red.

• Tell patient using topical form to clean area thoroughly with mild cleanser before use and then wait 15 to 20 minutes before applying drug. Tell her she may apply cosmetics to skin after applying drug; with topical lotion, instruct her to let skin dry at least 5 minutes before applying cosmetics.

• Tell female patient to consult prescriber if she is pregnant or plans to become pregnant.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

m

## micafungin sodium

Mycamine

**Pharmacologic class:** Semisynthetic lipopeptide (echinocandin)

**Therapeutic class:** Antifungal

**Pregnancy risk category C**

### Action

Inhibits synthesis of 1,3- $\beta$ -D-glucan, an essential component of fungal cell walls

### Availability

Powder for reconstitution for infusion (lyophilized): 50-mg and 100-mg single-use vials

### Indications and dosages

➤ Candidemia, acute disseminated candidiasis, *Candida* peritonitis and abscesses

**Adults:** 100 mg daily by I.V. infusion over 1 hour for 15 days (range, 10 to 47 days)

➤ Esophageal candidiasis

**Adults:** 150 mg daily by I.V. infusion over 1 hour for 15 days (range, 10 to 30 days)

➤ Prophylaxis of *Candida* infections in patients undergoing hematopoietic stem-cell transplantation

**Adults:** 50 mg daily by I.V. infusion over 1 hour for 19 days (range, 6 to 51 days)

### Contraindications

• Hypersensitivity to drug, its components, or other echinocandins

### Precautions

Use cautiously in:

- renal or hepatic disease
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Administer by I.V. infusion only.
  - Reconstitute with 5 ml normal saline solution injection (without bacteriostatic agent) or dextrose 5% injection added to 50-mg or 100-mg vial to yield approximately 10 mg/ml or 20 mg/ml, respectively.
  - To minimize excessive foaming, gently dissolve powder by swirling vial. Don't shake vigorously.
  - Protect diluted solution from light.
  - Add reconstituted solution to 100 ml normal saline solution or 100 ml dextrose 5% before infusing.
  - Flush existing I.V. line with normal saline solution before infusing drug.
  - Infuse over 1 hour. Be aware that more rapid infusion increases risk of histamine-mediated reactions (rash, pruritus, facial swelling, vasodilation).
- 📣 If serious hypersensitivity (anaphylaxis or anaphylactoid) reaction occurs, immediately discontinue infusion and provide appropriate interventions.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache, insomnia, fatigue, rigors, dizziness, anxiety

**CV:** vasodilation, hypotension, hypertension, bradycardia, tachycardia, phlebitis, flushing, **atrial fibrillation**

**EENT:** epistaxis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, anorexia, decreased appetite

**Hematologic:** anemia, **thrombocytopenia, aggravated anemia, neutropenia, febrile neutropenia**

**Metabolic:** fluid retention, **fluid overload**

**Musculoskeletal:** back pain

**Respiratory:** pneumonia, cough, dyspnea

**Skin:** rash, pruritus, decubitus ulcers, erythema

**Other:** facial swelling, injection-site reaction, infection, bacteremia, fever, mucosal inflammation, peripheral edema, **sepsis**, **septic shock**, **hypersensitivity reaction** (including **anaphylaxis**, **anaphylactoid reactions**, and **shock**)

### Interactions

**Drug-drug.** *Itraconazole, nifedipine,*

*sirolimus:* increased risk of toxicity

**Drug-diagnostic tests.** *ALP, ALT,*

*AST, sodium:* increased levels

*Calcium, glucose, magnesium, potassium:* decreased levels

*Liver function tests:* abnormal

### Patient monitoring

- If patient develops clinical or laboratory evidence of hematologic abnormalities, abnormal liver function tests, or electrolyte disorders, monitor closely for signs or symptoms that these conditions are getting worse. Risks against benefits of continuing therapy should be considered.

### Patient teaching

- Instruct patient to contact prescriber if unusual symptoms develop or if pre-existing symptoms persist or get worse.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## midazolam hydrochloride

Apo-Midazolam<sup>®</sup>, Hypnovel<sup>®</sup>

**Pharmacologic class:** Benzodiazepine

**Therapeutic class:** Anxiolytic, sedative-hypnotic, adjunct for general anesthesia induction

**Controlled substance schedule IV**

**Pregnancy risk category D**

### FDA BOXED WARNING

- I.V. form is linked to respiratory depression and respiratory arrest, especially when used for sedation in non-critical care settings. In some cases, where this wasn't recognized promptly and treated effectively, death or hypoxic encephalopathy resulted. Use I.V. form only in hospital or ambulatory care setting that provides continuous monitoring of respiratory and cardiac function. Ensure immediate availability of resuscitative drugs and equipment as well as personnel trained in their use and skilled in airway management. For deeply sedated pediatric patient, dedicated individual should monitor patient throughout procedure.
- Patients who are debilitated, older than age 60, or receiving concurrent opioids or other CNS depressants require lower dosages. Slowly titrate initial dose and all subsequent doses; give over at least 2 minutes and allow 2 or more additional minutes to fully evaluate sedative effect. In pediatric patients, calculate dosage on mg/kg basis, and titrate slowly.
- Don't give by rapid injection to neonates. Severe hypotension and seizures may result.

### Action

Unknown. Thought to suppress CNS stimulation at limbic and subcortical levels by enhancing the effects of gamma-aminobutyric acid, an inhibitory neurotransmitter.

### Availability

*Injection:* 1 mg/ml, 5 mg/ml

*Syrup:* 2 mg/ml

### Indications and dosages

➤ To induce general anesthesia

**Adults younger than age 55:** 0.3 to 0.35 mg/kg I.V. over 20 to 30 seconds if patient hasn't received premedication, or 0.15 to 0.35 mg/kg (usual dosage of

0.25 mg/kg) I.V. over 20 to 30 seconds if patient has received premedication. Wait 2 minutes to evaluate effect. Additional increments of 25% of initial dosage may be needed to complete induction.

➤ Continuous infusion to initiate sedation

**Adults:** When rapid sedation is required, give loading dose of 0.01 to 0.05 mg/kg I.V. slowly; repeat dose q 10 to 15 minutes until adequate sedation occurs. To maintain sedation, infuse at initial rate of 0.02 to 0.10 mg/kg/hour (1 to 7 mg/hour). Adjust infusion rate as needed.

➤ Preoperative sedation, anxiolysis, and amnesia

**Adults:** 0.07 to 0.08 mg/kg I.M. 30 minutes to 1 hour before surgery. For I.V. administration in healthy adults younger than age 60, give initial dose of 1 mg and titrate slowly to effect. Some patients may respond adequately to 1-mg dose. Don't give more than 2.5 mg over a 2-minute period. Total dosage above 5 mg is rarely necessary. Wait at least 2 minutes after additional doses to assess effect.

➤ Anxiolysis and amnesia before diagnostic, therapeutic, and endoscopic procedures or anesthesia induction

**Children:** 0.25 to 0.5 mg/kg P.O. as a single dose. Maximum dosage is 20 mg.

### Dosage adjustment

- Elderly patients
- Children or neonates

### Contraindications

- Hypersensitivity to drug, its components, or other benzodiazepines
- Acute closed-angle glaucoma
- Allergy to cherries (syrup preparation)

### Precautions

Use cautiously in:

- pulmonary disease, heart failure, renal impairment, severe hepatic impairment
- obese pediatric patients

- elderly or debilitated patients
- pregnant or breastfeeding patients
- children and neonates.

### Administration

⚠ Keep oxygen and resuscitation equipment at hand in case severe respiratory depression occurs.

- Inject I.M. deep into large muscle mass.
- Know that drug may be mixed in same syringe as meperidine, atropine, scopolamine, or morphine.
- Dilute concentrate for I.V. infusion to 0.5 mg/ml using dextrose 5% in water or normal saline solution. Infuse over at least 2 minutes; then wait at least 2 minutes before giving second dose. Be aware that excessive dosage or rapid I.V. delivery may cause severe respiratory depression.
- Give oral form with liquid, but never with grapefruit juice.

Route	Onset	Peak	Duration
P.O.	10-20 min	45-60 min	2-6 hr
I.V.	1.5-5 min	Rapid	2-6 hr
I.M.	15 min	15-60 min	2-6 hr

### Adverse reactions

**CNS:** headache, oversedation, drowsiness, agitation and excitement (in children)

**CV:** hypotension, irregular pulse, bradycardia, **arrhythmias, cardiac arrest**

**GI:** nausea, vomiting

**Respiratory:** decreased respiratory rate, hiccups, **apnea, respiratory arrest**

**Other:** pain and tenderness at injection site

### Interactions

**Drug-drug.** *CNS depressants (such as some antidepressants, antihistamines, barbiturates, opioids, tranquilizers), respiratory depressants:* potentiation of CNS effects of these drugs

*Diltiazem, verapamil:* increased midazolam blood level

*Erythromycin:* decreased midazolam clearance

*Hormonal contraceptives:* prolonged midazolam half-life

*Rifampin:* decreased midazolam blood level

*Theophylline:* increased sedative effect of midazolam

**Drug-food.** *Grapefruit juice:* increased bioavailability of oral midazolam

**Drug-herbs.** *Chamomile, kava, skull-cap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* potentiation of midazolam effects

### Patient monitoring

- Monitor vital signs, ECG, respiratory status, and oxygen saturation.
- Assess neurologic status closely, especially in pediatric patient.
- Watch for nausea and vomiting.

### Patient teaching

- Advise patient that drug causes perioperative amnesia.
- If patient will use oral drug at home, instruct him to take it with liquid but never grapefruit juice.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Tell female patient to inform prescriber if she is pregnant or breastfeeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, foods, herbs, and behaviors mentioned above.

## midodrine hydrochloride

Amatine<sup>®</sup>, Apo-Midodrine<sup>®</sup>, Orvaten, ProAmatine

**Pharmacologic class:** Alpha<sub>1</sub>-adrenergic agonist

**Therapeutic class:** Antihypotensive, vasopressor

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug can markedly increase supine blood pressure, and should be used in patients whose lives are considerably impaired despite standard clinical care. Indication for its use in treating symptomatic orthostatic hypotension rests mainly on an increase in systolic pressure measured 1 minute after standing. Currently, drug's clinical benefits (mainly improved ability to perform activities of daily living) haven't been verified.

### Action

Forms active metabolite, desglymidodrine, an alpha<sub>1</sub>-adrenergic agonist that activates alpha-adrenergic receptors in arteriolar and venous vasculature. This effect increases vascular resistance and ultimately raises blood pressure.

### Availability

Tablets: 2.5 mg, 5 mg

### Indications and dosages

➤ Symptomatic orthostatic hypotension

**Adults:** 10 mg P.O. t.i.d. during daytime hours with patient in upright position. Give first dose when patient arises in morning, second dose at midday, and third dose in late afternoon.

### Dosage adjustment

- Renal impairment

### Contraindications

- Severe coronary artery disease or organic heart disease
- Acute renal disease, urinary retention
- Pheochromocytoma
- Thyrotoxicosis
- Persistent, excessive supine hypertension

### Precautions

Use cautiously in:

- renal or hepatic impairment, diabetes mellitus, vision problems
- pregnant or breastfeeding patients.

## Administration

- Don't give within 4 hours of bedtime.

Route	Onset	Peak	Duration
P.O.	Rapid	1-2 hr	Unknown

## Adverse reactions

**CNS:** paresthesia

**CV:** vasodilation, bradycardia, **supine hypertension**

**GI:** abdominal pain, dry mouth

**GU:** urinary retention, frequency, or urgency

**Skin:** rash, pruritus, piloerection

**Other:** chills, increased pain

## Interactions

**Drug-drug.** *Alpha- and beta-adrenergic blockers, cardiac glycosides, steroids:* increased risk of bradycardia, atrioventricular block

*Alpha-adrenergic blockers, fludrocortisone:* increased risk of supine hypertension

## Patient monitoring

- Monitor supine and sitting blood pressures closely. Report marked rise in supine blood pressure.
- Stay alert for paresthesias.
- Monitor kidney function studies and fluid intake and output. Watch for urinary frequency, urgency, or retention.

## Patient teaching

 Instruct patient to take while in upright position.

- Tell patient to take first dose as soon as he arises for the day, second dose at midday, and third dose in late afternoon (before 6 P.M.). Stress that doses must be taken at least 3 hours apart. Advise patient not to take drug after dinner or within 4 hours of bedtime.

 Instruct patient to promptly report symptoms of supine

hypertension (pounding in ears, blurred vision, headache).

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, vision, and alertness.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## mifepristone (RU-486)

Korlym, Mifegyne ,

Mifeprex

**Pharmacologic class:** Synthetic steroid

**Therapeutic class:** Antiprogesterational agent, abortifacient

**Pregnancy risk category** NR

## FDA BOXED WARNING

- Rare cases of serious and sometimes fatal infections and bleeding have followed spontaneous, surgical, and medical abortions, including after mifepristone use. Before starting drug, inform patient of risk of these serious events and discuss medication guide and patient agreement. Ensure that patient knows whom to call and what to do, including going to emergency department (ED) if none of provided contacts are reachable; if she experiences sustained fever, severe abdominal pain, prolonged heavy bleeding, or syncope; or if she has abdominal pain or discomfort or general malaise (including weakness, nausea, vomiting, or diarrhea) more than 24 hours after taking drug.
- Patients with serious bacterial infections and sepsis may present without fever, bacteremia, or significant pelvic examination findings after abortion.

Rare deaths have occurred in patients without fever, with or without abdominal pain, but with leukocytosis with marked left shift, tachycardia, hemoconcentration, and general malaise. Maintain high index of suspicion to rule out serious infection and sepsis.

- Advise patient to take medication guide with her if she visits ED or another health care provider who didn't prescribe drug, so provider will be aware that patient is undergoing medical abortion.
- Be aware that pregnancy must be excluded before initiation of treatment with Korlym. Patients must avoid pregnancy during treatment and for 1 month after therapy ends by using a nonhormonal, medically acceptable method of contraception; if patient has had a surgical sterilization, no additional contraception is needed. Pregnancy must also be excluded if treatment is interrupted for more than 14 days in females of childbearing potential.

### Action

Antagonizes progesterone receptor sites, inhibiting activity of endogenous and exogenous progesterone and stimulating uterine contractions, which causes fetus to separate from placental wall

### Availability

Tablets: 200 mg, 300 mg

### Indications and dosages

- Termination of intrauterine pregnancy through day 49 of pregnancy
- Adults:** On day 1, mifepristone 600 mg P.O. as a single dose. On day 3, misoprostol 400 mcg P.O. (unless abortion has been confirmed).
- Hypertension secondary to hyperglycemia secondary to hypercortisolism in adults with endogenous Cushing's syndrome who have type 2 diabetes or glucose

intolerance and have failed surgery or aren't candidates for surgery

**Adults:** Initially, 300 mg P.O. daily; increase based on clinical response and tolerability in 300-mg increments to a maximum of 1,200 mg daily. Don't exceed 20 mg/kg/day.

### Dosage Adjustment

- Renal impairment (Korlym)
- Mild to moderate hepatic impairment (Korlym)
- Concurrent use of strong P450 CYP3A inhibitors (Korlym)

### Contraindications

- Hypersensitivity to drug, misoprostol, or other prostaglandins
- Confirmed or suspected ectopic pregnancy or adnexal mass
- Chronic adrenal failure
- Bleeding disorders
- Concurrent anticoagulant therapy or long-term corticosteroid therapy
- Presence of intrauterine device (IUD)
- Inherited porphyrias
- Concomitant treatment with systemic corticosteroids for serious medical conditions or illnesses (Korlym)
- Concurrent use of simvastatin or lovastatin and CYP3A substrates with narrow therapeutic range (Korlym)
- History of unexplained vaginal bleeding or endometrial hyperplasia with atypia or endometrial carcinoma (Korlym)
- Pregnancy (Korlym)

### Precautions

Use cautiously in:

- cardiovascular, respiratory, renal, or hepatic disorders; hypertension; type 1 diabetes mellitus; anemia; jaundice; seizure disorder; cervicitis; infected endocervical lesions; acute vaginitis; uterine scarring
- hypokalemia, underlying heart conditions including heart failure and coronary vascular disease (Korlym)

- hemorrhagic disorders or concurrent use of anticoagulants (Korlym)
- concurrent use of QT interval-prolonging drugs, patients with potassium channel variants resulting in long QT interval (avoid Korlym use)
- concurrent use of drugs metabolized by CYP2B6 and moderate CYP3A inhibitors (Korlym)
- concurrent use of CYP3A inducers (such as rifampin, rifabutin, rifapentin, phenobarbital, phenytoin, carbamazepine, and St. John's wort) or hormonal contraceptives (avoid use)
- concurrent use of strong CYP3A inhibitors (use Korlym with extreme caution and only when necessary; limit dosage to 300 mg)
- concurrent use of drugs metabolized by CYP2C8/2C9 (use lowest dose of CYP2C8/2C9 substrates when used with Korlym)
- breastfeeding patients (Korlym)
- children (Korlym); safety and efficacy not established).

### Administration

- Before giving dose for termination of pregnancy, make sure patient doesn't have an IUD in place.
- Correct hypokalemia before starting Korlym.
- Give for termination of pregnancy only in health care facility under supervision of health care provider qualified to assess pregnancy stage and rule out ectopic pregnancy.
- Administer with fluids, but not with grapefruit juice.
- When giving for termination of pregnancy, confirm pregnancy termination 14 days after initial dose.

Route	Onset	Peak	Duration
P.O.	Rapid	90 min	11 days

### Adverse reactions

**CNS:** dizziness, fainting, headache, weakness, fatigue, insomnia, asthenia, anxiety, syncope, rigors

**CV:** hypertension, **QT-interval prolongation** (Korlym)

**EENT:** sinusitis

**GI:** nausea, vomiting, diarrhea, abdominal cramping, dyspepsia

**GU:** vaginitis, leukorrhea, uterine cramping, pelvic pain; endometrial hypertrophy, cystic dilatation of endometrial glands, vaginal bleeding (Korlym); **uterine hemorrhage**

**Hematologic:** anemia

**Metabolic:** hypokalemia, adrenal insufficiency (Korlym)

**Musculoskeletal:** leg pain, back pain, arthralgia

**Skin:** rash (Korlym)

**Other:** viral infections; fever, decreased appetite, peripheral edema, opportunistic infections (Korlym)

### Interactions

**Drug-drug.** *CYP2C8/2C9 substrates:* increased plasma concentrations of these drugs

*CYP3A inducers (such as carbamazepine, phenobarbital, phenytoin, rifabutin, rifampin, rifapentin):*

decreased mifepristone concentrations  
*CYP3A substrates with narrow therapeutic range (such as cyclosporine, dihydroergotamine, ergotamine, fentanyl, pimozide, quinidine, sirolimus, tacrolimus):* increased exposure of these drugs and effects

*Drugs metabolized by CYP2B6 (bupropion, efavirenz):* significantly increased exposure of these drugs

*Drugs metabolized by CYP3A (lovastatin, simvastatin):* increased risk of myopathy and rhabdomyolysis

*Glucocorticoids:* antagonized glucocorticoid effect

*Moderate CYP3A inhibitors (such as amprenavir, aprepitant, atazanavir, ciprofloxacin, darunavir/ritonavir, diltiazem, erythromycin, fluconazole, imatinib, verapamil), strong CYP3A inhibitors (such as amprenavir, boceprevir, clarithromycin, conivaptan, fosamprenavir, indinavir, itraconazole,*

lopinavir, mibefradil, nefazodone, nelfinavir, posaconazole, ritonavir, saquinavir, telaprevir, telithromycin, voriconazole): increased plasma mifepristone concentration  
*Oral contraceptives*: decreased oral contraceptive effectiveness

**Drug-diagnostic tests.** *Hematocrit, hemoglobin*: decreased values

*Potassium*: decreased level

*Red blood cells*: decreased count

**Drug-food.** *Grapefruit juice*: increased mifepristone blood level and effects

**Drug-herbs.** *St. John's wort*: decreased mifepristone blood level and effects

### Patient monitoring

- Assess vital signs, breath sounds, and bowel sounds.
- Monitor uterine contractions and type and amount of vaginal bleeding.
- Evaluate CBC.
- Monitor serum potassium level 1 to 2 weeks after starting or increasing Korlym dosage and periodically thereafter.
- 🔊 Closely monitor patient taking Korlym for signs and symptoms of adrenal insufficiency, including weakness, nausea, increased fatigue, hypotension, and hypoglycemia. If adrenal insufficiency is suspected, discontinue drug immediately and administer glucocorticoids without delay. May resume Korlym at a lower dosage after resolution of adrenal insufficiency.
- Be aware that patients with endogenous Cushing's syndrome are at risk for opportunistic infections such as *Pneumocystis jiroveci* pneumonia while taking Korlym. Monitor patient for respiratory distress shortly after Korlym initiation. Initiate appropriate diagnostic tests and treat *P. jiroveci* as indicated.

### Patient teaching

*When used for termination of pregnancy:*

- After administration, tell patient she will need to return in 48 hours for a

prostaglandin drug or to verify pregnancy termination.

- Tell patient she will have contractions for 3 or more hours after receiving drug and that vaginal bleeding may last 9 to 16 days.

🔊 Instruct patient to contact prescriber if she has persistent or extremely heavy vaginal bleeding, extreme fatigue, or orthostatic hypotension.

Caution patient that vaginal bleeding does not prove that complete abortion has occurred. Tell her she will need follow-up appointment 2 weeks later to verify pregnancy termination.

- Inform patient that she is at risk for pregnancy right after abortion is complete. Encourage appropriate contraceptive decision.

*When used for hyperglycemia secondary to hypercortisolism in patients with endogenous Cushing's syndrome:*

🔊 Instruct patient to recognize and report signs and symptoms of hypokalemia, respiratory infections, and adrenal insufficiency.

- Advise patient not to take drug with grapefruit juice and not to use herbal products without consulting prescriber.

*When used for either indication:*

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

m

## miglitol

Glyset

**Pharmacologic class:** Alpha-glucosidase inhibitor

**Therapeutic class:** Hypoglycemic

**Pregnancy risk category B**

**Action**

Inhibits alpha-glucosidases, which convert oligosaccharides and disaccharides to glucose. This inhibition causes blood glucose reduction (especially in postprandial hyperglycemia).

**Availability**

Tablets: 25 mg, 50 mg, 100 mg

**Indications and dosages**

➤ Adjunct to diet in non-insulin-dependent (type 2) diabetes mellitus or combined with a sulfonylurea when diet plus either miglitol or a sulfonylurea alone doesn't control hyperglycemia

**Adults:** 25 mg P.O. t.i.d. with first bite of each main meal. After 4 to 8 weeks, may increase to 50 mg P.O. t.i.d. After 3 months, adjust dosage further based on glycosylated hemoglobin (HbA1c) level, to a maximum of 100 mg P.O. t.i.d.

**Contraindications**

- Hypersensitivity to drug or its components
- Insulin-dependent (type 1) diabetes mellitus, diabetic ketoacidosis
- Chronic intestinal disorder associated with marked digestive or absorptive disorders or conditions that may deteriorate due to increased gas formation
- Inflammatory bowel disease, colonic ulceration, partial intestinal obstruction, or predisposition to intestinal obstruction

**Precautions**

Use cautiously in:

- significant renal impairment (safety not established)
- fever, infection, trauma, stress
- pregnant or breastfeeding patients
- children (safety not established).

**Administration**

- Give with first bite of three main meals.

Route	Onset	Peak	Duration
P.O.	Unknown	2-3 hr	Unknown

**Adverse reactions**

**GI:** abdominal pain, diarrhea, flatulence

**Skin:** rash

**Interactions**

**Drug-drug.** *Digestive enzyme preparations (such as amylase), intestinal absorbents (such as charcoal):* reduced miglitol efficacy

*Digoxin, propranolol, ranitidine:* decreased bioavailability of these drugs

**Drug-diagnostic tests.** *Serum iron:* below-normal level

**Drug-food.** *Carbohydrates:* increased diarrhea

**Patient monitoring**

- Monitor CBC, blood glucose, and HbA1c levels.
- Watch for hyperglycemia or hypoglycemia, especially if patient also takes insulin or oral sulfonylureas.

**Patient teaching**

- Instruct patient to take drug three times daily with first bite of three main meals.
- Advise patient to take drug as prescribed. If appropriate, tell him he may need insulin during periods of increased stress, infection, or surgery.
- Teach patient about diabetes. Stress importance of proper diet, exercise, weight control, and blood glucose monitoring.
- Inform patient that sucrose (as in table sugar) and fruit juice don't effectively treat miglitol-induced hypoglycemia. Advise him to use dextrose or glucagon instead to raise blood glucose level quickly.
- Tell patient drug may cause abdominal pain, diarrhea, and gas. Reassure him that these effects usually subside after several weeks.
- As appropriate, review all other significant adverse reactions and interactions,

especially those related to the drugs, tests, and foods mentioned above.

## milnacipran hydrochloride

Savella

**Pharmacologic class:** Selective serotonin and norepinephrine reuptake inhibitor

**Therapeutic class:** Antidepressant

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug causes increased risk of suicidal ideation, thinking, and behavior in children, adolescents, and young adults taking antidepressants for major depressive disorder and other psychiatric disorders.
- Drug isn't approved for use in children.

### Action

Unknown

### Availability

Tablets: 12.5 mg, 25 mg, 50 mg, 100 mg

### Indications and dosages

➤ Management of fibromyalgia

**Adults:** Initially, 12.5 mg P.O. on day 1; increase to 100 mg daily over 1 week by giving 12.5 mg b.i.d. on days 2 and 3; then 25 mg b.i.d. on days 4 to 7; after day 7, give 50 mg b.i.d.; may increase to 100 mg b.i.d. based on patient response

### Dosage adjustment

- Severe renal impairment

### Contraindications

- Monoamine oxidase (MAO) inhibitor use within past 14 days

- Uncontrolled narrow-angle glaucoma

### Precautions

Use cautiously in:

- severe hepatic or moderate renal impairment
- seizures, significant hypertension, cardiac disease
- history of mania, patients with depressive symptoms, those at risk for suicide
- controlled narrow-angle glaucoma
- concomitant use of serotonin precursors (such as tryptophan) and selective serotonin reuptake inhibitors and selective norepinephrine reuptake inhibitors (use not recommended)
- concomitant use of drugs that increase blood pressure or heart rate
- concomitant use of I.V. digoxin
- concomitant use of nonsteroidal anti-inflammatory drugs (NSAIDs), aspirin, or other drugs that affect coagulation
- significant alcohol use or chronic hepatic disease (avoid use)
- obstructive uropathies (in males)
- elderly patients
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Check blood pressure and pulse rate before starting drug.
- Administer with or without food.
- 🔊 Don't give concurrently or within 14 days of MAO inhibitor therapy; allow 5 days after stopping drug before starting MAO inhibitor.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache, tension headache, migraine, dizziness, insomnia, paresthesia, hypoesthesia, tremor, anxiety, fatigue, irritability, somnolence,

depression, stress, **seizures, neuroleptic malignant syndrome, suicidal behavior or ideation** (especially in child or adolescent)

**CV:** increased heart rate, hypertension, tachycardia, palpitations, peripheral edema

**EENT:** blurred vision

**GI:** nausea, vomiting, constipation, dry mouth, abdominal pain, decreased appetite, diarrhea, dyspepsia, gastroesophageal reflux disease, flatulence, abdominal distention

**GU:** dysuria; ejaculation disorder; ejaculation failure; erectile dysfunction; decreased libido; prostatitis; scrotal, testicular, and urethral pain; testicular swelling; urinary hesitation and retention; decreased urine flow (males); urinary tract infection, cystitis

**Hematologic:** bleeding

**Hepatic:** fulminant hepatitis (rare)

**Metabolic:** hyponatremia, hypercholesterolemia

**Respiratory:** upper respiratory tract infection, dyspnea

**Skin:** rash, pruritus

**Other:** hot flushes, flushing, hyperhidrosis, chest pain or discomfort, chills, weight loss or gain, pyrexia, injury, poisoning, procedural complications, abnormal taste, night sweats, **serotonin syndrome**

## Interactions

**Drug-drug.** *Catecholamines* (such as *epinephrine, norepinephrine*): increased risk of paroxysmal hypertension, cardiac arrhythmias

*Clonidine*: inhibited clonidine antihypertensive effects

*Digoxin* (I.V.): increased risk of adverse hemodynamic effects (such as orthostatic hypotension, tachycardia)

Drugs that affect coagulation (such as *aspirin, NSAIDs*): increased risk of bleeding

*Drugs that affect serotonergic neurotransmitter system* (such as *antipsychotics, dopamine antagonists, lithium,*

*triptans, tryptophan, and inhibitors of serotonin uptake* [such as *citalopram, escitalopram, fluoxetine, fluvoxamine, paroxetine, sertraline*): increased risk of serotonin syndrome or neuroleptic malignant syndrome–like reactions, increased risk of hypertension, coronary artery vasoconstriction

*MAO inhibitors* (such as *isocarboxazid, phenelzine, tranylcypromine*): increased risk of potentially fatal reactions (hyperthermia, myoclonus, autonomic instability)

*Other centrally acting drugs*: increased risk of CNS effects

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, cholesterol*: increased levels

*Sodium*: decreased level

**Drug-behaviors.** *Substantial alcohol use*: aggravation of preexisting hepatic disease

## Patient monitoring

☞ Monitor patient's mental status carefully. Stay alert for mood changes and indications of suicidal ideation, especially in child or adolescent.

☞ Discontinue drug and provide appropriate treatment if signs and symptoms of serotonin syndrome or neuroleptic malignant syndrome occur.

☞ Discontinue drug if signs and symptoms of hepatic dysfunction occur; don't restart drug unless another cause can be determined.

- Consider discontinuing drug if symptomatic hyponatremia occurs.
- Monitor blood pressure and pulse rate periodically throughout treatment; consider discontinuing drug if sustained increases persist.
- Monitor liver function tests.

## Patient teaching

- Instruct patient to take drug with or without food but that taking with food may increase tolerability.

- 📣 Advise patient (and significant other as appropriate) to monitor patient's mental status carefully and to immediately report increased depression or suicidal thoughts or behavior (especially in child or adolescent).
- 📣 Instruct patient to immediately report signs and symptoms of serotonin syndrome (from shivering and diarrhea to severe symptoms such as muscle rigidity, fever, and seizures).
- 📣 Instruct patient to immediately report signs and symptoms of neuroleptic malignant syndrome, such as fever, muscle rigidity, altered mental status (including catatonic signs), irregular pulse or blood pressure, rapid heartbeat, and excessive sweating.
- 📣 Tell patient to immediately report signs and symptoms of liver problems (such as yellowing of skin or eyes).
- 📣 Caution patient not to stop taking drug suddenly and that drug must be tapered.
- Instruct patient to report headache, difficulty concentrating, memory impairment, weakness, or unsteadiness.
- Tell patient to monitor blood pressure and pulse rate regularly and report sustained increases.
- Tell patient to report signs and symptoms of bleeding, including easy bruising.
- Advise patient to avoid alcohol use while taking drug.
- Advise patient to consult prescriber before taking other prescription or nonprescription drugs, especially aspirin or NSAIDs.
- Caution patient to avoid driving and other hazardous activities until drug's effects on concentration and alertness are known.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## milrinone lactate

Apo-Milrinone<sup>®</sup>

**Pharmacologic class:** Bipyridine phosphodiesterase inhibitor

**Therapeutic class:** Inotropic

**Pregnancy risk category C**

### Action

Increases cellular levels of cyclic adenosine monophosphate, causing inotropic action that relaxes vascular smooth muscle and increases myocardial contractility

### Availability

**Injection:** 1 mg/ml in 10-, 20-, and 50-ml vials

**Injection (premixed):** 200 mcg/ml in dextrose 5% in water (D<sub>5</sub>W)

### Indications and dosages

➤ Heart failure

**Adults:** Initially, 50 mcg/kg I.V. bolus given slowly over 10 minutes, followed by continuous I.V. infusion of 0.375 to 0.75 mcg/kg/minute. Don't exceed total daily dosage of 1.13 mg/kg.

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to drug

### Precautions

Use cautiously in:

- atrial flutter or fibrillation, supraventricular and ventricular arrhythmias, renal impairment, electrolyte abnormalities, decreased blood pressure, severe aortic or pulmonic valvular disease, acute phase of myocardial infarction (not recommended), electrolyte abnormalities, abnormal blood digoxin level

- elderly patients
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

• Dilute 1 mg/ml solution with half-normal saline solution, normal saline solution, or D<sub>5</sub>W per manufacturer's instructions.

- ⚠ Don't administer through same I.V. line as furosemide or torsemide (precipitate will form).
- Deliver I.V. slowly over 10 minutes.
- Expect to titrate infusion rate depending on response.

Route	Onset	Peak	Duration
I.V.	5-15 min	1-2 hr	3-6 hr

### Adverse reactions

CNS: headache

CV: hypotension, chest pain, angina, ventricular or supraventricular arrhythmias, ventricular tachycardia or fibrillation

### Interactions

None significant

### Patient monitoring

- Monitor vital signs and ECG. Watch closely for ventricular arrhythmias, sustained tachycardia, and fibrillation.
- Assess cardiovascular status closely. Stay alert for complaints of chest pain.
- ⚠ Stop drug and contact prescriber immediately if patient's systolic pressure drops 30 mm Hg or more.

### Patient teaching

- Instruct patient to change position slowly, to avoid light-headedness or dizziness from hypotension.
- As appropriate, review all other significant and life-threatening adverse reactions.

## minocycline hydrochloride

Aknemin<sup>Ⓢ</sup>, Dentomycin<sup>Ⓢ</sup>, Dom-Minocycline<sup>Ⓢ</sup>, Dynacin, Gen-Minocycline<sup>Ⓢ</sup>, Minocin, Novo-Minocycline<sup>Ⓢ</sup>, PMS-Minocycline<sup>Ⓢ</sup>, Ratio-Minocycline<sup>Ⓢ</sup>, Riva-Minocycline<sup>Ⓢ</sup>, Sandoz Minocycline<sup>Ⓢ</sup>, Sebomin<sup>Ⓢ</sup>, Sebren<sup>Ⓢ</sup>, Solodyn

**Pharmacologic class:** Tetracycline

**Therapeutic class:** Anti-infective

**Pregnancy risk category D**

### Action

Binds reversibly to 30S ribosome, inhibiting bacterial protein synthesis

### Availability

*Capsules:* 50 mg, 75 mg, 100 mg

*Capsules (pellet-filled):* 50 mg, 100 mg

*Microspheres (sustained-release):* 1 mg

*Suspension:* 50 mg/5 ml

*Tablets:* 50 mg, 75 mg, 100 mg

### Indications and dosages

➤ Infections caused by susceptible organisms

**Adults:** Initially, 200 mg P.O. then 100 mg P.O. q 12 hours or 50 mg P.O. q 6 hours

**Children ages 8 and older:** 4 mg/kg P.O. followed by 2 mg/kg q 12 hours

➤ Gonorrhea in penicillin-sensitive patients

**Adults:** Initially, 200 mg P.O., then 100 mg q 12 hours for at least 4 days

➤ Uncomplicated gonococcal urethritis in men

**Adults:** 100 mg P.O. q 12 hours for 5 days

➤ Syphilis

**Adults:** Initially, 200 mg P.O., then 100 mg q 12 hours for 10 to 15 days

➤ Acne

**Adults:** 50 mg P.O. one to three times daily

## Dosage adjustment

- Renal impairment

## Contraindications

- Hypersensitivity to drug, its components, or tetracyclines

## Precautions

Use cautiously in:

- sulfite sensitivity, renal disease, hepatic impairment, nephrogenic diabetes insipidus
- cachectic or debilitated patients
- pregnant (last half of pregnancy) or breastfeeding patients
- children younger than age 8 (not recommended).

## Administration

- Ask patient about sulfite sensitivity before giving.
- Give with 8 oz. of water, with or without food.
- Know that drug is used in penicillin-sensitive patients.

Route	Onset	Peak	Duration
P.O.	Unknown	1-4 hr	Unknown

## Adverse reactions

**CNS:** headache

**CV:** pericarditis

**EENT:** pharyngitis

**GI:** nausea, vomiting, diarrhea, oral candidiasis, stomatitis, mouth ulcers

**GU:** bladder or vaginal yeast infection

**Metabolic:** eosinophilia, **hemolytic anemia, thrombocytopenia**

**Skin:** photosensitivity, rash

**Other:** dental caries; dental infection; gingivitis; periodontitis; tooth disorder, pain, or discoloration; superinfection; hypersensitivity reactions including **anaphylaxis**

## Interactions

**Drug-drug.** *Adsorbent antidiarrheals:* decreased minocycline absorption  
*Antacids containing aluminum, calcium, or magnesium; calcium, iron, and*

*magnesium supplements; sodium bicarbonate:* decreased minocycline absorption

*Cholestyramine, colestipol:* decreased oral absorption of minocycline

*Hormonal contraceptives:* decreased contraceptive efficacy

*Methoxyflurane:* nephrotoxicity

*Penicillin:* interference with bactericidal action of penicillin

*Sucralfate:* blocked absorption of minocycline

*Warfarin:* increased anticoagulant effect

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, amylase, aspartate aminotransferase, bilirubin, blood urea nitrogen:* increased levels

*Hemoglobin, platelets, neutrophils, white blood cells:* decreased levels

*Urinary catecholamines:* false elevation

**Drug-food.** *Dairy products:* decreased minocycline absorption

**Drug-behaviors.** *Alcohol use:* decreased antibiotic effect

*Sun exposure:* increased risk of photosensitivity reaction

## Patient monitoring

- Assess patient's oral health closely for dental problems.
- Monitor patient for superinfection, especially oral, bladder, and vaginal yeast infections.
- Evaluate CBC and renal and liver function tests frequently.
- 📣 Watch closely for hypersensitivity reactions, including anaphylaxis.

## Patient teaching

- Tell patient he may take with or without food, followed by a full glass of water. Instruct him to space doses evenly over 24 hours and to take one dose 1 hour before bedtime.
- Advise patient not to take with antacids or iron, calcium, or magnesium products.

- 📣 Instruct patient to immediately report fever, chills, skin rash, unusual bleeding or bruising, sore throat, or mouth pain or discomfort.
- Stress importance of good oral hygiene to minimize adverse oral and dental effects.
- Tell patient to complete entire course of therapy even after symptoms improve.
- 📣 Caution patient not to use outdated minocycline because it may cause serious kidney disease.
- Inform female patient that drug may make hormonal contraceptives ineffective. Urge her to use barrier contraception.
- Tell pregnant patient that drug may stain fetus' teeth if taken during last half of pregnancy.
- Advise female patient to tell prescriber if she is breastfeeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

## minoxidil

Apo-Gain<sup>☼</sup>, Gen-Minoxidil<sup>☼</sup>, Loniten<sup>☼☼</sup>, Minox<sup>☼</sup>, Regaine<sup>☼</sup>, Rogaine, Rogaine Extra Strength

**Pharmacologic class:** Peripheral vasodilator (direct-acting)

**Therapeutic class:** Antihypertensive, hair growth stimulant

**Pregnancy risk category** C

### FDA BOXED WARNING

- Drug may cause serious adverse effects (such as pericardial effusion occasionally progressing to tamponade) and may exacerbate angina pectoris. Reserve it for hypertensive patients who respond inadequately to maximum

therapeutic doses of diuretic and two other antihypertensives.

- Give under close supervision, usually concurrently with therapeutic doses of beta blocker to prevent tachycardia and increased myocardial workload. Usually, drug also must be given with diuretic to prevent serious fluid accumulation. Patients with malignant hypertension and those already receiving guanethidine should be hospitalized when therapy begins so they can be monitored to avoid too rapid, or large orthostatic, blood pressure decreases.

### Action

Reduces blood pressure by relaxing vascular smooth muscle, causing vasodilation. Action in hair growth stimulation unclear; vasodilatory action may enhance microcirculation around hair follicles.

### Availability

Tablets: 2.5 mg, 10 mg

Topical solution: 2%, 5%

### Indications and dosages

➤ Severe symptomatic hypertension; hypertension associated with end-organ damage

#### Adults and children ages 12 and older:

5 mg/day as a single dose, increased carefully q 3 days. Usual range is 10 to 40 mg/day in single or divided doses. For rapid blood pressure control with careful monitoring, dosage may be adjusted q 6 hr. Maximum dosage is 100 mg/day.

**Children younger than age 12:** 0.2 mg/kg/day P.O. as a single dose. May increase in increments of 50% to 100% until blood pressure control is optimal. Usual range is 0.25 to 1 mg/kg/day; maximum recommended dosage is 50 mg/day.

➤ Male-pattern baldness; diffuse hair loss or thinning in women; adjunct to hair transplantation

**Adults:** Apply 1 ml of 2% or 5% topical solution to affected area b.i.d. for 4 months or longer.

➤ Alopecia areata

**Adults:** Apply 1 ml of 2% or 5% topical solution to scalp b.i.d.

### Contraindications

- Hypersensitivity to drug or its components
- Dissecting aortic aneurysm
- Pheochromocytoma

### Precautions

Use cautiously in:

- recent MI, malignant hypertension, heart failure, angina pectoris, severe renal impairment
- concurrent guanethidine therapy
- pregnant or breastfeeding patients.

### Administration

• Give oral form with meals to decrease GI upset.

- If patient is also receiving guanethidine, discontinue that drug 1 to 3 days before starting minoxidil, to avoid severe orthostatic hypotension.
- Know that oral form is usually given with a beta-adrenergic blocker or diuretic to control hypertension.

Route	Onset	Peak	Duration
P.O.	30 min	2-3 hr	2-5 days
Topical	Unknown	Unknown	Unknown

### Adverse reactions

**CV:** ECG changes (such as T-wave changes), tachycardia, angina, **pericardial effusion, cardiac tamponade, heart failure**

**GI:** nausea, vomiting

**Respiratory:** pulmonary edema

**Skin:** hypertrichosis

**Other:** weight gain, edema

### Interactions

**Drug-drug.** *Antihypertensives, nitrates:* additive hypotension

*Guanethidine:* severe orthostatic hypotension

*Nonsteroidal anti-inflammatory drugs:* decreased minoxidil efficacy

**Drug-diagnostic tests.** *Alkaline phosphatase, blood urea nitrogen, creatinine, plasma renin activity, sodium:* increased levels

*Hematocrit, hemoglobin, red blood cells:* decreased levels

### Patient monitoring

- Monitor vital signs and ECG.
- Assess daily weight and fluid intake and output.
- Monitor cardiovascular status carefully. Stay alert for signs and symptoms of heart failure.
- Watch for hypertrichosis.
- Know that hematologic and renal values usually return to pretreatment levels with continued therapy.

### Patient teaching

- Instruct patient to take oral form with meals to decrease GI upset.
- Advise patient to weigh himself daily and report sudden gains.
- Tell patient taking oral form that drug may darken, lengthen, and thicken body hair. Tell him to shave or use depilatory to reduce unwanted hair growth. Reassure him that unwanted growth will disappear 1 to 6 months after he stops taking drug.
- Instruct patient to immediately report difficulty breathing (especially when lying down) or pain in chest, arm, or shoulder.
- Teach patient how to use topical form. Urge him to read package insert carefully.
- Caution patient not to use topical form on other body parts and not to let it contact mucous membranes.
- Tell patient using topical form that new scalp hair will be soft and barely visible. Caution him to use only 1 ml twice daily, regardless of amount of balding. Remind him not to stop using

drug suddenly, because new hair growth will be lost.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## mirtazapine

Apo-Mirtazapine<sup>✳</sup>, Dom-Mirtazapine<sup>✳</sup>, Gen-Mirtazapine<sup>✳</sup>, Novo-Mirtazapine<sup>✳</sup>, PHL-Mirtazapine<sup>✳</sup>, PMS-Mirtazapine<sup>✳</sup>, Ratio-Mirtazapine<sup>✳</sup>, Remeron, Remeron RD<sup>✳</sup>, Remeron Soltab, Riva-Mirtazapine<sup>✳</sup>, Sandoz Mirtazapine<sup>✳</sup>, Zispin<sup>✳</sup>

**Pharmacologic class:** Piperazine-azepine derivative

**Therapeutic class:** Tetracyclic antidepressant

**Pregnancy risk category** C

### FDA BOXED WARNING

- Drug may increase risk of suicidal thinking and behavior in children and adolescents with major depressive disorder and other psychiatric disorders. Risk must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family and caregivers to observe patient closely and communicate with prescriber as needed.
- Drug isn't approved for use in pediatric patients.

## Action

Potentiates effects of norepinephrine and serotonin by blocking their synaptic reuptake. Also exerts anticholinergic activity by disrupting muscarinic receptors.

## Availability

Tablets: 15 mg, 30 mg, 45 mg

Tablets (orally disintegrating): 15 mg, 30 mg, 45 mg

## Indications and dosages

➤ Depression

**Adults:** Initially, 15 mg/day as a single dose at bedtime; may increase dosage q 1 to 2 weeks up to 45 mg/day. For maintenance, 15 to 45 mg/day.

## Dosage adjustment

- Renal or hepatic impairment
- Elderly patients

## Contraindications

- Hypersensitivity to drug
- MAO inhibitor use within past 14 days

## Precautions

Use cautiously in:

- hepatic or renal impairment
- history of seizures, cardiovascular or cerebrovascular disease, or psychiatric illness
- elderly patients
- pregnant or breastfeeding patients
- children (safety not established).

## Administration

- Administer orally disintegrating tablet without water. Have patient place it on tongue until it melts. Make sure tablet isn't broken.
- Be aware that drug is usually used in conjunction with psychotherapy.
- ⚠ Don't give within 14 days of MAO inhibitors.

Route	Onset	Peak	Duration
P.O.	1-2 wk	≥6 wk	Unknown

## Adverse reactions

**CNS:** drowsiness, dizziness, abnormal dreams, abnormal thinking, asthenia, tremor, confusion, **suicidal behavior or ideation (especially in child or adolescent)**

**CV:** orthostatic hypotension, chest pain

**EENT:** sinusitis

**GI:** constipation, dry mouth

**GU:** urinary frequency, urinary tract infection

**Hematologic:** agranulocytosis

**Musculoskeletal:** back pain, myalgia

**Respiratory:** increased cough, dyspnea

**Skin:** photosensitivity

**Other:** flulike symptoms, edema, increased appetite, weight gain, increased thirst

## Interactions

**Drug-drug.** *Benzodiazepines, other CNS depressants:* additive CNS depression

*Drugs metabolized by CYP450 enzyme:* altered metabolism of these drugs

*MAO inhibitors:* hypertension, seizures, death

**Drug-diagnostic tests.** *Alanine aminotransferase, cholesterol, triglycerides:* increased levels

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

*S-adenosylmethionine (SAM-e), St. John's wort:* increased risk of serotonergic adverse effects (including serotonin syndrome)

**Drug-behaviors.** *Alcohol use:* additive CNS effects

## Patient monitoring

- Monitor vital signs, especially for orthostatic hypotension.
- Assess neurologic status.
- Watch for weight gain caused by edema or increased appetite.
- Stay alert for urinary tract infection, sinusitis, and flulike symptoms.

🚨 Monitor CBC with white cell differential. Stay alert for agranulocytosis.

🚨 Watch for suicidal behavior or ideation (especially in child or adolescent).

## Patient teaching

- Advise patient to take with food or milk to reduce GI upset.

- Tell patient he may crush conventional tablets if he can't swallow them whole.

- Instruct patient to take orally disintegrating tablet without water. Tell him to place it on tongue until it melts and to make sure tablet isn't broken.

- Advise patient that therapeutic effects may take 2 to 3 weeks.

🚨 Tell patient to immediately report sore throat, fever, mouth sores, or other signs or symptoms of infection.

🚨 Instruct patient (or parent) to immediately report suicidal thoughts or actions (especially in child or adolescent).

🚨 Caution patient not to discontinue drug abruptly. Dosage must be tapered.

- If drug causes oversedation, tell patient to consult prescriber about taking entire daily dose at bedtime.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- Tell patient to avoid alcohol and to discuss herbal use with prescriber.

- Instruct patient to avoid exposure to excessive sunlight or sun lamps.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

m

## misoprostol

Apo-Misoprostol<sup>✳</sup>, Cytotec, Novo-Misoprostol<sup>✳</sup>, PMS-Misoprostol<sup>✳</sup>

**Pharmacologic class:** Prostaglandin E<sub>1</sub> analog

**Therapeutic class:** Antiulcerative, cytoprotective agent

**Pregnancy risk category** X

### FDA BOXED WARNING

- In pregnant women, drug can cause abortion, premature birth, or birth defects. Uterine rupture has occurred when drug was given to pregnant women to induce labor or to induce abortion beyond week 8 of pregnancy.
- Don't give to pregnant women to reduce risk of nonsteroidal anti-inflammatory drug (NSAID)-induced ulcers.
- Advise patients of drug's abortifacient property and warn them not to give it to others.
- Don't use drug to reduce risk of NSAID-induced ulcers in women of childbearing potential unless patient is at high risk for complications from gastric ulcers linked to NSAIDs or at high risk for gastric ulcers. In such patients, drug may be prescribed if patient has had negative serum pregnancy test within 2 weeks before starting therapy; is able to comply with effective contraceptive measures; has received both oral and written warnings of drug's hazards, risk of possible contraception failure, and danger to other women of childbearing potential should drug be taken by mistake; and will begin drug only on second or third day of next normal menstrual period.

### Action

Reduces gastric acid secretion and increases gastric mucus and bicarbonate production, creating a protective coating on gastric mucosa

### Availability

Tablets: 100 mcg, 200 mcg

### Indications and dosages

➤ To prevent gastric ulcers caused by NSAIDs

**Adults:** 200 mcg q.i.d. with food, with last daily dose given at bedtime. If intolerance occurs, decrease to 100 mcg q.i.d.

### Off-label uses

- Duodenal ulcer
- Pregnancy termination

### Contraindications

- Prostaglandin hypersensitivity
- Pregnancy

### Precautions

Use cautiously in:

- females of childbearing age
- breastfeeding patients
- children younger than age 18 (safety not established).

### Administration

📢 Before starting therapy, make sure female patient understands dangers of taking drug while pregnant or breastfeeding.

- Be aware that drug should not be used in females of childbearing age, except those who need NSAIDs and are at high risk for complications from NSAID-associated gastric ulcers.
- For antiulcer use in females, start therapy on day 2 or 3 of normal menses.

Route	Onset	Peak	Duration
P.O.	Rapid	14-20 min	3-6 hr

### Adverse reactions

CNS: headache

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, flatulence

**GU:** miscarriage, menstrual disorders, postmenopausal bleeding

## Interactions

**Drug-drug.** *Magnesium-containing antacids:* increased risk of diarrhea

## Patient monitoring

- Assess GI status. Report significant adverse reactions.
- Monitor menstrual pattern or postmenopausal bleeding. Report significant problems.

## Patient teaching

- Instruct patient to take with food.
- Advise patient to report diarrhea, abdominal pain, and menstrual irregularities.
-  Tell patient drug may cause spontaneous abortion. Stress importance of using reliable contraception.
- Instruct female patient using drug for ulcer treatment to start therapy on second or third day of normal menses.
- Caution patient not to take magnesium-containing antacids, which may worsen diarrhea.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

## mitomycin

Mutamycin

**Pharmacologic class:** Antitumor antibiotic

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** C

## FDA BOXED WARNING

- Give under supervision of physician experienced in cancer chemotherapy, in facility with adequate diagnostic and treatment resources.
- Most common and severe toxic effect is bone marrow suppression.
- Some patients receiving systemic drug have experienced hemolytic uremic syndrome, a serious complication consisting primarily of microangiopathic hemolytic anemia, thrombocytopenia, and irreversible renal failure. Syndrome may arise at any time during systemic therapy, but most cases occur at doses of 60 mg or higher. Blood product transfusion may exacerbate symptoms.

## Action

Selectively inhibits DNA synthesis by causing cross-linking of DNA strands and suppressing RNA and protein synthesis, resulting in cell death

## Availability

*Injection:* 5-mg, 20-mg, and 40-mg vials

## Indications and dosages

➤ Disseminated adenocarcinoma of stomach or pancreas (given with other chemotherapeutic agents); palliative treatment when other therapies fail  
**Adults:** 20 mg/m<sup>2</sup> I.V. as a single dose. Repeat cycle q 6 to 8 weeks, adjusting dosage if necessary.

## Dosage adjustment

- Reduced white blood cell or platelet count

## Contraindications

- Hypersensitivity to drug
- Thrombocytopenia, coagulation disorders, increased bleeding tendency

## Precautions

Use cautiously in:

- active infections, decreased bone marrow reserve, impaired hepatic function
- history of pulmonary disorders
- elderly patients
- pregnant or breastfeeding patients.

## Administration

Follow facility policy for handling, administering, and disposing of mutagenic, teratogenic, and carcinogenic drugs.

Reconstitute 5-mg vial with 10 ml of sterile water. Shake, let mixture stand, and administer by direct I.V. injection through Y-tube or three-way stopcock. Infuse over 5 to 10 minutes through line with running infusion of normal saline solution or dextrose 5% in water.

Avoid extravasation and contact with skin, mucous membranes, and eyes.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

## Adverse reactions

**GI:** nausea, vomiting, anorexia, mouth ulcers, stomatitis

**GU:** renal failure, hemolytic uremic syndrome

**Hematologic:** anemia, leukopenia, thrombocytopenia

**Respiratory:** pulmonary toxicity, interstitial pneumonitis

**Skin:** reversible alopecia; pruritus; desquamation; phlebitis, necrosis, and sloughing with I.V. site extravasation

**Other:** fever

## Interactions

**Drug-drug.** *Live-virus vaccines:* decreased antibody response to vaccine, increased risk of adverse reactions

*Other antineoplastics:* additive bone marrow depression

*Vinca alkaloids:* respiratory toxicity

## Patient monitoring

Closely monitor CBC with white cell differential and platelet count. Stay alert for evidence of blood dyscrasias.

Assess kidney function tests. Measure fluid intake and output and evaluate fluid balance.

Watch for signs and symptoms of hemolytic uremic syndrome (irritability, fatigue, pallor, and decreased urinary output).

Closely monitor I.V. site and skin integrity to prevent extravasation.

Assess respiratory status carefully to detect severe pulmonary problems.

## Patient teaching

Teach patient to recognize and immediately report signs and symptoms of hemolytic uremic syndrome, blood dyscrasias, and renal failure.

Instruct patient to report cough or shortness of breath, even if it occurs several months after therapy ends.

Advise patient to limit exposure to infections and to avoid live vaccines.

Tell patient drug may cause hair loss. Discuss options for dealing with this problem.

As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## mitoxantrone hydrochloride

Novantrone, Onkotrone

**Pharmacologic class:** Antibiotic antineoplastic

**Therapeutic class:** Antineoplastic, immune modifier

**Pregnancy risk category D**

**FDA BOXED WARNING**

- Administer slowly into free-flowing I.V. infusion. Never give I.M., subcutaneously, intra-arterially, or intrathecally; severe local tissue damage may occur with extravasation.
- Except in acute nonlymphocytic leukemia, drug generally shouldn't be given to patients with baseline neutrophil counts below  $1,500/\text{mm}^3$ . Obtain frequent peripheral blood cell counts on all patients to monitor for bone marrow depression.
- Myocardial toxicity, whose severe form manifests as potentially fatal congestive heart failure (CHF), may occur during therapy or months to years afterward. Risk increases with cumulative dose. In cancer patients, risk of symptomatic CHF is about 2.6% for those receiving up to a cumulative dose of  $140 \text{ mg/m}^2$ . Monitor patients for evidence of cardiotoxicity and ask about CHF symptoms before starting therapy. In multiple sclerosis (MS) patients who reach cumulative dose of  $100 \text{ mg/m}^2$ , monitor for evidence of cardiotoxicity before each subsequent dose; they shouldn't receive cumulative dose above  $140 \text{ mg/m}^2$ .
- Active or dormant cardiovascular disease, previous or concomitant radiation to mediastinal or pericardial area, previous anthracycline or anthracenedione therapy, or concurrent use of other cardiotoxic drugs may increase cardiotoxicity risk.
- Secondary acute myelogenous leukemia has occurred in cancer patients and MS patients who received drug. Refractory secondary leukemia is more common when drug is given with DNA-damaging antineoplastics, when patients have been heavily pretreated with cytotoxic drugs, or when dosages have been escalated.

**Action**

Selectively inhibits DNA synthesis by causing cross-linking of DNA strands and suppressing RNA and protein synthesis, resulting in cell death

**Availability**

*Injection:* 2 mg/ml in 10-ml, 12.5-ml, and 15-ml vials

**Indications and dosages**

➤ Acute nonlymphocytic leukemia (given with other agents)

**Adults:** For induction— $12 \text{ mg/m}^2/\text{day}$  I.V. on days 1 to 3, with  $100 \text{ mg/m}^2$  of cytosine arabinoside given for 7 days as a continuous I.V. infusion (over 24 hours) on days 1 through 7. If remission doesn't occur, second course may follow, with mitoxantrone given for 2 days and cytosine arabinoside for 5 days at same daily dosages. For consolidation therapy— $12 \text{ mg/m}^2/\text{day}$  mitoxantrone I.V. on days 1 and 2 and  $100 \text{ mg/m}^2$  cytosine arabinoside I.V. as a continuous infusion over 24 hours on days 1 through 5, given 6 weeks after induction therapy.

➤ Pain in patients with advanced hormone-refractory prostatic cancer (given with corticosteroids)

**Adults:**  $12$  to  $14 \text{ mg/m}^2$  I.V. given over 15 to 30 minutes q 21 days

➤ Multiple sclerosis

**Adults:**  $12 \text{ mg/m}^2$  I.V. given over 5 to 15 minutes q 3 months. Maximum cumulative lifetime dosage is  $140 \text{ mg/m}^2$ .

**Contraindications**

- Hypersensitivity to drug

**Precautions**

Use cautiously in:

- bone marrow depression, heart failure, chronic debilitating illness, hepatobiliary dysfunction
- elderly patients
- pregnant or breastfeeding patients
- children.

## Administration

☞ Follow facility policy for handling, administering, and disposing of mutagenic, teratogenic, and carcinogenic drugs.

- Dilute with 50 ml or more of normal saline solution or dextrose 5% in water (D<sub>5</sub>W). Infuse I.V. over 3 to 5 minutes into running line of normal saline solution or D<sub>5</sub>W.

- Alternatively, dilute drug further in normal saline solution or D<sub>5</sub>W and infuse intermittently I.V. over 15 to 30 minutes.

☞ If extravasation occurs, stop infusion immediately.

☞ Avoid contact with skin, mucous membranes, and eyes.

- Be aware that drug isn't indicated for primary progressive multiple sclerosis.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** headache, **seizures**

**CV:** **heart failure, arrhythmias, cardiotoxicity**

**EENT:** conjunctivitis, mucositis

**GI:** nausea, vomiting, diarrhea, abdominal pain, stomatitis, **GI bleeding**

**GU:** urinary tract infection, blue-green urine, **renal failure**

**Hematologic:** anemia, **bone marrow depression, leukopenia, thrombocytopenia**

**Hepatic:** jaundice, **hepatotoxicity**

**Metabolic:** hyperuricemia

**Respiratory:** cough, dyspnea

**Skin:** rash, petechiae, bruising, alopecia

**Other:** fever, infection, hypersensitivity reaction

## Interactions

**Drug-drug.** *Anthracycline antineoplastics (daunorubicin, doxorubicin, idarubicin):* increased risk of cardiomyopathy  
*Live-virus vaccines:* decreased antibody response to vaccine

*Other antineoplastics:* additive bone marrow depression

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, bilirubin, uric acid:* increased levels

## Patient monitoring

☞ Monitor CBC with white cell differential. Watch for evidence of blood dyscrasias.

- Assess vital signs, ECG, and respiratory and cardiovascular status.

- Monitor kidney and liver function tests. Measure fluid intake and output and evaluate fluid balance.

- Monitor temperature. Stay alert for fever and signs and symptoms of urinary tract and other infections.

## Patient teaching

☞ Advise patient to immediately report chest pain, seizure, easy bruising or bleeding, change in urination pattern, yellowing of skin or eyes, or difficulty breathing.

- Instruct patient to limit exposure to infections and to avoid live vaccines.

- Tell patient drug may turn urine blue-green.

- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.

- Tell female patient to inform prescriber if she is pregnant or breastfeeding.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## modafinil

Alertec<sup>⚡</sup>, Apo-Mofafinil<sup>⚡</sup>, Provigil

**Pharmacologic class:** Nonamphetamine CNS stimulant

**Therapeutic class:** Analeptic

**Controlled substance schedule** IV

**Pregnancy risk category** C

**Action**

Unknown. Thought to stimulate CNS by decreasing the release of gamma-aminobutyric acid (a CNS depressant), thereby increasing mental alertness.

**Availability**

Tablets: 100 mg, 200 mg

**Indications and dosages**

➤ Narcolepsy

**Adults:** 200 mg/day P.O. as a single dose in morning

**Dosage adjustment**

- Severe hepatic impairment

**Contraindications**

- Hypersensitivity to drug

**Precautions**

Use cautiously in:

- recent myocardial infarction, unstable angina, severe hepatic impairment, hyperthyroidism, hypertension, glaucoma, anxiety
- history of left ventricular hypertrophy, ischemic ECG changes, chest pain, arrhythmias, or mitral valve prolapse with previous CNS stimulant use
- history of psychosis
- drug abuse
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

**Administration**

- Give without food (food delays drug absorption).

Route	Onset	Peak	Duration
P.O.	Unknown	2-4 hr	Unknown

**Adverse reactions**

**CNS:** headache, dizziness, nervousness, insomnia, depression, anxiety, amnesia, tremor, emotional lability

**CV:** hypertension, chest pain, vasodilation, hypotension, syncope, **arrhythmias**

**EENT:** abnormal vision, amblyopia, epistaxis, rhinitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, dry mouth, anorexia

**GU:** abnormal urine, urinary retention, albuminuria, abnormal ejaculation

**Hematologic:** eosinophilia

**Metabolic:** hyperglycemia

**Musculoskeletal:** joint disorders, neck pain and rigidity

**Respiratory:** lung disorder, dyspnea, **asthma**

**Skin:** dry skin

**Other:** fever, chills, herpes simplex infection

**Interactions**

**Drug-drug.** *Carbamazepine, phenobarbital, rifampin, other CYP3A4 inducers:* decreased modafinil blood level

*Cyclosporine, theophylline:* decreased blood levels of these drugs

*Diazepam, phenytoin, propranolol, tricyclic antidepressants, warfarin:*

increased blood levels of these drugs

*Hormonal contraceptives:* decreased contraceptive efficacy

*Itraconazole, ketoconazole, other*

*CYP3A4 inhibitors:* increased modafinil blood level

*Methylphenidate:* delayed modafinil absorption

**Drug-diagnostic tests.** *Aspartate aminotransferase, eosinophils, gamma-glutamyl transferase, glucose:* increased levels

*Hepatic enzymes:* abnormal levels

**Patient monitoring**

- Monitor respiratory and cardiovascular status, including vital signs and ECG.

- Monitor neurologic status, including mood, motor function, cognition, and emotional lability.

- Monitor blood glucose level in diabetic patient.

- Monitor patient carefully if he is also receiving MAO inhibitors. (However, interaction studies with MAO inhibitors haven't been done.)

**Patient teaching**

- Tell patient he may take with or without food, but that food may delay drug absorption up to 1 hour.
-  Advise patient to immediately report chest pain, irregular heart beats, light-headedness, or fainting.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, vision, motor function, and alertness.
- Instruct female patient to use reliable nonhormonal contraception during and for 1 month after therapy.
- Tell diabetic patient to monitor blood glucose level closely and stay alert for hyperglycemia.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

**moexipril hydrochloride**Perdix , Univasc**Pharmacologic class:** Angiotensin-converting enzyme (ACE) inhibitor**Therapeutic class:** Antihypertensive**Pregnancy risk category C** (first trimester), **D** (second and third trimesters)**FDA BOXED WARNING**

- When used during second or third trimester of pregnancy, drug may cause fetal harm or death. Discontinue drug as soon as possible when pregnancy is detected.

**Action**

Inhibits conversion of angiotensin I to the vasoconstrictor angiotensin II, inactivates bradykinin and other

vasodilatory prostaglandins, increases plasma renin levels, and reduces aldosterone levels. Net effect is systemic vasodilation.

**Availability**

Tablets: 7.5 mg, 15 mg

**Indications and dosages**

➤ Hypertension

**Adults:** 7.5 mg P.O. daily 1 hour before a meal; may increase if blood pressure control is inadequate. Range is 7.5 mg to 30 mg/day in one or two divided doses given 1 hour before a meal.

**Dosage adjustment**

- Renal impairment
- Concurrent diuretic therapy

**Contraindications**

- Hypersensitivity to drug
- Angioedema secondary to ACE inhibitor use

**Precautions**

Use cautiously in:

- renal or hepatic impairment, hypovolemia, hyponatremia, aortic stenosis or hypertrophic cardiomyopathy, cardiac or cerebrovascular insufficiency
- family history of angioedema
- concurrent diuretic therapy
- black patients
- elderly patients
- pregnant or breastfeeding patients
- children (safety not established).

**Administration**

- Give 1 hour before meals (food reduces drug absorption).
- Adjust dosage, as ordered, according to blood pressure response.

Route	Onset	Peak	Duration
P.O.	30 min	6 hr	Up to 24 hr

**Adverse reactions****CNS:** dizziness, fatigue**CV:** chest pain, peripheral edema

**EENT:** pharyngitis, sinusitis

**GI:** nausea, diarrhea

**GU:** urinary frequency

**Metabolic:** hyperkalemia

**Musculoskeletal:** myalgia

**Respiratory:** upper respiratory infection, increased cough

**Skin:** rash, flushing, angioedema

**Other:** fever, flulike symptoms, hypersensitivity reaction

### Interactions

**Drug-drug.** *Allopurinol:* increased risk of hypersensitivity reaction

*Antacids:* decreased moexipril absorption

*Antihypertensives, general anesthetics, nitrates, phenothiazines:* additive hypotension

*Cyclosporine, indomethacin, potassium-sparing diuretics, potassium supplements, salt substitutes:* hyperkalemia

*Digoxin, lithium:* increased blood levels of these drugs

*Diuretics:* excessive hypotension

*Nonsteroidal anti-inflammatory drugs:* blunted antihypertensive response

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, potassium:* increased levels

*Antinuclear antibody:* positive titer

*Sodium:* decreased level

**Drug-food.** *Salt substitutes containing potassium:* hyperkalemia

**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension

### Patient monitoring

- Monitor vital signs and neurologic and cardiovascular status.
- Assess respiratory status, staying alert for persistent dry cough.
- Evaluate for allergic reactions and angioedema.
- Know that moexipril monotherapy is less effective in black patients, who may need additional concurrent antihypertensives.

### Patient teaching

- Instruct patient to take 1 hour before a meal.
- Tell patient to report persistent dry cough and signs or symptoms of infection (especially upper respiratory infection).
- Advise patient to change position slowly (especially during first few days of therapy), to minimize hypotension and dizziness.
- Instruct patient to limit foods high in potassium and avoid salt substitutes containing potassium.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

## montelukast sodium

Singulair

**Pharmacologic class:** Leukotriene receptor antagonist

**Therapeutic class:** Antiasthmatic

**Pregnancy risk category** B

### Action

Blocks action of leukotrienes, decreasing smooth muscle contractions and edema in bronchial airways and preventing inflammation and bronchospasm

### Availability

*Oral granules:* 4-mg base/packet

*Tablets:* 10 mg

*Tablets (chewable):* 4 mg, 5 mg

### Indications and dosages

➤ Long-term asthma management

**Adults and children ages 15 and older:**

10-mg tablet P.O. daily in evening

**Children ages 6 to 14:** 5-mg chewable tablet P.O. daily in evening

**Children ages 2 to 5:** 4-mg chewable tablet or one 4-mg packet oral granules P.O. daily in evening

**Children ages 12 to 23 months:** 4-mg packet oral granules P.O. daily in evening

➤ Prevention of exercise-induced bronchoconstriction (EIB)

**Adults and children ages 15 and older:** Single-dose, 10-mg tablet P.O. at least 2 hours before exercise; additional dose shouldn't be taken within 24 hours. Patients already taking 1 tablet daily for another indication shouldn't take an additional dose.

**Children ages 6 to 14:** 5-mg chewable tablet P.O. at least 2 hours before exercise; additional dose shouldn't be taken within 24 hours. Patients already taking 1 tablet daily for another indication shouldn't take an additional dose.

➤ Seasonal allergic rhinitis

**Adults:** 10 mg P.O. daily

**Children ages 2 to 5:** 4 mg P.O. daily either as either chewable tablet or packet of oral granules

➤ Perennial allergic rhinitis

**Adults and children ages 15 and**

**older:** 10 mg tablet P. O. daily

**Children ages 6 to 14:** 5 mg P.O. daily as chewable tablet

**Children ages 2 to 5:** 4 mg P.O. daily as either chewable tablet or one 4-mg packet of oral granules

**Children ages 6 to 23 months:** 1 packet (4 mg) oral granules P.O. daily

### Off-label use

- Chronic urticaria

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- acute asthma attack, hepatic impairment, phenylketonuria

- pregnant or breastfeeding patients
- children younger than age 6 when used for EIB prevention (safety not established)
- children younger than age 2 when used for seasonal allergy (safety not established)
- children younger than age 1 when used for asthma (safety not established)
- children younger than age 6 months when used for perennial allergy (safety not established).

### Administration

- Give with or without food.
- Administer oral granules either directly in mouth, dissolved in 1 teaspoon (5 mL) cold or room temperature baby formula or breast milk, or mixed with spoonful of cold or room temperature soft foods (applesauce, carrots, rice, or ice cream only). Don't open packet until ready to use. After opening packet, administer full dose (with or without mixing with baby formula, breast milk, or food); dose must be given within 15 minutes. If granules have been mixed with baby formula, breast milk, or food, don't store for future use.
- Ensure that patient taking drug for prevention of EIB has short-acting beta-agonist available for rescue.

Route	Onset	Peak	Duration
P.O.	Unknown	3-4 hr	Unknown
P.O. (chewable)	Unknown	2-2.5 hr	Unknown
P.O. (granules)	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** fatigue, headache, dizziness, asthenia, agitation, aggressive behavior or hostility, anxiousness, depression, disorientation, dream abnormalities, hallucinations, insomnia, irritability,

restlessness, somnambulism, tremor,  
**suicidal thinking and behavior**  
 (including suicide)

**EENT:** nasal congestion, otitis and sinusitis (in children)

**GI:** abdominal pain; nausea and diarrhea (in children); dyspepsia; infectious gastroenteritis

**Respiratory:** cough

**Skin:** rash

**Other:** dental pain, influenza, fever

### Interactions

**Drug-drug.** *CYP450 inducers (such as phenobarbital, rifampin):* decreased montelukast effects

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, eosinophils:* increased levels

### Patient monitoring

- Assess eosinophil count.
- Monitor temperature. Watch for fever and other signs and symptoms of infection.
- 📣 Monitor patient for change in mood or behavior, including suicidal ideation.

### Patient teaching

- Advise patient (or caregiver) who has asthma or asthma and rhinitis to take drug in evening.
- Instruct patient (or caregiver) who has EIB not to take another dose within 24 hours of previous dose.
- Inform patient (or caregiver) that he may sprinkle granules onto soft foods (applesauce, carrots, rice, or ice cream only) and take immediately. Drug isn't intended to be dissolved in any liquid other than breast milk or baby formula. Don't store drug that has been mixed with food or liquids for future use.
- Instruct patient or caregiver that after opening packet of oral granules, dose must be taken within 15 minutes.
- 📣 Tell patient or caregiver that drug is for preventive use only, not for treatment of acute asthma attacks and that

appropriate rescue medication should be available.

📣 Instruct patient or caregiver to notify prescriber if mood or behavior changes.

- Caution patient to avoid driving and other hazardous activities, because drug causes dizziness.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## morphine hydrochloride

Doloral<sup>✳</sup>, Morphitec<sup>✳</sup>

## morphine sulfate, morphine sulphate<sup>⚡</sup>

Astramorph PF, Avinza, Duramorph, Filnarine<sup>⚡</sup>, Filnarine SR<sup>⚡</sup>, Infumorph, Kadian, Morcap SR<sup>⚡</sup>, Morphogesic<sup>⚡</sup>, Morphogesic SR<sup>⚡</sup>, MS Contin, MST Continus<sup>⚡</sup>, MXL<sup>⚡</sup>, Novo-Morphine<sup>✳</sup>, Oramorph SR, Oramorph SR<sup>⚡</sup>, PMS Morphine Sulfate SR<sup>✳</sup>, Ratio-Morphine Sulfate SR, Rhotard<sup>⚡</sup>, Sevredol<sup>⚡</sup>, Statex<sup>✳</sup>, Sulfate SR<sup>✳</sup>, Zomorph<sup>⚡</sup>

**Pharmacologic class:** Opioid agonist

**Therapeutic class:** Opioid analgesic

**Controlled substance schedule II**

**Pregnancy risk category C**

### FDA BOXED WARNING

- Avinza (morphine sulfate) capsules are modified-release form indicated for once-daily P.O. administration to relieve moderate to severe pain requiring continuous, around-the-clock opioids for extended time. Instruct

patients to swallow capsules whole or sprinkle contents on applesauce. Warn them never to chew, crush, or dissolve capsules or consume alcoholic beverages or use prescription or nonprescription drugs containing alcohol during therapy, as this may lead to rapid release and absorption of potentially fatal dose.

- Intrathecal dosage of morphine sulfate injection is usually one-tenth of epidural dosage.

### Action

Interacts with opioid receptor sites, primarily in limbic system, thalamus, and spinal cord. This interaction alters neurotransmitter release, altering perception of and tolerance for pain.

### Availability

#### morphine hydrochloride

*Rectal suppositories:* 20 mg, 30 mg

*Syrup:* 1 mg/ml, 5 mg/ml, 10 mg/ml, 20 mg/ml, 50 mg/ml

*Tablets:* 10 mg, 20 mg, 40 mg, 60 mg

#### morphine sulfate

*Capsules:* 15 mg, 30 mg

*Capsules (extended-release):* 10 mg, 20 mg, 30 mg, 50 mg, 60 mg, 80 mg, 90 mg, 100 mg, 120 mg, 200 mg

*Capsules (sustained-release):* 10 mg, 20 mg, 30 mg, 50 mg, 60 mg, 100 mg

*Oral solution:* 2 mg/ml, 4 mg/ml, 20 mg/ml (concentrate), 10 mg/5 ml, 20 mg/5 ml, 100 mg/5 ml

*Rectal suppositories:* 5 mg, 10 mg, 20 mg, 30 mg

*Solution for epidural injection*

*(extended-release, liposomal):* 10 mg/ml, 15 mg/1.5 ml, 20 mg/2-ml vials

*Solution for epidural or intrathecal use (preservative free, for continuous microinfusion device):* 10 mg/ml and 25 mg/ml in 20-ml vials

*Solution for epidural or I.V. injection (preservative-free):* 0.5 mg/ml, 1 mg/ml

*Solution for I.M., I.V., or subcutaneous injection:* 1 mg/ml, 2 mg/ml, 4 mg/ml,

5 mg/ml, 8 mg/ml, 10 mg/ml, 15 mg/ml, 25 mg/ml, 50 mg/ml

*Solution for I.V. injection (for patient-controlled analgesia [PCA] device):*

1 mg/ml, 2 mg/ml, 3 mg/ml, 5 mg/ml

*Tablets:* 15 mg, 30 mg

*Tablets (controlled-release, sustained-release):* 15 mg, 30 mg, 60 mg, 100 mg, 200 mg

*Tablets (soluble):* 10 mg, 15 mg, 30 mg

### Indications and dosages

➤ Severe to moderate pain

*Oral use—*

**Adults:** 5 to 30 mg P.O. (immediate-release) q 4 hours p.r.n. Or 20 mg P.O. (controlled-release, Kadian) once or twice daily p.r.n. Or 200 mg P.O. (MS Contin) in opioid-tolerant patients who require daily morphine-equivalent dosages above 400 mg.

*I.M. or subcutaneous use—*

**Adults:** 5 to 20 mg/70 kg I.M. or subcutaneously q 4 hours p.r.n.

*I.V. use—*

**Adults:** 2 to 10 mg/70 kg I.V. p.r.n. given slowly over 4 to 5 minutes. As a continuous I.V. infusion, 0.1 to 1 mg/ml in dextrose 5% in water delivered by controlled-infusion device.

*Rectal use—*

**Adults:** 10 to 30 mg P.R. q 4 hours p.r.n.

*Epidural use—*

**Adults:** Initially 5 mg (Astramorph PF, Duramorph) injected in lumbar region (may relieve pain up to 24 hours). If response isn't adequate within 1 hour, carefully give incremental doses of 1 to 2 mg p.r.n., up to 10 mg/24 hours. For continuous epidural infusion, 2 to 4 mg/24 hours. For epidural injection (DepoDur) before orthopedic leg surgery, recommended dosage is 15 mg; before lower abdominal or pelvic surgery, 10 to 15 mg. For cesarean section after umbilical cord clamping, recommended dosage is 10 mg.

*Intrathecal use—*

**Adults:** Usual intrathecal dosage is one-tenth of epidural dosage; 0.2 to

1 mg as a single injection in lumbar area may relieve pain up to 24 hours.

### Dosage adjustment

- Adults weighing less than 50 kg (110 lb)
- Elderly patients
- Children

### Contraindications

- Hypersensitivity to drug, tartrazine, bisulfites, or alcohol
- Acute bronchial asthma
- Upper airway obstruction
- Respiratory depression
- GI obstruction, paralytic ileus

### Precautions

Use cautiously in:

- head trauma; increased intracranial pressure; severe renal, hepatic, or pulmonary disease; hypothyroidism; adrenal insufficiency; prostatic hypertrophy
- elderly or debilitated patients
- pregnant or breastfeeding patients.

### Administration

- For best response, give at pain onset.
- Give oral form with food or milk to minimize GI upset.
- If desired, crush immediate-release form and mix with food or fluids.
- Don't crush or break extended-release form; remind patient to swallow it whole.
- If desired, open sustained-release capsules (Kadian) and sprinkle entire contents onto small amount of food (such as applesauce). Have patient consume mixture immediately without chewing, crushing, or dissolving pellets.
- When giving by direct I.V., dilute in at least 5 ml of sterile water for injection or normal saline solution. Give 2.5 to 10 mg over 4 to 5 minutes.
- For continuous I.V. infusion, use infusion pump or PCA pump. Titrate

dosage to provide adequate pain relief.

- Don't use parenteral form if it's cloudy or contains visible particulates.

Route	Onset	Peak	Duration
P.O.	Unknown	60-120 min	4-5 hr
P.O. (extended)	Unknown	Unknown	8-24 hr
I.V.	Rapid	20 min	4-5 hr
I.M.	10-30 min	30-60 min	4-5 hr
Subcut.	20 min	50-90 min	4-5 hr
Epidural	6-30 min	Unknown	Up to 24 hr
Epidural (ext., liposomal)	Unknown	Unknown	Unknown
Intra-thecal	Rapid (min)	Unknown	Up to 24 hr
P.R.	Unknown	20-60 min	4-5 hr

### Adverse reactions

**CNS:** confusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, nightmares  
**CV:** hypotension, bradycardia  
**EENT:** blurred vision, diplopia, miosis  
**GI:** nausea, vomiting, constipation, dry mouth  
**GU:** urinary retention  
**Respiratory:** apnea, respiratory depression, respiratory arrest  
**Skin:** flushing, itching, sweating  
**Other:** physical or psychological drug dependence, drug tolerance

### Interactions

**Drug-drug.** *Antihistamines, barbiturates, clomipramine, sedative-hypnotics, tricyclic antidepressants:* additive CNS depression  
*Buprenorphine, butorphanol, dezocine, nalbuphine, pentazocine:* decreased analgesia  
*Cimetidine:* decreased morphine metabolism and increased effects  
*MAO inhibitors:* severe, unpredictable reactions

*Mixed opioid agonist-antagonists:* precipitation of withdrawal symptoms in physically dependent patients

*Warfarin:* increased anticoagulant effect

**Drug-diagnostic tests.** *Amylase, lipase:* increased levels

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

### Patient monitoring

- Monitor vital signs. Contact prescriber if respiratory rate is 10 breaths/minute or less.
- Assess pain character, location, and intensity.
- Monitor fluid intake and output. Stay alert for urinary retention.
- Monitor bowel elimination pattern. If constipation occurs, intervene as appropriate.
- Assess neurologic status. Implement safety measures as needed to prevent injury.
- Evaluate patient for signs and symptoms of physical or psychological dependence. Be watchful for drug hoarding.

### Patient teaching

- Tell patient he may crush immediate-release form and mix with food or fluids.
- Advise patient not to crush or break extended-release form. Instruct him to swallow it whole.
- Tell patient he may open sustained-release capsule (Kadian), sprinkle entire contents of capsule onto a small amount of food (such as applesauce), and consume immediately. Stress importance of not chewing, crushing, or dissolving pellets.
- Advise patient to take drug at the first sign of pain, because continuous dosing is more effective than p.r.n. dosing.

 Tell patient and caregiver that drug may cause respiratory depression. Instruct them to immediately report respiratory rate of 10 breaths/minute or less.

- Inform patient that drug may cause constipation or urinary retention. Encourage high-fiber diet and high fluid intake.
- Stress importance of taking drug only as prescribed. Point out that drug may cause psychological or physical dependence.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, vision, and alertness.
- Teach patient and caregiver about appropriate safety measures to prevent injury.
- Caution patient to avoid alcohol and other CNS depressants during and for 24 hours after therapy.
- Advise patient to avoid herbs, which may worsen adverse CNS effects.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## moxifloxacin hydrochloride

Avelox, Moxeza, Vigamox

**Pharmacologic class:** Fluoroquinolone

**Therapeutic class:** Anti-infective

**Pregnancy risk category** C

### FDA BOXED WARNING

- Fluoroquinolones for systemic use are associated with an increased risk of tendinitis and tendon rupture in all ages. This risk is further increased in patients usually over age 60, with concomitant use of corticosteroids, and in

kidney, heart, and lung transplant recipients.

- Fluoroquinolones, including Avelox, may exacerbate muscle weakness in patients with myasthenia gravis. Avoid Avelox in patients with known history of myasthenia gravis.

### Action

Selectively inhibits DNA synthesis by disrupting DNA replication and transcription and suppressing protein synthesis, causing bacterial cell death

### Availability

*Injection (premixed):* 400 mg/250-ml bag

*Ophthalmic solution:* 5% (3 ml in 4-ml bottle)

*Tablets:* 400 mg

### Indications and dosages

➤ Acute bacterial sinusitis

**Adults:** 400 mg P.O. or I.V. q 24 hours for 10 days

➤ Acute bacterial exacerbation of chronic bronchitis

**Adults:** 400 mg P.O. or I.V. q 24 hours for 5 days

➤ Community-acquired pneumonia

**Adults:** 400 mg P.O. or I.V. q 24 hours for 7 to 14 days

➤ Uncomplicated skin and skin-structure infections

**Adults:** 400 mg P.O. or I.V. q 24 hours for 7 days

➤ Bacterial conjunctivitis

**Adults:** Instill one drop of Vigamox ophthalmic solution into affected eye t.i.d. for 7 days or one drop of Moxeza ophthalmic solution into affected eye b.i.d. for 7 days.

### Contraindications

- Hypersensitivity to drug, its components, or other fluoroquinolones

### Precautions

Use cautiously in:

- known or suspected CNS disorders that may predispose to seizures or lower seizure threshold, peripheral neuropathy, diarrhea, renal impairment, cirrhosis, bradycardia, acute myocardial ischemia, dialysis
- prolonged QTc interval, hypokalemia, and drugs that prolong QT interval
- history of myasthenia gravis (avoid use)
- elderly patients
- pregnant or breastfeeding patients (safety not established except in post-exposure inhalation anthrax)
- children younger than age 18 (except in post-exposure inhalation anthrax)
- children younger than age 4 months (Moxeza ophthalmic use) or age 1 (Vigamox ophthalmic use).

### Administration

- Give premixed I.V. dose over 60 minutes. Avoid bolus or rapid infusion.
- Don't mix with other drugs in same I.V. line.
- Know that although milk or yogurt may impair absorption of P.O. moxifloxacin, drug may be given with other calcium products.

Route	Onset	Peak	Duration
P.O.	Within 1 hr	1-3 hr	24 hr
I.V.	Rapid	End of infusion	24 hr
Ophthalmic	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** dizziness, drowsiness, headache, confusion, light-headedness, insomnia, agitation, hallucinations, acute psychoses, tremor, **seizures**

**CV:** hypertension, vasodilation, tachycardia, **prolonged QT interval, arrhythmias**

**EENT:** conjunctivitis; decreased visual acuity; keratitis; eye dryness, discomfort, pain, pruritus, and hyperemia; subconjunctival hemorrhage; tearing;

otitis media; pharyngitis; rhinitis (all with ophthalmic solution)

**GI:** nausea, diarrhea, abdominal pain, **pseudomembranous colitis**

**GU:** vaginitis

**Hematologic:** eosinophilia, **thrombocytopenia, leukopenia**

**Musculoskeletal:** joint pain, tendinitis, tendon rupture

**Respiratory:** increased cough (with ophthalmic solution)

**Skin:** rash, photosensitivity, phototoxicity, **Stevens-Johnson syndrome**

**Other:** altered taste (with ophthalmic solution), phlebitis at I.V. site, superinfection, fever, exacerbation of myasthenia gravis, hypersensitivity reactions including **anaphylaxis**

## Interactions

**Drug-drug.** *Amiodarone, bepridil, disopyramide, erythromycin, pentamidine, phenothiazines, pimozide, procainamide, quinidine, sotalol, tricyclic antidepressants:* increased risk of serious adverse cardiovascular reactions  
*Antacids, bismuth subsalicylate, iron salts, sucralfate, zinc salts:* decreased moxifloxacin absorption

*Nonsteroidal anti-inflammatory drugs:* increased risks of CNS stimulation and seizures

*Theophylline:* increased theophylline blood level and possible toxicity

*Warfarin and its derivatives:* enhanced anticoagulant effect

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, lactate dehydrogenase, platelets:* increased levels

**Drug-food.** *Concurrent tube feedings, milk, yogurt:* impaired absorption of P.O. moxifloxacin

**Drug-herbs.** *Dong quai, St. John's wort:* phototoxicity

*Fennel:* decreased moxifloxacin absorption

**Drug-behaviors.** *Sun exposure:* phototoxicity

## Patient monitoring

☞ Watch for hypersensitivity reaction (such as anaphylaxis) and other allergic reactions, which may occur after initial dose. Discontinue drug at first sign of rash, jaundice, or other signs or symptoms of hypersensitivity.

- Monitor cardiovascular and neurologic status closely.

☞ Stay alert for tendinitis and Achilles tendon rupture. Discontinue drug if tendon pain or inflammation occurs.

- Monitor CBC and liver function tests.

- Assess GI status. Report signs or symptoms of pseudomembranous colitis. Be aware that if pseudomembranous colitis is suspected or confirmed, ongoing antibiotic use not directed against *Clostridium difficile* may need to be discontinued.

- Watch closely for superinfection.

- Discontinue drug if peripheral neuropathy or phototoxicity occurs.

- Closely monitor prothrombin time, International Normalized Ratio, or other suitable anticoagulation tests if drug is given concomitantly with warfarin or its derivatives.

## Patient teaching

- Advise patient to take tablets once a day with or without food, 4 hours before or 8 hours after antacids, multivitamins, sucralfate, or preparations containing aluminum, magnesium, iron, or zinc.

☞ Tell patient drug may cause serious allergic reactions even several days after therapy begins. Advise him to stop taking drug and report these reactions immediately.

☞ Urge patient to stop taking drug and promptly report tendon pain, diarrhea with blood or pus, and signs and symptoms of superinfection.

- Teach patient how to use eye drops. Caution him to avoid touching

applicator tip to eye, finger, or other object.

- Instruct patient being treated for bacterial conjunctivitis not to wear contact lenses.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## mupirocin (pseudomonic acid, pseudomonic acid A)

Bactroban, Bactroban Nasal 2%, Taro-Mupirocin\*

**Pharmacologic class:** Dermatologic agent

**Therapeutic class:** Anti-infective, topical

**Pregnancy risk category B**

### Action

Inhibits bacterial protein and RNA synthesis by reversibly and specifically binding to bacterial isoleucyl-transfer RNA synthetase. Bactericidal.

### Availability

*Intranasal ointment:* 2.15%

*Topical cream:* 2%

*Topical ointment:* 2%

### Indications and dosages

➤ Impetigo

**Adults and children ages 2 months to 16 years:** Apply a small amount of ointment topically t.i.d. for 3 to 5 days. Reevaluate if no response.

➤ Infected traumatic skin lesions

**Adults and children ages 3 months to 16 years:** Apply a small amount of cream topically t.i.d. for 10 days.

➤ Nasal colonization of methicillin-resistant *Streptococcus aureus*

**Adults and children ages 12 and older:** Apply intranasal ointment (half of single-use tube to each nostril) topically to anterior nares b.i.d. for 5 days.

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- moderate or severe renal impairment (with large doses)
- breastfeeding patients
- children younger than age 12 (intranasal ointment), younger than age 3 months (cream), or younger than age 2 months (ointment).

### Administration

- After intranasal application, press nares together repeatedly to distribute drug.
- Avoid contact with eyes.
- Discontinue use if sensitization or severe local irritation occurs.
- If desired, cover affected area with gauze dressing after applying cream or ointment.
- Don't use intranasal form with any other nasal spray.
- Don't use Bactroban ointment on mucosal surfaces. Use Bactroban Nasal (mupirocin calcium ointment) intranasally.
- Know that although mupirocin isn't absorbed systemically, polyethylene glycol (its water-miscible ointment base) may be absorbed from open wounds and damaged skin and may be excreted by the kidneys.

Route	Onset	Peak	Duration
Topical, intranasal	Not systemically absorbed		

**Adverse reactions**

**CNS:** headache (with intranasal use)

**EENT:** rhinitis, nasal stinging or burning, pharyngitis (all with intranasal use)

**GI:** mouth and lip sores

**Skin:** pruritus (with intranasal use); dry skin, rash, redness, stinging or pain, secondary wound infection

**Other:** taste disorders (with intranasal use)

**Interactions**

None significant

**Patient monitoring**

- Monitor for drug efficacy.

**Patient teaching**

- Instruct patient to wash affected area with soap and water and dry it thoroughly, then apply small amount of drug to area and rub in gently. If desired, tell him to apply gauze dressing.
- Advise patient to complete entire course of therapy, even if symptoms disappear. Tell him to try not to miss doses.
- If patient misses a dose, tell him to apply dose as soon as he remembers. However, if it's almost time for next dose, advise him to skip missed dose and resume regular dosing schedule.
- Advise patient to contact prescriber if skin infection doesn't improve within 3 to 5 days or if it worsens.
- Caution patient not to apply drug to eye or mucous membranes (except nasal form for intranasal use).
- As appropriate, review all other significant adverse reactions.

**muromonab-CD3**

Orthoclone OKT3

**Pharmacologic class:** Murine monoclonal antibody

**Therapeutic class:** Immunosuppressant

**Pregnancy risk category C**

**FDA BOXED WARNING**

- Give under supervision of physician experienced in immunosuppressive therapy and management of solid-organ transplant patients, in facility equipped for cardiopulmonary resuscitation where patient can be monitored closely based on health status.
- Drug may cause anaphylactic and anaphylactoid reactions and occasionally life-threatening or lethal systemic, cardiovascular, and CNS reactions. Monitor patient's fluid status closely before and during therapy. Methylprednisolone pretreatment is recommended to minimize symptoms of cytokine release syndrome.

**Action**

Binds to and blocks function of T lymphocytes responsible for antigen recognition, thereby reversing graft rejection

**Availability**

**Injection:** 1 mg/1 ml in 5-ml ampules

**Indications and dosages**

➤ Acute allograft rejection in kidney transplant patients; steroid-resistant acute allograft rejection in heart and liver transplant patients

**Adults and children weighing more than 30 kg (66 lb):** 5 mg/day I.V. for 10 to 14 days

**Children weighing 30 kg (66 lb) or less:** 2.5 mg/day I.V. for 10 to 14 days

## Contraindications

- Hypersensitivity to drug or other murine products
- Uncompensated heart failure
- Uncontrolled hypertension
- Predisposition to or history of seizures
- Antimouse antibody titer of 1:1000 or higher
- Pregnancy or breastfeeding

## Precautions

Use cautiously in:

- fever
- children younger than age 2.

## Administration

• In kidney transplant patients, know that therapy should start as soon as acute kidney rejection is diagnosed. In heart and liver transplant patients, therapy should start when physician determines that steroid therapy hasn't reversed allograft rejection.

 Know that drug must be given in facility equipped and staffed to treat cardiopulmonary arrest.

- For I.V. bolus injection, draw solution into syringe through low-protein-binding 0.2- or 0.22-micron filter. Discard filter and attach needle-free adapter.
- Administer bolus over less than 1 minute.
- Give antipyretics to decrease fever and corticosteroids to reduce allergic response, as prescribed.

Route	Onset	Peak	Duration
I.V.	Immediate	Unknown	1 wk

## Adverse reactions

**CNS:** fatigue, headache, weakness, tremors, hallucinations, **aseptic meningitis, cerebral edema, seizures, encephalopathy**

**CV:** chest pain, hypertension, hypotension, **heart failure, tachycardia, cardiac arrest, shock**

**EENT:** vision loss, blurred vision, conjunctivitis, photophobia, tinnitus, otitis media

**GI:** nausea, vomiting, diarrhea

**GU:** **oliguria, anuria**

**Respiratory:** dyspnea, wheezing, **severe pulmonary edema, adult respiratory distress syndrome (ARDS)**

**Skin:** flushing

**Other:** fever, chills, flulike symptoms, infection, **anaphylaxis, cytokine release syndrome**

## Interactions

**Drug-drug.** *Indomethacin:* increased muromonab blood level, encephalopathy and other adverse CNS effects  
*Live-virus vaccines:* increased viral replication and effects

*Other immunosuppressants:* increased risk of infection

**Drug-diagnostic tests.** *Blood urea nitrogen, creatinine:* increased levels

**Drug-herbs.** *Astragalus, echinacea, melatonin:* interference with immunosuppressant effect

## Patient monitoring

- Evaluate vital signs and cardiovascular status. Monitor ECG closely.

 Stay alert for signs and symptoms of cytokine release syndrome, including fever up to 41.6 °C (107 °F), chills, rigor, nausea, vomiting, abdominal pain, diarrhea, malaise, joint and muscle pain, headache, and tremors.

 Be aware that most adverse reactions occur within 30 minutes to 6 hours of first dose.

- Monitor temperature closely. Stay alert for fever and other signs and symptoms of infection.

 Assess neurologic status and respiratory status closely. Evaluate for evidence of aseptic meningitis, encephalopathy, cerebral edema, pulmonary edema, and ARDS.

## Patient teaching

- Inform patient that drug can cause serious adverse reactions. Reassure him that he will be monitored closely and will receive interventions to relieve

these reactions. Teach him which signs and symptoms to report immediately.

- Reassure patient that adverse reactions will subside as treatment progresses.
- Advise female patient to avoid becoming pregnant or breastfeeding during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## mycophenolate mofetil

CellCept

## mycophenolate mofetil hydrochloride

CellCept Intravenous

## mycophenolate sodium

Myfortic

**Pharmacologic class:** Mycophenolic acid derivative

**Therapeutic class:** Immunosuppressant

**Pregnancy risk category D**

### FDA BOXED WARNING

• Increased susceptibility to infection and possible lymphoma development may result from immunosuppression. Give drug under supervision of physician experienced in immunosuppressive therapy and management of renal, cardiac, or hepatic transplant patients, in facility with adequate diagnostic and treatment resources. Physician responsible for maintenance therapy should have complete information needed for patient follow-up.

- Use of CellCept during pregnancy is associated with increased risk of pregnancy loss and congenital malformations. Female patients of childbearing potential who are taking CellCept must use contraception.

### Action

Inhibits binding of interleukin (IL)-1 to IL-1 receptors, preventing proliferation and differentiation of activated B and T cells. Binds to intracellular proteins to prevent T-cell activation, suppressing immune responses.

### Availability

*Capsules:* 250 mg

*Injection:* 500 mg/vial

*Oral suspension:* 200 mg/ml (after constitution)

*Tablets:* 500 mg

*Tablets (delayed-release):* 180 mg, 360 mg

### Indications and dosages

➤ To prevent organ rejection in patients receiving allogeneic kidney transplants

**Adults:** 1 g P.O. or I.V. b.i.d. or 720 mg P.O. b.i.d. (delayed-release), given with corticosteroids and cyclosporine

**Children:** 400 mg/m<sup>2</sup> P.O. b.i.d. (delayed-release), up to a maximum of 720 mg b.i.d.; or 600 mg/m<sup>2</sup> P.O. b.i.d., up to a maximum daily dosage of 2 g/10 ml (oral suspension). Given with corticosteroids and cyclosporine.

➤ To prevent organ rejection in patients receiving allogeneic heart transplants

**Adults:** 1.5 g P.O. or I.V. b.i.d., given with corticosteroids and cyclosporine. May start I.V. therapy less than 24 hours after transplantation; switch to P.O. dosing when tolerated.

➤ To prevent organ rejection in patients receiving allogeneic liver transplants

**Adults:** 1.5 g b.i.d. P.O. or 1 g I.V. b.i.d., given with corticosteroids and cyclosporine

### Dosage adjustment

- Severe chronic renal impairment
- Neutropenia

### Contraindications

- Hypersensitivity to drug or its components, mycophenolic acid, or polysorbate 80 (I.V. form)

### Precautions

Use cautiously in:

- lymphoma, cancer, neutropenia, renal disease, or GI disorders
- elderly patients
- pregnant or breastfeeding patients
- children (indicated for kidney transplant only).

### Administration

- Give P.O. form at least 1 hour before or 2 hours after meals. To enhance absorption, don't give with other drugs.
- Give delayed-released tablets whole. Don't let patient crush or chew them.
- Know that pharmacist should mix oral solution before dispensing.

 Be aware that drug is teratogenic. Avoid inhaling powder in capsules or letting powder contact skin, mucous membranes, or eyes. If contact occurs, wash skin thoroughly with soap and water or flush eyes with water.

- Know that delayed-release tablets aren't interchangeable with immediate-release tablets, capsules, or oral suspension.

- For I.V. use, reconstitute with dextrose 5% in water and dilute to 6 mg/ml. Administer over 2 hours.

 Don't give by rapid I.V. push or bolus.

Route	Onset	Peak	Duration
P.O.	Unknown	30-75 min	7.5-18 hr
P.O. (delayed, suspension)	Unknown	Unknown	Unknown
I.V.	Unknown	Unknown	10-17 hr

### Adverse reactions

**CNS:** headache, dizziness, insomnia, asthenia, tremor

**CV:** chest pain, hypertension, peripheral edema

**EENT:** pharyngitis, oral moniliasis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, **GI hemorrhage**

**GU:** urinary tract infection, hematuria, **renal tubular necrosis**

**Hematologic:** anemia, hypochromic anemia, **leukocytosis, leukopenia, thrombocytopenia**

**Metabolic:** hypophosphatemia, hyperglycemia, hypokalemia, **hyperkalemia**

**Musculoskeletal:** back pain

**Respiratory:** dyspnea, cough, bronchitis, pneumonia

**Skin:** acne, rash

**Other:** pain, fever, opportunistic infections, **fatal infections, sepsis, lymphoma and other cancers** (especially of skin)

### Interactions

**Drug-drug.** *Acyclovir, ganciclovir, other drugs that undergo renal tubular secretion:* increased risk of toxicity from either drug

*Antacids containing aluminum or magnesium:* decreased mycophenolate absorption

*Cholestyramine:* reduced mycophenolate bioavailability

*Hormonal contraceptives:* reduced contraceptive efficacy

*Phenytoin, theophylline:* increased blood levels of both drugs

*Probenecid, salicylates:* increased mycophenolate blood level

**Drug-diagnostic tests.** *Cholesterol:* increased level

**Drug-herbs.** *Astragalus, echinacea, melatonin:* interference with immunosuppressant effect

m

**Patient monitoring**

- Monitor CBC with white cell differential, electrolyte levels, lipid panel, blood chemistry, and liver function tests frequently.
- Evaluate vital signs. Assess cardiovascular and respiratory status carefully. Watch for signs and symptoms of bronchitis and pneumonia.
- 🔊 Assess all body systems carefully for signs and symptoms of infection.
- 🔊 Monitor patient closely for bleeding tendency.

**Patient teaching**

- Advise patient to take oral drug at least 1 hour before or 2 hours after meals. Tell him not to crush, break, or chew tablets, not to open or chew capsules, and not to take with other drugs.
- 🔊 If capsule breaks, tell patient not to inhale powder or let it contact skin, mucous membranes, or eyes. If contact occurs, tell him to wash skin thoroughly with soap and water or flush eyes with water.
- 🔊 Instruct patient to take his temperature and promptly report fever or other signs or symptoms of infection. Tell him to immediately report unusual bleeding or bruising.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Instruct patient to avoid crowds and people with known infections.
- Advise patient not to take herbs without consulting prescriber.
- Tell patient to avoid live-virus vaccines.
- 🔊 Instruct patient to avoid excessive exposure to sunlight and ultraviolet light, because of increased risk of skin cancer.
- 🔊 Tell female patient to use abstinence or two other contraceptive methods during and for 6 weeks after therapy (even if she has a history of

infertility). Urge her to report suspected pregnancy immediately.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

**nabilone**

Cesamet

**Pharmacologic class:** Synthetic cannabinoid

**Therapeutic class:** Antiemetic

**Controlled substance schedule II**

**Pregnancy risk category C**

**Action**

Unclear. Drug has complex effects on CNS, including relaxation, drowsiness, and euphoria; antiemetic effect may result from interaction with cannabinoid receptor system in neural tissues.

**Availability**

**Capsules:** 1 mg

**Indications and dosages**

➤ Nausea and vomiting associated with cancer chemotherapy in patients who respond inadequately to conventional antiemetics

**Adults:** 1 to 2 mg P.O. twice daily; give initial dose 1 to 3 hours before chemotherapy. Maximum daily dose, 6 mg given in divided doses three times daily.

**Contraindications**

- Hypersensitivity to drug or other cannabinoids

## Precautions

Use cautiously in:

- hepatic or renal impairment, hypertension, cardiac disease, QT interval prolongation, psychiatric disorders (current or previous)
- history of substance abuse
- concurrent use of sedatives, hypnotics, other psychoactive drugs, or CNS depressants
- concurrent alcohol use
- pregnant or breastfeeding patients
- elderly patients
- children (safety and efficacy not established).

## Administration

- On day of chemotherapy, give 1 to 3 hours before chemotherapeutic drug is administered.
- To minimize adverse reactions, give recommended lower starting dosage and increase dosage as necessary.
- Know that drug may be given two or three times daily during entire course of each chemotherapy cycle and, if needed, for 48 hours after last dose of each chemotherapy cycle.

Route	Onset	Peak	Duration
P.O.	Unknown	2 hr	Unknown

## Adverse reactions

**CNS:** drowsiness, euphoria, dysphoria, inebriated feeling, mood swings, irritability, fatigue, malaise, ataxia, headache, poor concentration, disorientation, anxiety, depersonalization, depersonalization syndrome, speech disorder or disturbance, insomnia, abnormal dreams, vertigo, light-headedness, dizziness, orthostatic dizziness, twitching, depression, confusion, asthenia, sedation, hallucinations, paresthesia, memory disturbance, perception disturbance, seizures, dystonia, numbness, akathisia, tremor, incoordination, toxic psychosis, paranoia, apathy, thought disorder, panic disorder, withdrawal,

nervousness, phobic neurosis, emotional disorder, hyperactivity, hypotonia, sinus headache

**CV:** orthostatic hypotension

**EENT:** visual disturbances, pharyngitis, nasal congestion, dry throat, dry nose, nosebleed, voice change, thick tongue sensation

**GI:** nausea, dry mouth

**GU:** increased or decreased urination, urinary retention, urinary frequency

**Metabolic:** thirst

**Musculoskeletal:** muscle pain, back pain, neck pain, joint pain

**Respiratory:** dyspnea, wheezing, cough

**Skin:** excessive sweating, pruritus, rash, photosensitivity

**Other:** taste changes, increased appetite, fever, hot flashes, chills, unspecified pain, bacterial infection, chest pain, allergic reaction

## Interactions

**Drug-drug.** *Amitriptyline, amoxapine, desipramine, other tricyclics:* additive tachycardia, hypertension, drowsiness  
*Amphetamines, cocaine, other sympathomimetics:* additive hypertension, tachycardia, possible cardiotoxicity  
*Anticholinergics, antihistamines, tricyclic antidepressants:* increased tachycardia and hypertension

*Antihistamines, atropine, scopolamine, other anticholinergics:* additive or superadditive tachycardia, drowsiness  
*Antihistamines, barbiturates, benzodiazepines, buspirone, lithium, muscle relaxants, opioids, other CNS depressants:* additive drowsiness and CNS depression  
*Antipyrine, barbiturates:* decreased clearance of these drugs

*Disulfiram, fluoxetine:* reversible hypomanic reaction

*Opioids:* cross-tolerance and mutual potentiation

*Naltrexone:* enhanced nabilone effects

*Theophylline:* increased theophylline metabolism

**Drug-behaviors.** *Alcohol use:* increased positive mood effects, increased CNS depression

*Sun exposure:* increased risk of skin reactions

### Patient monitoring

- Ensure that patient remains under supervision of responsible adult, especially during initial use and dosage adjustments.
- Monitor vital signs for orthostatic hypotension and tachycardia.
- 📢 Check for adverse CNS reactions. Report significant depression, paranoid reaction, or emotional lability. Be aware that adverse psychiatric reactions can last for 48 to 72 hours after treatment ends.
- Monitor for excessive use, abuse, or misuse of drug.
- Monitor patient's nutritional and hydration status.

### Patient teaching

- Instruct patient to take drug on day of chemotherapy 1 to 3 hours before chemotherapeutic drug is scheduled.
- Teach patient about significant CNS side effects (especially mood changes) and cardiovascular side effects. Stress importance of taking drug only as prescribed and needed.
- Inform patient that drug may cause additive CNS depression if used with alcohol or other CNS depressants (such as sleeping pills, tranquilizers, or anxiolytics).
- 📢 Advise patient, family member, or caregiver to immediately report depression, suicidal thoughts, paranoid reactions, and other serious CNS reactions.
- Caution patient to avoid driving and other hazardous activities until drug effects are known.
- Instruct breastfeeding patient not to use drug while breastfeeding.

- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and behaviors mentioned above.

## nabumetone

Gen-Nabumetone<sup>☼</sup>, Nabumetone<sup>☼</sup>, Novo-Nabumetone<sup>☼</sup>, Relifex<sup>☼</sup>, Sandoz<sup>☼</sup>

**Pharmacologic class:** Nonsteroidal anti-inflammatory drug (NSAID)

**Therapeutic class:** Antiarthritic

**Pregnancy risk category C** (first and second trimesters), **D** (third trimester)

### FDA BOXED WARNING

- Drug may increase risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke. Risk may increase with duration of use. Patients with cardiovascular disease or risk factors for it may be at greater risk.
- Drug increases risk of serious GI adverse events, including bleeding, ulcers, and stomach or intestinal perforation. These events can occur at any time during use and without warning. Elderly patients are at greater risk.
- Drug is contraindicated for treatment of perioperative pain in setting of coronary artery bypass graft surgery.

### Action

Unknown. Thought to stimulate anti-inflammatory response and block pain impulses by inhibiting cyclooxygenase, an enzyme needed for prostaglandin synthesis.

## Availability

Tablets: 500 mg, 750 mg

## Indications and dosages

➤ Rheumatoid arthritis; osteoarthritis

**Adults:** 1,000 mg/day P.O. as a single dose or in two divided doses; may increase up to 2,000 mg/day

## Contraindications

- Hypersensitivity to drug
- Active GI bleeding or ulcer disease
- History of aspirin- or NSAID-induced asthma, urticaria, or other allergic-type reaction
- Concurrent use of other NSAIDs
- Pregnancy (third trimester)

## Precautions

Use cautiously in:

- severe cardiovascular, renal, or hepatic disease
- history of ulcer disease
- pregnant (first or second trimester) or breastfeeding patients
- children (safety and efficacy not established).

## Administration

- Give with food or milk to increase absorption.
- In chronic therapy, use lowest effective dosage.

Route	Onset	Peak	Duration
P.O.	1-2 hr	5 hr	12-24 hr

## Adverse reactions

**CNS:** dizziness, drowsiness, fatigue, headache, insomnia, malaise, nervousness

**CV:** vasculitis

**EENT:** abnormal vision, tinnitus

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, flatulence, stomatitis, dry mouth, **GI bleeding**

**Skin:** pruritus, rash, **angioedema**

**Other:** edema, fluid retention, allergic reactions including **anaphylaxis**

## Interactions

**Drug-drug.** *Acetaminophen:* increased risk of adverse renal reactions (with chronic nabumetone use)

*Anticoagulants, cefamandole, cefoperazone, cefotetan, clopidogrel, eptifibatide, plicamycin, thrombolytics, ticlopidine, tirofiban, valproic acid:* increased risk of bleeding

*Antihypertensives, diuretics:* decreased nabumetone efficacy

*Antineoplastics:* increased risk of adverse hematologic reactions

*Aspirin, corticosteroids, other NSAIDs, potassium supplements:* additive adverse GI effects

*Cyclosporine:* increased risk of renal toxicity

*Insulins, oral hypoglycemics:* increased hypoglycemic effect

*Methotrexate:* increased risk of methotrexate toxicity

## Patient monitoring

 Watch closely for signs and symptoms of angioedema, anaphylaxis, or other hypersensitivity reactions (including hives, swelling, shortness of breath, and abdominal pain).

- Monitor GI status. Report nutritional deficiencies.
- Assess vital signs.
- Monitor fluid intake and output.

## Patient teaching

• Tell patient he may crush tablet if he can't swallow it whole.

• To minimize GI upset, advise patient to take drug with food; eat small, frequent servings of healthy food; and drink plenty of fluids.

• Advise patient to continue taking drug for entire duration prescribed.

 Teach patient to recognize and immediately report signs and symptoms of hypersensitivity reaction and angioedema (hives, swelling, shortness of breath, abdominal pain).

• Caution patient to avoid driving and other hazardous activities until he

knows how drug affects concentration, vision, strength, and alertness.

- Advise patient not to drink alcohol. Tell him to avoid aspirin, ibuprofen, and over-the-counter preparations (unless prescribed).
- Caution female patient not to take drug, especially during third trimester.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## nadolol

Apo-Nadolol<sup>☼</sup>, Corgard,  
Novo-Nadolol<sup>☼</sup>

**Pharmacologic class:** Beta-adrenergic blocker (nonselective)

**Therapeutic class:** Antianginal, antihypertensive

**Pregnancy risk category C**

### FDA BOXED WARNING

• Catecholamine hypersensitivity may occur after drug withdrawal. Angina exacerbation and in some cases, myocardial infarction have followed abrupt withdrawal. When discontinuing long-term nadolol, reduce dosage gradually over 1 to 2 weeks and monitor patient carefully. If angina worsens markedly or acute coronary insufficiency develops, reinstate drug promptly and take other appropriate measures to manage angina. Caution patient not to interrupt or stop therapy without physician's advice. Because coronary artery disease is common and may be unrecognized, don't discontinue drug abruptly, even in patients treated only for hypertension.

## Action

Blocks stimulation of beta<sub>1</sub>- and beta<sub>2</sub>-adrenergic receptor sites, decreasing cardiac output and thereby slowing heart rate and reducing blood pressure

## Availability

**Tablets:** 20 mg, 40 mg, 80 mg, 120 mg, 160 mg

## Indications and dosages

➤ Angina pectoris

**Adults:** Initially, 40 mg P.O. daily; may increase by 40 to 80 mg q 3 to 7 days p.r.n., up to a maximum of 240 mg/day

➤ Hypertension

**Adults:** Initially, 40 mg P.O. daily; may increase by 40 to 80 mg q 7 days p.r.n., up to 320 mg/day

## Dosage adjustment

- Renal impairment

## Off-label uses

- Hyperthyroidism
- Migraine headache
- Parkinson's tremor

## Contraindications

- Hypersensitivity to drug or other beta-adrenergic blockers
- Pulmonary edema or cardiogenic shock
- Sinus bradycardia or heart block
- Heart failure (unless secondary to tachyarrhythmia treatable with beta blockers)
- Bronchial asthma (including severe chronic obstructive pulmonary disease)

## Precautions

Use cautiously in:

- renal or hepatic impairment, pulmonary disease, diabetes mellitus, thyrotoxicosis
- history of severe allergic reactions
- elderly patients
- pregnant or breastfeeding patients
- children (safety not established).

## Administration

- Give with or without food.
- Be aware that drug may be given alone or with diuretic for hypertension.

Route	Onset	Peak	Duration
P.O.	5 days	3-4 hr	24 hr

## Adverse reactions

**CNS:** dizziness, fatigue, paresthesia, behavior changes, sedation

**CV:** bradycardia, peripheral vascular insufficiency (Raynaud's phenomenon), **heart failure**

**EENT:** blurred vision, dry eyes, nasal congestion

**GI:** nausea, constipation, diarrhea, abdominal discomfort or bloating, indigestion, anorexia

**Respiratory:** bronchospasm

**Skin:** rash

## Interactions

**Drug-drug.** *Amphetamines, ephedrine, epinephrine, norepinephrine, phenylephrine, pseudoephedrine:* severe vasoconstriction and bradycardia  
*Antihypertensives, nitrates:* additive hypotension

*Clonidine:* increased hypotension and bradycardia

*Digoxin:* additive bradycardia

*Diltiazem, general anesthetics, phenytoin (I.V.), verapamil:* additive myocardial depression

*Insulins, oral hypoglycemics:* altered glycemic control

*Nonsteroidal anti-inflammatory drugs:* decreased antihypertensive action

*Thyroid hormones:* decreased nadolol efficacy

**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension

*Cocaine use:* severe vasoconstriction, bradycardia

## Patient monitoring

- Monitor vital signs and peripheral circulation. Notify prescriber of heart rate below 55 beats/minute.

- Assess for signs and symptoms of heart failure or bronchospasm.

## Patient teaching

- Advise patient to take drug with meals and a bedtime snack to minimize GI upset.
- Teach patient how to measure pulse and blood pressure; tell him when to notify prescriber.
- Instruct patient to avoid over-the-counter products containing stimulants, such as some cold and flu remedies and nasal decongestants.
- Tell diabetic patient and family that drug may mask hypoglycemia symptoms. Advise patient to monitor urine or blood glucose regularly.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and behaviors mentioned above.

n

## nafarelin acetate

Synarel

**Pharmacologic class:** Gonadotropin-releasing hormone (GnRH)

**Therapeutic class:** Hormone

**Pregnancy risk category** X

## Action

Inhibits secretion of gonadotropin, a luteinizing hormone (LH)-releasing hormone. Initially increases pituitary production of LH and follicle-stimulating hormone (FSH), which ultimately leads to deactivation of testicular and ovarian functions.

**Availability**

*Nasal spray:* 2 mg/ml in 10-ml bottle (200 mcg/spray)

**Indications and dosages**

➤ Endometriosis

**Adults:** One spray (200 mcg) intranasally in one nostril in morning and one spray in other nostril in evening (400 mcg/day). May increase to one spray in each nostril in morning and evening (800 mcg/day).

➤ Central precocious puberty

**Children:** Two sprays in each nostril in morning and evening (1,600 mcg/day). May increase up to 1,800 mcg/day (three sprays in alternating nostrils t.i.d.).

**Contraindications**

- Hypersensitivity to GnRH, its analogs, or sorbitol
- Undiagnosed abnormal vaginal bleeding
- Pregnancy or breastfeeding

**Precautions**

Use cautiously in:

- rhinitis, ovarian cysts, major risk factors for bone density loss (such as chronic alcoholism or chronic corticosteroid use).

**Administration**

- Make sure patient isn't pregnant before starting therapy.
- For endometriosis, start therapy on day 2 to day 4 of menstrual period.
- If patient needs topical decongestant, wait at least 2 hours after nafarelin dose before giving.
- Know that retreatment for endometriosis isn't recommended.

Route	Onset	Peak	Duration
Intranasal	Within 4 wk	3-4 wk	3-6 mo

**Adverse reactions**

**CNS:** emotional lability, headache, depression, insomnia, **seizures**

**CV:** chest pain, **thromboembolism**

**EENT:** nasal irritation, rhinitis

**GU:** vaginal dryness, bleeding, or discharge; menses cessation; transient breast enlargement; decreased libido

**Musculoskeletal:** reduced bone density, myalgia

**Respiratory:** dyspnea

**Skin:** urticaria, rash, pruritus, acne, oily skin, hirsutism, transient pubic hair increase

**Other:** weight changes, hot flashes, edema, body odor, hypersensitivity reaction

**Interactions**

**Drug-drug.** *Topical nasal decongestants:* reduced nafarelin absorption

**Patient monitoring**

- Monitor patient for emotional lability or depression.
- Assess nasal mucosa for erosion.
- Monitor vital signs. Weigh patient regularly; report edema.
- Stay alert for adverse hormonal effects, including hot flashes, menses cessation followed by breakthrough bleeding, hirsutism, acne, decreased libido, and vaginal dryness.
- ⚠ Closely monitor patient for signs and symptoms of seizures and thromboembolism.

**Patient teaching**

- Instruct patient to complete entire course of therapy. Advise her to keep enough of drug on hand to prevent interruption.
- Inform patient that regular menstruation should cease after 4 to 6 weeks of therapy but that breakthrough bleeding may still occur.
- Tell patient ovulation may still occur. Instruct her to use barrier contraception during therapy and to report suspected pregnancy.
- Caution patient not to breastfeed.

- Teach patient about adverse hormonal effects. Identify which signs and symptoms to report.
- Inform patient that drug may cause emotional changes or depression. Advise her to report these to prescriber.
- 📢 Instruct patient to immediately report signs and symptoms of seizures and thromboembolism.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

## **nalbuphine hydrochloride**

Nubain

**Pharmacologic class:** Opioid agonist-antagonist

**Therapeutic class:** Analgesic, adjunct to anesthesia

**Pregnancy risk category C**

### Action

Binds to opiate receptors in CNS, inhibiting ascending pain pathways. This inhibition alters perception of and response to painful stimuli.

### Availability

*Injection:* 10 mg/ml, 20 mg/ml

### Indications and dosages

➤ Moderate to severe pain

**Adults:** 10 mg/70 kg I.V., I.M., or subcutaneously q 3 to 6 hours p.r.n., up to 160 mg/day. Maximum for single dose is 20 mg.

➤ Adjunct to balanced anesthesia

**Adults:** 0.3 mg to 3 mg/kg I.V. over 10 to 15 minutes, followed by maintenance dose of 0.25 mg to 0.50 mg/kg I.V. in single doses p.r.n.

### Contraindications

- Hypersensitivity to drug

### Precautions

Use cautiously in:

- increased intracranial pressure, head trauma, myocardial infarction, severe heart disease, respiratory depression, renal or hepatic disease, impaired ventilation, hypothyroidism, adrenal insufficiency, prostatic hypertrophy, emotional instability, alcoholism
- history of substance abuse or dependence
- pregnant or breastfeeding patients
- children.

### Administration

📢 Make sure emergency resuscitation equipment and naloxone (antidote) are available before starting therapy.

- For I.M. use, inject deep into large muscle mass; rotate injection sites.
- When giving I.V. for pain, infuse undiluted over 2 to 3 minutes into vein or I.V. line with compatible solution (such as dextrose 5% in water, normal saline solution, or lactated Ringer's solution).

Route	Onset	Peak	Duration
I.V.	2-3 min	30 min	3-6 hr
I.M.	15 min	1 hr	3-6 hr
Subcut.	15 min	Unknown	3-6 hr

### Adverse reactions

**CNS:** dizziness, sedation, headache, vertigo

**CV:** hypertension, hypotension, tachycardia, bradycardia

**EENT:** miosis

**GI:** nausea, vomiting, dry mouth

**Respiratory:** dyspnea, **respiratory depression**

**Skin:** sweating, clammy skin

**Other:** hypersensitivity reactions including anaphylaxis

### Interactions

**Drug-drug.** *CNS depressants (including general anesthetics, MAO inhibitors, sedative-hypnotics, tranquilizers, tricyclic antidepressants):* additive CNS effects

**Drug-diagnostic tests.** *Amylase, lipase:* increased levels

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* additive CNS and respiratory depression

### Patient monitoring

- Monitor vital signs. Watch for respiratory depression and heart rate changes.
- Evaluate patient for CNS changes. Institute safety measures as needed to prevent injury.

🚫 Watch for hypersensitivity reactions, including anaphylaxis.

### Patient teaching

- Instruct patient to change position slowly and carefully to avoid dizziness from sudden blood pressure decrease.
- Tell patient to avoid CNS depressants (including alcohol, sedative-hypnotics, and some herbs) for at least 24 hours after taking nalbuphine.
- Advise patient to consult prescriber before taking herbs.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, vision, and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## naproxen

Apo-Naproxen<sup>☼</sup>, EC-Naprosyn, Gen Naproxen<sup>☼</sup>, Naprosyn, Naprosyn-E<sup>☼</sup>, Naprosyn-EC<sup>☼</sup>, Naprosyn SR<sup>☼</sup>, Novo-Naprox<sup>☼</sup>, Nu-Naprox<sup>☼</sup>, Nycopren<sup>☼</sup>, PMS-Naproxen EC<sup>☼</sup>, Riva-Naproxen<sup>☼</sup>

## naproxen sodium

Aflaxen, Aleve, Anaprox, Anaprox DS, Apo-Napro-Na<sup>☼</sup>, Apo-Napro-Na DS<sup>☼</sup>, Arthroxen<sup>☼</sup>, Gen-Naproxen EC<sup>☼</sup>, Napratec<sup>☼</sup>, Naprelan, Novo-Naprox Sodium<sup>☼</sup>, Novo-Naprox Sodium DS<sup>☼</sup>, Riva-Naproxen Sodium<sup>☼</sup>, Synflex<sup>☼</sup>, Synflex<sup>☼</sup>

**Pharmacologic class:** Nonsteroidal anti-inflammatory drug (NSAID)

**Therapeutic class:** Nonopioid analgesic, antipyretic, anti-inflammatory

**Pregnancy risk category B** (first and second trimesters), **D** (third trimester)

### FDA BOXED WARNING

- Drug may increase risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke (which can be fatal). Risk may increase with duration of use. Patients with cardiovascular disease or risk factors for it may be at greater risk.
- Drug increases risk of serious GI adverse events, including bleeding, ulcers, and stomach or intestinal perforation (which can be fatal). These events can occur at any time during use and without warning. Elderly patients are at greater risk.
- Drug is contraindicated for treatment of perioperative pain in setting of coronary artery bypass graft surgery.

### Action

Unknown. Thought to inhibit prostaglandin synthesis.

### Availability

#### naproxen

*Oral suspension:* 125 mg/5 ml

*Tablets:* 250 mg, 375 mg, 500 mg

*Tablets (delayed-release):* 375 mg, 500 mg

**naproxen sodium**

Caplets, tablets: 220 mg, 275 mg, 500 mg

Tablets (controlled-release): 375 mg, 500 mg, 750 mg

**Indications and dosages**

➤ Pain; osteoarthritis; ankylosing spondylitis; dysmenorrhea; bursitis; acute tendinitis

**Adults:** 250 to 500 mg (naproxen) P.O. b.i.d. (up to 1.5 g/day); 375 to 500 mg (naproxen delayed-release) P.O. t.i.d.; 250 mg, 375 mg, or 500 mg (naproxen oral suspension) P.O. b.i.d.; 275 to 550 mg (naproxen sodium) P.O. b.i.d. (up to 1.65 g/day)

**Children:** 10 mg/kg P.O. daily in two divided doses (naproxen only)

➤ Mild to moderate pain; primary dysmenorrhea

**Adults:** Initially, 500 mg (naproxen) P.O., followed by 250 mg q 6 to 8 hours p.r.n., to a maximum of 1.25 g/day. Or initially, 550 mg (naproxen sodium) P.O., followed by 275 mg q 6 to 8 hours p.r.n., to a maximum of 1,375 mg/day.

➤ Gout

**Adults:** Initially, 750 mg (naproxen) P.O., followed by 250 mg q 8 hours or initially, 825 mg (naproxen sodium) P.O., followed by 275 mg q 8 hours. On day 1, 1,000 to 1,500 mg (naproxen sodium controlled-release formulation) P.O. once daily, followed by 1,000 mg once daily until attack has subsided.

➤ Management of pain, primary dysmenorrhea, acute tendinitis and bursitis

**Adults:** Initially, two 500-mg naproxen sodium controlled-release tablets P.O. once daily. Or, for patients requiring greater analgesic benefit, two 750-mg naproxen sodium controlled-release tablets P.O. once daily. Or, three 500-mg naproxen sodium controlled-release tablets may be used for a limited period. Thereafter, total daily dose shouldn't exceed two 500-mg tablets.

➤ Rheumatoid arthritis, osteoarthritis, ankylosing spondylitis

**Adults:** Initially, two 375-mg naproxen sodium controlled-release tablets P.O. once daily, one 750-mg tablet P.O. once daily, or two 500-mg tablets P.O. once daily. During long-term administration, adjust dosage up or down depending on patient's clinical response. Use lowest effective dose in all patients. (Patients already taking naproxen 250 mg, 375 mg, or 500 mg b.i.d. may have their total daily dosage replaced with naproxen sodium controlled-release tablets as a single daily dose.)

**Dosage adjustment**

- Renal or hepatic impairment
- Elderly patients

**Contraindications**

- Hypersensitivity to drug or other NSAIDs
- Asthma, urticaria, or allergic-type reactions after taking aspirin or other NSAIDs
- Perioperative pain in the setting of coronary artery bypass graft surgery

**Precautions**

Use cautiously in:

- severe cardiovascular, renal, or hepatic disease
- advanced renal disease (not recommended)
- history of ulcer disease or GI bleeding (use with extreme caution)
- chronic alcohol use or abuse
- elderly patients
- pregnant patients
- breastfeeding patients (avoid use)
- children (naproxen sodium controlled-release) and naproxen use in children younger than age 2 (safety not established).

## Administration

- Give with food or milk to avoid GI upset.

Route	Onset	Peak	Duration
P.O. (analgesia)	1 hr	2-4 hr	8-12 hr
P.O. (anti-inflamm.)	14 days	2-4 wk	Unknown

## Adverse reactions

**CNS:** dizziness, drowsiness, headache, vertigo, light-headedness

**CV:** palpitations, tachycardia, hypertension

**GU: renal toxicity** (with long-term use in patients in whom renal prostaglandins have a compensatory role in maintenance of renal perfusion), **renal papillary necrosis**

**EENT:** visual disturbances, tinnitus, auditory disturbances

**GI:** nausea, diarrhea, constipation, heartburn, abdominal pain, stomatitis,

**GI bleeding**

**Skin:** rash, pruritus, skin eruptions, sweating, photosensitivity, **exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis**

**Other:** thirst, edema, allergic reactions including **anaphylaxis**

## Interactions

**Drug-drug.** *Acetaminophen* (chronic use), *cyclosporine*: increased risk of adverse renal effects

*Anticoagulants, thrombolytics*: increased anticoagulant effect

*Antihypertensives, cefamandole, cefoperazone, cefotetan, diuretics, eptifibatide*: decreased response

*Antineoplastics, methotrexate*: increased risk of nephrotoxicity

*Aspirin*: decreased naproxen efficacy

*Aspirin, corticosteroids, other NSAIDs*: additive adverse GI effects

*Clopidogrel, plicamycin, ticlopidine, valproic acid*: increased risk of bleeding

*Insulin, oral hypoglycemics*: increased risk of hypoglycemia

*Lithium*: increased lithium blood level and risk of nephrotoxicity

*Other photosensitizing agents*: increased risk of photosensitivity

*Probenecid*: increased naproxen blood level, increased risk of toxicity

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, blood urea nitrogen, creatinine, lactate dehydrogenase, potassium*: increased levels

*Bleeding time*: prolonged for up to 4 days after therapy ends

*Creatinine clearance, glucose, hematocrit, hemoglobin, leukocytes, platelets*: decreased values

*Urine 5-hydroxy-indoleacetic acid, urine steroids*: test interference

**Drug-herbs.** *Anise, arnica, chamomile, clove, dong quai, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, licorice*: increased anticoagulant effect, increased risk of bleeding

## Patient monitoring

- Monitor GI status. Stay alert for signs and symptoms of GI bleeding.

🚨 In long-term use, assess CBC with white cell differential and coagulation studies, and monitor for visual and hearing impairment and renal toxicity.

- Monitor cardiovascular status for tachycardia, palpitations, hypertension, and edema.

- Monitor blood glucose level closely in diabetic patients.

🚨 Monitor patient for signs and symptoms of serious skin manifestations; discontinue drug at first appearance of rash or other signs of hypersensitivity.

## Patient teaching

- Tell patient to take medication with food or milk followed by 8 oz of water, and to stay upright for 30 minutes afterward.

- Inform patient that he may crush or break regular tablets but must swallow delayed- or controlled-release form whole.

- Tell patient that drug's full therapeutic effect may take up to 2 weeks.
- Caution patient not to exceed recommended dosage.
- 📣 Instruct patient how to recognize and immediately report signs and symptoms of renal toxicity and serious skin manifestations.
- Advise patient to use sunscreen to prevent photosensitivity reaction.
- Instruct patient not to take over-the-counter medications unless prescribed.
- Tell patient to consult prescriber before taking herbs.
- Advise female patient to tell prescriber if she is pregnant or breastfeeding before starting drug.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## naratriptan hydrochloride

Amerge, Naramig 📄

**Pharmacologic class:** Selective 5-hydroxytryptamine<sub>1</sub> (5-HT<sub>1</sub>) agonist

**Therapeutic class:** Vascular headache suppressant, antimigraine drug

**Pregnancy risk category** C

### Action

Binds with specific 5-HT<sub>1</sub> receptors in intracranial blood vessels and sensory trigeminal nerves, leading to vasoconstriction and migraine relief

### Availability

Tablets: 1 mg, 2.5 mg

### 📌 Indications and dosages

➤ Migraine headache

**Adults:** 1 or 2.5 mg P.O. as single dose; may repeat in 4 hours. Don't exceed

5 mg in 24 hours; don't use to treat more than four headaches per month.

### Dosage adjustment

• Mild to moderate renal or hepatic impairment

### Contraindications

- Hypersensitivity to drug or its components
- Hemiplegic or basilar headaches
- Severe renal, cardiovascular or hepatic impairment
- History of cerebrovascular or peripheral vascular conditions
- Ischemic bowel disease
- Uncontrolled hypertension
- Use of ergot-type drugs (such as dihydroergotamine) and other 5-HT<sub>1</sub> agonists within 24 hours
- MAO inhibitor use within past 14 days

### Precautions

Use cautiously in:

- mild to moderate renal or hepatic impairment, cardiovascular risk factors
- elderly patients (not recommended)
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Know that drug does not prevent migraine.
- Give only if patient's cardiovascular status has been evaluated and determined to be safe, and if first dose can be given under supervision.

Route	Onset	Peak	Duration
P.O.	30-60 min	2-3 hr	Up to 24 hr

### Adverse reactions

**CNS:** dizziness, drowsiness, malaise, fatigue, paresthesia, **cerebral hemorrhage, subarachnoid hemorrhage, stroke, other cerebrovascular events**  
**CV:** **significant blood pressure elevation including hypertensive**

**crisis (rare), coronary artery vasospasm, myocardial infarction, ventricular fibrillation or tachycardia**  
**GI:** nausea, vomiting, **colonic ischemia with abdominal pain, bloody diarrhea**

**Other:** pain or pressure sensation in throat or neck, **peripheral vascular ischemia, serotonin syndrome**, hypersensitivity including **anaphylaxis or anaphylactoid reactions**

### Interactions

**Drug-drug.** *Ergot-type compounds (dihydroergotamine, methysergide):*

prolonged vasospastic reaction

*Hormonal contraceptives:* increased naratriptan blood level and effects

*MAO inhibitors:* increased systemic exposure to naratriptan, increased risk of adverse reactions

*Selective serotonin reuptake inhibitors:* weakness, hyperreflexia, incoordination

*Sibutramine:* serotonin syndrome

**Drug-herbs.** *S-adenosylmethionine (SAM-e), St. John's wort:* increased risk of adverse serotonergic effects

**Drug-behaviors.** *Cigarette smoking:* increased naratriptan metabolism

### Patient monitoring

- Maintain especially close monitoring in patients with cardiovascular risk factors (such as hypertension, hypercholesterolemia, obesity, diabetes mellitus, cigarette smoking, strong family history), postmenopausal women, and men older than age 40.

- Assess vital signs and ECG.

- Monitor neurologic status closely. Institute safety measures as needed to prevent injury.

🚫 Discontinue drug if serotonin syndrome is suspected.

### Patient teaching

- Tell patient to take at first sign of headache.

- Advise patient to take second dose (if approved) at least 4 hours after first

dose if headache has not gone away completely or has returned.

- Caution patient not to take more than two tablets in a 24-hour period.

🚫 Instruct patient how to recognize and immediately report signs and symptoms of stroke and other neurologic conditions, serotonin syndrome, hypersensitivity, or bloody diarrhea.

- Advise patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- Tell patient to avoid cigarette smoking and to discuss herb use with prescriber.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, herbs, and behaviors mentioned above.

## naltaluzimab

(Tysabri)

**Pharmacologic class:** Recombinant humanized IgG4K monoclonal antibody

**Therapeutic class:** Immunologic agent

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug increases risk of progressive multifocal leukoencephalopathy (PML), an opportunistic viral infection of the brain that usually leads to death or severe disability.

- Monitor patient and withhold drug immediately at first sign or symptom suggestive of PML.

- Drug is available only through a special restricted distribution program, TOUCH® Prescribing Program, and must be administered only to patients enrolled in this program.

## Action

Binds to the  $\alpha 4$ -subunit of  $\alpha 4\beta 1$  and  $\alpha 4\beta 7$  integrins expressed on the surface of all leukocytes except neutrophils, and inhibits the  $\alpha 4$ -mediated adhesion of leukocytes to their counterreceptor(s). The receptors for the  $\alpha 4$  family of integrins include vascular cell adhesion molecule-1 (VCAM-1), which is expressed on activated vascular endothelium, and mucosal address in cell adhesion molecule-1 (MAdCAM-1) present on vascular endothelial cells of the GI tract. Disruption of these molecular interactions prevents transmigration of leukocytes across the endothelium into inflamed parenchymal tissue. Specific mechanisms by which drug exerts its effects in multiple sclerosis (MS) and Crohn's disease haven't been fully defined.

## Availability

*Solution for infusion:* 300 mg/15-ml vial (20 mg/ml)

## Indications and dosages

➤ Relapsing forms of MS; moderately to severely active Crohn's disease in patients with evidence of inflammation who have had inadequate response to or can't tolerate conventional therapy

**Adults:** 300 mg by I.V. infusion over approximately 1 hour q 4 weeks. In Crohn's disease, discontinue in patient who hasn't experienced therapeutic benefit by 12 weeks of induction therapy and in patient who can't discontinue long-term concomitant steroids within 6 months of starting natalizumab.

## Contraindications

- Hypersensitivity to drug
- History of or current PML

## Precautions

Use cautiously in:

- hepatic impairment

- infections, immune reconstitution inflammatory syndrome
- concurrent use of TNF $\alpha$  inhibitors, antineoplastics, prolonged immunosuppressant or immunomodulatory therapy; systemic medical condition resulting in significantly compromised immune system (avoid use)
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

## Administration

- ⚠ Don't give as I.V. push or bolus.
- To prepare solution, withdraw 15 ml of drug concentrate from vial. Inject concentrate into 100 ml 0.9% sodium chloride injection, leading to concentration of 2.6 mg/ml. Don't use other I.V. diluents or mix with other drugs. Gently invert vial to mix completely; don't shake. Following dilution, infuse solution immediately or refrigerate at 2° to 8° C (36° to 46° F), and use within 8 hours.
- Infuse 300 mg in 100 ml 0.9% sodium chloride injection over approximately 1 hour (infusion rate approximately 5 mg/minute). After infusion is complete, flush with 0.9% sodium chloride injection.
- ⚠ Observe patient during infusion and for 1 hour after infusion is complete. Promptly discontinue infusion at first sign or symptom consistent with a hypersensitivity reaction.
- ⚠ Obtain MRI scan in MS patients before starting therapy to help differentiate subsequent MS signs and symptoms from those of PML. Withhold drug immediately at first sign or symptom suggestive of PML.
- Be aware that a baseline brain MRI in patients with Crohn's disease may help distinguish preexisting lesions from newly developed lesions.
- ⚠ For patients with Crohn's disease who start drug while taking long-term corticosteroids, start steroid withdrawal as soon as therapeutic benefit

n

has occurred. If patient can't discontinue systemic corticosteroids within 6 months, discontinue natalizumab.

 Discontinue drug in patients with jaundice or other evidence of significant liver injury.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache, fatigue, depression, somnolence, vertigo, tremor, **PML**  
**EENT:** tonsillitis, pharyngolaryngeal pain, sinusitis

**GI:** nausea, diarrhea, constipation, dyspepsia, gastroenteritis, abdominal discomfort, flatulence, aphthous stomatitis, exacerbation of Crohn's disease, **intestinal obstruction or stenosis**

**GU:** vaginitis; irregular menstruation; dysmenorrhea; amenorrhea; ovarian cyst; urinary tract infection; urinary incontinence, urgency, frequency

**Hepatic:** abnormal liver function test values

**Musculoskeletal:** arthralgia, extremity pain, back pain, muscle cramps, joint swelling, limb injury

**Respiratory:** upper and lower respiratory tract infections, cough

**Skin:** rash, dermatitis, pruritus, urticaria, dry skin, skin laceration, thermal burn

**Other:** infections, chest discomfort, seasonal allergy, weight changes, tooth infections, toothache, herpes infection, night sweats, rigors, peripheral edema, influenza-like illness, **immunosuppression, infusion reactions, hypersensitivity reactions including anaphylaxis**

### Interactions

**Drug-drug.** *Corticosteroids, immunosuppressants (such as azathioprine, cyclosporine, 6-mercaptopurine, methotrexate), TNF $\alpha$  inhibitors:* increased risk of PML and other infections

**Drug-diagnostic tests.** *Circulating basophils, eosinophils, lymphocytes, monocytes, nucleated RBCs:* increased levels

*Hemoglobin:* decreased level

### Patient monitoring

• Monitor CBC with differential and hepatic function tests.

 Continue to monitor patient for hypersensitivity reactions; infection; hepatotoxicity; signs and symptoms of immune reconstitution inflammatory syndrome (including unanticipated clinical decline in patient's condition after return of immune function and in some cases after apparent clinical improvement; and PML signs and symptoms (such as progressive weakness on one side of the body, limb clumsiness, vision disturbances, and changes in thinking, memory, and orientation leading to confusion and personality changes).

### Patient teaching

• Explain the TOUCH Prescribing Program to patient.

 Instruct patient to immediately report hypersensitivity reactions (such as flushing, nausea, headache, dizziness, fatigue, hives, or itching); signs and symptoms of infections; signs and symptoms of hepatotoxicity (such as yellowing of skin or eyes, dark urine, or right upper abdominal pain or discomfort); unanticipated clinical decline in condition or new signs and symptoms; or signs and symptoms of PML (such as progressive weakness on one side of the body, limb clumsiness, vision disturbances, and changes in thinking, memory, and orientation leading to confusion and personality changes).

• Instruct patient to tell prescriber about all drugs he's taking, because some drugs have potential for serious drug interactions and shouldn't be taken with natalizumab.

- Advise female patient of childbearing age that drug should be used during pregnancy only if potential benefit justifies potential risk to fetus.
- Advise breastfeeding patient that she should decide whether to discontinue breastfeeding or discontinue drug, taking into account importance of drug for her treatment.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## nateglinide

Starlix

**Pharmacologic class:** Amino acid derivative

**Therapeutic class:** Hypoglycemic

**Pregnancy risk category C**

### Action

Decreases blood glucose level by stimulating insulin secretion from pancreatic beta cells; interacts with calcium and potassium channels in pancreas

### Availability

Tablets: 60 mg, 120 mg

### Indications and dosages

➤ To decrease glucose levels in type 2 (non-insulin-dependent) diabetes mellitus not adequately controlled by diet and exercise

**Adults:** 120 mg P.O. t.i.d. up to 30 minutes before meals, or 60 mg P.O. t.i.d. if patient is near glycosylated hemoglobin (HbA1c) goal

### Contraindications

- Hypersensitivity to drug or its components
- Diabetic ketoacidosis
- Type 1 (insulin-dependent) diabetes mellitus

### Precautions

Use cautiously in:

- renal or hepatic impairment, adrenal or pituitary insufficiency
- elderly or malnourished patients
- pregnant or breastfeeding patients.

### Administration

- Give 30 minutes before meals. If meal is missed, don't give dose.
- Know that drug may be given alone or with metformin.

Route	Onset	Peak	Duration
P.O.	Rapid	Within 1 hr	4 hr

### Adverse reactions

**CNS:** dizziness

**GI:** diarrhea

**Metabolic:** hypoglycemia

**Musculoskeletal:** back pain, joint pain

**Respiratory:** upper respiratory tract infection, bronchitis, coughing

**Other:** flulike symptoms, trauma

### Interactions

**Drug-drug.** *Beta-adrenergic blockers, MAO inhibitors, nonsteroidal anti-inflammatory drugs, salicylates:*

increased hypoglycemic effect  
*Corticosteroids, sympathomimetics, thiazides, thyroid products:* reduced hypoglycemic effect

**Drug-diagnostic tests.** *Glucose:* decreased level

### Patient monitoring

- Monitor blood glucose and HbA1c levels.
- Assess pulmonary status for bronchitis, upper respiratory infection, and flulike signs and symptoms.
- Monitor musculoskeletal status. Check for back pain and arthropathy.
- Note GI complaints, and identify nutritional deficiencies.

### Patient teaching

- Instruct patient to take dose up to 30 minutes before each main meal.

- Advise patient not to skip a meal. If he does, tell him to also skip accompanying nateglinide dose, to prevent hypoglycemia.
- Teach patient how to monitor blood and urine for glucose and ketones, as prescribed.
- Instruct patient to report adverse CNS effects and signs and symptoms of respiratory infection.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects sensation and balance.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## neбиволол

Bystolic

**Pharmacologic class:** Beta-adrenergic blocker

**Therapeutic class:** Antihypertensive

**Pregnancy risk category C**

### Action

Not fully known. The following factors may be involved: decreased heart rate, reduced myocardial contractility, decreased tonic sympathetic outflow to periphery from cerebrovasomotor centers, suppressed renin activity, vasodilation, and decreased peripheral vascular resistance.

### Availability

Tablets: 2.5 mg, 5 mg, 10 mg

### Indications and dosages

➤ Hypertension

**Adults:** Individualized; 5 mg P.O. daily. If patient requires further blood pressure reduction, dosage may be increased at 2-week intervals up to 40 mg P.O. daily.

### Dosage adjustment

- Moderate hepatic impairment or severe renal impairment (creatinine clearance less than 30 ml/minute)

### Contraindications

- Hypersensitivity to drug or its components
- Severe bradycardia, heart block greater than first degree, cardiogenic shock, decompensated cardiac failure, sick sinus syndrome (unless permanent pacemaker is in place)
- Severe hepatic impairment

### Precautions

Use cautiously in:

- moderate hepatic impairment
- severe renal impairment
- congestive heart failure (CHF)
- peripheral vascular disease
- bronchospastic disease (use not recommended)
- diabetic patients receiving hypoglycemic drugs
- known or suspected pheochromocytoma
- concurrent use of myocardial depressants, AV conduction inhibitors (such as cardiac glycosides and certain calcium antagonists), or antiarrhythmics (such as disopyramide)
- perioperative use with anesthetics that depress myocardial function (such as ether, cyclopropane, or trichloroethylene)
- pregnant patients
- breastfeeding patients (use not recommended)
- children (safety and efficacy not established).

### Administration

- Give with or without food.
- Be aware that drug may be used alone or in combination with other antihypertensives.
- Know that drug shouldn't be combined with other beta blockers. Closely monitor patients receiving

catecholamine-depleting drugs (such as reserpine or guanethidine), because added beta blockade may decrease sympathetic activity excessively. In patients receiving nebivolol with clonidine, discontinue nebivolol for several days before gradually tapering clonidine.

📣 Don't withdraw drug abruptly; taper over 1 to 2 weeks when possible. Drug may mask signs and symptoms of hyperthyroidism, such as tachycardia; abrupt withdrawal may exacerbate signs and symptoms of hyperthyroidism or may trigger thyroid storm.

Route	Onset	Peak	Duration
P.O.	Unknown	1.5-4 hr	Unknown

**Adverse reactions**

**CNS:** headache, fatigue, dizziness, insomnia

**CV:** bradycardia

**GI:** nausea, diarrhea

**Respiratory:** dyspnea

**Skin:** rash

**Other:** chest pain, peripheral edema

**Interactions**

**Drug-drug.** *Antiarrhythmics (such as disopyramide), myocardial depressants or AV conduction inhibitors (such as cardiac glycosides and certain calcium antagonists):* increased risk of slowed AV conduction and bradycardia

*Cimetidine:* increased d-nebivolol (active isomer) blood level

*CYP2D6 inhibitors (such as fluoxetine, paroxetine, propafenone, quinidine):*

increased d-nebivolol blood level

*Other beta-adrenergic blockers:* excessive reduction of sympathetic activity

*Sildenafil:* decreased effect of sildenafil

**Drug-diagnostic tests.** *Blood urea nitrogen, triglycerides, uric acid:* increased levels

*Cholesterol, high-density lipoproteins, platelet count:* decreased

**Patient monitoring**

📣 Be aware that beta blockade may further depress myocardial contractility

and trigger more severe heart failure in patients with compensated CHF. If CHF worsens, consider discontinuing drug.

📣 During perioperative use, closely monitor patients receiving anesthetics that depress myocardial function, such as ether, cyclopropane, or trichloroethylene. Also, know that if drug is withdrawn before major surgery, the heart's impaired ability to respond to reflex adrenergic stimuli may increase risks of general anesthesia and surgery.

• Because of significant negative inotropic and chronotropic effects in patients treated with verapamil- or diltiazem-type beta blockers or calcium channel blockers, use caution in patients treated concomitantly with these agents; monitor ECG and blood pressure.

**Patient teaching**

• Tell patient drug may be taken with or without food.

• Advise patient not to stop taking drug unless prescriber approves.

📣 Instruct patient to immediately report difficulty breathing, increasing shortness of breath, excessively slow pulse, or weight gain.

• Caution patient to avoid driving and other hazardous activities until drug's effects on alertness are known.

• Advise breastfeeding patient not to breastfeed during therapy.

• As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

n

**nefazodone hydrochloride**

**Pharmacologic class:** Phenylpiperazine

**Therapeutic class:** Antidepressant

**Pregnancy risk category C**

**FDA BOXED WARNING**

- Drug may increase risk of suicidal thinking and behavior in children and adolescents with major depressive disorder and other psychiatric disorders. Risk must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family and caregivers to observe patient closely and communicate with prescriber as needed.
- Drug isn't approved for use in pediatric patients.

**Action**

Potentiates effects of norepinephrine and serotonin by blocking synaptic reuptake in nerve cells and disrupting  $\alpha_1$ -adrenergic receptors

**Availability**

Tablets: 50 mg, 100 mg, 150 mg, 200 mg, 250 mg

**Indications and dosages**

➤ Major depression

**Adults:** Initially, 100 mg P.O. b.i.d. May increase weekly up to 600 mg/day in two divided doses.

**Dosage adjustment**

- Elderly patients

**Contraindications**

- Hypersensitivity to drug, its components, or other phenylpiperazines
- Active hepatic disease, baseline transaminase elevation, or previous drug withdrawal necessitated by hepatic damage
- MAO inhibitor use within past 14 days
- Concurrent cisapride (not available in U.S.), pimoziide, carbamazepine, or triazolam therapy

**Precautions**

Use cautiously in:

- cardiovascular or cerebrovascular disease
- history of suicide attempt, drug abuse, or mania
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 18 (safety not established).

**Administration**

- Give with food or milk if GI upset occurs.
- Know that tablets may be crushed.
- 🚫 Don't give concurrently with cisapride, pimoziide, carbamazepine, or triazolam.
- 🚫 Don't give within 14 days of MAO inhibitors.

Route	Onset	Peak	Duration
P.O.	Days-wks	Few wks	Unknown

**Adverse reactions**

**CNS:** dizziness, asthenia, agitation, light-headedness, insomnia, drowsiness, confusion, weakness, headache, impaired memory, poor concentration, paresthesia, psychomotor retardation, tremor, **suicidal behavior or ideation (especially in child or adolescent)**

**CV:** hypotension, orthostatic hypotension, peripheral edema

**EENT:** abnormal or blurred vision, eye pain, tinnitus, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, dry mouth

**GU:** urinary frequency or retention, urinary tract infection

**Hepatic: hepatotoxicity, hepatic failure**

**Respiratory:** increased cough

**Skin:** rash, pruritus

**Other:** increased appetite, thirst, infection, chills, fever, flulike symptoms

## Interactions

**Drug-drug.** *Alprazolam, triazolam:* increased blood level and effects of these drugs

*Antihypertensives, nitrates:* additive hypotension

*Carbamazepine, cisapride, pimozide:* increased nefazodone blood level, leading to toxicity

*CNS depressants (including antihistamines, opioids, sedative-hypnotics):* additive CNS depression

*Digoxin:* increased digoxin blood level

*HMG-CoA reductase inhibitors:* increased risk of myopathy

*MAO inhibitors:* potentially fatal reactions (hyperpyrexia, excitation, seizures, delirium, coma)

**Drug-diagnostic tests.** *CBC, cholesterol, glucose, hematocrit:* decreased levels

*Hepatic enzymes:* increased levels

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

*S-adenosylmethionine (SAM-e), St. John's wort:* increased risk of adverse serotonergic effects, including serotonin syndrome

**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension

*Alcohol use:* increased CNS depression

## Patient monitoring

- Monitor vital signs with patient lying down, sitting, and standing. Notify prescriber if blood pressure drops 20 mm Hg.

- Assess CBC.

-  Monitor liver function tests frequently. Notify prescriber of abnormal results.

- Closely monitor neurologic status.

- Evaluate patient for withdrawal symptoms (which may occur if therapy stops abruptly).

-  Monitor closely for increasing depression and suicidal ideation (especially in child or adolescent).

## Patient teaching

- Advise patient to take with food or milk to minimize GI upset.

- Tell patient to crush drug if he can't swallow it whole.

- Inform patient that therapeutic response may take up to 4 weeks. Encourage him to keep taking drug as prescribed.

-  Tell patient drug may cause adverse CNS effects. Advise him to report significant mood changes (especially depression or suicidal thoughts). Caution parent to report these problems in child or adolescent.

-  Instruct patient to immediately report unusual tiredness, yellowing of skin or eyes, nausea, or anorexia.

- Instruct patient to rise slowly and carefully, to avoid dizziness from temporary blood pressure drop.

- Tell patient to avoid alcohol and to consult prescriber before taking herbs.

-  Instruct patient not to stop taking drug abruptly. Dosage must be tapered.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

n

## nelarabine

Arranon, Atriance 

**Pharmacologic class:** Antimetabolite

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

- Administer I.V. only.
- Give under supervision of physician experienced in use of cancer chemotherapy.
- Drug has caused severe neurologic events, including severe somnolence,

seizures, and peripheral neuropathy. Demyelination-associated events also have occurred. Drug discontinuation doesn't always lead to full recovery from these events. Monitor patient closely for neurologic changes; discontinue drug for serious neurologic events.

### Action

Inhibits DNA synthesis in leukemic blasts, leading to cell death

### Availability

*Solution for injection:* 250 mg/50 ml

### Indications and dosages

➤ T-cell acute lymphoblastic leukemia and T-cell lymphoblastic lymphoma in patients whose disease hasn't responded to at least two chemotherapy regimens or who've relapsed after such therapy

**Adults:** 1,500 mg/m<sup>2</sup> I.V. undiluted over 2 hours on days 1, 3, and 5; repeat every 21 days. Continue therapy until disease progresses, unacceptable toxicity occurs, patient becomes eligible for bone marrow transplant, or patient no longer benefits from therapy.

**Children:** 650 mg/m<sup>2</sup> I.V. undiluted over 1 hour daily for 5 consecutive days; repeat every 21 days. Continue therapy until disease progresses, unacceptable toxicity occurs, patient becomes eligible for bone marrow transplant, or patient no longer benefits from therapy.

### Dosage adjustment

- Neurologic or hematologic toxicity

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- renal or hepatic dysfunction

- patients undergoing concurrent intrathecal chemotherapy
- patients previously treated with intrathecal chemotherapy or craniospinal irradiation
- concurrent administration of live vaccines (immunocompromised patients)
- elderly patients
- pregnant or breastfeeding patients.

### Administration

- Administer undiluted.
- Infuse over 2 hours in adults or over 1 hour in children.
- In patients at risk for tumor lysis syndrome, take measures to prevent hyperuricemia (such as hydration, urine alkalization, and allopurinol prophylaxis).
-  Discontinue drug if serious neurologic adverse reactions occur.

Route	Onset	Peak	Duration
I.V.	Unknown	End of infusion	Unknown

### Adverse reactions

**CNS:** confusional state, insomnia, depression, headache, peripheral neuropathy, somnolence, paresthesia, hypoesthesia, fine motor dysfunction, neurologic disorder, tremor, ataxia, abnormal gait, dizziness, amnesia, balance disorder, sensory loss, demyelination, asthenia, fatigue, rigors, decreased level of consciousness, **seizures, cerebral hemorrhage, coma**

**CV:** tachycardia, chest pain, hypotension

**EENT:** blurred vision, epistaxis, sinusitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, abdominal distention, stomatitis, anorexia

**Hematologic:** anemia, **neutropenia, thrombocytopenia, leukopenia**

**Metabolic:** dehydration

**Musculoskeletal:** myalgia, arthralgia, back pain, muscle weakness, extremity pain

**Respiratory:** pneumonia, cough, dyspnea, exertional dyspnea, wheezing, pleural effusion

**Skin:** petechiae

**Other:** abnormal taste, infection, fever, edema, peripheral edema, pain, non-cardiac chest pain

## Interactions

**Drug-drug.** *Pentostatin:* decreased nelarabine efficacy

**Drug-diagnostic tests.** *Bilirubin, serum creatinine, transaminases:* increased  
*Blood albumin, CBC, calcium, glucose, magnesium, platelets, potassium:* decreased

## Patient monitoring

🚨 Watch closely for neurologic events, such as somnolence, confusion, seizures, ataxia, motor incoordination, and peripheral neuropathy (which may not subside even after therapy ends).

Know that previous craniospinal irradiation or current or previous intrathecal chemotherapy may increase patient's risk of adverse neurologic events.

- Closely monitor patients with hepatic or renal dysfunction for adverse reactions.
- Monitor CBC regularly.

## Patient teaching

• Instruct patient or caregiver to read patient information leaflet thoroughly.

🚨 Urge patient or caregiver to immediately report neurologic symptoms, such as extreme sleepiness, confusion, seizures, unsteadiness or weakness on walking, difficulty with tasks such as buttoning clothing, and numbness and tingling in fingers, hands, or feet.

🚨 Tell patient to immediately report easy bruising, bleeding, fever, or signs or symptoms of infection.

- Inform patient that he'll need to undergo frequent blood tests.
- Instruct patient to avoid live virus vaccines.
- Caution patient to avoid driving and other hazardous activities until drug effects are known.

- Urge female with childbearing potential to avoid pregnancy and breastfeeding during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## nelfinavir mesylate

Viracept

**Pharmacologic class:** Protease inhibitor

**Therapeutic class:** Antiretroviral

**Pregnancy risk category B**

## Action

Inhibits action of human immunodeficiency virus (HIV) protease and prevents cleavage of viral polyproteins, resulting in production of immature, noninfectious virus

## Availability

*Oral powder:* 50 mg/1 g powder (1 g powder/level scoopful)

*Tablets:* 250 mg, 625 mg

## Indications and dosages

➤ HIV infection

**Adults and children older than age 13:**

750 mg P.O. t.i.d. or 1,250 mg b.i.d., given with other antiretrovirals

**Children ages 2 to 13:** 20 to 30 mg/kg P.O. t.i.d., given with a meal or light snack

## Contraindications

- Hypersensitivity to drug or its components
- Concurrent use of amiodarone, dihydroergotamine, ergonovine, ergotamine, midazolam, pimozone, quinidine, rifampin, sildenafil (when used

for pulmonary arterial hypertension), or triazolam

### Precautions

Use cautiously in:

- moderate or severe hepatic impairment (avoid use)
- hemophilia, diabetes mellitus
- concurrent use of lovastatin, simvastatin, or St. John's wort (not recommended)
- concurrent use of other HMG-CoA reductase inhibitors also metabolized by the CYP3A pathway, proton pump inhibitors, and rifampin
- phenylketonuria (oral powder contains phenylalanine)
- breastfeeding patients.

### Administration

- Give tablets with food.
- For adult who can't swallow tablets whole, crush and mix in food or dissolve in small amount of water. Have patient consume mixture immediately, or refrigerate for up to 6 hours.
- For child who can't swallow tablets, mix oral powder with small amount of water, formula, or milk. Have child consume mixture immediately, or refrigerate for up to 6 hours.
- Don't mix powder with water in its original container.
- Don't mix powder with acidic juice (combination produces bitter taste).
- 🚫 Don't give concurrently with amiodarone, astemizole, cisapride, dihydroergotamine, ergotamine, midazolam, quinidine, rifampin, terfenadine, or triazolam.

Route	Onset	Peak	Duration
P.O.	Rapid	2-4 hr	8 hr

### Adverse reactions

**CNS:** anxiety, depression, dizziness, drowsiness, emotional lability, headache, hyperkinesia, insomnia, malaise, migraine headache, sleep disorders,

weakness, myasthenia, paresthesia, **suicidal ideation, seizures**

**EENT:** acute iritis, rhinitis, sinusitis, pharyngitis

**GI:** nausea, diarrhea, abdominal pain, flatulence

**GU:** nephrolithiasis, sexual dysfunction

**Hematologic:** anemia, **leukopenia, thrombocytopenia**

**Metabolic:** dehydration, hyperuricemia, hyperglycemia, **hypoglycemia**

**Musculoskeletal:** joint pain, arthritis, back pain, myalgia, myopathy

**Respiratory:** dyspnea, **bronchospasm**

**Skin:** pruritus, rash, sweating, fungal dermatitis, folliculitis, urticaria

**Other:** fever, body fat redistribution, allergic reactions, **immune reconstitution syndrome**

### Interactions

**Drug-drug.** *Amiodarone, dihydroergotamine, ergotamine, midazolam, quinidine, triazolam:* excessive sedation, vasoconstriction, serious arrhythmias

*Atorvastatin, rosuvastatin:* increased statin concentration

*Azithromycin, bosentan, colchicine, inhaled fluticasone, salmeterol:* increased concentration of these drugs

*Carbamazepine, phenobarbital, phenytoin, rifampin:* decreased nelfinavir blood level and efficacy

*Delavirdine:* increased nelfinavir concentration, decreased delavirdine concentrations

*HMG-CoA reductase inhibitors:* increased risk of serious reactions, such as myopathy and rhabdomyolysis

*Hormonal contraceptives:* decreased contraceptive blood level and efficacy

*Immunosuppressants (cyclosporine, sirolimus, tacrolimus):* increased immunosuppressant concentration

*Indinavir, saquinavir:* increased indinavir or saquinavir concentration and increased nelfinavir concentration

*Methadone, trazodone*: decreased concentration of these drugs

*Nevirapine*: decreased nelfinavir concentration

*Rifabutin*: decreased rifabutin metabolism and effects

*Ritonavir*: increased nelfinavir concentration

*Sildenafil, tadalafil, vardenafil*: increased risk of adverse events

*Warfarin*: affected warfarin concentration

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, amylase, aspartate aminotransferase, creatine kinase, gamma-glutamyl transpeptidase, lactic dehydrogenase lipids, uric acids*: increased levels  
*Blood glucose*: increased or decreased level

*Hemoglobin, platelets, white blood cells*: decreased levels

**Drug-food.** *Most foods*: enhanced drug absorption

**Drug-herbs.** *St. John's wort*: decreased nelfinavir blood level and efficacy

### Patient monitoring

🔊 Watch for signs and symptoms of depression and suicidal ideation.

- Evaluate neurologic status closely, particularly for seizures and sensorimotor dysfunction.
- Assess CBC, lipid panel, uric acid level, and HIV-specific tests.
- Watch for secondary infections, particularly fungal and EENT infections.

🔊 Be aware that immune reconstitution syndrome may occur in patients receiving combination antiretroviral therapy. During initial phase of therapy, patient whose immune system responds may develop an inflammatory response to indolent or residual opportunistic infections (such as *Mycobacterium avium* complex, cytomegalovirus, *Pneumocystis jiroveci* pneumonia, and

tuberculosis), which may necessitate further evaluation and treatment.

### Patient teaching

- Advise patient to take with a meal or snack. Inform him that he may mix oral powder with nonacidic fluids.
- Tell patient he may take missed dose up to 1 hour before next scheduled dose.

🔊 Instruct patient to report depression or suicidal thoughts.

• Tell patient that drug may predispose him to other infections, especially fungal and EENT infections. Advise him to avoid crowds and to wash hands often and thoroughly.

• Tell patient with phenylketonuria (or caregiver) that powder contains phenylalanine.

🔊 Tell patient to immediately report new or worsening signs or symptoms.

🔊 Advise patient not to use St. John's wort while taking this drug.

• Advise female patient to use reliable barrier contraception.

• Advise female patient not to breast-feed, because breast milk may transfer HIV to infant.

• Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, vision, strength, and alertness.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## neomycin sulfate

Neo-Fradin, Nivemycin<sup>®</sup>

**Pharmacologic class:** Aminoglycoside

**Therapeutic class:** Anti-infective

**Pregnancy risk category** D

**FDA BOXED WARNING**

- Systemic absorption follows oral use and may lead to toxic reactions. Observe patient closely for indications of toxicity. Neurotoxicity (including ototoxicity) and nephrotoxicity have occurred, even at recommended doses. Perform serial, vestibular, and audiometric tests as well as renal function tests, especially in high-risk patients. Risk of nephrotoxicity and ototoxicity is greater in patients with renal impairment. Ototoxicity may be delayed, and patients developing cochlear damage won't have symptoms during therapy; total or partial deafness may occur long after drug is stopped.
- Neuromuscular blockage and respiratory paralysis may follow oral use. Consider these risks, especially to patients receiving anesthetics or neuromuscular blockers (such as tubocurarine, succinylcholine, and decamethonium) and those receiving massive transfusions of citrated anticoagulated blood. If blockage occurs, calcium salts may reverse these phenomena, but patient may need mechanical respiratory assistance.
- Avoid concurrent or sequential systemic, oral, or topical use of other aminoglycosides or neurotoxic drugs, as toxicity may be additive.
- Advanced age and dehydration increase risk of toxicity.
- Avoid giving drug concurrently with potent diuretics, as some diuretics are ototoxic. Also, I.V. diuretics may enhance neomycin toxicity by altering its blood and tissue levels.

**Action**

Interferes with bacterial protein synthesis by binding to 30S ribosomal subunit, causing misreading of genetic code. Inaccurate peptide sequence then forms in protein chain, causing bacterial death.

**Availability**

*Ointment:* 0.5%

*Oral solution:* 125 mg/5 ml

*Tablets:* 500 mg

**Indications and dosages**

- Preoperative intestinal antiseptics  
**Adults:** 1 g P.O. q hour for four doses, then 1 g q 4 hours for 24 hours or 1 g at 19 hours, 18 hours, and 9 hours before surgery
- Hepatic encephalopathy  
**Adults:** 4 to 12 g/day P.O. in divided doses
- Superficial bacterial infections  
**Adults:** Apply ointment topically one to five times daily.

**Contraindications**

- Hypersensitivity to drug or other aminoglycosides
- Intestinal obstruction

**Precautions**

Use cautiously in:

- renal impairment, neuromuscular diseases (such as myasthenia gravis), hearing impairment
- obese patients
- elderly patients
- pregnant or breastfeeding patients
- children under age 18 (safety not established).

**Administration**

- Give preoperative dose before bowel surgery, after cathartic administration, as ordered.

Route	Onset	Peak	Duration
P.O.	Variable	1-4 hr	Unknown
Topical	Unknown	Unknown	Unknown

**Adverse reactions**

**CNS:** neuromuscular blockade

**EENT:** ototoxicity (with prolonged, high-dose use)

**GI:** nausea, vomiting, diarrhea, malabsorption syndrome

**GU: nephrotoxicity** (with prolonged, high-dose use)

**Other:** superinfection

### Interactions

**Drug-drug.** *Acyclovir, amphotericin B, cephalosporin, cisplatin, other aminoglycosides, vancomycin:* increased risk of ototoxicity and nephrotoxicity

*Digoxin:* decreased digoxin absorption  
*Dimenhydrinate:* masking of ototoxicity symptoms

*Oral anticoagulants:* increased anticoagulant effect

*Potent loop diuretics:* increased risk of ototoxicity

### Patient monitoring

- Assess for neuromuscular blockade, ototoxicity, and nephrotoxicity.
- Monitor kidney function tests.

### Patient teaching

- Instruct patient to drink plenty of water.
- Tell patient to complete full course of therapy.
- Inform patient that drug may cause muscle weakness.
- Instruct patient to report hearing problems and change in urination pattern.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects neuromuscular status.
- Tell patient he'll undergo frequent blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## neostigmine bromide

Prostigmin

## neostigmine methylsulfate

PMS-Neostigmine Methylsulfate<sup>✳</sup>, Prostigmin

**Pharmacologic class:** Anticholinesterase

**Therapeutic class:** Muscle stimulant

**Pregnancy risk category C**

### Action

Inhibits enzyme acetylcholinesterase, leading to increased acetylcholine concentration at synapse and prolonged acetylcholine effects. Exerts direct cholinomimetic effect on skeletal muscle.

### Availability

*Injection (methylsulfate):* 2 mg/ml, 1 mg/ml, 0.5 mg/ml, 0.25 mg/ml

*Tablets (bromide):* 15 mg

### Indications and dosages

➤ Myasthenia gravis

**Adults:** 15 mg/day P.O.; may increase p.r.n. up to 375 mg/day; average dosage is 150 mg/day. Or 1 ml of 1:2,000 solution (0.5 mg) subcutaneously or I.M. based on response and tolerance.

➤ Postoperative abdominal distention and bladder atony

**Adults:** 0.5 to 1 mg I.M. or subcutaneously. If given for urinary retention and no response occurs within 1 hour, catheterize patient as ordered and repeat dose q 3 hours for five doses.

➤ Antidote for nondepolarizing neuromuscular blockers

**Adults:** 0.5 to 2.5 mg I.V.; repeat p.r.n. up to 5 mg. Precede initial dose with 0.6 to 1.2 mg atropine sulfate I.V., as ordered.

### Contraindications

- Hypersensitivity to cholinergics or bromide
- Mechanical obstruction of GI or urinary tract
- Peritonitis

## Precautions

Use cautiously in:

- asthma, peptic ulcer, bradycardia, arrhythmias, recent coronary occlusion, vagotonia, hyperthyroidism, seizure disorder
- pregnant or breastfeeding patients.

## Administration

 Before giving, ensure that atropine sulfate is available to treat cholinergic crisis.

- Know that atropine may be combined with usual neostigmine dose to decrease risk of adverse reactions.
- Give oral form 1 hour before or 2 hours after a meal.
- Administer I.V. dose undiluted directly into vein or I.V. line. Give 0.5-mg dose slowly over 1 minute.
-  Keep resuscitation equipment nearby.

Route	Onset	Peak	Duration
P.O.	45-75 min	1-2 hr	2-4 hr
I.V.	4-8 min	1-2 hr	2-4 hr
I.M., subcut.	20-30 min	1-2 hr	2-4 hr

## Adverse reactions

**CNS:** dizziness, headache, drowsiness, asthenia, **loss of consciousness**

**CV:** hypotension, tachycardia, bradycardia, **atrioventricular (AV) block, cardiac arrest**

**EENT:** vision changes, lacrimation, miosis

**GI:** nausea, vomiting, diarrhea, abdominal cramping, flatulence, increased peristalsis

**GU:** urinary frequency

**Musculoskeletal:** muscle cramps, spasms, and fasciculations; joint pain

**Respiratory:** dyspnea, **bronchospasm, respiratory depression, respiratory arrest, laryngospasm**

**Skin:** rash, urticaria, flushing

**Other:** anaphylaxis

## Interactions

**Drug-drug.** *Aminoglycosides, anticholinergics, atropine, corticosteroids, local and general anesthetics:* reversal of anticholinergic effects

*Cholinergics:* additive toxicity

*Kanamycin, neomycin, streptomycin:*

increased neuromuscular blockade

*Succinylcholine:* potentiation of neuromuscular blockade, prolonged respiratory depression

## Patient monitoring

 Monitor vital signs. Assess patient for hypotension, bradycardia or tachycardia, AV block, and evidence of impending cardiac arrest.

- Evaluate respiratory and neurologic status.

## Patient teaching

- Instruct patient to take tablets 1 hour before or 2 hours after meals.

 Tell patient drug may alter his respiratory and cardiac status. Teach him to recognize and immediately report warning signs.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, vision, muscle function, and alertness.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## nesiritide

Natrecor

**Pharmacologic class:** Human B-type natriuretic peptide

**Therapeutic class:** Vasodilator

**Pregnancy risk category** C

## Action

Binds to receptors on vascular smooth muscle and endothelial cells, causing smooth muscle relaxation and vasodilation. As a result, systemic and pulmonary pressures decrease and diuresis occurs.

## Availability

*Injection:* 1.5 mg in single-use vials

## Indications and dosages

➤ Acutely decompensated heart failure in patients who have dyspnea at rest or with minimal activity

**Adults:** 2 mcg/kg I.V. bolus, followed by continuous I.V. infusion of 0.01 mcg/kg/minute

## Contraindications

- Hypersensitivity to drug or its components
- Systolic pressure below 90 mm Hg
- Primary therapy for cardiogenic shock

## Precautions

Use cautiously in:

- restrictive or obstructive cardiomyopathy, constrictive pericarditis, pericardial tamponade, renal dysfunction, hypotension
- pregnant or breastfeeding patients.

## Administration

⚠ Know that nesiritide is a high-alert drug.

- For I.V. use, prime tubing before connecting to patient. Withdraw bolus and infuse over 60 seconds into I.V. port of tubing. Follow immediately with constant infusion delivering 0.01 mcg/kg/minute.
- Know that drug should be mixed and infused in dextrose 5% in water, normal saline solution, or dextrose in half-normal saline solution.

⚠ Don't mix with other drug solutions. Always administer through separate line.

- Know that nesiritide therapy beyond 48 hours has not been studied.

Route	Onset	Peak	Duration
I.V.	Immediate	15 min	Unknown

## Adverse reactions

**CNS:** dizziness, headache, insomnia, anxiety

**CV:** hypotension, angina pectoris, bradycardia, ventricular extrasystole, **ventricular tachycardia**

**GI:** nausea, vomiting, abdominal pain

**Musculoskeletal:** leg cramps, back pain

**Respiratory:** cough, hemoptysis, **apnea**

**Other:** injection site reactions

## Interactions

**Drug-drug.** *Angiotensin-converting enzyme inhibitors, nitrates:* increased hypotension

*Bumetanide, enalaprilat, ethacrynate sodium, furosemide, heparin, hydralazine, insulin:* physical and chemical incompatibility with nesiritide

**Drug-diagnostic tests.** *Hematocrit, hemoglobin:* decreased values

## Patient monitoring

- Monitor vital signs and pulmonary artery wedge pressure continuously during and for several hours after infusion.
- Assess cardiovascular status closely.

## Patient teaching

- Tell patient he'll be monitored closely during and for several hours after infusion.
- Inform patient that drug may cause serious adverse effects. Reassure him that he'll receive appropriate interventions to relieve symptoms.
- Instruct patient to report chest pain, dizziness, palpitations, and other uncomfortable symptoms.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## nevirapine

Viramune, Viramune XR

**Pharmacologic class:** Nonnucleoside reverse transcriptase inhibitor

**Therapeutic class:** Antiretroviral

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug has caused severe, life-threatening, and in some cases fatal hepatotoxicity, particularly in first 18 weeks. In some cases, patients had nonspecific, prodromal signs or symptoms of hepatitis and progressed to hepatic failure. These events are commonly associated with rash. Women and patients with higher CD4+ cell counts at initiation of therapy are at increased risk. Women with CD4+ cell counts greater than 250/mm<sup>3</sup>, including pregnant women receiving nevirapine in combination with other antiretrovirals for treatment of HIV-1 infection, are at greatest risk. However, hepatotoxicity associated with nevirapine use can occur in both men and women, and at any time during treatment. Hepatic failure has also been reported in patients without HIV taking nevirapine for postexposure prophylaxis (PEP). Use of nevirapine for occupational and nonoccupational PEP is contraindicated. Patients must discontinue drug and seek immediate medical help if they develop hepatitis signs or symptoms or have increased transaminase levels along with rash or other systemic symptoms.
- Severe, life-threatening skin reactions (including fatal cases) have occurred; these have included Stevens-Johnson syndrome, toxic epidermal necrolysis, and hypersensitivity reactions. Patients who develop signs or symptoms of

severe skin reactions or hypersensitivity reactions must discontinue drug and seek immediate medical help.

- Monitor patients intensively during first 18 weeks of therapy. Be especially vigilant during first 6 weeks. Don't restart drug in patient who has had clinical hepatitis or transaminase elevations combined with rash or other systemic symptoms, or after severe rash, or hypersensitivity reaction.

### Action

Inhibits human immunodeficiency virus (HIV) nonnucleoside reverse transcriptase by binding directly to reverse transcriptase and blocking RNA-dependent and DNA-dependent polymerase activity

### Availability

*Oral suspension:* 50 mg/5 ml

*Tablets:* 200 mg

*Tablets (extended-release):* 400 mg

### Indications and dosages

➤ Treatment of HIV-1 infection

**Adults:** 200 mg P.O. daily for 14 days, then 200 mg (immediate-release) P.O. b.i.d., given in combination with other antiretrovirals; 400 mg (extended-release) P.O. daily after either a 14-day 200-mg lead-in regimen or after switching from a 200-mg b.i.d. regimen.

**Children ages 15 days and older:**

150 mg/m<sup>2</sup> (immediate-release tablet or oral suspension) P.O. once daily for 14 days, followed by 150 mg/m<sup>2</sup> b.i.d. thereafter. Total daily dosage shouldn't exceed 400 mg for any patient.

### Dosage adjustment

- Chronic hemodialysis

### Off-label uses

- Prophylaxis of maternal-fetal HIV transmission

## Contraindications

- Hypersensitivity to drug or its components
- Moderate or severe hepatic impairment (Child-Pugh Class B or C, respectively)
- Use as part of occupational and nonoccupational postexposure prophylaxis regimens

## Precautions

Use cautiously in:

- impaired renal or hepatic function
- pregnant or breastfeeding patients
- children.

## Administration

- Be aware that drug should be given alone for first 14 days to reduce incidence of rash.
- If patient experiences rash during 14-day lead-in period with immediate-release form, don't initiate extended-release form until rash has resolved.
- Don't continue immediate-release lead-in dosing regimen beyond 28 days. If immediate-release dosing is interrupted for more than 7 days, restart recommended dosing, including 14-day lead-in dosing.
- For patients who interrupt extended-release dosing for more than 7 days, restart recommended lead-in dosing with immediate-release form using one 200-mg tablet daily for first 14 days.
- Be aware that drug shouldn't be started in adult females with CD4+ cell counts greater than 250/mm<sup>3</sup> or in adult males with CD4+ cell counts greater than 400/mm<sup>3</sup> because of serious and life-threatening hepatotoxicity, unless benefit outweighs risk.
- Give with or without food.

Route	Onset	Peak	Duration
P.O.	Unknown	4 hr	Unknown

## Adverse reactions

**CNS:** paresthesia, headache, malaise, fatigue

**GI:** nausea, diarrhea, abdominal pain

**Hematologic:** agranulocytosis

**Hepatic:** hepatitis, hepatotoxicity, hepatic failure

**Musculoskeletal:** myalgia, pain

**Skin:** rash, blistering, toxic epidermal necrolysis, Stevens-Johnson syndrome

**Other:** fever

## Interactions

**Drug-drug.** *Antiarrhythmics, antifungals, calcium channel blockers, cancer chemotherapy, ergot alkaloids, immunosuppressants, motility agents, opiate agonists:* possible decreased plasma concentrations of these drugs

*Anticoagulants:* possible increased or decreased anticoagulant plasma concentrations

*Clarithromycin, efavirenz, indinavir, ketoconazole, methadone:* decreased activity of these drugs

*Ethinyl estradiol, norethindrone:* decreased contraceptive plasma levels

*Fluconazole:* increased nevirapine level

*Lopinavir/ritonavir:* decreased lopinavir activity

*Nelfinavir:* decreased nelfinavir active metabolite, minimum nelfinavir concentration

*Rifabutin:* increased rifabutin level

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, bilirubin, gamma-glutamyltransferase:* increased levels

*Hemoglobin, neutrophils:* decreased levels

**Drug-herbs.** *St. John's wort:* decreased nevirapine blood level

## Patient monitoring

☞ Check closely for rash (which may be first sign of Stevens-Johnson syndrome), especially during first 6 months of therapy.

- Monitor patient's weight, temperature, and chest X-ray periodically.

- Assess patient's appetite and energy and physical activity levels.

- Monitor liver function tests and CBC with white cell differential.

n

### Patient teaching

- Tell patient he may take with or without food.
- Tell patient or caregiver to shake suspension gently before use and that it's important to take the entire measured dose of suspension by using an oral dosing syringe or dosing cup.
- Tell patient or caregiver that the extended-release tablet must be swallowed whole and must not be chewed, crushed, or divided.
- Instruct patient to take missed dose as soon as he remembers. But if it's almost time for next dose, tell him to skip missed dose. Caution him not to double the dose.
- Inform female patient that hormonal contraceptives, implants, or shots may be ineffective during nevirapine therapy. Urge her to use alternative birth-control method.
- ☚ Teach patient to recognize and immediately report rash, easy bruising or bleeding, and signs and symptoms of hepatotoxicity.
- Inform patient that nevirapine won't cure HIV or prevent its transmission.
- Caution female not to breastfeed, because breast milk may transfer HIV to infant.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## nifedipine hydrochloride

Cardene, Cardene IV, Cardene SR

**Pharmacologic class:** Calcium channel blocker

**Therapeutic class:** Antianginal, antihypertensive

**Pregnancy risk category** C

### Action

Inhibits calcium transport into myocardial and vascular smooth muscle cells, causing cardiac output and myocardial contractions to decrease

### Availability

**Capsules:** 20 mg, 30 mg

**Capsules (sustained-release):** 30 mg, 45 mg, 60 mg

**Injection:** 2.5 mg/ml in 10-ml ampules

### Indications and dosages

➤ Chronic stable angina, given alone or with beta-adrenergic blockers

**Adults:** Titrate dosage individually, starting with 20 to 40 mg P.O. (immediate-release) t.i.d. Wait at least 3 days before increasing dosage.

➤ Hypertension, given alone or with other antihypertensives

**Adults:** Titrate dosage individually, starting with 20 mg P.O. (immediate release) t.i.d. Wait at least 3 days before increasing dosage. Dosage range is 20 to 40 mg P.O. t.i.d. Patient may be switched to sustained-release capsules at nearest equivalent daily dosage of immediate-release capsules, starting with 30 mg P.O. b.i.d. Effective range is 30 to 60 mg/day.

➤ Short-term treatment of hypertension when oral therapy isn't feasible or desirable

**Adults:** Continuous I.V. infusion of 0.5 mg/hour (equal to 20 mg P.O. q 8 hours), or 1.2 mg/hour (equal to 30 mg P.O. q 8 hours), or 2.2 mg/hour (equal to 40 mg P.O. q 8 hours)

### Off-label uses

- Raynaud's disease
- Heart failure
- Migraine

### Contraindications

- Hypersensitivity to drug
- Advanced aortic stenosis

## Precautions

Use cautiously in:

- hepatic or mild renal impairment
- hypotension, heart failure, significant left ventricular dysfunction
- pheochromocytoma
- pregnant or breastfeeding patients (safety not established)
- children younger than age 18 (safety not established).

## Administration

- Give immediate-release capsules without regard to meals; if GI upset occurs, give with meals. Don't give with grapefruit or grapefruit juice.
- Don't open, crush, break, or let patient chew sustained-release capsules. Give with meals, but not with high-fat meals, grapefruit, or grapefruit juice.
- For I.V. use, dilute each 25-mg ampule with 240 ml of compatible I.V. fluid (such as dextrose 5% in water, normal saline solution, dextrose 5% with normal saline solution, or half-normal saline solution) to a concentration of 0.1 mg/ml.
- ⚠ Don't dilute with sodium bicarbonate 5% or lactated Ringer's injection (incompatible).
- Don't mix with furosemide, heparin, or thiopental.
- ⚠ Give by slow I.V. infusion. Titrate dosage to blood pressure response.

Route	Onset	Peak	Duration
P.O.	20 min	0.5-2 hr	8 hr
P.O. (sustained)	Unknown	Unknown	12 hr
I.V.	Few min	45 min	Unknown

## Adverse reactions

**CNS:** dizziness, headache, asthenia, drowsiness, paresthesia

**CV:** hypotension, peripheral edema, chest pain, increased angina, palpitations, tachycardia

**GI:** nausea, dyspepsia, dry mouth

**Musculoskeletal:** myalgia

**Skin:** flushing

## Interactions

**Drug-drug.** *Cimetidine:* increased nifedipine blood level

*Cyclosporine:* increased cyclosporine blood level

*Fentanyl anesthesia:* increased hypotension

**Drug-food.** *Grapefruit, grapefruit juice:* increased drug blood level and effects  
*High-fat meal (sustained-release form):* decreased drug blood level

**Drug-herbs.** *Ephedra (ma huang), yohimbine:* antagonism of drug's anti-hypertensive effect

*St. John's wort:* decreased nifedipine blood level

**Drug-behaviors.** *Alcohol use:* additive hypotension, increased drowsiness or dizziness

## Patient monitoring

- Assess vital signs and cardiovascular status.
- Monitor fluid intake and output. Assess for signs and symptoms of heart failure.

## Patient teaching

- Tell patient he may take immediate-release capsules without regard to meals. If GI upset occurs, advise him to take them with food, but not with grapefruit or grapefruit juice.
- Tell patient not to open, crush, break, or chew sustained-release capsules. Instruct him to take them with meals, but not with high-fat meals, grapefruit, or grapefruit juice.
- Tell patient to monitor blood pressure and report abnormal findings.
- ⚠ Advise patient to immediately report chest pain or blood pressure drop.
- Instruct patient to consult prescriber before drinking alcohol or taking herbs or over-the-counter drugs (especially cold remedies).

• As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, foods, herbs, and behaviors mentioned above.

## nicotine

### nicotine inhaler

Nicotrol Inhaler

### nicotine nasal spray

Nicotrol NS

### nicotine polacrilex

Commit, Nicorette, Nicotinell 

### nicotine transdermal system

Clear Nicoderm CQ, Nicoderm CQ, Nicopatch , Nicorette Patch , NiQuitin , Prostep 

*Pharmacologic class:* Cholinergic

*Therapeutic class:* Smoking deterrent

*Pregnancy risk category C* (gum), *D* (inhalation, nasal, transdermal)

### Action

Supplies nicotine during controlled withdrawal from cigarette smoking. Binds selectively to nicotinic-cholinergic receptors in central and peripheral nervous systems, autonomic ganglia, adrenal medulla, and neuromuscular junction. At low doses, has a stimulating effect; at high doses, a reward effect.

### Availability

*Chewing gum:* 2 mg, 4 mg

*Inhalation:* 42 cartridges/system, each containing 10 mg nicotine (delivers 4 mg)

*Nasal spray:* 10 mg/ml (0.5 mg/spray) in 10-ml bottles (100 doses)

*Transdermal patch:* 7 mg/day, 11 mg/day, 14 mg/day, 15 mg/day, 21 mg/day, 22 mg/day

### Indications and dosages

➤ Adjunctive therapy (with behavior modification) for nicotine withdrawal *Transdermal system*—

**Adults:** 21 mg/day transdermally (Habitrol) for 4 to 8 weeks, then 14 mg/day for 2 to 4 weeks, then 7 mg/day for 2 to 4 weeks, for a total of 8 to 16 weeks; patient must wear system 24 hours/day. Or 21 mg/day transdermally (Nicoderm CQ) for 6 weeks, then 14 mg/day for 2 weeks, then 7 mg/day for 2 weeks, for a total of 10 weeks; patient must wear system 24 hours/day. Or 15 mg/day transdermally (one Nicotrol patch) for 6 weeks; patient must wear system 16 hours/day, removing it at bedtime.

**Adults, adolescents, and children weighing less than 45 kg (100 lb) who smoke fewer than 10 cigarettes daily or have underlying cardiovascular disease:** 14 mg/day transdermally (Habitrol) for 4 to 8 weeks, then 7 mg/day for 2 to 4 weeks, for a total of 6 to 8 weeks; patient must wear system 24 hours/day. Or 14 mg/day transdermally (Nicoderm CQ) for 6 weeks, then 7 mg/day for 2 weeks, for a total of 8 weeks; patient must wear system 24 hours/day.

*Nasal spray*—

**Adults:** One spray intranasally in each nostril once or twice per hour, up to five times per hour or 40 times per day, for no longer than 6 months

*Inhalation*—

**Adults:** For optimal response, at least six cartridges inhaled daily for first 3 to 6 weeks, to a maximum of 16 cartridges daily for up to 12 weeks. Patient self-titrates dosage to required nicotine level (usually 6 to 16 cartridges daily),

followed by gradual withdrawal over 6 to 12 weeks.

#### Chewing gum—

**Adults:** Use as needed depending on smoking urge or chewing rate, or use on fixed schedule q 1 to 2 hours. Initial requirement may range from 18 to 48 mg/day, not to exceed 60 mg/day.

### Contraindications

- Hypersensitivity to drug or its components or to menthol (inhaler only)
- Allergy to adhesive (transdermal forms only)

### Precautions

Use cautiously in:

- cardiovascular disease, hypertension, bronchospastic disease, diabetes mellitus, pheochromocytoma, peripheral vascular disease, hyperthyroidism, peptic ulcer disease, hepatic disease
- immediately after myocardial infarction, severe arrhythmia, or severe or worsening angina (use not recommended)
- skin disorders (transdermal form)
- dental disorders, esophagitis, pharyngitis, stomatitis (gum form)
- females of childbearing age
- pregnant or breastfeeding patients.
- children under age 18 (safety and efficacy not established).

### Administration

- Apply patch when patient awakens and remove patch (as prescribed) at same time each day.
- Administer nasal spray regularly during first week, to help patient get used to irritant effects.
- With inhalation use, give at least six cartridges daily for first 3 to 6 weeks.
- Encourage patient to titrate dosage to level required, followed by gradual withdrawal.

Route	Onset	Peak	Duration
Gum	Rapid	15-30 min	Unknown
Inhalation	Rapid	15 min	Unknown
Nasal spray	Rapid	4-15 min	Unknown
Transdermal (Habitrol)	Rapid	6-12 hr	Unknown
Transdermal (Nicoderm CQ)	Rapid	2-4 hr	Unknown

### Adverse reactions

**CNS:** headache, dizziness, drowsiness, poor concentration, nervousness, weakness, paresthesia, insomnia, abnormal dreams

**CV:** chest pain, hypertension, tachycardia, **atrial fibrillation**

**EENT:** sinusitis; pharyngitis (with gum); mouth and throat irritation (with inhaler); nasopharyngeal irritation, rhinitis, sneezing, watering eyes, eye irritation (with nasal spray)

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dry mouth, dyspepsia; increased salivation, sore mouth (with gum)

**GU:** dysmenorrhea

**Musculoskeletal:** joint pain, back pain, myalgia; jaw ache (with gum)

**Respiratory:** increased cough (with nasal spray or inhaler), **bronchospasm**

**Skin:** burning at patch site, erythema, pruritus, cutaneous hypersensitivity, rash, sweating (all with transdermal patch)

**Other:** abnormal taste, increased appetite (with gum), allergy, hiccups

### Interactions

**Drug-drug.** *Acetaminophen, adrenergic antagonists (such as prazosin, labetalol), clozapine, furosemide, imipramine, oxazepam, pentazocine, propranolol and other beta-adrenergic blockers, theophylline:* increased effects of these drugs  
*Bupropion:* treatment-emergent hypertension  
*Insulin:* decreased insulin requirement

*Isoproterenol, phenylephrine*: increased requirements for these drugs

*Propoxyphene*: decreased nicotine metabolism

**Drug-food.** *Caffeine-containing foods and beverages*: increased nicotine effects

**Drug-behaviors.** *Cigarette smoking*: increased nicotine metabolism and effects

### Patient monitoring

- Assess for signs and symptoms of nicotine withdrawal (irritability, drowsiness, fatigue, headache).

🔊 Watch for bronchospasm and evidence of nicotine toxicity (nausea, vomiting, diarrhea, increased salivation, headache, dizziness, visual disturbances).

### Patient teaching

🔊 Caution patient against any type of smoking during therapy. Urge him to immediately report chest tightness or difficulty breathing.

- If patient uses gum, advise him to chew one piece whenever nicotine craving occurs. Instruct him to chew it slowly until he feels a tingling sensation, then store it between cheek and gum until tingling disappears.
- Instruct patient to apply transdermal patch to clean, dry skin of upper arm or torso when he awakens; to keep it in place when showering, bathing, or swimming; and to remove it at same time each day.
- If patient uses nasal spray, instruct him to tilt head back slightly when spraying. Remind him not to sniff, swallow, or inhale through nose.
- If patient uses inhalation form, teach him to puff continuously for 20 minutes and to use at least six cartridges daily for first 3 to 6 weeks.
- As appropriate, review all significant and life-threatening adverse reactions and interactions, especially those

related to the drugs, foods, and behaviors mentioned above.

## nifedipine

Adalat CC, Adalat LA ⚡, Adalat P.A. ⚡, Adalat Retard ⚡, Adalat XL ⚡, Adipine ⚡, Afeditab CR, Angiopine ⚡, Apo-Nifed ⚡, Calchan ⚡, Cardilate MR ⚡, Coracten ⚡, Fortipine ⚡, Gen-Nifedical ⚡, Hypolar Retard ⚡, Neozipine XL ⚡, Nifediac CC, Nifedical XL, Nifedipress MR ⚡, Nifopress MR ⚡, Novo-Nifedin ⚡, Nu-Nifed, Procardia, Procardia XL, Slofedipine ⚡, Tensipine ⚡, Valni Retard ⚡, Valni XL ⚡

**Pharmacologic class:** Calcium channel blocker

**Therapeutic class:** Antianginal, anti-hypertensive

**Pregnancy risk category C**

### Action

Inhibits calcium transport into myocardial and vascular smooth muscle cells, suppressing contractions. Dilates main coronary arteries and arterioles and inhibits coronary artery spasm, increasing oxygen delivery to heart and decreasing frequency and severity of angina attacks.

### Availability

*Capsules:* 5 mg, 10 mg, 20 mg

*Tablets (extended-release):* 10 mg, 20 mg, 30 mg, 60 mg, 90 mg

### Indications and dosages

➤ Vasospastic (Prinzmetal's) angina; chronic stable angina

**Adults:** Initially, 10 mg P.O. (immediate-release) t.i.d. titrated over 7 to 14 days; usual effective range is 10 to

20 mg t.i.d., not to exceed 180 mg/day. Patient may be switched to extended-release at nearest equivalent of immediate-release daily dosage (for instance, 30-mg immediate-release dose may be switched to 90-mg extended-release dose). Total extended-release dosage should not exceed 90 mg/day.

➤ Hypertension

**Adults:** 30 to 60 mg/day P.O. (extended-release only) titrated over 7 to 14 days to a maximum of 120 mg/day

### Off-label uses

- Aortic regurgitation
- Heart failure
- Migraine
- Prevention of labor

### Contraindications

- Hypersensitivity to drug

### Precautions

Use cautiously in:

- chronic renal insufficiency
- hypotension, aortic stenosis, heart failure, significant left ventricular dysfunction (especially when used with beta-adrenergic blockers), peripheral edema
- elderly patients
- pregnant or breastfeeding patients (safety not established)
- children (safety not established).

### Administration

- Give immediate-release form with or without food. If GI upset occurs, give with meals, but never with grapefruit or grapefruit juice.
- Don't crush or break extended-release tablet. Make sure patient swallows it whole. Give on empty stomach, and not with grapefruit or grapefruit juice.
- Know that Procardia XL and Adalat CC are not equivalent because of their pharmacokinetic differences.
- Be aware that only extended-release tablets are used to treat hypertension.

Route	Onset	Peak	Duration
P.O.	20 min	Unknown	6-8 hr
P.O. (Adalat PA)	Unknown	4 hr	12 hr
P.O. (Adalat CC, PA, XL)	Unknown	6 hr	24 hr

### Adverse reactions

**CNS:** headache, dizziness, fatigue, asthenia, paresthesia, vertigo

**CV:** peripheral edema, chest pain, hypotension

**EENT:** epistaxis, rhinitis

**GI:** nausea, constipation

**GU:** urinary frequency, erectile dysfunction

**Musculoskeletal:** leg cramps

**Skin:** flushing, rash

### Interactions

**Drug-drug.** *Beta-adrenergic blockers:* increased risk of heart failure, severe hypotension, or angina exacerbation

*Cimetidine:* increased nifedipine blood level

*Coumarin anticoagulants:* increased prothrombin time

*Digoxin:* increased risk of digoxin toxicity

*Quinidine:* decreased quinidine blood level

**Drug-diagnostic tests.** *Antinuclear antibody, direct Coombs' test:* false-positive results

**Drug-food.** *Grapefruit, grapefruit juice:* increased nifedipine blood level and effects

**Drug-herbs.** *Ephedra (ma huang), yohimbine:* antagonism of nifedipine effect

*Ginkgo, ginseng:* increased nifedipine blood level

*St. John's wort:* decreased nifedipine blood level

**Drug-behaviors.** *Alcohol use:* additive hypotension

**Patient monitoring**

- Monitor vital signs and cardiovascular status. Stay alert for chest pain and edema.
- Watch for rash.

**Patient teaching**

- Tell patient he may take immediate-release form with or without meals. If GI upset occurs, tell him to take it with meals, but never with grapefruit or grapefruit juice.
- Caution patient not to crush or break extended-release tablets. Tell him to swallow them whole. Advise him to take on empty stomach, and not with grapefruit or grapefruit juice.
- Inform patient that angina attacks may occur 30 minutes after a dose. Explain that these attacks are usually temporary and don't mean that drug should be withdrawn.
-  Tell patient to report rash immediately.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, balance, and alertness.
- Instruct patient to consult prescriber before taking herbs or over-the-counter drugs (especially cold remedies).
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

**nilotinib**

Tasigna

**Pharmacologic class:** Protein-tyrosine kinase inhibitor**Therapeutic class:** Antineoplastic**Pregnancy risk category D****FDA BOXED WARNING**

- Drug prolongs QT interval and may lead to sudden death. Don't give to patients with hypokalemia, hypomagnesemia, or long-QT syndrome. Correct hypokalemia or hypomagnesemia before starting drug and monitor for these imbalances periodically. Avoid concomitant drugs known to prolong QT interval; also avoid strong CYP3A4 inhibitors. Instruct patient not to eat 2 hours before or 1 hour after taking dose. Obtain ECG to monitor QTc at baseline, 7 days after drug initiation, periodically thereafter, and after dosage adjustments.
- Reduce dosage in patients with hepatic impairment.

**Action**

Inhibits proliferation of murine leukemic cell lines mediated by BCR-ABL kinase and human cell lines derived from patients with Philadelphia chromosome-positive (Ph+) chronic myeloid leukemia (CML)

**Availability***Capsules:* 200 mg**Indications and dosages**

➤ Chronic-phase or accelerated-phase Ph+ CML in patients resistant or intolerant to previous imatinib therapy

**Adults:** 400 mg P.O. q 12 hours

➤ Newly diagnosed Philadelphia chromosome positive CML

**Adults:** 300 mg P.O. q 12 hours**Dosage adjustment**

- QTc longer than 480 msec
- Hematologic toxicity
- Moderate or severe non-hematologic toxicity
- Concomitant use of CYP3A4 inducers
- Hepatic impairment

## Off-label uses

- Ph+ acute lymphoblastic leukemia (ALL)
- Systemic mastocytosis with *c-kit* receptor activation
- Hypereosinophilic syndrome

## Contraindications

- Hypokalemia
- Hypomagnesemia
- Long-QT syndrome

## Precautions

Use cautiously in:

- hepatic impairment
- rare hereditary problems of galactose intolerance, severe lactase deficiency, or glucose-galactose malabsorption (use not recommended)
- myelosuppression
- electrolyte abnormalities
- history of pancreatitis
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

## Administration

-  Correct hypophosphatemia and hypokalemia before starting drug.
- Don't give with food. Know that patient shouldn't consume food for at least 2 hours before or 1 hour after dose.
- Administer capsule whole with water.
- Be aware that drug may be given in combination with hematopoietic growth factors, if indicated.

Route	Onset	Peak	Duration
P.O.	Unknown	3 hr	Unknown

## Adverse reactions

**CNS:** headache, fatigue, asthenia, insomnia, dizziness, paresthesia, vertigo, **intracranial hemorrhage**

**CV:** palpitations, hypertension, flushing, **QT interval prolongation and sudden death**

**EENT:** dysphonia, nasopharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, abdominal

discomfort, dyspepsia, flatulence, anorexia

**Hematologic:** anemia, **neutropenia, thrombocytopenia, leukopenia, pancytopenia, febrile neutropenia**

**Hepatic:** **hepatotoxicity**

**Metabolic:** electrolyte abnormalities

**Musculoskeletal:** arthralgia, myalgia, extremity pain, bone pain, muscle spasms, back pain, chest pain

**Respiratory:** cough, dyspnea, exertional dyspnea, pneumonia

**Skin:** rash, pruritus, eczema, urticaria, alopecia, erythema, hyperhidrosis, dry skin

**Other:** fever, peripheral edema, night sweats, weight changes

## Interactions

**Drug-drug.** *Drugs eliminated by CYP2B6, CYP2C8, or CYP2C9:*

decreased blood levels of these drugs  
*Drugs eliminated by CYP3A4 (such as warfarin), CYP2C8, CYP2C9, CYP2D6, or UGT1A1:* increased blood levels of these drugs

*Drugs that inhibit P-glycoprotein*

*ABCB1:* increased nilotinib blood level  
*Midazolam:* increased midazolam exposure

*P-glycoprotein substrates:* increased blood levels of these drugs

*Strong CYP3A4 inducers (such as carbamazepine, dexamethasone, phenytoin, rifabutin, rifampin, rifapentin, phenobarbital):* decreased nilotinib blood level

*Strong CYP3A4 inhibitors (such as atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, voriconazole):* increased nilotinib blood level

**Drug-diagnostic tests.** *Albumin, calcium, magnesium, neutrophils, phosphorus, platelets, sodium, white blood cells:* decreased levels

*ALP, ALT, AST, bilirubin, blood glucose, creatinine, serum amylase, serum lipase:* increased levels

*Potassium:* increased or decreased level

**Drug-food.** *Grapefruit products:*

increased nilotinib blood level

*High-fat meal:* increased nilotinib onset**Drug-herbs.** *St. John's wort:* decreased nilotinib blood level**Patient monitoring**

 Closely monitor for prolonged QT interval if patient has hepatic impairment or is receiving strong CYP3A4 inhibitors.

- Obtain complete blood count every 2 weeks for first 2 months of therapy and monthly thereafter, or as indicated.
- Periodically monitor electrolyte and lipase levels and liver function tests.

**Patient teaching**

• Tell patient not to take drug with food and not to consume food for at least 2 hours before or 1 hour after dose.

• Advise patient to take capsules whole with water.

 Instruct patient to avoid grapefruit products and St. John's wort.

• Tell lactose-intolerant patient that drug contains lactose.

 Instruct patient to immediately notify prescriber if symptoms of QTc prolongation (faintness or irregular heartbeat) occur.

 Urge patient to immediately report signs or symptoms of liver damage, such as nausea, fatigue, anorexia, yellowing of skin or eyes, dark urine, light-colored stools, itching, or abdominal tenderness.

- Advise female patient that drug may harm fetus. Caution her to avoid pregnancy.
- Advise breastfeeding patient to seek guidance to help her decide whether to discontinue breastfeeding or discontinue drug.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, food, and herbs mentioned above.

**nilutamide**Anadron<sup>†</sup>, Nilandron**Pharmacologic class:** Antiandrogen**Therapeutic class:** Antineoplastic**Pregnancy risk category** C**FDA BOXED WARNING**

- Drug may cause interstitial pneumonitis. Though rare, interstitial changes have led to hospitalization and death postmarketing. Most cases occurred within first 3 months of therapy and reversed after drug was stopped. Obtain routine chest X-ray before starting treatment, and be prepared to obtain baseline pulmonary function tests if ordered. Instruct patient to report new or worsening shortness of breath; this symptom warrants immediate drug withdrawal pending evaluation.

**Action**

Inhibits testosterone uptake in target tissue, preventing normal androgenic response and arresting tumor growth in androgen-sensitive tissue

**Availability**

Tablets: 50 mg, 150 mg

 **Indications and dosages**

 Metastatic prostate cancer (used with surgical castration)

**Adults:** 300 mg/day P.O. for 30 days, starting on day of or day after surgery; then 150 mg/day P.O.

**Contraindications**

- Hypersensitivity to drug or its components
- Severe hepatic or respiratory insufficiency

## Precautions

Use cautiously in:

- renal impairment.

## Administration

- Give with or without food.
- Start therapy on same day as or day after surgical castration.

Route	Onset	Peak	Duration
P.O.	Rapid	Days	Wks

## Adverse reactions

**CNS:** dizziness, depression, hyperesthesia, insomnia

**CV:** hypertension, peripheral edema, **heart failure**

**EENT:** abnormal vision, impaired dark and light adaptation, chromatopsia

**GI:** nausea, vomiting, constipation, dyspepsia, anorexia

**GU:** hematuria, nocturia, urinary tract infection, gynecomastia, testicular atrophy, decreased libido, erectile dysfunction

**Hematologic:** anemia, **aplastic anemia**

**Hepatic:** **hepatitis**

**Respiratory:** dyspnea, upper respiratory infection, **interstitial pneumonia**

**Other:** flulike symptoms, pain, fever, hot flushes, alcohol intolerance

## Interactions

**Drug-drug.** *Phenytoin, theophylline, vitamin K:* increased risk of toxicity from these drugs

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase:* increased levels

**Drug-behaviors.** *Alcohol use:* disulfiram-like reaction

## Patient monitoring

- Check for signs and symptoms of hepatitis. Monitor liver function tests.
- Monitor CBC.
- Assess fluid intake and output and weight. Watch for signs and symptoms of heart failure.
- Monitor respiratory status, including chest X-rays.

## Patient teaching

- Advise patient he may take with or without food.
- Tell patient therapy will start on day of or day after surgical castration.
- Caution patient not to stop taking drug without consulting prescriber.
- Instruct patient to weigh himself daily and report sudden increases.

 Advise patient to report new onset or worsening of dyspnea as well as signs and symptoms of hepatotoxicity, such as nausea, vomiting, abdominal pain, unusual tiredness, or yellowing of skin or eyes.

- Advise patient to avoid alcohol during therapy, because serious adverse reactions may occur.
- Tell patient drug may impair his adaptation to darkness and light, which may cause difficulty driving at night or through tunnels.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, test, and behaviors mentioned above.

n

## nimodipine

Nimotop

**Pharmacologic class:** Calcium channel blocker

**Therapeutic class:** Cerebral vasodilator

**Pregnancy risk category C**

### FDA BOXED WARNING

- Don't give by I.V. or other parenteral route. Deaths and serious or life-threatening adverse events have occurred when capsule contents have been injected parenterally.

**Action**

Inhibits calcium transport into vascular smooth muscle cells, suppressing contractions; also dilates coronary and cerebral arteries

**Availability**

Capsules: 30 mg

**Indications and dosages**

➤ Subarachnoid hemorrhage

**Adults:** 60 mg P.O. q 4 hours for 21 days. Therapy should start within 96 hours of subarachnoid hemorrhage.

**Dosage adjustment**

- Hepatic impairment

**Contraindications**

None

**Precautions**

Use cautiously in:

- hepatic impairment, hypotension
- elderly patients
- pregnant or breastfeeding patients (safety not established)
- children (safety not established).

**Administration**

- Give at least 1 hour before or 2 hours after meals. Don't let patient consume grapefruit or grapefruit juice within 1 hour before or 2 hours after dose.
- If patient can't swallow capsule, puncture it with sterile needle and empty contents into syringe. Administer through nasogastric tube, then flush with normal saline solution (30 ml).

Route	Onset	Peak	Duration
P.O.	Unknown	1 hr	4 hr

**Adverse reactions**

**CNS:** headache, depression

**CV:** hypotension, peripheral edema, ECG abnormalities, bradycardia, tachycardia

**GI:** nausea, diarrhea, abdominal discomfort

**Musculoskeletal:** muscle cramps

**Respiratory:** dyspnea

**Skin:** acne, flushing, rash

**Interactions**

**Drug-drug.** *Other calcium channel blockers:* enhanced cardiovascular effects

**Drug-diagnostic tests.** *Liver function tests:* abnormal results

**Drug-food.** *Any food:* decreased drug blood level and effects

*Grapefruit juice, grapefruit juice:* increased drug blood level and effects

**Drug-herbs.** *Ephedra (ma huang), yohimbine:* antagonism of nimodipine effects

*St. John's wort:* decreased drug blood level

**Drug-behaviors.** *Alcohol use:* increased hypotension

**Patient monitoring**

- Monitor weight and fluid intake and output. Stay alert for fluid retention.
- Assess neurologic status and mood, watching for signs of depression.
- Check vital signs and ECG.

**Patient teaching**

- Tell patient to complete full course of therapy (21 days).
- Advise patient to take on an empty stomach 1 hour before or 2 hours after a meal. Instruct him to not to consume grapefruit or grapefruit juice within 1 hour before or 2 hours after taking drug.
- Tell patient to report irregular heart-beat, shortness of breath, rash, or swollen hands or feet.
- Instruct patient to minimize GI upset by eating small, frequent meals.
- Advise patient to weigh himself daily and report sudden weight gain.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## nisoldipine

Sular, Sycor 

**Pharmacologic class:** Calcium channel blocker

**Therapeutic class:** Antihypertensive

**Pregnancy risk category C**

### Action

Suppresses calcium transport into vascular smooth muscle cells. This suppression inhibits vasoconstriction and dilates coronary arteries, improving myocardial oxygen uptake.

### Availability

Tablets (*extended-release*): 8.5 mg, 17 mg, 22.5 mg, 34 mg

### Indications and dosages

➤ Hypertension

**Adults:** Initially, 17 mg P.O. daily; may increase by 8.5 mg per week or longer intervals to attain adequate blood pressure control. Usual maintenance dosage is 17 to 34 mg daily.

### Contraindications

- Hypersensitivity to drug or dihydropyridine calcium channel blockers

### Precautions

Use cautiously in:

- heart failure and left ventricular dysfunction, hepatic impairment, renal disease, coronary artery disease, hypotension
- concurrent phenytoin use
- elderly patients
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Give with meals, but not with high-fat meals, grapefruit, or grapefruit juice.

- Don't crush or break extended-release tablets. Make sure patient swallows them whole.
- Know that drug may be given alone or with other antihypertensives.

Route	Onset	Peak	Duration
P.O.	Unknown	6-12 hr	24 hr

### Adverse reactions

**CNS:** headache, dizziness

**CV:** peripheral edema, chest pain, vasodilation, hypotension, palpitations

**EENT:** pharyngitis, sinusitis

**GI:** nausea

**Skin:** rash

### Interactions

**Drug-drug.** *Cimetidine:* increased nisoldipine blood level

*Phenytoin, other CYP3A4 inducers:* decreased nisoldipine blood level and efficacy

**Drug-food.** *Grapefruit juice:* significantly increased drug blood level and effects

*High-fat meal:* decreased drug blood level

**Drug-herbs.** *Ephedra (ma huang), yohimbine:* antagonism of nimodipine effects

*St. John's wort:* decreased nimodipine blood level

**Drug-behaviors.** *Alcohol use:* increased hypotensive effects

### Patient monitoring

- Check vital signs and ECG.
- Monitor fluid intake and output. Watch for peripheral edema.

### Patient teaching

- Tell patient to swallow extended-release tablets whole and not to crush or break them.
- Advise patient to take with food, but not high-fat food. Recommend small, frequent meals.

- Instruct patient to avoid high-fat meals, alcohol, grapefruit, and grapefruit juice.
- Tell patient to immediately report irregular heart beat, shortness of breath, swelling, pronounced dizziness, rash, or chest pain.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, foods, herbs, and behaviors mentioned above.

## nitazoxanide

Alinia

**Pharmacologic class:** Antiprotozoal

**Therapeutic class:** Anti-infective

**Pregnancy risk category** B

### Action

Impedes pyruvate:ferredoxin oxidoreductase enzyme-dependent electron transfer reaction, which is essential to anaerobic energy metabolism

### Availability

Oral suspension: 100 mg/5 ml

Tablets: 500 mg

### Indications and dosages

➤ Diarrhea caused by *Giardia lamblia* or *Cryptosporidium parvum*

**Adults and children ages 12 and older:**

500 mg (tablet or 25 ml suspension) P.O. every 12 hours with food for 3 days

**Children ages 4 to 11:** 200 mg (10 ml suspension) P.O. every 12 hours with food for 3 days

**Children ages 1 to 3:** 100 mg (5 ml suspension) P.O. every 12 hours with food for 3 days

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- renal, hepatic, or biliary disease or dysfunction; immunodeficiency (including human immunodeficiency virus); diabetes mellitus (suspension)
- concurrent use of warfarin or other highly plasma protein-bound drugs
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 11 (tablets) or age 1 (suspension).

### Administration

- Give with food.
- Because a single tablet contains more nitazoxanide than recommended for pediatric dosing, don't give tablets to children younger than age 11.
- Keep suspension container tightly closed and shake well before each use. Suspension may be stored for 7 days; after that, discard unused portion.

Route	Onset	Peak	Duration
P.O.	Unknown	1-4 hr	Unknown

### Adverse reactions

**CNS:** headache

**GI:** nausea, vomiting, diarrhea, abdominal pain

### Interactions

**Drug-drug.** *Warfarin and other highly plasma protein-bound drugs with narrow therapeutic index:* competition for binding sites, resulting in increased nitazoxanide blood level and efficacy

### Patient monitoring

- Monitor renal and liver function tests frequently in patients with renal, hepatic, or biliary dysfunction.
- Monitor blood glucose levels in diabetic patients taking oral suspension.

### Patient teaching

- Instruct patient to take drug with food.

- Inform diabetic patient that oral suspension contains sucrose.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

## nitrofurantoin

Apo-Nitrofurantoin<sup>✳</sup>, Furadantin, Novo-Furantoin<sup>✳</sup>

## nitrofurantoin macrocrystals

Macrobid, Macrochantin

**Pharmacologic class:** 5-nitrofurantoin derivative

**Therapeutic class:** Anti-infective, urinary tract anti-infective

**Pregnancy risk category B**

### Action

Inhibits bacterial enzymes required for normal cell activity at low concentrations; inhibits normal cell-wall synthesis at high concentrations

### Availability

**Capsules:** 25 mg, 50 mg, 100 mg (macrocrystals)

**Capsules (extended-release):** 100 mg (macrocrystals)

**Oral suspension:** 25 mg/5 ml

**Tablets:** 50 mg, 100 mg (macrocrystals)

### Indications and dosages

➤ Active urinary tract infections (UTIs)

**Adults:** 50 to 100 mg P.O. q.i.d. or 100 mg q 12 hours (extended-release), continued for 1 week, or for 3 days after urine becomes sterile

**Children older than 1 month:** 5 to 7 mg/kg/day P.O. in four divided doses, continued for 1 week, or for 3 days after urine becomes sterile

➤ Chronic suppression of UTIs

**Adults:** 50 to 100 mg P.O. at bedtime

**Children:** 1 mg/kg/day P.O. in one or two divided doses

### Contraindications

- Hypersensitivity to drug or parabens (oral suspension)
- Oliguria, anuria, or significant renal impairment
- Pregnancy near term (38 to 42 weeks' gestation), imminent labor onset, labor and delivery
- Infants younger than 1 month

### Precautions

Use cautiously in:

- diabetes mellitus, renal impairment
- blacks and patients of Mediterranean or near-Eastern descent (because of possible G6PD deficiency)
- elderly or debilitated patients
- pregnant (to week 32) or breastfeeding patients.

### Administration

- As appropriate, obtain specimens for repeat urine culture and sensitivity tests before therapy.
- To avoid GI upset and increase drug bioavailability, give with food or milk.

Route	Onset	Peak	Duration
P.O.	Unknown	30 min	6-12 hr

### Adverse reactions

**CNS:** dizziness, drowsiness, headache, asthenia, peripheral neuropathy, vertigo

**CV:** chest pain

**EENT:** nystagmus

**GI:** nausea, vomiting, diarrhea, abdominal pain, anorexia, parotitis, pancreatitis

**Hematologic:** eosinophilia, agranulocytosis, thrombocytopenia, leukopenia, granulocytopenia, G6PD deficiency anemia, hemolytic anemia, megaloblastic anemia

**Hepatic:** hepatitis, hepatic necrosis

**Musculoskeletal:** arthralgia, myalgia

**Respiratory:** asthma attacks, pulmonary hypersensitivity reactions

including diffuse interstitial pneumonitis (with prolonged therapy)

**Skin:** rash, exfoliative dermatitis, alopecia, pruritus, urticaria, angioedema, photosensitivity, **Stevens-Johnson syndrome**

**Other:** drug fever, chills, superinfection (limited to urinary tract), hypersensitivity reactions including **anaphylaxis**, **lupus-like syndrome**

### Interactions

**Drug-drug.** *Anticholinergics:* increased nitrofurantoin absorption and bioavailability

*Drugs that can cause pulmonary toxicity:* increased risk of pneumonitis

*Hepatotoxic drugs:* increased risk of hepatotoxicity

*Magnesium salts:* decreased nitrofurantoin absorption

*Neurotoxic drugs:* increased risk of neurotoxicity

*Uricosurics (such as probenecid):*

decreased renal clearance and increased blood level of nitrofurantoin

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine:* increased levels  
*Granulocytes, platelets, hemoglobin:* decreased levels

*Urine glucose tests using Benedict's reagent or Fehling's solution:* false-positive results

**Drug-food.** *Any food:* increased drug bioavailability

### Patient monitoring

• Monitor patient's response to therapy. Assess urine culture and sensitivity tests.

☞ Watch for and immediately report peripheral neuropathy.

☞ Assess respiratory status. Watch for signs and symptoms of serious pulmonary hypersensitivity reaction.

☞ Monitor CBC and liver function tests closely. Stay alert for evidence of hematologic and hepatic disorders.

• Evaluate patient for rash.

### Patient teaching

• Instruct patient to take with food or milk at regular intervals around the clock.

• Advise patient to complete entire course of therapy.

• Tell patient not to take magnesium-containing drugs (such as antacids) during therapy.

• Caution patient not to drive or perform other hazardous activities until he knows how drug affects vision, concentration, and alertness.

☞ Tell patient to immediately report fever, chills, cough, chest pain, difficulty breathing, rash, bleeding or easy bruising, dark urine, yellowing of skin or eyes, numbness or tingling of fingers or toes, or intolerable GI distress.

• Advise female patient to avoid taking drug during pregnancy, especially near term.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## nitroglycerin

Minitran, Nitrek, Nitro-Dur, Nitroject<sup>♣</sup>, Nitrolingual, Nitromist, Nitronal<sup>♣</sup>, Nitroquick, Nitrostat

**Pharmacologic class:** Nitrate

**Therapeutic class:** Antianginal

**Pregnancy risk category C**

### Action

Inhibits calcium transport into myocardial and vascular smooth muscle cells,

suppressing contractions. Dilates main coronary arteries and arterioles, inhibits coronary artery spasm, increases oxygen delivery to heart, and reduces frequency and severity of angina attacks.

### Availability

*Capsules (extended-release):* 2.5 mg, 6.5 mg, 9 mg  
*Injection:* 0.5 mg/ml, 5 mg/ml  
*Ointment (transdermal):* 2%  
*Solution for injection:* 25 mg/250 ml, 50 mg/250 ml, 50 mg/500 ml, 100 mg/250 ml, 200 mg/500 ml  
*Spray (translingual):* 0.4 mg/spray in 14.5-g canister (200 doses)  
*Tablets (buccal, extended-release):* 1 mg, 2 mg, 3 mg, 5 mg  
*Tablets (extended-release):* 2.6 mg, 6.5 mg, 9 mg  
*Tablets (sublingual):* 0.3 mg, 0.4 mg, 0.6 mg  
*Transdermal system (patch):* 0.1 mg/hour, 0.2 mg/hour, 0.3 mg/hour, 0.4 mg/hour, 0.6 mg/hour, 0.8 mg/hour

### Indications and dosages

➤ Management and prophylaxis of angina pectoris

**Adults:** For acute angina attack, 0.3 to 0.6 mg S.L., repeated q 5 minutes for 15 minutes p.r.n.; or one to two translingual sprays, repeated q 5 minutes for 15 minutes p.r.n. For long-term or prophylactic use, 1-mg extended-release buccal tablet q 5 hours, with dosage and frequency increased p.r.n.; or 2.5 to 9 mg (extended-release tablets) P.O. q 8 to 12 hours; or 1.3 to 6.5 mg (extended-release capsules) P.O. q 8 to 12 hours.

➤ Hypertension during surgery; adjunct in heart failure

**Adults:** 5 mcg/minute I.V., increased by 5 mcg/minute q 3 to 5 minutes up to 20 mcg/minute, then increased by 10 to 20 mcg/minute q 3 to 5 minutes (dosage based on hemodynamic parameters)

➤ Heart failure associated with acute myocardial infarction (MI)

**Adults:** 12.5 to 25 mcg I.V., then a continuous infusion of 10 to 20 mcg/minute q 5 to 10 minutes; increase by 5 to 10 mcg/minute q 5 to 10 minutes as needed to a maximum of 200 mcg/minute.

### Contraindications

- Hypersensitivity to drug, other organic nitrates, nitrites, or adhesives (transdermal form)
- Angle-closure glaucoma
- Orthostatic hypotension
- Hypotension or uncorrected hypovolemia (I.V. form)
- Early MI (S.L. form)
- Increased intracranial pressure (as from head trauma or cerebral hemorrhage)
- Severe anemia
- Pericardial tamponade or constrictive pericarditis
- Concurrent sildenafil therapy

### Precautions

Use cautiously in:

- severe renal or hepatic impairment, glaucoma, hypertrophic cardiomyopathy
- hypovolemia, normal or decreased pulmonary capillary wedge pressure (with I.V. use)
- alcohol intolerance (with large I.V. doses)
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Administer tablets and capsules with water. Don't crush, break, or let patient chew them.
- For S.L. use, administer under tongue or in buccal pouch; instruct patient not to swallow tablet. For acute angina, give at pain onset. For angina prophylaxis, give before activities that may cause anginal pain.
- For translingual use, spray directly onto oral mucosa. Don't let patient inhale spray. Give at pain onset and as needed prophylactically before activities that trigger angina.

- For transdermal use, apply system to skin site with little hair and movement. Don't apply to distal extremities.

Rotate application sites to avoid irritation and sensitization.

- Apply transdermal ointment to skin by spreading prescribed amount over 6" × 6" area (using an applicator, not your fingers). Cover area with plastic wrap and tape. Rotate sites to reduce risk of irritation and inflammation.

 Know that solution for injection is a concentrate. Dilute with dextrose 5% in water or normal saline solution before giving by I.V. infusion.

 Don't mix solution for injection with other drugs, and don't give by direct I.V. injection.

- Be aware that solution for injection is affected by type of infusion set used and that dosage is based on use of conventional PVC tubing. When using nonabsorbent tubing, reduce dosage.

- For I.V. use, administer with infusion pump. Increase dosage in increments of 5 mcg/minute every 3 to 5 minutes p.r.n. to achieve desired blood pressure response. Once achieved, reduce dosage and lengthen dosage adjustment intervals.

 Don't give concurrently with sildenafil (may cause life-threatening hypotension).

Route	Onset	Peak	Duration
P.O. (extended)	40-60 min	Unknown	8-12 hr
I.V.	Immediate	Unknown	Several min
Buccal (extended)	Unknown	Unknown	5 hr
S.L.	1-3 min	Unknown	30-60 min
Trans-dermal (ointment)	20-60 min	Unknown	4-8 hr
Trans-dermal (patch)	40-60 min	Unknown	8-24 hr
Translingual	2-4 min	Unknown	30-60 min

## Adverse reactions

**CNS:** dizziness, headache

**CV:** hypotension, syncope

**Hematologic:** methemoglobinemia

**Skin:** contact dermatitis (with transdermal or ointment use), rash, exfoliative dermatitis, flushing

## Interactions

**Drug-drug.** *Antihypertensives, beta-adrenergic blockers, calcium channel blockers, haloperidol, phenothiazines:* additive hypotension

*Drugs with anticholinergic properties (antihistamines, phenothiazines, tricyclic antidepressants):* decreased absorption of lingual, S.L., or buccal nitroglycerin

*Sildenafil:* increased risk of potentially fatal hypotension

**Drug-diagnostic tests.** *Cholesterol:* false elevation

*Methemoglobin:* significant levels (with excessive doses)

*Urine catecholamines, urine vanillyl-mandelic acid:* increased levels

**Drug-behaviors.** *Alcohol use, acute alcohol ingestion:* increased risk of potentially fatal hypotension

## Patient monitoring

 With I.V. use, monitor blood pressure frequently. Titrate dosage to obtain desired results.

- With transdermal use, check for rash or skin irritation.

- Monitor patient for angina relief.

## Patient teaching

- Instruct patient to place S.L. tablet directly under tongue and hold it there as it dissolves. Caution him not to chew or swallow tablet.

- Tell patient to use drug before physical activities that may cause angina.

- Instruct patient to take drug at pain onset and repeat every 5 minutes for three doses. If pain doesn't subside, advise him to seek medical attention.

- Tell patient not to chew or crush sustained-release tablets.
- Advise patient to apply correct amount of ointment using applicator. Caution him to avoid rubbing site. Instruct him to cover ointment with plastic wrap and tape it, to wash hands after placement, and to rotate sites.
- Advise patient to consult prescriber or pharmacist before changing brands of transdermal system. Different brands may have different drug concentrations.
- As appropriate, review all significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## nitroprusside sodium

Nipride<sup>®</sup>, Nitropress

**Pharmacologic class:** Vasodilator

**Therapeutic class:** Antihypertensive

**Pregnancy risk category** C

### FDA BOXED WARNING

- After reconstitution with appropriate diluent, drug isn't suitable for direct injection. Dilute reconstituted solution further in sterile 5% dextrose injection before infusing.
- Drug may cause steep blood pressure decrease. In patients not properly monitored, this decrease can lead to irreversible ischemic injury or death. Give drug only when available equipment and personnel allow continuous blood pressure monitoring.
- Except when used briefly or at low infusion rates, drug gives rise to significant amount of cyanide ion, which can reach toxic, potentially lethal levels. Infusion at maximum dosage rate should never last more than 10 minutes.

If blood pressure isn't adequately controlled after 10 minutes of maximum-rate infusion, end infusion immediately. Monitor acid-base balance and venous oxygen concentration, but be aware that, although these tests may indicate cyanide toxicity, they provide imperfect guidance.

- Review these warnings thoroughly before giving drug.

### Action

Interferes with calcium influx and intracellular activation of calcium, causing peripheral vasodilation and direct blood pressure decrease

### Availability

**Injection:** 50 mg/vial in 2 ml- and 5-ml vials

### Indications and dosages

➤ Hypertensive emergencies; controlled hypotension during anesthesia

**Adults and children:** 0.3 to 10 mcg/kg/minute I.V., titrated to response

n

### Dosage adjustment

- Hepatic insufficiency
- Renal impairment
- Elderly patients

### Contraindications

- Hypertension caused by aortic coarctation or atrioventricular shunting
- Acute heart failure caused by reduced peripheral vascular resistance
- Congenital (Leber's) optic atrophy, tobacco amblyopia
- Inadequate cerebral circulation
- Moribund patients

### Precautions

Use cautiously in:

- hepatic or renal disease, fluid and electrolyte imbalances, hypothyroidism
- elderly patients
- pregnant or breastfeeding patients
- children.

## Administration

⚠ Be aware that nitroprusside is a high-alert drug.

⚠ Give only in settings with trained personnel and continuous blood pressure monitoring equipment.

- Dilute 50 mg in 2 to 3 ml of dextrose 5% in water (D<sub>5</sub>W); then dilute in 250 to 1,000 ml of D<sub>5</sub>W.
- Administer with microdrip regulator, infusion pump, or other device that allows precise flow rate measurement.
- Wrap infusion solution in aluminum foil or other opaque material to protect it from light.

Route	Onset	Peak	Duration
I.V.	1-2 min	1-10 min	10 min

## Adverse reactions

**CNS:** increased intracranial pressure

**CV:** ECG changes, bradycardia, tachycardia, **marked hypotension**

**GI:** ileus

**Hematologic:** decreased platelet aggregation, **methemoglobinemia**

**Metabolic:** hypothyroidism

**Skin:** rash, flushing

**Other:** pain, irritation, and venous streaking at injection site; too-rapid blood pressure decrease (causing apprehension, restlessness, palpitations, retrosternal discomfort, nausea, retching, abdominal pain, diaphoresis, headache, dizziness, muscle twitching);

**thiocyanate or cyanide toxicity** (initially, tinnitus, miosis, and hyperreflexia) at blood level of 60 mg/L;

**severe cyanide toxicity** (air hunger, confusion, **lactic acidosis, death**) at level of 200 mg/L

## Interactions

**Drug-drug.** *Enflurane, ganglionic blockers, halothane, negative inotropic drugs, volatile liquid anesthetics:* severe hypotension

**Drug-diagnostic tests.** *Creatinine:* increased level

*Methemoglobin:* hemoglobin sequestration as methemoglobin

## Patient monitoring

⚠ Measure blood pressure frequently (preferably with continuous arterial line) to detect rapid drop.

• Monitor injection site closely to avoid extravasation. Use central line whenever possible. Ensure that infusion rate is precisely controlled to prevent too-rapid infusion.

• Obtain baseline ECG and monitor for changes.

⚠ Watch for signs and symptoms of cyanide toxicity (lactic acidosis, dyspnea, headache, vomiting, confusion, and loss of consciousness).

## Patient teaching

• Tell patient he'll be closely monitored during therapy.

⚠ Instruct patient to immediately report headache, nausea, or pain at injection site.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## nizatidine

Apo-Nizatidine<sup>⚠</sup>, Axid, Axid AR, Dom-Nizatidine<sup>⚠</sup>, Gen-Nizatidine<sup>⚠</sup>, Novo-Nizatidine<sup>⚠</sup>, PHL-Nizatidine<sup>⚠</sup>, PMS-Nizatidine<sup>⚠</sup>, Zinga<sup>⚠</sup>

**Pharmacologic class:** Histamine<sub>2</sub> (H<sub>2</sub>)-receptor antagonist

**Therapeutic class:** Antiulcer drug

**Pregnancy risk category B**

## Action

Inhibits histamine action at H<sub>2</sub>-receptor sites in gastric parietal cells,

reducing gastric acid secretion and pepsin production

### Availability

*Capsules:* 150 mg, 300 mg

*Oral solution:* 15 mg/ml

*Tablets:* 75 mg

### Indications and dosages

➤ Active duodenal ulcer

**Adults:** 300 mg P.O. daily at bedtime or 150 mg b.i.d. for up to 8 weeks

➤ Maintenance of healed duodenal ulcers

**Adults and children ages 12 and older:**

150 mg P.O. daily at bedtime for up to 1 year

➤ Esophagitis and associated heart-burn caused by gastroesophageal reflux disease (GERD)

**Adults:** 150 mg P.O. b.i.d. for up to 12 weeks

➤ Active benign gastric ulcer

**Adults:** 150 mg P.O. b.i.d. or 300 mg P.O. once daily at bedtime

➤ Erosive esophagitis; GERD

**Children ages 12 and older:** 150 mg P.O. b.i.d. for up to 8 weeks

### Dosage adjustment

- Moderate to severe renal impairment
- Elderly patients

### Contraindications

- Hypersensitivity to drug or other H<sub>2</sub>-receptor antagonists

### Precautions

Use cautiously in:

- mild renal impairment
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 12 (safety and efficacy not established).

### Administration

- Give with or without food.
- If patient is to take drug twice daily, give one dose in morning and one at bedtime.

Route	Onset	Peak	Duration
P.O.	Unknown	0.5-3 hr	8-12 hr

### Adverse reactions

**CNS:** dizziness, drowsiness, headache, anxiety, nervousness, insomnia, abnormal dreams, asthenia

**CV:** chest pain

**EENT:** amblyopia, sinusitis, rhinitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, abdominal pain, flatulence, anorexia, dry mouth

**Hematologic:** anemia

**Musculoskeletal:** back pain, myalgia

**Respiratory:** cough

**Skin:** rash, pruritus

**Other:** tooth disorder, infection, fever, pain

### Interactions

**Drug-drug.** *Salicylates (high doses):* increased salicylate blood level

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase:* elevated levels  
*Urobilinogen tests using Multistix:* false-positive result

**Drug-herbs.** *Pennyroyal:* altered rate of herbal metabolite formation

### Patient monitoring

- Monitor liver and renal function tests.
- Check temperature; watch for fever and other signs and symptoms of infection.

### Patient teaching

- Advise patient to take once-daily dose at bedtime with or without food, or twice-daily doses in morning and at bedtime.
- Instruct patient to take exactly as prescribed. Caution him not to take other OTC drugs (especially aspirin).
- Tell patient to report signs and symptoms of infection.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## norelgestromin/ethinyl estradiol

Evra , Ortho Evra

**Pharmacologic class:** Estrogen

**Therapeutic class:** Hormone

**Pregnancy risk category X**

### FDA BOXED WARNING

- Cigarette smoking increases risk of serious cardiovascular adverse effects from hormonal contraceptive use. Risk increases with age and with heavy smoking (15 or more cigarettes per day) and is quite marked in women older than age 35. Strongly advise women who use hormonal contraceptives not to smoke.
- Risk of venous thromboembolism (VTE) among women ages 15 to 44 who used the transdermal patch compared to women who used oral contraceptives containing 30 to 35 mcg of ethinyl estradiol (EE) and either levonorgestrel or norgestimate was assessed in four U.S. case-control studies using electronic health care claims data. Odds ratios ranged from 1.2 to 2.2; one of the studies found a statistically significant increased risk of VTE for current patch users.
- The pharmacokinetic (PK) profile for the transdermal patch is different from the PK profile for oral

contraceptives in that it has higher steady state concentrations and lower peak concentrations. Area under the time-concentration curve and average concentration at steady state for EE are approximately 60% higher in women using the patch compared with women using an oral contraceptive containing 35 mcg of EE. In contrast, peak concentrations for EE are approximately 25% lower in women using the patch. It's unknown whether there are changes in risk of serious adverse events based on the differences in PK profiles of EE in women using the patch compared with women using oral contraceptives containing 30 to 35 mcg of EE. Increased estrogen exposure may increase risk of adverse events, including VTE.

### Action

Suppresses gonadotropin and inhibits ovulation by causing changes in cervical mucus and endometrium, thereby preventing egg implantation

### Availability

**Transdermal patch:** 6 mg norelgestromin and 0.75 mg ethinyl estradiol (releases 150 mcg norelgestromin and 20 mcg ethinyl estradiol q 24 hours)

### Indications and dosages

➤ To prevent pregnancy

**Adults:** Apply patch on day 1 of menstrual cycle (or first Sunday after period begins). Change patch weekly thereafter for 3 weeks (on same day each week), and then remove patch for fourth week. Repeat q month.

### Contraindications

- Hypersensitivity to drug or its components
- Undiagnosed abnormal genital bleeding
- Known or suspected breast cancer or history of such cancer

- Endometrial carcinoma or other known or suspected estrogen-dependent neoplasia
- Thromboembolism, history of thromboembolic disease, known thrombophilic conditions
- Current or past cerebrovascular or coronary artery disease
- Valvular heart disease with complications
- Diabetes with vascular involvement
- Persistent blood pressure values at or above 160 mm Hg systolic or 100 mm Hg diastolic
- Headache with focal neurologic symptoms
- Cholestatic jaundice of pregnancy, jaundice with previous hormonal contraceptive use
- Acute or chronic hepatic disease with abnormal liver function
- Hepatic adenomas or carcinomas
- Major surgery with prolonged immobilization
- Known or suspected pregnancy

### Precautions

Use cautiously in:

- cardiovascular disease, renal disease, asthma, bone disease, migraine, lipid disorders, fibrocystic breasts, increased risk for endometrial cancer, sexually transmitted diseases
- family history of breast or genital tract cancer
- abnormal mammogram
- elderly patients (use not indicated)
- women with body weight at or above 198 lb (90 kg)
- breastfeeding patients
- children before menarche (use not indicated).

### Administration

- Apply patch to clean, dry, intact skin on buttock, abdomen, upper torso, or upper outer arm.
- Change patch on same day each week (except for fourth week, when patch is removed).

Route	Onset	Peak	Duration
Transdermal	Rapid	2 days	Unknown

### Adverse reactions

**CNS:** headache, dizziness, lethargy, depression, emotional lability, **increased risk of cerebrovascular accident**

**CV:** edema, hypertension, **myocardial infarction, thromboembolism**

**EENT:** contact lens intolerance, worsening of myopia or astigmatism

**GI:** nausea, vomiting, jaundice, abdominal cramps, bloating, anorexia, gallbladder disease, **pancreatitis**

**GU:** amenorrhea, dysmenorrhea, breakthrough bleeding, cervical erosion, vaginal candidiasis, breast tenderness, breast enlargement or secretion, menstrual cramps, libido loss, **increased risk of breast or endometrial cancer**

**Hepatic:** cholestatic jaundice, **hepatic adenoma**

**Metabolic:** hyperglycemia, hypercalcemia, sodium and water retention

**Musculoskeletal:** leg cramps

**Respiratory:** upper respiratory infection, **pulmonary embolism**

**Skin:** acne, oily skin, increased pigmentation, urticaria, patch site reaction

**Other:** increased appetite, weight changes

### Interactions

**Drug-drug.** *Acetaminophen, ascorbic acid, atorvastatin, miconazole (vaginal capsules):* increased ethinyl estradiol blood level

*Antibiotics, barbiturates, carbamazepine, fosphenytoin, phenobarbital, phenytoin, rifampin:* decreased contraceptive efficacy

*Corticosteroids:* enhanced corticosteroid effects

*Cyclosporine:* increased risk of cyclosporine toxicity

*CYP3A4 inhibitors (such as ketoconazole, itraconazole):* increased hormone level

*Dantrolene, other hepatotoxic drugs:* increased risk of hepatotoxicity

*Insulin, oral hypoglycemics, warfarin:*

altered requirements for these drugs  
*Protease inhibitors:* increased contraceptive metabolism

*Tamoxifen:* interference with tamoxifen effects

**Drug-diagnostic tests.** *Antithrombin III, folate, low-density lipoproteins, pyridoxine, total cholesterol, urine pregnandiol:* decreased levels

*Cortisol; factors VII, VIII, IX, and X; glucose; high-density lipoproteins; phospholipids; prolactin; prothrombin;*

*sodium; triglycerides:* increased levels

*Metrapone test:* false decrease

*Thyroid function tests:* false interpretation

**Drug-food.** *Caffeine:* increased blood caffeine level

**Drug-herbs.** *Black cohosh:* increased adverse drug effects

*Red clover:* interference with hormonal therapy

*Saw palmetto:* antiestrogenic effects

*St. John's wort:* decreased drug blood level and effects

**Drug-behaviors.** *Smoking (15 or more cigarettes daily):* increased risk of adverse cardiovascular reactions

### Patient monitoring

- Evaluate menstrual pattern.
- 📢 Monitor blood pressure. Watch for signs and symptoms of thromboembolic disease (swelling or warmth in calf, sudden chest pain, shortness of breath).
- Check blood glucose level in diabetic patient.

### Patient teaching

- Instruct patient to start using patch on first day of menstrual period or on first Sunday after period starts. Advise her to use calendar to keep track of which day each week to change patch.

- Tell patient to remove patch during fourth week of each cycle. Explain that she will have bleeding that week.

- Advise patient to check daily to ensure that patch is attached firmly to skin. Explain that if patch is detached for 1 day or less, she should try to reattach it more firmly. If patch is detached for more than 1 day or for an unknown length of time, she should start with new patch and new calendar.
- Instruct patient to use alternative contraception during first week of patch use.

📢 Inform patient that smoking while using patch increases risk of thromboembolic disease and other serious cardiovascular reactions. Stress importance of not smoking. Tell her to immediately report swelling or warmth in calf, chest pain, or shortness of breath.

- Advise breastfeeding patient to use other forms of contraception until she has completely weaned her infant.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## norepinephrine bitartrate

Levophed, Noradrenaline ⚠️

**Pharmacologic class:** Sympathomimetic

**Therapeutic class:** Alpha- and beta-adrenergic agonist, cardiac stimulant, vasopressor

**Pregnancy risk category C**

### FDA BOXED WARNING

- If extravasation occurs, infiltrate area promptly with 10 to 15 ml of saline solution containing 5 to 10 mg

phentolamine to prevent sloughing and necrosis. Use syringe with fine hypodermic needle, and infiltrate solution liberally throughout area. Give phentolamine as soon as possible; its sympathetic blockade causes immediate local hyperemic changes if area is infiltrated within 12 hours.

**Action**

Stimulates beta<sub>1</sub> and alpha<sub>1</sub> receptors in sympathetic nervous system, causing vasoconstriction, increased blood pressure, enhanced contractility, and decreased heart rate

**Availability**

*Injection:* 1 mg/ml

 **Indications and dosages**

➤ Severe hypotension

**Adults:** 8 to 12 mcg/minute I.V.; then titrate based on blood pressure response. For maintenance, 2 to 4 mcg/minute.

**Contraindications**

- Concurrent cyclopropane or halothane anesthesia
- Hypotension caused by blood volume deficit (except in emergencies until blood volume replacement is completed), profound hypoxia or hypercarbia
- Mesenteric or peripheral vascular thrombosis

**Precautions**

Use cautiously in:

- sulfate sensitivity (some products), especially in asthmatic patients
- arterial embolism, cardiac disease, peripheral vascular disease, hypertension, hyperthyroidism
- patients receiving MAO inhibitors or tricyclic antidepressants concurrently
- elderly patients
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

**Administration**

- Mix with dextrose 5% in water or dextrose 5% in normal saline solution.
- Inspect solution to make sure it's clear and colorless. Don't infuse if it's brown or pink.
- Administer through infusion pump. Titrate infusion rate to achieve and maintain low-normal systolic blood pressure (80 to 100 mm Hg).
- Continue infusion until adequate blood pressure and tissue perfusion persist without drug therapy.
- Gradually titrate dosage downward.
- To avoid extravasation, administer only into large vein (antecubital) or through central line. Don't use femoral vein in patients who are elderly or have occlusive vascular disorders.
- 🔊 To prevent delivery of large drug concentrations, avoid line stasis and flushing.

Route	Onset	Peak	Duration
I.V.	Immediate	Immediate	1-2 min after infusion ends

**Adverse reactions**

- CNS:** headache, anxiety  
**CV:** bradycardia, **severe hypertension, arrhythmias**  
**Respiratory:** respiratory difficulty  
**Skin:** irritation with extravasation, necrosis  
**Other:** ischemic injury

**Interactions**

**Drug-drug.** *Alpha-adrenergic blockers:* antagonism of norepinephrine effects  
*Antihistamines, ergot alkaloids, guanethidine, MAO inhibitors, oxytocin, tricyclic antidepressants:* severe hypertension  
*Bretylium, inhalation anesthetics:* increased risk of arrhythmias

**Patient monitoring**

- 🔊 Check blood pressure every 2 minutes until desired pressure is achieved. Recheck every 5 minutes for duration of infusion.

- Maintain continuous ECG monitoring and blood pressure monitoring.
- 🔊 Be aware that headache may signal extreme hypertension and overdose.
- Monitor infusion site for extravasation.
- 🔊 Watch for signs and symptoms of peripheral vascular insufficiency (decreased capillary refill, pale to cyanotic to black skin color).
- 🔊 Never leave patient unattended during infusion.

### Patient teaching

- When patient is alert, explain why he's receiving drug.
- Reassure patient he'll be monitored continuously until he's stable.

## norethindrone acetate

Aygestin, Camila, Errin, Jolivette, Nora-BE, Nor-QD, Ortho Micronor

**Pharmacologic class:** Progesterone, hormone

**Therapeutic class:** Progestin

**Pregnancy risk category** X

### Action

Inhibits pituitary gonadotropin secretion, suppressing follicular maturation and ovulation and stimulating mammary tissue growth

### Availability

Tablets: 0.35 mg, 5 mg

### Indications and dosages

➤ Endometriosis

**Adults:** 5 mg Aygestin P.O. daily for 2 weeks, increased in increments of 2.5 mg/day q 2 weeks until 15 mg daily is reached

➤ Amenorrhea; abnormal uterine bleeding

**Adults:** 2.5 to 10 mg Aygestin P.O. daily starting on day 5 of menstrual cycle

➤ Prevention of pregnancy

**Adults:** 1 tablet (0.35 mg) P.O. daily

### Contraindications

- Hypersensitivity to drug
- Impaired liver function or liver disease
- Thromboembolic disorders
- Known or suspected breast cancer
- Undiagnosed vaginal bleeding
- Known or suspected pregnancy
- As a diagnostic test for pregnancy

### Precautions

Use cautiously in:

- hypertension, blood dyscrasias, bone marrow disease, hepatic or renal disease, gallbladder disease, heart failure, diabetes mellitus, depression, migraine, asthma, seizure disorder
- family history of breast or reproductive tract cancer
- breastfeeding patients.

### Administration

- Give with or without food.
- When administering for endometriosis, amenorrhea, or abnormal uterine bleeding, know that therapy may continue for 6 to 9 months or until breakthrough bleeding necessitates a temporary halt.
- When administering for prevention of pregnancy, know that drug must be given continuously every day at the same time with no interruptions between pill packs.

Route	Onset	Peak	Duration
P.O.	Variable	Unknown	24 hr

### Adverse reactions

**CNS:** migraine, depression, insomnia, drowsiness

**EENT:** retinal vascular lesions, sudden partial or complete vision loss, proptosis, diplopia, **papilledema**

**GI:** nausea

**GU:** breakthrough bleeding, menstrual flow changes, amenorrhea, changes in cervical erosion and secretions, breast tenderness and secretion

**Hepatic:** cholestatic jaundice

**Metabolic:** fluid retention, decreased glucose tolerance

**Skin:** rash, urticaria, acne, hirsutism, chloasma

**Other:** edema, weight gain or loss, fever

## Interactions

**Drug-drug.** *Hepatic enzyme-inducing drugs (such as carbamazepine, phenobarbital, phenytoin, rifampin):*

decreased norethindrone efficacy

**Drug-diagnostic tests.** *Alkaline phosphatase; amino acids; factors VII, VIII, IX, and X; nitrogen; pregnanediol:* increased levels

*Gamma-glutamyltransferase, high-density lipoproteins:* decreased levels

**Drug-herbs.** *Cola nut, guarana, yerba maté:* increased CNS stimulation

*St. John's wort:* decreased contraceptive efficacy

**Drug-behaviors.** *Smoking:* risk of serious cardiovascular reactions

## Patient monitoring

- Monitor pretreatment and annual physical exams to check blood pressure, breasts, abdomen, pelvic organs, and Pap smear results.

🚨 Assess for signs and symptoms of depression, especially in patients with history of depression. Stop giving drug if significant depression recurs.

- Check blood glucose level in diabetic patients.

## Patient teaching

- Instruct patient to avoid pregnancy or to discontinue drug if she gets pregnant (may cause serious fetal anomalies or fetal death).

🚨 Advise patient to discontinue drug and consult prescriber if she experiences sudden partial or complete vision loss.

- If patient is receiving drug to treat amenorrhea, tell her to mark administration days on calendar.

- Instruct patient taking drug to prevent pregnancy to take drug every day at the same time without interruption between pill packs.

- Tell diabetic patient to monitor blood glucose level closely and to watch for hyperglycemia.

- Instruct patient to report breakthrough bleeding, spotting, change in menstrual flow, or amenorrhea.

- Caution patient not to smoke during therapy.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## norfloxacin

Noroxin, Utinor<sup>®</sup>

**Pharmacologic class:** Fluoroquinolone

**Therapeutic class:** Anti-infective

**Pregnancy risk category C**

## FDA BOXED WARNING

- Fluoroquinolones for systemic use are associated with an increased risk of tendonitis and tendon rupture in all ages. This risk is further increased in patients usually over age 60, with concomitant use of corticosteroids, and in kidney, heart, and lung transplant recipients.

- Drug may exacerbate muscle weakness in patients with myasthenia gravis. Avoid use in patients with known history of myasthenia gravis.

## Action

Inhibits bacterial DNA synthesis by blocking DNA gyrase in susceptible

gram-negative and gram-positive aerobic and anaerobic bacteria

### Availability

Tablets: 400 mg

### Indications and dosages

➤ Urinary tract infections (UTIs) caused by *Escherichia coli*, *Klebsiella pneumoniae*, or *Proteus mirabilis*

**Adults:** 400 mg P.O. q 12 hours for 3 days

➤ UTIs caused by all organisms except

*E. coli*, *K. pneumoniae*, and *P. mirabilis*

**Adults:** 400 mg P.O. q 12 hours for 7 to 10 days. For complicated UTIs, may give for up to 21 days.

➤ Gonorrhea

**Adults:** 800 mg P.O. as a single dose

➤ Prostatitis caused by *E. coli*

**Adults:** 400 mg P.O. q 12 hours for 28 days

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to drug
- History of tendinitis or tendon rupture with fluoroquinolone use

### Precautions

Use cautiously in:

- CNS diseases or disorders, renal impairment, cirrhosis, bradycardia, acute myocardial ischemia
- known history of myasthenia gravis (avoid use)
- elderly patients
- pregnant or breastfeeding patients (safety not established except in postexposure inhalation or cutaneous anthrax).
- children younger than age 18.

### Administration

- Give with glass of water 1 hour before or 2 hours after a meal.
- Don't give antacids within 2 hours of norfloxacin.

Route	Onset	Peak	Duration
P.O.	Rapid	2-3 hr	12 hr

### Adverse reactions

**CNS:** dizziness, light-headedness, drowsiness, headache, asthenia, insomnia, agitation, confusion, acute psychoses, hallucinations, tremors, **increased intracranial pressure, seizures**

**CV:** vasodilation, **QT prolongation, arrhythmias**

**GI:** nausea, diarrhea, abdominal pain, **pancreatitis, pseudomembranous colitis**

**GU:** interstitial cystitis, vaginitis

**Hematologic:** **leukopenia**

**Hepatic:** **hepatitis**

**Metabolic:** hyperglycemia, **hypoglycemia**

**Musculoskeletal:** tendinitis, tendon rupture

**Skin:** rash, hyperhidrosis, photosensitivity, phototoxicity, **Stevens-Johnson syndrome**

**Other:** altered taste, myasthenia gravis exacerbation, hypersensitivity reactions including **anaphylaxis**

### Interactions

**Drug-drug.** *Antacids, bismuth, iron salts, subsalicylate, sucralfate, zinc salts:* decreased norfloxacin absorption

*Antineoplastics:* decreased norfloxacin blood level

*Cimetidine:* interference with norfloxacin elimination

*Corticosteroids:* increased risk of tendon rupture

*Nitrofurantoin:* antagonism of norfloxacin's antibacterial effects in GU tract

*Other fluoroquinolones:* increased risk of nephrotoxicity

*Probenecid:* decreased renal elimination of norfloxacin

*Theophylline:* increased theophylline blood level, greater risk of toxicity

*Warfarin:* increased anticoagulant effect

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, eosinophils, lactate dehydrogenase, platelets:* increased levels

*Hemoglobin, hematocrit:* decreased values

**Drug-food.** *Caffeine:* decreased hepatic metabolism of caffeine

*Milk or yogurt (consumed alone):* impaired drug absorption

*Tube feedings:* impaired drug absorption

**Drug-herbs.** *Dong quai, St. John's wort:* phototoxicity

*Fennel:* decreased drug absorption

**Drug-behaviors.** *Sun exposure:* phototoxicity

### Patient monitoring

- Monitor vital signs and cardiovascular status.

- Check fluid intake and output. Keep patient well-hydrated.

 Watch for signs and symptoms of tendinitis or tendon rupture.

- Assess patient's response to therapy. Obtain specimens for repeat culture and sensitivity tests if he relapses or doesn't improve.

- Monitor renal function.

### Patient teaching

- Tell patient to take on empty stomach with full glass of water, 1 hour before or 2 hours after a meal.

- If patient needs antacid for GI upset, instruct him not to take it within 2 hours of norfloxacin.

 Advise patient to stop taking drug and promptly report rash; severe GI problems; tendon pain, swelling, or inflammation; or weakness.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- Teach patient ways to counteract photosensitivity, such as by wearing sunglasses and avoiding excessive exposure to bright light.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## nortriptyline hydrochloride

Allegron , Apo-Nortriptyline , Aventyl, Dom-Nortriptyline , Gen-Nortriptyline , Novo-Nortriptyline , Norventyl , Nu-Nortriptyline , Pamelor, PMS-Nortriptyline , Ratio-Nortriptyline 

**Pharmacologic class:** Tricyclic compound

**Therapeutic class:** Antidepressant

**Pregnancy risk category** D

### FDA BOXED WARNING

- Drug may increase risk of suicidal thinking and behavior in children and adolescents with major depressive disorder and other psychiatric disorders. Risk must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family and caregivers to observe patient closely and communicate with prescriber as needed.

- Drug isn't approved for use in pediatric patients.

### Action

Increases serotonin and norepinephrine release by blocking their reuptake by presynaptic neurons; also possesses anticholinergic properties

**Availability**

*Capsules:* 10 mg, 25 mg, 50 mg, 75 mg

*Oral solution:* 10 mg/5 ml

**Indications and dosages**

➤ Depression

**Adults:** 25 mg P.O. t.i.d. or q.i.d., up to a maximum of 150 mg daily

**Dosage adjustment**

- Elderly patients
- Adolescents

**Off-label uses**

- Postherpetic neuralgia
- Neurologic pain

**Contraindications**

- Hypersensitivity to drug or dibenzazepines
- Acute recovery phase of myocardial infarction
- MAO inhibitor use within past 14 days

**Precautions**

Use cautiously in:

- asthma, cardiovascular disease, cardiac or hepatic disease, hyperthyroidism, increased intraocular pressure, angle-closure glaucoma, urinary retention, severe depression
- history of seizures
- elderly patients (especially elderly men with prostatic hyperplasia)
- pregnant or breastfeeding patients
- children (use not recommended).

**Administration**

- Give as prescribed, either in divided doses three or four times daily or as single dose at bedtime.
- Administer with meals or snack to minimize stomach upset.

📢 Don't give within 14 days of MAO inhibitors.

Route	Onset	Peak	Duration
P.O.	2-3 wk	6 wk	Unknown

**Adverse reactions**

**CNS:** dizziness, drowsiness, fatigue, headache, lethargy, insomnia, agitation,

confusion, extrapyramidal reactions, hallucinations, **seizures**, **suicidal behavior or ideation** (especially in child or adolescent)

**CV:** hypotension, ECG changes, palpitations, **heart block**, **arrhythmias**, **myocardial infarction**, **cerebrovascular accident**

**EENT:** blurred vision, dry eyes

**GI:** nausea, constipation, anorexia, dry mouth, **paralytic ileus**

**GU:** urinary retention, gynecomastia

**Hematologic:** blood dyscrasias

**Hepatic:** jaundice, **hepatotoxicity**

**Skin:** photosensitivity

**Other:** unpleasant taste, weight gain

**Interactions**

**Drug-drug.** *Anticholinergics, anticholinergic-like drugs (including antidepressants, antihistamines, atropine, disopyramide, haloperidol, phenothiazines, quinidine):* additive anticholinergic effects

*Antihypertensives:* poor therapeutic response to antihypertensives

*Antithyroid drugs:* increased risk of agranulocytosis

*Cimetidine, fluoxetine, hormonal contraceptives:* increased nortriptyline blood level and possible toxicity

*Clonidine:* hypertensive crisis

*CNS depressants (including antihistamines, opioids, sedative-hypnotics):* additive CNS depression

*Decongestants, vasoconstrictors:* additive adrenergic effects

*MAO inhibitors:* hypertension, hyperpyrexia, seizures, death

**Drug-diagnostic tests.** *Alkaline phosphatase, bilirubin:* increased levels

*Glucose:* increased or decreased level

**Drug-herbs.** *Angel's trumpet, belladonna, henbane, jimson weed, scopolia:* increased anticholinergic effects  
*Chamomile, hops, kava, skullcap, scopolia, valerian:* increased CNS depression

*St. John's wort:* decreased drug blood level and efficacy

**Drug-behaviors.** *Alcohol use:* increased drowsiness, impaired motor skills

### Patient monitoring

- Check vital signs and ECG.
  - Monitor bladder and bowel function.
- Stay alert for urine retention and constipation.
- Assess neurologic status and document mood swings.
  - Monitor liver function tests.
  - 📣 Watch for suicidal tendency, especially in child or adolescent.

### Patient teaching

- Explain that drug's full effect may take 4 weeks.
- Tell patient drug may cause drowsiness or dizziness, but these effects should subside within a few weeks.
- 📣 Advise patient (and family as appropriate) to immediately report worsening depression or suicidal ideation, especially in child or adolescent.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects him.
- Tell patient to avoid alcohol and to consult prescriber before using herbs.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## nystatin

Bio-Statin, Candistatin<sup>✳</sup>, Dom-Nystatin<sup>✳</sup>, Mycostatin, Nadostine<sup>✳</sup>, Nilstat<sup>✳</sup>, Nyaderm<sup>✳</sup>, Nystan<sup>⚠</sup>, Nystop, Pedi-Dri, PMS-Nystatin<sup>✳</sup>, Ratio-Nystatin<sup>✳</sup>

**Pharmacologic class:** Antifungal

**Therapeutic class:** Anti-infective

**Pregnancy risk category** A

### Action

Interferes with fungal cell-wall synthesis, inhibiting formation of ergosterols, increasing cell-wall permeability, and causing osmotic instability

### Availability

*Cream:* 100,000 units/g

*Ointment:* 100,000 units/g

*Powder:* 100,000 units/g

*Suspension:* 100,000 units/ml

*Tablets:* 500,000 units

*Troches:* 200,000 units

*Vaginal tablets:* 100,000 units

### Indications and dosages

➤ Candidiasis (topical use)

**Adults and children:** Apply cream, ointment, or powder two or three times daily until healing is complete.

➤ Oral candidiasis

**Adults:** 400,000 to 600,000 units (suspension) P.O. q.i.d. Have patient gargle and then swallow half of dose in each side of mouth.

**Infants:** 200,000 units (suspension) P.O. q.i.d. Use half of dose in each side of mouth.

**Newborn and premature infants:**

100,000 units (suspension) P.O. q.i.d. Use half of dose in each side of mouth.

➤ GI infections

**Adults:** 500,000 to 1 million units (one to two tablets) P.O. t.i.d. Continue for 48 hours after desired response occurs.

➤ Vaginal candidiasis

**Adults:** 100,000 units (one vaginal tablet) intravaginally daily for 2 weeks, or 100,000- to 500,000-unit applicatorful (cream) intravaginally once or twice daily for 2 weeks

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- renal or hepatic disease, achlorhydria
- pregnant or breastfeeding patients
- children younger than age 2.

## Administration

- Give oral suspension by placing half of dose in each side of patient's mouth. Instruct patient to hold suspension in mouth, swish it around, or gargle for several minutes before swallowing it.
- To prepare oral solution from powder, add one-eighth teaspoon to 120 ml of water and stir well. Give immediately.
- Advise patient to let troche dissolve slowly and completely in mouth. Tell her not to chew or swallow it whole.
- Know that nystatin vaginal tablets can be given orally to treat oral candidiasis.
- To apply cream, ointment, or powder, gently and thoroughly massage preparation into skin.
- Use applicator provided for vaginal administration.

Route	Onset	Peak	Duration
P.O., topical, vaginal	Unknown	Unknown	Unknown

## Adverse reactions

**GI:** nausea, vomiting, diarrhea, GI distress, oral irritation

**GU:** vulvovaginal irritation (with intravaginal form)

**Skin:** pruritus, rash

## Interactions

**Drug-drug.** *Topical corticosteroids:* increased corticosteroid absorption

**Drug-behaviors.** *Latex contraceptive use:* damage to contraceptive (with intravaginal use)

## Patient monitoring

- If patient takes oral tablets, inspect oral mucous membranes for irritation.
- With topical use, monitor affected area for increase in redness, swelling, or irritation.

## Patient teaching

- Advise patient to continue taking for at least 48 hours after symptoms resolve.
- Instruct patient to let lozenge dissolve slowly in mouth. Tell her not to chew or swallow it.
- If patient misses a dose, tell her to take dose as soon as possible and then resume her regular dosing schedule.
- Inform patient that diabetes mellitus, reinfection by sexual partner, tight-fitting pantyhose, and use of antibiotics, hormonal contraceptives, or corticosteroids predispose her to vaginal infection. Urge her to wear cotton underwear.
- Tell female patient to practice careful hygiene in affected areas.
- Instruct patient using vaginal tablets to wash applicator thoroughly after each use.
- Tell patient to continue therapy during menstruation.
- As appropriate, review all significant adverse reactions and interactions, especially those related to the drugs and behaviors mentioned above.

## octreotide acetate

Sandostatin, Sandostatin LAR

**Pharmacologic class:** Somatostatin analog

**Therapeutic class:** Antidiarrheal

**Pregnancy risk category B**

## Action

Suppresses secretion of serotonin, serotonin metabolites, and gastrohepatic peptides, increasing fluid and electrolyte absorption from GI tract. Also

suppresses growth hormone, insulin, and glucagon.

### Availability

*Depot injection:* 10 mg, 20 mg, 30 mg  
*Injection:* 0.05 mg/ml, 0.1 mg/ml, and 0.5 mg/ml in 1-ml ampules; 0.2 mg/ml and 1 mg/ml in 5-ml vials

### Indications and dosages

➤ Diarrhea and flushing associated with carcinoid tumors

**Adults:** 100 to 600 mcg (Sandostatin) subcutaneously or I.V. daily in two to four divided doses for 2 weeks. Then, depending on response, 20 mg (LAR Depot) I.M. q 4 weeks for 2 months.

➤ Diarrhea caused by vasoactive intestinal peptide tumors (VIPomas)  
**Adults:** 200 to 300 mcg (Sandostatin) subcutaneously or I.V. daily in two to four divided doses for 2 weeks. Then, depending on response, 20 mg (LAR Depot) I.M. q 2 weeks for 2 months.

➤ Acromegaly

**Adults:** 50 to 100 mcg (Sandostatin) subcutaneously or I.V. two or three times daily. Then, depending on response, 20 mg (LAR Depot) I.M. q 4 weeks for 3 months. Then adjust based on growth hormone levels.

### Dosage adjustment

- Renal impairment

### Off-label uses

- Dumping syndrome (postprandial hypotension)
- GI and pancreatic fistulas
- Variceal bleeding

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- gallbladder disease, renal impairment, hyperglycemia or hypoglycemia, fat malabsorption

- pregnant or breastfeeding patients
- children.

### Administration

- When giving subcutaneously, rotate administration site with each injection.

🚫 Don't give LAR Depot I.V.

- Mix I.M. solution and inject deep into gluteal muscle over 3 minutes. Don't use deltoid.

- For I.V. administration, dilute in 50 to 200 ml of dextrose 5% in water or normal saline solution. Infuse over 15 to 30 minutes.

- Know that octreotide suppression test and octreotide scintigraphy may be done to determine if drug will aid carcinoid tumor treatment.

- Drug may be kept at room temperature for 2 weeks. Refrigerate ampules.

Route	Onset	Peak	Duration
Subcut., I.V.	Unknown	0.4 hr	Up to 12 hr
I.M.	Unknown	2 wk	Up to 4 wk

### Adverse reactions

**CNS:** dizziness, drowsiness, fatigue, headache, weakness

**CV:** edema, bradycardia, conduction abnormalities, **arrhythmias**

**EENT:** vision disturbances

**GI:** nausea, vomiting, diarrhea, abdominal pain, cholelithiasis, fat malabsorption

**Skin:** flushing

**Metabolic:** hypothyroidism, hyperglycemia, **hypoglycemia**

**Other:** injection site pain

### Interactions

**Drug-drug.** *Cyclosporine:* reduced cyclosporine blood level

*Insulin, oral hypoglycemics:* altered requirements for these drugs

*Orally administered drugs:* altered absorption of these drugs

**Drug-diagnostic tests.** *Glucose:* increased or decreased level

*Hepatic enzymes:* slightly increased levels

*Schilling's test*: abnormal results  
*Thyroxine, vitamin B<sub>12</sub>*: decreased levels

**Drug-food.** *Fats*: altered octreotide absorption

### Patient monitoring

- Assess bowel sounds and stool frequency and consistency.
- Monitor vital signs and fluid intake and output. Stay alert for dehydration or edema.
- Evaluate diabetic patient for hypoglycemia or hyperglycemia.
- Know that in women with active acromegaly, normalization of growth hormone and insulin-like growth factor-1 may restore fertility.

### Patient teaching

- Tell patient being treated for carcinoma tumor to keep track of number of daily stools or flushing episodes.
- Instruct patient to weigh himself daily and report significant changes.
- Advise female with childbearing potential to use adequate contraception while taking drug.
- If patient will use drug at home, teach correct methods for injection, storage, and needle disposal.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, vision, and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## ofloxacin

Exocin , Floxin, Ocuflax, Tarivid 

**Pharmacologic class:** Fluoroquinolone

**Therapeutic class:** Anti-infective

**Pregnancy risk category** C

### FDA BOXED WARNING

- Fluoroquinolones for systemic use are associated with an increased risk of tendinitis and tendon rupture in all ages. This risk is further increased in patients usually over age 60, with concomitant use of corticosteroids, and in kidney, heart, and lung transplant recipients.
- Drug may exacerbate muscle weakness in patients with myasthenia gravis. Avoid use in patients with known history of myasthenia gravis.

### Action

Inhibits bacterial DNA synthesis by inhibiting DNA gyrase in susceptible bacteria

### Availability

*Ophthalmic solution*: 3 mg/ml (0.3%)

*Otic solution*: 0.3%

*Tablets*: 200 mg, 300 mg, 400 mg

### Indications and dosages

➤ Prostatitis caused by *Escherichia coli*

**Adults:** 300 mg P.O. q 12 hours for 6 weeks

➤ Complicated urinary tract infections caused by *E. coli*, *Klebsiella pneumoniae*, or *Proteus mirabilis*

**Adults:** 200 mg P.O. q 12 hours for 10 days

➤ Uncomplicated cystitis caused by *E. coli* or *K. pneumoniae*

**Adults:** 200 mg P.O. q 12 hours for 3 days

➤ Acute uncomplicated urethral and cervical gonorrhea

**Adults:** 400 mg P.O. as a single dose

➤ Nongonococcal cervicitis or urethritis caused by *Chlamydia trachomatis*; mixed infections of cervix or urethra caused by *C. trachomatis* or *Neisseria gonorrhoeae*

**Adults:** 300 mg P.O. q 12 hours for 7 days

➤ Acute bacterial exacerbation of chronic bronchitis, community-acquired pneumonia, and

uncomplicated skin and skin-structure infections caused by susceptible organisms

**Adults:** 400 mg P.O. q 12 hours for 10 days

➤ Acute pelvic inflammatory disease

**Adults:** 400 mg P.O. q 12 hours for 10 to 14 days

➤ Bacterial conjunctivitis

**Adults and children ages 1 and older:**

One to two drops of ophthalmic solution in affected eye q 2 to 4 hours on days 1 and 2; then one to two drops q.i.d. on days 3 through 7

➤ Corneal ulcers

**Adults:** One to two drops of ophthalmic solution in affected eye q 30 minutes while awake on days 1 and 2, then one to two drops q hour while awake on days 3 to 7, then one to two drops q.i.d. while awake on days 7 to 9

➤ Otitis externa

**Adults and children ages 13 and older:**

10 drops of otic solution into affected ear daily for 7 days

➤ Chronic suppurative otitis media with perforated tympanic membrane

**Adults and children ages 12 and older:**

10 drops of otic solution into affected ear b.i.d. for 14 days

### Dosage adjustment

- Renal impairment
- Severe hepatic impairment

### Contraindications

- Hypersensitivity to drug or other fluoroquinolones

### Precautions

Use cautiously in:

- underlying CNS disease, renal impairment, cirrhosis, bradycardia, acute myocardial ischemia
- known history of myasthenia gravis (avoid use)
- history of tendinitis or tendon rupture with fluoroquinolone use
- dialysis patients
- elderly patients

- pregnant or breastfeeding patients (safety not established except in postexposure inhalation or cutaneous anthrax).

- children younger than age 18 (except in postexposure inhalation or cutaneous anthrax and in ophthalmic and otic use).

### Administration

- Don't give zinc- or iron-containing drugs within 2 hours of ofloxacin.

Route	Onset	Peak	Duration
P.O.	Rapid	1-2 hr	12 hr
Ophthalmic, Unknown otic	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** dizziness, drowsiness, headache, light-headedness, insomnia, acute psychoses, agitation, confusion, tremors, hallucinations, **increased intracranial pressure, seizures**

**CV:** chest pain, vasodilation

**GI:** nausea, diarrhea, constipation, abdominal pain, **pseudomembranous colitis**

**GU:** interstitial cystitis, vaginitis

**Hematologic:** eosinophilia, **leukopenia**

**Musculoskeletal:** tendinitis, tendon rupture, joint pain, back pain

**Skin:** rash, photosensitivity, phototoxicity, **Stevens-Johnson syndrome**

**Other:** altered taste, superinfection, myasthenia gravis exacerbation

### Interactions

**Drug-drug.** *Amiodarone, bepridil, disopyramide, erythromycin, pentamidine, phenothiazines, pimozide, procaïnamide, quinidine, sotalol, tricyclic antidepressants:* increased risk of serious adverse cardiovascular reactions  
*Antacids, bismuth subsalicylate, iron or zinc salts, sucralfate:* decreased ofloxacin absorption

*Corticosteroids:* increased risk of tendon rupture

*Probenecid:* decreased renal elimination of ofloxacin

*Theophylline*: increased theophylline blood level and possible toxicity

*Warfarin*: increased warfarin effects

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, platelets*: increased levels

*Hemoglobin, hematocrit*: decreased values

**Drug-food.** *Milk or yogurt (consumed alone), tube feedings*: impaired drug absorption

**Drug-herbs.** *Fennel*: decreased drug absorption

*Dong quai, St. John's wort*: phototoxicity

**Drug-behaviors.** *Sun exposure*: phototoxicity

### Patient monitoring

- Assess patient for signs and symptoms of superinfection.
- Inspect for rash. Check for signs and symptoms of hypersensitivity reaction.
- 🔊 Watch for fever with diarrhea; diarrhea containing pus; or severe, persistent diarrhea; and tendinitis or tendon rupture.
- Evaluate neurologic status closely.

### Patient teaching

- Encourage patient to maintain fluid intake of at least 1,500 ml daily to prevent crystalluria.
- Inform patient being treated for gonorrhea that partners must be treated.
- 🔊 Tell patient to immediately report fever and diarrhea, especially if stool contains blood, pus, mucus. Caution him not to treat diarrhea without consulting prescriber.
- 🔊 Instruct patient to stop taking drug and immediately report rash or tendon pain or inflammation.
- Instruct patient not to take iron- or zinc-containing drugs or antacids within 2 hours of ofloxacin.
- Teach patient ways to counteract photosensitivity, such as by wearing sunglasses and avoiding excessive exposure to bright light.
- Teach patient how to use eye or ear drops. Caution him not to touch

dropper tip to any surface (including eye or ear).

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## olanzapine

Zyprexa, Zyprexa IntraMuscular, Zyprexa, Zydys

## olanzapine pamoate

Zyprexa Relprevv

**Pharmacologic class:** Thienobenzodiazepine

**Therapeutic class:** Antipsychotic

**Pregnancy risk category C**

### FDA BOXED WARNING

- Elderly patients with dementia-related psychosis are at increased risk for death. Drug isn't approved for patients with dementia-related psychosis.
- When using olanzapine and fluoxetine in combination, refer to boxed warning section of package insert for Symbyax (olanzapine and fluoxetine).
- Adverse events with signs and symptoms consistent with olanzapine overdose, in particular sedation, including coma and delirium (postinjection delirium-sedation syndrome), have been reported after injections of Zyprexa Relprevv. Injections must be administered in a registered health care facility with ready access to emergency response services. After each injection, patients must be observed at the health care facility by a health care professional for at least 3 hours. Because of this risk, Zyprexa Relprevv is available only through a restricted distribution

program called Zyprexa Relprevv Patient Care Program, which requires prescriber, health care facility, patient, and pharmacy enrollment.

### Action

Unknown. Thought to antagonize dopamine and serotonin type 2 in CNS. Also antagonizes muscarinic receptors in respiratory tract, causing cholinergic activation.

### Availability

*Injection powder for suspension (extended-release):* 210 mg/vial, 300 mg/vial, 405 mg/vial

*Solution for injection:* 10-mg vials

*Tablets:* 2.5 mg, 5 mg, 7.5 mg, 10 mg, 15 mg, 20 mg

*Tablets (orally disintegrating):* 5 mg, 10 mg, 15 mg, 20 mg

### Indications and dosages

➤ Schizophrenia

**Adults:** Initially, 5 to 10 mg (Zyprexa, Zyprexa Zydis) P.O. daily with a target dosage of 10 mg/day within several days; may increase or decrease q week by 5 mg/day (not to exceed 20 mg/day). Periodically reevaluate long-term usefulness of drug for individual patient. Or, for Zyprexa Relprevv dosages corresponding to Zyprexa target oral dosages, see chart below:

Target dosages (Zyprexa P.O.)	Dosing first 8 weeks (Zyprexa Relprevv I.M.)	Maintenance dosage after 8 weeks (Zyprexa Relprevv I.M.)
10 mg/day	210 mg/ 2 weeks or 405 mg/ 4 weeks	150 mg/ 2 weeks or 300 mg/ 4 weeks
15 mg/day	300 mg/ 2 weeks	210 mg/ 2 weeks or 405 mg/ 4 weeks
20 mg/day	300 mg/ 2 weeks	300 mg/ 2 weeks

**Adolescents:** Initially, 2.5 or 5 mg (Zyprexa, Zyprexa Zydis) P.O. daily with a target dosage of 10 mg/day. When dosage adjustments are needed, increments or decrements of 2.5 or 5 mg are recommended to a maximum of 20 mg/day.

➤ Bipolar I disorder (manic or mixed episodes)

**Adults:** Initially, 10 or 15 mg (Zyprexa, Zyprexa Zydis) P.O. daily; may increase or decrease q 24 hours by 5 mg/day (not to exceed 20 mg/day). Or 10 mg I.M. (Zyprexa IntraMuscular); maximum dosage is three 10-mg doses I.M. 2 to 4 hours apart. Or initially, 10 mg (Zyprexa, Zyprexa Zydis) P.O. daily when administered as adjunctive treatment to lithium or valproate.

**Adolescents:** Initially, 2.5 or 5 mg (Zyprexa, Zyprexa Zydis) P.O. daily with a target dosage of 10 mg/day. When dosage adjustments are necessary, increments or decrements of 2.5 or 5 mg are recommended to a maximum of 20 mg/day.

➤ Agitation associated with schizophrenia and bipolar I mania

**Adults:** 10 mg I.M. (Zyprexa IntraMuscular) or 5 mg or 7.5 mg I.M. when clinically warranted; maximum of three doses 2 to 4 hours apart. If agitation persists after initial dose, subsequent doses up to 10 mg may be given. If ongoing olanzapine therapy is clinically indicated, 5 to 20 mg/day (Zyprexa, Zyprexa Zydis) P.O. may be initiated as soon as clinically appropriate.

➤ Depressive episodes associated with bipolar I disorder

**Adults:** Initially, 5 mg (Zyprexa, Zyprexa Zydis) P.O. and 20 mg fluoxetine P.O. daily in the evening. Dosage adjustments, if indicated, can be made according to efficacy and tolerability within ranges of 5 to 12.5 mg (Zyprexa or Zyprexa Zydis) and fluoxetine 20 to 50 mg.

➤ Treatment-resistant depression

**Adults:** Initially, 5 mg (Zyprexa, Zyprexa Zydis) P.O. and 20 mg fluoxetine P.O. daily in the evening. Dosage adjustments, if indicated, can be made according to efficacy and tolerability within ranges of 5 to 20 mg (Zyprexa or Zyprexa Zydis) and fluoxetine 20 to 50 mg.

### Dosage adjustment

- Elderly or debilitated patients
- Patients predisposed to hypotensive reactions
- Patients who otherwise exhibit a combination of factors that may result in slower metabolism of olanzapine, or who may be more pharmacodynamically sensitive to olanzapine

### Off-label uses

- Borderline personality disorder (with oral use)

### Contraindications

None

### Precautions

Use cautiously in:

- hepatic impairment, cardiovascular or cerebrovascular disease, diabetes mellitus, prostatic hypertrophy, angle-closure glaucoma, phenylketonuria (with orally disintegrating tablets)
- history of seizures, paralytic ileus, or suicide attempt
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 18 (safety not established).

### Administration

- Administer without regard to meals.
- When administering as combination therapy, give in the evening.
- To remove orally disintegrating tablet from package, peel back foil; don't push tablet through foil.

- Establish tolerability with oral olanzapine before initiating treatment with I.M. forms.

- Be aware that the two Zyprexa intramuscular formulations have different dosing schedules; Zyprexa IntraMuscular is a short-acting formulation and Zyprexa Relprevv is a long-acting formulation.

 Be aware that I.M. forms are intended for deep I.M. injection into the gluteal muscle only. Don't give I.V. or subcutaneously.

- Reconstitute Zyprexa IntraMuscular for I.M. injection with 2.1 ml of sterile water for injection only, into single-packaged vial.

- After reconstituting Zyprexa IntraMuscular solution for injection, withdraw total contents of vial for 10-mg dose; 1.5 ml for 7.5-mg dose; 1 ml for 5-mg dose, or 0.5 ml for 2.5-mg dose.

- Use Zyprexa IntraMuscular solution for I.M. injection within 1 hour of reconstitution.

- Be aware that total Zyprexa daily dosages above 30 mg P.O. or 10 mg I.M. given more often than 2 hours after initial dose and 4 hours after second dose aren't recommended.

- Be aware that Zyprexa Relprevv may be irritating to the skin. Use gloves when reconstituting and flush area with water if contact is made with skin.

- Before administering Zyprexa Relprevv injection, confirm that someone will accompany patient after a 3-hour observation period. If this can't be confirmed, don't give the injection.

- Know that Zyprexa Relprevv must be suspended using only the diluent provided. After following manufacturer's directions for reconstitution, suspension concentration is 150 mg/ml. Final volume to inject is 1 ml for 150-mg dose, 1.4 ml for 210-mg dose, 2 ml for 300-mg dose, and 2.7 ml for 405-mg dose.

- Use Zyprexa Relprevv suspension immediately after removing from vial.

- Inject Zyprexa Relprevv deep into the gluteal muscle only. Don't massage injection site after injection.
- Don't combine in syringe with diazepam, lorazepam, or haloperidol.

Route	Onset	Peak	Duration
P.O.	Unknown	6 hr	Unknown
I.M. (Zyprexa IntraMuscular)	Rapid	15-45 min	Unknown
I.M. (Zyprexa Relprevv)	Unknown	1wk	Wks- Months

### Adverse reactions

**CNS:** dizziness, headache, weakness, fatigue, restlessness, sedation, insomnia, mood changes, agitation, personality disorder, impaired speech, tardive dyskinesia, dystonia, tremor, extrapyramidal effects, **neuroleptic malignant syndrome, coma, postinjection delirium-sedation syndrome**

**CV:** orthostatic hypotension, chest pain, tachycardia

**EENT:** amblyopia, rhinitis, pharyngitis

**GI:** nausea, constipation, abdominal pain, increased salivation, dry mouth

**GU:** urinary incontinence, urinary tract infection

**Hematologic:** leukopenia, neutropenia, agranulocytosis

**Metabolic:** goiter, increased thirst, hyperprolactinemia, hyperlipidemia, **severe hyperglycemia**

**Musculoskeletal:** hypertonia, joint pain

**Respiratory:** cough, dyspnea

**Skin:** ecchymosis, photosensitivity

**Other:** increased appetite, weight gain or loss, fever, flulike symptoms, impaired body temperature regulation, **death**

### Interactions

**Drug-drug.** *Antihypertensives, diazepam:* additive hypotension

*Carbamazepine, omeprazole, rifampin:* decreased olanzapine effects

*CNS depressants:* additive CNS depression

*Dopamine agonists, levodopa:* antagonism of these drugs' effects

*Fluvoxamine:* decreased olanzapine clearance

*Lorazepam:* increased somnolence with I.M. olanzapine

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, glucose, creatinine phosphokinase, gamma-glutamyltransferase, LDL cholesterol, lipids, prolactin, serum glucose, total cholesterol, triglycerides:* elevated levels  
*Neutrophils, platelets:* decreased count

**Drug-behaviors.** *Alcohol use:* additive CNS depression, potentiated orthostatic hypotension

*Smoking:* increased drug clearance

*Sun exposure:* increased risk of photosensitivity

### Patient monitoring

- Assess patient's mental status during therapy.

- Monitor vital signs during dosage adjustment periods.

- Make sure patient takes drug and doesn't hoard it.

 Watch for signs and symptoms of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, tiredness, severe muscle stiffness, loss of bladder control).

- Evaluate patient for onset of akathisia, tardive dyskinesia, and extrapyramidal effects.

 Watch for signs of increasing depression.

 Monitor blood glucose level closely, especially in patient with diabetes mellitus. Severe hyperglycemia, coma, and death may occur.

- Watch for orthostatic hypotension before I.M. injection. Keep patient recumbent if drowsiness or dizziness follows injection.

- Monitor baseline and periodic lipid and liver enzyme levels.

🔊 Monitor CBC frequently during first few months of therapy; consider discontinuing drug at first sign of a clinically significant decline in white blood cells (WBCs) in the absence of other causative factors. Discontinue drug in patients with severe neutropenia (absolute neutrophil count less than 1,000/mm<sup>3</sup>) and monitor WBC until recovery.

🔊 Monitor patient for signs and symptoms of postinjection delirium-sedation syndrome after Zyprexa Relprev injections.

🔊 Be aware that the possibility of a suicide attempt is inherent in patients with schizophrenia or bipolar I disorder; close supervision of high-risk patients should accompany drug therapy.

### Patient teaching

- Tell patient he may take without regard to meals.
- Instruct patient to remove orally disintegrating tablet from package by peeling back foil—not by pushing tablet through foil. Instruct him to remove tablet from foil using dry hands, and place entire tablet in mouth. Tell him tablet will disintegrate with or without liquid.
- Tell patient drug may cause extrapyramidal symptoms, akathisia, and tardive dyskinesia leading to involuntary movements, tremors, rigidity, muscle contractions, and restlessness.
- 🔊 Caution patient with diabetes mellitus to monitor blood glucose closely.
- Tell patient to move slowly when sitting up or standing to avoid dizziness. Advise him to dangle legs briefly before getting out of bed.
- Advise patient to avoid smoking, alcohol, or other CNS depressants.
- Tell patient to exercise in moderation and to avoid overly hot baths and showers, because drug impairs body temperature regulation.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

🔊 Instruct patient or caregiver how to recognize and report signs and symptoms of infection and postinjection delirium-sedation syndrome.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## olmesartan medoxomil

Benicar, Olmetec<sup>Ⓢ</sup>

**Pharmacologic class:** Angiotensin II type 1-receptor antagonist

**Therapeutic class:** Antihypertensive

**Pregnancy risk category C** (first trimester), **D** (second and third trimesters)

### FDA BOXED WARNING

- When used during second or third trimester of pregnancy, drug may cause fetal harm or death. Discontinue as soon as possible when pregnancy is detected.

### Action

Selectively blocks binding of angiotensin II to specific tissue receptors in vascular smooth muscle and adrenal gland. This action blocks vasoconstrictive effects of renin-angiotensin system as well as aldosterone release, thereby reducing blood pressure and possibly preventing vascular remodeling related to arteriosclerosis.

### Availability

Tablets: 5 mg, 20 mg, 40 mg

**Indications and dosages**

➤ Hypertension

**Adults and children ages 6 to 16 weighing more than 35 kg (77 lb):** 20 mg P.O. once daily; may titrate to 40 mg daily after 2 weeks, if needed  
**Children ages 6 to 16 weighing 20 kg (44 lb) to less than 35 kg (77 lb):** 10 mg P.O. daily; may titrate to 20 mg daily after 2 weeks, if needed.

**Dosage adjustment**

- Volume depletion

**Contraindications**

- Hypersensitivity to drug or its components

**Precautions**

Use cautiously in:

- hepatic disease, renal dysfunction, hypovolemia, sodium depletion
- elderly patients
- pregnant patients (first trimester; not recommended in second and third trimesters)
- breastfeeding patients
- children (safety and efficacy not established).

**Administration**

- Give with or without food.
- Know that drug may be used alone or with other antihypertensives.

Route	Onset	Peak	Duration
P.O.	Variable	1-2 hr	Unknown

**Adverse reactions**

**CNS:** fatigue, dizziness, headache, insomnia

**CV:** orthostatic hypotension, chest pain, peripheral edema, syncope, tachycardia

**EENT:** sinusitis, rhinitis, pharyngitis

**GI:** nausea, diarrhea, constipation, abdominal pain, dry mouth

**GU:** hematuria

**Hematologic:** hyperglycemia

**Musculoskeletal:** back pain, arthritis, muscle weakness

**Respiratory:** upper respiratory infection symptoms, bronchitis, cough

**Skin:** dry skin, rash, inflammation, pruritus, alopecia, angioedema

**Other:** dental pain, flulike symptoms

**Interactions**

**Drug-diagnostic tests.** *Triglycerides:* increased level

**Drug-herbs.** *Ephedra (ma huang):* antagonism of antihypertensive effect

**Patient monitoring**

- Monitor vital signs and cardiovascular status. Stay alert for orthostatic hypotension, syncope, and peripheral edema.
- Check temperature and watch for signs and symptoms of flu and other infections (especially respiratory and EENT infections).
- Watch for angioedema.
- In volume-depleted patient, monitor blood pressure carefully after initial dose. Transient blood pressure drop may occur.

**Patient teaching**

- Tell patient to take at same time each day, with or without food.
- Advise patient to promptly report signs and symptoms of infection, particularly respiratory symptoms.
- Inform patient that when he begins therapy, inadequate fluid intake, excessive perspiration, vomiting, or diarrhea may cause blood pressure to drop. Tell him to change position slowly to avoid dizziness or fainting.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- 📢 Tell female patient to notify prescriber immediately if she suspects pregnancy.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the tests and herbs mentioned above.

## olsalazine sodium

Dipentum

**Pharmacologic class:** Salicylate

**Therapeutic class:** Anti-inflammatory

**Pregnancy risk category** C

### Action

Unknown. Converts to active form, mesalamine, which blocks cyclooxygenase and inhibits prostaglandin production in colon.

### Availability

*Capsules:* 250 mg

### Indications and dosages

➤ Ulcerative colitis in patients who can't tolerate sulfasalazine

**Adults:** 500 mg P.O. b.i.d.

### Contraindications

- Hypersensitivity to drug or other salicylates

### Precautions

Use cautiously in:

- hepatic or renal impairment, severe allergy, bronchial asthma
- pregnant or breastfeeding patients
- children younger than age 14.

### Administration

- Give with meals to reduce GI irritation.

Route	Onset	Peak	Duration
P.O.	Variable	60 min	Unknown

### Adverse reactions

**CNS:** headache, fatigue, depression, vertigo

**GI:** nausea, vomiting, diarrhea, abdominal pain, cramps, dyspepsia, bloating, stomatitis

**Musculoskeletal:** joint pain

**Respiratory:** upper respiratory infection

**Skin:** rash, itching

### Interactions

**Drug-drug.** *Anticoagulants, coumarin derivatives:* prolonged prothrombin time, increased International Normalized Ratio

**Drug-food.** *Any food:* decreased GI irritation

### Patient monitoring

- Monitor neurologic status. Stay alert for depression.
- Assess GI symptoms. Encourage adequate fluid intake to avoid dehydration.
- Monitor urinalysis, blood urea nitrogen, and creatinine in patients with renal impairment.

### Patient teaching

- Instruct patient to take with food and to continue taking drug even after symptoms improve.
- Tell patient to eat appropriate foods in small, frequent servings to minimize GI upset.
- Advise patient to contact prescriber if symptoms worsen or don't improve after 1 to 2 months of therapy.
- Tell patient he may require periodic proctoscopy and sigmoidoscopy to determine response to drug.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects mood and wakefulness.
- As appropriate, review all significant adverse reactions and interactions, especially those related to the drugs and foods mentioned above.

## omalizumab

Xolair

**Pharmacologic class:** Recombinant DNA-derived immunoglobulin G subclass 1 (IgG1) monoclonal antibody

**Therapeutic class:** Monoclonal antibody

**Pregnancy risk category** B

**FDA BOXED WARNING**

• Anaphylaxis, presenting as bronchospasm, hypotension, syncope, urticaria, or angioedema of throat or tongue, has occurred after administration of omalizumab. Anaphylaxis has occurred after first dose but also has occurred beyond 1 year after beginning treatment. Closely observe patients for appropriate period after administration and be prepared to manage anaphylaxis that can be life-threatening. Inform patients of signs and symptoms of anaphylaxis and have them seek immediate medical care should signs and symptoms occur.

**Action**

Inhibits binding of IgE to high-affinity IgE receptors on surface of mast cells and basophils

**Availability**

*Powder for injection:* 150 mg/vial

**Indications and dosages**

➤ Persistent asthma in patients with positive skin tests or in vitro reactivity to perennial allergens whose symptoms aren't adequately controlled by inhaled corticosteroids

**Adults and adolescents ages 12 and**

**older:** 150 to 375 mg subcutaneously q 2 to 4 weeks, with dosing frequency determined by serum IgE level and weight

**Dosage adjustment**

- Significant weight change

**Contraindications**

- Hypersensitivity to drug

**Precautions**

Use cautiously in:

- elderly patients
- pregnant or breastfeeding patients
- children younger than age 12.

**Administration**

⚠ Be aware that omalizumab isn't a rescue drug and isn't intended for

acute asthma attacks or status asthmaticus.

⚠ Don't discontinue abruptly.

- Don't administer more than 150 mg per injection site.
- Prepare injection only with sterile water for injection.

Route	Onset	Peak	Duration
Subcut.	Unknown	7-8 days	Unknown

**Adverse reactions**

**CNS:** headache, fatigue, dizziness

**EENT:** sinusitis, pharyngitis, earache

**Musculoskeletal:** arthralgia, fracture, leg or arm pain

**Respiratory:** upper respiratory infection

**Skin:** pruritus, dermatitis

**Other:** injection-site reaction, viral infection, pain, **cancer, anaphylaxis**

**Interactions**

**Drug-diagnostic tests.** *Serum IgE:* elevated level

**Patient monitoring**

⚠ Monitor patient for severe hypersensitivity reactions, including anaphylaxis.

⚠ Watch for signs and symptoms of cancer (rare).

**Patient teaching**

⚠ Tell patient to take exactly as prescribed and not to change dosage or stop drug abruptly (unless hypersensitivity reaction occurs).

⚠ Instruct patient to discontinue drug and notify prescriber immediately at first sign of hypersensitivity reaction, such as rash, hives, or itching.

• Inform patient that asthma symptoms may not improve immediately after starting drug.

• Tell patient drug isn't intended for acute asthma attacks.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## omega-3-acid ethyl esters

Lovaza

**Pharmacologic class:** Combination ethyl esters of omega-3 fatty acids, principally eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA)

**Therapeutic class:** Lipid-regulating agent

**Pregnancy risk category C**

### Action

Unclear. May include inhibition of acyl-CoA:1,2-diacylglycerol acyltransferase, increased mitochondrial and peroxisomal  $\beta$ -oxidation in the liver, decreased lipogenesis in the liver, and increased plasma lipoprotein lipase activity; may reduce synthesis of triglycerides in the liver because EPA and DHA are poor substrates for the enzymes responsible for triglyceride synthesis, and EPA and DHA inhibit esterification of other fatty acids.

### Availability

Capsules: 1 g

### Indications and dosages

➤ Adjunct to diet to reduce triglyceride levels in patients with severe (500 mg/dl or greater) hypertriglyceridemia

**Adults:** 4 g P.O. daily as a single 4-g dose or as 2-g dose P.O. b.i.d.

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- hepatic impairment
- hypersensitivity to fish or shellfish
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Administer capsules whole with meals.
- Assess triglyceride levels carefully before starting therapy, and identify other causes (such as diabetes mellitus, hypothyroidism, or drugs) of high triglyceride levels; manage as appropriate.
- Ensure patient is on appropriate lipid-lowering diet before starting drug.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

### Adverse reactions

**GI:** vomiting, constipation, GI disorder, eructation, dyspepsia

**Hepatic:** increased liver enzyme levels

**Skin:** pruritus, rash

**Other:** taste perversion

### Interactions

**Drug-drug.** *Anticoagulants, other drugs affecting coagulation (such as aspirin, NSAIDs):* prolonged bleeding time

**Drug-diagnostic tests.** *ALT, AST, LDL-C:* increased levels

### Patient monitoring

- Monitor hepatic function tests in patients with hepatic impairment.
- Monitor LDL-C and triglyceride levels periodically.

### Patient teaching

- Tell patient to take capsules whole with meals and not to break open, crush, dissolve, or chew them.
- Instruct patient to tell prescriber if he's allergic to fish.
- Advise patient to maintain lipid-lowering diet.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## omeprazole magnesium

Heartburn Relief<sup>Ⓢ</sup>, Losec<sup>Ⓢ</sup>, Mepradec<sup>Ⓢ</sup>, Prilosec, Prilosec OTC, Ratio-Omeprazole<sup>Ⓢ</sup>, Sandoz Omeprazole<sup>Ⓢ</sup>, Zanol<sup>Ⓢ</sup>

## omeprazole and sodium bicarbonate

Zegerid, Zegerid OTC

**Pharmacologic class:** Proton pump inhibitor

**Therapeutic class:** Antiulcer drug

**Pregnancy risk category C**

### Action

Reduces gastric acid secretion and increases gastric mucus and bicarbonate production, creating protective coating on gastric mucosa and easing discomfort from excess gastric acid

### Availability

*Capsules (delayed-release):* 10 mg, 20 mg, 40 mg

*Powder for oral suspension (delayed-release):* 2.5 mg, 10 mg in packets

*Tablets (delayed-release):* 20 mg

### Indications and dosages

➤ Gastroesophageal reflux disease

**Adults:** 20 mg P.O. (capsules, powder) daily for 4 weeks

➤ Erosive esophagitis

**Adults:** 20 mg P.O. (capsules, powder) daily for 4 to 8 weeks

➤ Short-term treatment of active duodenal ulcer

**Adults:** 20 mg P.O. (capsules, powder) daily for 4 weeks. Some patients may need 4 additional weeks of therapy.

➤ To reduce risk of duodenal ulcers caused by *Helicobacter pylori*

**Adults:** 40 mg P.O. (capsules) daily in morning, given with clarithromycin t.i.d. for 2 weeks; then 20 mg daily for 2 weeks

➤ Gastric ulcers

**Adults:** 40 mg P.O. (capsules) daily for 4 to 8 weeks

➤ Pathologic hypersecretory conditions, including Zollinger-Ellison syndrome

**Adults:** Initially, 60 mg P.O. (capsules) daily; may increase up to 120 mg t.i.d. Divide daily dosages above 80 mg.

➤ Frequent heartburn (two or more episodes a week)

**Adults ages 18 and older:** 20 mg P.O. (OTC tablets, capsules, or powder) daily for 14 days

### Off-label uses

- Posterior laryngitis
- To enhance pancreatin efficacy in treating steatorrhea in cystic fibrosis patients

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- hepatic disease
- hypomagnesemia
- concurrent use of clopidogrel (avoid use)
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Give 30 to 60 minutes before a meal, preferably in morning.
- If desired, give concurrently with antacids.
- Know that if patient has ulcer at start of therapy, treatment may be extended.
- When giving through nasogastric tube, use powder for oral suspension, or separate capsule and mix pellets with water. Agitate syringe while injecting. After administration, flush with 30 to 60 ml of water.
- Don't crush capsules.

- Be aware that symptomatic response doesn't rule out gastric cancer.

Route	Onset	Peak	Duration
P.O.	Within 1 hr	Within 2 hr	72-96 hr
P.O. (delayed)	Unknown	10-90 min	Unknown

### Adverse reactions

**CNS:** dizziness, headache, asthenia

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain

**Metabolic:** hypomagnesemia

**Musculoskeletal:** back pain; fractures of hip, wrist, spine (with long-term daily use)

**Respiratory:** cough, upper respiratory tract infection

**Skin:** rash

### Interactions

**Drug-drug.** *Ampicillin, cyanocobalamin, iron salts, ketoconazole:* reduced absorption of these drugs

*Clarithromycin:* increased omeprazole blood level

*Clopidogrel:* diminished antiplatelet activity

*Diazepam, phenytoin, warfarin:* prolonged elimination and increased effects of these drugs

*Digoxin:* increased digoxin absorption and blood level, possible digoxin toxicity

*Drugs metabolized by CYP450 system:* competitive metabolism

*Methotrexate:* increased methotrexate serum level

*Penicillins:* serious and occasionally fatal hypersensitivity reactions including anaphylaxis

*Rifampin:* substantially decreased omeprazole concentrations

**Drug-diagnostic tests.** *Alanine phosphatase, alkaline aminotransferase, aspartate aminotransferase, bilirubin:* increased levels

*Gastrin:* increased level during first 1 to 2 weeks of therapy

*Serum chromogranin A:* increased level may cause false-positive results in

diagnostic investigations for neuroendocrine tumors

*Serum magnesium:* decreased level

**Drug-herbs.** *St John's wort:* substantially decreased omeprazole concentration

### Patient monitoring

- Assess vital signs.
- Check for abdominal pain, emesis, diarrhea, or constipation.
- Evaluate fluid intake and output.
- Watch for elevated liver function test results (rare).
- Monitor magnesium level before starting drug and periodically thereafter in patients expected to be on long-term treatment or who take proton pump inhibitors with other drugs such as digoxin or drugs that may cause hypomagnesemia.

### Patient teaching

- Tell patient to take 30 to 60 minutes before a meal, preferably in morning.
- Instruct patient to swallow capsules or tablets whole and not to chew or crush them. If he can't swallow capsule, tell him he may open it, carefully sprinkle and mix entire contents into 1 tbsp of cool applesauce, and swallow immediately with glass of water.
- Instruct patient on how to use delayed-release oral suspension: Empty contents of a 2.5-mg packet of powder into a container with 5 ml of water or 10-mg packet of powder into a container with 15 ml of water; don't use other liquids or foods. Stir and allow drug to thicken for 2 to 3 minutes. Stir well and drink within 30 minutes. If any drug remains after drinking, add more water to container, stir, and drink immediately.
- Inform patient taking OTC delayed-release tablets for heartburn that full effect may take 1 to 4 days. Advise him not to take tablets for more than 14 days without consulting health care professional.

- Advise patient to avoid St John's wort while taking this drug.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## onabotulinumtoxinA (Toxin type A)

Botox, Botox Cosmetic, Vistabel<sup>Ⓢ</sup>, Xeomin<sup>Ⓢ</sup>

## abobotulinumtoxinA (Toxin type A)

Dysport

## incobotulinumtoxinA (Toxin type A)

Xeomin

## rimabotulinumtoxinB (Toxin type B)

Myobloc, NeuroBloc<sup>Ⓢ</sup>

**Pharmacologic class:** Neurotoxin

**Therapeutic class:** Neuromuscular blocker

**Pregnancy risk category C**

### FDA BOXED WARNING

• Postmarketing reports indicate that the effects of all botulinum toxin products may spread from the area of injection to produce symptoms consistent with botulinum toxin effects, including asthenia, generalized muscle weakness, diplopia, blurred vision, ptosis, dysphagia, dysphonia, dysarthria, urinary incontinence, and breathing difficulties. These signs and symptoms have

been reported hours to weeks after injection. Swallowing and breathing difficulties can be life-threatening, and deaths have occurred.

- The risk of signs and symptoms is probably greatest in children treated for spasticity, but signs and symptoms can also occur in adults treated for spasticity and other conditions, particularly in patients who have underlying conditions that would predispose them to these symptoms.
- In unapproved uses, including spasticity in children and adults, and in approved indications, cases of spread of effect have been reported at dosages comparable to those used to treat cervical dystonia and at lower dosages.

### Action

Blocks neuromuscular transmission by binding to receptor sites on motor nerve terminals and inhibiting acetylcholine release, thereby causing localized muscle denervation. As a result, local muscle paralysis occurs, which leads to muscle atrophy and reinnervation due to development of new acetylcholine receptors.

### Availability

Toxin type A—(onabotulinumtoxinA)

*Powder for injection:* 100 units/vial

Toxin type A—abobotulinumtoxinA

*Freeze-dried powder for injection:*

300 units/vial, 500 units/vial

Toxin type A—(incobotulinumtoxinA)

*Powder for injection, lyophilized:* 50

units in single-use vials, 100 units in

single-use vials

Toxin type B—(rimabotulinumtoxinB)

*Solution for injection:* 5,000-units/ml vial

### Indications and dosages

**Toxin type A (onabotulinumtoxinA)**

➤ Temporary improvement in appearance of moderate to severe glabellar lines associated with corrugator or procerus muscle activity

**Adults ages 65 and younger:** *Botox cosmetic only*—Total of 20 units (0.5-ml solution) injected I.M. as divided doses of 0.1 ml into each of five sites: two in each corrugator muscle and one in procerus muscle. Injection usually needs to be repeated q 3 to 4 months to maintain effect. *Dysport*—50 units I.M. in five equal aliquots of 10 units each to achieve clinical effect. *Xeomin*—Or, 20 units per treatment session divided into five equal I.M. injections of 4 units each.

➤ Treatment of blepharospasm in patients previously treated with onabotulinumtoxinA (Botox)

**Adults:** *Xeomin*—When initiating therapy, base dose, number, and location of injections on the previous dosing of onabotulinumtoxinA (Botox). If previous dose of Botox isn't known, the recommended starting dose is 1.25 to 2.5 units per injection site.

➤ Upper limb spasticity

**Adults:** *Botox*—75 to 360 units I.M. divided among selected muscles at a given treatment session. Dose can be repeated no sooner than 12 weeks after the previous injection.

➤ Prophylaxis of headaches in patients with chronic migraine (15 or more days per month with headache lasting 4 hours a day or longer)

**Adults:** *Botox*—155 units as 0.1-ml (5 units) injections per each site divided across seven head and neck muscles

➤ Severe axillary hyperhidrosis inadequately managed by topical agents

**Adults:** *Botox*—50 units per axilla injected into defined hyperhidrotic area

➤ Blepharospasm

**Adults:** 1.25 to 2.5 units injected into medial and lateral pretarsal orbicularis oculi of upper eyelid and lateral pretarsal orbicularis oculi of lower eyelid

➤ Strabismus

**Adults:** 1.25 to 5 units injected into eyelid (dosage varies with strabismus severity). Dose can be repeated in 7 to 14 days if patient has adequate

response; with inadequate response, dosage may be doubled.

**Toxin types A and B (onabotulinumtoxinA, abobotulinumtoxinA, incobotulinumtoxinA, rimabotulinumtoxinB)**

➤ Treatment of cervical dystonia to decrease severity of abnormal head position and neck pain in both botulinum toxin-naïve and previously treated patients

**Adults:** *Xeomin*—120 units injected I.M. into affected muscles per treatment session.

➤ To relax skeletal muscles and reduce severity of abnormal head position and neck pain associated with cervical dystonia

**Adults:** *Botox*—Usual dosage is 236 units injected I.M. locally into affected muscles. Dosage ranges from 198 to 300 units. *Dysport*—500 units I.M. as a divided dose among affected muscles in patients with or without a history of prior treatment with botulinum toxin. *Myobloc*—2,500 to 5,000 units I.M. injected locally into affected muscles.

## Contraindications

- Hypersensitivity to drug or its components
- Allergy to cow's-milk protein (*Dysport*)
- Acute urinary tract infection or acute urinary retention (*Botox* intradetrusor injections)
- Active infection at injection site

## Precautions

Use cautiously in:

- cardiovascular disease, peripheral neuropathy, neuromuscular disorders, compromised respiratory function, dysphagia
- inflammation at injection site, injections near vulnerable anatomical structures
- pregnant or breastfeeding patient
- children younger than age 12; children younger than age 18 (*Dysport*, *Xeomin*)

## Administration

- Be aware that only trained professional medical personnel should inject this drug.

- Be aware that botulinum toxin products aren't interchangeable.

### Toxin type A (onabotulinumtoxinA) when administered for eye disorders

- Reconstitute by slowly injecting preservative-free normal saline solution into drug vial.
- Rotate vial gently to mix drug; then draw up at least 20 units (0.5-ml solution) and expel air bubbles.
- Remove needle used for reconstitution, and attach 30G needle. Then inject drug as divided doses of 0.1 ml into each of five sites (two in each corrugator muscle, one in procerus muscle).
- Prepare eye with several drops of local anesthetic and ocular decongestant, as prescribed, several minutes before injection for blepharospasm or strabismus.
- When administering for upper limb spasticity, dilute with preservative-free normal saline solution to 200 units/4 ml or 100 units/2 ml. Then, using a 25G to 30G needle for superficial muscles and a longer 22G needle for deeper musculature, inject no more than 50 units per site.

### Toxin type A (abobotulinumtoxinA)

- Reconstitute each 300-unit vial with 0.6 ml preservative-free normal saline solution and each 500-unit vial with 1 ml preservative-free normal saline solution.
- Swirl vial gently to mix drug.
- Remove needle used for reconstitution. Use a 23G to 25G needle for administration. Then inject 10 units into each of five sites (two in each corrugator muscle and one in the procerus muscle).
- Use within 4 hours of reconstitution.

### Toxin type B (rimabotulinumtoxinB)

- Draw up prescribed dose from preservative-free, 3.5-ml single-use vial.
- Don't shake vial.
- Divide prescribed dose and inject locally into affected muscles.

Route	Onset	Peak	Duration
I.M.	Mins-hrs	Unknown	3-4 mo
I.M. (blepharospasm)	3 days	1-2 wk	3 mo
I.M. (strabismus)	1-2 days	Unknown	1-2 wk
I.M. (cervical dystonia [Dysport])	Unknown	2-4 wk	Unknown

## Adverse reactions

**CNS:** headache, dizziness

**CV:** hypertension, arrhythmias, myocardial infarction (MI)

**EENT:** blepharoptosis, conjunctivitis, keratitis, eye dryness, double vision, tearing, increased sensitivity to light, sinusitis, pharyngitis

**GI:** nausea, dyspepsia, difficulty swallowing

**Musculoskeletal:** back pain, neck pain, muscle weakness

**Respiratory:** pneumonia, bronchitis, upper respiratory tract infection

**Skin:** skin tightness, ecchymosis

**Other:** tooth disorder, injection site redness, edema, or pain, flulike symptoms, facial muscle paralysis, infection, anaphylaxis

## Interactions

**Drug-drug.** *Aminoglycosides, anticholinesterase compounds, clindamycin, lincomycin, magnesium sulfate, other neuromuscular blockers (such as succinylcholine), polymyxin B, quinidine:* increased risk of adverse effects

## Patient monitoring

- Stay alert for signs and symptoms of anaphylaxis, particularly after first dose.
- Monitor vital signs and ECG, watching for evidence of hypertension, arrhythmias, and MI.
- Assess effect of drug on affected muscles; check for paralysis.
- ⚠ Be aware that spread of toxin effects may lead to swallowing and

breathing difficulties and death. Provide immediate medical attention if respiratory, speech, or swallowing difficulties occur.

- Monitor temperature. Watch for signs and symptoms of respiratory and EENT infections as well as flulike symptoms.

### Patient teaching

 Instruct patient to seek immediate medical attention if respiratory, speech, or swallowing difficulties occur.

- Teach patient about desired effect of injection. Advise patient to report paralysis.
- Instruct patient to report signs and symptoms of infection, particularly flulike illness and EENT and respiratory infections.
- Inform patient being treated for blepharospasm (uncontrollable blinking) that he may experience transient eyelid drooping, corneal inflammation, double vision, dry eyes, tearing, and light sensitivity.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## ondansetron hydrochloride

Apo-Ondansetron<sup>☼</sup>, Dom-Ondansetron<sup>☼</sup>, Gen-Ondansetron<sup>☼</sup>, Novo-Ondansetron<sup>☼</sup>, Ondemet<sup>☼</sup>, PHL-Ondansetron<sup>☼</sup>, PMS-Ondansetron<sup>☼</sup>, Ratio-Ondansetron<sup>☼</sup>, Sandoz Ondansetron<sup>☼</sup>, Zofran, Zofran ODT, Zofran Preservative Free

**Pharmacologic class:** Serotonin type 3 (5-HT<sub>3</sub>) antagonist

**Therapeutic class:** Antiemetic

**Pregnancy risk category B**

### Action

Blocks serotonin at 5-HT<sub>3</sub> receptor sites in vagal nerve terminals by disrupting CNS chemoreceptor trigger zone

### Availability

*Injection:* 2 mg/ml in 2- and 20-ml vials  
*Injection (premixed):* 32 mg/50 ml single-dose containers

*Injection USP (preservative-free):* 2 mg/ml in 2-ml single-dose vials

*Oral solution:* 4 mg/5 ml

*Tablets:* 4 mg, 8 mg, 24 mg

*Tablets (orally disintegrating):* 4 mg, 8 mg

### Indications and dosages

**>** To prevent nausea and vomiting caused by moderately emetogenic chemotherapy

**Adults and children older than age 12:** 8 mg (tablet) or 10 ml (oral solution) P.O. b.i.d.; give first dose 30 minutes before chemotherapy and repeat dose 8 hours later. Give 8 mg (tablet) or 10 ml (oral solution) P.O. q 12 hours for 1 to 2 days after chemotherapy ends.

**Children ages 4 to 11:** 4 mg (tablet) or 5 ml (oral solution) P.O. q 8 hours; give first dose 30 minutes before chemotherapy and repeat dose 4 and 8 hours later. Give 4 mg (tablet) or 5 ml (oral solution) P.O. q 8 hours for 1 to 2 days after chemotherapy ends.

**>** To prevent nausea and vomiting caused by highly emetogenic chemotherapy

**Adults and children older than age 12:** 32 mg I.V. as a single dose infused over 15 minutes, starting 30 minutes before chemotherapy; or three 0.15-mg/kg doses I.V., with first dose infused over 15 minutes, starting 30 minutes before chemotherapy and repeated 4 hours and 8 hours later.

**>** To prevent nausea and vomiting caused by radiation

**Adults and children older than age 12:** 8 mg (tablet) or 10 ml (oral solution) P.O. 1 to 2 hours before radiation and

repeated q 8 hours, depending on radiation type, location, and extent

➤ Prevention and treatment of postoperative nausea and vomiting

**Adults and children older than age 12:**

16 mg (tablet) or 20 ml (oral solution)

P.O. 1 hour before anesthesia induction, or 4 mg I.V. or I.M. before anesthesia or postoperatively

**Children ages 2 to 12 weighing more than 40 kg (88 lb):**

4 mg I.V. before anesthesia or postoperatively

**Children ages 2 to 12 weighing less than 40 kg (88 lb):** 0.1 mg/kg I.V.

before anesthesia or postoperatively

### Dosage adjustment

- Hepatic impairment

### Contraindications

- Hypersensitivity to drug
- Concurrent use of apomorphine

### Precautions

Use cautiously in:

- hepatic disease
- congenital long QT syndrome (avoid use)
- hypersensitivity to other selective 5-HT<sub>3</sub> receptor antagonists
- phenylketonuria (with orally disintegrating tablets)
- pregnant or breastfeeding patients
- children younger than age 12.

### Administration

- Give first dose before emetogenic event.
- Remove orally disintegrating tablet by peeling back foil with dry hands; don't push tablet through foil backing. After removing, place tablet on patient's tongue, where it will dissolve within seconds. Tell patient to swallow saliva.
- Give undiluted when administering I.M. before anesthesia induction.
- Give undiluted by direct I.V. immediately before anesthesia induction, or postoperatively if nausea and vomiting occur. Administer slowly, over at least

30 seconds (preferably over 2 to 5 minutes).

- For intermittent I.V. infusion, dilute in 50 ml of dextrose 5% in water (D<sub>5</sub>W) and normal saline solution or D<sub>5</sub>W and half-normal saline solution. Infuse over 15 minutes.

- When giving I.V., don't use flexible plastic container in series connection.

Route	Onset	Peak	Duration
P.O., I.V.	Rapid	15-30 min	4-8 hr
I.M.	Rapid	40 min	Unknown

### Adverse reactions

**CNS:** headache, dizziness, malaise, drowsiness, fatigue, weakness, extrapyramidal reactions

**CV:** chest pain, hypotension, ECG changes including **QT-interval prolongation (rare and mostly with I.V. use)**, **torsades de pointes (postmarketing reports)**

**GI:** constipation, diarrhea, abdominal pain, dry mouth

**GU:** urinary retention

**Respiratory:** bronchospasm

**Skin:** rash

**Other:** pain at injection site, shivering, **anaphylaxis**

### Interactions

**Drug-drug.** *Drugs that alter hepatic enzyme activity:* altered pharmacokinetics of ondansetron

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, bilirubin:* transient elevations

### Patient monitoring

- Monitor GI status.
- Assess for extrapyramidal reactions.
- Check vital signs. Watch for hypotension and bronchospasm.
- Monitor fluid intake and output. Stay alert for urinary retention.
- ⚠ Be aware that cases of torsades de pointes have been reported. Monitor ECG in patients with electrolyte abnormalities (such as hypokalemia or

hypomagnesemia), congestive heart failure, or bradyarrhythmias, and in patients taking other drugs that lead to prolonged QT interval.

 Be aware that using ondansetron after abdominal surgery or with chemotherapy-induced nausea and vomiting may mask a progressive ileus or gastric distention.

### Patient teaching

- Tell patient to remove orally disintegrating tablet by peeling back foil with dry hands—not by pushing tablet through foil backing. Instruct him to place tablet on tongue, where it will dissolve within seconds, and then to swallow saliva.

 Instruct patient to immediately report extrapyramidal symptoms, irregular heartbeats, abdominal distention after abdominal surgery, or allergic reaction.

- Inform patient with phenylketonuria (or caregiver) that powder contains phenylalanine.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## orlistat

Alli, Xenical

*Pharmacologic class:* GI lipase inhibitor

*Therapeutic class:* Weight control drug

*Pregnancy risk category* X

### Action

Inhibits absorption of dietary fats in stomach and small intestine

### Availability

*Capsules:* 60 mg (over-the-counter drug), 120 mg

### Indications and dosages

 Obesity management (in conjunction with reduced-calorie diet); to reduce risk of regaining after weight loss

**Adults:** 120 mg (Xenical) P.O. t.i.d. with each main meal containing fat (during or up to 1 hour after the meal)

 Weight loss in overweight adults (in conjunction with reduced-calorie and low-fat diet)

**Adults ages 18 and older:** 60 mg (Alli) P.O. t.i.d. with each meal containing fat

### Contraindications

- Hypersensitivity to drug or its components
- Chronic malabsorption syndrome or cholestasis
- Patients who have had organ transplant or are taking drugs to reduce organ rejection (such as cyclosporine), patients with known problems absorbing food (Alli)
- Pregnancy

### Precautions

Use cautiously in:

- hypothyroidism, nephrolithiasis, diabetes mellitus, clinically significant GI disease, fat-soluble vitamin deficiencies
- history of bulimia or anorexia nervosa
- breastfeeding patients
- children.

### Administration

- Know that organic causes of obesity should be ruled out before therapy starts.
- Give three times daily with meal containing fat (Alli) or up to 1 hour after a meal (Xenical).
- If patient misses a meal or eats a fat-free meal, omit dose.
- Know that orlistat therapy is frequently combined with psychotherapy.

Route	Onset	Peak	Duration
P.O.	Unknown	8 hr	48-72 hr

## Adverse reactions

**CNS:** *Xenical:* dizziness, headache, fatigue, insomnia, depression, anxiety

**EENT:** *Xenical:* ear, nose, and throat symptoms

**GI:** fecal urgency, flatus with discharge, oily or increased bowel movements, oily spotting, fecal incontinence

**GU:** *Xenical:* urinary tract infection (UTI), vaginitis, menstrual irregularities

**Hepatic:** **severe liver injury (rare)**

**Musculoskeletal:** *Xenical:* back pain, arthritis, myalgia, tendinitis

**Respiratory:** *Xenical:* upper or lower respiratory infection

**Skin:** *Xenical:* dry skin, rash

**Other:** *Xenical:* dental pain, tooth disorder, influenza

## Interactions

**Drug-drug.** *Beta-carotene, fat-soluble vitamins:* reduced vitamin absorption  
*Cyclosporine:* reduced cyclosporine blood level (*Xenical*)

*Pravastatin:* increased lipid-lowering effects (*Xenical*)

*Warfarin:* altered coagulation parameters

## Patient monitoring

🚨 Monitor hepatic function closely. If liver injury is suspected, discontinue drug immediately and continue to monitor liver function tests.

- Watch for signs and symptoms of UTI, respiratory infection, and EENT disorders.
- Monitor patient for weight loss.
- Evaluate patient's diet for appropriate caloric intake.
- Be aware that patient may develop an elevated urinary oxalate level. Monitor renal function in patients at risk for renal insufficiency.

## Patient teaching

- Instruct patient to take with meals as directed. Tell him he may omit a dose if he misses a meal or eats a fat-free meal.
- Advise patient to consume reduced-calorie diet and to spread daily fat intake over three main meals.

- Inform patient that drug predisposes him to EENT, respiratory, and urinary infections. Instruct him to promptly report signs and symptoms.

🚨 Instruct patient to report signs or symptoms of hepatic dysfunction (anorexia, pruritus, jaundice, dark urine, light-colored stools, or right upper quadrant pain).

- Tell patient about common adverse GI reactions, including problems controlling bowel movements. If significant GI upset occurs, encourage him to consult prescriber about taking psyllium at bedtime or with each dose.
- Advise patient to ask prescriber if he should take a daily multivitamin containing vitamins A, D, E, K, and beta-carotene at least 2 hours before or after taking drug.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

## oseltamivir phosphate

Tamiflu

**Pharmacologic class:** Viral neuroaminidase inhibitor

**Therapeutic class:** Antiviral

**Pregnancy risk category C**

## Action

Inhibits influenza virus neuraminidase, altering viral particle aggregation and decreasing viral release from infected cells

## Availability

*Capsules:* 30 mg, 45 mg, 75 mg

*Powder for oral suspension:* 12 mg/ml

## Indications and dosages

- To prevent influenza type A

**Adults and children older than age 13:** 75 mg P.O. daily for 10 days, starting within 2 days of exposure; 75 mg P.O. daily during community outbreak of influenza for up to 6 weeks

**Children ages 1 and older weighing more than 40 kg (88 lb):** 75 mg P.O. daily for 10 days, starting within 2 days of exposure; continue dosing during community outbreak of influenza for up to 6 weeks

**Children ages 1 and older weighing more than 23 kg up to 40 kg (more than 51 lb up to 88 lb):** 60 mg P.O. daily for 10 days, starting within 2 days of exposure; continue dosing during community outbreak of influenza for up to 6 weeks

**Children ages 1 and older weighing more than 15 kg up to 23 kg (33 lb up to 51 lb):** 45 mg P.O. daily for 10 days, starting within 2 days of exposure; continue dosing during community outbreak of influenza for up to 6 weeks

**Children ages 1 and older weighing 15 kg (33 lb) or less:** 30 mg P.O. daily for 10 days, starting within 2 days of exposure; continue dosing during community outbreak of influenza for up to 6 weeks

➤ Treatment of influenza type A  
**Adults and children older than age 13:** 75 mg P.O. b.i.d. for 5 days, starting within 2 days of symptom onset

**Children ages 1 and older who weigh more than 40 kg (88 lb):** 75 mg P.O. b.i.d. for 5 days, starting within 2 days of symptom onset

**Children ages 1 and older who weigh more than 23 kg and up to 40 kg (51 to 88 lb):** 60 mg P.O. b.i.d. for 5 days, starting within 2 days of symptom onset

**Children ages 1 year and older who weigh more than 15 kg and up to 23 kg (33 to 51 lb):** 45 mg P.O. b.i.d. for 5 days, starting within 2 days of symptom onset

**Children ages 1 and older who weigh less than 15 kg (33 lb):** 30 mg P.O.

b.i.d. for 5 days, starting within 2 days of symptom onset

## Dosage adjustment

- Renal impairment

## Contraindications

- Hypersensitivity to drug or its components

## Precautions

Use cautiously in:

- chronic cardiac or renal disease, respiratory disorders
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 1 (safety and efficacy not established).

## Administration

- For flu treatment, give first dose at onset of symptoms. For flu prevention, give within 2 days of exposure.

Route	Onset	Peak	Duration
P.O.	Variable	2.5	6 hr

## Adverse reactions

**CNS:** headache, dizziness, fatigue, insomnia, unusual behavior, confusion

**GI:** nausea, vomiting, diarrhea

**Respiratory:** cough, bronchitis

**Skin:** epidermal necrolysis, erythema multiforme, Stevens-Johnson syndrome

**Other:** hypersensitivity reactions (including anaphylaxis)

## Interactions

None significant

## Patient monitoring

🚨 Monitor patient closely for allergic reaction or severe rash; discontinue drug immediately if these occur.

- Closely monitor patient for unusual behavior or confusion.
- Monitor respiratory status. Watch for signs and symptoms of secondary infection.

## Patient teaching

- Instruct patient to take as soon as flu symptoms occur and to complete entire course of therapy.
- Advise patient to take with food or milk to minimize GI irritation.
- Tell patient to prepare oral solution by adding water to powder and shaking well.
- 📣 Instruct patient or caregiver to discontinue drug and seek immediate medical attention if rash or swelling of lips, face, or throat occurs
- Instruct patient or caregiver to report change in behavior.
- Caution patient not to share drug with others, even if they have similar symptoms.
- Instruct patient to consult prescriber before taking other drugs.
- As appropriate, review all other significant adverse reactions.

## oxaliplatin

Eloxatin

**Pharmacologic class:** Alkylator

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

- Anaphylaxis may occur within minutes of administration. Epinephrine, corticosteroids, and antihistamines have been used to relieve symptoms.

## Action

Unclear. Thought to form reactive platinum complexes that inhibit DNA synthesis through formation of inter-strand and intrastrand cross-linking of DNA molecules. Cell-cycle-phase non-specific.

## Availability

*Powder for reconstitution for injection, lyophilized:* 5 mg/ml in 50-mg and 100-mg single-use vials

*Solution for injection:* 5 mg/ml in 10-ml, 20-ml, and 40-ml single-use vials

## Indications and dosages

➤ Metastatic cancer of colon or rectum, given with 5-fluorouracil (5-FU) and leucovorin

**Adults:** On day 1, 85 mg/m<sup>2</sup> oxaliplatin I.V. infusion and 200 mg/m<sup>2</sup> leucovorin; give both drugs simultaneously over 2 hours, followed by 400 mg/m<sup>2</sup> I.V. bolus of 5-FU over 2 to 4 minutes, then 600 mg/m<sup>2</sup> 5-FU I.V. as 22-hour continuous infusion. On day two, 200 mg/m<sup>2</sup> leucovorin I.V. infusion over 2 hours, followed by 400 mg/m<sup>2</sup> 5-FU I.V. bolus over 2 to 4 minutes, then 600 mg/m<sup>2</sup> 5-FU I.V. as 22-hour continuous infusion.

## Contraindications

- Hypersensitivity to drug or platinum products

## Precautions

Use cautiously in:

- thrombocytopenia
- radiation therapy
- recent pneumococcal or smallpox vaccination
- elderly patients
- pregnant or breastfeeding patients
- children.

## Administration

📣 Follow facility policy for preparing, handling, and administering mutagenic, teratogenic, and carcinogenic drugs.

- Premedicate patient with antiemetics, as prescribed.
- Reconstitute with sterile water or dextrose 5% in water (D<sub>5</sub>W)—never with normal saline solution or other solutions containing chloride.

- Further dilute reconstituted drug in 250 to 500 ml of D<sub>5</sub>W.
- Infuse over 2 hours simultaneously with leucovorin, but in a separate I.V. bag.
- Don't use administration sets or needles that contain aluminum.
- ☚ Be aware of importance of using leucovorin rescue with this drug.
- ☚ Avoid extravasation, which may cause necrosis and other severe reactions.
- Know that treatment cycles are usually repeated every 2 weeks.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache, dizziness, fatigue, insomnia, peripheral neuropathy

**CV:** cardiac abnormalities

**EENT:** decreased visual acuity, hearing loss, tinnitus, rhinitis, pharyngitis

**GI:** severe nausea, vomiting, diarrhea, constipation, dyspepsia, gastroesophageal reflux, mucositis, flatulence, stomatitis, anorexia

**GU:** hematuria, dysuria

**Hematologic:** anemia, **thrombocytopenia, leukopenia, pancytopenia, neutropenia, hemolytic uremic syndrome**

**Metabolic:** hypokalemia

**Respiratory:** dyspnea, cough, upper respiratory infection, **pulmonary fibrosis**

**Skin:** alopecia, rash, flushing, extravasation, redness, swelling, angioedema

**Other:** weight loss, increased cold sensitivity, pain at injection site, **anaphylaxis**

### Interactions

**Drug-drug.** *Aminoglycosides, loop diuretics:* increased risk of nephrotoxicity

*Aspirin, nonsteroidal anti-inflammatory drugs:* increased risk of bleeding

*Live-virus vaccines:* decreased antibody response to vaccine

*Myelosuppressants:* increased bone marrow depression

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, bilirubin, creatinine:* increased levels  
*Hemoglobin, neutrophils, platelets, white blood cells:* decreased levels

**Drug-behaviors.** *Alcohol use:* increased risk of bleeding

### Patient monitoring

☚ Monitor I.V. site frequently to avoid extravasation.

- Monitor CBC, blood chemistry, and kidney and liver function tests before each treatment cycle.

☚ Watch closely for blood dyscrasias, hemolytic uremic syndrome, serious pulmonary problems, and anaphylaxis.

- Conduct complete neurologic exam before and after each dose.

- Monitor vital signs and ECG. Evaluate cardiovascular and respiratory status closely.

- Assess patient's comfort level. Keep him warm during infusion to minimize neurologic effects.

- Watch for signs and symptoms of toxicity (paresthesia, nausea, vomiting).

### Patient teaching

- Inform patient that chemotherapy drugs can cause many adverse effects.

- Tell patient he'll receive drug from trained health care professionals in hospital setting.

☚ Instruct patient to inform nurse immediately if drug contacts his skin, eyes, or mouth.

- Advise patient to notify nurse if pain or redness occurs at I.V. site.

- Instruct patient to stay warm and avoid iced drinks to minimize neurologic symptoms.

☚ Tell patient to report itching, hives, swelling of hands or face, chest tightness, difficulty breathing, unsteadiness,

severe diarrhea or vomiting, or tingling sensation in hands, arms, legs, or feet.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## oxaprozin

Apo-Oxaprozin<sup>®</sup>, Daypro,  
RhoXal-Oxaprozin<sup>®</sup>

**Pharmacologic class:** Propionic acid derivative, nonsteroidal anti-inflammatory drug (NSAID)

**Therapeutic class:** Anti-inflammatory, analgesic

**Pregnancy risk category C** (first and second trimesters), **D** (third trimester)

### FDA BOXED WARNING

- Drug may increase risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke. Risk may increase with duration of use. Patients with cardiovascular disease or risk factors for it may be at greater risk.
- Drug increases risk of serious GI adverse events, including bleeding, ulcers, and stomach or intestinal perforation. These events can occur at any time during use and without warning. Elderly patients are at greater risk.
- Drug is contraindicated for treatment of perioperative pain in setting of coronary artery bypass graft surgery.

### Action

Unclear. Thought to inhibit prostaglandin synthesis by blocking cyclooxygenase (COX-2), thereby reducing inflammation.

### Availability

Tablets: 600 mg

### Indications and dosages

➤ Rheumatoid arthritis; osteoarthritis

**Adults:** 1,200 mg daily in two to three divided doses. Maximum daily dosage is 1,800 mg (1,200 mg for potassium form).

### Dosage adjustment

- Mild disease
- Renal impairment
- Low body weight

### Contraindications

- Hypersensitivity to drug
- Concurrent use of other NSAIDs (including aspirin)
- Active GI bleeding or ulcer disease

### Precautions

Use cautiously in:

- severe cardiovascular or hepatic disease, renal impairment
- history of ulcer disease
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Give with food or after meals if GI upset occurs.
- Use lowest effective dosage to minimize adverse reactions.

Route	Onset	Peak	Duration
P.O.	Unknown	3-5 hr	Unknown

### Adverse reactions

**CNS:** dizziness, fatigue, headache, agitation, anxiety, confusion, depression, insomnia, malaise, paresthesia, tremor

**CV:** edema, vasculitis, blood pressure changes

**EENT:** abnormal vision, tinnitus

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, gastritis, dyspepsia, duodenal ulcer, flatulence,

stomatitis, dry mouth, anorexia, **GI bleeding**

**GU:** albuminuria, azotemia, **interstitial nephritis, acute renal failure**

**Hematologic:** anemia

**Hepatic:** cholestatic jaundice, **hepatitis**

**Respiratory:** dyspnea, **hypersensitivity pneumonitis**

**Skin:** rash, pruritus, diaphoresis, photosensitivity, angioedema, **Stevens-Johnson syndrome**

**Other:** appetite and weight increases, allergic reactions including **anaphylaxis**

## Interactions

**Drug-drug.** *Alcohol, aspirin and other NSAIDs, corticosteroids, potassium supplements:* additive adverse GI effects and toxicity

*Anticoagulants, cefamandole, cefoperazone, cefotetan, clopidogrel, eptifibatide, plicamycin, thrombolytics, ticlopidine, tirofiban, vitamin A:* increased risk of bleeding

*Antineoplastics:* increased risk of adverse hematologic reactions

*Insulin, oral hypoglycemics:* increased hypoglycemic effects of these drugs

*Methotrexate:* increased risk of methotrexate toxicity

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, blood urea nitrogen, creatinine, lactate dehydrogenase, potassium:* increased levels

*Bleeding time:* prolonged (for up to 2 weeks after drug discontinuation)

*Creatinine clearance, glucose, hemoglobin, hematocrit, platelets, white blood cells:* decreased levels

*Liver function tests:* abnormal results

**Drug-herbs.** *Alfalfa, anise, arnica, astragalus, bilberry, black currant seed oil, bladderwrack, bogbean, boldo (with fenugreek), borage oil, buchu, capsaicin, cat's claw, celery, chamomile, chapparal, chincona bark, clove, clove oil, dandelion, dong quai, evening primrose oil, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, guggul, licorice,*

*papaya extract, red clover, rhubarb, safflower oil, skullcap, tan-shen:* increased anticoagulant effect and bleeding risk

## Patient monitoring

- Monitor kidney and liver function tests, coagulation studies, and CBC.

🚨 Watch for signs and symptoms of acute renal failure, nephritis, hepatitis, bleeding tendency, and anemia.

- Monitor hearing and vision, including results of eye exams.

🚨 Watch for and promptly report rash or swelling.

- Assess respiratory status closely. Stay alert for dyspnea and pneumonitis.

## Patient teaching

- Instruct patient to take with food or meal.

- Inform patient that many common over-the-counter drugs (including acetaminophen, aspirin, and other NSAIDs) and herbal preparations increase drug's adverse effects. Tell him to consult prescriber before taking these products.

🚨 Instruct patient to immediately report rash, unusual tiredness, yellowing of skin or eyes, easy bruising or bleeding, change in urination pattern, weight gain, arm or leg swelling, vision changes, and black or tarry stools.

- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- Advise patient on long-term therapy to have periodic eye exams.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## oxazepam

Apo-Oxazepam<sup>\*</sup>, Bio-Oxazepam<sup>\*</sup>,  
Novoxepam<sup>\*</sup>, PMS-Oxazepam<sup>\*</sup>,  
Riva Oxazepam<sup>\*</sup>

**Pharmacologic class:** Benzodiazepine

**Therapeutic class:** Anxiolytic, sedative-hypnotic

**Controlled substance schedule** IV

**Pregnancy risk category** D

### Action

Suppresses CNS stimulation at limbic and subcortical levels by potentiating effects of gamma-aminobutyrate, an inhibitory neurotransmitter. This suppression reduces anxiety and diminishes alcohol withdrawal symptoms.

### Availability

**Capsules:** 10 mg, 15 mg, 30 mg  
**Tablets:** 15 mg

### Indications and dosages

➤ Mild to moderate anxiety

**Adults:** 10 to 15 mg P.O. three to four times daily

➤ Severe anxiety; alcohol withdrawal symptoms

**Adults:** 15 to 30 mg P.O. three to four times daily

### Dosage adjustment

- Elderly patients

### Off-label uses

- Insomnia

### Contraindications

- Hypersensitivity to drug or tartrazine (some products)

### Precautions

Use cautiously in:

- hepatic dysfunction, severe chronic obstructive pulmonary disease,

myasthenia gravis, CNS depression, uncontrolled severe pain

- history of suicide attempt or drug abuse
- concurrent use of other benzodiazepines
- elderly or debilitated patients
- pregnant or breastfeeding patients.

### Administration

- Administer with or without food.
- Taper dosage after long-term therapy.

Route	Onset	Peak	Duration
P.O.	45-90 min	3 hr	6-12 hr

### Adverse reactions

**CNS:** dizziness, drowsiness, headache, confusion, poor memory, hangover effect, slurred speech, depression, paradoxical stimulation

**CV:** orthostatic hypotension, hypotension, ECG changes, tachycardia

**EENT:** blurred vision, mydriasis, tinnitus

**GI:** nausea, vomiting, constipation, diarrhea

**GU:** urinary retention, urinary incontinence

**Hematologic:** leukopenia

**Hepatic:** jaundice, hepatitis

**Respiratory:** respiratory depression

**Skin:** rash, dermatitis, itching

**Other:** physical and psychological drug dependence, drug tolerance, withdrawal symptoms

### Interactions

**Drug-drug.** *Azole antifungals:* increased oxazepam blood level, greater risk of toxicity

*Hormonal contraceptives, phenytoin:* decreased oxazepam efficacy

*Levodopa:* decreased levodopa efficacy

*Other CNS depressants (including antidepressants, antihistamines, other benzodiazepines, sedative-hypnotics, opioids):* additive CNS depression

*Theophylline:* decreased sedative effect of oxazepam

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, lactate dehydrogenase:* increased levels

*Hematocrit, thyroid uptake of sodium iodide  $^{123}\text{I}$  and  $^{131}\text{I}$ , white blood cells:* decreased values

**Drug-food.** *Cabbage:* decreased drug blood level

**Drug-herbs.** *Chamomile, hops, kava, valerian, skullcap:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

### Patient monitoring

 Monitor liver function tests and watch for signs and symptoms of hepatitis.

- Check vital signs. Stay alert for respiratory depression, orthostatic hypotension, and tachycardia.
- Monitor neurologic status. As needed, take measures to prevent injury.
- Watch for signs and symptoms of psychological or physical dependence.
- When tapering, watch for withdrawal symptoms.

### Patient teaching

- Tell patient he may take with or without meals, but should avoid cabbage.
- Advise patient to take exactly as prescribed. Tell him drug can cause dependence, and emphasize importance of following tapering instructions to avoid withdrawal symptoms.
-  Urge patient to immediately report unusual tiredness, nausea, appetite loss, or yellowing of skin or eyes.
- Tell patient to change position slowly to avoid blood pressure decrease.
- Instruct patient to report severe dizziness, weakness, persistent drowsiness, palpitations, or visual changes.
- Advise patient not to drink alcohol.
- Caution patient to avoid driving and other hazardous activities until he

knows how drug affects vision, cognition, and balance.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## oxcarbazepine

Apo-Oxcarbazepine<sup>✳</sup>, Trileptal

**Pharmacologic class:** Carboxamide derivative

**Therapeutic class:** Anticonvulsant

**Pregnancy risk category C**

### Action

Blocks sodium channels in neural membranes, stabilizing hyperexcitable states and inhibiting neuronal firing and impulse transmission in brain

### Availability

*Oral suspension:* 300 mg/5-ml bottle

*Tablets:* 150 mg, 300 mg, 600 mg

### Indications and dosages

 Adjunctive therapy for partial seizures

**Adults:** 300 mg P.O. b.i.d. May increase by up to 600 mg/day q week, to a maximum of 1,200 mg/day.

**Children ages 2 to 16:** Initially, 8 to 10 mg/kg/day P.O. to a maximum of 600 mg/day

 Conversion to monotherapy for partial seizures

**Adults:** 300 mg P.O. b.i.d. May increase by 600 mg/day at weekly intervals over 2 to 4 weeks, to a maximum of 2,400 mg/day

**Children ages 4 to 16:** Initially, 8 to 10 mg/kg/day P.O. given in two divided doses, increased to a maximum of 10 mg/kg/day

➤ Initiation of monotherapy

**Adults:** 300 mg P.O. b.i.d., increased by 300 mg/day P.O. q 3 days up to 1,200 mg/day

**Children ages 4 to 16:** Initially, 8 to 10 mg/kg/day P.O. given in two divided doses; increase by 5 mg/kg q 3 days to a maximum of 1,200 mg/day

### Dosage adjustment

- Renal impairment
- Children ages 2 to younger than 4 weighing less than 20 kg (44 lb)

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- renal impairment
- pregnant or breastfeeding patients
- children younger than age 2 (safety not established).

### Administration

- Administer twice daily with or without food.
- Shake oral suspension well. If desired, mix in small glass of water.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** dizziness, vertigo, drowsiness, fatigue, headache, ataxia, tremor, emotional lability

**EENT:** abnormal vision, diplopia, nystagmus, rhinitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia

**Metabolic:** hyponatremia

**Skin:** acne, rash

**Other:** thirst, allergic reactions, edema, lymphadenopathy

### Interactions

**Drug-drug.** *Carbamazepine, valproic acid, verapamil:* decreased oxcarbazepine blood level

*CNS depressants (including antidepressants, antihistamines, opioids, sedative-hypnotics):* additive CNS depression

*Felodipine, hormonal contraceptives:* decreased blood levels of these drugs

*Phenobarbital:* decreased oxcarbazepine and increased phenobarbital blood levels

*Phenytoin:* increased phenytoin blood level

**Drug-diagnostic tests.** *Sodium:* decreased level

**Drug-behaviors.** *Alcohol use:* additive CNS depression

### Patient monitoring

- Monitor neurologic status closely for changes in cognition, mood, wakefulness, balance, and gait.
- Check sodium level. Watch for signs and symptoms of hyponatremia.

### Patient teaching

- Instruct patient to take at same time each day, with or without food.
- Tell patient to report vision changes and significant neurologic changes.
- Advise patient to have periodic eye exams.
- Tell female patient that drug makes hormonal contraceptives less effective.
- Inform patient that he may need frequent tests to check drug blood levels.
- Tell patient not to drink alcohol.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects him.
- As appropriate, review all significant adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## oxybutynin

Cystrin<sup>⚠</sup>, Kentera<sup>⚠</sup>, Oxytrol

### oxybutynin chloride

Apo-Oxybutynin<sup>⚠</sup>, Ditropan, Ditropan XL, Dom-Oxybutynin<sup>⚠</sup>, Gelnique, Gen-Oxybutynin<sup>⚠</sup>, Lyrinel XL<sup>⚠</sup>, Novo-Oxybutynin<sup>⚠</sup>, Nu-Oxybutynin<sup>⚠</sup>, PHL-Oxybutynin<sup>⚠</sup>, PMS-Oxybutynin<sup>⚠</sup>, Uromax<sup>⚠</sup>

**Pharmacologic class:** Anticholinergic

**Therapeutic class:** Urinary tract antispasmodic

**Pregnancy risk category B**

### Action

Inhibits acetylcholine action at post-ganglionic receptors, relaxing smooth muscle lining of GU tract and preventing bladder irritability

### Availability

*Syrup:* 5 mg/5 ml

*Tablets:* 5 mg

*Tablets (extended-release):* 5 mg, 10 mg, 15 mg

*Topical gel:* 1 g in 1.14-ml sachet

*Transdermal system (patch):* 39 cm<sup>2</sup>/36 mg

### Indications and dosages

➤ Frequent urination, urinary urgency or incontinence, and nocturia caused by neurogenic bladder; overactive bladder

**Adults:** 5 mg P.O. two to three times daily (not to exceed 5 mg q.i.d.); or 5 to 15 mg P.O. once daily (extended-release); or one 3.9 mg/day transdermal system applied twice weekly; or apply contents of one gel sachet daily.

**Children older than age 5:** 5 mg P.O. b.i.d., to a maximum of 5 mg t.i.d.

### Dosage adjustment

- Elderly patients

### Contraindications

- Hypersensitivity to drug
- Glaucoma
- Intestinal obstruction, severe colitis, atony, paralytic ileus, megacolon, or hemorrhage
- Obstructive uropathy, urinary retention
- Myasthenia gravis
- Acute hemorrhage with shock

### Precautions

Use cautiously in:

- cardiovascular disease, hyperthyroidism, GI disease
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 5 (safety not established).

### Administration

- Give oral forms without regard to food.
- Don't crush or break tablets.
- Apply contents of one gel sachet to dry, intact skin on the abdomen, upper arms, shoulders, or thighs.

Route	Onset	Peak	Duration
P.O.	30-60 min	3-6 hr	6-10 hr
P.O. (extended)	30-60 min	3-6 hr	Up to 24 hr
Transdermal	24-48 hr	48-96 hr	96 hr after removal
Gel	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** dizziness, drowsiness, hallucinations, insomnia, weakness, anxiety, restlessness, headache

**CV:** palpitations, hypotension, tachycardia

**EENT:** blurred vision, cycloplegia, increased intraocular pressure, mydriasis, photophobia

**GI:** nausea, vomiting, diarrhea, constipation, bloating, dry mouth

**GU:** urinary hesitancy, urinary retention, erectile dysfunction, suppressed lactation

**Metabolic:** hyperthermia

**Skin:** decreased sweating, urticaria, application-site reactions

**Other:** allergic reactions, fever, hot flashes

## Interactions

**Drug-drug.** *Anticholinergics, anticholinergic-like drugs (including amantadine, antidepressants, disopyramide, haloperidol, phenothiazines):* additive anticholinergic effects

*Atenolol:* increased atenolol absorption

*CNS depressants (including antidepressants, antihistamines, opioids, sedative-hypnotics):* additive CNS depression

*Digoxin:* increased digoxin blood level (with extended-release oxybutynin)

*Haloperidol:* decreased haloperidol blood level, tardive dyskinesia, worsening of schizophrenia

*Levodopa:* decreased levodopa efficacy

*Nitrofurantoin:* increased nitrofurantoin blood level, greater risk of toxicity

**Drug-herbs.** *Angel's trumpet, jimsonweed, scopolia:* increased anticholinergic effects

**Drug-behaviors.** *Alcohol use:* additive CNS depression

## Patient monitoring

- Monitor vital signs and temperature. Watch for hypotension, fever, and tachycardia.
- Evaluate patient's vision.
- Assess results of cystometric studies. Stay alert for urinary retention.

## Patient teaching

- Tell patient he may take with or without food. Caution him not to crush, break, or chew extended-release tablets.
- Instruct patient to apply transdermal patch to dry, intact skin on abdomen, hip, or buttock. Tell him to use a new

skin area with each new system and not to reapply new patch to same site within 7 days. Caution him not to cut or puncture patch.

- Instruct patient to apply contents of one gel sachet daily to dry, intact skin on the abdomen, upper arms, shoulders, or thighs. Tell patient to use a new skin area daily. Advise patient to cover application site with clothing if skin-to-skin contact at application site is anticipated and to wash hands immediately after product application. Warn patient that gel is flammable and to avoid open fire or smoking until gel has dried.
- Tell patient to report blurred vision, fever, skin rash, nausea, or vomiting.
- Advise patient he'll need to undergo periodic bladder exams.
- Caution patient to avoid driving and other hazardous activities if drug causes drowsiness or blurred vision.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, herbs, and behaviors mentioned above.

0

## oxycodone hydrochloride

Oxecta, OxyContin, Oxynorm<sup>®</sup>, Roxicodone, Supeudol<sup>®</sup>

**Pharmacologic class:** Opioid agonist

**Therapeutic class:** Narcotic analgesic

**Controlled substance schedule II**

**Pregnancy risk category B**

## FDA BOXED WARNING

- Drug is opioid agonist and Schedule II controlled substance, with abuse potential similar to morphine. This potential must be considered when prescribing or dispensing drug.

- Extended-release tablets are indicated for managing moderate to severe pain when continuous, around-the-clock analgesia is needed for extended period of time. Extended-release tablets aren't intended for as-needed analgesia.
- Extended-release 80-mg tablets are for use only in opioid-tolerant patients. This strength may cause fatal respiratory depression when given to patients without previous opioid exposure.
- Instruct patients to swallow extended-release tablets whole. Caution them not to break, chew, or crush them, as this causes rapid release and absorption of potentially fatal dose.

### Action

Unknown. Thought to interact with opioid receptor sites primarily in limbic system, thalamus, and spinal cord, blocking transmission of pain impulses.

### Availability

*Capsules (immediate-release):* 5 mg

*Solution (oral):* 5 mg/5 ml

*Tablets:* 5 mg, 7.5 mg, 10 mg, 15 mg, 20 mg, 30 mg

*Tablets (controlled-release):* 10 mg, 15 mg, 20 mg, 30 mg, 40 mg, 60 mg, 80 mg

### Indications and dosages

➤ Moderate to severe pain

**Adults:** 5 mg P.O. q 6 hours p.r.n., increased gradually to 10 to 30 mg q 6 hours p.r.n.

➤ Moderate or severe pain when continuous around-the-clock analgesia is needed

**Adults:** 10 mg P.O. (controlled-release) q 12 hours. For patients already taking opioids, use total oral oxycodone daily equianalgesic dosage and then round down to closest tablet strength. For breakthrough pain, give supplemental immediate-release doses.

### Dosage adjustment

- Hepatic disease
- Renal impairment
- Debilitated or opioid-naive patients

### Off-label uses

- Postherpetic neuralgia (controlled-release form)

### Contraindications

- Hypersensitivity to drug
- Paralytic ileus
- When opioids are contraindicated (as in respiratory depression, severe bronchial asthma, hypercarbia)

### Precautions

Use cautiously in:

- head trauma; increased intracranial pressure (ICP); severe renal, hepatic, or pulmonary disease; hypothyroidism; adrenal insufficiency; urethral stricture; undiagnosed abdominal pain or prostatic hyperplasia; extensive burns; alcoholism
- history of substance abuse
- prolonged or high-dose therapy
- elderly or debilitated patients
- labor and delivery
- pregnant or breastfeeding patients
- children younger than age 18.

### Administration

- Be aware that drug has high abuse potential.
- Know that controlled-release Oxy-Contin isn't indicated for p.r.n. pain control but is reserved for patients who need continuous, around-the-clock analgesia.
- Be aware that 80-mg controlled-release tablets are for opioid-tolerant patients only.
- ⚠ Never break, crush, or let patient chew controlled-release forms. Otherwise, rapid release and absorption of potentially fatal dose may occur.
- Give Oxecta tablets whole. Don't crush or dissolve tablets or administer by nasogastric, gastric, or other feeding

tubes, because this may cause obstruction of feeding tubes.

- When discontinuing, taper dosage gradually to prevent withdrawal symptoms.

Route	Onset	Peak	Duration
P.O.	15-30 min	1 hr	4-6 hr
P.O. (controlled)	Unknown	24-36 hr	>12 hr

### Adverse reactions

**CNS:** dizziness, asthenia, drowsiness, euphoria, light-headedness, insomnia, confusion, anxiety, twitching, abnormal dreams and thoughts

**CV:** orthostatic hypotension, **circulatory depression, bradycardia, shock**

**GI:** nausea, vomiting, constipation, diarrhea, ileus, abdominal pain, dyspepsia, gastritis, anorexia

**GU:** urinary retention

**Respiratory:** **apnea, respiratory depression, respiratory arrest**

**Skin:** pruritus, sweating

**Other:** chills, fever, hiccups, physical and psychological drug dependence

### Interactions

**Drug-drug.** *Antihistamines, sedative-hypnotics:* additive CNS depression

*Barbiturates, protease inhibitors:* increased respiratory and CNS depression

*Opioid agonist-antagonists:* precipitation of opioid withdrawal in physically dependent patients

**Drug-diagnostic tests.** *Amylase, lipase:* increased levels

**Drug-behaviors.** *Alcohol use:* additive CNS depression

### Patient monitoring

 Monitor vital signs and respiratory status. Withhold drug in significant respiratory or CNS depression.

- Assess patient's pain level frequently.
- Monitor bowel and bladder function.

- Assess patient for anxiety, twitching, and other CNS symptoms.

• Closely monitor head-trauma patient. Drug may increase ICP while masking signs and symptoms.

• Carefully assess patient with acute abdominal pain. Drug may obscure diagnosis.

- Stay alert for drug hoarding, tolerance, and dependence.

### Patient teaching

 Caution patient not to break, crush, chew, or dissolve controlled-release tablets. Warn him that doing so may cause rapid drug release and absorption (possibly fatal).

- Tell patient taking controlled-release form not to drive for 3 to 4 days after dosage increase, after consuming even a single alcoholic beverage, or if also taking antihistamines or other drugs that cause drowsiness.

- Tell patient to take Oxecta tablets whole.

 Instruct patient to promptly report adverse reactions, especially difficulty breathing or slow pulse.

- Advise patient not to drink alcohol.
- Tell patient not to be alarmed if controlled-release tablets appear in stools; drug has already been absorbed.
- Advise ambulatory patient to change position slowly, to avoid dizziness from orthostatic hypotension.
- Instruct patient to consult prescriber before taking other drugs.
- Caution patient to avoid driving and other hazardous activities, because drug may cause drowsiness or dizziness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

0

## oxymorphone hydrochloride

Opana, Opana ER, Oxynorm

**Pharmacologic class:** Opioid agonist

**Therapeutic class:** Narcotic analgesic

**Controlled substance schedule II**

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug is morphine-like opioid agonist and Schedule II controlled substance, with abuse potential similar to other opioids. This potential must be considered when prescribing or dispensing drug.
- Drug is indicated for managing moderate to severe pain when continuous, around-the-clock opioid is needed for extended period. It isn't intended for as-needed analgesia.
- Instruct patients to swallow extended-release tablets whole. Caution them not to break, chew, dissolve, or crush them, as this causes rapid release and absorption of potentially fatal dose.
- Caution patient not to consume alcoholic beverages or take prescription or nonprescription medications containing alcohol during therapy, as this may increase drug blood levels and cause potentially fatal overdose.

### Action

Unknown. Thought to interact with opioid receptor sites primarily in limbic system, thalamus, and spinal cord, blocking pain impulse transmission.

### Availability

**Injection:** 1 mg/ml, 1.5 mg/ml

**Tablets:** 5 mg, 10 mg

**Tablets (extended-release):** 5 mg, 7.5 mg, 10 mg, 15 mg, 20 mg, 30 mg, 40 mg

### Indications and dosages

➤ Moderate to severe pain

**Adults:** 1 to 1.5 mg I.M. or subcutaneously q 4 to 6 hours p.r.n.; or initially, 0.5 mg I.V., increased cautiously until pain relief is satisfactory

➤ To reduce labor pain

**Adults:** 0.5 to 1 mg I.M.

➤ Initiation of therapy for moderate to severe acute pain in opioid-naïve patients

**Adults:** 10 to 20 mg (Opana) P.O. q 4 to 6 hours depending on initial pain intensity. If deemed necessary to initiate therapy at lower dose, start with 5 mg. Adjust dosage based on patient's response to initial dose. Dose can then be adjusted to acceptable level of analgesia taking into account pain intensity and adverse effects experienced. For chronic around-the-clock opioid therapy, give 5 mg (Opana ER) q 12 hours; thereafter, individually adjust dosage, preferably at increments of 5 to 10 mg q 12 hours every 3 to 7 days to level that provides adequate analgesia and minimizes side effects; give under close supervision of prescribing physician.

➤ Moderate to severe acute pain when converting from parenteral to oral form in patients requiring continuous, around-the-clock opioid treatment for extended period

**Adults:** 10 times patient's total daily parenteral oxymorphone dose as Opana, in four or six equally divided doses (for example, approximately 10 mg Opana may be needed to provide pain relief equivalent to total daily I.M. dose of 4 mg oxymorphone); titrate dosage to optimal pain relief or combine with acetaminophen/nonsteroidal anti-inflammatories for optimal pain relief. Or 10 times patient's total daily parenteral oxymorphone dose as

Opana ER, in two equally divided doses (for example, approximately 20 mg Opana ER q 12 hours may be needed to provide pain relief equivalent to total daily parenteral dose of 4 mg oxymorphone.

➤ Moderate to severe acute pain when converting from other oral opioids to Opana or Opana ER

**Adults:** Refer to published relative potency information, keeping in mind that conversion ratios are only approximate. In general, it's safest to start Opana therapy by administering half of calculated total daily dose of Opana in four to six equally divided doses P.O. q 4 to 6 hours. Or, for patients requiring continuous, around-the-clock opioid treatment for extended period, give Opana ER in two divided doses P.O. q 12 hours. Gradually adjust initial dosage of Opana or Opana ER until adequate pain relief and acceptable adverse effects have been achieved.

➤ Moderate to severe acute pain in opioid-experienced patients when converting from Opana to Opana ER

**Adults:** Administer half patient's total daily oral Opana dose as Opana ER P.O. q 12 hours.

### Dosage adjustments

- Mild hepatic impairment (Opana, Opana ER)
- Severe hepatic impairment (Numorphan)
- Moderate to severe renal impairment (Opana, Opana ER)
- Concurrent use of other CNS depressants (Opana, Opana ER)
- Elderly or debilitated patients

### Contraindications

- Hypersensitivity to drug or its components, or morphine analogs
- Any situation in which opioids are contraindicated, such as respiratory depression (in absence of resuscitative equipment or in unmonitored

settings) and acute or severe bronchial asthma or hypercarbia

- Pulmonary edema secondary to chemical respiratory irritant (Numorphan)
- Suspected or existing paralytic ileus
- Moderate and severe hepatic impairment (Opana, Opana ER)

### Precautions

Use cautiously in:

- head trauma, increased intracranial pressure, severe renal disease, hypothyroidism, adrenal insufficiency, urethral stricture, undiagnosed abdominal pain or prostatic hyperplasia, biliary tract disease, pancreatitis, extensive burns, alcoholism
- history of substance abuse
- prolonged or high-dose therapy
- elderly or debilitated patients
- labor and delivery
- pregnant or breastfeeding patients
- Pain in immediate postoperative period (first 12 to 24 hours), or if pain is mild or not expected to persist for extended period (Opana ER)
- Children younger than age 18.

### Administration

- Give oral on empty stomach at least 1 hour before or 2 hours after eating.
- Tell patient to swallow extended-release tablets whole and not to break, chew, dissolve, or crush tablets.
- Be aware that extended-release tablets are not for p.r.n. use.
- Be aware that extended-release tablets are indicated only for postoperative use if patient had already been receiving drug before surgery or if postoperative pain is expected to be moderate or severe and persist for extended period.

⚠ Be aware that administration from any source (such as beverages or drugs) may result in increased plasma drug levels and potentially fatal overdose of oxymorphone.

 Keep naloxone available to reverse respiratory depression, if necessary.

- Give I.V. dose by direct injection over 2 to 3 minutes.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown
I.V.	5-10 min	30-60 min	3-6 hr
I.M., subcut.	10-15 min	30-60 min	3-6 hr

### Adverse reactions

**CNS:** somnolence (Opana, Opana ER), sedation, headache, drowsiness, confusion, dysphoria, euphoria, dizziness, hallucinations, lethargy, impaired mental and physical performance, depression, restlessness, insomnia, paradoxical stimulation, **seizures**

**CV:** hypotension, orthostatic hypotension, palpitations, **bradycardia, tachycardia**

**EENT:** blurred vision, miosis, diplopia, visual disturbances, tinnitus

**GI:** abdominal distention, flatulence (Opana), abdominal pain, dyspepsia (Opana ER), nausea, vomiting, constipation, biliary tract spasm, cramps, dry mouth, anorexia, **paralytic ileus, toxic megacolon**

**GU:** urinary hesitancy or retention, urethral spasm, antidiuretic effect

**Respiratory:** suppressed cough reflex, hypoxia (Opana), **atelectasis, respiratory depression, allergic bronchospastic reaction, allergic laryngeal edema or laryngospasm, apnea**

**Skin:** rash, urticaria, pruritus, facial flushing, diaphoresis

**Other:** pyrexia (Opana, Opana ER), physical or psychological drug dependence, drug tolerance, allergic reaction, injection site reaction (Numorphan)

### Interactions

**Drug-drug.** *Agonist/antagonist analgesia (such as buprenorphine, butorphanol, nalbuphine, or pentazocine):* reduced oxymorphone effect; may

precipitate withdrawal symptoms (Opana, Opana ER)

*Anticholinergics:* increased risk of urinary retention or severe constipation  
*Antihistamines (first-generation), antipsychotics, barbiturates, general anesthetics, MAO inhibitors, sedative-hypnotics, skeletal muscle relaxants, tricyclic antidepressants:* increased risk of respiratory depression

*Propofol:* increased risk of bradycardia (Numorphan)

**Drug-diagnostic tests.** *Amylase, lipase:* increased levels

**Drug-behaviors.** *Alcohol use or abuse, opiate abuse:* increased risk of respiratory depression

### Patient monitoring

 Closely monitor respiratory status. Stay alert for respiratory depression and allergic responses affecting bronchi and larynx.

- Monitor vital signs and ECG.
- With prolonged use, watch for signs and symptoms of drug dependence.
- Assess neurologic status carefully. Institute protective measures as needed.
- Monitor patient receiving Opana or Opana ER for breakthrough pain and adverse reaction (especially severe constipation).

### Patient teaching

 Instruct patient to immediately report seizures or difficulty breathing.

- Tell patient to rise slowly when changing position, to avoid dizziness from blood pressure decrease.
- Instruct patient taking Opana or Opana ER to report episodes of breakthrough pain and adverse reactions (especially severe constipation that may lead to paralytic ileus).

 Advise patient not to drink alcohol from any source because doing so may result in fatal overdose.

- Caution patient not to drive or perform other hazardous activities.
- Tell patient not to stop taking drug suddenly after several weeks, because withdrawal symptoms may occur.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## oxytocin

Pitocin, Syntocinon<sup>®</sup> ⚠️,  
Syntometrine<sup>®</sup>

**Pharmacologic class:** Posterior pituitary hormone

**Therapeutic class:** Uterine-active agent

**Pregnancy risk category** NR

### FDA BOXED WARNING

- Drug isn't indicated for elective induction of labor (defined as initiation of labor in pregnant woman with no medical indications for induction). Available data aren't adequate to evaluate benefits versus risk.

### Action

Unknown. Thought to directly stimulate smooth muscle contractions in uterus and cervix.

### Availability

*Injection:* 10 units/ml ampule or vial

### Indications and dosages

- To induce or stimulate labor
- Adults:** Initially, 1-ml ampule (10 units) in compatible I.V. solution infused at 1 to 2 milliunits/minute (0.001 to 0.002 units/minute). Increase rate in increments of 1 to

2 milliunits/minute q 15 to 30 minutes until acceptable contraction pattern is established.

- To control postpartum bleeding

**Adults:** 10 to 40 units in compatible I.V. solution infused at rate adequate to control bleeding; or 10 units I.M. after placenta delivery

- Incomplete abortion

**Adults:** 10 units in compatible I.V. solution infused at 10 to 20 milliunits/minute (0.01 to 0.02 units/minute)

### Off-label uses

- Antepartal fetal heart rate testing
- Breast enlargement

### Contraindications

- Hypersensitivity to drug
- Cephalopelvic disproportion
- Fetal distress when delivery is not imminent
- Prolonged use in uterine inertia or severe toxemia
- Hypertonic or hyperactive uterine pattern
- Unfavorable fetal position or presentation that's undeliverable without conversion
- Labor induction or augmentation when vaginal delivery is contraindicated (as in invasive cervical cancer, active genital herpes, or total placenta previa)

### Precautions

Use cautiously in:

- previous cervical or uterine surgery, history of uterine sepsis
- breastfeeding patients.

### Administration

- Reconstitute by adding 1 ml (10 units) to 1,000 ml of normal saline solution, lactated Ringer's solution, or dextrose 5% in water.
- ⚠️ Don't give by I.V. bolus injection.
- Infuse I.V. using controlled-infusion device.

- Be aware that drug isn't routinely given I.M.
- Know that drug should be given only to inpatients at critical care facilities when prescriber is immediately available.

Route	Onset	Peak	Duration
I.V.	Immediate	40 min	1 hr
I.M.	3-5 min	40 min	2-3 hr

### Adverse reactions

**CNS:** seizures, coma, neonatal brain damage, subarachnoid hemorrhage

**CV:** premature ventricular contractions, arrhythmias, neonatal bradycardia

**GI:** nausea, vomiting

**GU:** postpartal hemorrhage; pelvic hematoma; uterine hypertonicity, spasm, or tetanic contraction; abruptio placentae; uterine rupture (with excessive doses)

**Hematologic:** afibrinogenemia

**Hepatic:** neonatal jaundice

**Other:** hypersensitivity reactions including anaphylaxis, low 5-minute Apgar score (neonate)

### Interactions

**Drug-drug.** *Sympathomimetics:* postpartal hypertension

*Thiopental anesthetics:* delayed anesthesia induction

*Vasoconstrictors:* severe hypertension (when given within 3 to 4 hours of oxytocin)

**Drug-herbs.** *Ephedra (ma huang):* increased hypertension

### Patient monitoring

☞ Continuously monitor contractions, fetal and maternal heart rate, and maternal blood pressure and ECG. Discontinue infusion if uterine hyperactivity occurs.

☞ Monitor patient extremely closely during first and second stages of labor

because of risk of cervical laceration, uterine rupture, and maternal and fetal death.

- When giving drug to control postpartal bleeding, monitor and record vaginal bleeding.
- Assess fluid intake and output. Watch for signs and symptoms of water intoxication.

### Patient teaching

- Inform patient about risks and benefits of oxytocin-induced labor.
- ☞ Teach patient to recognize and immediately report adverse drug effects.

## paclitaxel

Apo-Paclitaxel<sup>☼</sup>, Paxene<sup>☼</sup>

**Pharmacologic class:** Antimicrotubule agent

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

- Give injection under supervision of physician experienced in use of cancer chemotherapy, in facility with adequate diagnostic and treatment resources.
- Anaphylaxis and severe hypersensitivity reactions may occur despite premedication. All patients should be pretreated with corticosteroids, diphenhydramine, and histamine<sub>2</sub> antagonists. Don't give drug to patients who've had previous severe reactions.
- Don't administer drug to patients with solid tumors whose baseline neutrophil counts are below 1,500 cells/mm<sup>3</sup> or to patients with AIDS-related Kaposi's sarcoma whose

baseline neutrophil counts are below 1,000 cells/mm<sup>3</sup>. To monitor for bone marrow suppression, obtain frequent peripheral blood cell counts on all patients.

- Albumin form of drug may substantially affect drug's functional properties. Don't substitute for or use with other paclitaxel forms.

### Action

Stabilizes cellular microtubules to prevent depolymerization. This action inhibits microtubule network (essential for vital interphase and mitotic cellular functions) and induces abnormal microtubule arrays or bundles throughout cell cycle and during mitosis.

### Availability

*Concentrate for injection:* 30 mg/5-ml vial, 100 mg/16.7-ml vial, 300 mg/50-ml vial

### Indications and dosages

- Advanced ovarian cancer

**Adults:** As first-line therapy, 175 mg/m<sup>2</sup> I.V. over 3 hours q 3 weeks, or 135 mg/m<sup>2</sup> I.V. over 24 hours q 3 weeks, followed by cisplatin. After failure of first-line therapy, 135 mg/m<sup>2</sup> I.V. or 175 mg/m<sup>2</sup> I.V. over 3 hours q 3 weeks.

- Breast cancer after failure of combination chemotherapy

**Adults:** As adjuvant treatment for node-positive breast cancer, 175 mg/m<sup>2</sup> I.V. over 3 hours q 3 weeks for four courses given sequentially with doxorubicin combination chemotherapy. After chemotherapy failure for metastatic disease or relapse within 6 months of adjuvant therapy, 175 mg/m<sup>2</sup> I.V. over 3 hours q 3 weeks.

- Non-small-cell lung cancer

**Adults:** 135 mg/m<sup>2</sup> I.V. over 24 hours q 3 weeks, followed by cisplatin

- AIDS-related Kaposi's sarcoma

**Adults:** 135 mg/m<sup>2</sup> I.V. over 3 hours q 3 weeks, or 100 mg/m<sup>2</sup> I.V. over 3 hours q 2 weeks

### Dosage adjustment

- Advanced human immunodeficiency virus infection (when used for Kaposi's sarcoma)

### Off-label uses

- Advanced head and neck cancer
- Small-cell lung cancer
- Upper GI tract adenocarcinoma
- Non-Hodgkin's lymphoma
- Pancreatic cancer
- Polycystic kidney disease

### Contraindications

- Hypersensitivity to drug or castor oil
- Solid tumors when baseline neutrophil count is below 1,500 cells/mm<sup>3</sup>
- AIDS-related Kaposi's sarcoma when baseline neutrophil count is below 1,000 cells/mm<sup>3</sup>

### Precautions

Use cautiously in:

- severe hepatic impairment, active infection, decreased bone marrow reserve, chronic debilitating illness
- patients with childbearing potential
- breastfeeding patients (not recommended)
- children (safety not established).

### Administration

 Follow facility protocol for handling chemotherapeutic drugs and preparing solutions.

- Dilute in dextrose 5% in water, normal saline solution, or dextrose 5% in lactated Ringer's solution per manufacturer's guidelines.
- Inspect solution for particles. Administer through polyethylene-lined administration set attached to 0.22-micron in-line filter.
- To prevent severe hypersensitivity reaction, premedicate with dexamethasone 20 mg 12 and 6 hours before infusion, as prescribed. Also give diphenhydramine 50 mg I.V., plus either cimetidine 300 mg or ranitidine 50 mg I.V. 30 to 60 minutes before paclitaxel.

⚠️ Keep epinephrine available. If severe hypersensitivity reaction occurs, stop infusion immediately and give epinephrine, I.V. fluids, and additional antihistamine and corticosteroid doses, as indicated and prescribed.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** peripheral neuropathy

**CV:** hypotension, hypertension, syncope, abnormal ECG, bradycardia,

**venous thrombosis**

**GI:** nausea, vomiting, diarrhea, stomatitis, mucositis

**Hematologic:** anemia, **leukopenia, neutropenia, bleeding, thrombocytopenia**

**Musculoskeletal:** joint pain, myalgia

**Skin:** alopecia, radiation reactions

**Other:** infection, injection site reaction, hypersensitivity reactions including **anaphylaxis**

## Interactions

**Drug-drug.** *Carbamazepine, phenobarbital:* decreased paclitaxel blood level and efficacy

*Cisplatin:* increased bone marrow depression (when paclitaxel dose follows cisplatin dose)

*Cyclosporine, diazepam, doxorubicin, felodipine, ketoconazole, midazolam:* inhibited paclitaxel metabolism and greater risk of toxicity

*Doxorubicin:* increased doxorubicin blood level and toxicity

*Live-virus vaccines:* decreased antibody response to vaccine, increased risk of adverse reactions

*Other antineoplastics:* increased risk of bone marrow depression

**Drug-diagnostic tests.** *Liver function tests:* abnormal results

*Triglycerides:* increased levels

## Patient monitoring

⚠️ Watch closely for hypersensitivity reaction.

- Monitor heart rate and blood pressure.
- Assess infusion site for local effects and extravasation, especially during prolonged infusion.

⚠️ Monitor CBC, including platelet count. If neutropenia develops, monitor patient for infection; if thrombocytopenia develops, watch for signs and symptoms of bleeding.

- If patient has preexisting cardiac conduction abnormality, maintain continuous cardiac monitoring.

## Patient teaching

- Instruct neutropenic patient to minimize infection risk by avoiding crowds, plants, and fresh fruits and vegetables.

- Tell thrombocytopenic patient to avoid activities that can cause injury. Advise him to use soft toothbrush and electric razor.

⚠️ Advise patient to promptly report signs and symptoms of infection, bleeding, or peripheral neuropathy (such as numbness and tingling of feet and hands).

- Tell patient to promptly report pain or burning at injection site.

- Explain that temporary hair loss may occur.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## palifermin

Kepivance

**Pharmacologic class:** Keratinocyte growth factor (KGF) (rDNA origin)

**Therapeutic class:** Biologic and immunologic agent

**Pregnancy risk category C**

## Action

Produced by recombinant DNA technology in *Escherichia coli*; binds to KGF receptor on cell surface, resulting in epithelial cell proliferation, differentiation, and migration

## Availability

Powder for injection (lyophilized):  
6.25 mg in single-use vials

## Indications and dosages

➤ To decrease incidence and duration of severe oral mucositis in patients with hematologic malignancies who are receiving myelotoxic therapy requiring hematopoietic stem cell support

**Adults:** 60 mcg/kg/day I.V. bolus injection for 3 consecutive days before and 3 consecutive days after myelotoxic therapy, for a total of six doses. Give first three doses before myelotoxic therapy, with third dose given 24 to 48 hours before such therapy. Administer last three doses after myelotoxic therapy, with first of these given after (but on same day of) hematopoietic stem cell infusion and at least 4 days after most recent palifermin dose.

## Contraindications

- Hypersensitivity to drug, its components, or *E. coli*-derived proteins

## Precautions

Use cautiously in:

- patients with nonhematologic cancers
- use with melphalan 200 mg/m<sup>2</sup> as a conditioning regimen (not recommended)
- elderly patients
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

## Administration

- Reconstitute powder with 1.2 ml sterile water for injection to yield final concentration of 5 mg/ml.

🔊 Swirl vial gently during dissolution; don't shake or vigorously agitate.

- Don't filter reconstituted solution during preparation or administration.
- Use immediately (within 1 hour) after reconstituting; protect from light.
- When heparin is used to maintain I.V. line, use normal saline solution to rinse line before and after palifermin administration.
- Administer by I.V. bolus injection.
- Don't give within 24 hours before, during infusion of, or within 24 hours after myelotoxic chemotherapy.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** dysesthesia

**CV:** hypertension

**EENT:** tongue discoloration or thickening

**Musculoskeletal:** pain, arthralgias

**Skin:** rash, pruritus, skin toxicities, erythema

**Other:** altered taste, edema, fever

## Interactions

**Drug-drug.** *Heparin:* possible binding  
**Drug-diagnostic tests.** *Amylase, lipase:* increased

## Patient monitoring

- Monitor serum amylase and lipase levels frequently.

## Patient teaching

- Instruct patient to report adverse reactions, including rash, itching, skin redness, swelling, discolored tongue, and altered taste.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

**paliperidone**

Invega

**paliperidone palmitate**

Invega Sustenna

**Pharmacologic class:** Benzisoxazole derivative**Therapeutic class:** Antipsychotic**Pregnancy risk category C****FDA BOXED WARNING**

- Elderly patients with dementia-related psychosis are at increased risk for death. Over course of 10-week controlled trial, death rate in drug-treated patients was about 4.5%, compared to about 2.6% in placebo group. Although causes of death varied, most appeared to be cardiovascular or infectious. Don't give drug to patients with dementia-related psychosis.

**Action**

Unknown. In schizophrenia, therapeutic activity may be mediated through combination of central serotonin<sub>2</sub>- and dopamine<sub>2</sub>-receptor antagonism. Drug is a major active metabolite of risperidone.

**Availability**

*Injection (paliperidone palmitate):* 39 mg, 78 mg, 117 mg, 156 mg, 234 mg in prefilled syringes

*Tablets (extended-release):* 1.5 mg, 3 mg, 6 mg, 9 mg

**Indications and dosages**

➤ Schizophrenia

**Adults:** 6 mg P.O. once daily. Some patients may benefit from daily dosages as high as 12 mg or as low as 3 mg. If indicated, increase in increments of

3 mg/day at intervals of more than 5 days. Or initially, 234 mg I.M. (paliperidone palmitate) on treatment day 1 and 156 mg I.M. 1 week later. Recommended monthly maintenance dose is 117 mg; some patients may benefit from lower or higher maintenance doses within recommended range of 39 to 234 mg. Adjustment of maintenance dosage may be made monthly. When making dosage adjustments, consider paliperidone palmitate's prolonged-release characteristics, as the full effect of the dosage adjustment may not be evident for several months.

**Adolescents ages 12 to 17 weighing 51 kg (112 lb) or more:** 3 mg P.O. daily; increase dosage, if necessary, only after clinical reassessment at increments of 3 mg/day at intervals of more than 5 days up to a maximum of 12 mg/day.

**Adolescents ages 12 to 17 weighing less than 51 kg (112 lb):** 3 mg P.O. daily; increase dosage, if necessary, only after clinical reassessment at increments of 3 mg/day at intervals of more than 5 days up to a maximum of 6 mg/day.

➤ Schizoaffective disorder

**Adults:** 6 mg P.O. once daily. Some patients may benefit from dosages as high as 12 mg or as low as 3 mg. Maximum recommended dosage is 12 mg/day.

**Dosage adjustment**

- Renal impairment

**Contraindications**

- Hypersensitivity to drug, its components, or risperidone

**Precautions**

Use cautiously in:

- GI strictures (use should be avoided), cardiovascular or cerebrovascular disease, diabetes mellitus, Parkinson's disease, or conditions that raise body temperature (such as exercise,

exposure to extreme heat, and concomitant anticholinergics use)

- increased risk of hypotension (as from dehydration, hypovolemia, or antihypertensives), aspiration pneumonia, or suicide attempt
- increased risk of metabolic changes (including hyperglycemia, dyslipidemia, weight gain)
- concurrent use of other drugs that are centrally acting or prolong the QT interval (use should be avoided)
- history of seizures or breast cancer
- elderly patients with dementia-related psychosis
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

### Administration

- Give tablets in morning with or without food.
- Administer tablets whole. Ensure that patient doesn't chew, divide, or crush them.
- 🔊 Administer paliperidone palmitate by deep I.M. injection only as a single injection. Don't give in divided injections. Don't administer I.V. or subcutaneously.
- 🔊 For first and second I.M. doses, give in the deltoid muscle using 1 $\frac{1}{2}$ -inch 22G needle for patients 90 kg (198 lb) or more or 1-inch 23G needle for patients less than 90 kg. After the second dose, monthly maintenance doses may be given in either the deltoid or gluteal muscle. For gluteal injection, use 1 $\frac{1}{2}$ -inch 22G needle regardless of patient weight.

Route	Onset	Peak	Duration
P.O.	Unknown	24 hr	Unknown
I.M.	1 day	13 days	126 days

### Adverse reactions

**CNS:** dizziness, headache, akathisia, tardive dyskinesia, dystonia, extrapyramidal disorder, hypertonia, parkinsonism, sedation, somnolence, tremor,

anxiety, asthenia, fatigue, **seizure**, **stroke (in elderly patients with dementia-related psychosis)**, **neuroleptic malignant syndrome (NMS)**  
**CV:** first-degree atrioventricular block, bundle-branch block, sinus arrhythmia, tachycardia, hypertension, orthostatic hypotension, prolonged QT interval, abnormal T wave, palpitations  
**EENT:** blurred vision  
**GI:** upper abdominal pain, dyspepsia, nausea, antiemetic effect, esophageal dysmotility, salivary hypersecretion, dry mouth  
**GU:** hyperprolactinemia  
**Hematologic:** leukopenia, neutropenia, agranulocytosis  
**Musculoskeletal:** back pain, extremity pain  
**Respiratory:** cough, dyspnea, aspiration pneumonia  
**Other:** fever, weight gain, possible drug tolerance or dependency

### Interactions

**Drug-drug.** *Antihypertensives:* increased risk of hypotension  
*Centrally acting drugs with sedative effect:* increased sedation  
*Class IA antiarrhythmics (such as procainamide, quinidine), Class III antiarrhythmics (such as amiodarone, sotalol), anti-infectives (such as gatifloxacin, moxifloxacin), other antipsychotics (such as chlorpromazine, thioridazine), other drugs that prolong the QT interval:* increased risk of prolonged QT interval  
*Dopamine agonists (such as levodopa):* antagonized effects of these drugs  
**Drug-diagnostic tests.** *Blood glucose, serum prolactin:* increased levels  
*Granulocytes, leukocytes, neutrophils:* decreased counts  
**Drug-food.** *Any food:* possibly increased paliperidone effects  
**Drug-behaviors.** *Alcohol use:* increased sedation

**Patient monitoring**

- Closely monitor patient at risk for suicide attempts.
- Monitor patient with diabetes regularly for signs and symptoms of worsening glycemic control.
- Stay alert for orthostatic hypotension.
- 🚨 Monitor patient for signs and symptoms of NMS (extremely high fever, muscle rigidity, altered mental status, irregular pulse or blood pressure, tachycardia, diaphoresis, arrhythmias). Immediately discontinue drug and take appropriate measures if NMS occurs.
- 🚨 Closely monitor CBC with differential, especially during first few months of therapy; discontinue drug if severe neutropenia occurs.
- Consider discontinuing drug if tardive dyskinesia occurs.
- Watch for signs and symptoms of drug tolerance, dependency, and abuse.

**Patient teaching**

- Inform patient he may take drug with or without food.
- Teach patient to take tablets whole and not to chew, divide, or crush them.
- Inform patient that tablet shell doesn't dissolve and may look like a complete tablet in stool.
- 🚨 Instruct patient to immediately discontinue drug and report signs or symptoms of NMS (such as high fever, muscle rigidity, altered mental status, irregular pulse or blood pressure, fast heart rate, or excessive sweating).
- Instruct patient to report fever or other signs and symptoms of infection.
- Tell patient drug may cause temporary blood pressure decrease if he stands or sits up suddenly. Instruct him to rise slowly and carefully.
- Advise patient to take precautions against dehydration and overheating.
- Caution patient not to consume alcohol during therapy.
- Caution patient to avoid hazardous activities until drug's effects on

concentration, coordination, vision, and alertness are known.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

**palivizumab**

Synagis

**Pharmacologic class:** Monoclonal antibody

**Therapeutic class:** Immunologic agent

**Pregnancy risk category C**

**Action**

Neutralizes and suppresses activity of syncytial virus in respiratory tract, inhibiting respiratory syncytial virus (RSV) replication

**Availability**

*Injection:* 50 mg, 100-mg vial

**Indications and dosages**

➤ To prevent serious lower respiratory disease caused by RSV in high-risk children

**Children:** 15 mg/kg I.M. q month throughout RSV season

**Contraindications**

- Hypersensitivity to drug or its components

**Precautions**

Use cautiously in:

- thrombocytopenia, coagulation disorders, established RSV infection.

**Administration**

🚨 Keep epinephrine 1:1,000 available in case anaphylaxis occurs. (However, drug isn't known to cause anaphylaxis.)

- Dilute in sterile water for injection. Gently swirl for 30 seconds to avoid foaming.
- Keep reconstituted solution at room temperature for at least 20 minutes before administering. Give within 6 hours of reconstitution.
- Inject I.M. into anterolateral thigh. Avoid gluteal injection, which may damage sciatic nerve.

Route	Onset	Peak	Duration
I.M.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** nervousness, pain

**EENT:** conjunctivitis, otitis media, rhinitis, pharyngitis, sinusitis

**GI:** vomiting, diarrhea, gastroenteritis, oral moniliasis

**Hematologic:** anemia

**Respiratory:** upper respiratory tract infection, cough, wheezing, dyspnea, bronchiolitis, bronchitis, pneumonia, croup, **asthma**, **apnea**

**Skin:** rash, fungal dermatitis, eczema

**Other:** hernia, pain, fever, injection site reaction, viral infection, flulike symptoms, failure to thrive

### Interactions

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase:* increased levels

*Hemoglobin:* decreased level

*Immunological-based RSV diagnostic tests:* interference, possibly leading to false-negative test results

### Patient monitoring

⚠ Watch closely for signs and symptoms of anaphylaxis immediately after dosing.

- Assess for signs and symptoms of infection, particularly EENT and respiratory infection.
- Monitor liver function tests and CBC.
- Assess patient's weight and hydration status.

### Patient teaching

- Tell parent that monthly injections are necessary during RSV season (November through April).
- Inform parent that drug may cause GI symptoms and failure to thrive. Provide dietary consultation as needed.
- ⚠ Caution parent that EENT and respiratory infections may follow administration. Advise parent to contact prescriber immediately if child has fever or other signs or symptoms of infection.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## palonosetron hydrochloride

Aloxi

**Pharmacologic class:** Selective serotonin subtype 3 (5-HT<sub>3</sub>) receptor antagonist

**Therapeutic class:** Antiemetic

**Pregnancy risk category B**

### Action

Selectively binds to and antagonizes 5-HT<sub>3</sub> receptors on vagal nerve terminals and in chemoreceptor trigger zone. This action blocks serotonin release, reducing the vomiting reflex.

### Availability

*Solution for injection:* 0.25 mg (free base) in 5-ml single-use vial

### Indications and dosages

- To prevent nausea and vomiting caused by cancer chemotherapy
- Adults:** 0.25 mg I.V. as a single dose 30 minutes before chemotherapy.

Repeated doses within 7 days aren't recommended.

➤ To prevent postoperative nausea and vomiting

**Adults:** 0.075 mg I.V. as a single dose given over 10 seconds immediately before anesthesia induction

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- hypersensitivity to other 5-HT<sub>3</sub> receptor antagonists
- diabetes mellitus, hepatic dysfunction
- pregnant or breastfeeding patients
- children.

### Administration

- Flush I.V. line with normal saline solution before and after giving.
- Deliver into I.V. line over 30 seconds. Don't mix with other drugs.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache, fatigue, insomnia, dizziness, anxiety

**CV:** hypotension, vein discoloration and distention, nonsustained tachycardia, bradycardia

**GI:** constipation, diarrhea, abdominal pain, anorexia

**GU:** glycosuria

**Metabolic:** fluctuating electrolyte levels, hyperglycemia, **metabolic acidosis**, **hyperkalemia**

**Musculoskeletal:** joint pain

**Other:** fever, flulike symptoms

### Interactions

**Drug-diagnostic tests:** *Alanine aminotransferase*, *aspartate aminotransferase*, *bilirubin*, *blood and urine glucose*, *potassium*: increased levels

### Patient monitoring

- Monitor vital signs and ECG. Watch closely for tachycardia, bradycardia, and hypotension.
- Watch electrolyte levels for fluctuations (especially hyperkalemia and metabolic acidosis).
- Evaluate temperature. Stay alert for flulike symptoms.
- Closely monitor blood and urine glucose levels in diabetic patients. Stay alert for hyperglycemia.

### Patient teaching

- Explain that drug helps prevent nausea and vomiting caused by chemotherapy.
- Teach patient to recognize and report signs and symptoms of hyperkalemia and metabolic acidosis.
- Advise patient to report flulike symptoms.
- Instruct diabetic patient to closely watch blood and urine glucose levels.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## pamidronate disodium

Aredia

**Pharmacologic class:** Bisphosphonate, hypocalcemic

**Therapeutic class:** Bone resorption inhibitor

**Pregnancy risk category C**

### Action

Inhibits normal and abnormal bone resorption and decreases calcium levels

**Availability**

*Injection:* 30 mg/vial, 90 mg/vial

**Indications and dosages**

➤ Hypercalcemia caused by cancer

**Adults:** For moderate hypercalcemia, 60 to 90 mg as a single-dose I.V. infusion over 2 to 24 hours. For severe hypercalcemia, 90 mg as a single-dose I.V. infusion over 2 to 24 hours.

➤ Osteolytic lesions caused by multiple myeloma

**Adults:** 90 mg I.V. as a 4-hour infusion q month

➤ Osteolytic bone metastases of breast cancer

**Adults:** 90 mg I.V. as a 2-hour infusion q 3 to 4 weeks

➤ Paget's disease

**Adults:** 30 mg I.V. daily as a 4-hour infusion for 3 days

**Contraindications**

• Hypersensitivity to drug, its components, or other bisphosphonates

**Precautions**

Use cautiously in:

- renal impairment
- pregnant or breastfeeding patients
- children (safety not established).

**Administration**

• Hydrate patient with saline solution as needed before starting therapy.

• Because of risk of renal failure, give no more than 90 mg in single doses.

🔊 Reconstitute vial using 10 ml of sterile water for injection. When completely dissolved, dilute in 250 to 1,000 ml of half-normal or normal saline solution or dextrose 5% in water.

🔊 Don't mix with solutions containing calcium, such as lactated Ringer's solution.

• Administer in I.V. line separate from all other drugs and fluids.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

**Adverse reactions**

**CNS:** anxiety, headache, insomnia, psychosis, drowsiness, weakness

**CV:** hypertension, syncope, tachycardia, **atrial flutter, arrhythmias, heart failure**

**EENT:** sinusitis

**GI:** nausea, vomiting, diarrhea, abdominal pain, constipation, dyspepsia, stomatitis, anorexia, **GI hemorrhage**

**GU:** urinary tract infection

**Hematologic:** anemia, **neutropenia, leukopenia, granulocytopenia, thrombocytopenia**

**Metabolic:** hypothyroidism

**Musculoskeletal:** bone pain, joint pain, myalgia

**Respiratory:** crackles, coughing, dyspnea, upper respiratory infection, **pleural effusion**

**Other:** fever, generalized pain, injection site reaction

**Interactions**

**Drug-diagnostic tests.** *Creatinine:* increased level

*Electrolytes, hemoglobin, magnesium, phosphorus, platelets, potassium, red blood cells, white blood cells:* decreased levels

**Patient monitoring**

• Monitor hydration status carefully.

• Monitor vital signs and ECG.

Evaluate cardiovascular and respiratory status closely.

• Assess hematologic studies and creatinine level before each treatment course.

• Assess electrolyte levels, especially calcium, magnesium, and phosphorus.

• Closely monitor fluid intake and output. Watch for signs and symptoms of urinary tract infection.

**Patient teaching**

- Instruct patient to weigh himself regularly and report sudden gains.
- 📢 Advise patient to promptly report significant respiratory problems, peripheral edema, or GI bleeding.
- 📢 Inform patient that drug lowers resistance to some infections. Tell him to immediately report fever and other signs and symptoms of infection.
- Explain importance of undergoing laboratory tests before, during, and after therapy.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, cognition, and alertness.
- Tell patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

**pancrelipase**

Creon, Pancreaze, Ultresa, Viokace, Zenpep

**Pharmacologic class:** Pancreatic enzyme

**Therapeutic class:** Digestant

**Pregnancy risk category** C

**Action**

Catalyzes hydrolysis of fats to mono-glyceride, glycerol, and free fatty acids; proteins into peptides and amino acids; and starches into dextrins and short chain sugars, such as maltose and maltotriose, in the duodenum and proximal small intestine, thereby acting like digestive enzymes physiologically secreted by the pancreas

**Availability****Creon**

*Capsules (delayed-release):* 3,000 USP units lipase, 9,500 USP units protease, 15,000 USP units amylase; 6,000 USP units lipase, 19,000 USP units protease, 30,000 USP units amylase; 12,000 USP units lipase, 38,000 USP units protease, 60,000 USP units amylase; 24,000 USP units lipase, 76,000 USP units protease, 120,000 USP units amylase

**Pancreaze**

*Capsules (delayed-release):* 4,200 USP units lipase, 10,000 USP units protease, 17,500 USP units amylase; 10,500 USP units lipase, 25,000 USP units protease, 43,750 USP units amylase; 16,800 USP units lipase, 40,000 USP units protease, 70,000 USP units amylase; 21,000 USP units lipase, 37,000 USP units protease, 61,000 USP units amylase

**Ultresa**

*Capsules (delayed-release):* 13,800 USP units lipase, 27,600 USP units protease, 27,600 USP units amylase; 20,700 USP units lipase, 41,400 USP units protease, 41,400 USP units amylase; 23,000 USP units lipase, 46,000 USP units protease, 46,000 USP units amylase

**Viokace**

*Tablets:* 10,440 USP units of lipase, 39,150 USP units of protease, 39,150 USP units of amylase; 20,880 USP units of lipase, 78,300 USP units of protease, 78,300 USP units of amylase

**Zenpep**

*Capsules (delayed-release):* 3,000 USP units lipase, 10,000 USP units protease, 16,000 USP units amylase; 5,000 USP units lipase, 17,000 USP units protease, 27,000 USP units amylase; 10,000 USP units lipase, 34,000 USP units protease, 55,000 USP units amylase; 15,000 USP units lipase, 51,000 USP units protease, 82,000 USP units amylase; 20,000 USP units lipase, 68,000 USP units protease, 109,000 USP units amylase; 25,000

USP units lipase, 85,000 USP units protease, 136,000 USP units amylase

## Indications and dosages

➤ Exocrine pancreatic insufficiency due to chronic pancreatitis or pancreatectomy

**Adults:** Individualize dosage based on clinical symptoms, degree of steatorrhea, and fat content of diet (Viokace)

➤ Exocrine pancreatic insufficiency due to cystic fibrosis (CF), chronic pancreatitis, pancreatectomy, and other conditions

### **Adults and children age 4 and older:**

Initially, 500 lipase units/kg/meal to a maximum of 2,500 lipase units/kg/meal (or 10,000 lipase units/kg/day or less), or less than 4,000 lipase units/g fat ingested per day (Creon)

### **Children older than age 12 months and younger than age 4:**

Initially, 1,000 lipase units/kg/meal to a maximum of 2,500 lipase units/kg/meal (or 10,000 lipase units/kg/day or less), or less than 4,000 lipase units/g fat ingested per day (Creon)

**Infants up to age 12 months:** 3,000 lipase units/120 ml formula or per breastfeeding (Creon)

Don't exceed recommended maximum dosage set forth by the Cystic Fibrosis Foundation Consensus Conferences Guidelines.

➤ Exocrine pancreatic insufficiency due to CF and other conditions

### **Adults and children age 4 and older:**

Initially, 500 lipase units/kg/meal to a maximum of 2,500 lipase units/kg/meal (or 10,000 lipase units/kg/day or less), or less than 4,000 lipase units/g fat ingested per day (Pancreaze, Zenpep)

### **Adults and children age 4 and older weighing 28 kg (62 lb) or more:**

Initially, 500 lipase units/kg/meal to a maximum of 2,500 lipase units/kg/meal (or 10,000 lipase units/kg/day or less), or less than 4,000

lipase units/g fat ingested per day (Ultresa)

### **Children older than age 12 months and younger than age 4:**

Initially, 1,000 lipase units/kg/meal to a maximum of 2,500 lipase units/kg/meal (or 10,000 lipase units/kg/day or less), or less than 4,000 lipase units/g fat ingested per day (Pancreaze, Zenpep)

### **Children older than age 12 months and younger than age 4 weighing 14 kg (31 lb) or more:**

Initially, 1,000 lipase units/kg/meal to a maximum of 2,500 lipase units/kg/meal (or 10,000 lipase units/kg/day or less), or less than 4,000 lipase units/g fat ingested per day (Ultresa)

**Infants up to age 12 months:** 2,000 to 4,000 lipase units/120 ml formula or per breastfeeding (Pancreaze); 3,000 lipase units/120 ml formula or per breastfeeding (Zenpep)

Don't exceed recommended maximum dosage set forth by the Cystic Fibrosis Foundation Consensus Conferences Guidelines.

## Contraindications

None

## Precautions

Use cautiously in:

- proteins of porcine origin allergy
- renal impairment, gout, hyperuricemia
- fibrosing colonopathy (with high doses)
- lactose intolerance
- pregnant or breastfeeding patients
- children younger than age 12 (with high doses).

## Administration

- Be aware that brands aren't interchangeable.
- Administer capsules whole with meals.
- Give to infants before each feeding but don't mix capsule contents directly into formula or breast milk.

- For infants or patients unable to swallow intact capsules, sprinkle contents on acidic soft food, such as applesauce, yogurt, or other acidic soft food with pH of 4.5 or less.
- Don't mix capsule contents with alkaline foods, such as milk, breast milk, formula, or ice cream.
- Be aware that attempting to divide capsule contents into small fractions to deliver small doses of lipase isn't recommended.
- Be aware that high-dose use (exceeding 6,000 lipase units/kg/meal) of pancreatic enzyme replacement therapy has been associated with fibrosing colonopathy and colonic strictures in children younger than age 12.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** dizziness, headache

**EENT:** nasopharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, abnormal feces, flatulence, frequent bowel movements, anal pruritus, **fibrosing colonopathy**

**Hepatic:** biliary tract stones

**Metabolic:** hyperglycemia, hypoglycemia, hyperuricemia

**Respiratory:** cough

**Skin:** pruritus, urticaria, rash

**Other:** viral transmission (theoretical risk), **severe allergic reactions**

### Interactions

None

### Patient monitoring

- Monitor patient for hyperglycemia, hypoglycemia, and hyperuricemia.
- 📣 Closely monitor patient for signs or symptoms of fibrosing colonopathy (such as abdominal pain or distention, vomiting, intermittent diarrhea, and weight loss) that may be associated with high-dose use.

### Patient teaching

- Tell patient or caregiver that capsules must be swallowed whole and shouldn't be crushed or chewed.
- Advise patient or caregiver to take drug with food with a full glass of water.
- Tell patient or caregiver not to hold drug in mouth, to avoid mucosal irritation.
- Tell patient or caregiver that for infants or patients who are unable to swallow intact capsules, contents can be sprinkled on soft acidic food, such as applesauce, yogurt, or other soft acidic food.
- Tell patient or caregiver not to mix capsule contents with alkaline foods, such as milk, breast milk, formula, or ice cream.
- Inform patient or caregiver that brands aren't interchangeable.
- 📣 Tell patient or caregiver to inform prescriber of pork allergy and to immediately seek medical attention if allergic reaction occurs.
- 📣 Tell patient or caregiver to immediately report signs or symptoms of fibrosing colonopathy (such as abdominal pain or distention, vomiting, intermittent diarrhea, or difficulty passing stool).
- Instruct patient or caregiver to report signs or symptoms of high blood sugar (such as extreme thirst), low blood sugar (such as confusion, shakiness, sweating, or hunger), or high uric acid (pain or swelling around joints).
- Advise breastfeeding patient to consider risk and benefit of drug in providing adequate nutritional support for exocrine pancreatic insufficiency.
- Advise female of childbearing age to notify prescriber if she is pregnant, thinking of becoming pregnant, or is breastfeeding during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions.

## pantoprazole sodium

Apo-Pantoprazole<sup>✳</sup>, Co  
 Pantoprazole<sup>✳</sup>, Gen-Pantoprazole<sup>✳</sup>,  
 Novo-Pantoprazole<sup>✳</sup>, Pantoloc<sup>✳</sup>,  
 PMS-Pantoprazole<sup>✳</sup>, Protium<sup>⊕</sup>,  
 Protonix, Protonix IV, Ran-  
 Pantoprazole<sup>✳</sup>, Ratio-Pantoprazole<sup>✳</sup>,  
 Sandoz Pantoprazole<sup>✳</sup>

**Pharmacologic class:** Proton pump inhibitor

**Therapeutic class:** GI agent

**Pregnancy risk category B**

### Action

Reduces gastric acid secretion and increases gastric mucus and bicarbonate production, creating protective coating on gastric mucosa

### Availability

*Granules (delayed-release oral suspension):* 40 mg

*Powder for injection (freeze-dried):* 40 mg/vial

*Tablets (delayed-release):* 20 mg, 40 mg

### Indications and dosages

➤ Erosive esophagitis caused by gastroesophageal reflux disease (GERD)

**Adults:** 40 mg I.V. daily for 7 to 10 days or 40 mg P.O. daily for 8 weeks. May repeat P.O. course for 8 additional weeks.

**Children ages 5 and older weighing 40 kg (88 lb) or more:** 40 mg P.O. daily for up to 8 weeks

**Children ages 5 and older weighing 15 kg (33 lb) to less than 40 kg (88 lb):** 20 mg P.O. daily for up to 8 weeks

➤ Erosive esophagitis

**Adults:** 40 mg P.O. daily

➤ Pathologic hypersecretory conditions

**Adults:** Initially, 40 mg P.O. b.i.d., increased as needed to maximum of

240 mg P.O. daily; some patients may need up to 2 years of therapy. Alternatively, 80 mg I.V. q 12 hours, to a maximum of 240 mg/day (80 mg q 8 hours).

### Contraindications

• Hypersensitivity to drug or any substituted benzimidazole

### Precautions

Use cautiously in:

- severe hepatic disease
- atrophic gastritis with long-term use
- increased risk of osteoporosis-related hip, wrist, or spine fractures with long-term use or multiple daily doses
- concurrent use of atazanavir, nelfinavir, or methotrexate
- pregnant or breastfeeding patients
- children.

### Administration

• Be aware that oral granules may be mixed with applesauce or apple juice and given 30 minutes before a meal. Once mixed, give drug within 10 minutes.

• Know that oral granules may be mixed with 10 ml apple juice and administered into nasogastric tube using 60-ml catheter-tip syringe. Rinse syringe with additional apple juice so that no granules remain in syringe.

• For I.V. administration, use in-line filter provided. If Y-site is used, place filter below Y-site closest to patient.

• Dilute I.V. form with 10 ml of normal saline solution; further dilute in dextrose 5% in water, normal saline solution, or lactated Ringer's solution, as directed. Give over 15 minutes at a rate no faster than 3 mg/minute.

• Don't give I.V. form with other I.V. solutions.

• Know that I.V. form is indicated for short-term treatment of GERD in patients with history of erosive

esophagitis as alternative to P.O. therapy.

- Be aware that symptomatic response doesn't rule out gastric cancer.

Route	Onset	Peak	Duration
P.O.	Rapid	2.5 hr	>24 hr
I.V.	Rapid	Unknown	>24 hr

### Adverse reactions

**CNS:** dizziness, headache

**CV:** chest pain

**EENT:** rhinitis

**GI:** vomiting, diarrhea, abdominal pain, dyspepsia

**Metabolic:** hyperglycemia

**Musculoskeletal:** hip, wrist, spine fractures (with long-term daily use)

**Skin:** rash, pruritus

**Other:** injection site reaction

### Interactions

**Drug-drug.** *Ampicillin, cyanocobalamin, digoxin, iron salts, ketoconazole:* delayed absorption of these drugs

*Atazanavir, nelfinavir:* substantially decreased atazanavir or nelfinavir plasma concentration with loss of therapeutic effect and development of drug resistance

*Clarithromycin, diazepam, flurazepam, phenytoin, triazolam:* increased pantoprazole blood level

*Sucralfate:* delayed pantoprazole absorption

*Warfarin:* increased bleeding

**Drug-diagnostic tests.** *Aspartate aminotransferase, glucose:* increased levels

*Tetrahydrocannabinol test:* false-positive result

### Patient monitoring

- Assess for symptomatic improvement.
- Monitor blood glucose level in diabetic patient.

### Patient teaching

- Tell patient to swallow delayed-release tablets whole without crushing, chewing, or splitting.

- Tell patient he may take tablets with or without food.
- Explain that antacids don't affect drug absorption.
- Instruct diabetic patients to monitor blood glucose level carefully and stay alert for signs and symptoms of hyperglycemia.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

Pexeva

**Pharmacologic class:** Selective serotonin reuptake inhibitor (SSRI)

**Therapeutic class:** Antidepressant, anxiolytic

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug may increase risk of suicidal thinking and behavior in children and adolescents with major depressive disorder and other psychiatric disorders. Risk must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family and caregivers to observe patient closely and communicate with prescriber as needed.

- Drug isn't approved for use in pediatric patients.

### Action

Unknown. Thought to inhibit neuronal reuptake of serotonin in CNS.

### Availability

paroxetine hydrochloride—

*Oral suspension:* 10 mg/5 ml in 250-ml bottle

*Tablets:* 10 mg, 20 mg, 30 mg, 40 mg

*Tablets (controlled-release):* 12.5 mg, 25 mg, 37.5 mg

paroxetine mesylate—

*Tablets:* 10 mg, 20 mg, 30 mg, 40 mg

### Indications and dosages

- Major depressive disorder

**Adults:** Initially, 20 mg/day P.O. (immediate-release) as a single dose; may increase as needed by 10 mg/day at weekly intervals (range is 20 to 50 mg); daily dosages of approximately 30 mg may maintain efficacy for up to 1 year. Or initially, 25 mg P.O. (controlled-release) daily; may increase by 12.5 mg/day at weekly intervals, up to 62.5 mg/day. Or, 20 mg/day P.O. (paroxetine mesylate) as a single dose in morning; may increase as needed by 10 mg/day at weekly intervals up to maximum of 50 mg/day; daily dosages of approximately 30 mg may maintain efficacy for up to 1 year.

- Obsessive-compulsive disorder

**Adults:** Initially, 20 mg/day P.O. (immediate-release); increase as needed by 10 mg/day at weekly intervals, up to 60 mg P.O. (range is 20 to 60 mg/day). Or, initially 20 mg P.O. (paroxetine mesylate); may increase as needed by 10 mg/day at weekly intervals up to maximum of 60 mg/day; recommended dosage is 40 mg/day.

- Panic disorder

**Adults:** Initially, 10 mg/day P.O. (immediate-release); may increase as needed by 10 mg/day at weekly intervals, up to 40 mg P.O. (range is 10 to

60 mg/day); maximum dosage is 60 mg/day, with dosage adjustments made to maintain patient on lowest effective dosage. Or initially, 12.5 mg/day P.O. (controlled-release); may increase by 12.5 mg/day at weekly intervals, to a maximum of 75 mg/day. Or, 10 mg/day P.O. (paroxetine mesylate) daily in morning; may increase as needed by 10 mg/day at weekly intervals up to maximum of 60 mg/day. Target dosage is 40 mg/day. Maintain patient on lowest effective dosage.

- Posttraumatic stress disorder

**Adults:** Initially, 20 mg/day P.O.; range is 20 to 50 mg/day. Make any dosage increases if needed in increments of 10 mg/day at intervals of at least 1 week. For maintenance, adjust to lowest effective dosage.

- Generalized anxiety disorder

**Adults:** Initially, 20 mg/day P.O.; range is 20 to 50 mg/day; however, dosages greater than 20 mg/day may not provide added benefit. Make any dosage increases if needed in increments of 10 mg/day at intervals of at least 1 week. Or, 20 mg/day P.O. (paroxetine mesylate) daily in morning.

- Premenstrual dysphoric disorder

**Adults:** 12.5 to 25 mg/day P.O. (controlled-release) daily. May give either daily throughout menstrual cycle or only during luteal phase cycle (per prescriber). Make any dosage changes if needed at intervals of at least 1 week.

### Dosage adjustment

- Hepatic impairment, severe renal impairment
- Elderly or debilitated patients

### Contraindications

- Hypersensitivity to drug or its components
- MAO inhibitor use within past 14 days
- Concurrent thioridazine use

## Precautions

Use cautiously in:

- severe renal or hepatic impairment
- narrow-angle glaucoma
- diseases or conditions that may affect metabolism or hemodynamic responses
- history of seizures, mania, or suicide attempt
- increased risk of suicide attempt, hyponatremia, or abnormal bleeding
- elderly or debilitated patients
- pregnant or breastfeeding patients
- children younger than age 18 (safety not established).

## Administration

- Give with or without food.
- Give controlled-release tablets whole. Make sure patient doesn't chew or crush them.

 Don't give to patients receiving MAO inhibitors or thioridazine.

- Reassess patient periodically to gauge need for continued therapy.

Route	Onset	Peak	Duration
P.O.	Unknown	2-8 hr	Unknown
P.O. (controlled)	Unknown	6-10 hr	Unknown

## Adverse reactions

**CNS:** anxiety, agitation, dizziness, drowsiness, asthenia, vascular headache, confusion, hangover, depression, paresthesia, tremor, twitching, myoclonus, amnesia, insomnia, abnormal dreams, unusual or severe mood changes, fatigue, **cerebral ischemia, suicidal behavior or ideation** (especially in child or adolescent)

**CV:** chest pain, hypertension, hypotension, palpitations, orthostatic hypotension, angina pectoris, ventricular or supraventricular extrasystoles, tachycardia, bradycardia, **thrombophlebitis, myocardial ischemia**

**EENT:** blurred vision, rhinitis, dry mouth

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, flatulence, anorexia

**GU:** urinary frequency, urinary disorders, urinary tract infection, genital disorders, ejaculatory disturbance, decreased libido

**Musculoskeletal:** back pain, myalgia, myasthenia, myopathy, joint pain

**Respiratory:** cough, bronchitis, respiratory disorders

**Skin:** sweating, pruritus, pallor, rash, photosensitivity, **Stevens-Johnson syndrome** (postmarketing reports)

**Other:** chills, edema, appetite and weight changes, accidental injury, yawning

## Interactions

**Drug-drug.** *Cimetidine:* increased paroxetine blood level

*Digoxin:* decreased digoxin efficacy

*Drugs metabolized by liver (such as amitriptyline, class IC antiarrhythmics, desipramine):* decreased metabolism and increased effects of these drugs

*5-hydroxytryptamine receptor agonists (such as frovatriptan, naratriptan, rizatriptan):* weakness, hyperreflexia, incoordination

*MAO inhibitors:* potentially fatal reactions (hyperthermia, rigidity, myoclonus, autonomic instability, fluctuating vital signs, extreme agitation, delirium, coma)

*Phenobarbital, phenytoin:* decreased paroxetine efficacy

*Tamoxifen:* decreased tamoxifen concentration

*Theophylline:* increased risk of theophylline toxicity

*Thioridazine:* increased thioridazine blood level, serious ventricular arrhythmias, sudden death

*Tryptophan:* headache, nausea, sweating, dizziness

*Warfarin:* increased risk of bleeding (without altering prothrombin time)

**Drug-diagnostic tests.** *Alkaline phosphatase, bilirubin, glucose:* increased levels

*5-hydroxyindole acetic acid, vanillylmandelic acid:* decreased levels

*Urinary catecholamines:* false increases

**Drug-herbs.** *S-adenosylmethionine* (SAM-e), *St. John's wort*: increased risk of adverse serotonergic effects, including serotonin syndrome

### Patient monitoring

- Check for signs and symptoms of toxicity, including drowsiness, nausea, tremor, tachycardia, confusion, and dizziness.

- Assess vital signs and cardiovascular status.

-  Monitor neurologic status. Watch closely for depression and suicidal behavior and ideation (especially in child or adolescent).

- Evaluate respiratory status. Stay alert for signs and symptoms of infection.

-  Monitor patient for signs and symptoms of Stevens-Johnson syndrome.

### Patient teaching

- Tell patient to swallow controlled-release tablets whole without chewing or crushing them.

-  Describe signs and symptoms of drug toxicity. Tell patient to report these immediately.

-  Teach patient or caregiver to recognize and immediately report signs of suicidal intent or expressions of suicidal ideation (especially in child or adolescent).

-  Teach patient or caregiver to immediately report rash if it occurs.

- Tell patient to continue to take drug even if he feels better. Caution him not to stop therapy abruptly.

- Advise patient to consult prescriber before taking other prescription drugs or over-the-counter preparations.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects him.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## pazopanib

Votrient

**Pharmacologic class:** Selective multi-targeted tyrosine kinase inhibitor

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

- Severe and fatal hepatotoxicity has been observed in clinical studies.
- Monitor hepatic function and interrupt, reduce, or discontinue dosing as recommended.

### Action

Specifically targets growth factor receptors associated with angiogenesis and tumor-cell proliferation; also exhibits inhibition of vascular endothelial growth factor receptors, platelet-derived growth factor receptors, fibroblast growth factor receptors, stem cell factor receptor (c-Kit), interleukin-2 receptor inducible T-cell kinase, leukocyte-specific protein tyrosine kinase, and transmembrane glycoprotein receptor tyrosine kinase

### Availability

Tablets: 200 mg

### Indications and dosages

➤ Advanced renal cell carcinoma (RCC); advanced soft-tissue sarcoma (STS) in patients who have received prior chemotherapy

**Adults:** 800 mg P.O. daily. In RCC, initial dosage reduction should be 400 mg, and additional dosage decrease or increase should be in 200-mg steps based on individual tolerability. In STS, a decrease or increase should be in 200-mg steps based on individual tolerability.

## Dosage adjustment

- Moderate hepatic impairment
- Strong CYP3A4 inducers/inhibitors

## Contraindications

None

## Precautions

Use cautiously in:

- severe hepatic impairment with total bilirubin greater than three times the upper limit of normal (ULN)
- mild to moderate hepatic impairment, proteinuria
- hypothyroidism, hypertension, cardiac disease, patients at risk for developing QT-interval prolongation
- signs and symptoms of serious infection
- patients at increased risk for myocardial infarction (MI), angina, ischemic stroke, transient ischemic attack, and GI perforation or fistula
- hemoptysis; cerebral or clinically significant GI hemorrhage in past 6 months (avoid use)
- patients undergoing surgical procedures
- concurrent use of other cancer therapies (not indicated)
- concurrent use of antiarrhythmics and other drugs that may prolong QT interval
- concurrent use of strong CYP3A4 inducers or inhibitors (avoid use)
- concurrent use of CYP substrates (use not recommended)
- concurrent use of simvastatin
- elderly patients
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

## Administration

- Administer without food at least 1 hour before or 2 hours after a meal. Don't give with grapefruit or grapefruit juice. Don't crush tablets.

- Perform baseline ECG and LVEF evaluation, and maintain electrolytes within normal range during therapy.

 Perform baseline urinalysis and discontinue drug for Grade 4 proteinuria.

- Ensure patient's blood pressure is well controlled before starting drug.

 Before starting treatment, monitor hepatic function and interrupt, reduce, or discontinue dosing as recommended.

 Don't administer to patient who has had MI, angina, ischemic stroke, transient ischemic attack, hemoptysis, or clinically significant GI hemorrhage in previous 6 months.

 Be aware that serious infections, including some with fatal outcome, have been reported. Institute appropriate anti-infective therapy promptly and consider drug interruption or discontinuation for serious infections.

 Temporarily interrupt therapy in patients undergoing surgical procedures for at least 7 days before surgery. Discontinue drug in patients who develop wound dehiscence.

 Be aware that drug isn't indicated for use in combination with other cancer agents, because of possible increased toxicity and mortality (pulmonary hemorrhage, GI hemorrhage, and sudden death).

Route	Onset	Peak	Duration
P.O.	Unknown	2-4 hr	Unknown

## Adverse reactions

**CNS:** fatigue, asthenia, headache

**CV:** hypertension, **decreased ejection fraction, congestive heart failure (CHF), QT-interval prolongation, torsades de pointes**

**GI:** nausea, vomiting, diarrhea, anorexia, dyspepsia, **GI perforation and fistula**

**GU:** proteinuria

**Hematologic:** leukopenia, neutropenia, thrombocytopenia, lymphocytopenia,

**arterial and venous thrombotic events, hemorrhagic events****Hepatic:** abnormal liver function test values, **hepatotoxicity****Metabolic:** altered electrolyte levels, hypothyroidism**Musculoskeletal:** musculoskeletal pain**Respiratory:** dyspnea**Skin:** alopecia, rash, skin depigmentation, impaired wound healing, palmar-plantar erythrodysesthesia**Other:** hair color changes, chest pain, dysgeusia, facial edema, weight loss, decreased appetite, infection, tumor pain, **reversible posterior leukoencephalopathy syndrome****Interactions****Drug-drug.** *CYP3A4 substrates (such as dextromethorphan, midazolam, paclitaxel):* inhibited metabolism of these drugs*Simvastatin:* increased risk of ALT elevations*Strong CYP3A4 inducers (such as rifampin):* decreased pazopanib concentration*Strong CYP3A4 inhibitors (such as clarithromycin, ketoconazole, ritonavir):* increased pazopanib concentration**Drug-diagnostic tests.** *ALT, AST, total bilirubin:* increased levels*Glucose:* increased or decreased level*Hemoglobin, magnesium, neutrophils, phosphorus, platelets, sodium:* decreased levels**Drug-food.** *Any food:* increased pazopanib systemic exposure*Grapefruit juice:* inhibited CYP3A4 activity and increased pazopanib plasma concentration**Patient monitoring**

- Monitor CBC with differential closely.

- ☞ Periodically monitor urinalysis during treatment, with follow-up measurement of 24-hour urine protein as clinically indicated. Interrupt therapy and reduce dosage for 24-hour

urine protein of 3 g or more; discontinue drug for repeat episodes despite dosage reductions.

- ☞ Monitor serum liver function tests at least once every 4 weeks for at least first 4 months of treatment or as clinically indicated; continue periodic monitoring thereafter. If ALT levels of more than three times ULN occur concurrently with bilirubin levels of more than two times ULN, permanently discontinue drug.

- ☞ Closely monitor patient for QT-interval prolongation and signs or symptoms of CHF; periodically monitor ECG and maintain electrolyte levels within normal range.

- Periodically evaluate left ventricular ejection fraction in patients at risk for cardiac dysfunction, including patients who have received previous anthracycline exposure.

- Monitor patients for hypertension; treat as needed. If hypertension persists despite therapy, reduce dosage or discontinue drug as appropriate.

- ☞ Closely monitor patient for signs and symptoms of reversible posterior leukoencephalopathy syndrome (RPLS) (headache, seizure, lethargy, confusion, blindness, other visual and neurologic disturbances, and possibly mild to severe hypertension). Discontinue drug if RPLS develops.

- ☞ Closely monitor patient for signs and symptoms of infection, hemorrhage, thrombotic events, and GI perforation or fistula.

- Be aware that proactive thyroid function monitoring is recommended.

- Monitor patient for impaired wound healing after surgery.

- Closely watch for ALT elevations in patients also taking simvastatin.

**Patient teaching**

- Tell patient to take drug without food at least 1 hour before or 2 hours after a meal, not to crush tablets, and

to avoid grapefruit and grapefruit juice.

 Instruct patient to immediately report unusual tiredness; dizziness; numbness or weakness on one side of the body; trouble talking; shortness of breath; irregular heartbeats; high blood pressure; chest pain; bleeding; itching; yellowing of skin or eyes; dark urine; right upper abdominal pain, discomfort, or distention; wounds that don't heal; or red, painful hands and feet.

- Teach patient how to manage diarrhea and to notify prescriber if moderate to severe diarrhea occurs.
- Tell patient that drug may cause depigmentation of the hair or skin.
- Instruct patient to tell prescriber about all drugs he's taking, because some drugs have potential for serious drug interactions and shouldn't be taken with pazopanib.
- Advise female patient of childbearing age to avoid pregnancy during therapy.
- Advise breastfeeding patient that she should decide whether to discontinue breastfeeding or discontinue drug, taking into account importance of drug for her treatment.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and food mentioned above.

## pegaptanib sodium injection

Macugen

**Pharmacologic class:** Selective vascular endothelial growth factor (VEGF) antagonist

**Therapeutic class:** Ophthalmic agent

**Pregnancy risk category B**

### Action

Binds to extracellular VEGF, which contributes to progression of neovascular age-related macular degeneration; this action suppresses pathologic neovascularization and macular degeneration progression.

### Availability

*Solution for ophthalmic injection:* 0.3 mg/90-microliter single-dose syringe

### Indications and dosages

 Neovascular (wet) age-related macular degeneration

**Adults:** 0.3 mg by intravitreal injection into affected eye once every 6 weeks

### Contraindications

- Hypersensitivity to drug or its components
- Ocular or periocular infection

### Precautions

Use cautiously in:

- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Administer only by ophthalmic intravitreal injection under controlled aseptic conditions.
- Inspect drug for particulates and discoloration before administering.
- Attach threaded plastic plunger rod to rubber stopper inside syringe barrel. Don't pull back on plunger.

Route	Onset	Peak	Duration
Intravitreal	Unknown	1-4 days	Unknown

### Adverse reactions

**CNS:** dizziness, headache, vertigo

**CV:** hypertension, carotid artery occlusion, chest pain, transient ischemic attack, **cerebrovascular accident**

**EENT:** anterior chamber inflammation, blurred vision, cataract, conjunctival

hemorrhage, corneal edema, eye discharge, eye inflammation or swelling, eye irritation or pain, increased intraocular pressure, ocular discomfort, punctate keratitis, reduced visual acuity, visual disturbance, vitreous disorder or hemorrhage, vitreous floaters or opacities, blepharitis, conjunctivitis, photopsia, allergic conjunctivitis, conjunctival edema, corneal abrasion, corneal deposits, corneal epithelial disorder, endophthalmitis, eyelid irritation, meibomianitis, mydriasis, periorbital hematoma, retinal edema, hearing loss

**GI:** diarrhea, nausea, vomiting,

dyspepsia

**GU:** urinary tract infection, urinary retention

**Metabolic:** diabetes mellitus

**Musculoskeletal:** arthritis, bone spur

**Respiratory:** bronchitis, pleural effusion

**Skin:** contact dermatitis, contusion

**Other: anaphylaxis, including angioedema (rare)**

## Interactions

None

## Patient monitoring

- Watch for increased intraocular pressure, especially within 30 minutes of injection. Be prepared to intervene appropriately.
- Monitor patient for endophthalmitis during week after injection to promote early detection and treatment.

## Patient teaching

-  Instruct patient to contact ophthalmologist immediately if treated eye becomes red, light-sensitive, or painful or if vision change occurs.
- As appropriate, review all other significant and life-threatening adverse reactions.

## pegaspargase (PEG-L-asparaginase)

Oncaspar

**Pharmacologic class:** Enzyme

**Therapeutic class:** Antineoplastic

**Pregnancy risk category C**

## Action

Stimulates production of effector proteins, such as serum neopterin and 2', 5' oligoadenylate synthetase; raises body temperature and reversibly lowers white blood cell and platelet counts

## Availability

**Injection:** 750 international units/ml, 5-ml vial in phosphate-buffered saline solution

## Indications and dosages

➤ Acute lymphoblastic leukemia

**Adults and children with body surface area (BSA) greater than 0.6 m<sup>2</sup>:**

2,500 international units/m<sup>2</sup> I.M. or I.V. q 14 days

**Adults and children with BSA less than 0.6 m<sup>2</sup>:** 82.5 international units/m<sup>2</sup> I.M. or I.V. q 14 days

## Contraindications

- Hypersensitivity or previous serious allergic reaction (such as generalized urticaria, bronchospasm, laryngeal edema, hypotension) to drug
- Pancreatitis or history of pancreatitis
- Previous hemorrhagic events related to L-asparaginase therapy

## Precautions

Use cautiously in:

- renal or hepatic disease, CNS disorders
- concurrent use of hepatotoxic agents, anticoagulants, aspirin or other

nonsteroidal anti-inflammatory drugs (NSAIDs)

- pregnant or breastfeeding patients.

### Administration

📣 Follow facility protocol for handling, preparing, and disposing of chemotherapeutic drugs.

📣 Avoid inhaling vapors and contact with skin or mucous membranes.

📣 Keep resuscitation equipment, epinephrine, oxygen, steroids, and antihistamines readily available.

- Know that I.M. route is preferred because it's less likely to cause hepatotoxicity, coagulopathy, and GI or renal disorders. For single I.M. injection, don't exceed volume of 2 ml.

- For I.V. use, dilute in 100 ml of normal saline solution or dextrose 5% in water. Infuse over 1 to 2 hours.

📣 Don't freeze; freezing inactivates drug.

Route	Onset	Peak	Duration
I.V.	Unknown	72-96 hr	2 wk
I.M.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** dizziness, headache, confusion, hallucinations, emotional lability, drowsiness, neuritis, Parkinson-like syndrome, malaise, **coma, seizures**

**CV:** hypertension, hypotension, chest pain, peripheral edema, tachycardia, **endocarditis**

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, flatulence, anorexia, **pancreatitis**

**GU:** glycosuria, polyuria, urinary frequency, hematuria

**Hematologic:** **hemolytic anemia, leukopenia, pancytopenia, thrombocytopenia, disseminated intravascular coagulation**

**Hepatic:** jaundice, fatty liver deposits, **hepatotoxicity, hepatomegaly**

**Metabolic:** hypoproteinemia, hyperuricemia, hyperammonemia, hyponatremia, hyperglycemia, **hypoglycemia**

**Respiratory:** dyspnea, cough, **bronchospasm**

**Skin:** rash, urticaria, pruritus, night sweats, alopecia

**Other:** increased appetite and thirst, weight loss, chills, fever, injection site reaction, facial or lip edema, hypersensitivity reactions including **anaphylaxis, septic shock**

### Interactions

**Drug-drug.** *Aspirin, dipyridamole, heparin, NSAIDs, warfarin:* increased risk of bleeding or thrombosis

*Methotrexate:* decreased methotrexate action

**Drug-diagnostic tests.** *Amylase, blood urea nitrogen, creatinine, lipase, uric acid:* increased levels

*Glucose:* increased or decreased level

*Liver function tests:* abnormal results

*Lymphoblasts:* decreased count

*Plasma proteins:* altered levels

### Patient monitoring

📣 Watch for anaphylaxis and other hypersensitivity reactions, especially during first hour of therapy.

- Monitor CBC (including platelet count); fibrinogen; prothrombin and partial thromboplastin times; International Normalized Ratio; and serum amylase, lipase, and uric acid levels.

📣 Assess neurologic status. Stay alert for decreased level of consciousness and evidence of impending seizure.

- Check for signs and symptoms of bleeding, infection, and hyperglycemia.

- Monitor heart rate, blood pressure, respiratory rate, temperature, and fluid intake and output.

### Patient teaching

📣 Teach patient to recognize and immediately report signs and symptoms of hypersensitivity reactions, bleeding, infection, and other adverse reactions.

- Tell patient drug is likely to cause reversible hair loss.

- Stress importance of undergoing follow-up laboratory tests.
- Advise patient to avoid situations that increase risk for infection.
- Instruct patient to consult prescriber before taking other prescription drugs or over-the-counter preparations.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## pegfilgrastim

Neulasta

**Pharmacologic class:** Granulocytic colony stimulating factor

**Therapeutic class:** Hematopoietic drug

**Pregnancy risk category C**

### Action

Binds to specific cell-surface receptors on hematopoietic cells, stimulating their proliferation and differentiation in bone marrow

### Availability

**Injection:** 6 mg/0.6 ml in prefilled syringes

### Indications and dosages

➤ To reduce risk of infection in non-myeloid cancer patients who are receiving myelosuppressive drugs

**Adults:** 6 mg subcutaneously as a single dose once per chemotherapy cycle

### Contraindications

- Hypersensitivity to drug, *Escherichia coli*-derived proteins, filgrastim, or other drug components

### Precautions

Use cautiously in:

- myeloid cancers, sickle cell disease
- patients undergoing chemotherapy or radiation
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Inspect solution for particles; discard if particles or discoloration appear.
- Don't give 14 days before to 24 hours after administration of cytotoxic chemotherapy.

Route	Onset	Peak	Duration
Subcut.	Variable	Variable	Variable

### Adverse reactions

**CNS:** headache, weakness, fatigue, dizziness, insomnia

**CV:** peripheral edema

**GI:** nausea, vomiting, diarrhea, abdominal pain, dyspepsia, stomatitis, **splenic rupture**

**Hematologic:** leukocytosis, granulocytopenia

**Musculoskeletal:** bone pain, myalgia, joint pain

**Respiratory:** adult respiratory distress syndrome (ARDS) in septic patients

**Skin:** alopecia, mucositis

**Other:** taste perversion, allergic reaction, increased pain, fever, neutropenic fever, **aggravation of sickle cell disease**

### Interactions

**Drug-drug.** *Lithium:* potentiation of neutrophil release

**Drug-diagnostic tests.** *Alkaline phosphatase, lactate dehydrogenase, uric acid:* increased levels

### Patient monitoring

🚨 Assess for signs and symptoms of impending splenic rupture, such as left upper abdominal quadrant or shoulder pain and splenic enlargement.

- Monitor vital signs and temperature.
- 📢 Watch for signs and symptoms of sepsis, ARDS, and neutropenic fever.
- Monitor CBC, uric acid level, and liver function tests.

### Patient teaching

- Teach patient or caregiver how to administer injection and dispose of syringes at home, if appropriate.
- 📢 Teach patient to recognize and immediately report respiratory distress or signs and symptoms of splenic rupture.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- Instruct patient to have follow-up laboratory tests as needed.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## peginesatide

Omontys

**Pharmacologic class:** Erythropoiesis-stimulating agent (ESA)

**Therapeutic class:** Hematologic agent

**Pregnancy risk category C**

### FDA BOXED WARNING

**Warning:** ESAs increase risk of death, myocardial infarction, stroke, venous thromboembolism, thrombosis of vascular access, and tumor progression or recurrence.

- In controlled trials, patients experienced greater risk of death, serious adverse CV reactions, and stroke when

administered ESAs to target a hemoglobin level of greater than 11 g/dl.

- No trial has identified a hemoglobin target level, ESA dosage, or dosing strategy that doesn't increase these risks.
- Use the lowest dosage sufficient to reduce the need for RBC transfusions.

### Action

Binds to and activates human erythropoietin receptor and stimulates erythropoiesis in human red cell precursors in vitro; increases reticulocyte count, followed by increases in hemoglobin. Rate of hemoglobin increase varies among patients and is dependent on peginesatide dosage.

### Availability

*Solution for injection:* 2 mg/0.5 ml, 3 mg/0.5 ml, 4 mg/0.5 ml, 5 mg/0.5 ml, 6 mg/0.5 ml in single-use vials; 1 mg/0.5 ml, 2 mg/0.5 ml, 3 mg/0.5 ml, 4 mg/0.5 ml, 5 mg/0.5 ml, 6 mg/0.5 ml in prefilled syringes; 10 mg/ml, 20 mg/2 ml in multi-use vials

### Indications and dosages

➤ Anemia caused by chronic kidney disease in patients on dialysis

**Adults:** Initially when hemoglobin level is less than 10 g/dl, 0.4 mg/kg subcutaneously or I.V. once monthly. When converting from another ESA, give once monthly based on total weekly epoetin or darbepoetin alfa dose at time of conversion.

### Dosage adjustment

- Based on hemoglobin level

### Contraindications

- Uncontrolled hypertension

### Precautions

Use cautiously in:

- patients with chronic kidney disease and an insufficient hemoglobin response
- patients with chronic kidney disease not on dialysis

- coexistent CV disease and stroke, controlled hypertension
- anemia due to cancer chemotherapy (not indicated)
- patients undergoing coronary artery bypass graft surgery or orthopedic procedures
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Don't dilute drug or administer with other drug solutions.
- Evaluate transferrin saturation and serum ferritin level before starting drug; administer supplemental iron therapy when serum ferritin level is less than 100 mcg/L or when serum transferrin saturation is less than 20%, as prescribed. Be aware that other causes of anemia (such as vitamin deficiency, metabolic or chronic inflammatory conditions, or bleeding) should be corrected or excluded before initiating drug.
- Monitor hemoglobin level at least every 2 weeks until stable. When adjusting therapy, consider hemoglobin rate of rise, rate of decline, ESA responsiveness, and hemoglobin variability; be aware that a single hemoglobin excursion may not require a dosing change. Don't increase dosage more frequently than once every 4 weeks.
  - ⚠ Be aware that for patient who doesn't respond adequately over a 12-week escalation period, increasing dosage further is unlikely to improve response and may increase risks. Drug should be used at the lowest dosage that will maintain a hemoglobin level sufficient to reduce need for RBC transfusions. Discontinue drug if responsiveness doesn't improve.
  - ⚠ Be aware that using ESAs to target a hemoglobin level greater than 11 g/dl increases risk of serious adverse CV reactions and hasn't been shown to provide additional benefits. Ensure that

patient's hypertension is under control before starting treatment. Reduce dosage or withhold drug if blood pressure becomes difficult to control.

⚠ Be aware that patients with cancer receiving ESAs or patients undergoing coronary artery bypass graft surgery may be at increased risk for serious CV adverse reactions or death; patients undergoing orthopedic procedures may be at risk for deep vein thrombosis; and patients with chronic kidney disease not on dialysis may be at increased risk for CV events.

- Be aware that the presence of peginesatide-specific binding antibodies is associated with declining hemoglobin levels and may require increased drug dosages to maintain hemoglobin levels or transfusion for anemia of chronic kidney disease.

⚠ Discontinue drug and administer appropriate therapy if a serious allergic reaction occurs.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown
Subcutaneous	Unknown	48 hr	Unknown

### Adverse reactions

**CNS:** headache, **seizures, stroke**

**CV:** procedural hypotension, hypotension, hypertension, **congestive heart failure (CHF), myocardial infarction (MI)**

**GI:** nausea, vomiting, diarrhea

**Hematologic:** thromboembolism

**Metabolic:** hyperkalemia

**Musculoskeletal:** muscle spasms, extremity pain, back pain, arthralgia

**Respiratory:** dyspnea, cough, upper respiratory tract infection

**Other:** arteriovenous fistula-site complications, pyrexia, peginesatide-specific binding antibodies, allergic reactions, **increased mortality**

### Interactions

**Drug-diagnostic tests.** *Potassium:* increased level

**Patient monitoring**

- Continue to monitor hemoglobin level at least monthly provided hemoglobin level remains stable.
- Continue to evaluate transferrin saturation and serum ferritin level during treatment and to administer supplemental iron as prescribed.
- 📣 During first several months after drug initiation, closely monitor patient for neurologic symptoms; appropriately control hypertension; and watch for such CV events as stroke, MI, and CHF.
- Be aware that patient receiving peginesatide may require increased anticoagulation with heparin to prevent clotting of the extracorporeal circuit during hemodialysis.

**Patient teaching**

- If patient will self-administer drug, tell him to follow exact directions for injection, storage, and proper disposal of needles and syringes.
- 📣 Advise patient to immediately report allergic reactions; new-onset seizures, premonitory symptoms, or change in seizure frequency; and CV signs and symptoms.
- Advise patient of importance of having blood tests and blood pressure checks, and of compliance with antihypertensive therapy, iron supplements, and dietary restrictions.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

**peginterferon alfa-2a**

Pegasy

**Pharmacologic class:** Interferon**Therapeutic class:** Biological response modifier**Pregnancy risk category** C**FDA BOXED WARNING**

- Drug may cause or aggravate fatal or life-threatening neuropsychiatric, autoimmune, ischemic, and infectious disorders. Monitor patient closely with periodic clinical and laboratory evaluations. Withdraw drug in patients who have persistently severe or worsening signs or symptoms of these conditions. In most cases, these disorders resolve once therapy ends.
- Concurrent use with ribavirin may cause birth defects or fetal death. Use extreme care to avoid pregnancy in female patients and female partners of male patients. Also, ribavirin causes hemolytic anemia, which may result in worsening of cardiac disease. (See ribavirin package insert for additional information and other warnings.)

**Action**

Unclear. Thought to bind to specific cell-surface receptors, suppressing cell proliferation and viral replication. Also increases effector protein levels and reduces white blood cell (WBC) and platelet counts.

**Availability**

**Injection:** 180-mcg/ml vial, 180 mcg/0.5-ml prefilled syringe, 180 mcg/0.5-ml autoinjector for single use, 135 mcg/0.5-ml autoinjector for single use

**Indications and dosages**

➤ Chronic hepatitis C virus infection in patients with compensated liver disease not previously treated with interferon alfa and in patients with histological evidence of cirrhosis and compensated liver disease  
**Adults:** 180 mcg subcutaneously q week for 48 weeks. When used in combination with ribavirin, recommended ribavirin dosage and duration for peginterferon alfa-2a are based on viral genotype.

**Children ages 5 and older:** 180 mcg/1.73 m<sup>2</sup> × body surface area subcutaneously q week, to a maximum dose of 180 mcg in combination with ribavirin. Recommended treatment duration is based on viral genotype.

➤ Chronic HCV infection with HIV coinfection and CD4 count greater than 100 cells/mm<sup>3</sup>

**Adults:** 180 mcg subcutaneously q week for 48 weeks. When used in combination with ribavirin, duration for peginterferon alfa-2a is 48 weeks regardless of viral genotype.

➤ Chronic hepatitis B virus infection in patients with compensated liver disease and evidence of viral replication and liver inflammation

**Adults:** 180 mcg subcutaneously as monotherapy q week for 48 weeks.

### Dosage adjustment

- Neutrophil count less than 750 cells/mm<sup>3</sup> or platelet count less than 50,000 cells/mm<sup>3</sup>
- Hepatic disease
- End-stage renal disease requiring dialysis
- Serious adverse reactions

### Off-label uses

- Renal cell carcinoma

### Contraindications

- Hypersensitivity to drug or its components
- Autoimmune hepatitis
- Decompensated hepatic disease
- Hemoglobinopathies
- Concurrent use of didanosine (in peginterferon alfa-2a and ribavirin combination therapy)
- Infants and neonates (due to benzyl alcohol content)
- Pregnant patients, men whose female partners are pregnant

### Precautions

Use cautiously in:

- thyroid disorders; bone marrow depression; hepatic, renal, or cardiac

disease; pancreatitis; autoimmune disorders; pulmonary disorders; colitis; ophthalmic disorders; depression

- elderly patients
- pregnant or breastfeeding patients
- children younger than age 18.

### Administration

- Keep refrigerated. Before giving, roll vial between palms for 1 minute to warm; don't shake. Protect solution from light.
- Administer undiluted in abdomen or thigh by subcutaneous injection.
- Use only one vial or prefilled syringe or disposable autoinjector per dose. Discard unused portion of single-use vials or prefilled syringes.
- Know that drug may be used alone or with ribavirin. However, monotherapy isn't recommended for treatment of chronic hepatitis C unless patient has a contraindication or significant intolerance to ribavirin.

Route	Onset	Peak	Duration
Subcut.	Gradual	72-96 hr	Unknown

### Adverse reactions

**CNS:** dizziness, vertigo, insomnia, fatigue, rigors, poor memory and concentration, asthenia, depression, irritability, anxiety, peripheral neuropathy, mood changes, **suicidal ideation**

**CV:** hypertension, chest pain, **supraventricular arrhythmias, myocardial infarction**

**EENT:** vision loss, blurred vision, retinal artery or vein thrombosis, retinal hemorrhage, optic neuritis, retinopathy, **papilledema**

**GI:** nausea, vomiting, diarrhea, abdominal pain, dry mouth, anorexia, **GI tract bleeding, ulcerative and hemorrhagic colitis, pancreatitis**

**Hematologic:** anemia, **leukopenia, thrombocytopenia, neutropenia**

**Metabolic:** diabetes mellitus, aggravated hypothyroidism or hyperthyroidism

**Musculoskeletal:** myalgia, back pain, joint pain; delay in weight and height increases (children)

**Respiratory:** pneumonia, **interstitial pneumonitis, bronchoconstriction, respiratory failure**

**Skin:** alopecia, pruritus, diaphoresis, rash, dermatitis, dry skin, eczema

**Other:** weight loss, flulike symptoms, injection-site reaction, pain, **auto-immune phenomena, severe and possibly fatal bacterial infections, severe hypersensitivity reactions including angioedema and anaphylaxis**

### Interactions

**Drug-drug.** *Theophylline:* increased theophylline blood level

**Drug-diagnostic tests.** *Absolute neutrophil count, hematocrit, hemoglobin, platelets, WBCs:* decreased values

*Alanine aminotransferase:* transient increase

*Glucose, thyroid function tests:* decreased or increased levels

*Triglycerides:* increased levels

### Patient monitoring

⚠️ Assess cardiac and pulmonary status closely. Watch for evidence of infections and hypersensitivity reactions, including anaphylaxis.

- Before therapy begins, assess CBC (including platelet count), blood glucose level, and thyroid, kidney, and liver function tests. Continue to monitor at 1, 2, 4, 6, and 8 weeks and then every 4 weeks during therapy (more often if abnormalities occur). Monitor thyroid function tests every 12 weeks.

⚠️ Monitor for development of diabetes mellitus, hypothyroidism, and hyperthyroidism.

⚠️ If serious adverse reaction occurs, discontinue drug or adjust dosage until reaction abates, as prescribed. If reaction persists or recurs despite adequate dosage adjustment, discontinue drug.

### Patient teaching

- Teach patient or caregiver how to administer injection subcutaneously in thigh or abdomen and how to dispose of equipment properly, if appropriate.

⚠️ Advise patient to promptly report rash, bleeding, bloody stools, infection symptoms (such as fever), decreased vision, chest pain, severe stomach or lower back pain, shortness of breath, depression, or suicidal thoughts.

- Instruct patient to administer drug exactly as prescribed. If he misses a dose but remembers it within 2 days, tell him to take missed dose as soon as possible; if more than 2 days have elapsed, tell him to contact prescriber.

- Caution patient not to switch brands without prescriber's approval.

- Instruct patient to have periodic eye exams.

- Advise female patient of childbearing age to avoid pregnancy and use two birth control methods before, during, and up to 6 months after therapy.

Instruct male patient to use condoms.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## peginterferon alfa-2b

PEG-Intron, PegIntron<sup>®</sup>, Unitron Peg<sup>®</sup>, ViraferonPeg<sup>®</sup>

**Pharmacologic class:** Immunomodulator

**Therapeutic class:** Immunologic agent

**Pregnancy risk category C** (monotherapy), X (when given with ribavirin)

### FDA BOXED WARNING

- Drug may cause or aggravate fatal or life-threatening neuropsychiatric,

autoimmune, ischemic, and infectious disorders. Monitor patient closely with periodic clinical and laboratory evaluations. Withdraw drug in patients with persistently severe or worsening signs or symptoms of these conditions. In most cases, these disorders resolve once therapy ends.

- Concurrent use with ribavirin may cause birth defects or fetal death. Use extreme care to avoid pregnancy in female patients and female partners of male patients.

### Action

Binds to specific cell-surface membrane receptors, causing suppression of cell proliferation, enhanced phagocytic macrophage activity, and inhibition of viral replication

### Availability

*Powder for injection with diluent:*  
50 mcg/0.5-ml vial, 80 mcg/0.5-ml vial, 120 mcg/0.5-ml vial, 150 mcg/0.5-ml vial (Redipen)

### Indications and dosages

➤ Chronic hepatitis C virus (HCV) infection in patients with compensated liver disease

**Adults ages 18 and older:** For monotherapy, 1 mcg/kg/week subcutaneously for 1 year given on the same day of the week. When given with ribavirin, 1.5 mcg/kg/week subcutaneously. When used in combination with ribavirin, recommended duration in interferon alfa-naïve patients is based on viral genotype. Combination treatment duration for patients who previously failed therapy is 48 weeks, regardless of HCV genotype.

**Children ages 3 to 17:** 60 mcg/m<sup>2</sup>/week subcutaneously in combination with ribavirin. Recommended treatment duration is based on viral genotype.

### Dosage adjustment

- Serious adverse reactions

- Renal impairment
- Cardiac disease
- Hematologic toxicity

### Contraindications

- Hypersensitivity to drug or its components
- Autoimmune hepatitis
- Decompensated hepatic damage

### Precautions

Use cautiously in:

- renal insufficiency
- cardiovascular disease, patients with history of psychiatric disorders, patients with debilitating medical conditions, such as those with history of pulmonary disease
- human immunodeficiency virus, hepatitis B infection
- patients who have failed other interferon alfa therapy
- patients who develop neutralizing antibodies
- organ transplant recipients
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

- Reconstitute by holding dual-chamber glass cartridge upright with dose button down and pressing two halves of pen together until you hear an audible click. Then gently invert (don't shake) pen to mix solution.
- To administer, hold pen upright, attach supplied needle, and select appropriate dosage by pulling back on dosing button until dark bands are visible. Then turn button until dark band aligns with correct dose.
- Use reconstituted solution immediately.
- Know that drug may be used alone or with ribavirin.
- Don't use combination therapy in patients with creatinine clearance less than 50 ml/minute.

Route	Onset	Peak	Duration
Subcut.	Unknown	15-44 hr	Unknown

### Adverse reactions

**CNS:** fatigue, headache, malaise, asthenia, dizziness, insomnia, depression, anxiety, emotional lability, irritability, poor concentration, agitation, nervousness, rigors, **suicidal behavior, suicidal or homicidal ideation**

**CV:** hypotension, tachycardia, chest pain, angina pectoris, **arrhythmias, cardiomyopathy, myocardial infarction**

**EENT:** vision decrease or loss, retinal artery or vein thrombosis, retinal hemorrhage, cotton-wool spots in visual field, rhinitis, sinusitis, pharyngitis

**GI:** nausea; vomiting; diarrhea; constipation; abdominal pain; dyspepsia; right upper abdominal quadrant pain; anorexia; dry mouth; **ulcerative, hemorrhagic, or ischemic colitis; pancreatitis**

**GU:** menstrual disorder

**Hematologic:** **neutropenia, thrombocytopenia**

**Hepatic:** **hepatomegaly**

**Metabolic:** aggravated hypothyroidism or hyperthyroidism

**Musculoskeletal:** myalgia, arthralgia, musculoskeletal pain

**Respiratory:** dyspnea, pneumonia, bronchiolitis obliterans, cough, **sarcoidosis, pulmonary infiltrates, interstitial pneumonitis, bronchoconstriction**

**Skin:** rash, dry skin, pruritus, sweating, flushing, alopecia

**Other:** exacerbation or development of autoimmune disorders, injection-site reaction, fever, viral or fungal infection, **systemic lupus erythematosus, severe hypersensitivity reactions including angioedema and anaphylaxis**

### Interactions

**Drug-diagnostic tests.** *Bilirubin, triglycerides, uric acid:* increased levels

*Glucose, thyroid function tests:* decreased or increased levels

*Hemoglobin, neutrophils, platelets, white blood cells:* decreased levels

### Patient monitoring

- Before therapy begins, assess CBC (including platelet count); blood glucose level, and thyroid, kidney, and liver function tests. Continue to monitor at weeks 2, 4, 8, and 12 and then every 6 weeks during therapy (more often if abnormalities occur). Monitor thyroid function tests every 12 weeks.

🚨 Assess cardiac and pulmonary status closely. Watch for signs and symptoms of infection and hypersensitivity reactions, including anaphylaxis.

🚨 Monitor neurologic status. Stay alert for such behavioral changes as irritability, anxiety, depression, and homicidal or suicidal ideation.

🚨 If serious adverse reaction occurs, know that drug will be discontinued or dosages adjusted accordingly.

- Monitor patient for development of diabetes mellitus, hypothyroidism, or hyperthyroidism.

- Be aware that if HCV level remains high after 6 months, drug should be discontinued.

### Patient teaching

- Tell patient to take exactly as prescribed. If he misses a dose but remembers it within 2 days, instruct him to take it as soon as possible. However, if more than 2 days have elapsed, advise him to contact prescriber.

- Teach patient or caregiver how to administer injection subcutaneously into thigh or abdomen, if appropriate, and how to properly dispose of equipment.

🚨 Advise patient to stop drug and promptly report infection symptoms, such as high fever, easy bruising or bleeding, decreased vision, chest pain, shortness of breath, severe stomach or

lower back pain, depression, or suicidal or homicidal thoughts.

- Urge patient to have periodic eye exams.
- Instruct female patient of childbearing age to avoid pregnancy and to use two birth control methods before, during, and up to 6 months after therapy. Instruct male patient to use condoms.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## pegvisomant

Somavert

**Pharmacologic class:** Growth hormone (GH) receptor antagonist

**Therapeutic class:** GH analog

**Pregnancy risk category B**

### Action

Selectively binds to GH receptors on cell surfaces, where it blocks binding of endogenous GH and interferes with GH signal transduction. This action decreases blood levels of insulin-like growth factor-1 (IGF-1) and other GH-responsive serum proteins.

### Availability

**Solution:** 10-mg, 15-mg, and 20-mg vials

### Indications and dosages

➤ Acromegaly

**Adults:** Initial subcutaneous loading dose of 40 mg, followed by 10 mg/day subcutaneously. May adjust in 5-mg increments after serum IGF-1 measurement q 4 to 6 weeks; don't exceed maximum daily maintenance dosage of 30 mg.

### Contraindications

- Hypersensitivity to drug, its components, or latex (in vial stopper)

### Precautions

Use cautiously in:

- GH-excreting tumors, diabetes mellitus, hepatic dysfunction
- pregnant or breastfeeding patients
- children.

### Administration

- Reconstitute in vial with 1 ml of sterile water for injection.
- Roll vial gently between palms to mix; don't shake. Withdraw prescribed dosage and administer subcutaneously.

Route	Onset	Peak	Duration
Subcut.	Unknown	Unknown	24 hr

### Adverse reactions

**CNS:** dizziness, paresthesia

**CV:** chest pain, hypertension, peripheral edema

**EENT:** sinusitis

**GI:** nausea, diarrhea, abdominal pain

**Musculoskeletal:** back pain

**Other:** infection, pain, injection site reaction, accidental injury, flulike symptoms, lipohypertrophy

### Interactions

**Drug-drug.** *Insulin, oral hypoglycemics:* decreased insulin sensitivity, reduced requirements for these drugs

*Opioids:* increased pegvisomant requirement

**Drug-diagnostic tests.** *GH assays:* interference with GH measurement

*Liver function tests:* abnormal results

**Drug-behaviors.** *Opioid addiction:* increased pegvisomant requirement

### Patient monitoring

- Assess liver function tests; watch for signs and symptoms of hepatic dysfunction.

- Monitor serum IGF-1 level. If appropriate, discuss dosage adjustments with prescriber.
- Monitor vital signs; check for hypertension, chest pain, and peripheral edema.
- Measure temperature. Watch for signs and symptoms of infection, especially sinusitis or flulike symptoms.
- Assess blood glucose level closely in diabetic patient. Notify prescriber of significant decrease.

### Patient teaching

- Teach patient proper technique for reconstituting and administering drug subcutaneously.
- 📢 Instruct patient to immediately report chest pain, peripheral edema, or signs or symptoms of infection.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects him.
- Teach diabetic patient to monitor blood glucose level closely and report significant decrease.
- 📢 Instruct patient to report yellowing of skin or eyes and other signs and symptoms of hepatic dysfunction. Tell him he'll undergo frequent liver function tests.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## pemetrexed

Alimta

**Pharmacologic class:** Folic acid antagonist

**Therapeutic class:** Antineoplastic, antimetabolite

**Pregnancy risk category** D

### Action

Disrupts folate-dependent metabolic processes essential for cell replication

### Availability

*Powder for injection:* 500 mg sterile lyophilized powder in single-use vials

### Indications and dosages

➤ Malignant pleural mesothelioma in patients whose disease is unresectable or who otherwise aren't eligible for curative surgery (given with cisplatin)  
**Adults:** 500 mg/m<sup>2</sup> as an I.V. infusion over 10 minutes on day 1 of each 21-day cycle. The recommended dose of cisplatin is 75 mg/m<sup>2</sup> infused over 2 hours starting approximately 30 minutes after pemetrexed administration ends.

➤ Nonsquamous non-small-cell lung cancer

**Adults:** 500 mg/m<sup>2</sup> I.V. infusion over 10 minutes on day 1 of each 21-day cycle for single-agent use, or in combination with cisplatin infused over 2 hours starting approximately 30 minutes after pemetrexed administration ends

### Dosage adjustment

- Hematologic toxicities, based on nadir absolute neutrophil and platelet counts
- Grade 2 to 4 neurotoxicity
- Grade 3 or higher nonhematologic toxicities (except neurotoxicity)
- Grade 3 or 4 diarrhea or any diarrhea requiring hospitalization
- Creatinine clearance below 45 ml/minute

### Contraindications

- Severe hypersensitivity reaction to drug or its components

### Precautions

Use cautiously in:

- hepatic or renal impairment, neurotoxicity

- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

• Reconstitute 500-mg vial with 20 ml preservative-free normal saline solution injection, yielding 25 mg/ml. Gently swirl vial until powder dissolves completely.

• Further dilute appropriate volume of reconstituted solution to 100 ml with preservative-free normal saline solution injection; administer I.V. over 10 minutes.

• Know that drug is physically incompatible with diluents containing calcium, including Ringer's and lactated Ringer's solutions. Administration with other drugs and diluents isn't recommended.

• Administer I.V. only.

• As ordered, pretreat with dexamethasone (or equivalent) 4 mg P.O. twice daily on day before, day of, and day after pemetrexed administration to minimize cutaneous reactions.

• When administering with cisplatin, hydrate patient with 1 to 2 L fluid infused over 8 to 12 hours before and after cisplatin administration. Maintain adequate hydration and urine output for 24 hours.

• To reduce toxicity, ensure that patient receives at least five daily doses of low-dose folic acid or multivitamin with folic acid within 7 days before first pemetrexed dose. Folic acid therapy should continue throughout course of therapy and for 21 days after final dose. Patient also must receive one I.M. injection of vitamin B<sub>12</sub> during week before first pemetrexed dose and every three cycles thereafter.

• Discontinue drug if creatinine clearance is below 45 ml/minute or patient has hematologic or nonhematologic Grade 3 or 4 toxicity after two dosage reductions (except Grade 3 transaminase elevation).

- Withdraw drug immediately in patients with Grade 3 or 4 neurotoxicity.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** fatigue, sensory neuropathy, altered mood, depression

**CV: thrombosis, embolism**

**EENT:** pharyngitis

**GI:** nausea, vomiting, constipation, diarrhea without colostomy, dysphagia, esophagitis, pain on swallowing, stomatitis, anorexia

**GU: renal failure**

**Hematologic: neutropenia, leukopenia, anemia, thrombocytopenia, febrile neutropenia**

**Hepatic:** abnormal liver function

**Musculoskeletal:** myalgia, arthralgia

**Respiratory:** dyspnea

**Skin:** rash, desquamation, alopecia

**Other:** fever, dehydration, noncardiac chest pain, infection without neutropenia or with Grade 3 or Grade 4 neutropenia, edema, other constitutional symptoms, allergic reaction, hypersensitivity reaction

### Interactions

**Drug-drug:** *Ibuprofen:* decreased pemetrexed clearance and increased concentration

*Nephrotoxic agents:* possible decrease in pemetrexed clearance

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, serum creatinine:* increased  
*Creatinine clearance, hematocrit, hemoglobin, platelets, WBCs:* decreased

### Patient monitoring

• Monitor CBC and platelet counts frequently.

• Monitor renal and liver function tests and blood chemistry results (especially serum creatinine) periodically.

P

- Know that patients with mild to moderate renal insufficiency should avoid taking nonsteroidal anti-inflammatory drugs (NSAIDs) with short elimination half-lives (such as aspirin, diclofenac, and ibuprofen) for 5 days before, on day of, and for 2 days after pemetrexed administration. If concomitant NSAID use is necessary, monitor patient closely for toxicities (especially myelosuppression and renal and GI toxicity).
- Be aware that all patients should avoid NSAIDs with long half-lives (such as diflunisal, piroxicam, and sulindac) for at least 5 days before, on day of, and for 2 days after pemetrexed administration. If concomitant NSAID use is necessary, monitor patient closely for toxicities (especially myelosuppression and renal and GI toxicity).

### Patient teaching

- Instruct patient to take folic acid and vitamin B<sub>12</sub> before and during therapy, as prescribed.
- Advise patient to drink ten 8-oz glasses of fluid and to urinate frequently during first 24 hours after therapy that includes cisplatin.
- Teach patient to recognize signs and symptoms of anemia and to contact prescriber if temperature above 100.4 °F (38 °C) develops.
- Tell patient to consult prescriber before taking products containing ibuprofen.
- Advise female with childbearing potential to avoid pregnancy during therapy.
- Instruct breastfeeding patient to stop breastfeeding during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## penicillin G benzathine

Bicillin L-A, Permapen

**Pharmacologic class:** Penicillin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

### Action

Inhibits biosynthesis of cell-wall mucopeptide; kills penicillin-susceptible bacteria during active multiplication stage

### Availability

*Suspension for I.M. injection:* 600,000 units/ml in 1-, 2-, and 4-ml prefilled syringes

### Indications and dosages

➤ Upper respiratory infections

**Adults:** 1.2 million units I.M. as a single dose

**Children weighing 27 kg (60) or more:** 900,000 units I.M. as a single dose

**Infants and children weighing less than 27 kg (60 lb):** 300,000 to 600,000 units I.M. as a single dose

➤ Early syphilis (primary, secondary, or latent)

**Adults:** 2.4 million units I.M. as a single dose

**Children:** 50,000 units/kg I.M. as a single dose, increased as needed up to adult dosage

➤ Congenital syphilis

**Children younger than age 2:** 50,000 units/kg I.M. as a single dose

➤ Late (tertiary) syphilis and neurosyphilis

**Adults:** 2.4 million units I.M. q week for up to 3 weeks, after aqueous penicillin G or procaine penicillin therapy

➤ Gummas and cardiovascular syphilis

**Adults:** 2.4 million units I.M. q week for 3 weeks

➤ Yaws, bejel, and pinta

**Adults:** 1.2 million units I.M. as a single dose

➤ Prophylaxis of rheumatic fever and glomerulonephritis

**Adults:** After acute attack, 1.2 million units I.M. q month or 600,000 units q 2 weeks

### Contraindications

- Hypersensitivity to penicillins, beta-lactamase inhibitors (piperacillin/tazobactam), or benzathine

### Precautions

Use cautiously in:

- severe renal insufficiency, significant allergies, asthma
- pregnant or breastfeeding patients.

### Administration

- Before giving, ask patient about allergy to penicillin, beta-lactamase inhibitors, and benzathine. Be aware that cross-sensitivity to cephalosporins and imipenem also may occur.

⚠ Do not give intravenously

- Inject deep I.M. into upper outer quadrant of buttock in adult or mid-lateral thigh in infant or small child. Don't inject into gluteal muscle in child younger than age 2. Rotate injection sites with repeated doses.

⚠ Keep epinephrine and emergency equipment at hand in case of anaphylaxis.

- Be aware that Hoigne's syndrome (transient bizarre behavior and neurologic reactions) may immediately follow I.M. injection.
- Know that in syphilis treatment, Jarisch-Hersheimer reaction (fever, chills, headache, sweating, malaise, hypotension or hypertension) may occur 2 to 12 hours after therapy begins and usually subsides within 24 hours.

Route	Onset	Peak	Duration
I.M.	Delayed	Dose dependent	Dose dependent

### Adverse reactions

**CNS:** headache, lethargy, hallucinations, anxiety, neuropathy, fatigue, nervousness, tremors, euphoria, asthenia, Hoigne's syndrome, **cerebrovascular accident, seizures, coma**

**CV:** hypotension, pulmonary hypertension, vasodilation, vasovagal reaction, syncope, palpitations, tachycardia, **cardiac arrest, pulmonary embolism**

**EENT:** blurred vision, vision loss, laryngeal edema

**GI:** nausea, vomiting, diarrhea, epigastric distress, abdominal pain, colitis, blood in stool, glossitis, **pseudomembranous colitis**

**GU:** hematuria, proteinuria, urogenic bladder, erectile dysfunction, priapism, nephropathy, **renal failure**

**Hematologic:** hemolytic anemia, leukopenia, thrombocytopenia

**Metabolic:** hypernatremia, **hyperkalemia**

**Respiratory:** dyspnea, hypoxia, **apnea, pulmonary embolism**

**Skin:** rash, urticaria, sweating

**Other:** fever, superinfection, injection site reactions and pain, Jarisch-Hersheimer reaction, **anaphylaxis, serum sickness**

### Interactions

**Drug-drug.** *Aspirin, probenecid:*

increased penicillin blood level

*Erythromycins, tetracyclines:* decreased antimicrobial activity of penicillin

*Hormonal contraceptives:* decreased contraceptive efficacy

**Drug-diagnostic tests.** *Alanine aminotransferase, blood urea nitrogen, creatinine, eosinophils, granulocytes, hemoglobin, platelets, potassium, white blood cells:* increased levels

*Direct Coombs' test:* positive result

*Sodium:* decreased level

*Urine glucose, urine protein:* false-positive results

**Patient monitoring**

☞ Watch closely for anaphylaxis and serum sickness.

- In long-term therapy, monitor electrolyte levels and CBC with white cell differential; watch for electrolyte imbalances and blood dyscrasias.
- Assess neurologic status, especially for seizures and decreasing level of consciousness.

☞ Watch for evidence of superinfection and pseudomembranous colitis.

**Patient teaching**

☞ Teach patient to recognize anaphylaxis symptoms and to contact emergency medical services immediately if these occur.

☞ Tell patient drug may cause diarrhea. Instruct him to immediately report severe, persistent diarrhea, and fever.

- Urge patient to complete entire course of therapy as prescribed, even after symptoms improve.
- Advise patient to contact prescriber if infection symptoms get worse.
- Tell female patient that drug may make hormonal contraceptives ineffective. Advise her to use barrier birth control if she wishes to avoid pregnancy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

**penicillin G potassium**

Pfizerpen

*Pharmacologic class:* Penicillin*Therapeutic class:* Anti-infective*Pregnancy risk category B***Action**

Inhibits biosynthesis of cell-wall mucopeptide; bactericidal against penicillin-susceptible microorganisms during active multiplication stage

**Availability**

*Powder for injection:* 1 million, 5 million, and 20 million units/vial  
*Premixed (frozen) solution for injection:* 1 million, 2 million, and 3 million units/50 ml

**Indications and dosages**

➤ Meningococcal meningitis

**Adults:** 1 to 2 million units I.M. q 2 hours or 20 to 30 million units/day by continuous I.V. infusion for 14 days, or until afebrile for 7 days

➤ Meningitis caused by susceptible pneumococcal or meningococcal strains

**Children:** 250,000 units/kg/day in equally divided doses I.M. or by continuous I.V. infusion q 4 hours for 7 to 14 days (depending on causative organism)

**Infants older than 7 days:** 200,000 to 300,000 units/kg/day I.V. in divided doses q 6 hours

**Infants less than 7 days old:** 100,000 to 150,000 units/kg/day I.V. in divided doses q 12 hours

➤ Actinomycosis

**Adults:** 1 to 6 million units/day I.M. or I.V. for cervicofacial infections; 10 to 20 million units/day I.V. q 4 to 6 hours for 6 weeks for thoracic and abdominal infections

➤ Clostridial infections

**Adults:** 20 million units/day I.M. or I.V. infusion q 4 to 6 hours, given with antitoxin therapy

➤ Fusospirochetal infections

**Adults:** 5 to 10 million units/day I.M. or 200,000 to 500,000 units I.V. infusion q 4 to 6 hours

➤ Rat bite fever; Haverhill fever

**Adults:** 12 to 20 million units/day I.M. or I.V. infusion q 4 to 6 hours for 3 or 4 weeks

➤ *Pasteurella* infections

**Adults:** 4 to 6 million units/day I.M. or I.V. infusion q 4 to 6 hours for 2 weeks

➤ Erysipeloid endocarditis

**Adults:** 12 to 20 million units/day I.M. or I.V. infusion q 4 to 6 hours for 4 to 6 weeks

➤ Diphtheria (as adjunctive therapy with antitoxin to prevent carrier state)

**Adults:** 2 to 3 million units/day I.M. or I.V. infusion in divided doses q 4 to 6 hours for 10 to 12 days

➤ Anthrax

**Adults:** At least 5 million units/day I.M. or I.V. infusion

➤ Serious streptococcal infections

**Adults:** 5 to 24 million units/day I.M. or I.V. infusion in divided doses q 4 to 6 hours

➤ Neurosyphilis

**Adults:** 18 to 24 million units/day I.V. (given in doses of 3 to 4 million units q 4 hours) for 10 to 14 days

➤ *Listeria* infections

**Adults:** 15 to 20 million units/day I.M. or I.V. infusion q 4 to 6 hours for 2 weeks in meningitis or 4 weeks in endocarditis

➤ Disseminated gonococcal infections

**Adults:** 10 million units/day I.V. (3 to 4 million units q 4 hours) for 10 to 14 days

### Off-label uses

- Lyme disease
- Pre dental prophylaxis against bacterial endocarditis

### Contraindications

- Hypersensitivity to penicillins or beta-lactamase inhibitors (piperacillin/tazobactam)

### Precautions

Use cautiously in:

- severe renal insufficiency, significant allergies, asthma
- pregnant or breastfeeding patients.

### Administration

- Before giving, ask patient about allergy to penicillin, beta-lactamase inhibitors, or benzathine. Know that cross-sensitivity to imipenem and cephalosporins also may occur.
- ⚠ Keep epinephrine and emergency equipment at hand in case anaphylaxis occurs.
- For I.V. use, dilute in sterile water for injection, normal saline solution, or dextrose 5% in water (D<sub>5</sub>W). For continuous infusion, further dilute in 1 to 2 L of compatible solution and infuse over 24 hours. For intermittent infusion, further dilute in 50 or 100 ml of normal saline solution or D<sub>5</sub>W; administer over 1 to 2 hours in adults or 15 to 30 minutes in children and infants.
- Know that drug also may be given by intrapleural or intrathecal route.
- Be aware that in syphilis treatment, Jarisch-Hersheimer reaction (fever, chills, headache, sweating, malaise, hypotension or hypertension) may occur 2 to 12 hours after therapy starts and usually subsides within 24 hours.

Route	Onset	Peak	Duration
I.M.	Rapid	15-30 min	4-6 hr
I.V.	Rapid	End of infusion	4-6 hr

### Adverse reactions

**CNS:** hyperreflexia, neuropathy, **coma**, seizures

**CV:** arrhythmias, **cardiac arrest**, **heart failure** (with high I.V. doses)

**GI:** nausea, vomiting, diarrhea, epigastric distress, abdominal pain, colitis, blood in stool, glossitis, **pseudomembranous colitis**

**GU:** nephropathy

**Hematologic:** **hemolytic anemia**, **leukopenia**, **thrombocytopenia**

**Metabolic:** **hyperkalemia** (with high-dose, continuous I.V. infusion)

**Skin:** rash, urticaria, exfoliative dermatitis

**Other:** pain at I.M. injection site, phlebitis at I.V. site, Jarisch-Hersheimer reaction, superinfection, **anaphylaxis**, **serum sickness**

### Interactions

**Drug-drug.** *Aspirin, probenecid:* increased penicillin blood level

*Erythromycins, tetracyclines:* decreased antimicrobial activity of penicillin

*Hormonal contraceptives:* decreased contraceptive efficacy

**Drug-diagnostic tests.** *Alanine aminotransferase, eosinophils, granulocytes, hemoglobin, platelets, potassium, white blood cells:* increased levels

*Direct Coombs' test:* positive result

*Sodium:* decreased level

*Urine glucose, urine protein:* false-positive results

### Patient monitoring

📢 Watch closely for signs and symptoms of anaphylaxis and serum sickness.

- In long-term therapy, monitor electrolyte levels and CBC with white cell differential; watch for electrolyte imbalances and blood dyscrasias.

- Closely monitor neurologic status, especially for seizures and decreasing level of consciousness.

📢 Stay alert for signs and symptoms of superinfection and pseudomembranous colitis.

### Patient teaching

📢 Teach patient to recognize signs and symptoms of anaphylaxis. Tell him to contact emergency medical services immediately if these occur.

📢 Tell patient drug may cause diarrhea. Instruct him to immediately report severe, persistent diarrhea and fever.

- Urge patient to complete entire course of therapy as prescribed, even after symptoms improve.

- Tell patient to contact prescriber if infection symptoms worsen.

- Inform female patient that drug may make hormonal contraceptives ineffective. Advise her to use barrier birth-control method if she wishes to avoid pregnancy.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## penicillin G procaine

Ayercillin<sup>☼</sup>, Crysticillin-AS<sup>☼</sup>

**Pharmacologic class:** Penicillin

**Therapeutic class:** Anti-infective

**Pregnancy risk category** B

### Action

Inhibits biosynthesis of cell-wall mucopeptide; bactericidal against penicillin-susceptible microorganisms during active multiplication stage

### Availability

*Suspension for I.M. injection:* 600,000 units/ml vial, 1.2 million units/2-ml vial, 2.4 million units/4-ml vial, 3 million units/10-ml vial

### Indications and dosages

➤ Anthrax; bacterial endocarditis; erysipeloid and fusospirochetal infections; group A streptococcal infections; moderately severe, uncomplicated pneumococcal pneumonia and staphylococcal infections; rat-bite fever

**Adults:** 600,000 to 1 million units/day I.M.

➤ Diphtheria

**Adults:** 300,000 to 600,000 units/day I.M. given with antitoxin for 14 days.

For carrier state, 300,000 units/day I.M. for 10 days.

➤ Syphilis, yaws, bejel, pinta

**Adults and children older than age 12:**

600,000 units/day I.M. for 8 days; for late infections, continue for 10 to 15 days. For neurosyphilis, 2.4 million units/day I.M. for 10 to 14 days, given with probenecid.

➤ Congenital syphilis

**Children:** 50,000 units/kg I.M. daily for at least 10 days

➤ Uncomplicated gonorrhea

**Adults:** 4.8 million units/day I.M., divided into at least two doses and two sites at one visit, with P.O. probenecid given 30 minutes before injection

### Off-label uses

- Lyme disease
- Pre dental prophylaxis against bacterial endocarditis

### Contraindications

- Hypersensitivity to penicillins, beta-lactamase inhibitors (piperacillin/tazobactam), or procaine

### Precautions

Use cautiously in:

- severe renal insufficiency, significant allergies, asthma
- pregnant or breastfeeding patients
- neonates.

### Administration

- Before giving, ask patient about allergy to penicillin, beta-lactamase inhibitors, or benzathine. Know that cross-sensitivity to imipenem and cephalosporins may occur.
- 📢 Keep epinephrine and emergency equipment at hand in case anaphylaxis occurs.
- In adults, inject I.M. deep into upper outer aspect of buttock.
- In infants and small children, inject at a slow, steady rate into midlateral aspect of thigh.

- Be aware that Hoigne's syndrome (transient bizarre behavior and neurologic reactions) may immediately follow I.M. injection.

- Know that in syphilis treatment, Jarisch-Hersheimer reaction (fever, chills, headache, sweating, malaise, hypotension or hypertension) may occur 2 to 12 hours after therapy starts and usually subsides within 24 hours.

Route	Onset	Peak	Duration
I.M.	Delayed	1-3 hr	24 hr

### Adverse reactions

**CNS:** lethargy, hallucinations, anxiety, depression, twitching, Hoigne's syndrome, **seizures, coma**

**EENT:** laryngeal edema

**GI:** nausea, vomiting, diarrhea, epigastric distress, abdominal pain, colitis, blood in stool, glossitis, **pseudomembranous colitis**

**GU:** interstitial nephritis

**Hematologic:** increased bleeding, hemolytic anemia, bone marrow depression, leukopenia, thrombocytopenia, granulocytopenia

**Skin:** rash, urticaria

**Other:** pain at I.M. injection site, fever, superinfection, Jarisch-Hersheimer reaction, sterile abscess, procaine toxicity, **anaphylaxis, serum sickness**

### Interactions

**Drug-drug.** *Aspirin, probenecid:* increased penicillin blood level

*Erythromycins, tetracyclines:* decreased antimicrobial activity of penicillin

*Hormonal contraceptives:* decreased contraceptive efficacy

**Drug-diagnostic tests.** *Alanine aminotransferase, eosinophils, granulocytes, hemoglobin, platelets, potassium, white blood cells:* increased levels

*Direct Coombs' test:* positive result

*Sodium:* decreased level

*Urine glucose, urine protein:* false-positive results

**Patient monitoring**

⚠ Watch closely for signs and symptoms of anaphylaxis and serum sickness.

- In long-term therapy, monitor electrolyte levels and CBC with white cell differential. Watch for electrolyte imbalances and blood dyscrasias.

- Assess neurologic status, especially for seizures and decreasing level of consciousness.

⚠ Monitor patient for signs and symptoms of superinfection and pseudomembranous colitis.

**Patient teaching**

⚠ Teach patient to recognize signs and symptoms of anaphylaxis. Tell him to contact emergency medical services immediately if these occur.

⚠ Tell patient drug may cause diarrhea. Instruct him to immediately report severe, persistent diarrhea and fever.

- Stress importance of completing entire course of therapy as prescribed, even after symptoms improve.

- Advise patient to contact prescriber if infection symptoms worsen.

- Tell female patient that drug may make hormonal contraceptives ineffective. Encourage her to use barrier birth-control method if she wishes to avoid pregnancy.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

**penicillin V potassium**

Apo-Pen VK<sup>⚠</sup>, Novo-Pen-VK<sup>⚠</sup>, Pen-Vee

**Pharmacologic class:** Penicillin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

**Action**

Inhibits biosynthesis of cell-wall mucopeptide; bactericidal against penicillin-susceptible microorganisms during active multiplication stage

**Availability**

*Oral solution:* 200,000 units (125 mg)/

5 ml, 400,000 units (250 mg)/5 ml

*Tablets:* 400,000 units (250 mg), 800,000 units (500 mg)

**Indications and dosages**

➤ Upper respiratory streptococcal infections, including scarlet fever and mild erysipelas

**Adults and children ages 12 and older:**

125 to 250 mg P.O. q 6 to 8 hours for 10 days

**Children younger than age 12:** 25 to 50 mg/kg/day P.O. in divided doses q 6 hours for 10 days

➤ Pneumococcal respiratory infections, including otitis media

**Adults and children ages 12 and older:**

250 to 500 mg P.O. q 6 hours until afebrile for at least 2 days

➤ Skin and soft-tissue staphylococcal infections; fusospirochetosis (Vincent's infection) of oropharynx

**Adults and children ages 12 and older:**

250 to 500 mg P.O. q 6 to 8 hours

➤ To prevent recurrence of rheumatic fever or chorea

**Adults and children ages 12 and older:**

125 to 250 mg P.O. b.i.d. on a continuing basis

**Off-label uses**

- Prophylaxis of *Streptococcus pneumoniae* septicemia in children with sickle cell anemia or splenectomy

- Early Lyme disease

- Actinomycosis

- Preexposure prophylaxis of anthrax

- Prophylaxis of bacterial endocarditis for dental procedures

## Contraindications

- Hypersensitivity to penicillins or beta-lactamase inhibitors (piperacillin/tazobactam)

## Precautions

Use cautiously in:

- severe renal insufficiency
- pregnant or breastfeeding patients.

## Administration

- Before giving, ask patient about allergies to penicillin, beta-lactamase inhibitors, or benzathine. Know that cross-sensitivity to imipenem and cephalosporins may occur.

 Keep epinephrine and emergency equipment at hand in case anaphylaxis occurs.

- Give with water 1 hour before or 2 hours after meals. Don't give with fruit juice or carbonated beverages.

Route	Onset	Peak	Duration
P.O.	Unknown	1 hr	6 hr

## Adverse reactions

**CNS:** lethargy, hallucinations, anxiety, depression, twitching, **seizures, coma**

**GI:** nausea, vomiting, diarrhea, epigastric distress, abdominal pain, colitis, blood in stool, glossitis, **pseudomembranous colitis**

**GU:** **interstitial nephritis**

**Hematologic:** anemia, **hemolytic anemia, increased bleeding, leukopenia, granulocytopenia, bone marrow depression, thrombocytopenia,**

**thrombocytopenic purpura**

**Metabolic:** hypokalemia, **hyperkalemia, metabolic alkalosis**

**Skin:** rash, urticaria

**Other:** fever, superinfection, **anaphylaxis, serum sickness**

## Interactions

**Drug-drug.** *Aspirin, probenecid:*

increased penicillin blood level

*Erythromycins, tetracyclines:* decreased antimicrobial activity of penicillin

*Hormonal contraceptives:* decreased contraceptive efficacy

**Drug-diagnostic tests.** *Alanine aminotransferase, eosinophils, granulocytes, hemoglobin, platelets:* increased levels  
*Albumin, lymphocytes, protein, sodium, uric acid, white blood cells:* decreased levels

*Direct Coombs' test:* positive result

*Potassium:* increased or decreased level

*Urine glucose, urine protein:* false-positive results

**Drug-herbs.** *Khat:* delayed and reduced penicillin absorption

## Patient monitoring

 Watch for signs and symptoms of anaphylaxis and serum sickness.

- In long-term therapy, monitor electrolyte levels and CBC with white cell differential; watch for electrolyte imbalances and blood dyscrasias.

- Assess neurologic status, especially for seizures and decreasing level of consciousness.

 Monitor patient closely for signs and symptoms of superinfection and pseudomembranous colitis.

## Patient teaching

- Instruct patient to take with water 1 hour before or 2 hours after meals. Tell him not to take with fruit juice or carbonated beverages.

 Teach patient to recognize anaphylaxis symptoms. Tell him to immediately contact emergency medical services if these occur.

- Instruct patient to report signs and symptoms of superinfection.

- Advise patient to contact prescriber if infection symptoms get worse.

 Tell patient drug may cause diarrhea. Instruct him to immediately report severe, persistent diarrhea and fever.

- Instruct patient to complete entire course of therapy as prescribed, even after symptoms improve.

- Tell female patient drug may make hormonal contraceptives ineffective.

Advise her to use barrier birth-control method if she wishes to avoid pregnancy.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## pentamidine isethionate

NebuPent, Pentacarinat<sup>®</sup>,  
Pentam 300

**Pharmacologic class:** Antiprotozoal

**Therapeutic class:** Anti-infective

**Pregnancy risk category** C

### Action

Unknown. May interfere with nuclear metabolism and synthesis of DNA, RNA, and proteins.

### Availability

*Aerosol:* 300 mg

*Injection:* 300 mg/vial

### Indications and dosages

➤ *Pneumocystis jiroveci* pneumonia

**Adults and children ages 5 and older:** 4 mg/kg I.V. or deep I.M. daily for 14 days

➤ To prevent *P. jiroveci* pneumonia in high-risk patients with human immunodeficiency virus

**Adults:** 300 mg by inhalation once q 4 weeks using Respigard II nebulizer

### Off-label uses

- Trypanosomiasis
- Visceral leishmaniasis

### Contraindications

- History of anaphylaxis from pentamidine or diamidine compounds (inhalation only)

(*Note:* No absolute contraindications exist for patients with *P. jiroveci*.)

### Precautions

Use cautiously if:

- anemia, blood dyscrasias, hepatic or renal disease, hypoglycemia, diabetes mellitus, ventricular tachycardia, hypocalcemia, hypertension, hypotension
- pregnant or breastfeeding patients
- children (safety and efficacy of inhalation solution not established).

### Administration

• For I.V. infusion, dilute 300 mg-vial with sterile water for injection. Withdraw prescribed dosage, then dilute further in 50 to 250 ml of dextrose 5% in water; infuse over 60 to 120 minutes.

• For I.M. use, dilute 300 mg-vial with 3 ml of sterile water for injection.

Withdraw prescribed dosage; administer deep I.M. using Z-track method.

• Keep patient supine during I.M. or I.V. administration to minimize hypotension.

• For inhalation, dilute in 6 ml of sterile water and administer through nebulizer at a flow rate of 6 L/minute from 50-psi compressed air source. Don't mix inhalation solution with other drugs.

Route	Onset	Peak	Duration
I.V.	Unknown	1 hr	Unknown
I.M., inhalation	Unknown	0.5 hr	Unknown

### Adverse reactions

**CNS:** headache, disorientation, hallucinations, dizziness, confusion, fatigue, neuralgia

**CV:** chest pain, ECG abnormalities, syncope, vasodilation, vasculitis, phlebitis, hypertension, palpitations,

**arrhythmias, severe hypotension**

**EENT:** pharyngitis

**GI:** nausea, vomiting, diarrhea, abdominal pain, anorexia, **acute pancreatitis**

**Hematologic:** anemia, **leukopenia, thrombocytopenia**

**Metabolic:** hypocalcemia, hyperglycemia, **hypoglycemia, hyperkalemia**

**Musculoskeletal:** myalgia

**Respiratory:** cough, dyspnea, congestion, **pneumothorax, bronchospasm**

**Skin:** rash, night sweats, urticaria, sterile abscess or induration at injection site

**Other:** metallic or bad taste, fever, chills, pain at injection site or elsewhere, edema, allergic reactions

### Interactions

**Drug-diagnostic tests.** *Blood urea nitrogen, creatinine, liver function tests, potassium:* increased values

*Calcium, hemoglobin, hematocrit, platelets, white blood cells:* decreased levels

*ECG:* alterations

*Glucose:* increased or decreased level

### Patient monitoring

🚨 Closely monitor blood pressure and blood glucose. Watch for arrhythmias and evidence of pulmonary infection, blood dyscrasias, and pancreatitis during and after I.M. or I.V. administration, until patient is stable. (Severe, life-threatening reactions may occur.)

- Assess I.V. site closely during and after I.V. administration. Know that sterile abscess, pain, or induration may occur at injection site.

- Evaluate neurologic status.

- Monitor CBC (including platelet count), calcium and potassium levels, and kidney and liver function tests.

### Patient teaching

- Explain purpose of therapy. Stress importance of completing entire course of treatment.

🚨 Teach patient to recognize and immediately report serious cardiovascular and neurologic reactions,

abdominal pain, and easy bruising or bleeding.

- Teach patient how to use aerosol.

- Tell patient to notify prescriber if infection worsens.

- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## pentazocine lactate

Talwin

## pentazocine hydrochloride and acetaminophen

Fortral 🌐

## pentazocine hydrochloride and naloxone hydrochloride

**Pharmacologic class:** Opioid agonist-antagonist

**Therapeutic class:** Opioid analgesic, adjunct to anesthesia

**Controlled substance schedule** IV

**Pregnancy risk category** C

### FDA BOXED WARNING

- When administering pentazocine hydrochloride and acetaminophen, be aware that acetaminophen has been associated with acute liver failure, at times resulting in liver transplant or death. Most of the cases of liver injury are associated with the use of acetaminophen at dosages that exceed

4,000 mg/day, and often involve more than one acetaminophen-containing product.

- Pentazocine and naloxone hydrochloride tablets are for oral use only. Severe, potentially lethal reactions may result from misuse by injection, alone or in combination with other substances.

### Action

Unknown. Thought to interact with opioid receptor sites primarily in limbic system, thalamus, and spinal cord, blocking transmission of pain impulses.

### Availability

*Injection:* 30 mg/ml (as lactate salt)

*Tablets:* 50 mg pentazocine and 0.5 mg naloxone (Talwin NX); 25 mg pentazocine and 650 mg acetaminophen (Talacen)

### Indications and dosages

➤ Moderate to severe pain; preoperative or preanesthetic medication; adjunct to surgical anesthesia

**Adults:** 30 mg subcutaneously, I.M., or I.V. q 3 to 4 hours (not to exceed 60 mg/dose subcutaneously or I.M., or 30 mg/dose I.V.). Maximum daily dosage is 360 mg.

➤ Moderate to severe pain

**Adults:** Initially, one tablet (Talwin Nx) q 3 to 4 hours, increased to two tablets p.r.n., up to a maximum of 12 tablets daily

➤ Mild to moderate pain

**Adults:** One tablet (Talacen) P.O. q 4 hours; up to a maximum of six tablets daily

➤ Labor

**Adults:** 20 mg I.V. for two or three doses at 2- to 3-hour intervals, or 30 mg I.M. as a single dose

### Contraindications

- Hypersensitivity to drug, acetaminophen, or naloxone (with oral form)

### Precautions

Use cautiously in:

- head trauma, increased intracranial pressure, respiratory conditions, adrenal insufficiency, seizure disorder, acute CNS manifestations, hepatic impairment, acute myocardial infarction, alcohol or narcotic use
- sulfite sensitivity (Talacen)
- history of drug abuse
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Administer each 5-mg I.V. dose by slow direct infusion over 1 minute, with patient lying supine.
- Use subcutaneous route only when necessary (may cause tissue damage).

Route	Onset	Peak	Duration
P.O. (Talwin NX)	15-30 min	1-3 hr	3 hr
P.O. (Talacen)	15-30 min	60-90 min	3 hr
I.V.	12-30 min	Unknown	3 hr
I.M., subcut.	15-20 min	15-60 min	3 hr

### Adverse reactions

**CNS:** dizziness, drowsiness, euphoria, hallucinations, headache, sedation, dysphoria, insomnia, unusual dreams, weakness, depression, irritability, excitement, tremor, paresthesia  
**CV:** hypertension, hypotension, syncope, tachycardia, **circulatory depression, shock**

**EENT:** blurred vision, diplopia, nystagmus, miosis (with high doses), tinnitus

**GI:** nausea, vomiting, constipation, diarrhea, dry mouth, ileus, cramps, abdominal distress, anorexia

**GU:** urinary retention, altered rate and strength of labor contractions

**Hematologic: thrombocytopenia purpura** (with Talacen)

**Respiratory:** dyspnea, transient apnea in neonates whose mothers received pentazocine during labor, **respiratory depression**

**Skin:** clammy skin, diaphoresis, rash, urticaria, nodules, cutaneous depression, skin and subcutaneous sclerosis, dermatitis, pruritus, flushing

**Other:** altered taste, chills, soft-tissue induration, stinging on injection, facial edema, physical or psychological drug dependence, drug tolerance, **anaphylaxis**

### Interactions

**Drug-drug.** *Barbiturates, first-generation (sedating) antihistamines, other sedating drugs:* additive CNS depression

*MAO inhibitors:* unpredictable reactions

*Opioids:* decreased analgesic effects

**Drug-diagnostic tests.** *Amylase, lipase:* increased levels

*Granulocytes, white blood cells:* reduced counts

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

### Patient monitoring

🚨 Monitor vital signs. Watch closely for evidence of shock, dyspnea, and circulatory or respiratory depression.

- Monitor drug efficacy.
- In prolonged use, assess for signs and symptoms of drug dependence.

### Patient teaching

🚨 Tell patient receiving Talacen or Talwin NX that drug is for oral use only. Life-threatening reactions may result from misusing drug by injection.

- Inform patient that withdrawal symptoms may occur if he stops taking drug suddenly after prolonged use.

- Urge patient to avoid alcohol.
- Advise patient to consult prescriber before taking other prescription drugs or over-the-counter preparations.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects him.
- Advise patient to have periodic eye exams.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## pentobarbital sodium

Nembutal Sodium

**Pharmacologic class:** Barbiturate

**Therapeutic class:** Sedative-hypnotic, anticonvulsant

**Controlled substance schedule II**

**Pregnancy risk category D**

### Action

Depresses sensory cortex, decreases motor activity, and alters cerebellar function; may interfere with nerve impulse transmission in brain

### Availability

*Injection:* 50 mg/ml in 2-ml prefilled syringes

### Indications and dosages

➤ Preoperative sedation

**Adults:** Initially, 150 to 200 mg I.M., or 100 mg I.V.

➤ Seizures

**Adults:** Initially, 100 mg. I.V.; may give additional doses after 1 minute. Maximum dosage is 500 mg.

**Children:** Initially, 50 mg. I.V.; may give additional doses until desired

response occurs. Don't exceed 100 mg/dose.

### Contraindications

- Hypersensitivity to drug or other barbiturates
- Nephritis (with large doses)
- Severe hepatic impairment
- Severe respiratory disease with dyspnea or obstruction
- Manifest or latent porphyria
- History of sedative-hypnotic abuse
- Subcutaneous or intra-arterial administration

### Precautions

Use cautiously in:

- hepatic or renal impairment, increased risk for suicide, alcohol use
- history of drug addiction
- labor and delivery
- elderly or debilitated patients.

### Administration

 When giving I.V., make sure resuscitation equipment is available.

- Give I.V. by direct injection no faster than 50 mg/minute.
- Inject I.M. deep into large muscle mass.

 Don't give by subcutaneous or intra-arterial routes, because severe reactions (such as tissue necrosis and gangrene) may occur.

- Know that drug is for short-term use only, losing efficacy after about 2 weeks.

Route	Onset	Peak	Duration
I.V.	Immediate	1 min	3-4 hr
I.M.	10-25 min	Unknown	3-4 hr

### Adverse reactions

**CNS:** drowsiness, agitation, confusion, hyperkinesia, ataxia, nightmares, nervousness, hallucinations, insomnia, anxiety, abnormal thinking

**CV:** hypotension, syncope, **bradycardia** (all with I.V. use)

**GI:** nausea, vomiting, constipation

**Hepatic:** hepatic damage

**Musculoskeletal:** joint pain, myalgia, neuralgia

**Respiratory:** laryngospasm (with I.V. use), bronchospasm, respiratory depression

**Skin:** rash, urticaria, exfoliative dermatitis

**Other:** phlebitis at I.V. site, physical or psychological drug dependence, fever, hypersensitivity reactions including angioedema

### Interactions

**Drug-drug.** *Acetaminophen:* increased risk of hepatotoxicity

*Activated charcoal:* decreased pentobarbital absorption

*Anticoagulants, beta-adrenergic blockers (except timolol), carbamazepine, clonazepam, corticosteroids, digoxin, doxorubicin, doxycycline, felodipine, fenoprofen, griseofulvin, hormonal contraceptives, metronidazole, quinine, theophylline, verapamil:* decreased efficacy of these drugs

*Antihistamines (first-generation), opioids, other sedative-hypnotics:* additive CNS depression

*Chloramphenicol, hydantoin, narcotics:* increased or decreased effects of either drug

*Divalproex, MAO inhibitors, valproic acid:* decreased pentobarbital metabolism, increased sedation

*Rifampin:* increased pentobarbital metabolism and decreased effects

**Drug-diagnostic tests.** *Sulfobromophthalein:* false increase

**Drug-herbs.** *Chamomile, hops, kava, valerian, or skullcap:* increased CNS depression

*St. John's wort:* decreased pentobarbital effects

**Drug-behaviors.** *Alcohol use:* increased sedation, additive CNS depression

## Patient monitoring

🔊 Closely monitor blood pressure and heart and respiratory rates. Watch for evidence of respiratory depression.

- Monitor neurologic status before and during therapy.
- Assess CBC and kidney and liver function tests.
- In long-term therapy, monitor patient for signs of drug dependence.

## Patient teaching

- Advise patient to avoid other CNS depressants, alcohol, and herbs.
- Caution patient to avoid driving and other hazardous activities.
- Advise patient taking hormonal contraceptives to use alternate birth-control method during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## pentostatin

Nipent

**Pharmacologic class:** Antimetabolite

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

- Give under supervision of physician experienced in cancer chemotherapy, in facility with adequate diagnostic and treatment resources.
- Use of higher dosages than those specified isn't recommended, as dose-limiting severe renal, liver, pulmonary, and CNS toxicities may occur.
- In study of patients with refractory chronic lymphocytic leukemia

receiving drug at recommended dosage in combination with fludarabine, four of six patients had severe or fatal pulmonary toxicity. Use in combination with fludarabine isn't recommended.

## Action

Unknown. Thought to inhibit adenosine deaminase, thereby increasing levels of deoxyadenosine triphosphate in cells, blocking DNA synthesis, and inhibiting ribonucleotide reductase.

## Availability

*Powder for injection:* 10-mg vials

## Indications and dosages

➤ Hairy cell leukemia

**Adults:** 4 mg/m<sup>2</sup> I.V. every other week

## Contraindications

- Hypersensitivity to drug

## Precautions

Use cautiously in:

- renal disease, bone marrow depression
- pregnant or breastfeeding patients
- children.

## Administration

- Before giving, hydrate patient with 500 to 1,000 ml of dextrose 5% and normal saline solution (or its equivalent). After administering, give 500 ml of dextrose 5% in water (D<sub>5</sub>W) or its equivalent.

🔊 Follow facility protocol for handling, administering, and disposing of chemotherapeutic drugs.

- Give by direct I.V. bolus injection or dilute with 25 to 50 ml of D<sub>5</sub>W or normal saline solution; infuse over 20 to 30 minutes.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** headache, malaise, anxiety, confusion, depression, dizziness, insomnia,

nervousness, paresthesia, drowsiness, abnormal thinking, fatigue, asthenia, hallucinations, hostility, amnesia

**CV:** peripheral edema, cellulitis, vasculitis, hypotension, angina, tachycardia, bradycardia, phlebitis, **thrombophlebitis, cardiac arrest, heart failure, hemorrhage, ventricular asystole, pericardial effusion, sinus arrest**

**EENT:** abnormal vision, nonreactive pupils, photophobia, retinopathy, eye pain, conjunctivitis, dry or watery eyes, hearing loss, tinnitus, ear pain, epistaxis, pharyngitis, rhinitis

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, abdominal pain, ileus, flatulence, stomatitis, glossitis, anorexia

**GU:** amenorrhea, breast lump, erectile dysfunction, decreased libido, renal calculi, **renal dysfunction, renal insufficiency, renal failure**

**Hematologic:** ecchymosis, anemia, **hemolytic anemia, agranulocytosis, aplastic anemia, leukopenia, thrombocytopenia**

**Metabolic:** hyperuricemia, hypercalcemia, hyponatremia

**Musculoskeletal:** myalgia, joint pain

**Respiratory:** cough, dyspnea, respiratory tract infection, **pulmonary embolism**

**Skin:** rash, eczema, petechiae, dry skin, pruritus, skin disorder, furunculosis, acne, alopecia, diaphoresis, photosensitivity

**Other:** unusual taste, gingivitis, fever, chills, pain, facial edema, lymphadenopathy, herpes simplex or herpes zoster infection, flulike symptoms, viral or bacterial infection, allergic reaction, **sepsis, neoplasm**

## Interactions

**Drug-drug.** *Allopurinol:* hypersensitivity vasculitis

*Carmustine, cyclophosphamide, etoposide:* potentially fatal acute pulmonary edema and hypotension

*Fludarabine:* severe or fatal pulmonary toxicity

*Vidarabine:* increased risk and severity of adverse reactions

**Drug-diagnostic tests.** *Calcium, liver function tests, serum uric acid:* increased values

*Granulocytes, platelets, sodium, white blood cells:* decreased levels

## Patient monitoring

 Monitor CBC (including platelet count). Watch for evidence of blood dyscrasias.

- Assess kidney and liver function tests. Stay alert for evidence of organ dysfunction.
- Monitor temperature. Watch for signs and symptoms of bacterial and viral infection.
- Closely monitor vital signs and ECG, particularly for life-threatening arrhythmias, heart failure, and pulmonary edema.

## Patient teaching

 Tell patient drug lowers resistance to infection. Instruct him to avoid crowds and to immediately report fever, cough, sore throat, and other infection symptoms.

- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- Instruct female patient of childbearing age to avoid pregnancy during drug therapy and to seek medical advice before becoming pregnant.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## pentoxifylline

Apo-Pentoxifylline, Neotren<sup>®</sup>,  
Pentoxil, Pentoxiphylline<sup>®</sup>,  
Pentoxiphylline SR<sup>®</sup>, Trental

**Pharmacologic class:** Hemorrhheologic, xanthine derivative

**Therapeutic class:** Hematologic agent

**Pregnancy risk category C**

### Action

Unknown. Thought to enhance blood flow to the circulatory system by increasing vasoconstriction and oxygen concentrations.

### Availability

Tablets (controlled-release, extended-release): 400 mg

### Indications and dosages

➤ Intermittent claudication

**Adults:** 400 mg t.i.d. If adverse reactions occur, decrease to 400 mg b.i.d.

### Dosage adjustment

- Renal impairment

### Off-label uses

- Diabetic angiopathies and neuropathies
- Transient ischemic attacks
- Severe idiopathic recurrent aphthous stomatitis
- Raynaud's phenomenon

### Contraindications

- Hypersensitivity to drug or methylxanthines (such as caffeine, theophylline, theobromine)
- Recent cerebral or retinal hemorrhage

### Precautions

Use cautiously in:

- patients at risk for bleeding
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Give with meals to minimize GI distress.
- Make sure patient swallows tablets whole without crushing, breaking, or chewing.

Route	Onset	Peak	Duration
P.O.	Variable	2-4 hr	8 hr

### Adverse reactions

**CNS:** agitation, dizziness, drowsiness, headache, insomnia, nervousness, tremor, anxiety, confusion, malaise

**CV:** angina, edema, hypotension,

**arrhythmias**

**EENT:** blurred vision, epistaxis, laryngitis, nasal congestion, sore throat

**GI:** nausea, vomiting, constipation, diarrhea, abdominal discomfort, belching, bloating, dyspepsia, flatus, cholecystitis, dry mouth, excessive salivation, anorexia

**Hematologic: leukopenia**

**Respiratory:** dyspnea

**Skin:** rash, urticaria, pruritus, brittle fingernails, flushing, angioedema

**Other:** bad taste, weight changes, thirst, flulike symptoms, lymphadenopathy

### Interactions

**Drug-drug.** *Anticoagulants, nonsteroidal anti-inflammatory drugs (NSAIDs):* increased risk of bleeding

*Antihypertensives:* additive hypotension

*Theobromide, theophylline:* increased risk of theophylline toxicity

**Drug-herbs.** *Anise, arnica, asafetida, chamomile, clove, dong quai, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, licorice:* increased risk of bleeding

**Drug-behaviors.** *Smoking:* decreased pentoxifylline efficacy

**Patient monitoring**

- Monitor vital signs and cardiovascular status. Watch for arrhythmias, angina, edema, and hypotension.
- Frequently monitor prothrombin time and International Normalized Ratio in patients receiving warfarin concurrently.
- Assess theophylline level in patients receiving theophylline-containing drugs concurrently.

**Patient teaching**

- Instruct patient to take with meals and to swallow tablets whole without crushing, breaking, or chewing.
- 📢 Inform patient that drug can cause serious adverse effects. Instruct him to immediately report chest pain, swelling, and flu-like symptoms.
- Tell patient smoking may make drug less effective and that many over-the-counter preparations (including aspirin, NSAIDs, and herbs) increase risk of bleeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, herbs, and behaviors mentioned above.

**perindopril erbumine**

Aceon, Apo-Perindopril\*, Coversyl®

**Pharmacologic class:** Angiotensin-converting enzyme (ACE) inhibitor**Therapeutic class:** Antihypertensive**Pregnancy risk category** D**FDA BOXED WARNING**

- Drugs that act directly on the renin-angiotensin system can cause injury to or death of a developing fetus. Discontinue drug as soon as possible when pregnancy is detected.

**Action**

Inhibits conversion of angiotensin I to angiotensin II (a potent vasoconstrictor). This effect leads to decreased plasma angiotensin II, reduced vasoconstriction, enhanced plasma renin activity, and decreased aldosterone activity.

**Availability**

Tablets: 2 mg, 4 mg, 8 mg

**Indications and dosages**

➤ Essential hypertension

**Adults:** 4 mg P.O. daily; may titrate upward to 16 mg/day, given as a single dose or in two divided doses. (Start with 2 to 4 mg/day in patients receiving diuretics.)

➤ Coronary artery disease

**Adults:** Initially, 4 mg P.O. daily for 2 weeks; then increase as tolerated to a maintenance dosage of 8 mg P.O. daily.

**Dosage adjustment**

- Renal impairment
- Elderly patients

**Off-label uses**

- Heart failure
- Diabetic nephropathy

**Contraindications**

- Hypersensitivity to drug or other ACE inhibitors
- Hereditary or idiopathic angioedema

**Precautions**

Use cautiously in:

- hepatic failure, renal impairment, renal artery stenosis, hyperkalemia, cough
- black patients
- pregnant or breastfeeding patients
- children (safety not established).

**Administration**

- Give without regard to food.
- 📢 Know that drug (especially first dose) may cause angioedema. Keep

epinephrine and antihistamines at hand in case of airway obstruction.

- For elderly patient, titrate dosage upward very slowly.
- Know that drug may be given alone or with other drugs.

Route	Onset	Peak	Duration
P.O.	1 hr	3-7 hr	12-24 hr

### Adverse reactions

**CNS:** dizziness, fatigue, headache, insomnia, sleep disorder, weakness, asthenia, drowsiness, vertigo, depression, paresthesia

**CV:** hypotension, angina pectoris, palpitations, chest pain, abnormal ECG, tachycardia

**EENT:** ear infection, sinusitis, rhinitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, abdominal pain, flatulence

**GU:** proteinuria, urinary tract infection, erectile or other male sexual dysfunction, decreased libido, menstrual disorder

**Metabolic:** hyperkalemia

**Musculoskeletal:** back, arm, leg, neck, or joint pain; hypertonia; myalgia; arthritis

**Respiratory:** cough, upper respiratory infection

**Skin:** rash, angioedema

**Other:** fever, viral infection, edema

### Interactions

#### Drug-drug.

*Antihypertensives, general anesthetics, nitrates, phenothiazines:* additive hypotension

*Diuretics:* excessive hypotension

*Gold (sodium aurothiomalate):* increased risk of rare nitritoid reactions (including facial flushing, nausea, vomiting, and hypotension)

*Lithium:* increased lithium toxicity

*Nonsteroidal anti-inflammatory drugs:* may result in deterioration of renal function, including acute renal failure

and attenuated ACE inhibitor antihypertensive effect

*Potassium-sparing diuretics, potassium supplements:* increased risk of hyperkalemia

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, blood urea nitrogen, creatinine, potassium, triglycerides:* increased levels

*Hematocrit, hemoglobin:* decreased values

**Drug-food.** *Salt substitutes containing potassium:* hyperkalemia

**Drug-herbs.** *Capsaicin:* cough

**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension

### Patient monitoring

- Assess blood pressure. Be aware that dosage increases or concomitant diuretic use may cause severe hypotension.

 Watch for angioedema, especially after first dose.

- Stay alert for signs and symptoms of infection, particularly EENT and respiratory infections.

- Monitor potassium level. Watch for signs and symptoms of hyperkalemia.

- Monitor liver and kidney function tests before and during therapy.

 In black patients, watch closely for angioedema and monitor drug efficacy. Monotherapy may be less effective in these patients.

### Patient teaching

- Tell patient to take at same time each day, with or without food.

 Instruct patient to stop using drug and contact prescriber immediately if hoarseness or difficulty swallowing or breathing occurs.

- Tell patient to avoid excessive perspiration or decreased fluid intake, which may cause symptomatic blood pressure drop. Inform him that vomiting or diarrhea also may lower blood pressure.

- Tell patient to report signs and symptoms of infection.

- Advise patient not to use potassium-containing salt substitutes.

 Caution female patient of child-bearing age to contact prescriber immediately if she suspects pregnancy.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## perphenazine

Apo-Perphenazine<sup>☼</sup>, Fentazin<sup>⚠</sup>

**Pharmacologic class:** Phenthiazine, dopaminergic antagonist

**Therapeutic class:** Antipsychotic, antiemetic

**Pregnancy risk category** NR

### Action

Unknown. Thought to antagonize dopamine and serotonin type 2 in CNS. Also antagonizes muscarinic receptors in respiratory tract, causing cholinergic activation.

### Availability

Tablets: 2 mg, 4 mg, 8 mg, 16 mg

### Indications and dosages

➤ Schizophrenia in nonhospitalized patients

**Adults and children older than age 12:** Initially, 4 to 8 mg P.O. t.i.d.

➤ Schizophrenia in hospitalized patients

**Adults and children older than age 12:** Initially, 8 to 16 mg P.O. two to four times daily, increased p.r.n.; avoid dosages greater than 64 mg daily.

➤ Severe nausea and vomiting

**Adults:** 8 to 16 mg P.O. daily in divided doses, to a maximum of 24 mg.

### Off-label uses

- Intractable hiccups

### Contraindications

- Hypersensitivity to drug, its components, or related compounds
- Blood dyscrasias
- Bone marrow depression
- Hepatic damage
- Subcortical damage
- Coma
- Concurrent use of high-dose CNS depressants

### Precautions

Use cautiously in:

- respiratory disorders, hepatic or renal dysfunction, breast cancer, alcohol withdrawal symptoms, suicidal tendency, surgery
- patients taking CNS depressants or anticholinergics
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 12.

### Administration

- Give with food to avoid GI upset.

Route	Onset	Peak	Duration
P.O.	Variable	1-3 hours	Unknown

### Adverse reactions

**CNS:** drowsiness, dizziness, insomnia, vertigo, headache, hyperactivity, nocturnal confusion, bizarre dreams, tremor, ataxia, slurring, exacerbation of psychotic symptoms, paranoid reactions, parkinsonism, dystonias, akathisia, tardive dyskinesia, hyperreflexia, cerebrospinal fluid abnormality, catatonic-like state, paradoxical stimulation, **seizures, neuroleptic malignant syndrome**  
**CV:** hypotension, orthostatic hypotension, hypertension, peripheral edema, ECG changes, tachycardia, bradycardia, **cardiac arrest, heart failure**  
**EENT:** glaucoma, blurred vision, miosis, mydriasis, corneal and lens deposits, pigmentary retinopathy, oculoerythric

crisis, photophobia, nasal congestion, dysphagia

**GI:** nausea, vomiting, diarrhea, constipation, obstipation, abnormal tongue color or movement, dry mouth, anorexia, **adynamic ileus**

**GU:** dark urine, urinary retention, urinary frequency, urinary incontinence, bladder paralysis, galactorrhea, lactation, breast enlargement, menstrual irregularities, inhibited ejaculation, libido changes

**Hematologic:** **hemolytic anemia, leukopenia, agranulocytosis, thrombocytopenic purpura**

**Hepatic:** jaundice, biliary stasis

**Metabolic:** hyponatremia, glycosuria, hyperglycemia, **hypoglycemia, syndrome of inappropriate antidiuretic hormone secretion, pituitary tumor**

**Musculoskeletal:** numbness and aching of arms and legs

**Respiratory:** dyspnea, suppressed cough reflex, **asthma, bronchospasm, laryngospasm, laryngeal edema**

**Skin:** urticaria, pallor, erythema, eczema, pruritus, perspiration, pigmentation changes, photosensitivity, angioedema, exfoliative dermatitis

**Other:** increased appetite, weight gain, fever, systemic lupus erythematosus-like syndrome, hypersensitivity reactions including **anaphylactoid reaction**

## Interactions

**Drug-drug.** *Anticholinergics:* increased risk of adverse anticholinergic reactions

*CNS depressants:* increased perphenazine effects, increased adverse CNS reactions

*Tricyclic antidepressants:* increased perphenazine blood level, greater risk of adverse reactions

**Drug-diagnostic tests.** *Eosinophils, liver function tests:* increased values  
*Glucose:* increased or decreased level  
*Granulocytes, hemoglobin, platelets, sodium, white blood cells:* decreased levels

*Pregnancy test:* false-positive result

**Drug-herbs.** *Kava:* dystonic reactions

*St. John's wort:* photosensitivity

*Yohimbe:* yohimbe toxicity

**Drug-behaviors.** *Alcohol use:* increased CNS depression

*Sun exposure:* increased risk of photosensitivity reaction

## Patient monitoring

 Watch for anaphylactoid reaction and angioedema. Monitor neurologic status; stay alert for signs and symptoms of neuroleptic malignant syndrome (high fever, unstable blood pressure, stupor, muscle rigidity, autonomic dysfunction), parkinsonian symptoms, and catatonic-like state.

- Monitor cardiovascular status and vital signs periodically.

 Evaluate respiratory status, especially for dyspnea and airway spasm.

 Monitor CBC, glucose level, and liver function tests. Watch for evidence of blood dyscrasias.

## Patient teaching

- Explain importance of combining drug therapy with psychotherapy.

- Tell patient to take exactly as prescribed and to report adverse reactions promptly.

- Instruct patient to avoid sun exposure and to wear sunscreen outdoors to prevent photosensitivity reaction.

- Advise patient to consult prescriber before taking other prescription drugs or over-the-counter preparations.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects him.

- Instruct patient to avoid alcohol, smoking, caffeine, and herbs.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

P

## pertuzumab

Perjeta

**Pharmacologic class:** Recombinant humanized monoclonal antibody

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

- Exposure to pertuzumab can result in embryo-fetal death and birth defects. Studies in animals have resulted in oligohydramnios, delayed renal development, and death. Advise patients of these risks and the need for effective contraception.

### Action

Targets the extracellular dimerization domain (Subdomain II) of the human epidermal growth factor receptor (EGFR) 2 protein (HER2) and thereby blocks ligand-dependent heterodimerization of HER2 with other HER family members, including EGFR, HER3, and HER4. As a result, pertuzumab inhibits ligand-initiated intracellular signaling through two major signal pathways, mitogen-activated protein kinase and phosphoinositide 3-kinase. Inhibition of these signaling pathways can result in cell growth arrest and apoptosis, respectively. In addition, pertuzumab mediates antibody-dependent cell-mediated cytotoxicity.

### Availability

*Solution for injection:* 420 mg/14-ml single-use vial

### Indications and dosages

➤ HER2-positive metastatic breast cancer in patients who have not received prior anti-HER2 therapy or chemotherapy for metastatic disease

**Adults:** Initially, 840 mg by 60-minute I.V. infusion, followed by 420 mg over 30 to 60 minutes by I.V. infusion q 3 weeks thereafter. When administered with trastuzumab, recommended initial dose of trastuzumab is 8 mg/kg by 90-minute I.V. infusion, followed by 6 mg/kg over 30 to 90 minutes by I.V. infusion q 3 weeks thereafter. When administered with docetaxel, recommended initial dose of docetaxel is 75 mg/m<sup>2</sup> by I.V. infusion; may escalate to 100 mg/m<sup>2</sup> q 3 weeks if initial dose is well tolerated.

### Dosage adjustment

- Left ventricular ejection fraction (LVEF) less than 40% or LVEF of 40% to 45% with a 10% or greater absolute decrease below pretreatment values

### Contraindications

None

### Precautions

Use cautiously in:

- pregnant and breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Be aware that HER2 testing should be performed for selection of patients appropriate for treatment with this drug.

- Assess LVEF before starting drug.
- Verify pregnancy status before starting drug.

⚠ Administer as an I.V. infusion only. Don't give as an I.V. push or bolus.

- Withdraw appropriate volume of drug solution from vial(s). Dilute in a 250-ml normal saline solution-in only PVC or non-PVC polyolefin infusion bag. Mix diluted solution by gentle inversion. Don't shake and don't mix with other drugs. Don't use dextrose (5%) solution.

- Administer immediately once prepared. If diluted infusion solution isn't

used immediately, it can be stored at 2° C to 8° C (36° F to 46° F) for up to 24 hours.

 Observe patient closely for 60 minutes after first infusion. If significant infusion-associated reaction occurs, slow or interrupt infusion and administer appropriate medical therapies. Discontinue drug immediately if patient develops a serous hypersensitivity reaction.

- Be aware that drug should be withheld or discontinued if trastuzumab treatment is withheld or discontinued. If docetaxel is discontinued, treatment with pertuzumab and trastuzumab may continue.
- Be aware that pertuzumab dosage reductions aren't recommended.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache, dizziness, fatigue, peripheral neuropathy, asthenia, insomnia

**CV: left ventricular dysfunction**

**EENT:** increased lacrimation, nasopharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, stomatitis

**Hematologic:** anemia, leukopenia, neutropenia, **febrile neutropenia**

**Musculoskeletal:** myalgia, arthralgia

**Respiratory:** upper respiratory tract infection, dyspnea, **pleural effusion**

**Skin:** alopecia, rash, nail disorder, pruritus, dry skin, paronychia

**Other:** mucosal inflammation, pyrexia, dysgeusia, decreased appetite, peripheral edema, **infusion and hypersensitivity reactions including anaphylaxis**

### Interactions

None

### Patient monitoring

 Closely monitor patient for 30 minutes after each subsequent

infusion for infusion and hypersensitivity reactions. If a significant infusion-associated reaction occurs, slow or interrupt infusion and administer appropriate medical therapies. Monitor patients carefully until complete resolution of signs and symptoms. Consider permanent discontinuation in patients with severe infusion reactions.

 Continue to assess LVEF at regular intervals (every 3 months) during treatment to ensure LVEF is within institution's normal limits. If LVEF is less than 40%, or is 40% to 45% with a 10% or greater absolute decrease below pretreatment value, withhold pertuzumab and trastuzumab and repeat LVEF assessment within approximately 3 weeks. Discontinue pertuzumab and trastuzumab if LVEF hasn't improved or has declined further, unless benefits to patient outweigh risks.

- Monitor women who become pregnant during pertuzumab therapy for oligohydramnios. If oligohydramnios occurs, perform fetal testing appropriate for gestational age and consistent with community standards of care.

### Patient teaching

 Tell patient to immediately report fever, chills, fatigue, headache, vomiting, weakness, rash, muscle pain, leg swelling, or shortness of breath.

- Advise female patient of childbearing potential to use effective contraception while receiving this drug and for 6 months after last dose.
- Advise breastfeeding patient that she should decide whether to discontinue breastfeeding or discontinue drug, taking into account importance of drug for her treatment.
- As appropriate, review all other significant and life-threatening adverse reactions mentioned above.

## phenazopyridine hydrochloride

AZO-Gesic, Azo-Standard, Baridium, Phenazo<sup>⚠</sup>, Prodiium, Pyridium, ReAzo, UTI Relief

**Pharmacologic class:** Nonopioid analgesic

**Therapeutic class:** Urinary analgesic

**Pregnancy risk category B**

### Action

Unknown. Thought to act locally on urinary tract mucosa to produce analgesic or anesthetic effects, relieving urinary burning, urgency, and frequency.

### Availability

Tablets: 95 mg, 97.2 mg, 100 mg, 200 mg

### Indications and dosages

➤ Pain caused by lower urinary tract irritation

**Adults:** 200 mg P.O. t.i.d.

**Children:** 12 mg/kg P.O. daily in three divided doses

### Contraindications

- Hypersensitivity to drug
- Renal insufficiency

### Precautions

Use cautiously in:

- hepatitis
- pregnant or breastfeeding patients
- children younger than age 12.

### Administration

- Give with or after meals.
- Discontinue after 2 days, as prescribed, when administering with antibiotics.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	6-8 hr

### Adverse reactions

**CNS:** headache

**EENT:** contact lens staining

**GI:** GI disturbances

**GU:** bright orange urine, **renal toxicity**

**Hepatic:** hepatotoxicity

**Hematologic:** hemolytic anemia, methemoglobinemia

**Skin:** rash, pruritus

**Other:** anaphylactoid-like reaction

### Interactions

**Drug-diagnostic tests.** *Bilirubin, glucose, ketones, protein, steroids:* interference with urine tests based on spectrophotometry or color reactions

### Patient monitoring

- Monitor patient for symptomatic improvement of urinary tract infection (UTI).

- Assess follow-up urine culture after antibiotic therapy ends.

🚨 Monitor for yellowing of skin or sclera. This change may indicate drug accumulation caused by impaired renal excretion, warranting drug withdrawal.

### Patient teaching

- Explain drug therapy and measures to help prevent UTI recurrence.

- Tell patient drug may discolor urine and tears and may stain clothing and contact lenses.

🚨 Advise patient to contact prescriber promptly if symptoms don't improve or if skin or eyes become yellow.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## phenobarbital

PMS-Phenobarbital, Solfoton

## phenobarbital sodium

Luminal Sodium

**Pharmacologic class:** Barbiturate

**Therapeutic class:** Anxiolytic, anticonvulsant, sedative-hypnotic

**Controlled substance schedule** IV

**Pregnancy risk category** D

### Action

Interferes with gamma-aminobutyric acid receptors, blocking nerve impulse transmission in CNS, which reduces motor activity and raises seizure threshold

### Availability

**Capsules:** 16 mg

**Elixir:** 15 mg/5 ml, 20 mg/5 ml

**Injection:** 30 mg/ml and 60 mg/ml in 1-ml prefilled syringes; 65 mg/ml in 1-ml vials; 130 mg/ml in 1-ml prefilled syringes, 1-ml vials, and 1-ml ampules

**Tablets:** 15 mg, 16 mg, 30 mg, 60 mg, 90 mg, 100 mg

### Indications and dosages

➤ Tonic-clonic (grand mal) and partial seizures; febrile seizures in children  
**Adults:** 60 to 100 mg/day P.O. as a single dose or in two or three divided doses; or initially, 100 to 320 mg I.V. p.r.n. (a total of 600 mg I.V. in a 24-hour period).

**Infants and children:** Loading dose of 15 to 20 mg/kg P.O. (produces drug blood level of 20 mcg/ml shortly after dosing). To achieve therapeutic blood level (10 to 25 mcg/ml), children usually need higher dosage/kg than adults. Follow loading dose with 3 to 6 mg/kg/day P.O. Alternatively, 4 to 6 mg/kg/day I.M.

or I.V. for 7 to 10 days to achieve blood level of 10 to 15 mcg/ml.

➤ Status epilepticus

**Adults:** 200 to 320 mg I.M. or I.V., repeated q 6 hours p.r.n.

**Children:** 15 to 20 mg/kg I.V. given over 10 to 15 minutes

➤ Sedation or hypnotic effect

**Adults:** For sedation, 30 to 120 mg/day P.O. or 30 to 120 mg/day I.M. or I.V. in two or three divided doses. As a hypnotic, 100 to 200 mg P.O. or 100 to 320 mg I.M. or I.V. at bedtime. Don't exceed 400 mg in a 24-hour period.

➤ Preoperative sedation

**Adults:** 100 to 200 mg I.M. 60 to 90 minutes before surgery

**Children:** 1 to 3 mg/kg I.M. or I.V., as prescribed.

### Dosage adjustment

- Impaired hepatic or renal function
- Elderly or debilitated patients

### Off-label uses

- Prevention and treatment of hyperbilirubinemia

### Contraindications

- Hypersensitivity to drug or other barbiturates
- Manifest or latent porphyria
- Nephritis (with large doses)
- Severe respiratory disease with dyspnea or obstruction
- History of sedative-hypnotic abuse
- Subcutaneous or intra-arterial administration

### Precautions

Use cautiously in:

- hepatic dysfunction, renal impairment, seizure disorder, fever, hyperthyroidism, diabetes mellitus, severe anemia, pulmonary or cardiac disease
- history of suicide attempt or drug abuse
- chronic phenobarbital use
- elderly or debilitated patients

- pregnant or breastfeeding patients
- children younger than age 6.

### Administration

- Inject I.M. deep into large muscle mass; limit volume to 5 ml.
- ☞ Give I.V. no faster than 60 mg/minute. Keep resuscitation equipment at hand.
- Stop injection immediately if patient complains of pain or if circulation at injection site diminishes (indicating inadvertent intra-arterial injection).
- ☞ Don't give by subcutaneous route; severe reactions (such as pain and tissue necrosis) may occur.
- ☞ Know that when given I.V. for status epilepticus, drug may take 15 minutes to attain peak blood level in brain. If injected continuously until seizures stop, drug brain level would keep rising and could exceed that required to control seizures. To avoid barbiturate-induced depression, use minimal amount required and wait for anticonvulsant effect to occur before giving second dose.
- Use parenteral route only when patient can't receive drug P.O.
- Know that drug is intended only for short-term use, losing efficacy after about 2 weeks.

Route	Onset	Peak	Duration
P.O.	30-60 min	Unknown	10-16 hr
I.V.	5 min	30 min	10-16 hr
I.M.	10-30 min	Unknown	10-16 hr

### Adverse reactions

**CNS:** headache, dizziness, anxiety, depression, drowsiness, excitation, delirium, lethargy, agitation, confusion, hyperkinesia, ataxia, vertigo, nightmares, nervousness, paradoxical stimulation, abnormal thinking, hallucinations, insomnia, CNS depression  
**CV:** hypotension, syncope, **bradycardia** (with I.V. use)  
**GI:** nausea, vomiting, constipation

**Hematologic:** megaloblastic anemia

**Hepatic:** hepatic damage

**Musculoskeletal:** joint pain, myalgia

**Respiratory:** hypoventilation, laryngospasm, bronchospasm, apnea (with I.V. use); **respiratory depression**

**Skin:** rash, urticaria, exfoliative dermatitis, **Stevens-Johnson syndrome**

**Other:** phlebitis at I.V. site, drug dependence, hypersensitivity reactions including angioedema

### Interactions

**Drug-drug.** *Acetaminophen:* increased risk of hepatotoxicity

*Activated charcoal:* decreased phenobarbital absorption

*Anticoagulants, beta-adrenergic blockers (except timolol), carbamazepine, clonazepam, corticosteroids, digoxin, doxorubicin, doxycycline, felodipine, fenpropfen, griseofulvin, hormonal contraceptives, metronidazole, quinidine, theophylline, verapamil:* decreased efficacy of these drugs

*Chloramphenicol, hydantoin, narcotics:* increased or decreased effects of either drug

*Cyclophosphamide:* increased risk of hematologic toxicity

*Divalproex, MAO inhibitors, valproic acid:* decreased phenobarbital metabolism, increased sedative effect

*Other CNS depressants (including first-generation antihistamines, opioids, other sedative-hypnotics):* additive CNS depression

*Rifampin:* increased phenobarbital metabolism and decreased effects

**Drug-diagnostic tests.** *Bilirubin:* decreased level in neonates and patients with seizure disorders or congenital nonhemolytic unconjugated hyperbilirubinemia

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

*St. John's wort:* decreased drug effects

**Drug-behaviors.** *Alcohol use:* additive CNS effects

### Patient monitoring

- Monitor vital signs; watch for bradycardia and hypotension.
- 🔊 In patients with seizure disorders, know that drug withdrawal may cause status epilepticus.
- Assess neurologic status. Institute safety measures as needed.
- 🔊 Closely monitor respiratory status, especially for respiratory depression and airway spasm.
- Monitor phenobarbital blood level, CBC, and kidney and liver function tests.
- Watch for signs of drug dependence.

### Patient teaching

- 🔊 Instruct patient to promptly report rash, facial and lip edema, syncope, dyspnea, or depression.
- 🔊 Stress importance of taking exactly as prescribed, with or without food. Caution patient not to stop therapy abruptly, especially if he's taking drug for seizures.
- Tell patient that prolonged use may lead to dependence.
- Instruct patient to seek medical advice before taking other prescription or over-the-counter drugs.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects him.
- Advise patient to avoid herbs, alcohol, and other CNS depressants.
- Instruct patient taking hormonal contraceptives to use alternate birth-control method.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## phentolamine mesylate

Rogitine<sup>®</sup> ⚠️

**Pharmacologic class:** Alpha-adrenergic blocker

**Therapeutic class:** Diagnostic agent, antihypertensive agent in pheochromocytoma

**Pregnancy risk category C**

### Action

Competitively blocks postsynaptic (alpha<sub>1</sub>) and presynaptic (alpha<sub>2</sub>) adrenergic receptors. Acts on arterial tree and venous bed, reducing total peripheral resistance and lowering venous return to heart.

### Availability

*Powder for injection:* 5 mg

### Indications and dosages

➤ To prevent or control hypertensive episodes before or during pheochromocytectomy

**Adults:** 5 mg I.V. or I.M. 1 to 2 hours before surgery, then 5 mg I.V. during surgery as indicated

**Children:** 1 mg I.V. or I.M. 1 to 2 hours before surgery, then 1 mg I.V. during surgery as indicated

➤ To aid pheochromocytoma diagnosis  
**Adults:** 2.5 or 5 mg (in 1 ml of sterile water) by I.V. injection; record blood pressure q 30 seconds for 3 minutes, then q minute for next 7 minutes. Or 5 mg (in 1 ml sterile water) I.M.; record blood pressure q 5 minutes for 30 to 45 minutes.

➤ To prevent or treat dermal necrosis after norepinephrine extravasation  
**Adults:** For prevention, add 10 mg to each liter of I.V. solution containing norepinephrine. For treatment, inject 5 to 10 mg in 10 ml of normal saline

solution into extravasated area within 12 hours.

### Off-label uses

- Hypertensive crisis caused by MAO inhibitors
- Rebound hypertension caused by withdrawal of clonidine, propranolol, or other antihypertensives
- Erectile dysfunction (given with papaverine)

### Contraindications

- Hypersensitivity to drug
- Coronary artery disease
- Myocardial infarction (MI) or history of MI
- Coronary insufficiency
- Angina

### Precautions

Use cautiously in:

- patients receiving cardiac glycosides concurrently
- pregnant or breastfeeding patients.

### Administration

- Reconstitute powder by diluting with 1 ml of sterile water for injection.
- For pheochromocytoma diagnosis, withhold sedatives, analgesics, and nonessential drugs for 24 to 72 hours before test (until hypertension returns). Keep patient supine until blood pressure stabilizes; then rapidly inject drug I.V. Maximum effect usually occurs within 2 minutes of dosing.

Route	Onset	Peak	Duration
I.V., I.M.	Immediate	Unknown	Brief

### Adverse reactions

**CNS:** weakness, dizziness

**CV:** tachycardia, acute and prolonged hypotension, orthostatic hypotension, **arrhythmias**

**EENT:** nasal congestion

**GI:** nausea, vomiting, diarrhea

**Skin:** flushing

### Interactions

**Drug-drug.** *Ephedrine, epinephrine:* antagonism of these drugs' effects

**Drug-herbs.** *Ephedra (ma huang):* antagonism of vasoconstrictive effects

### Patient monitoring

- When using for norepinephrine extravasation, monitor injection site closely and assess blood pressure, heart rate, and respiratory rate.
- For pheochromocytoma diagnosis, monitor blood pressure. In pheochromocytoma, systolic and diastolic pressures drop immediately and steeply. Monitor and record blood pressure immediately after injection, at 30-second intervals for first 3 minutes, and at 1-minute intervals for next 7 minutes. Systolic decrease of 60 mmHg and diastolic decrease of 25 mmHg within 2 minutes after I.V. administration indicates a positive reaction for pheochromocytoma.

### Patient teaching

- Explain drug administration procedure.
-  Instruct patient to promptly report adverse reactions. Assure him he'll be monitored closely.
- Tell patient to withhold other drugs (especially sedatives and analgesics) for at least 24 hours before pheochromocytoma testing, if appropriate.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and herbs mentioned above.

## phenylephrine hydrochloride

Afrin Children's Pump Mist, AH-Chew D, Coricidin, Fenox<sup>®</sup>, Minims Phenylephrine<sup>®</sup>, Mydrfrin<sup>®</sup>, Neo-Synephrine, Preferin<sup>®</sup>, Rhinall, Sudafed PE, Vicks Sinex Ultra Fine Mist

**Pharmacologic class:** Sympathomimetic, alpha-adrenergic agonist

**Therapeutic class:** Vasopressor, nasal decongestant, ophthalmic vasoconstrictor

**Pregnancy risk category C**

### FDA BOXED WARNING

- Clinicians should be completely familiar with package insert before using injection form.

### Action

Stimulates alpha-adrenergic receptors, increasing blood pressure and causing pronounced vasoconstriction in skin, mucous membranes, and mucosa. Produces mydriasis by contracting pupillary dilator muscle.

### Availability

**Injection:** 10 mg/ml

**Nasal solution:** 0.125%, 0.25%, 0.5%, 1%

**Ophthalmic solution:** 0.12%, 2.5%, 10%

**Tablets (chewable):** 10 mg

### Indications and dosages

- Mild to moderate hypotension  
**Adults:** 1 to 10 mg subcutaneously or I.M.; don't exceed an initial dosage of 5 mg.
- Severe hypotension and shock  
**Adults:** 0.1 to 0.18 mg/minute I.V. infusion. For maintenance infusion, 40 to 60 mcg/minute.

- To prevent hypotension during spinal anesthesia  
**Adults:** 2 to 3 mg subcutaneously or I.M. 3 to 4 minutes before spinal anesthetic is injected

- Hypotensive emergency during spinal anesthesia

**Adults:** 0.2 mg I.V., up to a maximum of 0.5 mg/dose

- To prolong spinal anesthesia

**Adults:** 2 to 5 mg added to anesthetic solution (prolongs spinal block by up to 50%)

- Vasoconstrictor for regional anesthesia

**Adults:** 1 mg of phenylephrine added to every 20 ml of local anesthetic solution

- Paroxysmal supraventricular tachycardia

**Adults:** 0.5 mg by rapid I.V. injection, not to exceed initial dosage of 0.5 mg. Subsequent dosages (determined by blood pressure) shouldn't exceed preceding dosage by more than 0.1 to 0.2 mg; maximum dosage is 1 mg.

- Nasal congestion

**Adults:** One or two sprays of 0.25% or 0.5% nasal solution in each nostril q 3 to 4 hours p.r.n.; severe congestion may warrant 1% solution. Or 10 to 20 mg P.O. (chewable tablets) q 4 hours.

- Vasoconstriction and pupil dilation

**Adults:** After topical anesthetic is applied, instill one drop of 2.5% ophthalmic solution into lacrimal sac; repeat 1 hour later.

- Uveitis

**Adults:** Instill one drop of 2.5% or 10% ophthalmic solution to upper surface of cornea. May repeat up to three times p.r.n.

- Open-angle glaucoma

**Adults:** Instill one drop of 10% ophthalmic solution to upper surface of cornea as often as necessary.

- For wide pupil dilation before intraocular surgery

**Adults:** Instill 2.5% or 10% ophthalmic solution, as prescribed, into lacrimal sac 30 to 60 minutes before surgery.

➤ Refraction

**Adults:** Before procedure, instill one drop of 2.5% ophthalmic solution combined with a rapid-acting cycloplegic into lacrimal sac, as prescribed.

**Children:** Before procedure, instill one drop of 2.5% ophthalmic solution into lacrimal sac 5 minutes after cycloplegic administration, as prescribed.

➤ Provocative test for angle-closure glaucoma

**Adults:** 2.5% ophthalmic solution applied to dilate pupil, with intraocular pressure (IOP) measured before application and after dilation. IOP rise of 3 to 5 mm Hg suggests angle block in patients with glaucoma; however, negative response doesn't rule out glaucoma from other causes.

➤ Retinoscopy (shadow test)

**Adults:** 2.5% ophthalmic solution

➤ Blanching test

**Adults:** Instill one to two drops of 2.5% ophthalmic solution into affected eye.

➤ Decongestant to relieve minor eye irritation

**Adults:** Instill one or two drops of 0.12% ophthalmic solution into eye(s) up to q.i.d. p.r.n.

### Dosage adjustment

- Hyperthyroidism
- Cardiac disease
- Elderly patients

### Contraindications

- Hypersensitivity to drug or its components
- Severe hypertension
- Ventricular tachycardia
- Angle-closure glaucoma
- Aneurysm (10% ophthalmic solution)
- During intraocular surgery when corneal epithelial barrier has been disturbed (ophthalmic solution)
- Elderly patients with severe arteriosclerotic or cerebrovascular disease
- Some low-birth-weight infants

### Precautions

Use cautiously in:

- sulfite sensitivity (some products)
- hyperthyroidism, partial heart block, bradycardia, hypertension, cardiac disease, arteriosclerosis, unstable vasomotor syndrome
- type 1 (insulin-dependent) diabetes mellitus, hypertension, hyperthyroidism, arteriosclerosis or other cardiac disease (10% ophthalmic solution)
- within 21 days of MAO inhibitors (2.5% or 10% ophthalmic solution)
- elderly patients
- pregnant or breastfeeding patients.

### Administration

• In emergencies, drug may be given by direct I.V. injection. Dilute 1 ml of solution containing 10 mg/ml with 9 ml of sterile water for injection.

⚠ For I.V. infusion, dilute 10 mg in 500 ml of dextrose 5% in water or normal saline solution; titrate dosage until blood pressure is slightly below patient's normal level or until maximum dosage is reached. Infuse I.V. in large vein (preferably through central venous catheter) using infusion pump. After condition stabilizes, taper dosage gradually; don't withdraw abruptly. Avoid extravasation.

⚠ Be aware that systemic absorption of ophthalmic solution during pupil dilation in patients with angle-closure glaucoma may trigger asthma attack.

• As ordered, apply a drop of suitable topical anesthetic before instilling ophthalmic solution, to prevent pain and drug dilution (caused by excessive lacrimation induced by pain).

⚠ Compress lacrimal sac for 1 minute after instilling 10% ophthalmic solution, to avoid excessive systemic absorption (which could cause serious cardiovascular problems, especially in elderly patients).

• Be aware that patients with heavily pigmented irides may require larger

ophthalmic doses for diagnostic procedures.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown
I.V.	Immediate	Unknown	15-20 min
I.M., subcut.	10-15 min	Unknown	0.5-2 hr
Nasal	15-20 min	Unknown	0.5-4 hr
Ophth. (0.12%)	Rapid	Unknown	30 min-4 hr
Ophth. (2.5%)	Rapid	15-60 min	3 hr
Ophth. (10%)	Rapid	10-60 min	6 hr

### Adverse reactions

**CNS:** headache, weakness, anxiety, restlessness, tremor, light-headedness, dizziness, drowsiness, insomnia, hallucinations, nervousness, restlessness, giddiness, prolonged psychosis, orofacial dystonia

**CV:** hypertension, palpitations, tachycardia, bradycardia, **arrhythmias**

**EENT:** with ophthalmic solution—transient pigment floaters in aqueous humor; rebound miosis; rebound hyperemia (with prolonged use); light sensitivity; photophobia; blurred vision; allergic conjunctivitis; eye burning, stinging, and irritation; transient epithelial keratitis; decreased IOP; with nasal solution—rebound congestion, burning, stinging, sneezing, dryness, local irritation

**GI:** nausea, vomiting, gastric irritation, anorexia

**GU:** urinary retention (in males with prostatitis)

**Hematologic:** leukopenia, agranulocytosis, thrombocytopenia

**Musculoskeletal:** brow ache (with ophthalmic solution)

**Respiratory:** asthmatic episodes

**Skin:** sweating, rash, urticaria, contact dermatitis, necrosis and sloughing (with extravasation at I.V. site)

### Interactions

**Drug-drug.** *Beta-adrenergic blockers:* blocked cardiostimulatory effects of phenylephrine

*Bretylium, sympathomimetics:* serious arrhythmias

*Furazolidone:* excessive hypertension  
*Guanethidine, methyl dopa:* decreased antihypertensive effects

*Halogenated hydrocarbon anesthetics:* serious arrhythmias

*MAO inhibitors:* severe headache, hypertension, hyperpyrexia

*Oxytocics, tricyclic antidepressants:* increased pressor response

**Drug-diagnostic tests.** *Tonometry:* false-normal readings (with ophthalmic form)

**Drug-behaviors.** *Sun exposure:* photophobia

### Patient monitoring

- Monitor ECG continuously during I.V. administration; monitor blood pressure every 5 to 15 minutes until it stabilizes, then every 30 to 60 minutes.
- Monitor central venous pressure and fluid intake and output. Keep in mind that drug doesn't eliminate need for fluid resuscitation.
- Assess CBC; watch for evidence of blood dyscrasias.
- Monitor I.V. site; extravasation can cause tissue damage.
- Assess for symptomatic improvement in patients using nasal form.
- 🚨 Monitor for adverse reactions, particularly life-threatening asthmatic episodes.

### Patient teaching

- Tell patient to take exactly as directed and not to exceed recommended dosage.
- Advise patient using nasal solution that dropper, inhaler, or spray dispenser shouldn't be used by more than one person. Teach proper instillation technique: instill nasal solution into dependent nostril with head down and in lateral position. Stay in this position

for 5 minutes; then instill solution in other nostril in same manner. Advise patient to rinse container tip with hot water after each use. Instruct him to discontinue use and contact prescriber if symptoms don't improve after 3 days. Tell him not to use for more than 3 days and to contact prescriber if symptoms persist.

- Teach proper technique for instilling eye drops. Stress importance of compressing lacrimal sac after instilling, to decrease systemic drug absorption. Tell patient that ophthalmic solution may cause light sensitivity lasting several hours. Inform elderly patient that he may see transient floaters 40 to 45 minutes after administration.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## phenytoin (diphenylhydantoin)

Dilantin-125, Dilantin Infatabs

## phenytoin sodium (diphenylhydantoin sodium)

Dilantin Kapseals, Diphenylan<sup>✳</sup>, Epanutin<sup>⚡</sup>, Phenytek<sup>✳</sup>

**Pharmacologic class:** Hydantoin derivative

**Therapeutic class:** Anticonvulsant

**Pregnancy risk category D**

### Action

Thought to limit seizure activity by promoting sodium efflux from neurons in motor cortex and reducing activity in brainstem centers responsible for tonic phase of tonic-clonic seizures

### Availability

**Capsules (prompt-release):** 30 mg, 100 mg

**Capsules (extended-release):** 30 mg, 100 mg

**Injection:** 50 mg/ml in 2- and 5-ml ampules

**Oral suspension:** 30 mg/5 ml, 125 mg/5 ml

**Tablets (chewable):** 50 mg

### Indications and dosages

➤ Status epilepticus

**Adults:** Loading dose of 10 to 15 mg/kg by slow I.V., then a maintenance dosage of 100 mg P.O. or I.V. q 6 to 8 hours

**Neonates and children:** Loading dose of 15 to 20 mg/kg I.V. in divided doses of 5 to 10 mg/kg

➤ Generalized tonic-clonic (grand mal) and complex partial (psychomotor, temporal lobe) seizures

**Adults:** Loading dose of 1 g P.O. (extended-release) in three divided doses (400 mg, 300 mg, and 300 mg) at 2-hour intervals in hospitalized patients requiring rapid steady-state serum levels (when I.V. route isn't desired). Maintenance dosing usually starts 24 hours after loading dose.

Patients who haven't had previous treatment usually start at 100 mg (125 mg suspension) P.O. t.i.d., adjusted as needed to a maximum of 600 mg (625 mg suspension) P.O. daily. Alternatively, if divided doses control seizures, one daily dose of 300 mg P.O.

(extended-release phenytoin sodium).

**Children:** Initially, 5 mg/kg/day P.O. in two or three equally divided doses; maintenance dosage individualized and given in two to three divided doses (not to exceed 300 mg/day).

➤ To prevent seizures during neurosurgery

**Adults:** 100 to 200 mg I.M. at 4-hour intervals

## Off-label uses

- Arrhythmias
- Severe preeclampsia
- Trigeminal neuralgia
- Recessive dystrophic epidermolysis bullosa, junctional epidermolysis bullosa

## Contraindications

- Hypersensitivity to drug
- Sinus bradycardia, sinoatrial block, second- or third-degree atrioventricular block, Adams-Stokes syndrome

## Precautions

Use cautiously in:

- hepatic disease, diabetes mellitus, skin rash
- pregnant or breastfeeding patients (safety not established).

## Administration

• Before I.V. use, check designated line for patency and flush with normal saline solution. Deliver no faster than 50 mg/minute for adults or 1 to 3 mg/kg/minute in children and neonates; then flush with normal saline solution. Avoid extravasation (can cause severe tissue damage).

-  Don't administer I.V. into dorsal hand veins, because purple glove syndrome may occur.
- When giving oral solution through nasogastric tube, dilute dose with sterile water or normal saline solution; after administration, flush tube with at least 20 ml of diluent.
- Withhold enteral feedings for at least 1 hour before and 1 hour after oral administration.
- Give I.M. only as last resort (may cause pain and reduce drug absorption).
- Know that patients with history of renal or hepatic disease should not receive P.O. loading dose.

Route	Onset	Peak	Duration
P.O.	Unknown	3 hr	6-12 hr
P.O. (extended)	Unknown	4-12 hr	12-36 hr
I.V.	Unknown	Rapid	12-24 hr
I.M.	Unknown	Erratic	12-24 hr

## Adverse reactions

**CNS:** headache, fatigue, dizziness, drowsiness, weakness, depression, ataxia, slurred speech, confusion, agitation, dysarthria, dyskinesia, extrapyramidal symptoms, insomnia, irritability, twitching, nervousness, numbness, psychotic disturbances, tremor, CNS depression (with I.V. use), **coma**

**CV:** vasodilation, edema, chest pain, **tachycardia, hypotension** (increased with I.V. use), **cardiovascular collapse** (with I.V. use)

**EENT:** diplopia, amblyopia, nystagmus, visual field defect, eye pain, conjunctivitis, photophobia, mydriasis, hearing loss, tinnitus, ear pain, epistaxis, rhinitis, sinusitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, lip enlargement, dry mouth

**GU:** pink, red, or reddish-brown urine; gynecomastia; Peyronie's disease

**Hepatic:** jaundice, **toxic hepatitis, hepatic damage**

**Hematologic:** macrocytosis, simple anemia, **megaloblastic anemia, monocytosis, leukocytosis, hemolytic anemia, thrombocytopenia, agranulocytosis, granulocytopenia, leukopenia, pancytopenia**

**Metabolic:** hypocalcemia, diabetes insipidus, hyperglycemia

**Musculoskeletal:** back pain, pelvic pain, osteomalacia

**Respiratory:** dyspnea, increased cough and sputum, pneumonia, hyperventilation, hypoxia, hemoptysis, bronchitis, **apnea, asthma, aspiration pneumonia, pulmonary fibrosis, atelectasis, pneumothorax**

**Skin:** rash, pruritus, bruising, exfoliative dermatitis, hypertrichosis, hirsutism, alopecia, **Stevens-Johnson syndrome**

**Other:** gingival hyperplasia, altered taste, fever, lymphadenopathy, weight gain or loss, injection site reaction, coarsened facial features, lupus erythematosus syndrome, allergic reactions

## Interactions

**Drug-drug.** *Acetaminophen, amiodarone, carbamazepine, cardiac glycosides, corticosteroids, dicumarol, disopyramide, doxycycline, estrogens, haloperidol, hormonal contraceptives, methadone, metapyrone, mexiletine, quinidine, theophylline, valproic acid:* increased metabolism and decreased effects of these drugs

*Activated charcoal, antacids, sucralfate:* decreased phenytoin absorption

*Allopurinol, amiodarone, benzodiazepines, chloramphenicol, chlorpheniramine, cimetidine, disulfiram, fluconazole, ibuprofen, isoniazid, metronidazole, miconazole, omeprazole, phenacemide, phenothiazines, phenylbutazone, salicylates, succinimides, sulfonamides, tricyclic antidepressants, trimethoprim, valproic acid:* increased phenytoin effects

*Antineoplastics, barbiturates, carbamazepine, diazoxide, folic acid, influenza vaccine, loxapine, nitrofurantoin, pyridoxine, rifampin, theophylline:* decreased phenytoin effects

*Cyclosporine, dopamine, furosemide, levodopa, levonorgestrel, mebendazole, muscle relaxants, nondepolarizing phenothiazines, sulfonyleureas:* decreased effects of these drugs

**Drug-diagnostic tests.** *Alkaline phosphatase, eosinophils, gamma-glutamyltransferase, glucose:* increased levels

*Dexamethasone (1-mg) suppression test, metyrapone test:* interference with test results

*Free thyroxine, serum thyroxine:* decreased levels

**Drug-food.** *Enteral tube feedings:* decreased phenytoin absorption

*Folic acid:* decreased folic acid absorption

**Drug-behaviors.** *Acute alcohol ingestion:* increased phenytoin blood level

*Chronic alcohol ingestion:* decreased phenytoin blood level

## Patient monitoring

- Assess blood pressure, ECG, and heart rate, especially during I.V. loading dose. Watch for adverse reactions.
- Monitor phenytoin blood level; therapeutic range is 10 to 20 mcg/ml.
- Evaluate CBC and kidney and liver function tests.
- Closely monitor prothrombin time and Internationalized Normal Ratio in patients receiving warfarin concurrently.
- Monitor drug efficacy.

## Patient teaching

- Explain drug therapy, need for follow-up tests, and importance of taking drug exactly as prescribed.
- Caution patient not to stop therapy abruptly.
- Advise patient to avoid alcohol.
-  Instruct patient to report rash immediately.
- Inform patient that drug may discolor urine.
- Tell female patient drug may make hormonal contraceptives ineffective.
- Instruct patient to practice good dental hygiene to minimize gingival hyperplasia.
- Encourage patient to seek medical advice before taking over-the-counter preparations.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

## pimecrolimus

Elidel

**Pharmacologic class:** Dermatologic agent

**Therapeutic class:** Immunomodulator

**Pregnancy risk category** C

### FDA BOXED WARNING

- Drug's long-term safety hasn't been established.
- Rare cases of lymphoma and skin cancer have occurred in patients who used drug. Avoid continuous long-term use in any age-group and limit application to areas of atopic dermatitis.
- Drug isn't indicated for use in children younger than age 2.

### Action

Unknown. Thought to inhibit T-cell activation by blocking transcription of early cytokines. Also blocks release of inflammatory cytokines and mediators from mast cells after stimulation by antigen/immunoglobulin E.

### Availability

*Cream:* 1%

### Indications and dosages

➤ Mild to moderate atopic dermatitis

**Adults and children ages 2 and older:**

Apply 1% cream topically b.i.d. to clean, dry, affected area.

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- eczema herpeticum (Kaposi's varicelliform eruption), varicella zoster

(chickenpox or shingles), herpes simplex infection, lymphadenopathy, mononucleosis, acute infectious Netherton's syndrome, skin infections or papilloma, warts, immunocompromised state

- concurrent use of CYP3A inhibitors
- pregnant or breastfeeding patients
- children younger than age 2 (safety not established).

### Administration

- Apply thin layer to affected area.
- Don't use with occlusive dressing (may increase systemic absorption).

Route	Onset	Peak	Duration
Topical	Not systemically absorbed		

### Adverse reactions

**CNS:** headache

**EENT:** sinus congestion, rhinorrhea

**GI:** nausea, vomiting, diarrhea, gastritis

**Respiratory:** upper respiratory tract infection

**Skin:** pruritus, application-site reaction or discomfort

**Other:** pyrexia, increased risk of viral or bacterial infections

### Interactions

**Drug-drug.** *CYP3A inhibitors (such as calcium channel blockers, cimetidine, erythromycin):* inhibition of action by hepatic enzymes that eliminate pimecrolimus

**Drug-behaviors.** *Sunbathing:* possible increased risk of skin cancer

### Patient monitoring

- Reevaluate at 6 weeks if lesions haven't healed.
- Discontinue therapy, as prescribed, if disease resolves.

### Patient teaching

- Tell patient to apply to clean, dry skin and to wash hands afterward (unless hands are being treated).

## 1004 pioglitazone hydrochloride

- Caution patient not to use occlusive dressings.
- Tell patient drug may cause local reaction, such as a feeling of warmth or burning sensation. Advise him to contact prescriber if reaction is severe or lasts more than 1 week.
- Advise patient to apply missed dose as soon as possible. If it's almost time for next dose, tell him to skip missed dose and resume regular schedule.
- Tell patient to avoid natural or artificial sunlight and to use adequate sunblock on skin and lips.
- Instruct patient to contact prescriber if no improvement occurs after 6 weeks or if condition worsens.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and behaviors mentioned above.

### pioglitazone hydrochloride

Actos, Apo-Pioglitazone<sup>✳</sup>, Co Pioglitazone<sup>✳</sup>, Gen-Pioglitazone<sup>✳</sup>, Novo-Pioglitazone<sup>✳</sup>, PMS-Pioglitazone<sup>✳</sup>, Ratio-Pioglitazone<sup>✳</sup>, Sandoz Pioglitazone<sup>✳</sup>

**Pharmacologic class:** Thiazolidinedione

**Therapeutic class:** Hypoglycemic

**Pregnancy risk category** C

#### FDA BOXED WARNING

- Drug may cause or exacerbate heart failure. After starting therapy or increasing dosage, observe patient carefully for signs and symptoms of heart failure. If these develop, manage patient according to current standards of care and consider discontinuing drug or reducing dosage.
- Drug isn't recommended in patients with symptomatic heart failure. In patients with established New York Heart

Association Class III or IV heart failure, drug initiation is contraindicated.

#### Action

Enhances insulin sensitivity in muscle and adipose tissue; inhibits hepatic gluconeogenesis

#### Availability

Tablets: 15 mg, 30 mg, 45 mg

#### Indications and dosages

➤ Adjunct to diet and exercise to improve glycemic control in type 2 (non-insulin-dependent) diabetes mellitus

**Adults:** 15 to 30 mg/day; may increase to 45 mg/day if needed

#### Contraindications

- Hypersensitivity to drug, its components, or rosiglitazone
- Established New York Heart Association Class III or IV heart failure

#### Precautions

Use cautiously in:

- edema, hepatic impairment
- symptomatic heart failure (use not recommended)
- female patients of childbearing age
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

#### Administration

- Give with or without food.
- Know that drug may be used with sulfonylureas, metformin, or insulin when combination of diet, exercise, and monotherapy doesn't achieve adequate glycemic control.

Route	Onset	Peak	Duration
P.O.	30 min	2 hr	24 hr

#### Adverse reactions

**CNS:** headache

**CV:** congestive heart failure (CHF) or exacerbation of CHF

**EENT:** sinusitis, pharyngitis

**Hematologic:** anemia

**Metabolic:** aggravation of diabetes mellitus, **hypoglycemia, hyperglycemia**

**Musculoskeletal:** myalgia

**Respiratory:** upper respiratory infection

**Other:** tooth disorders, pain, edema

## Interactions

**Drug-drug.** *Hormonal contraceptives:* decreased contraceptive efficacy

*Ketoconazole:* increased pioglitazone effects

**Drug-diagnostic tests.** *Creatine kinase:* transient increase

*Hematocrit, hemoglobin:* decreased values (usually during first 4 to 12 weeks of therapy)

**Drug-herbs.** *Chromium, coenzyme Q10, fenugreek:* additive hypoglycemic effects

*Glucosamine:* poor glycemic control

## Patient monitoring

Monitor patient carefully for signs and symptoms of heart failure (including excessive, rapid weight gain; dyspnea; and edema) after initiation and after dosage increases. Consider discontinuation or dosage reduction if these symptoms appear.

- Assess patient's weight and compliance with diet and exercise program.
- Monitor liver function tests before and during therapy.
- Monitor glycosylated hemoglobin, hemoglobin, hematocrit, and blood glucose levels.
- Assess for signs and symptoms of hypoglycemia or hyperglycemia.

## Patient teaching

- Instruct patient to take exactly as prescribed. Tell him he may take drug without regard to food.
- Tell patient drug may increase his risk for EENT and respiratory infections. Instruct him to contact prescriber if symptoms occur.

Advise patient to immediately report unexplained nausea, vomiting, abdominal pain, fatigue, anorexia, dark urine, fever, trauma, infection, rapid weight gain, edema, or shortness of breath.

- Tell premenopausal anovulatory patient that drug may cause ovulation. Recommend use of reliable contraception.
- Advise female of childbearing age to contact prescriber promptly if pregnancy occurs.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## piperacillin sodium and tazobactam sodium

Tazocin<sup>®</sup>, Zosyn

**Pharmacologic class:** Penicillin (extended-spectrum), beta-lactamase inhibitor

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

## Action

Piperacillin inhibits bacterial cell-wall synthesis, resulting in cell death. Tazobactam increases piperacillin efficacy.

## Availability

*Powder for injection:* 2 g piperacillin and 0.25 g tazobactam/vial, 3 g piperacillin and 0.375 g tazobactam/vial, 4 g piperacillin and 0.5 g tazobactam/vial

## Indications and dosages

Community-acquired pneumonia; ruptured appendix; peritonitis; pelvic inflammatory disease; skin and skin-structure infections

**Adults and children older than age 12:**

3.375 g (3 g piperacillin and 0.375 g tazobactam) I.V. q 6 hours for 7 to 10 days

➤ Nosocomial pneumonia

**Adults and children ages 12 and older:**

3.375 g (3 g piperacillin and 0.375 g tazobactam) I.V. over 30 minutes q 4 hours for 7 to 14 days, given with an aminoglycoside

**Dosage adjustment**

- Renal impairment

**Contraindications**

- Hypersensitivity to penicillins, cephalosporins, imipenems, or beta-lactamase inhibitors
- Neonates

**Precautions**

Use cautiously in:

- heart failure, renal insufficiency (in children), seizures, bleeding disorders, uremia, hypokalemia, cystic fibrosis
- patients with sodium restrictions
- pregnant or breastfeeding patient
- children younger than age 12 (safety and efficacy not established).

**Administration**

- Ask patient about allergy to penicillins, cephalosporins, imipenems, or beta-lactamase inhibitors before giving.
- Dilute each gram with 5 ml of diluent, such as sterile or bacteriostatic water for injection, normal saline solution for injection, dextrose 5% in water, dextrose 5% in normal saline solution for injection, or 6% dextran in normal saline solution. Don't use lactated Ringer's solution.
- Shake vial until drug dissolves. Dilute again to a final volume of 50 ml; infuse over 30 minutes.
- Don't mix with other drugs. If possible, stop primary infusion while piperacillin infuses.
- Don't mix in same container with aminoglycosides, which are chemically incompatible with piperacillin.

Route	Onset	Peak	Duration
I.V.	Immediate	Immediate	Unknown

**Adverse reactions**

**CNS:** headache, insomnia, agitation, dizziness, anxiety, lethargy, hallucinations, depression, twitching, **coma, seizures**

**CV:** hypertension, chest pain, tachycardia

**EENT:** rhinitis, glossitis

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, abdominal pain, **pseudomembranous colitis**

**GU:** proteinuria, hematuria, vaginal candidiasis, vaginitis, **oliguria, interstitial nephritis, glomerulonephritis**

**Hematologic:** anemia, **increased bleeding, bone marrow depression, leukopenia, thrombocytopenia**

**Metabolic:** hypokalemia, hypernatremia

**Respiratory:** dyspnea

**Skin:** rash, pruritus

**Other:** fever; pain, edema, inflammation, or phlebitis at I.V. site; superinfection; hypersensitivity reactions including **serum sickness and anaphylaxis**

**Interactions**

**Drug-drug.** *Aminoglycosides:* aminoglycoside inactivation

*Aspirin, probenecid:* increased piperacillin blood level

*Hormonal contraceptives:* decreased contraceptive efficacy

*Methotrexate:* increased risk of methotrexate toxicity

*Tetracyclines:* decreased piperacillin efficacy

*Vecuronium:* prolonged neuromuscular blockade

**Drug-diagnostic tests.** *Coombs' test, urine glucose tests using copper reduction method (Clinitest, Benedict's or Fehling's solution), urine protein:* false-positive results  
*Eosinophils:* increased count  
*Granulocytes, hemoglobin, platelets, white blood cells:* decreased levels

## Patient monitoring

- Assess neurologic status, especially for seizures.
- Monitor vital signs and fluid intake and output.
- Evaluate electrolyte levels, CBC with white cell differential, and culture and sensitivity tests. Watch for evidence of hypokalemia and blood dyscrasias.
- In patients receiving high doses or prolonged therapy, monitor for signs and symptoms of bacterial or fungal superinfection and pseudomembranous colitis.
- Monitor patient's dietary sodium intake (drug has high sodium content).
- 🚨 Immediately report rash, hives, severe diarrhea, black tongue, sore throat, fever, or unusual bleeding or bruising.

## Patient teaching

- Tell patient to monitor urinary output and report significant changes.
- Instruct patient to report unusual pain, redness, swelling, or other changes at infusion site.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## piroxicam

Apo-Piroxicam<sup>✳</sup>, Brexidol<sup>⚡</sup>, Dom-Piroxicam<sup>✳</sup>, Feldene, Gen-Piroxicam<sup>✳</sup>, Novo-Pirocam<sup>✳</sup>, Nu-Pirox<sup>✳</sup>, PMS-Piroxicam<sup>✳</sup>, PRO-Piroxicam<sup>✳</sup>

**Pharmacologic class:** Oxicam derivative, nonsteroidal anti-inflammatory drug (NSAID)

**Therapeutic class:** Analgesic, anti-inflammatory, antipyretic

**Pregnancy risk category C** (first and second trimesters), **D** (third trimester)

## FDA BOXED WARNING

- Drug may increase risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke (which can be fatal). Risk may increase with duration of use. Patients with cardiovascular disease or risk factors for it may be at greater risk.
- Drug increases risk of serious GI adverse events, including bleeding, ulcers, and stomach or intestinal perforation (which can be fatal). These events can occur at any time during use and without warning. Elderly patients are at greater risk.
- Drug is contraindicated for treatment of perioperative pain in setting of coronary artery bypass graft surgery.

## Action

Inhibits cyclooxygenase (an enzyme needed for prostaglandin synthesis), stimulating anti-inflammatory response and blocking pain impulses

## Availability

*Capsules:* 10 mg, 20 mg

## Indications and dosages

➤ Inflammatory disorders (such as arthritis)

**Adults:** 20 mg P.O. daily as a single dose or in two divided doses

## Dosage adjustment

- Hepatic or renal impairment
- Elderly patients

## Off-label uses

- Dysmenorrhea
- Ankylosing spondylitis
- Gout

## Contraindications

- Hypersensitivity to drug or other NSAIDs (including aspirin)
- Active GI bleeding or ulcer disease
- Third trimester of pregnancy

## Precautions

Use cautiously in:

- renal impairment, severe cardiovascular or hepatic disease
- history of ulcer disease
- pregnant patients in first or second trimester
- breastfeeding patients (not recommended)
- children (safety not established).

## Administration

- Give with milk, antacids, or food to minimize GI upset.

Route	Onset	Peak	Duration
P.O. (analgesia)	1 hr	Unknown	48-72 hr
P.O. (anti-inflam.)	7-12 days	2-3 wk	Unknown

## Adverse reactions

**CNS:** headache, drowsiness, dizziness

**CV:** edema, hypertension, vasculitis, tachycardia, **arrhythmias**

**EENT:** blurred vision, tinnitus

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, flatulence, dyspepsia, anorexia, **severe GI bleeding**

**GU:** proteinuria, **renal failure**

**Hematologic:** anemia, **blood dyscrasias**

**Hepatic:** jaundice, **hepatitis**

**Skin:** rash

**Other:** allergic reactions including **anaphylaxis**

## Interactions

**Drug-drug.** *Acetaminophen (chronic use)*, *cyclosporine*, *gold compounds*: increased risk of adverse renal reactions  
**Anticoagulants**, *cefamandole*, *cefoperazone*, *cefotetan*, *clopidogrel*, *eptifibatide*, *heparin*, *plicamycin*, *thrombolytics*, *ticlopidine*, *tirofiban*, *valproic acid*, *vitamin A*: increased risk of bleeding  
**Antineoplastics**: increased risk of hematologic toxicity  
*Aspirin*: decreased piroxicam blood level and efficacy  
**Corticosteroids**, **other NSAIDs**: additive adverse GI reactions

**Diuretics**, **other antihypertensives**: decreased response to these drugs

**Insulin**, **oral hypoglycemics**: increased risk of hypoglycemia

**Lithium**: increased lithium blood level and risk of toxicity

**Probenecid**: increased piroxicam blood level and risk of toxicity

**Drug-diagnostic tests.** *Alanine aminotransferase*, *alkaline phosphatase*, *aspartate aminotransferase*, *blood urea nitrogen*, *creatinine*, *electrolytes*, *lactate dehydrogenase*: increased levels

**Bleeding time**: prolonged

**Hematocrit**, **hemoglobin**, **platelets**, **white blood cells**: decreased levels

**Liver function tests**: abnormal results

**Drug-herbs.** *Alfalfa*, *anise*, *arnica*, *astragalus*, *bilberry*, *black currant seed oil*, *bladderwrack*, *bogbean*, *boldo*, *borage oil*, *buchu*, *capsaicin*, *cat's claw*, *celery*, *chaparral*, *cinchona bark*, *clove oil*, *coenzyme Q10*, *dandelion*, *danshen*, *dong quai*, *evening primrose oil*, *fenu-greek*, *feverfew*, *garlic*, *ginger*, *ginkgo*, *guggul*, *papaya extract*, *red clover*, *rhubarb*, *safflower oil*, *skullcap*, *St. John's wort*: increased anticoagulant effect, greater bleeding risk

## Patient monitoring

- Monitor vital signs and cardiovascular status. Stay alert for hypertension and arrhythmias.

- Monitor kidney and liver function tests, hearing, and CBC.

-  Watch for signs and symptoms of drug-induced hepatitis and GI toxicity, including ulcers and bleeding.

- Monitor for signs and symptoms of infection, which drug may mask.

## Patient teaching

- Advise patient to take with milk, antacids, or food to minimize GI upset.

- Tell patient drug may mask signs and symptoms of infection. Instruct him to contact prescriber if he suspects he has an infection.

- 🔊 Teach patient to recognize and immediately report signs and symptoms of allergic reaction or GI bleeding.
- Inform patient that many herbs increase the risk of GI bleeding. Caution him not to use herbs without prescriber's approval.
- Instruct patient to drink plenty of fluids and to report decreased urination.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Tell female patient to inform prescriber if she is pregnant or breastfeeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## pitavastatin

Livalo

**Pharmacologic class:** HMG-CoA reductase inhibitor

**Therapeutic class:** Antihyperlipidemic

**Pregnancy risk category** X

### Action

Increases rate at which body removes cholesterol from blood and reduces production of cholesterol by inhibiting enzyme that catalyzes early rate-limiting step in cholesterol synthesis

### Availability

*Tablets:* 1 mg, 2 mg, 4 mg

### Indications and dosages

➤ Primary hyperlipidemia, mixed dyslipidemia

**Adults:** 2 mg P.O. daily; may increase to maximum of 4 mg daily

### Dosage adjustment

- Renal impairment
- Patient with end-stage renal disease on dialysis
- Concurrent use of erythromycin or rifampin

### Contraindications

- Hypersensitivity to drug or its components
- Active liver disease, unexplained persistent transaminase elevations
- Concurrent use of cyclosporine
- Women of childbearing age
- Breastfeeding

### Precautions

Use cautiously in:

- patients with severe renal impairment not on dialysis (use not recommended)
- patients with predisposing factors for myopathy (such as untreated hypothyroidism)
- patients who consume substantial quantities of alcohol or have history of chronic liver disease
- concurrent use of protease inhibitors (such as lopinavir, ritonavir), erythromycin, fibric acids (such as fenofibrate, gemfibrozil), rifampin, or niacin
- elderly patients
- children (safety and efficacy not established).

### Administration

- Check liver function tests before starting therapy.
- Administer with or without food.

Route	Onset	Peak	Duration
P.O.	Unknown	1 hr	12 hr

### Adverse reactions

**CNS:** headache

**EENT:** nasopharyngitis

**GI:** diarrhea, constipation

**Hepatic:** liver enzyme abnormalities

**Musculoskeletal:** arthralgia, myalgia, back pain, extremity pain, rhabdomyolysis

**Skin:** rash, pruritus, urticaria

**Other:** influenza, hypersensitivity

### Interactions

**Drug-drug.** *Cyclosporine, erythromycin, fibric acids, niacin, protease inhibitors, rifampin:* increased pitavastatin effect and risk of myopathy

**Drug-diagnostic tests.** *Alanine aminotransferase (ALT), alkaline phosphatase, aspartate aminotransferase (AST), bilirubin, blood glucose, creatine kinase:* increased levels

**Drug-food.** *Grapefruit juice:* increased drug area under the curve

### Patient monitoring

Discontinue drug if markedly elevated creatine kinase level occurs or myopathy is diagnosed or suspected.

Temporarily withhold drug if an acute serious condition suggests myopathy or predisposes to development of renal failure secondary to rhabdomyolysis (such as sepsis, hypotension, dehydration, major surgery, trauma, uncontrolled seizures, or severe metabolic, endocrine, and electrolyte disorders).

- Analyze lipid levels 4 weeks after starting therapy and after dosage titration; monitor liver enzyme levels 12 weeks after starting therapy, after dosage titration, and periodically thereafter. Should an increase in ALT or AST level of more than three times the upper limit of normal persist, dosage reduction or drug withdrawal is recommended. Continue to monitor patient who develops increased transaminase levels until abnormalities resolve.
- In patient receiving warfarin concurrently, closely monitor prothrombin time and International Normalized Ratio.

### Patient teaching

Tell patient to take drug with or without food.

Instruct patient to immediately report to prescriber if unexplained muscle pain, tenderness, or weakness occurs, especially if accompanied by malaise or fever.

- Caution patient to avoid or decrease alcohol intake.
- Advise breastfeeding patient not to breastfeed while taking drug.
- Advise female patient of childbearing age to use an effective method of birth control to prevent pregnancy while using drug and if she becomes pregnant, advise her to stop taking drug and notify prescriber.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and food mentioned above.

## posaconazole

Noxafil, Posanol\*

**Pharmacologic class:** Triazole

**Therapeutic class:** Antifungal

**Pregnancy risk category C**

### Action

Inhibits fungal ergosterol synthesis (key component of fungal cell membrane) by inhibiting lanosterol 14-alpha demethylase and causing methylated sterol precursors to accumulate

### Availability

*Oral suspension (immediate-release):* 40 mg/ml in 123-ml bottle

### Indications and dosages

➤ Prophylaxis of invasive *Aspergillus* and *Candida* infections in patients at

risk for these infections because of severe immunocompromise (such as hematopoietic stem-cell transplant recipients with graft-versus-host disease and those who have hematologic cancers with prolonged neutropenia from chemotherapy)

**Adults and children age 13 and older:** 200 mg (5 ml) P.O. three times daily for duration of therapy based on recovery from neutropenia or immunosuppression

➤ Oropharyngeal candidiasis

**Adults and children age 13 and older:** Loading dose of 100 mg (2.5 ml) P.O. twice daily on first day, then 100 mg P.O. once daily for 13 days

➤ Oropharyngeal candidiasis refractory to itraconazole or fluconazole

**Adults and children age 13 and older:** 400 mg (10 ml) P.O. twice daily for duration of therapy based on disease severity and clinical response

### Off-label uses

- Esophageal candidiasis
- *Fusarium* infection
- Mycosis

### Contraindications

- Hypersensitivity to drug or its components
- Concurrent use of astemizole, cisapride, ergot alkaloids, halofantrine, pimozone, quinidine, sirolimus, or terfenadine

### Precautions

Use cautiously in:

- hypersensitivity to other azoles
- potentially proarrhythmic conditions, severe underlying medical conditions (such as hematologic cancers), preexisting hepatic impairment
- pregnant or breastfeeding patients
- children younger than age 13 (safety and efficacy not established).

### Administration

- Before starting drug, make rigorous attempts to correct potassium, magnesium, and calcium imbalances.
- Advise patient to take each dose with full meal or liquid nutritional supplement to enhance drug absorption.
- ⚠ Don't give concurrently with astemizole, cisapride, ergot alkaloids, halofantrine, pimozone, quinidine, or terfenadine.

Route	Onset	Peak	Duration
P.O.	Unknown	3-5 hr	Unknown

### Adverse reactions

**CNS:** seizure, insomnia, anxiety,

headache, fatigue, dizziness, weakness

**CV:** prolonged QT interval, hypertension, hypotension, tachycardia

**EENT:** blurred vision, epistaxis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, flatulence, mucositis, dry mouth, oral candidiasis, anorexia

**GU:** vaginal hemorrhage

**Hematologic:** anemia, **neutropenia**, febrile neutropenia, thrombocytopenia

**Hepatic:** cholestasis, hepatic damage, **hepatic failure**

**Metabolic:** adrenal insufficiency (rare), dehydration

**Musculoskeletal:** arthralgia, back pain

**Respiratory:** cough, dyspnea, upper respiratory tract infection, pneumonia

**Skin:** rash, pruritus, petechiae

**Other:** unusual taste, weight loss, fever, bacteremia, herpes simplex, edema, leg edema, rigors, cytomegalovirus infection

### Interactions

**Drug-drug.** *Astemizole, cisapride, halofantrine, pimozone, quinidine, terfenadine:* elevated blood levels of these drugs, leading to prolonged QT interval and increased risk of life-threatening arrhythmias (including torsades de pointes)

*Benzodiazepines metabolized through CYP3A4 (such as midazolam), phenytoin, rifabutin*: increased blood levels of these drugs

*Calcium channel blockers metabolized through CYP3A4 (such as amlodipine, diltiazem, felodipine)*: increased blood levels of these drugs, causing increased toxicity risk

*Cimetidine, phenytoin, rifabutin*: decreased posaconazole blood level  
*Cyclosporine, sirolimus, tacrolimus*: elevated blood levels of these drugs, causing increased risk of nephrotoxicity and other serious adverse reactions  
*Ergot derivatives (dihydroergotamine, ergotamine)*: increased blood levels of these drugs, causing increased ergotism risk

*HMG-CoA reductase inhibitors metabolized through CYP3A4 (such as atorvastatin, fluvastatin, lovastatin)*: increased blood levels of these drugs, causing increased risk of rhabdomyolysis  
*Vinca alkaloids (such as vinblastine, vincristine)*: increased vinca alkaloid blood levels, causing increased neurotoxicity risk

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, gamma-glutamyltransferase, serum creatinine*: increased levels

**Drug-food.** *Nonfat, high-fat, or liquid nutritional supplements*: approximately three- to four-fold increase in drug mean  $C_{max}$  and area under the curve values

### Patient monitoring

- Monitor serum potassium, magnesium, and calcium levels before and frequently during therapy.
- Obtain liver function tests and bilirubin level at start of therapy and periodically throughout. If liver function tests become abnormal during therapy, stay alert for signs and symptoms of more severe hepatic injury; consider withdrawing drug if these occur.

- Monitor blood drug levels frequently if patient is receiving concurrent cyclosporine, sirolimus, or tacrolimus. Consider reducing dosage as appropriate.

🔊 Monitor ECG if patient has potentially proarrhythmic condition or is receiving concurrent drugs that may prolong QT interval and are metabolized through CYP3A4. Stay alert for prolonged QT interval.

- Watch for breakthrough fungal infections in patients with severe diarrhea, vomiting, or severe renal impairment and in those receiving drugs that may decrease blood drug level or who can't eat a full meal or tolerate oral nutritional supplements.

### Patient teaching

- Instruct patient to take each dose with full meal or liquid nutritional supplement.
- Advise patient to inform prescriber of all drugs he is taking because serious interactions may occur.

🔊 Urge patient to contact prescriber immediately if he develops signs or symptoms of liver impairment, such as unusual tiredness, weakness, nausea, itching, yellowing of eyes or skin, upper right abdominal tenderness, or flu-like symptoms.

🔊 Tell patient to contact prescriber immediately if he develops irregular heartbeats or other cardiac symptoms.

🔊 Advise patient to notify prescriber of severe diarrhea or vomiting, because these conditions may alter blood drug level.

- Stress importance of keeping appointments for follow-up laboratory tests.
- Caution patient to avoid driving and other hazardous activities because drug may alter vision.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## potassium acetate

**Pharmacologic class:** Mineral, electrolyte

**Therapeutic class:** Electrolyte replacement, nutritional supplement

**Pregnancy risk category C**

### Action

Maintains acid-base balance, isotonicity, and electrophysiologic balance throughout body tissues; crucial to nerve impulse transmission and contraction of cardiac, skeletal, and smooth muscle. Also essential for normal renal function and carbohydrate metabolism.

### Availability

*Concentrate for injection:* 2 mEq/ml in 20-, 50-, and 100-ml vials; 4 mEq/ml in 50-ml vials

### Indications and dosages

➤ To prevent or treat potassium depletion; diabetic acidosis; metabolic alkalosis; arrhythmias; periodic paralysis attacks; hyperadrenocorticism; primary aldosteronism; healing phase of burns or scalds; overmedication with adrenocorticoids, testosterone, or corticotropin

**Adults:** Dosage highly individualized. For potassium level above 2.5 mEq/L, give 40 mEq/L as additive to I.V. infusion at a maximum rate of 10 mEq/hour; maximum daily dosage is 200 mEq. For potassium level less than 2 mEq/L, give 80 mEq/L as additive to I.V. infusion at a maximum rate of 40 mEq/hour (with cardiac monitoring); maximum daily dosage is 400 mEq.

**Children:** Dosage highly individualized; up to 3 mEq/kg or 40 mEq/m<sup>2</sup>/day as additive to I.V. infusion.

### Contraindications

- Acute dehydration
- Heat cramps
- Hyperkalemia
- Hyperkalemic familial periodic paralysis
- Severe renal impairment
- Severe hemolytic reactions
- Untreated Addison's disease
- Severe tissue trauma
- Concurrent use of potassium-sparing diuretics, angiotensin-converting enzyme (ACE) inhibitors, or salt substitutes containing potassium

### Precautions

Use cautiously in:

- cardiac disease, renal impairment, diabetes mellitus, hypomagnesemia
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

• Make sure patient is well hydrated and urinating before starting therapy.

🔊 Give only as additive to I.V. infusion. Never give by I.V. push or I.M. route, and never give undiluted. Use peripheral line with maximum rate of 40 mEq/hour (with cardiac monitoring).

🔊 To ensure that potassium is well mixed in compatible solution, don't add potassium to I.V. bottle in hanging position.

🔊 Dilute in compatible I.V. solution. Administer slowly to reduce risk of fatal hyperkalemia.

- Know that maximum infusion rate without cardiac monitoring is 20 mEq/hour. Infusion rates above 20 mEq/hour necessitate cardiac monitoring.
- If patient complains of burning with I.V. administration, decrease flow rate.
- Be aware that potassium preparations are not interchangeable.
- Know that dosages are expressed in mEq of potassium and that potassium acetate contains 10.2 mEq/g.

Route	Onset	Peak	Duration
I.V.	Rapid	End of infusion	Unknown

### Adverse reactions

**CNS:** confusion, unusual fatigue, restlessness, asthenia, flaccid paralysis, paresthesia, absent reflexes

**CV:** ECG changes, hypotension, **arrhythmias, heart block, cardiac arrest**

**GI:** nausea, vomiting, diarrhea, abdominal discomfort, flatulence

**Metabolic:** **hyperkalemia**

**Musculoskeletal:** weakness and heaviness of legs

**Respiratory:** **respiratory paralysis**

**Other:** irritation at I.V. site

### Interactions

**Drug-drug.** *ACE inhibitors, potassium-sparing diuretics, other potassium-containing preparations:* increased risk of hyperkalemia

**Drug-diagnostic tests.** *Potassium:* increased level

**Drug-food.** *Salt substitutes containing potassium:* increased risk of hyperkalemia

**Drug-herbs.** *Dandelion:* increased risk of hyperkalemia

*Licorice:* decreased response to potassium

### Patient monitoring

- Monitor renal function, fluid intake and output, and potassium, creatinine, and blood urea nitrogen levels.

-  Know that potassium is contraindicated in severe renal impairment and must be used with extreme caution (if at all) in patients with any degree of renal impairment, because of risk of life-threatening hyperkalemia.

- Assess vital signs and ECG. Watch for arrhythmias.

- Evaluate patient's neurologic status. Stay alert for neurologic complications.

- Monitor I.V. site for irritation.

### Patient teaching

- Instruct patient to report unusual pain, redness, swelling, or other reactions at infusion site.

- Advise patient to report nausea, vomiting, confusion, numbness and tingling, unusual tiredness or weakness, or heavy feeling in legs.

- Instruct patient to avoid salt substitutes.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## potassium bicarbonate

**Pharmacologic class:** Mineral, electrolyte

**Therapeutic class:** Electrolyte replacement, nutritional supplement

**Pregnancy risk category** C

### Action

Maintains acid-base balance, isotonicity, and electrophysiologic balance throughout body tissues; crucial to nerve impulse transmission and contraction of cardiac, skeletal, and smooth muscle. Also essential for normal renal function and carbohydrate metabolism.

### Availability

*Tablets for effervescent oral solution:* 25 mEq

### Indications and dosages

- To prevent potassium depletion

**Adults:** Dosage highly individualized. Usual dosage is 25 mEq/day P.O. in divided doses.

- To treat potassium depletion

**Adults:** 50 to 100 mEq/day P.O. in divided doses, not to exceed a maximum daily dosage of 150 mEq

## Contraindications

- Hypersensitivity to tartrazine or alcohol (with some products)
- Acute dehydration
- Heat cramps
- Hyperkalemia
- Hyperkalemic familial periodic paralysis
- Severe renal impairment
- Severe hemolytic reaction
- Severe tissue trauma
- Untreated Addison's disease
- Concurrent use of potassium-sparing diuretics, angiotensin-converting enzyme (ACE) inhibitors, or salt substitutes containing potassium

## Precautions

Use cautiously in:

- cardiac disease, renal impairment, diabetes mellitus, hypomagnesemia
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

## Administration

- Ensure that patient is adequately hydrated and urinating before starting therapy.
- Give with meals and a full glass of water or juice to minimize GI upset.
- Be aware that potassium preparations aren't interchangeable.
- Know that dosages are expressed in mEq of potassium and that potassium bicarbonate contains 10 mEq potassium/g.

Route	Onset	Peak	Duration
P.O.	Unknown	1-2 hr	Unknown

## Adverse reactions

**CNS:** confusion, unusual fatigue, restlessness, asthenia, flaccid paralysis, paresthesia

**CV:** ECG changes, hypotension, **heart block, arrhythmias, cardiac arrest**

**GI:** nausea, vomiting, diarrhea, abdominal discomfort, flatulence

**Metabolic:** hyperkalemia

**Musculoskeletal:** weakness and heaviness of legs

## Interactions

**Drug-drug.** ACE inhibitors, potassium-sparing diuretics, other potassium-containing preparations: increased risk of hyperkalemia

**Drug-diagnostic tests.** Potassium: increased level

**Drug-food.** Salt substitutes containing potassium: increased risk of hyperkalemia

**Drug-herbs.** Dandelion: increased risk of hyperkalemia

Licorice: decreased response to potassium

## Patient monitoring

- Monitor renal function, fluid intake and output, and potassium, creatinine, and blood urea nitrogen levels.

 Be aware that potassium is contraindicated in patients with severe renal impairment and must be used with extreme caution (if at all) in patients with any degree of renal impairment, because of risk of life-threatening hyperkalemia.

- Assess vital signs. Check ECG for arrhythmias.
- Monitor neurologic status. Stay alert for neurologic complications.

## Patient teaching

- Instruct patient to dissolve tablets thoroughly in 4 to 8 oz of cold water or juice and to sip solution over 5 to 10 minutes with a meal.

- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.

- Tell patient to report nausea, vomiting, confusion, numbness and tingling, unusual tiredness or weakness, or a heavy feeling in legs.

- Instruct patient to avoid salt substitutes.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## potassium chloride

Apo-K<sup>☼</sup>, K10<sup>☼</sup>, Kaon, Kay-Cee-L<sup>☼</sup>, K-Dur<sup>☼</sup>, K-Lor, Klor-Con, K-Lyte<sup>☼</sup>, Klotrix, K-Med<sup>☼</sup>, K-Tab, Micro-K, Riva K 20 SR<sup>☼</sup>, Slow-K<sup>☼</sup> , Slow-Pot

**Pharmacologic class:** Mineral, electrolyte

**Therapeutic class:** Electrolyte replacement, nutritional supplement

**Pregnancy risk category C**

### Action

Maintains acid-base balance, isotonicity, and electrophysiologic balance throughout body tissues; crucial to nerve impulse transmission and contraction of cardiac, skeletal, and smooth muscle. Also essential for normal renal function and carbohydrate metabolism.

### Availability

*Capsules (extended-release):* 8 mEq, 10 mEq

*Powder for oral solution:* 20 mEq, 25 mEq

*Parenteral injection (concentrate):* 2 mEq/ml

*Parenteral solution:* 0.1 mEq/ml, 0.2 mEq/ml, 0.3 mEq/ml, 0.4 mEq/ml

*Potassium chloride in 5% dextrose injection:* 10 mEq/L, 20 mEq/L, 30 mEq/L, 40 mEq/L

*Potassium chloride in 0.9% sodium chloride injection:* 20 mEq/L, 40 mEq/L

*Potassium chloride in dextrose and lactated Ringer's injection:* various strengths

*Potassium chloride in dextrose and sodium chloride injection:* various strengths

*Solution (oral):* 6.7 mEq, 10 mEq, 13.3 mEq, 15 mEq, 20 mEq, 30 mEq, 40 mEq

*Tablets:* 500 mg, 595 mg

*Tablets (effervescent):* 25 mEq, 50 mEq

*Tablets (extended-release):* 8 mEq, 10 mEq, 20 mEq

*Tablets (extended-release crystals):*

10 mEq, 20 mEq

*Tablets (extended-release, film coated):*

8 mEq, 10 mEq

*Tablets (film-coated):* 2.5 mEq, 10 mEq

### Indications and dosages

➤ To prevent potassium depletion

**Adults:** Dosage highly individualized. Usual single dosage is 20 mEq/day P.O. in divided doses.

➤ Potassium depletion; diabetic acidosis; metabolic alkalosis; arrhythmias; periodic paralysis attacks; hyperadrenocorticism; primary aldosteronism; healing phase of scalds or burns; over-medication with adrenocorticoids, testosterone, or corticotropin

**Adults:** Dosage highly individualized. 40 to 100 mEq/day P.O. in divided doses, not to exceed 20 mEq in a single dose. For serum potassium level above 2.5 mEq/L, 40 mEq/L as additive to I.V. infusion at a maximum rate of 10 mEq/hour; maximum daily dosage is 200 mEq. For serum potassium level less than 2 mEq/L, 80 mEq/L as additive to I.V. infusion at a maximum rate of 40 mEq/hour (with cardiac monitoring); maximum daily dosage is 400 mEq.

**Children:** Dosage highly individualized; give up to 3 mEq/kg or 40 mEq/m<sup>2</sup>/day as additive to I.V. infusion.

### Contraindications

- Hypersensitivity to tartrazine or alcohol (with some products)
- Acute dehydration
- Heat cramps
- Hyperkalemia

- Hyperkalemic familial periodic paralysis
- Severe renal impairment
- Severe hemolytic reactions
- Severe tissue trauma
- Untreated Addison's disease
- Esophageal compression caused by enlarged left atrium (with wax matrix forms)
- Concurrent use of potassium-sparing diuretics, angiotensin-enzyme converting (ACE) inhibitors, or salt substitutes containing potassium

### Precautions

Use cautiously in:

- cardiac disease, renal impairment, diabetes mellitus, hypomagnesemia
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

 Know that I.V. potassium chloride is a high-alert drug.

 Give I.V. form as additive by infusion only. Never give undiluted or by I.V. push or I.M. route. Use peripheral line and infuse at a maximum rate of 40 mEq/hour (with cardiac monitoring).

 Dilute in compatible I.V. solution per manufacturer's instructions. Administer slowly to reduce risk of fatal hyperkalemia.

 To ensure that potassium is well mixed in compatible solution, don't add potassium to I.V. bottle in hanging position.

 Be aware that maximum infusion rate without cardiac monitoring is 20 mEq/hour. Rates above 20 mEq/hour require cardiac monitoring.

- Make sure patient is well-hydrated and urinating before starting therapy.
- If patient complains of burning with I.V. administration, decrease flow rate.

- Give P.O. form with meals and a full glass of water or juice, to minimize GI upset.
- Ensure that patient swallows wax-matrix tablets completely, to avoid serious esophageal problems.
- Don't give wax matrix tablets to patients who have swallowing problems or possible esophageal compression.
- Be aware that potassium preparations aren't interchangeable.
- Know that dosages are expressed in mEq of potassium and that potassium chloride contains 13.4 mEq potassium/g.

Route	Onset	Peak	Duration
P.O.	Unknown	1-2 hr	Unknown
I.V.	Rapid	End of infusion	Unknown

### Adverse reactions

**CNS:** confusion, unusual fatigue, restlessness, asthenia, flaccid paralysis, paresthesia, absent reflexes

**CV:** ECG changes, hypotension, **arrhythmias, heart block, cardiac arrest**

**GI:** nausea, vomiting, diarrhea, abdominal discomfort, flatulence

**Metabolic:** hyperkalemia

**Musculoskeletal:** weakness and heaviness of legs

**Respiratory:** respiratory paralysis

**Other:** irritation at I.V. site

### Interactions

**Drug-drug.** *ACE inhibitors, potassium-sparing diuretics, other potassium-containing preparations:* increased risk of hyperkalemia

**Drug-diagnostic tests.** *Potassium:* increased level

**Drug-food.** *Salt substitutes containing potassium:* increased risk of hyperkalemia

**Drug-herbs.** *Dandelion*: increased risk of hyperkalemia

*Licorice*: decreased response to potassium

### Patient monitoring

- Monitor renal function, fluid intake and output, and potassium, creatinine, and blood urea nitrogen levels.
- Assess vital signs and ECG. Stay alert for arrhythmias.
- Monitor neurologic status. Watch for neurologic complications.
- Monitor I.V. site for irritation.

 Know that potassium is contraindicated in patients with severe renal impairment and must be used with extreme caution (if at all) in patients with any degree of renal impairment, because of risk of life-threatening hyperkalemia.

### Patient teaching

- Instruct patient to mix and dissolve powder completely in 3 to 8 oz of water or juice.
- Tell patient to swallow extended-release capsules whole without crushing or chewing them.
- Instruct patient to take oral form with or just after a meal, with a glass of water or fruit juice.
- Tell patient to sip diluted liquid form over 5 to 10 minutes.
- Advise patient to report nausea, vomiting, confusion, numbness and tingling, unusual fatigue or weakness, or a heavy feeling in legs.
- Tell patient to minimize GI upset by eating frequent, small servings of food and drinking plenty of fluids.
- Inform patient that although wax matrix form may appear in stool, drug has already been absorbed.
- Advise patient not to use salt substitutes.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## potassium iodide

lostat, Pima, SSKI, Thyrosafe, ThyroShield

**Pharmacologic class:** Iodine, iodide

**Therapeutic class:** Antithyroid agent, expectorant

**Pregnancy risk category D**

### Action

Rapidly inhibits thyroid hormone release, reduces thyroid vascularity, and decreases thyroid uptake of radioactive iodine after radiation emergencies or administration of radioactive iodine isotopes. As expectorant, thought to increase respiratory tract secretions, thereby decreasing mucus viscosity.

### Availability

**Saturated solution (SSKI):** 1 g potassium iodide/ml in 30- and 240-ml bottles

**Solution (strong iodine solution, Lugol's solution):** 5% iodine and 10% potassium iodide in 120-ml bottle

**Syrup:** 325 mg potassium iodide/5 ml

**Tablets:** 130 mg (available only through state and federal agencies)

### Indications and dosages

➤ Preparation for thyroidectomy

**Adults and children:** One to five drops SSKI P.O. t.i.d. or three to six drops strong iodine solution P.O. t.i.d. for 10 days before surgery

➤ Thyrotoxic crisis

**Adults and children:** 500 mg P.O. (approximately 10 drops SSKI) q 4 hours or 1 ml P.O. (strong iodine solution) t.i.d., at least 1 hour after initial propylthiouracil or methimazole dose

➤ Radiation protectant in emergencies

**Adults older than age 40 with predicted thyroid exposure of 500**

centigrays (cGy), adults ages 18 to 40 with predicted exposure of 10 cGy, pregnant or breastfeeding women with predicted exposure of 5 cGy, and adolescents weighing 70 kg (154 lb) or more with predicted exposure of 5 cGy: 130 mg P.O. (tablet)

Children ages 3 to 18 (except adolescents weighing 70 kg [154 lb] or more) with predicted thyroid exposure of 5 cGy: 65 mg P.O. (tablet)

Children ages 1 month to 3 years with predicted thyroid exposure of 5 cGy: 32 mg P.O. (tablet)

Infants from birth to age 1 month with predicted thyroid exposure of 5 cGy: 16 mg P.O. (tablet)

➤ Expectorant

**Adults:** 300 to 650 mg P.O. (SSKI) three or four times daily, given with at least 6 oz of fluid

**Children:** 60 to 250 mg P.O. (SSKI) q.i.d., given with at least 6 oz of fluid

### Off-label uses

- Lymphocutaneous sporotrichosis

### Contraindications

- Hypersensitivity to iodine, shellfish, or bisulfites (with some products)
- Hypothyroidism
- Renal impairment
- Acute bronchitis
- Addison's disease
- Acute dehydration
- Heat cramps
- Hyperkalemia
- Tuberculosis
- Iodism
- Concurrent use of potassium-containing drugs, potassium-sparing diuretics, or salt substitutes containing potassium

### Precautions

Use cautiously in:

- cystic fibrosis, adolescent acne, hypocomplementemic vasculitis, goiter, autoimmune thyroid disease

- pregnant or breastfeeding patients
- children.

### Administration

- Dilute saturated solution with at least 6 oz of water.

⚠ Don't give concurrently with other potassium-containing drugs or potassium-sparing diuretics, because of increased risk of hyperkalemia, arrhythmias, and cardiac arrest.

- Know that U.S. government stockpiles potassium iodide 130-mg tablets for emergency use.

- When giving to very young children or patients who can't swallow tablets, crush tablet, dissolve in 20 ml of water, and add 20 ml of selected beverage (such as orange juice).

- Be aware that potassium iodide use as expectorant has been largely replaced by safer and more effective drugs.

Route	Onset	Peak	Duration
P.O.	24 hr	10-15 days	Variable

### Adverse reactions

**CNS:** confusion; unusual fatigue; paresthesia, pain, or weakness in hands or feet

**Metabolic:** thyroid hyperplasia, goiter (with prolonged use), thyroid adenoma, severe hypothyroidism, **hyperkalemia**, **iodism** (with large doses or prolonged use)

**Musculoskeletal:** weakness and heaviness of legs

**Other:** tooth discoloration (with strong iodide solution), hypersensitivity reactions including angioedema, fever, cutaneous and mucosal hemorrhage, serum sickness-like reaction

### Interactions

**Drug-drug.** *Lithium, other thyroid drugs:* additive hypothyroidism  
*Potassium-sparing diuretics, other potassium preparations:* increased risk

of hyperkalemia, arrhythmias, and cardiac arrest

**Drug-diagnostic tests.** *Radionuclide thyroid imaging:* altered test results *Thyroid uptake of  $^{131}\text{I}$ ,  $^{123}\text{I}$ , sodium pertechnetate Tc 99m:* decreased uptake **Drug-food.** *Salt substitutes containing potassium:* increased risk of hyperkalemia

### Patient monitoring

 In long-term use, check for signs and symptoms of iodism (metallic taste, sore teeth and gums, sore throat, burning of mouth and throat, coldlike symptoms, severe headache, productive cough, GI irritation, diarrhea, angioedema, rash, fever, and cutaneous or mucosal hemorrhage). Discontinue drug immediately if these occur.

- Monitor potassium level; watch for signs and symptoms of potassium toxicity.
- Assess ECG, renal function, fluid intake and output, and creatinine and blood urea nitrogen levels.
- Monitor thyroid function tests. Watch for evidence of hypothyroidism or hyperthyroidism.

### Patient teaching

- Tell patient to dilute in at least 6 oz of water or juice and to take with meals.
- Advise patient to sip strong iodine solution through a straw to help prevent tooth discoloration.
-  Teach patient to recognize and immediately report signs and symptoms of iodism and potassium toxicity.
- Instruct patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- Inform patient that many salt substitutes are high in potassium. Advise him not to use these without prescriber's approval.

- Caution patient not to take drug if she is pregnant or breastfeeding (except in emergency use).
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## pralatrexate

Foloty®

**Pharmacologic class:** Folic acid antagonist

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

### Action

Competitively inhibits dihydrofolate reductase and is a competitive inhibitor for polyglutamylation by the enzyme folylpolyglutamyl synthetase, resulting in depletion of thymidine and other biological molecules, the synthesis of which depends on single carbon transfer

### Availability

*Solution for injection:* 20 mg/1 ml, 40 mg/2 ml in single-use vials

### Indications and dosages

 Relapsed or refractory peripheral T-cell lymphoma

**Adults:** 30 mg/m<sup>2</sup> by I.V. push over 3 to 5 minutes weekly for 6 weeks in 7-week cycles until disease progression or unacceptable toxicity occurs. Give with supplemental oral folic acid and I.M. vitamin B<sub>12</sub>.

### Dosage adjustment

- Mucositis
- Hematologic toxicities
- Liver function test abnormalities of Grade 3 or greater

## Contraindications

None

## Precautions

Use cautiously in:

- moderate to severe renal impairment, liver function test abnormalities
- thrombocytopenia, neutropenia, anemia, mucositis, dermatologic reactions, tumor lysis syndrome
- pregnant or breastfeeding patients (avoid use)
- children (safety and efficacy not established).

## Administration

- Be aware that drug should be administered under supervision of qualified physician experienced in the use of antineoplastics, with appropriate management of complications and adequate diagnostic and treatment facilities readily available.
- Obtain serum chemistry tests, including renal and hepatic function, before start of first and fourth dose of a given cycle.
- Before administering, be aware that mucositis should be Grade 1 or less, platelet count should be 100,000/mm<sup>3</sup> or more for first dose and 50,000/mm<sup>3</sup> or more for all subsequent doses, and absolute neutrophil count (ANC) should be 1,000/mm<sup>3</sup> or more.
- Don't dilute drug.
- Administer by I.V. push over 3 to 5 minutes through side port of a free-flowing 0.9% Sodium Chloride Injection I.V. line once weekly for 6 weeks in 7-week cycles (6 weeks on drug and 1 week off each cycle) until progressive disease or unacceptable toxicity occurs.
- Be aware that patient should take low-dose (1.0 to 1.25 mg) oral folic acid daily, initiated during 10-day period preceding first pralatrexate dose, with dosing continued during full course of therapy and for 30 days after last pralatrexate dose. In addition, patient should receive vitamin B<sub>12</sub>

(1 mg) I.M. no more than 10 weeks before first pralatrexate dose and every 8 to 10 weeks thereafter. Subsequent vitamin B<sub>12</sub> injections may be given the same day as pralatrexate treatment.

- Omit or modify doses for hematologic toxicities, Grade 2 or greater mucositis, severe dermatologic reactions, or liver function test abnormalities of Grade 3 or greater. Omitted doses must not be made up at end of cycle, and once a dosage has been reduced for toxicity, it must not be reescalated.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** fatigue, asthenia

**CV:** tachycardia

**EENT:** epistaxis, pharyngolaryngeal pain

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, anorexia, stomatitis, mucositis of GI tract

**GU:** mucositis of GU tract

**Hematologic:** anemia, neutropenia, leukopenia, thrombocytopenia, **febrile neutropenia**

**Hepatic:** liver function test abnormalities

**Metabolic:** hypokalemia

**Musculoskeletal:** extremity pain, back pain

**Respiratory:** dyspnea, cough, upper respiratory tract infection

**Skin:** rash, pruritus

**Other:** pyrexia, dehydration, edema, night sweats, **sepsis, tumor lysis syndrome**

## Interactions

**Drug-drug.** *Probenecid, other drugs that may affect relevant transporter systems (such as NSAIDs):* delayed pralatrexate clearance resulting in increased pralatrexate exposure with subsequent increased risk of systemic toxicity

**Drug-diagnostic tests.** *ALT, AST, transaminases:* increased levels  
*Platelets, potassium:* decreased levels

### Patient monitoring

- Monitor CBC with differential and severity of mucositis weekly.
- Continue to monitor serum chemistry tests, including renal and hepatic function.

 Continue to closely monitor patient for tumor lysis syndrome (irregular heartbeat, shortness of breath, high potassium level, high uric acid level, impaired mental ability, kidney failure), and dermatologic reactions.

### Patient teaching

- Inform patient about the need to take folic acid and vitamin B<sub>12</sub> during treatment.
-  Instruct patient to immediately report signs and symptoms of infection (including fever), skin reactions, mucositis, tumor lysis syndrome (irregular heartbeat, shortness of breath, impaired mental ability, urinary problems), yellowing of skin or eyes, dark urine, or right upper abdominal pain or discomfort.
- Instruct patient to tell prescriber about all drugs he's taking, including nonprescription drugs, because some drugs have potential for serious drug interactions.
- Advise female patient of childbearing age to avoid pregnancy and breastfeeding during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## pramipexole dihydrochloride

Apo-Pramipexole<sup>✳</sup>, Mirapex, Mirapex ER, Mirapexin<sup>⚠</sup>, Novo-Pramipexole<sup>✳</sup>, PMS-Pramipexole<sup>✳</sup>

**Pharmacologic class:** Non-ergot dopamine agonist

**Therapeutic class:** Antidyskinetic

**Pregnancy risk category C**

### Action

Unknown. May directly stimulate post-synaptic dopamine receptors in corpus striatum (unlike levodopa, which may increase brain's dopamine concentration).

### Availability

*Tablets:* 0.125 mg, 0.25 mg, 0.5 mg, 0.75 mg, 1 mg, 1.5 mg

*Tablets (extended-release):* 0.375 mg, 0.75 mg, 1.5 mg, 2.25 mg, 3 mg, 3.75 mg, 4.5 mg

### Indications and dosages

➤ Idiopathic Parkinson's disease

**Adults:** Initially, 0.125 mg P.O. t.i.d.; may increase by 0.125 mg q 5 to 7 days over 6 to 7 weeks. Maintenance dosage ranges from 1.5 to 4.5 mg/day in three divided doses. Or, 0.375 mg (extended-release) P.O. daily; may increase no more frequently than every 5 to 7 days, first to 0.75 mg/day and then by 0.75-mg increments up to a maximum recommended dosage of 4.5 mg/day. Assess therapeutic response and tolerability at a minimal interval of 5 days or longer after each dose increment.

➤ Moderate to severe primary restless leg syndrome

**Adults:** Initially, 0.125 mg P.O. once daily 2 to 3 hours before bedtime. For

patients requiring additional symptomatic relief, increase dosage as needed every 4 to 7 days, up to dosage of 0.5 mg once daily.

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- renal impairment
- elderly patients
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Administer extended-release tablets whole.
- Know that patients may be switched overnight from immediate-release tablets to extended-release tablets at the same daily dose; however, dosage adjustment may be needed in some patients.
- Don't give at same time as other CNS depressants.
- Don't stop therapy abruptly. Taper dosage over 1 week.

Route	Onset	Peak	Duration
P.O.	Unknown	2 hr	8 hr

### Adverse reactions

**CNS:** headache, dizziness, drowsiness, hallucinations, asthenia, confusion, dyskinesia, insomnia, hypertonia, unsteadiness, sleep attacks, abnormal dreams, amnesia

**CV:** orthostatic hypotension

**EENT:** retinal deterioration

**GI:** nausea, constipation, dyspepsia, dry mouth

**GU:** urinary frequency, erectile dysfunction

**Musculoskeletal:** leg cramps

**Respiratory: fibrotic complications** (such as retroperitoneal fibrosis, pulmonary infiltrates, pleural effusion or thickening)

**Skin: rhabdomyolysis** (immediate-release tablets)

**Other:** accidental injury, edema

### Interactions

**Drug-drug.** *Cimetidine:* increased pramipexole blood level

*Dopamine antagonists (such as butyrophenones, metoclopramide, phenothiazines, thioxanthenes):* decreased pramipexole efficacy

*Levodopa:* increased risk of hallucinations and dyskinesia

### Patient monitoring

- Evaluate patient for therapeutic and adverse effects.
- Assess blood pressure; watch for orthostatic hypotension.
- Monitor neurologic status, especially for sleep attacks and extrapyramidal symptoms.
- Watch closely for pulmonary complications.

### Patient teaching

- Instruct patient to take drug with food if it causes nausea. Tell him not to take at same time as other CNS depressants.
- Instruct patient to swallow extended-release tablets whole and not to chew, crush, or divide them.
- Advise patient to report respiratory problems, dyskinesia, hallucinations, and sleep attacks.
- Tell patient drug may cause erectile dysfunction. Encourage him to discuss this effect with prescriber.
- Inform patient and family that drug's neurologic and motor effects increase risk of sudden onset of sleep without warning and accidental injury. Teach them ways to prevent injury.
- 🚨 Advise patient and family to contact prescriber if vision changes or

unexplained muscle pain, tenderness, or weakness occurs.

- Tell patient to move slowly when sitting up or standing, to avoid dizziness from sudden blood pressure decrease.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## pramlintide acetate

Symlin

**Pharmacologic class:** Synthetic amylin

**Therapeutic class:** Hypoglycemic

**Pregnancy risk category C**

### FDA BOXED WARNING

• Drug is used with insulin and has been linked to increased risk of insulin-induced severe hypoglycemia, especially in patients with type 1 diabetes. When severe hypoglycemia occurs, it arises within 3 hours after injection. If it occurs while patient operates a motor vehicle or heavy machinery or performs other high-risk activities, serious injuries may occur. Careful patient selection, patient instruction, and insulin dosage adjustments are crucial to reduce risk.

### Action

Mimics amylin activity to modulate gastric emptying, prevent postprandial rise in plasma glucagons, and cause feeling of satiety leading to decreased caloric intake and potential weight loss

### Availability

**Solution for injection:** 0.6 mg/ml in 5-ml vials; 1.5-ml disposable multidose pen-injector containing 1,000 mcg/ml;

2.7-ml disposable multidose 120 pen-injector containing 1,000 mcg/ml

### Indications and dosages

➤ Type 1 diabetes mellitus as adjunct treatment in patients who take insulin with meals but haven't obtained desired glycemic control despite optimal insulin therapy

**Adults:** Initially, 15 mcg subcutaneous injection immediately before major meals; after 3 days, increase in 15-mcg increments to maintenance dosage of 30 or 60 mcg as tolerated. Decrease preprandial rapid- or short-acting insulin dosages (including fixed-mix insulins) by 50%.

➤ Type 2 diabetes mellitus as adjunct treatment in patients who take insulin with meals but haven't obtained desired glycemic control despite optimal insulin therapy, with or without concurrent sulfonylurea, metformin, or both

**Adults:** Initially, 60 mcg subcutaneous injection immediately before major meals; after 3 to 7 days, increase to 120 mcg as tolerated. Decrease preprandial rapid- or short-acting insulin dosages (including fixed-mix insulins) by 50%.

### Contraindications

- Hypersensitivity to drug or its components
- Confirmed gastroparesis
- Hypoglycemia unawareness

### Precautions

Use cautiously in:

- patients with poor compliance to insulin therapy or hemoglobin A1c levels above 9%
- patients with recurrent or severe hypoglycemia who've required treatment during past 6 months
- concurrent insulin therapy for type 1 diabetes

- concurrent use of drugs that stimulate GI motility
- elderly patients
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Administer immediately before major meals (at least 250 kcal or 30 g carbohydrates).
- Give pramlintide and insulin as separate injections.
- Inject pramlintide and insulin more than 2" apart.

Route	Onset	Peak	Duration
Subcut.	Unknown	19-21 min	Unknown

### Adverse reactions

**CNS:** headache, dizziness, fatigue

**EENT:** pharyngitis

**GI:** nausea, vomiting, abdominal pain, anorexia

**Metabolic: severe hypoglycemia**

**Musculoskeletal:** arthralgia

**Respiratory:** cough

**Other:** allergic reaction

### Interactions

**Drug-drug.** *Angiotensin-converting enzyme inhibitors, disopyramide, fibric acid derivatives, fluoxetine, monoamine oxidase inhibitors, oral hypoglycemics, pentoxifylline, propoxyphene, salicylates, sulfonamide antibiotics:* increased hypoglycemic effect, increased risk of hypoglycemia

*Beta-adrenergic blockers, clonidine, guanethidine, reserpine:* blunting of early hypoglycemia symptoms

*Drugs that delay gastric emptying (such as atropine) or slow food absorption (such as acarbose):* exacerbated delay in gastric emptying, slow food absorption  
**Insulin:** severe hypoglycemia (may occur within 3 hours of insulin administration)

*Oral drugs for which rapid effect is desired (such as analgesics):* delayed absorption of these drugs

### Patient monitoring

- Monitor premeal and postmeal blood glucose levels closely; watch for hypoglycemia.

### Patient teaching

- Instruct patient to take drug immediately before major meals.
- Teach patient how to self-administer injection; describe proper storage, handling, and disposal of drug and supplies.
- Instruct patient to inject pramlintide and insulin separately, more than 2" apart. Caution patient not to mix them together.
- Teach patient to recognize and immediately report hypoglycemia symptoms; tell him these may occur within 3 hours after pramlintide injection.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## prasugrel

Effient

**Pharmacologic class:** Thienopyridine platelet inhibitor

**Therapeutic class:** Antiplatelet drug

**Pregnancy risk category B**

### FDA BOXED WARNING

- Drug can cause significant, sometime fatal, bleeding.
- Don't use in patients with active pathological bleeding or history of

transient ischemic attack or stroke (patients age 75 and older).

- Drug is generally not recommended, because of increased risk of fatal and intracranial bleeding and uncertain benefit. In high-risk situations (such as patients with diabetes or history of prior myocardial infarction, where its effect appears to be greater), its use may be considered.
- Don't start drug in patients likely to undergo urgent coronary artery bypass graft (CABG). If possible, discontinue drug at least 7 days before any surgery.
- Additional risk factors for bleeding include body weight of less than 132 lb (60 kg), propensity for bleeding, concomitant use of medications that increase bleeding risk (such as warfarin, heparin, fibrinolytics, and nonsteroidal anti-inflammatory drugs [prolonged use]). Suspect bleeding in patient who is hypotensive and has recently undergone coronary angiography, percutaneous coronary intervention (PCI), CABG, or other surgical procedures.
- If possible, manage bleeding without discontinuing drug. Discontinuing drug, particularly in first few weeks after acute coronary syndrome, increases risk of subsequent cardiovascular events.

## Action

Inhibits platelet activation and aggregation through irreversible binding of its active metabolite to the P2Y<sub>12</sub> class of adenosine diphosphate receptors on platelets

## Availability

Tablets: 5 mg, 10 mg

## Indications and dosages

➤ Reduction of rate of thrombotic cardiovascular events in patients with acute coronary syndrome who are to

be managed with PCI as follows: patients with unstable angina or non-ST-elevation myocardial infarction (MI) and patients with ST-elevation MI when managed with primary or delayed PCI

**Adults:** Initially, 60 mg P.O. as loading dose; then, 10 mg P.O. daily (with aspirin 75 to 325 mg daily)

## Dosage adjustment

- Adults weighing less than 132 lb

## Contraindications

- Hypersensitivity to drug or its components
- Active pathological bleeding
- History of transient ischemic attack or cerebrovascular accident

## Precautions

Use cautiously in:

- CABG-related bleeding, patients at general risk for bleeding
- thrombotic thrombocytopenia purpura
- low body weight (less than 132 lb)
- elderly patients age 75 and older (use not recommended except in high-risk situations, such as diabetes and history of MI)
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

## Administration

- Administer with or without food.
- 📢 Be aware that premature drug discontinuation increases risk of stent thrombosis, MI, and death.

Route	Onset	Peak	Duration
P.O.	Unknown	30 min	Unknown

## Adverse reactions

**CNS:** headache, dizziness, fatigue,  
**intracranial hemorrhage**  
**CV:** hypertension, hypotension, bradycardia, peripheral edema, **atrial fibrillation**

**EENT:** epistaxis

**GI:** nausea, diarrhea, **GI hemorrhage**

**Hematologic:** leukopenia, bleeding, **life-threatening bleeding, thrombotic thrombocytopenia purpura**

**Metabolic:** hypercholesterolemia, hyperlipidemia

**Musculoskeletal:** back pain, extremity pain

**Respiratory:** dyspnea, cough

**Skin:** rash

**Other:** chest pain, pyrexia, **newly diagnosed malignancies**

## Interactions

**Drug-drug.** *Nonsteroidal anti-inflammatory drugs, warfarin:* increased risk of bleeding

**Drug-diagnostic tests.** *Cholesterol, lipids:* increased levels

*White blood cells:* decreased count

## Patient monitoring

🚨 Closely monitor coagulation studies and CBC with white cell differential and watch for evidence of bleeding.

- Monitor cholesterol and lipid levels closely.

## Patient teaching

- Instruct patient to take drug with or without food.

🚨 Instruct patient to immediately report to prescriber blood in stool or urine or unanticipated, prolonged, or excessive bleeding.

🚨 Instruct patient to promptly report to prescriber if fever, weakness, extreme skin paleness, purple skin patches, or neurologic changes, such as dizziness or headache, occur.

- Advise patient to notify all health care professionals that he's taking pravastatin.
- Advise patient not to take other prescription or nonprescription drugs or dietary supplements without first discussing with prescriber.
- Caution patient not to discontinue drug without first discussing with prescriber.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## pravastatin sodium

Apo-Pravastatin<sup>✳</sup>, CO Pravastatin<sup>✳</sup>, Dom-Pravastatin<sup>✳</sup>, Gen-Pravastatin<sup>✳</sup>, Lipostat<sup>Ⓢ</sup>, Novo-Pravastatin<sup>✳</sup>, Nu-Pravastatin<sup>✳</sup>, PHL-Pravastatin<sup>✳</sup>, PMS-Pravastatin<sup>✳</sup>, Pravachol, Ran-Pravastatin<sup>✳</sup>, Ratio-Pravastatin<sup>✳</sup>, Riva-Pravastatin<sup>✳</sup>, Sandoz Pravastatin<sup>✳</sup>

**Pharmacologic class:** HMG-CoA reductase inhibitor

**Therapeutic class:** Antilipemic

**Pregnancy risk category** X

## Action

Inhibits HMG-CoA reductase, an enzyme that catalyzes cholesterol synthesis pathway. This action decreases cholesterol, triglyceride, apolipoprotein B, and low-density lipoprotein (LDL) levels and increases high-density lipoprotein levels.

## Availability

*Tablets:* 10 mg, 20 mg, 40 mg, 80 mg

## Indications and dosages

➤ Adjunct to diet to reduce risk of total mortality by reducing coronary death, myocardial infarction, revascularization, stroke or transient ischemic attack, and progression of coronary atherosclerosis in patients with clinically evident coronary heart disease; to reduce elevated total cholesterol, LDL cholesterol (LDL-C), apolipoprotein B, and triglyceride (TG) levels and increase high-density lipoprotein levels in patients with primary

hypercholesterolemia and mixed dyslipidemia; to reduce elevated serum TG levels in patients with hypertriglyceridemia; to treat patients with primary dysbetalipoproteinemia who aren't responding to diet

**Adults:** 40 mg P.O. once daily. Use 80-mg dose only for patients not reaching LDL-C goal with 40 mg. Adjust dosage at 4 weeks according to patient's response and established treatment guidelines.

➤ Heterozygous familial hypercholesterolemia after failure of adequate trial of diet therapy

**Adolescents ages 14 to 18:** 40 mg P.O. daily

**Children ages 8 to 13:** 20 mg P.O. daily

### Dosage adjustment

- Significant renal impairment
- Concurrent use of niacin

### Contraindications

- Hypersensitivity to drug or other HMG-CoA reductase inhibitors
- Active hepatic disease or unexplained, persistent transaminase elevations
- Pregnancy, breastfeeding, females of childbearing age

### Precautions

Use cautiously in:

- renal impairment; severe hypotension or hypertension; severe acute infection; severe metabolic, endocrine, or electrolyte disorders; uncontrolled seizures; visual disturbances; myopathy; major surgery; trauma; alcoholism
- history of hepatic disease
- concurrent use of gemfibrozil (avoid use)
- concurrent use of colchicine, fibrates, or lipid-modifying doses of niacin (1 g/day or greater)
- children younger than age 8 (safety not established).

### Administration

- If patient's also receiving bile-acid resin, give pravastatin at bedtime, at least 4 hours after resin.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache, malaise, fatigue, dizziness, insomnia, anxiety, depression, tremor, vertigo, memory loss, peripheral nerve palsy, paresthesia, peripheral neuropathy, asthenia

**EENT:** impaired extraocular eye movements, cataract progression, ophthalmoplegia, dry eyes

**GI:** nausea, vomiting, diarrhea, constipation, abdominal or biliary pain, flatulence, dyspepsia, heartburn, anorexia, **pancreatitis**

**GU:** decreased libido, erectile dysfunction, gynecomastia

**Hematologic:** anemia, **thrombocytopenia, leukopenia**

**Hepatic:** jaundice, cholestatic jaundice, fatty liver changes, **hepatoma, hepatic necrosis, hepatitis**

**Musculoskeletal:** joint pain, myalgia, myositis, **rhabdomyolysis**

**Respiratory:** dyspnea, upper respiratory tract infection

**Skin:** nodules, skin discoloration, alopecia, dry skin, pruritus, rash, urticaria, nail changes, photosensitivity

**Other:** altered taste, localized pain, rare hypersensitivity reactions (including polymyalgia rheumatica, arthritis, dermatomyositis, vasculitis, purpura, positive antinuclear antibody, eosinophilia, fever, chills, flushing, **hemolytic anemia, epidermal necrolysis, erythema multiforme, Stevens-Johnson syndrome, angioedema, lupus erythematosus–like reaction, and anaphylaxis**)

### Interactions

**Drug-drug.** *Clarithromycin, colchicine, cyclosporine, erythromycin, fibrates,*

*gemfibrozil, lipid-modifying doses of niacin, other HMG-CoA reductase inhibitors*: increased risk of myopathy

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, creatine kinase, creatinine phosphokinase*: increased levels

### Patient monitoring

- Watch for signs and symptoms of allergic reaction.
- Monitor vital signs and cardiovascular status.

 Evaluate liver function tests before starting therapy, 6 to 12 weeks later, and at least semiannually thereafter. Also monitor lipid levels, and watch for evidence of hepatic disorders (rare).

 Assess creatine kinase level if patient has muscle pain or is receiving other drugs associated with myopathy. Discontinue drug if myopathy is diagnosed or suspected. Continue to monitor for signs and symptoms of rhabdomyolysis (rare).

### Patient teaching

- Caution patient not to take with antacids.
-  Teach patient to recognize and immediately report signs and symptoms of allergic response and other adverse reactions, especially myositis.
- Tell patient drug may cause headache and musculoskeletal pain. Encourage him to discuss activity recommendations and pain management with prescriber.
-  Advise patient to promptly report unusual fatigue, yellowing of skin or eyes, and unexplained muscle pain, tenderness, or weakness.
- Advise female of childbearing age to notify prescriber of suspected pregnancy. Caution her not to breastfeed during therapy.
- Tell male patient that drug may cause erectile dysfunction and abnormal

ejaculation. Suggest that he discuss these issues with prescriber.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, alertness, and vision.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## prednisolone

Delacortril , Deltastab ,  
Precortisyl , Prelone

## prednisolone acetate

Diopred , Omnipred, Pred Forte  
Ophthalmic, Pred Mild Ophthalmic

## prednisolone sodium phosphate

Inflamase Mild Ophthalmic ,  
Orapred, Orapred ODT, PEDIAPRED,  
Predsol 

**Pharmacologic class:** Corticosteroid (intermediate-acting)

**Therapeutic class:** Anti-inflammatory, immunosuppressant

**Pregnancy risk category** C

### Action

Exerts potent anti-inflammatory (glucocorticoid) and weak sodium-retaining (mineralocorticoid) activity. Glucocorticoid activity causes profound and varied metabolic effects.

### Availability

*Oral solution:* 5 mg/ml

*Suspension for injection (acetate):*  
25 mg/ml, 40 mg/ml, 50 mg/ml

*Suspension (ophthalmic)*: 0.12%, 0.125%, 1%

*Syrup*: 5 mg/5 ml, 15 mg/5 ml

*Tablets*: 5 mg

*Tablets (orally disintegrating, sodium phosphate)*: 10 mg, 15 mg, 30 mg

## Indications and dosages

➤ Severe inflammation; immunosuppression

**Adults:** Dosage individualized based on diagnosis, severity of condition, and response. Usual dosage ranges from 5 to 60 mg P.O. (prednisolone) daily in two to four divided doses, or 4 to 60 mg I.M. (acetate) daily in divided doses, or 5 to 50 mg P.O. (sodium phosphate) daily in divided doses.

➤ Acute exacerbation of multiple sclerosis

**Adults:** 200 mg P.O. daily for 1 week, followed by 80 mg every other day for 1 month

➤ Refractory bronchial asthma

**Children:** 1 to 2 mg/kg/day (sodium phosphate) as a single dose or in divided doses; may continue for 3 to 10 days or until symptoms resolve or patient achieves peak expiratory flow rate of 80% of personal best

➤ Nephrotic syndrome in children

**Children:** 60 mg/m<sup>2</sup> P.O. (sodium phosphate solution) daily in three divided doses for 4 weeks, then 4 weeks of alternate-day therapy at single doses of 40 mg/m<sup>2</sup>

➤ Various allergic conditions and dermatologic, endocrine, GI, hematologic, neoplastic, nervous system, ophthalmic, respiratory, and rheumatic disorders

**Adults:** Variable and individualized depending on condition being treated and patient response. Initially, 10 to 60 mg (ODT) P.O. daily.

**Children:** Variable and individualized depending on condition being treated. Initial dosage range is 0.14 to

2 mg/kg/day P.O. in three or four divided doses.

➤ Steroid-responsive inflammatory eye conditions

**Adults:** In severe cases, initially one to two drops (acetate or sodium phosphate) instilled into conjunctival sac q hour during day and q 2 hours at night. In mild or moderate inflammation or in severe cases that respond favorably, one to two drops q 3 to 12 hours.

## Contraindications

- Hypersensitivity to drug, other corticosteroids, alcohol, bisulfite, or tartrazine (with some products)
- Systemic fungal infections
- Active untreated infections (except in selected patients with meningitis)
- Acute superficial herpes simplex, keratitis, fungal or viral eye diseases, tuberculosis of eye, or after uncomplicated removal of superficial corneal foreign body (ophthalmic use)
- Idiopathic thrombocytopenic purpura (with I.M. use)
- Live-virus vaccines (with immunosuppressive prednisolone dosages)

## Precautions

Use cautiously in:

- diabetes mellitus, glaucoma, renal or hepatic disease, hypothyroidism, cirrhosis, diverticulitis, nonspecific ulcerative colitis, recent intestinal anastomoses, inflammatory bowel disease, thromboembolic disorders, seizures, myasthenia gravis, heart failure, hypertension, osteoporosis, ocular herpes simplex, immunosuppression, emotional instability
- pregnant or breastfeeding patients
- children younger than age 6 (younger than age 2 when treated for nephrotic syndrome; younger than age 1 month when treated for aggressive lymphomas and leukemias with ODT form).

## Administration

 Be aware that prednisolone has many different formulations that may be given by various routes: P.O., I.M., or ophthalmic. Before administering, make sure formulation can be given by prescribed route.

- Don't break ODT tablets.
- Place ODT tablet on tongue and either swallow tablet whole or allow it to dissolve in mouth with or without water.
- Inject I.M. form deep into gluteal muscle. Rotate injection sites.
- Avoid subcutaneous injection.
-  In systemic therapy, don't discontinue drug abruptly, even if inhaled steroid is added.
- Know that additional corticosteroids are needed during stress or trauma.

Route	Onset	Peak	Duration
P.O. (prednisolone, sod. phos.)	Unknown	1-2 hr	1.25-1.5 days
I.M. (acetate)	Slow	Unknown	Unknown
Ophth. (acetate, sod. phos.)	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** headache, nervousness, depression, euphoria, personality changes, psychosis, vertigo, paresthesia, insomnia, restlessness, **seizures, meningitis, increased intracranial pressure, hypertrophic cardiomyopathy in premature infants**

**CV:** hypotension, hypertension, vasculitis, **thrombophlebitis, thromboembolism, fat embolism, arrhythmias, heart failure, shock**

**EENT:** cataracts, glaucoma, visual disturbances, exacerbation of ocular infection, secondary ocular infections, globe perforation at corneal or scleral thinning site, transient stinging or burning of eyes, dry eyes, corneal ulcers, mydriasis (all with ophthalmic

use); posterior subcapsular cataracts (especially in children), glaucoma, nasal irritation and congestion, rebound congestion, sneezing, epistaxis, nasopharyngeal and oropharyngeal fungal infections, perforated nasal septum, anosmia, dysphonia, hoarseness, throat irritation (with long-term use)

**GI:** nausea, vomiting, abdominal distention, rectal bleeding, dry mouth, esophageal candidiasis, esophageal ulcer, **pancreatitis, peptic ulcer**

**GU:** amenorrhea, irregular menses

**Hematologic:** purpura

**Metabolic:** sodium and fluid retention, hypokalemia, hypocalcemia, hyperglycemia, decreased carbohydrate tolerance, growth retardation (in children), diabetes mellitus, cushingoid effects (with long-term use), **hypothalamic-pituitary-adrenal suppression** (with systemic use longer than 5 days), **adrenal suppression** (with high-dose, long-term use)

**Musculoskeletal:** muscle weakness or atrophy, myalgia, myopathy, osteoporosis, aseptic joint necrosis, spontaneous fractures (with long-term use), osteonecrosis, tendon rupture

**Respiratory:** cough, wheezing, **bronchospasm**

**Skin:** urticaria, rash, pruritus, contact dermatitis, acne, striae, poor wound healing, thin fragile skin, bruising, hirsutism, petechiae, subcutaneous fat atrophy, urticaria, angioedema

**Other:** aggravation or masking of infections, increased or decreased appetite, weight gain (with long-term use), facial edema and erythema, edema, hypersensitivity reaction

## Interactions

**Drug-drug.** *Amphotericin B, mezlocillin, piperacillin, thiazide and loop diuretics, ticarcillin:* additive hypokalemia  
*Anticholinesterase drugs:* decreased anticholinesterase effect (when prednisolone is used for myasthenia gravis)

*Aspirin, other nonsteroidal anti-inflammatory drugs*: increased risk of GI discomfort and bleeding

*Cardiac glycosides*: increased risk of digitalis toxicity due to hypokalemia

*Cyclosporine*: therapeutic benefits in organ transplant recipients, but with increased risk of toxicity

*Erythromycin, indinavir, itraconazole, ketoconazole, ritonavir, saquinavir*: increased prednisolone blood level and effects

*Hormonal contraceptives*: impaired metabolism and increased effects of prednisolone

*Isoniazid*: decreased isoniazid blood level

*Live-virus vaccines*: decreased antibody response to vaccine, increased risk of adverse effects

*Oral anticoagulants*: reduced anticoagulant requirement, opposition to anticoagulant action

*Phenobarbital, phenytoin, rifampin*: decreased prednisolone efficacy

*Salicylates*: reduced salicylate blood level

*Somatrem*: inhibition of somatrem's growth-promoting effects

*Theophylline*: altered pharmacologic effects of either drug

*Skin tests*: suppressed results

**Drug-diagnostic tests.** *Calcium, potassium, thyroid <sup>131</sup>I uptake, thyroxine, triiodothyronine*: decreased levels

*Cholesterol, glucose*: increased levels

*Nitroblue tetrazolium test for bacterial infection*: false-negative result

*Skin tests*: suppressed results

**Drug-herbs.** *Alfalfa*: activation of quiescent systemic lupus erythematosus

*Echinacea*: increased immune-stimulating effects

*Ephedra (ma huang)*: decreased drug blood level

*Ginseng*: potentiation of immunomodulating effect

*Licorice*: prolonged drug activity

**Drug-behaviors.** *Alcohol use*: increased risk of gastric irritation and GI ulcers

## Patient monitoring

- Monitor weight, blood pressure, and electrolyte levels.
- Watch for cushingoid effects (moon face, central obesity, buffalo hump, hair thinning, high blood pressure, frequent infections).
- 🔊 Assess patient for depression and psychosis.
- Monitor blood glucose level carefully in diabetic patient.
- Evaluate for signs and symptoms of infection, which drug may mask or exacerbate.
- 🔊 Monitor for signs and symptoms of early adrenal insufficiency (fatigue, weakness, joint pain, fever, anorexia, shortness of breath, dizziness, syncope).
- Assess musculoskeletal status for joint, tendon, and muscle pain.

## Patient teaching

- Tell patient to take oral dose with food or milk to reduce GI upset.
- Instruct patient to remove ODT tablet from blister just before taking.
- Instruct patient to place ODT tablet on tongue and either swallow tablet whole or allow it to dissolve in mouth with or without water. Caution patient not to cut, split, or break tablet.
- 🔊 Teach patient to recognize and immediately report cushingoid effects and signs and symptoms of early adrenal insufficiency.
- 🔊 Advise patient and significant other to immediately report depression or psychosis.
- Explain that drug increases risk of infection. Instruct patient to contact prescriber at first sign of infection.
- 🔊 Caution patient not to suddenly stop drug (including ophthalmic forms). Instruct him to discuss any changes in therapy with prescriber.

 Tell patient to immediately report bleeding or joint, muscle, tendon, or abdominal pain.

- Inform patient that he may need higher dosage during periods of stress. Encourage him to wear or carry medical identification stating this.
- Tell patient to avoid vaccinations during therapy. Mention that others in household shouldn't receive oral polio vaccine because they could pass poliovirus to him.
- Caution patient not to take over-the-counter drugs or herbs during therapy.
- Teach patient how to use eye drops. Caution him not to touch dropper tip to eye or any other surface.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## prednisone

Apo-Prednisone<sup>✳</sup>, Winpred<sup>✳</sup>

**Pharmacologic class:** Corticosteroid (intermediate acting)

**Therapeutic class:** Anti-inflammatory, immunosuppressant

**Pregnancy risk category C**

### Action

Decreases inflammation by reversing increased cell capillary permeability and inhibiting migration of polymorphonuclear leukocytes. Suppresses immune system by reducing lymphatic activity.

### Availability

**Oral solution:** 5 mg/ml, 5 mg/5 ml

**Syrup:** 5 mg/5 ml

**Tablets:** 1 mg, 2.5 mg, 5 mg, 10 mg, 20 mg, 50 mg

## Indications and dosages

 Severe inflammation; immunosuppression

**Adults:** Dosage individualized based on diagnosis, severity of condition, and response. Usual dosage is 5 to 60 mg P.O. daily as a single dose or in divided doses.

 Acute exacerbation of multiple sclerosis

**Adults:** 200 mg P.O. daily for 1 week, then 80 mg every other day for 1 month

 Adjunctive therapy for *Pneumocystis jiroveci* pneumonia in AIDS patients

**Adults:** 40 mg P.O. b.i.d. for 5 days, then 40 mg once daily for 5 days, then 20 mg once daily for 11 days

## Contraindications

- Hypersensitivity to drug, other corticosteroids, alcohol, bisulfite, or tartrazine (with some products)
- Systemic fungal infections
- Live-virus vaccines (with immunosuppressant doses)
- Active untreated infections (except in selected meningitis patients)

## Precautions

Use cautiously in:

- diabetes mellitus, glaucoma, renal or hepatic disease, hypothyroidism, cirrhosis, diverticulitis, nonspecific ulcerative colitis, recent intestinal anastomoses, inflammatory bowel disease, thromboembolic disorders, seizures, myasthenia gravis, heart failure, hypertension, osteoporosis, hypothyroidism, ocular herpes simplex, immunosuppression, emotional instability
- pregnant or breastfeeding patients
- children under age 6.

## Administration

- Give with food or milk to reduce GI upset.
- Administer once-daily dose early in morning.

Route	Onset	Peak	Duration
P.O.	Unknown	1-2 hr	1.25-1.5 days

### Adverse reactions

**CNS:** headache, nervousness, depression, euphoria, personality changes, psychosis, vertigo, paresthesia, insomnia, restlessness, **seizures, meningitis, increased intracranial pressure**

**CV:** hypotension, hypertension, vasculitis, **heart failure, thrombophlebitis, thromboembolism, fat embolism, arrhythmias, shock**

**EENT:** posterior subcapsular cataracts (especially in children), glaucoma, nasal irritation and congestion, rebound congestion, sneezing, epistaxis, nasopharyngeal and oropharyngeal fungal infections, perforated nasal septum, anosmia, dysphonia, hoarseness, throat irritation (all with long-term use)

**GI:** nausea, vomiting, abdominal distention, rectal bleeding, esophageal candidiasis, dry mouth, esophageal ulcer, **pancreatitis, peptic ulcer**

**GU:** amenorrhea, irregular menses

**Hematologic:** purpura

**Metabolic:** sodium and fluid retention, hypokalemia, hypocalcemia, hyperglycemia, decreased carbohydrate tolerance, diabetes mellitus, growth retardation (in children), cushingoid effects (with long-term use), **hypothalamic-pituitary-adrenal suppression** (with systemic use longer than 5 days), **adrenal suppression** (with high-dose, long-term use)

**Musculoskeletal:** muscle weakness or atrophy, myalgia, myopathy, osteoporosis, aseptic joint necrosis, spontaneous fractures (with long-term use), osteonecrosis, tendon rupture

**Respiratory:** cough, wheezing, **bronchospasm**

**Skin:** rash, pruritus, contact dermatitis, acne, striae, poor wound healing, hirsutism, thin fragile skin, petechiae,

bruising, subcutaneous fat atrophy, urticaria, angioedema

**Other:** bad taste, increased or decreased appetite, weight gain (with long-term use), facial edema, aggravation or masking of infections, hypersensitivity reaction

### Interactions

**Drug-drug.** *Amphotericin B, mezlocillin, piperacillin, thiazide and loop diuretics, ticarcillin:* additive hypokalemia

*Aspirin, other nonsteroidal anti-inflammatory drugs:* increased risk of GI discomfort and bleeding

*Cardiac glycosides:* increased risk of digitalis toxicity due to hypokalemia  
*Cyclosporine:* therapeutic benefits in organ transplant recipients, but with increased risk of toxicity

*Erythromycin, indinavir, itraconazole, ketoconazole, ritonavir, saquinavir:* increased prednisone blood level and effects

*Hormonal contraceptives:* impaired metabolism and increased effects of prednisone

*Isoniazid:* decreased isoniazid blood level  
*Live-virus vaccines:* decreased antibody response to vaccine, increase risk of adverse effects

*Oral anticoagulants:* reduced anticoagulant requirements, opposition to anticoagulant action

*Phenobarbital, phenytoin, rifampin:* decreased prednisone efficacy

*Salicylates:* reduced salicylate blood level  
*Somatrem:* inhibition of somatrem's growth-promoting effects

*Theophylline:* altered pharmacologic effects of either drug

**Drug-diagnostic tests.** *Calcium, potassium, thyroid <sup>131</sup>I uptake, thyroxine, triiodothyronine:* decreased levels

*Cholesterol, glucose:* increased levels  
*Nitroblue tetrazolium test for bacterial infection:* false-negative result

**Drug-herbs.** *Alfalfa:* activation of quiescent systemic lupus erythematosus

*Echinacea*: increased immune-stimulating effects

*Ephedra (ma huang)*: decreased drug blood level

*Ginseng*: potentiation of immunomodulating effect

*Licorice*: prolonged drug activity

**Drug-behaviors.** *Alcohol use*: increased risk of gastric irritation and GI ulcers

### Patient monitoring

- Monitor weight, blood pressure, and electrolyte levels.
- Watch for cushingoid effects (moon face, central obesity, buffalo hump, hair thinning, high blood pressure, frequent infections).
- 🚨 Check for signs and symptoms of depression and psychosis.
- Assess blood glucose level carefully in diabetic patient.
- Monitor patient for signs and symptoms of infection, which drug may mask or exacerbate.
- 🚨 Assess for early indications of adrenal insufficiency (fatigue, weakness, joint pain, fever, appetite loss, shortness of breath, dizziness, syncope).
- Monitor musculoskeletal status for joint, tendon, and muscle pain.

### Patient teaching

- Tell patient to take with food or milk to reduce GI upset.
- 🚨 Teach patient to recognize and immediately report signs and symptoms of early adrenal insufficiency and cushingoid effects.
- 🚨 Inform patient that drug increases his risk of infection. Instruct him to contact prescriber at first sign of infection.
- 🚨 Caution patient not to stop drug suddenly. Advise him to discuss any changes in therapy with prescriber.
- 🚨 Tell patient to immediately report bleeding or joint, muscle, tendon, or abdominal pain.

🚨 Advise patient or significant other to immediately report depression or psychosis.

- Caution patient not to take herbs or over-the-counter drugs during therapy.
- Instruct patient to avoid vaccinations during therapy. Tell him that others in household shouldn't receive oral polio vaccine because they could pass poliovirus to him.
- Tell patient he may need higher dosage during periods of stress. Encourage him to wear or carry medical identification stating this.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## pregabalin capsules CV

Lyrica

**Pharmacologic class:** Miscellaneous anticonvulsant

**Therapeutic class:** Anticonvulsant

**Pregnancy risk category C**

### Action

Unclear. Binds with high affinity to CNS  $\alpha_2$ -delta site (auxiliary subunit of voltage-gated calcium channels), possibly resulting in antinociceptive and antiseizure effects.

### Availability

**Capsules:** 25 mg, 50 mg, 75 mg, 100 mg, 150 mg, 200 mg, 225 mg, 300 mg

### Indications and dosages

➤ Adjunct for partial-onset seizures in adults

**Adults:** Initially, 75 mg P.O. b.i.d. or 50 mg P.O. t.i.d.; may increase to maximum of 600 mg P.O. daily given in

divided doses based on response and tolerance

➤ Neuropathic pain related to diabetic peripheral neuropathy

**Adults:** Initially, 50 mg P.O. t.i.d. in patients with creatinine clearance of at least 60 ml/minute; may increase to maximum of 100 mg P.O. t.i.d. within 1 week based on efficacy and tolerance

➤ Postherpetic neuralgia

**Adults:** Initially, 75 mg P.O. b.i.d., or 50 mg P.O. t.i.d. in patients with creatinine clearance of at least 60

ml/minute; may increase to maximum of 300 mg P.O. daily within 1 week based on efficacy and tolerance. Tolerant patients who don't obtain sufficient pain relief after 2 to 4 weeks of 300 mg daily may receive up to 300 mg b.i.d. or 200 mg t.i.d. Reserve dosages above 300 mg daily for patients with ongoing pain who tolerate 300 mg daily.

➤ Fibromyalgia

**Adults:** Initially, 75 mg P.O. b.i.d. in patients with creatinine clearance of at least 60 ml/minute; may increase to 150 mg P.O. b.i.d. within 1 week based on efficacy and tolerance. If patient doesn't obtain sufficient benefit at 300 mg daily, dosage may be increased further to 225 mg b.i.d. Dosages above 450 mg daily aren't recommended.

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- abnormal creatinine clearance
- concurrent use of thiazolidinedione antidiabetics
- history of angioedema episode
- concurrent use of drugs associated with angioedema (such as angiotensin-converting enzyme inhibitors)

- elderly patients
- children (safety and efficacy not established).

### Administration

- Give with or without food.
- To discontinue drug, withdraw gradually over at least 1 week to reduce risk of increased seizure frequency in patients with history of seizure disorders.

Route	Onset	Peak	Duration
P.O.	Unknown	1.5 hr	Unknown

### Adverse reactions

**CNS:** dizziness, somnolence, euphoria, balance disorder, abnormal thinking, asthenia, neuropathy, ataxia, vertigo, confusion, incoordination, abnormal gait, tremor, amnesia, nervousness, headache, speech disorder, twitching, myoclonus, fatigue, feeling drunk, hypertonia, hypoesthesia, paresthesia, lethargy, anxiety, disorientation, depression, depersonalization, stupor

**EENT:** abnormal or blurred vision, diplopia, nystagmus, conjunctivitis, sinusitis, otitis media, tinnitus, pharyngolaryngeal pain

**GI:** vomiting, constipation, flatulence, abdominal distention, gastroenteritis, dry mouth

**GU:** urinary incontinence, urinary frequency, decreased libido, anorgasmia, erectile dysfunction

**Metabolic:** hypoglycemia, fluid retention

**Musculoskeletal:** back pain, myasthenia, arthralgia, muscle spasms

**Respiratory:** dyspnea, bronchitis

**Skin:** ecchymosis, pruritus

**Other:** increased appetite, weight gain, edema, peripheral edema, accidental injury, pain, chest pain, infection, allergic reaction, **angioedema**, **hypersensitivity reactions** including **anaphylactoid reactions** (rare)

## Interactions

**Drug-drug.** *Gabapentin:* slight decrease in pregabalin rate of absorption

*Lorazepam, oxycodone:* exacerbated effects on cognitive and gross motor functioning

**Drug-diagnostic tests.** *Serum glucose:* decreased level

**Drug-behaviors.** *Alcohol use:* exacerbated effects on cognitive and gross motor functioning

## Patient monitoring

🔊 Monitor patient closely for hypersensitivity reaction and angioedema; if these effects occur, discontinue drug and begin emergency measures immediately.

- Know that patients with history of drug or alcohol abuse may be more likely to misuse or abuse drug.

## Patient teaching

- Instruct patient to take drug with or without food.

🔊 Teach patient to recognize signs and symptoms of angioedema and to discontinue drug and seek immediate medical care if these arise.

🔊 Inform patient that drug may cause hypersensitivity reactions, such as wheezing, dyspnea, rash, hives, and blisters. Advise patient to discontinue drug and seek medical care if these reactions occur.

- Inform patient that drug may cause weight gain and edema.

- Advise patient to avoid driving and other hazardous activities until drug's effects on vision and alertness are known.

- Caution patient to avoid alcohol while taking drug.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## primaquine phosphate

**Pharmacologic class:** 8-aminoquinoline compound

**Therapeutic class:** Antimalarial

**Pregnancy risk category C**

### FDA BOXED WARNING

- Familiarize yourself completely with full contents of accompanying leaflet before prescribing or administering.

## Action

Unknown. Thought to disrupt parasitic mitochondria and bind to native DNA, leading to structural changes that disrupt metabolic processes and to inhibition of gametocyte and erythrocyte forms. Destroys some gametocytes and makes others incapable of undergoing maturation division.

## Availability

Tablets: 26.3 mg (15 mg base)

## Indications and dosages

➤ To prevent or treat relapse of malaria caused by *Plasmodium vivax*  
**Adults:** 15 mg base P.O. daily for 14 days

**Children:** 0.3 mg base/kg/day P.O. for 14 days, to a maximum of 15 mg base daily

## Off-label uses

- *Pneumocystis jiroveci* pneumonia

## Contraindications

- Hypersensitivity to drug
- Concurrent use of quinacrine, other hemolytic drugs, or myelosuppressants
- Bone marrow depression

- Systemic disease with history of or tendency to granulocytopenia (such as lupus erythematosus or rheumatoid arthritis)

### Precautions

Use cautiously in:

- porphyria, methemoglobinemia, methemoglobin reductase deficiency, hemolytic anemia in G6PD deficiency (particularly in Blacks, Asians, and persons of Mediterranean descent), iodine deficiency, anemia
- pregnant patients.

### Administration

 Before giving, check prescription to see if dosage is written as mg or mg base.

- Start therapy during last 2 weeks of suppression course with chloroquine or comparable drug, or after suppression course ends.

Route	Onset	Peak	Duration
P.O.	Unknown	1-3 hr	Unknown

### Adverse reactions

**CNS:** headache, dizziness, asthenia

**CV:** hypertension

**EENT:** blurred vision, difficulty focusing

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, epigastric distress

**Hematologic:** mild anemia, leukocytosis, hemolytic anemia, methemoglobinemia

**Skin:** pruritus, skin eruptions, pallor

### Interactions

**Drug-drug.** *Aluminum and magnesium salts:* decreased GI absorption of primaquine

*Quinacrine:* increased risk of primaquine toxicity

**Drug-diagnostic tests.** *Hemoglobin, red blood cells:* decreased levels

*White blood cells:* increased or decreased count

### Patient monitoring

 Monitor CBC. Watch for evidence of blood dyscrasias or hemolytic reaction (dark urine, chills, fever, chest pain, bluish skin). Stop drug and notify prescriber at once if these occur.

- Monitor blood pressure.

### Patient teaching

- Advise patient to take with food to minimize GI upset.

 Teach patient to recognize and immediately report signs and symptoms of hemolytic reactions.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, vision, and alertness.

- Instruct patient to complete entire course of therapy as prescribed, even after symptoms improve.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## primidone

Apo-Primidone<sup>®</sup>, Mysoline

**Pharmacologic class:** Barbiturate

**Therapeutic class:** Anticonvulsant

**Pregnancy risk category** NR

### Action

Unknown. May raise seizure threshold by decreasing neuronal firing after being converted to phenobarbital.

### Availability

*Suspension:* 250 mg/5 ml

*Tablets:* 50 mg, 250 mg

### Indications and dosages

- > Grand mal, psychomotor, or focal epileptic seizures

**Adults and children ages 8 and older:**

Initially, 100 to 125 mg P.O. at bedtime on days 1 to 3, then 100 to 125 mg P.O. b.i.d. on days 4 to 6, then 100 to 125 mg P.O. t.i.d. on days 7 to 9, followed by a maintenance dosage of 250 mg P.O. three or four times daily

**Children younger than age 8:** Initially, 50 mg P.O. at bedtime on days 1 to 3, then 50 mg P.O. b.i.d. on days 4 to 6, then 100 mg P.O. b.i.d. on days 7 to 9. For maintenance, 125 to 250 mg t.i.d. or 10 to 25 mg/kg/day in divided doses.

**Dosage adjustment**

- Renal impairment

**Off-label uses**

- Benign familial (essential) tremor

**Contraindications**

- Hypersensitivity to drug or phenobarbital
- Porphyria

**Precautions**

Use cautiously in:

- hepatic, renal, or chronic obstructive pulmonary disease
- pregnant or breastfeeding patients
- hyperactive children.

**Administration**

- Don't change brands. Bioequivalency problems have occurred.

 Don't stop therapy suddenly.

Dosage must be tapered.

- Know that drug may be given alone or with other anticonvulsants.

Route	Onset	Peak	Duration
P.O.	Unknown	3-4 hr	Unknown

**Adverse reactions**

**CNS:** headache, dizziness, stimulation, drowsiness, sedation, confusion, hallucinations, psychosis, ataxia, vertigo, hyperirritability, emotional disturbances, paranoid symptoms, **coma**

**EENT:** diplopia, nystagmus, eyelid edema

**GI:** nausea, vomiting, anorexia

**GU:** erectile dysfunction

**Hematologic:** megaloblastic anemia, thrombocytopenia

**Skin:** flushing, rash

**Interactions**

**Drug-drug.** *Acetazolamide, succinimide:* decreased primidone blood level  
*Carbamazepine:* decreased primidone blood level, increased carbamazepine blood level

*Hydantoins, isoniazid, nicotinamide:* increased primidone blood level

**Drug-diagnostic tests.** *Hemoglobin, platelets:* decreased levels

*Liver function tests:* altered results

**Patient monitoring**

- Monitor primidone and phenobarbital blood levels.
- Monitor CBC and blood chemistry. Watch for evidence of blood dyscrasias.
- Assess neurologic status regularly. Stay alert for excessive drowsiness and emotional status changes.

**Patient teaching**

 Caution patient not to discontinue therapy suddenly. Advise him to discuss dosage changes with prescriber.

 Instruct patient to immediately report unusual bleeding, bruising, or rash.

- Tell patient drug may cause sexual dysfunction. Advise him to discuss this issue with prescriber.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, vision, and alertness.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## probenecid

Benuryl\*

**Pharmacologic class:** Sulfonamide-derived uricosuric

**Therapeutic class:** Antigout drug, tubular blocking agent

**Pregnancy risk category B**

### Action

Promotes uric acid excretion from kidney by blocking tubular reabsorption; also inhibits tubular secretion of weak organic acids (most penicillins and cephalosporins, some beta-lactams)

### Availability

Tablets: 0.5 g

### Indications and dosages

> Hyperuricemia caused by gout

**Adults and children weighing more than 50 kg (110 lb):** After acute gout attack subsides, 250 mg P.O. b.i.d. for 1 week, then 500 mg b.i.d.; may increase by 500 mg/day q 4 weeks (not to exceed 3 g/day)

> To prolong action or increase blood level of penicillins or cephalosporins

**Adults:** 500 mg P.O. q.i.d.

**Children ages 2 to 14:** Initially, 25 mg/kg or 0.7 g/m<sup>2</sup>, then a maintenance dosage of 40 mg/kg/day or 1.2 g/m<sup>2</sup> in four divided doses

> Gonorrhea

**Adults:** 1 g P.O. as a single dose given with or immediately before prescribed ampicillin dose

### Dosage adjustment

- Renal impairment

### Off-label uses

- Hyperuricemia secondary to thiazide therapy

### Contraindications

- Hypersensitivity to drug
- Acute gout attack
- Uric acid calculi
- Blood dyscrasias
- Concurrent salicylate use
- Concurrent penicillin use in patients with renal impairment
- Children younger than age 2

### Precautions

Use cautiously in:

- peptic ulcer, renal impairment
- pregnant or breastfeeding patients.

### Administration

🚫 Don't give until acute gout attack subsides.

- Ensure high fluid intake and alkaline urine during therapy.

Route	Onset	Peak	Duration
P.O.	30 min	2-4 hr	8 hr

### Adverse reactions

**CNS:** headache, dizziness

**GI:** nausea, vomiting, diarrhea, abdominal pain, anorexia

**GU:** urinary frequency, uric acid calculi, renal colic, **nephrotic syndrome**

**Hematologic:** anemia, hemolytic anemia, aplastic anemia

**Hepatic:** hepatitis, hepatic necrosis

**Metabolic:** gout exacerbation

**Musculoskeletal:** costovertebral pain

**Skin:** flushing, rash, pruritus

**Other:** sore gums, fever, hypersensitivity reactions including **anaphylaxis**

### Interactions

**Drug-drug.** *Acyclovir, allopurinol, barbiturates, cephalosporins, pantothenic acid, penicillins:* increased blood levels of these drugs, enhanced uric acid-reducing effect of probenecid  
*Benzodiazepines:* faster onset and prolonged effects of these drugs  
*Clofibrate:* increased clofibrate blood level  
*Dapsone:* accumulation of dapsone and its metabolites

*Dyphylline*: increased half-life and decreased clearance of dyphylline  
*Methotrexate, nonsteroidal anti-inflammatory drugs, rifampin, sulfonamides*: increased blood levels, therapeutic effects, and toxicity of these drugs  
*Oral hypoglycemics*: increased half-life and effects of these drugs  
*Penicillamine*: increased pharmacologic effect of penicillamine  
*Salicylates*: decreased probenecid or salicylate activity  
*Thiopental*: extended anesthetic effect of thiopental  
*Zidovudine*: increased risk of zidovudine toxicity  
**Drug-diagnostic tests.** *Urine glucose tests using copper reduction method (such as Clinitest)*: false-positive result

### Patient monitoring

- Monitor kidney and liver function tests, CBC, and blood urea nitrogen level.
- Assess fluid intake and output to ensure good hydration and reduce urinary side effects.
- During first 6 to 12 months of therapy, monitor pattern and severity of acute gout attacks to assess need for additional anti-inflammatory drugs.

### Patient teaching

- Advise patient to take with food or milk to minimize GI upset.
- Teach patient about causes of gout and proper use of drug. Stress that he must wait until acute attack subsides and then take drug regularly to prevent further attacks.
- Tell patient drug may exacerbate acute gout attacks for first 6 to 12 months, necessitating colchicine or other anti-inflammatory drug for 3 to 6 months.
- Instruct patient to drink 2 to 3 liters of fluids daily.
- Tell patient with gout to limit foods high in purine (such as anchovies, organ meats, and legumes).

- Instruct diabetic patient to test urine glucose level during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## procainamide hydrochloride

**Pharmacologic class:** Membrane stabilizer

**Therapeutic class:** Antiarrhythmic (class IA)

**Pregnancy risk category C**

### FDA BOXED WARNING

- Prolonged use often leads to positive antinuclear antibody (ANA) test, with or without symptoms of lupus erythematosus-like syndrome. If positive ANA titer develops, weigh benefits versus risks of continued therapy.

### Action

Decreases myocardial excitability by inhibiting conduction velocity. Also depresses myocardial contractility.

### Availability

*Injection:* 100 mg/ml, 500 mg/ml

### Indications and dosages

➤ Life-threatening ventricular arrhythmias

**Adults:** 100 mg by slow I.V. push at a rate of 50 mg/minute, repeated q 5 minutes until arrhythmia subsides, up to a maximum advisable dosage of 1 g. Alternatively, loading dose of 500 to 600 mg by I.V. infusion over 25 to 30 minutes. With either I.V. method, maximum loading dose is 1 g. When

arrhythmia subsides, give continuous I.V. infusion of 2 to 6 mg/minute. Or 50 mg/kg I.M. in divided doses q 3 to 6 hours until patient can tolerate P.O. therapy.

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to drug, tartrazine, procaine, or sulfites
- Complete heart block
- Torsades de pointes
- Lupus erythematosus

### Precautions

Use cautiously in:

- procaine hypersensitivity, renal impairment, ischemic heart disease, heart failure, first-degree heart block, atypical ventricular tachycardia, myasthenia gravis, systemic lupus erythematosus, cytopenia
- patients receiving other antiarrhythmics concurrently
- pregnant or breastfeeding patients
- children.

### Administration

- 🔊 Ask patient about procaine sensitivity before giving; cross-sensitivity may occur.
- For I.V. use, dilute with dextrose 5% in water.
- Administer I.V. doses with patient in supine position to avoid hypotensive effects.
- When giving by I.V. infusion, use infusion pump to ensure that drug infuses at 50 mg/minute or less.
- 🔊 Don't leave patient's bedside during I.V. administration.

Route	Onset	Peak	Duration
I.V.	Immediate	Immediate	Unknown
I.M.	10-30 min	15-60 min	Unknown

### Adverse reactions

**CNS:** headache, dizziness, confusion, psychosis, restlessness, asthenia, depression, neuropathy, **seizures**

**CV:** hypotension, bradycardia, **atrioventricular block, ventricular fibrillation, ventricular asystole, cardiovascular collapse, cardiac arrest**  
**GI:** nausea, vomiting, diarrhea, anorexia  
**Hematologic:** hemolytic anemia, agranulocytosis, thrombocytopenia, **neutropenia**

**Skin:** rash, urticaria, pruritus, flushing  
**Other:** bitter taste, lupuslike syndrome, edema

### Interactions

**Drug-drug.** *Amiodarone:* increased procainamide blood level and risk of toxicity  
*Anticholinesterase drugs:* decreased anticholinesterase effects  
*Antihypertensives:* additive hypotension  
*Beta-adrenergic blockers, cimetidine, ranitidine, trimethoprim:* increased procainamide blood level  
*Lidocaine:* additive cardiodepressant action, conduction abnormalities  
*Neuromuscular blockers:* increased skeletal muscle relaxation  
*Other antiarrhythmics:* additive or antagonistic effects, additive toxicity  
*Trimethoprim:* increased pharmacologic effect of procainamide  
**Drug-herbs.** *Henbane:* increased anticholinergic activity  
*Jimsonweed:* adverse cardiovascular effects  
*Licorice:* prolonged QT interval  
**Drug-behaviors.** *Alcohol use:* altered drug blood level

### Patient monitoring

- 🔊 When giving I.V., stay at patient's bedside and monitor blood pressure and ECG continuously.
- 🔊 If ECG shows prolonged QT interval and QRS complexes, heart block, or worsening arrhythmia, stop drug therapy, run rhythm strip, and contact prescriber immediately.
- Assess blood levels of procainamide and *N*-acetylprocainamide (drug's active metabolite).
- 🔊 Monitor electrolyte levels, CBC, and antinuclear antibody titers. Watch

for signs and symptoms of blood dyscrasias.

- Evaluate patient for signs and symptoms of lupuslike syndrome.

### Patient teaching

 Advise patient to immediately report cardiovascular symptoms or bleeding tendency.

- Emphasize importance of taking exactly as prescribed. Advise patient to use alarm clock to help him remember to take nighttime doses.
- Advise patient to avoid alcohol.
- Instruct patient not to take herbal remedies unless prescriber approves.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, herbs, and behaviors mentioned above.

## procarbazine hydrochloride

Matulane

*Pharmacologic class:* Alkylating agent

*Therapeutic class:* Antineoplastic

*Pregnancy risk category* D

### FDA BOXED WARNING

- Give under supervision of physician experienced in use of potent antineoplastics, in setting with adequate clinical and laboratory facilities to monitor patient.

### Action

Thought to inhibit DNA, RNA, and protein synthesis, resulting in death of rapidly dividing cells. Also inhibits MAO.

### Availability

*Capsules:* 50 mg

## Indications and dosages

 Hodgkin's disease

**Adults:** 2 to 4 mg/kg P.O. daily as a single dose or in divided doses for 1 week, then 4 to 6 mg/kg P.O. daily until white blood cell (WBC) count is less than 4,000/mm<sup>3</sup> or platelet count is less than 100,000/mm<sup>3</sup>, or until desired response occurs. With desired response, give maintenance dosage of 1 to 2 mg/kg P.O. daily (rounded off to nearest 50 mg). As component of MOPP (mechlorethamine, vincristine, procarbazine, prednisone) regimen for advanced Hodgkin's disease, usual dosage is 100 mg/m<sup>2</sup> P.O. daily on days 1 to 14 of 28-day cycle.

**Children:** Dosage highly individualized. Usual dosage is 50 mg/m<sup>2</sup> P.O. daily for first week, then 100 mg/m<sup>2</sup> P.O. daily until leukopenia, thrombocytopenia, or desired response occurs. With desired response, maintenance dosage is 50 mg/m<sup>2</sup> P.O. daily.

### Off-label uses

- Brain tumor
- Lymphoma

### Contraindications

- Hypersensitivity to drug
- Inadequate bone marrow reserve

### Precautions

Use cautiously in:

- infection, chronic debilitating illness, headache, hepatic or renal impairment, cardiovascular disease, heart failure, diarrhea, stomatitis, pheochromocytoma, psychiatric illness, alcoholism
- patients who have undergone radiation therapy or received other chemotherapy drugs within previous month
- elderly patients
- pregnant or breastfeeding patients
- females of childbearing age.

## Administration

- Weigh patient; know that dosages are based on weight. However, use caution in patients with edema or ascites.

Route	Onset	Peak	Duration
P.O.	Rapid	1 hr	Unknown

## Adverse reactions

**CNS:** confusion, dizziness, drowsiness, hallucinations, headache, mania, depression, nightmares, psychosis, syncope, tremor, neuropathy, paresthesia, **seizures**

**CV:** edema, hypotension, tachycardia  
**EENT:** nystagmus, photophobia, retinal hemorrhage

**GI:** nausea, vomiting, diarrhea, dysphagia, ascites, stomatitis, dry mouth, anorexia

**GU:** gonadal suppression, gynecomastia

**Hematologic:** anemia, **leukopenia**, **thrombocytopenia**

**Hepatic:** **hepatic dysfunction**

**Respiratory:** cough, **pleural effusion**

**Skin:** alopecia, photosensitivity, pruritus, rash

## Interactions

**Drug-drug.** *Digoxin:* decreased digoxin blood level

*Levodopa:* flushing, hypertension

*Opioids:* deep coma, death

*Sympathomimetics (indirect-acting):*

abrupt, life-threatening hypertension

*Tricyclic antidepressants:* severe toxicity and fatal reactions (including blood pressure fluctuations, seizures, and coma)

**Drug-diagnostic tests.** *Hematocrit, hemoglobin, platelets, reticulocytes, WBCs:* decreased levels

**Drug-food.** *Caffeine-containing foods and beverages:* hypertension, arrhythmias

*Tyramine-containing foods and beverages:* life-threatening hypertension

**Drug-behaviors.** *Alcohol use:* disulfiram-like reaction

## Patient monitoring

- Monitor vital signs and nutritional status.
- Assess fluid intake and output. Watch for evidence of fluid overload.
- 🚨 Monitor neurologic status for seizures, paresthesia, neuropathy, and confusion. Discontinue drug and notify prescriber if these occur.
- 🚨 Monitor CBC and platelet count. Discontinue drug and contact prescriber if WBC count falls below 4,000/mm<sup>3</sup> or platelet count falls below 100,000/mm<sup>3</sup>.
- 🚨 Evaluate patient's concurrent drug use to ensure that he isn't receiving other drugs that could cause potentially fatal interactions.
- 🚨 Check for diarrhea. Discontinue drug and contact prescriber if patient has frequent bowel movements or watery stools.
- Monitor blood urea nitrogen level, liver and kidney function tests, and urinalysis.
- 🚨 Discontinue drug at first sign of hypersensitivity, stomatitis, diarrhea, or bleeding.

## Patient teaching

- Instruct patient to avoid caffeine-containing foods and beverages.
- 🚨 Tell patient to avoid foods and beverages containing tyramine (such as cheese, Chianti wine, tea, coffee, cola, and bananas).
- Advise patient to avoid alcohol.
- Tell female of childbearing age to discuss contraception with prescriber.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

## prochlorperazine

Compazine<sup>✳</sup>, Compro, Stemetil<sup>✳</sup>

## prochlorperazine edisylate

Compazine<sup>✳</sup>

## prochlorperazine maleate

Buccastem<sup>✳</sup>, Compazine<sup>✳</sup>,  
Proziere<sup>✳</sup>, Stemetil<sup>✳</sup>

**Pharmacologic class:** Phenothiazine

**Therapeutic class:** Antiemetic, anti-psychotic, anxiolytic

**Pregnancy risk category C**

### Action

Exerts anticholinergic, CNS depressant, and antihistaminic effects. Depresses release of hypothalamic and hypophyseal hormones, decreases sensitivity of middle-ear labyrinth, and reduces conduction in vestibular-cerebellar pathways.

### Availability

*Capsules (extended-release, maleate):*

10 mg, 15 mg, 30 mg

*Injection (edisylate):* 5 mg/ml

*Oral solution (edisylate):* 5 mg/5 ml

*Suppositories:* 2.5 mg, 5 mg, 25 mg

*Tablets:* 5 mg, 10 mg, 25 mg

### Indications and dosages

➤ Nausea

**Adults:** 5 to 10 mg P.O. three to four times daily or 15 mg P.O. once daily or 10 mg P.O. (extended-release) b.i.d., up to 40 mg/day. Or 2.5 to 10 mg I.V., not to exceed 40 mg/day.

**Children weighing 18 to 38 kg (40 to 85 lb):** 2.5 mg P.O. or P.R. t.i.d. or 5 mg P.O. or P.R. b.i.d., not to exceed 15 mg/day

**Children weighing 13.6 to 17.7 kg (30 to 39 lb):** 2.5 mg P.O. or P.R. two or

three times daily, not to exceed 10 mg/day

**Children weighing 9 to 13 kg (20 to 29 lb):** 2.5 mg P.O. or P.R. daily to b.i.d., not to exceed 7.5 mg/day

➤ Nausea and vomiting related to surgery

**Adults:** 5 to 10 mg I.V. 15 to 30 minutes before anesthesia induction, repeated once if necessary; or 5 to 10 mg I.M. 1 to 2 hours before anesthesia induction, repeated once in 30 minutes if necessary

➤ Schizophrenia

**Adults and children older than age 12:**

For mild symptoms, 5 to 10 mg P.O. three to four times daily; for moderate to severe symptoms in hospitalized or supervised patients, 10 mg P.O. three to four times daily, increased p.r.n. q 2 to 3 days to 50 to 75 mg P.O. daily or up to 150 mg/day as tolerated p.r.n. for more severely disturbed patients. Or 10 to 20 mg I.M.; may repeat q 2 to 4 hours for up to four doses p.r.n.

**Children ages 2 to 12:** Initially, 2.5 mg P.O. or P.R. two or three times daily (maximum of 10 mg on day 1); then increase based on response. Don't exceed 25 mg/day for children ages 6 to 12 or 20 mg/day for children ages 2 to 5.

➤ Anxiety

**Adults and children older than age 12:**

5 mg P.O. three to four times daily; or 15 mg P.O. (extended-release) once daily or 10 mg P.O. (extended-release) q 12 hours; up to 20 mg/day for a maximum of 12 weeks

### Off-label uses

- Migraine

### Contraindications

- Hypersensitivity to drug or other phenothiazines
- Coma
- Concurrent use of large amounts of CNS depressants
- Pediatric surgery
- Children younger than age 2 or weighing less than 9 kg (20 lb)

## Precautions

Use cautiously in:

- cardiovascular or hepatic disease, glaucoma, seizures
- anticipated exposure to extreme heat
- children with acute illness.

## Administration

- For I.V. infusion, dilute 20 mg in 1 L of compatible I.V. solution, such as normal saline solution.
- Don't mix in same syringe with other drugs.
- Know that injection solution may cause contact dermatitis. Don't get it on hands or clothing.
- ☞ Give I.V. by slow infusion only. Don't give as bolus.
- Know that I.M. injection is not preferred because it can cause local irritation. However, if I.M. route is prescribed, inject deep into upper outer quadrant of gluteal area.
- Don't give by subcutaneous route.
- After desired response, switch to P.O. form as prescribed.
- When infusing I.V., watch for hypotension. Keep patient supine for 30 minutes after infusion.

Route	Onset	Peak	Duration
P.O.	30-40 min	Unknown	3-4 hr
P.O. (extended)	30-40 min	Unknown	10-12 hr
I.V.	Rapid (min)	10-30 min	3-4 hr
I.M.	10-20 min	10-30 min	3-4 hr
P.R.	60 min	Unknown	3-4 hr

## Adverse reactions

**CNS:** sedation, extrapyramidal reactions, tardive dyskinesia, **neuroleptic malignant syndrome**

**CV:** orthostatic hypotension, ECG changes, tachycardia

**EENT:** blurred vision, lens opacities, pigmentary retinopathy, dry eyes

**GI:** constipation, ileus, dry mouth, anorexia

**GU:** pink or reddish-brown urine, urinary retention, galactorrhea

**Hematologic:** agranulocytosis, leukopenia

**Hepatic:** cholestatic jaundice, hepatitis

**Metabolic:** hyperthermia

**Skin:** photosensitivity, pigmentation changes, rash

**Other:** allergic reactions

## Interactions

**Drug-drug.** *Anticonvulsants:* reduced seizure threshold

*Antineoplastics:* masking of antineoplastic toxicity

*CNS depressants (including antihistamines, anticholinergics, opioids, other phenothiazines, sedative-hypnotics):* additive CNS depression

*Guanethidine:* inhibition of antihypertensive effects

*Oral anticoagulants:* decreased anticoagulant effect

*Phenytoin:* increased or decreased phenytoin blood level

*Propranolol:* increased blood levels of both drugs

*Thiazide diuretics:* increased risk of orthostatic hypotension

**Drug-diagnostic tests.** *Liver function tests:* abnormal results

*Phenylketonuria test:* false-positive result

**Drug-herbs.** *Betel nut:* increased risk of extrapyramidal reactions

*Evening primrose oil:* increased risk of seizures

*Kava:* increased risk of drug-related adverse reactions

**Drug-behaviors.** *Alcohol use:* additive CNS depression

## Patient monitoring

☞ Monitor neurologic status, especially for signs and symptoms of neuroleptic malignant syndrome (high fever, sweating, unstable blood pressure, stupor, muscle rigidity, and autonomic dysfunction).

- In long-term therapy, assess for other adverse CNS effects, including

extrapyramidal symptoms and tardive dyskinesia.

- Monitor patient closely if he's receiving drug for nausea and vomiting associated with chemotherapy, because it may mask symptoms of chemotherapy toxicity.
- Evaluate CBC and liver function tests.

### Patient teaching

- Instruct patient to dilute oral solution with tomato or fruit juice, milk, coffee, soda, tea, water, or soup.
-  Teach patient to recognize and immediately report signs and symptoms of an allergic reaction or neuroleptic malignant syndrome.
- Inform patient about drug's other CNS effects. Tell him to contact prescriber if these occur.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, vision, alertness, and motor skills.
- Tell patient drug may turn urine pink or reddish brown.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## progesterone

Crinone, Endometrin, Prometrium

**Pharmacologic class:** Progestin

**Therapeutic class:** Hormone

**Pregnancy risk category B** (oral), **D** (injection), **NR** (vaginal)

### FDA BOXED WARNING

- Estrogen plus progestin therapy shouldn't be used for prevention of cardiovascular disease or dementia.

- The Women's Health Initiative (WHI) estrogen plus progestin sub-study reported increased risk of stroke, deep vein thrombosis, pulmonary embolism, and myocardial infarction in postmenopausal women (ages 50 to 79) during 5.6 years of treatment with daily oral conjugated estrogens (0.625 mg) combined with medroxyprogesterone acetate (2.5 mg) relative to placebo.
- The substudy also demonstrated increased risk of invasive breast cancer.
- The WHI Memory Study estrogen plus progestin ancillary study of the WHI reported increased risk of dementia in postmenopausal women ages 65 and older.

### Action

Suppresses ovulation by altering the vaginal epithelium, relaxing uterine smooth muscle, and promoting mammary tissue growth. Also inhibits pituitary activity and causes withdrawal bleeding in presence of estrogen.

### Availability

*Injection (in sesame or peanut oil with benzyl alcohol):* 50 mg/ml in 10-ml vials

*Micronized capsules (oral) in peanut oil:* 100 mg, 200 mg

*Micronized vaginal gel:* 4%, 8%

### Indications and dosages

➤ Secondary amenorrhea

**Adults:** 400 mg/day P.O. in evening for 10 days, or 5 to 10 mg/day I.M. for 6 to 8 days, given 8 to 10 days before expected menstrual period. Or 45 mg (one applicatorful of 4% gel) vaginally once every other day for up to six doses; may increase to 90 mg (one applicatorful of 8% gel) once every other day for up to six doses.

➤ Dysfunctional uterine bleeding

**Adults:** 5 to 10 mg I.M. daily for 6 days

➤ To prevent postmenopausal estrogen-induced endometrial hyperplasia  
**Adults:** 200 mg/day P.O. at bedtime for 14 days on days 8 to 21 of 28-day cycle or on days 12 to 25 of 30-day cycle. If patient currently receives estrogen 1.25 mg/day, 300 mg progesterone in two divided doses (100 mg 2 hours after breakfast and 200 mg at bedtime); further adjustment may be required.

➤ Corpus luteum insufficiency; assisted reproduction technology  
**Adults:** For luteal-phase support, 90 mg (one applicatorful of 8% gel) vaginally once daily. For in vitro fertilization, 90 mg (one applicatorful of 8% gel) vaginally once daily, starting within 24 hours of embryo transfer and continued through day 30 after transfer; if pregnancy occurs, treatment may continue for up to 12 weeks. For partial or complete ovarian failure, 90 mg (one applicatorful of 8% gel) vaginally b.i.d. while patient undergoes donor oocyte transfer; if pregnancy occurs, treatment may last up to 12 weeks.

### Contraindications

- Hypersensitivity to drug, peanuts (injection, micronized capsules), or sesame (injection)
- Thromboembolic disease
- Cerebrovascular disease
- Severe hepatic disease
- Porphyria
- Breast or reproductive system cancer
- Missed abortion
- Undiagnosed vaginal bleeding
- Diagnosis of pregnancy

### Precautions

Use cautiously in:

- renal or cardiovascular disease, seizure disorders, fluid retention, diabetes mellitus, asthma, migraine, depression
- history of hepatic disease
- breastfeeding patients.

### Administration

- Before first dose, make sure patient has read package insert regarding adverse effects. Reinforce written information with oral review.

⚠ Before first I.M. dose, ask if patient has allergy to peanuts or sesame. Before giving micronized capsules, ask about peanut allergy.

- Inject I.M. dose deep into muscle. Rotate injection sites.

Route	Onset	Peak	Duration
P.O.	Unknown	2-4 hr	Unknown
I.M., vaginal	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** depression, emotional lability, cerebrovascular accident

**CV:** thrombophlebitis, thromboembolism

**EENT:** retinal thrombosis

**GI:** abdominal cramps

**GU:** amenorrhea, breakthrough bleeding, spotting, cervical erosions, breast tenderness, menstrual flow changes, galactorrhea

**Hepatic:** hepatitis

**Respiratory:** pulmonary embolism

**Skin:** melasma, rash, angioedema

**Other:** gingival bleeding, weight gain or loss, hypersensitivity reactions including anaphylaxis

### Interactions

**Drug-drug.** *Conjugated estrogens:* increased levels of both drugs

**Drug-diagnostic tests.** *Alkaline phosphatase, amino acids, low-density lipoproteins:* increased levels

*Chloride and sodium excretion:* reduced (with high doses)

*High-density lipoproteins:* decreased level

*Pregnanediol excretion:* reduced

*Thyroid function tests:* altered results

**Drug-herbs.** *Red clover:* interference with drug effects

**Drug-behaviors.** *Smoking:* increased risk of thromboembolic effects

### Patient monitoring

🔊 Watch for evidence of thromboembolic disorders, including cerebrovascular accident, pulmonary embolism, diplopia, proptosis, or sudden partial or complete vision loss (may signal retinal thrombosis). If these occur, discontinue drug and notify prescriber immediately.

🔊 Assess for emotional lability and depression.

### Patient teaching

🔊 Teach patient to recognize and immediately report signs and symptoms of thromboembolic disorders.

🔊 Instruct patient and significant other to stay alert for and immediately report depression.

- Advise patient to monitor weight regularly and report significant changes.

- Tell female patient that drug may cause menstrual abnormalities.

- Advise female patient to discuss breastfeeding with prescriber before taking drug.

🔊 Instruct patient to immediately report possible pregnancy.

- Tell patient that smoking increases thromboembolism risk. Encourage her to stop smoking if she smokes.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## promethazine hydrochloride

Avomine<sup>®</sup>, Histantil<sup>®</sup>, Phenergan<sup>®</sup>, PMS-Promethazine, Promethegan, Sominex<sup>®</sup>, Ziz<sup>®</sup>

**Pharmacologic class:** Phenothiazine (nonselective)

**Therapeutic class:** Antihistamine, antiemetic, sedative-hypnotic

**Pregnancy risk category C**

### FDA BOXED WARNING

- Don't use promethazine in patients younger than age 2 due to potential for fatal respiratory depression. (Postmarketing cases of respiratory depression have been reported in these patients.)
- Use caution when administering to pediatric patients age 2 years and older. Preferably, use lowest effective dosage in these patients and avoid concurrent use of other drugs with respiratory depressant effects.
- Promethazine injection can cause severe chemical irritation and damage to tissue regardless of administration route. Irritation and damage can result from perivascular extravasation, unintentional intra-arterial injection, and intraneuronal or perineuronal infiltration.
- Adverse reactions to I.V. injection include burning, pain, thrombophlebitis, tissue necrosis, and gangrene. In some cases, surgical intervention, including fasciotomy, skin graft, or amputation, has been required.
- Because of risks of I.V. injection, preferred parenteral administration route is deep I.M. injection. Subcutaneous injection is contraindicated.

P

**Action**

Blocks effects but not release of histamine and exerts strong alpha-adrenergic effect. Also inhibits chemoreceptor trigger zone in medulla and alters dopamine effects by indirectly reducing reticular stimulation in CNS.

**Availability**

*Injection:* 25 mg/ml and 50 mg/ml in 1-ml ampules and 1- and 10-ml vials

*Suppositories:* 12.5 mg, 25 mg, 50 mg

*Syrup:* 6.25 mg/5 ml

*Tablets:* 12.5 mg, 25 mg, 50 mg

**Indications and dosages**

➤ Type 1 hypersensitivity reaction

**Adults:** 25 mg P.O. or P.R. at bedtime or 12.5 mg P.O. before meals and at bedtime. Or 25 mg I.M. or I.V.; may repeat in 2 hours.

**Children older than age 2:** 25 mg P.O. or P.R. at bedtime or 6.25 to 12.5 mg P.O. t.i.d.

➤ Motion sickness

**Adults:** Initially, 25 mg P.O. or P.R. 30 to 60 minutes before traveling; may repeat 8 to 12 hours later if needed. On successive travel days, 25 mg P.O. or P.R. b.i.d. (on arising and before evening meal).

**Children older than age 2:** 12.5 to 25 mg P.O. or P.R. b.i.d.

➤ Sedation

**Adults:** 25 to 50 mg P.O., I.M., I.V., or P.R. at bedtime

**Children older than age 2:** 12.5 to 25 mg P.O. or P.R. at bedtime

➤ Adjunct to preoperative or postoperative analgesia

**Adults:** 25 to 50 mg P.O., P.R., I.M., or I.V. given with appropriately reduced dosage of narcotic or barbiturate and required dosage of belladonna alkaloid

**Children older than age 2:** 0.5 mg/lb P.O., P.R., I.M., or I.V., given with appropriately reduced dosage of narcotic or barbiturate and required dosage of belladonna alkaloid

➤ Nausea

**Adults:** 25 mg P.O. or P.R.; may repeat doses of 12.5 to 25 mg P.O. or P.R. q 4 to 6 hours p.r.n. Or 12.5 to 25 mg I.M. or I.V.; may repeat q 4 hours p.r.n.

**Children older than age 2:** 25 mg or 0.5 mg/lb P.O. or P.R.; may repeat doses of 12.5 to 25 mg P.O. or P.R. q 4 to 6 hours p.r.n. May give I.M. or I.V. as no more than half of adult dosage. Know that drug should not be given if cause of vomiting is unknown.

**Contraindications**

- Hypersensitivity to drug
- Previous idiosyncratic reaction to phenothiazines
- Coma
- Intra-arterial and subcutaneous injection
- Children younger than age 2

**Precautions**

Use cautiously in:

- cardiovascular or hepatic disease, seizures, bone marrow depression, narrow-angle glaucoma, prostatic hypertrophy, stenosing peptic ulcer, pyloroduodenal or bladder neck obstruction
- CNS depression caused by narcotics, barbiturates, general anesthesia, tranquilizers, or alcohol
- pregnant or breastfeeding patients.

**Administration**

- Don't give I.V. at concentrations greater than 25 mg/ml or faster than 25 mg/minute.
- Use light-resistant covering for I.V. drug.
- Inject I.M. deep into large muscle. Don't give by subcutaneous route.

Route	Onset	Peak	Duration
P.O., I.M., P.R.	20 min	Unknown	4-12 hr
I.V.	3-5 min	Unknown	4-12 hr

## Adverse reactions

**CNS:** confusion, disorientation, fatigue, marked drowsiness, sedation, dizziness, extrapyramidal reactions, insomnia, nervousness, **neuroleptic malignant syndrome**

**CV:** hypertension, hypotension, bradycardia, tachycardia

**EENT:** blurred vision, diplopia, tinnitus

**GI:** constipation, dry mouth

**Hematologic: blood dyscrasias**

**Hepatic:** cholestatic jaundice

**Respiratory: respiratory depression**

**Skin:** photosensitivity, rash

**Other:** hypersensitivity reaction

## Interactions

**Drug-drug.** *Anticholinergics:* additive anticholinergic effects

*CNS depressants:* additive CNS depression

*Epinephrine:* reversal of epinephrine's vasopressor effects

*MAO inhibitors:* increased extrapyramidal effects

**Drug-diagnostic tests.** *Glucose:* increased level

*Granulocytes, platelets, white blood cells:* decreased counts

*Pregnancy test:* false-positive or false-negative result

*Skin tests using allergen extracts:* false-negative results

**Drug-herbs.** *Betel nut:* increased risk of extrapyramidal reactions

*Evening primrose oil:* increased risk of seizures

*Kava:* increased risk of adverse drug effects

**Drug-behaviors.** *Alcohol use:* additive CNS depression

*Sun exposure:* increased risk of photosensitivity

## Patient monitoring

🚨 Monitor neurologic status. Stay alert for signs and symptoms of neuroleptic malignant syndrome (high fever, sweating, unstable blood pressure, stupor, muscle rigidity, and autonomic dysfunction).

• In long-term therapy, assess for other adverse CNS effects, including extrapyramidal reactions.

• Monitor CBC and liver function tests.

## Patient teaching

🚨 Teach patient to recognize and immediately report signs and symptoms of hypersensitivity reaction or neuroleptic malignant syndrome.

• Tell patient about drug's other significant neurologic effects. Instruct him to contact prescriber if these occur.

• Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, vision, alertness, and motor skills.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## propafenone hydrochloride

APO-Propafenone<sup>✳</sup>, Arythmol<sup>⚡</sup>, Gen-Propafenone<sup>✳</sup>, PMS-Propafenone<sup>✳</sup>, Rythmol, Rythmol SR

**Pharmacologic class:** Direct membrane stabilizer

**Therapeutic class:** Antiarrhythmic (class IC)

**Pregnancy risk category** C

## FDA BOXED WARNING

• In study of patients with asymptomatic, non-life-threatening ventricular arrhythmias who'd had myocardial infarctions more than 6 days but less than 2 years previously, excessive mortality or nonfatal cardiac arrest rate occurred in those treated with encainide or flecainide, compared with

patients in carefully matched placebo groups. Given drug's known proarrhythmic properties and lack of evidence of improved survival for any antiarrhythmic in patients without life-threatening arrhythmias, reserve drug for patients with life-threatening ventricular arrhythmias.

### Action

Slows conduction velocity in atrio-ventricular (AV) node, decreases automaticity, and increases ratio of effective refractory period to action potential duration; also has mild beta-adrenergic blocking properties

### Availability

*Tablets:* 150 mg, 225 mg, 300 mg

*Capsules (sustained-release):* 225 mg, 325 mg, 425 mg

### Indications and dosages

➤ Patients without structural heart disease to treat life-threatening ventricular arrhythmias; paroxysmal atrial fibrillation or flutter and paroxysmal supraventricular tachycardia associated with disabling symptoms

**Adults:** Dosage highly individualized based on response and tolerance. Initially, 150 mg P.O. (prompt-release) q 8 hours (450 mg/day); may increase after 3 to 4 days to 225 mg P.O. q 8 hours (675 mg/day) or, if necessary, up to 300 mg P.O. q 8 hours (900 mg/day). Don't exceed 900 mg/day P.O.

➤ Symptomatic atrial fibrillation in patients without structural heart disease

**Adults:** Dosage individualized based on response and tolerance. Initially, 225 mg P.O. (extended-release) q 12 hours; may increase at 5-day intervals to 325 mg q 12 hours or, if necessary, up to 425 mg q 12 hours.

### Dosage adjustment

- Hepatic disease

- Significant widening of the QRS complex or second- or third-degree AV block
- Ventricular arrhythmia with marked previous myocardial damage
- Elderly patients

### Contraindications

- Hypersensitivity to drug
- Sinoatrial, AV, and intraventricular disorders of impulse generation or conduction (such as sick sinus node syndrome, AV block) unless artificial pacemaker is in place
- Cardiogenic shock
- Bradycardia
- Uncontrolled heart failure
- Marked hypotension
- Bronchospastic disorders, severe obstructive pulmonary disease
- Electrolyte imbalances

### Precautions

Use cautiously in:

- hepatic or renal impairment, myasthenia gravis
- concurrent use of both a CYP2D6 inhibitor and a CYP3A4 inhibitor with extended-release propafenone (avoid use)
- concurrent use of amiodarone or quinidine (not recommended)
- pregnant or breastfeeding patients
- children.

### Administration

- Give prompt-release tablets with food (but not with grapefruit juice) in three divided doses daily, once every 8 hours. Give extended-release capsules whole with or without food.

Route	Onset	Peak	Duration
P.O.	Variable	3.5 hr	Unknown
P.O. (extended)	Unknown	3-8 hr	Unknown

### Adverse reactions

**CNS:** headache, dizziness, drowsiness, syncope, vertigo, confusion, asthenia,

speech disturbances, memory loss, ataxia, paresthesia, anxiety, abnormal dreams, insomnia, tremor

**CV:** palpitations, angina, chest pain, hypotension, bradycardia, premature ventricular contractions, **first-degree AV block, supraventricular or ventricular arrhythmias, heart failure, atrial fibrillation, intraventricular conduction delay**

**EENT:** blurred vision, tinnitus

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, abdominal pain or cramps, flatulence, dry mouth, anorexia

**GU:** reversible disorders of spermatogenesis

**Hematologic:** purpura, **hemolytic anemia, leukopenia, agranulocytosis, thrombocytopenia, neutropenia**

**Hepatic:** cholestasis, **abnormal hepatic function**

**Musculoskeletal:** muscle weakness, myalgia, leg cramps, myasthenia gravis exacerbation

**Respiratory:** dyspnea

**Skin:** rash, alopecia, diaphoresis

**Other:** altered taste, edema

## Interactions

**Drug-drug.** *Amiodarone:* conduction and repolarization changes

*Beta-adrenergic blockers:* increased blood level and effects of beta-adrenergic blockers metabolized by liver

*Cimetidine:* increased propafenone blood level

*CYP1A2 inhibitors (such as amiodarone), CYP2D6 inhibitors (such as desipramine, paroxetine, ritonavir, sertraline), CYP3A4 inhibitors (such as erythromycin, ketoconazole, ritonavir, saquinavir):* increased propafenone plasma level

*Digoxin, drugs metabolized by CYP2D6 (such as desipramine, haloperidol, imipramine, venlafaxine), warfarin:* increased plasma concentrations of these drugs

*Lidocaine:* increased CNS adverse reactions

*Orlistat:* reduced propafenone concentration

*Quinidine:* delayed propafenone metabolism

*Rifampin:* decreased blood level and antiarrhythmic efficacy of propafenone

**Drug-diagnostic tests.** *Antinuclear antibody:* positive titer

*Bleeding time:* prolonged

*Creatine kinase, glucose:* increased levels

*Granulocytes, white blood cells:* decreased counts

**Drug-food.** *Grapefruit juice:* increased propafenone plasma level

## Patient monitoring

- Monitor ECG and vital signs.

- Evaluate neurologic status. Stay alert for decreasing level of consciousness.

-  Monitor CBC and liver function tests. Watch for evidence of blood dyscrasias and abnormal hepatic function.

- Monitor respiratory status for dyspnea.

## Patient teaching

- Instruct patient to take prompt-release tablets with food.

- Tell patient to take extended-release capsules whole with or without food and not to crush or divide capsule contents.

-  Tell patient which cardiac, neurologic, and respiratory adverse effects to report immediately.

-  Instruct patient to immediately report unusual bleeding or bruising.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, vision, and alertness.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

**propranolol hydrochloride**

Apo-Propranolol<sup>✳</sup>, Bedranol SR<sup>⚡</sup>, Betachron E-R, Beta-Prograne<sup>⚡</sup>, Dom-Propranolol<sup>✳</sup>, Half Beta-Prograne<sup>⚡</sup>, Half Inderal LA<sup>⚡</sup>, Inderal LA, Inno-pran XL, Novopropranol<sup>✳</sup>, Nu-Propranolol<sup>✳</sup>, PMS Propranolol<sup>✳</sup>, Rapranol SR<sup>⚡</sup>, Slo-Pro<sup>⚡</sup>, Syprol<sup>⚡</sup>

**Pharmacologic class:** Beta-adrenergic blocker (nonselective)

**Therapeutic class:** Antianginal, antiarrhythmic (class II), antihypertensive, vascular headache suppressant

**Pregnancy risk category C**

**FDA BOXED WARNING**

• In patients with angina pectoris, exacerbations of angina and, in some cases, myocardial infarction (MI) have followed abrupt drug withdrawal. For planned withdrawal, reduce dosage gradually over at least a few weeks and caution patient not to interrupt or stop therapy without physician's advice. If therapy is interrupted and angina exacerbation occurs, consider reinstating drug and taking other measures to manage unstable angina. As coronary artery disease may be unrecognized, it may be prudent to follow same advice in patients at risk for occult atherosclerotic heart disease who receive drug for other indications.

**Action**

Blocks stimulation of beta<sub>1</sub>-adrenergic (myocardial) and beta<sub>2</sub>-adrenergic (pulmonary, vascular, and uterine) receptor sites. This action decreases cardiac output, slows heart rate, and reduces blood pressure.

**Availability**

*Capsules (extended-release, sustained-release):* 60 mg, 80 mg, 120 mg, 160 mg  
*Injection:* 1 mg/ml

*Oral solution:* 4 mg/ml, 8 mg/ml, 80 mg/ml

*Tablets:* 10 mg, 20 mg, 40 mg, 60 mg, 90 mg

**Indications and dosages**

➤ Angina pectoris

**Adults:** 80 to 320 mg P.O. daily in three to four divided doses or 160 mg (extended- or sustained-release) P.O. daily; maximum daily dosage is 320 mg.

➤ Hypertension

**Adults:** 40 mg P.O. b.i.d. or 80 mg (extended- or sustained-release) P.O. daily. Maximum daily dosage is 640 mg; usual maintenance dosage is 120 to 240 mg/day.

➤ Prophylaxis after MI

**Adults:** 180 to 240 mg P.O. daily in three to four divided doses; maximum daily dosage is 240 mg.

➤ Hypertrophic subaortic stenosis

**Adults:** 20 to 40 mg P.O. three to four times daily (before meals and at bedtime) or 80 to 160 mg (extended- or sustained-release) P.O. daily

➤ Adjunctive therapy in pheochromocytoma

**Adults:** 60 mg P.O. daily in divided doses for 3 days, given after primary therapy with alpha-adrenergic blocker

➤ To prevent migraine or vascular headache

**Adults:** 80 mg P.O. (extended- or sustained-release) daily; may increase as needed up to 240 mg/day. Effective range is 160 to 240 mg/day.

➤ Essential tremor

**Adults:** 40 mg P.O. b.i.d.; if necessary, 240 to 320 mg/day. Maximum daily dosage is 320 mg.

➤ Arrhythmias

**Adults:** 10 to 30 mg P.O. (tablets or oral solution) three or four times daily

➤ Life-threatening arrhythmias; arrhythmias occurring during anesthesia

**Adults:** 1 to 3 mg slow I.V. injection. If necessary, give second dose after 2 minutes and additional doses at intervals of no less than 4 hours until desired response occurs.

### Contraindications

- Hypersensitivity to drug, its components, or other beta-adrenergic blockers
- Uncompensated heart failure
- Cardiogenic shock
- Sinus bradycardia, heart block greater than first degree
- Bronchospastic disease

### Precautions

Use cautiously in:

- renal or hepatic impairment, sinus node dysfunction, pulmonary disease, diabetes mellitus, hyperthyroidism, Raynaud's syndrome, hypertensive emergencies, myasthenia gravis
- concurrent thioridazine use
- history of severe allergic reactions
- elderly patients
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

☞ Take apical pulse for 1 full minute. Withhold dose and notify prescriber if patient has bradycardia or tachycardia.

☞ Be aware that I.V. use is usually reserved for arrhythmias that are life-threatening or occur during anesthesia.

- Inject I.V. dose directly into large vein or into tubing of compatible I.V. solution (dextrose 5% in water, normal or half-normal saline solution, or lactated Ringer's solution).
- Don't give as continuous I.V. infusion.
- For intermittent I.V. infusion, dilute with normal saline solution and infuse in 0.1- to 0.2-mg increments over 10 to 15 minutes.

☞ Keep I.V. isoproterenol, atropine, or glucagon at hand in case of emergency.

☞ Don't stop giving drug suddenly. Dosage must be tapered.

Route	Onset	Peak	Duration
P.O.	30 min	60-90 min	6-12 hr
P.O. (extended, sustained)	Unknown	6 hr	24 hr
I.V.	Immediate	1 min	4-6 hr

### Adverse reactions

**CNS:** fatigue, asthenia, anxiety, dizziness, drowsiness, insomnia, memory loss, depression, mental status changes, nervousness, paresthesia, nightmares

**CV:** peripheral vasoconstriction, orthostatic hypotension, bradycardia, **arrhythmias, heart failure, myocardial infarction and sudden death** (with abrupt withdrawal in angina therapy)

**EENT:** blurred vision, dry eyes, nasal congestion, rhinitis, sore throat

**GI:** nausea, vomiting, diarrhea, constipation, dry mouth

**GU:** erectile dysfunction, decreased libido

**Hematologic:** purpura, **thrombocytopenic purpura**

**Metabolic:** fluid retention, hyperglycemia, **hypoglycemia** (increased in children), **thyrotoxicosis** (with abrupt withdrawal in hypertension therapy)

**Musculoskeletal:** joint pain, back pain, myalgia, muscle cramps

**Respiratory:** wheezing, **bronchospasm, pulmonary edema**

**Skin:** pruritus, rash

**Other:** fever

### Interactions

**Drug-drug.** *Antacids (aluminum-based):* decreased propranolol absorption

*Anticholinergics, tricyclic antidepressants:* antagonism of cardiac beta-adrenergic blocking effect

*Chlorpromazine*: additive hypotension

*Cimetidine*: increased propranolol blood level and risk of toxicity

*Digoxin*: additive bradycardia

*Diuretics, other antihypertensives*: increased hypotensive effect

*Glucagon, isoproterenol*: antagonism of propranolol's effects

*Insulin, oral hypoglycemics*: impaired glucose tolerance, increased risk of hypoglycemia

*Neuromuscular blockers*: increased neuromuscular blockade (with high propranolol doses)

*Nonsteroidal anti-inflammatory drugs*: decreased hypotensive effect

*Theophylline*: decreased theophylline clearance, antagonism of theophylline's bronchodilating effect

*Thioridazine*: increased thioridazine blood level, leading to prolonged QT interval

**Drug-diagnostic tests.** *Alkaline phosphatase, blood urea nitrogen, eosinophils, lactate dehydrogenase, serum transaminases, triiodothyronine*: increased levels

*Glucose*: decreased or increased level

*Platelets, thyroxine*: decreased levels

**Drug-behaviors.** *Acute alcohol ingestion*: additive hypotension

### Patient monitoring

- Monitor vital signs, ECG, and central venous pressure.
- Assess fluid balance. Check for signs and symptoms of heart failure.
- Monitor CBC and liver and thyroid function tests.
- Watch closely for signs and symptoms of hypoglycemia, which drug may mask.
- Monitor blood glucose level in diabetic patient, to identify need for altered insulin or oral hypoglycemic dosage. Be aware that in labile diabetes, hypoglycemia may be accompanied by steep blood pressure rise.

### Patient teaching

- Advise patient to take with meals at same time every day to minimize GI upset.
-  Caution patient not to stop taking drug suddenly. Tell him dosage must be tapered.
- Tell patient to monitor pulse and to promptly report bradycardia or tachycardia.
- Inform patient that drug may cause muscle aches or bone pain. Advise him to discuss activity recommendations and pain management with prescriber.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, vision, and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## propylthiouracil (PTU)

Propyl-Thyracil<sup>®</sup>

**Pharmacologic class:** Thioamide derivative

**Therapeutic class:** Antithyroid agent

**Pregnancy risk category D**

### FDA BOXED WARNING

- Drug has caused severe liver injury and acute liver failure, in some cases fatal. These reports of hepatic reactions include cases requiring liver transplant.
- Reserve drug for patients intolerant of methimazole and in whom radioactive iodine therapy or surgery isn't appropriate for management of hyperthyroidism.
- Because of risk of fetal abnormalities associated with methimazole, propylthiouracil may be treatment of choice

when an antithyroid drug is indicated during or just before first trimester.

### Action

Directly interferes with thyroid synthesis by preventing iodine from combining with thyroglobulin, leading to decreased thyroid hormone levels

### Availability

Tablets: 50 mg

### Indications and dosages

➤ Hyperthyroidism

**Adults:** Initially, 300 to 450 mg P.O. daily in equally divided doses q 8 hours; for maintenance, 100 to 150 mg P.O. daily.

➤ Thyrotoxic crisis

**Adults:** 200 mg P.O. q 4 to 6 hours during first 24 hours, then a maintenance dosage of 100 to 150 mg P.O. daily

### Contraindications

- Hypersensitivity to drug

### Precautions

Use cautiously in:

- decreased bone marrow reserve
- pregnancy and breastfeeding patients
- children.

### Administration

- Give with meals to reduce GI upset.
- Be aware that drug shouldn't be used in children unless patient is allergic to or intolerant of methimazole, and there are no other treatment options available.

Route	Onset	Peak	Duration
P.O.	Unknown	1-1.5 hr	Unknown

### Adverse reactions

**CNS:** drowsiness, headache, vertigo, neuritis, paresthesia

**GI:** nausea, vomiting, diarrhea, epigastric distress

**Hematologic:** agranulocytosis, leukopenia, thrombocytopenia

**Hepatic:** jaundice, hepatic necrosis, liver failure

**Metabolic:** hypothyroidism

**Musculoskeletal:** joint pain, myalgia

**Skin:** rash, urticaria, pruritus, skin discoloration, alopecia, cutaneous vasculitis

**Other:** taste loss, fever, lymphadenopathy, parotitis, edema

### Interactions

**Drug-drug.** *Anticoagulants:* potentiation of anticoagulant effect

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, lactate dehydrogenase:* increased levels

*Granulocytes, platelets:* decreased levels

*Prothrombin time:* prolonged

### Patient monitoring

- Monitor CBC and liver and thyroid function tests.

- Assess for signs and symptoms of hypothyroidism (cold intolerance, nonpitting edema, fatigue, weight gain, and depression).

-  Monitor for severe rash, fever, jaundice, or enlarged cervical lymph nodes. If present, stop therapy and notify prescriber.

### Patient teaching

- Instruct patient to take with meals to reduce GI upset.

- Teach patient to recognize and report signs and symptoms of hypothyroidism and jaundice.

- Advise patient to discuss iodine intake (as in iodized salt and shellfish) with prescriber.

- Tell patient to avoid over-the-counter cold remedies that contain iodine.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- Advise female patient of childbearing age to discuss pregnancy or breastfeeding with prescriber before taking.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## pseudoephedrine hydrochloride

Contac Non Drowsy , Galsud , Genaphed, Kidkare Decongestant, Meltus Decongestant , Non-Drowsy Sudafed Decongestant , Robidrine , Silfedrine Children's, Sudafed, Sudafed Children's Nasal Decongestant, Sudafed 12 Hour, Sudo-Tab, Sudodrin, SudoGest

## pseudoephedrine sulfate

Drixoral Nasal Decongestant, Drixoral Non-Drowsy Formula

**Pharmacologic class:** Sympathomimetic

**Therapeutic class:** Decongestant (systemic)

**Pregnancy risk category C**

### Action

Stimulates alpha-adrenergic receptors, causing vasoconstriction of respiratory tract; relaxes bronchial smooth muscle through beta<sub>2</sub>-adrenergic stimulation

### Availability

**pseudoephedrine hydrochloride**

*Capsules:* 60 mg

*Capsules (extended-release):* 120 mg, 240 mg

*Capsules (soft gel):* 30 mg

*Oral solution:* 15 mg/5 ml, 30 mg/5 ml

*Syrup:* 30 mg/5 ml

*Tablets:* 30 mg, 60 mg

*Tablets (chewable):* 15 mg

*Tablets (extended-release):* 120 mg, 240 mg

**pseudoephedrine sulfate**

*Tablets (extended-release, film-coated):* 120 mg

## Indications and dosages

➤ Nasal, sinus, or eustachian tube congestion

**Adults and children ages 12 and older:**

60 mg P.O. q 4 to 6 hours p.r.n. (not to exceed 240 mg/day); or 120 mg (extended-release) q 12 hours or 240 mg (extended-release) q 24 hours

### Contraindications

- Hypersensitivity to drug or other sympathomimetics
- Alcohol intolerance (with some liquid products)
- Hypertension
- Severe coronary artery disease
- MAO inhibitor use within past 14 days
- Children younger than age 12 (extended-release forms)

### Precautions

Use cautiously in:

- hyperthyroidism, diabetes mellitus, prostatic hypertrophy, ischemic heart disease, glaucoma
- elderly patients (more sensitive to drug's CNS effects)
- pregnant or breastfeeding patients.

### Administration

- Give at least 2 hours before bedtime to minimize insomnia.

Route	Onset	Peak	Duration
P.O.	30 min	Unknown	4-8 hr
P.O. (extended)	60 min	Unknown	12 hr

### Adverse reactions

**CNS:** anxiety, nervousness, dizziness, drowsiness, excitability, fear, hallucinations, headache, insomnia, restlessness, asthenia, **seizures**

**CV:** palpitations, hypertension, tachycardia, **cardiovascular collapse**

**GI:** anorexia, dry mouth

**GU:** dysuria

**Respiratory:** respiratory difficulty

## Interactions

**Drug-drug.** *Beta-adrenergic blockers:* increased pressor effects of pseudoephedrine

*MAO inhibitors:* hypertensive crisis  
*Mecamylamine, methyldopa, reserpine:* decreased antihypertensive effect of these drugs

*Other sympathomimetics:* additive effects, greater risk of toxicity

**Drug-food.** *Foods that acidify urine:* decreased drug efficacy

*Foods that alkalize urine:* increased drug efficacy

## Patient monitoring

- Monitor vital signs.
- Assess neurologic and cardiovascular status regularly.

## Patient teaching

- Advise patient to take at least 2 hours before bedtime to reduce insomnia.
- Tell patient not to crush or break extended-release tablets or capsules.
- Advise patient to discontinue use and consult prescriber if he experiences nervousness, dizziness, or insomnia.
- Tell patient to consult prescriber before taking other over-the-counter products.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and foods mentioned above.

## psyllium

Fiberall, Fibrelief<sup>Ⓢ</sup>, Fibro-Lax, Fibro-XL, Fybogel<sup>Ⓢ</sup>, Hydrocil Instant, Isogel<sup>Ⓢ</sup>, Ispagel<sup>Ⓢ</sup>, Karacil<sup>Ⓢ</sup>, Konsyl, Metamucil, Metamucil Orange Flavor, Metamucil Sugar Free, Modane Bulk, Natural Fiber Therapy, Prodiem Plain<sup>Ⓢ</sup>, Regulan<sup>Ⓢ</sup>, Reguloid, Reguloid Sugar Free

**Pharmacologic class:** Psyllium colloid

**Therapeutic class:** Bulk-forming laxative

**Pregnancy risk category B**

## Action

Stimulates lining of colon, increasing peristalsis and water absorption of stool and promoting evacuation

## Availability

*Chewable pieces:* 1.7 g/piece, 3.4 g/piece

*Granules:* 2.5 g/tsp, 4.03 g/tsp

*Powder:* 3.3 g/tsp, 3.4 g/tsp, 3.5 g/tsp, 4.94 g/tsp

*Powder (effervescent):* 3.4 g/packet, 3.7 g/packet

*Wafers:* 3.4 g/2 wafers

## Indications and dosages

➤ Chronic constipation; ulcerative colitis; irritable bowel syndrome

**Adults and children ages 12 and older:**

30 g daily in divided doses of 2.5 to 7.5 g/dose P.O. in 8 oz of water or juice

## Contraindications

- Hypersensitivity to drug
- Intestinal obstruction
- Abdominal pain or other appendicitis symptoms
- Fecal impaction

**Precautions**

Use cautiously in:

- phenylketonuria
- pregnant patients.

**Administration**

- Mix powder with 8 oz of cold liquid (such as orange juice) to mask taste.
- Give diluted drug immediately after mixing, before it congeals. Follow with another glass of fluid.

Route	Onset	Peak	Duration
P.O.	12-24 hr	3 days	Variable

**Adverse reactions**

**GI:** nausea; vomiting; diarrhea (with excessive use); abdominal cramps with severe constipation; anorexia; **esophageal, gastric, small-intestine, or rectal obstruction** (with dry form)

**Respiratory:** asthma (rare)

**Other:** severe allergic reactions including anaphylaxis

**Interactions**

None significant

**Patient monitoring**

- Monitor patient's bowel movements.
- Check for signs and symptoms of severe (but rare) allergic reactions, such as anaphylaxis and asthma.

**Patient teaching**

- Tell patient to dissolve in 8 oz of cold beverage and drink immediately, followed by another glass of liquid.
- Caution patient not to take without dissolving in liquid.
- Instruct patient to take after meals if drug decreases his appetite.
- Tell patient drug usually causes bowel movement within 12 to 24 hours but may take as long as 3 days.
- 📢 Instruct patient to immediately stop taking drug and notify prescriber if signs and symptoms of allergic reaction occur.

- Advise diabetic patient to use sugar-free drug form.
- Instruct patient with phenylketonuria to avoid forms containing phenylalanine.
- As appropriate, review all other significant and life-threatening adverse reactions.

**pyrazinamide**

PMS Pyrazinamide\*, Tebrazid\*

**Pharmacologic class:** Niacinamide derivative

**Therapeutic class:** Antitubercular

**Pregnancy risk category C**

**Action**

Unknown. Thought to exert bacteriostatic activity.

**Availability**

Tablets: 500 mg

**Indications and dosages**

➤ Tuberculosis

**Adults and children:** 15 to 30 mg/kg/day P.O., not to exceed 2 g/day; or 50 to 70 mg/kg P.O. twice weekly, up to a maximum of 4 g/dose; or 50 to 70 mg/kg/dose P.O. three times weekly, up to a maximum of 3 g/dose

**Dosage adjustment**

- Renal impairment

**Contraindications**

- Hypersensitivity to drug
- Severe hepatic disease
- Acute gout

**Precautions**

Use cautiously in:

- renal failure, diabetes mellitus, porphyria, chronic gout, history of gout
- pregnant or breastfeeding patients
- children younger than age 13.

## Administration

- Give with other antituberculars, as prescribed, to reduce risk of resistant organisms.
- Be aware that drug therapy may last 6 months or longer.

Route	Onset	Peak	Duration
P.O.	Rapid	2 hr	Unknown

## Adverse reactions

**CNS:** headache

**GI:** nausea, vomiting, diarrhea, peptic ulcer, abdominal cramps, anorexia

**GU:** dysuria, increased uric acid secretion

**Hematologic:** hemolytic anemia

**Hepatic:** hepatotoxicity

**Metabolic:** hyperuricemia, gout

**Musculoskeletal:** joint pain

**Skin:** urticaria, photosensitivity

## Interactions

**Drug-drug.** *Ethionamide:* increased risk of hepatotoxicity

*Probenecid:* decreased probenecid efficacy (possibly precipitating gout)

**Drug-diagnostic tests.** *Acetest or*

*Ketostix urine test:* false interpretation

*Liver function tests:* abnormal results

*Uric acid:* increased level

## Patient monitoring

- Monitor CBC, uric acid level, and liver and kidney function tests.
- Assess for signs and symptoms of gout, hepatic failure, and hemolytic anemia.
- 🚫 Discontinue at first sign of hepatic impairment or hyperuricemia accompanied by acute gouty arthritis.

## Patient teaching

- Advise patient to take regularly with other antituberculars, as prescribed.
- 🚫 Teach patient to recognize and immediately report signs and symptoms of gout and liver impairment.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially

those related to the drugs and tests mentioned above.

## pyridostigmine bromide

Mestion, Mestion-SR<sup>®</sup>,

Mestion Timespan, Regonol

**Pharmacologic class:** Anticholinesterase

**Therapeutic class:** Muscle stimulant, antimyasthenic

**Pregnancy risk category C**

## Action

Prevents acetylcholine destruction, resulting in stronger contractions of muscles weakened by myasthenia gravis or curare-like neuromuscular blockers

## Availability

*Injection:* 5 mg/ml

*Syrup:* 60 mg/5 ml

*Tablets:* 60 mg

*Tablets (extended-release):* 180 mg

## Indications and dosages

➤ Myasthenia gravis

**Adults:** 600 mg P.O. given over 24 hours, with doses spaced for maximum symptom relief. For myasthenic crisis, 2 mg or 1/50 of oral dose I.M. or very slow I.V. q 2 to 3 hours.

➤ Postoperative reversal of nondepolarizing neuromuscular blockers

**Adults:** 10 to 20 mg slow I.V. injection (range is 0.1 to 0.25 mg/kg) with or immediately after 0.6 to 1.2 mg atropine sulfate I.V.

## Dosage adjustment

- Renal impairment
- Seizure disorders

**Off-label uses**

- Myasthenia gravis in children
- Constipation in patients with Parkinson's disease
- Nerve agent prophylaxis

**Contraindications**

- Hypersensitivity to drug or bromides
- Mechanical intestinal or urinary tract obstruction

**Precautions**

Use cautiously in:

- seizure disorders, bronchial asthma, coronary occlusion, arrhythmias, bradycardia, hyperthyroidism, peptic ulcer, vagotonia, cholinergic crisis
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

**Administration**

- ☞ Don't exceed I.V. injection rate of 1 mg/minute.
- ☞ Don't give concurrently with other anticholinesterase drugs.
- Have atropine available for use in emergencies.

Route	Onset	Peak	Duration
P.O.	20-30 min	Unknown	Unknown
P.O. (extended)	30-60 min	Unknown	6-12 hr
I.V.	2-5 min	Unknown	2-4 hr
I.M.	<15 min	Unknown	2-4 hr

**Adverse reactions**

**CNS:** headache, dysarthria, dysphoria, drowsiness, dizziness, headache, syncope, **loss of consciousness, seizures**

**CV:** decreased cardiac output leading to hypotension, bradycardia, nodal rhythm, **atrioventricular block, cardiac arrest, arrhythmias**

**EENT:** diplopia, lacrimation, miosis, spasm of accommodation, conjunctival hyperemia

**GI:** nausea, vomiting, diarrhea, abdominal cramps, increased peristalsis, flatulence dysphagia, increased salivation

**GU:** urinary frequency, urgency, or incontinence

**Musculoskeletal:** muscle weakness, fasciculations, and cramps; joint pain  
**Respiratory:** increased pharyngeal and tracheobronchial secretions, dyspnea, **central respiratory paralysis, respiratory muscle paralysis, laryngospasm, bronchospasm, bronchiolar constriction**

**Skin:** diaphoresis, flushing, rash, urticaria

**Other:** **thrombophlebitis at I.V. site, cholinergic crisis, anaphylaxis**

**Interactions**

**Drug-drug.** *Aminoglycosides:* potentiation of neuromuscular blockade  
*Anesthetics (general and local), antiarrhythmics:* decreased anticholinesterase effects

*Atropine, belladonna derivatives:* suppression of parasympathomimetic GI symptoms (leaving only fasciculations and voluntary muscle paralysis as signs of anticholinesterase overdose)

*Corticosteroids:* decreased anticholinesterase effects; after corticosteroid withdrawal, increased anticholinesterase effects

*Ganglionic blockers (such as mecamylamine):* increased anticholinesterase effects

*Magnesium:* antagonism of beneficial anticholinesterase effects

*Nondepolarizing neuromuscular blockers (atropine, pancuronium, tubocurarine):* antagonism of neuromuscular blockade and reversal of muscle relaxation after surgery (with parenteral pyridostigmine)

*Other anticholinesterase drugs:* in patients with myasthenia gravis, symptoms of anticholinesterase overdose that mimic underdose, causing patient's condition to worsen

*Succinylcholine:* increased and prolonged neuromuscular blockade (including respiratory depression)

## Patient monitoring

- Assess patient's response to each dose.
- Monitor vital signs, ECG, and cardiovascular and respiratory status.
- 🔊 Assess for signs and symptoms of overdose, which indicate cholinergic crisis.

## Patient teaching

- If patient is using syrup, advise him to pour it over ice.
- Instruct patient using extended-release tablets not to crush them.
- 🔊 Teach patient to recognize and promptly report signs and symptoms of overdose, including muscle fasciculations, sweating, excessive salivation, and constricted pupils.
- Tell patient drug may cause headache and muscle cramps. Encourage him to discuss activity recommendations and pain management with prescriber.
- Advise patient to monitor and report his response to ongoing therapy so that optimal dosage can be determined.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## pyrimethamine

Daraprim

**Pharmacologic class:** Folic acid antagonist

**Therapeutic class:** Antiprotozoal, antimalarial

**Pregnancy risk category C**

## Action

Inhibits reduction of dihydrofolic acid to tetrahydrofolic acid (folinic acid) by binding to and reversibly inhibiting dihydrofolate reductase

## Availability

Tablets: 25 mg

## Indications and dosages

➤ To control plasmodia transmission and suppress susceptible strains

**Adults and children ages 10 and older:** 25 mg P.O. daily for 2 days, given with a sulfonamide

➤ Toxoplasmosis

**Adults:** Initially, 50 to 75 mg P.O. daily for 1 to 3 weeks, given with a sulfonamide. Depending on response and tolerance, reduce dosages of both drugs by 50% and continue therapy for 4 to 5 more weeks.

**Children:** 1 mg/kg P.O. daily in two equally divided doses for 2 to 4 days, then reduced to 0.5 mg/kg/day for approximately 1 month. Alternatively, 2 mg/kg (up to 100 mg) P.O. daily in two equally divided doses for 3 days, then 1 mg/kg (up to 25 mg) in two equally divided doses for 4 weeks, given with sulfadiazine for 4 weeks.

➤ Prophylaxis of malaria caused by susceptible plasmodia strains

**Adults and children older than age 10:** 25 mg P.O. weekly

**Children ages 4 to 10:** 12.5 mg P.O. weekly

**Infants and children younger than age 4:** 6.25 mg P.O. weekly

## Off-label uses

- Isosporiasis
- Prophylaxis of *Pneumocystis jiroveci* pneumonia

## Contraindications

- Hypersensitivity to drug
- Megaloblastic anemia caused by folate deficiency
- Concurrent folate antagonist therapy

## Precautions

Use cautiously in:

- anemia, bone marrow depression, hepatic or renal impairment, G6PD deficiency

- history of seizures
- patients more than 16 weeks pregnant
- breastfeeding patients.

### Administration

- Administer with meals.
- When giving tablets to young children, crush them and administer as oral suspension in water, cherry syrup, or sweetened solution.
- Know that because of worldwide resistance to pyrimethamine, its use alone to prevent or treat acute malaria is no longer recommended.
- Be aware that fixed combination of pyrimethamine and sulfadoxine is available and has been used for uncomplicated mild to moderate malaria caused by chloroquine-resistant *Plasmodium falciparum* and for presumptive self-treatment by travelers.

Route	Onset	Peak	Duration
P.O.	Unknown	2-6 hr	2 wk

### Adverse reactions

**CNS:** headache, light-headedness, insomnia, malaise, depression, **seizures**

**CV:** **arrhythmias**

**EENT:** dry throat

**GI:** nausea, vomiting, diarrhea, anorexia, atrophic glossitis

**GU:** hematuria

**Hematologic:** megaloblastic anemia, leukopenia, pancytopenia, thrombocytopenia

**Metabolic:** hyperphenylalaninemia

**Respiratory:** pulmonary eosinophilia

**Skin:** pigmentation changes, dermatitis, erythema multiforme, **toxic epidermal necrolysis**, **Stevens-Johnson syndrome**

**Other:** fever, **anaphylaxis**

### Interactions

**Drug-drug.** *Lorazepam:* hepatotoxicity  
*Myelosuppressants (including antineoplastics):* increased risk of bone marrow depression

**Drug-diagnostic tests.** *Platelets, white blood cells:* decreased counts

### Patient monitoring

- Monitor CBC. Watch for evidence of blood dyscrasias.
- Assess for signs and symptoms of folic acid deficiency.
- Closely monitor neurologic and cardiovascular status. Stay alert for seizures and arrhythmias.
-  Watch for evidence of erythema multiforme, including sore throat, cough, mouth sores, rash, iritic lesions, and fever. Report early signs before condition can progress to Stevens-Johnson syndrome.

### Patient teaching

- Advise patient to take with meals.
-  Tell patient to discontinue drug and contact prescriber at first sign of rash.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## quetiapine fumarate

Seroquel, Seroquel XR

**Pharmacologic class:** Dibenzothiazepine derivative

**Therapeutic class:** Atypical antipsychotic

**Pregnancy risk category** C

**FDA BOXED WARNING**

- Elderly patients with dementia-related psychosis are at increased risk for death. Over course of 10-week controlled trial, death rate in drug-treated patients was about 4.5%, compared to about 2.6% in placebo group. Although causes of death varied, most appeared to be cardiovascular or infectious. Don't give drug to patients with dementia-related psychosis.
- Drug may increase risk of suicidal thinking and behavior in children and adolescents with major depressive disorder and other psychiatric disorders. Risk must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family and caregivers to observe patient closely and communicate with prescriber as needed.
- Drug isn't approved for use in pediatric patients.

**Action**

Unknown. Antipsychotic effects may occur through antagonism of dopamine D<sub>2</sub> and serotonin 5-HT<sub>2</sub> receptors. Other effects may result partly from antagonism of other receptors, such as histamine H<sub>1</sub> and alpha<sub>1</sub>-adrenergic receptors.

**Availability**

*Tablets:* 25 mg, 50 mg, 100 mg, 200 mg, 300 mg, 400 mg

*Tablets (extended-release):* 50 mg, 150 mg, 200 mg, 300 mg, 400 mg

**Indications and dosages**

➤ Schizophrenia

**Adults:** Initially, 25 mg P.O. b.i.d., on day 1, increased by 25 to 50 mg given two to three times daily on days 2 and 3 to range of 300 to 400 mg by day 4.

Further adjustments can be made in increments of 25 to 50 mg b.i.d. in intervals of not less than 2 days. Recommended dosage range is 150 to 750 mg/day. Or, 300 mg P.O. (extended-release tablet) once daily, preferably in evening; dosage should be titrated to 400 to 800 mg based on response and tolerability. Dosage increases may be done at 1-day intervals at increments of up to 300 mg.

**Children and adolescents ages 13 to 17:** Immediate-release tablets administered twice daily, with total daily dosage for initial 5 days of therapy as 50 mg P.O. on day 1, 100 mg on day 2, 200 mg on day 3, 300 mg on day 4, and 400 mg on day 5. After day 5, adjust dosage within recommended range of 400 to 800 mg/day based on response and tolerability. Make dosage adjustments in increments of no greater than 100 mg/day. Based on response and tolerability, may administer three times daily.

➤ Acute manic episodes associated with bipolar I disorder

**Adults:** Immediate-release tablets administered twice daily, with total daily dosages as 100 mg P.O. on day 1, 200 mg on day 2, 300 mg on day 3, and 400 mg on day 4. Increase in increments of no more than 200 mg/day up to 800 mg/day by day 6. Recommended dosage range is 400 to 800 mg/day. May be given as monotherapy or as adjunctive therapy with lithium or divalproex. Or, extended-release tablets 300 mg P.O. on day 1, 600 mg on day 2, and 400 to 800 mg on day 3. Recommended dosage range is 400 to 800 mg/day.

**Children and adolescents ages 10 to 17:** Immediate-release tablets administered twice daily, with total daily dosage for initial 5 days of therapy as 50 mg P.O. on day 1, 100 mg on day 2, 200 mg on day 3, 300 mg on day 4, and 400 mg on day 5. After day 5, adjust dosage within recommended range of

400 to 600 mg/day based on response and tolerability. Adjust dosage in increments of no more than 100 mg/day. Based on response and tolerability, may administer three times daily.

➤ Depression associated with bipolar disorder

**Adults:** Immediate-release or extended-release tablets administered once daily at bedtime as 50 mg P.O. on day 1, 100 mg on day 2, 200 mg on day 3, and 300 mg on day 4. Maximum dosage is 300 mg/day.

➤ Adjunctive treatment of major depressive disorder

**Adults:** Initially, 50 mg (extended-release) P.O. once daily in the evening on days 1 and 2 and 150 mg (extended-release) P.O. once daily on days 3 and 4 as adjunct to existing antidepressive therapy. Recommended dosage is 150 to 300 mg/day.

### Dosage adjustment

- Hepatic impairment
- History of hypotensive reactions
- Elderly or debilitated patients

### Off-label uses

- Bipolar disorder
- Mania
- Obsessive-compulsive disorder
- Posttraumatic stress disorder
- Psychosis related to Parkinson's disease

### Contraindications

- None

### Precautions

Use cautiously in:

- diabetes mellitus, hepatic impairment, cardiovascular disease (including family history of QT-interval prolongation, congestive heart failure, and cardiac hypertrophy), cerebrovascular disease, dehydration, hypovolemia, Alzheimer's dementia, hypothyroidism
- history of seizures, suicide attempt, or hypotensive reactions
- history of cardiac arrhythmias such as bradycardia, hypokalemia or

hypomagnesemia, concurrent use of other drugs that prolong the QTc interval, congenital QT-interval prolongation (avoid use)

- concurrent use of drugs known to cause electrolyte imbalance
- elderly or debilitated patients
- pregnant patients
- children (safety not established).

### Administration

- Monitor fasting blood lipids before treatment.
  - Give immediate-release tablets with or without food; give extended-release tablets without food or with a light meal.
- ⚠ Don't confuse Seroquel with Serzone (an antidepressant).

Route	Onset	Peak	Duration
P.O.	Rapid	1.5 hr	8-12 hr
P.O. (extended)	Unknown	6 hr	Unknown

### Adverse reactions

**CNS:** dizziness, sedation, cognitive impairment, extrapyramidal symptoms, tardive dyskinesia, **neuroleptic malignant syndrome, seizures, suicide**

**CV:** tachycardia, palpitations, peripheral edema, orthostatic hypotension, hypertension, **QT-interval prolongation**

**EENT:** cataracts, ear pain, rhinitis, pharyngitis

**GI:** constipation, dyspepsia, dry mouth, anorexia

**Hematologic:** leukopenia

**Metabolic:** hypothyroidism

**Respiratory:** cough, dyspnea

**Skin:** diaphoresis

**Other:** weight gain, flulike symptoms, acute withdrawal symptoms with abrupt cessation

### Interactions

**Drug-drug.** *Antihistamines, opioids, sedative-hypnotics, other CNS depressants:* additive CNS depression

*Antibiotics (such as gatifloxacin, moxifloxacin), antipsychotics (such as chlorpromazine, thioridazine, ziprasidone), Class IA antiarrhythmics (such as procainamide, quinidine), Class III antiarrhythmics (such as amiodarone, sotalol), drugs known to prolong QTc interval (such as levomethadyl acetate, methadone, pentamidine):* increased risk of prolonged QTc interval  
*Antihypertensives:* increased risk of hypotension

*Barbiturates, carbamazepine, corticosteroids, phenytoin, rifampin, thioridazine:* increased clearance and decreased efficacy of quetiapine

*Dopamine agonists, levodopa:* antagonism of these drugs' effects

*Erythromycin, fluconazole, itraconazole, ketoconazole, other CYP450-3A4*

*inhibitors:* increased quetiapine effects

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase:* asymptomatic elevations

*Total cholesterol, triglycerides:* increased levels

*Urine tricyclic antidepressant assay:* false-positive screen

*White blood cells:* decreased count

**Drug-behaviors.** *Alcohol use:* increased CNS effects

## Patient monitoring

🚨 Monitor neurologic status, especially for signs and symptoms of tardive dyskinesia, suicidal ideation, or neuroleptic malignant syndrome.

- Be aware that patient should undergo lens examination when starting treatment and at 6-month intervals during long-term treatment.

- Monitor blood pressure for orthostatic hypotension.

🚨 Monitor patient closely for prolonged QT interval.

- Monitor fasting blood lipids periodically during treatment.

🚨 Monitor CBC and differential in patients with preexisting low white blood cell (WBC) count; discontinue

drug at first sign of WBC decrease in absence of other causes.

## Patient teaching

- Tell patient to take immediate-release tablets with or without food and to take extended-release form preferably in the evening, swallowed whole, without food or with a light meal.

- Instruct patient not to crush, break, or chew extended-release tablets.

🚨 Teach patient to recognize and immediately report signs and symptoms of neuroleptic malignant syndrome (such as high fever, sweating, unstable blood pressure, stupor, muscle rigidity, changes in mood or behavior and tardive dyskinesia) and prolonged QT interval.

- Instruct patient to move slowly when sitting up or standing, to avoid dizziness from sudden blood pressure decrease.

🚨 Tell patient not to stop taking drug abruptly. Tell him dosage must be tapered.

- Caution patient not to drink alcohol.

- Instruct patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## quinapril hydrochloride

Accuproil, Accupro , Quinil 

**Pharmacologic class:** Angiotensin-converting enzyme (ACE) inhibitor

**Therapeutic class:** Antihypertensive

**Pregnancy risk category D**

**FDA BOXED WARNING**

- Drugs that act directly on the renin-angiotensin system can cause injury to or death of a developing fetus. Discontinue drug as soon as possible when pregnancy is detected.

**Action**

Inhibits conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; decreases cardiac output. Increases plasma renin levels and reduces aldosterone levels, causing systemic vasodilation.

**Availability**

Tablets: 5 mg, 10 mg, 20 mg, 40 mg

**Indications and dosages**

- Hypertension

**Adults:** Initially, 10 to 20 mg P.O. daily for patients not receiving diuretics, with subsequent dosages adjusted at 2-week intervals according to blood pressure response at peak (2 to 6 hours) and trough (predose) blood levels; for maintenance, 20 to 80 mg/day as a single dose or in two divided doses. In patients receiving diuretics, discontinue diuretic 2 to 3 days before starting quinapril; if blood pressure isn't controlled, resume diuretic. If diuretic can't be discontinued, start therapy with 5 mg/day quinapril.

- Adjunct in heart failure

**Adults:** Initially, 5 mg P.O. b.i.d., titrated weekly until effective dosage is determined. For maintenance, 20 to 40 mg/day in two evenly divided doses.

**Dosage adjustment**

- Renal impairment
- Elderly patients

**Off-label uses**

- Aortic insufficiency
- Atherosclerosis
- Postoperative hypertension

- Myocardial infarction
- Diabetic or nondiabetic neuropathy

**Contraindications**

- Hypersensitivity to drug or other ACE inhibitors
- Angioedema caused by other ACE inhibitors

**Precautions**

Use cautiously in:

- autoimmune diseases, aortic stenosis, renal artery stenosis, hypertrophic cardiomyopathy, cerebrovascular or cardiac insufficiency, collagen vascular disease, hepatic or renal impairment, hypovolemia, hyponatremia, hypotension, neutropenia, chronic cough, proteinuria, febrile illness
- family history of angioedema
- risk factors for development of hyperkalemia, including renal insufficiency, diabetes mellitus, concurrent use of potassium-sparing diuretics, potassium supplements, or potassium-containing salt substitutes
- concurrent use of nonsteroidal anti-inflammatory drugs (NSAIDs) in patients who are elderly, volume-depleted (including those on diuretics), or with compromised renal function
- concurrent immunosuppressant, lithium, or diuretic therapy
- black patients
- elderly patients
- pregnant or breastfeeding patients
- children (safety not established).

**Administration**

- Administer with or without food, but not with high-fat meal.
- Know that if quinapril alone doesn't adequately control blood pressure, a diuretic may be added.

Route	Onset	Peak	Duration
P.O.	0.5-1 hr	2-6 hr	Up to 24 hr

## Adverse reactions

**CNS:** dizziness, drowsiness, fatigue, headache, insomnia, depression, vertigo, paresthesia, asthenia, malaise, nervousness, syncope

**CV:** hypotension, angina pectoris, palpitations, chest pain, tachycardia,

### arrhythmias

**EENT:** amblyopia, sinusitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, anorexia, dry mouth

**GU:** erectile dysfunction

**Metabolic:** hyperkalemia

**Musculoskeletal:** back pain

**Respiratory:** cough, dyspnea

**Skin:** rash, pruritus, alopecia, flushing, diaphoresis, photosensitivity

**Other:** taste disturbances, fever, viral infections, hypersensitivity reactions including **anaphylaxis**

## Interactions

### Drug-drug.

*Diuretics, other antihypertensives:* increased hypotension

*Gold (sodium aurothiomalate):* increased risk of rare nitritoid reactions (including facial flushing, nausea, vomiting, and hypotension)

*Lithium:* increased serum lithium level and lithium toxicity

*NSAIDs:* may result in deterioration of renal function, including acute renal failure and attenuated ACE inhibitor antihypertensive effect

*Potassium-sparing diuretics, potassium supplements:* increased risk of hyperkalemia

*Tetracyclines:* decreased tetracycline absorption

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, potassium:* increased levels

**Drug-food.** *High-fat foods:* decreased rate and extent of drug absorption

*Salt substitutes containing potassium:* increased risk of hyperkalemia

## Patient monitoring

- Monitor vital signs and cardiovascular status. Be sure to ask patient if he's experiencing angina.

- Assess CBC and liver function tests.

- Monitor potassium level. Watch for evidence of hyperkalemia.

☞ Watch closely for signs and symptoms of angioedema, especially in black patients after first dose.

- Assess for dry, nonproductive cough and signs and symptoms of infection.

- Monitor renal function periodically in patients receiving concurrent NSAID therapy.

## Patient teaching

- Tell patient he may take with or without food, but not with high-fat meal.

☞ Advise patient to immediately report facial or tongue swelling or difficulty breathing.

- Instruct patient to monitor and record his blood pressure.

- Tell patient to promptly report dry, nonproductive cough and signs and symptoms of infection.

- Instruct patient to move slowly when sitting up or standing, to avoid dizziness or light-headedness from sudden blood pressure decrease.

- Tell patient that excessive fluid loss (as from sweating, vomiting, or diarrhea) and inadequate fluid intake increase the risk of light-headedness (especially in hot weather).

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- Advise patient to avoid salt substitutes containing potassium.

- Tell female patient to notify prescriber of possible pregnancy. Caution her not to breastfeed.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

**quinidine gluconate**

Apo-Quin-G\*

**quinidine sulfate**

Apo-Quinidine\*

**Pharmacologic class:** Cinchona alkaloid**Therapeutic class:** Antiarrhythmic (class IA), antimalarial**Pregnancy risk category C****FDA BOXED WARNING**

• In many trials of antiarrhythmic therapy for non-life-threatening arrhythmias, active antiarrhythmic therapy has led to increased deaths; risk of active therapy is probably greatest in patients with structural heart disease. Deaths associated with quinidine were more than three times as high as deaths in placebo group. Another analysis showed that in patients with non-life-threatening ventricular arrhythmias, quinidine-associated deaths were consistently higher than those linked to various alternative antiarrhythmics.

**Action**

Slows conduction and prolongs refractory period, reducing myocardial irritability and interrupting or preventing certain arrhythmias. As an antimalarial, acts primarily as intra-erythrocytic schizonticide.

**Availability****quinidine gluconate***Injection:* 80 mg/ml*Tablets (extended-release):* 324 mg**quinidine sulfate***Tablets:* 200 mg, 300 mg*Tablets (extended-release):* 300 mg**Indications and dosages**

➤ Test dose

**Adults:** 200 mg sulfate P.O. as a single dose or 200 mg gluconate I.M. to check for idiosyncratic reaction

➤ Premature atrial and ventricular contractions

**Adults:** 200 to 300 mg sulfate P.O. three to four times daily, or gluconate (extended-release) given as 324 to 660 mg P.O. q 8 to 12 hours

➤ Paroxysmal supraventricular tachycardia (PSVT)

**Adults:** 400 to 600 mg sulfate P.O. q 2 or 3 hours until arrhythmia ends; or 324 to 660 mg (extended-release) P.O. q 8 to 12 hours. For parenteral use, 400 mg gluconate I.M., repeated q 2 hours if necessary; or 330 mg gluconate I.V. (up to 750 mg) in diluted solution, infused no faster than 1 ml/minute.

➤ To convert atrial fibrillation to sinus rhythm

**Adults:** 200 mg sulfate P.O. q 2 or 3 hours for five to eight doses, increased daily until sinus rhythm returns or toxic effects occur; maximum daily dosage is 4 g. Or 300 mg sulfate (extended-release) P.O. q 8 to 12 hours, increased cautiously if necessary. Or 324 to 660 mg gluconate (extended-release) P.O. q 8 to 12 hours. For parenteral use, 800 mg gluconate I.V. in diluted solution, infused no faster than 0.25 mg/kg/minute.➤ Severe, life-threatening *Plasmodium falciparum* malaria**Adults:** Loading dose of 10 mg/kg gluconate I.V. diluted in 5 ml/kg of normal saline solution (or 250 ml of normal saline solution in otherwise healthy, 50-kg [110-lb] patient) by continuous infusion over 1 to 2 hours, then a continuous maintenance infusion of 0.02 mg/kg/minute for 72 hours or until parasitemia drops to less than 1% or oral therapy can begin. Or alternative loading dose of 24 mg/kg gluconate I.V. diluted in 250 ml of

0.9% sodium chloride injection by intermittent infusion over 4 hours, followed by maintenance dosage of 12 mg/kg gluconate I.V. at 8-hour intervals, starting 8 hours after loading dose, infused over 4 hours for 7 days or until patient tolerates oral therapy.

### Dosage adjustment

- Hepatic insufficiency

### Off-label uses

- Myocardial infarction

### Contraindications

- Hypersensitivity to drug or related cinchona derivatives
- Thrombocytopenia with previous quinidine therapy
- Myasthenia gravis
- Complete heart block
- Left bundle-branch block or other severe intraventricular conduction defects
- Aberrant ectopic impulses and abnormal rhythm
- History of prolonged QT interval or drug-induced torsades de pointes
- Digoxin toxicity

### Precautions

Use cautiously in:

- potassium imbalance, renal or hepatic disease, heart failure, respiratory depression
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

 Before first dose, assess apical pulse and blood pressure. If patient has bradycardia or tachycardia, withhold dose and contact prescriber.

- If patient has atrial fibrillation, expect to give digoxin, calcium channel blocker, beta-adrenergic blocker, and possibly an anticoagulant before administering quinidine.

- If sinus rhythm isn't restored after patient has received a total of 10 mg/kg quinidine gluconate, other means of cardioversion may be considered.
- Monitor blood pressure and ECG; titrate flow rate to correct arrhythmia.
- When giving large doses, monitor blood pressure and ECG continuously.
- Know that quinidine gluconate is the only parenteral cinchona alkaloid antimalarial commercially available in U.S. Because newer antiarrhythmics have replaced quinidine in many cardiac uses, it may not be readily available and prescribers may not be familiar with its use. For information about availability or use, contact manufacturer at 800-821-0538.

Route	Onset	Peak	Duration
P.O. (extended)	Unknown	3-5 hr	Unknown
P.O. (sulfate)	Unknown	1-3 hr	Unknown
I.V.	Immediate	Immediate	Unknown
I.M.	30-90 sec	Unknown	Unknown

### Adverse reactions

**CNS:** vertigo, headache, ataxia, apprehension, excitement, delirium, syncope, confusion, depression, dementia

**CV:** ECG changes, hypotension, vasculitis, tachycardia, premature ventricular contractions, paradoxical tachycardia, **ventricular tachycardia, ventricular fibrillation, ventricular flutter, ventricular ectopy, torsades de pointes, complete atrioventricular (AV) block, widened QRS complex, prolonged QT interval, asystole, aggravated heart failure, arterial embolism, vascular collapse**

**EENT:** diplopia, blurred vision, mydriasis, abnormal color perception, scotoma, photophobia, night blindness, optic neuritis, decreased hearing, tinnitus

**GI:** nausea, vomiting, diarrhea, abdominal pain, increased salivation, anorexia

**GU:** lupus nephritis

**Hematologic:** purpura, hemolytic anemia, hypotherbinemia, leukocytosis, shift to left in white blood cell differential, neutropenia, thrombocytopenia, thrombocytopenic purpura, agranulocytosis

**Hepatic:** hepatotoxicity

**Respiratory:** acute asthma attack, respiratory arrest

**Skin:** rash, pruritus, urticaria, photosensitivity, angioedema

**Other:** fever, cinchonism, lupuslike syndrome, hypersensitivity reaction

## Interactions

**Drug-drug.** *Amiodarone:* increased quinidine blood level, causing potentially fatal arrhythmias

*Antacids, cimetidine:* increased quinidine blood level

*Anticholinergics:* additive vagolytic effect

*Anticoagulants, beta-adrenergic blockers, procainamide, propafenone, tricyclic antidepressants:* increased effects of these drugs

*Barbiturates, hydantoins, nifedipine, rifampin, sucralfate:* decreased therapeutic effect of quinidine

*Cardiac glycosides:* increased cardiac glycoside blood level, greater risk of toxicity

*Cholinergics:* decreased quinidine effect (may cause failure to terminate PSVT)

*Depolarizing (decamethonium, succinylcholine) and nondepolarizing (tubocurarine, pancuronium) neuromuscular blockers:* potentiation of neuromuscular blockade

*Diltiazem, verapamil:* decreased quinidine clearance, resulting in hypotension, bradycardia, ventricular tachycardia, AV block, or pulmonary edema

*Disopyramide:* increased disopyramide or decreased quinidine blood level

*Potassium, urinary alkalinizers:* increased blood level and effects of quinidine

**Drug-diagnostic tests.** *Granulocytes, hemoglobin, platelets:* decreased levels  
*Creatine kinase, hepatic enzymes:* increased levels

*Renal function tests:* altered results

**Drug-food.** *Grapefruit juice:* inhibited drug metabolism

*Reduced sodium intake:* increased quinidine blood level

**Drug-herbs.** *Jimsonweed:* adverse cardiovascular effects

*Licorice:* additive effects

## Patient monitoring

 Monitor ECG and vital signs closely. Assess for worsening heart failure, especially with I.V. use.

- Assess CBC, kidney and liver function tests and quinidine blood level.

- Watch for signs and symptoms of blood dyscrasias.

 Closely monitor respiratory status. Stay alert for asthma attacks and impending respiratory arrest.

- Monitor for adverse GI effects, which may signify drug toxicity.

## Patient teaching

- Advise patient to take with food to reduce GI upset.

- Instruct patient not to crush or chew extended-release tablets.

 Teach patient to recognize and immediately report signs and symptoms of toxicity, including tinnitus, nausea, headache, dizziness, and visual disturbances.

- Caution patient to avoid potassium supplements, licorice, and grapefruit juice. Tell him to maintain constant level of sodium intake.

- Advise patient to consult prescriber before taking herbs.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## quinine sulfate

Apo-Quinine<sup>★</sup>, Novo-Quinine<sup>★</sup>,  
Qualaquin

**Pharmacologic class:** Cinchona alkaloid

**Therapeutic class:** Antimalarial

**Pregnancy risk category** C

### FDA BOXED WARNING

• Using drug for treatment or prevention of nocturnal leg cramps may cause serious and life-threatening hematologic reactions, including thrombocytopenia and hemolytic uremic syndrome/thrombotic thrombocytopenic purpura (TTP). Chronic renal impairment associated with development of TTP has occurred. Risks associated with drug use in absence of evidence of its effectiveness in treatment or prevention of nocturnal leg cramps outweigh potential benefits.

### Action

Unknown. Thought to interfere with DNA synthesis by increasing pH in intracellular organelles of susceptible parasites.

### Availability

Capsules: 324 mg

### Indications and dosages

➤ Uncomplicated *Plasmodium falciparum* malaria

**Adults and children age 16 and older:**  
648 mg (two capsules) P.O. q 8 hours  
for 7 days

### Dosage adjustment

• Severe chronic renal impairment

### Contraindications

• Hypersensitivity to drug (including but not limited to thrombocytopenia,

idiopathic thrombocytopenia purpura, thrombocytopenic purpura, hemolytic uremic syndrome, blackwater fever), mefloquine, quinidine

- G6PD deficiency
- Optic neuritis
- Tinnitus
- Prolonged QT interval
- Myasthenia gravis

### Precautions

Use cautiously in:

- renal or hepatic impairment
- hypoglycemia
- concurrent use of digoxin and drugs known to prolong QT interval, including Class IA antiarrhythmics (such as disopyramide, procainamide, quinidine) and Class III antiarrhythmics (such as amiodarone, dofetilide, sotalol)
- concurrent use of antacids, rifampin, ritonavir, neuromuscular blockers, macrolide anti-infectives, CYP3A4 substrates, including astemizole, cisapride, terfenadine (not available in U.S.), pimozone, halofantrine, quinidine (avoid use)
- pregnant or breastfeeding patients.
- children younger than age 16 (safety and efficacy of capsules not established).

### Administration

- Give with or without food.

Route	Onset	Peak	Duration
P.O.	Unknown	1-3 hr	4-11 hr

### Adverse reactions

**CNS:** headache, vertigo, syncope, apprehension, restlessness, excitement, confusion, delirium, dizziness, **seizures**

**CV:** angina, vasculitis, **cardiac rhythm or conduction disturbances**

**EENT:** diplopia, amblyopia, blurred vision, scotoma, abnormal color perception, photophobia, night blindness, mydriasis, optic atrophy, hearing loss, tinnitus

**GI:** nausea, vomiting, diarrhea, abdominal cramps, epigastric pain, dysphagia

**GU:** hemolytic uremic syndrome

**Hematologic:** hemolytic anemia, hypoprothrombinemia, acute hemolysis, thrombocytopenic purpura, agranulocytosis

**Hepatic:** hepatotoxicity

**Metabolic:** hypothermia, hypoglycemia

**Respiratory:** asthma

**Skin:** rash, pruritus, photosensitivity, flushing, diaphoresis

**Other:** cinchonism, facial edema, hypersensitivity reactions including fever and hemolytic uremic syndrome

## Interactions

**Drug-drug.** *Aminophylline, theophylline:* increased quinine mean area under the curve (AUC) and  $C_{max}$

*Antacids:* delayed or decreased quinine absorption

*Atorvastatin, other HMG-CoA reductase inhibitors that are CYP3A4 substrates:* increased risk of myopathy

*Cimetidine:* decreased metabolism and increased effects of quinine

*Class IA, Class III antiarrhythmics:* increased risk of ECG abnormalities, including prolonged QT interval

*CYP3A4 inducers (such as carbamazepine, phenobarbital, phenytoin):* decreased quinine plasma concentration and increased carbamazepine, phenobarbital, and phenytoin AUC and  $C_{max}$

*CYP3A4 inducers or inhibitors, CYP3A4 and CYP2D6 substrates:* decreased efficacy and increased adverse effects of these drugs

*Digoxin:* increased digoxin blood level

*Other antimalarials including halofantrine, mefloquine:* increased risk of seizures, ECG abnormalities, and cardiac arrest

*Neuromuscular blockers:* increased effects of these drugs, leading to respiratory difficulty

*Rifampin:* increased metabolism and decreased effects of quinine

*Ritonavir:* increased quinine mean AUC,  $C_{max}$ , and elimination half-life

*Succinylcholine:* delayed succinylcholine metabolism

*Tetracycline:* increased quinine mean plasma concentration

*Urinary alkalinizers (such as acetazolamide, sodium bicarbonate):* increased quinine blood level and risk of toxicity

*Warfarin:* increased warfarin effects, increased risk of bleeding

**Drug-diagnostic tests.** *Urinary 17-ketogenic steroids:* elevated levels

## Patient monitoring

 Monitor for signs and symptoms of hypersensitivity reaction, including fever and hemolytic uremic syndrome. Discontinue drug if signs or symptoms of hypersensitivity occur.

- Stay alert for signs and symptoms of cinchonism, including tinnitus, headache, nausea, and visual disturbances.

 Assess for bleeding tendency, arrhythmias, and hepatotoxicity.

- Monitor CBC, renal and liver function tests, and quinine and glucose levels.

## Patient teaching

- Tell patient he may take with or without food.

 Teach patient to recognize and immediately report signs and symptoms of cinchonism, cardiac arrhythmias, nephrotoxicity, and hepatotoxicity.

 Instruct patient to report unusual bleeding or bruising.

- Tell female patient to discuss pregnancy or breastfeeding with prescriber before taking drug.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## quinupristin and dalfopristin

Synercid

**Pharmacologic class:** Streptogramin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

### FDA BOXED WARNING

• Drug combination is approved for treating serious or life-threatening infections related to vancomycin-resistant *Enterococcus faecium* bacteremia under the Food and Drug Administration's accelerated approval regulations that allow marketing of products for use in life-threatening conditions when other therapies aren't available.

### Action

Synergistic effects of drug combination interfere with bacterial cell-wall synthesis by disrupting DNA and RNA transcription

### Availability

**Injection:** 500 mg/10 ml (150 mg quinupristin, 350 mg dalfopristin), 600 mg/10 ml (180 mg quinupristin, 420 mg dalfopristin)

### Indications and dosages

➤ Serious or life-threatening infections caused by vancomycin-resistant *Enterococcus faecium*

**Adults and adolescents ages 16 and older:** 7.5 mg/kg by I.V. infusion over 1 hour q 8 hours

➤ Complicated skin and skin-structure infections caused by *Staphylococcus aureus* (methicillin-susceptible) or *Streptococcus pyogenes*

**Adults and adolescents ages 16 and older:** 7.5 mg/kg by I.V. infusion over 1 hour q 12 hours for at least 7 days

### Dosage adjustment

• Hepatic impairment

### Contraindications

• Hypersensitivity to drug or other streptogramins

### Precautions

Use cautiously in:

- hepatic impairment
- breastfeeding patients
- children younger than age 16 (safety and efficacy not established).

### Administration

⚠ Don't mix with other drugs or saline solution.

- For intermittent infusion through a common I.V. line, flush line with dextrose 5% in water (D<sub>5</sub>W) before and after giving drug.
- Add 5 ml of sterile water or D<sub>5</sub>W to powdered drug in vial, and swirl gently by hand until powder dissolves; don't shake vial. Solution should be clear.
- Within 30 minutes of first dilution, draw up prescribed dosage and dilute further in D<sub>5</sub>W to a final concentration of 2 mg/ml or less.
- Know that if patient has a central venous catheter and is fluid-restricted, drug may be given in 100 ml of D<sub>5</sub>W.
- Administer by infusion pump over 60 minutes.
- If significant peripheral vein irritation occurs, dilute in 500 to 750 ml of D<sub>5</sub>W.
- Be aware that duration of therapy depends on infection site and severity.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache

**CV:** thrombophlebitis

**GI:** nausea, vomiting, diarrhea**Musculoskeletal:** joint pain, myalgia**Skin:** rash, pruritus**Other:** inflammation, pain, or edema at infusion site**Interactions**

**Drug-drug.** *Drugs metabolized by CYP450-3A4 (antiretrovirals; antineoplastics, such as vinca alkaloids, docetaxel, and paclitaxel; astemizole; benzodiazepines; calcium channel blockers; carbamazepine; cisapride; corticosteroids; disopyramide; HMG-CoA reductase inhibitors; immunosuppressants such as cyclosporine and tacrolimus; lidocaine; quinidine; terfenadine):* increased therapeutic and adverse effects of these drugs

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, bilirubin:* increased levels

**Patient monitoring**

- Monitor closely for infusion site reactions and thrombophlebitis. If these problems occur, consider increasing infusion volume, changing infusion site, or infusing through peripherally inserted central catheter or central venous catheter.
- Assess weight and fluid intake and output to help detect edema.
- Monitor bilirubin level.

**Patient teaching**

- 📢 Instruct patient to immediately report pain or redness at infusion site.
- Tell patient to report muscle aches and pains.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

**rabeprazole sodium**

AcipHex, Novo-Rabeprazole<sup>✳</sup>, Pariet<sup>⚠</sup>, PMS-Rabeprazole<sup>✳</sup>, Ran-Rabeprazole<sup>✳</sup>

**Pharmacologic class:** Proton pump inhibitor

**Therapeutic class:** Gastric anti-secretory agent

**Pregnancy risk category B**

**Action**

Reduces gastric acid secretion and increases gastric mucus and bicarbonate production, creating a protective coating on gastric mucosa

**Availability**

Tablets (*delayed-release*): 20 mg

**Indications and dosages**

- Erosive or ulcerative gastroesophageal reflux disease (GERD)
- Adults:** 20 mg P.O. daily for 4 to 8 weeks. If healing doesn't occur within 8 weeks, another 8 weeks of therapy may be considered. Maintenance dosage is 20 mg P.O. daily.

## ➤ GERD

**Adults:** 20 mg P.O. daily for 4 weeks. If symptoms don't resolve after 4 weeks, another course of therapy may be considered.

- Short-term treatment of symptomatic GERD

**Adolescents ages 12 and older:** 20 mg P.O. daily for up to 8 weeks

- Hypersecretory conditions, including Zollinger-Ellison syndrome
- Adults:** Initially, 60 mg P.O. daily; adjust dosage as needed up to 100 mg P.O. daily as a single dose or 60 mg

P.O. b.i.d. Maximum daily dosage is 120 mg.

➤ Duodenal ulcer

**Adults:** 20 mg P.O. daily for up to 4 weeks

➤ *Helicobacter pylori* eradication

**Adults:** 20 mg P.O. b.i.d. for 7 days (given with amoxicillin and clarithromycin)

### Off-label uses

- Dyspepsia
- Benign gastric ulcer

### Contraindications

- Hypersensitivity to drug, its components, or benzimidazoles

### Precautions

Use cautiously in:

- severe hepatic impairment
- concurrent use of atazanavir (not recommended)
- pregnant patients
- breastfeeding patients (not recommended)
- children (safety not established).

### Administration

- Don't crush or split tablets.
- Give without regard to food.

Route	Onset	Peak	Duration
P.O.	Within 1 hr	Unknown	24 hr

### Adverse reactions

**CNS:** headache

**Metabolic:** hypomagnesemia

**Musculoskeletal:** fractures of hip, wrist, spine (with long-term daily use)

### Interactions

**Drug-drug.** *Atazanavir:* substantially decreased atazanavir plasma concentration and reduced therapeutic effect  
*Combined administration of rabeprazole, amoxicillin, and clarithromycin:* increased rabeprazole and 14-hydroxy-clarithromycin plasma concentrations

*Gastric pH-dependent drugs (such as digoxin, ketoconazole):* increased or decreased absorption

*Methotrexate:* possibly elevated and prolonged methotrexate serum level

*Warfarin:* increased risk of bleeding

**Drug-diagnostic tests.** *Magnesium:* decreased level

### Patient monitoring

- Stay alert for symptomatic response, but know that a positive response doesn't rule out gastric cancer.
- Monitor magnesium level before starting therapy and periodically thereafter in patients expected to be on prolonged therapy or who take proton pump inhibitors with drugs such as digoxin or drugs that may cause hypomagnesemia (such as diuretics).

### Patient teaching

- Tell patient he may take with or without food. Instruct him not to crush, chew, or split tablets.
- Caution female patient not to breast-feed during therapy.
- As appropriate, review all significant adverse reactions and interactions, especially those related to the drugs mentioned above.

**r**

## raloxifene

Evista

**Pharmacologic class:** Nonsteroidal benzothiophene derivative

**Therapeutic class:** Selective estrogen receptor modulator, bone resorption inhibitor

**Pregnancy risk category X**

### FDA BOXED WARNING

- An increased risk of deep vein thrombosis and pulmonary embolism is

associated with raloxifene. Women with history of or active venous thromboembolism shouldn't take this drug.

- A trial in postmenopausal women with documented coronary heart disease or at increased risk for major coronary events found increased risk of death due to stroke. Consider risk-benefit ratio in women at risk for stroke.

### Action

Binds to estrogen receptors, activating estrogen pathways and increasing bone mineral density. These effects decrease bone resorption and turnover.

### Availability

Tablets: 60 mg

### Indications and dosages

➤ Treatment and prevention of osteoporosis in postmenopausal women; reduction of invasive breast cancer risk in postmenopausal women with osteoporosis; reduction of invasive breast cancer risk in postmenopausal women at high risk for invasive breast cancer

**Adults:** 60 mg P.O. daily

### Off-label uses

- Prophylaxis of cardiovascular disease

### Contraindications

- Hypersensitivity to drug or its components
- History of thromboembolic events
- Premenopausal women
- Females of childbearing age
- Pregnancy or breastfeeding
- Children

### Precautions

Use cautiously in:

- altered lipid metabolism, hepatic dysfunction
- concurrent estrogen therapy (use not recommended)

- immobilized patients and others at increased risk for thromboembolic events.

### Administration

- Give with or without food.

Route	Onset	Peak	Duration
P.O.	Unknown	6 hr	Unknown

### Adverse reactions

**CNS:** depression, insomnia, vertigo, syncope, hypoesthesia, migraine, neuralgia

**CV:** chest pain, peripheral edema, varicose veins, **deep-vein thrombosis, thrombophlebitis**

**EENT:** conjunctivitis, sinusitis, rhinitis, pharyngitis, laryngitis

**GI:** nausea, vomiting, diarrhea, abdominal pain dyspepsia, flatulence, gastroenteritis

**GU:** urinary tract infection or disorder, cystitis, vaginitis, leukorrhea, endometrial disorder, **vaginal hemorrhage**

**Musculoskeletal:** leg cramps, joint pain, myalgia, arthritis, tendon disorder

**Respiratory:** cough, pneumonia, bronchitis, **pulmonary embolism**

**Skin:** rash, diaphoresis

**Other:** weight gain, hot flashes, infection, pain, flulike symptoms

### Interactions

**Drug-drug.** *Cholestyramine:* reduced raloxifene absorption

*Highly protein-bound drugs (such as diazepam, diazoxide, lidocaine):* interference with binding of these drugs

*Warfarin:* decreased prothrombin time

**Drug-diagnostic tests.** *Albumin, apolipoprotein B, calcium, fibrinogen, inorganic phosphate, low-density lipoproteins, platelets, protein, total cholesterol:* decreased levels

*Apolipoprotein A1; corticosteroid-binding, sex steroid-binding, and thyroid-binding globulin:* increased levels

## Patient monitoring

 Watch for thromboembolic events, especially during first 4 months of therapy.

- Stay alert for other adverse effects, particularly leg cramps, other musculoskeletal complaints, and respiratory disorders.
- Assess bone mineral density test results.
- Monitor for unexplained vaginal bleeding.

## Patient teaching

- Tell patient she may take with or without food.
- Instruct patient to read package insert before starting drug and then periodically.
-  Teach patient to recognize and immediately report symptoms of blood clots.
- Instruct patient to stop taking drug 3 days before anticipated period of prolonged immobility, and to restart it only after she regains normal mobility.
- Tell patient that drug may cause hot flashes, but that these are normal effects.
- Advise patient to report unexplained vaginal bleeding or leg cramps.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## raltegravir

Isentress

**Pharmacologic class:** Human immunodeficiency virus (HIV) integrase-strand transfer inhibitor

**Therapeutic class:** Antiretroviral

**Pregnancy risk category C**

## Action

Rapidly blocks HIV integrase (enzyme needed for HIV replication), leading to viral load reduction and increased CD4+ count

## Availability

Tablets (*chewable*): 25 mg, 100 mg

Tablets (*film-coated*): 400 mg

## Indications and dosages

 HIV-1 infection in adults used in combination with other antiretrovirals  
**Adults and adolescents ages 12 and older:** 400 mg film-coated tablet P.O. b.i.d.

**Children age 6 to younger than age 12 weighing at least 25 kg (55 lb):** One 400-mg film-coated tablet P.O. b.i.d. or chewable tablets, weight based to maximum of 300 mg P.O. b.i.d.

**Children age 6 to younger than age 12 weighing less than 25 kg (55 lb):** Chewable tablets, weight based to maximum of 300 mg P.O. b.i.d.

**Children age 2 to younger than age 6 weighing at least 10 kg (22 lb):** Chewable tablets, weight based to maximum of 300 mg P.O. b.i.d.

## Contraindications

None

## Precautions

Use cautiously in:

- treatment-naïve adults (safety and efficacy not established)
- increased risk of myopathy or rhabdomyolysis (such as with concomitant use of drugs known to cause these conditions)
- elderly patients
- pregnant patients
- breastfeeding patients (use not recommended)
- children younger than age 2 (safety and efficacy not established).

## Administration

- Administer with or without food.
- Be aware that film-coated tablets can't be substituted with chewable tablets.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** headache, fatigue, asthenia, dizziness, insomnia

**CV: myocardial infarction**

**GI:** nausea, vomiting, diarrhea, abdominal pain, gastritis

**GU: toxic nephropathy, renal failure, renal tubular necrosis**

**Hematologic:** anemia, neutropenia

**Hepatic:** hepatitis

**Musculoskeletal:** myopathy, rhabdomyolysis

**Skin:** lipodystrophy, **Stevens-Johnson syndrome, toxic epidermal necrolysis**

**Other:** fever, herpes simplex, immune reconstitution syndrome, hypersensitivity reaction

## Interactions

**Drug-drug.** *Strong UGT1A1 inducers (such as rifampin):* reduced raltegravir blood level

*UGT1A1 inhibitors (such as atazanavir):* increased raltegravir blood level

**Drug-diagnostic tests.** *Absolute neutrophil count, hemoglobin, platelets:* decreased levels

*ALP, ALT, AST, blood glucose, creatine kinase, lipase, pancreatic enzymes, total bilirubin:* increased levels

## Patient monitoring

- Monitor renal function tests.
- Be aware that immune reconstitution syndrome has occurred in patients receiving drug with combination antiretroviral therapy. During initial phase of therapy, patient whose immune system responds may develop inflammatory response to indolent or residual

opportunistic infections (such as *Mycobacterium avium* complex, cytomegalovirus, *Pneumocystis jiroveci* pneumonia, or tuberculosis), which may necessitate further evaluation and treatment.

- Be aware that severe, potentially life-threatening and fatal skin reactions have been reported, including Stevens-Johnson syndrome, hypersensitivity reaction, and toxic epidermal necrolysis. Immediately discontinue drug if severe hypersensitivity, severe rash, or rash with systemic symptoms or liver aminotransferase elevations develops. Closely monitor clinical status, including liver aminotransferases.

## Patient teaching

- Tell patient drug may be taken with or without food.
- Inform patient with phenylketonuria that chewable tablets contain phenylalanine.
- Inform patient that drug doesn't cure HIV infection or reduce risk of passing it to others through sexual contact, needle sharing, or blood exposure.
- Advise patient to immediately report muscle weakness, urinary problems, new infections, rash, fever, general malaise, swelling of face or throat, or chest pain.
- Instruct female patient to notify prescriber if she is pregnant or intends to become pregnant.
- Caution breastfeeding patient to discontinue breastfeeding while taking drug, because of potential HIV transmission and adverse reactions in infants.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## ramelteon

Rozerem

**Pharmacologic class:** Melatonin receptor agonist

**Therapeutic class:** Hypnotic

**Pregnancy risk category C**

### Action

Promotes sleep through activity at melatonin MT<sub>1</sub> and MT<sub>2</sub> receptors, which are thought to be involved in maintaining circadian rhythm underlying normal sleep-wake cycle

### Availability

Tablets: 8 mg

### Indications and dosages

➤ Insomnia marked by difficulty with sleep onset

**Adults:** 8 mg P.O. within 30 minutes of going to bed

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- sleep apnea, chronic obstructive pulmonary disease, hepatic impairment
- concurrent use of fluvoxamine
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Give within 30 minutes of patient's bedtime.
- Don't give with or immediately after a high-fat meal.

Route	Onset	Peak	Duration
P.O.	Unknown	0.5-1.5 hr	Unknown

### Adverse reactions

**CNS:** headache, somnolence, fatigue, dizziness, exacerbated insomnia, depression

**GI:** nausea, diarrhea

**Musculoskeletal:** myalgia, arthralgia

**Respiratory:** upper respiratory tract infection

**Other:** altered taste, influenza

### Interactions

**Drug-drug.** *Fluconazole, fluvoxamine, ketoconazole:* increased ramelteon blood level

*Rifampin:* decreased ramelteon efficacy

**Drug-diagnostic tests.** *Blood cortisol:* decreased

**Drug-food.** *High-fat meals:* altered ramelteon absorption

**Drug-herbs.** *American elder, bishop's weed, cat's claw, devil's claw, eucalyptus, feverfew, ginkgo, kava, licorice, pomegranate:* increased ramelteon blood level  
*Valerian:* additive sedation, increased ramelteon blood level

**Drug-behaviors.** *Alcohol use:* additive psychomotor impairment

### Patient monitoring

- Monitor prolactin and testosterone levels, if ordered, in patient who develops unexplained amenorrhea, galactorrhea, decreased libido, or fertility problems.
- Evaluate patient for physical and psychiatric disorders before and during therapy. Worsening of insomnia or onset of new behavioral or cognitive symptoms could signal underlying psychiatric disorder.

### Patient teaching

- Instruct patient to take drug within 30 minutes of going to bed.
- Advise patient not to take drug with or immediately after a high-fat meal.
- Caution patient to avoid driving and other hazardous activities until drug effects are known.

- Advise patient to contact prescriber if insomnia worsens.
- Instruct patient to report menses cessation, excessive or spontaneous lactation, decreased libido, or fertility problems.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, food, herbs, and behaviors mentioned above.

## ramipril

Altace, Apo-Ramipril<sup>✳</sup>, Co Ramipril<sup>✳</sup>, Lopace<sup>✳</sup>, Novo-Ramipril<sup>\*</sup>, Ratio-Ramipril<sup>✳</sup>, Sandoz Ramipril<sup>✳</sup>, Tritace<sup>⊕</sup>

**Pharmacologic class:** Angiotensin-converting enzyme (ACE) inhibitor

**Therapeutic class:** Antihypertensive

**Pregnancy risk category D**

### FDA BOXED WARNING

- Drugs that act directly on the renin-angiotensin system can cause injury to or death of a developing fetus. Discontinue drug as soon as possible when pregnancy is detected.

### Action

Inhibits conversion of angiotensin I to angiotensin II, a potent vasoconstrictor. Increases plasma renin levels and reduces aldosterone levels, causing systemic vasodilation and decreased cardiac output.

### Availability

*Capsules:* 1.25 mg, 2.5 mg, 5 mg, 10 mg

### Indications and dosages

- Hypertension

**Adults:** Initially, 2.5 mg P.O. daily in patients not receiving diuretics; may increase dosage slowly p.r.n. according to response. For maintenance, 2.5 to 20 mg/day P.O. as a single dose or in two equally divided doses. If ramipril alone doesn't control blood pressure, a diuretic may be added.

➤ To reduce the risk of myocardial infarction (MI), cerebrovascular accident, or death from cardiovascular causes

**Adults:** Initially, 2.5 mg P.O. daily for 1 week, followed by 5 mg P.O. daily for the next 3 weeks, then increased as tolerated to a maintenance dosage of 10 mg P.O. daily. In hypertensive patients and those who've had a recent MI, may divide maintenance dose.

➤ Heart failure after MI

**Adults:** Initially, 2.5 mg P.O. b.i.d.; may decrease to 1.25 mg b.i.d. if higher dosage causes hypotension. Titrate toward target dosage of 5 mg b.i.d. at 3-week intervals.

### Dosage adjustment

- Renal impairment
- Concurrent diuretic use

### Off-label uses

- Angina associated with syndrome X
- Atherosclerosis
- Mitral insufficiency
- Renovascular hypertension
- Diabetic or nondiabetic nephropathy
- Erythrocytosis

### Contraindications

- Hypersensitivity to drug or other ACE inhibitors
- Angioedema with previous ACE inhibitor use or history of hereditary or idiopathic angioedema

### Precautions

Use cautiously in:

- autoimmune diseases, aortic stenosis, hypertrophic cardiomyopathy, cerebrovascular or cardiac insufficiency, collagen vascular disease,

febrile illness, hepatic or renal impairment, hypotension, neutropenia, chronic cough, proteinuria, renal artery stenosis

- risk factors for development of hyperkalemia (including renal insufficiency, diabetes mellitus, concurrent use of potassium-sparing diuretics, potassium supplements, or potassium-containing salt substitutes)
- family history of angioedema
- concurrent immunosuppressant or diuretic therapy
- black patients
- elderly patients
- pregnant patients
- breastfeeding patients (avoid use)
- children (safety not established).

### Administration

- If possible, discontinue diuretics 2 to 3 days before ramipril therapy begins to prevent severe hypotension.
- If patient can't swallow capsule, open it and mix contents in water or apple juice or sprinkle in small amount of applesauce.
- Know that drug may be used alone or with other antihypertensives.

Route	Onset	Peak	Duration
P.O.	1-2 hr	2-4 hr	24 hr

### Adverse reactions

**CNS:** dizziness, light-headedness, fatigue, headache, vertigo, asthenia

**CV:** hypotension, orthostatic hypotension, angina pectoris, tachycardia, **MI, heart failure**

**EENT:** blurred vision, sinusitis

**GI:** nausea, vomiting, diarrhea

**Hematologic:** purpura, **agranulocytosis**

**Metabolic:** hyperkalemia

**Musculoskeletal:** muscle cramps

**Respiratory:** cough, asthma, upper respiratory tract infection, **bronchospasm**

**Skin:** rash, pruritus, urticaria, photosensitivity, **angioedema, anaphylactoid reactions**

**Other:** fever

### Interactions

**Drug-drug.** *Diuretics, other antihypertensives:* increased hypotension

*Gold (sodium aurothiomalate):*

increased risk of rare nitritoid reactions (including facial flushing, nausea, vomiting, and hypotension)

*Lithium:* increased lithium blood level and risk of toxicity

*Nonsteroidal anti-inflammatory drugs:* may result in deterioration of renal function, including acute renal failure and attenuated ACE inhibitor antihypertensive effect

*Potassium-sparing diuretics, potassium supplements:* increased risk of hyperkalemia

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, potassium:* increased levels

**Drug-food.** *Any food:* decreased rate (but not extent) of drug absorption  
*Salt substitutes containing potassium:* increased risk of hyperkalemia

### Patient monitoring

- Assess vital signs and cardiovascular status. Ask patient if he's experiencing angina.
- Monitor CBC and liver function tests.
- Closely monitor potassium level. Watch for signs and symptoms of hyperkalemia.
- Stay alert for signs and symptoms of hypersensitivity reactions (including angioedema), especially in black patients after first dose
- Evaluate for dry, nonproductive cough.

### Patient teaching

- Tell patient he may take with or without food.
- Instruct patient to immediately report swelling of tongue or face or difficulty breathing.
- Teach patient how to monitor and record blood pressure.

- Tell patient drug may cause dry, non-productive cough. Instruct him to report this problem if it becomes bothersome.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Advise patient to move slowly when sitting up or standing, to avoid dizziness from sudden blood pressure decrease.
- Inform patient that excessive fluid loss (as from sweating, vomiting, or diarrhea) and inadequate fluid intake increase risk of light-headedness (especially in hot weather).
- Tell patient to avoid salt substitutes containing potassium.
- Advise female patient to tell prescriber if she is pregnant. Caution her not to take drug during third trimester or when breastfeeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## ranitidine hydrochloride

Acid Reducer<sup>✳</sup>, Apo-Ranitidine<sup>✳</sup>, Co Ranitidine<sup>✳</sup>, Gavilast<sup>⚠</sup>, Histac<sup>⚠</sup>, Raciran<sup>⚠</sup>, Ranitil<sup>⚠</sup>, Rantek<sup>⚠</sup>, Zantac, Zantac 75, Zantac EFFERdose

**Pharmacologic class:** Histamine<sub>2</sub>-receptor antagonist

**Therapeutic class:** Antiulcer drug

**Pregnancy risk category B**

### Action

Reduces gastric acid secretion and increases gastric mucus and bicarbonate

production, creating a protective coating on gastric mucosa

### Availability

**Capsules (liquid-filled):** 150 mg, 300 mg

**Solution for injection:** 25 mg/ml in 2-, 6-, and 40-ml vials

**Solution for injection (pre-mixed):** 50 mg/50 ml in 0.45% sodium chloride

**Syrup:** 15 mg/ml

**Tablets:** 150 mg, 300 mg

**Tablets (effervescent):** 150 mg

### Indications and dosages

➤ Active duodenal ulcer

**Adults:** 150 mg or 10 ml P.O. b.i.d., or 300 mg or 20 ml P.O. daily, or 50 mg I.V. or I.M. q 6 to 8 hours

➤ To maintain healing of duodenal ulcers

**Adults:** 150 mg or 10 ml P.O.

➤ Benign gastric ulcer

**Adults:** 150 mg or 10 ml P.O. b.i.d. For maintenance, 150 mg or 10 ml P.O. or 50 mg I.V. or I.M. q 6 to 8 hours.

➤ Active duodenal and gastric ulcers

**Children ages 1 month to 16 years:** 2 to 4 mg/kg/day P.O., up to a maximum of 300 mg/day

➤ To maintain healing of duodenal and gastric ulcers

**Children ages 1 month to 16 years:** 2 to 4 mg/kg/day P.O., up to a maximum of 150 mg/day

➤ Erosive esophagitis

**Adults:** 150 mg or 10 ml P.O. q.i.d.

**Children ages 1 month to 16 years:** 5 to 10 mg/kg P.O. daily in two divided doses

➤ Gastroesophageal reflux disease

**Adults:** 150 mg or 10 ml P.O. b.i.d.

**Children ages 1 month to 16 years:** 5 to 10 mg/kg P.O. daily in two divided doses

➤ Pathologic hypersecretory conditions, including Zollinger-Ellison syndrome

**Adults:** 150 mg or 10 ml P.O. b.i.d., adjusted according to patient's needs. In severe cases, up to 6 g/day may be

needed. Continue therapy as long as indicated.

➤ Hospitalized patients with pathologic hypersecretory conditions, including Zollinger-Ellison syndrome; intractable duodenal ulcers; patients who can't receive oral drugs

**Adults:** 50 mg I.M. q 6 to 8 hours, or 50 mg intermittent I.V. bolus q 6 to 8 hours, or 50 mg intermittent I.V. infusion q 6 to 8 hours.

**Children ages 1 month to 16 years:** 2 to 4 mg/kg/day I.V. in divided doses q 6 to 8 hours, up to a maximum of 50 mg q 6 to 8 hours

### Dosage adjustment

- Renal or hepatic impairment
- Debilitated patients

### Off-label uses

- Asthma
- GI hemorrhage
- *Helicobacter pylori* infection
- Short-bowel syndrome
- Immunosuppression reversal
- Psoriasis
- Aspiration pneumonitis prophylaxis

### Contraindications

- Hypersensitivity to drug or its components
- Alcohol intolerance (with some oral products)
- History of acute porphyria

### Precautions

Use cautiously in:

- renal or hepatic impairment, heart rhythm disturbances, phenylketonuria (effervescent tablets)
- elderly patients
- pregnant or breastfeeding patients.

### Administration

- For intermittent I.V. bolus injection, dilute in normal saline solution or other compatible solution to a concentration not exceeding 2.5 mg/ml.

Inject no faster than 4 ml/minute (5 minutes).

- For continuous I.V. infusion in patients with Zollinger-Ellison syndrome, add to dextrose 5% in water (D<sub>5</sub>W) or other compatible solution; dilute to a concentration not exceeding 2.5 mg/ml, and start infusion at 1 mg/kg/hour. After 4 hours, if measured gastric acid output exceeds 10 mEq/hour or symptoms occur, increase dosage in increments of 0.5 mg/kg/hour, and remeasure acid output.

- Give P.O. doses with or without food. Give once-daily dose at bedtime.

- For intermittent I.V. infusion, dilute in D<sub>5</sub>W or other compatible solution to a concentration not exceeding 0.5 mg/ml. Infuse no faster than 7 ml/minute (15 to 20 minutes).

- Be aware that premixed Zantac solution of 50 mg in half-normal saline solution (50 ml) doesn't require dilution. Infuse over 15 to 20 minutes.

- Know that I.V. form may be added to total parenteral nutrition solutions.

- Inject I.M. undiluted deep into large muscle.

Route	Onset	Peak	Duration
P.O.	Unknown	1-3 hr	8-12 hr
I.V., I.M.	Unknown	15 min	8-12 hr

### Adverse reactions

**CNS:** headache, agitation, anxiety

**GI:** nausea, vomiting, diarrhea, constipation, abdominal discomfort or pain

**Hematologic:** reversible **granulocytopenia** and **thrombocytopenia**

**Hepatic:** hepatitis

**Skin:** rash

**Other:** pain at I.M. injection site, burning or itching at I.V. site, hypersensitivity reaction

### Interactions

**Drug-drug.** *Antacids:* decreased ranitidine absorption

*Propantheline*: delayed ranitidine absorption and increased peak blood level

**Drug-diagnostic tests.** *Creatinine*: slight elevation

*Hepatic enzymes*: increased levels

*Urine protein tests using Multistix*: false-negative results

**Drug-herbs.** *Yerba maté*: decreased drug clearance

**Drug-behaviors.** *Smoking*: decreased ranitidine effects

### Patient monitoring

- Assess vital signs.
- Monitor CBC and liver function tests.

### Patient teaching

- Tell patient he may take oral drug with or without food. Advise him to take once-daily prescription drug at bedtime.
- Instruct patient to dissolve EFFER-dose in 6 to 8 oz of water before taking.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Tell patient smoking may decrease drug effects.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## ranolazine

Ranexa

**Pharmacologic class:** Piperazine derivative

**Therapeutic class:** Antianginal

**Pregnancy risk category** C

### Action

Unclear. Appears to modulate myocardial metabolism by partially inhibiting

fatty acid oxidation, thereby increasing glucose oxidation and generating more adenosine triphosphate.

### Availability

*Tablets (extended-release)*: 500 mg, 1,000 mg

### Indications and dosages

➤ Chronic angina

**Adults:** Initially, 500 mg P.O. twice daily, increased to maximum recommended dosage of 1,000 mg P.O. twice daily if needed

### Dosage adjustment

- Concurrent use of moderate CYP3A inhibitors, such as diltiazem, verapamil, and erythromycin
- Concurrent use of P-gp inhibitors such as cyclosporine

### Contraindications

- Liver cirrhosis
- Concurrent use of strong CYP3A inhibitors (such as ketoconazole, clarithromycin, nelfinavir)
- Concurrent use of CYP3A inducers (such as rifampin, phenobarbital, St. John's wort)

### Precautions

Use cautiously in:

- concurrent digoxin therapy, QT-interval prolongation, drugs that prolong QT interval, moderate CYP3A inhibitors (including diltiazem, verapamil, aprepitant, erythromycin, fluconazole, grapefruit juice, or grapefruit-containing products)
- patients age 75 and older
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Administer without regard to meals.
- Don't give with grapefruit juice.

Route	Onset	Peak	Duration
P.O.	Unknown	2-5 hr	Unknown

## Adverse reactions

**CNS:** dizziness, headache, vertigo

**CV:** palpitations

**EENT:** tinnitus, dry mouth

**GI:** nausea, vomiting, constipation, abdominal pain

**Respiratory:** dyspnea

**Other:** peripheral edema

## Interactions

**Drug-drug.** *CYP3A inducers such as carbamazepine, phenobarbital, phenytoin, rifabutin, rifampin, rifapentin:* decreased ranolazine plasma concentration

*CYP3A inhibitors such as diltiazem, ketoconazole, macrolide antibiotics, paroxetine, protease inhibitors, verapamil:* increased ranolazine blood level  
*Digoxin, simvastatin:* increased blood levels of these drugs

*P-gp inhibitors (such as cyclosporine):* increased ranolazine exposure

**Drug-food.** *Grapefruit juice and grapefruit-containing products:* increased ranolazine blood level

## Patient monitoring

- Obtain baseline and follow-up ECGs to evaluate drug effects on QT interval.
- Monitor blood pressure regularly in patients with severe renal impairment.

## Patient teaching

- Inform patient that drug can be taken with or without food, but not with grapefruit juice or grapefruit-containing products.
- Advise patient not to chew or crush tablets.
- Instruct patient to consult prescriber before taking other prescription or over-the-counter drugs or herbal products.
- Inform patient that drug isn't intended for acute angina episodes.
- Caution patient to avoid driving and other hazardous activities until drug effects are known.

- Advise female with childbearing potential to tell prescriber if she is pregnant or plans to become pregnant.
- Advise female not to breastfeed during therapy.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and foods mentioned above.

## rasagiline

Azilect

**Pharmacologic class:** MAO inhibitor (type B)

**Therapeutic class:** Antiparkinsonian agent, antidyskinetic

**Pregnancy risk category** C

## Action

Unknown. Thought to increase dopaminergic activity by irreversibly inhibiting MAO type B in nerve cells, increasing dopamine availability to brain cells

## Availability

*Tablets:* 0.5 mg, 1 mg

## Indications and dosages

➤ Initial monotherapy for idiopathic Parkinson's disease

**Adults:** 1 mg P.O. daily

➤ Adjunctive treatment of idiopathic Parkinson's disease in patients receiving levodopa

**Adults:** 0.5 mg P.O. once daily. If patient doesn't achieve sufficient clinical response, dosage may be increased to 1 mg P.O. once daily.

## Dosage adjustment

- Mild hepatic impairment
- Concurrent use of ciprofloxacin and other CYP1A2 inhibitors

## Contraindications

- Within 14 days of other MAO inhibitors or meperidine
- Concurrent use with cyclobenzaprine, dextromethorphan, methadone, propoxyphene, tramadol, and St. John's wort

## Precautions

Use cautiously in:

- mild hepatic impairment (use not recommended in moderate or severe hepatic impairment), melanoma
- concurrent use of levodopa, antidepressants, or CYP1A2 inhibitors (such as ciprofloxacin)
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

## Administration

- Give with or without food.
- 🚫 Don't give tyramine-rich foods, beverages, dietary supplements, or over-the-counter (OTC) cough or cold medications during therapy because of possible hypertensive crisis.
- 🚫 Don't give within 14 days of other MAO inhibitors, meperidine, cyclobenzaprine, dextromethorphan, methadone, propoxyphene, tramadol, or St. John's wort.

Route	Onset	Peak	Duration
P.O.	Unknown	1 hr	Unknown

## Adverse reactions

**CNS:** headache, vertigo, dizziness, agitation, anxiety, somnolence, amnesia, confusion, dystonia, hypertonia, abnormal gait, ataxia, dyskinesia, hyperkinesia, paresthesia, neuropathy, tremor, depression, malaise, abnormal dreams, asthenia, myasthenia, hallucinations, **stroke**

**CV:** orthostatic hypotension, syncope, angina, **bundle-branch block**

**EENT:** conjunctivitis, epistaxis, rhinitis

**GI:** abdominal pain, dyspepsia, indigestion, nausea, vomiting, diarrhea,

constipation, dysphagia, gastroenteritis, dry mouth, gingivitis, anorexia, **GI hemorrhage**

**GU:** hematuria, urinary incontinence, erectile dysfunction, decreased libido

**Hematologic:** leukopenia, anemia, **hemorrhage**

**Musculoskeletal:** arthralgia, arthritis, neck pain, tenosynovitis, bursitis, leg cramps

**Respiratory:** asthma, dyspnea, increased cough

**Skin:** alopecia, skin cancer, rash, sweating, pruritus, skin ulcer, ecchymosis, photosensitivity reaction

**Other:** falls, accidental injury, flulike syndrome, chest pain, fever, infection, hernia, weight loss, allergic reaction

## Interactions

**Drug-drug.** *Antidepressants (selective serotonin reuptake inhibitors, tricyclic and tetracyclic antidepressants):* severe CNS toxicity, high fever, possible death  
*Carbidopa-levodopa, levodopa:* increased incidence of dyskinesia, hallucinations, and orthostatic hypotension

*CYP1A2 inhibitors (including ciprofloxacin):* increased rasagiline blood level and possible increased adverse reactions

*Dextromethorphan:* bizarre behavior  
*Meperidine, methadone, propoxyphene, tramadol:* increased risk of serious and possibly fatal reactions

*Other MAO inhibitors, vitamin supplements containing tyramine:* increased risk of hypertensive crisis

*Sympathomimetics (including amphetamines, cold remedies, nasal decongestants, and weight-loss preparations containing vasoconstrictors):* severe hypertensive reactions

**Drug-diagnostic tests.** *Albumin:* increased value

**Drug-food.** *Tyramine-containing foods (aged, dried, fermented meats; pickled fish; improperly stored meats and fish; broad bean pods; aged cheeses;*

unpasteurized beers; red wines; concentrated yeast extracts; sauerkraut; soybean products): increased risk of hypertensive crisis

**Drug-herbs.** *St. John's wort*: bizarre behavior

**Drug-behaviors.** *Alcohol use*: hypertensive crisis

### Patient monitoring

 Stay alert for hypertensive crisis in patients using concurrent drugs that may cause this serious interaction.

- Be alert for dopaminergic adverse effects and exacerbation of preexisting dyskinesias when rasagiline is used as adjunct to levodopa. Levodopa dosage may need to be reduced.
- Monitor for orthostatic hypotension during first 2 months of therapy, especially when drug is used as adjunct to levodopa.
- Inspect patient frequently for signs of melanoma.
- In patient with hepatic insufficiency, obtain periodic liver function tests.

### Patient teaching

• Tell patient he may take drug with or without food.

 Stress importance of avoiding alcohol and certain foods, beverages, prescription drugs, and OTC preparations during therapy and for 14 days afterward. Ask pharmacist to give patient complete list of foods, beverages, and medications to avoid.

• Instruct patient to avoid using herbs during therapy unless prescriber approves.

 Instruct patient or caregiver to immediately report occipital headache, confusion, palpitations, stiff neck, unexplained nausea or vomiting, sweating, dilated pupils, and visual disturbances (indications of hypertensive crisis).

 Instruct patient to immediately report skin changes.

• Tell patient drug may cause blood pressure to drop if he stands or sits up

suddenly. Advise him to rise slowly and carefully.

- Instruct patient to report hallucinations promptly.
- Caution patient to avoid hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## rasburicase

Elitek, Fasturtek 

**Pharmacologic class:** Recombinant urate oxidase enzyme

**Therapeutic class:** Antimetabolite

**Pregnancy risk category C**

### FDA BOXED WARNING

• Drug may cause severe hypersensitivity reactions (including anaphylaxis), severe hemolysis in patients with G6PD deficiency, and methemoglobinemia. Withdraw immediately and permanently if patient shows evidence of these problems. Before starting therapy, screen patients at higher risk for G6PD deficiency (those of African or Mediterranean ancestry).

• Drug causes spuriously low uric acid levels.

### Action

Catalyzes oxidation of uric acid into an inactive soluble metabolite

### Availability

*Powder for injection:* 1.5 mg/vial

## Indications and dosages

➤ Chemotherapy-induced hyperuricemia in patients with leukemia, lymphoma, or solid-tumor cancers  
**Adults and children:** 0.2 mg/kg by I.V. infusion over 30 minutes as a single daily dose for 5 days. Chemotherapy should begin 4 to 24 hours after first dose.

## Contraindications

- Hypersensitivity to drug or its components
- History of anaphylaxis, hemolytic anemia, or methemoglobinemia as a reaction to rasburicase
- G6PD deficiency

## Precautions

Use cautiously in:

- pregnant or breastfeeding patients
- children younger than age 2.

## Administration

- Know that patients at high risk for G6PD deficiency (those of African or Mediterranean descent) should be screened for this disorder before therapy starts.
- Give 4 to 24 hours before first chemotherapy dose, as ordered.
- Dilute by adding 1-ml vial of diluent provided. Swirl gently; don't shake. Dilute further by injecting diluted dose into infusion bag containing appropriate volume of normal saline solution, to achieve final volume of 50 ml.
- Administer daily by I.V. infusion over 30 minutes.
- ⚠ Don't give as I.V. bolus.
- Don't use I.V. filters.
- Don't mix with other drugs. Use a separate I.V. line, or flush line with 15 ml of normal saline solution before and after infusing rasburicase.
- Know that more than one course of treatment isn't recommended.

Route	Onset	Peak	Duration
I.V.	4 hr	96 hr	Unknown

## Adverse reactions

**CNS:** headache

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain

**Hematologic:** neutropenia, methemoglobinemia, severe hemolysis (in patients with G6PD deficiency)

**Respiratory:** respiratory distress

**Skin:** rash

**Other:** fever, mucositis, hypersensitivity reactions including anaphylaxis, sepsis

## Interactions

**Drug-diagnostic tests.** *Neutrophils:* decreased count

*Uric acid:* interference with measurement (if blood is at room temperature)

## Patient monitoring

- Monitor for signs and symptoms of hypersensitivity reaction.
- Assess for respiratory distress and signs and symptoms of infection.
- Monitor CBC and uric acid level frequently.
- ⚠ Watch closely for signs and symptoms of hemolysis, especially in patients of African or Mediterranean descent.

## Patient teaching

- ⚠ Teach parents and patient (as appropriate) to recognize and immediately report adverse effects, including hypersensitivity reaction.
- ⚠ Tell parents or parents (as appropriate) drug may cause sepsis. Instruct patient or parents to monitor temperature and immediately report fever and other signs and symptoms of infection.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## repaglinide

Gluconorm<sup>®</sup>, NovoNorm<sup>®</sup>, Prandin

**Pharmacologic class:** Meglitinide

**Therapeutic class:** Hypoglycemic

**Pregnancy risk category C**

### Action

Inhibits alpha-glucosidases, enzymes that convert oligosaccharides and disaccharides to glucose. This inhibition lowers blood glucose level, especially in postprandial hyperglycemia.

### Availability

Tablets: 0.5 mg, 1 mg, 2 mg

### Indications and dosages

➤ Adjunct to diet and exercise in type 2 (non-insulin-dependent) diabetes mellitus uncontrolled by diet and exercise alone, or combined with metformin in type 2 diabetes mellitus uncontrolled by diet, exercise, and either repaglinide or metformin alone  
**Adults:** 0.5 to 4 mg P.O. before each meal; may adjust at 1-week intervals based on blood glucose response. Maximum daily dosage is 16 mg.

### Contraindications

- Hypersensitivity to drug or its components
- Diabetic ketoacidosis
- Type 1 (insulin-dependent) diabetes mellitus
- Administration with gemfibrozil

### Precautions

Use cautiously in:

- renal or hepatic impairment; adrenal or pituitary insufficiency; stress caused by infection, fever, trauma, or surgery

- concurrent use of CYP2C8 inhibitors (such as trimethoprim, gemfibrozil, montelukast)
- concurrent use of CYP3A4 inhibitors (such as ketoconazole, itraconazole, erythromycin)
- concurrent use of CYP3A4 or CYP2C8 inducers (such as rifampin, barbiturates, carbamazepine)
- elderly or malnourished patients
- pregnant or breastfeeding patients
- children.

### Administration

- Give 15 to 30 minutes before meals. Administer two, three, or four times daily, if needed, to adapt to patient's meal pattern.

Route	Onset	Peak	Duration
P.O.	Within 30 min	60-90 min	<4 hr

### Adverse reactions

**CNS:** headache, paresthesia

**CV:** angina, chest pain

**EENT:** sinusitis, rhinitis

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia

**GU:** urinary tract infection

**Metabolic:** hyperglycemia, **hypoglycemia**

**Musculoskeletal:** joint pain, back pain

**Respiratory:** upper respiratory infection, bronchitis

**Other:** tooth disorder, hypersensitivity reaction

### Interactions

**Drug-drug.** *Barbiturates, carbamazepine, rifampin:* decreased repaglinide blood level

*Beta-adrenergic blockers, chloramphenicol, MAO inhibitors, nonsteroidal anti-inflammatory drugs, probenecid, sulfonamides, warfarin:* potentiation of repaglinide effects

*Calcium channel blockers, corticosteroids, estrogens, hormonal contraceptives, isoniazid, phenothiazines, phenytoin, nicotinic acid, sympathomimetics,*

*thyroid preparations*: loss of glycemic control

*Clarithromycin*: increased repaglinide area under the curve and  $C_{max}$

*Cyclosporine*: increased repaglinide plasma concentration

*Erythromycin*, *ketoconazole*, *miconazole*: decreased repaglinide metabolism, increased risk of hypoglycemia

*Gemfibrozil*, *itraconazole*: significantly increased repaglinide exposure

*Simvastatin*: increased repaglinide level

**Drug-food.** *Any food*: decreased drug bioavailability

**Drug-herbs.** *Aloe gel (oral)*, *bitter melon*, *chromium*, *coenzyme Q10*, *fenu-greek*, *gymnema sylvestre*, *psyllium*, *St. John's wort*: additive hypoglycemic effects

*Glucosamine*: poor glycemic control

### Patient monitoring

- Monitor blood glucose and glycosylated hemoglobin levels.
- Monitor patient's meal pattern. Consult prescriber about adjusting dosage if patient adds or misses a meal.
- Assess for angina, shortness of breath, or other discomforts.
- Watch for signs and symptoms of bronchitis and upper respiratory, urinary, and EENT infections.

### Patient teaching

- Tell patient to take 15 to 30 minutes before each meal.
- Instruct patient to monitor blood glucose level carefully. Teach him to recognize signs and symptoms of hypoglycemia and hyperglycemia.
- Advise patient to report signs and symptoms of infection.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, foods, and herbs mentioned above.

## reteplase, recombinant

Rapilysin , Retavase

**Pharmacologic class:** Tissue plasminogen activator

**Therapeutic class:** Thrombolytic enzyme

**Pregnancy risk category C**

### Action

Converts plasminogen to plasmin, which in turn breaks down fibrin and fibrinogen, thereby dissolving thrombus

### Availability

*Injection:* Retavase Half-Kit—one vial of 10.4 units (18.1 mg)/vial; Retavase Kit—two vials of 10.4 units (18.1 mg)/vial

### Indications and dosages

 Acute myocardial infarction

**Adults:** 10 units by I.V. bolus over 2 minutes, repeated in 30 minutes

### Off-label uses

- Pulmonary embolism

### Contraindications

- Hypersensitivity to drug or alteplase
- Active internal bleeding
- Bleeding diathesis
- Recent intracranial or intraspinal surgery or trauma
- Intracranial neoplasm
- Arteriovenous malformation or aneurysm
- Severe uncontrolled hypertension
- History of cerebrovascular accident

### Precautions

Use cautiously in:

- previous puncture of noncompressible vessels, major surgery, obstetric delivery, organ biopsy, trauma,

hypertension, conditions that may cause left-sided heart thrombus (including mitral stenosis), acute pericarditis, subacute bacterial endocarditis, hemostatic defects, diabetic hemorrhagic retinopathy, cerebrovascular disease, severe hepatic or renal dysfunction, septic thrombophlebitis or occluded AV cannula at a seriously infected site, other conditions in which bleeding poses a significant hazard

- concurrent use of oral anticoagulants (such as warfarin)
- patients older than age 75
- pregnant or breastfeeding patients.

### Administration

 If patient shows signs or symptoms of bleeding or anaphylaxis after first bolus dose, withhold second bolus and contact prescriber immediately.

- Use only diluent supplied (preservative-free sterile water for injection) to reconstitute drug into colorless solution of 1 unit/ml.
- If drug foams, let it sit until foam subsides.
- Don't use solution if it is discolored or contains visible precipitates.
- Don't give with other drugs in same I.V. line. Know that drug is incompatible with heparin.

Route	Onset	Peak	Duration
I.V.	Immediate	End of infusion	Variable

### Adverse reactions

**CNS:** intracranial hemorrhage

**CV:** arrhythmias, hemorrhage

**GI:** nausea, vomiting, **GI bleeding**

**GU:** hematuria

**Hematologic:** anemia, **bleeding tendency**

**Other:** fever, bleeding at puncture sites

### Interactions

**Drug-drug.** *Anticoagulants, indomethacin, phenylbutazone, platelet aggregation inhibitors (such as abciximab,*

*aspirin, dipyridamole):* increased risk of bleeding

**Drug-diagnostic tests.** *Hemoglobin:* decreased level

*International Normalized Ratio, partial thromboplastin time, prothrombin time:* increased

**Drug-herbs.** *Ginkgo, many other herbs:* increased risk of bleeding

### Patient monitoring

 Check closely for signs and symptoms of bleeding in all body systems. Monitor coagulation studies and CBC.

- Monitor ECG for arrhythmias caused by coronary thrombolysis.
- Assess neurologic status to detect early signs and symptoms of intracranial hemorrhage.

### Patient teaching

- Teach patient about drug's anticoagulant effect. Review safety measures to avoid injury, which can cause uncontrolled bleeding.

 Instruct patient to immediately report signs and symptoms of bleeding problems.

- Tell patient he'll undergo frequent blood testing during therapy.

## ribavirin

Copegus, Rebetol, Ribasphere, Virazole

**Pharmacologic class:** Synthetic nucleoside analog

**Therapeutic class:** Antiviral

**Pregnancy risk category** X

### FDA BOXED WARNING

- Ribavirin monotherapy isn't effective in treating chronic hepatitis C infection

and shouldn't be used alone for this indication.

- Drug's main clinical toxicity is hemolytic anemia, which may worsen cardiac disease and lead to fatal and nonfatal myocardial infarctions. Don't administer to patients with history of significant or unstable cardiac disease.
- Drug is contraindicated in pregnant women and their male partners. Caution female patients and female partners of male patients receiving ribavirin to use extreme care to avoid pregnancy during therapy and for 6 months afterward.

### Action

Unknown. Thought to inhibit RNA and DNA synthesis by depleting nucleotides and blocking replication and maturation of viral cells.

### Availability

*Capsules:* 200 mg

*Powder to be reconstituted for inhalation (Virazole):* 6 g in 100-ml glass vial

*Tablets:* 200 mg

### Indications and dosages

- Chronic hepatitis C infection

*Note:* Dosage calculated solely on basis of patient's weight.

**Adults and children weighing 75 kg (165 lb) or more:** 600 mg P.O. q morning and evening, given with interferon alfa-2b

**Adults weighing less than 75 kg (165 lb) and children weighing more than 61 kg (134 lb):** 400 mg P.O. q morning and 600 mg P.O. q evening, given with interferon alfa-2b

**Children weighing 50 to 61 kg (110 to 134 lb):** 400 mg P.O. b.i.d., given with interferon alfa-2b

**Children weighing 37 to 49 kg (81 to 108 lb):** 200 mg P.O. every morning and 400 mg P.O. every evening, given with interferon alfa-2b

**Children weighing 25 to 36 kg (55 to 79 lb):** 200 mg P.O. b.i.d., given with interferon alfa-2b

- Hospitalized children with severe lower respiratory infection caused by respiratory syncytial virus

**Infants and young children:** 20 mg/ml by inhalation as a starting solution in Viratek Small Particle Aerosol Generator (SPAG-2) for 12 to 18 hours daily for 3 to 7 days. Give by oxygen hood from SPAG-2 unit to infant who isn't mechanically ventilated.

### Dosage adjustment

- Cardiovascular disease
- Chronic obstructive pulmonary disease (COPD)
- Renal impairment
- Hemoglobin below 10 g/dl

### Off-label uses

- Influenza A or B
- Pneumonia caused by adenovirus
- Severe lower respiratory tract infection in adults
- Genital herpes
- Hemorrhagic fever

### Contraindications

- Hypersensitivity to drug or its components
- Autoimmune hepatitis (oral combination therapy)
- Creatinine clearance below 50 ml/minute
- Significant or unstable cardiac disease
- Hemoglobinopathy (such as sickle cell anemia, thalassemia major)
- Females of childbearing age (inhalation form)
- Pregnancy, pregnant partner of male patient (oral drug)
- Breastfeeding

### Precautions

Use cautiously in:

- decompensated hepatic disease, coinfection with hepatitis B or human immunodeficiency virus, COPD

- liver or other transplant recipients
- patients who don't respond to interferon.

### Administration

- ☞ Be aware that oral form must be given with interferon alfa-2b injection.
- Give aerosol by Viratek SPAG-2 only. Don't use other aerosol-generating equipment.
- Dilute powder in sterile water for injection. Don't use solutions with antimicrobial ingredients.
- Know that drug may be given by oral or nasal inhalation.
- Discard solution in SPAG-2 every 24 hours before adding new solution.
- ☞ Avoid prolonged contact with aerosol, which can cause headache or eye irritation.

Route	Onset	Peak	Duration
Oral	Unknown	Unknown	Unknown
Inhalation	Slow	60-90 min	Unknown

### Adverse reactions

**CNS:** fatigue, headache, nervousness, depression, **suicidal ideation**

**CV:** hypotension, bradycardia (with inhalation form), **cardiac arrest**

**EENT:** conjunctivitis, eyelid erythema or rash

**GI:** nausea, dyspepsia, anorexia, **pancreatitis**

**Hematologic:** **reticulocytosis, hemolytic anemia**

**Respiratory:** **bacterial pneumonia, pneumothorax, bronchospasm, pulmonary edema, apnea, worsening respiratory status** (with inhalation form)

**Skin:** rash, pruritus

### Interactions

**Drug-drug.** *Abacavir, didanosine, lamivudine, stavudine, zalcitabine, zidovudine:* potentially fatal lactic acidosis  
*Stavudine, zidovudine:* decreased anti-viral activity

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, bilirubin:* increased levels  
*Hemoglobin:* decreased level  
*Reticulocytes:* increased count

### Patient monitoring

- ☞ Carefully monitor patient's respiratory status. Check ventilator often to ensure that drug precipitates don't impede function.
- ☞ Monitor ECG and vital signs. Watch for hypotension, bradycardia, and other signs of impending cardiac arrest or worsening respiratory condition.
- ☞ Assess neurologic status. Stay alert for depression and suicidal ideation.
- Monitor liver function tests and CBC with white cell differential.

### Patient teaching

- Explain drug delivery system and precautions carefully to patient or to parents of children receiving inhalation form.
- ☞ Tell patient or parents that drug may cause depression or suicidal thoughts, which should be reported immediately.
- ☞ Instruct patient or parents to immediately report new or worsening respiratory symptoms.
- Counsel sexually active patients (both males and females) about appropriate birth control. Tell them to use extreme care to avoid pregnancy. Stress importance of using two forms of effective contraception during and for 6 months after treatment (when using oral ribavirin).
- Advise female patient not to breast-feed.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## rifabutin

Mycobutin

**Pharmacologic class:** Rifamycin derivative

**Therapeutic class:** Antimycobacterial

**Pregnancy risk category B**

### Action

Inhibits RNA synthesis by blocking RNA transcription in susceptible organisms (mycobacteria and some gram-positive and gram-negative bacteria)

### Availability

**Capsules:** 150 mg

### Indications and dosages

➤ To prevent disseminated *Mycobacterium avium intracellulare* complex in patients with advanced human immunodeficiency virus (HIV) infection

**Adults:** 300 mg P.O. daily as a single dose or in two divided doses

### Off-label uses

- Tuberculosis
- Prophylaxis and treatment of *M. avium intracellulare* in children

### Contraindications

- Hypersensitivity to drug
- Active tuberculosis

### Precautions

Use cautiously in:

- severe hepatic disease
- pregnant or breastfeeding patients.

### Administration

- Give in divided doses twice daily with food to reduce GI upset.

Route	Onset	Peak	Duration
P.O.	Unknown	2-3 hr	>24 hr

### Adverse reactions

**CNS:** headache, asthenia, weakness

**CV:** pressure sensation in chest

**EENT:** uveitis; discolored tears, saliva, or sputum

**GI:** nausea, vomiting, diarrhea, dyspepsia, abdominal pain, eructation, flatulence, discolored feces, anorexia

**GU:** discolored urine

**Hematologic:** eosinophilia, **neutropenia, leukopenia, thrombocytopenia**

**Musculoskeletal:** joint pain, myalgia

**Respiratory:** dyspnea

**Skin:** rash, discolored skin or sweat

**Other:** abnormal taste, fever, flulike symptoms

### Interactions

**Drug-drug.** *Clarithromycin, itraconazole, saquinavir:* reduced blood levels and efficacy of these drugs

*Delavirdine:* decreased delavirdine blood level, increased rifabutin blood level

*Drugs metabolized by liver (such as zidovudine):* altered blood levels of these drugs

*Hormonal contraceptives:* decreased contraceptive efficacy

*Indinavir, nelfinavir, ritonavir:* increased rifabutin blood level

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, eosinophils:* increased levels

*Neutrophils, platelets, white blood cells:* decreased counts

**Drug-food.** *High-fat foods:* delayed drug absorption

### Patient monitoring

- Monitor CBC with white cell differential. Watch for signs and symptoms of blood dyscrasias.

- Assess nutritional status.

- Closely monitor vital signs and temperature. Stay alert for dyspnea and flulike symptoms.

## Patient teaching

- Advise patient to take twice daily with food (but not high-fat food) if GI upset occurs. To further minimize GI upset, teach him to eat small, frequent servings of healthy food and drink plenty of fluids.
- Instruct patient to take exactly as prescribed, even after symptoms subside.
- 🔊 Tell patient to immediately report easy bruising or bleeding.
- Tell patient drug may turn tears, urine, and other body fluids reddish or brownish orange. Instruct him not to wear contact lenses during therapy because drug may stain them permanently.
- Inform patient that drug occasionally causes eye inflammation. Instruct him to report symptoms promptly.
- Caution patient to avoid driving and other hazardous activities until effects of drug are known.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## rifampin (rifampicin) ⚠️

Rifadin, Rofact\*

**Pharmacologic class:** Rifamycin derivative

**Therapeutic class:** Antitubercular

**Pregnancy risk category C**

### Action

Inhibits RNA synthesis by blocking RNA transcription in susceptible organisms (mycobacteria and some gram-positive and gram-negative bacteria)

### Availability

**Capsules:** 150 mg, 300 mg

**Powder for injection:** 600 mg/vial

## Indications and dosages

➤ Tuberculosis

**Adults:** 10 mg/kg/day (up to 600 mg/day) P.O. or I.V. infusion as a single dose

**Children:** 10 to 20 mg/kg/day (up to 600 mg/day) P.O. or I.V. infusion as a single dose

➤ Asymptomatic *Neisseria meningitidis* carriers

**Adults:** 600 mg P.O. or I.V. infusion b.i.d. for 2 days

**Children ages 1 month and older:** 10 mg/kg/day P.O. or I.V. infusion (up to 600 mg/day) q 12 hours for 2 days

**Infants younger than 1 month old:** 5 mg/kg P.O. or I.V. infusion q 12 hours for 2 days

### Off-label uses

- *Mycobacterium avium intracellulare* complex infection
- Brucellosis
- *Haemophilus influenzae* type B
- Severe staphylococcal bone and joint infections
- Prosthetic valve endocarditis caused by coagulase-negative staphylococci
- Leprosy
- Prophylaxis in high-risk close contact of patients with *N. meningitidis* infections

### Contraindications

- Hypersensitivity to drug or other rifamycin derivatives

### Precautions

Use cautiously in:

- porphyria
- history of hepatic disease
- concurrent use of other hepatotoxic drugs
- pregnant or breastfeeding patients.

### Administration

• Add 10 ml of sterile water to vial to yield a 60-mg/ml solution for I.V. infusion.

• Further dilute in 100 ml of dextrose 5% in water (D<sub>5</sub>W) and infuse over

30 minutes, or add to 500 ml of D<sub>5</sub>W and infuse over 3 hours.

- Give oral doses with a full glass of water 1 hour before or 2 hours after a meal.
- For an adult who can't swallow capsules or for a young child, mix capsule contents with syrup, shake well, and administer.
- If patient can't receive dextrose, use normal saline solution to dilute. Don't use other I.V. solutions.

Route	Onset	Peak	Duration
P.O.	Rapid	2-4 hr	12-24 hr
I.V.	Rapid	End of infusion	12-24 hr

### Adverse reactions

**CNS:** ataxia, confusion, drowsiness, fatigue, headache, asthenia, psychosis, generalized numbness

**EENT:** conjunctivitis; discolored tears, saliva, and sputum

**GI:** nausea, vomiting, diarrhea, abdominal cramps, dyspepsia, epigastric distress, flatulence, discolored feces, anorexia, sore mouth and tongue, **pseudomembranous colitis**

**GU:** discolored urine

**Hematologic:** eosinophilia, transient leukopenia, hemolytic anemia, hemolysis, disseminated intravascular coagulation (DIC), thrombocytopenia

**Hepatic:** jaundice

**Metabolic:** hyperuricemia

**Musculoskeletal:** myalgia, joint pain

**Respiratory:** dyspnea, wheezing

**Skin:** flushing, rash, pruritus, discolored sweat, **erythema multiforme**, **toxic epidermal necrolysis**, **Stevens-Johnson syndrome**

**Other:** flulike symptoms, hypersensitivity reactions including vasculitis

### Interactions

**Drug-drug.** *Barbiturates, beta-adrenergic blockers, cardiac glycosides, clarithromycin, clofibrate, cyclosporine, dapsone,*

*diazepam, doxycycline, fluoroquinolones (such as ciprofloxacin), haloperidol, levothyroxine, methadone, progestins, quinine, tacrolimus, theophylline, tricyclic antidepressants, zidovudine:* increased metabolism of these drugs  
*Chloramphenicol, corticosteroids, disopyramide, efavirenz, estrogens, fluconazole, hormonal contraceptives, itraconazole, ketoconazole, nevirapine, quinidine, opioid analgesics, oral hypoglycemics, phenytoin, quinidine, ritonavir, theophylline, tocainide, verapamil, warfarin:* decreased efficacy of these drugs  
*Delavirdine, indinavir, nelfinavir, saquinavir:* decreased blood levels of these drugs

*Hepatotoxic drugs (including isoniazid, ketoconazole, pyrazinamide):* increased risk of hepatotoxicity

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, uric acid:* increased levels  
*Dexamethasone suppression test:* interference with results

*Direct Coombs' test:* false-positive result

*Folate, vitamin B<sub>12</sub> assay:* interference with standard assays

*Hemoglobin:* decreased value

*Liver function tests:* abnormal values (transient)

*Sulfobromophthalein uptake and excretion test:* delayed hepatic uptake and excretion

**Drug-behaviors.** *Alcohol use:* increased risk of hepatotoxicity

### Patient monitoring

- Monitor kidney and liver function tests, CBC, and uric acid level.

🚨 Watch for signs and symptoms of bleeding tendency, especially DIC.

- Assess for signs and symptoms of hepatic impairment.

- Monitor bowel movements for diarrhea, which may signal pseudomembranous colitis.

## Patient teaching

- Advise patient to take oral dose 1 hour before or 2 hours after meals. If drug causes significant GI upset, instruct him to take it with meals. To further minimize GI upset, teach him to eat small, frequent servings of food and drink plenty of fluids.
- 📣 Instruct patient to immediately report easy bruising or bleeding, fever, malaise, appetite loss, nausea, vomiting, or yellowing of skin or eyes.
- Tell patient drug may color his tears, urine, and other body fluids reddish or brownish orange. Instruct him not to wear contact lenses during therapy, because drug may stain them permanently.
- Instruct patient not to drink alcohol.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## rifapentine

Priftin

**Pharmacologic class:** Rifamycin derivative

**Therapeutic class:** Antitubercular

**Pregnancy risk category C**

### Action

Inhibits RNA synthesis by blocking RNA transcription in susceptible organisms (mycobacteria and some gram-positive and gram-negative bacteria)

### Availability

Tablets: 150 mg

## Indications and dosages

➤ Pulmonary tuberculosis (TB)

**Adults:** *Intensive-phase treatment*—600 mg P.O. twice weekly for 2 months, with doses spaced 72 hours apart; must be given with at least one other antitubercular. *Continuation-phase treatment*—600 mg P.O. once weekly for 4 months, given with another antitubercular.

### Off-label uses

• *Mycobacterium avium intracellulare* complex infection

### Contraindications

• Hypersensitivity to drug or other rifamycin derivatives

### Precautions

Use cautiously in:

- hepatic disorders, porphyria
- concurrent protease inhibitor therapy for human immunodeficiency virus infection
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 12.

### Administration

- Know that drug is given with at least one other antitubercular.
- Expect to give drug with pyridoxine to adolescents, malnourished patients, and patients at risk for neuropathy.

Route	Onset	Peak	Duration
P.O.	Slow	5-6 hr	17-18 hr

### Adverse reactions

**CNS:** headache, fatigue, anxiety, dizziness, aggressive behavior

**CV:** hypertension, peripheral edema

**EENT:** visual disturbances; discolored tears, sputum, and saliva

**GI:** nausea, vomiting, diarrhea, dyspepsia, esophagitis, gastritis, discolored feces, anorexia, **pancreatitis**

**GU:** hematuria, pyuria, proteinuria, urinary casts, discolored urine

**Hematologic:** anemia, thrombocytosis, hematoma, purpura, eosinophilia, **neutropenia, leukopenia**

**Hepatic:** hepatitis

**Metabolic:** hyperuricemia, hypovolemia, **hyperkalemia**

**Musculoskeletal:** gout, arthritis, joint pain

**Skin:** rash, pruritus, acne, urticaria, discolored skin and sweat

**Other:** edema

## Interactions

**Drug-drug.** *Amitriptyline, anticoagulants, barbiturates, beta-adrenergic blockers, chloramphenicol, clofibrate, corticosteroids, cyclosporine, dapsone, delavirdine, diazepam, digoxin, diltiazem, disopyramide, doxycycline, fentanyl, fluconazole, fluoroquinolones, haloperidol, hormonal contraceptives, indinavir, itraconazole, ketoconazole, methadone, mexiletine, nelfinavir, nifedipine, nortriptyline, oral hypoglycemics, phenothiazines, progestin, quinidine, quinine, ritonavir, saquinavir, sildenafil, tacrolimus, theophylline, thyroid preparations, tocainide, verapamil, warfarin, zidovudine:* decreased actions of these drugs

*Antiretroviral drugs:* decreased efficacy of these drugs

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, eosinophils, lactate dehydrogenase, potassium, uric acid:* increased levels

*Folate, vitamin B<sub>12</sub> assays:* interference with standard assays

*Hemoglobin, neutrophils, platelets, white blood cells:* decreased values

## Patient monitoring

- Monitor CBC, uric acid level, and liver function tests. Watch for signs and symptoms of blood dyscrasias and hepatitis.
- Assess vital signs and fluid intake and output. Stay alert for hypertension and edema.
- Closely monitor nutritional status and hydration.

## Patient teaching

 Instruct patient to immediately report fever, malaise, appetite loss, nausea, vomiting, or yellowing of skin or eyes.

- Emphasize importance of taking with companion drugs, as prescribed, to prevent growth of resistant TB strains.

- Tell patient drug may color tears, urine, and other body fluids reddish or brownish orange. Instruct him not to wear contact lenses during therapy, because drug may stain them permanently.

- Advise patient to take with meals and to minimize GI upset by eating small, frequent servings of healthy food and drinking plenty of fluids.

- Tell patient to monitor his weight and report sudden gains. Also tell him to report swelling.

 Instruct patient to immediately report rash or unusual bleeding or bruising.

 Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, vision, and alertness.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## rifiximin

Xifaxan

**Pharmacologic class:** Rifampin-related antibiotic

**Therapeutic class:** Anti-infective

**Pregnancy risk category C**

**Action**

Binds to beta-subunit of bacterial DNA-dependent RNA polymerase, inhibiting bacterial RNA synthesis

**Availability**

Tablets: 200 mg, 550 mg

**Indications and dosages**

➤ Travelers' diarrhea caused by non-invasive strains of *Escherichia coli*

**Adults and children age 12 and older:**

200 mg P.O. three times daily for 3 days

➤ Reduction of risk of overt hepatic encephalopathy recurrence

**Adults:** 550 mg P.O. b.i.d.

**Off-label uses**

- Hepatic encephalopathy

**Contraindications**

- Hypersensitivity to drug, its components, or rifamycin anti-infectives

**Precautions**

Use cautiously in:

- elderly patients
- pregnant or breastfeeding patients
- children (safety and efficacy not established in those younger than age 12).

**Administration**

- Administer with or without food.
- Don't give to patients with diarrhea complicated by fever or blood in stool or to patients with suspected *Campylobacter jejuni*, *Shigella*, or *Salmonella* infection.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

**Adverse reactions**

**CNS:** headache

**GI:** nausea, vomiting, constipation, flatulence, abdominal pain, rectal tenesmus, defecation urgency, **pseudomembranous colitis**

**Other:** pyrexia, overgrowth of susceptible organisms

**Interactions**

None

**Patient monitoring**

- Monitor for fever, blood in stools, and worsening of diarrhea.
- Monitor patient's fluid and electrolyte status.
- Monitor for new infections; if needed, consider alternative therapy.

**Patient teaching**

- Tell patient drug can be taken with or without food.
- 🔊 Advise patient to stop drug and notify prescriber if diarrhea symptoms worsen or last beyond 48 hours.
- As appropriate, review all other significant or life-threatening adverse reactions.

**riluzole**

Rilutek

**Pharmacologic class:** Glutamate antagonist

**Therapeutic class:** Amyotrophic lateral sclerosis (ALS) agent

**Pregnancy risk category C**

**Action**

Unknown. Thought to inhibit amino acid accumulation on motor neurons of CNS, improving nerve impulse transmission.

**Availability**

Tablets: 50 mg

**Indications and dosages**

➤ ALS

**Adults:** 50 mg P.O. q 12 hours

**Off-label uses**

- Cervical dystonia
- Huntington's disease

**Contraindications**

- Hypersensitivity to drug or its components

**Precautions**

Use cautiously in:

- hepatic or renal insufficiency, neutropenia, febrile illness
- elderly patients
- female patients and Japanese patients (may have decreased metabolic capacity to eliminate drug)
- pregnant or breastfeeding patients
- children.

**Administration**

- Give at least 1 hour before or 2 hours after a meal to maximize absorption.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

**Adverse reactions**

**CNS:** headache, dizziness, drowsiness, asthenia, hypertonia, depression, insomnia, malaise, vertigo, circumoral paresthesia

**CV:** hypertension, orthostatic hypotension, tachycardia, palpitations, peripheral edema, phlebitis, **cardiac arrest**

**EENT:** rhinitis, sinusitis, oral candidiasis

**GI:** nausea, vomiting, diarrhea, abdominal pain, dyspepsia, flatulence, stomatitis, dry mouth, anorexia

**GU:** urinary tract infection, dysuria

**Hematologic:** **neutropenia**

**Musculoskeletal:** back pain, joint pain

**Respiratory:** decreased lung function, increased cough, pneumonia

**Skin:** pruritus, eczema, alopecia, exfoliative dermatitis

**Other:** tooth disorders, weight loss

**Interactions**

**Drug-drug.** *Allopurinol, methyl dopa, sulfasalazine:* increased risk of hepatotoxicity

*CYP450-1A2 inducers (such as omeprazole, rifampin):* increased riluzole elimination

*CYP450-1A2 inhibitors (such as amitriptyline, phenacetin, quinolones, theophylline):* decreased riluzole elimination  
**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, bilirubin, gamma-glutamyltransferase:* increased levels

**Drug-food.** *High-fat foods:* decreased riluzole absorption

**Drug-behaviors.** *Alcohol use:* increased risk of hepatotoxicity

**Patient monitoring**

- Monitor liver function tests and CBC.
- Assess vital signs and cardiovascular status, particularly for hypertension, orthostatic hypotension, and peripheral edema.
- Closely monitor respiratory status for decreased lung function and pneumonia.
- Monitor weight, nutritional status, and hydration.
- Closely monitor females and patients of Japanese origin, who are at increased risk for adverse reactions.

**Patient teaching**

- Tell patient to take 1 hour before or 2 hours after a meal, at same time each day.
- Instruct patient to take his temperature regularly and report fever.
-  Teach patient to immediately report arm or leg swelling, difficulty breathing, and other signs of decreased lung function.
- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- Caution patient to avoid high-fat foods and alcohol.
- Instruct patient to move slowly when sitting up or standing, to avoid dizziness from sudden blood pressure decrease.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

## rimantadine hydrochloride

Flumadine

**Pharmacologic class:** Miscellaneous and anticholinergic-like agent

**Therapeutic class:** Antiviral

**Pregnancy risk category C**

### Action

Prevents nucleic acid uncoating during viral cell replication, preventing penetration in host. Also causes dopamine release from neurons.

### Availability

*Syrup:* 50 mg/5 ml

*Tablets:* 100 mg

### Indications and dosages

➤ Treatment of influenza type A

**Adults:** 100 mg P.O. b.i.d.

➤ Prophylaxis of influenza type A

**Adults and children older than age 10:** 100 mg P.O. b.i.d.

**Children younger than age 10:** 5 mg/kg P.O. daily. Maximum dosage is 150 mg daily.

### Dosage adjustment

- Renal or hepatic disease
- Seizure disorders
- Elderly patients

### Off-label uses

- Parkinson's disease

### Contraindications

- Hypersensitivity to drug or amantadine

### Precautions

Use cautiously in:

- history of seizures or renal or hepatic disease
- pregnant or breastfeeding patients
- children younger than age 1.

### Administration

- Give several hours before bedtime.
- Start therapy within 48 hours of symptom onset and continue for at least 1 week.

Route	Onset	Peak	Duration
P.O.	Slow	6 hr	Unknown

### Adverse reactions

**CNS:** headache, dizziness, fatigue, depression, insomnia, poor concentration, asthenia, nervousness

**CV:** hypotension

**EENT:** tinnitus

**GI:** nausea, vomiting, diarrhea, abdominal pain, dyspepsia, dry mouth, anorexia

**Respiratory:** dyspnea

**Skin:** rash

### Interactions

**Drug-drug.** *Acetaminophen, aspirin:* decreased rimantadine peak blood level  
*Cimetidine:* increased rimantadine blood level

### Patient monitoring

- Assess patient's flu symptoms. Notify prescriber if symptoms don't improve within 2 to 3 days.
- Monitor vital signs; watch for hypotension.
- Closely monitor nutritional status and hydration.

### Patient teaching

- Advise patient to take several hours before bedtime.
- If patient's taking syrup, tell him to use specially marked oral syringe or measuring device to ensure accurate dose.
- Instruct patient to contact prescriber if symptoms don't improve within 2 to 3 days.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, motor function, and alertness.

- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

## risedronate sodium

Actonel, Atelvia

**Pharmacologic class:** Bisphosphonate

**Therapeutic class:** Calcium regulator

**Pregnancy risk category C**

### Action

Inhibits osteoclast-mediated bone resorption. Also exerts antiresorptive effect, probably by directly inhibiting mature osteoclast activity or indirectly inhibiting osteoblasts.

### Availability

Tablets: 5 mg, 30 mg, 35 mg, 150 mg

Tablets (delayed-release): 35 mg

### Indications and dosages

➤ Prevention of postmenopausal osteoporosis

**Adults:** 5 mg P.O. daily or 35 mg P.O. weekly (immediate-release)

➤ Treatment of postmenopausal osteoporosis

**Adults:** 5 mg P.O. daily, or 35 mg P.O. weekly, or 150 mg P.O. monthly (immediate-release). Or, 35 mg P.O. weekly (delayed-release).

➤ Osteoporosis in men

**Adults:** 35 mg (immediate-release) P.O. weekly

➤ Glucocorticoid-induced osteoporosis

**Adults:** 5 mg (immediate-release) P.O. daily

➤ Paget's disease

**Adults:** 30 mg (immediate-release) P.O. daily for 2 months. If indicated, may retreat with same dosage after

post-treatment observation period of at least 2 months.

### Off-label uses

- Hypercalcemia of malignancy
- Primary hyperparathyroidism

### Contraindications

- Hypersensitivity to drug, its components, or other bisphosphonates
- Hypocalcemia
- Inability to stand or sit upright for at least 30 minutes
- Esophageal abnormalities that delay esophageal emptying, such as stricture or achalasia

### Precautions

Use cautiously in:

- hypotension, upper GI disorders, difficulty swallowing
- severe renal impairment with creatinine clearance less than 30 ml/minute (not recommended)
- pregnant or breastfeeding patients
- children (use not indicated)

### Administration

- Be aware that hypocalcemia and other disturbances of bone and mineral metabolism should be effectively treated before starting drug.
- Give immediate-release tablets with 6 to 8 oz of water 30 minutes before first food or beverage of day (other than water).
- Give delayed-release tablets in the morning immediately after breakfast with at least 4 oz of plain water.
- 📢 Make sure patient stays upright for at least 30 minutes after taking.
- Be aware that patient with poor dietary intake may need calcium and vitamin D supplements.
- Give calcium, magnesium, or aluminum supplements or antacids at different time of day so they don't interfere with risedronate absorption.

Route	Onset	Peak	Duration
P.O.	Rapid	1 hr	Unknown
P.O. (delayed)	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache, anxiety, depression, dizziness, vertigo, syncope, asthenia

**CV:** hypertension, vasodilation, angina, chest pain, cardiovascular disorder, peripheral edema

**EENT:** cataract, conjunctivitis, dry eyes, otitis media, rhinitis, sinusitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, flatulence, gastroenteritis, colitis, esophageal irritation, dry mouth, anorexia, **esophageal stricture or perforation (rare)**

**GU:** urinary tract infection

**Hematologic:** anemia

**Musculoskeletal:** bone, back, or joint pain; bone fracture; bursitis; myalgia; arthritis; leg and muscle cramps; jaw osteonecrosis

**Respiratory:** crackles, cough, bronchitis, pneumonia

**Skin:** rash, pruritus, ecchymosis, **skin cancer**

**Other:** accidental injury, infection, neck pain, flulike symptoms, allergic reactions, **neoplasm**, hypersensitivity reactions **including angioedema (rare)**

### Interactions

**Drug-drug.** *Antacids, aspirin, calcium- or magnesium-based supplements or laxatives, iron preparations:* decreased risedronate absorption

*Nonsteroidal anti-inflammatory drugs, salicylates:* increased GI irritation

**Drug-diagnostic tests.** *Bone-imaging diagnostic agents:* interference with test agents

*Calcium, phosphorus:* decreased levels

**Drug-food.** *Any food:* decreased drug absorption

### Patient monitoring

- Watch for difficulty swallowing and signs and symptoms of esophageal irritation. Discontinue drug if new or worsening symptoms occur.

- Assess skin for unusual findings that may indicate skin cancer.

- Monitor patient for severe bone, joint, or muscle pain; consider discontinuing drug if symptoms are severe

### Patient teaching

- Advise patient to read patient information insert before starting therapy.

-  Stress importance of taking immediate-release tablets with a full glass (6 to 8 oz) of water at least 30 minutes before first food or drink of day and delayed-release tablets in the morning immediately after breakfast with at least 4 oz of plain water. Tell patient to stay upright for at least 30 minutes afterward.

-  Instruct patient to stop drug and notify prescriber if difficulty or pain on swallowing, midline chest pain, or severe, persistent heartburn occurs.

- Tell patient that chewing or sucking tablet may cause mouth irritation.

- Tell patient to report signs and symptoms of colitis.

- Advise patient taking calcium-, magnesium-, or aluminum-based supplements or antacids to take them at least 2 hours after risedronate.

- Advise patient to promptly report leg cramps or bone, joint, or jaw pain.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## risperidone

Novo-Risperidone<sup>✳</sup>, PHL-Risperidone<sup>✳</sup>, PMS-Risperidone<sup>✳</sup>, Ran-Risperidone<sup>✳</sup>, Ratio-Risperidone<sup>✳</sup>, Risperdal, Risperdal Consta, Risperdal M-Tab, Riva-Risperidone<sup>✳</sup>, Sandoz Risperidone<sup>✳</sup>

**Pharmacologic class:** Benzisoxazole derivative

**Therapeutic class:** Antipsychotic

**Pregnancy risk category C**

### FDA BOXED WARNING

• Elderly patients with dementia-related psychosis are at increased risk for death. Over course of 10-week controlled trial, death rate in drug-treated patients was about 4.5%, compared to about 2.6% in placebo group. Although causes of death varied, most appeared to be cardiovascular or infectious. Don't give drug to patients with dementia-related psychosis.

### Action

Antagonizes serotonin<sub>2</sub> and dopamine<sub>2</sub> receptors in CNS. Also binds to alpha<sub>1</sub>- and alpha<sub>2</sub>-adrenergic receptors and histamine H<sub>1</sub> receptors.

### Availability

*Oral solution:* 1 mg/ml in 30-ml bottles

*Powder for injection (extended-release microspheres):* 12.5 mg, 25-mg, 37.5-mg, 50-mg vials in dose pack with diluent in prefilled syringes

*Tablets:* 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg

*Tablets (orally disintegrating):* 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg

### Indications and dosages

➤ Schizophrenia

**Adults:** Initially, 2 mg P.O. daily (as once daily or 1 mg b.i.d.). May increase dosage at 24-hour intervals or more in increments of 1 to 2 mg per day, as tolerated, to recommended dosage of 4 to 8 mg/day. In some patients, slower titration may be appropriate. Efficacy has been demonstrated with a range of 4 to 16 mg/day. However, dosages above 6 mg/day for b.i.d. dosing weren't demonstrated to be more efficacious than lower dosages, were associated with more extrapyramidal symptoms and other adverse effects, and generally aren't recommended. Or, 25 mg deep I.M. q 2 weeks; some patients may benefit from a higher dosage (37.5 or 50 mg). Maximum dosage is 50 mg I.M. q 2 weeks. Efficacy hasn't been evaluated for longer than 12 weeks.

**Adolescents ages 13 to 17:** 0.5 mg P.O. as single daily dose in morning or evening. Dosage adjustments, if indicated, should occur at intervals of not less than 24 hours, in increments of 0.5 or 1 mg/day, as tolerated, to recommended dosage of 3 mg/day.

➤ Short-term management of acute manic or mixed episodes associated with bipolar 1 disorder as monotherapy or as adjunct to lithium or valproate

**Adults:** Initially, 2 to 3 mg/day P.O. May adjust in increments or decrements of 1 mg/day at 24-hour intervals. Range is 1 to 6 mg/day. Or, 25 mg I.M. q 2 weeks; some patients may benefit from higher dosage (37.5 or 50 mg). Make upward adjustments no more frequently than q 4 weeks. Maximum dosage is 50 mg I.M. q 2 weeks.

➤ Short-term management of bipolar 1 disorder as monotherapy

**Children and adolescents ages 10 to 17:** 0.5 mg P.O. daily as a single daily dose in the morning or evening. May adjust in increments or decrements of 0.5 to 1 mg/day at 24-hour intervals as tolerated, to recommended target

dose of 1 to 2.5 mg/day. Range is 1 to 6 mg/day.

➤ Irritability due to autistic disorder

#### Children and adolescents ages 5 to 17:

Initially, 0.25 mg P.O. (Risperdal) daily for patients weighing less than 20 kg (44 lb) and 0.5 mg/day for patients weighing 20 kg or more. After minimum of 4 days, increase as needed to recommended dosage of 0.5 mg/day for patients weighing less than 20 kg and 1 mg/day for patients weighing 20 kg or more. Maintain this dosage for minimum of 14 days. If sufficient clinical response not achieved, consider dosage increases at 2-week or more intervals in increments of 0.25 mg/day for patients weighing less than 20 kg or 0.5 mg/day for patients weighing 20 kg or more. Effective dosage range is 0.5 to 3 mg/day. Once sufficient clinical response has been achieved and maintained, consider gradually lowering dosage to achieve optimal balance of efficacy and safety.

#### Dosage adjustment

- Mild to moderate hepatic or renal impairment (appropriate oral dosage titration should occur before initiation of I.M. dosing)
- Severe hepatic or renal impairment (with oral use)
- Elderly or debilitated patients
- Concurrent use of enzyme inducers (such as carbamazepine, phenobarbital, phenytoin, rifampin), fluoxetine, or paroxetine

#### Off-label uses

- Tourette syndrome

#### Contraindications

- Hypersensitivity to drug

#### Precautions

Use cautiously in:

- renal or hepatic impairment, cardiovascular disease, prolonged QT interval, dysphagia, hyperprolactinemia,

hypothermia or hyperthermia, Parkinson's disease, phenylketonuria, tardive dyskinesia, metabolic changes that may increase cardiovascular or cerebrovascular risk (such as hyperglycemia, dyslipidemia, weight gain), previous diagnosis of breast cancer or prolactin-dependent tumors

- history of seizures, drug abuse, or suicide attempt
- elderly or debilitated patients
- pregnant patients
- breastfeeding patients (use not recommended)
- children (safety not established for Risperdal Consta, Risperdal M-Tab, and Risperdal in children weighing less than 33 lb [15 kg]), children younger than age 5 with autistic disorder, younger than age 10 with bipolar disorder, or younger than age 13 with schizophrenia (Risperdal).

#### Administration

- Record baseline blood pressure before starting therapy.
- ⚠ Do not give powder for injection I.V.
- Be aware that oral drug tolerability should be established before starting I.M. therapy in patients who have never taken oral risperidone.
- Be aware that oral risperidone (or another antipsychotic) should be given with the first I.M. injection and continued for 3 weeks (then discontinued) to ensure that adequate therapeutic plasma concentrations are maintained before the main release phase of long-acting risperidone injection.
- When reconstituting powder for injection, use only the diluent and needle supplied.
- Shake vial vigorously for a minimum of 10 seconds to ensure homogeneous suspension. When properly mixed, the suspension appears uniform, thick, and milky with visible particles.
- If 2 minutes elapse before giving injection, shake vial vigorously before

administering. Give injection within 6 hours of reconstitution.

- Don't combine two different dose strengths of I.M. drug in a single administration.
- For I.M. use, inject deep into buttock; rotate injection sites between buttocks.
- Be aware that children and adolescents experiencing persistent somnolence may benefit from once-daily Risperdal dose administered at bedtime, from administering half daily dose twice daily, or from reduction of dose.

Route	Onset	Peak	Duration
P.O.	1-2 wk	Unknown	Up to 6 wk
I.M.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** tremor, parkinsonism, aggressive behavior, dizziness, drowsiness, extrapyramidal reactions, headache, increased dreams, longer sleep periods, insomnia, sedation, fatigue, nervousness, agitation, anxiety, tardive dyskinesia, hyperkinesia, akathisia, **transient ischemic attack (TIA), cerebrovascular accident (CVA), neuroleptic malignant syndrome, suicide**

**CV:** orthostatic hypotension, chest pain, tachycardia, **arrhythmias**

**EENT:** vision disturbances, rhinitis, sinusitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, dry mouth, increased salivation, anorexia, dysphagia

**GU:** difficulty urinating, polyuria, galactorrhea, dysmenorrhea, menorrhagia, decreased libido

**Hematologic:** leukopenia, neutropenia, **agranulocytosis**

**Metabolic:** dyslipidemia, hyperprolactinemia, hyperglycemia, worsening of diabetes mellitus

**Musculoskeletal:** joint or back pain

**Respiratory:** cough, dyspnea, upper respiratory tract infection

**Skin:** pruritus, diaphoresis, rash, dry skin, seborrhea, increased pigmentation, photosensitivity

**Other:** toothache, fever, impaired temperature regulation, weight changes

### Interactions

**Drug-drug.** *Antihistamines, opioids, sedative-hypnotics:* additive CNS depression

*Carbamazepine:* increased metabolism and decreased efficacy of risperidone

*Clozapine:* decreased metabolism and increased effects of risperidone

*Levodopa, other dopamine agonists:* decreased antiparkinsonian effects of these drugs

**Drug-diagnostic tests.** *Blood glucose, prolactin:* increased levels

*Granulocytes, leukocytes, neutrophils:* decreased counts

**Drug-behaviors.** *Alcohol use:* increased CNS depression

*Sun exposure:* increased risk of photosensitivity

### Patient monitoring

🚨 Closely monitor neurologic status, especially for mood changes or suicidal ideation, neuroleptic malignant syndrome (high fever, sweating, unstable blood pressure, stupor, muscle rigidity, and autonomic dysfunction), extrapyramidal reactions, TIA, CVA, and tardive dyskinesia.

🚨 Closely monitor CBC with differential, especially during first few months of therapy; discontinue drug if severe neutropenia occurs.

- Monitor blood pressure, particularly for orthostatic hypotension.

- Assess body temperature. Check for fever and other signs and symptoms of infection.

- Monitor patient with diabetes mellitus for worsening of glucose control. Patients with risk factors for diabetes mellitus who are starting treatment with risperidone should undergo fasting blood glucose testing at the

beginning of and periodically during treatment. Monitor all patients receiving drug for signs and symptoms of hyperglycemia, including polydipsia, polyuria, polyphagia, and weakness. Also watch for other metabolic changes such as dyslipidemia or significant weight gain.

- Reassess patients periodically to determine need for maintenance treatment.

### Patient teaching

- Instruct patient to remove orally disintegrating tablet from blister pack, place on tongue immediately, and swallow as tablet dissolves.
- Tell patient to mix oral solution with water, coffee, orange juice, or low-fat milk. Tell him solution isn't compatible with cola or tea.
- Advise patient to use effective bedtime routine to avoid sleep disorders.
-  Teach patient to recognize and immediately report signs and symptoms of serious adverse reactions, mood changes or suicidal ideation, including tardive dyskinesia, and neuroleptic malignant syndrome.
- Instruct patient to move slowly when sitting up or standing, to avoid dizziness from sudden blood pressure decrease.
- Tell patient that excessive fluid loss (as from sweating, vomiting, or diarrhea) and inadequate fluid intake increase risk of light-headedness (especially in hot weather).
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Advise female patient to tell prescriber if she is or plans to become pregnant. Caution her not to breast-feed during therapy.
- Advise patient not to drink alcohol.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially

those related to the drugs and behaviors mentioned above.

## ritonavir

Norvir

**Pharmacologic class:** Protease inhibitor

**Therapeutic class:** Antiretroviral

**Pregnancy risk category B**

### FDA BOXED WARNING

- Coadministration with certain nonsedating antihistamines, sedative hypnotics, antiarrhythmics, or ergot alkaloids may cause potentially serious or life-threatening adverse events.

### Action

Inhibits human immunodeficiency virus (HIV) nonnucleoside reverse transcriptase by binding directly to reverse transcriptase and blocking RNA-dependent and DNA-dependent polymerase activity

### Availability

*Capsules:* 100 mg

*Oral solution:* 80 mg/ml

*Tablets:* 100 mg

### Indications and dosages

➤ HIV in combination with other antiretrovirals

**Adults:** Initially, 300 mg P.O. b.i.d.; increase by 100 mg b.i.d. q 2 to 3 days, up to a usual maintenance dosage of 600 mg b.i.d.

**Children age 1 month and older:** 350 to 400 mg/m<sup>2</sup> P.O. b.i.d., not to exceed 600 mg b.i.d. Start with 250 mg/m<sup>2</sup> P.O. b.i.d.; increase by 50 mg/m<sup>2</sup> P.O. b.i.d. q 2 to 3 days, up to a usual maintenance dosage of 400 mg P.O. b.i.d. If patient doesn't tolerate 400 mg/m<sup>2</sup>

b.i.d. due to adverse reactions, the highest tolerated dose may be used for maintenance therapy, or alternative therapy should be considered.

**Children ages 2 and older:** 400 mg/m<sup>2</sup> b.i.d., not to exceed 600 mg b.i.d. Start with 250 mg/m<sup>2</sup> to minimize nausea.

### Dosage adjustment

- Concurrent use of other protease inhibitors

### Off-label uses

- Chronic hepatitis B

### Contraindications

- Hypersensitivity to drug or its components
- Concurrent use of alfuzosin, amiodarone, cisapride, dihydroergotamine, ergonovine, ergotamine, flecainide, lovastatin, methylegonovine, oral midazolam, pimozone, propafenone, quinidine, sildenafil (Revatio, when used for pulmonary arterial hypotension), simvastatin, triazolam, voriconazole, or St. John's wort

### Precautions

Use cautiously in:

- hepatic disease, diabetes mellitus, hemophilia types A and B
- underlying structural heart disease, preexisting conduction system abnormalities, ischemic heart disease, cardiomyopathies
- concurrent use with drugs that prolong PR interval (including calcium channel blockers, beta-adrenergic blockers, digoxin, atazanavir)
- concurrent use with drugs for erectile dysfunction (such as sildenafil, tadalafil, vardenafil)
- concurrent use with fluticasone, atorvastatin, lovastatin, simvastatin, and St. John's wort (use not recommended)
- pregnant or breastfeeding patients.

### Administration

- Give with meals to increase absorption.
- Mix oral solution with chocolate milk or liquid nutritional supplement to mask taste.
- Know that drug is usually given with other antiretrovirals.

 Don't give concurrently with amiodarone, astemizole, bepridil, cisapride, dihydroergotamine, ergonovine, ergotamine, flecainide, methylegonovine, midazolam, pimozone, propafenone, quinidine, terfenadine, or triazolam. Serious interactions may occur.

Route	Onset	Peak	Duration
P.O.	Rapid	2-4 hr	Unknown

### Adverse reactions

**CNS:** headache, dizziness, depression, insomnia, drowsiness, asthenia, paresthesia, syncope, malaise

**CV:** vasodilation, **prolonged PR interval**

**EENT:** pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, flatulence, abdominal pain, anorexia, **pancreatitis**

**Musculoskeletal:** myalgia

**Skin:** diaphoresis, mild skin eruptions, **Stevens-Johnson syndrome (rare)**

**Respiratory:** bronchospasm

**Other:** abnormal taste, fever, pain, allergic reactions including **anaphylaxis (rare)**, **immune reconstitution syndrome**

### Interactions

**Drug-drug.** *Amiodarone, bepridil, cisapride, flecainide, midazolam, pimozone, propafenone, quinidine, triazolam:* inhibited metabolism of these drugs, leading to life-threatening reactions (such as arrhythmias, prolonged sedation, and respiratory depression) *Amitriptyline, anticoagulants, atovaquone, carbamazepine, clozapine, cyclosporine, desipramine, diltiazem, disopyramide, divalproex, dofetilide,*

*dronabinol, ethinyl estradiol, lamotrigine, phenytoin, sulfamethoxazole, theophylline, zidovudine*: increased risk of toxicity of these drugs

*Amprenavir*: increased amprenavir blood level

*Astemizole, cisapride, encainide*: increased risk of arrhythmias

*Atorvastatin, cerivastatin, lovastatin, simvastatin, terfenadine*: increased blood levels of these drugs, increased risk of rhabdomyolysis

*Barbiturates, nevirapine, phenytoin, rifamycins*: decreased ritonavir blood level

*Bupropion*: increased risk of seizures

*Clarithromycin, efavirenz*: increased blood levels of both drugs

*Dihydroergotamine, ergonovine, ergotamine, methylegonovine*: ergot toxicity  
*Fluconazole*: increased ritonavir blood level

*Fluticasone*: increased fluticasone exposure resulting in decreased cortisol concentration

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, cholesterol, creatine kinase, gamma-glutamyltransferase, triglycerides, uric acid*: increased levels

*Hematocrit, hemoglobin, neutrophils, red blood cells, white blood cells*: decreased levels

**Drug-herbs.** *St. John's wort*: decreased ritonavir blood level

### Patient monitoring

- Monitor CBC, liver function tests, electrolyte levels, and lipid panel.
- Assess neurologic status closely. Stay alert for depression.
- Monitor bone mineral density in patients with history of pathologic fractures or who are at risk for osteopenia.

☚ Monitor for signs and symptoms of immune reconstitution syndrome, especially during initial phase of combination antiretroviral treatment when patients whose immune systems

respond may develop an inflammatory response to indolent or residual opportunistic infections (such as *Mycobacterium avium* infection, cytomegalovirus, *Pneumocystis jiroveci* pneumonia, or tuberculosis), which may necessitate further evaluation and treatment.

- Monitor vital signs and watch for syncope.
- Closely monitor nutritional and hydration status.

### Patient teaching

- Advise patient to take with meals to increase absorption.
- Encourage patient or caregiver to mix oral solution with chocolate milk or liquid nutritional supplement to mask taste. Tell caregiver that oral solution is recommended for children older than age 1 month who can't swallow capsules or tablets and, when possible, to administer dose using a calibrated dosing syringe.
- Tell patient to swallow tablets whole and not to chew, break, or crush them.
- Tell patient drug may cause numbness, tingling, weakness, and other CNS effects that increase his injury risk. Urge him to use appropriate safety precautions.
- Instruct patient to report depression.
- Advise patient not to take nonprescription drugs or herbal products, particularly *St. John's wort*, without consulting prescriber.
- Tell female patient not to breastfeed because of risk of serious adverse reactions and possible HIV transmission to infant.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## rituximab

MabThera , Rituxan

**Pharmacologic class:** Murine/human monoclonal antibody

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** C

### FDA BOXED WARNING

- Deaths from infusion reactions have occurred within 24 hours of rituximab infusion. Approximately 80% of fatal reactions were linked to first infusion. If severe infusion reaction develops, discontinue infusion and intervene appropriately.
- Acute renal failure requiring dialysis, severe mucocutaneous reactions, and progressive multifocal leukoencephalopathy have been reported.

### Action

Binds to CD20 antigen on malignant B lymphocytes; recruits immune effector functions to mediate B-cell lysis (possibly through complement-dependent cytotoxicity and antibody-dependent cell-mediated cytotoxicity)

### Availability

**Injection:** 10 mg/ml in 10-ml (100-mg) and 50-ml (500-mg) vials

### Indications and dosages

➤ Non Hodgkin's lymphoma (NHL)

**Adults:** 375 mg/m<sup>2</sup> by I.V. infusion according to the following schedules:

*Relapsed or refractory, low grade or follicular, CD20-positive B-cell NHL:* Give weekly for four or eight doses.

*Retreatment for relapsed or refractory, low grade or follicular, CD20-positive B-cell NHL:* Give weekly for four doses.

*Previously untreated, follicular, CD20-positive, B-cell NHL:* Give on day 1 of

each cycle of cyclophosphamide, vincristine, prednisolone (CVP) chemotherapy, for up to eight doses. *Non-progressing, low-grade, CD20-positive B-cell NHL, after first line CVP chemotherapy:* Following completion of six to eight cycles of CVP chemotherapy, give weekly for four doses at 6-month intervals to a maximum of 16 doses.

*Diffuse large B-cell NHL:* Give on day 1 of each cycle of chemotherapy for up to eight infusions.

*Dosage in combination with ibrutinomab:* On day 1, rituximab 250 mg/m<sup>2</sup> by I.V. infusion. Within 4 hours after rituximab infusion, give 5 mCi In-111 ibritumomab I.V. On days 7, 8, and 9, give rituximab 250 mg/m<sup>2</sup> by I.V. infusion and platelet-count-dependent dose of Y-90 ibritumomab I.V.

➤ Moderately to severely active rheumatoid arthritis in patients who have had an inadequate response to one or more tumor necrosis factor antagonist

**Adults:** Two 1,000 mg I.V. infusions separated by 2 weeks in combination with methotrexate. Give subsequent courses every 24 weeks or based on clinical evaluation, but not sooner than every 16 weeks.

➤ Chronic lymphocytic leukemia (CLL) in combination with fludarabine and cyclophosphamide (FC)

**Adults:** 375 mg/m<sup>2</sup> I.V. day before start of FC chemotherapy; then 500 mg/m<sup>2</sup> on day 1 of cycles 2 to 6 (every 28 days).

### Off-label uses

- Waldenström's macroglobulinemia

### Contraindications

- Hypersensitivity to drug, its components, or murine products

### Precautions

Use cautiously in:

- history of drug allergy or sensitivity

- previous exposure to murine-based monoclonal antibodies
- high level of circulating malignant cells
- cardiac or pulmonary conditions
- pregnant or breastfeeding patients
- children.

### Administration

- Follow facility policy regarding handling, administration, and disposal of chemotherapeutic drugs.
- Know that *Pneumocystis jirovecii* pneumonia and antiherpetic viral prophylaxis is recommended for patients with CLL during treatment and for up to 12 months following treatment, as appropriate.
- To reduce the incidence and severity of infusion reactions, premedicate patient with diphenhydramine and acetaminophen, as prescribed. In addition, for patients with rheumatoid arthritis, give I.V. methylprednisolone (or its equivalent) 30 minutes before each infusion.
- Consider withholding antihypertensive agents 12 hours before giving drug to help prevent hypotension.
- Give drug as I.V. infusion.
-  Never give as I.V. bolus or I.V. push.
- Don't mix or dilute with other drugs.
- Dilute in dextrose 5% in water (D<sub>5</sub>W) or normal saline solution to a concentration of 1 to 4 mg/ml. Invert bag gently to mix solution.
- Administer the first infusion at an initial rate of 50 mg/hr. If no infusion reaction occurs, increase the infusion rate in 50 mg/hr increments every 30 minutes, to a maximum of 400 mg/hr.
- If the patient tolerates the first infusion well, administer subsequent infusions at an initial rate of 100 mg/hr and increase by 100 mg/hr increments every 30 minutes to a maximum of 400 mg/hr, as tolerated.
-  Be aware that a severe infusion reaction may occur usually after first infusion. This reaction consists of a

complex of hypoxia, pulmonary infiltrates, acute respiratory distress syndrome, M.I., ventricular fibrillation, or cardiogenic shock. If such a reaction occurs, stop infusion immediately and treat appropriately.

- If hypersensitivity reaction (non-IgE-mediated) or infusion reaction that is not severe occurs, interrupt or temporarily slow infusion. When symptoms improve, infusion can continue at half of previous rate.

Route	Onset	Peak	Duration
I.V.	Variable	Variable	6-12 mo

### Adverse reactions

**CNS:** dizziness, headache, nervousness, hypertonia, hyperesthesia, insomnia, agitation, malaise, paresthesia, asthenia, fatigue, tremor, rigors

**CV:** hypotension, hypertension, peripheral edema, chest pain, tachycardia, bradycardia, angina, **arrhythmias**

**EENT:** conjunctivitis, lacrimation disorders, rhinitis, sinusitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, anorexia

**GU: renal toxicity**

**Hematologic:** anemia, **neutropenia, leukopenia, thrombocytopenia**

**Metabolic:** hyperglycemia, hypocalcemia

**Musculoskeletal:** myalgia, back pain

**Respiratory:** dyspnea, cough, bronchitis, **bronchospasm**

**Skin:** pruritus, rash, urticaria, flushing, dermatitis, angioedema, **toxic epidermal necrolysis, Stevens-Johnson syndrome**

**Other:** altered taste, fever, chills, pain at injection site, hypersensitivity reactions including **sepsis, severe infusion reaction**

### Interactions

**Drug-drug.** *Cisplatin:* increased risk of renal failure

*Live-virus vaccines*: increased risk of infection from vaccine

**Drug-diagnostic tests.** *Calcium, hemoglobin, neutrophils, platelets, white blood cells*: decreased values

*Glucose, lactate dehydrogenase*: increased levels

### Patient monitoring

- Monitor closely for signs and symptoms of hypersensitivity reaction.
- 🚫 Stop drug immediately and notify prescriber if patient develops signs or symptoms of Stevens-Johnson syndrome or other severe mucocutaneous reactions (including severe rash).
- 🚫 Monitor pulse and blood pressure throughout I.V. infusion. Stop infusion if hypotension, bronchospasm, or angioedema occurs. Then consult prescriber about restarting infusion at half of previous rate.
- 🚫 Monitor ECG throughout infusion. Stop infusion if serious arrhythmia develops.
- Monitor CBC, blood glucose, and electrolyte levels.
- Assess for signs and symptoms of infection, including fever.

### Patient teaching

- 🚫 Tell patient to immediately report signs and symptoms of hypersensitivity reaction or severe skin reaction.
- 🚫 Instruct patient to take his temperature daily and immediately report fever and other signs or symptoms of infection.
- 🚫 Instruct patient to immediately report unusual bleeding or bruising.
- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## rivastigmine tartrate

Exelon

**Pharmacologic class:** Cholinesterase inhibitor

**Therapeutic class:** Anti-Alzheimer's drug

**Pregnancy risk category B**

### Action

Unknown. Thought to enhance cholinergic function by elevating acetylcholine levels in brain through reversible inhibition of its hydrolysis by cholinesterase.

### Availability

*Capsules*: 1.5 mg, 3 mg, 4.5 mg, 6 mg

*Oral solution*: 2 mg/ml

*Transdermal patch*: 4.6 mg/24 hours, 9.5 mg/24 hours

### Indications and dosages

- Mild to moderate dementia of Alzheimer's disease
 

**Adults:** Initially, 1.5 mg P.O. b.i.d. May increase to 3 mg b.i.d. after 2 weeks; may increase further to 4.5 mg b.i.d. and 6 mg b.i.d., if tolerated, after 2 weeks at previous dosage. Typical effective range is 6 to 12 mg/day, up to a maximum of 12 mg/day. Or initially, apply one 4.6-mg patch to the skin q 24 hours. After minimum of 4 weeks, may increase to maintenance dose of one 9.5-mg patch applied to the skin q 24 hours.
- Mild to moderate dementia of Parkinson's disease
 

**Adults:** Initially, 1.5 mg P.O. b.i.d. May increase to 3 mg b.i.d. after 2 weeks; may increase further to 4.5 mg b.i.d. and 6 mg b.i.d. if tolerated, after 4 weeks at previous dosage. Typical effective range is 3 to 12 mg/day, up to a maximum of 12 mg/day. Or initially, apply one 4.6-mg patch to the skin

q 24 hours. After minimum of 4 weeks, may increase to maintenance dose of one 9.5-mg patch applied to the skin q 24 hours.

### Off-label uses

- Huntington's disease

### Contraindications

- Hypersensitivity to drug, its components, or carbamate derivatives

### Precautions

Use cautiously in:

- renal or hepatic impairment, diabetes mellitus, obstructive pulmonary disease, neurologic conditions that can cause seizures, peptic ulcers, GI bleeding, supraventricular conduction disorders
- patients older than age 85
- pregnant patients.

### Administration

- Give with food in morning and evening.

Route	Onset	Peak	Duration
P.O.	Unknown	1 hr	12 hr

### Adverse reactions

**CNS:** depression, dizziness, headache, confusion, insomnia, psychosis, hallucinations, anxiety, tremor, drowsiness, fatigue, syncope, asthenia

**CV:** chest pain, hypertension, peripheral edema

**EENT:** rhinitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, flatulence, eructation, dyspepsia, anorexia

**GU:** urinary tract infection, urinary incontinence

**Musculoskeletal:** back pain, joint pain, bone fractures

**Respiratory:** upper respiratory infection, cough, bronchitis

**Skin:** rash, diaphoresis

**Other:** weight loss, pain, flulike symptoms

### Interactions

**Drug-drug.** *Anticholinergics:* interference with anticholinergic effects  
*Cholinergic agonists (such as bethanechol), succinylcholine and similar neuromuscular blockers:* synergistic effects

**Drug-herbs.** *S-adenosylmethionine (SAM-e), St. John's wort:* increased risk of serotonin syndrome

**Drug-behaviors.** *Nicotine use:* increased drug clearance

### Patient monitoring

- Monitor patient's nutritional and hydration status, especially at start of therapy.
- Assess vital signs and cardiovascular status. Stay alert for chest pain and peripheral edema.
- Closely monitor cognitive status, particularly memory. Report significant decline or improvement.
- Assess temperature. Watch for fever and other signs and symptoms of infection.

### Patient teaching

- Instruct caregiver to give with food in morning and evening.
- Instruct caregiver to use dosing syringe provided with oral solution to withdraw prescribed amount of solution from container; patient may swallow directly from syringe. Or, drug may be mixed with a small glass of water, cold fruit juice, or soda; stir mixture and have patient drink entire amount.
- Instruct caregiver how to apply transdermal patch.
- Inform caregiver that drug initially may worsen CNS impairment. Recommend appropriate safety measures.
- Tell caregiver that memory improvement generally is subtle and that drug works by preventing further memory loss.
- Inform caregiver that drug commonly causes nausea, vomiting,

decreased appetite, and weight loss, especially at start of therapy.

- Advise caregiver to watch for and report weight loss, dehydration, and signs and symptoms of GI bleeding.
- Tell caregiver that drug interacts with many over-the-counter products and nicotine. Advise him to discuss these products with prescriber before giving to patient.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, herbs, and behaviors mentioned above.

## rizatriptan benzoate

Maxalt, Maxalt-MLT, Maxalt RPD<sup>†</sup>

**Pharmacologic class:** Serotonin 5-hydroxytryptamine (5-HT<sub>1</sub>) receptor agonist

**Therapeutic class:** Antimigraine drug

**Pregnancy risk category** C

### Action

Thought to act as agonist at specific 5-HT<sub>1</sub> receptor sites in intracranial vessels, causing vasoconstriction. Also may act on sensory trigeminal nerves, reducing transmission along pain pathways.

### Availability

Tablets: 5 mg, 10 mg

Tablets (orally disintegrating): 5 mg, 10 mg

### Indications and dosages

➤ Acute migraine

**Adults:** 5 to 10 mg P.O.; may repeat in 2 hours, not to exceed 30 mg in 24 hours. For patients receiving propranolol concurrently, 5 mg P.O., up to a maximum of three doses in 24 hours.

**Children ages 6 to 17 weighing 40 kg (88 lb) or more:** 10 mg P.O. as a single dose. For patients receiving propranolol concurrently, 5 mg P.O., up to a maximum of three doses in 24 hours.

**Children ages 6 to 17 weighing less than 40 kg (88 lb):** 5 mg P.O. as a single dose. Don't prescribe drug for propranolol-treated children who weigh less than 40 kg.

### Contraindications

- Hypersensitivity to drug or its components
- Ischemic heart disease or other significant cardiovascular disease
- Ischemic bowel disease
- Transient ischemic attacks
- Basilar or hemiplegic migraine
- Uncontrolled hypertension
- Use of other 5-HT<sub>1</sub> agonists or ergot-type compounds (dihydroergotamine, methysergide) within 24 hours
- MAO inhibitor use within past 14 days

### Precautions

Use cautiously in:

- severe renal impairment (especially in dialysis patients), moderate hepatic impairment, cardiovascular risk factors
- phenylketonuria (PKU) in patients receiving orally disintegrating tablets
- pregnant or breastfeeding patients
- children younger than age 6 (safety not established).

### Administration

- Place orally disintegrating tablet on patient's tongue to dissolve. Make sure he swallows it with saliva only. Don't give with beverages.
- 🔊 Don't give within 14 days of MAO inhibitors (may cause serious adverse reactions).

Route	Onset	Peak	Duration
P.O.	30 min	1-1.5 hr	Unknown

## Adverse reactions

**CNS:** headache, dizziness, drowsiness, asthenia, fatigue, paresthesia, decreased mental acuity, euphoria, tremor

**CV:** chest pain, tightness, heaviness, or pressure; **hypertensive crisis; arrhythmias, myocardial infarction (MI) (rare)**

**GI:** nausea, vomiting, diarrhea, dry mouth

**Respiratory:** dyspnea

**Skin:** flushing

**Other:** neck, throat, or jaw pain, tightness, or pressure; hot flashes; warm or cold sensations; **noncoronary vasospastic reactions, serotonin syndrome**

## Interactions

**Drug-drug.** *Ergot or ergot-type compounds (such as dihydroergotamine, methysergide), other 5-HT<sub>1</sub> agonists:* additive vasoactive effects

*MAO inhibitors, propranolol:* increased rizatriptan blood level, greater risk of adverse effects

*Selective serotonin reuptake inhibitors:* weakness, hyperreflexia, incoordination

**Drug-herbs.** *S-adenosylmethionine (SAM-e), St. John's wort:* increased risk of adverse serotonergic effects, including serotonin syndrome

## Patient monitoring

- Monitor patient's response to drug. Assess need for repeat doses.
- Assess vital signs and cardiovascular status, especially if patient has cardiovascular risk factors. Discontinue drug if arrhythmia occurs.

⚠ Be aware that drug may cause noncoronary vasospastic reactions, such as peripheral vascular ischemia, GI vascular ischemia and infarction (abdominal pain and bloody diarrhea), splenic infarction, and Raynaud's syndrome. In patients who experience signs or symptoms suggestive of noncoronary vasospasm reaction, rule out

the suspected vasospasm reaction before giving additional doses.

⚠ Be aware that drug may cause serotonin syndrome. Discontinue drug if serotonin syndrome is suspected.

## Patient teaching

- Teach patient how to use drug. Stress that it's effective only in treating diagnosed migraine—not in preventing migraine or treating other types of headache.
- Advise patient to peel back blister pack of Maxalt-MLT with dry hands and place tablet on tongue. Tell him to swallow drug with saliva only, not beverages.
- Tell patient he may repeat dose in 2 hours if headache recurs, but should take no more than 30 mg in 24 hours.
- Inform patient with PKU that orally disintegrating tablets contain phenylalanine.
- ⚠ Teach patient how to recognize and immediately report signs and symptoms of significant increases in blood pressure, arrhythmia, MI, serotonin syndrome, and vasospastic reactions.
- ⚠ Instruct female patient to immediately report possible pregnancy.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and herbs mentioned above.

## ropinirole hydrochloride

Adartrel<sup>®</sup>, Requip, Requip XL

**Pharmacologic class:** Dopamine agonist

**Therapeutic class:** Antidyskinetic

**Pregnancy risk category** C

**Action**

Unknown. Thought to stimulate dopamine receptors in brain.

**Availability**

*Tablets:* 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg, 5 mg

*Tablets (extended-release):* 2 mg, 4 mg, 6 mg, 8 mg

**Indications and dosages**

➤ Idiopathic Parkinson's disease

**Adults:** For conventional tablets, initially, 0.25 mg P.O. t.i.d. for 1 week, followed by 0.5 mg P.O. t.i.d. for 1 week, then 0.75 mg t.i.d. for 1 week, and then 1 mg t.i.d. for 1 week. After week 4, may increase by 1.5 mg/day q week, up to 9 mg/day; then may increase further by up to 3 mg/day q week, up to 24 mg/day. For extended-release tablets, initially 2 mg P.O. once daily for 1 to 2 weeks, followed by increases of 2 mg/day at 1-week or longer intervals as appropriate, depending on therapeutic response and tolerability, up to a recommended maximum dosage of 24 mg/day.

➤ Moderate to severe primary restless leg syndrome

**Adults:** Initially, 0.25 mg P.O. once daily, 1 to 3 hours before bedtime. After 2 days, may increase dosage to 0.5 mg once daily and to 1 mg once daily during week 2. For weeks 3 through 6, may increase dosage by 0.5 mg/week, to a dosage of 3 mg; at week 7, dosage may be increased to 4 mg (immediate-release tablets only).

**Contraindications**

- Hypersensitivity to drug or its components

**Precautions**

Use cautiously in:

- severe hepatic impairment or cardiovascular disease, bradycardia
- elderly patients
- pregnant patients

- breastfeeding patients (use not recommended).

**Administration**

- Give with food if drug causes nausea.
- Assess patient for therapeutic response and tolerability at 1-week intervals (minimum) or longer after each dosage increment.
- Know that drug withdrawal should occur over 7 days, with frequency reduced to twice-daily dosing for first 4 days and then to once-daily dosing for next 3 days.

Route	Onset	Peak	Duration
P.O.	30-60 min	1-2 hr	16 hr

**Adverse reactions**

**CNS:** headache, dizziness, confusion, drowsiness, fatigue, neuralgia, amnesia, hyperesthesia, yawning, dystonia, increased dyskinesia, hyperkinesia, akathisia, hallucinations, abnormal thinking, poor concentration, syncope, vertigo, myoclonus, asthenia, malaise, sleep attacks

**CV:** orthostatic hypotension, hypertension, palpitations, extrasystole, peripheral edema, peripheral ischemia, chest pain, tachycardia, **atrial fibrillation**

**EENT:** abnormal vision, rhinitis, sinusitis, pharyngitis

**GI:** nausea, vomiting, flatulence, abdominal pain, dyspepsia, dry mouth, anorexia

**GU:** urinary tract infection, decreased libido, erectile dysfunction

**Respiratory:** bronchitis, dyspnea

**Skin:** diaphoresis, flushing

**Other:** viral infection, pain, edema

**Interactions**

**Drug-drug.** *Butyrophenones (such as haloperidol), metoclopramide, phenothiazines, thioxanthenes:* decreased ropinirole effects

*Ciprofloxacin, estrogens:* increased ropinirole effects

*Drugs that alter activity of CYP450-1A2 enzyme system:* altered rosinirole clearance

*Levodopa:* increased levodopa effects

**Drug-diagnostic tests.** *Alkaline phosphatase, blood urea nitrogen:* increased levels

**Drug-herbs.** *Kava:* decreased rosinirole efficacy

### Patient monitoring

- Monitor vital signs, especially for orthostatic hypotension. Assess for peripheral edema.
- Assess neurologic status carefully. Report severe adverse reactions.
- Monitor nutritional and hydration status.

### Patient teaching

- Encourage patient to take drug with food if it causes nausea.
- Instruct patient to swallow extended-release tablets whole and not to chew, crush, or divide them.
- Inform patient that hallucinations may occur during rosinirole therapy.
- Advise patient that he may experience the urge to gamble, increased sexual urges, or other intense urges and the inability to control these urges.
- Inform patient (and caregiver, as appropriate) that drug can cause serious CNS reactions; tell him which ones to report. Recommend appropriate safety measures.
- Instruct patient to move slowly when sitting up or standing, to avoid dizziness from sudden blood pressure decrease.
-  Caution patient not to stop drug abruptly. Dosage must be tapered.
- Advise patient to report swelling of hands or feet.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, vision, and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially

those related to the drugs, tests, and herbs mentioned above.

## rosiglitazone maleate

Avandia

**Pharmacologic class:** Thiazolidinedione

**Therapeutic class:** Hypoglycemic

**Pregnancy risk category C**

### FDA BOXED WARNING

- Thiazolidinediones, including rosiglitazone maleate, may cause or exacerbate heart failure in some patients. After initiating therapy or increasing dosage, observe patient carefully for heart failure signs and symptoms (including excessive, rapid weight gain; dyspnea; or edema). If these occur, manage condition per current standards of care and consider withdrawing drug or lowering dosage.
- Drug isn't recommended in patients with symptomatic heart failure and is contraindicated in those with established New York Heart Association Class III or IV heart failure.
- A meta-analysis of 52 clinical trials, most of which compared rosiglitazone maleate to placebo, showed drug to be associated with a statistically significant increased risk of myocardial infarction (MI). Three other trials, comparing rosiglitazone to other approved oral antidiabetic agents or placebo, showed a statistically non-significant increased risk of MI, and a statistically nonsignificant decreased risk of death. No clinical trials directly compared cardiovascular risk of rosiglitazone and pioglitazone (another thiazolidinedione), but in a separate trial, pioglitazone (when

compared to placebo) didn't show an increased risk of MI or death.

- Because of the possibly increased risk of MI, rosiglitazone is available only through a restricted distribution program called the AVANDIA-Rosiglitazone Medicines Access Program. Both prescribers and patients need to enroll in the program.

## Action

Inhibits alpha-glucosidases, enzymes that convert oligosaccharides and disaccharides to glucose. This inhibition lowers blood glucose level, especially in postprandial hyperglycemia.

## Availability

Tablets: 2 mg, 4 mg, 8 mg

## Indications and dosages

➤ Adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes mellitus who are either already taking rosiglitazone or not already taking rosiglitazone and are unable to achieve adequate glycemic control on other antidiabetics and, in consultation with their healthcare provider, have decided not to take pioglitazone for medical reasons

**Adults:** 4 mg P.O. once daily or 2 mg b.i.d. After 8 to 12 weeks, may increase to 8 mg daily or 4 mg b.i.d. if needed.

## Off-label uses

- Polycystic ovary syndrome

## Contraindications

- Established New York Heart Association (NYHA) Class III or IV heart failure

## Precautions

Use cautiously in:

- diabetic ketoacidosis, type 1 (insulin-dependent) diabetes mellitus (use not recommended)

- edema, NYHA Class I and II heart failure, elevated liver enzymes, jaundice
- concurrent use of insulin (not recommended)
- pregnant patients
- breastfeeding patients (use not recommended)
- children (safety and efficacy not established).

## Administration

📢 Obtain liver enzyme results before starting drug. Be aware that therapy shouldn't be initiated in patient with elevated baseline liver enzyme levels (alanine aminotransferase [ALT] level greater than 2.5 times the upper limit of normal) or if patient exhibits clinical evidence of active liver disease.

- Give with or without food.
- Be aware that drug is active only in presence of endogenous insulin and thus is ineffective in diabetic ketoacidosis or type 1 diabetes mellitus.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	12-24 hr

## Adverse reactions

**CNS:** fatigue, headache

**CV:** hypertension, **heart failure**, **increased risk of myocardial infarction**

**EENT:** macular edema, decreased visual acuity, nasopharyngitis

**GI:** diarrhea

**GU:** menstrual dysfunction

**Hematologic:** anemia

**Metabolic:** hyperglycemia, **hypoglycemia**

**Musculoskeletal:** back pain, arthralgia, increased risk of fracture

**Respiratory:** upper respiratory infection

**Other:** edema, injury, weight gain

## Interactions

**Drug-drug.** *CYP2C8 inducers (such as rifampin):* decreased rosiglitazone area under the curve (AUC)

*CYP2C8 inhibitors (such as gemfibrozil): increased rosiglitazone AUC*

**Drug-diagnostic tests.** *Free fatty acids, high-density lipoproteins, liver enzymes, low-density lipoproteins, total cholesterol:* increased levels

*Hematocrit, hemoglobin:* decreased levels

### Patient monitoring

- Monitor CBC, lipid panel, blood glucose, and glycosylated hemoglobin levels.
- Monitor patient's weight. Assess for fluid retention, which may lead to heart failure. Be aware that dosage increases should be accompanied by careful monitoring for adverse reactions related to fluid retention.

🔊 Closely monitor liver function tests. Be aware that patients with mildly elevated liver enzymes (ALT level 2.5 times ULN) at baseline or during therapy should be evaluated to determine cause of the liver enzyme elevation and if liver enzyme elevation resolves or worsens. If at any time ALT level increases to more than 3 times ULN, recheck liver enzyme levels as soon as possible. If ALT level remains at 3 times ULN, discontinue drug. If jaundice occurs, discontinue drug.

### Patient teaching

- Tell patient he may take with or without food.
- Advise patient to monitor blood glucose level regularly and report significant changes.

🔊 Inform patient that drug may increase fluid retention, causing or exacerbating heart failure. Encourage him to weigh himself regularly and report sudden weight gain, swelling, or shortness of breath.

🔊 Teach patient to recognize and immediately report signs and symptoms of heart attack or liver problems.

- Tell patient to promptly report vision changes.

- Tell patient he'll undergo regular blood testing during therapy.
- Advise female patient that drug may result in ovulation in some premenopausal anovulatory women. Inform patient she may be at increased risk for pregnancy while taking this drug; recommend adequate contraception.
- Caution female patient not to breast-feed during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests and herbs mentioned above.

## rosuvastatin calcium

Crestor

**Pharmacologic class:** HMG-CoA reductase inhibitor

**Therapeutic class:** Antilipemic

**Pregnancy risk category** X

### Action

Selectively and competitively inhibits HMG-CoA reductase, which catalyzes its conversion to the cholesterol precursor mevalonate and thus limits cholesterol synthesis. This action increases high-density lipoprotein level and decreases low-density lipoprotein (LDL) level.

### Availability

*Tablets:* 5 mg, 10 mg, 20 mg, 40 mg

### Indications and dosages

➤ Primary prevention of cardiovascular disease; adjunct to diet for hyperlipidemia, mixed dyslipidemia, hypertriglyceridemia, primary dysbetalipoproteinemia (type III hyperlipoproteinemia); slowing of progression of atherosclerosis

**Adults:** 5 to 40 mg P.O. daily. Use 40-mg dose only for patients not reaching LDL-C goal with 20 mg.

➤ Homozygous familial hypercholesterolemia

**Adults:** 20 mg/day P.O. daily. (Response to therapy should be estimated from preapheresis LDL-C levels.).

➤ Heterozygous familial hypercholesterolemia after failure of an adequate trial of diet therapy

**Children ages 10 to 17:** 5 to 20 mg P.O. daily. Maximum recommended dosage is 20 mg/day. Individualize dosages according to recommended goal of therapy. Make adjustments at intervals of 4 weeks or more.

### Dosage adjustment

- Patients with severe renal impairment (creatinine clearance less than 30 ml/minute/1.73 m<sup>2</sup>) not on hemodialysis
- Unexplained persistent proteinuria or hematuria
- Concurrent use of cyclosporine, niacin, fenofibrate, gemfibrozil, or combination of lopinavir and ritonavir or atazanavir and ritonavir
- Asian patients

### Contraindications

- Hypersensitivity to drug or its components
- Active hepatic disease or persistent, unexplained hepatic enzyme elevations
- Women who are pregnant or may become pregnant
- Breastfeeding patients

### Precautions

Use cautiously in:

- predisposing factors for myopathy (such as renal impairment, advanced age, hypothyroidism)
- heavy alcohol use or history of chronic liver disease
- hypersensitivity to other HMG-CoA reductase inhibitors (such as fluvastatin, simvastatin)

- proteinuria and hematuria
- concurrent use of drugs that may decrease levels or activity of endogenous steroid hormones (such as ketoconazole, spironolactone, and cimetidine)
- concurrent use of fenofibrate, lipid-modifying doses (1 g/day or more) of niacin, coumarin anticoagulants, protease inhibitors given in combination with ritonavir
- concurrent use of gemfibrozil (avoid use or, if used, don't exceed 10 mg daily)
- elderly patients
- children younger than age 10 (safety and efficacy not established).

### Administration

🔊 Check liver function tests before therapy starts.

- Give with or without food.
- Measure lipid levels within 2 to 4 weeks after therapy starts and after titration.
- Know that drug should be used as adjunct to other lipid-lowering treatments, such as diet.

Route	Onset	Peak	Duration
P.O.	Unknown	3-5 hr	Unknown

### Adverse reactions

**CNS:** headache, dizziness, anxiety, depression, insomnia, hypertonia, paresthesia, asthenia, tremor, vertigo, neuralgia

**CV:** palpitations, tachycardia, chest pain, angina pectoris, hypertension, vasodilation, peripheral edema

**EENT:** rhinitis, sinusitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, flatulence, gastritis, gastroenteritis,

**pancreatitis**

**GU:** urinary tract infection, **myoglobinuria, acute renal failure**

**Hepatic: fatal and nonfatal hepatic failure (rare)**

**Hematologic:** anemia

**Metabolic:** hyperglycemia, diabetes mellitus

**Musculoskeletal:** myalgia, myopathy, joint pain, **rhabdomyolysis**

**Skin:** rash, pruritus, urticaria

**Other:** hypersensitivity reactions (including **angioedema**)

## Interactions

**Drug-drug.** *Antacids:* decreased rosuvastatin blood level

*Cyclosporine, gemfibrozil protease inhibitor combinations lopinavir/ritonavir and atazanavir/ritonavir:* increased rosuvastatin bioavailability

*Hormonal contraceptives:* increased contraceptive blood level

*Niacin in lipid-modifying doses (1 g/day or more):* increased risk of enhanced musculoskeletal effects

*Warfarin:* increased International Normalized Ratio

**Drug-diagnostic tests.** *Alanine aminotransferase (ALT), alkaline phosphatase, aspartate aminotransferase (AST), bilirubin, creatine kinase (CK), glucose:* increased levels

*Thyroid function tests:* altered results

*Urine protein:* present beyond trace

## Patient monitoring

🔊 Monitor CK, creatinine, and urine protein levels closely. Also watch for signs and symptoms of rhabdomyolysis with acute renal failure: CK level above 10 times normal limits, muscle ache or weakness, creatinine elevation, and urine protein level beyond trace, accompanied by hematuria. If these findings occur, withhold drug and notify prescriber immediately.

🔊 Monitor liver function tests 12 weeks after therapy begins, after dosage increases, and at least semiannually thereafter. Reduce dosage or withdraw drug if ALT or AST persists at three times normal levels.

🔊 Temporarily withhold drug in patients with acute, serious conditions predisposing to renal failure caused by rhabdomyolysis (such as sepsis, hypotension, major surgery, trauma, uncontrolled seizures, or severe metabolic, endocrine, and electrolyte disorders).

- Monitor blood glucose, electrolyte levels, and lipid panel.
- Assess vital signs and cardiovascular status, especially for tachycardia and palpitations.
- Monitor for signs and symptoms of respiratory tract infection.
- Stay alert for tremor and asthenia.

## Patient teaching

• Tell patient he may take with or without food. If he's using antacids, instruct him to take these 2 hours after rosuvastatin.

• Instruct patient to maintain a standard cholesterol-lowering diet.

🔊 Tell patient to immediately report unexplained muscle pain, tenderness, or weakness (particularly if accompanied by malaise or fever).

🔊 Caution female patient of child-bearing age not to take drug if she is pregnant, plans to become pregnant, or is breastfeeding.

• Teach patient how to check blood or urine glucose level and recognize signs and symptoms of hypoglycemia and hyperglycemia.

• Tell patient that foods, beverages, and preparations containing caffeine or ephedra may increase drug's stimulant effect. Encourage him to limit caffeine intake and avoid ephedra.

• Advise patient against heavy alcohol use, which increases risk of liver disease.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## ruxolitinib

Jakafi

**Pharmacologic class:** Kinase inhibitor

**Therapeutic class:** Antineoplastic

**Pregnancy risk category C**

### Action

Inhibits Janus-associated kinases (JAKs) JAK1 and JAK2, which mediate the signaling of a number of cytokines and growth factors important for hematopoiesis and immune function. Myelofibrosis, a myeloproliferative neoplasm, is known to be associated with dysregulated JAK1 and JAK2 signaling.

### Availability

Tablets: 5 mg, 10 mg, 15 mg, 20 mg, 25 mg

### Indications and dosages

➤ Patients with intermediate- or high-risk myelofibrosis (including primary myelofibrosis, post-polycythemia vera myelofibrosis and post-essential thrombocythemia myelofibrosis)

**Adults:** 20 mg P.O. b.i.d. for patients with platelet count greater than  $200 \times 10^9/L$ , and 15 mg P.O. b.i.d. for patients with platelet count between  $100 \times 10^9/L$  and  $200 \times 10^9/L$ . Increase dosage based on response and as recommended to maximum of 25 mg P.O. b.i.d. Discontinue after 6 months if no spleen reduction or symptom improvement.

### Dosage adjustment

- Absolute neutrophil count (ANC) greater than  $0.75 \times 10^9/L$
- Concomitant use of strong CYP3A4 inhibitors

- Decreased platelet count and thrombocytopenia
- Failure to achieve reduction from pretreatment baseline in either palpable spleen length of 50% or 35% reduction in spleen volume as measured by computed tomography scan or magnetic resonance imaging
- Platelet count greater than  $125 \times 10^9/L$  at 4 weeks and platelet count never below  $100 \times 10^9/L$
- Renal and hepatic impairment

### Contraindications

None

### Precautions

Use cautiously in:

- renal or hepatic impairment
- end-stage renal disease (creatinine clearance less than 15 mL/minute) not requiring dialysis and patients with moderate or severe renal impairment and platelet count less than  $100 \times 10^9/L$  (avoid use)
- hepatic impairment in patients with platelet count less than  $100 \times 10^9/L$  (avoid use)
- patients with thrombocytopenia, anemia, neutropenia; patients at risk for infection
- ANC levels greater than  $0.75 \times 10^9/L$
- concurrent use of strong CYP3A4 inhibitors in patients with platelet count less than  $100 \times 10^9/L$  (avoid use)
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Administer with or without food but not with grapefruit juice.
- For patients unable to ingest tablets, give through nasogastric (NG) tube by suspending one tablet in approximately 40 ml of water, stirring for approximately 10 minutes, and administering within 6 hours after

tablet has dispersed. Rinse NG tube with approximately 75 ml of water.

- Obtain CBC before start of therapy.
- Ensure that serious infections are resolved before start of therapy.
- ⚠ Be aware that thrombocytopenia, anemia, and neutropenia can occur. Manage by dosage reduction, dose interruption, or transfusion. After recovery of platelet count above  $50 \times 10^9/L$ , restart or increase dosing after recovery of platelet count to acceptable levels.
- When discontinuing drug for reasons other than thrombocytopenia, consider gradually tapering dosage, for example, by 5 mg b.i.d. weekly.

Route	Onset	Peak	Duration
P.O.	Unknown	1-2 hr	Unknown

### Adverse reactions

**CNS:** headache, dizziness

**GI:** flatulence

**GU:** urinary tract infections

**Hematologic:** anemia, **neutropenia, thrombocytopenia**

**Skin:** bruising

**Other:** weight gain, herpes zoster

### Interactions

**Drug-drug.** *CYP3A4 inducers (such as rifampin):* decreased ruxolitinib  $C_{max}$  and area under the curve (AUC)

*Mild or moderate CYP3A4 inhibitors (such as erythromycin):* increased ruxolitinib  $C_{max}$  and AUC

*Strong CYP3A4 inhibitors (such as boceprevir, clarithromycin, conivaptan, indinavir, itraconazole, ketoconazole, lopinavir/ritonavir, mibefradil, nefazodone, nelfinavir, posaconazole, ritonavir, saquinavir, telaprevir, telithromycin, voriconazole):* increased ruxolitinib  $C_{max}$ , AUC, and half-life

**Drug-diagnostic tests.** *ALT, AST, cholesterol:* increased levels

*Hemoglobin, neutrophils, platelets, RBCs:* decreased levels

**Drug-food.** *Grapefruit juice:* increased ruxolitinib  $C_{max}$ , AUC, and half-life

### Patient monitoring

- Monitor CBC with differential every 2 to 4 weeks until dosages are stabilized, then as clinically indicated.
- Monitor renal and hepatic function tests closely.
- Assess patient for risk of developing serious bacterial, mycobacterial, fungal, and viral infections and promptly initiate appropriate treatment.

### Patient teaching

- Tell patient to take drug with or without food but not with grapefruit juice.
- For patient unable to ingest tablets, tell patient or caregiver to give through NG tube by suspending one tablet in approximately 40 ml of water, stirring for approximately 10 minutes, and administering within 6 hours after tablet has dispersed. Then rinse NG tube with approximately 75 ml of water.
- Inform patient of importance of having CBC before starting drug and regularly during treatment.
- ⚠ Instruct patient to immediately report signs and symptoms of low CBC (unusual bleeding, bruising, fatigue, shortness of breath) or infection (fever, chills, aches, weakness, painful rash or blisters).
- Instruct patient to tell prescriber about all drugs he's taking, because some drugs have potential for serious drug interactions and shouldn't be taken with ruxolitinib.
- Teach patient with end-stage renal disease to take drug on dialysis days after each dialysis session.
- Teach patient about early signs and symptoms of herpes zoster; advise patient to seek treatment as early as possible if these occur.

- Advise breastfeeding patient that she should decide whether to discontinue breastfeeding or discontinue drug, taking into account importance of drug for her treatment.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and food mentioned above.

## salmeterol xinafoate

Serevent<sup>®</sup>, Serevent Diskus

**Pharmacologic class:** Beta<sub>2</sub>-adrenergic receptor agonist (long-acting)

**Therapeutic class:** Bronchodilator

**Pregnancy risk category C**

### FDA BOXED WARNING

• Drug may increase risk of asthma-related death. Currently available data are inadequate to determine whether concurrent use of inhaled corticosteroids or other long-term asthma control drugs mitigates the increased risk of asthma-related death from long-acting beta<sub>2</sub>-adrenergic agonists. Because of this risk, use of salmeterol xinafoate for the treatment of asthma without a concomitant long-term asthma control medication such as an inhaled corticosteroid is contraindicated. When treating asthmatic patients, use only as additional therapy for those not adequately controlled on other asthma-controller medications or whose disease severity clearly warrants treatment with two maintenance therapies (including salmeterol). Once asthma control is

achieved and maintained, assess patient at regular intervals and step down therapy (for example, discontinue salmeterol xinafoate), if possible, without loss of asthma control and maintain patient on a long-term asthma-control medication such as an inhaled corticosteroid. Don't use salmeterol for patients whose asthma is adequately controlled on low- or medium-dose inhaled corticosteroids

- Available data from controlled clinical trials suggest that long-acting beta<sub>2</sub>-adrenergic agonists increase risk of asthma-related hospitalization in children and adolescents. For children and adolescents with asthma who require addition of a long-acting beta<sub>2</sub>-adrenergic agonist to an inhaled corticosteroid, a fixed-dose combination product containing both an inhaled corticosteroid and a long-acting beta<sub>2</sub>-adrenergic agonist should ordinarily be used to ensure adherence with both drugs. In cases in which use of a separate long-term asthma-control medication (for example, inhaled corticosteroid) and a long-acting beta<sub>2</sub>-adrenergic agonist is clinically indicated, take appropriate steps to ensure adherence with both treatment components. If adherence can't be assured, a fixed-dose combination product containing both an inhaled corticosteroid and a long-acting beta<sub>2</sub>-adrenergic agonist is recommended.

### Action

Stimulates intracellular adenylate cyclase, an enzyme that catalyzes conversion of adenosine triphosphate to cyclic-3',5'-adenosine monophosphate (cAMP). Increased cAMP levels relax bronchial smooth muscle and inhibit release of mediators of immediate hypersensitivity (especially from mast cells).

## Availability

Powder for inhalation using Diskus delivery system: 50 mcg/blister (60 blisters)

## Indications and dosages

➤ Maintenance treatment of asthma; prevention of bronchospasm in patients with reversible obstructive airway disease; maintenance treatment of bronchospasm in patients with chronic obstructive pulmonary disease (COPD)

**Adults and children older than age 4:** 50 mcg (one inhalation) b.i.d. approximately 12 hours apart

➤ Prevention of exercise-induced bronchospasm

**Adults and children older than age 4:** 50 mcg (one inhalation) 30 to 60 minutes before exercise. Withhold additional doses for at least 12 hours.

## Off-label uses

- Cystic fibrosis
- High-altitude pulmonary edema
- Atopic asthma

## Contraindications

- Hypersensitivity to drug or its components
- Acute asthma attack

## Precautions

Use cautiously in:

- cardiovascular disease, diabetes mellitus, hyperthyroidism
- concurrent use of MAO inhibitors or tricyclic antidepressants (extreme caution required)
- pregnant or breastfeeding patients
- children younger than age 4.

## Administration

- To use Serevent Diskus, activate device and hold in horizontal position.
- Make sure patient doesn't exhale into device.
- Preferably, give doses 12 hours apart in morning and evening.

Route	Onset	Peak	Duration
Inhalation	10-25 min	3-4 hr	12 hr

## Adverse reactions

**CNS:** headache, nervousness, dizziness, tremor

**CV:** palpitations, hypertension, tachycardia, **arrhythmias**

**GI:** nausea, diarrhea, abdominal pain

**Metabolic:** hyperglycemia, **hypokalemia**

**Musculoskeletal:** muscle cramps and soreness

**Respiratory:** **paradoxical bronchospasm**

**Skin:** urticaria, angioedema, rash

**Other:** hypersensitivity reaction

## Interactions

**Drug-drug.** *Beta-adrenergic blockers:* decreased salmeterol efficacy, increased risk of severe bronchospasm in patients with asthma or COPD

*Diuretics (except potassium-sparing):* increased risk of hypokalemia and ECG changes

*MAO inhibitors, tricyclic antidepressants:* potentiation of salmeterol's cardiovascular actions

**Drug-diagnostic tests.** *Glucose:* increased level

*Potassium:* decreased level

**Drug-food.** *Caffeine-containing foods and beverages:* increased stimulant effect

*Urine-acidifying foods:* increased drug blood level

**Drug-herbs.** *Caffeine-containing herbs (such as cola nut, yerba maté), ephedra (ma huang):* increased stimulant effect

## Patient monitoring

- Assess pulmonary status and vital signs.

🚨 Stay alert for signs and symptoms of hypersensitivity reaction, particularly rash, urticaria, angioedema, and paradoxical bronchospasm.

## Patient teaching

- Remind patient that drug isn't a rescue bronchodilator and won't give immediate relief in emergency.
- Teach patient proper technique for using inhaler or Diskus. Instruct him not to exhale into device or use a spacer with Diskus.
- Advise patient to keep Diskus dry. Tell him not to rinse, wash, or take it apart.
- Instruct patient to take regular doses 12 hours apart. Tell him to take doses for exercise-induced bronchospasm 30 to 60 minutes before exercising.
- Advise patient to take drug exactly as prescribed and not to exceed one inhalation twice daily.
- Tell patient to consult prescriber if he needs more inhalations than usual.
- Caution patient not to stop taking drug without consulting prescriber.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## saquinavir mesylate

Invirase

**Pharmacologic class:** Protease inhibitor

**Therapeutic class:** Antiretroviral

**Pregnancy risk category B**

## Action

Inhibits human immunodeficiency virus (HIV) protease, preventing cleavage of HIV polyproteins and blocking virus replication and maturation

## Availability

*Capsules:* 200 mg

*Tablets:* 500 mg

## Indications and dosages

➤ Advanced HIV infection in selected patients

**Adults older than age 16:** 1,000 mg P.O. b.i.d. given only in combination with zidovudine b.i.d.

## Contraindications

- Clinically significant hypersensitivity (for example, anaphylactic reaction, Stevens-Johnson syndrome) to drug or its components and zidovudine
- When administered with zidovudine in patients with severe hepatic impairment
- Congenital or documented acquired QT-interval prolongation, refractory hypokalemia or hypomagnesemia, or concurrent therapy with other drugs that prolong QT interval
- Complete atrioventricular (AV) block without implanted pacemaker, or patient at high risk for complete AV block

## Precautions

Use cautiously in:

- hepatic disease, hemophilia types A and B, diabetes mellitus
- pregnant or breastfeeding patients
- children younger than age 16.

## Administration

• Give around the clock without missing doses, within 2 hours of a full meal.

🔊 Know that drug is given *only* in combination with zidovudine, which inhibits its metabolism. Give both drugs at same time.

🔊 Don't give concurrently with CYP3A substrates (such as alfuzosin, amiodarone, bepridil, cisapride, dofetilide, dihydroergotamine, ergonovine, ergotamine, flecainide, lovastatin, methylergonovine, oral midazolam, pimozone, propafenone, quinidine, rifampin, simvastatin, sildenafil when used for pulmonary arterial hypertension, systemic lidocaine,

trazodone, triazolam). Life-threatening reactions may occur.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache, dizziness, paresthesia, asthenia, depression, insomnia, anxiety, confusion, ataxia, **seizures, suicidal ideation, intracranial hemorrhage**

**CV:** chest pain, peripheral vasoconstriction, **thrombophlebitis**

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, flatulence, dyspepsia, buccal mucosal ulcers, pancreatitis

**GU:** urinary retention, nephrolithiasis, **oliguria, acute renal insufficiency**

**Hematologic:** **hemolytic anemia, pancytopenia, thrombocytopenia, acute myeloblastic leukemia**

**Hepatic:** jaundice, **portal hypertension, exacerbation of chronic hepatic disease** (with grade 4 elevated liver function test results)

**Metabolic:** hyperglycemia, diabetes mellitus (exacerbation or new onset), hypercalcemia, **hyperkalemia, hypoglycemia**

**Musculoskeletal:** musculoskeletal pain

**Respiratory:** bronchitis, cough

**Skin:** rash, **Stevens-Johnson syndrome**

**Other:** altered taste, drug fever, allergic reactions, immune reconstitution syndrome

### Interactions

**Drug-drug.** *Alfuzosin, digoxin, sildenafil when used for pulmonary arterial hypertension, tadalafil, tricyclic antidepressants, vardenafil:* increased blood levels of these drugs

*Antiarrhythmics (amiodarone, bepridil, dofetilide, flecainide, propafenone, quinidine), astemizole, cisapride, pimozone, propafenone, systemic lidocaine, terfenadine:* increased blood levels of these drugs, life-threatening arrhythmias

*Benzodiazepines, calcium channel blockers:* increased blood levels of these drugs  
*Carbamazepine, dexamethasone, nevirapine, phenobarbital, phenytoin, rifabutin, rifampin:* reduced saquinavir steady-state level

*Clarithromycin, indinavir, ketoconazole, nelfinavir, ritonavir:* increased saquinavir blood level

*Ergot derivatives:* elevated blood level of these drugs, life-threatening reactions such as acute ergot toxicity (peripheral vasospasm and ischemia of extremities and other tissues)

*HIV-1 protease inhibitors (atazanavir):* possible additive effects on PR interval prolongation

*HMG-CoA reductase inhibitors:* increased risk of myopathy (including rhabdomyolysis)

*Oral midazolam, triazolam:* increased risk of life-threatening prolonged or increased sedation or respiratory depression

*Nonnucleoside reverse transcriptase inhibitors (delavirdine, nevirapine):* increased saquinavir blood level

*Rifampin:* increased risk of severe hepatocellular toxicity

*Warfarin:* altered International Normalized Ratio

**Drug-diagnostic tests.** *Alanine aminotransferase (ALT), amylase, aspartate aminotransferase (AST), bilirubin, calcium, creatinine phosphokinase, potassium:* increased levels

*Blood glucose:* increased or decreased level

*Phosphate:* decreased level

*Platelets, red blood cells, white blood cells:* decreased counts

**Drug-food.** *Any food:* increased drug absorption

*Grapefruit juice:* elevated drug blood level, increased pharmacologic and adverse effects

**Drug-herbs.** *Garlic capsules:* decreased saquinavir blood level

*St. John's wort:* 50% reduction in saquinavir blood level

## Patient monitoring

Be aware that immune reconstitution syndrome may occur in patients receiving combination antiretroviral therapy. During initial phase of therapy, patient whose immune system responds may develop inflammatory response to indolent or residual opportunistic infections (such as *Mycobacterium avium* complex, cytomegalovirus, *P. jiroveci* pneumonia, and tuberculosis), which may necessitate further evaluation and treatment.

- Monitor platelet count, CBC, liver function tests, electrolytes, and uric acid and bilirubin levels. Watch for evidence of life-threatening blood dyscrasias and portal hypertension.
- Assess nutritional status and hydration.
- Monitor neurologic status. Stay alert for depression, suicidal ideation, seizures, and signs or symptoms of intracranial hemorrhage.

## Patient teaching

- Tell patient to take with food (but not grapefruit juice) or within 2 hours of a full meal. Stress importance of taking doses around the clock on a regular schedule.

Inform patient (and significant other as appropriate) that drug may cause depression and suicidal thoughts, which should be reported immediately.

- Advise patient to notify prescriber if rash occurs.

Teach patient to recognize and immediately report signs and symptoms of liver disorder or bleeding tendency.

- Tell patient drug interacts with many other drugs, causing serious reactions. Advise him to discuss all drug use with prescriber before therapy starts.

- Caution patient to avoid St. John's wort and garlic capsules during therapy.

- Instruct female patient not to breast-feed, because she may transmit drug effects and HIV to infant.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## sargramostim (GM-CSF)

Leukine

**Pharmacologic class:** Granulocyte-macrophage colony stimulating factor

**Therapeutic class:** Hematopoietic agent

**Pregnancy risk category C**

## Action

Stimulates proliferation and differentiation of hematopoietic cells that activate mature granulocytes and macrophages of target cells

## Availability

*Liquid:* 500 mcg/ml

*Powder for injection:* 250 mcg

## Indications and dosages

➤ Post peripheral blood progenitor cell (PBPC) transplantation

**Adults:** 250 mcg/m<sup>2</sup>/day I.V. over 24 hours or subcutaneously once daily, starting immediately after progenitor cell infusion

➤ Mobilization of PBPCs into peripheral blood for collection by leukapheresis

**Adults:** 250 mcg/m<sup>2</sup>/day I.V. over 24 hours or subcutaneously once daily, continued throughout harvesting

➤ Neutrophil recovery after chemotherapy in acute myelogenous leukemia  
**Adults:** 250 mcg/m<sup>2</sup>/day I.V. over 4 hours, starting 4 days after completion of chemotherapy induction

➤ Bone-marrow transplantation failure or engraftment delay

**Adults:** 250 mcg/m<sup>2</sup>/day as 2-hour I.V. infusion for 14 days. If engraftment doesn't occur, may repeat after 7 days of drug hiatus.

➤ Myeloid reconstitution after autologous or allogeneic bone-marrow transplantation

**Adults:** 250 mcg/m<sup>2</sup>/day as a 2-hour I.V. infusion, starting 2 to 4 hours after autologous bone marrow infusion and at least 24 hours after last chemotherapy or radiotherapy dose

### Off-label uses

- Crohn's disease
- Melanoma
- Wound healing
- Mucositis
- Stomatitis
- Vaccine adjuvant

### Contraindications

- Hypersensitivity to drug, its components, or yeast products
- Excessive leukemic myeloid blasts in bone marrow or peripheral blood (10% or more)
- Within 24 hours before or after chemotherapy or radiation therapy

### Precautions

Use cautiously in:

- renal or hepatic insufficiency, fluid retention, pulmonary disorders, pulmonary infiltrates, heart failure, leukocytosis, transient supraventricular arrhythmias
- cancer patients undergoing sargramostim-mobilized PBPC collection
- patients receiving purged bone marrow or previously exposed to intensive chemotherapy or radiation therapy
- pregnant or breastfeeding patients
- children.

### Administration

⚠ Don't give within 24 hours of chemotherapy or radiation therapy.

- Add 1 ml of sterile water to powder for injection by directing water stream against side of vial and swirling vial gently to disperse contents.
- Avoid shaking or agitating solution.
- For a final drug concentration below 10 mcg/ml, add human albumin 0.1% to saline solution; then dilute drug in normal saline solution.
- Infuse as soon as possible after reconstitution, but no more than 6 hours after mixing.
- Don't add other drugs to infusion; don't use in-line filter.

Route	Onset	Peak	Duration
I.V.	Immediate	2 hr	3-6 hr
Subcut.	15 min	1-3 hr	6 hr

### Adverse reactions

**CNS:** malaise, asthenia

**CV:** peripheral edema, tachycardia, hypotension, transient supraventricular tachycardia, **pericardial effusion**

**GI:** nausea, vomiting, diarrhea, anorexia, stomatitis, **GI hemorrhage**

**GU:** urinary tract disorder, **abnormal renal function**

**Hematologic:** blood dyscrasias, hemorrhage

**Hepatic:** hepatic damage

**Musculoskeletal:** joint pain, myalgia, bone pain

**Respiratory:** dyspnea, lung disorder

**Skin:** rash, alopecia

**Other:** fever, chills, sepsis, edema, first-dose reaction (respiratory distress, hypoxia, syncope, tachycardia, hypotension, flushing)

### Interactions

**Drug-drug.** *Corticosteroids, lithium:* potentiation of myeloproliferative effects

*Vincristine:* severe peripheral neuropathy

S

### Patient monitoring

- Monitor for dyspnea. Halve dosage and contact prescriber if dyspnea occurs.
- Assess CBC with white cell differential. Check for presence of blast cells, and watch for signs and symptoms of blood dyscrasias.
- Closely monitor vital signs and fluid intake and output. Stay alert for signs and symptoms of fluid overload.
- 🔊 Monitor liver function tests, and watch for evidence of hepatic damage and bleeding (especially GI hemorrhage).

### Patient teaching

- 🔊 Tell patient sargramostim is a powerful drug that can cause significant adverse reactions. Teach him to recognize and report serious reactions at once.
- 🔊 Instruct patient to immediately report unusual bleeding or bruising or yellowing of skin or eyes.
- Tell patient drug may cause weakness and musculoskeletal pain.
- Inform patient that he'll undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## saxagliptin

Onglyza

**Pharmacologic class:** Dipeptidyl peptidase-4 (DPP-4) inhibitor

**Therapeutic class:** Hypoglycemic

**Pregnancy risk category** B

### Action

Inhibits DPP-4 and slows inactivation of incretin hormones, thereby increasing blood concentrations and reducing

fasting and postprandial glucose concentrations in a glucose-dependent manner in patients with type 2 diabetes mellitus

### Availability

Tablets: 2.5 mg, 5 mg

### Indications and dosages

➤ Adjunct to diet and exercise to improve glycemic control in patients with type 2 diabetes mellitus

**Adults:** 2.5 to 5 mg P.O. daily

### Dosage adjustment

- Moderate, severe, or end-stage renal disease
- Concurrent use of strong CYP450 inhibitors

### Contraindications

- History of serious hypersensitivity to drug (such as anaphylaxis, angioedema, or exfoliative skin conditions)

### Precautions

Use cautiously in:

- renal impairment, history of pancreatitis
- concurrent use of insulin secretagogues or strong CYP450 and CYP3A4/5 inhibitors
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Assess renal function before starting therapy.

🔊 Before starting drug, identify possible risk factors for pancreatitis, such as history of pancreatitis, alcoholism, gallstones, or hypertriglyceridemia.

- Administer without regard to meals.
- Be aware that drug shouldn't be used for the treatment of type 1 diabetes mellitus or diabetic ketoacidosis.

Route	Onset	Peak	Duration
P.O.	Unknown	2 hr	Unknown

### Adverse reactions

**CNS:** headache

**EENT:** sinusitis

**GI:** vomiting, abdominal pain, gastroenteritis, **acute pancreatitis**

**GU:** urinary tract infection

**Metabolic:** hypoglycemia

**Respiratory:** upper respiratory tract infection

**Skin:** urticaria, **exfoliative skin conditions**

**Other:** peripheral edema, facial edema, hypersensitivity (including **anaphylaxis and angioedema**)

### Interactions

**Drug-drug.** *Insulin secretagogues (such as sulfonylureas):* possible increased risk of hypoglycemia

*Strong CYP3A4/5 inhibitors (such as atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin):* significantly increased saxagliptin effect

**Drug-diagnostic tests.** *Lymphocytes:* decreased count

**Drug-food.** *Any food:* increased saxagliptin area under the curve

### Patient monitoring

- Monitor blood glucose and hemoglobin A<sub>1C</sub> levels and renal function tests periodically during therapy.
- Monitor CBC with differential, particularly lymphocyte count, in patients with unusual or prolonged infection.
- 🚨 Observe patient carefully for signs and symptoms of pancreatitis. If pancreatitis is suspected, promptly discontinue drug and initiate appropriate management.

### Patient teaching

- Tell patient to take drug with or without food. Tell patient not to split or cut tablet.
- Teach patient about signs and symptoms of hypoglycemia (blurred vision, confusion, tremor, diaphoresis, excessive hunger, drowsiness, increased heart rate) and how to treat it, especially if taking saxagliptin with other drugs that may cause hypoglycemia.
- 🚨 Instruct patient to discontinue drug and immediately report signs and symptoms of hypersensitivity reaction (such as hives, rash, or swelling of face, lips, or throat) or pancreatitis (persistent severe abdominal pain, sometimes radiating to the back, which may or may not be accompanied by vomiting).
- Instruct patient to routinely monitor blood glucose level at home.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, and food mentioned above.

### scopolamine (hyoscine) ⚠️

Scopoderm TTS ⚠️, Transderm-Scop, Transderm-V ⚠️

### scopolamine hydrobromide (hyoscine hydrobromide)

Buscopan ⚠️, Kwells ⚠️

**Pharmacologic class:** Antimuscarinic, belladonna alkaloid

**Therapeutic class:** Antiemetic, anti-vertigo agent, anticholinergic

**Pregnancy risk category C**

### Action

Acts as competitive inhibitor at post-ganglionic muscarinic receptor sites

of parasympathetic nervous system and on smooth muscles that respond to acetylcholine but lack cholinergic innervation. May block cholinergic transmission from vestibular nuclei to higher CNS centers and from reticular formation to vomiting center.

### Availability

**Injection:** 1 mg/ml in 1-ml vials, 0.4 mg/ml in 0.5-ml ampules and 1-ml vials, 0.86 mg/ml in 0.5-ml ampules  
**Transdermal system (Transderm-Scop):** 1.5 mg/patch (releases 0.5 mg scopolamine over 3 days)

### Indications and dosages

➤ Preanesthetic sedation and obstetric amnesia

**Adults:** 0.3 to 0.6 mg I.M., I.V., or subcutaneously 45 to 60 minutes before anesthesia, usually given with analgesics

➤ Postoperative nausea and vomiting

**Adults:** One transdermal patch placed behind ear on evening before surgery and kept in place for 24 hours after surgery. For cesarean section, one transdermal patch placed behind ear 1 hour before surgery.

➤ Motion sickness

**Adults:** One transdermal patch placed behind ear 4 hours before anticipated need, replaced q 3 days if needed

### Contraindications

- Hypersensitivity to scopolamine, other belladonna alkaloids, or barbiturates
- Hypersensitivity to bromides (injection only)
- Angle-closure glaucoma
- Acute hemorrhage
- Myasthenia gravis
- Obstructive uropathy (including prostatic hypertrophy)
- Obstructive GI disease (including paralytic ileus and intestinal atony)
- Reflux esophagitis

- Ulcerative colitis or toxic megacolon
- Hepatic or renal impairment
- Chronic lung disease (with repeated doses)

### Precautions

Use cautiously in:

- suspected intestinal obstruction; pulmonary or cardiac disease; tachyarrhythmia or tachycardia; open-angle glaucoma; autonomic neuropathy; hypertension; hyperthyroidism; ileostomy or colostomy
- history of seizures or psychosis
- elderly patients
- pregnant or breastfeeding patients (safety not established)
- children.

### Administration

- For I.V. use, give by direct injection at prescribed rate after diluting with sterile water.
- After removing protective strip from transdermal patch, avoid finger contact with exposed adhesive layer to prevent contamination.

Route	Onset	Peak	Duration
I.M., Subcut.	30 min	1 hr	4-6 hr
I.V.	10 min	1 hr	2-4 hr
Transdermal	4 hr	Unknown	72 hr

### Adverse reactions

**CNS:** drowsiness, dizziness, confusion, restlessness, fatigue

**CV:** tachycardia, palpitations, hypotension, transient heart rate changes

**EENT:** blurred vision, mydriasis, photophobia, conjunctivitis

**GI:** constipation, dry mouth

**GU:** urinary hesitancy or retention

**Skin:** decreased sweating, rash

### Interactions

**Drug-drug.** *Antidepressants, antihistamines, disopyramide, quinidine:* additive anticholinergic effects

*Antidepressants, antihistamines, opioid analgesics, sedative-hypnotics*: additive CNS depression

*Oral drugs*: altered absorption of these drugs

*Wax-matrix potassium tablets*: increased GI mucosal lesions

**Drug-herbs.** *Angel's trumpet, jimsonweed, scopolia*: increased anticholinergic effects

**Drug-behaviors.** *Alcohol use*: increased CNS depression

### Patient monitoring

- Assess vital signs and neurologic, cardiovascular, and respiratory status.
- Monitor patient for urinary hesitancy or retention.

### Patient teaching

- Tell patient transdermal patch is most effective if applied to dry skin behind ear 4 hours before traveling.
- Caution patient to avoid touching exposed adhesive layer of transdermal patch.
- Advise patient to wash and dry hands thoroughly before and after applying patch.
- If patch becomes dislodged, instruct patient to remove it and apply new patch on a different site behind ear.
- Tell patient that using patch for more than 72 hours may cause withdrawal symptoms (headache, nausea, vomiting, dizziness). Advise him to limit use when feasible.
- Inform patient that his eyes may be markedly sensitive to light during patch use. Instruct him to wear sunglasses and use other measures to guard eyes from light.
- Caution patient to avoid alcohol because it may increase CNS depression.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the

drugs, herbs, and behaviors mentioned above.

## selegiline hydrochloride

Apo-Selegiline<sup>✳</sup>, Dom-Selegiline<sup>✳</sup>, Eldepryl, Emsam, Gen-Selegiline<sup>✳</sup>, Novo-Selegiline<sup>✳</sup>, Nu-Selegiline<sup>✳</sup>, PMS-Selegiline, Zelapar

**Pharmacologic class:** MAO inhibitor (type B)

**Therapeutic class:** Antidyskinetic

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug may increase risk of suicidal thinking and behavior in children and adolescents with major depressive disorder (MDD) and other psychiatric disorders. Anyone considering using it for MDD in a child or adolescent must balance risk with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family and caregivers to observe patient closely and communicate with prescriber as needed.
- Drug isn't approved for use in pediatric patients.

### Action

Unknown. Thought to increase dopaminergic activity by inhibiting MAO type B in nerve cells, increasing dopamine availability to brain cells.

### Availability

*Capsules:* 5 mg

*Tablets:* 5 mg

*Tablets (orally disintegrating):* 1.25 mg

*Transdermal system:* 6 mg/24 hours, 9 mg/24 hours, 12 mg/24 hours

## Indications and dosages

➤ Adjunctive treatment of Parkinson's disease in patients who don't respond to carbidopa-levodopa alone

**Adults:** 10 mg P.O. daily in divided doses. After 2 to 3 days, attempt to reduce carbidopa-levodopa dosage (typically by 10% to 30%). Or initially, 1.25 mg (orally disintegrating tablets) P.O. daily for at least 6 weeks. May increase after 6 weeks to 2.5 mg P.O. daily based on effect and tolerability.

➤ Major depressive disorder

**Adults:** Initially, apply 6 mg/24 hours patch; increase in dose increments of 2 mg/24 hours up to a maximum dose of 12 mg/24 hours at intervals of no less than two weeks, if needed.

## Off-label uses

- Initial therapy for Parkinson's disease
- Alzheimer's disease
- Narcolepsy
- Adjunct in schizophrenia

## Contraindications

- Hypersensitivity to drug or its components
- Concurrent meperidine therapy

## Precautions

Use cautiously in:

- patients receiving tricyclic antidepressants (TCAs), selective serotonin reuptake inhibitors (SRRIs), or dextromethorphan, carbamazepine, and analgesics such as tramadol, methadone, and propoxyphene
- patients with pheochromocytoma
- elderly patients
- pregnant or breastfeeding patients
- children.

## Administration

- Give orally disintegrating tablets in the morning before breakfast; don't

give food or liquid 5 minutes before and after administration.

- Give capsules or regular tablets with breakfast and lunch, but restrict foods high in tyramine (such as aged cheese, red wine, yogurt, and smoked high-protein foods).

 Don't give within 14 days of TCAs or SSRIs (5 weeks for fluoxetine because of its long half-life).

- Apply patch to dry, intact skin on the upper torso (below the neck and above the waist), upper thigh, or the outer surface of the upper arm once every 24 hours.

Route	Onset	Peak	Duration
P.O.	Unknown	0.5-2 hr	Unknown

## Adverse reactions

**CNS:** agitation, anxiety, bradykinesia, chorea, confusion, delusions, depression, dizziness, hallucinations, headache, dyskinesias, increased akinetic involuntary movements, insomnia, lethargy, light-headedness, loss of balance, syncope, vivid dreams

**CV:** orthostatic hypotension, hypertension, new or increased angina, palpitations, **arrhythmias**

**GI:** nausea, diarrhea, abdominal pain, dry mouth, buccal mucosa irritation (with orally disintegrating tablets)

**GU:** urinary retention

**Musculoskeletal:** leg pain, low back pain

**Other:** generalized aches, weight loss

## Interactions

**Drug-drug.** *Adrenergics:* increased pressor response

*Buspirone:* elevated blood pressure

*Dextromethorphan:* brief episodes of psychosis or bizarre behavior

*Levodopa:* increased adverse reactions to levodopa

*Meperidine and analgesics such as tramadol, methadone, and propoxyphene:* stupor, muscle rigidity, severe agitation, fever, death

*Other MAO inhibitors:* hypertensive crisis

*SSRIs, TCAs:* severe mental status changes, CNS toxicity (with possible hyperpyrexia and death)

**Drug-food.** *Tyramine-rich foods (such as aged cheese, red wine, yogurt, smoked high-protein foods):* hypertensive crisis

**Drug-herbs.** *Cacao:* vasopressor effects  
*Ginseng:* headache, tremor, mania  
*St. John's wort:* life-threatening adverse reactions

### Patient monitoring

- Monitor vital signs and cardiovascular status.
- Assess neurologic status and motor function. Institute safety measures as needed to prevent injury.
- Monitor weight and fluid intake and output.
- Monitor CBC and liver and kidney function tests.

### Patient teaching

- Tell patient to take capsules or regular tablets with or without food, but he should avoid foods and beverages high in tyramine. Provide a list of these foods and beverages.
- Instruct patient (and caregiver as appropriate) to take orally disintegrating tablets in the morning before breakfast and not to push these tablets through the foil backing. Tell patient to peel back the backing of one or two blisters (as prescribed) with dry hands, gently remove the tablet, then immediately place the tablet on top of the tongue where it will disintegrate in seconds. Remind patient to avoid ingesting food or liquids for 5 minutes before and after taking orally disintegrating tablets.
- Inform patient to avoid tyramine-rich foods and beverages beginning on the first day of application of 9mg/24hours- or 12mg/24hours-patch and continue to avoid these foods and beverages for two weeks after a dose reduction to the

6mg/24hours-patch or following the discontinuation of the 9mg/24hours- or 12mg/24hours-patch.

- Instruct patient (and caregiver as appropriate) to monitor neurologic status and motor function and to institute safety precautions as needed to prevent injury.
- Instruct patient to move slowly when sitting up or standing, to avoid dizziness from sudden blood pressure decrease.
- Tell patient (or caregiver) that drug may cause serious interactions with many drugs. Instruct him to tell all prescribers he's taking it.
- Tell patient not to use St. John's wort without consulting with prescriber.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, foods, and herbs mentioned above.

## senna, sennosides

Argoral<sup>✳</sup>, Black Draught, Ex-Lax Gentle, Fleet Pedia-Lax Quick Dissolve, Fletcher's, Maximum Relief Ex-Lax, Nu-Lax<sup>✳</sup>, Perdiem, Senexon, Senna-Gen, Sennatural, Senokot, Senokot Granules, SenokotXTRA, Senolax, Sure-Lax<sup>Ⓜ</sup>

**Pharmacologic class:** Anthraquinone laxative

**Therapeutic class:** Laxative (stimulant)

**Pregnancy risk category C**

### Action

Causes local irritation in colon, which promotes peristalsis and bowel evacuation. Softens feces by increasing water and electrolytes in large intestine.

### Availability

*Granules:* 15 mg/tsp

*Liquid:* 8.8 mg/5 ml, 25 mg/5 ml, 33.3 mg/ml (concentrate)

*Tablets:* 8.6 mg, 10 mg, 15 mg, 17 mg, 25 mg

*Strips (orally disintegrating):* 8.6 mg

*Tablets (chewable):* 10 mg, 15 mg

## Indications and dosages

➤ Acute constipation; preparation for bowel examination

### Adults and children ages 12 and older:

For acute constipation, 12 to 50 mg P.O. daily or b.i.d. For bowel preparation, 105 to 157.5 mg (concentrate) 12 to 14 hours before scheduled procedure.

**Children ages 6 to 11:** 50% of adult dosage. Or, two orally disintegrating strips; don't exceed four strips in 24 hours.

**Children ages 2 to 5:** 33% of adult dosage. Or, one orally disintegrating strip; don't exceed two strips in 24 hours.

## Contraindications

- Hypersensitivity to drug or its components
- GI bleeding or obstruction
- Suspected appendicitis or undiagnosed abdominal pain
- Acute surgical abdomen
- Fecal impaction
- Inflammatory bowel disease (such as Crohn's disease)

## Precautions

Use cautiously in:

- pregnant or breastfeeding patients
- children.

## Administration

- Give with a full glass of cold water.
- To prepare patient for bowel examination, give 12 to 14 hours before procedure, followed by a clear liquid diet.

Route	Onset	Peak	Duration
P.O.	6-24 hr	Unknown	Unknown

## Adverse reactions

**GI:** nausea, vomiting, diarrhea, abdominal cramps, nutrient malabsorption, yellow or yellowish-green feces, loss of normal bowel function (with excessive use), dark pigmentation of rectal mucosa (with long-term use), protein-losing enteropathy

**GU:** reddish-pink discoloration of alkaline urine, yellowish-brown discoloration of acidic urine

**Metabolic:** electrolyte imbalances (such as hypokalemia)

**Other:** laxative dependence (with long-term or excessive use)

## Interactions

**Drug-diagnostic tests.** *Calcium, potassium:* decreased levels

## Patient monitoring

- Assess bowel movements to determine laxative efficacy.
- In long-term use, monitor fluid balance, nutritional status, and electrolyte levels and watch for laxative dependence.

## Patient teaching

- Tell patient using drug for constipation to take at bedtime with a glass of water.
- Instruct patient to place orally disintegrating strips on the tongue, allow strip to dissolve, then drink plenty of water.
- In long-term use, advise patient to watch for and report signs and symptoms of nutritional deficiencies and fluid and electrolyte imbalance.
- If patient will undergo bowel examination, advise him to take drug 12 to 14 hours before procedure, followed by a clear liquid diet.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the tests mentioned above.

## sertraline hydrochloride

Apo-Sertraline<sup>✳</sup>, Co Sertraline, Dom-Sertraline, Gen-Sertraline<sup>✳</sup>, Lustral<sup>⚡</sup>, Novo-Sertraline<sup>✳</sup>, Nu-Sertraline<sup>✳</sup>, PHL-Sertraline<sup>✳</sup>, PMS-Sertraline<sup>✳</sup>, Ratio-Sertraline<sup>✳</sup>, Riva-Sertraline<sup>✳</sup>, Sandoz Sertraline<sup>✳</sup>, Zoloft

**Pharmacologic class:** Selective serotonin reuptake inhibitor (SSRI)

**Therapeutic class:** Antidepressant

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug may increase risk of suicidal thinking and behavior in children and adolescents with major depressive disorder (MDD) and other psychiatric disorders. Risk must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family and caregivers to observe patient closely and communicate with prescriber as needed.
- Drug isn't approved for treating MDD in pediatric patients.

### Action

Inhibits neuronal uptake of serotonin in CNS, potentiating serotonin activity; has little effect on norepinephrine or dopamine uptake

### Availability

Oral concentrate: 20 mg/ml

Tablets: 25 mg, 50 mg, 100 mg

## Indications and dosages

➤ Depression

**Adults:** Initially, 50 mg/day P.O. depending on response. May increase at weekly intervals to a maximum of 200 mg/day.

➤ Obsessive-compulsive disorder

**Adults and children ages 13 to 17:** Initially, 50 mg/day P.O. May increase at weekly intervals to a maximum of 200 mg/day.

**Children ages 6 to 12:** 25 mg/day P.O.

➤ Panic disorder; social anxiety disorder; posttraumatic stress disorder  
**Adults:** Initially, 25 mg/day P.O. After 1 week, may increase to 50 mg/day; depending on response, may then increase at weekly intervals to a maximum of 200 mg/day.

➤ Premenstrual dysphoric disorder  
**Adults:** Initially, 50 mg/day P.O., either throughout entire menstrual cycle or only during luteal phase. For maintenance, 50 to 150 mg/day.

### Off-label uses

- Premature ejaculation

### Contraindications

- Hypersensitivity to drug or its components
- MAO inhibitor use within past 14 days
- Concurrent pimozide use
- Concurrent use of disulfiram (oral concentrate)

### Precautions

Use cautiously in:

- seizures disorders, severe hepatic or renal impairment, increased risk for suicide
- history of mania
- concurrent use of serotonergic agents such as tryptophan (use not recommended)
- pregnant or breastfeeding patients
- children.

## Administration

- Give as a single dose in morning or evening.

 Don't use rubber dropper when giving concentrate to patient with latex allergy.

 Don't give concurrently with pimoziide or within 14 days of MAO inhibitors.

Route	Onset	Peak	Duration
P.O.	Unknown	4.5-8.5 hr	Unknown

## Adverse reactions

**CNS:** dizziness, drowsiness, fatigue, headache, insomnia, agitation, anxiety, confusion, emotional lability, poor concentration, mania, nervousness, weakness, yawning, tremor, hypertonia, hypoesthesia, paresthesia, **suicidal behavior or ideation** (especially in child or adolescent), **neuroleptic malignant syndrome-like reactions**

**CV:** chest pain, palpitations

**EENT:** vision abnormalities, tinnitus, rhinitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, flatulence, abdominal pain, dry mouth, anorexia

**GU:** urinary frequency, urinary disorders, sexual dysfunction, menstrual disorders

**Musculoskeletal:** back pain, myalgia

**Skin:** diaphoresis, rash

**Other:** altered taste, increased appetite, fever, thirst, hot flashes, **serotonin syndrome**

## Interactions

**Drug-drug.** *Adrenergics:* increased adrenergic sensitivity, increased risk of serotonin syndrome

*Cimetidine:* increased sertraline blood level and effects

*Clozapine, most benzodiazepines, phenytoin, tricyclic antidepressants, tolbutamide, warfarin:* increased blood levels and effects of these drugs

*Disulfiram:* disulfiram reaction, indicated by nausea, vomiting, flushing, throbbing headache, diaphoresis,

cardiovascular and respiratory reactions (with sertraline oral concentrate)

*Drugs affecting serotonergic system (selective serotonin reuptake inhibitors, selective norepinephrine reuptake inhibitors), linezolid, lithium, tramadol, triptans, tryptophan:* increased risk of serotonin syndrome

*Drugs metabolized by CYP450-2D6 or CYP450-3A4:* increased blood levels of these drugs

*MAO inhibitors:* potentially fatal reactions (hyperthermia, rigidity, myoclonus, autonomic instability)

*Pimoziide:* increased pimoziide blood level

*Sumatriptan:* weakness, hyperreflexia, incoordination

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase:* increased levels

*Immunoassay screening tests for benzodiazepines:* false-positive results

**Drug-herbs.** *S-adenosylmethionine (SAM-e), St. John's wort:* increased risk of serotonergic side effects, including serotonin syndrome

**Drug-behaviors.** *Alcohol use:* increased CNS effects

## Patient monitoring

 Monitor patient's mental status carefully. Stay alert for mood changes and indications of suicidal ideation, especially in child or adolescent.

 Monitor patient for development of potentially life-threatening serotonin syndrome or neuroleptic malignant syndrome-like reactions.

- Evaluate neurologic status regularly. Institute safety measures, as appropriate, to prevent injury.

- Monitor temperature. Watch for fever and other signs or symptoms of infection.

## Patient teaching

- Advise patient to take once a day, either in morning or night, with or without food.

- If evening dose causes insomnia, recommend switching to morning dose.
- Instruct patient to mix oral concentrate with 4 oz of recommended liquid only. Advise him to swallow diluted drug immediately after mixing.
- Tell patient using oral concentrate that drug contains alcohol.
- 🔊 Caution patient not to stop taking drug suddenly. Dosage must be tapered.
- Inform patient that drug may cause serious interactions with many common drugs. Instruct him to tell all prescribers he's taking it.
- 🔊 Advise patient (and significant other as appropriate) to monitor his mental status carefully and to immediately report increased depression or suicidal thoughts or behavior (especially in child or adolescent).
- 🔊 Teach patient to recognize and immediately report signs and symptoms of serotonin syndrome or neuroleptic malignant syndrome.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## sildenafil

Revatio

## sildenafil citrate

Viagra

**Pharmacologic class:** Phosphodiesterase type 5 (PDE5) inhibitor

**Therapeutic class:** Anti-erectile dysfunction agent

**Pregnancy risk category B**

## Action

Inhibits PDE5, enhancing the effects of nitric oxide released during sexual stimulation. This action inactivates cyclic guanosine monophosphate (cGMP), which then increases cGMP levels in corpus cavernosum. Resulting smooth muscle relaxation promotes increased blood flow and subsequent erection. Also relaxes pulmonary vascular smooth muscle cells and, to a lesser degree, vasodilation in systemic circulation.

## Availability

**Injection (Revatio):** 10 mg in 12.5-ml single-use vial

**Tablets:** 20 mg (Revatio); 25 mg, 50 mg, 100 mg (Viagra)

## Indications and dosages

➤ Erectile dysfunction

**Adults:** 50 mg P.O., preferably 1 hour before anticipated sexual activity. Range is 25 to 100 mg taken 30 minutes to 4 hours before sexual activity, not to exceed one dose daily.

➤ Pulmonary hypertension (Revatio only)

**Adults:** 20 mg P.O. t.i.d. approximately 4 to 6 hours apart, with or without food. Higher doses not recommended. Or, 10 mg by I.V. bolus t.i.d.

## Dosage adjustment

- Hepatic or renal impairment (Viagra)
- Concurrent use of hepatic isoenzyme inhibitors (such as cimetidine, erythromycin, itraconazole, ketoconazole) (Viagra)
- Elderly patients (Viagra)

## Contraindications

- Hypersensitivity to drug
- Concurrent use of nitrates (nitroglycerin, isosorbide mononitrate or dinitrate)

## Precautions

Use cautiously in:

- serious cardiovascular disease (such as history of myocardial infarction, cerebrovascular accident, or serious arrhythmia within past 6 months); coronary artery disease (current or previous) with unstable angina; resting blood pressure below 90/50 mm Hg or above 170/110 mm Hg (current or previous); heart failure (current or previous); renal or hepatic impairment (current or previous); bleeding disorder; active peptic ulcer; anatomic penile deformity; retinitis pigmentosa; conditions associated with priapism (sickle cell anemia, multiple myeloma, leukemia); pulmonary veno-occlusive disease; use not recommended for any of these conditions
- history of uncontrolled hypertension or hypotension
- concurrent use of alpha blockers and antihypertensives (particularly bosentan)
- concurrent use of potent CYP3A inhibitors such as erythromycin, ketoconazole, itraconazole, ritonavir, or saquinavir (use not recommended)
- patients older than age 65
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

## Administration

 Don't give concurrently with nitrates.

- Administer Viagra 30 minutes to 4 hours before sexual activity.
- If administering Revatio I.V., give by bolus injection only.

Route	Onset	Peak	Duration
P.O.	Within 1 hr	Unknown	Up to 4 hr
I.V.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** headache, dizziness, anxiety, drowsiness, vertigo, transient global amnesia, insomnia, paresthesia,

seizures, cerebrovascular hemorrhage, transient ischemic attack

**CV:** hypertension, hypotension, myocardial infarction (MI), cardiovascular collapse, ventricular arrhythmias, sudden death

**EENT:** transient vision loss, blurred or color-tinged vision, increased light sensitivity, ocular redness, retinal bleeding, vitreous detachment or traction, photophobia, hearing loss, epistaxis, rhinitis, sinusitis nasal congestion

**GI:** diarrhea, dyspepsia, gastritis

**Musculoskeletal:** myalgia

**Respiratory:** exacerbation of dyspnea

**GU:** hematuria, urinary tract infection, priapism

**Skin:** flushing, rash, erythema, pyrexia

**Other:** hypersensitivity including anaphylactic reactions (rare)

## Interactions

**Drug-drug.** *Alpha blockers, Antihypertensives, nitrates:* increased risk of hypotension

*Enzyme inducers, rifampin:* reduced sildenafil blood level

*Hepatic isoenzyme inhibitors (such as cimetidine, erythromycin, itraconazole, ketoconazole), protease inhibitors (such as indinavir, nelfinavir, ritonavir, saquinavir):* increased sildenafil blood level and effects

**Drug-food.** *High-fat diet:* reduced drug absorption, decreased peak level

## Patient monitoring

- Monitor cardiovascular status carefully.
- Evaluate patient's vision and hearing.
- Assess for drug efficacy.

## Patient teaching

- Advise patient taking drug for erectile dysfunction to take 30 minutes to 4 hours before sexual activity.

- Tell patient not to exceed prescribed dosage or take more than one dose daily.

-  Instruct patient to stop sexual activity and contact prescriber immediately if chest pain, dizziness, or nausea occurs.

-  Teach patient to recognize and immediately report serious cardiac and vision problems and sudden decrease in or loss of hearing.

- Inform patient that drug can cause serious interactions with many common drugs. Instruct him to tell all prescribers he's taking it.

-  Caution patient never to take drug with nitrates, because of risk of potentially fatal hypotension.

- Instruct patient not to take other PDE5 inhibitors.

- Instruct patient to report priapism (persistent, painful erection) or erections lasting more than 4 hours.

- Tell patient that high-fat diet may interfere with drug efficacy.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and foods mentioned above.

## silodosin

Rapaflo

**Pharmacologic class:** Alpha<sub>1</sub>-adrenergic receptor antagonist

**Therapeutic class:** Benign prostatic hyperplasia (BPH) agent

**Pregnancy risk category B**

## Action

Selectively inhibits alpha<sub>1</sub>-adrenergic receptors in the lower urinary tract, relaxing smooth muscle in bladder neck and prostate

## Availability

**Capsules:** 4 mg, 8 mg

## Indications and dosages

> BPH

**Adults:** 8 mg P.O. daily

## Dosage adjustment

- Moderate renal impairment

## Contraindications

- Severe hepatic or renal impairment
- Concomitant administration with strong CP450 3A4 (CYP3A4) inhibitors

## Precautions

Use cautiously in:

- moderate renal impairment
- orthostatic hypotension
- cataract surgery (risk of intraoperative floppy iris syndrome)
- concurrent use with other alpha blockers, antihypertensives, moderate CYP3A4 inhibitors, PDE5 inhibitors
- concurrent use with strong P-glycoprotein inhibitors (not recommended)
- females (not indicated)
- children (safety and efficacy not established).

## Administration

- Administer drug with a meal.

Route	Onset	Peak	Duration
P.O.	Unknown	2-6 hr	Unknown

## Adverse reactions

**CNS:** dizziness, headache, insomnia, asthenia

**CV:** orthostatic hypotension

**EENT:** nasopharyngitis, nasal congestion, rhinorrhea, sinusitis

**GI:** diarrhea, abdominal pain

**GU:** retrograde ejaculation

**Hematologic:** purpura

## Interactions

**Drug-drug.** *Antihypertensives:* increased dizziness and hypotension  
*PDE5 inhibitors (such as tadalafil):* increased risk of symptomatic hypotension

*Strong CYP3A4 inhibitors (such as clarithromycin, itraconazole, ketoconazole, ritonavir, strong P-glycoprotein inhibitors (such as cyclosporine):* increased silodosin plasma concentration

**Drug-diagnostic tests.** *Prostate-specific antigen:* increased level

## Patient monitoring

- Monitor renal and hepatic function tests closely.
- Monitor blood pressure. Stay alert for orthostatic hypotension.

## Patient teaching

- Instruct patient to take drug with a meal.
- Advise patient to move slowly when sitting up or standing, to avoid dizziness or light-headedness from sudden blood pressure decrease.
- Caution patient to avoid driving and other hazardous activities until drug's effects on concentration and alertness are known.
- Advise patient to tell ophthalmologist about taking silodosin before cataract surgery or other procedures involving the eyes, even if patient is no longer taking drug.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and tests mentioned above

## simethicone (simeticone)

Dentinox Colic Drops , Equalizer Gas Relief, GasAid, Gas-X, Gas-X Extra Strength, Genasyme, Infacol , Infantaire Gas, Maximum Strength Mylanta Gas, Mylanta Gas, Mylicon, Mylicon Infant Drops, Ovol , Phazyme, Wind-Eze 

**Pharmacologic class:** Methylated linear siloxane mixture

**Therapeutic class:** Antiflatulent, antifoam agent

**Pregnancy risk category** NR

## Action

Causes gas bubbles to coalesce and allows gas to pass through GI tract via belching or passing of flatus. Silicone antifoam spreads on surface of aqueous liquids, forming a film of low surface tension that causes foam bubbles to collapse.

## Availability

*Capsules:* 95 mg, 125 mg

*Capsules (liquid-filled):* 125 mg, 166 mg

*Drops:* 40 mg/0.6 ml, 40 mg/1 ml, 95 mg/1.425 ml

*Suspension:* 40 mg/0.6 ml, 50 mg/5 ml

*Tablets:* 60 mg, 62.5 mg, 80 mg, 95 mg

*Tablets (chewable):* 40 mg, 80 mg, 125 mg, 150 mg, 166 mg

## Indications and dosages

 Excess gas in GI tract after surgery or from air swallowing, dyspepsia, peptic ulcer, or diverticulitis

**Adults and children older than age 12:** 40 to 125 mg P.O. q.i.d. after meals and at bedtime, up to 500 mg/day

**Children ages 2 to 12:** 40 mg P.O. q.i.d., up to 240 mg/day

**Children younger than age 2:** 20 mg P.O. q.i.d.

## Contraindications

- Hypersensitivity to drug
- Intestinal perforation or obstruction

## Precautions

Use cautiously in:

- abdominal pain of unknown cause (especially when accompanied by fever).

## Administration

- Give as needed after meals and at bedtime.

Route	Onset	Peak	Duration
P.O.	Immediate	Unknown	3 hr

## Adverse reactions

None significant

## Interactions

None significant

## Patient monitoring

- Monitor GI status to assess drug efficacy.

## Patient teaching

- Tell patient to take after meals and at bedtime as needed.
- Caution patient not to take dose higher than indicated on package unless prescriber approves.

## simvastatin

Apo-Simvastatin<sup>\*</sup>, Co Simvastatin<sup>\*</sup>, Dom-Simvastatin<sup>\*</sup>, Gen-Simvastatin<sup>\*</sup>, Novo-Simvastatin<sup>\*</sup>, Nu-Simvastatin<sup>\*</sup>, PHL-Simvastatin<sup>\*</sup>, PMS-Simvastatin<sup>\*</sup>, Ranzolont<sup>⊕</sup>, Ratio-Simvastin<sup>\*</sup>, Riva-Simvastatin<sup>\*</sup>, Sandoz Simvastatin<sup>\*</sup>, Simvador<sup>⊕</sup>, Zocor

**Pharmacologic class:** HMG-CoA reductase inhibitor

**Therapeutic class:** Antihyperlipidemic

**Pregnancy risk category** X

## Action

Inhibits hepatic enzyme HMG-CoA reductase, interrupting cholesterol synthesis and low-density lipoprotein (LDL) consumption. Net effect is total cholesterol and serum triglyceride reductions.

## Availability

*Tablets:* 5 mg, 10 mg, 20 mg, 40 mg, 80 mg

## Indications and dosages

➤ Adjunct to diet to reduce risk of coronary heart disease (CHD) deaths, cardiovascular events, and hyperlipidemia

**Adults:** Initially, 10 to 20 mg P.O. daily in the evening. For patients at high risk for a CHD event due to existing CHD, diabetes, peripheral vessel disease, or history of stroke or other cerebrovascular disease, initial dosage is 40 mg/day. Range is 5 to 40 mg/day. Restrict use of 80-mg dose to patients who have been taking simvastatin 80 mg long term (for example, for 12 months or more) without evidence of muscle toxicity. Patients unable to achieve their LDL-C goal utilizing 40-mg dose should not be titrated to 80-mg dose, but should be placed on alternative LDL-C-lowering treatment that provides greater LDL-C lowering effects.

➤ Adjunct to other lipid-lowering treatments (such as LDL apheresis) or if such treatments are unavailable for patients with homozygous familial hypercholesterolemia

**Adults:** 40 mg/day P.O. in the evening.

➤ Heterozygous familial hypercholesterolemia after failure of an adequate trial of diet therapy

**Adolescent boys and postmenarchal girls ages 10 to 17:** Initially, 10 mg P.O. daily in the evening. Range is 10 to 40 mg/day; maximum dose is 40 mg/day. Adjust at intervals of 4 weeks or longer.

## Dosage adjustment

- Severe renal impairment
- Concurrent use of amiodarone, amlodipine, diltiazem, fibrates, niacin, ranolazine, verapamil, or voriconazole
- Elderly patients

## Contraindications

- Hypersensitivity to drug or its components
- Active hepatic disease or unexplained persistent serum transaminase elevations
- Concurrent use of cyclosporine, danazol, gemfibrozil, or strong CYP3A4 inhibitors
- Women who are pregnant or may become pregnant
- Breastfeeding patients

## Precautions

Use cautiously in:

- severe renal impairment; severe acute infection; hypotension; severe metabolic, endocrine, or electrolyte problems; uncontrolled seizures; visual disturbances; myopathy; major surgery; trauma; alcoholism
- history of hepatic disease, liver enzyme abnormalities
- concurrent use of amiodarone, amlodipine, colchicine, digoxin, diltiazem, and lipid-modifying dosages (1 g/day or more) of niacin-containing products, other fibrates, ranolazine, verapamil, or warfarin
- concurrent use of simvastatin in dosages exceeding 20 mg/day with lipid-modifying dosages (1 g/day or more) of niacin-containing products in Chinese patients (avoid use)
- large quantities of grapefruit juice (avoid use)
- elderly patients
- children younger than age 10 (safety not established).

## Administration

- Check liver function tests before starting therapy.

- Give with evening meal. Don't give with large amounts of grapefruit juice.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** headache, asthenia

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain or cramps, flatulence, dyspepsia

**Musculoskeletal:** myalgia, **rhabdomyolysis**

**Respiratory:** upper respiratory infection

## Interactions

**Drug-drug.** *Amiodarone, calcium channel blockers (such as amlodipine, diltiazem, verapamil), colchicine, other lipid-lowering drugs (such as fibrates or lipid-modifying doses of niacin-containing products), ranolazine, voriconazole:* increased risk of myopathy including rhabdomyolysis

*Cyclosporine, danazol, diltiazem, gemfibrozil, nefazodone, strong CYP3A4 inhibitors (clarithromycin, erythromycin, HIV protease inhibitors, itraconazole, ketoconazole, posaconazole, telithromycin):* increased risk of severe myopathy or rhabdomyolysis

*Digoxin:* slightly increased digoxin blood level

*Warfarin:* modestly increased anticoagulant effects

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase:* increased levels

**Drug-food.** *Grapefruit juice (more than 1 qt daily):* increased drug blood level, greater risk of adverse reactions

**Drug-behaviors.** *Alcohol use:* increased risk of hepatotoxicity

## Patient monitoring

 Watch closely for myositis and other adverse musculoskeletal reactions. Know that drug may cause rhabdomyolysis.

- Monitor liver function tests, CBC, and lipid levels.
- In patients receiving warfarin concurrently, closely monitor prothrombin time and International Normalized Ratio.

### Patient teaching

- Advise patient to take with evening meal, but not with large amounts of grapefruit juice.
- Tell patient drug may take up to 4 weeks to be effective.
- 🔊 Caution patient to stop taking drug and contact prescriber if she suspects she is pregnant.
- 🔊 Teach patient to recognize and report signs and symptoms of myopathy or hepatic disorders.
- Instruct patient to avoid alcohol use.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## sipuleucel-T

Provenge

**Pharmacologic class:** Autologous cellular immunotherapy

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** None

### Action

Not clearly understood. Induces an immune response targeted against prostatic acid phosphatase (PAP), an antigen expressed in most prostate cancers. During *ex vivo* culture with PAP-GM-CSF (granulocyte macrophage-colony stimulating factor), APCs (tumor suppressor genes) take up and process the recombinant target antigen into small peptides that are then displayed on the APC surface.

### Availability

*Suspension for injection:* 50 million autologous CD54+ cells activated with PAP-GM-CSF suspended in 250 ml of lactated Ringer's injection in infusion bag

### Indications and dosages

➤ Asymptomatic or minimally symptomatic metastatic castration-resistant (hormone refractory) prostate cancer  
**Adults:** 50 million autologous CD54+ cells activated with PAP-GM-CSF in lactated Ringer's solution by I.V. infusion over approximately 60 minutes; give three complete doses at approximately 2-week intervals

### Contraindications

None

### Precautions

Use cautiously in:

- cardiac or pulmonary conditions
- infusion reactions
- concurrent use of chemotherapy or immunosuppressive therapy.

### Administration

- Be aware that drug is for autologous use only.
- Don't infuse drug until confirmation of product release has been received from manufacturer.
- Premedicate with acetaminophen and an antihistamine such as diphenhydramine approximately 30 minutes before infusing drug, to prevent infusion reactions.
- Administer by I.V. infusion only. Don't use a cell filter.
- Gently mix and resuspend bag's contents; inspect for clumps and clots. Small clumps of cellular material should disperse with gentle manual mixing. Don't administer if bag leaks during handling or if clumps remain in bag.
- 🔊 Interrupt or slow infusion for acute infusion reactions. If infusion

S

must be interrupted, don't resume infusion if infusion bag is held at room temperature for more than 3 hours.

- Observe patient for at least 30 minutes after each infusion.
- Be aware that if patient is unable to receive scheduled infusion for any reason, patient will need to undergo an additional leukapheresis procedure if course of treatment is to be continued.
- Be aware that drug isn't recommended for patients with visceral disease and less than 6-month life expectancy.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache, dizziness, fatigue, paresthesia, asthenia, insomnia, tremor, **cerebrovascular events**

**CV:** hypertension

**GI:** nausea, vomiting, diarrhea, constipation, anorexia, oral paresthesia

**GU:** hematuria, urinary tract infection

**Hematologic:** anemia

**Musculoskeletal:** back pain, joint and muscle ache, extremity pain, muscle and bone pain, neck pain, muscle spasms

**Respiratory:** dyspnea, upper respiratory tract infection, cough

**Skin:** rash

**Other:** chills, fever, pain, citrate toxicity, influenza-like illness, peripheral edema, hot flushes, chest pain, sweating, weight loss, **risk of transmitting infectious diseases, acute infusion reactions**

### Interactions

None

### Patient monitoring

- 🔊 Continue to observe patient for infusion reaction after each infusion.
- 🔊 Monitor patient for cerebrovascular events, including hemorrhagic and ischemic strokes.

### Patient teaching

- Inform patient that each infusion is preceded by a leukapheresis procedure approximately 3 days before drug infusion and that it's important to maintain all scheduled appointments and arrive at each appointment on time, because the leukapheresis and infusions must be appropriately spaced and drug expiration time must not be exceeded.
- Explain importance of premedication before starting infusion.
- 🔊 Instruct patient to immediately report signs and symptoms of acute infusion reactions (such as fever, chills, fatigue, breathing problems, dizziness, high blood pressure, nausea, vomiting, headache, or muscle aches).
- Instruct patient to promptly notify prescriber if fever or swelling or redness around catheter site occurs, because these could indicate an infected catheter.
- Instruct patient to tell prescriber about all drugs he's taking, especially immunosuppressants.
- As appropriate, review all other significant and life-threatening adverse reactions mentioned above.

## sirolimus

Rapamune

**Pharmacologic class:** Macrocyclic lactone

**Therapeutic class:** Immunosuppressant

**Pregnancy risk category C**

### FDA BOXED WARNING

- Immunosuppression may increase patient's susceptibility to infection and lymphoma development. Give under supervision of physician experienced in immunosuppressive therapy and

management of renal transplant patients, in facility with adequate diagnostic and treatment resources.

Physician responsible for maintenance therapy should have complete information needed for patient follow-up.

- Safety and efficacy of sirolimus as an immunosuppressant haven't been established in liver or lung transplant patients; therefore, such use isn't recommended.
- Sirolimus in combination with tacrolimus was associated with excess mortality and graft loss in a study in de novo liver transplant patients. Many of these patients had evidence of infection at or near time of death. In this and another study in de novo liver transplant patients, sirolimus in combination with cyclosporine or tacrolimus was associated with an increase in hepatic artery thrombosis (HAT); most cases of HAT occurred within 30 days after transplantation and most led to graft loss or death.
- Cases of bronchial anastomotic dehiscence, most fatal, have occurred in de novo lung transplant patients when sirolimus was used as part of an immunosuppressive regimen.

## Action

Inhibits early activation and proliferation of T lymphocytes and inhibits cell cycle progression at a later stage

## Availability

*Oral solution:* 1 mg/ml

*Tablets:* 1 mg, 2 mg

## Indications and dosages

➤ Prevention of organ rejection in patients with kidney transplants

**Adults and adolescents older than age 13 who weigh more than 40 kg (88 lb):**

Initially, 6 mg P.O. as a single dose as soon as possible after transplantation, then a maintenance dosage of 2 mg

P.O. once daily. Usually given with cyclosporine and corticosteroids.

## Dosage adjustment

- Mild to moderate hepatic failure

## Contraindications

- Hypersensitivity to drug or its components

## Precautions

Use cautiously in:

- renal or hepatic disease, cancer, diabetes mellitus, hyperlipidemia, infectious complications
- patients with liver or lung transplants (use not recommended)
- concurrent use of aminoglycosides, amphotericin B, and other nephrotoxic agents
- concurrent use of strong CYP3A4 inhibitors such as ketoconazole, voriconazole, itraconazole, erythromycin, telithromycin, or clarithromycin or strong CYP3A4 inducers such as rifampin or rifabutin (use not recommended)
- pregnant or breastfeeding patients
- children younger than age 13.

## Administration

- Administer consistently either with or without food.
- Use syringe provided to withdraw prescribed amount. Dilute oral solution in a glass or plastic (not Styrofoam) cup containing at least 2 oz of water or orange juice. Don't use other fluids, especially grapefruit juice.
- Swirl cup to mix drug thoroughly; discard syringe. Administer diluted drug right away. Then fill cup with 4 oz of water or orange juice, and have patient drink fluid right away.
- ⚠ If solution touches skin or mucous membranes, immediately wash affected area with soap and water.
- Wait 4 hours after the cyclosporine dose (if prescribed) before giving sirolimus.

Route	Onset	Peak	Duration
P.O.	Unknown	1-3 hr	Unknown

### Adverse reactions

**CNS:** headache, drowsiness, paresthesia, hypoesthesia, hypertonia, hyper-tonia, emotional lability, dizziness, confusion, syncope, malaise, asthenia, depression, anxiety, tremor, insomnia

**CV:** hypertension, hypotension, tachycardia, chest pain, edema, palpitations, vasodilation, peripheral edema, peripheral vascular disorders,

**thrombophlebitis, thrombosis, heart failure, atrial fibrillation, hemorrhage, pericardial effusion**

**EENT:** abnormal vision, cataract, conjunctivitis, hearing loss, ear pain, otitis media, tinnitus, epistaxis, rhinitis, sinusitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, hernia, enlarged abdomen, ascites, esophagitis, eructation, flatulence, gastritis, gastroenteritis, dysphagia, stomatitis, mouth ulcers, oral candidiasis, anorexia, **peritonitis**

**GU:** dysuria, nocturia, pyuria, urinary retention, hematuria, albuminuria, urinary frequency or incontinence, urinary tract infection, pelvic pain, kidney or bladder pain, hydronephrosis, erectile dysfunction, scrotal edema, testes disorders, **oliguria, GU tract hemorrhage, renal tubular necrosis, toxic nephropathy**

**Hematologic:** anemia, bruising, polycythemia, **leukocytosis, thrombocytopenia, leukopenia, thrombotic thrombocytopenia**

**Metabolic:** hyperlipidemia, glycosuria, hyperglycemia, diabetes mellitus, hypokalemia, hypophosphatemia, hypovolemia, hypercalcemia, dehydration, Cushing's syndrome, **acidosis**

**Respiratory:** dyspnea, cough, upper respiratory infection, bronchitis, hypoxia, pneumonia, **atelectasis, pleural effusion, pulmonary edema,**

**asthma, interstitial lung disease (including pneumonitis, bronchiolitis obliterans organizing pneumonia, pulmonary fibrosis)**

**Skin:** skin ulcers, skin hypertrophy, pruritus, fungal dermatitis, hirsutism, rash, acne, cellulites, **non-melanoma skin cancer**

**Other:** gingivitis, gum hyperplasia, weight changes, neck pain, fever, abscess, chills, facial edema, flu-like symptoms, infection, lymphadenopathy, abnormal healing, lymphocele, fluid accumulation (including lymphedema, ascites), **opportunistic infections (such as tuberculosis, fatal infections, sepsis), hypersensitivity reactions (including anaphylactic/anaphylactoid reactions, angioedema, exfoliative dermatitis, hypersensitivity vasculitis) lymphoma**

### Interactions

**Drug-drug.** *Aminoglycosides, amphotericin, other nephrotoxic drugs:* increased risk of nephrotoxicity  
*Bromocriptine, cimetidine, clarithromycin, danazol, erythromycin, fluconazole, indinavir, itraconazole, metoclopramide, nifedipine, ritonavir, verapamil, other CYP3A4 inhibitors:* decreased sirolimus metabolism and increased blood level

*Carbamazepine, phenobarbital, phenytoin, rifabutin, rifampin, other CYP3A4 inducers:* decreased sirolimus blood level

*Cyclosporine, diltiazem:* increased sirolimus blood level

*Live-virus vaccines:* reduced vaccine efficacy

**Drug-diagnostic tests.** *Blood urea nitrogen, cholesterol, creatinine, hepatic enzymes, lipids, red blood cells:* increased levels

*Calcium, glucose, phosphate, white blood cells:* increased or decreased levels

*Hemoglobin, magnesium, platelets, sodium:* decreased levels

**Drug-food.** *Grapefruit juice:* decreased sirolimus metabolism and increased blood level

**Drug-herbs.** *Astragalus, echinacea, melatonin, St. John's wort:* decreased sirolimus efficacy

### Patient monitoring

- Watch closely for signs and symptoms of infection and hypersensitivity reactions.
- Monitor renal function tests, lipid panel, electrolyte levels, blood chemistry studies, and sirolimus blood level.
- Evaluate all body systems carefully, especially cardiovascular, respiratory, and renal.
- Assess neurologic status closely. Implement safety precautions as needed to prevent injury.
- Be aware that cases of *Pneumocystis carinii* pneumonia have occurred in patients not receiving antimicrobial prophylaxis. Therefore, antimicrobial prophylaxis for *P. carinii* pneumonia should be administered for 1 year following transplantation. In addition, cytomegalovirus (CMV) prophylaxis is recommended for 3 months after transplantation, particularly for patients at increased risk for CMV disease.
- Watch for abnormal wound healing, especially in patients with body mass index greater than 30 kg/m<sup>2</sup>.

### Patient teaching

- Teach patient correct procedure for taking drug.
- Advise patient to take consistently either with or without food, but not with grapefruit juice.
- Instruct patient to wait 4 hours after cyclosporine dose (if prescribed) before taking sirolimus.
- 📣 Tell patient to wash affected area with soap and water immediately if

drug touches his skin or mucous membranes.

- Inform patient that drug affects almost every body system. Advise him to report significant adverse reactions.
- 📣 Advise patient that drug lowers resistance to infection. Instruct him to immediately report fever, cough, breathing problems, sore throat, or other signs and symptoms of infection.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- 📣 Instruct patient to immediately report unusual bleeding or bruising.
- 📣 Advise female patient to use effective contraception before and during therapy and for 12 weeks after discontinuation.
- 📣 Caution patient to limit exposure to sunlight and ultraviolet light. Advise him to wear protective clothing and to use sunscreen with a high protection factor to help prevent skin cancer.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## sitagliptin phosphate

Januvia

S

**Pharmacologic class:** Dipeptidyl peptidase 4 (DPP-4) inhibitor

**Therapeutic class:** Hypoglycemic

**Pregnancy risk category B**

### Action

Inhibits DPP-4 and slows inactivation of incretin hormones, helping to regulate glucose homeostasis through increased insulin release and decreased glucagon levels

**Availability**

Tablets: 25 mg, 50 mg, 100 mg

**Indications and dosages**

➤ Adjunct to diet and exercise to improve glycemic control in type 2 diabetes mellitus

**Adults:** 100 mg P.O. once daily

**Dosage adjustment**

• Moderate to severe renal insufficiency or end-stage renal disease

**Contraindications**

• History of serious hypersensitivity to drug (such as anaphylaxis or angioedema)

**Precautions**

Use cautiously in:

- concurrent administration of drugs that cause hypoglycemia (such as sulfonylureas or insulin)
- renal impairment, history of pancreatitis
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

**Administration**

- Assess renal function before starting therapy.
- ⚠ Before starting drug, ask patient about possible risk factors for pancreatitis, such as history of pancreatitis, alcoholism, gallstones, or hypertriglyceridemia. However, it's unknown if these conditions make it more likely that pancreatitis will occur.
- Give with or without food.
- Be aware that drug shouldn't be used to treat type 1 diabetes mellitus or diabetic ketoacidosis.
- Know that when drug is used with a sulfonylurea, a lower dose of sulfonylurea may be required, to reduce risk of hypoglycemia.

Route	Onset	Peak	Duration
P.O.	Rapid	1-4 hr	Unknown

**Adverse reactions**

**CNS:** headache

**EENT:** nasopharyngitis

**GI:** abdominal pain, nausea, vomiting, diarrhea, **pancreatitis**

**GU:** acute renal failure

**Respiratory:** upper respiratory tract infection

**Other:** hypersensitivity reactions (including **anaphylaxis, angioedema, exfoliative skin conditions such as Stevens-Johnson syndrome**)

**Interactions**

**Drug-drug.** *Digoxin:* minimally increased digoxin effect and blood level

*Insulin, sulfonylureas:* possible increased hypoglycemia risk

**Patient monitoring**

- Monitor renal function periodically.
- Measure patient's weight and body mass index periodically during therapy.
- Monitor blood glucose and hemoglobin A<sub>1c</sub> levels periodically during therapy.
- ⚠ Monitor patient for signs and symptoms of hypersensitivity reactions and immediately stop drug and institute emergency measures if such reactions occur.
- Check for diabetes signs and symptoms and disease progression routinely during therapy.
- ⚠ Be aware of postmarketing reports of acute pancreatitis, including fatal and nonfatal hemorrhagic or necrotizing pancreatitis. If pancreatitis is suspected, promptly discontinue drug.

**Patient teaching**

- Instruct patient to take drug with or without food.
- Teach patient about signs and symptoms of hypoglycemia (such as blurred vision, confusion, tremor, sweating, excessive hunger, drowsiness, and fast heart rate).

📣 Teach patient about signs and symptoms of hypersensitivity reactions (such as rash, throat swelling, or difficulty breathing) and to immediately contact prescriber if these occur.

📣 Instruct patient to immediately discontinue drug and report if signs and symptoms of pancreatitis occur (persistent severe abdominal pain, sometimes radiating to the back, which may or may not be accompanied by vomiting).

- Instruct patient to routinely monitor blood glucose levels at home.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

## sodium bicarbonate

Arm & Hammer Baking Soda, Bell/ans, Citrocarbonate, Naturalyte<sup>®</sup>

**Pharmacologic class:** Fluid and electrolyte agent

**Therapeutic class:** Alkalinizer, antacid

**Pregnancy risk category C**

### Action

Restores body's buffering capacity; neutralizes excess acid

### Availability

**Injection:** 4% (2.4 mEq/5 ml), 4.2% (5 mEq/10 ml), 5% (297.5 mEq/500 ml), 7.5% (8.92 mEq/10 ml and 44.6 mEq/50 ml), 8.4% (10 mEq/10 ml and 50 mEq/50 ml)

**Oral solution (Citrocarbonate):** sodium 30.46 mEq/3.9 g and sodium citrate 1.82 g/3.9 g

**Tablets:** 325 mg, 650 mg

### Indications and dosages

- Metabolic acidosis

**Adults and children:** 2 to 5 mEq/kg by I.V. infusion over 4 to 8 hours. However, dosage highly individualized based on patient's condition and blood pH and carbon dioxide content.

➤ Urinary alkalization

**Adults:** Initially, 4 g P.O.; then 1 to 2 g P.O. q 4 hours

**Children:** 1 to 10 mEq/kg/day P.O. in divided doses given q 4 to 6 hours

➤ Renal tubular acidosis

**Adults:** For distal tubular acidosis, 0.5 to 2 mEq/kg P.O. daily in four to five equal doses. For proximal tubular acidosis, 4 to 10 mEq/kg P.O. daily in divided doses.

➤ Antacid

**Adults:** 300 mg to 2 g P.O. up to q.i.d., given with a glass of water

### Contraindications

- Hypocalcemia
- Metabolic or respiratory alkalosis
- Hypernatremia
- Hypokalemia
- Severe pulmonary edema
- Seizures
- Vomiting resulting in chloride loss
- Diuretic use resulting in hypochloremic alkalosis
- Acute ingestion of mineral acids (with oral form)

### Precautions

Use cautiously in:

- renal insufficiency, heart failure, hypertension, peptic ulcer, cirrhosis, toxemia
- pregnant patients.

### Administration

• For I.V. use, infuse at prescribed rate using controlled infusion device.

📣 Don't give concurrently with calcium or catecholamines (such as norepinephrine, dobutamine, dopamine). If patient is receiving sodium bicarbonate with any of these drugs, flush I.V. line thoroughly after each dose to prevent contact between drugs.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown
I.V.	Immediate	Immediate	Unknown

### Adverse reactions

**CNS:** headache, irritability, confusion, stimulation, tremors, twitching, hyperreflexia, weakness, **seizures of alkalosis, tetany**

**CV:** irregular pulse, edema, **cardiac arrest**

**GI:** gastric distention, belching, flatulence, acid reflux, **paralytic ileus**

**GU:** renal calculi

**Metabolic:** hypokalemia, fluid retention, hypernatremia, **hyperosmolarity** (with overdose), **metabolic alkalosis**

**Respiratory:** slow and shallow respirations, **cyanosis, apnea**

**Other:** weight gain, pain and inflammation at I.V. site

### Interactions

**Drug-drug.** *Anorexiant, flecainide, mecamlamine, methenamine, quinidine, sympathomimetics:* increased urinary alkalization, decreased renal clearance of these drugs

*Chlorpropamide, lithium, methotrexate, salicylates, tetracycline:* increased renal clearance and decreased efficacy of these drugs

*Enteric-coated tablets:* premature gastric release of these drugs

**Drug-diagnostic tests.** *Lactate, potassium, sodium:* increased levels

**Drug-herbs.** *Oak bark:* decreased sodium bicarbonate action

### Patient monitoring

🚫 When giving I.V., closely monitor arterial blood gas results and electrolyte levels.

🚫 Stay alert for signs and symptoms of metabolic alkalosis and electrolyte imbalances.

- Monitor fluid intake and output. Assess for fluid overload.

🚫 Avoid rapid infusion, which may cause tetany.

- Watch for inflammation at I.V. site.

### Patient teaching

- Tell patient using drug as antacid that too much sodium bicarbonate can cause systemic problems. Urge him to use only the amount approved by prescriber.

- Advise patient not to take oral form with milk. Caution him to avoid the herb oak bark.

- Tell patient sodium bicarbonate interferes with action of many common drugs. Instruct him to notify all prescribers if he's taking oral sodium bicarbonate on a regular basis.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## sodium chloride

Minims Sodium Chloride<sup>☼</sup>, Slo-Salt, Slow Sodium

**Pharmacologic class:** Electrolyte supplement

**Therapeutic class:** Sodium replacement

**Pregnancy risk category** C

### Action

Replaces deficiencies of sodium and chloride and maintains these electrolytes at adequate levels

### Availability

*Injection:* 0.45% sodium chloride—25 ml, 50 ml, 150 ml, 250 ml, 500 ml, 1,000 ml; 0.9% sodium chloride—2 ml, 3 ml, 5 ml, 10 ml, 20 ml, 25 ml, 30 ml, 50 ml, 100 ml, 150 ml, 250 ml, 500 ml, 1,000 ml; 3% sodium

chloride—500 ml; 5% sodium chloride—500 ml; 14.6% sodium chloride—20 ml, 40 ml, 200 ml; 23.4% sodium chloride—30 ml, 50 ml, 100 ml, 200 ml

Tablets: 650 mg, 1 g, 2.25 g

Tablets (slow-release): 600 mg

## Indications and dosages

➤ Water and sodium chloride replacement; metabolic alkalosis; to dilute or dissolve drugs for I.V., I.M., or subcutaneous use; to flush I.V. catheter; as a priming solution in hemodialysis; to initiate or end blood transfusions

**Adults:** 0.9% sodium chloride (isotonic solution) with dosage individualized

➤ Hydrating solution; hyperosmolar diabetes

**Adults:** 0.45% sodium chloride (hypotonic solution) with dosage individualized

➤ Rapid fluid and electrolyte replacement in hyponatremia and hypochloremia; severe sodium depletion; drastic body water dilution after excessive water intake

**Adults:** 3% or 5% sodium chloride (hypertonic solution) with dosage individualized, given by slow I.V. infusion with close monitoring of electrolyte levels

➤ Heat cramps caused by excessive perspiration

**Adults:** See product label.

## Contraindications

- Normal or elevated electrolyte levels (with 3% and 5% solutions)
- Fluid retention

## Precautions

Use cautiously in:

- renal impairment, heart failure, edema or sodium retention, hypoproteinemia
- surgical patients.

## Administration

 Be aware that sodium chloride injection is a high-alert drug.

- Dilute I.V. dose per product label. Infuse slow I.V. to minimize risk of pulmonary edema.

 Don't confuse normal saline solution for injection with concentrates meant for use in total parenteral nutrition.

- Avoid salt tablets for heat cramps; they may pass through GI tract undigested, causing vomiting and potassium loss.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown
I.V.	Immediate	Immediate	Unknown

## Adverse reactions

**CV:** edema (when given too rapidly or in excess), **thrombophlebitis**, **heart failure exacerbation**

**Metabolic:** fluid and electrolyte disturbances (such as hypernatremia and hyperphosphatemia), **aggravation of existing metabolic acidosis** (with excessive infusion)

**Respiratory:** **pulmonary edema**

**Other:** pain, swelling, local tenderness, abscess, or tissue necrosis at I.V. site

## Interactions

**Drug-diagnostic tests.** *Phosphate, potassium, sodium:* increased levels

## Patient monitoring

- Monitor electrolyte levels and blood chemistry results.

 Watch for signs and symptoms of pulmonary edema or worsening heart failure.

- Carefully monitor vital signs, fluid balance, weight, and cardiovascular status.

- Assess injection site closely to help prevent tissue necrosis and thrombophlebitis.

## Patient teaching

📣 Teach patient to recognize and immediately report serious adverse reactions, such as breathing problems or swelling.

- Instruct patient to report pain, tenderness, or swelling at injection site.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## sodium iodide <sup>131</sup>I

Iodotope, Sodium Iodide <sup>131</sup>I

Therapeutic

**Pharmacologic class:** Radiopharmaceutical

**Therapeutic class:** Antithyroid drug

**Pregnancy risk category** X

## Action

Incorporated into iodoamino acids in thyroid and deposited in follicular colloid, from where drug is slowly released. Destructive beta particles in follicle act on thyroidal parenchymal cells, minimizing damage to surrounding tissue.

## Availability

### Iodotope

**Capsules:** radioactivity ranging from 1 to 130 millicuries (mCi)/capsule at time of calibration

### Sodium Iodide <sup>131</sup>I Therapeutic

**Capsules:** radioactivity ranging from 0.75 to 100 mCi/capsule at time of calibration

**Oral solution:** radioactivity ranging from 3.5 to 150 mCi/vial at time of calibration

## Indications and dosages

➤ Thyroid cancer

**Adults:** Dosage highly individualized. Usual dosage for ablation of normal thyroid tissue is 50 mCi P.O., with subsequent dosages of 100 to 150 mCi P.O.

➤ Hyperthyroidism

**Adults:** 4 to 10 mCi P.O. (usually achieves remission without destroying thyroid). Toxic nodular goiter may require higher dosages.

## Contraindications

- Vomiting and diarrhea
- Known or suspected pregnancy

## Precautions

Use cautiously in:

- hypersensitivity to sulfites (with some products)
- breastfeeding
- children (safety and efficacy not established).

## Administration

📣 Don't administer if you're pregnant.

- Make sure all antithyroid drugs and thyroid preparations are discontinued 7 days before radioactive iodine therapy begins. Otherwise, consult prescriber about giving thyroid-stimulating hormone for 3 days.
- Instruct patient to fast for 12 hours before therapy starts.
- Know that all doses must be measured by suitable radioactivity calibration system immediately before use.
- For female patient of childbearing age, give drug the week of or week after menstruation.
- Be aware that drug rarely is used to treat hyperthyroidism in patients younger than age 30.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** unusual fatigue

**CV:** chest pain, tachycardia

**EENT:** pain on swallowing, sore throat

**GI:** nausea, vomiting, severe salivary gland inflammation

**Hematologic:** anemia, leukopenia, thrombocytopenia, acute leukemia, bone marrow depression, other blood dyscrasias

**Metabolic:** hypothyroidism, transient thyroiditis, acute thyroid crisis

**Respiratory:** cough

**Skin:** temporary hair thinning, rash, hives, urticaria

**Other:** chromosomal abnormalities, neck tenderness and swelling, lymphedema, increase in clinical symptoms, weight gain, radiation sickness, death

### Interactions

**Drug-drug.** Other antithyroid drugs (such as methimazole), iodine, thyroid agents:

altered uptake of sodium iodide <sup>131</sup>I

**Drug-diagnostic tests.** Hemoglobin, platelets, white blood cells: decreased levels  
*Procedures using contrast media:* altered sodium iodide <sup>131</sup>I uptake

### Patient monitoring

☞ Monitor patient to make sure he's following full radiation precautions, including proper body fluid disposal.

☞ If you're pregnant, don't provide care to patient who has received this drug.

- If patient has received drug for thyroid cancer, limit contact with him to 30 minutes per shift on first day. Increase as required to 1 hour on second day and longer on subsequent days.

- Monitor thyroxine and thyroid-stimulating hormone blood levels, along with CBC with white cell differential.

- Assess fluid intake and output 48 hours after administration. Encourage high fluid intake.

- Watch for signs and symptoms of hypothyroidism, including fatigue, cold intolerance, depression, and sudden weight gain.

☞ Monitor for bleeding tendency and signs and symptoms of radiation

sickness (vomiting, dehydration, skin lesions, and fatigue).

### Patient teaching

- Instruct patient to fast for 12 hours before therapy starts and to drink as much fluid as possible for 48 hours after administration.

☞ Teach patient and significant other how to follow full radiation exposure precautions.

☞ If patient is receiving drug for thyroid cancer, instruct him to avoid contact with small children. Tell him not to sleep in same room with anyone else for 7 days after receiving dose.

☞ Teach patient to recognize and report signs and symptoms of hypothyroidism and radiation sickness.

☞ Advise patient to immediately report unusual bleeding or bruising.

- Tell female patient to inform prescriber if she is pregnant or plans to become pregnant. Caution her not to breastfeed during therapy.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## sodium polystyrene sulfonate

Kayexalate, K-Exit Poudre<sup>✳</sup>, Kionex, PHL-Sodium Polystyrene Sulfonate<sup>✳</sup>, PMS-Sodium Polystyrene Sulfonate<sup>✳</sup>, Resonium A<sup>⚡</sup>, SPS Sodium Polystyrene Sulfonate

**Pharmacologic class:** Cation exchange resin

**Therapeutic class:** Potassium-removing resin

**Pregnancy risk category C**

**Action**

Exchanges sodium ions for potassium ions in intestine; potassium is then eliminated in feces, which decreases serum potassium level.

**Availability**

*Oral or rectal powder for suspension:*

15 g/4 level teaspoons

*Suspension:* 15 g/60 ml

**Indications and dosages**

➤ Hyperkalemia

**Adults:** 15 g P.O. one to four times daily in water or syrup, or 30 to 50 g P.R. q 6 hours; may instill through nasogastric tube as necessary

**Contraindications**

- Hypersensitivity to drug
- Hypokalemia or other electrolyte imbalances
- Obstructive bowel disease
- Neonates with reduced gut motility; oral administration in neonates

**Precautions**

Use cautiously in:

- renal or heart failure, severe edema, severe hypertension
- concomitant administration of sorbitol (use not recommended)
- pregnant patients
- children (efficacy not established).

**Administration**

- Know that drug may take hours to days to lower serum potassium level. Thus, it shouldn't be used alone to treat severe hyperkalemia.
- For rectal use, mix resin in water only; never use mineral oil. Insert #28F rubber tube 20 cm into sigmoid colon, and tape it in place. Or use indwelling urinary catheter with 30-ml balloon inflated distal to anal sphincter. Keep rectal solution at room temperature; swirl gently while administering. After giving dose, flush tubing with approximately 100 ml of sodium-free fluid;

then flush rectum to remove drug residue.

- For oral use, position patient carefully to avoid aspiration that may lead to bronchopulmonary complications.
- In elderly patients prone to fecal impaction, give cleansing enema before sodium polystyrene enema.

Route	Onset	Peak	Duration
P.O.	2-12 hr	Unknown	Unknown
P.R.	Unknown	Unknown	Unknown

**Adverse reactions**

**GI:** nausea, vomiting, constipation, fecal impaction, gastric irritation, anorexia, **intestinal necrosis, other serious GI adverse events (bleeding, ischemic colitis, perforation)**

**Metabolic:** sodium retention, other electrolyte abnormalities, **severe hypokalemia**

**Interactions**

**Drug-drug.** *Antacids, laxatives:* systemic alkalosis

**Drug-diagnostic tests.** *Calcium, magnesium, potassium:* decreased levels  
*Sodium:* increased level

**Patient monitoring**

🔊 Monitor electrolyte levels. Watch for signs and symptoms of electrolyte imbalances, particularly sodium overload and hypokalemia.

🔊 Be aware that intestinal necrosis and other serious GI adverse events (bleeding, ischemic colitis, perforation) have occurred with drug use. The majority of cases occurred with concomitant use of sorbitol.

🔊 If clinically significant constipation develops, discontinue drug until normal bowel motion resumes. Be aware that magnesium-containing laxatives or sorbitol shouldn't be used to correct constipation.

## Patient teaching

- Tell patient drug may cause constipation. Instruct him to report this if it becomes a problem.
- Teach patient about recommended diet (generally, low in sodium and potassium).
- For oral use, instruct patient to mix only with water, or syrup—never with orange juice.
- Advise patient to refrigerate oral solution to improve taste.
- 📣 Instruct patient to immediately report serious GI problems, including bleeding and abdominal pain, and early signs and symptoms of hypokalemia, including a pattern of irritable confusion and delayed thought processes.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## solifenacin succinate

VESIcare, Vesicare 🏪

*Pharmacologic class:* Anticholinergic

*Therapeutic class:* Renal and genitourinary agent

*Pregnancy risk category C*

### Action

Antagonizes muscarinic receptors, reducing urinary bladder smooth-muscle contractions

### Availability

Tablets: 5 mg, 10 mg

### Indications and dosages

➤ Overactive bladder with symptoms of urge urinary incontinence, urgency, and urinary frequency

**Adults:** 5 mg P.O. daily initially; may increase to 10 mg P.O. daily if well tolerated

### Dosage adjustment

- Moderate hepatic impairment
- Severe renal impairment
- Concurrent use of potent CYP3A4 inhibitors (such as ketoconazole)

### Contraindications

- Hypersensitivity to drug or its components
- Urinary retention
- Gastric retention
- Uncontrolled angle-closure glaucoma

### Precautions

Use cautiously in:

- hepatic or renal impairment, bladder outflow obstruction, decreased GI motility, GI obstructive disorder, controlled angle-closure glaucoma, congenital or acquired QT interval prolongation
- increased risk of urinary retention or heat prostration
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Give with liquids, with or without food. Make sure patient swallows tablet whole.

Route	Onset	Peak	Duration
P.O.	Unknown	3-8 hr	Unknown

### Adverse reactions

**CNS:** dizziness, depression, fatigue, asthenia

**CV:** hypertension

**EENT:** dry eyes, blurred vision, dry throat, pharyngitis

**GI:** nausea, vomiting, constipation, upper abdominal pain, dyspepsia, dry mouth

**GU:** urinary tract infection, urinary retention

**Respiratory:** cough  
**Skin:** dry skin, rash, pruritus  
**Other:** influenza, leg or foot edema

### Interactions

**Drug-drug.** *Anticholinergics:* increased frequency or severity of adverse reactions

*CYP3A4 inhibitors (such as ketoconazole):* increased solifenacin blood level

### Patient monitoring

- Monitor GI, renal, and hepatic function frequently.
- Monitor patient for ophthalmic disorders, especially angle-closure glaucoma. If present, stop drug until condition stabilizes.

### Patient teaching

- Instruct patient to take drug with liquids, with or without food, and to swallow tablet whole.
- Advise patient to contact prescriber if severe abdominal pain or constipation lasting 3 or more days occurs.
- Caution patient to avoid driving and other hazardous activities until drug effects are known.
- Advise patient of risk for heat prostration; describe symptoms.
- Instruct patient to consult prescriber before taking over-the-counter products such as antihistamines because these may increase risk of side effects.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

## somatropin, recombinant

Genotropin, Humatrope, Norditropin, Nutropin AQ, Nutropin AQ Pen, Nutropin Depot, Omnitrope, Saizen, Serostim, Tev-Tropin, Zomacton , Zorbtive

**Pharmacologic class:** Posterior pituitary hormone

**Therapeutic class:** Growth hormone (GH)

**Pregnancy risk category B** (Genotropin, Saizen, Serostim), **C**

### Action

Stimulates linear and skeletal growth, increases number and size of muscle cells, and influences internal organ size

### Availability

*Genotropin injection:* 1.5 mg (about 4 international units/vial), 5.8 mg (about 15 international units/vial), 13.8 mg (about 41.4 international units/vial)

*Humatrope injection:* 2 mg (about 6 international units/vial), 5 mg (about 15 international units/vial), 6 mg (about 18 international units/vial), 12 mg (about 36 international units/vial), 24 mg (about 72 international units/vial)

*Norditropin injection:* 4 mg (12 international units/vial), 8 mg (24 international units/vial)

*Norditropin injection cartridge:* 5 mg/1.5 ml, 10 mg/1.5 ml, 15 mg/1.5 ml

*Nutropin AQ injection:* 10 mg  
*Nutropin AQ Pen injection cartridge:* 10 mg

*Nutropin Depot:* 13.5-mg, 18-mg, and 22.5-mg single-use vials; 13.5-mg, 18-mg, and 22.5-mg kits

*Nutropin injection:* 5 mg (about 15 international units/vial), 10 mg (about 30 international units/vial)

*Saizen injection*: 5 g (about 15 international units/vial)

*Serostim injection*: 5 mg (about 15 international units/vial), 6 mg (about 18 international units/vial)

*Tev-Tropin injection*: 5 mg

*Zorbtive injection*: 8.8 mg in 10-ml vial

## Indications and dosages

➤ Growth failure in children with inadequate endogenous GH

**Children:** 0.16 to 0.24 mg/kg (Genotropin) subcutaneously q week in six or seven divided doses. Or 0.18 mg/kg/week (Humatrope) subcutaneously or I.M., divided equally and given on three alternate days six times weekly (or daily, if epiphyseal closure hasn't occurred). Or 0.024 to 0.034 mg/kg (Norditropin) subcutaneously six or seven times each week using NordiPen injection pen. Or 0.3 mg/kg/week (Nutropin AQ, Nutropin AQ Pen, Tev-Tropin) subcutaneously in equally divided daily doses. Or 0.06 mg/kg (Saizen) subcutaneously or I.M. three times weekly.

➤ Endogenous GH replacement in adults with GH deficiency

**Adults:** 0.04 mg/kg/week (Genotropin) subcutaneously in six or seven divided doses. Or 0.006 mg/kg/day (Humatrope) subcutaneously. Or initially, no more than 0.006 mg/kg/day (Nutropin AQ, Nutropin AQ Pen, Tev-Tropin) subcutaneously; may increase to a maximum of 0.025 mg/kg daily in patients younger than age 35 or 0.0125 mg/kg/day in patients ages 35 and older. Or 0.005 mg/kg/day (Saizen) subcutaneously; may increase to a maximum of 0.01 mg/kg/day after 4 weeks, depending on patient tolerance.

➤ Short stature related to Turner's syndrome

**Children:** 0.375 mg/kg/week (Humatrope) subcutaneously, divided into equal doses given on 3 alternate days or daily. Or up to 0.375 mg/kg/week (Nutropin AQ, Nutropin AQ Pen)

subcutaneously, divided into equal doses given three or seven times weekly.

➤ Idiopathic short stature (non-GH-deficient) in children whose epiphyses haven't closed

**Children:** Up to 0.37 mg/kg (Humatrope) subcutaneously q week. Divide dosage and give in equal doses six or seven times weekly.

➤ Growth failure in children with Prader-Willi syndrome

**Children:** 0.24 mg/kg/week (Genotropin) subcutaneously in six or seven divided doses

➤ Infants born small for gestational age

**Children:** 0.48 mg/kg/week (Genotropin) subcutaneously in six or seven divided doses

➤ AIDS wasting or cachexia

**Adults and children weighing more than 55 kg (121 lb):** 6 mg (Serostim) subcutaneously at bedtime

**Adults and children weighing 45 to 55 kg (99 to 121 lb):** 5 mg (Serostim) subcutaneously at bedtime

**Adults and children weighing 35 to 45 kg (77 to 99 lb):** 4 mg (Serostim) subcutaneously at bedtime

**Adults and children weighing less than 35 kg (77 lb):** 0.1 mg/kg/day (Serostim) subcutaneously at bedtime

➤ Growth failure due to chronic renal insufficiency (up to time of kidney transplantation)

**Children:** Up to 0.35 mg/kg/weekly (Nutropin AQ, Nutropin AQ Pen) subcutaneously, divided into daily doses

➤ Short bowel syndrome in patients receiving specialized nutritional support

**Adults:** 0.1 mg/kg/day subcutaneously (Zorbtive), to a maximum of 8 mg/day for no more than 4 weeks

## Contraindications

- Hypersensitivity to drug, benzyl alcohol, glycerin, or metacresol (with some diluents)
- Active neoplasia

- Acute, critical illness after open-heart surgery, acute respiratory failure, or multiple trauma
- Children with closed epiphyses
- Neonates (Zorbtive)

### Precautions

Use cautiously in:

- hypothyroidism
- diabetes mellitus.

### Administration

- Reconstitute by injecting supplied diluent through rubber top of vial and aiming liquid stream at side of vial. Swirl vial gently to mix; don't shake.
- Inspect reconstituted solution. Don't use if it has visible particles or is cloudy.
- Keep diluted drug refrigerated; use within 14 days.
- When using prefilled cartridges, follow manufacturer's instructions carefully.
- Know that patients receiving Zorbtive for short bowel syndrome may receive specialized nutritional support as needed.

Route	Onset	Peak	Duration
I.M., subcut.	Unknown	1-5 hr	12-48 hr

### Adverse reactions

**CNS:** headache, weakness

**CV:** mild and transient edema

**GU:** hypercalciuria

**Hematologic:** leukemia

**Metabolic:** fluid retention, mild hyperglycemia, hypothyroidism, **ketosis**

**Musculoskeletal:** localized muscle pain, tissue swelling, joint pain

**Skin:** rash, urticaria

**Other:** pain, inflammation at injection site

### Interactions

**Drug-drug.** *Androgens, thyroid hormone:* epiphyseal closure

*Corticotrophin, corticosteroids:* inhibited growth response (with long-term use)

**Drug-diagnostic tests.** *Alkaline phosphatase, glucose, inorganic phosphorus, parathyroid hormone:* increased levels

### Patient monitoring

- Monitor patient's height, X-rays, blood chemistry results, blood glucose level, and thyroid function studies.

 Watch for signs and symptoms of leukemia.

### Patient teaching

- Advise patient and parents that regular check-ups and blood tests are needed to detect adverse reactions.
- Teach parents how to reconstitute and administer drug. Stress importance of following manufacturer's instructions carefully when using pre-filled cartridges.
- Teach parents about proper handling and disposal of syringes, needles, and cartridges.
- As appropriate, review all significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## sorafenib

Nexavar

**Pharmacologic class:** Multikinase inhibitor

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

### Action

Decreases tumor cell proliferation in vitro and inhibits tumor growth of murine renal cell carcinoma; interacts with multiple intracellular and cell-surface kinases, several of which are involved with angiogenesis

**Availability**

Tablets: 200 mg

**Indications and dosages**

➤ Advanced renal cell carcinoma; unresectable hepatocellular carcinoma  
**Adults:** 400 mg P.O. twice daily, continued until patient no longer benefits from therapy or experiences unacceptable toxicity

**Dosage adjustment**

- Bleeding event
- Cardiac ischemia or infarction
- Severe or persistent hypertension
- Skin toxicity
- Major surgery

**Off-label uses**

- Advanced pancreatic cancer
- Recurrent epithelial ovarian cancer
- Hepatocellular, breast, colon, colorectal, non-small-cell lung, and thyroid cancers
- Melanoma and sarcoma

**Contraindications**

- Hypersensitivity to drug or its components
- Combination with carboplatin and paclitaxel in patients with squamous cell lung cancer

**Precautions**

Use cautiously in:

- skin toxicities, hypertension, bleeding, cardiac ischemia, myocardial infarction (MI), congestive heart failure (CHF), bradyarrhythmias, or electrolyte abnormalities
- congenital long QT syndrome (avoid use)
- concurrent use of gemcitabine/cisplatin in patients with squamous cell lung cancer (not recommended)
- concurrent use of drugs known to prolong QT interval (including Class Ia and III antiarrhythmics), CYP3A4 inducers, or CYP2B6 and CYP2C8 substrates

- patients undergoing surgery
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

**Administration**

- Administer without food (1 hour before or 2 hours after eating).

Route	Onset	Peak	Duration
P.O.	Unknown	3 hr	Unknown

**Adverse reactions**

**CNS:** fatigue, sensory neuropathy, headache, asthenia, depression

**CV:** hypertension, myocardial ischemia, MI, **heart failure, hypertensive crisis, prolonged QT/QTc interval**

**EENT:** hoarseness

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, mouth pain, mucositis, stomatitis, dyspepsia, dysphagia, anorexia, **GI perforation (uncommon)**

**GU:** erectile dysfunction

**Hepatic: drug-induced hepatitis**

**Hematologic:** lymphopenia, anemia, **leukopenia, thrombocytopenia, neutropenia, hemorrhage**

**Musculoskeletal:** arthralgia, myalgia

**Respiratory:** cough, dyspnea

**Skin:** rash, desquamation, palmar-plantar erythrodysesthesia (PPE), alopecia, pruritus, dry skin, erythema, acne, flushing, exfoliative dermatitis, **Stevens-Johnson syndrome (SJS), toxic epidermal necrolysis (TEN)**

**Other:** decreased appetite, weight loss, flulike syndrome, fever, hypersensitivity (including **angioedema, anaphylactic reaction**)

**Interactions**

**Drug-drug.** *CYP3A4 inducers (such as carbamazepine, dexamethasone, phenytoin, phenobarbital, rifampin):* increased sorafenib metabolism and decreased blood level

*Docetaxel*: increased docetaxel area under the curve (AUC) and plasma concentration

*Neomycin*: decreased sorafenib mean area under the curve

*Warfarin*: increased risk of bleeding, elevated INR

**Drug-diagnostic tests.** *Amylase, bilirubin, lipase*: increased

*Hemoglobin, platelets, serum phosphates, WBCs*: decreased

*Liver enzymes*: increased

**Drug-food.** *High-fat meal*: reduced drug bioavailability

**Drug-herbs.** *St. John's wort*: decreased sorafenib blood level

### Patient monitoring

- Monitor CBC with differential, platelets, serum phosphate, INR, amylase, lipase, and liver enzyme levels.
- Watch closely for PPE.
- Measure blood pressure weekly during first 6 weeks of therapy and thereafter as needed.
- 🚨 Monitor for cardiac symptoms, especially prolonged QT interval, in patients with CHF, bradyarrhythmias, electrolyte abnormalities, and concurrent use of drugs known to prolong QT interval. If cardiac ischemia or infarction occurs, consider temporarily or permanently discontinuing drug.
- 🚨 If GI perforation occurs, discontinue drug and initiate appropriate measures.
- 🚨 Be aware that drug-induced hepatitis may result in hepatic failure and death. Discontinue drug if there is no alternative explanation for significant transaminase elevations (such as viral hepatitis or progressing, underlying malignancy).
- 🚨 Monitor patient for SJS and TEN; discontinue drug if either of these conditions, which may be life-threatening, occur.
- 🚨 Watch for bleeding. If bleeding necessitates medical intervention, consider discontinuing drug.

### Patient teaching

- Instruct patient to take drug 1 hour before or 2 hours after eating.
- 🚨 Urge patient to immediately report irregular heartbeats or signs and symptoms of liver disorder or hypersensitivity, including rash, bleeding, or chest pain.
- Advise patient to report symptoms of PPE (redness, pain, swelling, or blisters on hands and soles). Mention that these symptoms may warrant dosage decrease.
- Stress importance of weekly blood pressure checks during first 6 weeks of therapy.
- Instruct males and females to use effective birth control during therapy.
- Tell female with childbearing potential to avoid pregnancy during therapy and for at least 2 weeks after.
- Advise breastfeeding patient to stop breastfeeding during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## sotalol hydrochloride

Apo-Sotalol<sup>☼</sup>, Beta-Cardone<sup>☼</sup>, Betapace, Betapace AF, Co Sotalol<sup>☼</sup>, Dom-Sotalol<sup>☼</sup>, Gen-Sotalol<sup>☼</sup>, Med Sotalol<sup>☼</sup>, Novo-Sotalol<sup>☼</sup>, Nu-Sotalol<sup>☼</sup>, PHL-Sotalol<sup>☼</sup>, PMS-Sotalol<sup>☼</sup>, Ratio-Sotalol<sup>☼</sup>, Rhoxal-Sotalol<sup>☼</sup>, Rylosol<sup>☼</sup>, Sandoz Sotalol<sup>☼</sup>, Sorine, Sotacor<sup>☼</sup>

**Pharmacologic class:** Beta-adrenergic blocker (nonselective)

**Therapeutic class:** Antiarrhythmic (classes II and III)

**Pregnancy risk category B**

**FDA BOXED WARNING**

- To minimize risk of induced arrhythmia, patients starting or restarting drug should be placed for at least 3 days (on maintenance dosage) in facility that can provide cardiac resuscitation, continuous ECG monitoring, and creatinine clearance calculations.
- Drug also is indicated to treat documented life-threatening ventricular arrhythmias and marketed as Betapace. However, don't substitute Betapace for Betapace AF because of significant labeling differences.

**Action**

Blocks stimulation of cardiac beta<sub>1</sub>-adrenergic and pulmonary, vascular, and uterine beta<sub>2</sub>-adrenergic receptor sites. This action reduces cardiac output and blood pressure, depresses sinus heart rate, and prolongs refractory period in atria and ventricles.

**Availability**

Tablets: 80 mg, 120 mg, 160 mg, 240 mg  
Tablets (Betapace AF): 80 mg, 120 mg, 160 mg

**Indications and dosages**

➤ Ventricular arrhythmias

**Adults:** 80 mg P.O. b.i.d. (Betapace); may increase dosage gradually. For maintenance, 160 to 320 mg/day in two to three divided doses; some patients may require 240 to 320 mg/day in divided doses. For refractory ventricular fibrillation, may increase to 480 to 640 mg/day in divided doses.

➤ Atrial fibrillation or atrial flutter

**Adults:** 80 mg P.O. b.i.d. (Betapace AF). With careful monitoring, may increase to 120 mg b.i.d. p.r.n., to a maximum of 160 P.O. b.i.d.

**Dosage adjustment**

- Renal impairment

**Contraindications**

- Hypersensitivity to drug
- Uncontrolled heart failure
- Bronchial asthma, chronic obstructive pulmonary disease
- Congenital or acquired long-QT syndrome
- Sinus bradycardia, second- or third-degree atrioventricular (AV) block (unless patient has pacemaker)
- Sick sinus syndrome
- Cardiogenic shock
- Hypokalemia
- Creatinine clearance below 40 ml/minute

**Precautions**

Use cautiously in:

- renal or hepatic impairment, diabetes mellitus, hyperthyroidism, patients undergoing major surgery
- history of severe allergic reactions
- elderly patients
- pregnant or breastfeeding patients
- children (safety not established).

**Administration**

- Give 1 hour before or 2 hours after meals or antacids.
- Keep in mind that Betapace and Betapace AF have different indications and are not interchangeable or therapeutically equivalent.

Route	Onset	Peak	Duration
P.O.	Unknown	2-4 hr	8-12 hr

**Adverse reactions**

**CNS:** fatigue, weakness, anxiety, dizziness, drowsiness, insomnia, memory loss, depression, mental status changes, nervousness, paresthesia, nightmares

**CV:** orthostatic hypotension, peripheral vasoconstriction, bradycardia, **arrhythmias, heart failure, AV block**  
**EENT:** blurred vision, dry eyes, nasal stuffiness

**GI:** nausea, constipation, diarrhea

**GU:** erectile dysfunction, decreased libido

**Metabolic:** hyperglycemia, **hypoglycemia**

**Musculoskeletal:** joint pain, back pain, muscle cramps

**Respiratory:** wheezing, **bronchospasm**

**Skin:** itching, rash

**Other:** lupus syndrome, hypersensitivity reaction

## Interactions

**Drug-drug.** *Amphetamines, ephedrine, epinephrine, norepinephrine, phenylephrine, pseudoephedrine:* unopposed alpha-adrenergic stimulation, causing excessive hypotension and bradycardia  
*Beta-adrenergic bronchodilators, theophylline:* decreased efficacy of these drugs

*Calcium channel blockers:* increased risk of adverse cardiovascular reactions

*Class IA antiarrhythmics (such as amiodarone, quinidine):* increased risk of arrhythmias

*Clonidine:* excessive rebound hypertension with clonidine withdrawal

*Ergot alkaloids:* peripheral ischemia or gangrene

*General anesthetics, phenytoin (I.V.), verapamil:* additive myocardial depression

*Lidocaine:* increased lidocaine blood level, resulting in toxicity

*Sulfonylureas:* increased hypoglycemic effect

**Drug-diagnostic tests.** *Antinuclear antibody:* increased titers

*Blood urea nitrogen, glucose, lipoproteins, potassium, triglycerides, uric acid:* increased levels

**Drug-food.** *Any food:* decreased drug absorption

## Patient monitoring

- Monitor ECG, electrolyte levels, and vital signs closely for first 3 days of therapy.

- Assess patient closely for signs and symptoms of heart failure.

- In long-term use, watch for signs and symptoms of drug-induced lupus syndrome.

## Patient teaching

- Tell patient drug may cause significant cardiac effects. Explain need for ECG monitoring during first few days of therapy.

-  Teach patient to recognize and immediately report signs and symptoms of heart failure and electrolyte imbalances.

- Inform patient that drug can cause serious interactions with many common drugs. Instruct him to tell all prescribers he's taking it.

-  Teach patient to recognize and promptly report signs and symptoms of drug-induced lupus syndrome.

- Advise patient that drug may cause CNS effects that increase his injury risk. Encourage him to use appropriate safety precautions.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## spironolactone

Aldactone, Novo-Spiroton\*

**Pharmacologic class:** Aldosterone inhibitor

**Therapeutic class:** Potassium-sparing diuretic

**Pregnancy risk category D**

## FDA BOXED WARNING

- Drug induced tumors in chronic toxicity studies in rats. Use only in conditions listed under "Indications and dosages." Avoid unnecessary use.

## Action

Inhibits aldosterone effects in distal renal tubule, promoting sodium and

water excretion and potassium retention

### Availability

Tablets: 25 mg, 50 mg, 100 mg

### Indications and dosages

➤ Edema caused by heart failure, hepatic cirrhosis, or nephrotic syndrome

**Adults:** As sole diuretic, initially 100 mg/day P.O. (range of 25 to 200 mg) in single or divided doses, continued for 5 or more days and then adjusted to optimal therapeutic level

**Children:** 1 to 3 mg/kg/day P.O. as a single dose or in divided doses

➤ Essential hypertension

**Adults:** Initially, 50 to 100 mg/day P.O. as a single dose or in divided doses, continued for at least 2 weeks

**Children:** 1 to 2 mg/kg P.O. b.i.d.

➤ Hypokalemia

**Adults:** 25 to 100 mg/day P.O.

➤ Diagnosis and treatment of primary hyperaldosteronism

**Adults:** For diagnosis, 400 mg/day P.O. for 4 days in short test or for 3 to 4 weeks in long test. Resolution of hypokalemia and hypertension confirm diagnosis of primary hyperaldosteronism. Dosages of 100 to 400 mg/day P.O. may be used as a bridge to surgical therapy; in patients unsuitable for this therapy, lowest effective dosage may be used for long-term maintenance.

### Off-label uses

- Acne vulgaris
- Familial male precocious puberty (given with other drugs)
- Premenstrual syndrome

### Contraindications

- Anuria, acute renal insufficiency, significant impairment of renal excretory function
- Hyperkalemia

### Precautions

Use cautiously in:

- hepatic dysfunction, diabetes mellitus, fluid and electrolyte imbalances, severe heart failure
- concurrent use of other potassium-sparing diuretics, such as amiloride and triamterene (avoid use)
- concurrent use of potassium supplements (avoid use with serum potassium level greater than 3.5 mEq/L)
- concurrent use of ACE inhibitors and nonsteroidal anti-inflammatory drugs (NSAIDs) (use with extreme caution)
- concurrent use of lithium (generally avoid use)
- elderly or debilitated patients
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Give single daily dose with breakfast. If two daily doses are prescribed, give second dose with food in mid-afternoon.

Route	Onset	Peak	Duration
P.O.	Unknown	1-2 hr	2-3 days

### Adverse reactions

**CNS:** headache, drowsiness, lethargy, ataxia, confusion

**GI:** vomiting, diarrhea, cramping, gastritis, GI ulcers, **GI bleeding**

**GU:** gynecomastia, irregular menses or amenorrhea, postmenopausal bleeding, erectile dysfunction, **breast cancer**

**Hematologic:** agranulocytosis

**Metabolic:** hyponatremia, **hyperchloremic metabolic acidosis, hyperkalemia**

**Skin:** rash, pruritus, hirsutism, **drug rash with eosinophilia and systemic symptoms (DRESS), Stevens-Johnson Syndrome, toxic epidermal necrolysis**

**Other:** deepening of voice, drug fever, hypersensitivity (including **vasculitis, anaphylactic reactions**)

## Interactions

**Drug-drug.** *Angiotensin-converting enzyme inhibitors, NSAIDs, potassium-sparing diuretics, potassium supplements, other potassium-containing drugs:* increased risk of hyperkalemia  
*Anticoagulants, heparin:* reduced hypoprothrombinemic effects of these drugs  
*Digoxin:* increased digoxin blood level  
*Lithium:* reduced lithium renal clearance and increased risk of lithium toxicity

*Salicylates:* decreased diuretic effect

**Drug-diagnostic tests.** *Blood urea nitrogen, potassium:* increased levels  
*Digoxin assays:* false digoxin elevation  
*Granulocytes:* decreased count

**Drug-food.** *Potassium-containing salt substitutes, potassium-rich diet:* increased risk of hyperkalemia

**Drug-herbs.** *Licorice:* potassium loss

## Patient monitoring

🚨 Monitor electrolyte levels (especially potassium), particularly in patients with severe heart failure. Watch for signs and symptoms of imbalances and metabolic acidosis. Interrupt or discontinue treatment for serum potassium level greater than 5 mEq/L or serum creatinine greater than 4 mg/dl.

- Monitor weight and fluid intake and output. Stay alert for indications of fluid imbalance.
- Monitor CBC with white cell differential.

## Patient teaching

- Tell patient to take daily dose with breakfast. If two daily doses are prescribed, advise him to take second dose with food in mid-afternoon.
- Advise patient to restrict intake of high-potassium foods and to avoid licorice and salt substitutes containing potassium.
- Tell male patient drug may cause breast enlargement.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## stavudine (d4T)

Zerit

**Pharmacologic class:** Nucleoside reverse transcriptase inhibitor

**Therapeutic class:** Antiretroviral

**Pregnancy risk category C**

## FDA BOXED WARNING

- Lactic acidosis and severe hepatomegaly with steatosis (including fatal cases) have occurred with use of drug alone or in combination with other nucleoside analogs. Fatal lactic acidosis has been reported in pregnant women who received stavudine–didanosine combination with other antiretrovirals. Use this combination cautiously in pregnant women and only if potential benefit clearly outweighs potential risk.
- Pancreatitis (fatal and nonfatal cases) has occurred when stavudine was used as part of combination regimen that included didanosine, in both treatment-naïve and treatment-experienced patients.

## Action

Inhibits replication of human immunodeficiency virus (HIV) by interfering with the enzyme reverse transcriptase, thereby terminating DNA chain

## Availability

*Capsules:* 15 mg, 20 mg, 30 mg, 40 mg

*Powder for oral solution:* 1 mg/ml

## Indications and dosages

➤ HIV-1 infection

**Adults weighing 60 kg (132 lb) or more:** 40 mg P.O. q 12 hours

**Adults and children weighing less than 60 kg (132 lb):** 30 mg P.O. q 12 hours

**Children weighing 30 kg (66 lb) or more:** 30 mg P.O. q 12 hours

**Children 14 days and older who weigh less than 30 kg (66 lb):** 1 mg/kg P.O. q 12 hours

**Newborns to infants 13 days old:** 0.5 mg/kg P.O. q 12 hours

## Dosage adjustment

- Renal impairment
- Elderly patients

## Contraindications

- Hypersensitivity to drug or its components

## Precautions

Use cautiously in:

- advanced HIV infection, bone marrow depression, renal failure, peripheral neuropathy, hepatic dysfunction, hyperlactatemia, lactic acidosis
- concurrent use of hydroxyurea or didanosine (avoid use)
- elderly patients (with renal impairment)
- pregnant or breastfeeding patients.

## Administration

- Give with or without food.
- Know that drug is usually given with other antiretrovirals.

Route	Onset	Peak	Duration
P.O.	Variable	60-90 min	Unknown

## Adverse reactions

**CNS:** headache, insomnia, peripheral neuropathy

**GI:** nausea, vomiting, diarrhea, abdominal pain, anorexia, **pancreatitis**

**Hematologic:** anemia, **leukopenia**, **thrombocytopenia**

**Hepatic:** hepatic steatosis, hepatitis, hepatic failure

**Metabolic:** increased glucose tolerance, **lactic acidosis**

**Musculoskeletal:** myalgia

**Skin:** rash

**Other:** body fat redistribution or accumulation, chills, fever, allergic reaction, **immune reconstitution syndrome**

## Interactions

**Drug-drug.** *Chloramphenicol, dapson, didanosine, ethambutol, hydralazine, hydroxyurea, lithium, phenytoin, vincristine, zalcitabine:* increased risk of peripheral neuropathy

*Doxorubicin, ribavirin, zidovudine:* inhibition of stavudine's absorption and metabolism

*Myelosuppressants:* increased bone marrow depression

**Drug-diagnostic tests.** *Alanine aminotransferase, amylase, aspartate aminotransferase, bilirubin, gamma-glutamyl transferase, lipase:* increased levels

*Neutrophils, platelets:* decreased counts

## Patient monitoring

🚨 Monitor closely for signs and symptoms of lactic acidosis, hyperlactatemia, or pronounced hepatotoxicity (which may include hepatomegaly and steatosis even in the absence of marked transaminase elevations). Consult prescriber about suspending drug if these occur. Consider permanent discontinuation of drug for patients with confirmed lactic acidosis.

- Monitor patient for signs and symptoms of immune reconstitution syndrome.

- Watch for and report onset and worsening of peripheral neuropathy.

🚨 Monitor CBC. Report evidence of bone marrow depression.

- Monitor liver function tests and blood chemistry results.

### Patient teaching

- Tell patient he may take with or without food.
-  Teach patient to recognize and promptly report signs and symptoms of lactic acidosis (such as fatigue, GI distress, and difficult or rapid breathing), hepatotoxicity, immune reconstitution syndrome, and pancreatitis.
- Instruct patient to report numbness or tingling in arms, legs, hands, or feet.
- Caution female patient not to breast-feed, because she may transmit drug effects and HIV to infant.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## streptokinase

### Streptase

**Pharmacologic class:** Group C beta-hemolytic streptococcal nonenzymatic protein

**Therapeutic class:** Thrombolytic

**Pregnancy risk category C**

### Action

Converts plasminogen to plasmin, an enzyme that degrades fibrin clots and lyses thrombi and emboli

### Availability

*Powder for injection:* 250,000, 750,000, and 1.5 million international units/vial

### Indications and dosages

- Acute evolving transmural myocardial infarction

**Adults:** 1.5 million international units by I.V. infusion over 1 hour as soon as possible after symptom onset. For intracoronary infusion, 20,000 international units by I.V. bolus via coronary catheter, followed by infusion of 2,000 international units/minute over 1 hour (total of 140,000 international units).

➤ Deep-vein thrombosis (DVT)

**Adults:** Loading dose of 250,000 international units by I.V. infusion over 30 minutes, followed by 100,000 international units/hour I.V. for 72 hours. Begin therapy as soon as possible after thrombotic symptoms begin (preferably within 7 days).

➤ Pulmonary emboli

**Adults:** Loading dose of 250,000 international units by I.V. infusion over 30 minutes, then 100,000 international units/hour I.V. for 24 hours (or 72 hours if concurrent DVT is suspected). Begin therapy as soon as possible after thrombotic symptoms begin (preferably within 7 days).

➤ Arterial thrombosis or emboli

**Adults:** Loading dose of 250,000 international units by I.V. infusion over 30 minutes, then 100,000 international units/hour I.V. for 24 to 72 hours. Begin therapy as soon as possible after thrombotic symptoms begin (preferably within 7 days).

### Contraindications

- Hypersensitivity to drug or anistreplase
- Cerebrovascular accident, intracranial or intraspinal surgery within past 2 months
- Active internal bleeding
- Intracranial neoplasm
- Severe, uncontrolled hypertension

### Precautions

Use cautiously in:

- severe hepatic or renal disease, recent major surgery or trauma,

obstetric delivery, acute pericarditis, infectious endocarditis, atrioventricular malformation or aneurysm, suspected thrombus in left side of heart, septic thrombophlebitis or occluded arteriovenous cannula at seriously infected site

- conditions in which bleeding may be hard to manage (such as organ biopsy, peptic ulcer, previous puncture of noncompressible blood vessel)
- history of cerebrovascular disease
- use of drug within past 2 years
- concurrent anticoagulant use
- elderly patients
- pregnant or breastfeeding patients.

### Administration

⚠ Before giving, make sure hydrocortisone is available to treat allergic reaction and aminocaproic acid is available to treat excessive bleeding.

⚠ As ordered, give test dose of 100 international units intradermally to check for hypersensitivity. Wheal-and-flare response within 20 minutes indicates probable allergy.

- To reconstitute, add 5 ml of normal saline solution or dextrose 5% in water to each vial, then dilute again to 45 ml. Roll vial gently between hands; don't shake.
- If necessary, dilute further to 50 ml in plastic container or to 500 ml in glass bottle.
- Don't mix with other drugs or give other drugs through same I.V. line.

Route	Onset	Peak	Duration
I.V.	Immediate	1 hr	4 hr
Intra-coronary	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache, **intracranial hemorrhage**

**CV:** hypotension, **arrhythmias**

**EENT:** periorbital swelling

**GI:** nausea, vomiting, **GI hemorrhage**

**GU:** hematuria

**Hematologic:** anemia, **bleeding tendency**

**Musculoskeletal:** musculoskeletal pain

**Respiratory:** minor breathing difficulties, **bronchospasm, apnea**

**Skin:** urticaria, itching, flushing

**Other:** bleeding at puncture sites, delayed hypersensitivity reaction

### Interactions

**Drug-drug.** *Anticoagulants, aspirin, dipyridamole, indomethacin, phenylbutazone:* increased risk of bleeding

**Drug-diagnostic tests.** *Hemoglobin:* decreased value

*International Normalized Ratio, transaminases:* increased values

*Partial thromboplastin time (PTT), prothrombin time (PT):* prolonged

### Patient monitoring

• Monitor vital signs and neurologic status carefully after giving test dose and throughout therapy.

⚠ Watch for signs and symptoms of hypersensitivity reaction. Stop drug if these occur.

• Check for bleeding every 15 minutes for first hour, every 30 minutes for next 7 hours, then every 4 hours.

⚠ Stop therapy and contact prescriber immediately if excessive bleeding occurs.

• Assess neurologic status closely.

Watch for indications of intracranial bleeding.

• Handle patient gently and sparingly.

If necessary, pad bed rails to prevent injury.

• Monitor pulse rate every hour. Also monitor distal circulation.

• Monitor PTT, PT, plasma thrombin time, hemoglobin, hematocrit, and platelet count.

• Avoid giving I.M. injections during therapy.

### Patient teaching

• Tell patient why he's receiving drug.

⚠ Teach patient to recognize and immediately report signs or symptoms

of hypersensitivity reaction or excessive bleeding.

- Instruct patient to report unusual bruising or bleeding. Teach him safety measures to avoid bruising and bleeding.
- Advise patient that he'll undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## streptomycin sulfate

**Pharmacologic class:** Aminoglycoside

**Therapeutic class:** Anti-infective

**Pregnancy risk category** D

### FDA BOXED WARNING

- Risk of severe neurotoxic reactions (including vestibular and cochlear dysfunction) is markedly higher in patients with impaired renal function or prerenal azotemia. Incidence of clinically detectable, irreversible vestibular damage is particularly high.
- Neurotoxicity can lead to respiratory paralysis from neuromuscular blockade, especially when drug is given soon after anesthesia or muscle relaxants.
- Monitor renal function carefully; reduce dosage in patients with renal impairment or nitrogen retention.
- Avoid concurrent or sequential use of other neurotoxic or nephrotoxic drugs, including cephaloridine, colistin, cyclosporine, gentamicin, kanamycin, neomycin, paromomycin, polymyxin B, tobramycin, and viomycin.
- Reserve parenteral administration for settings where adequate laboratory and audiometric studies are available during therapy.

### Action

Binds to 30S ribosomal subunit, inhibiting protein synthesis in bacterial cell, which causes misreading of genetic code and, ultimately, cell death

### Availability

**Injection:** 400 mg/ml in 2.5-ml ampules, 200 mg/ml in 1-g vials

### Indications and dosages

➤ Adjunct in tuberculosis and other mycobacterial infections

**Adults:** 15 mg/kg/day I.M., up to 1 g/day

**Children:** 20 to 40 mg/kg I.M. daily, up to 1 g/day

➤ Enterococcal or streptococcal infections

**Adults:** 1 g I.M. b.i.d. for 1 week, then 500 mg I.M. b.i.d. for 1 week. For enterococcal endocarditis, 1 g I.M. b.i.d. given with penicillin for 1 week, then 500 mg I.M. b.i.d. for 4 weeks.

➤ Brucellosis

**Adults:** 1 g I.M. once or twice daily with tetracycline or doxycycline for 1 week, then once daily for at least 1 more week

➤ Tularemia

**Adults:** 1 to 2 g I.M. daily in divided doses for 7 to 14 days until patient is afebrile for 5 to 7 days. For tularemia caused by *Francisella tularensis*, 1 g I.M. b.i.d. for 10 days or 7.5 to 10 mg/kg I.M. b.i.d. for 10 to 14 days.

➤ Plague caused by *Yersinia pestis*

**Adults:** 1 g I.M. b.i.d. for 10 to 14 days

### Dosage adjustment

- Renal impairment
- Elderly patients

### Off-label uses

- *Mycobacterium avium-intracellulare* complex in AIDS patients

### Contraindications

- Hypersensitivity to drug, other aminoglycosides, or bisulfites

## Precautions

Use cautiously in:

- renal impairment, hearing impairment, neuromuscular disease (such as myasthenia gravis)
- elderly patients
- pregnant or breastfeeding patients
- infants and neonates (safety not established).

## Administration

- Inject I.M. deep into upper outer quadrant of buttock.
- Alternate injection sites.
- Know that drug may be given with other antituberculars.
- Be aware that streptomycin will be withdrawn after several months or when bacteriologic smears are negative and other antituberculars are continued for 1 year.

Route	Onset	Peak	Duration
I.M.	Rapid	30-90 min	Unknown

## Adverse reactions

**CNS:** vertigo, numbness and tingling, peripheral neuropathy, myasthenia gravis–like syndrome, **neuromuscular blockade, seizures**

**CV:** myocarditis

**EENT:** amblyopia, ototoxicity

**GI:** nausea, vomiting

**GU:** azotemia, **nephrotoxicity**

**Hematologic:** eosinophilia, **hemolytic anemia, pancytopenia, leukopenia, thrombocytopenia**

**Hepatic:** hepatic necrosis

**Musculoskeletal:** muscle weakness, twitching

**Respiratory:** apnea

**Skin:** rash, urticaria, exfoliative dermatitis, toxic epidermal necrolysis, angioedema

**Other:** fever, superinfection, **serum sickness, anaphylaxis**

## Interactions

**Drug-drug.** *Acyclovir, amphotericin B, cephalosporin, cisplatin, potent diuretics,*

*vancomycin:* increased risk of ototoxicity and nephrotoxicity

*Depolarizing and nondepolarizing neuromuscular blockers, general anesthetics:* potentiation of neuromuscular blockade  
*Dimenhydrinate:* masking of ototoxicity symptoms

*Indomethacin:* increased streptomycin peak and trough blood levels

*Parenteral penicillins (ampicillin, ticarcillin):* streptomycin inactivation

**Drug-diagnostic tests.** *Bilirubin, blood urea nitrogen, creatinine, lactate dehydrogenase, nonprotein nitrogen:* increased levels

*Granulocytes, hemoglobin, platelets, white blood cells:* decreased levels

## Patient monitoring

- Draw blood for peak drug level 1 hour after I.M. injection. Draw blood for trough level just before next dose.
- Monitor liver and kidney function tests. Watch for evidence of hepatotoxicity and nephrotoxicity.
- Monitor temperature. Stay alert for fever and other signs and symptoms of superinfection.
- Assess neurologic status and sensory function carefully. Watch closely for neurotoxicity, neuromuscular blockade, and seizures.
- Assess for signs and symptoms of ototoxicity.
- Monitor CBC. Watch for evidence of blood dyscrasias.

## Patient teaching

- Instruct patient to report unusual bleeding or bruising.
- 📣 Inform patient that drug can be toxic to many body systems. Teach him to recognize and immediately report serious adverse reactions.
- 📣 Tell patient drug may promote growth of certain organisms. Advise him to immediately report signs and symptoms of superinfection.
- Inform patient that drug may impair cognitive, motor, and sensory function.

Advise him to use caution when driving and performing other hazardous activities.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## sulfacetamide sodium

Bleph-10, Diosulf<sup>✳</sup>, Klaron, PMS-Sulfacetamide<sup>✳</sup>

**Pharmacologic class:** Sulfonamide

**Therapeutic class:** Anti-infective

**Pregnancy risk category C**

### Action

Inhibits bacterial synthesis of folic acid by preventing condensation of pteridine with aminobenzoic acid through competitive inhibition of dihydropteroate synthetase

### Availability

**Lotion:** 10% in 2-oz and 4-oz bottles

**Ophthalmic solution:** 10% in 5-ml and 15-ml dropper bottles

### Indications and dosages

➤ Acne vulgaris

**Adults and children ages 12 and older:**

Apply thin film topically to affected areas b.i.d.

➤ Superficial ocular infections (including conjunctivitis)

**Adults and children ages 2 months**

**and older:** Initially, apply one to two drops of ophthalmic solution into conjunctival sac of affected eye q 2 to 3 hours. Taper by increasing dosing intervals as condition responds. Usual duration is 7 to 10 days.

➤ Adjunct in trachoma

**Adults:** Apply two drops of ophthalmic solution into conjunctival sac of affected

eye q 2 hours; must be accompanied by systemic sulfonamide therapy.

### Contraindications

- Hypersensitivity to drug or other sulfonamides

### Precautions

Use cautiously in:

- sulfite allergy
- dry eye syndrome.

### Administration

- To avoid contamination, don't touch container tip to eye, eyelid, or any other surface.

Route	Onset	Peak	Duration
Ophthalm., topical	Unknown	Unknown	Unknown

### Adverse reactions

**EENT:** conjunctival hyperemia, eye burning, stinging, tearing (ophthalmic form)

**Skin:** local irritation, erythema, itching and edema (topical form), photosensitivity reaction

**Other:** secondary infections

### Interactions

**Drug-drug.** *Porfimer:* increased severity of photosensitivity reaction, leading to excessive tissue damage

*Silver preparations:* precipitation

### Patient monitoring

- Monitor patient for drug efficacy.

Know that drug may be inactivated by purulent exudate.

### Patient teaching

- Tell patient to apply a thin film of lotion to affected areas, as prescribed.

- Teach patient how to apply ophthalmic form. Instruct him to always wash hands first and to clean eye area of discharge by wiping from inner to outer area before applying.

- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

## sulfamethoxazole-trimethoprim (co-trimoxazole<sup>⊕</sup>)

Apo-Sulfatrim<sup>✳</sup>, Apo-Sulfatrim DS<sup>✳</sup>, Bactrim, Bactrim DS, Fectrim<sup>⊕</sup>, Novo-Trimel<sup>✳</sup>, Novo-Trimel DS<sup>✳</sup>, Nu-Cotrimox<sup>✳</sup>, Nu-Cotrimox DS<sup>✳</sup>, Protrin<sup>✳</sup>, Protrin DS<sup>✳</sup>, Septra, Septra DS, Septrin<sup>⊕</sup>, Sulfatrim, Trisulfa<sup>✳</sup>, Trisulfa DS<sup>✳</sup>, Trisulfa S Suspension<sup>✳</sup>

**Pharmacologic class:** Sulfonamide

**Therapeutic class:** Anti-infective

**Pregnancy risk category** C

### Action

Sulfamethoxazole inhibits bacterial synthesis of dihydrofolic acid by competing with para-aminobenzoic acid (PABA). Trimethoprim inhibits enzymes of folic acid pathways.

### Availability

**Injection:** 80 mg/ml sulfamethoxazole and 16 mg/ml trimethoprim

**Suspension:** 200 mg sulfamethoxazole and 40 mg trimethoprim/5 ml

**Tablets:** 400 mg sulfamethoxazole and 80 mg trimethoprim (single strength); 800 mg sulfamethoxazole and 160 mg trimethoprim (double strength)

### Indications and dosages

➤ Urinary tract infections caused by susceptible organisms

**Adults:** One double-strength tablet or two single-strength tablets or 20 ml suspension P.O. q 12 hours for 10 to 14 days

**Children ages 2 months and older:** 40 mg/kg sulfamethoxazole and 8 mg/kg trimethoprim P.O. q 12 hours for 10 days

➤ Severe urinary tract infections caused by susceptible organisms

**Adults and children ages 2 months and older:** 8 to 10 mg/kg (based on trimethoprim component) I.V. q 6, 8, or 12 hours for up to 14 days

➤ Shigellosis caused by susceptible strains of *Shigella flexneri* or *Shigella sonnei*

**Adults:** One double-strength tablet or two single-strength tablets or 20 ml suspension P.O. q 12 hours for 10 to 14 days. Alternatively, 8 to 10 mg/kg (based on trimethoprim component) I.V. q 6, 8, or 12 hours for 5 days.

**Children ages 2 months and older:** 40 mg/kg (sulfamethoxazole) and 8 mg/kg (trimethoprim) P.O. q 12 hours for 5 days. Alternatively, 8 to 10 mg/kg (based on trimethoprim component) I.V. q 6, 8, or 12 hours for up to 5 days.

➤ Acute exacerbation of chronic bronchitis caused by susceptible strains of *Streptococcus pneumoniae* or *Haemophilus influenzae*

**Adults:** One double-strength tablet or two single-strength tablets or 20 ml suspension P.O. q 12 hours for 10 to 14 days

➤ *Pneumocystis jiroveci* pneumonia

**Adults and children older than 2 months:** 75 to 100 mg/kg (sulfamethoxazole) and 15 to 20 mg/kg (trimethoprim) P.O. daily in equally divided doses q 6 hours for 14 to 21 days. Alternatively, 15 to 20 mg/kg (based on trimethoprim component) I.V. q 6 to 8 hours for up to 14 days.

➤ Prophylaxis of *P. jiroveci* pneumonia

**Adults:** One double-strength tablet P.O. daily

**Children ages 2 months and older:** 750 mg/m<sup>2</sup> (sulfamethoxazole) and 150 mg/m<sup>2</sup> (trimethoprim) P.O. b.i.d. in equally divided doses on 3 consecutive days each week. Total dosage should not exceed 1,600 mg sulfamethoxazole and 320 mg trimethoprim.

➤ Traveler's diarrhea caused by susceptible strains of enterotoxigenic *Escherichia coli*

**Adults:** One double-strength tablet or two single-strength tablets or 20 ml suspension q 12 hours for 5 days

➤ Acute otitis media caused by susceptible strains of *S. pneumoniae* or *H. influenzae*

**Children ages 2 months and older:**

40 mg/kg sulfamethoxazole and 8 mg/kg trimethoprim P.O. q 12 hours for 10 days

### Off-label uses

- Granuloma inguinale
- Toxoplasmic encephalitis (as primary prophylaxis)

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to sulfonamides, trimethoprim, sulfonyleureas, thiazides, or loop diuretics
- Porphyria
- Marked renal or hepatic impairment
- Megaloblastic anemia caused by folate deficiency
- Pregnancy at term or when premature birth is possible
- Infants younger than 2 months (except in *P. jiroveci* pneumonia prophylaxis)

### Precautions

Use cautiously in:

- urinary obstruction, renal or hepatic disease, bronchial asthma, G6PD deficiency, group A beta-hemolytic streptococcal infection, blood dyscrasias
- history of multiple allergies
- elderly patients
- pregnant (before term) or breast-feeding patients
- children.

### Administration

- Dilute each 5 ml of I.V. drug in 125 ml of dextrose 5% in water.
- Infuse I.V. over 60 to 90 minutes. Avoid rapid infusion.

- Don't mix with other drugs or solutions. Don't refrigerate. Use within 6 hours after dilution.

Route	Onset	Peak	Duration
P.O.	Rapid	1-4 hr	Unknown
I.V.	Rapid	1 hr	Unknown

### Adverse reactions

**CNS:** headache, depression, hallucinations, insomnia, drowsiness, fatigue, apathy, anxiety, ataxia, vertigo, polyneuritis, peripheral neuropathy, **seizures**

**CV:** **allergic myocarditis or pericarditis**

**EENT:** periorbital edema, optic neuritis, transient myopia, tinnitus

**GI:** nausea, vomiting, abdominal pain, stomatitis, glossitis, dry mouth, pancreatitis, anorexia, **pseudomembranous colitis**

**GU:** hematuria, proteinuria, **crystaluria, toxic nephrosis with oliguria and anuria, renal failure**

**Hematologic:** **megaloblastic anemia, agranulocytosis, aplastic anemia, thrombocytopenia, leukopenia, hemolytic anemia**

**Hepatic:** jaundice, **hepatitis, hepatocellular necrosis**

**Respiratory:** shortness of breath, pleuritis, **allergic pneumonitis, pulmonary infiltrates, fibrosing alveolitis**

**Skin:** generalized skin eruption, urticaria, pruritus, alopecia, local irritation, exfoliative dermatitis, photosensitivity reaction, **epidermal necrolysis, erythema multiforme, Stevens-Johnson syndrome**

**Other:** irritation at I.V. site, chills, drug fever, hypersensitivity reactions including **anaphylaxis, serum sickness, lupus-like syndrome**

### Interactions

**Drug-drug.** *Cyclosporine:* increased nephrotoxicity

*Dapsone:* increased blood levels of both drugs

*Hydantoins, zidovudine:* increased blood levels of these drugs

*Indomethacin, probenecid*: increased sulfamethoxazole blood level

*Methotrexate*: increased risk of bone marrow suppression

*Oral anticoagulants*: increased anticoagulant effect

*PABA, PABA-derived local anesthetics*: inhibited sulfamethoxazole action

*Sulfonylureas*: increased risk of hypoglycemia

*Thiazide diuretics*: increased thrombocytopenic effects

*Uricosuric drugs*: increased uricosuric effects

**Drug-diagnostic tests.** *Bilirubin, blood urea nitrogen, creatinine, eosinophils, transaminases*: increased levels

*Granulocytes, hemoglobin, platelets, white blood cells*: decreased levels

*Urine glucose tests*: false-positive results

**Drug-herbs.** *Dong quai, St. John's wort*: increased risk of photosensitivity

**Drug-behaviors.** *Sun exposure*: increased risk of photosensitivity

### Patient monitoring

🔊 Monitor CBC with white cell differential. Watch for evidence of blood dyscrasias.

🔊 Stay alert for erythema multiforme. Report early signs before condition can progress to Stevens-Johnson syndrome.

- Monitor patient for signs and symptoms of superinfection, including fever, tachycardia, and chills.

🔊 Monitor liver function tests and assess for evidence of hepatitis.

🔊 Check kidney function tests weekly. Evaluate patient's fluid intake, urine output, and urine pH. Report hematuria, oliguria, or anuria right away.

- Monitor neurologic status. Report seizures, hallucinations, or depression.

### Patient teaching

- Advise patient to take on regular schedule as prescribed, along with a full glass of water. Tell him to drink plenty of fluids to minimize crystal formation in urine.

- If suspension is prescribed, make sure patient has a specially marked measuring spoon or other device so he can measure doses accurately.

- Instruct patient to complete full course of treatment even if he starts to feel better.

🔊 Teach patient to recognize and immediately report signs and symptoms of hypersensitivity, especially rash.

🔊 Inform patient that drug can cause blood disorders, GI and liver problems, serious skin reactions, and other infections. Describe key warning signs and symptoms (easy bruising or bleeding, severe diarrhea, unusual tiredness, yellowing of skin or eyes, sore throat, rash, cough, mouth sores, fever). Tell him to report these right away.

🔊 Urge patient to promptly report scant or bloody urine or inability to urinate.

- Tell patient to contact prescriber if he develops depression.

- Teach patient effective ways to counteract photosensitivity effect. Advise him that dong quai and St. John's wort increase phototoxicity risk and should be avoided during therapy.

- Advise female patient to inform prescriber if she is pregnant. Tell her not to take drug near term.

- Caution female patient not to breast-feed, because she could pass drug effects to infant.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## sulfasalazine

APO Sulfasalazine\*, Azulfidine, Azulfidine EN-tabs, PMS-Sulfasalazine\*, PMS-Sulfasalazine-E.C.\*, Salazopyrin\*, Salazopyrin EN-Tabs\*, SAS Tab\*, Sulazine\*, Sulfazine, Sulfazine EC

**Pharmacologic class:** Sulfonamide

**Therapeutic class:** Anti-infective, GI tract anti-inflammatory, antirheumatic

**Pregnancy risk category B**

### Action

Unknown. Thought to inhibit prostaglandin synthesis by interfering with secretions in colon and causing local anti-inflammatory action.

### Availability

Tablets: 500 mg

Tablets (Azulfidine EN-tabs—delayed-release, enteric-coated): 500 mg

### Indications and dosages

➤ Ulcerative colitis

**Adults:** Initially, 1 to 2 g P.O. daily in equally divided doses q 6 to 8 hours, then 3 to 4 g P.O. daily in equally divided doses q 6 to 8 hours. For maintenance, 500 mg q 6 hours.

**Children ages 6 and older:** 40 to 60 mg/kg P.O. daily in three to six divided doses. For maintenance, 30 mg/kg P.O. q 6 hours in four divided doses.

➤ Acute rheumatoid arthritis

**Adults:** Initially, 500 mg to 1 g (delayed-release) P.O. daily for 1 week; then increase by 500 mg/day P.O. q week up to 2 g/day in two divided doses. If no benefit after 12 weeks, increase to 3 g/day given in two divided doses.

➤ Polyarticular-course juvenile rheumatoid arthritis

**Children ages 6 and older:** 30 to 50 mg/kg P.O. daily in two evenly divided doses. Maximum dosage is 2 g daily.

### Off-label uses

- Ankylosing spondylitis
- Crohn's disease
- Psoriatic arthritis

### Contraindications

- Hypersensitivity to drug, its metabolites, other sulfonamides, or salicylates
- Porphyria
- Urinary tract or intestinal obstruction

### Precautions

Use cautiously in:

- renal or hepatic disease, bronchial asthma, G6PD deficiency, group A beta-hemolytic streptococcal infections, blood dyscrasias
- history of multiple allergies
- pregnant or breastfeeding patients
- children younger than age 2.

### Administration

- Give after meals and space doses evenly to reduce GI effects.
- Give with a full glass of water.
- Administer delayed-release tablets whole. Don't let patient crush or chew them.

Route	Onset	Peak	Duration
P.O.	1.5 hr	10 hr	Unknown

### Adverse reactions

**CNS:** headache, depression, hallucinations, insomnia, drowsiness, vertigo, fatigue, apathy, anxiety, ataxia, polyneuritis, peripheral neuropathy, **seizures**

**CV:** **allergic myocarditis or pericarditis**

**EENT:** periorbital edema, optic neuritis, transient myopia, tinnitus

**GI:** nausea, vomiting, abdominal pain, stomatitis, glossitis, pancreatitis, dry mouth, anorexia, **pseudomembranous colitis**

**GU:** hematuria, proteinuria, orange-yellow urine, reversible oligospermia, **crystalluria, toxic nephrosis with oliguria and anuria, renal failure**

**Hematologic:** megaloblastic anemia, agranulocytosis, aplastic anemia, thrombocytopenia, leukopenia, hemolytic anemia

**Hepatic:** jaundice, hepatitis, hepatocellular necrosis

**Respiratory:** shortness of breath, pleuritis, cyanosis, allergic pneumonitis, pulmonary infiltrates, fibrosing alveolitis

**Skin:** generalized skin eruption, urticaria, pruritus, alopecia, local irritation, orange-yellow skin discoloration, exfoliative dermatitis, photosensitivity reaction, erythema multiforme, epidermal necrolysis, Stevens-Johnson syndrome

**Other:** reversible immunoglobulin suppression, chills, drug fever, hypersensitivity reactions including anaphylaxis, serum sickness, lupus-like syndrome

## Interactions

**Drug-drug.** *Digoxin, folic acid:* reduced absorption of these drugs

**Drug-diagnostic tests.** *Bilirubin, blood urea nitrogen, creatinine, eosinophils, transaminases:* increased levels  
*Granulocytes, hemoglobin, platelets, white blood cells:* decreased levels  
*Urine glucose test:* false-positive result

**Drug-food.** *Folic acid:* decreased folic acid absorption

**Drug-herbs.** *Dong quai, St. John's wort:* increased risk of photosensitivity

**Drug-behaviors.** *Sun exposure:* increased risk of photosensitivity

## Patient monitoring

☞ Monitor CBC with white cell differential. Watch for evidence of blood dyscrasias.

☞ Stay alert for signs of erythema multiforme. Report early signs before

condition can progress to Stevens-Johnson syndrome.

- Monitor patient for signs and symptoms of superinfection, including fever, tachycardia, and chills.

☞ Monitor liver function tests; watch for signs and symptoms of hepatitis.

☞ Check kidney function tests weekly. Evaluate patient's fluid intake, urine output, and urine pH. Report hematuria, oliguria, or anuria right away.

- Monitor neurologic status. Report seizures, hallucinations, or depression.

- If patient takes drug for rheumatoid arthritis, monitor therapeutic response 4 to 12 weeks after therapy begins.

## Patient teaching

- Tell patient to take on regular schedule as prescribed, along with a full glass of water. Instruct him to drink plenty of fluids to minimize crystal formation in urine.

- Urge patient to complete full course of treatment, even if he feels better after a few days.

☞ Instruct patient to watch for and immediately report signs and symptoms of hypersensitivity reaction, especially rash.

☞ Tell patient drug can cause blood disorders, GI and liver problems, serious skin reactions, and other infections. Describe key warning signs and symptoms (easy bruising or bleeding, severe diarrhea, unusual tiredness, yellowing of skin or eyes, sore throat, rash, cough, mouth sores, fever). Instruct him to report these right away.

☞ Advise patient to promptly report scant or bloody urine or inability to urinate.

- Instruct patient to contact prescriber if he develops depression.

- Teach patient effective ways to counteract photosensitivity effect. Tell him that dong quai and St. John's wort

increase phototoxicity risk and should be avoided during therapy.

- Inform patient that drug may discolor skin and body fluids orange-yellow and may permanently stain contact lenses.
- Advise female patient to inform prescriber if she is pregnant. Caution her not to take drug near term or when breastfeeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## sumatriptan succinate

Apo-Sumatriptan<sup>✳</sup>,  
Co Sumatriptan<sup>✳</sup>, Dom-Sumatriptan<sup>✳</sup>, Gen-Sumatriptan<sup>✳</sup>,  
Imigran<sup>⚡</sup>, Imitrex, Novo-Sumatriptan<sup>✳</sup>, PHL-Sumatriptan<sup>✳</sup>,  
PMS-Sumatriptan<sup>✳</sup>, Ratio-Sumatriptan<sup>✳</sup>, Riva-Sumatriptan<sup>✳</sup>,  
Sandoz Sumatriptan<sup>✳</sup>, Sumavel  
DosePro

**Pharmacologic class:** Selective 5-hydroxytryptamine<sub>1</sub> (5-HT<sub>1</sub>) agonist

**Therapeutic class:** Vascular headache suppressant

**Pregnancy risk category** C

### Action

Selectively activates vascular 5-HT<sub>1</sub> receptor sites, causing vasoconstriction in intracranial arteries

### Availability

**Injection:** 6 mg/0.5-ml prefilled syringes, 0.6 mg/0.5-ml single-dose vials; 6 mg/0.5-ml prefilled, single-dose, needle-free subcutaneous delivery system; 4- and 6-mg STATdose system containing two prefilled single-dose syringe

cartridges and one STATdose Pen; 4- and 6-mg kits containing two prefilled single-dose syringe cartridges and one autoinjector pen

**Nasal spray:** 5 mg in 100-mcl unit dose spray device (package of six), 20 mg in 100-mcl unit dose spray device (package of six)

**Tablets:** 25 mg, 50 mg, 100 mg

### Indications and dosages

➤ Acute migraine, cluster headaches

**Adults:** Initially, 25 mg P.O.; if response inadequate after 2 hours, may give up to 100 mg P.O. If migraine recurs, repeat dose q 2 hours, not to exceed 200 mg/day. Or 6 mg subcutaneously, repeated as needed after 1 hour, not to exceed 12 mg in 24 hours. If P.O. therapy will follow subcutaneous injection, additional P.O. sumatriptan may be given q 2 hours, not to exceed 100 mg/day. Or a single dose of 5, 10, or 20 mg intranasally in one nostril, repeated p.r.n. in 2 hours, not to exceed 40 mg in 24 hours.

### Dosage adjustment

- Hepatic impairment

### Contraindications

- Hypersensitivity to drug
- Hemiplegic or basilar migraine headache
- Ischemic cardiac, cerebrovascular, or peripheral vascular disease (such as a history of myocardial infarction, stroke, angina, or ischemic bowel)
- Uncontrolled hypertension
- Severe hepatic impairment
- MAO inhibitor use within past 14 days
- Use of other 5-HT<sub>1</sub> agonists, ergotamine-containing drugs, or ergot-type products within past 24 hours

### Precautions

Use cautiously in:

- patients with cardiovascular risk factors (hypertension, hypercholesterolemia, smoking, obesity, diabetes,

family history of cardiovascular disease, men over age 40, menopausal women)

- elderly patients
- women of childbearing age
- pregnant or breastfeeding patients
- children younger than age 18 (safety not established).

### Administration

- Be aware that parenteral form is for subcutaneous use only.
- Be aware that an autoinjection device is available for use with the 4- and 6-mg prefilled syringe cartridges to facilitate patient self-administration using the 4- or 6-mg dose. For patients receiving doses other than 4 or 6 mg, only the 6-mg single-dose vial dosage form should be used.

 If patient has risk factors for coronary artery disease, know that first dose should be given in medical setting with emergency equipment at hand.

 Don't give within 14 days of MAO inhibitors.

 Don't administer within 24 hours of other 5-HT<sub>1</sub> agonists, ergotamine-containing drugs, or ergot-type products.

Route	Onset	Peak	Duration
P.O.	Within 30 min	2-2.5 hr	Unknown
Subcut.	10-20 min	Unknown	Unknown
Intranasal	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache, malaise, dizziness, drowsiness, fatigue, vertigo, anxiety, tight feeling in head, numbness

**CV:** angina, chest pressure or tightness, transient hypertension, ECG changes, **coronary vasospasm, myocardial infarction**

**EENT:** vision changes, nasal sinus discomfort, throat discomfort

**GI:** abdominal discomfort, dysphagia

**Musculoskeletal:** jaw discomfort, muscle cramps, myalgia, neck pain or stiffness

**Skin:** flushing; tingling; warm, cool or, burning sensation

**Other:** injection site reaction, feeling of heaviness or tightness

### Interactions

**Drug-drug.** *Dihydroergotamine, ergotamine, methysergide:* increased risk of vasospastic reaction

*Lithium, MAO inhibitors, selective serotonin reuptake inhibitors:* weakness, hyperreflexia, incoordination

**Drug-herbs.** *Horehound:* enhanced serotonergic effects

### Patient monitoring

 Monitor cardiovascular status closely. Be aware that drug may cause serious and possibly fatal cardiac disorders.

- Watch for neurologic and vision changes. Institute safety measures as needed to prevent injury.
- Monitor patient's response to drug. Assess need for repeat doses.
- Watch for injection site reaction, which should subside within 1 hour.

### Patient teaching

• Instruct patient to take as soon as possible after migraine onset.

 Teach patient to recognize and immediately report serious cardiovascular reactions.

• Explain proper drug use. Tell patient it doesn't prevent migraine.

• With subcutaneous use, instruct patient to follow directions in the patient leaflet carefully before injecting drug and to inject dose subcutaneously using spring-loaded injector system or needle-free subcutaneous delivery system included in package. If headache recurs after dose, tell him he may take a second dose, but should wait at least 1 hour after initial dose and shouldn't exceed two 6-mg injections in a 24-hour period. Instruct

him to report injection site reaction that doesn't subside within 1 hour.

- With oral use, tell patient he may take a second dose 2 hours after first dose if migraine recurs. Tell him he may repeat oral doses every 2 hours as needed, up to 200 mg in a 24-hour period.
- With intranasal use, tell patient to spray 5, 10, or 20 mg into one nostril, as prescribed. Tell him he may repeat dose after 2 hours but shouldn't exceed 40 mg in a 24-hour period.
- Advise patient not to use drug for more than four episodes per month.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and herbs mentioned above.

## sunitinib malate

Sutent

**Pharmacologic class:** Receptor tyrosine kinase inhibitor

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

- Hepatotoxicity, which has been observed in clinical trials and postmarketing experience, may be severe, and deaths have occurred.

### Action

Inhibits multiple receptor tyrosine kinases, some of which are implicated in tumor growth, pathologic angiogenesis, and metastatic cancer progression

### Availability

**Capsules:** 12.5 mg, 25 mg, 50 mg

### Indications and dosages

➤ GI stromal tumor after disease progression with or intolerance to imatinib mesylate; advanced renal cell carcinoma

**Adults:** 50 mg P.O. daily on cycle of 4 weeks on and 2 weeks off treatment; may increase or decrease dosage in 12.5-mg increments based on safety and tolerance

### Dosage adjustment

- Concurrent use of strong CYP3A4 inducers or inhibitors

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- left ventricular dysfunction, hypertension, history of prolonged QT interval, concurrent use of antiarrhythmics, patients with relevant preexisting cardiac disease, bradycardia, or electrolyte disturbances
- patients who have experienced cardiac events within previous 12 months
- hepatotoxicity
- concurrent use of strong CYP3A4 inhibitors
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

📢 Monitor liver function tests before start of treatment.

- Administer with or without food.
- Interrupt therapy or reduce dosage, as prescribed, in patients who lack clinical evidence of heart failure but have ejection fractions (EFs) below 50% and above 20% below baseline.

Route	Onset	Peak	Duration
P.O.	Unknown	6-12 hr	Unknown

## Adverse reactions

**CNS:** headache, asthenia

**CV:** hypertension, **left ventricular dysfunction**

**EENT:** epistaxis, oral pain

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, mucositis, stomatitis, anorexia

**Hematologic:** bleeding, anemia, **thrombocytopenia, neutropenia, lymphopenia, hemorrhage**

**Hepatic:** **hepatotoxicity**

**Metabolic:** acquired hypothyroidism, adrenal toxicity

**Musculoskeletal:** arthralgia, back pain, limb pain, myalgia

**Respiratory:** dyspnea, cough, **pulmonary embolism**

**Skin:** skin abnormalities, skin discoloration, rash, palmar-plantar erythrodysesthesia, alopecia, hair color changes

**Other:** altered taste, fatigue, fever

## Interactions

**Drug-drug.** *Atazanavir, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, voriconazole:* increased sunitinib blood level

*Carbamazepine, dexamethasone, phenobarbital, phenytoin, rifabutin, rifampin, rifapentin:* decreased sunitinib blood level

**Drug-diagnostic tests.** *Amylase, creatinine, lipase, uric acid:* increased

*Liver function tests:* abnormal

*Serum phosphorus, potassium, sodium:* decreased

**Drug-food.** *Grapefruit juice, pomegranate:* increased sunitinib blood level

**Drug-herbs.** *Alpha-lipoic acid:* decreased chemotherapeutic efficacy  
*American elder, bishop's weed, cat's claw, devil's claw, eucalyptus, feverfew,*

*Siberian ginseng, valerian:* increased sunitinib blood level

*St. John's wort:* unpredictable decrease in sunitinib blood level

## Patient monitoring

- Obtain CBC with platelet count and blood chemistries (including phosphate) at start of each treatment cycle and frequently thereafter.

- Know that physician may order baseline and periodic evaluation of left ventricular EF in patients who experienced cardiac events within 12 months before starting drug. Watch closely for signs and symptoms of left ventricular dysfunction (especially heart failure).

- Be aware that physician may order baseline EF testing for patients without cardiac risk factors.

- Monitor for hypertension; administer standard antihypertensive therapy as ordered and needed.

- Monitor for adrenal insufficiency if patient experiences stress (as from surgery, trauma, or severe infection).

-  Monitor liver function tests during each cycle of treatment and as clinically indicated. Interrupt therapy for Grade 3 or 4 drug-related hepatic adverse events; discontinue drug if no resolution. Don't restart drug if severe changes in liver function tests subsequently occur or if patient has other signs and symptoms of liver failure.

## Patient teaching

- Instruct patient to take drug with or without food.

-  Urge patient to immediately report sudden signs and symptoms of liver problems (such as yellowing of skin or eyes, unusual tiredness, loss of appetite), chest pain, swelling, or difficulty breathing.

- Tell patient drug may cause skin changes (drying, cracking, or rashes on hands or feet) and hair color changes.

- Advise patient to consult prescriber before taking other drugs, including over-the-counter drugs and herbs.
- Caution patient not to take St. John's wort during therapy.
- Advise female with childbearing potential to avoid pregnancy and breastfeeding during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## tacrolimus

Advagraf<sup>†</sup>, Prograf, Protopic

**Pharmacologic class:** Macrolide

**Therapeutic class:** Immunosuppressant

**Pregnancy risk category C**

### FDA BOXED WARNING

- Immunosuppression may increase patient's susceptibility to infection and lymphoma development. Give under supervision of physician experienced in immunosuppressive therapy and management of organ transplant patients, in facility with adequate diagnostic and treatment resources. Physician responsible for maintenance therapy should have complete information needed for patient follow-up.
- Be aware that long-term safety of topical calcineurin inhibitors hasn't been established.
- Although a causal relationship hasn't been established, rare cases of malignancy (such as skin cancers and lymphoma) have been reported in patients

treated with topical calcineurin inhibitors, including tacrolimus ointment. Therefore, continuous long-term use of tacrolimus ointment in any age-group should be avoided and application limited to areas of atopic dermatitis involvement. Tacrolimus ointment isn't indicated for use in children younger than age 2. Only 0.03% tacrolimus ointment is indicated for use in children ages 2 to 15.

### Action

Unknown. Thought to inhibit T-lymphocyte activation.

### Availability

*Capsules:* 0.5 mg, 1 mg, 5 mg

*Injection:* 5 mg/ml

*Topical ointment:* 0.03%, 0.1%

### Indications and dosages

➤ Prevention of organ rejection in patients with allogeneic liver transplants

**Adults:** Initially, 0.1 to 0.15 mg/kg/day P.O. in two divided doses q 12 hours. Alternatively, 0.03 to 0.05 mg/kg/day by continuous I.V. infusion.

**Children:** 0.15 to 0.2 mg/kg/day P.O. in two divided doses q 12 hours. Alternatively, 0.03 to 0.05 mg/kg/day by continuous I.V. infusion.

➤ Prevention of organ rejection in patients with allogeneic kidney transplants

**Adults:** Initially, 0.2 mg/kg/day P.O. in two divided doses q 12 hours when used in combination with azathioprine, or 0.1 mg/kg/day P.O. when used in combination with mycophenolate mofetil (MMF). Alternatively, 0.03 to 0.05 mg/kg/day by continuous I.V. infusion until oral dosing can be tolerated.

➤ Prevention of heart transplant rejection

**Adults:** Initially, 0.075 mg/kg/day P.O. q 12 hours in two divided doses in combination with azathioprine or MMF.

➤ Moderate to severe atopic dermatitis

**Adults:** 0.03% or 0.1% ointment applied b.i.d. to affected area, continued 1 week after dermatitis symptoms resolve

**Children ages 2 and older:** 0.03% ointment applied b.i.d. to affected area, continued 1 week after dermatitis symptoms resolve

### Dosage adjustment

- Hepatic or renal impairment
- Concurrent use of CYP3A inducers or inhibitors
- Black patients

### Contraindications

- Hypersensitivity to drug or its components (including castor oil derivatives)

### Precautions

Use cautiously in:

- severe hepatic disease, renal impairment, diabetes mellitus, hypertension, hyperkalemia, hyperuricemia, lymphoma, serious infections
- skin barrier defect with increased potential for systemic absorption of tacrolimus ointment
- premalignant and malignant skin conditions (avoid use)
- concurrent use of cyclosporine, nefinavir, or live vaccines (avoid use)
- concurrent use of strong CYP3A4 inhibitors (such as boceprevir, clarithromycin, itraconazole, ketoconazole, ritonavir, telaprevir, voriconazole,) and strong inducers (such as rifampin, rifabutin) (not recommended)
- concurrent use of other substrates or CYP3A4 inhibitors that also have potential to prolong QT interval
- concurrent use of sirolimus (not recommended in liver and heart transplant; use with sirolimus in kidney transplant not established)
- concurrent use of other nephrotoxic drugs or drugs that cause hyperkalemia

- prolonged exposure to ultraviolet (UV) light and sunlight (avoid)
- pregnant or breastfeeding patients
- children younger than age 12 (age 2 for ointment use).

### Administration

- Give oral form consistently with or without food but not with grapefruit juice.
- Give I.V. doses by infusion only. Be aware that I.V. use is reserved for patients who can't tolerate capsules orally.
- Start therapy within 24 hours of kidney transplantation and no earlier than 6 hours after liver or heart transplantation. Switch to oral dosing as soon as tolerable, starting 8 to 12 hours after I.V. dosing ends.

📢 Before giving I.V., ensure that epinephrine 1:1,000 and oxygen are at hand in case of emergency.

- For I.V. use, dilute in normal saline solution or dextrose 5% in water to a concentration of 0.004 to 0.02 mg/ml. Give by infusion only.
- Be aware that ointment is used only as second-line therapy for the short-term and noncontinuous treatment of moderate to severe atopic dermatitis in *nonimmunocompromised* patients who have failed to respond adequately to other topical prescription treatments for atopic dermatitis.
- After applying ointment, don't place occlusive dressing or wrapping over affected area.

Route	Onset	Peak	Duration
P.O.	Unknown	1.5-3.5 hr	Unknown
I.V.	Rapid	1-2 hr	Unknown
Ointment	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** tremor, headache, insomnia, paresthesia, delirium, asthenia, **neurotoxicities (including posterior reversible encephalopathy syndrome, delirium, seizures, and coma)**

**CV:** hypertension, peripheral edema, **myocardial hypertrophy**

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, ascites, anorexia

**GU:** hematuria, proteinuria, urinary tract infection, albuminuria, abnormal renal function, **oliguria, renal failure, nephrotoxicity**

**Hematologic:** anemia, **leukocytosis, thrombocytopenia, agranulocytosis, hemolytic anemia, pure red cell aplasia**

**Metabolic:** new-onset diabetes mellitus, hyperglycemia, hypomagnesemia, hypokalemia, **hyperkalemia**

**Musculoskeletal:** back pain

**Respiratory:** dyspnea, **pleural effusion, atelectasis**

**Skin:** burning (with ointment), rash, flushing, pruritus, alopecia

**Other:** pain, fever, chills, lymphadenopathy, **serious infections (including cytomegalovirus infections and polyoma virus infections), lymphoma and other malignancies, anaphylaxis**

## Interactions

**Drug-drug.** *Bromocriptine, chloramphenicol, cimetidine, clarithromycin, clotrimazole, cyclosporine, danazol, diltiazem, erythromycin, fluconazole, itraconazole, ketoconazole, methylprednisolone, metoclopramide, metronidazole, nicardipine, omeprazole, protease inhibitors, verapamil:* increased tacrolimus blood level

*Cyclosporine:* increased risk of nephrotoxicity

*CYP450 inducers (such as carbamazepine, phenobarbital, phenytoin, rifampin):* decreased tacrolimus metabolism

*Immunosuppressants (except adrenocorticoids):* immunologic oversuppression

*Live-virus vaccines:* interference with immune response to vaccine

*Mycophenolate mofetil:* increased mycophenolate blood level

*Nephrotoxic drugs (such as aminoglycosides, amphotericin B, cisplatin, cyclosporine):* additive or synergistic effects

**Drug-diagnostic tests.** *Blood urea nitrogen, creatinine, glucose:* increased levels  
*Hemoglobin, magnesium, platelets, white blood cells:* decreased levels

*Liver function tests:* abnormal values  
*Potassium:* increased or decreased level

**Drug-food.** *Any food:* inhibited drug absorption

*Grapefruit or grapefruit juice:* increased drug blood level

**Drug-herbs.** *Astragalus, echinacea, melatonin:* decreased immunosuppression

*St. John's wort:* decreased tacrolimus blood level

## Patient monitoring

🔊 Once I.V. infusion starts, watch closely for signs and symptoms of anaphylaxis.

- Monitor cardiac, liver, and kidney function test results. Watch for signs and symptoms of cardiovascular disorder, nephrotoxicity, and hepatic dysfunction.

🔊 Assess neurologic status for evidence of neurotoxicity (including posterior encephalopathy syndrome and seizures).

- Monitor potassium level closely. Stay alert for signs and symptoms of hyperkalemia.

- Monitor blood glucose. Watch for indications of hyperglycemia.

- Evaluate respiratory status regularly.

## Patient teaching

🔊 Teach patient to recognize and immediately report serious adverse reactions.

- Tell patient to take oral doses consistently with or without food, but not with grapefruit or grapefruit juice.

- Tell diabetic patient to expect increased blood glucose level, which may warrant further antidiabetic therapy. Advise him to monitor glucose level carefully.

- Instruct patient not to place occlusive dressings or wrappings over

affected area after applying ointment. Tell him to use drug for 1 week after dermatitis symptoms resolve.

- Advise patient to avoid live vaccines and prolonged exposure to UV light or sunlight.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## tadalafil

Cialis, Adcirca

**Pharmacologic class:** Phosphodiesterase type 5 (PDE5) inhibitor

**Therapeutic class:** Anti-erectile dysfunction agent

**Pregnancy risk category B**

### Action

Inhibits PDE5, increasing cyclic guanosine monophosphate level and enhancing erectile function; also relaxes pulmonary vascular smooth muscle cells and vasodilation of the pulmonary vascular bed

### Availability

Tablets: 2.5 mg, 5 mg, 10 mg, 20 mg, 40 mg

### Indications and dosages

➤ Erectile dysfunction (for as-needed use)

**Adults:** Initially, 10 mg (Cialis) P.O. before anticipated sexual activity; may increase to 20 mg or decrease to 5 mg based on patient response and tolerance. For most patients, maximum recommended dosing frequency is once daily.

➤ Erectile dysfunction (for daily use)

**Adults:** 2.5 mg (Cialis) P.O. once daily, given at approximately the same time

without regard to sexual activity; may increase to 5 mg P.O. once daily based on efficacy and tolerability

➤ Benign prostatic hyperplasia (BPH); concurrent erectile dysfunction and BPH

**Adults:** 5 mg (Cialis) P.O. daily at approximately the same time each day.

➤ Pulmonary hypertension

**Adults:** 40 mg (Adcirca) P.O. daily

### Dosage adjustment

- Mild to moderate hepatic impairment or renal impairment
- Administration with alpha blockers or potent CYP3A4 inhibitors such as ketoconazole or ritonavir

### Contraindications

- Hypersensitivity to drug or its components
- Concurrent use of organic nitrates (regularly or intermittently)

### Precautions

Use cautiously in:

- mild to moderate hepatic or renal impairment
- severe renal impairment (avoid Adcirca use; once-daily Cialis use not recommended)
- severe hepatic impairment (Cialis use not recommended; avoid Adcirca use)
- cardiac risk that makes sexual activity inadvisable, left ventricular outflow obstruction, myocardial infarction within last 90 days, unstable angina or angina occurring during sexual intercourse, New York Heart Association Class II or greater heart failure in last 6 months, uncontrolled arrhythmias, blood pressure below 90/50 mm Hg, uncontrolled hypertension (blood pressure above 170/100 mm Hg), stroke within last 6 months, pulmonary veno-occlusive disease), erectile dysfunction whose cause hasn't been evaluated, conditions that increase risk of priapism (use not recommended)

- concurrent use of potent CYP450-3A4 inhibitors or inducers, or other PDE5 inhibitors (avoid use)
- concurrent use of alpha blockers (except tamsulosin 0.4 mg/day), anti-hypertensives, or alcohol
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Know that patient should take drug with or without food and that patient should take Cialis before anticipated sexual activity when given on an as-needed basis.

Route	Onset	Peak	Duration
P.O.	Rapid	30 min-6 hr	Up to 36 hr

### Adverse reactions

**CNS:** headache, fatigue, dizziness, insomnia, hyperesthesia, paresthesia, drowsiness, vertigo, asthenia, transient global amnesia

**CV:** angina pectoris, chest pain, hypertension, hypotension, orthostatic hypotension, palpitations, syncope, tachycardia, **myocardial infarction**

**EENT:** blurred vision, color vision changes, conjunctivitis, eye pain, increased lacrimation, eyelid swelling, epistaxis, nasal congestion, pharyngitis

**GI:** nausea, vomiting, diarrhea, dyspepsia, esophagitis, gastroesophageal reflux, gastritis, upper abdominal pain, dysphagia, dry mouth

**GU:** increased or spontaneous erection

**Musculoskeletal:** myalgia; back, neck, limb, and joint pain

**Respiratory:** dyspnea

**Skin:** pruritus, rash, sweating

**Other:** facial edema, pain

### Interactions

**Drug-drug.** *Alpha-adrenergic blockers (except tamsulosin 0.4 mg/day):* marked blood pressure decrease

*Angiotensin receptor blockers, enalapril, metoprolol:* decreased blood pressure

*CYP450-3A4 inducers (such as carbamazepine, phenobarbital, phenytoin, rifampin):* decreased tadalafil blood level  
*CYP450-3A4 inhibitors (such as erythromycin, itraconazole, ketoconazole, ritonavir):* increased tadalafil blood level

*Theophylline:* slight increase in heart rate

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, lactate dehydrogenase, uric acid:* increased levels

**Drug-food.** *Grapefruit juice:* increased drug blood level

**Drug-behaviors.** *Alcohol use:* decreased blood pressure

### Patient monitoring

- Monitor for drug efficacy.

### Patient teaching

- Advise patient taking Cialis for erectile dysfunction on an as-needed basis to take before anticipated sexual activity.
- Instruct patient that when taking Cialis on a daily basis he should take tablet at approximately the same time every day, without regard to sexual activity.
- Instruct patient to take Adcirca tablets one after the other every day and not to split the dose.
- 🚫 Caution patient never to take concurrently with nitrates.
- 🚫 Instruct patient to stop sexual activity and contact prescriber immediately if chest pain, dizziness, or nausea occurs.
- 🚫 Advise patient to seek immediate medical attention if sudden loss of vision or sudden decrease in or loss of hearing occurs.
- Instruct patient not to take other PDE5 inhibitors.
- Instruct patient to contact prescriber if erection lasts more than 4 hours.
- Tell patient drug can cause serious interactions with many common drugs. Instruct him to tell all prescribers he is taking it.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Inform patient that drug may cause temporary blood pressure drop, leading to light-headedness if he stands up suddenly. Advise him to rise slowly and carefully.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## tamoxifen citrate

Apo-Tamoxifen<sup>✳</sup>, Gen-Tamoxifen<sup>✳</sup>, Nolvadex, Nolvadex-D<sup>✳</sup>, Novo-Tamoxifen<sup>✳</sup>, PMS-Tamoxifen<sup>✳</sup>, Soltamox, Tamofen<sup>✳</sup>

**Pharmacologic class:** Nonsteroidal antiestrogen

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

• For women with ductal carcinoma in situ or high risk of breast cancer, serious and life-threatening events associated with drug use in risk-reduction setting include stroke, pulmonary embolism, and uterine cancer. Some of these events were fatal. Discuss potential benefits versus potential risks of these events with these patients. In women already diagnosed with breast cancer, drug's benefits outweigh risks.

### Action

Competes with estrogen receptors in tumor cells for binding to target tissues

(such as breast); reduces DNA synthesis and estrogen response

### Availability

*Oral solution:* 10 mg/5 ml

*Tablets:* 10 mg, 20 mg

*Tablets (enteric-coated):* 20 mg

### Indications and dosages

➤ Adjunctive treatment of breast cancer

**Adults:** 20 to 40 mg P.O. daily for 5 years. Daily dosages of 20 mg may be taken as a single dose; daily dosages above 20 mg should be divided and taken b.i.d. (morning and evening).

➤ To reduce breast cancer incidence in high-risk women; treatment of ductal carcinoma in situ

**Adults:** 20 mg P.O. daily for 5 years

### Off-label uses

- Mastalgia
- Ovulation stimulation

### Contraindications

- Hypersensitivity to drug
- Concurrent warfarin use
- Women with a history of deep-vein thrombosis or pulmonary embolism
- Pregnancy or breastfeeding

### Precautions

Use cautiously in:

- decreased bone marrow reserve, leukopenia, thrombocytopenia, cataracts, hyperlipidemia
- females of childbearing age.

### Administration

- Don't break or crush enteric-coated tablets.
- Know that drug is indicated for reducing breast cancer risk only in high-risk women, defined as those older than age 35 who have at least a 1.67% chance of developing breast cancer over 5 years.

Route	Onset	Peak	Duration
P.O.	Unknown	5 hr	Unknown

### Adverse reactions

**CNS:** confusion, depression, headache, weakness, fatigue, light-headedness

**CV:** chest pain, **deep-vein thrombosis**

**EENT:** blurred vision, ocular lesion, retinopathy, corneal opacity

**GI:** nausea, vomiting, abdominal cramps, anorexia

**GU:** vaginal bleeding, discharge, or dryness; irregular menses; amenorrhea; oligomenorrhea; ovarian cyst; pruritus vulvae; **endometrial or uterine cancer**

**Hematologic:** leukopenia, thrombocytopenia

**Metabolic:** hypercalcemia, fluid retention

**Musculoskeletal:** bone pain

**Respiratory:** cough, **pulmonary embolism**

**Skin:** skin changes, hair thinning or partial hair loss

**Other:** altered taste, weight loss, tumor flare, tumor pain, hot flashes, edema

### Interactions

**Drug-drug.** *Aminoglutethimide, estrogens:* decreased tamoxifen effects

*Antineoplastics:* increased risk of thromboembolic events

*Bromocriptine:* increased tamoxifen blood level

*Warfarin:* increased anticoagulant effect

**Drug-diagnostic tests.** *Aspartate aminotransferase, bilirubin, calcium, creatinine, hepatic enzymes:* increased levels  
*Platelets, white blood cells:* decreased counts

### Patient monitoring

- Monitor lipid panel, calcium level, mammography results, and gynecologic exam results.

⚠️ Watch for signs and symptoms of thromboembolic events, including cerebrovascular accident and pulmonary embolism.

- Monitor menstrual cycle pattern for changes that may signal endometrial or uterine cancer.

### Patient teaching

- Tell patient to swallow enteric-coated tablets whole without breaking or crushing.

⚠️ Instruct patient to immediately report leg or calf pain, swelling, or tenderness; unexpected shortness of breath; sudden chest pain; coughing up blood; new breast lumps; vaginal bleeding; menstrual irregularities; changes in vaginal discharge; pelvic pain or pressure; and vision changes.

- Inform patient that increase in bone or tumor pain usually means drug will be effective. Advise her to discuss pain management with prescriber.

- Stress importance of undergoing regular blood tests, mammograms, and gynecologic exams to identify early signs of serious adverse reactions.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## tamsulosin hydrochloride

Bazetham ⚠️, Contiflo XL ⚠️, Flomax, Flomax CR ⚠️, Flomaxtra ⚠️, Novo-Tamsulosin ⚠️, Omnic MR ⚠️, Ran-Tamsulosin ⚠️, Ratio-Tamsulosin ⚠️, Sandoz Tamsulosin ⚠️, Stronazon ⚠️, Tabphyn ⚠️

**Pharmacologic class:** Alpha-adrenergic blocker

**Therapeutic class:** Anti-adrenergic

**Pregnancy risk category B**

**Action**

Decreases smooth muscle contractions of prostate by binding to  $\alpha_1$ -adrenergic receptors. This action increases urine flow and reduces symptoms of benign prostatic hyperplasia (BPH).

**Availability**

Capsules: 0.4 mg

**Indications and dosages**

➤ BPH

**Adults:** 0.4 mg/day P.O. after a meal. After 2 to 4 weeks, may increase to 0.8 mg/day.

**Contraindications**

- Hypersensitivity to drug or its components

**Precautions**

Use cautiously in:

- concurrent use of other  $\alpha$ -adrenergic blockers or strong CYP3A4 inhibitors (avoid use)
- concurrent use of moderate CYP3A4 inhibitors, strong or moderate CYP2D6 inhibitors, other cytochrome P450 inhibitors, warfarin, and in patients who are poor CYP2D6 metabolizers
- patients at increased risk for prostate cancer.

**Administration**

- Give 30 minutes after same meal each day.

Route	Onset	Peak	Duration
P.O.	Unknown	4-5 hr	9-15 hr

**Adverse reactions**

**CNS:** dizziness, headache, asthenia, insomnia, drowsiness, syncope, vertigo  
**CV:** orthostatic hypotension, chest pain  
**EENT:** rhinitis, amblyopia, pharyngitis, sinusitis  
**GU:** retrograde or diminished ejaculation, decreased libido  
**Musculoskeletal:** back pain

**Respiratory:** increased cough  
**Other:** tooth disorder, infection

**Interactions**

**Drug-drug.** *Cimetidine:* increased tamsulosin blood level, greater risk of toxicity

*Doxazosin, prazosin, terazosin:* increased risk of hypotension

*Ketoconazole (strong CYP3A4 inhibitor), paroxetine (strong CYP2D6 inhibitor):* increased tamsulosin  $C_{max}$  and area under the curve

**Drug-behaviors.** *Alcohol use:* increased risk of hypotension

**Patient monitoring**

- Monitor blood pressure. Stay alert for orthostatic hypotension.

**Patient teaching**

- Tell patient to take 30 minutes after same meal each day.
- Instruct patient not to chew or open capsule. Advise him to swallow it whole.
- Tell patient to move slowly when sitting up or standing, to avoid dizziness or light-headedness from sudden blood pressure decrease.
- Caution patient to avoid hazardous activities on first day of therapy.
- Inform patient that drug may cause abnormal ejaculation. Advise him to discuss this issue with prescriber.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and behaviors mentioned above.

**tapentadol hydrochloride**

Nucynta, Nucynta ER

**Pharmacologic class:** Opioid agonist

**Therapeutic class:** Opioid analgesic

**Controlled substance schedule II**

**Pregnancy risk category C**

**FDA BOXED WARNING**

- Know that Nucynta ER is an opioid agonist and Schedule II controlled substance with an abuse liability similar to other opioid agonists, legal or illicit. Assess each patient's risk of opioid abuse or addiction before prescribing Nucynta ER. Risk of opioid abuse increases in patients with a personal or family history of substance abuse (including drug or alcohol abuse or addiction) or mental illness (such as major depressive disorder). Routinely monitor all patients receiving Nucynta ER for signs and symptoms of misuse, abuse, and addiction during treatment.
- Respiratory depression, including fatal cases, may occur with Nucynta ER, even when drug has been used as recommended and not misused or abused. Proper dosing and titration are essential; Nucynta ER should only be prescribed by health care professionals knowledgeable in the use of potent opioids for management of chronic pain. Monitor patients for respiratory depression, especially during initiation of Nucynta ER or after a dosage increase. Instruct patients to swallow tablets whole. Crushing, dissolving, or chewing extended-release tablets can cause rapid release and absorption of a potentially fatal tapentadol dose.
- Accidental ingestion of Nucynta ER, especially in children, can result in a fatal tapentadol overdose.
- Consuming alcohol with Nucynta ER may result in increased tapentadol plasma level and potentially fatal overdose. Instruct patients not to consume alcoholic beverages or use prescription or nonprescription products that contain alcohol while taking Nucynta ER.

**Action**

Exact mechanism unknown. Analgesic effect may be due to mu-opioid agonist activity and inhibition of norepinephrine reuptake.

**Availability**

Tablets: 50 mg, 75 mg, 100 mg  
Tablets (extended-release): 50 mg, 100 mg, 150 mg, 200 mg, 250 mg

**Indications and dosages**

➤ Relief of moderate to severe acute pain

**Adults ages 18 and older:** 50 mg, 75 mg, or 100 mg (immediate-release) P.O. q 4 to 6 hours depending on pain intensity. On day 1, may give second dose as early as 1 hour after initial dose, if needed. Maximum daily dosage on day 1 is 700 mg and on subsequent days, 600 mg. Higher dosages not recommended.

➤ Management of moderate to severe chronic pain and neuropathic pain associated with diabetic peripheral neuropathy when continuous, around-the-clock opioid analgesic is needed for an extended period

**Adult:** Individualize dosing regimen according to pain severity and previous experience with similar drugs. Initially in patient not currently taking opioid analgesics, 50 mg (extended-release tablets) P.O. b.i.d. q 12 hours. Dosage range is 100 to 250 mg (extended-release tablets) P.O. b.i.d. q 12 hours. Patients receiving immediate-release form may be converted to extended-release by administering same total daily dose at half the total daily immediate-release dose q 12 hours. Maximum daily extended-release dosage is 500 mg.

**Dosage adjustment**

- Moderate hepatic impairment
- Elderly patients

## Contraindications

- Hypersensitivity to drug or its components (extended-release form)
- Significant respiratory depression, acute or severe bronchial asthma or hypercapnia in unmonitored settings or in absence of resuscitative equipment
- Paralytic ileus
- Monoamine oxidase (MAO) inhibitor use within last 14 days

## Precautions

Use cautiously in:

- severe hepatic or renal impairment (use not recommended)
- moderate hepatic impairment
- respiratory depression, hypoxia, hypercapnia, upper airway obstruction, decreased respiratory reserve (such as asthma, chronic obstructive pulmonary disease, or cor pulmonale), severe obesity, sleep apnea syndrome, myxedema, kyphoscoliosis, CNS depression, coma, hypotension
- biliary tract disease, including pancreatitis
- head injury, other intracranial injuries, increased intracranial pressure, seizures
- impaired consciousness or coma susceptible to intracranial effects of carbon dioxide retention (avoid extended-release use)
- concurrent use of other CNS depressants or serotonergic agents
- elderly or debilitated patients
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

## Administration

- Administer with or without food. Give extended-release tablets whole.
- 🚫 Don't give concurrently or within 14 days of MAO inhibitor.
- Be aware that extended-release tablets aren't for use as an as-needed analgesic, for pain that is mild or not expected to persist for an extended

time, for acute pain, or for postoperative pain unless patient is already receiving long-term opioid therapy.

- Be aware that withdrawal symptoms may occur if extended-release form is discontinued abruptly. Taper dosage to reduce withdrawal symptoms.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** dizziness, somnolence, headache, fatigue, tremor, lethargy, insomnia, confusion, abnormal dreams, anxiety, **seizures**

**EENT:** nasopharyngitis

**GI:** nausea, vomiting, constipation, dry mouth, dyspepsia, decreased appetite

**GU:** urinary tract infection

**Musculoskeletal:** arthralgia

**Respiratory:** upper respiratory tract infection, **respiratory depression**

**Skin:** rash, pruritus, excessive sweating

**Other:** hot flushing, physical or psychological drug dependence, drug tolerance, hypersensitivity

## Interactions

**Drug-drug.** *Antidepressants, antihistamines, general anesthetics, sedative-hypnotics, other CNS depressants:*

additive CNS depression leading to potentially life-threatening reactions  
*MAO inhibitors (such as isocarboxazid, phenelzine, tranylcypromine):* increased risk of potentially fatal reactions (hyperthermia, myoclonus, autonomic instability)

*Mixed agonist or antagonist opioids (such as butorphanol, nalbuphine, pentazocine):* reduced analgesic effect; precipitated withdrawal symptoms  
*Serotonergics (such as MOA inhibitors and triptans, selective norepinephrine reuptake inhibitors, selective serotonin reuptake inhibitors, tricyclic antidepressants, other drugs that impair*

*metabolism of serotonin*): risk of potentially life-threatening serotonin syndrome

**Drug-behaviors.** *Alcohol use:* increased CNS depression

### Patient monitoring

- 🔊 Stay alert for overdose signs and symptoms, such as CNS and respiratory depression, GI cramping, and constipation; provide supportive measures as appropriate.
- Monitor vital signs and CNS and respiratory status.
- Assess pain level and efficacy of pain relief.
- Monitor patient for signs and symptoms of drug dependence or tolerance.
- Monitor patient for hypotension during dosage initiation and titration.

### Patient teaching

- Instruct patient to take drug with or without food.
- Tell patient to take one extended-release tablet at a time with a sufficient amount of water to ensure complete swallowing immediately after placing tablet in the mouth. Tell patient that these tablets must be swallowed whole and must not be split, broken, chewed, dissolved, or crushed.
- 🔊 Instruct patient to stop taking drug and immediately tell prescriber if a seizure occurs.
- 🔊 Caution patient not to stop taking drug suddenly and that drug must be tapered.
- Advise patient to avoid alcohol use while taking drug.
- Advise patient to consult prescriber before taking other prescription or nonprescription drugs.
- Tell patient to notify prescriber if shortness of breath or difficulty breathing occurs or if nausea, vomiting, or constipation become pronounced.

- Instruct patient to move slowly when sitting up or standing to avoid dizziness or light-headedness from sudden blood pressure decrease.
- Caution patient to avoid driving and other hazardous activities until drug's effects on concentration, alertness, vision, coordination, and physical dexterity are known.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and behaviors mentioned above.

## telavancin

Vibativ

**Pharmacologic class:** Lipoglycopeptide

**Therapeutic class:** Anti-infective

**Pregnancy risk category C**

### FDA BOXED WARNING

- Women of childbearing age should have serum pregnancy test before receiving telavancin.
- Avoid using telavancin during pregnancy unless potential benefit to patient outweighs potential risk to fetus.
- Adverse developmental outcomes observed in three animal species at clinically relevant doses raise concerns about potential adverse developmental outcomes in humans.

### Action

Binds to bacterial membrane and disrupts membrane barrier function

### Availability

*Injection:* 250 mg, 750 mg in single-use vials

## Indications and dosages

➤ Complicated skin and skin-structure infections caused by susceptible gram-positive bacteria  
**Adults:** 10 mg/kg I.V infusion over 60 minutes q 24 hours for 7 to 14 days

## Dosage adjustment

- Renal impairment

## Contraindications

None

## Precautions

Use cautiously in:

- renal impairment
- concurrent use of drugs known to prolong QT interval
- history of congenital long QT syndrome, known prolongation of QTc interval, uncompensated heart failure, severe left ventricular hypertrophy (avoid use)
- elderly patients
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

## Administration

- Obtain renal function studies before starting therapy.
- Administer slowly (over 60 minutes) to reduce risk of infusion-related reactions.
- Although drug doesn't interfere with coagulation, it does, shortly after completion of infusion, interfere with certain tests used to monitor coagulation, such as prothrombin time (PT), International Normalized Ratio (INR), activated partial thromboplastin time (aPTT), activated clotting time, and coagulation-based factor Xa tests. Don't collect blood samples for such assays immediately or shortly after infusion completion because such effects dissipate as telavancin concentration decreases.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** dizziness

**CV:** cardiac events

**GI:** nausea, vomiting, diarrhea, abdominal pain, taste disturbance,  
***Clostridium difficile*–associated diarrhea**

**GU:** foamy urine, renal events,  
**nephrotoxicity**

**Respiratory:** respiratory events

**Skin:** rash, pruritus, infusion-site erythema

**Other:** rigors, decreased appetite, infectious events, superinfection, infusion-site pain, infusion reactions

## Interactions

**Drug-diagnostic tests.** *Activated clotting time, aPTT, coagulation-based factor Xa tests, INR, PT; urine qualitative protein assays:* interference with results

## Patient monitoring

 Be aware that new-onset or worsening renal impairment has occurred in patients taking telavancin. Monitor renal function at 48- and 72-hour intervals during treatment, or more frequently if clinically indicated, and at end of therapy.

 Watch for *C. difficile*–associated diarrhea, which may range in severity from mild diarrhea to fatal colitis; consider discontinuing drug if *C. difficile*–associated diarrhea occurs.

• Watch for “red-man” syndrome, which can result from rapid infusion. Signs and symptoms include flushing of upper body, hypotension, pruritus, and maculopapular rash on face, neck, trunk, and limbs.

## Patient teaching

 Instruct patient to tell prescriber if severe diarrhea occurs.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## telithromycin

Ketek

**Pharmacologic class:** Ketolide antibiotic

**Therapeutic class:** Anti-infective

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug is contraindicated in myasthenia gravis because life-threatening or fatal respiratory failure has occurred in these patients.

### Action

Blocks protein synthesis by binding to domains II and V of 23S rRNA of 50S ribosomal subunit. Binding at domain II enables drug to retain activity against gram-positive cocci in resistance mediated by methylases that alter domain-V binding site.

### Availability

Tablets (film-coated): 300 mg, 400 mg

### Indications and dosages

➤ Mild to moderate community-acquired pneumonia caused by *Streptococcus pneumoniae* (including multidrug-resistant isolates), *Haemophilus influenzae*, *Moraxella catarrhalis*, *Chlamydomydia pneumoniae*, or *Mycoplasma pneumoniae*  
**Adults age 18 and older:** 800 mg P.O. daily for 7 to 10 days

### Dosage adjustment

- Severe renal impairment, with or without coexisting hepatic impairment

### Contraindications

- Hypersensitivity to drug, its components, or macrolide antibiotics
- History of hepatitis or jaundice with previous use of telithromycin or macrolide antibiotics
- Concurrent use of cisapride or pimozide
- Myasthenia gravis

### Precautions

Use cautiously in:

- severe renal impairment, hepatic dysfunction, congenital prolongation of QT interval, ongoing proarrhythmic conditions (such as uncorrected hypokalemia or hypomagnesemia), clinically significant bradycardia (use should be avoided)
- concurrent use of some HMG-CoA reductase inhibitors (atorvastatin, lovastatin, simvastatin), rifampin, and Class IA or Class III antiarrhythmics (use should be avoided)
- concurrent use of midazolam and other benzodiazepines metabolized by CYP3A4 that undergo high first-pass effect (such as triazolam)
- concurrent use of ergot alkaloid derivatives, metoprolol, or rifampin (use not recommended)
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

### Administration

- Administer tablets whole with or without food.
- Give at least 1 hour before or after theophylline (if prescribed).
- 🔊 Don't give currently with cisapride or pimozide.

Route	Onset	Peak	Duration
P.O.	Unknown	1 hr	Unknown

## Adverse reactions

**CNS:** headache, dizziness, fatigue, loss of consciousness

**CV:** prolonged QT interval with increased risk of **ventricular arrhythmias** and **torsades de pointes**

**EENT:** visual disturbances, poor visual accommodation

**GI:** nausea, vomiting, diarrhea, loose stools, light-colored stools, dysgeusia, anorexia, **pseudomembranous colitis** (possibly caused by *Clostridium difficile*)

**GU:** dark urine

**Hepatic:** abnormal hepatic function, **fulminant hepatitis**, **hepatic necrosis**, **hepatic failure**

**Skin:** pruritus

**Other:** **superinfection**, **hypersensitivity reactions** including **angioedema** and **anaphylaxis** (rare), **acute myasthenia gravis exacerbation**

## Interactions

**Drug-drug.** *Atorvastatin*, *lovastatin*, *simvastatin*: increased blood levels of these drugs, increased myopathy risk  
*Benzodiazepines metabolized by CYP3A4* (such as *midazolam*, *triazolam*):

increased blood levels of these drugs  
*Cisapride*, *pimozide*: increased blood levels of these drugs, increasing risk of significantly prolonged QT interval

*Class IA antiarrhythmics* (such as *procainamide*, *quinidine*), *Class III antiarrhythmics* (such as *dofetilide*): interference with antiarrhythmic efficacy

*Colchicine*: increased serum colchicine blood level and toxicity risk

*Cyclosporine*, *sirolimus*, *tacrolimus*: increased blood levels of these drugs, with increased toxicity risk

*CYP3A4 inducers* (such as *carbamazepine*, *phenobarbital*, *phenytoin*, *rifampin*): subtherapeutic telithromycin blood level

*CYP3A4 inhibitors* (such as *itraconazole*, *ketoconazole*): increased telithromycin blood level

*Digoxin*: increased peak and trough digoxin levels

*Ergot alkaloid derivatives* (such as *dihydroergotamine*, *ergotamine*): acute ergot toxicity

*Hexobarbital*: increased hexobarbital blood level and toxicity risk

*Metoprolol*: increased metoprolol effect  
*Oral anticoagulants*: possible potentiation of these drugs

*Sotalol*: decreased sotalol absorption

*Theophylline*: increased theophylline blood level, with exacerbated adverse GI reactions

*Verapamil*: increased verapamil blood level, causing increased risk of cardiotoxicity

**Drug-diagnostic tests.** *Alanine aminotransferase*, *aspartate aminotransferase*: increased levels

## Patient monitoring

- Monitor liver function tests frequently.

⚠ Discontinue drug permanently if patient develops clinical hepatitis or transaminase elevations and other systemic symptoms.

- Monitor patient closely for adverse GI reactions, especially diarrhea.

- In patients receiving drug concurrently with anticoagulants, stay alert for potentiation of anticoagulant effects.

- In patients receiving drug concurrently with midazolam, stay alert for need to adjust midazolam dosage.

- In patients receiving drug concurrently with digoxin, monitor peak and trough digoxin levels periodically, and stay alert for adverse reactions to digoxin.

## Patient teaching

- Ensure that patient has received and read medication guide that comes with drug.

- Instruct patient to take tablet whole with or without food.

- Advise patient to take drug at least 1 hour before or after theophylline (if prescribed).

- Stress importance of completing full course of therapy, even if patient feels better.

- 📣 Urge patient to immediately stop taking drug and report signs and symptoms of liver damage, such as nausea, fatigue, appetite loss, yellowing of skin or eyes, dark urine, light-colored stools, itching, and tender abdomen.

- 📣 Instruct patient to immediately report fainting episodes or signs of heartbeat irregularities.

- 📣 Urge patient to immediately report watery or loose stools even as late as several months after taking the last dose.

- 📣 Advise patient to immediately report itching, throat swelling, and other signs or symptoms of allergic reaction.

- Inform patient that drug may cause visual disturbances.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects vision and alertness.

- Advise patient to consult prescriber before taking other prescription or over-the-counter drugs or dietary supplements.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## telmisartan

Micardis

**Pharmacologic class:** Angiotensin II receptor antagonist

**Therapeutic class:** Antihypertensive

**Pregnancy risk category C** (first trimester), **D** (second and third trimesters)

### FDA BOXED WARNING

- Drugs that act directly on the renin-angiotensin system can cause injury to or death of a developing fetus. Discontinue drug as soon as possible when pregnancy is detected.

### Action

Inhibits vasoconstricting effects and blocks aldosterone-producing effects of angiotensin II at various receptor sites, including vascular smooth muscle and adrenal glands

### Availability

Tablets: 20 mg, 40 mg, 80 mg

### Indications and dosages

➤ Hypertension

**Adults:** 40 mg P.O. daily, titrated up or down within range of 20 to 80 mg daily based on response and tolerance

➤ Cardiovascular risk reduction

**Adults:** 80 mg P.O. daily in patients unable to take angiotensin-converting enzyme (ACE) inhibitors

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- heart failure, impaired renal function secondary to primary renal disease or renal stenosis, obstructive biliary disorders, hepatic impairment, volume or sodium depletion

- patients receiving high-dose diuretics
- concomitant use of ACE inhibitors and angiotensin receptor blockers (avoid use)

- pregnant or breastfeeding patients
- children younger than age 18 (safety not established).

## Administration

- Don't remove tablet from blister pack until just before giving.
- Know that drug may be used alone or with other antihypertensives.

Route	Onset	Peak	Duration
P.O.	Unknown	0.5-1 hr	24 hr

## Adverse reactions

**CNS:** dizziness, headache, fatigue

**CV:** chest pain, peripheral edema, hypertension, intermittent claudication

**EENT:** sinusitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, dyspepsia, abdominal pain

**GU:** urinary tract infection

**Musculoskeletal:** myalgia, back and leg pain

**Respiratory:** cough, upper respiratory infection

**Skin:** ulcer

**Other:** pain, flu or flulike symptoms, hypersensitivity

## Interactions

**Drug-drug.** *Antihypertensives, diuretics:* increased risk of hypotension

*Ace inhibitors (ramipril):* increased ramipril steady-state  $C_{max}$  and area under the curve (AUC), decreased telmisartan  $C_{max}$  and AUC

*Digoxin:* increased digoxin blood level

*Lithium:* increased serum lithium concentration and toxicity

*Nonsteroidal anti-inflammatory drugs, including selective cyclooxygenase-2 inhibitors):* deterioration of renal function, including possible acute renal failure in elderly patients, volume-depleted patients (including those on diuretic therapy), or with compromised renal function; attenuated telmisartan antihypertensive effect

**Drug-diagnostic tests.** *Creatinine:* slight elevation

**Drug-food.** *Any food:* slightly reduced drug bioavailability

## Patient monitoring

- Monitor blood pressure frequently and watch for signs and symptoms of hypotension.
- Closely monitor patient with impaired hepatic or renal function. Correct volume deficits as appropriate before therapy starts. Monitor fluid intake and output and creatinine level during therapy.

## Patient teaching

- Tell patient to take 1 hour before or 2 hours after meals.
- Caution patient not to remove tablet from blister pack until just before taking.
- Advise patient to report swelling or chest pain.
- Teach patient to measure blood pressure regularly and report significant changes.
- Tell patient to report suspected pregnancy to prescriber. Caution her not to breastfeed.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## temazepam

Apo-Temazepam<sup>⌘</sup>, Co Temazepam<sup>⌘</sup>, Dom-Temazepam<sup>⌘</sup>, Gen-Temazepam<sup>⌘</sup>, Novo-Temazepam<sup>⌘</sup>, Nu-Temazepam<sup>⌘</sup>, PHL-Temazepam<sup>⌘</sup>, PMS-Temazepam<sup>⌘</sup>, Ratio-Temazepam<sup>⌘</sup>, Restoril

**Pharmacologic class:** Benzodiazepine

**Therapeutic class:** Sedative-hypnotic

**Controlled substance schedule IV**

**Pregnancy risk category X**

**Action**

Depresses CNS at limbic, thalamic, and hypothalamic levels. Enhances effects of gamma-aminobutyric acid, resulting in sedation, hypnosis, skeletal muscle relaxation, and anticonvulsant and anxiolytic activity.

**Availability**

*Capsules:* 7.5 mg, 15 mg, 22.5 mg, 30 mg

**Indications and dosages**

➤ Insomnia

**Adults:** 15 mg P.O. at bedtime p.r.n.  
Range is 7.5 to 30 mg.

**Dosage adjustment**

- Elderly or debilitated patients

**Contraindications**

- Hypersensitivity to drug or other benzodiazepines
- Pregnancy

**Precautions**

Use cautiously in:

- chronic pulmonary insufficiency, hepatic dysfunction, renal disease, psychoses, drug abuse
- history of suicide attempt or drug abuse
- elderly or debilitated patients
- breastfeeding patients
- children younger than age 15.

**Administration**

- Give at bedtime with or without food.

Route	Onset	Peak	Duration
P.O.	30 min	1.2-1.6 hr	Unknown

**Adverse reactions**

**CNS:** hangover, headache, dizziness, drowsiness, lethargy, fatigue, paradoxical stimulation, light-headedness, talkativeness, irritability, nervousness, confusion, euphoria, relaxed feeling, tremor, incoordination, impaired memory, nightmares, paresthesia  
**CV:** chest pain, palpitations, tachycardia

**EENT:** eye irritation, pain, and swelling; photophobia; tinnitus

**GI:** nausea, vomiting, constipation, diarrhea, heartburn, abdominal pain, dry mouth, anorexia

**Musculoskeletal:** joint pain

**Other:** altered taste, body pain, physical or psychological drug dependence, drug tolerance

**Interactions**

**Drug-drug.** *Antidepressants, antihistamines, opioid analgesics, other sedative-hypnotics:* additive CNS depression

*Digoxin:* increased digoxin blood level, greater risk of toxicity

*Probenecid:* faster temazepam onset and prolonged effects

*Theophylline:* antagonism of temazepam's sedative effects

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* additive CNS depression

*Smoking:* increased drug metabolism

**Patient monitoring**

- Monitor neurologic status carefully. Check for paradoxical reactions, especially in elderly patient.
- Watch for signs and symptoms of physical and psychological drug dependence. Stay alert for drug hoarding.

**Patient teaching**

- Advise patient to establish effective bedtime routine, to minimize insomnia.
- Inform patient (and significant other if appropriate) that drug may cause psychological and physical dependence and should be used only as prescribed and needed.
- Caution patient to avoid driving and other hazardous activities on day after taking drug, until he knows how it affects concentration and alertness.
- Instruct patient not to drink alcohol.

- Advise patient not to smoke or use herbs without consulting prescriber.
- Instruct patient to report suspected pregnancy.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, herbs, and behaviors mentioned above.

## temozolomide

Temodal<sup>®</sup>, Temodar

**Pharmacologic class:** Alkylating agent

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### Action

Rapidly converts to monomethyl triazeno imidazole carboxamide, an active compound that prevents DNA transcription

### Availability

**Capsules:** 5 mg, 20 mg, 100 mg, 140 mg, 180 mg, 250 mg

**Injection (powder for solution, lyophilized):** 100 mg

### Indications and dosages

➤ Refractory anaplastic astrocytoma

**Adults:** 150 mg/m<sup>2</sup> P.O. or by 90-minute I.V. infusion daily for 5 consecutive days of each 28-day treatment cycle. Adjust dosage as appropriate based on absolute neutrophil count.

➤ Newly diagnosed glioblastoma multiforme with radiotherapy

**Adults:** 75 mg/m<sup>2</sup> P.O. or by 90-minute I.V. infusion for 42 days with focal radiotherapy (RT), followed by initial maintenance dose of 150 mg/m<sup>2</sup> P.O. or by 90-minute I.V. infusion daily for days 1 to 5 of a 28-day cycle for six cycles. Four weeks after completing the drug plus RT phase, administer drug

for an additional six cycles of maintenance treatment. Dosage in maintenance cycle 1 is 150 mg/m<sup>2</sup> P.O. or by 90-minute I.V. infusion daily for 5 days, followed by 23 days without treatment. At start of maintenance cycle 2, dosage may be escalated to 200 mg/m<sup>2</sup> based on absolute neutrophil and platelet counts. Continue dosage at 200 mg/m<sup>2</sup> daily for first 5 days of each subsequent cycle except if toxicity occurs. If dosage wasn't escalated at maintenance cycle 2, escalation shouldn't be done in subsequent cycles.

### Dosage adjustment

- Neutropenia, thrombocytopenia

### Contraindications

- Hypersensitivity to drug, its components, or dacarbazine

### Precautions

Use cautiously in:

- severe hepatic or renal impairment, active infection, decreased bone marrow reserve, other chronic debilitating illness
- elderly patients
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Follow facility policy for handling and disposing of chemotherapeutic drugs.
- Give capsules whole daily with a full glass of water, consistently either with or without food.
- Bring powder for injection to room temperature before reconstituting with 41 ml sterile water for injection that results in a 2.5-mg/ml solution. Gently swirl but don't shake vials. Don't further dilute reconstituted solution. Use reconstituted solution within 14 hours, including infusion time. Withdraw prescribed dose and transfer into empty 250-ml infusion bag. Give reconstituted solution only by I.V.

infusion using infusion pump over 90 minutes. Flush lines before and after each infusion.

- Know that drug may be given in same I.V. line with normal saline solution for injection only.
- Be aware that dosages in 28-day cycle depend on nadir neutrophil and platelet counts.

Route	Onset	Peak	Duration
P.O.	Rapid	1 hr	Unknown
I.V.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** fatigue, headache, dysphasia, poor coordination, ataxia, anxiety, depression, dizziness, drowsiness, confusion, amnesia, insomnia, mental status changes, weakness, paresis, hemiparesis, paresthesias, **seizures**

**CV:** peripheral edema

**EENT:** abnormal vision, diplopia, pharyngitis, sinusitis

**GI:** nausea, vomiting, constipation, diarrhea, abdominal pain, anorexia

**GU:** urinary incontinence or frequency, urinary tract infection, breast pain (in women)

**Hematologic:** anemia, **leukopenia**, **thrombocytopenia**

**Metabolic:** adrenal hypercorticism

**Musculoskeletal:** abnormal gait, back pain, myalgia

**Respiratory:** cough, upper respiratory infection

**Skin:** pruritus, rash

**Other:** fever, viral infection, weight gain

### Interactions

**Drug-drug.** *Antineoplastics:* additive bone marrow depression

*Live-virus vaccines:* decreased antibody response to vaccine, greater risk of adverse reactions

*Valproic acid:* decreased oral clearance of temozolomide

**Drug-diagnostic tests.** *Neutrophils, platelets:* decreased counts

**Drug-food.** *Any food:* reduced rate and extent of temozolomide absorption

### Patient monitoring

 Monitor CBC with white cell differential. Stay alert for evidence of bone marrow depression.

- Assess neurologic status carefully.
- Monitor fluid intake and output, and weigh patient regularly.
- Be aware that *Pneumocystis jiroveci* pneumonia prophylaxis is required during concomitant administration of RT and should be continued in patients who develop lymphocytopenia until recovery from lymphocytopenia (circulating tumor cells Grade 1 or less).

### Patient teaching

- Tell patient to take capsules consistently with or without food, and with a full glass of water.
- Instruct patient to swallow capsules whole without opening or chewing them and if capsules are accidentally opened or damaged, to avoid inhalation or contact with the skin or mucous membranes.
- If drug causes nausea or vomiting, advise patient to take it 1 hour before or 2 hours after a meal.
- Inform patient that drug may cause abnormal gait and dizziness.
-  Instruct patient to immediately report unusual bleeding or bruising.
- Advise patient to avoid live-virus vaccines.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, alertness, and vision.
- Instruct patient to report suspected pregnancy. Caution her not to breastfeed.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## tenecteplase

Metalyse , TNKase

**Pharmacologic class:** Tissue plasminogen activator

**Therapeutic class:** Thrombolytic enzyme

**Pregnancy risk category C**

### Action

Binds to fibrin and converts plasminogen to plasmin, which breaks down fibrin clots and lyses thrombi and emboli. Causes systemic fibrinolysis.

### Availability

*Powder for injection:* 50 mg/vial with 10-ml syringe and TwinPak Dual Canula Device and 10-ml vial of sterile water for injection

### Indications and dosages

➤ To reduce mortality associated with acute myocardial infarction

**Adults weighing 90 kg (198 lb) or more:** 50 mg I.V. bolus given over 5 seconds

**Adults weighing 80 kg to 89 kg (176 to 197 lb):** 45 mg I.V. bolus given over 5 seconds

**Adults weighing 70 kg to 79 kg (154 to 175 lb):** 40 mg I.V. bolus given over 5 seconds

**Adults weighing 60 to 69 kg (132 to 153 lb):** 35 mg I.V. bolus given over 5 seconds

**Adults weighing less than 60 kg (132 lb):** 30 mg I.V. bolus given over 5 seconds

### Contraindications

- Hypersensitivity to drug or other tissue plasminogen activators
- Active internal bleeding
- Bleeding diathesis
- Recent intracranial or intraspinal surgery or trauma

- Severe uncontrolled hypertension
- Intracranial neoplasm
- Arteriovenous malformation or aneurysm
- History of cerebrovascular accident (CVA)

### Precautions

Use cautiously in:

- previous puncture of noncompressible vessels, organ biopsy, hypertension, acute pericarditis, high risk of left ventricular thrombosis, subacute bacterial endocarditis, hemostatic defects, diabetic hemorrhagic retinopathy, septic thrombophlebitis, obstetric delivery
- patients taking warfarin concurrently
- patients older than age 75
- pregnant or breastfeeding patients.

### Administration

- Reconstitute by mixing contents of prefilled syringe with 10 ml of sterile water for injection. Swirl gently; don't shake. Draw up prescribed dosage from vial, then discard remainder. Give I.V. over 5 seconds through designated line.
- ⚠ Don't deliver in same I.V. line with dextrose solutions. Flush I.V. line with normal saline solution before giving drug if patient has been receiving dextrose.
- ⚠ Give with heparin if ordered, but not through same I.V. line.

Route	Onset	Peak	Duration
I.V.	Immediate	Unknown	Unknown

### Adverse reactions

**CNS:** intracranial hemorrhage, CVA  
**CV:** hypotension, arrhythmia, myocardial rupture, myocardial reinfarction, cardiogenic shock, atrioventricular block, cardiac arrest, cardiac tamponade, heart failure, pericarditis, pericardial effusion, mitral regurgitation, thrombosis, embolism, hemorrhage

**EENT:** epistaxis, minor pharyngeal bleeding

**GI:** nausea, vomiting, **hemorrhage**

**GU:** hematuria

**Hematologic:** anemia, **bleeding tendency**

**Respiratory:** respiratory depression, **pulmonary edema, apnea**

**Skin:** bleeding at puncture sites, hematoma

## Interactions

**Drug-drug.** *Anticoagulants, aspirin, dipyridamole, indomethacin, phenylbutazone:* increased bleeding risk

**Drug-diagnostic tests.** *Coagulation tests:* fibrinogen degradation in blood sample

## Patient monitoring

🔊 Monitor ECG. Stay alert for reperfusion arrhythmias.

🔊 Monitor vital signs carefully. Watch for signs and symptoms of respiratory depression and reinfarction.

🔊 Evaluate all body systems closely for signs and symptoms of bleeding. If bleeding occurs, stop drug and give antiplatelet agents, as ordered.

- Monitor CBC and coagulation studies. However, know that drug may skew coagulation results.

## Patient teaching

🔊 Inform patient that drug increases risk of bleeding. Advise him to immediately report signs and symptoms of bleeding.

- Teach patient safety measures to avoid bruising and bleeding.
- Tell patient he'll undergo regular blood tests during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

# tenofovir disoproxil fumarate

Viread

**Pharmacologic class:** Nucleoside analog reverse transcriptase inhibitor

**Therapeutic class:** Antiretroviral

**Pregnancy risk category B**

## FDA BOXED WARNING

- Severe acute exacerbations of hepatitis have been reported in patients with hepatitis B virus (HBV) infection who have discontinued anti-hepatitis B therapy. Monitor hepatic function closely with both clinical and laboratory follow-up for at least several months in patients who discontinue anti-hepatitis B therapy. If appropriate, resumption of anti-hepatitis B therapy may be warranted.
- Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported with the use of nucleoside analogs, including tenofovir.
- Drug should not be given with adefovir dipivoxil.
- Because of risk of development of human immunodeficiency virus-1 (HIV-1) resistance, drug should only be used in HIV-1 and HBV co-infected patients as part of an appropriate antiretroviral combination regimen.
- HIV-1 antibody testing should be offered to all HBV-infected patients before start of therapy. It is also recommended that all patients with HIV-1 infection be tested for presence of chronic HBV infection before start of drug therapy.
- Drug's effects on bone haven't been studied in patients with chronic HBV infection.
- In HIV-infected patients, redistribution or accumulation of body fat,

including central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, facial wasting, breast enlargement, and cushingoid appearance, has been observed in patients receiving combination antiretroviral therapy.

- Immune reconstitution syndrome has been reported in HIV-infected patients treated with combination antiretroviral therapy.

### Action

Inhibits activity of HIV by competing with natural substrate deoxyadenosine 5'-triphosphate; disrupts cellular DNA by causing chain termination

### Availability

*Powder, oral:* 40 mg/scoop

*Tablets:* 150 mg, 200 mg, 250 mg, 300 mg

### Indications and dosages

➤ HIV-1 infection, chronic hepatitis B infection

**Adults and adolescents age 12 and older weighing 35 kg (77 lb) or more:** 300 mg P.O. daily; for patients unable to swallow tablets, give 7.5 scoops of oral powder.

➤ HIV-1 infection

**Children ages 2 to younger than 12:** 8 mg/kg (to maximum of 300 mg) P.O. once daily as oral powder or tablets

### Dosage adjustment

- Baseline creatinine clearance less than 50 ml/minute

### Contraindications

- None

### Precautions

Use cautiously in:

- renal impairment
- lactic acidosis
- exacerbation of hepatitis, hepatomegaly with steatosis

- co-administration of adefovir dipivoxil or other tenofovir-containing products
- concurrent or recent use of nephrotoxic drugs.
- decreased bone marrow density
- redistribution or accumulation of body fat
- immune reconstitution syndrome
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 2 with HIV-1 infection and younger than age 12 or less than 35 kg (77 lb) with chronic hepatitis B infection (safety and efficacy not established).

### Administration

- Assess creatinine clearance before starting drug.
- Give tablets without regard to meals.
- Give oral powder with 2 to 4 oz of soft foods that can be swallowed without chewing (such as applesauce, baby food, or yogurt). Don't mix with liquids. Give dose immediately after mixing.
- Know that drug is usually given with other antiretrovirals for HIV infection.

Route	Onset	Peak	Duration
P.O.	Rapid	45-75 min	Unknown

### Adverse reactions

**CNS:** headache, asthenia, depression

**GI:** nausea, vomiting, diarrhea, abdominal pain, flatulence, anorexia

**GU:** new-onset or worsening renal impairment (including acute renal failure and Fanconi syndrome)

**Skin:** rash

**Hepatic:** severe hepatomegaly with steatosis

**Metabolic:** hyperglycemia, lactic acidosis

**Other:** body fat redistribution, pain, immune reconstitution syndrome

## Interactions

**Drug-drug.** *Acyclovir, cidofovir, didanosine, ganciclovir, indinavir, lopinavir, probenecid, ritonavir, valacyclovir, valganciclovir, other drugs eliminated by active tubular secretion (such as adefovir dipivoxil):* increased blood level of either drug

*Atazanavir, lopinavir/ritonavir:* increased tenofovir concentration

**Drug-diagnostic tests.** *Alanine aminotransferase, amylase, aspartate aminotransferase, blood and urine glucose, creatine kinase, triglycerides:* increased levels

*Neutrophils:* decreased count

**Drug-food.** *Any food:* decreased drug bioavailability and efficacy

## Patient monitoring

📣 Watch for and report signs and symptoms of lactic acidosis or hepatotoxicity.

- Monitor bone mineral density in patients with history of pathologic fractures or who are at risk for osteopenia.

📣 Monitor for signs of immune reconstitution syndrome, especially during initial phase of combination antiretroviral treatment when patients whose immune systems respond may develop an inflammatory response to indolent or residual opportunistic infections (such as *Mycobacterium avium* infection, cytomegalovirus, *Pneumocystis jiroveci* pneumonia, or tuberculosis), which may necessitate further evaluation and treatment.

- Monitor kidney and liver function tests.
- Assess nutritional status and hydration in light of adverse GI reactions and underlying disease.

## Patient teaching

- Tell patient to take tablets once daily at the same time every day with or

without food and take oral powder at the same time every day with food.

- Tell patient not to mix oral powder with liquids. Tell patient to use only the dosing scoop supplied, to mix only with 2 to 4 oz of soft foods that can be swallowed without chewing (such as baby food, applesauce, or yogurt), and to take entire dose immediately after mixing.

📣 Instruct patient to immediately report unusual tiredness or yellowing of skin or eyes.

- Tell patient drug may cause weakness and headache. Caution him to avoid driving and other hazardous activities until he knows how drug affects performance.

- Caution female patient not to breast-feed.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## terazosin hydrochloride

Apo-Terazosin<sup>✳</sup>, Dom-Terazosin<sup>✳</sup>, Hytrin, Novo-Terazosin<sup>✳</sup>, Nu-Terazosin<sup>✳</sup>, PHL-Terazosin<sup>✳</sup>, PMS-Terazosin<sup>✳</sup>, Ratio-Terazosin<sup>✳</sup>

**Pharmacologic class:** Anti-adrenergic (peripherally acting)

**Therapeutic class:** Antihypertensive

**Pregnancy risk category C**

## Action

Blocks postsynaptic alpha<sub>1</sub>-adrenergic receptors, causing vasodilation and decreasing smooth muscle contractions in bladder neck and prostate

**Availability**

Capsules: 1 mg, 2 mg, 5 mg, 10 mg

**Indications and dosages**

➤ Hypertension

**Adults:** Initially, 1 mg P.O., increased slowly as needed up to 5 mg/day. Usual range is 1 to 5 mg/day, not to exceed 20 mg/day.

➤ Benign prostatic hyperplasia

**Adults:** 1 mg P.O. at bedtime. To achieve desired response, may increase gradually to 2 mg/day, then to 5 mg/day, and then to a maximum of 10 mg/day.

**Contraindications**

- Hypersensitivity to drug or other quinazoline derivatives

**Precautions**

Use cautiously in:

- prostate cancer, hepatic disease, dehydration, volume or sodium depletion
- pregnant or breastfeeding patients
- children (safety not established).

**Administration**

🔊 Don't stop therapy suddenly. Dosage must be tapered.

- Know that drug may be given as a single dose at bedtime or in two divided doses.

Route	Onset	Peak	Duration
P.O.	15 min	2-3 hr	24 hr

**Adverse reactions**

**CNS:** dizziness, headache, weakness, drowsiness, nervousness, paresthesia, vertigo, fatigue, syncope

**CV:** orthostatic hypotension (with first dose), rebound hypertension, chest pain, palpitations, peripheral edema, tachycardia, **arrhythmias**

**EENT:** blurred vision, conjunctivitis, amblyopia, nasal congestion, sinusitis

**GI:** nausea, vomiting, diarrhea, abdominal pain, dry mouth

**GU:** urinary frequency or incontinence, erectile dysfunction, priapism

**Musculoskeletal:** joint, back, and extremity pain; arthritis

**Respiratory:** dyspnea

**Skin:** pruritus

**Other:** fever, weight gain, flulike symptoms

**Interactions**

**Drug-drug.** *Estrogens, nonsteroidal anti-inflammatory drugs (NSAIDs), sympathomimetics:* decreased anti-hypertensive effects

*Midodrine:* antagonism of terazosin's action

*Nitrates, other antihypertensives:* additive hypotension

**Drug-herbs.** *Ephedra (ma huang):* antagonism of terazosin's action

**Drug-behaviors.** *Alcohol use:* additive hypotension

**Patient monitoring**

- Monitor blood pressure. Stay alert for orthostatic hypotension (first-dose effect) when therapy begins.
- Assess cardiovascular status. Report chest pain, peripheral edema, palpitations, and other significant effects.

**Patient teaching**

- Instruct patient to take at same time every day, with or without food.
- 🔊 Caution patient not to stop therapy abruptly. Dosage must be tapered.
- 🔊 Advise patient to immediately report swelling, breathing difficulty, palpitations, chest pain, and other cardiovascular reactions.
- Tell patient drug may cause erectile dysfunction and other sexual problems.
- Caution patient not to use NSAIDs or drink alcohol.
- Instruct patient to move slowly when sitting up or standing, to avoid dizziness from sudden blood pressure decrease.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, herbs, and behaviors mentioned above.

## terbinafine hydrochloride

Lamisil, Lamisil AT

**Pharmacologic class:** Synthetic allylamine derivative

**Therapeutic class:** Antifungal

**Pregnancy risk category B**

### Action

Unclear. Thought to interfere with sterol biosynthesis of fungal cell membrane permeability by inhibiting enzymes responsible for normal fungal growth and maturation, resulting in cell death.

### Availability

*Cream:* 1%

*Gel (topical):* 1%

*Oral granules:* 125 mg, 187.5 mg

*Solution (topical):* 1%

*Spray (topical):* 1%

*Tablets:* 250 mg

### Indications and dosages

➤ Tinea cruris; tinea corporis; tinea pedis; tinea versicolor

#### Adults and children ages 12 and older:

Massage cream into affected area and surrounding area once or twice daily for 7 to 14 days, not to exceed 4 weeks. Or, for tinea pedis, apply gel to affected area once daily at bedtime for 1 week. Or, for tinea cruris and tinea corporis, spray or apply gel to affected area once daily (morning or night) for 1 week. Or, for tinea pedis, spray between toes b.i.d. (morning and night) for 1 week.

➤ Onychomycosis of fingernail or toenail

**Adults:** For fingernail infection, 250 mg P.O. daily for 6 weeks. For toenail infection, 250 mg P.O. daily for 12 weeks.

➤ Tinea capitis

**Children ages 4 and older weighing less than 25 kg (55 lb):** 125 mg P.O. daily for 6 weeks

**Children ages 4 and older weighing 25 to 35 kg (55 to 77 lb):** 187.5 mg P.O. daily for 6 weeks

**Children ages 4 and older weighing more than 35 kg (77 lb):** 250 mg P.O. daily for 6 weeks

### Contraindications

- Hypersensitivity to drug or its components
- Chronic active hepatic disease

### Precautions

Use cautiously in:

- renal impairment (use not recommended)
- pregnant or breastfeeding patients (use not recommended)
- children younger than age 12 (safety and efficacy not established with cream, spray, or tablet use).

### Administration

- Give with or without food, but not with coffee, cola, or tea.
- Know that oral granules should be sprinkled on nonacidic food, such as pudding or mashed potatoes. Fruit-based food such as applesauce shouldn't be used.
- Know that oral granules should be swallowed without being chewed.
- Don't put occlusive dressing over affected area after cream application.

Route	Onset	Peak	Duration
P.O.	Unknown	≤ 2 hr	Unknown
Topical	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache, depression

**EENT:** visual disturbances

**GI:** nausea, diarrhea, dyspepsia, abdominal pain, flatulence

**Hematologic:** neutropenia

**Hepatic:** hepatic failure

**Skin:** burning, stinging, dryness, itching, and local irritation (with topical form); rash; pruritus; urticaria; **erythema multiforme**; **Stevens-Johnson syndrome**

**Other:** taste and smell disturbances

### Interactions

**Drug-drug.** *Cimetidine:* decreased terbinafine clearance

*Cyclosporine:* increased cyclosporine clearance

*Dextromethorphan:* increased dextromethorphan blood level

*Rifampin:* increased terbinafine clearance

*Warfarin:* altered warfarin efficacy

**Drug-diagnostic tests.** *Hepatic enzymes:* increased levels

*Neutrophils:* decreased count

**Drug-food.** *Caffeine-containing foods and beverages:* decreased caffeine clearance

**Drug-herbs.** *Chaparral, comfrey, germander, jin bu huan, kava, pennyroyal:* increased risk of hepatotoxicity  
*Cola nut, guarana, yerba maté:* decreased clearance of these herbs

### Patient monitoring

- Monitor CBC and liver function tests.

🔊 Watch for signs and symptoms of erythema multiforme. Report early indications before they progress to Stevens-Johnson syndrome.

### Patient teaching

- Tell patient he may take with or without food.
- Advise caregiver that oral granules should be sprinkled on nonacidic food, such as pudding or mashed potatoes and not to use fruit-based food such as applesauce.
- Advise caregiver that oral granules should be swallowed without being chewed.

- Instruct patient to avoid coffee, tea, and colas, which can worsen adverse drug reactions.
- Tell patient drug may take 4 weeks to be effective in fingernail infections and 10 weeks in toenail infections. Urge him to keep taking it even though symptoms don't improve right away.

🔊 Advise patient to immediately report rash, sore throat, cough, fever, or yellowing of skin or eyes.

- Instruct patient how to use topical drug, to wash affected area with soap and water and dry area completely before applying drug, and to wash hands after each use.
- Instruct patient not to place occlusive dressing over affected area after applying cream.
- Advise patient to wear well-fitting, ventilated shoes and to change shoes and socks at least once daily when receiving treatment for athlete's foot.
- Caution patient not to let topical drug contact eyes, nose, or mouth.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## terbutaline sulfate

Monovent<sup>®</sup>

**Pharmacologic class:** Selective beta<sub>2</sub>-adrenergic receptor agonist

**Therapeutic class:** Bronchodilator

**Pregnancy risk category B**

### Action

Relaxes bronchial smooth muscle by stimulating beta<sub>2</sub>-adrenergic receptors; inhibits release of hypersensitivity mediators, especially from mast cells

**Availability**

*Injection:* 1 mg/ml

*Tablets:* 2.5 mg, 5 mg

**Indications and dosages**

➤ Bronchospasm in reversible obstructive airway disease

**Adults and children older than age**

**12:** 0.25 mg subcutaneously, repeated in 15 to 30 minutes p.r.n., up to a maximum of 0.5 mg in 4 hours. Or 2.5 to 5 mg P.O. q 6 hours t.i.d. while awake, up to a maximum of 15 mg/day in adults; 2.5 mg P.O. q 6 hours t.i.d. while awake, up to a maximum of 7.5 mg/day in children.

**Dosage adjustment**

- Renal impairment

**Off-label uses**

- Tocolytic in preterm labor

**Contraindications**

- Hypersensitivity to drug, its components, or sympathomimetic amines

**Precautions**

Use cautiously in:

- cardiovascular disorders, hypertension, arrhythmias, hyperthyroidism, diabetes mellitus, seizure disorders, glaucoma
- concurrent use of MAO inhibitors, tricyclic antidepressants, or beta-adrenergic blockers
- elderly patients
- breastfeeding patients.

**Administration**

- Inject subcutaneously into lateral deltoid.

Route	Onset	Peak	Duration
P.O.	30 min	2-3 hr	4-8 hr
Subcut.	15 min	30 min	1.5-4 hr

**Adverse reactions**

**CNS:** tremors, anxiety, nervousness, insomnia, headache, dizziness, drowsiness, stimulation

**CV:** palpitations, chest discomfort, tachycardia

**GI:** nausea, vomiting

**Skin:** diaphoresis, flushing

**Interactions**

**Drug-drug.** *Beta-adrenergic blockers:* blockage of bronchodilating effect

*MAO inhibitors, tricyclic antidepressants:* potentiation of terbutaline's adverse cardiovascular reactions

*Other sympathomimetic amines:* additive adverse cardiovascular reactions

**Patient monitoring**

- Monitor vital signs.
- Assess neurologic status.

**Patient teaching**

- Tell patient he may take with or without food.
- Advise patient or parents to establish effective bedtime routine to minimize insomnia.
- Instruct patient or parents to space doses evenly during waking hours, to avoid taking drug at bedtime.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

**teriparatide (recombinant)**

Forsteo , Forteo

**Pharmacologic class:** Biosynthetic fragment of human parathyroid hormone

**Therapeutic class:** Parathyroid hormone

**Pregnancy risk category C**

**FDA BOXED WARNING**

- In male and female rats, drug increased incidence of osteosarcoma (malignant bone tumor). Because of uncertain relevance of this finding to humans, use drug only in patients for whom potential benefits outweigh potential risk. Don't administer to patient at increased baseline risk for osteosarcoma.

**Action**

Stimulates new bone growth by binding to specific high-affinity cell-surface receptors

**Availability**

*Injection:* Multidose prefilled delivery device (pen) with 28 daily doses of 20 mcg/dose (600 mcg/2.4 ml)

**Indications and dosages**

➤ Osteoporosis in patients at high risk for bone fracture

**Adults:** 20 mcg/day subcutaneously for up to 2 years

**Contraindications**

- Hypersensitivity to drug
- Conditions that increase osteosarcoma risk (such as Paget's disease, unexplained alkaline phosphatase elevation, open epiphyses, skeletal radiation therapy)
- Bone cancer metastases or history of bone cancer
- Metabolic bone disease other than osteoporosis
- Hypercalcemia

**Precautions**

Use cautiously in:

- urolithiasis, hypotension
- concurrent use of cardiac glycosides
- pregnant or breastfeeding patients.

**Administration**

- Inject subcutaneously into thigh or abdominal wall, with patient lying down.

- Know that prefilled injection pen delivers 20 mcg of drug per actuation and may be reused for up to 28 days after first injection. Discard pen in protected container after 28 days, even if it's not empty.

Route	Onset	Peak	Duration
Subcut.	Rapid	Rapid	Unknown

**Adverse reactions**

**CNS:** dizziness, headache, insomnia, depression, vertigo, asthenia

**CV:** hypertension, angina, syncope

**EENT:** rhinitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, dyspepsia, anorexia

**Metabolic:** hyperuricemia

**Musculoskeletal:** joint pain, cramps

**Respiratory:** cough, dyspnea, pneumonia

**Skin:** rash, sweating

**Other:** pain

**Interactions**

**Drug-drug.** *Digoxin:* increased digoxin toxicity

**Drug-diagnostic tests.** *Calcium:* increased level

**Patient monitoring**

- Monitor respiratory and neurologic status and assess patient's mood.
- Monitor bone mineral density tests and calcium level.

**Patient teaching**

- Instruct patient to promptly report such adverse reactions as cough and difficulty breathing.
- Tell patient that prefilled injection pen delivers 20 mcg of drug per actuation. Inform him that he may reuse it for up to 28 days after first injection, and should then discard it in appropriate receptacle, even if it's not empty.
- Advise patient to establish effective bedtime routine to minimize insomnia.
- Caution patient to avoid driving and other hazardous activities until he

knows how drug affects strength and balance.

- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## testosterone

Axiron, Androderm, AndroGel, Andropatch , Fortesta, Striant, Testim, Testogel , Testopel Pellets, Testos 

## testosterone cypionate

Depo-Testosterone

## testosterone enanthate

Delatestryl, PMS-Testosterone Enanthate 

**Pharmacologic class:** Hormone

**Therapeutic class:** Androgenic and anabolic steroid, antineoplastic

**Controlled substance schedule III**

**Pregnancy risk category X**

### FDA BOXED WARNING

- Virilization has occurred in children secondarily exposed to testosterone gel.
- Children should avoid contact with unwashed or unclothed application sites in men using testosterone gel.
- Health care providers should advise patients to strictly adhere to recommended instructions for use.

## Action

Responsible for normal growth and development of male sex organs and maintenance and maturation of secondary sex characteristics. Also decreases estrogen activity, which aids treatment of some breast cancers.

## Availability

### testosterone

**Buccal system:** 30 mg

**Gel:** 1% (25 mg, 50 mg), 1.62% (metered-dose pump delivers 20.25 mg/actuation), 2% (10 mg/one metered-dose pump actuation)

**Injection (aqueous suspension):** 100 mg/ml

**Pellets (subcutaneous implant):** 75 mg

**Solution (topical):** 30 mg/metered-dose pump actuation

**Transdermal system:** 2 mg/day, 4 mg/day

### testosterone cypionate

**Injection:** 100 mg/ml, 200 mg/ml

### testosterone enanthate

**Injection (in oil):** 200 mg/ml

## Indications and dosages

➤ Male hypogonadism

**Adult males:** 10 to 25 mg (testosterone) I.M. two to three times weekly or 50 to 400 mg (enanthate) I.M. q 2 to 4 weeks for 3 to 4 years. Or 150 to 450 mg (pellet) implanted subcutaneously q 3 to 6 months. Or, 4 mg (transdermal system) daily, adjusted to 2 mg or 6 mg based on serum testosterone level. Or, 60 mg (one 30-mg actuation of Axiron topical solution applied to each axilla) daily at same time each morning, adjusted to 30 mg (one pump actuation) or increased from 60 to 90 mg (three pump actuations) or from 90 to 120 mg (four pump actuations) based on serum testosterone concentration from single blood draw 2 to 8 hours after applying solution and at least 14 days after starting treatment or following dosage adjustment. Or, 40 mg (four actuations of Fortesta topical gel) applied to clean, intact skin of thighs once daily in morning, adjusted to 10 mg (one pump actuation) or up to 70 mg (seven pump actuations) based on total serum testosterone level 2 hours after applying gel at approximately 14 days after starting treatment or following dosage adjustment. Or,

50 mg testosterone gel (AndroGel 1%) daily applied topically, adjusted up to 75 mg daily within 14 days, with subsequent dosages up to 100 mg daily. Or, 30 mg (buccal system) to gum region b.i.d. Or, 50 to 400 mg I.M. (cypionate) q 2 to 4 weeks.

➤ Delayed puberty

**Adult males:** 50 to 200 mg I.M. (enanthate only) q 2 to 4 weeks for limited duration (4 to 6 months); or 150 to 450 mg subcutaneously (pellets) q 3 to 6 months

➤ Inoperable breast cancer in women 1 to 5 years after menopause

**Adults:** 200 to 400 mg I.M. (enanthate) q 2 to 4 weeks

### Contraindications

- Hypersensitivity to drug, its components, or tartrazine
- Males with breast cancer or suspected prostate cancer
- Females (buccal or transdermal systems or gel)
- Pregnancy or breastfeeding

### Precautions

Use cautiously in:

- diabetes mellitus; edema associated with serious cardiac, hepatic, or renal disease; sleep apnea; hypercalcemia
- children younger than age 18 (safety and efficacy not established).

### Administration

- Evaluate elderly patients and patients at increased risk for prostate cancer for presence of prostate cancer before starting testosterone replacement therapy.
- Inspect aqueous solution for injection. If crystals are visible, warm bottle and shake contents to dissolve crystals.
- Rotate I.M. injection sites within upper outer quadrant of gluteus maximus. Inject deeply into muscle.
- Apply gel once daily to clean, dry, intact skin on shoulder, upper arm, or abdomen.

- Place buccal system just above incisor tooth. Have patient hold it in place for 30 seconds to ensure adhesion. Rotate to other side of mouth with each application.

Route	Onset	Peak	Duration
Buccal	Slow	10-12 hr	Unknown
I.M.	Unknown	10-100 min	Unknown
Subcut.	Unknown	Unknown	3-4 mo
Topical gel	30 min	Unknown	Unknown
Transdermal	Unknown	2-4 hr	Unknown

### Adverse reactions

**CNS:** headache, depression, emotional lability, nervousness, anxiety, asthenia, memory loss, dizziness, vertigo, **cerebrovascular accident**

**CV:** edema, peripheral edema, **deep-vein phlebitis, heart failure**

**GI: bleeding**

**GU:** hematuria, urinary tract infection, impaired urination, scrotal cellulitis, benign prostatic hyperplasia, scrotal papilloma (with transdermal use), prostatitis, libido changes, breast pain or tenderness, gynecomastia, virilization in females, excessive hormonal effects in males

**Hematologic: polycythemia, leukopenia, suppressed clotting factors**

**Hepatic: hepatic adenoma** (with long-term enanthate use)

**Metabolic:** hyperphosphatemia, hypernatremia, hypercalcemia, **hypoglycemia, hyperkalemia**

**Musculoskeletal:** myalgia

**Respiratory:** sleep apnea

**Skin:** acne; rash, itching, burning, discomfort, irritation, burn-like blister, erythema (with transdermal use); pain, local edema, and induration at injection site (with I.M. or subcutaneous use)

**Other:** accidental injury, flulike symptoms, hypersensitivity reaction

## Interactions

**Drug-drug.** *Corticosteroids:* increased risk of edema

*Hepatotoxic drugs:* increased risk of hepatotoxicity

*Insulin, oral hypoglycemics:* decreased blood glucose level

*Oral anticoagulants:* increased anticoagulant effect

*Oxyphenbutazone:* increased oxyphenbutazone blood level

*Propranolol:* increased propranolol clearance

**Drug-diagnostic tests.** *Bilirubin, liver function tests:* abnormal results

*Calcium, cholesterol, hematocrit, hemoglobin, phosphate, prostate-specific antigen (with topical use), sodium:* increased levels

*Clotting factors, creatine excretion, glucose, serum creatinine, thyroxine, thyroxine-binding globulin:* decreased levels

*Urine creatine and creatinine:* decreased excretion

*Urine 17-ketosteroids:* increased excretion

**Drug-herbs.** *Chaparral, comfrey, germander, jin bu huan, kava, pennyroyal:* increased risk of hepatotoxicity

## Patient monitoring

- Monitor electrolyte levels, liver function tests, blood and urine calcium levels, lipid panels, CBC with white cell differential, and semen studies.
- Assess diabetic patient carefully for hypoglycemia.
- Closely monitor neurologic status. Stay alert for sleep apnea.
- Assess for early signs of excessive hormonal effects in females (virilization). If these occur, drug withdrawal may be indicated.

## Patient teaching

 Instruct patient to immediately report signs and symptoms of liver problems, including nausea, vomiting, yellowing of skin or eyes, and ankle swelling.

- Teach prepubertal male about signs and symptoms of excessive hormonal effects, such as acne, priapism, increased body and facial hair, and penile enlargement.
- Teach postpubertal male about signs and symptoms of excessive adverse hormonal effects, such as erectile dysfunction, gynecomastia, epididymitis, testicular atrophy, and infertility.
-  Tell female patient to immediately report signs of masculinization, such as excessive body or facial hair, deepening of voice, clitoral enlargement, and menstrual irregularities.
- Advise female of childbearing age to use barrier contraceptives. Caution her not to breastfeed.
- Tell patient which transdermal patches can be applied to scrotum. Instruct him to apply patch daily to clean, dry skin after removing protective liner to expose drug-containing film. To prevent irritation, instruct him to apply each patch to a different site, waiting at least 1 week before reusing same site.
- Advise patient to apply topical gel once daily to clean, dry skin on shoulder, upper arm, or abdomen. Tell him that after opening packet, he should squeeze entire contents into palm and apply immediately. Instruct him to wait until gel dries before getting dressed.
- Teach patient to place buccal system in comfortable position just above incisor tooth and hold it in place for about 30 seconds to ensure adhesion. Tell him to use opposite side of mouth with each application. Caution him not to dislodge buccal system, especially when eating, drinking, brushing teeth, or using mouthwash. If system doesn't properly adhere or falls out during 12-hour dosing interval, tell him to discard it and apply new system. If it falls out within 4 hours of next dose, tell him to apply new system and keep it in place until next regularly scheduled dose.

- Instruct patient to apply topical solution to clean, dry, intact skin of axilla area only and to allow application site to dry completely before dressing. Advise patient to wash axilla with soap and water to remove any testosterone residue if direct skin-to-skin contact with another person is anticipated.
- Tell patient drug shouldn't be used to enhance athletic performance or physique.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## tetracycline hydrochloride

Apo-Tetra<sup>⚡</sup>, Novotetra<sup>⚡</sup>,  
Nu-Tetra<sup>⚡</sup>, Topicycline<sup>⚡</sup>

**Pharmacologic class:** Tetracycline

**Therapeutic class:** Anti-infective

**Pregnancy risk category B** (topical form), **D** (oral form)

### Action

Unknown. Thought to inhibit bacterial protein synthesis at level of 30S and 50S bacterial ribosomes and to alter cytoplasmic membrane of susceptible organisms.

### Availability

Capsules: 250 mg, 500 mg

### Indications and dosages

➤ Mild to moderate infections caused by susceptible organisms

**Adults:** 500 mg P.O. b.i.d. or 250 mg P.O. q.i.d.

➤ Severe infections caused by susceptible organisms

**Adults:** 500 mg P.O. q.i.d.

**Children older than age 8:** 25 to 50 mg/kg P.O. q.i.d.

➤ Syphilis in penicillin-allergic patients

**Adults:** 500 mg P.O. q.i.d. for 14 days

➤ Late syphilis (except neurosyphilis)

**Adults:** 500 mg P.O. q.i.d. for 28 days

➤ Leptospirosis when penicillin is contraindicated or ineffective

**Adults:** 1 to 2 g P.O. daily in two to four divided doses for 5 to 7 days

➤ Yaws

**Adults:** 1 to 2 g P.O. daily in two to four divided doses for 10 to 14 days

➤ Gonorrhea in penicillin-allergic patients

**Adults:** Initially, 1.5 g P.O., followed by 500 mg P.O. q 6 hours for 4 days, up to a total of 9 g

➤ Uncomplicated urethral, endocervical, or rectal infections caused by *Chlamydia trachomatis*

**Adults:** 500 mg P.O. q.i.d. for 7 days

➤ Rickettsial and mycoplasmal infections

**Adults:** 1 to 2 g P.O. daily in two to four divided doses for 7 days

➤ *Helicobacter pylori* infection

**Adults:** In patients with active duodenal ulcer, 500 mg P.O. q.i.d. at meals and bedtime for 14 days, given with other drugs (such as metronidazole, bismuth subsalicylate, amoxicillin, or omeprazole)

➤ Brucellosis

**Adults:** 500 mg P.O. q.i.d. for 3 weeks, given with streptomycin I.M. b.i.d. during week 1 and streptomycin once daily during week 2

➤ Granuloma inguinale; chancroid

**Adults:** 1 to 2 g P.O. daily in two to four divided doses for 2 to 4 weeks

➤ Cholera

**Adults:** 500 mg P.O. q 6 hours for 48 to 72 hours

➤ Plague when streptomycin is contraindicated or ineffective

**Adults:** 2 to 4 g P.O. q.i.d. for 10 days

**Children older than age 8:** 30 to 40 mg/kg P.O. q.i.d. for 10 to 14 days

➤ Tularemia as an alternative to streptomycin

**Adults:** 1 to 2 g P.O. daily in two to four divided doses for 1 to 2 weeks

➤ *Campylobacter* infection

**Adults:** 1 to 2 g P.O. daily in two to four divided doses for 10 days

➤ Relapsing fever caused by *Borrelia recurrentis*

**Adults:** 1 to 2 g P.O. daily in two to four divided doses for 7 days or until patient is afebrile

➤ Adjunctive treatment of inflammatory acne

**Adults and adolescents:** 500 mg to 1 g P.O. q.i.d. for 1 to 2 weeks, decreased gradually to 125 to 500 mg P.O. daily

### Dosage adjustment

- Renal impairment

### Off-label uses

- Rosacea
- Anthrax
- Arthritis
- Lyme disease
- Sclerosing agent to control pleural effusions

### Contraindications

- Hypersensitivity to drug, other tetracyclines, bisulfites, or alcohol (in some products)

### Precautions

Use cautiously in:

- renal disease, hepatic impairment, nephrogenic diabetes insipidus
- cachectic or debilitated patients
- pregnant or breastfeeding patients (except in anthrax treatment)
- children younger than age 8 (except in anthrax treatment).

### Administration

- Give with 8 oz of water at least 1 hour before or 2 hours after a meal (especially if it includes milk or other dairy

products), antacids, laxatives, or antidiarrheal drugs.

Route	Onset	Peak	Duration
P.O.	Rapid	2-3 hr	6-12 hr

### Adverse reactions

**CNS:** paresthesia, **benign intracranial hypertension**

**CV:** pericarditis

**EENT:** abnormal conjunctival pigmentation, hoarseness, pharyngitis

**GI:** nausea, vomiting, diarrhea, loose bulky stools, esophageal ulcers, epigastric distress, enterocolitis, oral and anogenital candidiasis, stomatitis, black hairy tongue, glossitis, anorexia, **pancreatitis**

**GU:** dark yellow or brown urine, vaginal candidiasis, anogenital lesions

**Hematologic:** eosinophilia, **hemolytic anemia, neutropenia, thrombocytopenia, thrombocytopenia purpura**

**Hepatic:** fatty liver

**Musculoskeletal:** retarded bone growth, polyarthralgia

**Respiratory:** **pulmonary infiltrates**

**Skin:** photosensitivity, maculopapular or erythematous rash, increased pigmentation, urticaria, onycholysis

**Other:** permanent tooth discoloration (in children younger than age 8), tooth enamel defects, superinfection, hypersensitivity reactions including **anaphylaxis, serum sickness–like reaction, exacerbation of systemic lupus erythematosus**

### Interactions

**Drug-drug.** *Adsorbent antidiarrheals, antacids, calcium, cholestyramine, cimetidine, colestipol, iron, magnesium, sodium bicarbonate:* decreased tetracycline absorption

*Digoxin:* increased digoxin blood level, greater risk of toxicity

*Hormonal contraceptives:* decreased contraceptive efficacy

*Insulin:* reduced insulin requirement

*Lithium*: increased or decreased lithium blood level

*Methoxyflurane*: increased risk of nephrotoxicity

*Penicillin*: decreased penicillin activity

*Sucralfate*: prevention of tetracycline absorption from GI tract

*Warfarin*: enhanced warfarin effects

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, amylase, aspartate aminotransferase, bilirubin, blood urea nitrogen*: increased levels

*Hemoglobin, neutrophils, platelets, white blood cells*: decreased levels

*Urinary catecholamines*: false elevation

**Drug-food.** *Dairy products, foods containing calcium*: decreased drug absorption

**Drug-behaviors.** *Alcohol use*: decreased drug efficacy

*Sun exposure*: increased risk of photosensitivity

### Patient monitoring

- Monitor for signs and symptoms of superinfection and hypersensitivity reaction.
- With long-term use, monitor CBC, liver function tests, and (in prepubertal patients) bone growth.
- Assess neurologic status. Stay alert for benign intracranial hypertension (especially in children).

### Patient teaching

- Tell patient to take oral form with 8 oz of water at least 1 hour before or 2 hours after eating a meal, consuming dairy products, or taking antacids, laxatives, or antidiarrheal drugs. Advise him to take last daily dose at least 1 hour before bedtime.
- Stress importance of completing entire course of therapy as ordered, even after symptoms improve.
- 🔊 Caution patient not to use outdated tetracycline, because it may cause serious kidney disease.

- Teach patient to recognize and report signs and symptoms of yeast infection and other infections.

- With long-term therapy, tell patient he'll undergo regular blood testing.

Advise parents that prepubertal child should have periodic bone X-rays.

- Caution patient to avoid alcohol during therapy.

- Tell parents that tetracycline use during tooth development period (last half of pregnancy, infancy, and childhood to age 8) may cause permanent yellow, gray, or brownish tooth discoloration.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

## thalidomide

Thalomid

**Pharmacologic class:** Synthetic glutamic acid derivative

**Therapeutic class:** Immunomodulator, angiogenesis inhibitor

**Pregnancy risk category** X

### FDA BOXED WARNING

- When taken during pregnancy, drug may cause severe, life-threatening birth defects or fetal death. Never administer to women who are pregnant or could become pregnant during therapy. Because of its toxicity and to reduce risk of fetal exposure, drug is approved for marketing only under special Food and Drug Administration–approved restricted distribution program, called System for Thalidomide Education and Prescribing Safety (S.T.E.P.S.<sup>TM</sup>). Only prescribers and pharmacists registered with program are allowed to prescribe and dispense drug. Also,

patients must be advised of, agree to, and comply with program requirements.

- Use of thalidomide in patients with multiple myeloma results in an increased risk of venous thromboembolic events (VTEs), such as deep venous thrombosis and pulmonary embolism. Risk increases significantly when thalidomide is used in combination with standard chemotherapeutic agents, including dexamethasone. In one controlled trial, rate of VTEs was 22.5% in patients receiving thalidomide in combination with dexamethasone compared to 4.9% in patients receiving dexamethasone alone ( $p = 0.002$ ). Patients and physicians are advised to watch for signs and symptoms of thromboembolism. Instruct patients to seek medical care if they develop signs and symptoms, such as shortness of breath, chest pain, or arm or leg swelling. Consider thromboprophylaxis based on assessment of individual patient's underlying risk factors.

### Action

Suppresses excess levels of tumor necrosis factor-alpha in patients with erythema nodosum leprosum (ENL). Alters leukocyte migration by changing cell surface characteristics.

### Availability

*Capsules:* 50 mg, 100 mg, 200 mg

### Indications and dosages

➤ Cutaneous manifestations of moderate to severe ENL; to prevent and suppress recurrent ENL

**Adults weighing 50 kg (110 lb) or more:** 100 to 300 mg P.O. daily, or up to 400 mg P.O. daily, depending on disease severity or previous response. Continue therapy until symptoms of active reactions subside (usually after 2 weeks); then may taper in 50-mg decrements q 2 to 4 weeks.

**Adults weighing less than 50 kg (110 lb):** Initially, 100 mg P.O. daily, or up to 400 mg P.O. daily, depending on disease severity or previous response. Continue therapy until symptoms of active reactions subside (usually after 2 weeks); then may taper in 50-mg decrements q 2 to 4 weeks.

➤ Newly diagnosed multiple myeloma (MM)

**Adults:** 200 mg P.O. once daily, in combination with dexamethasone 40 mg/day P.O. on days 1 to 4, 9 to 12, and 17 to 20 every 28 days.

### Dosage adjustment

- Neutropenia
- Bradycardia

### Off-label uses

- Aphthous stomatitis
- Wasting syndrome associated with human immunodeficiency virus (HIV)
- Multiple myeloma
- Refractory Crohn's disease

### Contraindications

- Hypersensitivity to drug or its components
- Pregnancy

### Precautions

Use cautiously in:

- neutropenia, bradycardia, peripheral neuropathy, hypotension, underlying malignancy, history of seizures or risk of seizures, risk of tumor lysis syndrome
- concurrent use of drugs that slow cardiac conduction, drugs that cause peripheral neuropathy (such as alcohol, amiodarone, bortezomib, cisplatin, disulfiram, docetaxel, metronidazole, paclitaxel, phenytoin, vincristine), and hormonal contraceptives
- concurrent use of opioids, antihistamines, antipsychotics, anti-anxiety agents, or other CNS depressants (avoid use)

- breastfeeding patients (use not recommended)
- children younger than age 12 (safety not established).

### Administration

 Follow all instructions provided by System for Thalidomide Education and Prescribing Safety (S.T.E.P.S.™) program, accessible at <http://www.steps-info.com>.

- Give with 8 oz of water just before bedtime, at least 1 hour after evening meal.
- Know that patients who need prolonged maintenance therapy to prevent cutaneous ENL recurrence and those who have flares during tapering should receive minimum effective dosage, with tapering attempted every 3 to 6 months. To taper, decrease dosage by 50 mg every 2 to 4 weeks.

Route	Onset	Peak	Duration
P.O.	48 hr	1-2 mo	Unknown

### Adverse reactions

**CNS:** drowsiness, dizziness, vertigo, sedation, tremor, asthenia, peripheral neuropathy, fatigue, confusion, anorexia, anxiety, agitation (with MM use), headache, **seizures**

**CV:** bradycardia, orthostatic hypotension, peripheral edema, **deep vein thrombosis** (with MM use)

**EENT:** rhinitis, sinusitis, pharyngitis

**GI:** nausea, constipation, diarrhea, abdominal pain, oral moniliasis

**GU:** erectile dysfunction

**Hematologic:** leukopenia, **neutropenia**

**Metabolic:** hypocalcemia

**Musculoskeletal:** muscle weakness (with MM use), back pain

**Respiratory:** dyspnea, **pulmonary embolus** (with MM use)

**Skin:** dry skin, desquamation (with MM use), exfoliative, purpuric, bullous, or maculopapular rash; pruritus; fungal dermatitis; nail disorder;

photosensitivity; toxic epidermal necrolysis, **Stevens-Johnson syndrome**  
**Other:** weight gain or loss (with MM use), fever, tooth pain, chills, accidental injury, hypersensitivity reactions, increased HIV viral load, **severe birth defects, fetal death, tumor lysis syndrome**

### Interactions

**Drug-drug.** *Barbiturates, chlorpromazine, reserpine, sedative-hypnotics, and other CNS depressants:* increased sedation

*Cardiovascular agents (such as alpha- and beta-adrenergic blockers, beta blockers, calcium channel blockers, digoxin), neuromuscular blockers (succinylcholine), lithium, noncardiovascular agents such as H<sub>2</sub> blockers (cimetidine, famotidine), tricyclic antidepressants:* increased risk of bradycardia  
*Drugs linked to peripheral neuropathy:* increased risk of peripheral neuropathy

*Hormonal contraceptives:* increased risk of thromboembolic disease

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, lactate dehydrogenase, lipids, liver function tests:* increased values  
*Calcium, hemoglobin, neutrophils, white blood cells:* decreased values

**Drug-food.** *High-fat meal:* interference with drug absorption

**Drug-behaviors.** *Alcohol use:* increased sedation, increased risk of peripheral neuropathy

### Patient monitoring

 Monitor for signs and symptoms of hypersensitivity reaction. If rash occurs, discontinue drug and contact prescriber immediately. Don't restart drug if Stevens-Johnson syndrome, toxic epidermal necrolysis, or exfoliative, purpuric, or bullous rash occurs.

 Watch for and report signs and symptoms of peripheral neuropathy. If symptoms develop, discontinue drug

immediately. Usually, treatment with thalidomide should only be reinitiated if the neuropathy returns to baseline status.

- Assess CBC with white cell differential.
- Carefully monitor patient's reproductive status.
- 🔊 Monitor patients at risk for tumor lysis syndrome (such as those with high tumor burden before treatment) and take appropriate precautions.
- 🔊 Closely monitor patients with history of seizures or who are at risk for seizures for clinical changes that could precipitate acute seizure activity.
- 🔊 Observe patients (particularly patients being treated for MM) for signs and symptoms of thromboembolism.
- Monitor patients for bradycardia and possible syncope; dosage reduction or drug discontinuation may be required.
- Be aware that patients treated for MM who develop such adverse reactions as constipation or somnolence may benefit from temporarily discontinuing drug or continuing drug at lower dosage.
- Measure viral load after first and third months of treatment and every 3 months thereafter.

### Patient teaching

- Instruct patient to take with 8 oz of water just before bedtime, at least 1 hour after dinner.
- 🔊 Tell patient to immediately report signs and symptoms of peripheral neuropathy, tumor lysis syndrome, seizures, thromboembolism, bradycardia, or hypersensitivity reaction, especially rash.
- Teach patient about risks of fetal exposure to drug. Carefully review relevant portions of S.T.E.P.S.<sup>TM</sup> program with patient.
- Instruct female of childbearing age to use two highly effective birth control methods simultaneously, from 1 month

before first thalidomide dose until 1 month after last dose.

- Explain mandatory pregnancy testing schedule to female patient, and stress importance of compliance.
- 🔊 Advise female patient to contact prescriber immediately if she suspects she's pregnant.
- Caution female patient not to breast-feed.
- Instruct male patient to use latex condoms during every sexual encounter.
- Tell patient that dizziness and orthostatic hypotension may occur. Advise patient to remain upright for a few minutes before standing up from a lying position.
- Tell patient to avoid alcohol and drugs that may cause drowsiness during drug therapy.
- Advise patient not to donate blood or sperm while taking this drug and for 4 weeks after stopping drug.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

## theophylline

Apo-Theo LA<sup>☼</sup>, Elixophyllin, Novo-Theophyl SR<sup>☼</sup>, Nuelin SA<sup>⚡</sup>, PMS-Theophylline<sup>☼</sup>, Pulmophyllin ELX<sup>☼</sup>, Ratio-Theo-Bronc<sup>☼</sup>, Slo-Phyllin<sup>⚡</sup>, Theo-24, Theochron, Theolair<sup>☼</sup>, Theo-Time, Uniphyll, Uniphyllin Continus<sup>⚡</sup>

**Pharmacologic class:** Xanthine derivative

**Therapeutic class:** Bronchodilator, spasmolytic

**Pregnancy risk category C**

**Action**

Relaxes bronchial smooth muscles, suppressing airway response to stimuli. Also inhibits phosphodiesterase and release of slow-reacting substance of anaphylaxis and histamine.

**Availability**

*Capsules (immediate-release):* 100 mg, 200 mg

*Capsules (extended-release, 8 to 12 hours):* 50 mg, 60 mg, 65 mg, 75 mg, 100 mg, 125 mg, 130 mg

*Capsules (extended-release, 12 hours):* 50 mg, 125 mg, 130 mg, 250 mg, 260 mg

*Capsules (extended-release, 24 hours):* 100 mg, 200 mg, 300 mg, 400 mg

*Elixir:* 80 mg/15 ml

*Injection (with dextrose):* 0.4 mg/ml, 0.8 mg/ml, 1.6 mg/ml, 2 mg/ml, 3.2 mg/ml, 4 mg/ml

*Syrup (cherry):* 80 mg/15 mg, 150 mg/15 ml

*Tablets (immediate-release):* 100 mg, 125 mg, 200 mg, 250 mg, 300 mg

*Tablets (extended-release, 12 to 24 hours):* 100 mg, 200 mg, 300 mg, 400 mg, 450 mg, 600 mg

*Tablets (extended-release, 24 hours):* 400 mg, 600 mg

**Indications and dosages**

➤ Acute bronchospasm in patients not receiving theophylline

**Adults (otherwise healthy nonsmokers):** Initially, 6 mg/kg P.O., followed in next 12 to 16 hours by 3 mg/kg P.O. q 6 hours for two doses, then a maintenance dosage of 3 mg/kg P.O. q 8 hours

**Children ages 9 to 16; young adult smokers:** Initially, 6 mg/kg P.O., followed in next 12 to 16 hours by 3 mg/kg P.O. q 4 hours for three doses, then a maintenance dosage of 3 mg/kg P.O. q 6 hours

**Children ages 1 to 9:** Initially, 6 mg/kg P.O., followed in next 12 to 16 hours by 4 mg/kg P.O. q 4 hours for three doses, then a maintenance dosage of 4 mg/kg P.O. q 6 hours

➤ Acute bronchospasm in patients receiving theophylline

**Adults and children:** Loading dose based partly on time, amount, and administration route of last dose and on expectation that each 0.5 mg/kg will produce 1 mcg/ml rise in theophylline blood level. In significant respiratory distress, loading dose may be 2.5 mg/kg P.O. or I.V. to increase theophylline level by approximately 5 mcg/ml.

➤ Chronic bronchospasm

**Adults and children: Immediate-release forms—**16 mg/kg or 400 mg P.O. daily (whichever is lower) in three to four divided doses q 6 to 8 hours.

**Timed-release forms—**12 mg/kg or 400 mg P.O. daily (whichever is lower) in three to four divided doses q 8 to 12 hours. May increase dosage of either immediate- or timed-release form at 2- to 3-day intervals, to a maximum of 13 mg/kg or 900 mg daily (whichever is lower) in patients older than age 16, 18 mg/kg daily in children ages 12 to 16, 20 mg/kg daily in children ages 9 to 12, or 24 mg/kg daily in children up to age 9.

**Dosage adjustment**

- Cor pulmonale or heart failure
- Elderly patients
- Young adults

**Off-label uses**

- Essential tremor
- Apnea and bradycardia in premature infants

**Contraindications**

- Hypersensitivity to drug or other xanthines (such as coffee, theobromine)
- Active peptic ulcer
- Seizure disorder

**Precautions**

Use cautiously in:

- alcoholism; heart failure or other cardiac or circulatory impairment; hypertension; renal or hepatic disease;

COPD; hypoxemia; hyperthyroidism; diabetes mellitus; glaucoma; peptic ulcer disease

- elderly patients
- children younger than age 1.

### Administration

- For I.V. delivery, use infusion solution designed for drug, or mix with dextrose 5% in water. Administer by controlled infusion pump.
- Know that for acute bronchospasm, theophylline preferably is given I.V. as 20 mg/ml of theophylline (or 25 mg/ml of aminophylline).
- Don't give timed-release form to patient with acute bronchospasm.

Route	Onset	Peak	Duration
P.O.	Rapid	1-2 hr	6 hr
P.O. (timed)	Delayed	4-8 hr	8-24 hr
I.V.	Rapid	End of infusion	6-8 hr

### Adverse reactions

**CNS:** irritability, dizziness, nervousness, restlessness, headache, insomnia, reflex hyperexcitability, **seizures**

**CV:** palpitations, marked hypotension, sinus tachycardia, extrasystole, **circulatory failure, ventricular arrhythmias**

**GI:** nausea, vomiting, diarrhea, hematemesis, gastroesophageal reflux

**GU:** increased diuresis, proteinuria

**Metabolic:** hyperglycemia, **syndrome of inappropriate antidiuretic hormone secretion**

**Musculoskeletal:** muscle twitching

**Respiratory:** tachypnea, **respiratory arrest**

**Skin:** urticaria, rash, alopecia, flushing

**Other:** fever, hypersensitivity reaction

### Interactions

**Drug-drug.** *Allopurinol, calcium channel blockers, cimetidine, corticosteroids, disulfiram, ephedrine, hormonal contraceptives, influenza virus vaccine,*

*interferon, macrolides, mexiletine, nonselective beta-adrenergic blockers, quinolones, thiabendazole:* increased theophylline blood level, greater risk of toxicity

*Aminoglutethimide, barbiturates, ketoconazole, rifampin, sulfipyrazone, sympathomimetics:* decreased theophylline blood level and effects

*Carbamazepine, isoniazid, loop diuretics:* increased or decreased theophylline blood level

*Halothane:* increased risk of arrhythmias

*Hydantoins:* decreased hydantoin blood level

*Lithium:* decreased therapeutic effect of lithium

*Nondepolarizing muscle relaxants:* reversal of neuromuscular blockade

*Propofol:* antagonism of propofol's sedative effects

*Tetracyclines:* increased risk of adverse reactions to theophylline

**Drug-diagnostic tests.** *Glucose:* increased level

**Drug-food.** *Any food:* altered bioavailability and absorption of some timed-release theophylline forms, causing rapid release and possible toxicity

*Caffeine- or xanthine-containing foods and beverages:* increased theophylline blood level and greater risk of adverse CNS and cardiovascular reactions

*Diet high in protein and charcoal-broiled beef and low in carbohydrates:* increased theophylline elimination, decreased efficacy

*High-carbohydrate, low-protein diet:* decreased theophylline elimination, increased risk of adverse reactions

**Drug-herbs.** *Caffeine-containing herbs (such as cola nut, guarana, maté):* increased theophylline blood level, greater risk of adverse CNS and cardiovascular reactions

*Ephedra (ma huang):* increased stimulant effect

*St. John's wort:* decreased theophylline blood level and efficacy

**Drug-behaviors.** *Nicotine* (in cigarettes, gum, transdermal patches): increased theophylline metabolism, decreased efficacy

### Patient monitoring

- Monitor for signs and symptoms of hypersensitivity reaction, including rash and fever.
- Assess respiratory status. Monitor pulmonary function tests to gauge drug efficacy and identify adverse effects.
- Monitor cardiovascular and neurologic status carefully.
- Assess glucose level in diabetic patient.

### Patient teaching

- Advise patient to take oral form with 8 oz of water 1 hour before or 2 hours after meals.
- Tell patient not to crush or chew timed-release form.
- Caution patient not to use different drug brands interchangeably.
-  Instruct patient to immediately report worsening dyspnea and other respiratory problems.
- Teach patient to recognize and report adverse neurologic reactions.
- Tell patient that all nicotine forms (including cigarettes, patches, and gum) decrease drug efficacy. Discourage nicotine use.
- Advise patient that a diet high in protein and charcoal-broiled beef and low in carbohydrates makes drug less effective.
- Tell patient that a high-carbohydrate, low-protein diet increases risk of adverse reactions, as do products containing caffeine.
- Caution patient to avoid herbs, especially ephedra and St. John's wort.
- Advise patient not to take over-the-counter drugs without prescriber's approval. Tell him to inform all prescribers he's taking drug, because it interacts with many other drugs.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## thyroid, desiccated

Armour Thyroid, Nature-Thyroid, Westhroid

**Pharmacologic class:** Hormone supplement

**Therapeutic class:** Thyroid hormone

**Pregnancy risk category A**

### FDA BOXED WARNING

- Drug shouldn't be used alone or with other agents to treat obesity or weight loss. In euthyroid patients, doses within range of daily hormonal requirements are ineffective for weight loss. Larger doses may cause serious or life-threatening toxicity, particularly when given with sympathomimetic amines (such as those used for anorectic effects).

### Action

Regulates cell growth and differentiation and increases metabolic rate of body tissues; effects mediated at cellular level

### Availability

*Tablets:* 15 mg, 30 mg, 60 mg, 90 mg, 120 mg, 180 mg, 240 mg, 300 mg

### Indications and dosages

➤ Mild hypothyroidism

**Adults:** Initially, 60 mg/day P.O.; may increase by 60 mg q 30 days to desired response. Usual maintenance dosage is 60 to 180 mg/day.

➤ Severe hypothyroidism

**Adults:** Initially, 15 mg/day P.O. daily; may increase to 30 mg/day after 2 weeks and then to 60 mg/day 2 weeks later. Assess after 1 month, and again 1 month later at 60 mg-dose. If necessary, dosage may then increase to 120 mg/day P.O. for 2 months, with assessment repeated. Subsequent assessments and dosage increases may occur up to a maximum of 180 mg/day.

➤ Congenital or severe hypothyroidism

**Children:** Initially, 15 mg P.O. daily; may increase to 30 mg/day after 2 weeks, with subsequent increases at 2-week intervals. Maintenance dosage may be higher in growing children than in hypothyroid adults.

### Dosage adjustment

- Cardiovascular disease
- Elderly patients

### Contraindications

- Hypersensitivity to drug or its components
- Adrenal insufficiency
- Thyrotoxicosis

### Precautions

Use cautiously in:

- tartrazine sensitivity (some products)
- cardiovascular disease
- elderly patients
- breastfeeding patients.

### Administration

- Give before breakfast each day.

Route	Onset	Peak	Duration
P.O.	Unknown	12-48 hr	Unknown

### Adverse reactions

**CNS:** insomnia, tremors, headache

**CV:** palpitations, angina pectoris, hypertension, tachycardia, **arrhythmias, cardiac arrest**

**GI:** nausea, vomiting, diarrhea

**GU:** menstrual irregularities

**Metabolic:** heat intolerance, **thyroid storm**

**Musculoskeletal:** accelerated bone maturation (in children)

**Skin:** sweating

**Other:** weight loss, appetite changes, fever

### Interactions

**Drug-drug.** *Anticoagulants, catecholamines, sympathomimetics:* increased effects of these drugs

*Bile acid sequestrants:* decreased thyroid hormone absorption

*Digoxin, insulin, oral hypoglycemics:* decreased effects of these drugs

*Estrogen:* decreased thyroid hormone effects

*Oral anticoagulants:* increased risk of bleeding

**Drug-diagnostic tests.** *Aspartate aminotransferase, creatine kinase, glucose, lactate dehydrogenase, protein-bound iodine:* increased levels

*Thyroid function tests:* decreased values

**Drug-herbs.** *Bugleweed, soy:* increased adverse drug reactions

### Patient monitoring

☞ Monitor for chest pain. If it occurs, withhold drug and contact prescriber.

• Assess vital signs and temperature frequently.

☞ Monitor thyroid function tests closely. Immediately report evidence of thyroid storm.

• In diabetic patient, monitor blood glucose level closely.

• In children, monitor sleeping pulse rate and morning basal temperature.

• In female on long-term therapy, monitor bone density tests.

### Patient teaching

• Tell patient to take each morning before breakfast.

☞ Caution patient not to stop therapy abruptly. Dosage must be tapered.

 Advise patient to immediately report chest pain or signs and symptoms of drug toxicity (fever, chest pain, rapid pulse, skipped heartbeats, heat intolerance, excessive sweating, nervousness, emotional instability).

- Instruct patient to tell all prescribers he's taking drug. Caution him not to use over-the-counter preparations without consulting prescriber.
- Tell diabetic patient that drug may alter blood glucose level. Encourage frequent glucose self-monitoring.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## tiagabine hydrochloride

Gabitril Filmtabs

**Pharmacologic class:** Nipecotinic acid derivative

**Therapeutic class:** Anticonvulsant

**Pregnancy risk category C**

### Action

Unknown. Thought to raise seizure threshold by enhancing activity of gamma-aminobutyric acid (a major inhibitory neurotransmitter in CNS).

### Availability

**Tablets:** 2 mg, 4 mg, 12 mg, 16 mg, 20 mg

### Indications and dosages

 Adjunctive treatment of partial seizures

**Adults older than age 18:** Initially, 4 mg P.O. once daily for 1 week; may increase as needed by 4 to 8 mg/day at weekly intervals, up to 56 mg/day in two to four divided doses

**Adolescents ages 12 to 18:** Initially, 4 mg P.O. once daily. May increase total daily dosage by 4 mg at start of week 2; thereafter, may increase by 4 to 8 mg q week until clinical response occurs or patient is receiving up to 32 mg/day. Give total daily dosage in two to four divided doses.

### Dosage adjustment

- Hepatic impairment

### Off-label uses

- Anxiety

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- hepatic impairment
- pregnant or breastfeeding patients
- children younger than age 12 (safety not established).

### Administration

 Don't stop drug suddenly. Dosage must be tapered.

- Be aware that concomitant anticonvulsant therapy need not be modified unless indicated.

Route	Onset	Peak	Duration
P.O.	Unknown	45 min	Unknown

### Adverse reactions

**CNS:** dizziness, insomnia, drowsiness, nervousness, asthenia, confusion, poor concentration, impaired memory, depression, emotional lability, hostility, agitation, ataxia, abnormal gait, tremors, paresthesia, speech disorder, language problems

**CV:** vasodilation

**EENT:** nystagmus, epistaxis, pharyngitis

**GI:** nausea, vomiting, diarrhea, abdominal pain, mouth ulcers

**Musculoskeletal:** myasthenia

**Respiratory:** increased cough

**Skin:** rash, pruritus

**Other:** increased appetite, weight changes, pain, allergic reaction

### Interactions

**Drug-drug.** *Carbamazepine, phenobarbital, phenytoin, primidone:* increased tiagabine clearance, decreased blood level

### Patient monitoring

- 🚨 Watch for signs or symptoms of depression and suicidal ideation.
- Assess vital signs and cardiovascular status.
- Monitor closely for severe generalized weakness. If present, consult prescriber regarding possible dosage reduction.

### Patient teaching

- Tell patient to take on regular schedule with food.
- 🚨 Caution patient not to stop therapy suddenly. Dosage must be tapered.
- Instruct patient to report signs or symptoms of depression.
- 🚨 Advise patient to report neurologic reactions. Tell him to contact prescriber immediately if severe overall weakness or severe depression occurs.
- Advise female patient to tell prescriber if she suspects she is pregnant.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

## ticarcillin disodium and clavulanate potassium

Timentin

**Pharmacologic class:** Penicillin (extended-spectrum)

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

### Action

Ticarcillin disodium inhibits bacterial cell-wall synthesis during replication; clavulanic acid extends ticarcillin's antibiotic spectrum by inactivating beta-lactamase enzymes (which otherwise would degrade ticarcillin).

### Availability

**Injection:** 3 g ticarcillin and 100 mg clavulanic acid in 3.1-g vials

### Indications and dosages

- Systemic and urinary tract infections caused by susceptible organisms
- Adults weighing more than 60 kg (132 lb):** 3.1 g (30:1 fixed-ratio combination of 3 g ticarcillin and 100 mg clavulanic acid) by I.V. infusion q 4 to 6 hours
- Adults weighing less than 60 kg (132 lb):** 200 to 300 mg/kg/day (based on ticarcillin content) by I.V. infusion in divided doses q 4 to 6 hours
- Gynecologic infections caused by susceptible organisms
- Adults weighing more than 60 kg (132 lb):** For moderate infections, 200 mg/kg/day (based on ticarcillin content) by I.V. infusion in divided doses q 6 hours. For severe infections, 300 mg/kg/day (based on ticarcillin content) by I.V. infusion in divided doses q 4 hours.
- Adults weighing less than 60 kg (132 lb):** 200 to 300 mg/kg/day by I.V. infusion q 4 to 6 hours
- Mild to moderate or severe infections in children caused by susceptible organisms
- Children weighing more than 60 kg (132 lb):** For mild to moderate infections, 3.1 g (30:1 fixed-ratio combination of 3 g ticarcillin and 100 mg clavulanic acid) by I.V. infusion q 6 hours. For severe infections, 3.1 g (30:1 fixed-ratio combination of 3 g ticarcillin and 100 mg clavulanic acid) by I.V. infusion q 4 hours.

**Children ages 3 months to 16 years weighing less than 60 kg (132 lb):** For mild to moderate infections, 200 mg/kg/day (based on ticarcillin content) by I.V. infusion in divided doses q 6 hours. For severe infections, 300 mg/kg/day (based on ticarcillin content) by I.V. infusion in divided doses q 4 hours.

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to drug or other penicillins

### Precautions

Use cautiously in:

- cystic fibrosis, renal or hepatic disease
- pregnant or breastfeeding patients.

### Administration

- Ask patient about penicillin allergy before giving.
- Add 13 ml of sterile water or normal saline solution to vial; shake gently. Dilute further to 10 to 100 mg/ml of ticarcillin; infuse I.V. over 30 minutes.
- Give at least 1 hour before I.V. aminoglycosides (such as amikacin or gentamicin).

Route	Onset	Peak	Duration
I.V.	Immediate	Immediate	Unknown

### Adverse reactions

**CNS:** headache, giddiness, dizziness, lethargy, fatigue, hyperreflexia, neuromuscular excitability, asterixis, hallucinations, stupor, **seizures**

**GI:** nausea, vomiting, diarrhea, flatulence, **pseudomembranous colitis**

**Hematologic:** eosinophilia, transient **neutropenia** and **leukopenia** (with high doses)

**Skin:** urticaria, rash

**Other:** unpleasant taste; fever; overgrowth of nonsusceptible organisms; pain, vein irritation, erythema, phlebitis, and **thrombophlebitis** at I.V. site;

hypersensitivity reactions including **anaphylaxis**

### Interactions

**Drug-drug.** *Aminoglycosides:* physical incompatibility, causing aminoglycoside inactivation when mixed in same I.V. solution

*Aminoglycosides, tetracyclines:* additive activity against some bacteria

*Lithium:* altered lithium elimination

*Probenecid:* increased ticarcillin blood level

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, eosinophils, lactate dehydrogenase, sodium:* increased levels

*Bleeding time:* prolonged

*Granulocytes, hemoglobin, platelets, white blood cells:* decreased levels

*Liver function tests:* transient increases

*Urine glucose, urine protein:* false-positive results

### Patient monitoring

- Monitor liver function tests and CBC with white cell differential.
- Watch closely for signs and symptoms of superinfection and severe allergic reactions.
- Assess neurologic status, and stay alert for seizures.

### Patient teaching

📣 Advise patient to report skin reactions and severe diarrhea right away.

📣 Tell patient drug may increase risk of other infections. Advise him to promptly report signs and symptoms of new infection.

- Instruct patient to limit sodium intake (drug contains sodium).

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## ticlopidine hydrochloride

Apo-Ticlopidine\*, Dom-Ticlopidine\*, Gen-Ticlopidine\*, Novo-Ticlopidine\*, NU-Ticlopidine\*, PMS-Ticlopidine\*, Sandoz Ticlopidine\*, Ticlid

**Pharmacologic class:** Platelet aggregation inhibitor

**Therapeutic class:** Antiplatelet agent

**Pregnancy risk category B**

### FDA BOXED WARNING

- Drug may cause life-threatening hematologic adverse reactions, including neutropenia, agranulocytosis, thrombotic thrombocytopenic purpura (TTP), and aplastic anemia. Such reactions may arise within several days of starting therapy. TTP incidence peaks after about 3 to 4 weeks; neutropenia, at approximately 4 to 6 weeks; and aplastic anemia, after about 4 to 8 weeks. Thereafter, incidence of hematologic reactions declines.
- During first 3 months of therapy, monitor patient hematologically and clinically for evidence of neutropenia or TTP. If it occurs, discontinue drug immediately.

### Action

Inhibits release of first and second phases of adenosine diphosphate-induced effects on platelet aggregation, preventing thrombus formation

### Availability

Tablets: 250 mg

### Indications and dosages

➤ To reduce risk of thrombotic cerebrovascular accident when aspirin is ineffective or intolerable

**Adults:** 250 mg P.O. b.i.d. with meals  
 ➤ Adjunctive therapy to prevent subacute stent thrombosis in patients with implanted coronary stents  
**Adults:** 250 mg P.O. b.i.d. with meals, given with antiplatelet doses of aspirin for up to 30 days after successful stent implantation

### Dosage adjustment

- Renal impairment

### Off-label uses

- Chronic arterial occlusion
- Coronary artery bypass graft
- Open-heart surgery
- Intermittent claudication
- Primary glomerulonephritis
- Sickle cell disease
- Subarachnoid hemorrhage
- Uremic patients with atrioventricular shunts or fistulas

### Contraindications

- Hypersensitivity to drug
- Hematopoietic disorders
- Hemostatic disorders or active bleeding
- Severe hepatic disease
- History of thrombotic thrombocytopenia purpura (TTP) or aplastic anemia

### Precautions

Use cautiously in:

- renal or hepatic impairment
- high risk for bleeding
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 18 (safety not established).

### Administration

- Give with meals.
- Don't give within 2 hours of antacids.

Route	Onset	Peak	Duration
P.O.	Within 4 days	8-11 days	2 wk

**Adverse reactions**

**CNS:** dizziness, headache, weakness,

**intracerebral bleeding**

**EENT:** conjunctival hemorrhage, tinnitus, epistaxis

**GI:** nausea, vomiting, diarrhea, full sensation, GI pain, dyspepsia, flatulence, anorexia, **GI bleeding**

**GU:** hematuria

**Hematologic:** ecchymosis, eosinophilia, purpura, **TTP, thrombocytosis, neutropenia, agranulocytosis, bone marrow depression**

**Skin:** rashes, bruising, pruritus, urticaria

**Other:** pain, posttraumatic or perioperative bleeding

**Interactions**

**Drug-drug.** *Antacids:* decreased ticlopidine blood level

*Aspirin:* potentiation of aspirin's effect on platelets

*Cimetidine (long-term use):* reduced ticlopidine clearance

*Digoxin:* slightly decreased digoxin blood level

*Phenytoin:* increased phenytoin blood level, greater risk of toxicity

*Theophylline:* decreased theophylline clearance, greater risk of toxicity

*Vitamin A:* altered anticoagulant effects

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase:* increased levels

*Granulocytes, neutrophils, platelets, white blood cells:* decreased counts

*Liver function tests:* abnormal results

**Drug-food.** *Any food:* increased ticlopidine absorption

**Drug-herbs.** *Alfalfa, anise, arnica, astragalus, bilberry, black current seed oil, bladderwrack, bogbean, boldo, borage oil, buchu, capsacin, cat's claw, celery, chapparal, cinchona bark, clove oil, coenzyme Q10, dandelion, dong quai, evening primrose oil, fenugreek, feverfew, garlic, ginger, ginkgo, guggal, papaya extract, red clover, rhubarb,*

*safflower oil, skullcap, St. John's wort, tan shen:* altered anticoagulant effects

**Patient monitoring**

☞ Closely monitor coagulation studies and CBC with white cell differential. Watch for evidence of bleeding tendency and blood dyscrasias.

☞ Assess neurologic status carefully. Stay alert for signs and symptoms of intracranial bleeding.

- Monitor liver function tests.

**Patient teaching**

- Tell patient to take with meals, but not within 2 hours of antacids.

☞ Instruct patient to immediately report easy bruising or bleeding.

- Advise patient to stop taking drug 10 to 14 days before elective surgery.

- Tell patient to inform all prescribers that he is taking drug.

- Inform patient that aspirin-containing products and many herbs increase risk of bleeding. Urge him to consult prescriber before taking over-the-counter drugs or herbs.

- Caution patient to avoid activities that can cause injury. Tell him to use soft toothbrush and electric razor to avoid gum and skin injury.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

t

**tigecycline**

## Tygacil

**Pharmacologic class:** Glycylcycline antibiotic

**Therapeutic class:** Anti-infective

**Pregnancy risk category D**

## Action

Inhibits protein translation in bacteria by binding to 30S ribosomal subunit and blocking entry of amino-acyl tRNA molecules into ribosomal A site, which in turn prevents incorporation of amino acid residues into elongating peptide chains

## Availability

*Powder for injection (lyophilized):*  
50 mg/5 ml in single-dose vial

## Indications and dosages

➤ Treatment of skin, skin-structure infections, and complicated intra-abdominal infections caused by susceptible organisms

**Adults age 18 and older:** 100 mg I.V. initially, followed by 50 mg I.V. every 12 hours for 5 to 14 days, depending on infection site and severity and patient's clinical and bacteriologic process

➤ Community-acquired bacterial pneumonia caused by susceptible organisms

**Adults age 18 and older:** Initially, 100 mg I.V., followed by 50 mg I.V. q 12 hours for 7 to 14 days, depending on infection site and severity and patient's clinical and bacteriologic process

## Dosage adjustment

- Severe hepatic impairment

## Contraindications

- Hypersensitivity to drug or its components

## Precautions

Use cautiously in:

- mild to moderate hepatic impairment, complicated intra-abdominal infections secondary to perforation, ventilator-associated pneumonia
- pregnant and breastfeeding patients
- children younger than age 18.

## Administration

- Reconstitute with 5.3 ml of normal saline solution injection or 5% dextrose injection to yield a concentration of 10 mg/ml (50 mg).

- Swirl vial gently until drug dissolves. Immediately withdraw 5 ml of reconstituted solution from vial and add to 100-ml I.V. bag for infusion. Maximum concentration in I.V. bag should be 1 mg/ml.

- Discard reconstituted solution that isn't yellow or orange.

- Administer through dedicated I.V. line or Y-site. If same I.V. line is used for sequential infusion of several drugs, flush before and after infusion, using either normal saline solution injection or 5% dextrose injection. Use infusion solution compatible with tigecycline and other drugs given through same line.

- Administer over 30 to 60 minutes.

- Don't give amphotericin B, chlorpromazine, methylprednisolone, or voriconazole simultaneously through same Y-site.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** headache, dizziness, insomnia, asthenia, pseudotumor cerebri

**CV:** hypertension, hypotension, phlebitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, increased GI enzymes, **pseudomembranous colitis, pancreatitis**

**Hematologic:** anemia, leukocytosis, thrombocytopenia

**Hepatic:** hepatic dysfunction, hepatic failure

**Metabolic:** antianabolic action (with increased BUN, azotemia, acidosis, and hyperphosphatemia)

**Musculoskeletal:** back pain

**Respiratory:** increased cough, dyspnea

**Skin:** pruritus, rash, sweating, photosensitivity

**Other:** abscess, fever, infection, pain, peripheral edema, abnormal healing, superinfection, permanent tooth discoloration (during tooth development), **increase in all-cause mortality, hypersensitivity reaction (including anaphylaxis)**

## Interactions

**Drug-drug.** *Hormonal contraceptives:* reduced contraceptive efficacy

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, amylase, aspartate aminotransferase, bilirubin, blood glucose, blood urea nitrogen:* increased

*Blood protein, potassium, WBCs:* decreased

## Patient monitoring

• Monitor prothrombin time or other suitable anticoagulation tests if patient is receiving warfarin concomitantly.

🔊 Closely monitor liver function tests; watch for signs and symptoms of hepatic impairment.

## Patient teaching

🔊 Instruct patient to immediately report rash and other signs or symptoms of allergic reaction.

- Tell patient to complete full course of therapy, even if he feels better.
- Advise patient taking oral hormonal contraceptives to use alternative birth control method during therapy.
- Caution female with childbearing potential to avoid pregnancy because drug may harm fetus.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## timolol maleate

Apo-Timol<sup>⚡</sup>, Betim<sup>⚡</sup>, Betimol, Dom-Timolol<sup>⚡</sup>, Gen-Timolol<sup>⚡</sup>, Istalol, Novo-Timol<sup>⚡</sup>, NU-Timolol<sup>⚡</sup>, PMS-Timolol<sup>⚡</sup>, Rhoxal-Timolol<sup>⚡</sup>, Sandoz Timolol<sup>⚡</sup>, Timoptic, Timoptix-XE

**Pharmacologic class:** Beta-adrenergic blocker (nonselective)

**Therapeutic class:** Antihypertensive, vascular headache suppressant, antiglaucoma agent

**Pregnancy risk category C**

## FDA BOXED WARNING

- Exacerbations of angina pectoris and myocardial infarction (MI) may follow abrupt withdrawal of some beta blockers. When discontinuing long-term therapy, particularly in patients with ischemic heart disease, reduce dosage gradually over 1 to 2 weeks and monitor patient carefully. If angina worsens markedly or acute coronary insufficiency develops, reinstate drug promptly (at least temporarily) and take other appropriate measures to manage unstable angina. Caution patient not to interrupt or discontinue therapy without prescriber's advice. Because coronary artery disease is common and may be unrecognized, it may be prudent not to discontinue drug abruptly even in patients treated only for hypertension.

## Action

Blocks stimulation of beta<sub>1</sub>-adrenergic (myocardial) and beta<sub>2</sub>-adrenergic (pulmonary, vascular, uterine) receptor sites. May reduce aqueous production, which decreases intraocular pressure (IOP).

**Availability***Ophthalmic gel:* 0.25%, 0.5%*Ophthalmic solution:* 0.25%, 0.5%*Tablets:* 5 mg, 10 mg, 20 mg**Indications and dosages****> Hypertension**

**Adults:** Initially, 10 mg P.O. b.i.d., given alone or with a diuretic; may increase at 7-day intervals as needed. Usual maintenance dosage is 10 to 20 mg daily in two divided doses, up to 60 mg/day.

**> Acute MI**

**Adults:** 10 mg P.O. b.i.d. starting 1 to 4 weeks after MI

**> To prevent vascular headaches**

**Adults:** Initially, 10 mg P.O. b.i.d. For maintenance, 20 mg may be given as a single daily dose. Total daily dosage may be increased to a maximum of 30 mg in divided doses or decreased to 10 mg/day, depending on response and tolerance. Withdraw drug if satisfactory response doesn't occur after 6 to 8 weeks at maximum dosage.

**> Elevated IOP in patients with ocular hypertension or open-angle glaucoma**

**Adults:** One drop of 0.25% to 0.5% ophthalmic solution in affected eye b.i.d., or 0.25% to 0.5% ophthalmic gel in affected eye once daily

**Off-label uses**

- Angina pectoris
- Supraventricular arrhythmias

**Contraindications**

- Hypersensitivity to drug or other beta-adrenergic blockers
- Uncompensated heart failure
- Bradycardia or heart block
- Cardiogenic shock
- Bronchial asthma (current or previous), severe chronic obstructive pulmonary disease

**Precautions**

Use cautiously in:

- renal or hepatic impairment, diabetes mellitus, thyrotoxicosis
- elderly patients
- pregnant or breastfeeding patients
- children (safety not established).

**Administration**

- Measure apical pulse before giving. If patient has significant bradycardia or tachycardia, withhold dose and consult prescriber.

Route	Onset	Peak	Duration
P.O.	Unknown	1-2 hr	12-24 hr
Ophthalmic	≤ 30 min	1-2 hr	≤ 24 hr

**Adverse reactions**

**CNS:** fatigue, dizziness, asthenia, insomnia, headache, vertigo, nervousness, depression, paresthesia, hallucinations, memory loss, disorientation, emotional lability, clouded sensorium  
**CV:** hypotension, angina pectoris exacerbation, bradycardia, **atrioventricular or sinoatrial block, arrhythmias, heart failure**

**EENT:** visual disturbances, dry eyes, tinnitus, nasal congestion

**GI:** nausea, constipation, diarrhea, abdominal discomfort

**GU:** erectile dysfunction, decreased libido

**Metabolic:** hyperuricemia, **hypoglycemia, hyperkalemia**

**Musculoskeletal:** joint pain

**Respiratory:** dyspnea, crackles, **bronchospasm, pulmonary edema**

**Skin:** itching, rash

**Interactions**

**Drug-drug.** *Antihypertensives, nitrates:* additive hypotension

*Insulin, oral hypoglycemics:* altered efficacy of these drugs

*Nonsteroidal anti-inflammatory drugs:* decreased antihypertensive effect of timolol

**Quinidine:** inhibited timolol metabolism, leading to increased beta-adrenergic blockade and bradycardia

**Reserpine:** increased risk of hypotension and bradycardia

**Theophylline:** reduced effects of both drugs

**Drug-diagnostic tests.** *Antinuclear antibodies:* increased titer

*Blood urea nitrogen, liver function tests, potassium, uric acid:* increased values

*Glucose, high-density lipoproteins, hematocrit, hemoglobin:* decreased values

**Drug-herbs.** *Ephedra (ma huang), St. John's wort, yohimbine:* decreased timolol efficacy

### Patient monitoring

- Closely monitor vital signs, blood pressure, cardiovascular status, and ECG.
- Assess respiratory status. Check breath sounds for wheezing and bronchospasm.
- Monitor blood glucose level in patient with diabetes mellitus.

### Patient teaching

- Teach patient how to measure pulse before each dose. Instruct him to contact prescriber if pulse is outside established safe range.
- 🚫 Caution patient not to stop taking drug abruptly. Dosage must be tapered.
- Teach patient how to administer eye drops. Instruct him to use drops only as prescribed, because they are absorbed systemically. Caution him not to touch dropper tip to eye or any other surface.
- 🚫 Teach patient to recognize and immediately report significant adverse respiratory, cardiac, and neurologic reactions.
- Inform patient that many over-the-counter drugs and herbs may decrease the efficacy of timolol. Advise him to consult prescriber before using these products.

- Advise diabetic patient that drug may lower blood glucose level. Encourage regular blood glucose monitoring.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## tinidazole

Fasigyn<sup>®</sup>, Tindamax

**Pharmacologic class:** Antiprotozoal

**Therapeutic class:** Anti-infective

**Pregnancy risk category** C

### FDA BOXED WARNING

- Prolonged use of metronidazole (a structurally related drug with similar biologic effects) has caused cancer in mice and rats. Reserve tinidazole for conditions listed under "Indications and dosages."

### Action

Free nitro radical (generated from tinidazole reduction by *Trichomonas* cell extracts) may explain activity against *Trichomonas* species; activity against *Giardia* and *Entamoeba* species is unknown.

### Availability

Tablets: 250 mg, 500 mg

### Indications and dosages

➤ Trichomoniasis caused by *Trichomonas vaginalis*

**Adults:** Single dose of 2 g P.O. with food, given to both sexual partners simultaneously

➤ Bacterial vaginosis in nonpregnant females

**Adults:** 2 g P.O. once daily with food for 2 days, or 1 g P.O. once daily with food for 5 days

➤ Giardiasis caused by *Giardia duodenalis* (*Giardia lamblia*)

**Adults:** Single dose of 2 g P.O. with food

**Children older than age 3:** Single dose of 50 mg/kg (up to 2 g) with food

➤ Amebiasis caused by *Entamoeba histolytica*

**Adults:** 2 g P.O. daily with food for 3 days

**Children older than age 3:** 50 mg/kg (up to 2 g) P.O. daily with food for 3 days

➤ Amebic liver abscess caused by *E. histolytica*

**Adults:** 2 g P.O. daily with food for 3 to 5 days

**Children older than age 3:** 50 mg/kg (up to 2 g) P.O. daily with food for 3 to 5 days

## Dosage adjustment

- Hemodialysis patients

## Contraindications

- Hypersensitivity to drug, its components, or other nitroimidazole derivatives
- First trimester of pregnancy

## Precautions

Use cautiously in:

- CNS disease, hepatic dysfunction
- history of blood dyscrasias
- elderly patients
- pregnant or breastfeeding patients
- children (except to treat giardiasis and amebiasis in children older than age 3).

## Administration

- Give with food to minimize GI discomfort.

Route	Onset	Peak	Duration
P.O.	Unknown	1.6 hr	Unknown

## Adverse reactions

**CNS:** weakness, fatigue, malaise, dizziness, vertigo, ataxia, insomnia,

drowsiness, giddiness, headache, transient peripheral neuropathy, **seizures**

**CV:** palpitations

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, gastric discomfort, tongue discoloration, stomatitis, anorexia

**Hematologic:** transient neutropenia and leukopenia

**Musculoskeletal:** arthralgia, myalgia, arthritis

**Other:** altered taste, overgrowth of susceptible organisms, hypersensitivity reactions including **angioedema**

## Interactions

**Drug-drug.** *Cyclosporine, lithium, tacrolimus:* possible increase in blood levels of these drugs

*Cholestyramine:* decreased oral bioavailability of tinidazole

*CYP450 inducers (such as phenobarbital, rifampin):* increased tinidazole elimination and decreased blood level

*CYP450 inhibitors (such as cimetidine, ketoconazole):* increased tinidazole blood level

*Fluorouracil:* decreased fluorouracil clearance

*Fosphenytoin, phenytoin:* prolonged half-life and reduced clearance of these drugs

*Oxytetracycline:* antagonism of therapeutic effects of tinidazole

*Warfarin, other oral coumarin anticoagulants:* increased effects of these drugs

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, hexokinase glucose, lactate dehydrogenase, triglycerides:* interference with test results

**Drug-behaviors.** *Alcohol use:* disulfiram-like reaction during tinidazole therapy and for 3 days after

## Patient monitoring

🔊 Closely monitor patient for neurologic abnormalities, such as seizures and peripheral neuropathy. If these occur, withdraw drug immediately.

- Monitor blood chemistry tests, especially liver function tests.

### Patient teaching

- Advise patient to take drug with food.
- For child or other patient unable to swallow tablets, inform parent or caregiver that drug can be crushed in artificial cherry syrup and given with food.
- 🔊 Caution patient or caregiver to stop therapy and call prescriber immediately if seizures or numbness or tingling in extremities occurs.
- Instruct patient to avoid alcohol use during therapy.
- Advise female patient to avoid pregnancy during therapy.
- Counsel female patient to avoid breastfeeding during therapy and for 3 days after last dose.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## tiotropium

Spriva , Spiriva HandiHaler

**Pharmacologic class:** Antimuscarinic, anticholinergic

**Therapeutic class:** Bronchodilator

**Pregnancy risk category** C

### Action

Inhibits smooth-muscle muscarinic  $M_3$ -receptors, leading to bronchodilation

### Availability

Capsules for inhalation: 18 mcg

### Indications and dosages

➤ Long-term, once-daily maintenance treatment of bronchospasm

associated with chronic obstructive pulmonary disease

**Adults:** Contents of one capsule inhaled orally once daily using supplied HandiHaler

### Contraindications

- Hypersensitivity to atropine or its derivatives (including ipratropium) or drug components

### Precautions

Use cautiously in:

- angle-closure glaucoma, prostatic hyperplasia, bladder neck obstruction, moderate to severe renal impairment, severe hypersensitivity to milk proteins
- concurrent use of other anticholinergics
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Give contents of one capsule once daily using HandiHaler.
- Don't let patient swallow capsule.

Route	Onset	Peak	Duration
Inhalation (P.O.)	30 min	3 hr	24 hr

### Adverse reactions

**CNS:** depression, paresthesia

**CV:** angina, increased heart rate

**EENT:** eye pain or discomfort, blurred vision, visual halos, cataract, colored images in association with red eyes (with inadvertent eye exposure), epistaxis, rhinitis, sinusitis, laryngitis, pharyngitis, dysphonia

**GI:** vomiting, constipation, dyspepsia, abdominal pain, gastroesophageal reflux, stomatitis, dry mouth

**GU:** urinary tract infection, urinary retention, urinary difficulty

**Musculoskeletal:** myalgia, skeletal pain, arthritis, leg pain

**Respiratory:** upper respiratory tract infection, coughing, **paradoxical bronchospasm**

**Skin:** rash

**Other:** nonspecific chest pain, edema, infection, candidiasis, flulike symptoms, herpes zoster, **hypersensitivity reaction (including angioedema)**

## Interactions

**Drug-diagnostic tests.** *Blood glucose, cholesterol:* increased

## Patient monitoring

🔊 Closely monitor patient for allergic reaction and paradoxical bronchospasm; if these occur, discontinue drug and consider alternative therapy.

- Closely monitor patients with moderate to severe renal impairment.

## Patient teaching

- Give patient information portion of package insert on HandiHaler use.
- Inform patient that drug is once-daily maintenance medicine that opens narrowed airways and helps keep them open for 24 hours. Stress that it's not for immediate (rescue) relief of breathing problems.
- Tell patient that capsules are intended for oral inhalation only and should be used only with HandiHaler device. Emphasize that HandiHaler must not be used to take any other drug.

🔊 Caution patient not to let powder get into eyes.

- Teach patient to take prescribed dose in these steps: Immediately before use, open one sealed blister foil and HandiHaler device, insert capsule, press HandiHaler button once to pierce capsule, and exhale completely before placing mouthpiece into mouth with head upright. Then breathe in slowly and deeply at a rate fast enough to hear capsule vibrate, until lungs are full. Holding breath as long as comfortable, take HandiHaler device out of mouth. Then place device back in mouth and inhale again to get full dose.

- Tell patient not to exhale into HandiHaler mouthpiece at any time.

- Caution patient not to swallow capsules.

- Tell patient not to store capsules in HandiHaler device.

- Instruct patient to clean device as shown in patient information sheet.

- Instruct patient to discard any capsules inadvertently exposed to air while preparing dose.

🔊 Tell patient to contact prescriber immediately if eye pain or discomfort, blurred vision, visual halos, or colored images occur.

🔊 Instruct patient to immediately stop drug and report signs and symptoms of hypersensitivity reaction (including itching, rash, swelling of the lips, tongue, or throat) or difficulty breathing.

🔊 Tell patient to immediately report signs and symptoms of prostatic hyperplasia or bladder-neck obstruction (such as difficulty passing urine or painful urination).

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## tipranavir

Aptivus

**Pharmacologic class:** Nonpeptidic protease inhibitor of human immunodeficiency virus type 1 (HIV-1)

**Therapeutic class:** Antiretroviral

**Pregnancy risk category C**

### FDA BOXED WARNING

- When given concurrently with ritonavir 200 mg, drug has been linked to reports of fatal and nonfatal intracranial hemorrhage and clinical hepatitis

and hepatic decompensation. Use extra vigilance in patients with chronic hepatitis B or hepatitis C co-infection.

### Action

Inhibits virus-specific processing of viral Gag and Gag-Pol polyproteins in HIV-1 infected cells, preventing formation of mature virions

### Availability

*Capsules:* 250 mg

*Oral solution:* 100 mg/ml

### Indications and dosages

➤ Combination antiretroviral treatment of HIV-1 infected patients who are treatment-experienced and infected with HIV-1 strains resistant to more than one protease inhibitor

**Adults:** 500 mg P.O. twice daily given with 200 mg ritonavir

**Children ages 2 to 18:** 14 mg/kg P.O. with ritonavir 6 mg/kg (or 375 mg/m<sup>2</sup> with ritonavir 150 mg/m<sup>2</sup>) twice daily, not to exceed maximum dosage of tipranavir 500 mg with ritonavir 200 mg twice daily. For children who develop intolerance or toxicity and can't continue with tipranavir 14 mg/kg with ritonavir 6 mg/kg, consider decreasing dosage to tipranavir 12 mg/kg with ritonavir 5 mg/kg (or tipranavir 290 mg/m<sup>2</sup> with ritonavir 115 mg/m<sup>2</sup>) twice daily provided virus isn't resistant to multiple protease inhibitors.

### Contraindications

- Moderate to severe hepatic impairment
- Concurrent use of amiodarone, astemizole, bepridil, cisapride, dihydroergotamine, ergonovine, ergotamine, flecainide, methylethylergonovine, oral midazolam, pimozide, propafenone, quinidine, terfenadine, or triazolam
- Sildenafil (Revatio) when used for pulmonary hypertension

### Precautions

Use cautiously in:

- treatment-naïve patients (avoid use)
- sulfonamide allergy
- hepatic insufficiency, diabetes mellitus, hyperglycemia, hemophilia, increased risk of bleeding
- concurrent use of drugs known to increase risk of bleeding
- concurrent use of other protease inhibitors, fluticasone propionate, or salmeterol (use not recommended)
- concurrent use of calcium channel blockers, carbamazepine, itraconazole, ketoconazole, parenteral midazolam, PDE5 inhibitors (when used for erectile dysfunction), phenobarbital, phenytoin, trazodone, valproic acid
- pregnant or breastfeeding patients.

### Administration

- Administer with or without food when given with ritonavir capsules or solution; must administer only with meals when given with ritonavir tablets.
- Give 2 hours before or 1 hour after antacids.

Route	Onset	Peak	Duration
P.O.	Unknown	2.9-3 hr	Unknown

### Adverse reactions

**CNS:** fatigue, headache, depression, insomnia, asthenia, **intracranial hemorrhage**

**GI:** diarrhea, nausea, vomiting, abdominal pain, dyspepsia, flatulence

**Hematologic:** leukopenia, anemia, neutropenia, thrombocytopenia

**Hepatic: hepatotoxicity**

**Metabolic:** hyperglycemia, new-onset or exacerbations of diabetes mellitus

**Respiratory:** bronchitis, cough

**Skin:** rash

**Other:** pyrexia, fat accumulation or redistribution, immune reconstitution syndrome

## Interactions

**Drug-drug.** *Antacids:* decreased tipranavir peak concentration  
*Atorvastatin, desipramine, fluticasone, itraconazole, ketoconazole, rifabutin, selective serotonin reuptake inhibitors, sildenafil, tadalafil, trazodone, vardenafil, voriconazole:* increased levels of these drugs

*Calcium channel blockers:* possible unpredictable effects

*Clarithromycin:* increased levels of both drugs

*Didanosine, ethinyl estradiol, methadone:* decreased levels of these drugs

*Disulfiram, other drugs that produce disulfiram-like reaction (such as metronidazole):* increased risk of disulfiram-like reactions

*Fluconazole:* increased tipranavir level

*Hormonal contraceptives:* decreased hormonal concentration, increased risk of rash

*Lovastatin, simvastatin:* increased potential for serious reactions (such as myopathy and rhabdomyolysis)

*Metronidazole:* disulfiram-like interaction

*PDE5 inhibitors:* increased PDE5 inhibitor-associated adverse events, including hypotension, syncope, visual disturbances, and priapism

*Rifampin:* loss of virologic response, tipranavir resistance

*Salmeterol:* increased risk of cardiovascular adverse events including QT interval prolongation, palpitations, and sinus tachycardia

*Trazodone:* increased trazodone plasma concentrations

*Valproic acid:* decreased valproic acid effectiveness

*Warfarin:* altered warfarin blood level

**Drug-diagnostic tests.** *Alanine aminotransferase (ALT), amylase, aspartate aminotransferase (AST), cholesterol, triglycerides:* increased

*Platelets, WBCs:* decreased

**Drug-food.** *High-fat meal:* increased drug bioavailability

**Drug-herbs.** *St. John's wort:* loss of virologic response, tipranavir resistance

## Patient monitoring

- Monitor liver function tests and watch for signs and symptoms of hepatic impairment before and during therapy. Discontinue drug if signs and symptoms of clinical hepatitis, asymptomatic increases in ALT/AST of more than 10 times upper limit of normal (ULN), or asymptomatic increases in ALT/AST of 5 to 10 times ULN with concomitant increases in total bilirubin occur.
- Monitor triglyceride and cholesterol levels before therapy starts and at periodic intervals during therapy.
- Monitor CBC, platelets, and serum amylase levels.
- Monitor INR frequently when therapy starts in patients receiving warfarin.
- Closely monitor patients with hyperglycemia or chronic hepatitis B or C.
- Because this drug interacts with many other drugs, closely monitor patient's drug regimen for possible interactions and adjust dosage, as appropriate.
- Be aware that immune reconstitution syndrome has occurred in patients treated with combination antiretroviral therapy. During initial phase of combination antiretroviral treatment, patients whose immune system responds may develop inflammatory response to indolent or residual opportunistic infections (such as *Mycobacterium avium* infection, cytomegalovirus, *Pneumocystis jiroveci* pneumonia, tuberculosis, or reactivation of herpes simplex and herpes zoster), which may necessitate further evaluation and treatment.

## Patient teaching

- Instruct patient to take capsules or solution with or without food when

taking with ritonavir capsules or solution and to take with meals when taking with ritonavir tablets. Tell patient to swallow capsule whole, without chewing it.

- Tell patient to take drug 2 hours before or 1 hour after antacids.
- 🔊 Emphasize that patient must take prescribed ritonavir dosage with this drug to achieve desired therapeutic effect.
- Instruct patient not to alter dosage or discontinue tipranavir or ritonavir without consulting prescriber.
- Advise patient to take a missed dose as soon as possible and then return to normal schedule. Caution against taking double doses.
- 🔊 Instruct patient to immediately stop taking drug and contact prescriber if he develops unusual fatigue, general ill feeling, flulike symptoms, appetite loss, nausea, yellowing of skin or eyes, dark urine, pale stools, or right-sided abdominal pain.
- 🔊 Tell patient to discontinue drug and promptly report severe report rash to prescriber.
- Inform patient that because drug may cause many interactions, he shouldn't take other prescription or over-the-counter drugs without consulting prescriber.
- Tell patient drug may cause body fat redistribution or accumulation.
- Instruct patient to store capsules in refrigerator and to use contents within 60 days of opening bottle.
- Advise female taking estrogen-based hormonal contraceptives to use additional or alternative birth control method during therapy.
- Instruct female not to breastfeed because of risk of transmitting HIV infection and adverse drug effects to infant.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## tirofiban hydrochloride

Aggrastat

**Pharmacologic class:** Glycoprotein (GP IIb/IIIa)-receptor inhibitor

**Therapeutic class:** Platelet aggregation inhibitor

**Pregnancy risk category B**

### Action

Inhibits reversible platelet aggregation by binding to GP IIb/IIIa receptor on platelets

### Availability

**Injection:** 25-ml and 50-ml vials (250 mcg/ml), 100-ml and 250-ml premixed vials (50 mcg/ml)

### Indications and dosages

- Acute coronary syndrome (given with heparin); patients undergoing percutaneous transluminal coronary angioplasty (PTCA) or atherectomy
- Adults:** Loading dose of 0.4 mcg/kg/minute I.V. for 30 minutes, followed by continuous I.V. infusion of 0.1 mcg/kg/minute for 48 to 108 hours in patients being managed medically. Continue infusion for 12 to 24 hours after PTCA or atherectomy.

### Dosage adjustment

- Renal insufficiency

### Contraindications

- Hypersensitivity to drug or its components
- Active internal bleeding or history of bleeding diathesis within past 30 days
- Cerebrovascular accident (CVA) within past 30 days, or history of hemorrhagic CVA
- History of intracranial hemorrhage, intracranial neoplasm, arteriovenous

malformation, aneurysm, or thrombocytopenia after previous tirofiban use

- History, symptoms, or findings that suggest aortic dissection
- Severe hypertension
- Acute pericarditis
- Major surgery or severe trauma within past 30 days
- Concurrent use of other parenteral GP IIb/IIIa inhibitors

### Precautions

Use cautiously in:

- renal disease
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 18 (safety not established).

### Administration

 Know that drug comes both in premixed vials of 50 mcg/ml and injection concentrate of 250 mcg/ml.

- Dilute injection concentrate to same concentration as premixed vial (50 mcg/ml) by withdrawing and discarding 50 ml of solution from 250-ml plastic bag of normal saline solution or dextrose 5% in water, or by withdrawing and discarding 100 ml of solution from 500-ml plastic bag of same solution and replacing with equal volume of concentrated drug form.
- Mix I.V. solution well and inspect visually before administering.
- Squeeze plastic bag and check for leaks; discard if it has leaks.
- Don't use drug in series connections with other plastic bags. Don't add other drugs to bag containing tirofiban.

Route	Onset	Peak	Duration
I.V.	Immediate	Immediate	4-6 hr

### Adverse reactions

**CNS:** headache, dizziness, **spinal-epidural hematoma, intracranial hemorrhage**

**CV:** vasovagal reaction, bradycardia, **hemopericardium, coronary artery dissection**

**GI:** nausea, vomiting, occult bleeding, hematemesis, **retroperitoneal hemorrhage**

**GU:** pelvic pain, hematuria

**Hematologic:** bleeding, **thrombocytopenia**

**Musculoskeletal:** leg pain

**Respiratory:** **pulmonary hemorrhage**

**Skin:** diaphoresis

**Other:** infusion site bleeding, chills, fever, edema, allergic reactions, **anaphylaxis**

### Interactions

**Drug-drug.** *Clopidogrel, dipyridamole, nonsteroidal anti-inflammatory drugs, oral anticoagulants (such as thrombolytics, ticlopidine, warfarin), other drugs affecting hemostasis:* increased risk of bleeding

*Levothyroxine, omeprazole:* increased renal clearance of tirofiban

*Vitamin A:* increased risk of bleeding

**Drug-diagnostic tests.** *Hematocrit, hemoglobin, platelets:* decreased values

**Drug-herbs.** *Alfalfa, anise, arnica, astragalus, bilberry, black currant seed oil, bladderwrack, bogbean, boldo (with fenugreek), borage oil, buchu, capsaicin, cat's claw, celery, chaparral, chincona bark, clove oil, dandelion, dong quai, evening primrose oil, fenugreek, feverfew, garlic, ginger, ginkgo, guggul, papaya extract, red clover, rhubarb, safflower oil, skullcap, tan-shen:* increased risk of bleeding

### Patient monitoring

 Monitor CBC, platelet count, and coagulation studies. Assess stool for occult blood.

- Watch for bleeding at puncture sites, especially at cardiac catheterization access site. Immobilize access site to reduce bleeding risk.

 Monitor for signs and symptoms of bleeding in cranium and other body systems (especially respiratory, GI, and GU).

- Monitor vital signs and ECG.

🔊 Assess cardiovascular status. Stay alert for signs and symptoms of coronary artery dissection or hemopericardium.

### Patient teaching

🔊 Teach patient to recognize and immediately report serious adverse reactions.

- Tell patient he will be closely monitored and undergo regular blood testing during therapy.

## tizanidine hydrochloride

Apo-Tizanidine\*, Gen-Tizanidine\*, Zanaflex

**Pharmacologic class:** Alpha-adrenergic agonist (centrally acting)

**Therapeutic class:** Skeletal muscle relaxant

**Pregnancy risk category C**

### Action

Stimulates alpha<sub>2</sub>-adrenergic agonist receptor sites and reduces spasticity by inhibiting presynaptic motor neurons

### Availability

Tablets: 2 mg, 4 mg

### Indications and dosages

➤ Increased muscle tone associated with spasticity

**Adults:** Initially, 4 mg P.O. q 6 to 8 hours (no more than three doses in 24 hours). Increase in increments of 2 to 4 mg, up to 8 mg/dose or 24 mg/day (not to exceed 36 mg/day), as needed.

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- renal or hepatic impairment
- elderly patients
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Give with or without food.

Route	Onset	Peak	Duration
P.O.	Unknown	1-2 hr	3-6 hr

### Adverse reactions

**CNS:** drowsiness, asthenia, dizziness, speech disorder, dyskinesia, nervousness, anxiety, depression, hallucinations, sedation, paresthesia

**CV:** hypotension, bradycardia

**EENT:** blurred vision, pharyngitis, rhinitis

**GI:** vomiting, diarrhea, constipation, abdominal pain, dyspepsia, dry mouth

**GU:** urinary frequency, urinary tract infection

**Hepatic: hepatitis**

**Musculoskeletal:** back pain, myasthenia

**Skin:** rash, skin ulcers, sweating

**Other:** fever, infection, flulike symptoms

### Interactions

**Drug-drug.** *Alpha<sub>2</sub>-adrenergic agonist antihypertensives:* increased risk of hypotension

*CNS depressants (such as antihistamines, opioids, sedative-hypnotics):* additive CNS depression

*Hormonal contraceptives:* increased tizanidine blood level, greater risk of adverse reactions

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, glucose:* increased levels

**Drug-food.** *Any food:* increased drug bioavailability, shorter time to peak concentration (with no effect on absorption)

**Drug-behaviors.** *Alcohol use:* additive CNS depression

### Patient monitoring

- Monitor temperature and vital signs. Watch for orthostatic hypotension, bradycardia, and fever or other signs and symptoms of infection.
- Assess liver function tests.

### Patient teaching

- Advise patient he may take with or without food.
- Tell patient to report signs or symptoms of infection or depression.
- Instruct patient to move slowly when sitting up or standing, to avoid dizziness from sudden blood pressure decrease.

 Tell patient to immediately report unusual tiredness or yellowing of skin or eyes.

- Caution patient not to drink alcohol.
- Instruct patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

## tobramycin

Aktob, Apo-Tobramycin<sup>✳</sup>, PMS-Tobramycin<sup>✳</sup>, TOBI, Tobrex

## tobramycin sulfate

**Pharmacologic class:** Aminoglycoside

**Therapeutic class:** Anti-infective

**Pregnancy risk category B** (inhalation, ophthalmic), **D** (parenteral)

## FDA BOXED WARNING

The following boxed warnings apply to parenteral administration only:

- When giving drug by injection, observe patient closely for potential ototoxicity and nephrotoxicity. Rarely, nephrotoxicity doesn't emerge until first few days after therapy ends.
- Neurotoxicity, manifested as both auditory and vestibular ototoxicity, can occur. Auditory changes are irreversible and usually bilateral. Eighth-nerve impairment and nephrotoxicity also may develop, mainly in patients with preexisting renal damage and in those with normal renal function who receive drug for longer periods or in higher doses than those recommended. Other neurotoxicity manifestations may include numbness, skin tingling, muscle twitching, and seizures. Risk of drug-induced hearing loss increases with degree of exposure to high peak or high trough drug blood levels. Patients who develop cochlear damage may lack symptoms during therapy to warn of eighth-nerve toxicity, and partial or total irreversible bilateral deafness may continue to develop after withdrawal.
- Monitor renal and eighth-nerve function closely in patients with known or suspected renal impairment and in those whose renal functional initially is normal but who develop signs of renal dysfunction during therapy. Monitor peak and trough drug blood levels periodically during therapy; avoid levels above 12 mcg. Rising trough levels (above 2 mcg) may indicate tissue accumulation. Such accumulation, excessive peak levels, advanced age, and cumulative dose may contribute to ototoxicity and nephrotoxicity. Examine urine for decreased specific gravity and increased protein, cells, and casts. Measure blood urea nitrogen (BUN), serum creatinine, and creatinine

clearance periodically. When feasible, obtain serial audiograms. Evidence of impairment of renal, vestibular, or auditory function warrants drug withdrawal or dosage adjustment.

- Avoid concurrent or sequential use of other neurotoxic or nephrotoxic antibiotics, especially other aminoglycosides (such as amikacin, gentamicin, kanamycin, neomycin, and streptomycin), cephaloridine, cisplatin, colistin, polymyxin B, vancomycin, and viomycin. Advanced age and dehydration also increase risk.
- Don't give concurrently with potent diuretics (such as furosemide and ethacrynic acid), because these drugs are also ototoxic. Also, I.V. diuretics may increase tobramycin toxicity by altering antibiotic serum and tissue levels.
- Use drug cautiously in premature infants and neonates.
- Drug may harm fetus when given to pregnant women.

### Action

Interferes with protein synthesis in bacterial cell by binding to 30S ribosomal subunit

### Availability

*Injection:* 10 mg/ml, 40 mg/ml, 1.2-g vial

*Nebulizer solution:* 300 mg/5 ml in 5-ml ampule

*Ophthalmic ointment:* 0.3%

*Ophthalmic solution:* 0.3%

*Pediatric solution for injection:* 20 mg/2 ml

*Premixed I.V. solution:* 60 mg in 50 ml normal saline, 80 mg in 100 ml normal saline

### Indications and dosages

➤ Serious infections caused by susceptible organisms

**Adults:** 3 mg/kg/day I.V. or I.M. in evenly divided doses q 8 hours. For life-threatening infections, may increase up to 5 mg/kg/day I.V. or I.M. in three or

four evenly divided doses, then reduce to 3 mg/kg/day as soon as possible.

**Children older than 1 week:** 6 to 7.5 mg/kg/day in three or four evenly divided doses, such as 2 to 2.5 mg/kg I.V. or I.M. q 8 hours or 1.5 to 1.9 mg/kg I.V. or I.M. q 6 hours

**Neonates less than 1 week old:** Up to 4 mg/kg/day I.V. or I.M. in evenly divided doses q 12 hours

➤ *Pseudomonas aeruginosa* in cystic fibrosis patients

**Adults and children older than age 6:** 300 mg inhalation b.i.d. (preferably q 12 hours but no less than 6 hours apart) for 28 days, then off for 28 days; then repeat cycle

➤ Ocular infections caused by susceptible organisms

**Adults and children:** For mild to moderate infections, apply a ribbon of ophthalmic ointment (approximately 1 cm) to infected eye two or three times daily, or instill one to two drops of ophthalmic solution into infected eye q 4 hours. For severe infections, apply ophthalmic ointment q 3 to 4 hours or instill two drops of ophthalmic solution into infected eye q 30 to 60 minutes; decrease dosing frequency when improvement occurs. Therapy should continue for at least 48 hours after infection is under control.

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to drug, other aminoglycosides, bisulfites (with some products), or benzyl alcohol (in neonates, with some products)

### Precautions

Use cautiously in:

- renal or hearing impairment, neuromuscular diseases, obesity
- elderly patients
- pregnant or breastfeeding patients
- neonates and premature infants.

## Administration

- Know that premixed I.V. solution is ready to use and requires no further dilution. Don't mix with other drugs.
- 🔊 Don't use flexible container in series connections because of risk of air embolism.
- Dilute I.V. dose from vials in 50 to 100 ml of normal saline solution or dextrose 5% in water. For child, smaller volumes are needed.
- Infuse over at least 30 minutes. Flush line after administration.
- Give cephalosporins or penicillin, if ordered, 1 hour before or after tobramycin.
- Give inhalation doses by nebulizer over 10 to 15 minutes.

Route	Onset	Peak	Duration
I.V.	Rapid	15-30 min	Unknown
I.M.	Rapid	30-90 min	Unknown
Inhalation, ophthalmic	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** confusion, lethargy, headache, delirium, dizziness, vertigo

**EENT:** eye stinging (with ophthalmic form), ototoxicity, hearing loss, roaring in ears, tinnitus

**GI:** nausea, vomiting, diarrhea, stomatitis

**GU:** proteinuria, oliguria, nephrotoxicity

**Hematologic:** anemia, eosinophilia, leukocytosis, leukopenia, thrombocytopenia, granulocytopenia

**Metabolic:** hypocalcemia, hyponatremia, hypokalemia, hypomagnesemia

**Musculoskeletal:** muscle weakness

**Respiratory:** apnea

**Skin:** rash, urticaria, itching

**Other:** superinfection, fever, pain and irritation at injection site

## Interactions

**Drug-drug.** *Cephalosporins, vancomycin:* increased risk of nephrotoxicity

*Dimenhydrinate:* masking of ototoxicity symptoms

*General anesthetics, neuromuscular*

*blockers:* increased neuromuscular

blockade and respiratory depression

*Indomethacin:* increased tobramycin

trough and peak levels

*Loop diuretics:* increased risk of ototoxicity

*Penicillins:* physical incompatibility, tobramycin inactivation when mixed in same I.V. solution

*Polypeptide anti-infectives:* increased risk of respiratory paralysis and renal dysfunction

**Drug-diagnostic tests.** *Alanine amino-*

*transferase, aspartate aminotransferase,*

*bilirubin, BUN, creatinine, lactate*

*dehydrogenase, nonprotein nitrogen,*

*urine protein:* increased levels

*Calcium, granulocytes, hemoglobin,*

*magnesium, platelets, potassium,*

*sodium, white blood cells:* decreased

levels

## Patient monitoring

- Draw sample for peak drug level 1 hour after I.M. or 30 minutes after I.V. administration. Draw sample for trough level just before next dose.
- Assess liver and kidney function tests.
- Monitor CBC with white cell differential.
- Closely monitor patient's hearing.

## Patient teaching

🔊 Tell patient drug may cause hearing impairment and other serious adverse reactions, such as unusual bleeding or bruising. Instruct him to report these reactions at once.

- Advise patient to report new signs or symptoms of infection.

- With inhalation form, teach patient how to use nebulizer. Instruct him to administer dose over 10 to 15 minutes by breathing normally through mouthpiece while sitting or standing. Remind him to use only the hand-held nebulizer and compressor originally

dispensed with drug. Advise him to use a nose clip to help him breathe through his mouth. If he uses other inhaled drugs, instruct him to take tobramycin last.

- Teach patient proper use of eye drops. Caution him not to touch dropper to eye or any other surface.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## tocilizumab

Actemra

**Pharmacologic class:** Interleukin-6 (IL-6) receptor inhibitor

**Therapeutic class:** Immunomodulator

**Pregnancy risk category C**

### FDA BOXED WARNING

- Serious infections leading to hospitalization or death, including tuberculosis (TB) and bacterial, invasive fungal, viral, and other opportunistic infections, have occurred in patients receiving tocilizumab.
- If a serious infection develops, interrupt therapy until infection is controlled.
- Perform test for latent TB; if positive, start treatment for TB before starting tocilizumab.
- Monitor all patients for active TB during treatment, even if initial latent TB test is negative.

### Action

Binds specifically to both soluble and membrane-bound IL-6 receptors (sIL-6R and mIL-6R), and has been shown to inhibit IL-6–mediated signaling through these receptors; decreases

levels of C-reactive protein to within normal range; decreases rheumatoid factor, erythrocyte sedimentation rate, serum amyloid A; increases hemoglobin

### Availability

*Solution for injection, concentrate:* 80 mg/4 ml, 200 mg/10 ml, 400 mg/20 ml (20 mg/ml) in single-use vials

### Indications and dosages

➤ Moderate to severe active rheumatoid arthritis in patients who have had inadequate response to one or more tumor necrosis factor (TNF) antagonists

**Adults:** Initially (when used in combination with disease-modifying antirheumatic drugs [DMARDs] or as monotherapy), 4 mg/kg by I.V. infusion over 60 minutes q 4 weeks; may increase to 8 mg/kg by I.V. infusion over 60 minutes q 4 weeks based on clinical response. Maximum dosage, 800 mg/infusion.

➤ Active systemic juvenile idiopathic arthritis (SJIA)

**Children age 2 and older weighing 30 kg (66 lb) or more:** 8 mg/kg (alone or with methotrexate) by I.V. infusion over 60 minutes q 2 weeks

**Children age 2 and older weighing less than 30 kg:** 12 mg/kg (alone or with methotrexate) by I.V. infusion over 60 minutes q 2 weeks

### Dosage adjustment

- Elevated liver enzyme levels
- Neutropenia, thrombocytopenia

### Contraindications

- Hypersensitivity to drug

### Precautions

Use cautiously in:

- active hepatic disease or hepatic impairment (use not recommended)
- absolute neutrophil count less than 2,000/mm<sup>3</sup>, platelet count less than

100,000/mm<sup>3</sup>, ALT or AST more than 1.5 times the upper limit of normal (use not recommended)

- patients who may be at increased risk for GI perforation (such as patients with diverticulitis)
- patients at risk for infection
- demyelinating disorders (such as multiple sclerosis and chronic inflammatory demyelinating polyneuropathy)
- active infection (don't use)
- concurrent use of biological DMARDs such as TNF antagonists, IL-1R antagonists, anti-CD20 monoclonal antibodies, selective co-stimulation modulators, and live vaccines (avoid use)
- concurrent use of CYP3A4 substrates when decrease in effectiveness is undesirable (such as oral contraceptives, lovastatin, atorvastatin)
- concurrent use of immunosuppressants and corticosteroids
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 2 and for conditions other than SJIA (safety and efficacy not established).

### Administration

- ⚠ Be aware that drug should only be administered by healthcare professional with appropriate medical support to manage anaphylaxis. If anaphylaxis or other clinically significant hypersensitivity reaction occurs, stop drug immediately and permanently.
- Evaluate patient for TB risk factors; test for latent infection before starting therapy.
- Consider risks and benefits of treatment before starting therapy in patients with chronic or recurrent infection, in those who have been exposed to TB, in those with history of serious or opportunistic infection, in those who have resided or traveled in areas of endemic TB or endemic mycoses, and in those with underlying

conditions that may predispose to infection.

- For adults and SJIA patients who weigh 30 kg or more, dilute concentrated solution to 100 ml in 0.9% sodium chloride for I.V. infusion using 100-ml infusion bag.
- For SJIA patients weighing less than 30 kg, dilute to 50 ml in 0.9% sodium chloride for I.V. infusion using 50-ml infusion bag.
- Withdraw a volume of 0.9% sodium chloride injection from infusion bag or bottle equal to volume of drug required for dose.
- Slowly add drug for I.V. infusion from each vial into infusion bag. Gently invert bag to avoid foaming to mix solution. Allow fully diluted solution to reach room temperature before infusing. Don't mix or infuse with other drugs. Discard unused product.
- ⚠ Administer as single I.V. drip infusion over 1 hour; don't administer as bolus or push.
- Interrupt therapy if patient develops serious infection, opportunistic infection, or sepsis until infection has been controlled.
- ⚠ Be aware that interruption or discontinuation of drug may be needed for management of dose-related laboratory abnormalities, including elevated liver enzyme levels, neutropenia, and thrombocytopenia. If appropriate, concomitant methotrexate or other drugs should be dose-modified or stopped.
- On initiation or discontinuation of tocilizumab in patients being treated with CYP450 substrates with narrow therapeutic indices, monitor therapeutic effect of drugs such as warfarin or drug concentration of drugs such as cyclosporine or theophylline.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** headache, dizziness

**CV:** hypertension

**EENT:** nasopharyngitis

**GI:** gastroenteritis, diverticulitis, mouth ulcerations, upper abdominal pain, gastritis, **GI perforation**

**GU:** urinary tract infection

**Hematologic:** neutropenia, decreased platelets

**Hepatic:** abnormal liver function test results, increased lipids

**Musculoskeletal:** bacterial arthritis

**Respiratory:** upper respiratory tract infection, pneumonia, bronchitis

**Skin:** cellulitis, rash

**Other:** herpes zoster exacerbation, **other serious and opportunistic infections, sepsis, malignancies, infusion reactions, hypersensitivity reactions including anaphylaxis**

## Interactions

**Drug-drug.** *CYP450 substrates with narrow therapeutic indices (such as cyclosporine, theophylline, warfarin):* increased metabolism of these drugs  
*Omeprazole, simvastatin:* decreased exposure of these drugs

**Drug-diagnostic tests.** *ALT, AST, HDL, LDL, total cholesterol, triglycerides:* increased levels

*Neutrophils, platelets:* decreased counts

## Patient monitoring

- Monitor CBC with differential, particularly neutrophils and platelets, and hepatic function tests, particularly ALT and AST, every 4 to 8 weeks. Monitor ALT, AST, neutrophils, and platelets every 2 to 4 weeks in children with SJIA. Monitor lipid levels approximately 4 to 8 weeks after initiation of therapy, then at approximately 24-week intervals in adults and children.
- ⚠️ Continue to closely watch for signs and symptoms of hypersensitivity, demyelinating disorders, serious infection, and sepsis.

- Be aware that patients who develop new infection during treatment should undergo prompt and complete diagnostic workup appropriate for immunocompromised patients, receive appropriate antimicrobial therapy, and undergo close monitoring.

- Continue to closely monitor patients for signs and symptoms of TB, including patients who tested negative for latent TB before start of therapy.

⚠️ Monitor patients who may be at increased risk for GI perforation. Promptly evaluate for early identification of GI perforation in patients who present with new-onset abdominal signs and symptoms.

- ⚠️ Be aware that treatment with immunosuppressants may increase risk of malignancies.

## Patient teaching

- Instruct patient or caregiver about importance of telling prescriber about known infections before starting drug.
- Tell patient or caregiver that TB test will be done before start of therapy and tests for blood counts and liver function will be done frequently.
- ⚠️ Instruct patient to immediately seek medical attention if hives, rash, throat swelling, or difficulty breathing occurs.
- ⚠️ Instruct patient or caregiver of importance of immediately contacting prescriber if severe, persistent abdominal pain; change in bowel habits; infection (fever, chills, cough, or burning on urination); or other new signs and symptoms occur.
- Instruct patient or caregiver that patient shouldn't receive live vaccines during therapy.
- Advise female patient of childbearing age to inform prescriber if she becomes pregnant during therapy.
- Advise breastfeeding patient that she should decide whether to discontinue breastfeeding or discontinue drug, taking into account importance of drug for her treatment.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## tolcapone

Tasmar

**Pharmacologic class:** Catecholamine inhibitor

**Therapeutic class:** Antiparkinsonian

**Pregnancy risk category C**

### FDA BOXED WARNING

- Before prescribing or administering drug, make sure you're thoroughly familiar with prescribing information.
- Don't administer until prescriber has discussed risks with patient and patient has provided written acknowledgment that risks have been explained.
- Due to risk of hepatocellular injury (including potentially fatal, acute fulminant liver failure), drug ordinarily should be used in patients with Parkinson's disease who are receiving L-dopa/carbidopa, experiencing symptom fluctuations, and not responding satisfactorily to or not appropriate candidates for other adjunctive therapies. Withdraw therapy if patient doesn't show substantial benefit within 3 weeks of starting drug.
- Don't initiate therapy if patient has clinical evidence of hepatic disease. Don't restart therapy if patient developed hepatocellular injury while receiving drug and was withdrawn from therapy for any reason.
- Before and during therapy, obtain appropriate tests to exclude liver disease. Discontinue drug if alanine aminotransferase (ALT) or aspartate

aminotransferase (AST) levels exceed two times the upper limit of normal or if clinical signs and symptoms suggest onset of hepatic dysfunction.

### Action

Unknown. When given with levodopa-carbidopa, thought to reversibly inhibit catechol *O*-methyltransferase, leading to increased levodopa bioavailability and stimulation in brain.

### Availability

Tablets: 100 mg, 200 mg

### Indications and dosages

➤ Adjunct to levodopa-carbidopa in idiopathic Parkinson's disease

**Adults:** Initially, 100 mg P.O. t.i.d. given with levodopa-carbidopa. If beneficial, may increase dosage to 200 mg P.O. t.i.d.; maximum dosage is 600 mg daily. If response inadequate after 3 weeks, stop therapy.

### Contraindications

- Hypersensitivity to drug
- Nontraumatic rhabdomyolysis
- Drug-related hyperpyrexia or confusion
- Hepatic disease, alanine aminotransferase or aspartate aminotransferase elevation
- History of tolcapone-induced hepatocellular injury

### Precautions

Use cautiously in:

- renal or cardiac disease, hypertension, asthma
- concurrent use of nonselective MAO inhibitor (such as phenelzine, tranylcypromine)
- pregnant or breastfeeding patients.

### Administration

📣 Before giving first dose, obtain patient's written informed consent for drug therapy.

- Check liver function tests before starting drug.
- 🚫 Don't stop drug abruptly, because this may cause a syndrome similar to neuroleptic malignant syndrome.
- Know that levodopa-carbidopa dosage may be decreased to minimize dyskinesia.

Route	Onset	Peak	Duration
P.O.	Unknown	2 hr	Unknown

### Adverse reactions

**CNS:** dizziness, asthenia, headache, fatigue, hypokinesia, mental deficiency, agitation, tremor, hyperactivity, paresthesia, irritability, syncope, depression, speech disorder, confusion, sleep disorder, excessive dreaming, hallucinations, drowsiness, hypertension, imbalance, falling, hyperkinesias, dystonia, dyskinesia

**CV:** hypotension, chest discomfort or pain, orthostatic hypotension, palpitations

**EENT:** tinnitus, sinus congestion, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, abdominal pain, flatulence, dry mouth, anorexia

**GU:** hematuria, urinary tract infection (UTI), urinary incontinence, urine discoloration, urinary disorder, erectile dysfunction

**Hepatic:** jaundice, **severe hepatocellular injury (including fulminant hepatic failure, death)**

**Musculoskeletal:** neck pain, arthritis, muscle cramps, stiffness, **rhabdomyolysis**

**Respiratory:** upper respiratory infection, dyspnea, bronchitis

**Skin:** rash, dermal bleeding, diaphoresis

**Other:** fever, influenza

### Interactions

**Drug-drug.** *Desipramine:* increased risk of adverse tolcapone reactions

*Nonselective MAO inhibitors (such as phenelzine, tranylcypromine):* inhibition of principal pathways of tolcapone metabolism

*Warfarin:* increased warfarin blood level  
**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase:* increased levels

### Patient monitoring

- Monitor parkinsonian symptoms during first 3 weeks of therapy. Report improvement (or lack thereof) to help determine if therapy should continue.
- Assess neurologic status closely.
- 🚫 Monitor liver function tests. Watch closely for signs and symptoms of hepatic impairment.
- Closely monitor temperature. Stay alert for fever and other indications of infection (particularly upper respiratory infection, influenza, and UTI).

### Patient teaching

- Tell patient to take drug with first levodopa-carbidopa dose of day.
- 🚫 Advise patient to immediately report signs or symptoms of liver problems (persistent nausea, fatigue, appetite loss, dark urine, itching, tenderness on right side of abdomen, and yellowing of skin or eyes).
- Instruct patient to promptly report signs and symptoms of infection.
- 🚫 Advise female patient to immediately report suspected pregnancy. Caution her not to breastfeed.
- Tell patient drug may cause involuntary movements, hallucinations, lightheadedness, and other significant reactions. Urge him to use safety measures as needed.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Advise patient to move slowly when sitting up or standing, to avoid dizziness from sudden blood pressure decrease.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## tolterodine

Detrol, Detrol LA, Detrusitol<sup>⚡</sup>, Detrusitol XL<sup>⚡</sup>

**Pharmacologic class:** Anticholinergic

**Therapeutic class:** Urinary tract antispasmodic

**Pregnancy risk category C**

### Action

Competitively antagonizes muscarinic receptors, inhibiting bladder contractions and reducing urinary frequency

### Availability

*Capsules (extended-release):* 2 mg, 4 mg  
*Tablets:* 1 mg, 2 mg

### Indications and dosages

➤ Overactive bladder

**Adults:** 2 mg (immediate-release) P.O. b.i.d.; may decrease to 1 mg P.O. b.i.d. depending on response and tolerance. Or 4 mg (extended-release) P.O. daily; may decrease to 2 mg P.O. daily, depending on response.

### Dosage adjustment

- Hepatic impairment or disease
- Renal impairment
- Concurrent use of potent CYP3A4 inhibitors

### Contraindications

- Hypersensitivity to drug, its components, or to fesoterodine fumarate extended-release tablets
- Urinary or gastric retention
- Uncontrolled angle-closure glaucoma

### Precautions

Use cautiously in:

- GI obstruction, significant bladder outflow obstruction, controlled angle-closure glaucoma, significant hepatic impairment, renal impairment
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Give with food to increase bioavailability.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	12 hr

### Adverse reactions

**CNS:** headache, dizziness, vertigo, drowsiness, paresthesia, fatigue

**CV:** chest pain

**EENT:** vision abnormalities, xerophthalmia, pharyngitis

**GI:** diarrhea, constipation, abdominal pain, dyspepsia, dry mouth

**GU:** dysuria, urinary retention or frequency, urinary tract infection

**Musculoskeletal:** joint pain

**Skin:** dry skin

**Other:** weight gain, flulike symptoms, infection, **anaphylaxis, angioedema**

### Interactions

**Drug-drug.** *Clarithromycin, erythromycin, itraconazole, ketoconazole, miconazole:* inhibited metabolism and increased effects of tolterodine

**Drug-food.** *Any food:* increased drug bioavailability

### Patient monitoring

🚨 Monitor patient for anaphylaxis and angioedema with first or subsequent doses. If difficulty breathing, upper airway obstruction, or fall in blood pressure occurs, discontinue drug and promptly provide appropriate treatment.

🚨 Monitor patient for signs and symptoms of anticholinergic CNS effects, particularly after beginning

treatment or increasing dosage. Consider dosage reduction or drug discontinuation if symptoms occur.

- Monitor bladder function.
- Assess blood pressure and stay alert for chest pain.
- Monitor neurologic status. Report paresthesia or visual impairment.

### Patient teaching

- Tell patient to take with food.
- If patient takes extended-release form, instruct him not to chew or crush it.
-  Instruct patient how to recognize and immediately report signs and symptoms of anaphylaxis or angioedema.
- Caution patient not to drive or operate heavy machinery until drug's effects are known.
- Advise patient to use sugarless gum or hard candy to relieve dry mouth.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and foods mentioned above.

## topiramate

Apo-Topiramate<sup>✳</sup>, Co-Topiramate<sup>✳</sup>, Dom-Topiramate<sup>✳</sup>, Gen-Topiramate<sup>✳</sup>, Novo-Topiramate<sup>✳</sup>, PHL-Topiramate<sup>✳</sup>, PMS-Topiramate<sup>✳</sup>, Ratio-Topiramate<sup>✳</sup>, Sandoz-Topiramate<sup>✳</sup>, Topamax

**Pharmacologic class:** Sulfamate-substituted monosaccharide derivative

**Therapeutic class:** Anticonvulsant

**Pregnancy risk category C**

### Action

Blocks sodium channels, enhancing the action of gamma-amino butyrate (a neurotransmitter); also inhibits amino acid excitatory receptors

### Availability

*Sprinkle capsules:* 15 mg, 25 mg

*Tablets:* 25 mg, 50 mg, 100 mg, 200 mg

### Indications and dosages

➤ Adjunct in partial-onset seizures, primary generalized tonic-clonic seizures, and seizures associated with Lennox-Gastaut syndrome

#### Adults and children older than age 17:

Initially, 25 to 50 mg P.O. daily. To achieve adequate response, may increase by 25 to 50 mg weekly, up to 200 mg b.i.d.

#### Children ages 2 to 16:

Initially, up to 25 mg P.O. daily; increase at 1- or 2-week intervals in increments of 1 to 3 mg/kg/day given in two divided doses to achieve adequate response.

➤ Migraine prophylaxis

**Adults:** Dosage titrated to 100 mg P.O. daily as follows: 25 mg/day during week 1, 25 mg b.i.d. during week 2, 25 mg in morning and 50 mg in evening during week 3, and 50 mg b.i.d. during week 4

➤ **Monotherapy for epilepsy**

#### Adults and children ages 10 and older:

Initially, 50 mg P.O. daily in two divided dosages. Increase dosage weekly by increments of 50 mg for first 4 weeks, then 100 mg for weeks 5 and 6. Maximum dosage is 400 mg/day in two divided doses.

#### Children ages 2 to younger than 10:

Initially, 25 mg/day P.O. nightly for first week. Titrate dosage over 5 to 7 weeks, with total maximum daily dosage based on weight.

### Dosage adjustment

- Renal impairment

### Off-label uses

- Cluster headaches
- Infantile spasms
- Mood stabilization

### Contraindications

None

## Precautions

Use cautiously in:

- renal or hepatic impairment, dehydration, urolithiasis, glaucoma, myopia, patients at increased risk for hyperammonemia (such as those with inborn errors of metabolism or reduced mitochondrial activity)
- concurrent use of other carbonic anhydrase inhibitors, other drugs causing metabolic acidosis, or patients on ketogenic diet (avoid use)
- concurrent use of other drugs that predispose patients to heat-related disorders (such as carbonic anhydrase inhibitors, drugs with anticholinergic activity)
- pregnant or breastfeeding patients.
- children younger than age 2 (safety and efficacy not established).

## Administration

- Give without regard to meals.
- Don't break tablets, because of bitter taste.
- Administer capsules either whole or by opening capsule carefully and sprinkling entire contents into small amount of soft food. Instruct patient to swallow mixture immediately without chewing sprinkles.

 Don't stop therapy suddenly. Dosage must be tapered.

Route	Onset	Peak	Duration
P.O.	Unknown	2 hr	12 hr

## Adverse reactions

**CNS:** dizziness, drowsiness, fatigue, malaise, poor memory and concentration, nervousness, psychomotor slowing, speech and language problems, aggressive reaction, agitation, anxiety, confusion, depression, irritability, ataxia, paresthesia, hyperesthesia, tremor, **suicide attempt, increased seizures**

**EENT:** abnormal vision, diplopia, nystagmus, acute myopia, secondary

angle-closure glaucoma, decreased hearing, rhinitis, sinusitis, epistaxis, pharyngitis

**GI:** nausea, constipation, abdominal pain, dry mouth, gastroenteritis, increased salivation (in children), anorexia

**GU:** renal calculi, urinary incontinence, leukorrhea

**Hematologic:** purpura, **leukopenia, thrombocytopenia**

**Metabolic:** hypocalcemia, hyperchloremia, hyponatremia, hyponatremia, hypophosphatemia, **hyperammonemia, metabolic acidosis, hypoglycemia**

**Musculoskeletal:** myalgia, back pain, leg pain

**Respiratory:** pneumonia

**Skin:** rash, skin disorder, alopecia, dermatitis, hypertrichosis, eczema, seborrhea, skin discoloration

**Other:** altered taste, weight loss, thirst, fever, flulike symptoms, hot flashes, infection, edema, hypothermia (when used in conjunction with valproic acid), hyperthermia, decreased sweating, allergic reaction

## Interactions

**Drug-drug.** *Carbamazepine:* decreased topiramate blood level and effects  
*Carbonic anhydrase inhibitors (such as acetazolamide):* increased risk of renal calculi

*CNS depressants:* increased risk of CNS depression and other adverse cognitive or neuropsychiatric reactions

*Hormonal contraceptives:* decreased contraceptive efficacy

*Phenytoin:* increased phenytoin blood level and effects, decreased topiramate blood level and effects

*Valproic acid:* decreased effects of both drugs

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, ammonia, aspartate aminotransferase, creatinine:* increased levels  
*Calcium, cholesterol, glucose, phosphate:* decreased levels

*Sodium*: increased or decreased level

**Drug-behaviors.** *Alcohol use*: increased  
CNS depression

### Patient monitoring

🔊 Monitor seizure type and pattern.  
Report new seizure types or worsening seizure pattern.

- Assess neurologic status closely.

Report significant adverse reactions.

🔊 Watch for and immediately report signs and symptoms of depression or suicidal ideation.

- Monitor fluid intake and output. Report indications of urinary tract infection, urinary incontinence, or renal calculi.

🔊 Monitor vision. If patient becomes acutely nearsighted with symptoms of angle-closure glaucoma (cloudy vision, eye pain), stop drug and contact prescriber right away.

🔊 Monitor patient for hyperammonemia and encephalopathy with or without concomitant valproic acid use; measure ammonia level if encephalopathic symptoms occur.

🔊 Monitor patient for metabolic acidosis; obtain baseline and periodic measurements of serum bicarbonate.

Consider dosage reduction or drug discontinuation if clinically appropriate.

### Patient teaching

- Tell patient he may take with or without food.

- Caution patient not to crush or break tablets.

• If patient takes capsules, tell him he may open them, sprinkle contents onto small amount of soft food, and consume immediately. Tell him not to store this mixture.

🔊 Caution patient not to stop drug suddenly. Dosage must be tapered.

- Instruct patient to drink plenty of fluids to reduce risk of kidney stones.

🔊 Tell patient drug may cause new seizure types or worsen seizure pattern.

Instruct him to report these developments immediately.

🔊 Instruct patient (and significant other as appropriate) to immediately report signs or symptoms of depression or suicidal thoughts.

🔊 Instruct patient how to recognize and immediately report signs and symptoms of hyperammonemia and metabolic acidosis.

🔊 Advise patient to immediately report vision changes, especially nearsightedness, cloudy vision, or eye pain.

- Caution patient not to drive or perform other hazardous activities.
- Tell patient not to drink alcohol during drug therapy.
- Advise female patient to notify prescriber of suspected pregnancy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## topotecan hydrochloride

Hycamtin

**Pharmacologic class:** DNA topoisomerase inhibitor

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

• Give under supervision of physician experienced in cancer chemotherapy, in facility with adequate diagnostic and treatment resources.

• Don't administer to patients with baseline neutrophil counts below 1,500 cells/mm<sup>3</sup>. Obtain frequent peripheral blood cell counts on all patients to monitor for bone marrow depression.

**Action**

Regulates DNA replication and repair of broken DNA strands, relieving torsional strain; exerts cytotoxic effects during DNA synthesis

**Availability**

*Capsules:* 0.25 mg, 1 mg

*Injection:* 4 mg in 4-ml single-dose vials

*Injection (powder for solution):* 4 mg in single-dose vials

**Indications and dosages**

➤ Metastatic ovarian cancer or small-cell lung cancer after first-line chemotherapy fails

**Adults:** 1.5 mg/m<sup>2</sup> daily by I.V. infusion given over 30 minutes for 5 consecutive days, starting on day 1 of 21-day cycle

➤ Relapsed small-cell lung cancer

**Adults:** 2.3 mg/m<sup>2</sup> P.O. daily for 5 consecutive days; repeat every 21 days

➤ Stage IV-B, recurrent, or persistent cervical carcinoma not amenable to curative treatment with surgery or radiation therapy (in combination with cisplatin)

**Adults:** 0.75 mg/m<sup>2</sup> I.V. daily over 30 minutes on days 1, 2, and 3; followed by cisplatin 50 mg/m<sup>2</sup> by I.V. infusion on day 1, repeated every 21 days

**Dosage adjustment**

- Renal impairment
- Neutropenia
- Grade 3 or 4 diarrhea (capsules)

**Contraindications**

- History of severe hypersensitivity to drug or its components
- Severe bone marrow depression

**Precautions**

Use cautiously in:

- pregnant or breastfeeding patients
- children (safety and efficacy not established).

**Administration**

⚠ Before starting therapy, check blood counts. Patient must have baseline neutrophil count above 1,500 cells/mm<sup>3</sup> and platelet count above 100,000 cells/mm<sup>3</sup> to receive drug.

⚠ Prepare drug under vertical laminar-flow hood, wearing gloves and protective clothing. Follow facility policy for discarding used drug containers and I.V. equipment.

- If skin contacts drug, wash immediately with soap and water.
- To reconstitute, add 4 ml of sterile water to 4-mg vial. Dilute further in normal saline solution or dextrose 5% in water. Give immediately over 30 minutes using infusion pump.
- Round calculated oral daily dose to nearest 0.25 mg, and administer minimum number of 1-mg and 0.25-mg capsules. Know that the same number of capsules should be prescribed for each of the 5 dosing days.

Route	Onset	Peak	Duration
P.O.	Rapid	1-2 hr	Unknown
I.V.	Unknown	Unknown	Unknown

**Adverse reactions**

**CNS:** asthenia, fatigue, paresthesia

**GI:** nausea, diarrhea, constipation, abdominal pain, stomatitis, anorexia, severe diarrhea, neutropenic colitis

**Hematologic:** anemia, leukopenia, thrombocytopenia, neutropenia

**Musculoskeletal:** back pain, skeletal pain  
**Respiratory:** coughing, dyspnea, interstitial lung disease

**Skin:** erythematous or maculopapular rash, pruritus, urticaria, dermatitis, bullous eruption, alopecia

**Other:** fever, body pain, sepsis

**Interactions**

**Drug-drug.** *Cisplatin:* severe bone marrow depression

*Granulocyte colony-stimulating factor:* prolonged neutropenia

*Live-virus vaccines*: increased risk of infection from vaccine

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, bilirubin*: increased levels

### Patient monitoring

- Closely monitor CBC with white cell differential.

- ▶ Assess for signs and symptoms of bleeding tendency, severe diarrhea (with capsule use), and neutropenic colitis (fever, neutropenia, and compatible pattern of abdominal pain).

- ▶ Monitor patient for signs and symptoms of interstitial lung disease (cough, fever, dyspnea, or hypoxia); discontinue drug if diagnosis is confirmed.

- Monitor closely for sepsis, other infections, and increased hepatic enzyme levels.

### Patient teaching

- Tell patient to take capsules whole with or without food and not to break, divide, chew, or crush them.

- ▶ Advise patient to immediately report unusual bleeding or bruising, diarrhea, abdominal pain, cough, difficulty breathing, sore throat, fever, or chills.

- Teach patient safety measures to avoid bruising and bleeding.

- Tell patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.

- ▶ Advise female patient to notify prescriber of suspected pregnancy. Caution her not to breastfeed during therapy.

- Inform patient that drug may cause hair loss.

- Tell patient he'll undergo regular blood testing during therapy.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## torsemide (torasemide<sup>Ⓢ</sup>)

Demadex, Torem<sup>Ⓢ</sup>

**Pharmacologic class:** Loop diuretic

**Therapeutic class:** Diuretic, antihypertensive

**Pregnancy risk category B**

### Action

Inhibits sodium and chloride reabsorption from ascending loop of Henle and distal renal tubule; increases renal excretion of water, sodium, chloride, magnesium, calcium, and hydrogen. Also may exert renal and peripheral vasodilatory effects. Net effect is natriuretic diuresis.

### Availability

*Injection:* 10 mg/ml

*Tablets:* 5 mg, 10 mg, 20 mg, 100 mg

### Indications and dosages

- ▶ Heart failure

**Adults:** 10 to 20 mg P.O. or I.V. daily. If response inadequate, double dosage until desired response occurs. Don't exceed 200 mg as a single dose.

- ▶ Hypertension

**Adults:** 5 mg P.O. daily. May increase to 10 mg daily after 4 to 6 weeks; if drug still isn't effective, additional antihypertensives may be prescribed.

- ▶ Chronic renal failure

**Adults:** 20 mg P.O. or I.V. daily. If response inadequate, double dosage until desired response occurs. Don't exceed 200 mg as a single dose.

- ▶ Hepatic cirrhosis

**Adults:** 5 or 10 mg P.O. or I.V. daily, given with aldosterone antagonist or potassium-sparing diuretic. If response inadequate, double dosage. Don't exceed 40 mg as a single dose.

**Contraindications**

- Hypersensitivity to drug, thiazides, or sulfonyleureas
- Anuria

**Precautions**

Use cautiously in:

- severe hepatic disease accompanied by cirrhosis or ascites, preexisting uncorrected electrolyte imbalances, diabetes mellitus, worsening azotemia
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 18.

**Administration**

- Give I.V. by direct injection over at least 2 minutes or by continuous I.V. infusion.
- Flush I.V. line with normal saline solution before and after administering.

Route	Onset	Peak	Duration
P.O.	Within 1 hr	1-2 hr	6-8 hr
I.V.	Within 10 min	Within 1 hr	6-8 hr

**Adverse reactions**

**CNS:** dizziness, headache, asthenia, insomnia, nervousness, syncope

**CV:** hypotension, ECG changes, chest pain, volume depletion, **atrial fibrillation, ventricular tachycardia, shunt thrombosis**

**EENT:** rhinitis, sore throat

**GI:** nausea, diarrhea, vomiting, constipation, dyspepsia, anorexia, rectal bleeding, **GI hemorrhage**

**GU:** excessive urination

**Metabolic:** hyperglycemia, hyperuricemia, hypokalemia

**Musculoskeletal:** joint pain, myalgia

**Respiratory:** increased cough

**Skin:** rash

**Other:** edema

**Interactions**

**Drug-drug.** *Aminoglycosides, cisplatin:* increased risk of ototoxicity

*Amphotericin B, corticosteroids, mezlocillin, piperacillin, potassium-wasting diuretics, stimulant laxatives:* additive hypokalemia

*Antihypertensives, nitrates:* additive hypotension

*Lithium:* increased lithium blood level and toxicity

*Neuromuscular blockers:* prolonged neuromuscular blockade

*Nonsteroidal anti-inflammatory drugs, probenecid:* inhibited diuretic response

*Sulfonyleureas:* decreased glucose tolerance, hyperglycemia in patients with previously well-controlled diabetes

**Drug-diagnostic tests.** *Glucose, uric acid:* increased levels

*Potassium:* decreased level

**Drug-herbs.** *Dandelion:* interference with diuresis

*Ephedra (ma huang):* reduced hypotensive effect of torsemide

*Geranium, ginseng:* increased risk of diuretic resistance

*Licorice:* rapid potassium loss

**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension

**Patient monitoring**

- Monitor vital signs, especially for hypotension.

- Assess ECG for arrhythmias and other changes.

- Monitor weight and fluid intake and output to assess drug efficacy.

- Monitor electrolyte levels, particularly potassium. Stay alert for signs and symptoms of hypokalemia.

- Assess hearing for signs and symptoms of ototoxicity.

- Monitor blood glucose level carefully in diabetic patient.

**Patient teaching**

- Advise patient to take in morning with or without food.

- Instruct patient to move slowly when sitting up or standing, to avoid dizziness from sudden blood pressure drop.

- Tell patient to monitor weight and report sudden increases.
- Instruct diabetic patient to monitor blood glucose level carefully.
- Caution patient to avoid alcohol during drug therapy.
- Advise patient to consult prescriber before using herbs.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## tramadol hydrochloride

ConZip, Dromadol SR<sup>Ⓢ</sup>, Dromadol XL<sup>Ⓢ</sup>, Larapam SR<sup>Ⓢ</sup>, Mabron<sup>Ⓢ</sup>, Nobligan Retard<sup>Ⓢ</sup>, Ralivia<sup>Ⓢ</sup>, Rybix ODT, Ryzolt, Tradorec XL<sup>Ⓢ</sup>, Tramake<sup>Ⓢ</sup>, Tridural<sup>Ⓢ</sup>, Ultram, Ultram ER, Zamadol<sup>Ⓢ</sup>, Zydol<sup>Ⓢ</sup>, Zytram XL<sup>Ⓢ</sup>

**Pharmacologic class:** Opioid agonist

**Therapeutic class:** Analgesic

**Pregnancy risk category** C

### Action

Inhibits reuptake of serotonin and norepinephrine in CNS

### Availability

Tablets: 50 mg

Tablets (extended-release): 100 mg, 200 mg, 300 mg

Tablets (orally disintegrating [ODT]): 50 mg

### Indications and dosages

➤ Moderate to moderately severe pain in patients who require around-the-clock treatment of pain for an extended period

**Adults:** In rapid titration, 50 to 100 mg (immediate-release) P.O. q 4 to 6 hours

p.r.n. (not to exceed 400 mg/day, or 300 mg/day in patients older than age 75). In gradual titration, initially 25 mg (immediate-release) P.O. daily; increase by 25 mg/day q 3 days to 100 mg/day, then increase by 50 mg/day q 3 days, up to 200 mg/day p.r.n. Alternately, 100 mg P.O. (extended-release) up to a maximum of 300 mg daily. Titrate daily doses by 100-mg/day increments q 2 to 3 days (Ryzolt) or q 5 days (ConZip) to achieve a balance between adequate pain control and individual tolerability. Continue with lowest effective dose. Maximum dose is 300 mg/day. For patients on immediate-release product, calculate total 24-hour immediate-release dose and initiate at a dose rounded down to next lower 100-mg increment. Individualize dose according to patient need and tolerance, not to exceed 300 mg daily. Or, in patients not requiring rapid analgesic effect, tolerability can be improved by initiating therapy with a titration regimen. Total daily dose may be increased by 50 mg (ODT tablets) P.O. as tolerated q 3 days to reach 200 mg/day (50 mg q.i.d.). After titration, 50 to 100 mg (ODT tablets) P.O. can be administered as needed for pain relief q 4 to 6 hours, not to exceed 400 mg/day.

### Dosage adjustment

- Renal or hepatic impairment

### Contraindications

- Hypersensitivity to drug, its components, or opioids
- Acute intoxication with alcohol, sedative-hypnotics, centrally acting analgesics, opioid analgesics, or psychotropic agents
- Physical opioid dependence
- Significant respiratory depression, acute or severe bronchial asthma or hypercapnia in unmonitored settings or absence of resuscitative equipment

## Precautions

Use cautiously in:

- seizure disorder or risk factors for seizures, increased intracranial pressure, head trauma, acute abdomen, patients at risk for respiratory depression, patients who use alcohol in excess, patients who suffer from emotional disturbance or depression, patients receiving CNS depressants, other opioids, anesthetics, tranquilizers, or sedative-hypnotics
- mild to severe hepatic impairment, and renal impairment with creatinine clearance less than 30 ml/minute
- history of sensitivity to phenylketones (avoid ODT use)
- history of opioid dependence or recent use of large opioid doses or patients who are suicidal or addiction-prone (use not recommended)
- concurrent use of monoamine oxidase (MAO) inhibitors (use with great caution)
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 16 or 18 (ConZip) (safety not established, use not recommended).

## Administration

- Give as prescribed, preferably before pain becomes severe.

 Be aware that serious and rarely fatal anaphylactoid reactions have occurred, often following first dose.

Route	Onset	Peak	Duration
P.O.	1 hr	2-3 hr	4-6 hr
PO (ER)	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** dizziness, vertigo, headache, drowsiness, anxiety, stimulation, confusion, incoordination, euphoria, nervousness, sleep disorder, asthenia, hypertonia, **seizures, suicide**

**CV:** vasodilation

**EENT:** visual disturbances

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, flatulence, dry mouth, anorexia

**GU:** urinary retention and frequency, proteinuria, menopausal symptoms

**Respiratory:** respiratory depression (with large doses, concomitant anesthetic use, or alcohol ingestion), **bronchospasm**

**Skin:** pruritus, sweating, hives, **angioedema, toxic epidermal necrolysis, Stevens-Johnson syndrome**

**Other:** physical or psychological drug dependence, drug tolerance, **serotonin syndrome, serious and rarely fatal anaphylactoid reactions**

## Interactions

**Drug-drug.** *Anesthetics, antihistamines, CNS depressants, other opioids, psychotropic agents, sedative-hypnotics:* increased risk of CNS depression  
*Carbamazepine:* increased tramadol metabolism and decreased efficacy  
*Serotonergic drugs (including MAO inhibitors, selective norepinephrine reuptake inhibitors, selective serotonin reuptake inhibitors, tricyclic antidepressants, triptans), drugs that impair serotonin metabolism (including MAO inhibitors), drugs that impair tramadol metabolism (such as CYP2D6 and CYP3A4 inhibitors):* increased risk of serotonin syndrome and seizures  
**Drug-diagnostic tests.** *Creatinine, hepatic enzymes:* increased levels  
*Hemoglobin:* decreased level

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

## Patient monitoring

- Assess patient's response to drug 30 minutes after administration.
- Monitor respiratory status. Withhold drug and contact prescriber if respirations become shallow or slower than 12 breaths/minute.

- Monitor for physical and psychological dependence. Report signs to prescriber.

- ☞ Monitor patient for signs and symptoms of potentially life-threatening serotonin syndrome, which may range from shivering and diarrhea to muscle rigidity, fever, and mental-status changes, and seizures.

### Patient teaching

- Tell patient drug works best when taken before pain becomes severe.
- Tell patient to take extended-release tablets with or without food, to swallow them whole at same time each day with a sufficient quantity of liquid, and not to split, chew, dissolve, or crush them.
- Instruct patient to open ODT tablet blister pack and to peel back the foil on the blister; caution patient not to push tablet through foil. Instruct patient to remove a tablet and place it in the mouth, where it will dissolve in seconds and then be swallowed with saliva. Tell patient not to chew, break, or split tablet. Inform patient who has phenylketonuria that ODT tablet contains phenylalanine.
- Inform patient (and significant other as appropriate) that drug may cause respiratory depression if used with alcohol. Recommend abstinence.
- ☞ Instruct patient to immediately report seizure, suicidal behavior, or suicidal ideation.
- ☞ Instruct patient to watch for and immediately report signs and symptoms of serotonin syndrome (shivering and diarrhea, muscle rigidity, fever, and seizures).
- ☞ Tell patient to immediately report sign and symptoms of allergic reaction (such as itching, hives, difficulty breathing, or swelling of face, tongue, or throat).
- Tell patient drug interacts with many common over-the-counter drugs and herbal remedies. Instruct him to

consult prescriber before taking these products.

- Inform patient that drug can cause physical and psychological dependence. Urge him to take it only as prescribed and needed.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Caution patient to avoid alcohol use while taking this drug.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## trandolapril

Goptin<sup>®</sup>, Mavik

**Pharmacologic class:** Angiotensin-converting enzyme (ACE) inhibitor

**Therapeutic class:** Antihypertensive

**Pregnancy risk category** D

### FDA BOXED WARNING

- Drugs that act directly on the renin-angiotensin system can cause injury to or death of a developing fetus. Discontinue drug as soon as possible when pregnancy is detected.

### Action

Inhibits conversion of angiotensin I to the potent vasoconstrictor angiotensin II, promoting vasodilation. Also increases plasma renin and stimulates aldosterone secretion, inducing diuresis.

### Availability

Tablets: 1 mg, 2 mg, 4 mg

## Indications and dosages

### ➤ Hypertension

**Adults:** For patients not receiving diuretics, 1 mg/day P.O. in nonblack patients or 2 mg/day P.O. in black patients. If response inadequate, may increase at weekly intervals up to 4 mg/day. For patients receiving diuretics, start with 0.5 mg/day P.O.

### ➤ Heart failure or left ventricular dysfunction after myocardial infarction

**Adults:** Initially, 1 mg P.O. daily. Titrate up to 4 mg daily, if tolerated.

## Dosage adjustment

- Renal impairment (creatinine clearance less than 30 ml/minute)
- Hepatic cirrhosis

## Contraindications

- Hypersensitivity to drug or other ACE inhibitors
- Hereditary/idiopathic angioedema and angioedema with previous ACE inhibitor use
- Patients with diabetes mellitus taking insulin or oral hypoglycemics

## Precautions

Use cautiously in:

- renal or hepatic impairment, hypovolemia, hyponatremia, aortic stenosis or hypertrophic cardiomyopathy, cerebrovascular or cardiac insufficiency, surgery and anesthesia, risk factors for hyperkalemia (including renal insufficiency, diabetes mellitus, concurrent use of potassium supplements or potassium-containing salt substitutes)
- family history of angioedema
- concurrent diuretic therapy or drugs that cause increased serum potassium level
- black patients with hypertension
- elderly patients
- pregnant patients
- breastfeeding patients (avoid use)
- children (safety not established).

## Administration

- Give once or twice daily as prescribed, with or without food.

Route	Onset	Peak	Duration
P.O.	Within 1 hr	4-10 hr	Up to 24 hr

## Adverse reactions

**CNS:** insomnia, paresthesia, dizziness, drowsiness, asthenia, syncope, **cerebrovascular accident**

**CV:** chest pain, palpitations, intermittent claudication, bradycardia, **first-degree atrioventricular block, cardiogenic shock**

**EENT:** epistaxis, sinusitis, throat inflammation

**GI:** vomiting, diarrhea, constipation, abdominal pain or distention, gastritis, dyspepsia, intestinal angioedema, **pancreatitis**

**GU:** urinary tract infection, erectile dysfunction, decreased libido

**Hematologic:** agranulocytosis, neutropenia

**Hepatic:** syndrome of cholestatic jaundice, fulminant hepatic necrosis, and death (rare)

**Metabolic:** hypocalcemia, gout, increased creatinine, **hyperkalemia**

**Musculoskeletal:** muscle cramps, myalgia, extremity pain

**Respiratory:** cough, dyspnea, upper respiratory infection

**Skin:** rash, flushing, pruritus

**Other:** edema, **angioedema** (face, extremities, lips, tongue, glottis, and larynx)

## Interactions

**Drug-drug.** *Diuretics, general anesthetics, other antihypertensives:* increased risk of hypotension

*Hypoglycemics (insulin, oral agents):* increased risk of blood glucose-lowering effect with greater risk of hypoglycemia

*Lithium:* increased lithium blood level, greater risk of toxicity

*Nonsteroidal anti-inflammatory drugs, including selective cyclooxygenase-2 inhibitors*: increased risk of renal impairment, including acute renal failure in elderly patients, volume-depleted patients, or those with compromised renal function; loss oftrandolapril antihypertensive effect  
*Potassium-sparing diuretics, potassium supplements, salt substitutes containing potassium*: additive hyperkalemia  
*Sodium aurothiomalate (gold)*: increased risk of nitritoid reactions (including facial flushing, nausea, vomiting, and hypotension)

**Drug-diagnostic tests.** *Creatinine, potassium*: increased level  
*Neutrophils, platelets*: decreased counts  
**Drug-food.** *Salt substitutes containing potassium*: hyperkalemia

### Patient monitoring

- Monitor vital signs, especially for hypotension and bradycardia when therapy begins.
- Assess CBC with white cell differential. Watch for signs and symptoms of bleeding and infection.
- Monitor electrolyte levels, especially potassium. Stay alert for hyperkalemia.
- Assess renal function tests and fluid intake and output.
- 📢 Stay alert for signs and symptoms of hypersensitivity reactions (including angioedema). Discontinue drug immediately if laryngeal stridor or angioedema of face, tongue, or glottis occurs, treat appropriately, and closely observe patient until swelling disappears.
- 📢 Be aware that rarely ACE inhibitors have been associated with a syndrome of cholestatic jaundice, fulminant hepatic necrosis, and death. If patient develops jaundice, discontinue drug and provide appropriate follow-up care.

### Patient teaching

- Tell patient drug may cause bleeding tendency or increase his infection risk. Teach him which warning signs to report.
- 📢 Teach patient to recognize and report signs or symptoms of hyperkalemia, infection, angioedema (including intestinal angioedema that may present as abdominal pain with or without nausea), and syndrome of cholestatic jaundice.
- Instruct patient to move slowly when sitting up or standing, to avoid dizziness from sudden blood pressure drop.
- Caution patient not to exercise vigorously in hot environments.
- Advise patient not to use salt substitutes containing potassium. Tell him to avoid high-potassium foods.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## trastuzumab

Herceptin

**Pharmacologic class:** Recombinant DNA-derived monoclonal antibody

**Therapeutic class:** Antineoplastic

**Pregnancy risk category B**

### FDA BOXED WARNING

- Drug can result in subclinical and clinical cardiac failure manifesting as congestive heart failure and decreased left ventricular ejection fraction.
- Incidence and severity of left ventricular dysfunction were highest in patients who received trastuzumab concurrently with anthracycline-containing chemotherapy regimens.

- Discontinue trastuzumab in patients receiving adjuvant therapy and strongly consider discontinuing in patients with metastatic breast cancer who develop clinically significant decrease in left ventricular function.
- Monitor patients for decreased left ventricular function before starting trastuzumab and frequently during and after treatment. Monitor more frequently if drug is withheld in patients who develop significant left ventricular dysfunction.
- Serious infusion reactions, some fatal, and pulmonary toxicity have occurred. In most cases, signs and symptoms occurred during or within 24 hours of administration. Interrupt infusion for patients experiencing dyspnea or clinically significant hypotension.
- Discontinue drug for infusion reactions manifesting as anaphylaxis, angioedema, interstitial pneumonitis, or acute respiratory distress syndrome.
- Exacerbation of chemotherapy-induced neutropenia has also occurred.

### Action

Selectively binds to human epidermal growth factor receptor 2 (HER2), inhibiting proliferation of human tumor cells that overexpress HER2

### Availability

*Lyophilized powder:* 440-mg vial (each vial contains 20 ml bacteriostatic water for injection, 1.1% benzyl alcohol)

### Indications and dosages

 Metastatic breast cancer in patients whose tumors overexpress HER2

**Adults:** As monotherapy, loading dose of 4 mg/kg I.V. infusion over 90 minutes, followed by weekly maintenance dose of 2 mg/kg I.V. infusion given

over 30 minutes if loading dose was tolerated. Don't give by I.V. push.

### Contraindications

None

### Precautions

Use cautiously in:

- hypersensitivity to Chinese hamster ovary cell protein or to benzyl alcohol
- cardiac disease, anemia, leukopenia
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

### Administration

- Be aware that baseline left ventricular ejection fraction (LVEF) measurement should be performed immediately before starting drug.
- Follow facility policy for handling, administering, and disposal of carcinogenic, mutagenic, and teratogenic agents.
- Give antiemetic, as prescribed, before administering trastuzumab.
-  Administer by I.V. infusion only. Don't give by I.V. push or bolus.
- To reconstitute, add 20 ml of bacteriostatic water for injection to vial, pointing diluent stream at lyophilized cake. Swirl vial gently; don't shake. Withdraw prescribed dose and add it to 250 ml of normal saline solution. (Don't use dextrose 5% in water.)
- Infuse loading dose I.V. over 90 minutes. Infuse weekly doses I.V. over 30 minutes.
- Immediately after reconstituting, write a date that is 28 days from reconstitution date in the space after "Do not use after" on vial label.
- If patient has benzyl alcohol hypersensitivity, reconstitute with sterile water for injection. Use immediately after reconstitution; discard unused portion.
-  Never administer intrathecally; doing so causes death.

- Know that for patient who hasn't previously received chemotherapy for metastatic disease, drug is given at same dosage but in combination with paclitaxel.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** dizziness, headache, depression, paresthesia, insomnia, ataxia, confusion, manic reaction, **seizures**

**CV:** peripheral edema, hypotension, tachycardia, syncope, **arrhythmias, shock, pericardial effusion, vascular thrombosis, heart failure, cardiotoxicity, cardiac arrest, cardiomyopathy**

**EENT:** amblyopia, hearing loss

**GI:** nausea, vomiting, diarrhea, gastroenteritis, hematemesis, colitis, esophageal ulcer, stomatitis, ileus, anorexia, **intestinal obstruction, pancreatitis**

**GU:** urinary tract infection, hematuria, hemorrhagic cystitis, hydronephrosis, pyelonephritis, **renal failure**

**Hematologic:** **coagulation disorder, pancytopenia, leukemia, exacerbation of chemotherapy-induced neutropenia**

**Hepatic:** ascites, **hepatitis, hepatic failure**

**Metabolic:** hypothyroidism, hypercalcemia, hyponatremia

**Musculoskeletal:** back, bone, or joint pain; myopathy; fractures; **bone necrosis**

**Respiratory:** upper respiratory infection, dyspnea, **pulmonary toxicity** (dyspnea, interstitial pneumonitis, pulmonary infiltrates, pleural effusions, noncardiogenic pulmonary edema, pulmonary insufficiency and hypoxia, acute respiratory distress syndrome, pulmonary fibrosis)

**Skin:** cellulitis, rash, acne, herpes simplex, herpes zoster, skin ulcers

**Other:** weight loss, edema, infection, fever, chills, flulike syndrome, lymphangitis, hypersensitivity reactions

including **anaphylaxis, infusion reaction**

### Interactions

**Drug-drug.** *Anthracyclines, cyclophosphamide:* cardiotoxicity

### Patient monitoring

☚ Monitor closely for signs and symptoms of infusion reaction (including respiratory distress). Halt infusion if these occur.

- Monitor vital signs, especially for hypotension and bradycardia.

☚ Use with extreme caution in patients with cardiac dysfunction. Assess cardiovascular status carefully; stay alert for heart failure, cardiomyopathy, and peripheral edema.

- Assess neurologic status for depression and paresthesia.
- Monitor respiratory status. Report increased dyspnea or flulike symptoms.
- Watch closely for signs and symptoms of infection, including herpes simplex.
- Monitor electrolyte levels and CBC with white cell differential.
- Monitor LVEF measurement every 3 months during and at completion of therapy; measure LVEF at 4-week intervals if drug is withheld for significant left ventricular cardiac dysfunction. Continue LVEF measurement every 6 months for at least 2 years after completion of therapy.

### Patient teaching

☚ Instruct patient to immediately report difficulty breathing, flulike symptoms, and fever, chills, and other signs and symptoms of infection.

☚ Advise patient to monitor weight. Tell him to report sudden weight gain as well as swelling and other signs and symptoms of heart failure.

☚ Instruct patient to immediately report abdominal pain, change in

bowel habits, yellowing of skin or eyes, and easy bruising or bleeding.

- Tell patient drug may cause depression. Advise him (or significant other as appropriate) to contact prescriber if this occurs.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## trazodone hydrochloride

Apo-Trazodone<sup>✳</sup>, Dom-Trazodone<sup>✳</sup>, Gen-Trazodone<sup>✳</sup>, Molipaxin<sup>⚡</sup>, Novo-Trazodone<sup>✳</sup>, Nu-Trazodone<sup>✳</sup>, Oleptro, PHL-Trazodone<sup>✳</sup>, PMS-Trazodone<sup>✳</sup>, Ratio-Trazodone<sup>✳</sup>, Trazorel<sup>✳</sup>

**Pharmacologic class:** Triazolopyridine derivative

**Therapeutic class:** Antidepressant

**Pregnancy risk category** C

### FDA BOXED WARNING

- Drug may increase risk of suicidal thinking and behavior in children and adolescents with major depressive disorder and other psychiatric disorders. Risk must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family and caregivers to observe patient closely and communicate with prescriber as needed.
- Drug isn't approved for use in pediatric patients.

## Action

Unclear. Thought to selectively inhibit serotonin and norepinephrine uptake in brain.

## Availability

**Tablets:** 50 mg, 100 mg, 150 mg, 300 mg

**Tablets (extended-release, bisectable):** 150 mg, 300 mg

## Indications and dosages

➤ Major depression

**Adults:** 150 mg/day P.O. (immediate-release) in three divided doses; may increase by 50 mg/day q 3 to 4 days until desired response occurs. Don't exceed 400 mg/day in outpatient or 600 mg/day in hospitalized patient. Or, 150 mg P.O. (extended-release) daily; may increase by 75 mg/day q 3 days. Don't exceed 375 mg/day.

## Dosage adjustment

- Concurrent use of antihypertensives

## Off-label uses

- Alcohol dependence
- Cocaine withdrawal
- Anxiety neurosis
- Insomnia

## Contraindications

- Hypersensitivity to drug
- None (Oleptro)

## Precautions

Use cautiously in:

- cardiovascular disease, severe hepatic or renal disease, suicidal behavior or ideation
- initial recovery period after myocardial infarction (not recommended)
- concurrent use of drugs that increase QT interval, antidopaminergic agents including antipsychotics, or nonsteroidal anti-inflammatory drugs (NSAIDs), aspirin, or other drugs that affect coagulation (avoid use)

- concurrent use or within 14 days of monoamine oxidase (MAO) inhibitors (avoid use)
- concurrent use of selective serotonin reuptake inhibitor (SSRI), selective norepinephrine reuptake inhibitor (SNRI), 5-hydroxytryptamine receptor agonist such as triptan, or serotonin precursors such as tryptophan (not recommended)
- elderly patients
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Give immediate-release tablets after meals or snacks. Give extended-release tablets whole or broken in half along score line at same time every day in late evening or at bedtime, on an empty stomach.
  - Know that drug is often used in conjunction with psychotherapy.
  - Be aware that when discontinuing extended-release tablets, gradual dosage reduction is recommended.
-  Don't administer within 14 days of MAO inhibitor use.

Route	Onset	Peak	Duration
P.O.	Unknown	1 hr	Unknown
P.O. (extended)	Unknown	9 hr	Unknown

### Adverse reactions

**CNS:** drowsiness, confusion, dizziness, fatigue, hallucinations, headache, insomnia, nightmares, slurred speech, syncope, weakness, tremor, activation of mania or hypomania, **suicidal behavior or ideation** (especially in child or adolescent), **neuroleptic malignant syndrome-like reactions**  
**CV:** chest pain, orthostatic hypotension, hypotension, hypertension, palpitations, tachycardia, **arrhythmias**, **prolonged QT interval**  
**EENT:** blurred vision, tinnitus

**GI:** nausea, vomiting, diarrhea, constipation, excessive salivation, flatulence, dry mouth

**GU:** urinary frequency, hematuria, erectile dysfunction, priapism

**Hematologic:** anemia, bleeding, **leukopenia**

**Metabolic:** hyponatremia

**Musculoskeletal:** myalgia

**Skin:** rash

**Other:** serotonin syndrome

### Interactions

**Drug-drug.** *Antihypertensives:* additive hypotension

*Aspirin, NSAIDs, other drugs that affect coagulation:* increased risk of bleeding

*CYP3A4 inducers (such as carbamazepine):* increased risk of decreased

trazodone plasma concentration

*CYP3A4 inhibitors (such as indinavir, itraconazole, ketoconazole):* increased

risk of substantial increases in trazodone plasma concentration and cardiac arrhythmias

*Digoxin, phenytoin:* increased blood levels of these drugs

*Drugs that prolong QT interval (such as amiodarone, fluconazole, fluoxetine, imipramine):* increased risk of torsades

de pointes, with sudden, unexplained death

*MAO inhibitors:* risk of fatal reactions, including hyperthermia, rigidity, myoclonus, autonomic instability with rapid fluctuation in vital signs, and mental status changes

*Other CNS depressants (such as opioid analgesics, sedative-hypnotics):* additive CNS depression

*Serotonergics (including SNRIs, SSRIs, triptans):* increased risk of serotonin syndrome

*Warfarin:* risk of increased or decreased prothrombin time

**Drug-diagnostic tests.** *Alkaline phosphatase, bilirubin, glucose:* increased levels

*Urinary catecholamines:* false increases

*Serum sodium, urinary 5-hydroxyindole acetic acid, vanillylmandelic acid:*

decreased levels

*St. John's wort:* increased risk of serotonergic effects (including serotonin syndrome)

**Drug-behaviors.** *Alcohol use:* additive CNS depression and hypotension

### Patient monitoring

 Monitor vital signs and ECG. Be aware that drug is known to prolong QT/QTc interval; some drugs that prolong QT/QTc interval can cause torsades de pointes, with sudden, unexplained death.

 Monitor neurologic status. Report significant adverse reactions, particularly signs and symptoms of neuroleptic malignant syndrome-like reactions (hyperthermia, muscle rigidity, autonomic instability with possible rapid fluctuation of vital signs, and mental status changes).

- Watch for signs and symptoms of serotonin syndrome, including mental status changes (such as agitation, hallucinations, and coma), autonomic instability (such as tachycardia, labile blood pressure, and hyperthermia), neuromuscular aberrations (such as hyperreflexia, incoordination), or GI symptoms (such as nausea, vomiting, and diarrhea).

 Assess patient's mood frequently. Stay alert for worsening depression and suicidal ideation.

- Watch for drug hoarding or overuse.
- When discontinuing extended-release tablets, taper dosage and watch for such symptoms as anxiety and sleep disturbance.

### Patient teaching

- Tell patient to take immediate-release tablets with meals or snacks to improve drug absorption.
- Tell patient to take extended-release tablets at same time every day in late evening or at bedtime, on an empty

stomach. Advise patient to swallow extended-release tablets whole or broken in half along the score line, and not to chew or crush them.

- Instruct patient to take only as prescribed. Caution him not to overuse or hoard drug.

- Advise patient (and significant other as appropriate) to monitor his mood. Explain that drug should ease depression.

 Caution patient (and parent or significant other) to immediately report suicidal thoughts or behavior, especially in child or adolescent.

- Tell patient drug may cause significant adverse reactions. Instruct him to report priapism, hallucinations, fainting spells, and other serious problems.

- Instruct patient not to take over-the-counter drugs or drink alcohol during drug therapy without consulting prescriber.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, vision, and alertness. Reassure him that dizziness and drowsiness usually subside after first few weeks.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## treprostinil sodium

Remodulin, Tyvaso

**Pharmacologic class:** Synthetic prostacyclin analog

**Therapeutic class:** Antiplatelet agent, vasodilator

**Pregnancy risk category B**

### Action

Dilates pulmonary and systemic arterial vascular beds, reducing right and

left ventricular afterload and increasing cardiac output and stroke volume. Also inhibits platelet aggregation.

### Availability

*Injection:* 1 mg/ml, 2.5 mg/ml, 5 mg/ml, 10 mg/ml

*Solution for oral inhalation:* 2.9-ml ampule containing 1.74 mg treprostinil (0.6 mg/ml)

### Indications and dosages

➤ To diminish exercise-induced symptoms of pulmonary artery hypertension (PAH) in patients with NYHA class II-IV symptoms

**Adults:** Initially, 1.25 ng/kg/minute by continuous subcutaneous infusion; if initial dose isn't tolerated, reduce infusion rate to 0.625 ng/kg/minute. For maintenance, may increase infusion rate in increments of no more than 1.25 ng/kg/minute q week for first 4 weeks, then in increments of no more than 2.5 ng/kg/minute q week, if needed. Maximum dosage is 40 ng/kg/minute.

➤ To treat pulmonary arterial hypertension (PAH) WHO Group 1 to improve exercise ability

**Adults:** Initially, 3 breaths (18 mcg) oral inhalation solution per treatment session q.i.d. If 3 breaths aren't tolerated, reduce to 1 or 2 breaths and subsequently increase to 3 breaths, as tolerated. For maintenance, increase dose by an additional 3 breaths at approximately 1- to 2-week intervals, if tolerated, until target dose of 9 breaths (54 mcg) is reached per treatment session q.i.d. If adverse effects preclude titration to target dose, continue at highest tolerated dose. If scheduled treatment session is missed or interrupted, resume therapy as soon as possible at usual dose. Maximum recommended dosage is 9 breaths per treatment session q.i.d.

### Dosage adjustment

- Hepatic insufficiency
- Concurrent use of CYP2C8 inhibitors or inducers

### Contraindications

None

### Precautions

Use cautiously in:

- renal disease
- history of hepatic disease
- significant underlying lung disease such as asthma or chronic obstructive pulmonary disease (Tyvaso)
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

 Give first continuous subcutaneous infusion dose in setting where resuscitation equipment is available and other health care personnel can assist if an emergency arises.

- Administer by continuous subcutaneous infusion through subcutaneous catheter with infusion pump made specifically for subcutaneous infusions.
- Expect to adjust continuous subcutaneous infusion dosage for first 6 to 12 weeks as prescriber balances symptom improvement against adverse reactions.

 Don't stop infusion abruptly (may worsen PAH).

- Use oral inhalation solution only with inhalation system provided.
- Don't mix oral inhalation solution with other drugs.
- Space oral inhalation solution treatment sessions equally during waking hours, approximately 4 hours apart.

Route	Onset	Peak	Duration
Subcut.	Unknown	Unknown	Unknown
Inhal.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** dizziness, headache, anxiety, restlessness

**CV:** vasodilation, edema, hypotension, syncope

**EENT:** jaw pain, throat irritation, pharyngolaryngeal pain (inhalation solution)

**Hematologic:** bleeding

**Respiratory:** cough (inhalation solution)

**GI:** nausea, vomiting, diarrhea

**Skin:** rash, pruritus, flushing

**Other:** infusion site pain or reaction (such as erythema, rash, induration), **possible fatal bloodstream infections and sepsis** (subcutaneous infusion)

## Interactions

**Drug-drug.** *Anticoagulants:* increased risk of bleeding

*Antihypertensives, diuretics, other vasodilators:* increased risk of hypotension

*CYP2C8 inhibitors (such as gemfibrozil) or inducers (such as rifampin):*

decreased treprostinil exposure

*Vitamin A:* increased risk of bleeding

**Drug-herbs.** *Alfalfa, anise, arnica, astragalus, bilberry, black currant seed oil, bladderwrack, bogbean, boldo (with fenugreek), borage oil, buchu, capsaicin, cat's claw, celery, chaparral, chincona bark, clove oil, dandelion, dong quai, evening primrose oil, fenugreek, feverfew, garlic, ginger, ginkgo, guggul, papaya extract, red clover, rhubarb, safflower oil, skullcap, tan-shen:* increased risk of bleeding

## Patient monitoring

⚠ Especially after first dose, watch closely for severe vasodilation leading to chest pain and hypotension. These signs and symptoms call for emergency measures.

⚠ Monitor vital signs. Assess carefully for indications of right ventricular failure.

- Assess neurologic status. Institute safety measures as needed to prevent injury.

⚠ Watch for infusion site reaction; be aware that route is associated with risk of bloodstream infections and sepsis, which may be fatal.

## Patient teaching

- Tell patient continuous subcutaneous infusion is a long-term measure to control PAH and requires a commitment to maintain infusion system.
- Tell patient to follow instructions for operation of inhalation system and for daily cleaning of device components after last treatment session of day.
- Tell patient not to swallow and to avoid skin or eye contact with oral inhalation solution.

⚠ Instruct patient to immediately report signs and symptoms of infusion site reaction (such as redness, rash, and hardened tissue).

- Teach patient which symptoms reflect underlying disease and which may reflect adverse reactions that he should report.

- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and herbs mentioned above.

## tretinoin

Atralin, Avita, Renova, Retin-A, Retin-A Micro, Vesanoid

**Pharmacologic class:** Retinoid

**Therapeutic class:** Antineoplastic, dermatologic agent (topical)

**Pregnancy risk category C** (topical), **D** (oral)

## FDA BOXED WARNING

- Patients with acute promyelocytic leukemia (APL) are at high risk in general and may have severe adverse reactions. Give drug under supervision of

physician experienced in managing patients with acute leukemia, in facility with laboratory and supportive resources sufficient to monitor drug tolerance and protect and maintain patient compromised by drug toxicity.

- Before using drug, physician must conclude that possible benefit to patient outweighs the following known adverse effects:

- Retinoic acid-APL (RA-APL syndrome), which may be accompanied by impaired myocardial contractility, hypotension, and progressive hypoxemia. Several patients have died with multiorgan failure. Syndrome generally occurs during first month of therapy (in some cases, after first dose).

- Leukocytosis at presentation or evolving rapidly during drug therapy. Patients with high white blood cell (WBC) at diagnosis (above  $5 \times 10^9/L$ ) have increased risk of further rapid rise in WBC counts. Rapidly evolving leukocytosis raises risk of life-threatening complications.

- Teratogenic effects. Drug therapy during pregnancy carries high risk of severe birth defects. Nonetheless, if drug is best available treatment for pregnant woman or woman of child-bearing potential, ensure that she has received full information and warnings of risk to fetus and of risk of possible contraception failure, and has been taught to use two reliable contraceptive methods simultaneously during therapy and for 1 month afterward.

## Action

Unknown. Thought to cause differentiation of promyelocytic leukemic blast cells, leading to apoptosis (cell shrinkage and death) and cancer remission.

## Availability

*Capsules:* 10 mg

*Topical cream:* 0.02%, 0.025%, 0.05%, 0.1%

*Topical gel:* 0.01%, 0.025%, 0.04%, 0.1%

## Indications and dosages

- APL when anthracycline chemotherapy fails or is contraindicated

**Adults and children ages 1 and older:** 45 mg/m<sup>2</sup>/day P.O. in two evenly divided doses. Discontinue after 90 days of therapy or 30 days after complete remission occurs, whichever comes first.

- Acne vulgaris

**Adults:** Apply Avita cream, Retin-A cream gel, or Retin-A Micro gel daily before bedtime or in evening. Cover entire affected area lightly.

- Adjunct for mitigating fine wrinkles in patients who use comprehensive skin care and sun avoidance programs

**Adults:** Apply Renova 0.02% cream to face daily in evening for up to 52 weeks, using only enough to lightly cover entire affected area.

- Adjunct for mitigating fine wrinkles, mottled hyperpigmentation, and tactile roughness of facial skin when comprehensive skin care and sun avoidance programs alone fail

**Adults ages 50 and younger:** Apply Renova 0.05% cream to face daily in evening for up to 48 weeks, using only enough to lightly cover entire affected area.

## Contraindications

- Hypersensitivity to drug or parabens
- Pregnancy or breastfeeding (oral use)

## Precautions

Use cautiously in:

- eczema, sunburn, photosensitivity
- concurrent use of over-the-counter (OTC) acne products or abrasive soaps or cleansers with strong drying effects or high alcohol or lime content (with all topical forms)

- concurrent use of astringents, spices, permanent wave solutions, electrolysis, hair depilatories or waxes, or photosensitizing drugs (such as fluoroquinolones, phenothiazines, tetracyclines, thiazides)
- heavily pigmented, elderly, pregnant, or breastfeeding patients (safety and efficacy not established for topical use)
- children younger than age 1 for oral use or younger than age 18 for topical use (safety and efficacy not established).

### Administration

- Verify that female patient has had required pregnancy test before P.O. therapy starts.
- Know that Renova topical cream isn't indicated for acne vulgaris, and that other topical forms are indicated only for acne vulgaris. Also know that some absorption of topical products occurs.

Route	Onset	Peak	Duration
P.O.	Unknown	1-2 hr	Unknown
Topical	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** dizziness, headache, asthenia, paresthesia, confusion, agitation, hallucinations, anxiety, aphasia, depression, agnosia, insomnia, asterixis, cerebellar edema, hypotaxia, drowsiness, slow speech, facial paralysis, hemiplegia, hyporeflexia, hypotaxia, dementia, spinal cord disorder, tremors, dysarthria, **cerebrovascular accident (CVA), coma, seizures, intracranial hypertension, cerebral hemorrhage**  
**CV:** heart murmur, chest discomfort, peripheral edema, hypertension, hypotension, phlebitis, edema, enlarged heart, ischemia, **arrhythmias, secondary cardiomyopathy, myocarditis, myocardial infarction (MI), heart failure, pericardial**

### effusion, impaired myocardial contractility, progressive hypoxemia

**EENT:** vision disturbances, visual acuity changes, visual field defect, absence of light reflex, hearing loss, earache, full sensation in ears

**GI:** nausea, vomiting, constipation, diarrhea, abdominal pain and distention, GI disorders, mucositis, dyspepsia, ulcer, anorexia, **GI hemorrhage**

**GU:** dysuria, urinary frequency, enlarged prostate, **renal insufficiency, renal tubular necrosis, acute renal failure**

**Hematologic:** leukocytosis, disseminated intravascular coagulation (DIC), **hemorrhage**

**Hepatic:** ascites, **hepatosplenomegaly, hepatitis**

**Metabolic:** fluid imbalance, **acidosis**  
**Musculoskeletal:** bone pain or inflammation, myalgia, flank pain

**Respiratory:** respiratory tract disorders, dyspnea, expiratory wheezing, crackles, pneumonia, **laryngeal edema, pulmonary infiltrates, pleural effusion, bronchial asthma, pulmonary hypertension**

**Skin:** rash; pallor; flushing; diaphoresis; alopecia; dry skin and mucous membranes; skin changes; pruritus; cellulitis; burning, erythema, peeling, and stinging (with topical use)

**Other:** weight changes, fever, lymphatic disorder, hypothermia, infections, facial edema, pain, **RA-APL syndrome, multisystem failure, septicemia**

### Interactions

**Drug-drug.** *Photosensitizing drugs (such as fluoroquinolones, phenothiazines, tetracyclines, thiazides):* increased risk of photosensitivity reaction (with topical forms)

**Drug-diagnostic tests.** *Cholesterol, triglycerides:* increased levels

**Drug-food.** *Any food:* enhanced tretinoin absorption

**Drug-behaviors.** *Sun exposure:* increased risk of photosensitivity

### Patient monitoring

🔊 Watch closely for septicemia, multisystem failure, and retinoic acid-APL syndrome (which causes pulmonary and pericardial effusion, fever, weight gain, and dyspnea).

🔊 Monitor for significant adverse CNS reactions, including seizures, CVA, and cerebral hemorrhage.

🔊 Monitor cardiovascular status. Stay alert for signs and symptoms of arrhythmias, MI, and heart failure.

🔊 Closely monitor liver and kidney function tests. Watch for evidence of hepatitis and renal failure.

🔊 Monitor coagulation studies. Watch closely for DIC and hemorrhage.

- Evaluate respiratory status. Stay alert for indications of pulmonary hypertension and respiratory insufficiency.

- Frequently assess lipid panel and CBC with white cell differential.

### Patient teaching

- Instruct patient to take oral doses with food.

🔊 Teach patient to recognize and immediately report serious adverse reactions.

- Tell patient he will undergo regular blood testing during oral therapy.

- Instruct patient using topical form to gently wash face with mild soap, pat skin dry, and then wait 20 to 30 minutes before applying. Advise him to apply to face in evening, using only enough to cover entire affected area lightly and only for prescribed duration.

- Caution patient to avoid OTC acne drugs and extreme weather conditions (such as wind and cold). Urge him to adhere to prescribed skin care and sunlight avoidance programs when using topical form.

- Tell patient using topical form that transient burning, erythema, peeling,

pruritus, and stinging may occur. Advise him to notify prescriber if these symptoms become severe.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

## triamcinolone acetonide

Adcortyl<sup>®</sup>, Kenalog, Kenalog-10, Kenalog-40, Nasacort AQ, Triaderm<sup>®</sup>

## triamcinolone hexacetonide

Aristospan Intra-Articular, Aristospan Intralesional

**Pharmacologic class:** Synthetic corticosteroid

**Therapeutic class:** Anti-inflammatory (steroidal)

**Pregnancy risk category** C

### Action

Unknown. Thought to decrease inflammation mainly by inhibiting activities of mast cells, macrophages, and other mediators of allergic reactions. Also suppresses immune system by depressing lymphatic activity.

### Availability

#### triamcinolone acetonide

*Cream:* 0.025%, 0.1%, 0.5%

*Injectable suspension:* 10 mg/ml, 40 mg/ml

*Lotion:* 0.025%, 0.1%

*Ointment:* 0.025%, 0.1%, 0.5%

*Suspension:* 55 mcg/metered spray

#### triamcinolone hexacetonide

*Injectable suspension:* 5 mg/ml, 20 mg/ml

## Indications and dosages

➤ Allergic rhinitis

### Adults and children older than age 12:

220 mcg (two sprays of acetonide suspension) in each nostril daily. When maximum benefit has been achieved and symptoms have been controlled, reduce dosage to 110 mcg/day (one spray in each nostril daily).

**Children ages 6 to 12:** Initially, 110 mcg (two sprays of acetonide suspension) as one spray in each nostril once daily. Use 220 mcg (two sprays in each nostril) daily in children not responding adequately to 110 mcg daily.

**Children ages 2 to 5:** Recommended and maximum dosage is 110 mcg as one spray in each nostril once daily.

➤ Severe inflammation; immunosuppression

### Adults and children older than age 12:

60 mg (acetonide) I.M. at 6-week intervals. For intralesional or sublesional use, 1 mg at each injection site, repeated one or more times weekly; for intra-articular, intrasynovial, or soft-tissue injection, 2.5 to 40 mg, repeated when symptoms recur. Or 0.5 mg/square inch of affected skin (hexacetonide) by intralesional or sublesional injection or 2 to 20 mg by intra-articular injection; may repeat at 3- to 4-week intervals.

**Children ages 6 to 12:** 0.03 to 0.2 mg/kg or 1 to 6.25 mg/m<sup>2</sup> I.M. at intervals of 1 to 7 days

➤ Corticosteroid-responsive dermatoses

### Adults and children older than age 12:

Apply cream, ointment, or lotion sparingly to affected area two to four times daily.

## Contraindications

- Hypersensitivity to drug, tartrazine, chlorofluorocarbon propellants, alcohol, propylene glycol, or polyethylene glycol
- Systemic fungal infections (parenteral use)

- Idiopathic thrombocytopenic purpura (I.M. use)
- Administration of live-virus vaccines (with immunosuppressant doses of triamcinolone)

## Precautions

Use cautiously in:

- active untreated infection, systemic infection, immunosuppression, hypertension, osteoporosis, diabetes mellitus, glaucoma, renal disease, hypothyroidism, cirrhosis, diverticulitis, nonspecific ulcerative colitis, recent intestinal anastomoses, thromboembolic disorders, seizures, myasthenia gravis, heart failure, ocular herpes simplex, emotional instability
- pregnant or breastfeeding patients
- children younger than age 2 (safety not established).

## Administration

- ⚠ Don't withdraw systemic corticosteroids abruptly when patient begins inhalation steroid therapy.
- ⚠ Know that patient will need additional steroids during times of stress or trauma.
- ⚠ Apply cream, lotion, or ointment sparingly. Know that triamcinolone is a high-potency steroid; it can be absorbed systemically and should not be withdrawn abruptly.
- ⚠ Avoid intralesional injection to face or head (may cause blindness).
- Don't apply topical form near eyes.
- Know that occlusive dressing may be used with topical form when treating psoriasis or other recalcitrant conditions, but should be removed if infection occurs.

Route	Onset	Peak	Duration
I.M.	Unknown	Unknown	1-4 wk
Intralesional, sublesional, intra-articular	Slow	Unknown	Unknown
Topical	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** headache, vertigo, paresthesia, syncope, personality changes, **pseudotumor cerebri, seizures**

**CV:** hypertension, **thrombophlebitis, arrhythmias, thromboembolism, heart failure**

**EENT:** cataract, glaucoma, increased intraocular pressure, exophthalmos, otitis, nasal or sinus congestion, rhinitis, epistaxis, sneezing, dry mucous membranes, pharyngitis, throat discomfort

**GI:** nausea, vomiting, dyspepsia, abdominal distention or pain, peptic ulcer, ulcerative esophagitis, oral candidiasis, dry mouth, **pancreatitis**

**GU:** cystitis, urinary tract infection, glycosuria, menstrual irregularities, vaginal candidiasis

**Metabolic:** fluid retention, hypernatremia, hypokalemia, hyperglycemia, hypocalcemia, decreased growth (in children), carbohydrate intolerance, exacerbation of latent diabetes mellitus, cushingoid appearance (moon face, buffalo hump), **hypokalemic alkalosis, acute adrenal insufficiency** (with abrupt withdrawal or acute stress in long-term use)

**Musculoskeletal:** muscle weakness; steroid myopathy; loss of muscle mass; myalgia; bursitis; tenosynovitis; osteoporosis; fractures; aseptic necrosis; with intra-articular injection—osteonecrosis, tendon rupture, post-injection flare

**Respiratory:** cough, wheezing, chest congestion

**Skin:** delayed wound healing; thin and fragile skin; petechiae; bruising; with topical use—local eruptions, pruritus, hypopigmentation or hyperpigmentation, scarring, stinging, skin maceration, secondary infection, cutaneous or subcutaneous atrophy, diaphoresis, facial erythema

**Other:** toothache, weight gain, fever, pain, voice alteration, hypersensitivity reaction

## Interactions

**Drug-drug.** *Erythromycin, indinavir, itraconazole, ketoconazole, ritonavir, saquinavir:* increased triamcinolone blood level and effects

*Fluoroquinolones:* increased risk of tendon rupture

*Live-virus vaccines:* decreased antibody response to vaccine

*Nonsteroidal anti-inflammatory drugs (including aspirin):* increased risk of adverse GI reactions

*Potassium-wasting drugs (including amphotericin B, thiazide and loop diuretics, mezlocillin, piperacillin, ticarcillin):* additive hypokalemia

**Drug-diagnostic tests.** *Cholesterol:* increased level

*Skin tests:* suppressed reaction

## Patient monitoring

- Monitor respiratory status. Watch for worsening signs and symptoms.
- With long-term use, assess for adverse endocrine and musculoskeletal reactions.
- Monitor carefully for signs and symptoms of infection, which drug may mask.

## Patient teaching

- Teach patient correct use of drug. Make sure he has received manufacturer's patient information sheet.
- Inform patient that drug can affect many body systems. Urge him to report serious adverse effects promptly.
- Tell parents drug may make child more vulnerable to childhood infections, such as chicken pox and measles.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

**triamterene**Dyrenium, Dytac<sup>Ⓢ</sup>**Pharmacologic class:** Potassium-sparing diuretic**Therapeutic class:** Diuretic**Pregnancy risk category B****FDA BOXED WARNING**

• Abnormal serum potassium elevation may occur, and is more likely in patients with renal impairment or diabetes and in elderly or severely ill patients. As uncorrected hyperkalemia may be fatal, monitor serum potassium levels frequently, especially when dosage is changed or patient has an illness that may influence renal function.

**Action**

Depresses sodium resorption and potassium excretion in renal distal tubule

**Availability**

Capsules: 50 mg, 100 mg

**Indications and dosages**

➤ Edema

**Adults:** 100 mg P.O. b.i.d. Do not exceed 300 mg/day.

**Dosage adjustment**

- Concurrent antihypertensive drug therapy
- Elderly patients

**Off-label uses**

- Diabetes insipidus

**Contraindications**

- Hypersensitivity to drug
- Hyperkalemia
- Severe hepatic disease

- Anuria, severe renal dysfunction (except nephrosis)
- Concurrent use of other potassium-sparing diuretics or potassium supplements

**Precautions**

Use cautiously in:

- hepatic dysfunction, renal insufficiency, diabetes mellitus
- history of gout or renal calculi
- elderly or debilitated patients
- pregnant or breastfeeding patients
- children (safety not established).

**Administration**

- Give after meals.
- Know that drug may be used alone or as adjunct to thiazide or loop diuretics.
- Make sure patient stops taking potassium supplements before starting triamterene.

Route	Onset	Peak	Duration
P.O.	2-4 hr	Unknown	12-16 hr

**Adverse reactions**

**CNS:** headache, fatigue, asthenia, dizziness

**GI:** nausea, vomiting, diarrhea, dry mouth

**GU:** azotemia, renal calculi

**Hematologic:** megaloblastic anemia, thrombocytopenia

**Hepatic:** jaundice

**Metabolic:** hyperglycemia, hyperkalemia, metabolic acidosis

**Skin:** rash, photosensitivity

**Other:** anaphylaxis

**Interactions**

**Drug-drug.** *Amantadine:* increased amantadine blood level, greater risk of toxicity

*Angiotensin-converting enzyme inhibitors, cyclosporine, indomethacin, potassium-sparing diuretics, potassium supplements, other potassium-containing preparations:* increased risk of hyperkalemia

*Antihypertensives, nondepolarizing muscle relaxants, other diuretics, pre-anesthetic and anesthetic agents:* potentiated effects of these drugs

*Chlorpropamide:* increased risk of hyponatremia

*Cimetidine:* increased bioavailability and decreased renal clearance of triamterene

*Indomethacin:* increased risk of acute renal failure

*Lithium:* decreased lithium clearance, greater risk of lithium toxicity

**Drug-diagnostic tests.** *Alkali reserves, hemoglobin, platelets:* decreased values  
*Blood urea nitrogen (BUN), creatinine, glucose, hepatic enzymes, potassium:* increased levels

*Liver function tests:* increased values

*Quinidine blood level:* interference with fluorescent measurement

**Drug-food.** *Salt substitutes containing potassium:* increased risk of hyperkalemia

**Drug-herbs.** *Gosypol, licorice:* increased risk of hypokalemia

### Patient monitoring

- Monitor BUN, creatinine, and electrolyte levels. Stay alert for hyperkalemia.
- Assess CBC with white cell differential.

### Patient teaching

- Advise patient to take after meals to reduce nausea.
- Instruct patient to take last daily dose in early evening to avoid nocturia.
- Teach patient to recognize and report signs and symptoms of electrolyte imbalances.
- Tell patient to avoid salt substitutes. Advise him not to use herbs without consulting prescriber.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## triazolam

Apo-Triazo<sup>®</sup>, Gen-Triazolam<sup>®</sup>, Halcion

**Pharmacologic class:** Benzodiazepine

**Therapeutic class:** Sedative-hypnotic

**Controlled substance schedule IV**

**Pregnancy risk category X**

### Action

Inhibits gamma-aminobutyric acid, a neurotransmitter that activates receptors at limbic, thalamic, and hypothalamic levels of CNS

### Availability

*Tablets:* 0.125 mg, 0.25 mg, 0.5 mg

### Indications and dosages

➤ Insomnia

**Adults:** 0.125 to 0.5 mg P.O. at bedtime p.r.n. After 7 to 10 days, decrease dosage gradually and then discontinue.

### Dosage adjustment

- Elderly or debilitated patients

### Off-label uses

- Presurgical hypnotic

### Contraindications

- Hypersensitivity to drug or other benzodiazepines
- Concurrent use of itraconazole, ketoconazole, or nefazodone
- Pregnancy

### Precautions

Use cautiously in:

- hepatic or renal dysfunction, sleep apnea, respiratory compromise, psychosis
- history of suicide attempt or drug abuse
- elderly or debilitated patients
- breastfeeding patients

- children younger than age 18 (safety and efficacy not established).

### Administration

- Don't give with grapefruit juice.

Route	Onset	Peak	Duration
P.O.	15-30 min	2 hr	Unknown

### Adverse reactions

**CNS:** dizziness, excessive sedation, hangover, headache, anterograde or traveler's amnesia, confusion, incoordination, lethargy, depression, paradoxical excitation, light-headedness, psychological disturbance, euphoria

**GI:** nausea, vomiting

**Other:** physical or psychological drug dependence, drug tolerance, withdrawal symptoms (tremor, abdominal and muscle cramps, vomiting, diaphoresis, dysphoria, perceptual disturbances, insomnia)

### Interactions

**Drug-drug.** *Antidepressants, antihistamines, chloral hydrate, opioid analgesics, other psychotropic drugs:* additive CNS depression

*Cimetidine, disulfiram, fluconazole, hormonal contraceptives, isoniazid, itraconazole, ketoconazole, nefazodone, rifampin, and other drugs that inhibit CYP450-3A4-mediated metabolism:* decreased oxidative metabolism and increased action of triazolam

*Digoxin:* increased digoxin blood level, greater risk of toxicity

*Macrolide anti-infectives (such as azithromycin, clarithromycin, erythromycin):* increased triazolam bioavailability

*Probenecid:* rapid onset and prolonged effects of triazolam

*Ranitidine:* increased triazolam blood level

*Theophylline:* decreased sedative effect of triazolam

**Drug-food.** *Grapefruit juice:* increased triazolam blood level and effects

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

*Smoking:* increased triazolam clearance

### Patient monitoring

- Monitor neurologic status. Watch for paradoxical or rebound drug effects.
- Observe for signs of drug hoarding and drug abuse.

### Patient teaching

- Tell patient to take at bedtime with a liquid other than grapefruit juice.
- Explain that drug is meant only for short-term use (7 to 10 days).
- Tell patient rebound insomnia may occur for 1 to 2 nights after he discontinues drug.
- Instruct patient to avoid alcohol use and smoking.
- Caution patient to avoid driving and other hazardous activities while under drug's influence.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, foods, herbs, and behaviors mentioned above.

## trifluoperazine hydrochloride

Apo-Trifluoperazine<sup>★</sup>, Novo-Trifluzine<sup>★</sup>, PMS-Trifluoperazine<sup>★</sup>, Terfluzine<sup>★</sup>

**Pharmacologic class:** Piperazine phenothiazine

**Therapeutic class:** Antipsychotic

**Pregnancy risk category** C

**Action**

Unknown. Thought to act on subcortical levels of hypothalamic and limbic systems by producing antidopaminergic effects. Also lowers seizure threshold and exhibits some adrenergic, muscarinic, and anticholinergic activity.

**Availability**

Tablets: 1 mg, 2 mg, 5 mg, 10 mg

**Indications and dosages**

➤ Schizophrenia

**Adults:** 2 to 5 mg P.O. b.i.d.; may increase gradually to obtain adequate response. Usual maintenance dosage is 15 to 20 mg/day.

**Children ages 6 to 12:** Initially, 1 mg P.O. once or twice daily in hospitalized patients or those under close supervision; may increase gradually up to 15 mg/day P.O. until symptoms are controlled or adverse reactions are intolerable.

➤ Nonpsychotic anxiety

**Adults:** 1 to 2 mg P.O. b.i.d. Do not exceed 6 mg/day or 12 weeks' duration.

**Dosage adjustment**

- Hepatic disease
- Elderly or debilitated patients

**Contraindications**

- Hypersensitivity to drug, other phenothiazines, or bisulfites
- Severe hepatic disease
- Bone marrow depression
- Blood dyscrasias
- Coma
- Concomitant use of other CNS depressants in high doses

**Precautions**

Use cautiously in:

- seizure disorders, cardiovascular disorders, GI obstruction, glaucoma, retinopathy
- elderly or debilitated patients
- pregnant or breastfeeding patients.

**Administration**

- Be aware that dosage should be adjusted to needs of individual. Lowest effective dosage should always be used.

Route	Onset	Peak	Duration
P.O.	Unknown	2-4 hr	12-24 hr

**Adverse reactions**

**CNS:** sedation, dizziness, drowsiness, insomnia, fatigue, extrapyramidal effects, tardive dyskinesia, **neuroleptic malignant syndrome (NMS)**

**CV:** tachycardia, hypotension, orthostatic hypotension, peripheral edema, **prolonged QT interval, torsades de pointes**

**EENT:** dry eyes, blurred vision, miosis, mydriasis, epithelial keratopathy, pigmentary retinopathy

**GI:** constipation, biliary stasis, dry mouth, anorexia, **adynamic ileus**

**GU:** urinary retention, glycosuria, amenorrhea, ejaculatory disorders, galactorrhea, gynecomastia

**Hematologic:** **leukopenia, agranulocytosis**

**Hepatic:** cholestatic jaundice

**Musculoskeletal:** muscle weakness

**Skin:** photosensitivity, altered pigmentation, erythema, rash

**Other:** mild fever, weight gain, allergic reaction

**Interactions**

**Drug-drug.** *Alpha-adrenergic blockers:* additive effect

*Antacids containing aluminum:*

decreased trifluoperazine absorption

*Anticholinergics, anticholinergic-like drugs (including antidepressants,*

*antihistamines, disopyramide, other phenothiazines, quinidine):* additive anticholinergic effects

*Anticonvulsants:* decreased seizure threshold

*Antihistamines, CNS depressants, general anesthetics, opioids, sedative-hypnotics:* additive CNS depression

*Barbiturates*: decreased blood levels of both drugs

*Guanethidine*: decreased antihypertensive effect

*Lithium*: increased risk of extrapyramidal reactions, disorientation, and unconsciousness

*Oral anticoagulants*: decreased anticoagulant effect

*Phenytoin*: interference with phenytoin metabolism, causing phenytoin toxicity

*Propranolol*: increased blood levels of both drugs

*Thiazide diuretics*: additive orthostatic hypotension

**Drug-diagnostic tests.** *Hepatic enzymes*: increased levels

*Phenylketonuria test*: false-positive result

*Prolactin*: increased level, causing interference with gonadotropin tests

*Urine bilirubin*: false-positive result

**Drug-herbs.** *St. John's wort*: increased risk of photosensitivity

**Drug-behaviors.** *Alcohol use*: additive CNS depression and hypotension

*Sun exposure*: increased risk of photosensitivity

### Patient monitoring

- Monitor ECG and blood pressure. Watch closely for hypotension.
- Assess CBC (including platelet count) and liver function tests. Stay alert for signs and symptoms of hepatic damage and blood dyscrasias.
- 📣 Monitor neurologic status, especially for indications of NMS (unstable blood pressure, high fever, sweating, stupor, muscle rigidity, and autonomic dysfunction). Immediately discontinue drug if these symptoms occur.
- If signs and symptoms of tardive dyskinesia appear (repetitive, involuntary, purposeless movements, such as grimacing, tongue protrusion, lip smacking, and rapid eye blinking), consider discontinuing drug. However, some patients may require treatment despite presence of the syndrome.

### Patient teaching

- Tell patient that drug's full effect usually occurs in 1 to 2 weeks.
- Instruct patient to move slowly when sitting up or standing, to avoid dizziness from sudden blood pressure drop.
- 📣 Teach patient to recognize and immediately report signs and symptoms of NMS and tardive dyskinesia.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects him.
- Tell patient to avoid alcohol and certain herbs.
- Advise patient to avoid sun exposure and to wear sunscreen and protective clothing when going outdoors.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## trihexyphenidyl hydrochloride

Apo-Trihex<sup>☼</sup>, Broflex<sup>☼</sup>,  
PMS-Trihexyphenidyl<sup>☼</sup>

**Pharmacologic class:** Anticholinergic

**Therapeutic class:** Antidyskinetic

**Pregnancy risk category C**

### Action

Inhibits parasympathetic nervous system, relaxing smooth muscles and decreasing involuntary movements

### Availability

*Syrup*: 2 mg/5 ml

*Tablets*: 2 mg, 5 mg

### Indications and dosages

➤ Adjunct in idiopathic, postencephalitic, or arteriosclerotic parkinsonism

**Adults:** 1 mg P.O. on first day; may increase in 2-mg increments q 3 to 5 days, up to a maximum of 6 to 10 mg/day. In postencephalitic parkinsonism, 12 to 15 mg P.O. daily.

➤ Drug-induced extrapyramidal symptoms

**Adults:** Initially, 1 mg P.O. daily, increased progressively if extrapyramidal symptoms aren't controlled within several hours. Usual dosage range is 5 to 15 mg/day P.O. in divided doses.

### Dosage adjustment

- Concurrent use of levodopa or other parasympathetic inhibitor
- Elderly patients

### Off-label uses

- Dystonia

### Contraindications

- Hypersensitivity to drug or its components
- Angle-closure glaucoma
- Pyloric or duodenal obstruction
- Stenosing peptic ulcer
- Megacolon
- Prostatic hypertrophy or bladder-neck obstruction
- Achalasia
- Myasthenia gravis

### Precautions

Use cautiously in:

- chronic renal, hepatic, pulmonary, or cardiac disease; hypertension; tachycardia secondary to cardiac insufficiency; hyperthyroidism
- elderly patients
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Give with meals. However, if drug causes severe dry mouth, give before meals.
- Administer last dose at bedtime.

Route	Onset	Peak	Duration
P.O.	1 hr	2-3 hr	6-12 hr

### Adverse reactions

**CNS:** dizziness, nervousness, drowsiness, asthenia, headache

**CV:** orthostatic hypotension, tachycardia

**EENT:** blurred vision, mydriasis, increased intraocular pressure (IOP), angle-closure glaucoma (with long-term use)

**GI:** nausea, vomiting, constipation, dry mouth

**GU:** urinary hesitancy or retention

### Interactions

**Drug-drug.** *Amantadine, other anticholinergics (including disopyramide, phenothiazines, quinidine, tricyclic antidepressants):* additive anticholinergic effects

*Other CNS depressants (such as antihistamines, opioids, sedative-hypnotics):* additive CNS depression

*Phenothiazines:* decreased phenothiazine effects

**Drug-herbs.** *Angel's trumpet, jimsonweed, scopolia:* increased anticholinergic effects

**Drug-behaviors.** *Alcohol use:* additive CNS depression

### Patient monitoring

- With prolonged use, monitor vision and IOP regularly.
- Assess drug efficacy to help guide dosage titration.
- Monitor vital signs. Watch for orthostatic hypotension.
- Closely monitor fluid intake and output. Stay alert for urinary retention.

### Patient teaching

- Instruct patient to take with meals or, if severe dry mouth occurs, before meals.
- Tell patient drug has a bitter taste, which may be followed by numbness and tingling in mouth.

- Stress importance of follow-up eye exams.
- Instruct patient to consult prescriber before taking over-the-counter preparations or herbs.
- Advise patient to avoid alcohol and hazardous activities during drug therapy.
- Tell patient to move slowly when sitting up or standing, to avoid dizziness from sudden blood pressure decrease.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, herbs, and behaviors mentioned above.

## trimethobenzamide hydrochloride

Tigan

**Pharmacologic class:** Anticholinergic

**Therapeutic class:** Antiemetic

**Pregnancy risk category** C

### Action

Unclear. Thought to block dopamine receptors and emetic impulses in chemoreceptor trigger zone, preventing nausea and vomiting.

### Availability

**Capsules:** 300 mg

**Injection:** 100 mg/ml in 2-ml ampules and prefilled syringes and in 20-ml vials

### Indications and dosages

➤ Nausea and vomiting

**Adults:** 300 mg P.O. three to four times daily or 200 mg I.M. three to four times daily

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to drug
- Parenteral form in children

### Precautions

Use cautiously in:

- renal impairment, arrhythmias, encephalitis, gastroenteritis, dehydration, electrolyte imbalances
- concurrent alcohol use
- elderly or debilitated patients
- pregnant or breastfeeding patients
- children with known or suspected viral illnesses.

### Administration

- In I.M. use, inject deep into upper outer quadrant of gluteus maximus.
- Withhold drug in children with signs or symptoms of Reye's syndrome.

Route	Onset	Peak	Duration
P.O.	10-40 min	Unknown	3-4 hr
I.M.	15-35 min	Unknown	2-3 hr

### Adverse reactions

**CNS:** drowsiness, dizziness, headache, depression, disorientation, parkinsonian symptoms, **coma, seizures**

**CV:** hypotension

**EENT:** blurred vision

**Hematologic:** blood dyscrasias

**Hepatic:** jaundice

**Musculoskeletal:** muscle cramps, opisthotonos

**Skin:** rash, urticaria, flushing

**Other:** pain and stinging at I.M. injection site, hypersensitivity reaction

### Interactions

**Drug-drug.** *Antidepressants, antihistamines, CNS depressants, opioids, sedative-hypnotics:* additive CNS depression

**Drug-behaviors.** *Alcohol use:* additive CNS depression

### Patient monitoring

- Monitor neurologic status, especially for parkinsonian symptoms and other serious adverse reactions.
- Assess CBC and liver function tests. Watch for blood dyscrasias and jaundice.

- Evaluate injection site for pain and stinging.
- Closely monitor patient's nutritional and hydration status. Report continuing nausea.

### Patient teaching

- Advise patient to take as needed for nausea and vomiting, but only as prescribed.
- Tell patient to contact prescriber promptly if nausea persists despite therapy.
- Instruct patient to minimize nausea and vomiting by eating small, frequent servings of healthy food and drinking plenty of fluids.
- Advise patient to avoid alcohol.
- Caution patient to avoid driving and other hazardous activities until drug effects are known.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and behaviors mentioned above.

## triptorelin pamoate

Decapeptyl SR ,  
Gonapeptyl Depot , Trelstar  
Depot, Trelstar LA

**Pharmacologic class:** Synthetic agonist analog of luteinizing hormone-releasing hormone (LHRH)

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** X

### Action

Initially causes surge in luteinizing hormone (LH), follicle-stimulating hormone (FSH), and testosterone levels. After several weeks of therapy, LH and FSH secretion decrease, causing sustained testosterone reduction equivalent to pharmacologic castration.

### Availability

*Microgranules for injection (lyophilized):*  
3.75 mg (depot), 11.25 mg (long-acting), 22.5 mg (long-acting)

### Indications and dosages

➤ Palliative treatment of advanced prostate cancer

**Adults:** 3.75 mg (depot) I.M. monthly as a single injection or 11.25 mg (long-acting) I.M. q 12 weeks as a single injection or 22.5 mg (long-acting) I.M. q 24 weeks

### Off-label uses

- Infertility
- Endometriosis
- Uterine fibroids
- Precocious puberty

### Contraindications

- Hypersensitivity to drug, LHRH, or other LHRH agonists
- Pregnancy
- Women of childbearing potential

### Precautions

Use cautiously in:

- renal insufficiency
- prostate cancer with impending spinal cord compression or severe urinary tract disorder
- breastfeeding patients (use not recommended).

### Administration

- Reconstitute with 2 ml of sterile water for injection, using accompanying syringe (don't use other diluents). Add syringe contents to vial containing particles; shake well. Withdraw vial contents and inject I.M. immediately.
- Inject deep I.M. into either buttock. Rotate injection sites.
-  Keep epinephrine and emergency equipment at hand in case of anaphylactic reaction.

Route	Onset	Peak	Duration
I.M. (depot)	Slow	4 days	1 mo
I.M. (long-acting)	Slow	2-3 days	3 mo

### Adverse reactions

**CNS:** insomnia, dizziness, headache, emotional lability, fatigue, **stroke**

**CV:** hypertension, **increased risk of myocardial infarction and sudden cardiac death**

**GI:** vomiting, diarrhea

**GU:** urinary retention, urinary tract infection, gynecomastia, erectile dysfunction, testicular atrophy

**Hematologic:** anemia

**Metabolic:** hyperglycemia

**Musculoskeletal:** skeletal or leg pain

**Skin:** pruritus

**Other:** leg edema, temporary worsening of disease, edema, hot flashes, pain at injection site, hypersensitivity reactions including **anaphylaxis**

### Interactions

**Drug-diagnostic tests.** *Hemoglobin:* decreased value

*Pituitary-gonadal function tests:* misleading results (with continuous or long-term use)

*Serum glucose:* increased

### Patient monitoring

- Monitor serum testosterone and prostate-specific antigen levels periodically to assess drug efficacy.

-  Monitor patient for signs and symptoms suggestive of cardiovascular disease and manage as appropriate.

### Patient teaching

- Explain drug therapy to patient. Stress need for follow-up laboratory tests.
- Tell patient prostate cancer symptoms may worsen during first few weeks of therapy.
- Instruct patient to monitor weight and report sudden weight gain or leg swelling.

- Advise female patient to tell prescriber before starting therapy if she is or plans to become pregnant. Caution her not to breastfeed during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## tromethamine

Tham

**Pharmacologic class:** Protein substrate

**Therapeutic class:** Systemic alkalinizer

**Pregnancy risk category C**

### Action

Combines with hydrogen ions to form bicarbonate and a buffer, correcting acidosis. Also shows some diuretic activity.

### Availability

*Injection:* 18 g/500 ml

### Indications and dosages

➤ Metabolic acidosis associated with cardiac bypass surgery

**Adults:** 9 ml/kg (0.32 g/kg) by slow I.V. infusion; 500 ml (18 g) is usually adequate. Maximum single dosage is 500 mg/kg infused over at least 1 hour.

➤ Metabolic acidosis associated with cardiac arrest

**Adults:** 3.6 to 10.8 g by I.V. injection into large peripheral vein if chest isn't open, or 2 to 6 g I.V. directly into ventricular cavity if chest is open. After reversal of cardiac arrest, patient may need additional amounts to control persistent acidosis.

➤ To correct acidity of acid-citrate-dextrose (ACD) blood in cardiac bypass surgery

**Adults:** 0.5 to 2.5 g added to each 500 ml of ACD blood used for priming pump-oxygenator. Usual dosage is 2 g.

### Dosage adjustment

- Elderly patients

### Contraindications

- Hypersensitivity to drug
- Anuria
- Uremia

### Precautions

Use cautiously in:

- renal disease, severe respiratory disease, respiratory depression
- pregnant patients
- infants.

### Administration

 Keep intubation equipment nearby in case respiratory depression occurs.

- For metabolic acidosis associated with cardiac bypass surgery, give by slow I.V. infusion through large-bore I.V. catheter into large antecubital vein. Elevate arm after infusion.

- If extravasation occurs, discontinue drug and infiltrate affected area with 1% procaine hydrochloride (containing hyaluronidase).

- Be aware that in cardiac arrest, drug is used with standard resuscitative measures. When giving by direct I.V. injection into open chest, never inject into cardiac muscle.

Route	Onset	Peak	Duration
I.V.	Immediate	Immediate	Unknown

### Adverse reactions

GU: oliguria

Hepatic: hemorrhagic hepatic necrosis

Metabolic: metabolic alkalosis, transient hypoglycemia, fluid-solute overload, hyperkalemia

Respiratory: respiratory depression

Other: fever; I.V. site infection; extravasation with venous thrombosis or

phlebitis, inflammation, necrosis, and sloughing

### Interactions

**Drug-diagnostic tests.** *Glucose:* decreased level

*Potassium:* increased level

### Patient monitoring

- Maintain continuous cardiac monitoring.

- Monitor arterial blood gas levels.

Watch for alkalosis and signs and symptoms of respiratory depression.

- Assess liver function tests. Stay alert for signs and symptoms of hepatic impairment.

- Monitor glucose and potassium levels. Watch for hypoglycemia and hyperkalemia.

- Closely monitor fluid intake and output. Check for fluid and electrolyte imbalances and oliguria related to hyperkalemia.

### Patient teaching

- Explain drug therapy to patient.

Assure him he will be monitored continuously.

- As appropriate, review all significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## trospium chloride

Regurin , Sanctura, Sanctura XR

**Pharmacologic class:** Anticholinergic, antimuscarinic

**Therapeutic class:** Renal and genitourinary agent, antispasmodic

**Pregnancy risk category** C

**Action**

Antagonizes effects of acetylcholine on muscarinic receptors in cholinergically innervated organs, reducing bladder smooth muscle tone

**Availability**

*Capsules (extended-release):* 60 mg

*Tablets:* 20 mg

**Indications and dosages**

➤ Overactive bladder with symptoms of urge urinary incontinence, urgency, and urinary frequency

**Adults:** 20 mg P.O. twice daily 1 hour before meals or on empty stomach, or 1 60-mg capsule daily in morning with water at least 1 hour before a meal

**Dosage adjustment**

- Severe renal impairment
- Patients age 75 and older

**Contraindications**

- Hypersensitivity to drug or its components
- Preexisting or risk of urinary or gastric retention or uncontrolled angle-closure glaucoma

**Precautions**

Use cautiously in:

- moderate renal impairment, moderate to severe hepatic impairment, decreased GI motility, controlled angle-closure glaucoma, clinically significant bladder outflow obstruction or GI obstructive disorders
- patients at risk for heat prostration
- elderly patients
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

**Administration**

- Give at least 1 hour before meals or on empty stomach.

Route	Onset	Peak	Duration
P.O.	Unknown	5-6 hr	Unknown

**Adverse reactions**

**CNS:** headache, fatigue, syncope, hallucinations, delirium, dizziness, drowsiness

**CV:** tachycardia, chest pain

**EENT:** dry eyes, blurred vision, dry throat

**GI:** vomiting, constipation (new-onset or aggravated), upper abdominal pain, dyspepsia, flatulence, abdominal distention, dry mouth

**GU:** urinary retention

**Skin:** dry skin

**Other:** altered taste, heat prostration, angioedema

**Interactions**

**Drug-drug.** *Anticholinergics:* additive anticholinergic effects

*Digoxin, metformin, morphine, pancuronium, procainamide, tenofovir, vancomycin:* increased blood levels of both drugs

**Drug-behaviors.** *Alcohol use:* increased risk of drowsiness

**Patient monitoring**

- Monitor renal and hepatic function tests.
- Monitor patient for decreased GI motility and urinary retention.
- ⚠ If patient has controlled angle-closure glaucoma, stay alert for severe eye pain accompanied by nausea, rainbows around lights, red eye, and blurred vision. Be prepared to treat immediately, as appropriate.
- ⚠ Be aware that angioedema associated with life-threatening upper airway swelling may occur. If involvement of the tongue, hypopharynx, or larynx occurs, promptly discontinue drug and provide appropriate treatment.

**Patient teaching**

- Instruct patient to take tablet 1 hour before meals on an empty stomach or to take capsule in morning with water at least 1 hour before a meal.

- Instruct patient not to consume alcohol within 2 hours of taking extended-release capsule.
- Advise patient to consult prescriber before taking over-the-counter products such as antihistamines because these may increase risk of side effects.
- Inform patient that drug increases risk of heat prostration; describe symptoms and advise him to seek prompt medical attention if these occur.
- Caution patient to avoid driving and other hazardous activities until drug effects are known.
- Advise patient to avoid alcohol use.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and behaviors mentioned above.

## valacyclovir hydrochloride (valaciclovir )

Apo-Valacyclovir<sup>®</sup>, Valtrex

**Pharmacologic class:** Acyclic purine nucleoside analog

**Therapeutic class:** Antiviral

**Pregnancy risk category B**

### Action

Rapidly converts to acyclovir, which interferes with viral DNA synthesis and replication

### Availability

Caplets: 500 mg, 1 g

### Indications and dosages

➤ Herpes zoster (shingles)

**Adults:** 1 g P.O. t.i.d. for 7 days. Therapy should begin at first sign or symptom of herpes zoster, within 48 hours of onset of zoster rash.

➤ Genital herpes

**Adults:** For initial episode, 1 g P.O. b.i.d. for 10 days. For recurrent episodes, 500 mg P.O. b.i.d. for 3 days. For chronic suppression, 1 g P.O. daily for no more than 1 year; in patients with history of fewer than nine yearly recurrences, 500 mg P.O. daily for no more than 1 year.

➤ To reduce risk of genital herpes in immunocompetent patients

**Adults:** 500 mg P.O. daily for source partner, along with counseling regarding safe sex practices

➤ Herpes labialis

**Adults:** 2 g b.i.d. for 1 day taken 12 hours apart. Begin therapy at first symptom of lesion.

### Dosage adjustment

- Renal impairment

### Off-label uses

- Cytomegalovirus prophylaxis

### Contraindications

- Hypersensitivity to drug, its components, or acyclovir

### Precautions

Use cautiously in:

- renal impairment, concurrent use of nephrotoxic drugs, inadequately hydrated patients
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

- Be aware that therapy may be ineffective if begun more than 72 hours after initial genital herpes outbreak, or more than 24 hours after symptom onset in herpes recurrence.

Route	Onset	Peak	Duration
P.O.	Unknown	1.5-2.5 hr	8-24 hr

**Adverse reactions**

**CNS:** headache, dizziness, depression, agitation, hallucinations, confusion, **encephalopathy**

**GI:** nausea, vomiting, diarrhea, abdominal pain

**GU:** dysmenorrhea, **acute renal failure**

**Hematologic:** anemia, **leukopenia**, **thrombocytopenia**, **hemolytic uremic syndrome/thrombotic thrombocytopenic purpura/ (HUS/TTP)**

**Musculoskeletal:** joint pain

**Other:** hypersensitivity reaction

**Interactions**

**Drug-drug.** *Cimetidine, probenecid:* increased valacyclovir blood level

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase:* increased levels

**Patient monitoring**

 Monitor CBC. Stay alert for signs and symptoms of blood dyscrasias. Discontinue drug if clinical signs and symptoms and laboratory findings consistent with HUS/TTP occur.

- Assess liver and kidney function tests.

**Patient teaching**

- Inform patient that herpes transmission can occur even when he is asymptomatic.
- Tell patient and significant other that no cure exists for herpes. Urge them to practice safe sex.
- Inform pregnant patient of risk of neonatal herpes infection.
- Instruct pregnant patient or female of childbearing age to tell health care provider that she has herpes. After delivery, tell her to inform neonatal care providers.

 Instruct patient to promptly report unusual bleeding or bruising, urinary changes, or serious adverse CNS reactions.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## valganciclovir hydrochloride

Valcyte

**Pharmacologic class:** Synthetic guanine derivative

**Therapeutic class:** Antiviral

**Pregnancy risk category C**

### FDA BOXED WARNING

- Clinical toxicities of drug (which is metabolized to ganciclovir) include granulocytopenia, anemia, and thrombocytopenia. In animal studies, ganciclovir caused cancer, birth defects, and aspermatogenesis.

**Action**

Converts to its active form, inhibiting activity of cytomegalovirus (CMV)

**Availability**

*Solution (oral):* 50 mg/ml

*Tablets:* 450 mg

### Indications and dosages

 Active CMV retinitis in AIDS patients

**Adults:** For induction therapy, 900 mg P.O. b.i.d. for 21 days. For maintenance, 900 mg P.O. daily.

 CMV prevention in high-risk kidney, heart, and kidney-pancreas transplant patients

**Adults:** 900 mg P.O. daily with food, starting within 10 days of transplantation and continuing until 100 days after transplantation

➤ CMV prevention in high-risk kidney or heart transplant patients

**Children ages 4 months to 16 years:**

Base dosage on body surface area and creatinine clearance calculated using a modified Schwartz formula. Give oral solution P.O. daily with food, starting within 10 days of transplantation and continuing until 100 days after transplantation; round all calculated doses to the nearest 25-mg increment, with a maximum dose of 900 mg.

**Dosage adjustment**

- Renal impairment

**Contraindications**

- Hypersensitivity to drug, its components, or ganciclovir
- Absolute neutrophil count below 500 cells/mm<sup>3</sup>, platelet count below 25,000 cells/mm<sup>3</sup>, or hemoglobin below 8 g/dl

**Precautions**

Use cautiously in:

- cytopenia, impaired renal function
- patients receiving myelosuppressive drug therapy or radiation therapy
- elderly patients
- pregnant or breastfeeding patients.

**Administration**

- Avoid direct contact with broken or crushed tablet. If skin contact occurs, wash thoroughly with soap and water; if eye contact occurs, rinse eyes thoroughly with plain water.
- Know that oral solution is preferred for children but tablets may be used if the calculated doses are within 10% of available tablet strength (450 mg).

Route	Onset	Peak	Duration
P.O.	Unknown	1-3 hr	Unknown

**Adverse reactions**

**CNS:** headache, insomnia, sedation, dizziness, peripheral neuropathy, paresthesia, hallucinations, confusion, agitation, psychosis, ataxia, **seizures**

**EENT:** retinal detachment

**GI:** nausea, vomiting, diarrhea, abdominal pain

**Hematologic:** anemia, **bone marrow depression, aplastic anemia, pancytopenia, thrombocytopenia, neutropenia**

**Other:** fever, catheter-related infection, local or systemic infection, hypersensitivity reaction, **sepsis**

**Interactions**

**Drug-drug.** *Cytotoxic drugs (such as adriamycin, amphotericin B, co-trimoxazole, dapson, doxorubicin, flucytosine, pentamidine, vinblastine, vincristine):* additive toxicity

*Cilastatin, imipenem:* seizures

*Didanosine:* decreased valganciclovir blood level, increased didanosine blood level

*Nephrotoxic drugs (such as amphotericin B, cyclosporine):* increased creatinine level

*Probenecid:* decreased renal clearance of valganciclovir

*Zidovudine:* increased risk of granulocytopenia and anemia

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, creatinine:* increased levels

*Creatinine clearance:* decreased value  
*Granulocytes, hemoglobin, neutrophils, platelets, white blood cells:* decreased levels

**Drug-food.** *Any food:* increased drug absorption

**Patient monitoring**

- Monitor CBC with white cell differential and platelet count. Watch for signs and symptoms of blood dyscrasias.

🚨 Stay alert for hypersensitivity reaction and signs and symptoms of infection.

- Closely monitor neurologic status. Observe for signs and symptoms of impending seizure.

- Periodically assess creatinine level and creatinine clearance.

### Patient teaching

- Instruct patient to take with food.
- Instruct patient (or caregiver) how to take oral solution using oral dispenser provided.
- Explain drug therapy to patient. Stress importance of taking drug exactly as prescribed to prevent overdose.
- Tell patient to avoid direct contact with solution or broken or crushed tablets. If skin contact occurs, advise patient to wash area thoroughly with soap and water or, if eye contact occurs, to rinse eyes thoroughly with plain water.
- 📣 Tell patient drug can cause serious adverse reactions. Teach him which ones to report immediately.
- Advise patient to avoid driving and other hazardous activities.
- Caution female of childbearing age to avoid pregnancy and breastfeeding.
- Urge male patient to use barrier contraception during and for 90 days after therapy.
- Instruct patient to have follow-up eye exams every 4 to 6 weeks, as well as periodic laboratory tests.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

### valproate sodium

Apo-Divalproex<sup>✳</sup>, Apo-Valproic Syrup<sup>✳</sup>, Depacon, Dom-Divalproex<sup>✳</sup>, Dom-Valproic Acid<sup>✳</sup>, Epilem<sup>⚡</sup>, Epilem Chrono<sup>⚡</sup>, Episenta<sup>⚡</sup>, Epival CR<sup>⚡</sup>, Epival ECT<sup>✳</sup>, Gen-Divalproex<sup>✳</sup>, Gen-Valproic-Cap<sup>✳</sup>, Novo-Divalproex<sup>✳</sup>, Novo-Valproic ECC<sup>✳</sup>, Nu-Divalproex<sup>✳</sup>, Nu-Valproic<sup>✳</sup>, Orlept<sup>⚡</sup>, PHL-Divalproex<sup>✳</sup>, PHL-Valproic Acid<sup>✳</sup>, PMS-Divalproex<sup>✳</sup>, PMS-Valproic Acid<sup>✳</sup>, Ratio-Valproic<sup>✳</sup>, Ratio-Valproic ECC<sup>✳</sup>, Sandoz Valproic<sup>✳</sup>

### valproic acid

Convulex<sup>⚡</sup>, Depakene, Stavzor

### divalproex sodium

Depakote, Depakote ER, Depakote Sprinkle

**Pharmacologic class:** Carboxylic acid derivative

**Therapeutic class:** Anticonvulsant, mood stabilizer, antimigraine agent

**Pregnancy risk category D**

### FDA BOXED WARNING

- Hepatic failure resulting in death has occurred in patients receiving Depacon. Children younger than age 2 are at considerably increased risk for fatal hepatotoxicity, especially those on multiple anticonvulsants, those with congenital metabolic disorders or organic brain disease, and those with severe seizure disorders accompanied by mental retardation. In this patient group, use Depacon with extreme caution and as sole agent. Weigh benefits

of therapy against risks. Above this age-group, incidence of fatal hepatotoxicity decreases considerably in progressively older patients.

- Valproate can cause teratogenic effects, such as neural tube defects. When using it in women with child-bearing potential, weigh benefits against risk of fetal injury.
- Life-threatening pancreatitis has occurred in both children and adults receiving valproate. Some cases were hemorrhagic, with rapid progression from initial symptoms to death.

### Action

Increases level of gamma-aminobutyric acid in brain, reducing seizure activity

### Availability

#### valproate sodium

*Injection:* 100 mg/ml in 5-ml vial

*Syrup:* 250 mg/5 ml

#### valproic acid

*Capsules (delayed-release):* 125 mg, 250 mg, 500 mg

*Capsules (liquid-filled):* 250 mg

#### divalproex sodium

*Capsules (containing coated particles or sprinkles):* 125 mg

*Tablets (enteric-coated, delayed-release):* 125 mg, 250 mg, 500 mg

*Tablets (extended-release):* 250 mg, 500 mg

### Indications and dosages

- Complex partial seizures

#### Adults and children older than age 10:

Initially, 10 to 15 mg/kg/day P.O. or I.V. (valproate sodium). May increase by 5 to 10 mg/kg/day q week until blood drug level is 50 to 100 mcg/ml or adverse reactions occur; don't exceed 60 mg/kg/day. If daily dosage exceeds 250 mg, give in two divided doses.

- Simple or complex absence seizures

#### Adults and children older than age 10:

Initially, 15 mg/kg/day P.O. or I.V. (valproate sodium). May increase by 5 to 10 mg/kg/day at weekly intervals until therapeutic blood drug level is reached or adverse reactions occur; don't exceed 60 mg/kg/day. If daily dosage exceeds 250 mg, give in two divided doses.

- Mania associated with bipolar disorder

**Adults:** Initially, 750 mg (divalproex or valproic acid delayed-release) P.O. daily in divided doses. Titrate rapidly to desired effect or trough level of 50 to 125 mcg/ml. Don't exceed 60 mg/kg/day.

- To prevent migraine

**Adults:** 250 mg (divalproex or valproic acid delayed-release) P.O. b.i.d. Or 500 mg (divalproex extended-release) P.O. daily for 1 week (up to 1 g/day). Maximum dosage is 1 g/day.

### Off-label uses

- Chorea
- Photosensitivity-related seizures
- Sedative-hypnotic withdrawal

### Contraindications

- Hypersensitivity to drug or tartrazine (some products)
- Hepatic impairment
- Urea cycle disorders

### Precautions

Use cautiously in:

- bleeding disorders, organic brain disease, bone marrow depression, renal impairment
- posttraumatic seizures caused by head injury (use not recommended)
- history of hepatic disease
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

- Give I.V. only when oral therapy isn't feasible.

- For I.V. use, dilute valproate sodium in at least 50 ml of dextrose 5% in water, lactated Ringer's solution, or normal saline solution. Infuse over 1 hour at a rate slower than 20 mg/minute.
- Know that I.V. and P.O. dosages and dosing frequencies are identical. However, patient should be switched to oral therapy as soon as possible.
- Give oral forms with food.
- Be aware that divalproex extended-release and delayed-release forms are not bioequivalent.
- Make sure patient swallows divalproex extended-release tablets and valproic acid capsules whole without chewing or crushing.
- If patient can't swallow capsule containing coated particles, sprinkle entire contents of capsule onto about 5 ml of semisolid food, such as pudding or applesauce, immediately before giving.
- Don't give syrup in carbonated beverages (may cause mouth and throat irritation).

Route	Onset	Peak	Duration
P.O. (capsules)	Rapid	1-4 hr	6-24 hr
P.O. (delayed, extended)	Unknown	Unknown	Unknown
P.O. (syrup)	Rapid	15-120 min	6-24 hr
I.V.	Rapid	End of 1-hr infusion	Unknown

### Adverse reactions

**CNS:** confusion, dizziness, headache, sedation, ataxia, paresthesia, asthenia, tremor, drowsiness, emotional lability, abnormal thinking, amnesia, **hyperammonemic encephalopathy, suicidal behavior or ideation**

**EENT:** amblyopia, blurred vision, nystagmus, tinnitus, pharyngitis

**GI:** nausea, vomiting, diarrhea, abdominal pain, dyspepsia, anorexia, **pancreatitis**

**Hematologic:** leukopenia, thrombocytopenia

**Hepatic:** hepatotoxicity

**Metabolic:** hyperammonemia

**Musculoskeletal:** back pain

**Respiratory:** dyspnea

**Skin:** rash, alopecia, bruising

**Other:** abnormal taste, increased appetite, weight gain, flulike symptoms, infection, infusion site pain and reaction, **multiorgan hypersensitivity reaction**

### Interactions

**Drug-drug.** *Activated charcoal, cholestyramine:* decreased valproate absorption

*Antiplatelet agents (including abciximab, aspirin and other nonsteroidal anti-inflammatory drugs, eptifibatid, tirofiban), cefamandole, cefoperazone, cefotetan, heparin, thrombolytics, warfarin:* increased risk of bleeding

*Barbiturates, primidone:* decreased metabolism and greater risk of toxicity of these drugs, decreased valproate efficacy

*Carbamazepine:* increased carbamazepine blood level, decreased valproate blood level, poor seizure control

*Chlorpromazine:* decreased valproate clearance and increased trough level

*Cimetidine:* decreased valproate clearance

*Clonazepam:* absence seizures in patients with history of these seizures

*CNS depressants (such as antihistamines and antidepressants, MAO inhibitors, opioid analgesics, sedative-hypnotics):* additive CNS depression

*Diazepam:* displacement of diazepam from binding site, inhibited diazepam metabolism

*Erythromycin, felbamate:* increased valproate blood level, greater risk of toxicity

*Ethosuximide:* inhibited ethosuximide metabolism

*Lamotrigine:* decreased valproate blood level, increased lamotrigine blood level

*Phenytoin*: increased phenytoin effects and risk of toxicity, decreased valproate effects

*Salicylates (large doses in children)*: increased valproate effects

*Topiramate*: increased risk of hyperammonemia with and without encephalopathy and hypothermia

*Tricyclic antidepressants*: increased blood levels of these drugs, greater risk of adverse reactions

*Zidovudine*: decreased zidovudine clearance in patients with human immunodeficiency virus

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin*: increased levels

*Bleeding time*: prolonged

*Ketone bodies*: false-positive results

*Platelets, white blood cells*: decreased counts

*Thyroid function tests*: interference with results

**Drug-behaviors.** *Alcohol use*: additive CNS depression

### Patient monitoring

☞ Closely monitor neurologic status. Watch for seizures and suicidal behavior or ideation.

☞ If hyperammonemia or hyperammonemic encephalopathy (unexplained lethargy and vomiting or changes in mental status) is suspected, measure ammonia level.

☞ Evaluate GI status. Stay alert for signs and symptoms of pancreatitis. Consider discontinuing drug if pancreatitis is diagnosed.

☞ Watch for diverse signs and symptoms of multiorgan hypersensitivity reaction, such as fever and rash associated with other organ system involvement (lymphadenopathy, hepatitis, liver function test abnormalities, hematologic abnormalities, pruritus, nephritis, oliguria, hepatorenal syndrome, arthralgia, and asthenia).

Discontinue drug if multiorgan hypersensitivity reaction occurs.

- Monitor I.V. infusion site for local reactions.

- Assess CBC (including platelet count), prothrombin time, International Normalized Ratio, and liver function tests.

- Monitor valproate blood level; therapeutic range is 50 to 100 mcg/ml.

### Patient teaching

- Instruct patient to take with food to minimize GI upset.

- Tell patient taking extended-release tablets or valproic acid capsules to swallow them whole without chewing or breaking.

- Inform patient taking capsules with delayed-release pellets that he may swallow them whole or open them and sprinkle contents onto a teaspoon of semisolid food, such as pudding or applesauce.

- Tell patient (or parents) that valproate syrup shouldn't be taken with carbonated beverages.

☞ Advise patient to immediately report signs and symptoms of liver dysfunction (such as malaise, weakness, lethargy, appetite loss, vomiting, or yellowing of skin or eyes), signs and symptoms of pancreatitis (such as abdominal pain, nausea, vomiting, loss of appetite), or suicidal behavior or ideation.

☞ Tell patient to immediately report unexplained signs and symptoms that may reflect hypersensitivity reaction (fever, rash, hepatitis signs and symptoms, bleeding or bruising, itching, urinary problems, muscle pains, or weakness).

- If patient is taking drug for seizure control, tell him to avoid driving and other hazardous activities.

☞ Caution patient not to stop therapy abruptly.

- Instruct patient to avoid alcohol.

- Stress importance of follow-up laboratory tests.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## valsartan

Diovan

**Pharmacologic class:** Angiotensin II receptor antagonist

**Therapeutic class:** Antihypertensive

**Pregnancy risk category C** (first trimester), **D** (second and third trimesters)

### FDA BOXED WARNING

- Drugs that act directly on the renin-angiotensin system can cause injury to or death of a developing fetus. Discontinue drug as soon as possible when pregnancy is detected.

### Action

Blocks the vasoconstrictive and aldosterone-producing effects of angiotensin II at various receptor sites, including vascular smooth muscle and adrenal glands

### Availability

Tablets: 40 mg, 80 mg, 160 mg, 320 mg

### Indications and dosages

➤ Hypertension

**Adults:** Initially, 80 to 160 mg P.O. daily. May increase as needed to a maximum of 320 mg P.O. daily, or a diuretic may be added.

**Children ages 6 to 16:** Initially, 1.3 mg/kg (up to 40 mg total) P.O. once daily; dosage range is 1.3 to 2.7 mg/kg (40 to 160 mg total).

➤ Heart failure

**Adults:** 40 mg P.O. b.i.d., titrated to 80 mg or 160 mg P.O. b.i.d., as tolerated

➤ Reduction of cardiovascular mortality in clinically stable patients with left ventricular failure or left ventricular dysfunction following myocardial infarction

**Adults:** 20 mg P.O. b.i.d., followed by titration to 40 mg P.O. b.i.d., with subsequent titration to a target maintenance dosage of 160 mg P.O. b.i.d., as tolerated

### Dosage adjustment

- Symptomatic hypotension
- Renal dysfunction

### Off-label uses

- Left ventricular hypertrophy
- Diabetic nephropathy

### Contraindications

- None

### Precautions

Use cautiously in:

- severe heart failure; volume or sodium depletion; hepatic or renal impairment; obstructive biliary disorders; angioedema; aortic, mitral valve, or renal artery stenosis; hyperkalemia, hypotension
- pregnant or breastfeeding patients
- children younger than age 6 (safety not established).

### Administration

- Give with or without food.
- For children who can't swallow tablets or children for whom calculated dosage doesn't correspond to available tablet strength, use a suspension but be aware that exposure to the suspension is 1.6 times greater than the tablet.
- To prepare 160 ml of a 4-mg/ml suspension, add 80 ml of Ora-Plus to bottle containing eight valsartan 80-mg tablets and shake for at least 2 minutes. Allow suspension to stand for at least 1 hour. Then shake for at least 1 additional minute. Add 80 ml of Ora-Sweet to bottle and shake for at least

10 seconds before giving appropriate dose. May store suspension for 30 days at room temperature or up to 75 days if refrigerated.

⚠ Be aware that drug isn't recommended for children with glomerular filtration rate of less than 30 ml/minute/1.73<sup>2</sup>.

Route	Onset	Peak	Duration
P.O.	Within 2 hr	4-6 hr	24 hr

### Adverse reactions

**CNS:** dizziness, fatigue, headache

**CV:** hypotension, palpitations

**EENT:** sinus disorders, rhinitis, pharyngitis

**GI:** nausea, diarrhea, constipation, abdominal pain, dry mouth

**GU:** albuminuria, **renal impairment**

**Hematologic:** neutropenia

**Metabolic:** hyperkalemia

**Musculoskeletal:** back pain, joint pain, muscle cramps

**Respiratory:** cough, upper respiratory tract infection

**Skin:** alopecia, angioedema

**Other:** dental pain, fever, viral infection, edema

### Interactions

**Drug-drug.** *Nonsteroidal anti-inflammatory drugs including selective cyclooxygenase-2 inhibitors:* increased risk of renal impairment including acute renal failure in elderly patients, volume-depleted patients, or those with compromised renal function; loss of valsartan antihypertensive effect  
*Other antihypertensives:* increased risk of hypotension

*Potassium-sparing diuretics, potassium supplements:* increased risk of hyperkalemia

**Drug-diagnostic tests.** *Serum creatinine, serum and urine albumin, urine potassium:* increased levels

**Drug-food.** *Salt substitutes containing potassium:* increased risk of hyperkalemia

**Drug-herbs.** *Ephedra (ma huang):* reduced hypotensive effect of valsartan

**Drug-behaviors.** *Alcohol use:* increased CNS depression

### Patient monitoring

- Monitor blood pressure closely, especially during initial therapy and dosage adjustments.

- Assess potassium level. Stay alert for hyperkalemia.

- Be aware that in black patients, drug may be ineffective when used alone. Additional agents may be required.

### Patient teaching

- Tell patient he may take with or without food.

- For children who can't swallow tablets or children for whom calculated dosage doesn't correspond to available tablet strength, show caregiver how to prepare a suspension.

- ⚠ Instruct female of childbearing age to report pregnancy immediately.

- Advise breastfeeding patient to avoid breastfeeding while taking drug.

- Advise patient to avoid potassium-containing salt substitutes.

- Caution patient to avoid alcohol.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## vancomycin hydrochloride

PMS-Vancomycin<sup>†</sup>, Vancocin

**Pharmacologic class:** Tricyclic glycopeptide

**Therapeutic class:** Anti-infective

**Pregnancy risk category C (with parenteral use); B (with oral use)**

**Action**

Binds to bacterial cell wall, inhibiting cell-wall synthesis and causing secondary damage to bacterial membrane

**Availability**

*Capsules:* 125 mg, 250 mg

*Powder for injection:* 500-mg vial, 1-g vial, 5-g vial, 10 g-vial

**Indications and dosages**

➤ Severe, life-threatening infections caused by susceptible strains of methicillin-resistant staphylococci, *Staphylococcus epidermidis*, *Streptococcus viridans* or *Streptococcus bovis* (alone or combined with an aminoglycoside), or *Enterococcus faecalis* (combined with an aminoglycoside)

**Adults:** 500 mg I.V. q 6 hours or 1 g I.V. q 12 hours

**Children:** 10 mg/kg I.V. q 6 hours

**Infants and neonates:** Initially, 15 mg/kg I.V., followed by 10 mg/kg I.V. q 8 hours in infants 8 days to 1 month old, or 10 mg/kg I.V. q 12 hours in infants less than 8 days old

➤ Endocarditis prophylaxis in penicillin-allergic patients at moderate risk who are scheduled for dental and other invasive procedures

**Adults:** 1 g I.V. slowly over 1 to 2 hours, with infusion completed 30 minutes before invasive procedure begins

**Children:** 20 mg/kg I.V. over 1 to 2 hours, with infusion completed 30 minutes before invasive procedure begins

➤ Enterocolitis caused by *Staphylococcus aureus*

**Adults:** 500 mg to 2 g P.O. daily in three or four divided doses for 7 to 10 days

**Children:** 40 mg/kg P.O. daily in three or four divided doses for 7 to 10 days; total daily dose shouldn't exceed 2 g.

➤ *Clostridium difficile*-associated diarrhea

**Adults:** 125 mg P.O. q.i.d. for 10 days

**Children:** 40 mg/kg P. O. in three or four divided doses for 7 to 10 days; total daily dose shouldn't exceed 2 g.

**Dosage adjustment**

- Renal impairment
- Elderly patients

**Off-label uses**

- Peritonitis
- Meningitis
- Intraocular infections
- Febrile neutropenia

**Contraindications**

- Hypersensitivity to drug

**Precautions**

Use cautiously in:

- renal impairment, preexisting hearing loss
- concurrent use of anesthetics, immunosuppressants, or nephrotoxic or ototoxic drugs
- elderly patients
- pregnant or breastfeeding patients
- neonates.

**Administration**

⚠ Know that I.V. therapy is ineffective against enterocolitis and pseudomembranous diarrhea.

- For intermittent I.V. infusion, dilute by adding 10 or 20 ml of sterile water for injection to vial containing 500 mg or 1 g of drug, respectively, to yield a concentration of 50 mg/ml. Dilute further by adding at least 100 ml or 200 ml, respectively, of dextrose 5% in water or normal saline solution; infuse over at least 1 hour.

- Don't give by I.M. route.

- Be aware that capsules aren't systemically absorbed; therefore, oral therapy is ineffective in infections other than *C. difficile*-associated diarrhea and enterocolitis caused by *S. aureus*.

⚠ Keep emergency equipment and epinephrine on hand in case of anaphylaxis.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown
I.V.	Immediate	Immediate	Unknown

**Adverse reactions**

**CV:** hypotension, **cardiac arrest, vascular collapse**

**EENT:** permanent hearing loss, ototoxicity, tinnitus

**GI:** nausea, vomiting, abdominal pain, **pseudomembranous colitis**

**GU:** **nephrotoxicity, severe uremia**

**Hematologic:** eosinophilia, **leukopenia, neutropenia**

**Metabolic:** **hypokalemia**

**Respiratory:** wheezing, dyspnea

**Skin:** “red man” syndrome (nonallergic histamine reaction with rapid I.V. infusion), rash, urticaria, pruritus, necrosis

**Other:** chills, fever, thrombophlebitis at injection site, **anaphylaxis**

**Interactions**

**Drug-drug.** *Aminoglycosides, amphotericin B, bacitracin, cephalosporins, cisplatin, colistin, nondepolarizing neuromuscular blockers, pentamidine (with parenteral use):* increased risk of nephrotoxicity and ototoxicity

*Anesthetic agents (with parenteral use):* erythema and histamine-like flushing

**Drug-diagnostic tests.** *Albumin, blood urea nitrogen (BUN), creatinine:* increased levels

*Eosinophils, neutrophils:* decreased counts

*Potassium:* decreased level

**Patient monitoring**

🔊 Monitor closely for signs and symptoms of hypersensitivity reactions, including anaphylaxis.

- Check drug blood level weekly.

Therapeutic peak ranges from 30 to 40 g/L; therapeutic trough, 5 to 10 mg/L.

- Assess BUN and creatinine levels every 2 days, or daily in patients with unstable renal function.
- Monitor urine output daily. Weigh patient at least weekly.
- Assess hearing before and during therapy; stay alert for hearing loss.

Patient may require baseline and weekly audiograms.

- Check I.V. site often for phlebitis.

• Watch for “red-man” syndrome, which can result from rapid infusion. Signs and symptoms include hypotension, pruritus, and maculopapular rash on face, neck, trunk, and limbs.

- Monitor CBC. Watch for signs and symptoms of blood dyscrasias.

• Closely monitor respiratory status. Stay alert for wheezing and dyspnea.

🔊 Monitor vital signs and cardiovascular status, especially for vascular collapse and other signs of impending cardiac arrest.

**Patient teaching**

- Tell patient he may take with or without food.

• Instruct patient to take oral drug exactly as prescribed for as long as prescribed, even if symptoms improve.

- Explain importance of prophylactic I.V. therapy to patients at risk for endocarditis who are scheduled for invasive procedures.

🔊 Advise patient to promptly report rash, hearing loss, breathing problems, and signs and symptoms of “red-man” syndrome, nephrotoxicity, and blood dyscrasias.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

**vardenafil hydrochloride**

Levitra

**Pharmacologic class:** Phosphodiesterase-5 (PDE5) inhibitor

**Therapeutic class:** Erectile dysfunction agent

**Pregnancy risk category B**

**Action**

Selectively blocks PDE5, which neutralizes cyclic guanosine monophosphate, resulting in enhanced erectile function

**Availability**

Tablets: 2.5 mg, 5 mg, 10 mg, 20 mg

**Indications and dosages**

➤ Erectile dysfunction

**Adult males:** 10 or 20 mg P.O. approximately 1 hour before anticipated sexual activity. Maximum dosing frequency is once daily.

**Dosage adjustment**

- Patients older than age 65
- Concurrent use of CYP450-3A4 inhibitors
- Concurrent HIV therapy (except highly active antiretroviral therapy)

**Contraindications**

- Hypersensitivity to drug
- Concurrent use of nitrates or nitrate patches to treat angina
- Concurrent use of alpha-adrenergic blockers

**Precautions**

Use cautiously in:

- cardiovascular disease, retinitis pigmentosa, hepatic or renal impairment, reduced hepatic blood flow
- patients at increased risk for priapism (as from sickle-cell disease, leukemia, multiple myeloma, polycythemia, or history of priapism).

**Administration**

- Advise patient not to take more than one tablet daily.

Route	Onset	Peak	Duration
P.O.	Unknown	1 hr	4 hr

**Adverse reactions**

CNS: headache

CV: hypotension

EENT: blurred vision, altered color perception, light sensitivity, rhinitis

GI: dyspepsia

Skin: flushing

Other: flulike symptoms

**Interactions**

**Drug-drug.** *Alpha-adrenergic blockers, nitrates:* hypotension

*Erythromycin, itraconazole, ketoconazole, protease inhibitors:* increased vardenafil blood level

**Drug-diagnostic tests.** *Creatine kinase:* increased level

**Patient monitoring**

- Monitor blood pressure and heart rate, particularly if patient has cardiovascular disease.

**Patient teaching**

- Tell patient he may take with or without food.
- Instruct patient to take one tablet about 1 hour before anticipated sexual activity. Caution him not to take more than one tablet daily.
- Instruct patient to promptly contact prescriber if erection lasts more than 4 hours, because irreversible damage to penis may occur.
- Caution patient not to take nitrates. Tell him to inform prescriber of other drugs he's taking.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

**varenicline**

Champix<sup>⚠</sup>, Chantix

**Pharmacologic class:** Autonomic drug, miscellaneous

**Therapeutic class:** Smoking cessation agent

**Pregnancy risk category C**

**FDA BOXED WARNING**

- Varenicline has caused serious neuropsychiatric events, including, but not limited to, depression, suicidal ideation, suicide attempt, and completed suicide. Some reported cases may have been complicated by signs and symptoms of nicotine withdrawal (such as depression) in patients who stopped smoking. Depression, rarely including suicidal ideation, has been reported in smokers undergoing a smoking cessation attempt without medication. However, some of these symptoms have occurred in patients taking varenicline who continued to smoke. Observe all patients taking varenicline for neuropsychiatric symptoms, such as changes in behavior, hostility, agitation, depressed mood, and suicide-related events, including ideation, behavior, and attempted suicide. These symptoms, as well as worsening of preexisting psychiatric illness and completed suicide, have occurred in some patients attempting to quit smoking while taking varenicline in postmarketing experience. These events have occurred in patients with and without preexisting psychiatric disease. Patients with serious psychiatric illness, such as schizophrenia, bipolar disorder, and major depressive disorder, didn't participate in premarketing studies of varenicline; therefore, safety and efficacy of varenicline in such patients haven't been established.
- Advise patient and caregivers that patient should stop taking varenicline and contact prescriber immediately if agitation, hostility, depressed mood, or changes in behavior or thinking not typical for patient are observed, or if patient develops suicidal ideation or suicidal behavior.
- Weigh benefits of varenicline against its risks. Varenicline has been shown to increase likelihood of abstinence from

smoking for as long as 1 year compared to placebo.

**Action**

In smoking cessation, action presumably results from activity at nicotinic receptor subtype, where its binding produces agonist activity while simultaneously preventing nicotine binding to  $\alpha_4\text{-}\beta_2$  receptors.

**Availability**

*Tablets (film coated):* 0.5 mg, 1 mg

**Indications and dosages**

➤ To aid smoking-cessation treatment

**Adults:** Begin with 1-week titration of 0.5 mg P.O. daily on days 1 to 3; then, 0.5 mg P.O. b.i.d. on days 4 to 7. Starting on day 8, give 1 mg P.O. b.i.d. till end of treatment. If patient has successfully stopped smoking at end of 12 weeks, additional course of 12 weeks is recommended to improve likelihood of long-term abstinence.

**Dosage adjustment**

- Severe renal impairment

**Contraindications**

- History of serious hypersensitivity or skin reactions to drug

**Precautions**

Use cautiously in:

- renal impairment
- concurrent use of drugs affected by smoking, such as insulin, theophylline, and warfarin (whose dosages may need to be adjusted)
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

**Administration**

- Give with full glass of water after a meal.

Route	Onset	Peak	Duration
P.O.	Unknown	3-4 hr	Unknown

## Adverse reactions

**CNS:** headache, migraine, somnolence, lethargy, dizziness, syncope, attention disturbance, sensory disturbance, anxiety, depression, emotional disorder, irritability, restlessness, sleep disorders, abnormal dreams, nightmares, insomnia, fatigue, malaise, asthenia, aggression, agitation, amnesia, dissociation, mood swings, parosmia, psychomotor hyperactivity, restless leg syndrome, abnormal thinking, tremor, vertigo, **suicidal ideation suicide attempt, suicide**

**CV:** hot flushes, hypertension, angina pectoris, bradycardia, hypotension, palpitations, peripheral ischemia, tachycardia, **thrombosis, ventricular extrasystoles, arrhythmia, myocardial infarction**

**EENT:** tinnitus, epistaxis, rhinorrhea

**GI:** nausea, vomiting, constipation, abdominal pain, flatulence, dyspepsia, gastroesophageal reflux disease, gingivitis, anorexia, increased or decreased appetite, dysgeusia, dry mouth, **intestinal obstruction (rare), acute pancreatitis (rare)**

**GU:** polyuria, menstrual disorder, decreased libido, **acute renal failure (rare)**

**Hematologic:** anemia, lymphadenopathy

**Musculoskeletal:** arthralgia, back pain, muscle cramp, musculoskeletal pain, myalgia

**Respiratory:** dyspnea, upper respiratory tract disorders, **pulmonary embolism (rare)**

**Skin:** rash, pruritus, hyperhidrosis **Stevens-Johnson syndrome, erythema multiforme (rare)**

**Other:** chest pain, flulike illness, edema, thirst, increased weight, nicotine withdrawal symptoms, hypersensitivity reactions including **angioedema**

## Interactions

**Drug-diagnostic tests.** *Liver function tests:* abnormal

## Patient monitoring

☞ Monitor patient for serious neuropsychiatric symptoms, including behavior changes, agitation, depressed mood, and suicidal ideation and behavior.

☞ Closely monitor patient for hypersensitivity or serious skin reactions.

- Monitor patients taking drugs that may be affected by smoking; dosages of these drugs may need to be adjusted once patient quits smoking.
- Monitor liver function tests.
- Monitor renal function, especially in elderly patients.

## Patient teaching

☞ Instruct patient to discontinue drug and immediately report changes in behavior, including depression and suicidal thoughts or action; rash; or swelling of face, mouth, or throat.

- Advise patient to set date to quit smoking and to start drug 1 week before quit date. Or, patient can begin drug dosing and then quit smoking between days 8 and 35 of treatment.
- Teach patient how to titrate drug for first week of therapy.
- Instruct patient to take drug with full glass of water after eating.
- Give patient educational materials and counseling referral to support smoking-cessation attempt.
- Encourage patient who relapses after quit day to continue to try to quit smoking.
- Inform patient that nausea and insomnia are side effects and usually disappear. However, if these symptoms remain troubling, advise patient to notify prescriber, who may consider dosage reduction.
- Inform patient that some drugs may require dosage adjustment after smoking cessation.

- Caution patient to avoid driving and other hazardous activities until effects of drug and smoking cessation are known.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## venlafaxine hydrochloride

Co Venlafaxine<sup>⚡</sup>, Co Venlafaxine XR, Efexor<sup>⚡</sup>, Effexor, Effexor XR, Gen-Venlafaxine XR<sup>⚡</sup>, Novo-Venlafaxine XR<sup>⚡</sup>, PMS-Venlafaxine XR<sup>⚡</sup>, Ratio-Venlafaxine XR<sup>⚡</sup>, Riva-Venlafaxine XR<sup>⚡</sup>, Sandoz Venlafaxine XR<sup>⚡</sup>

**Pharmacologic class:** Phenethylamine derivative

**Therapeutic class:** Antidepressant, anxiolytic

**Pregnancy risk category** C

### FDA BOXED WARNING

- Drug may increase risk of suicidal thinking and behavior in children and adolescents with major depressive disorder and other psychiatric disorders. Risk must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family and caregivers to observe patient closely and communicate with prescriber as needed.
- Drug isn't approved for use in pediatric patients.

## Action

Inhibits neuronal serotonin and norepinephrine reuptake and slightly inhibits dopamine reuptake

## Availability

*Capsules (extended-release):* 37.5 mg, 75 mg, 150 mg

*Tablets:* 25 mg, 37.5 mg, 50 mg, 75 mg, 100 mg

*Tablets (extended-release):* 37.5 mg, 75 mg, 150 mg, 225 mg

## Indications and dosages

➤ Depression

**Adults:** In outpatients, 75 mg P.O. daily in two or three divided doses; may increase in increments of 75 mg/day q 4 or more days to a maximum of 225 mg/day; extended-release form can be given as a single daily dose. In hospitalized patients, 75 mg P.O. daily in two or three divided doses; may increase in increments of 75 mg/day q 4 days to a maximum of 375 mg/day given in three divided doses.

➤ Generalized anxiety disorder

**Adults:** Single dose of 37.5 to 75 mg (extended-release) P.O. daily; may increase in increments of 75 mg/day q 4 days to a maximum of 225 mg/day

➤ Panic disorder

**Adults:** 37.5 mg (extended-release) P.O. daily for 7 days; increase to 75 mg P.O. daily for 7 days; then increase by 75 mg daily at weekly intervals to a maximum of 225 mg P.O. daily

➤ Social anxiety disorder

**Adults:** 75 mg (extended-release capsule) P.O. daily as a single dose

## Dosage adjustment

- Hepatic or renal impairment

## Off-label uses

- Premenstrual dysphoric disorder

## Contraindications

- Hypersensitivity to drug
- MAO inhibitor use within past 14 days

## Precautions

Use cautiously in:

- cardiovascular disease; hypertension; heart failure, recent myocardial infarction, and other conditions in which increased heart rate poses a danger; hepatic or renal impairment; glaucoma; hyperthyroidism; hyponatremia; syndrome of inappropriate antidiuretic hormone secretion (SIADH)
- history of seizures, neurologic impairment, or drug abuse
- pregnant or breastfeeding patients
- children younger than age 18.

## Administration

 Don't give within 14 days of MAO inhibitors.

Route	Onset	Peak	Duration
P.O.	Within 2 wk	2-4 wk	Unknown

## Adverse reactions

**CNS:** abnormal dreams, anxiety, dizziness, headache, insomnia, nervousness, abnormal thinking, agitation, confusion, depersonalization, drowsiness, emotional lability, worsening depression, twitching, tremor, asthenia, paresthesia, mania, hypomania, **suicidal ideation or behavior** (especially in child or adolescent)

**CV:** chest pain, hypertension, palpitations, tachycardia, vasodilation

**EENT:** visual disturbances, blurred vision, mydriasis, tinnitus, rhinitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, flatulence, dry mouth, anorexia

**GU:** urinary frequency or retention, sexual dysfunction, abnormal ejaculation, anorgasmia, erectile dysfunction

**Metabolic:** hyponatremia, **SIADH**

**Skin:** bruising, pruritus, rash, diaphoresis, photosensitivity

**Other:** altered taste, weight loss, chills, yawning

## Interactions

**Drug-drug.** *Cimetidine:* increased venlafaxine effects

*MAO inhibitors:* potentially fatal reactions

*Sumatriptan, trazodone:* serotonin syndrome (including altered level of consciousness)

**Drug-diagnostic tests.** *Sodium:* decreased level

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

*S-adenosylmethionine (SAM-e), St. John's wort:* increased risk of sedative or hypnotic effects

## Patient monitoring

 Monitor neurologic status, particularly for seizures, worsening depression, and suicidal ideation.

- Closely monitor vital signs and cardiovascular status. Stay alert for hypertension and tachycardia.

- Monitor nutritional status, hydration, and weight.

## Patient teaching

- Tell patient taking extended-release capsules to swallow them whole without chewing, breaking, dividing, or dissolving.

 Caution patient not to stop therapy abruptly.

 Advise patient to promptly report seizures, worsening depression, or suicidal thoughts (especially in child or adolescent).

- Caution patient to avoid driving and other dangerous activities until drug effects are known.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## verapamil hydrochloride

Apo-Verap<sup>✳</sup>, Apo-Verap SR<sup>✳</sup>, Calan, Calan SR, Cordilox MR<sup>⊕</sup>, Covera-HS, Dom-Verapamil SR<sup>✳</sup>, Gen-Verapamil<sup>✳</sup>, Gen-Verapamil SR<sup>✳</sup>, Half Securon<sup>⊕</sup>, Isoptin, Isoptin SR, Med Verapamil<sup>✳</sup>, Novo-Veramil<sup>✳</sup>, Nu-Verap<sup>✳</sup>, Nu-Verap SR<sup>✳</sup>, PHL-Verapamil SR<sup>✳</sup>, PMS-Verapamil SR<sup>✳</sup>, Riva-Verapamil SR<sup>✳</sup>, Securon SR<sup>⊕</sup>, Univer<sup>⊕</sup>, Verapress<sup>⊕</sup>, Vera-Til SR<sup>⊕</sup>, Verelan, Verelan PM, Vertab SR<sup>⊕</sup>, Zolvera<sup>⊕</sup>

**Pharmacologic class:** Calcium channel blocker

**Therapeutic class:** Antianginal, antiarrhythmic (class IV), antihypertensive

**Pregnancy risk category C**

### Action

Decreases conduction of sinoatrial and atrioventricular (AV) nodes by inhibiting calcium influx into cardiac and vascular smooth muscle cells, inhibiting excitatory contraction. These effects prolong AV node refractoriness and decrease myocardial oxygen consumption.

### Availability

**Capsules (extended-release):** 100 mg, 120 mg, 180 mg, 200 mg, 240 mg, 300 mg, 360 mg

**Capsules (sustained-release):** 120 mg, 180 mg, 240 mg, 360 mg

**Injection:** 2.5 mg/ml in 2- and 4-ml vials, ampules, and syringes

**Tablets (extended-release):** 120 mg, 180 mg, 240 mg

**Tablets (immediate-release):** 40 mg, 80 mg, 120 mg

## Indications and dosages

➤ Angina

**Adults:** Initially, 80 mg (immediate-release) P.O. t.i.d.; may titrate at daily or weekly intervals to 360 mg/day. Or initially, 180 mg (extended-release) P.O. once daily at bedtime, titrated up to 480 mg/day at bedtime.

➤ Supraventricular tachyarrhythmias (SVTs)

**Adults:** 5 to 10 mg (0.075 to 0.15 mg/kg) I.V. bolus over 2 minutes; may give additional 10 mg after 30 minutes if response inadequate. Or 240 to 480 mg (immediate-release) P.O. daily in three or four divided doses.

➤ To control ventricular rate in chronic atrial flutter or atrial fibrillation in patients receiving digoxin

**Adults:** 240 to 320 mg P.O. daily in three or four divided doses

➤ Hypertension

**Adults:** Initially, 180 mg (extended-release tablet) or 200 mg (extended-release capsule) P.O. daily at bedtime. For maintenance, may titrate up to 480 mg (extended-release tablet) or 400 mg (extended-release capsule) P.O. daily at bedtime. Or initially, 80 mg (immediate-release tablet) P.O. t.i.d.; may titrate at daily or weekly intervals up to 360 to 480 mg/day. Or initially, 240 mg (sustained-release capsule) P.O. q day in morning; for maintenance, may titrate up to 240 mg P.O. b.i.d. or 480 mg P.O. once daily in morning. Titrate based on response.

### Dosage adjustment

- Renal or hepatic impairment
- Concurrent digoxin therapy

### Off-label uses

- Ventricular tachycardia
- Migraine headache prophylaxis
- Neurogenic bladder
- Premature labor

## Contraindications

- Hypersensitivity to drug or other calcium channel blockers
- Sick sinus syndrome
- Second- or third-degree AV block (except in patients with artificial pacemakers)
- Hypotension
- Heart failure, severe ventricular dysfunction, or cardiogenic shock (except when associated with SVTs)
- Atrial flutter or atrial fibrillation associated with accessory bypass tracts (such as Wolff-Parkinson-White or Lown-Ganong-Levine syndrome)

## Precautions

Use cautiously in:

- renal or severe hepatic impairment; first-degree AV block; idiopathic hypertrophic cardiomyopathy; neuromuscular transmission defects (such as Duchenne's muscular dystrophy); respiratory depression; digital ulcers, ischemia, or gangrene
- elderly patients
- pregnant or breastfeeding patients.

## Administration

- Give I.V. over at least 2 minutes.
- Discontinue disopyramide 48 hours before starting verapamil. Don't restart disopyramide for at least 24 hours after verapamil therapy ends.

Route	Onset	Peak	Duration
P.O. (immediate)	30 min	1-2 hr	3-7 hr
P.O. (extended)	Unknown	5-7 hr	24 hr
P.O. (sustained)	Unknown	Unknown	Unknown
I.V.	Immediate	3-5 min	2 hr

## Adverse reactions

**CNS:** anxiety, confusion, dizziness, syncope, drowsiness, headache, jitteriness, abnormal dreams, disturbed equilibrium, psychiatric disturbances, asthenia, paresthesia, tremor, fatigue

**CV:** chest pain, hypotension, palpitations, peripheral edema, tachycardia, **arrhythmias, heart failure, bradycardia, AV block**

**EENT:** blurred vision, epistaxis, tinnitus

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, dry mouth, anorexia

**GU:** dysuria, urinary frequency, nocturia, polyuria, sexual dysfunction, gynecomastia

**Hematologic:** anemia, **leukopenia, thrombocytopenia**

**Metabolic:** hyperglycemia

**Musculoskeletal:** joint stiffness, muscle cramps

**Respiratory:** cough, dyspnea, shortness of breath, **pulmonary edema**

**Skin:** dermatitis, flushing, diaphoresis, photosensitivity, pruritus, urticaria, rash, **erythema multiforme, Stevens-Johnson syndrome**

**Other:** gingival hyperplasia, edema, weight gain

## Interactions

**Drug-drug.** *Antihypertensives:* additive hypotension

*Aspirin:* increased risk of bleeding

*Beta-adrenergic blockers, other antiarrhythmics:* additive adverse cardiovascular reactions

*Carbamazepine, cyclosporine:* increased blood levels of these drugs

*CYP450-3A4 inducers (such as rifampin):* decreased verapamil blood level

*CYP450-3A4 inhibitors (such as erythromycin, ritonavir):* increased verapamil blood level

*Digoxin:* increased digoxin blood level, greater risk of toxicity

*Lithium:* increased or decreased lithium blood level

*Neuromuscular blockers (succinylcholine, tubocurarine, vecuronium):* prolonged neuromuscular blockade

*Theophylline:* decreased verapamil clearance, increased blood level, and possible toxicity

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, blood urea nitrogen, glucose, lactate dehydrogenase:*

increased levels

*Granulocytes:* decreased count

**Drug-food.** *Coffee, tea:* increased caffeine blood level

*Grapefruit juice:* increased verapamil blood level and effects

**Drug-herbs.** *Black catechu:* increased drug effects

*Cola nut, guarana:* increased caffeine blood level

*Ephedra (ma huang), St. John's wort:* reduced hypotensive effect of verapamil

*Yerba maté:* decreased clearance of this herb

**Drug-behaviors.** *Alcohol use:* additive hypotension

### Patient monitoring

- With I.V. use, monitor vital signs and ECG continuously.
- Assess blood pressure when therapy begins and when dosage is adjusted.
- Watch closely for signs and symptoms of heart failure.

 Monitor for signs and symptoms of erythema multiforme (fever, rash, sore throat, mouth sores, cough, iris lesions). Report early indications immediately, before condition can progress to Stevens-Johnson syndrome.

- Assess CBC. Watch for blood dyscrasias.
- Monitor blood glucose level. Stay alert for hyperglycemia in diabetic patients.

### Patient teaching

- Instruct patient to avoid chewing, breaking, or crushing extended-release form.

 Advise patient to immediately report rash, unusual bleeding or bruising, fainting, and (in long-term use) fatigue, nausea, or yellowing of skin or eyes.

- Caution patient not to take with grapefruit juice.
- Instruct patient to limit caffeine intake and avoid alcohol.
- Advise patient to seek medical advice before using over-the-counter medications or herbs.
- Tell patient to avoid sun exposure and to wear sunscreen and protective clothing when going outdoors.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## vinblastine sulfate (VLB)

**Pharmacologic class:** Vinca alkaloid

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

- Drug should be administered only by individuals experienced in giving it. **Make sure needle is positioned properly in vein before injecting drug.** Leakage into surrounding tissue during I.V. administration may cause considerable irritation. If it does, discontinue injection immediately and inject remaining portion of dose into another vein. To treat extravasation, administer local injection of hyaluronidase and apply moderate heat to affected area.
- Drug is fatal if given intrathecally. Give I.V. only.

### Action

Arrests mitosis and blocks cell division, interfering with nucleic acid synthesis. Cell-cycle-phase specific.

**Availability**

*Lyophilized powder for injection:* 10-mg vial

**Indications and dosages**

➤ Hodgkin's disease; advanced testicular cancer; lymphoma; AIDS-related Kaposi's sarcoma; bladder cancer; renal cancer; non-small-cell lung cancer; melanoma; breast cancer; choriocarcinoma; histiocytosis X; mycosis fungoides

**Adults:** 3.7 mg/m<sup>2</sup> I.V. weekly; may increase to a maximum of 18.5 mg/m<sup>2</sup> I.V. weekly, based on response. Withhold weekly dose if white blood cell (WBC) count is less than 4,000 cells/mm<sup>3</sup>. May increase dosage in increments of 1.8 mg/m<sup>2</sup> if needed, but not after WBC count drops to approximately 3,000 cells/mm<sup>3</sup>.

**Dosage adjustment**

- Hepatic impairment

**Contraindications**

- Hypersensitivity to drug
- Significant granulocytopenia from causes other than disease being treated
- Uncontrolled bacterial infections
- Intrathecal use
- Elderly patients with cachexia or skin ulcers

**Precautions**

Use cautiously in:

- hepatic or pulmonary dysfunction, renal disease with hypertension, malignant-cell infiltration of bone marrow, neuromuscular disease
- females of childbearing age
- pregnant or breastfeeding patients (use not recommended).

**Administration**

⚠ Follow facility protocol for handling and preparing chemotherapeutic drugs. Take special care to avoid eye contamination.

- Know that patient is usually premedicated with antiemetic.

⚠ Give by I.V. route only. (Intrathecal injection is fatal.)

- Reconstitute powder in 10-mg vial with 10 ml of normal saline solution for injection, to a concentration of 1 mg/ml. Refrigerate solution and protect from light; discard after 28 days.

- Inject I.V. dose into tubing of running I.V. line, or inject directly into vein over about 1 minute.

- Avoid extravasation, which may cause tissue necrosis. If extravasation occurs, stop injection, inject hyaluronidase locally, and apply moderate heat.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

**Adverse reactions**

**CNS:** headache, malaise, depression, paresthesia, loss of deep tendon reflexes, peripheral neuropathy and neuritis, **cerebrovascular accident, seizures**

**CV:** hypertension, tachycardia, **myocardial infarction**

**EENT:** pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, bleeding ulcer, abdominal pain, stomatitis, anorexia, **paralytic ileus**

**GU:** aspermia

**Hematologic:** anemia, **thrombocytopenia, leukopenia**

**Metabolic:** hyperuricemia, **syndrome of inappropriate antidiuretic hormone secretion**

**Musculoskeletal:** bone pain, muscle pain and weakness

**Respiratory:** shortness of breath, **acute bronchospasm, pulmonary infiltrates**

**Skin:** alopecia, skin irritation

**Other:** weight loss; jaw pain; tumor site pain; sloughing, cellulitis, and phlebitis at I.V. site; tissue necrosis (with extravasation)

## Interactions

**Drug-drug.** *Erythromycin, other*

*CYP450 inhibitors:* increased vinblastine toxicity

*Mitomycin:* increased risk of bronchospasm and shortness of breath

*Phenytoin:* decreased phenytoin blood level

## Patient monitoring

- 🔊 Assess respiratory status closely. Drug may cause acute shortness of breath and bronchospasm, especially in patients who previously received mitomycin.
- Check injection site for extravasation.
- Monitor blood pressure.
- Assess CBC. Stay alert for signs and symptoms of infection.
- Monitor closely for numbness and tingling of hands or feet and other adverse reactions.

## Patient teaching

- Explain drug therapy to patient. Emphasize importance of follow-up laboratory tests.
- Tell patient to promptly report signs and symptoms of infection and to take his temperature daily.
- Inform patient that drug may cause pain over tumor site.
- Instruct female of childbearing age to avoid pregnancy. Caution her not to breastfeed during therapy.
- Encourage patient to practice good oral hygiene to help prevent infected mouth sores.
- Inform patient that hair loss is a common side effect but typically reverses after treatment ends.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## vincristine sulfate (VCR)

**Pharmacologic class:** Vinca alkaloid

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

### FDA BOXED WARNING

- Drug should be administered only by individuals experienced in giving it. **Make sure needle is positioned properly in vein before injecting drug.** Leakage into surrounding tissue during I.V. administration may cause considerable irritation. If it does, discontinue injection immediately and inject remaining portion of dose into another vein. To treat extravasation, administer local injection of hyaluronidase and apply moderate heat to affected area.
- Drug is fatal if given intrathecally. Give I.V. only.

## Action

Unknown. Thought to block cell division and interfere with synthesis of nucleic acid. Cell-cycle-phase specific.

## Availability

*Solution for injection:* 1 mg/ml in 1-, 2-, and 5-ml vials

## Indications and dosages

➤ Acute leukemia

**Adults:** 0.4 to 1.4 mg/m<sup>2</sup> I.V. weekly, not to exceed 2 mg/dose. (Dosages higher than 2 mg may be used depending on patient, physician, protocol, and facility.)

**Children weighing more than 10 kg (22 lb):** 2 mg/m<sup>2</sup> I.V. weekly

**Children weighing 10 kg (22 lb) or less:** 0.05 mg/kg I.V. weekly

**Dosage adjustment**

- Hepatic impairment

**Off-label uses**

- Brain, hepatic, ovarian, testicular, and other cancers
- Neuroblastoma
- Kaposi's sarcoma
- Idiopathic thrombocytopenic purpura

**Contraindications**

- Hypersensitivity to drug
- Demyelinating form of Charcot-Marie-Tooth disease
- Intrathecal use

**Precautions**

Use cautiously in:

- infections, decreased bone marrow reserve, hepatic impairment, acute uric acid nephropathy, neuromuscular disease, pulmonary dysfunction, other chronic debilitating illnesses
- females of childbearing age
- pregnant or breastfeeding patients (use not recommended).

**Administration**

 Follow facility protocol for handling and preparing chemotherapeutic drugs. Be especially careful to avoid eye contamination.

- Be aware that patient is usually premedicated with antiemetic.
-  Give by I.V. route only. (Intrathecal injection is fatal.)
- Inject into tubing of running I.V. line, or inject directly into vein over 1 minute.
- Avoid extravasation (may cause tissue necrosis). If extravasation occurs, stop injection, inject hyaluronidase locally, and apply moderate heat.
- Know that drug may be used with other antineoplastics in some diseases.

Route	Onset	Peak	Duration
I.V.	Unknown	4 days	7 days

**Adverse reactions**

**CNS:** agitation, insomnia, depression, mental status changes, ascending

peripheral neuropathy, transient cortical blindness, **seizures, coma**

**EENT:** diplopia

**GI:** nausea, vomiting, constipation, abdominal cramps, stomatitis, anorexia, **paralytic ileus**

**GU:** nocturia, urinary retention,

gonadal suppression, **oliguria**

**Hematologic:** anemia, **leukopenia, thrombocytopenia** (mild and brief)

**Metabolic:** hyperuricemia, **syndrome of inappropriate antidiuretic hormone secretion**

**Respiratory:** bronchospasm

**Skin:** alopecia

**Other:** tissue necrosis (with extravasation), phlebitis at I.V. site

**Interactions**

**Drug-drug.** *Asparaginase:* decreased hepatic metabolism of vincristine

*Live-virus vaccines:* decreased antibody response to vaccine, increased risk of adverse reactions

*Mitomycin:* increased risk of bronchospasm and shortness of breath

**Drug-diagnostic tests.** *Platelets:*

increased or decreased count

*Uric acid:* increased level

*White blood cells:* decreased count (slight leukopenia) 4 days after therapy, resolving within 7 days

**Patient monitoring**

 Assess respiratory status. Drug may cause bronchospasm, especially in patients who previously received mitomycin.

- Monitor blood pressure.
- Evaluate neurologic status. Know that neurotoxicity is a dose-limiting adverse reaction.

• Monitor CBC with platelet count. Watch for signs and symptoms of blood dyscrasias.

- Stay alert for signs and symptoms of infection.

## Patient teaching

- Explain drug therapy to patient. Emphasize importance of follow-up laboratory tests.
- Advise patient to promptly report signs and symptoms of infection and to take his temperature daily.
- Urge patient to practice good oral hygiene, to help prevent infected mouth sores.
- Instruct female of childbearing age to avoid pregnancy. Caution her not to breastfeed during therapy.
- Tell patient that hair loss is a common side effect but typically reverses once treatment ends.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## vinorelbine tartrate

Navelbine

**Pharmacologic class:** Vinca alkaloid

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

- Give under supervision of physician experienced in use of cancer chemotherapy, in facility with adequate diagnostic and treatment resources.
- **Product is for I.V. use only.** Intrathecal administration of other vinca alkaloids has resulted in death. Syringes containing this product should be labeled "WARNING. FOR I.V. USE ONLY. FATAL IF GIVEN INTRATHECALLY."
- Severe granulocytopenia causing increased susceptibility to infection may occur. Before starting drug, patient's granulocyte count should be

at least 1,000 cells/mm<sup>3</sup>. Adjust dosage according to complete blood counts (CBCs) with differentials obtained on day of treatment.

- **Make sure I.V. needle or catheter is properly positioned before injecting drug.** Administration may lead to extravasation, causing local tissue necrosis and thrombophlebitis.

## Action

Blocks cell division and interferes with nucleic acid synthesis. Cell-cycle-phase specific.

## Availability

**Injection:** 10 mg/ml in 1- and 5-ml vials

## Indications and dosages

➤ Inoperable non-small-cell lung cancer

**Adults:** As monotherapy, 30 mg/m<sup>2</sup> I.V. weekly given over 6 to 10 minutes. In combination therapy, 25 mg/m<sup>2</sup> weekly given with cisplatin q 4 weeks. Alternatively, in combination therapy, 30 mg/m<sup>2</sup> I.V. given with cisplatin on days 1 and 29, then q 6 weeks.

## Dosage adjustment

- Hepatic impairment
- Neurotoxicity

## Off-label uses

- Cervical, breast, or ovarian cancer

## Contraindications

- Hypersensitivity to drug
- Pretreatment granulocyte count below 1,000 cells/mm<sup>3</sup>

## Precautions

Use cautiously in:

- hepatic impairment, decreased bone marrow reserve, past or present neuropathy
- history of radiation therapy

- females of childbearing age
- pregnant or breastfeeding patients (use not recommended)
- children (safety not established).

### Administration

 Follow facility protocols for handling and preparing chemotherapeutic drugs. Be especially careful to avoid eye contamination.

- Know that patient is usually premedicated with antiemetic.

 Give by I.V. route only. (Intrathecal injection is fatal.)

- Before use, dilute drug in syringe with dextrose 5% in water or normal saline solution to yield a concentration of 1.5 to 3 mg/ml. Or dilute in I.V. bag of compatible solution to yield a concentration of 0.5 to 2 mg/ml.
- Administer into tubing of running I.V. line or directly into vein over 6 to 10 minutes. Immediately after injection, flush line with 75 to 125 ml of compatible I.V. solution.

Route	Onset	Peak	Duration
I.V.	Unknown	7-10 days	7-15 days

### Adverse reactions

**CNS:** fatigue, **neurotoxicity**

**CV:** chest pain, phlebitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, anorexia, **pancreatitis, intestinal obstruction, paralytic ileus**

**Hematologic:** anemia, **bone marrow depression, severe granulocytopenia, neutropenia, thrombocytopenia**

**Metabolic:** hyponatremia

**Musculoskeletal:** joint, back, or jaw pain; myalgia

**Respiratory:** **acute respiratory distress syndrome, acute shortness of breath, bronchospasm, interstitial pulmonary changes**

**Skin:** alopecia, rash, skin reactions

**Other:** tumor site pain; irritation, pain, and phlebitis at I.V. site; **sepsis**

### Interactions

**Drug-drug.** *Cisplatin, other antineoplastic:* increased risk and severity of bone marrow depression

*Mitomycin:* increased risk of acute pulmonary reaction

**Drug-diagnostic tests.** *Bilirubin, hepatic enzymes, liver function tests:* increased values

*Granulocytes, hemoglobin, platelets, white blood cells:* decreased levels

### Patient monitoring

- Monitor vital signs closely.
- Assess liver function tests and CBC with platelet count.
- Watch for signs and symptoms of infection.
- Observe injection site closely for reactions and extravasation.
-  Closely monitor neurologic and respiratory status. Drug may lead to acute pulmonary changes, especially in patients who previously received mitomycin.

### Patient teaching

- Explain drug therapy to patient. Emphasize importance of follow-up laboratory tests.
- Advise patient to promptly report signs and symptoms of infection and to take his temperature daily.
- Tell patient that hair loss is a common side effect but typically reverses once treatment ends.
- Instruct female of childbearing age to avoid pregnancy. Caution her not to breastfeed during therapy.
- Urge patient to practice good oral hygiene, to help prevent infected mouth sores.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## voriconazole

Vfend

**Pharmacologic class:** Triazole

**Therapeutic class:** Antifungal

**Pregnancy risk category D**

### Action

Inhibits fungal cytochrome P450–mediated 14- $\alpha$ -lanosterol demethylation, preventing fungal biosynthesis and inactivating fungal cell

### Availability

*Lyophilized powder for injection:* 200 mg

*Powder for oral suspension:* 40 mg/ml

*Tablets:* 50 mg, 200 mg

### Indications and dosages

➤ Invasive aspergillosis; serious fungal infections caused by *Scedosporium apiospermum* and *Fusarium* species

**Adults and children ages 12 and older:** Initially, 6 mg/kg I.V. q 12 hours for two doses (each dose infused over 1 to 2 hours), followed by a maintenance dose of 4 mg/kg I.V. q 12 hours given no faster than 3 mg/kg/hour. Change to oral dosing as described below when patient can tolerate it.

**Adults and children ages 12 and older weighing more than 40 kg (88 lb):** 200 mg P.O. q 12 hours 1 hour before or after a meal; may increase to 300 mg P.O. q 12 hours p.r.n.

**Adults and children ages 12 and older weighing less than 40 kg (88 lb):** 100 mg P.O. q 12 hours at least 1 hour before or after a meal; may increase to 150 mg P.O. q 12 hours p.r.n.

➤ Esophageal candidiasis

**Adults and children ages 12 and older weighing 40 kg (88 lb) or more:** 200 mg P.O. q 12 hours for at least 14 days, and for at least 7 days after symptoms resolve

**Adults and children ages 12 and older weighing less than 40 kg (88 lb):**

100 mg P.O. q 12 hours for at least 14 days, and for at least 7 days after symptoms resolve

➤ Candidemia (in nonneutropenic patients) and other deep-tissue *Candida* infections

**Adults and children ages 12 and**

**older:** 6 mg/kg I.V. q 12 hours for first 24 hours, followed by maintenance dose of 3 mg/kg I.V. q 12 hours. Or 200 mg P.O. q 12 hours for candidemia and 4 mg/kg I.V. q 12 hours or 200 mg P.O. q 12 hours for other deep-tissue *Candida* infections. Patients should be treated for at least 14 days after resolution of symptoms or after last positive culture, whichever is longer.

### Dosage adjustment

- Mild to moderate hepatic impairment
- Moderate to severe renal impairment (with I.V. use)
- Adult patients weighing less than 40 kg (88 lb)
- Concurrent use of phenytoin or efavirenz

### Off-label uses

- Febrile neutropenia (as empiric therapy)

### Contraindications

- Hypersensitivity to drug or its components
- Concurrent use of long-acting barbiturates, ergot alkaloids, rifabutin, rifampin, CYP450-3A4 substrates (such as astemizole, cisapride, pimozide, quinidine, terfenadine), sirolimus, high-dose ritonavir, St. John's wort, or carbamazepine

### Precautions

Use cautiously in:

- hypersensitivity to other azoles
- renal disease, hepatic dysfunction, risk factors for pancreatitis (such as

recent chemotherapy, hematopoietic stem cell transplant)

- hereditary problems of galactose intolerance, Lapp lactase deficiency, or glucose-galactose malabsorption (avoid tablet use)
- concurrent use of low-dose ritonavir (avoid use unless benefit-risk to patient justifies use)
- pregnant or breastfeeding patients
- children younger than age 12 (safety and efficacy not established).

### Administration

- Correct electrolyte disturbances before therapy starts.

 Don't give concurrently with astemizole, cisapride, or terfenadine (no longer available in U.S.); carbamazepine; ergot alkaloids; long-acting barbiturates; pimozide; quinidine; rifabutin; rifampin; ritonavir; or sirolimus.

 Don't give by I.V. bolus injection.

- Reconstitute powder with 19 ml of water for injection, to yield a volume of 20 ml. Shake vial until powder dissolves. Withdraw prescribed dose, then dilute further in compatible I.V. solution to a final concentration of 0.5 to 5 mg/ml. Give I.V. over 1 to 2 hours at a rate not exceeding 3 mg/kg/hour.

- Don't give through same I.V. line with other drugs, blood products, or electrolytes.
- To reconstitute powder for oral suspension, tap bottle to release powder. Add 46 ml of water, and shake vigorously for about 1 minute. Remove cap, push bottle adapter into neck of bottle, and replace cap. After reconstitution, suspension volume is 75 ml, providing usable volume of 70 ml (40 mg/ml). Shake bottle before each use. Use only 5-ml oral dispenser supplied. Don't mix with other drugs, and don't dilute further.
- Give oral suspension and tablets 1 hour before or after a meal.

Route	Onset	Peak	Duration
P.O.	1-2 hr	Unknown	Unknown
I.V.	Start of infusion	Unknown	Unknown

### Adverse reactions

**CNS:** dizziness, headache, hallucinations

**CV:** hypotension, hypertension, tachycardia, chest pain, vasodilation, peripheral edema

**EENT:** photophobia, blurred vision, visual disturbances, eye hemorrhage, chromatopsia

**GI:** nausea, vomiting, diarrhea, abdominal pain, dry mouth, **pancreatitis**

**GU:** **renal dysfunction, acute renal failure**

**Hematologic:** anemia, **pancytopenia, leukopenia, thrombocytopenia**

**Hepatic:** cholestatic jaundice, **hepatic failure**

**Metabolic:** hypomagnesemia, hypokalemia

**Musculoskeletal:** fluorosis, periostitis (with long-term use)

**Respiratory:** respiratory disorders

**Skin:** pruritus, maculopapular rash, **erythema multiforme, toxic epidermal necrolysis, Stevens-Johnson syndrome**

**Other:** chills, fever, **sepsis, infusion-related reactions** including **anaphylaxis**

### Interactions

**Drug-drug.** *Barbiturates (long-acting), carbamazepine, phenytoin, rifampin:* decreased voriconazole blood level

*Benzodiazepines:* sedation

*Calcium channel blockers, HMG-CoA reductase inhibitors:* increased blood levels of these drugs

*Cyclosporine, sirolimus, tacrolimus:* increased blood levels of these drugs, greater risk of nephrotoxicity

*CYP450-3A4 substrates:* increased blood levels of these drugs, causing prolonged QT interval and risk of torsades de pointes

*Ergot alkaloids*: increased blood levels of these drugs, resulting in ergotism  
*Non-nucleoside reverse transcriptase inhibitors, protease inhibitors*: inhibited voriconazole metabolism

*Rifabutin*: decreased voriconazole blood level, increased rifabutin blood level

*Sulfonylureas*: increased sulfonylurea blood level, greater risk of hypoglycemia

*Vinca alkaloids*: increased risk of neurotoxicity

*Warfarin, other coumarin derivatives*: increased partial thromboplastin time

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, creatinine*: increased levels

**Drug-herbs.** *Gossypol*: increased risk of nephrotoxicity

*St. John's wort*: significantly reduced voriconazole plasma exposure

### Patient monitoring

- Monitor kidney and liver function tests. Watch for signs and symptoms of organ toxicity.
- Assess electrolyte levels and CBC, including platelet count.
- 🔊 Monitor ECG. Stay alert for prolonged QT interval.
- 🔊 During infusion, monitor patient for anaphylactoid-type reactions, including flushing, fever, sweating, tachycardia, chest tightness, dyspnea, faintness, nausea, pruritus, and rash; consider stopping infusion should these reactions occur.
- 🔊 Be aware of postmarketing reports of pancreatitis, especially in children, and monitor appropriately.
- 🔊 Monitor patient receiving long-term therapy for skeletal pain. Discontinue drug if radiologic findings indicate fluorosis or periostitis.
- Check for vision problems in therapy exceeding 28 days.

### Patient teaching

- Explain therapy to patient. Stress importance of follow-up laboratory tests.
- Tell patient using oral form to take doses 1 hour before or after a meal.
- Emphasize importance of taking drug exactly as directed for entire duration prescribed.
- Instruct patient to promptly report adverse reactions.
- Tell female of childbearing age to immediately report pregnancy.
- Caution patient to avoid driving and other hazardous activities, because drug may cause visual disturbances.
- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- Advise patient not to use St. John's wort without consulting prescriber.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

### warfarin sodium

Apo-Warfarin<sup>✱</sup>, Coumadin, Gen-Warfarin<sup>✱</sup>, Jantoven, Marevan<sup>✱</sup>, Novo-Warfarin<sup>✱</sup>, Taro-Warfarin<sup>✱</sup>

**Pharmacologic class:** Coumarin derivative

**Therapeutic class:** Anticoagulant

**Pregnancy risk category** X

W

**FDA BOXED WARNING**

- Drug may cause major or fatal bleeding. Bleeding is more likely during starting period and with higher dosage (resulting in higher International Normalized Ratio [INR]). Monitor INR regularly in all patients. Those at high risk for bleeding may benefit from more frequent INR monitoring, careful dosage adjustment, and shorter duration of therapy. Instruct patients about measures to minimize risk of bleeding and advise them to immediately report signs and symptoms of bleeding.

**Action**

Interferes with synthesis of vitamin K–dependent clotting factors (II, VII, IX, and X) and anticoagulant proteins C and S in liver

**Availability**

*Injection:* 5.4 mg/vial (2 mg/ml when reconstituted)

*Tablets:* 1 mg, 2 mg, 2.5 mg, 3 mg, 4 mg, 5 mg, 6 mg, 7.5 mg, 10 mg

**Indications and dosages**

➤ Venous thrombosis; pulmonary embolism; atrial fibrillation; myocardial infarction (MI); thromboembolic complications of cardiac valve placement

**Adults:** Initially, 2.5 to 10 mg P.O. or I.V. daily for 2 to 4 days, then adjusted based on prothrombin time (PT) or International Normalized Ratio (INR). Usual maintenance dosage is 2 to 10 mg P.O. daily.

**Dosage adjustment**

- Elderly or debilitated patients

**Off-label uses**

- Acute coronary syndrome
- Intracoronary stent placement
- Prevention of catheter thrombosis

**Contraindications**

- Hypersensitivity to drug
- Uncontrolled bleeding
- Open wounds
- Severe hepatic disease
- Hemorrhagic or bleeding tendency
- Cerebrovascular hemorrhage
- Cerebral aneurysm or dissecting aorta
- Blood dyscrasias
- Pericarditis or pericardial effusion
- Bacterial endocarditis
- Malignant hypertension
- Recent brain, eye, or spinal cord injury or surgery
- Lumbar puncture and other procedures that may cause uncontrollable bleeding
- Major regional or lumbar block anesthesia
- Threatened abortion, eclampsia, preeclampsia
- Unsupervised senile, alcoholic, or psychotic patients
- Pregnancy, females of childbearing potential

**Precautions**

Use cautiously in:

- cancer, heparin-induced thrombocytopenia, moderate to severe renal impairment, moderate to severe hypertension, infectious GI disease, known or suspected deficiency in protein C–mediated anticoagulant response, polycythemia vera, vasculitis, severe diabetes mellitus
- indwelling catheter use
- history of poor compliance
- elderly or debilitated patients
- breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

**Administration**

⚠ Be aware that warfarin is a high-alert drug.

- Know that I.V. form is reserved for patients who can't tolerate oral form. I.V. and oral dosages are identical.

- For I.V. use, reconstitute vial with 2.7 ml of sterile water for injection; administer over 1 to 2 minutes. After reconstitution, drug is stable for 4 hours at room temperature.
- Be aware that vitamin K reverses warfarin effects. If major bleeding occurs, fresh frozen plasma may be given.
- When converting to warfarin from heparin, give both drugs concomitantly for 4 to 5 days until therapeutic effect of warfarin occurs.

Route	Onset	Peak	Duration
P.O.	Several hr	0.5-3 days	2-5 days
I.V.	Unknown	Unknown	Unknown

### Adverse reactions

**GI:** nausea, vomiting, diarrhea, abdominal cramps, stomatitis, anorexia

**GU:** hematuria

**Hematologic:** eosinophilia, **bleeding, hemorrhage, agranulocytosis, leukopenia**

**Hepatic:** hepatitis

**Skin:** rash, dermatitis, urticaria, pruritus, alopecia, dermal necrosis

**Other:** fever, “purple toes” syndrome (bilateral painful, purple lesions on toes and sides of feet), hypersensitivity reaction

### Interactions

**Drug-drug.** *Abciximab, acetaminophen (chronic use), androgens, aspirin, capcitabine, cefamandole, cefoperazone, cefotetan, chloral hydrate, chloramphenicol, clopidogrel, disulfiram, eptifibatide, fluconazole, fluoroquinolones, itraconazole, metronidazole (including vaginal use), nonsteroidal anti-inflammatory drugs, plicamycin, quinidine, quinine, sulfonamides, thrombolytics, ticlopidine, tirofiban, valproic acid, zafirlukast:* increased response to warfarin, greater risk of bleeding

*Barbiturates, hormonal contraceptives containing estrogen:* decreased anti-coagulant effect

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, INR:* increased values

*Partial thromboplastin time, PT:* prolonged

**Drug-food.** *Vitamin K-rich foods (large amounts):* antagonism of anti-coagulant effect

**Drug-herbs.** *Angelica:* prolonged PT  
*Anise, arnica, asafetida, bromelain, chamomile, clove, danshen, devil’s claw, dong quai, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, licorice, meadowsweet, motherwort, onion, papain, parsley, passionflower, quassia, red clover, Reishi mushroom, rue, sweet clover, turmeric, white willow, others:* increased risk of bleeding  
*Coenzyme Q10, green tea, St. John’s wort:* decreased anticoagulant effect  
**Drug-behaviors.** *Alcohol use:* enhanced warfarin activity

### Patient monitoring

- Monitor PT, INR, and liver function tests.
- Watch for signs and symptoms of bleeding and hepatitis.

### Patient teaching

- 📢 Explain therapy to patient. Stress importance of adhering to schedule for laboratory tests.
- 📢 Instruct patient to promptly report unusual bleeding or bruising.
- Caution patient to consult prescriber before taking over-the-counter preparations or herbs.
- Advise patient to inform all other health care providers (including dentist) that he is taking warfarin.
- Tell patient not to vary his intake of foods high in vitamin K (such as leafy green vegetables, fish, pork, green tea, and tomatoes), to avoid alterations in drug’s anticoagulant effect.

- 📣 Instruct females of childbearing age to report pregnancy immediately.
- Stress importance of avoiding contact sports and other activities that could cause injury and bleeding.
- Caution patient to avoid alcohol during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## zafirlukast

Accolate

**Pharmacologic class:** Leukotriene receptor antagonist

**Therapeutic class:** Antiasthmatic, bronchodilator

**Pregnancy risk category B**

### Action

Antagonizes activity of three leukotrienes at specific receptor sites in airway smooth muscle, inhibiting inflammation

### Availability

Tablets (coated): 10 mg, 20 mg

### Indications and dosages

➤ Prophylaxis and long-term treatment of asthma

**Adults and children ages 12 and older:** 20 mg P.O. b.i.d.

**Children ages 5 to 11:** 10 mg P.O. b.i.d.

### Off-label uses

- Exercise-induced bronchospasm
- Chronic urticaria

### Contraindications

- Hypersensitivity to drug or its components
- Hepatic impairment, including hepatic cirrhosis

### Precautions

Use cautiously in:

- acute asthma attacks
- concurrent use of warfarin
- patients older than age 55
- pregnant patients
- breastfeeding patients (use not recommended)
- children younger than age 5 (safety not established).

### Administration

- Give at least 1 hour before or 2 hours after a meal.

Route	Onset	Peak	Duration
P.O.	30 min	3.5 hr	12 hr

### Adverse reactions

**CNS:** headache, dizziness, asthenia, insomnia, depression (especially in children and adolescents)

**GI:** nausea, vomiting, diarrhea, abdominal pain, dyspepsia

**Hepatic:** hepatic dysfunction including liver failure and death (rare)

**Musculoskeletal:** joint or back pain, myalgia

**Other:** fever, infection, pain

### Interactions

**Drug-drug.** *Aspirin:* increased zafirlukast blood level

*Erythromycin, theophylline:* decreased zafirlukast blood level

*Warfarin:* increased warfarin effects, greater risk of bleeding

**Drug-food.** *Any food:* decreased rate and extent of zafirlukast absorption

### Patient monitoring

- Assess patient's respiratory status to help evaluate drug efficacy.

 Monitor liver function tests closely; watch for signs and symptoms of liver dysfunction.

### Patient teaching

- Tell patient to take at least 1 hour before or 2 hours after a meal.
- Advise patient to take exactly as prescribed, even if he is symptom-free.
-  Tell patient to immediately report asthma attack. Advise him not to use drug for rapid relief of bronchospasm.
- Instruct patient to continue taking other asthma drugs unless prescriber directs otherwise.
-  Instruct patient to immediately report signs and symptoms of liver dysfunction (nausea, anorexia, fatigue, lethargy, pruritus, jaundice, flulike symptoms, or right upper quadrant abdominal pain).
- Instruct patient or caregiver to report insomnia or depression.
- Instruct female patient to consult prescriber if she plans to breastfeed.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and foods mentioned above.

## zaleplon

Sonata

**Pharmacologic class:** Pyrazolopyrimidine, nonbenzodiazepine hypnotic

**Therapeutic class:** Sedative-hypnotic

**Controlled substance schedule IV**

**Pregnancy risk category C**

### Action

Binds to omega-1 receptor of gamma-aminobutyric acid receptor complex, relaxing smooth muscles, reducing anxiety, and producing sedation. Also has anticonvulsant effect.

### Availability

Capsules: 5 mg, 10 mg

### Indications and dosages

 Insomnia

**Adults younger than age 65:** 10 mg P.O. at bedtime. Dosage above 20 mg is not recommended.

### Dosage adjustment

- Mild to moderate hepatic impairment
- Elderly or debilitated patients

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- tartrazine sensitivity
- severe renal impairment (use not recommended), mild to moderate hepatic impairment, respiratory impairment, depression
- history of suicide attempt
- patients weighing less than 50 kg (110 lb)
- patients older than age 65
- pregnant or breastfeeding patients (use not recommended)
- children younger than age 18 (safety not established).

### Administration

- Give at bedtime.
- Don't administer with high-fat meal.

Route	Onset	Peak	Duration
P.O.	Rapid	1 hr	3-4 hr

### Adverse reactions

**CNS:** headache, amnesia, anxiety, hallucinations, light-headedness, dizziness, drowsiness, depersonalization, transient memory or psychomotor impairment, incoordination, malaise, vertigo, asthenia, hyperesthesia, paresthesia, tremor

**CV:** peripheral edema

**EENT:** abnormal vision, eye pain, ear pain, hearing sensitivity, epistaxis

**GI:** nausea, abdominal pain, colitis, dyspepsia, anorexia

**GU:** dysmenorrhea

**Musculoskeletal:** myalgia

**Skin:** photosensitivity

**Other:** altered sense of smell, fever

## Interactions

**Drug-drug.** *Cimetidine:* decreased metabolism and increased effects of zaleplon

*CNS depressants (including antihistamines, opioids, other sedative-hypnotics, phenothiazines, tricyclic antidepressants):* additive CNS depression

*CYP450-3A4 inducers (such as carbamazepine, phenobarbital, phenytoin, rifampin):* decreased blood level and reduced efficacy of zaleplon

*CYP450-3A4 inhibitors (such as erythromycin, ketoconazole):* increased zaleplon blood level

**Drug-food.** *High-fat meal:* delayed drug absorption

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

## Patient monitoring

- Monitor drug efficacy. Insomnia persisting after 7 to 10 days warrants reevaluation for underlying psychological or physical illness.
- Stay alert for adverse drug reactions.

## Patient teaching

- Explain therapy to patient. Emphasize importance of taking drug just before bedtime or after trying to sleep—but only if he will be able to get at least 4 hours of sleep.
- Inform patient that high-fat meal slows drug absorption and delays drug effects.

- Caution patient to avoid driving and other hazardous activities while under drug's influence.

- Instruct patient to avoid alcohol during therapy.

- Tell patient rebound insomnia may occur for 1 or 2 nights after he stops taking drug.

- Advise female of childbearing age to notify prescriber if she is or plans to become pregnant or if she is breastfeeding.

- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, foods, herbs, and behaviors mentioned above.

## zanamivir

### Relenza

**Pharmacologic class:** Neuraminidase inhibitor

**Therapeutic class:** Antiviral

**Pregnancy risk category C**

## Action

Inhibits influenza virus neuraminidase, an enzyme essential for viral replication

## Availability

*Powder for inhalation:* 5 mg/blister

## Indications and dosages

➤ Prevention of influenza

**Adults and children ages 5 and older:** Prophylaxis in the household setting, 2 inhalations (10 mg) once daily for 10 days. Prophylaxis during community outbreaks, 2 inhalations (10 mg) once daily for 28 days.

➤ Influenza virus A or B

**Adults and children ages 7 and older:** Two oral inhalations (5 mg/inhalation) b.i.d. for 5 days

## Contraindications

- History of allergic reaction to components of drug, including lactose milk proteins

## Precautions

Use cautiously in:

- chronic obstructive pulmonary disease, asthma, lactose intolerance
- concurrent use of live attenuated intranasal influenza vaccine (Don't administer until 48 hours after cessation of zanamivir and don't administer zanamivir until 2 weeks after administration of live attenuated influenza vaccine, unless medically indicated.)
- pregnant or breastfeeding patients
- children younger than age 7 (safety not established).

## Administration

- Give two doses on day 1, spaced at least 2 hours apart. On subsequent days, space doses 12 hours apart, and give at approximately same time each day.

Route	Onset	Peak	Duration
Inhalation	Rapid	1-2 hr	12 hr

## Adverse reactions

**CNS:** headache, dizziness

**EENT:** sinusitis, EENT infections

**GI:** nausea, vomiting, diarrhea

**Respiratory:** bronchitis, cough

**Other:** allergic reaction

## Interactions

None significant

## Patient monitoring

- Assess respiratory status. Watch closely for signs and symptoms of declining respiratory function.

## Patient teaching

- Explain therapy to patient. Demonstrate how to use Diskhaler device.
- Tell patient to take drug exactly as prescribed for as long as directed, even if symptoms improve.

- If patient is also taking an inhaled bronchodilator, advise him to take bronchodilator before zanamivir.
- Emphasize that drug doesn't prevent spread of influenza to others.
- Instruct patient to immediately report worsening respiratory symptoms.
- As appropriate, review other significant adverse reactions.

## zidovudine

Apo-Zidovudine<sup>✳</sup>, Novo-AZT<sup>✳</sup>, Retrovir

**Pharmacologic class:** Nucleoside reverse transcriptase inhibitor

**Therapeutic class:** Antiretroviral

**Pregnancy risk category C**

## FDA BOXED WARNING

- Drug has been linked to hematologic toxicity (including neutropenia and severe anemia), particularly in patients with advanced human immunodeficiency virus (HIV) infection.
- Prolonged use is associated with symptomatic myopathy.
- Lactic acidosis and severe hepatomegaly with steatosis (including fatal cases) have occurred with use of nucleoside analogs alone or in combination, including zidovudine and other antiretrovirals.

## Action

After conversion to its active metabolite, inhibits activity of HIV reverse transcriptase and terminates viral DNA growth

## Availability

**Capsules:** 100 mg

**Injection:** 10 mg/ml in 20-ml vial

**Syrup:** 50 mg/5 ml

**Tablets:** 300 mg

## Indications and dosages

➤ HIV-1 infection

### Adults and children older than age 12:

600 mg P.O. total daily dosage divided into either b.i.d. or t.i.d. dosing; or 1 mg/kg I.V. five to six times daily; in combination with other antiretrovirals

### Children ages 4 weeks to younger than 18 years weighing 30 kg (66 lb) or more:

600 mg P.O. total daily dosage divided into either b.i.d. or t.i.d. dosing; or 480 mg/m<sup>2</sup> total daily dosage divided into either b.i.d. or t.i.d. dosing. Don't exceed recommended adult dosage.

### Children ages 4 weeks to younger than 18 years weighing 9 kg (20 lb) to less than 30 kg (66 lb):

18 mg/kg/day total daily dosage divided into either b.i.d. or t.i.d. dosing; or 480 mg/m<sup>2</sup> total daily dosage divided into either b.i.d. or t.i.d. dosing. Don't exceed recommended adult dosage.

### Children ages 4 weeks to younger than 18 years weighing 4 kg (9 lb) to less than 9 kg (20 lb):

24 mg/kg/day total daily dosage divided into either b.i.d. or t.i.d. dosing; or 480 mg/m<sup>2</sup> total daily dosage divided into either b.i.d. or t.i.d. dosing. Don't exceed recommended adult dosage.

➤ To prevent maternal-fetal HIV transmission

**Pregnant women (more than 14 weeks of pregnancy):** 500 mg P.O. daily in divided doses (usually as five 100-mg doses) until labor begins; then 2 mg/kg I.V. over 1 hour followed by a continuous infusion of 1 mg/kg/hour until umbilical cord is clamped

**Neonates:** 2 mg/kg P.O. q 6 hours starting within 12 hours of delivery and continuing for 6 weeks. For neonates unable to receive oral dosing, 1.5 mg/kg by I.V. infusion over 30 minutes q 6 hours

## Dosage adjustment

• End-stage renal disease in patients maintained on hemodialysis or peritoneal dialysis

- Hematologic toxicity
- Concurrent use of drugs (such as fluconazole or valproic acid) in patients experiencing pronounced anemia

## Off-label uses

- Occupational exposure to HIV

## Contraindications

- Patients who have had potentially life-threatening allergic reactions (such as anaphylaxis, Stevens-Johnson syndrome) to drug or its components

## Precautions

Use cautiously in:

- renal or hepatic impairment, known risk factors for liver disease, decreased bone marrow reserve, hemoglobin less than 9.5 g/dl, granulocyte count less than 1,000 cells/mm<sup>3</sup>
- concurrent use of Combivir or Trizivir (zidovudine-containing products) or interferon- and ribavirin-based regimens
- pregnant or breastfeeding patients.

## Administration

 For I.V. use, remove dose from vial and add to I.V. solution containing dextrose 5% in water, to yield a final concentration no higher than 4 mg/ml. Infuse over 1 hour. Avoid rapid infusion or bolus injection. Don't give by I.M. route.

- In adults, give by I.V. route only until patient can tolerate oral dose.
- If a child is unable to reliably swallow a capsule or tablet, give syrup formulation.

Route	Onset	Peak	Duration
P.O.	Variable	30-90 min	4 hr
I.V.	Rapid	End of infusion	4 hr

## Adverse reactions

CNS: headache, paresthesia, malaise, insomnia, dizziness, drowsiness, asthenia, **seizures**

**GI:** nausea, vomiting, constipation, abdominal pain, dyspepsia, anorexia, **pancreatitis**

**Hematologic:** **severe anemia** (necessitating transfusions), **agranulocytopenia**, **severe bone marrow depression**

**Hepatic:** **severe hepatomegaly with steatosis**

**Metabolic:** **lactic acidosis**

**Musculoskeletal:** myalgia, back pain, myopathy

**Respiratory:** dyspnea

**Skin:** diaphoresis, rash, altered nail pigmentation

**Other:** abnormal taste, fever, **immune reconstitution syndrome**

## Interactions

**Drug-drug.** *Acetaminophen, aspirin, indomethacin:* increased risk of zidovudine toxicity

*Amphotericin B, dapsone, flucytosine, pentamidine:* increased risk of nephrotoxicity and bone marrow depression  
*Cyclosporine:* extreme drowsiness, lethargy  
*Cytotoxic drugs, myelosuppressants, nephrotoxic drugs (such as ganciclovir, interferon alfa):* increased risk of hematologic toxicity

*Fluconazole, methadone, probenecid, valproic acid:* increased zidovudine blood level, greater risk of toxicity  
*Ribavirin:* antagonism of zidovudine's antiviral activity

**Drug-diagnostic tests.** *Granulocytes, hemoglobin, platelets:* decreased levels

**Drug-herbs.** *St. John's wort:* decreased zidovudine efficacy

## Patient monitoring

• Monitor neurologic status, especially for signs and symptoms of impending seizure.

🔊 Periodically assess CBC and kidney and liver function tests. Be aware that drug can cause hepatotoxicity.

🔊 Watch for signs and symptoms of pancreatitis, immune reconstitution syndrome, and lactic acidosis.

## Patient teaching

• Tell patient he may take with or without food.

• Instruct patient to take capsules with at least 4 oz of fluid and to stay upright after taking.

• Explain therapy to patient. Emphasize that drug doesn't cure HIV infection.

• Urge patient to take drug exactly as prescribed.

🔊 Teach patient to recognize and immediately report signs and symptoms of serious side effects, such as seizures.

• Stress importance of follow-up laboratory testing.

• Advise female of childbearing age to use effective contraception.

• Inform pregnant patient that drug reduces risk of, but may not prevent, HIV transmission to neonate.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## ziprasidone hydrochloride

Geodon, Zeldox\*

**Pharmacologic class:** Benzisoxazole derivative

**Therapeutic class:** Antipsychotic

**Pregnancy risk category C**

## FDA BOXED WARNING

• Elderly patients with dementia-related psychosis are at increased risk for death. Although causes of death varied, most appeared to be cardiovascular or infectious.

• Drug isn't approved for treatment of dementia-related psychosis.

**Action**

Unknown. Thought to antagonize dopamine<sub>2</sub> and serotonin<sub>2</sub> receptors.

**Availability**

*Capsules:* 20 mg, 40 mg, 60 mg, 80 mg

*Injection (powder, lyophilized for solution):* 20 mg/ml

**Indications and dosages**

➤ Schizophrenia

**Adults:** Initially, 20 mg P.O. b.i.d. with food; may increase q 2 days up to 80 mg b.i.d. Usual maintenance dosage is 20 to 80 mg P.O. b.i.d.; maximum recommended dosage is 80 mg b.i.d. For prompt control of acute agitation, 10 to 20 mg I.M. as a single dose; depending on patient's response, may repeat 10-mg I.M. dose q 2 hours or 20-mg I.M. dose q 4 hours to a maximum daily dosage of 40 mg.

➤ Acute treatment as monotherapy of manic or mixed episodes associated with bipolar I disorder

**Adults:** Initially, 40 mg P.O. b.i.d. with food; may increase to 60 or 80 mg P.O. b.i.d. on second day of treatment and subsequently adjust on basis of tolerance and efficacy within range of 40 to 80 mg P.O. b.i.d. For maintenance (as an adjunct to lithium or valproate), continue treatment at same dosage on which patient was initially stabilized, within range of 40 to 80 mg P.O. b.i.d. with food; also continue periodic assessments to determine need for maintenance treatment.

**Contraindications**

- Hypersensitivity to drug
- History of arrhythmias, prolonged QT interval
- Recent myocardial infarction
- Uncompensated heart failure
- Concomitant use of arsenic trioxide, chlorpromazine, class IA or III antiarrhythmics, or other drugs that prolong the QT interval

**Precautions**

Use cautiously in:

- renal impairment, cerebrovascular disease, history of seizures or with conditions that lower seizure threshold, cardiovascular disorders, dysphagia, hyperprolactinemia
- bradycardia, hypokalemia, or hypomagnesemia (avoid use)
- adverse reactions with previous use of atypical antipsychotics (such as risperidone or clozapine)
- pregnant patients
- breastfeeding patients (use not recommended)
- children (safety and efficacy not established).

**Administration**

- Give with food.
- Know that P.O. therapy should replace I.M. therapy as soon as possible.
- ⚠ Don't give with drugs that prolong the QT interval.

Route	Onset	Peak	Duration
P.O.	Several hr	1-3 days	Unknown
I.M.	Unknown	1 hr	Unknown

**Adverse reactions**

**CNS:** dizziness, drowsiness, dystonia, hypertonia, asthenia, akathisia, extrapyramidal reactions, agitation, headache, insomnia, personality disorder, paresthesia, speech disorder, **neuroleptic malignant syndrome, seizures, suicide attempt**

**CV:** orthostatic hypotension, hypertension, tachycardia, **arrhythmias** (from prolonged QT interval)

**EENT:** abnormal vision, rhinitis

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, dry mouth, anorexia

**GU:** dysmenorrhea, priapism

**Metabolic:** hypomagnesemia (rare), hypokalemia, hyperglycemia

**Musculoskeletal:** myalgia

**Respiratory:** cough, cold symptoms

**Skin:** urticaria, rash, fungal dermatitis, diaphoresis, photosensitivity

**Other:** accidental injury, pain at I.M. injection site

## Interactions

**Drug-drug.** *Antihypertensives:* additive hypotension

*Carbamazepine:* decreased ziprasidone blood level

*Centrally acting drugs:* additive CNS effects

*Dopamine agonists, levodopa:* antagonism of these drugs' effects

*Drugs that decrease potassium or magnesium level (such as diuretics) or prolong QT interval (such as dofetilide, moxifloxacin, pimozone, quinidine, sotalol, sparfloxacin, thioridazine):* increased risk of arrhythmias

*Ketoconazole:* increased ziprasidone blood level

**Drug-diagnostic tests.** *Glucose, magnesium, potassium:* decreased levels

**Drug-food.** *Any food:* increased drug absorption

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

## Patient monitoring

☞ Monitor ECG before and during therapy. Stay alert for prolonged QT interval. Know that dizziness, syncope, or palpitations may signify life-threatening arrhythmias caused by prolonged QT interval.

☞ Obtain baseline serum potassium and magnesium levels in patients at risk for significant electrolyte disturbances. Replace potassium and magnesium as appropriate before proceeding with therapy. Periodically monitor serum potassium and magnesium levels in patients on concurrent diuretics. Discontinue drug in patients with persistent QTc measurements greater than 500 msec.

• In patients with preexisting low white blood cell count (WBC) or

history of leukopenia or neutropenia, determine WBC count frequently during first few months of therapy; discontinue drug at first sign of WBC decrease in the absence of other causative factors.

• Monitor patients with risk factors for diabetes mellitus for signs and symptoms of hyperglycemia, including polydipsia, polyuria, polyphagia, and weakness, and perform glucose testing before and during treatment.

• Assess blood pressure for hypertension and orthostatic hypotension.

☞ Monitor neurologic status, especially for neuroleptic malignant syndrome and tardive dyskinesia. Immediately discontinue drug and provide appropriate treatment if these conditions develop. However, some patients who develop tardive dyskinesia may require this drug despite the presence of the syndrome.

☞ Be aware that patient with bradycardia, hypokalemia, or hypomagnesemia is at greater risk for torsades de pointes and sudden death.

☞ Closely supervise patients at high risk for suicide.

☞ Discontinue drug in patients who develop a rash without an identified cause.

## Patient teaching

• Tell patient to take with food.

• Explain therapy and need for follow-up laboratory testing.

☞ Advise patient to promptly report suicidal thoughts or actions, extrapyramidal reactions (such as repetitive, involuntary, purposeless movements), severe thirst or other signs of hyperglycemia, rash, fainting, seizures, high fever, sweating, unstable blood pressure, stupor, muscle rigidity, or suspected infection.

• Instruct patient to consult prescriber before taking over-the-counter preparations.

- Caution patient to avoid driving and other hazardous activities until drug effects are known.
- Instruct patient to move slowly when sitting up or standing, to avoid dizziness from sudden blood pressure drop.
- Advise patient to avoid sun exposure and to wear sunscreen and protective clothing when going outdoors.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and herbs mentioned above.

## zoledronic acid

Aclasta<sup>☼</sup>, Reclast, Zometa

**Pharmacologic class:** Third-generation bisphosphonate

**Therapeutic class:** Calcium regulator

**Pregnancy risk category** D

### Action

Inhibits osteoclast-mediated bone by blocking resorption of mineralized bone and cartilage, eventually causing cell death and limiting tumor growth. Also limits calcium release produced by tumor.

### Availability

*Concentrate for dilution for infusion*

(Zometa): 4 mg/5 ml single-use vial

*Solution for infusion* (Reclast): 5 mg/

100 ml in ready-to-infuse bottles

*Solution for infusion* (Zometa):

4 mg/100 ml in single-use ready-to-use bottles

### Indications and dosages

- Hypercalcemia caused by cancer
- Adults:** 4 mg (Zometa) I.V. as a single dose infused over 15 minutes. If albumin-corrected calcium level doesn't return to normal or stay normal,

retreatment with 4 mg I.V. begins no sooner than 7 days after initial treatment. For single dose, maximum recommended dosage is 4 mg.

- Multiple myeloma; bone metastasis from solid tumors in conjunction with standard antineoplastic therapy

**Adults:** 4 mg I.V. (Zometa) as a single dose infused over 15 minutes q 3 to 4 weeks for patients with creatinine clearance greater than 60 ml/minute. Optimal duration of therapy is unknown.

- Paget's disease of bone

**Adults:** 5 mg (Reclast) I.V. as single dose in 100 ml ready-to-infuse solution infused over 15 minutes with constant infusion rate by vented infusion line

- Treatment of osteoporosis in men and postmenopausal women

**Adults:** 5 mg (Reclast) I.V. as single 5-mg infusion over 15 minutes once yearly

- Prevention of osteoporosis in postmenopausal women

**Adults:** 5 mg (Reclast) I.V. as single 5-mg infusion over 15 minutes once every 2 years

- Treatment and prevention of glucocorticoid-induced osteoporosis

**Adults:** 5 mg (Reclast) I.V. as single 5-mg infusion over 15 minutes once yearly

### Dosage adjustment

- Renal impairment (Zometa)

### Contraindications

- Hypersensitivity to drug or its components
- Hypocalcemia (Reclast)
- Patients with creatinine clearance less than 35 ml/minute and those with evidence of acute renal impairment (Reclast)

### Precautions

Use cautiously in:

- bone metastasis with severe renal impairment (use not recommended)

- asthma, renal dysfunction, hepatic insufficiency, history of hypoparathyroidism
- pregnant patients (avoid Reclast use)
- concurrent use of nephrotoxic drugs
- breastfeeding patients
- children (use not indicated)

### Administration

- Before starting therapy, make sure patient is adequately hydrated.
- Don't allow drug to come in contact with calcium-containing solutions; administer as single I.V. solution.
- Reconstitute Zometa concentrate for infusion by adding 5 ml of sterile water for injection to 4-mg vial. Dilute further by adding reconstituted drug to 100 ml of normal saline solution or dextrose 5% in water.
- ⚠ To avoid inadvertent injection of undiluted Zometa concentrate for infusion, don't store undiluted drug in a syringe.
- Be aware that Zometa ready-to-use solution for infusion (for single-use only) may be administered directly without further preparation.
- To prepare reduced Zometa dosages for patients with baseline creatinine clearance of 60 ml/minute or less, see manufacturer's directions.
- Give Reclast I.V. in 100 ml ready-to-infuse solution administered by vented infusion line. Infusion time must not be less than 15 minutes, with constant infusion rate. Following infusion, flush I.V. line with 10 ml normal saline.
- Be aware that a single Reclast dose shouldn't exceed 5 mg.
- ⚠ Give by I.V. infusion over no less than 15 minutes. (Faster infusion may cause renal failure.)
- Be aware that all patients must be adequately supplemented with oral calcium and vitamin D daily during treatment with this drug.

Route	Onset	Peak	Duration
I.V. (Zometa)	Unknown	Unknown	7-28 days
I.V. (Reclast)	Rapid	End of infusion	Short

### Adverse reactions

**CNS:** dizziness, lethargy, rigors, asthenia, headache, agitation, confusion, insomnia, anxiety, drowsiness, fatigue, paresthesia

**CV:** hypotension

**EENT:** conjunctivitis

**GI:** nausea, vomiting, diarrhea, constipation, dysphagia, anorexia

**GU:** urinary tract infection, **renal toxicity**

**Hematologic:** anemia, **neutropenia**

**Metabolic:** dehydration, hypomagnesemia, **hypocalcemia**, hypophosphatemia

**Musculoskeletal:** myalgia, joint or bone pain, osteonecrosis of jaw, atypical subtrochanteric and diaphyseal femoral fractures

**Respiratory:** dyspnea, cough, **pleural effusion**

**Skin:** rash

**Other:** flu-like syndrome, pyrexia, pain, peripheral edema, infection, fever, chills, infusion site reactions, hypersensitivity reactions (including rare cases of **urticaria, angioedema, and anaphylactic reaction or shock**)

### Interactions

**Drug-drug.** *Aminoglycosides, loop diuretics, other nephrotoxic agents, thalidomide:* increased risk of renal toxicity

**Drug-diagnostic tests.** *Calcium, hemoglobin, magnesium, phosphorus, platelets, potassium, red blood cells, white blood cells:* decreased levels

*Creatinine:* increased or decreased level

### Patient monitoring

- Monitor electrolyte levels (especially calcium). Watch for signs and symptoms of electrolyte imbalance.

- Assess vital signs. Stay alert for hypotension, dyspnea, and pleural effusion.
- 🔊 Closely monitor fluid intake and output and creatinine level. Check for signs and symptoms of renal toxicity.
- Monitor CBC with platelet count.
- 🔊 Be aware that drug may cause atypical femur fractures. Evaluate patient with thigh or groin pain and consider discontinuing or interrupting therapy based on an individual benefit-risk assessment. Also, if severe incapacitating bone, joint, or muscle pain occurs, withhold drug.

### Patient teaching

- Explain therapy to patient, including associated risk of renal failure and need for follow-up laboratory tests.
- Tell patient to report shortness of breath, unusual bleeding or bruising, decreased urine output, or other significant problems.
- Instruct patient to take daily oral calcium supplement and multivitamin containing vitamin D as prescribed.
- Tell patient to avoid invasive dental procedures while taking this drug.
- Advise female of childbearing age to avoid pregnancy and breastfeeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## zolmitriptan

Zomig Rapimelt<sup>⚠️</sup>, Zomig-ZMT

**Pharmacologic class:** Selective 5-hydroxytryptamine receptor agonist

**Therapeutic class:** Antimigraine agent

**Pregnancy risk category C**

### Action

Blocks serotonin release, constricting inflamed and dilated cerebral and cranial blood vessels and reducing nerve transmission in trigeminal pain pathways

### Availability

*Nasal spray:* 5-mg single-use spray device

*Tablets (immediate-release):* 2.5 mg, 5 mg

*Tablets (orally disintegrating):* 2.5 mg

### Indications and dosages

➤ Acute migraine

**Adults:** 1.25 to 2.5 mg (immediate-release) P.O., repeated if migraine returns in 2 hours or less; maximum dosage is 10 mg in any 24-hour period. Or 2.5 mg (orally disintegrating tablet) P.O., repeated if migraine returns in 2 hours or less; maximum dosage is 10 mg in any 24-hour period. Alternatively, one dose of nasal spray (5 mg); if migraine returns, may repeat dose after 2 hours; don't exceed maximum daily dosage of 10 mg in any 24-hour period.

### Dosage adjustment

- Hepatic impairment

### Contraindications

- Hypersensitivity to drug
- Hemiplegic or basilar migraine
- Ischemic cardiac disease or other significant cardiac disease
- Uncontrolled hypertension
- Cerebrovascular accident or transient ischemic attack
- Peripheral vascular disease, including ischemic bowel disease
- Use of ergot-type or ergot-containing drugs or other 5-HT<sub>1</sub> agonists within past 24 hours
- MAO inhibitor use within past 14 days

### Precautions

Use cautiously in:

- hepatic or renal impairment

- risk factors for coronary artery disease (such as strong family history of this disease, diabetes mellitus, obesity, cigarette smoking, high cholesterol level, men older than age 40, post-menopausal women)
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

- Place orally disintegrating tablet on patient's tongue, where it should dissolve.
- Don't break orally disintegrating tablet in half.
- Know that each nasal spray unit is intended for one use only.

Route	Onset	Peak	Duration
P.O.	Unknown	2 hr	Unknown
Nasal	15 min	2-5 hr	24 hr

### Adverse reactions

**CNS:** paresthesia, asthenia, dizziness, insomnia, hyperesthesia, drowsiness, syncope, vertigo, agitation, depression, anxiety, emotional lability, fatigue, malaise

**CV:** chest pain, heaviness, or tightness; hypertension; palpitations; angina; **arrhythmias**

**EENT:** dry eyes, ear pain, tinnitus, epistaxis, altered sense of smell, laryngitis

**GI:** nausea, vomiting, dyspepsia, dysphagia, gastroenteritis, esophagitis, dry mouth

**GU:** urinary frequency, hematuria, polyuria, cystitis

**Hepatic:** hepatic dysfunction

**Metabolic:** hyperglycemia

**Musculoskeletal:** leg cramps, neck pain, tenosynovitis, myasthenia, myalgia, back pain

**Respiratory:** bronchitis, hiccups

**Skin:** pruritus, rash, diaphoresis, bruising, urticaria, photosensitivity

**Other:** unusual taste, flushing, sweating or redness in face (with nasal

spray); fever; chills; excessive thirst; facial or tongue edema; pressure or tightness in throat or jaw; yawning; warm or cold sensation

### Interactions

**Drug-drug.** *Cimetidine:* doubling of zolmitriptan's half-life

*Ergot-containing drugs:* vasospasm  
*Fluoxetine, fluvoxamine, paroxetine, sertraline:* weakness, incoordination, hyperreflexia

*MAO inhibitors:* increased zolmitriptan effects

**Drug-diagnostic tests.** *Blood glucose:* increased level

**Drug-herbs.** *S-adenosylmethionine (SAM-e), St. John's wort:* serotonin syndrome

**Drug-behaviors.** *Smoking:* increased risk of adverse cardiovascular effects

### Patient monitoring

- Assess therapeutic response to help gauge drug efficacy.
- Watch for adverse cardiovascular and respiratory reactions, particularly dyspnea and chest pain or tightness.
- Assess blood glucose level in diabetic patient.

### Patient teaching

 Tell patient to immediately report shortness of breath or pain or tightness in chest or throat.

- Explain that drug is intended to treat migraine, not prevent it.

- Tell patient to remove orally disintegrating tablet from blister pack just before taking it, and then place it on his tongue and let it dissolve. Instruct him not to break it.

- Teach patient proper use of nasal spray. Tell him each unit is intended for one use only.

- Caution patient to avoid driving and other hazardous activities during severe migraine or if drug causes adverse CNS effects.

- Inform patient that smoking may increase drug's cardiovascular risks.
- Advise female of childbearing age not to take drug if she is, might be, or plans to become pregnant.
- Advise patient to avoid sun exposure and to wear sunscreen and protective clothing when going outdoors.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## zolpidem tartrate

Ambien, Ambien CR, Edluar, Intermezzo, Stilnoct<sup>⚠</sup>, Zolpimist

**Pharmacologic class:** Imidazopyridine

**Therapeutic class:** Sedative-hypnotic

**Controlled substance schedule IV**

**Pregnancy risk category B**

### Action

Depresses CNS by binding to gamma-aminobutyric acid receptors

### Availability

*Oral spray:* 5 mg/actuation

*Tablets:* 5 mg, 6.25 mg, 10 mg, 12.5 mg

*Tablets (sublingual):* 1.75 mg, 3.5 mg, 5 mg, 10 mg

### Indications and dosages

➤ Insomnia

**Adults:** 10 mg P.O. (Ambien) or 12.5 mg P.O. (Ambien CR), or 10 mg (Edluar) sublingual, or 10 mg oral spray (two sprays) immediately before bedtime

➤ As-needed use for treatment of insomnia when middle-of-the-night awakening is followed by difficulty returning to sleep

**Adults:** 1.75 mg (Intermezzo) sublingually for women and 3.5 mg

(Intermezzo) sublingually for men, taken only once per night if needed

### Dosage adjustment

- Hepatic impairment
- Concurrent use of CNS depressants
- Elderly or debilitated patients

### Off-label uses

- Long-term treatment of insomnia
- Insomnia related to selective serotonin reuptake inhibitors
- Postoperative sedation

### Contraindications

- Hypersensitivity to drug

### Precautions

Use cautiously in:

- pulmonary disease, hepatic or severe renal impairment
- history of psychiatric illness, suicide attempt, or substance abuse
- elderly or debilitated patients
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Don't give with or immediately after a meal.

Route	Onset	Peak	Duration
P.O.	Rapid	30 min-2 hr	6-8 hr
P.O. (spray)	Unknown	0.9 hr	Unknown
S.L.	Unknown	30 min-2 hr	Unknown

### Adverse reactions

**CNS:** amnesia, ataxia, confusion, euphoria, vertigo, daytime drowsiness, dizziness, drugged feeling

**EENT:** diplopia, abnormal vision

**GI:** nausea, vomiting, diarrhea, dry mouth

**Other:** hypersensitivity reaction, physical or psychological drug dependence, drug tolerance

### Interactions

**Drug-drug.** *Antihistamines, opioid analgesics, phenothiazines, sedative-hypnotics,*

*tricyclic antidepressants*: increased CNS depression

*Ketoconazole, ritonavir*: increased blood level and enhanced effects of zolpidem

*Rifampin*: decreased zolpidem efficacy

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian*: increased CNS depression

**Drug-behaviors.** *Alcohol use*: increased CNS depression

### Patient monitoring

- Monitor for physical and psychological drug dependence. Watch for drug hoarding.
- Assess for adverse reactions, including confusion, ataxia, and amnesia.

### Patient teaching

- Tell patient to take immediately before bedtime (and not after a meal), because it works quickly.
- Instruct patient to place sublingual tablet under the tongue, where it will disintegrate; tell patient not to swallow tablet and not to take it with water.
- Instruct patient that oral spray pump needs to be primed initially and after not using spray for 14 days. Tell patient to fully press down on pump to make sure a full dose (5 mg) of oral spray is sprayed directly into the mouth over the tongue with each spray.
- Advise patient to take only when he is able to get a full night's sleep (7 to 8 hours) before he needs to be active again. Tell patient to use oral spray only if 4 hours of bedtime remain before planned time of waking.
- Stress that drug is meant only for short-term use (7 to 10 days).
- Tell patient rebound insomnia may occur for 1 to 2 nights after he discontinues drug.
- Inform patient that drug may cause amnesia, drowsiness, and a drugged feeling the next day.

- Caution patient to avoid driving and other hazardous activities while under drug's influence.

- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, herbs, and behaviors mentioned above.

## zonisamide

Zonegran

**Pharmacologic class:** Sulfonamide

**Therapeutic class:** Anticonvulsant

**Pregnancy risk category** C

### Action

Raises seizure threshold and reduces seizure duration, probably by stabilizing neuronal membranes through action on sodium and calcium channels

### Availability

*Capsules:* 25 mg, 50 mg, 100 mg

### Indications and dosages

➤ Adjunctive treatment of partial seizures

#### Adults and children older than age 16:

Initially, 100 mg P.O. daily for 2 weeks, then, if required, increased to 200 mg P.O. daily for at least 2 weeks. May increase in 100-mg increments at 2-week intervals to 300 to 400 mg daily as required. Daily dosage ranges from 100 to 600 mg.

### Dosage adjustment

- Hepatic or renal impairment
- Elderly patients

### Off-label uses

- Infantile spasms
- Progressive myoclonic epilepsy
- Weight loss

## Contraindications

- Hypersensitivity to drug or other sulfonamides

## Precautions

Use cautiously in:

- hepatic or renal disease
- pregnant or breastfeeding patients
- children younger than age 16 (safety not established).

## Administration

- Give with or without food.

Route	Onset	Peak	Duration
P.O.	Unknown	2-6 hr	24 hr

## Adverse reactions

**CNS:** drowsiness, fatigue, agitation, irritability, depression, dizziness, psychomotor slowing, psychosis, asthenia, abnormal gait, incoordination, tremor, ataxia, headache, confusion, impaired memory, hyperesthesia, paresthesia, **seizures**

**EENT:** diplopia, amblyopia, nystagmus, tinnitus, rhinitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, dyspepsia, dry mouth, anorexia, **pancreatitis**

**GU:** renal calculi

**Hematologic:** anemia, **leukopenia**

**Respiratory:** cough

**Skin:** rash, pruritus, bruising, **Stevens-Johnson syndrome**

**Other:** abnormal taste, weight loss, allergic reactions, oligohidrosis and hyperthermia (in children), flulike symptoms, accidental injury

## Interactions

**Drug-drug.** *Carbamazepine, phenobarbital, phenytoin, valproic acid:* decreased zonisamide blood level and effects

*CYP450-3A4 inducers:* decreased zonisamide half-life

*CYP450-3A4 inhibitors:* increased zonisamide blood level

**Drug-diagnostic tests.** *Blood urea nitrogen, creatine kinase, creatinine:* increased levels

*Platelets, white blood cells:* decreased counts

## Patient monitoring

- Monitor CBC with white cell differential.
- Assess neurologic status; report significant adverse reactions.
- Monitor renal function tests. Watch for signs and symptoms of renal calculi.

 Monitor for rash, which may be first sign of Stevens-Johnson syndrome. If rash occurs, discontinue drug and notify prescriber immediately.

## Patient teaching

- Explain therapy to patient. Instruct him to keep seizure diary and show it to prescriber.
- Instruct patient to swallow capsules whole. Advise him to drink 6 to 8 glasses of water daily to help prevent kidney stones.
-  Warn patient that stopping drug abruptly may cause status epilepticus.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects him and until seizures are well controlled.
-  Tell patient to immediately report rash, fever, sore throat, sudden back pain, depression, speech or language problems, or painful urination.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

*Drug classes*

*Vitamins and minerals*

*Herbs and supplements*

*This page intentionally left blank*

## Drug classes

The collective monographs below cover the most common drug classes, and provide general information for the most commonly used generic drugs in each class. The drugs listed in each class are those covered in individual monographs in this book; the list is not intended to be comprehensive.

Keep in mind that drugs in the same class may vary as to contraindications, precautions, adverse reactions, interactions, and patient monitoring. For specific information on a particular drug, see the individual monograph. Also, because pregnancy risk category and interactions may differ for the drugs in a given class, this information is not included in the monographs below.

### alpha<sub>1</sub>-adrenergic agents

#### *Alpha<sub>1</sub>-adrenergic blockers:*

alfuzosin hydrochloride, doxazosin mesylate, phentolamine mesylate, silodosin, tamsulosin hydrochloride, terazosin hydrochloride

*Centrally acting alpha-adrenergic agonists:* clonidine hydrochloride, methyldopa, methyldopa hydrochloride

*Peripherally acting alpha-adrenergic agonists:* midodrine hydrochloride

#### Action

*Alpha<sub>1</sub>-adrenergic blockers* selectively block postsynaptic alpha<sub>1</sub>-adrenergic receptors, causing dilation of arterioles and veins, in turn lowering supine and

standing blood pressure. *Centrally acting alpha-adrenergic agonists* reduce sympathetic outflow from CNS and decrease peripheral resistance, renal vascular resistance, heart rate, and blood pressure. *Peripherally acting alpha-adrenergic agonists* activate alpha-adrenergic receptors of the arteriolar and venous vasculature, increasing vascular tone and blood pressure.

#### Indications

Hypertension, refractory heart failure, peripheral vascular disorders, benign prostatic hypertrophy, orthostatic hypotension (midodrine only), severe pain in cancer patients (injectable clonidine only)

#### Contraindications and precautions

- Contraindicated in hypersensitivity to drug and concomitant administration with strong CYP3A4 (CYP3A4) inhibitors (silodosin)
- Use cautiously in orthostatic hypotension; cataract surgery; concurrent use of other alpha blockers; anti-hypertensives; moderate CYP3A4 inhibitors; PDE5 inhibitors; and strong P-glycoprotein inhibitors (not recommended) with silodosin; renal insufficiency; angina pectoris; overt heart failure; when adding diuretics to drug regimen; in pregnant or breastfeeding patients; and in children (safety not established).

#### Adverse reactions

**CNS:** dizziness, headache, asthenia, drowsiness, nervousness, paresthesia, vertigo, fatigue

**CV:** orthostatic hypotension (with first dose of alpha<sub>1</sub>-adrenergic blocker), rebound hypertension, chest pain, palpitations, peripheral edema, tachycardia, **arrhythmias**

**EENT:** blurred vision, conjunctivitis, nasal congestion, sinusitis

**GI:** nausea, vomiting, diarrhea, abdominal pain, dry mouth

**GU:** urinary frequency or incontinence, priapism, erectile dysfunction, gynecomastia (with centrally acting agonists)

**Musculoskeletal:** joint, back, or extremity pain

**Respiratory:** dyspnea

**Skin:** pruritus, angioedema, urticaria, alopecia (with centrally acting agonists)

**Other:** fever, weight gain

### Patient monitoring

- Monitor electrolyte levels, ECG, and vital signs.

## antacids

aluminum hydroxide, calcium carbonate, magnesium hydroxide, magnesium oxide, sodium bicarbonate

### Action

Neutralize gastric acidity, which increases pH of stomach and duodenal bulb. Aluminum-containing antacids bind with phosphate ions in intestine to form insoluble aluminum phosphate, which is excreted in feces.

### Indications

Peptic ulcer, gastric hyperacidity, upset stomach associated with hyperacidity. Magnesium oxide is indicated for magnesium deficiency or depletion caused by malnutrition, restricted diet, alcoholism, or magnesium-depleting drugs.

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug, renal calculi, hypercalcemia, and hypophosphatemia
- Use cautiously in renal impairment, chronic pain syndrome, recent massive GI hemorrhage, and pregnant patients.

### Adverse reactions

**CNS:** aluminum toxicity, encephalopathy (aluminum-containing antacids)

**GI:** diarrhea (magnesium-containing antacids); constipation, possibly leading to intestinal obstruction (aluminum-containing antacids)

**Metabolic:** dose-dependent rebound hyperacidity; milk-alkali syndrome; hypermagnesemia in renal failure patients (magnesium-containing antacids); hypophosphatemia, aluminum accumulation in blood (aluminum-containing antacids)

**Musculoskeletal:** osteomalacia, aluminum accumulation in bone (aluminum-containing antacids)

### Patient monitoring

- Assess for constipation.
- Monitor serum electrolyte levels as appropriate.

## anti-Alzheimer's agents

donepezil hydrochloride, galantamine hydrobromide, memantine, rivastigmine tartrate

### Action

Reversibly inhibit acetylcholinesterase hydrolysis in CNS, which increases acetylcholine level and promotes nerve impulse transmission. Unlike donepezil, galantamine, and rivastigmine, memantine binds preferentially to cation channels operated by *N*-methyl-D-aspartate and doesn't affect reversible acetylcholinesterase inhibition.

### Indications

Mild to moderate Alzheimer's disease, moderate to severe Alzheimer's disease (memantine only)

## Contraindications and precautions

- Contraindicated in hypersensitivity to drug, piperidine derivatives, or acridines; angle-closure glaucoma; undiagnosed skin lesions; and jaundice with previous use of these drugs
- Use cautiously in moderate to severe renal or hepatic dysfunction, GI bleeding, seizures, cardiovascular disease, sick sinus syndrome, asthma or chronic obstructive pulmonary disease, impaired urinary outflow, diabetes mellitus, obesity, history of ulcer, postmenopausal patients, elderly patients, pregnant or breastfeeding patients, and children.

## Adverse reactions

**CNS:** tremor, confusion, insomnia, psychosis, hallucinations, depression, dizziness, headache, anxiety, nervousness, drowsiness, fatigue, abnormal dreams, irritability, paresthesia, aggression, vertigo, ataxia, restlessness, abnormal crying, syncope, aphasia, **seizures**

**CV:** chest pain, hypotension, hypertension, peripheral edema, vasodilation, **atrial fibrillation**

**EENT:** cataract, blurred vision, eye irritation, rhinitis, pharyngitis, sore throat

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, flatulence, eructation, anorexia

**GU:** urinary tract infection, urinary frequency or incontinence, increased libido

**Metabolic:** dehydration, hot flashes

**Musculoskeletal:** back and joint pain, bone fracture, muscle cramps, arthritis

**Respiratory:** upper respiratory infection, cough, bronchitis, dyspnea, influenza

**Skin:** rash, pruritus, urticaria, diaphoresis, flushing

**Other:** toothache, weight loss, pain, accidental trauma, flulike symptoms

## Patient monitoring

- Assess for severe nausea, vomiting, and diarrhea (which may lead to dehydration and weight loss).

 Watch closely for adverse reactions in patients with a history of GI bleeding, arrhythmias, seizures, pulmonary conditions, or use of nonsteroidal anti-inflammatory drugs.

- Monitor alanine aminotransferase level weekly during first 18 weeks of therapy.

## antiarrhythmics

adenosine, amiodarone hydrochloride, atropine sulfate, diltiazem hydrochloride, digoxin, disopyramide phosphate, dronedarone, esmolol hydrochloride, flecainide acetate, ibutilide fumarate, lidocaine hydrochloride, phenytoin, phenytoin sodium, procainamide hydrochloride, propafenone hydrochloride, propranolol hydrochloride, quinidine gluconate, quinidine sulfate, sotalol hydrochloride, verapamil hydrochloride

## Action

Varies with classification and subdivision (which are based on drug's action on cardiac muscle). *Class I* antiarrhythmics decrease rate of sodium entry during depolarization, reduce rate of action potential, and lengthen effective refractory period of fast-response fibers. *Class I* antiarrhythmics fall into three subdivisions. *Class IA* drugs (such as disopyramide, procainamide, and quinidine) depress phase 0 and lengthen the action potential. *Class IB* drugs (such as lidocaine, phenytoin, and tocainide) somewhat depress phase 0 and shorten the action potential. *Class IC* drugs (such as flecainide and propafenone) greatly depress phase 0

and slow conduction. Moricizine shares properties of class IA, IB, and IC antiarrhythmics.

**Class II** antiarrhythmics (such as propranolol) competitively block beta-adrenergic receptors and depress phase 4 depolarization.

**Class III** antiarrhythmics (such as amiodarone, bretylium, dofetilide, ibutilide, and sotalol) prolong duration of the action potential but don't affect polarization phase or resting membrane potential.

**Class IV** antiarrhythmics (calcium channel blockers such as verapamil) slow conduction velocity and increase atrioventricular (AV) node refractoriness.

## Indications

Arrhythmias, premature ventricular tachycardia, atrial flutter, atrial fibrillation, AV heart block

## Contraindications and precautions

- Contraindicated in hypersensitivity to drug, congenital or acquired long-QT syndrome, baseline QT or QTc interval greater than 440 msec, sick sinus syndrome, second- or third-degree AV block (unless patient has an artificial pacemaker), systolic pressure below 90 mm Hg, recent myocardial infarction or pulmonary congestion, pulmonary hypertension, aortic stenosis, severe renal impairment, digoxin toxicity, patients with NYHA Class IV heart failure or NYHA Class II to III heart failure with a recent decompensation requiring hospitalization or referral to specialized heart failure clinic (dronedarone), pregnancy, breastfeeding, and neonates
- Use cautiously in mild to moderate renal or hepatic impairment, enlarged prostate, myasthenia gravis, glaucoma, diabetes mellitus, potassium imbalance, conduction abnormalities,

ventricular tachycardia, ventricular arrhythmias, history of serious ventricular arrhythmias or heart failure, elderly patients, and children (safety not established).

## Adverse reactions

**CNS:** dizziness, light-headedness, agitation, jitteriness, anxiety, depression, fatigue, drowsiness, headache, syncope, malaise, involuntary movements, ataxia, paresthesia, peripheral neuropathy, incoordination, tremor, abnormal dreams, insomnia, confusion, acute psychosis, psychiatric disturbances  
**CV:** chest pain, palpitations, peripheral edema, bradycardia, tachycardia, **hypotension**, development or worsening of **arrhythmias, heart failure, heart block**

**EENT:** blurred vision, angle-closure glaucoma, corneal microdeposits, optic neuritis or neuropathy, photophobia, dry eyes, tinnitus, disturbed equilibrium, epistaxis, dry nose, altered smell perception

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, bloating, flatulence, dry mouth, anorexia

**GU:** dysuria, nocturia, polyuria, urinary hesitancy, urinary retention, erectile or other sexual dysfunction, decreased libido, epididymitis

**Hematologic:** anemia, **leukopenia, thrombocytopenia, agranulocytosis**  
**Hepatic:** jaundice, **hepatic dysfunction**

**Metabolic:** hypokalemia, hypothyroidism, hyperthyroidism, **hypoglycemia**

**Musculoskeletal:** muscle weakness, aches, or cramps; joint stiffness

**Respiratory:** cough, dyspnea, pneumonia, **pulmonary fibrosis, adult respiratory distress syndrome**

**Skin:** bluish skin discoloration, rash, dermatosis, pruritus, alopecia, flushing, photosensitivity, toxic epidermal necrolysis, **Stevens-Johnson syndrome**

**Other:** gingival hyperplasia, edema, weight gain

### Patient monitoring

- Monitor antiarrhythmic blood level.
- Assess blood pressure and pulse.

Report heart rate below 50 or above 120 beats/minute.

- Monitor blood glucose and electrolyte levels and liver and kidney function tests.

 Closely monitor extent of palpitations. Stay alert for fluttering or missed heartbeats, chest pain, and fainting episodes. Obtain ECG to document arrhythmias.

## anticholinergics

atropine sulfate, atropine sulfate ophthalmic, benzotropine mesylate, darifenacin hydrobromide, dicyclomine hydrochloride, dimenhydrinate, diphenoxylate hydrochloride and atropine sulfate, glycopyrrolate, hyoscyamine, hyoscyamine sulfate, meclizine hydrochloride, oxybutynin, oxybutynin chloride, scopolamine, scopolamine hydrobromide, solifenacin succinate, trihexyphenidyl hydrochloride, tiotropium, trimethobenzamide hydrochloride, trospium chloride

### Action

Block acetylcholine action in CNS and on autonomic effectors; also block vagal effects on sinoatrial and atrioventricular nodes, causing heart rate to increase. Small doses decrease salivary and bronchial secretions and reduce sweating; intermediate doses dilate pupils, inhibit accommodation, and increase heart rate; large doses decrease GI and GU motility; even higher doses reduce gastric acid secretion.

### Indications

Bradyarrhythmias, symptomatic bradycardia, heart block caused by vagal activity, peptic ulcer disease, pylorospasm, small-intestine hypertoxicity, colonic hypermotility, mild dysentery, diverticulitis, bronchospasm, spastic or overactive bladder, cystitis, infant colic, biliary or renal colic, pancreatitis, acute iritis, acute rhinitis, sialorrhea, hyperhidrosis, anticholinesterase poisoning, nausea, vomiting, dizziness, motion sickness, drug-induced extrapyramidal disorders, parkinsonism, adjunct for Parkinson's disease. Also used for cycloplegic refraction, to control gastric secretions and block cardiac vagal reflexes preoperatively, to promote diagnostic hypotonic duodenography, and to increase radiologic visibility of kidney.

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug, GI or GU tract obstruction, reflux esophagitis, severe ulcerative colitis, glaucoma, myasthenia gravis, intestinal atony, unstable cardiovascular status in acute hemorrhage, arrhythmias, tachycardia caused by cardiac insufficiency or thyrotoxicosis, toxic megacolon, GI infection, severe prostatic hypertrophy, bladder neck obstruction, bronchial asthma, chronic obstructive pulmonary disease, breastfeeding, and infants less than 6 months old
- Use cautiously in alcohol, sulfite, or tartrazine intolerance; high environmental temperatures; hepatic or renal impairment; autonomic neuropathy; mild to moderate prostatic hypertrophy; hyperthyroidism; coronary disease; heart failure; hypertension; hiatal hernia; ulcerative colitis; brain damage; Down syndrome; spasticity; phenylketonuria; elderly patients; pregnant patients (safety not established); neonates; and immature infants.

**Adverse reactions**

**CNS:** asthenia, nervousness, stimulation, insomnia, drowsiness, dizziness, headache, confusion

**CV:** palpitations, tachycardia

**EENT:** increased intraocular pressure, dilated pupils, blurred vision, photophobia

**GI:** nausea, vomiting, constipation, abdominal distention, epigastric distress, heartburn, gastroesophageal reflux, dry mouth, **paralytic ileus**

**GU:** urinary hesitancy or retention, erectile dysfunction, lactation suppression

**Skin:** urticaria, decreased diaphoresis

**Other:** taste loss, fever, irritation at I.M. injection site, allergic reaction, **anaphylaxis**

**Patient monitoring**

- Closely monitor vital signs and urine output.

**anticoagulants**

argatroban, bivalirudin, dalteparin sodium, danaparoid sodium, enoxaparin sodium, fondaparinux sodium, heparin calcium, heparin sodium, lepirudin, warfarin sodium

**Action**

Interfere with one or more parts of the pathways that lead to stable fibrin clot formation. May inhibit coagulation factors, bind to antithrombin, cause release of tissue factor pathway inhibitors, and prevent conversion of fibrinogen to fibrin.

**Indications**

Treatment or prophylaxis of venous thrombosis, pulmonary embolism, atrial fibrillation with embolization, myocardial infarction, or thromboembolic events (including deep-vein

thrombosis); during cardiovascular surgery; prevention of thrombus formation and embolization after prosthetic valve placement; after abdominal surgery or total hip or knee replacement surgery

**Contraindications and precautions**

- Contraindicated in hypersensitivity to drug, uncontrolled or active major bleeding, or thrombocytopenia caused by antiplatelet antibodies associated with low-molecular-weight heparins
- Use cautiously in severe hepatic or renal disease; hypertensive or diabetic retinopathy; untreated or severe uncontrolled hypertension; hemorrhagic stroke; severe thrombocytopenia; active GI bleeding or ulcers or recent history of ulcer disease; cancer; bacterial endocarditis; history of congenital or acquired bleeding disorder; recent brain, spinal, or ophthalmic surgery; spinal or epidural anesthesia; patients weighing less than 45 kg (99 lb); elderly patients; pregnant or breastfeeding patients; and children (safety not established).

**Adverse reactions**

**CNS:** headache, dizziness, insomnia, confusion, **spinal hematoma, cerebral or intracranial bleeding**

**CV:** hypotension, hypertension, angina pectoris, tachycardia, **arrhythmias, pulmonary embolism, thromboembolism, myocardial infarction**

**EENT:** ocular hemorrhage, rhinitis, epistaxis

**GI:** nausea, vomiting, constipation, dyspepsia, hematemesis, anorectal bleeding, melena, flatulence, **retroperitoneal or intra-abdominal bleeding, GI hemorrhage**

**GU:** dysuria, hematuria, urinary tract infection, urinary retention, **vaginal hemorrhage**

**Hematologic:** purpura, anemia, **granulocytopenia, thrombocytopenia,**

**agranulocytosis, pancytopenia, hemorrhage**

**Hepatic:** hepatitis

**Musculoskeletal:** back pain

**Respiratory:** dyspnea, pneumonia, respiratory disorder

**Skin:** rash, pruritus, bullous eruption, skin necrosis, urticaria, cellulitis, injection site or wound hematoma, alopecia

**Other:** fever, pain, infection, dependent edema, impaired healing, hypersensitivity reaction, **congenital anomalies, fetal distress, fetal death**

### Patient monitoring

 Watch for tarry stools and unusual bleeding or bruising.

- Assess baseline coagulation tests and CBC with white cell differential.
- Monitor venipuncture sites for bleeding, hematoma, and inflammation.

## anticonvulsants

carbamazepine, clonazepam, clonazepam dipotassium, diazepam, divalproex sodium, fosphenytoin sodium, gabapentin, lamotrigine, levetiracetam, magnesium sulfate, oxcarbazepine, pentobarbital, phenobarbital sodium, phenytoin, phenytoin sodium, pregabalin, primidone, tiagabine hydrochloride, topiramate, valproate sodium, valproic acid, zonisamide

### Action

Selectively depress hyperactive brain areas responsible for seizures

### Indications

Prophylaxis and treatment of status epilepticus and generalized tonic-clonic, mixed, petit mal, petit mal variant, akinetic, complex-partial, and myoclonic seizures; management of panic disorder, trigeminal neuralgia,

migraine, anxiety, psychoneurotic reactions, and alcohol withdrawal; skeletal muscle relaxation for endoscopy or cardioversion

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug or intolerance of alcohol, propylene glycol, tartrazine, or tricyclic antidepressants; bone marrow depression; severe hepatic disease; and MAO inhibitor use within past 14 days
- Use cautiously in mild to moderate hepatic or renal disease, severe cardiac or respiratory disease, acute or chronic pain, fever, hyperthyroidism, diabetes mellitus, severe anemia, uremia, angle-closure glaucoma, coma, CNS depression, sinus bradycardia, sinoatrial block, second- or third-degree heart block, Stokes-Adams syndrome, obesity, history of suicide attempt or drug abuse, elderly or debilitated patients, and pregnant or breastfeeding patients.

### Adverse reactions

**CNS:** dizziness, light-headedness, syncope, drowsiness, lethargy, sedation, depression, apathy, fatigue, disorientation, anger, hostility, mania or hypomania, restlessness, confusion, crying, delirium, headache, slurred speech, dysarthria, stupor, rigidity, tremor, dystonia, vertigo, euphoria, nervousness, poor concentration, vivid dreams, psychomotor retardation, paresthesia, extrapyramidal symptoms, mild paradoxical stimulation (first 2 weeks of therapy)

**CV:** hypertension, hypotension, palpitations, bradycardia, tachycardia, aggravation of coronary artery disease, **cardiovascular collapse, heart failure, arrhythmias**

**EENT:** blurred vision, diplopia, corneal opacities, nystagmus and other abnormal eye movements, conjunctivitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dysphagia, gastric disorders, stomatitis, glossitis, dry mouth, increased salivation, pharyngeal dryness, anorexia

**GU:** urinary hesitancy, retention, frequency, or incontinence; albuminuria; glycosuria; dysuria; nocturia; menstrual irregularities; libido changes; erectile dysfunction; gynecomastia

**Hematologic:** eosinophilia, **leukopenia**, **agranulocytosis**, **aplastic anemia**, **thrombocytopenia**

**Hepatic:** **hepatitis**

**Metabolic:** **syndrome of inappropriate antidiuretic hormone secretion**

**Musculoskeletal:** muscle rigidity

**Respiratory:** **pneumonitis**

**Skin:** photosensitivity, rash, urticaria, diaphoresis, **erythema multiforme**,

**Stevens-Johnson syndrome**

**Other:** chills, fever, hiccups, weight changes, edema, lymphadenopathy, physical and psychological drug dependence, drug tolerance

### Patient monitoring

- Monitor CBC, glucose and uric acid levels, urinalysis, and kidney and liver function tests.

 With I.V. use, watch closely for respiratory depression and cardiovascular collapse.

- Monitor for sore throat, easy bruising and bleeding, and epistaxis.
- Stay alert for oversedation.

## antidepressants

amitriptyline hydrochloride, bupropion hydrochloride, citalopram hydrobromide, clomipramine hydrochloride, desipramine hydrochloride, desvenlafaxine, doxepin hydrochloride, duloxetine hydrochloride, escitalopram oxalate, fluoxetine

hydrochloride, fluvoxamine maleate, imipramine hydrochloride, imipramine pamoate, milnacipran, mirtazapine, nefazodone hydrochloride, nortriptyline hydrochloride, paroxetine hydrochloride, paroxetine mesylate, sertraline hydrochloride, trazodone hydrochloride, venlafaxine hydrochloride

### Action

Produce changes in serotonin or norepinephrine receptor systems; inhibit neuronal serotonin, norepinephrine, or dopamine reuptake

### Indications

Endogenous or reactive depression, including depression associated with anxiety and sleep disturbances

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug, MAO inhibitor use within past 14 days, uncontrolled narrow-angle glaucoma (milnacipran)
- Use cautiously in cardiovascular disease; hypertension; hepatic or renal impairment; severe depression; increased intraocular pressure; angle-closure glaucoma; hyperthyroidism; prostatic hypertrophy; acute recovery phase after myocardial infarction (MI); electroshock therapy; elective surgery; suicidal tendency; history of seizures, neurologic impairment, mania, or drug abuse; concomitant use of serotonin precursors (such as tryptophan) and selective serotonin reuptake inhibitors and selective norepinephrine reuptake inhibitors (use not recommended); use of drugs that increase blood pressure or heart rate; use of I.V. digoxin; use of nonsteroidal anti-inflammatory drugs, aspirin, or other drugs that affect coagulation; significant alcohol use (avoid use);

obstructive uropathies (in males); elderly patients (milnacipran); pregnant or breastfeeding patients; and children younger than age 18.

### Adverse reactions

**CNS:** lethargy, sedation, hallucinations, delusions, disorientation, anxiety, nervousness, EEG changes, fatigue, peripheral neuropathy, insomnia, restlessness, drowsiness, dizziness, syncope, extrapyramidal effects, **neuroleptic malignant syndrome, seizures, coma, cerebrovascular accident (CVA)**

**CV:** hypotension, hypertension, ECG changes, tachycardia, palpitations, chest pain, **arrhythmias, MI**

**EENT:** visual disturbances, blurred vision, mydriasis, increased intraocular pressure, dry eyes, tinnitus, rhinitis

**GI:** nausea, vomiting, diarrhea, constipation, epigastric or abdominal pain, dyspepsia, dry mouth, anorexia, **paralytic ileus**

**GU:** urinary frequency or retention, gynecomastia, sexual dysfunction

**Hematologic:** **leukopenia, agranulocytosis, thrombocytopenia**

**Hepatic:** **hepatitis**

**Metabolic:** blood glucose changes

**Skin:** rash, urticaria, diaphoresis, bruising, pruritus, photosensitivity

**Other:** altered taste, increased appetite, weight changes, edema, chills, yawning, hypersensitivity reaction

### Patient monitoring

- Monitor CBC, blood glucose level, and kidney and liver function tests.
- 🔊 Assess ECG and heart sounds. Watch for tachycardia and more frequent angina attacks (which may precede MI or CVA).
- Evaluate neurologic function.
- Watch for sleep disturbances, lethargy, apathy, impaired thought processes, and poor therapeutic response.

- Check results of periodic eye exams. Report vision changes, perception of halos, eye pain, dilated pupils, headache, and nausea.

## antidiabetic drugs (hypoglycemics)

acarbose, exenatide acetate, glimepiride, glipizide, glyburide, insulins, liraglutide, metformin hydrochloride, miglitol, nateglinide, pioglitazone hydrochloride, pramlintide acetate, repaglinide, rosiglitazone maleate, saxagliptin, sitagliptin phosphate, tolazamide

### Action

Bind to plasma membrane of functional pancreatic beta cells, decreasing potassium permeability and membrane depolarization. These effects increase intracellular calcium transport and enhance release of secretory granules containing insulin.

Insulins promote glucose transport and stimulate carbohydrate metabolism, which inhibits the release of free fatty acids and stimulates protein metabolism and synthesis.

### Indications

Type 1 (insulin-dependent) or type 2 (non-insulin-dependent) diabetes mellitus

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug; personal or family history of medullary thyroid carcinoma; in patients with multiple endocrine neoplasia syndrome type 2 (liraglutide); and in diabetes mellitus complicated by ketoacidosis

- Use cautiously in severe cardiovascular, hepatic, or renal disease; heart failure; intestinal disorders; thyroid, pituitary, or adrenal dysfunction; malnutrition; high fever; prolonged nausea or vomiting; dehydration; hypoxemia; excessive alcohol ingestion (acute or chronic); concurrent use of insulin secretagogue or strong CYP450 and CYP3A4/5 inhibitors (saxagliptin); pancreatitis; elderly patients; and pregnant or breastfeeding patients.

### Adverse reactions

**CNS:** lethargy, sedation, hallucinations, delusions, disorientation, peripheral neuropathy, EEG changes, nervousness, restlessness, anxiety, fatigue, insomnia, drowsiness, dizziness, syncope, asthenia, extrapyramidal effects, **neuroleptic malignant syndrome, seizures, coma, cerebrovascular accident**

**CV:** hypotension, hypertension, ECG changes, tachycardia, palpitations, chest pain, **arrhythmias, myocardial infarction**

**EENT:** blurred vision, visual disturbances, mydriasis, dry eyes, increased intraocular pressure, tinnitus, rhinitis

**GI:** nausea, vomiting, diarrhea, constipation, epigastric or abdominal pain, dyspepsia, dry mouth, anorexia, **paralytic ileus**

**GU:** urinary frequency or retention, gynecomastia, sexual dysfunction

**Hematologic:** **leukopenia, agranulocytosis, thrombocytopenia**

**Hepatic:** **hepatitis**

**Metabolic:** hypokalemia, sodium retention, blood glucose changes, **hypoglycemia**

**Skin:** rash, urticaria, pruritus, diaphoresis, bruising, photosensitivity

**Other:** altered taste, increased appetite, weight changes, edema, chills, yawning, hypersensitivity reaction, injection site reaction

### Patient monitoring

- Monitor blood glucose level, especially during times of increased stress (such as infection, fever, surgery, and trauma).
- Assess weight and nutritional status.
- Evaluate liver and kidney function tests.

## antiemetics

### 5-HT<sub>3</sub> receptor antagonists:

dolasetron mesylate, granisetron hydrochloride, ondansetron hydrochloride, palonosetron hydrochloride

**Anticholinergics:** dimenhydrinate, diphenhydramine hydrochloride, meclizine hydrochloride, trimethoprim benzamide hydrochloride

**Antidopaminergics:** chlorpromazine hydrochloride, metoclopramide hydrochloride, perphenazine, prochlorperazine, promethazine hydrochloride

**Other:** aprepitant, dronabinol

### Action

Block activity of central neurotransmitters, dopamine in chemoreceptor trigger zone, acetylcholine in vomiting center, or 5-HT<sub>3</sub> receptors on vagal neurons in GI tract

### Indications

Prevention of nausea and vomiting caused by chemotherapy or radiation therapy, prevention or treatment of postoperative nausea or vomiting

### Contraindications and precautions

- 5-HT<sub>3</sub> receptor antagonists are contraindicated in hypersensitivity to drug. Antidopaminergics are

contraindicated in coma and drug- or alcohol-induced CNS depression.

- Use cautiously in hepatic disease; premature infants (if drug contains benzyl alcohol); or sulfite or tartrazine sensitivity (if drug contains sulfite or tartrazine). Also use cautiously in patients who have or may develop prolonged conduction intervals, especially marked QTc prolongation.

### Adverse reactions

**CNS:** anxiety, agitation, confusion, asthenia, dizziness, drowsiness, sedation, headache, malaise, fatigue, weakness, pain, vertigo, paresthesia, tremor, sleep disorder, depersonalization, ataxia, twitching, extrapyramidal syndrome

**CV:** hypertension, hypotension, angina, syncope, bradycardia, tachycardia, **arrhythmias, Mobitz I heart block**

**EENT:** epistaxis

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, abdominal pain, dry mouth, anorexia

**GU:** hematuria, dysuria, polyuria, urinary retention, **oliguria**

**Hematologic:** anemia, purpura, hematoma, **leukopenia, thrombocytopenia**

**Respiratory:** hypoxia

**Skin:** rash, flushing, increased diaphoresis, pruritus

**Other:** altered taste, fever, chills, cold sensation, edema, facial or peripheral edema, injection site reaction, **anaphylaxis**

### Patient monitoring

- Monitor CBC, liver function tests, and ECG changes.

 Stay alert for prolonged PR interval and widened QRS complexes, especially in patients receiving concurrent antiarrhythmics.

- Watch for excessive diuresis.
- When giving antidopaminergics, monitor for signs and symptoms of neuroleptic malignant syndrome.

## antifungals

amphotericin B, caspofungin acetate, fluconazole, flucytosine, griseofulvin, itraconazole, ketoconazole, micafungin sodium, miconazole, nystatin, posaconazol, terbinafine hydrochloride, voriconazole

### Action

Varies with specific drug. See individual monographs.

### Indications

Meningitis, visceral leishmaniasis in immunocompetent patients, invasive fungal infections, systemic fungal infections (histoplasmosis, coccidioidomycosis, blastomycosis, cryptococcosis, phycomycosis, disseminated candidiasis, zygomycosis), oral and perioral candidal infections, GI tract infections caused by *Candida albicans*

### Contraindications and precautions

- Contraindicated in hypersensitivity to antifungals and concurrent use of cisapride or pimozide
- Use cautiously in renal, hepatic, or cardiac disease; achlorhydria; pregnant or breastfeeding patients; and children younger than age 2.

### Adverse reactions

**CNS:** anxiety, confusion, headache, insomnia, asthenia, abnormal thinking, agitation, depression, dizziness, hallucinations, hypertonia, vertigo, psychosis, drowsiness, speech disorder, malaise, **stupor, seizures**

**CV:** chest pain, vasodilation, hypotension, orthostatic hypotension, hypertension, phlebitis, tachycardia, bradycardia, **supraventricular tachycardia, cardiac arrest, asystole, atrial fibrillation, shock**

**EENT:** diplopia, amblyopia, blurred vision, eye hemorrhage, hearing loss, tinnitus, epistaxis, rhinitis, sinusitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, abdominal pain, abdominal distention, melena, stomatitis, dry mouth, oral candidiasis, anorexia, **GI hemorrhage**

**GU:** dysuria, hematuria, albuminuria, glycosuria, urinary retention or incontinence, **oliguria, renal failure, abnormal renal function with hypokalemia**

**Hematologic:** anemia, eosinophilia, **leukocytosis, thrombocytopenia, leukopenia, agranulocytosis**

**Hepatic:** jaundice, **acute hepatic failure, hepatitis**

**Metabolic:** dehydration, hypomagnesemia, hypokalemia, hypocalcemia, hypernatremia, hyperglycemia, hypoproteinemia, hyperlipidemia, **acidosis**

**Musculoskeletal:** myalgia; joint, neck, or back pain

**Respiratory:** increased cough, wheezing, dyspnea, tachypnea, hypoxia, hyperventilation, hemoptysis, asthma, **pulmonary edema, pleural effusion, bronchospasm, respiratory failure**

**Skin:** pruritus, acne, alopecia, diaphoresis, skin discoloration, nodules, ulcers, urticaria, maculopapular rash

**Other:** gingivitis, weight changes, chills, fever, infection, peripheral or facial edema, pain or reaction at injection site, tissue damage (with extravasation), allergic reactions including **anaphylaxis, sepsis, multisystem failure**

### Patient monitoring

- Monitor vital signs and fluid intake and output.
- Assess electrolyte levels, CBC, and kidney and liver function tests.

## antigout agents (anti-hyperuricemia agents)

allopurinol, allopurinol sodium, colchicine, febuxostat, probenecid, rasburicase

### Action

Decrease uric acid levels by inhibiting uric acid production or tubular reabsorption of urate or by catalyzing enzymatic oxidation of uric acid into allantoin (an inactive and soluble metabolite)

### Indications

Primary or secondary gout, calcium oxalate calculi, management of uric acid levels during chemotherapy

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug, blood dyscrasias, or methemoglobinemia and G6PD deficiency, and concomitant use of azathioprine, mercaptopurine, or theophylline
- Use cautiously in acute gout attack during initiation of therapy, bone marrow depression, renal or hepatic disease, cardiac disease, idiopathic hemochromatosis, seizure disorders, peptic ulcer, and children (except those with cancer-related hyperuricemia); use not recommended in patients with greatly increased rate of urate formation, such as in malignant disease and its treatment and Lesch-Nyhan syndrome (febuxostat).

### Adverse reactions

**CNS:** headache, somnolence, peripheral neuropathy, neuritis, paresthesia

**CV:** vasculitis, **necrotizing angitis**

**EENT:** epistaxis

**GI:** nausea, vomiting, diarrhea, abdominal pain, gastritis, dyspepsia

**GU:** uremia, renal failure

**Hematologic:** ecchymosis, purpura, eosinophilia, **leukopenia, leukocytosis, thrombocytopenia**

**Hepatic:** cholestatic jaundice, **hepatomegaly, granulomatous hepatitis, hepatic necrosis**

**Metabolic:** acute gout attack

**Musculoskeletal:** arthralgia, myopathy

**Skin:** rash, vesicular bullous dermatitis, eczematoid dermatitis, pruritus, urticaria, onycholysis, lichen planus, alopecia, purpura, toxic epidermal necrolysis, **Stevens-Johnson syndrome**

**Other:** taste loss or perversion, fever, hypersensitivity reaction

### Patient monitoring

- Assess fluid intake and output. Intake should be sufficient to yield daily output of at least 2 liters of slightly alkaline urine.
- Monitor uric acid level.

## antihistamines

azelastine, brompheniramine, cetirizine hydrochloride, chlorpheniramine maleate, cyproheptadine hydrochloride, desloratadine, diphenhydramine hydrochloride, fexofenadine hydrochloride, hydroxyzine hydrochloride, hydroxyzine pamoate, levocetirizine, loratadine, promethazine

### Action

Bind either nonselectively to central and peripheral histamine<sub>1</sub> (H<sub>1</sub>) receptors or selectively to peripheral H<sub>1</sub> receptors, causing either CNS stimulation or depression

### Indications

Sedation, nausea and vomiting, cough, parkinsonian symptoms, motion sickness, allergy symptoms, adjunct to pre- or postoperative analgesia

### Contraindications and precautions

- Contraindicated in hypersensitivity to specific or structurally related antihistamines, angle-closure glaucoma, stenosing peptic ulcer, symptomatic prostatic hypertrophy, bladder neck obstruction, pyloroduodenal obstruction, MAO inhibitor use within past 14 days, elderly or debilitated patients (cyproheptadine), premature infants, and neonates
- Use cautiously in respiratory or cardiovascular disease, seizure disorders, ulcer disease, sleep apnea, renal or hepatic impairment, elderly patients, pregnant or breastfeeding patients, and children.

### Adverse reactions

**CNS:** drowsiness, sedation, weakness, dizziness, syncope, incoordination, fatigue, lassitude, confusion, restlessness, excitation, euphoria, tremor, headache, insomnia, nightmares, paresthesia, catatonic-like state, hallucinations, disorientation, pseudoschizophrenia, vertigo, hysteria, tongue protrusion, neuritis, **seizures**

**CV:** orthostatic hypotension, hypotension, hypertension, palpitations, bradycardia, tachycardia, reflex tachycardia, extrasystoles, ECG changes, venous thrombosis at injection site (with I.V. promethazine), **cardiac arrest**

**EENT:** blurred vision; diplopia; oculogyric crisis; tinnitus; labyrinthitis; nasal stuffiness; dry mouth, nose, and throat; sore throat; **laryngeal edema**

**GI:** nausea, vomiting, diarrhea, constipation, epigastric distress, stomatitis, anorexia

**GU:** dysuria, glycosuria, urinary frequency, urinary retention, lactation, early menses, gynecomastia, inhibited ejaculation

**Hematologic:** **thrombocytopenic purpura; hemolytic, hypoplastic, or aplastic anemia; thrombocytopenia;**

**leukopenia; agranulocytosis; pancytopenia**

**Musculoskeletal:** torticollis; tingling, heaviness, and weakness of hands

**Respiratory:** thickened bronchial secretions, chest tightness, wheezing, asthma, **respiratory depression**

**Skin:** rash, dermatitis, erythema, urticaria, excessive perspiration, angioedema, photosensitivity

**Other:** appetite increase, weight gain, peripheral edema, chills, **lupus erythematosus–like syndrome, anaphylaxis**

### Patient monitoring

- Monitor cardiovascular status, especially in patients with cardiovascular disease.
- Use side rails as needed. Supervise patient during ambulation.

## antihyperlipidemics

**Bile acid suppressants:** cholestyramine, colesevelam hydrochloride, colestipol hydrochloride

**Fibric acid derivatives:** fenofibrate, fenofibric acid, gemfibrozil

**HMG-CoA reductase inhibitors:** atorvastatin calcium, fluvastatin sodium, lovastatin, pitavastatin, pravastatin sodium, rosuvastatin calcium, simvastatin

**Other:** ezetimibe, omega-3-acid ethyl esters

### Action

**Bile acid suppressants** bind bile acids in intestine to form an insoluble complex that's excreted in feces; increased fecal loss of bile acids enhances cholesterol oxidation to bile acids, which lowers low-density lipoprotein (LDL) and cholesterol levels. **Fibric acid derivatives** inhibit peripheral lipolysis and

decrease hepatic extraction of free fatty acids, reducing hepatic triglyceride production. They also inhibit synthesis and increase clearance of apolipoprotein B (which carries very-low-density lipoproteins [VLDLs]), thus lowering VLDL production. **HMG-CoA reductase inhibitors** competitively inhibit HMG-CoA reductase (an enzyme that catalyzes the first step in cholesterol synthesis pathway); this inhibition decreases total cholesterol, LDL, VLDL, triglyceride, and apolipoprotein B levels while increasing high-density lipoprotein levels.

### Indications

Elevated LDL, total cholesterol, triglyceride, or apolipoprotein B levels in primary hypercholesterolemia or mixed dyslipidemia (Fredrickson types IIa and IIb); primary dysbetalipoproteinemia (Fredrickson type III); adjunct to diet in hypertriglyceridemia (Fredrickson type IV)

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug; active hepatic disease; complete biliary obstruction; persistent, unexplained elevations in liver function tests; concurrent use of cyclosporine; females of childbearing age; and breastfeeding (pitavastatin)
- Use cautiously in severe metabolic, endocrine, or electrolyte disorders; visual disturbances; uncontrolled seizures; myopathy; cerebral arteriosclerosis; coronary artery disease; severe hypotension or hypertension; history of hepatic disease, alcoholism, renal impairment, severe acute infection, major surgery, or trauma; concurrent use of protease inhibitors, erythromycin, fibric acids, rifampin, or niacin; elderly patients (pitavastatin); females of childbearing age; and children younger than age 18 (safety not established).

## Adverse reactions

**CNS:** amnesia, abnormal dreams, malaise, asthenia, emotional lability, facial paralysis, headache, hyperkinesia, incoordination, paresthesia, drowsiness, syncope, peripheral neuropathy  
**CV:** orthostatic hypotension, palpitations, vasodilation, phlebitis, **arrhythmias**

**EENT:** eye hemorrhage, amblyopia, glaucoma, altered refraction, dry eyes, hearing loss, tinnitus, epistaxis, sinusitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal cramps, abdominal or biliary pain, dyspepsia, gastroenteritis, colitis, flatulence, melena, tenesmus, dysphagia, esophagitis, pancreatitis, dry mouth, stomatitis, glossitis, anorexia,  
**GI ulcers, rectal hemorrhage**

**GU:** dysuria, nocturia, hematuria, urinary frequency or urgency, urinary retention, cystitis, renal calculi, nephritis, abnormal ejaculation, decreased libido, epididymitis, erectile dysfunction

**Hematologic:** anemia, **thrombocytopenia**

**Hepatic:** jaundice, **hepatic failure, hepatitis**

**Metabolic:** gout, hyperglycemia, **hypoglycemia**

**Musculoskeletal:** joint or back pain, bursitis, leg cramps, neck rigidity, torticollis, myalgia, myositis, myasthenia gravis

**Respiratory:** dyspnea, pneumonia, bronchitis

**Skin:** diaphoresis, acne, pruritus, rash, urticaria, alopecia, contact dermatitis, eczema, dry skin, skin ulcers, seborrhea, photosensitivity

**Other:** gingival hemorrhage, taste loss, increased appetite, weight gain, flulike symptoms, infection, fever, allergic reaction

## Patient monitoring

- Monitor liver function tests and blood lipid panel.

## anti-infectives

**Aminoglycosides:** amikacin sulfate, gentamicin sulfate, neomycin sulfate, streptomycin sulfate, tobramycin, tobramycin sulfate

**Carbapenems:** doripenem monohydrate, ertapenem sodium, imipenem cilastatin sodium, meropenem

**Cephalosporins, first generation:** cefadroxil, cefazolin sodium, cephalixin

**Cephalosporins, second generation:** cefaclor, cefoxitin sodium, cefprozil, cefuroxime axetil, cefuroxime sodium

**Cephalosporins, third generation:** cefdinir, cefepime hydrochloride, cefixime, cefoperazone sodium, cefotaxime sodium, cefpodoxime proxetil, ceftazidime, ceftibuten, ceftriaxone sodium

**Cephalosporins, fourth generation:** cefepime hydrochloride

**Fluoroquinolones:** ciprofloxacin, gemifloxacin, levofloxacin, moxifloxacin hydrochloride, norfloxacin, ofloxacin

**Lincosamides:** clindamycin hydrochloride, clindamycin palmitate hydrochloride, clindamycin phosphate

**Lipoglycopeptide:** telavancin

**Macrolides:** azithromycin, azithromycin dihydrate, clarithromycin, erythromycin, erythromycin ethylsuccinate, erythromycin lactobionate, erythromycin stearate, erythromycin (topical)

**Monobactams:** aztreonam

**Penicillins:** amoxicillin, amoxicillin trihydrate, amoxicillin and clavulanate potassium, ampicillin sodium, ampicillin sodium and sulbactam sodium, penicillin G benzathine, penicillin G potassium, penicillin G procaine, penicillin V potassium, piperacillin sodium and tazobactam sodium, ticarcillin disodium and clavulanate potassium

**Streptogramins:** quinupristin and dalbopristin

**Sulfonamides:** sulfacetamide sodium, sulfamethoxazole-trimethoprim, sulfasalazine

**Tetracyclines:** doxycycline, doxycycline calcium, doxycycline hyclate, doxycycline monohydrate, minocycline hydrochloride, tetracycline hydrochloride

**Other:** linezolid, metronidazole, metronidazole hydrochloride, mupirocin, nitazoxanide, nitrofurantoin, nitrofurantoin macrocrystals, pentamidine isethionate, rifaximin, telithromycin, tigecycline, tinidazole, vancomycin

## Action

**Bactericidal** anti-infectives (aminoglycosides, cephalosporins, carbapenems, dapson, fluoroquinolones, lincosamides, linezolid, macrolides and nitrofurantoin at high concentrations, metronidazole, monobactams, penicillins, quinupristin, and vancomycin) kill bacterial cells by inhibiting cell-wall synthesis of actively dividing bacterial cells via binding to one or more penicillin-bound proteins or 30S ribosomal

subunits or via inhibition of DNA gyrase and topoisomerase IV.

**Bacteriostatic** anti-infectives (chloramphenicol, dapson, linezolid [against enterococci and staphylococci only], macrolides and nitrofurantoin at low concentrations, quinupristin/dalbopristin [bacteriostatic against *Enterococcus faecium*], sulfonamides, telithromycin, and tetracyclines) inhibit bacterial cell growth or multiplication by giving the host immune system adequate time to mount a lethal response.

## Indications

Vary with drug. See individual monographs.

## Contraindications and precautions

- Contraindicated in hypersensitivity to drug. (For additional contraindications, see individual monographs.)
- Use cautiously in renal impairment, cirrhosis or other hepatic disease, neuromuscular disease, CNS disease, bradycardia, acute myocardial ischemia, parkinsonism, hearing impairment, concurrent use of drugs known to prolong QT interval or history of congenital long QT syndrome, known prolongation of QTc interval, uncompensated heart failure, severe left ventricular hypertrophy (avoid telavancin use), dialysis patients, obese patients, elderly patients, pregnant or breastfeeding patients, neonates, and premature infants.

## Adverse reactions

**CNS:** dizziness, vertigo, tremor, numbness, depression, confusion, lethargy, nystagmus, headache, paresthesia, **neuromuscular blockade, seizures, neurotoxicity**  
**CV:** hypotension, hypertension, palpitations, phlebitis, **thrombophlebitis**  
**EENT:** visual disturbances; eye stinging, redness, itching, or dryness; photophobia; tinnitus; hearing loss;

ototoxicity; increased salivation; hoarseness (with tetracyclines)

**GI:** nausea, vomiting, diarrhea, abdominal cramps, stomatitis, oral candidiasis, black “hairy” tongue, anorexia, splenomegaly, **pseudomembranous colitis**

**GU:** polyuria, dysuria, azotemia, increased urinary cast excretion, erectile dysfunction, vaginal candidiasis, **nephrotoxicity, renal failure**

**Hematologic:** purpura, eosinophilia, lymphocytosis, **leukemoid reaction, hemolytic or aplastic anemia, neutropenia, agranulocytosis, leukopenia, thrombocytopenia, pancytopenia, hypoprothrombinemia, bone marrow depression**

**Hepatic:** hepatomegaly, hepatic necrosis

**Metabolic:** blood glucose changes

**Musculoskeletal:** joint pain, tendinitis, tendon rupture

**Respiratory:** dyspnea, apnea

**Skin:** rash, urticaria, pruritus, exfoliative dermatitis, alopecia, sterile abscess,

**Stevens-Johnson syndrome**

**Other:** permanent tooth discoloration, tooth enamel defects, weight loss, superinfection, pain, irritation at I.M. injection site, induration, chills, fever, edema, **serum sickness, anaphylaxis**

### Patient monitoring

- Monitor vital signs and fluid intake and output. Push fluids to help prevent renal tubular irritation.
- Monitor drug blood level.
- Watch for signs and symptoms of overgrowth of resistant organisms.
- Assess CBC and kidney function tests.
- Monitor International Normalized Ratio in prolonged therapy and in patients with malnutrition or high risk of renal or hepatic impairment.
- Assess for ototoxicity by comparing current and baseline audiograms.

## antimalarials

chloroquine hydrochloride, chloroquine phosphate, doxycycline, hydroxychloroquine sulfate, mefloquine hydrochloride, primaquine hydrochloride, pyrimethamine, quinine sulfate

### Action

Varies. See individual monographs.

### Indications

Prophylaxis or treatment of malaria

### Contraindications and precautions

- Contraindicated for prophylactic use in severe renal insufficiency, marked hepatic parenchymal damage, or blood dyscrasias. Also contraindicated in hypersensitivity to drug, megaloblastic anemia caused by folate deficiency, depression (current or previous), generalized anxiety disorder, psychosis, schizophrenia or other major psychiatric disorder, history of seizures, pregnancy at term, breastfeeding, and infants younger than 2 months old.
- Use cautiously in hepatic dysfunction, cardiac disease, and ocular lesions.

### Adverse reactions

**CNS:** headache, psychic stimulation, psychotic episodes, **seizures**

**CV:** hypotension, ECG changes, **cardiomyopathy**

**EENT:** irreversible retinal damage; visual disturbances; night blindness; scotomatous vision with field defects of paracentral and pericentral ring types and typically temporal scotomas

**GI:** vomiting, abdominal cramps, atrophic glossitis, anorexia

**GU:** hematuria

**Hematologic:** hemolytic or megaloblastic anemia, leukopenia, thrombocytopenia, pancytopenia, methemoglobinemia, agranulocytosis

**Skin:** pruritus, lichen planus–like eruptions, skin and mucosal pigment changes, pleomorphic skin eruptions, alopecia, toxic epidermal necrolysis, **erythema multiforme**, **Stevens-Johnson syndrome**

**Other:** hypersensitivity reactions including **anaphylaxis**

### Patient monitoring

- Monitor liver function tests, CBC, and G6PD levels in susceptible patients before and periodically during therapy.

## antimigraine drugs

**Ergotamine derivatives:** dihydroergotamine mesylate, ergotamine tartrate

**Serotonin (5-hydroxytryptamine [5-HT<sub>1</sub>]) receptor agonists:** almotriptan malate, eletriptan, frovatriptan, naratriptan hydrochloride, rizatriptan hydrochloride, sumatriptan, topiramate, zolmitriptan

### Action

*Ergotamine derivatives* exert partial agonist or antagonist activity against tryptaminergic, dopaminergic, and alpha-adrenergic receptors (depending on their site), causing peripheral and cranial vasoconstriction and depression of central vasomotor centers.

*5-HT<sub>1</sub> receptor agonists* activate serotonin 5-HT<sub>1B/1D</sub> receptors, causing cranial vasoconstriction, inhibition of neuropeptide release, and reduced impulse transmission in trigeminal pain pathways.

### Indications

Migraine

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug; hemiplegic or basilar migraine; ischemic heart or bowel disease; severe renal or hepatic impairment; Prinzmetal's angina or other significant underlying cardiovascular disease; uncontrolled hypertension; use of ergotamine-containing preparations, ergot-type drugs, or other 5-HT<sub>1</sub> agonists within past 24 hours; MAO inhibitor use within past 14 days; and I.V. use
- Use cautiously in hypertension, hypercholesterolemia, diabetes mellitus, cardiovascular disease, smoking, obesity, men older than age 40, menopausal women, pregnant or breastfeeding patients, and children younger than age 18.

### Adverse reactions

**CNS:** dizziness, paresthesia, hypoesthesia, asthenia, drowsiness, somnolence, fatigue, headache, myasthenia, vertigo  
**CV:** chest tightness, pressure, or heaviness

**EENT:** rhinitis, sinusitis, pharyngitis

**GI:** nausea; vomiting; diarrhea; abdominal pain or discomfort; stomach pain, cramps, or pressure; dyspepsia; dysphagia; dry mouth

**Musculoskeletal:** neck, throat, or jaw pain; stiffness

**Other:** altered taste, hot or cold sensations, hot flushes, application site reaction

### Patient monitoring

- Monitor ECG for changes.

## antineoplastics

**Alkylating agents:** bendamustine hydrochloride, busulfan, carboplatin, carmustine, chlorambucil, cisplatin,

cyclophosphamide, dacarbazine, ifosfamide, lomustine, melphalan, melphalan hydrochloride, oxaliplatin, procarbazine hydrochloride, temozolomide

*Antibiotic antineoplastics:* bleomycin, sulfate, daunorubicin citrate liposome, daunorubicin hydrochloride, doxorubicin hydrochloride, doxorubicin hydrochloride liposomal, epirubicin hydrochloride, idarubicin, hydrochloride mitomycin, mitoxantrone hydrochloride

*Antimetabolites:* azacitidine, capecitabine, clofarabine, cytarabine, fluorouracil (5-fluorouracil, 5-FU), gemcitabine hydrochloride, hydroxyurea, mercaptopurine, methotrexate, methotrexate sodium, nelarabine, paclitaxel, pemetrexed, pentostatin

*Antimitotics:* cabazitaxel, docetaxel, paclitaxel, vinblastine sulfate, vincristine sulfate, vinorelbine tartrate

*Biological antineoplastics:* aldesleukin (interleukin-2, IL-2), cetuximab, denileukin diftitox, ibritumomab tiuxetan, interferon alfa-2b, recombinant, interferon gamma-1b, peginterferon alfa-2a, peginterferon alfa-2b, rituximab, trastuzumab

*Cytoprotective agents:* amifostine, leucovorin calcium (citrovorum factor, folinic acid), mesna

*DNA topoisomerase inhibitors:* irinotecan hydrochloride, topotecan hydrochloride

*Enzyme antineoplastics:* asparaginase, pegasparaginase

*Epipodophyllotoxins:* etoposide, (VP-16-213), etoposide phosphate

*Folic acid antagonists:* pralatrexate

*Hormonal antineoplastics:* anastrozole, bicalutamide, exemestane, flutamide, fulvestrant, goserelin acetate, letrozole, leuprolide acetate, medroxyprogesterone acetate, megestrol, nilutamide, raloxifene, tamoxifen citrate, triptorelin pamoate

*Other:* abiraterone acetate, alitretinoin, arsenic trioxide, axitinib, bortezomib, brentuximab vedotin, dasatinib, degarelix, erbulin, erlotinib, everolimus, ibritumomab tiuxetan, imatinib mesylate, lapatanib, lenalidomide, nilotinib, pazopanib, pertuzumab, ruxolitinib, sipuleucel-T, sorafenib, sunitinib maleate, tretinoin

## Action

Varies with specific drug. Generally, antineoplastics inhibit normal substrate use in tumor cells, forming dysfunctional macromolecules by inserting themselves into abnormal cells; also intercalate between DNA strands and interfere with DNA templates. Some antineoplastics modify growth of hormone-dependent tumors.

## Indications

Hodgkin's or non-Hodgkin's lymphoma, testicular teratomas, mycosis fungoides, breast cancer, ovarian cancer, prostate cancer, lung cancer, head and neck cancer, colorectal cancer, pancreatic cancer, bronchogenic carcinoma, malignant melanoma, chronic lymphatic or chronic myeloid leukemia, other cancers

## Contraindications and precautions

- Contraindicated in hypersensitivity to drug or its components
- Use cautiously in heart disease, renal or hepatic impairment, decreased bone

marrow reserve, active infections, severe myocardial insufficiency, coagulation and bleeding disorders, active thrombophlebitis or thromboembolic disorders, shock, trauma, major surgery within previous month, elderly or debilitated patients, patients with childbearing potential, and pregnant or breastfeeding patients.

### Adverse reactions

**CNS:** dizziness, fatigue, lethargy, asthenia, drowsiness, malaise, headache, sensory or motor dysfunction, impaired memory, confusion, agitation, depression, emotional lability, sleep disturbances, hallucinations, rigors, peripheral neuropathy, paresthesia, tremor, ataxia, flaccid paresis, abnormal gait, vertigo, syncope, cranial nerve dysfunction, hemiparesis, mental status changes, acute cerebellar dysfunction, **demyelination, seizures, leukoencephalopathy, cerebrovascular accident, suicidal ideation**

**CV:** hypotension, hypertension, chest pain, peripheral edema, tachycardia, **cardiomegaly, prolonged QT interval, thromboembolic events, arrhythmias, cardiac tamponade, torsades de pointes, cardiac arrest, capillary leak syndrome, myocardial infarction, left-sided heart failure, pericardial effusion**

**EENT:** retinal thrombosis, corneal opacity, photophobia, diplopia, visual changes, nystagmus, lacrimation, lacrimal duct stenosis, sty, epistaxis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, fecal incontinence, abdominal pain, dyspepsia, GI ulcer, ascites, dry mouth, mucositis, oral candidiasis, dysphagia, anorexia, **intestinal perforation, paralytic ileus, GI bleeding**

**GU:** proteinuria, hematuria, dysuria, urinary hesitancy or retention, urinary obstruction, cystitis, bladder fibrosis, vaginitis, vaginal hemorrhage, breast swelling and tenderness, menstrual abnormalities, abortion, gynecomastia,

sterility, libido loss, erectile dysfunction, decreased testes size, reduced sperm count, **progressive azotemia, hemolytic uremic syndrome, nephrotoxicity, oliguria or anuria, renal failure**

**Hematologic:** anemia, eosinophilia, **neutropenia, thrombocytopenia, leukopenia, leukocytosis, bone marrow depression, agranulocytosis, pancytopenia, coagulation disorders, hemorrhage**

**Hepatic:** jaundice, **hepatitis, hepatotoxicity**

**Metabolic:** hyperglycemia, fluid retention, **hyperkalemia**

**Musculoskeletal:** muscle twitching, joint or bone pain, decreased bone density, carpal tunnel syndrome

**Respiratory:** tachypnea, dyspnea, wheezing, pulmonary congestion, cough, chronic obstructive pulmonary disease, upper respiratory tract infection, **tracheoesophageal fistula, pleural effusion, interstitial pneumonitis, bronchospasm, pulmonary toxicity, pulmonary edema, respiratory failure, apnea, development or worsening of pulmonary fibrosis**

**Skin:** erythema, pruritus, rash, diaphoresis, night sweats, dry skin, urticaria, alopecia, phlebitis at I.V. site, palmar-plantar erythrodysesthesia, nail loss, bruising, petechiae, exacerbation of postradiation erythema, painful plaque erosions, epidermal necrolysis, exfoliative dermatitis, **Stevens-Johnson syndrome**

**Other:** increased appetite, weight gain, fever, chills, pain, flulike symptoms, herpes simplex or other infection, tumor flare, hypersensitivity reaction, **risk of second malignancy, anaphylaxis, sepsis, tumor lysis syndrome**

### Patient monitoring

- 🚨 Watch for bleeding. If platelet count is low, avoid giving I.M. injections and taking rectal temperature.
- Stay alert for bone marrow depression, neutropenia, and anemia.

- Monitor fluid intake and output.
- Monitor for GI upset. Give antiemetics as needed and prescribed.

## antiparkinsonian drugs

**Anticholinergics:** benzotropine, trihexyphenidyl hydrochloride

**Antivirals:** amantadine hydrochloride

**Dopaminergics:** apomorphine hydrochloride, bromocriptine mesylate, carbidopa-levodopa, levodopa, pramipexole, ropinirole hydrochloride, tolcapone

**MAO inhibitors:** rasagiline, selegiline

### Action

Block central cholinergic receptors or inhibit prolactin secretion; also may act as dopamine receptor agonists by activating postsynaptic dopamine receptors

### Indications

Parkinson's disease

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug, angle-closure glaucoma, tardive dyskinesia, stenosing peptic ulcer, achalasia, pyloric or duodenal obstruction, prostatic hypertrophy, bladder neck obstruction, myasthenia gravis, and children younger than age 3
- Use cautiously in seizure disorders, arrhythmias, tachycardia, hypertension, hypotension, hepatic or renal dysfunction, alcoholism, exposure to hot environments, elderly patients, and pregnant or breastfeeding patients (safety not established).

### Adverse reactions

**CNS:** confusion, headache, dizziness, fatigue, light-headedness, drowsiness,

nervousness, insomnia, nightmares, mania, delusions, **seizures, cerebrovascular accident**

**CV:** hypotension, palpitations, extrasystole, bradycardia, **arrhythmias, acute myocardial infarction**

**EENT:** diplopia, blurred vision, burning sensation of eyes, nasal congestion

**GI:** nausea, vomiting, diarrhea, constipation, abdominal cramps, dry mouth, anorexia, **GI hemorrhage**

**GU:** urinary incontinence, frequency, or retention; diuresis; erectile dysfunction

**Hepatic:** hepatic failure

**Musculoskeletal:** leg cramps, numb fingers

**Skin:** urticaria; pale, cool fingers and toes; facial and arm rash; alopecia

**Other:** hyperthermia, **heat stroke**

### Patient monitoring

- Monitor fluid intake and output and assess vital signs (especially blood pressure).

## antiplatelet drugs

abciximab, anagrelide hydrochloride, cilostazol, clopidogrel bisulfate, dipyridamole, eptifibatide, prasugrel, ticlopidine hydrochloride, tirofiban hydrochloride, treprostinil sodium

### Action

Inhibit platelet aggregation by reversibly preventing fibrinogen, von Willebrand's factor, and other adhesion ligands from binding to glycoprotein (GP) IIb/IIIa receptor or by inhibiting platelet fibrinogen induced by adenosine diphosphate

### Indications

Acute coronary syndrome, cerebrovascular accident (CVA)

## Contraindications and precautions

- Contraindicated in hypersensitivity to drug, CVA or abnormal bleeding within past 30 days, history of bleeding diathesis, history of hemorrhagic CVA, major surgery within past 6 weeks, concurrent or planned use of other parenteral GP IIb/IIIa inhibitors, dependence on renal dialysis, severe uncontrolled hypertension (systolic pressure above 200 mm Hg or diastolic pressure above 110 mm Hg), platelet count below 100,000/mm<sup>3</sup>, or serum creatinine of 4 mg/dl or more
- Use cautiously in hemorrhagic retinopathy; severe renal insufficiency; chronic hemodialysis; hepatic failure; platelet count below 150,000/mm<sup>3</sup>; hypotension, pulmonary edema, or pulmonary veno-occlusive disease (treprostinil); or concurrent use of thrombolytics or other drugs that affect hemostasis, thrombotic thrombocytopenic purpura, low body weight, patients age 75 and older (use not recommended except in high-risk situations), pregnant or breastfeeding patients, and children (safety and efficacy not established).

## Adverse reactions

**CNS:** depression, somnolence, confusion, insomnia, nervousness, amnesia, migraine, dizziness, headache, **intracranial hemorrhage**

**CV:** chest pain, angina pectoris, orthostatic hypotension, hypertension, vasodilation, syncope, bradycardia, cardiovascular disease, **arrhythmias, thrombosis, aortic dissection, heart failure**

**EENT:** amblyopia, abnormal vision, visual field abnormality, diplopia, tinnitus, epistaxis, rhinitis, sinusitis

**GI:** nausea, diarrhea, constipation, gastritis, abdominal pain, dyspepsia, melena, eructation, aphthous stomatitis, **GI hemorrhage**

**GU:** dysuria, hematuria, urinary tract infection

**Hematologic:** anemia, ecchymosis, **bleeding, thrombocytopenia**

**Hepatic:** **hemorrhage**

**Metabolic:** dehydration

**Musculoskeletal:** arthralgia, myalgia, leg cramps or pain, pelvic pain

**Respiratory:** respiratory disease, pneumonia, bronchitis, asthma

**Skin:** skin disease, diaphoresis, alopecia, photosensitivity

**Other:** lymphadenopathy, fever, chills, edema, flulike symptoms, accidental injury

## Patient monitoring

- Monitor CBC, platelet count, and coagulation studies.
- Watch for unusual bleeding or bruising.
- Assess vital signs and cardiovascular status.

## antipsychotics

aripiprazole, asenapine, chlorpromazine hydrochloride, clozapine, fluphenazine decanoate, fluphenazine hydrochloride, haloperidol, haloperidol decanoate, haloperidol lactate, iloperidone, lithium carbonate, lithium citrate, loxapine succinate, olanzapine, paliperidone, perphenazine, prochlorperazine, prochlorperazine edisylate, prochlorperazine maleate, quetiapine fumarate, risperidone, trifluoperazine hydrochloride, ziprasidone

## Action

Block postsynaptic mesolimbic and mesocortical dopamine receptors in brain, relieving hallucinations, delusions, and psychoses. Also thought to relieve anxiety by filtering internal

arousal stimuli to reticular system in brain stem.

### Indications

Acute or chronic psychosis, acute intermittent porphyria, nausea and vomiting, intractable hiccups, preoperative sedation

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug, phenothiazines, sulfites (when injected), or benzyl alcohol (sustained-release forms); angle-closure glaucoma; bone marrow depression; blood dyscrasias; myeloproliferative disorders; subcortical brain damage; cerebral arteriosclerosis; hepatic damage; coronary artery disease; severe hypotension or hypertension; coma; and severe depression
- Use cautiously in diabetes mellitus; respiratory, cerebrovascular, or cardiovascular disease; prostatic hypertrophy; CNS tumors; seizure disorders; intestinal obstruction; concomitant use of CYP1A2 inhibitors, drugs that are both substrates and inhibitors of CYP2D6, drugs with anticholinergic activity, other centrally acting drugs, certain antihypertensives, alcohol, and drugs known to prolong QT interval; patients who experience conditions that may contribute to core body temperature elevation; dehydration; elderly or debilitated patients; elderly patients with dementia-related psychosis; pregnant or breastfeeding patients (safety not established); and children with acute illness, infection, gastroenteritis, or dehydration.

### Adverse reactions

**CNS:** drowsiness, sedation, extrapyramidal reactions, tardive dyskinesia, pseudoparkinsonism, **seizures, neuroleptic malignant syndrome**  
**CV:** hypotension (increased with I.M. or I.V. use), tachycardia

**EENT:** blurred vision, lens opacities, dry eyes, nasal congestion

**GI:** constipation, anorexia, dry mouth, **paralytic ileus**

**GU:** urinary retention, menstrual irregularities, inhibited ejaculation, priapism, galactorrhea

**Hematologic:** eosinophilia, **hemolytic anemia, agranulocytosis, leukopenia, aplastic anemia, thrombocytopenia**

**Hepatic:** jaundice, **hepatitis**

**Skin:** photosensitivity, pigmentation changes, rash, sterile abscess

**Other:** allergic reactions, hyperthermia, pain at injection site

### Patient monitoring

- Monitor vital signs (especially blood pressure), ECG, CBC, urinalysis, liver and kidney function tests, and periodic eye exams.

## antirheumatic drugs

*Biological response modifiers:* adalimumab, anakinra, etanercept, golimumab, infliximab, tocilizumab

*Disease-modifying agents:* aurano-fin, aurothioglucose, azathioprine, cyclosporine, hydroxychloroquine sulfate, leflunomide, methotrexate, methotrexate sodium

### Action

*Biological response modifiers* bind specifically to tumor necrosis factor (TNF) alpha or competitively inhibit binding of interleukin-1 (IL-1) to IL-1 type I receptors, thereby blocking biologic activity of TNF alpha or IL-1.

*Disease-modifying agents* suppress the immune system and decrease inflammation.

### Indications

Rheumatoid arthritis

## Contraindications and precautions

- Contraindicated in hypersensitivity to drug, moderate to severe heart failure, demyelinating CNS disorder, hematologic abnormalities, poorly controlled or advanced diabetes mellitus, and significant exposure to varicella virus
- Use cautiously in severe myocardial, hepatic, or renal disease; decreased bone marrow reserve; active infection; hypotension; coma; history of or exposure to tuberculosis; elderly patients; pregnant or breastfeeding patients; and children.

## Adverse reactions

**CNS:** confusion, hallucinations, headache, fatigue, insomnia, depression, EEG abnormalities, peripheral neuropathy, sensorimotor effects, **encephalitis, seizures**

**CV:** hypertension

**EENT:** iritis, corneal ulcers, gold deposits in ocular tissues, rhinitis, pharyngitis, sinusitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal cramps, flatulence, dyspepsia, dysphagia, ulcerative enterocolitis, melena, occult blood in stool, anorexia, **GI bleeding**

**GU:** hematuria, proteinuria, urinary tract infection, **nephrotic syndrome or glomerulitis, acute renal failure, acute tubular necrosis, acute nephritis, degeneration of proximal tubular epithelium**

**Hematologic:** eosinophilia, anemia, thrombocytopenia, leukopenia, neutropenia, agranulocytosis, pancytopenia, hypoplastic anemia, aplastic anemia, pure red-cell aplasia, **granulocytopenia, pancytopenia, hemorhagic diathesis**

**Hepatic:** jaundice, intrahepatic cholestasis, **hepatitis with jaundice, toxic hepatitis**

**Musculoskeletal:** arthralgia, back pain, myalgia, synovial destruction

**Respiratory:** upper respiratory infection, cough, dyspnea, **tuberculosis**

**Skin:** rash; urticaria; pruritus; erythema; papular, vesicular, or exfoliative dermatitis; abscess; alopecia; nail shedding; angioedema; photosensitivity

**Other:** bad taste, fever, chest pain, candidiasis, infection, chrysiasis, lupus-like syndrome, lymphoproliferative disease, hypersensitivity reaction, **cancer**

## Patient monitoring

- Monitor for signs and symptoms of hypersensitivity reaction and infection.
- Monitor CBC with white cell differential and platelet count; assess liver and kidney function tests.
- Assess for heart failure in patients with history of cardiac disease.

## antituberculars

ethambutol hydrochloride, isoniazid, pyrazinamide, rifabutin, rifampin, rifapentine, streptomycin sulfate

## Action

Unknown. May interfere with synthesis of one or more bacterial metabolites, altering RNA synthesis during cell division.

## Indications

Tuberculosis and atypical mycobacterial infections caused by *Mycobacterium tuberculosis*

## Contraindications and precautions

- Contraindicated in hypersensitivity to drug (including drug-induced hepatitis)
- Use cautiously in severe renal impairment, malnutrition, diabetes mellitus, chronic alcoholism, diabetic retinopathy, cataracts, optic neuritis and other ocular defects, history of hepatic damage or chronic alcohol ingestion, patients older than age

50, Black or Hispanic females, postpartal patients, pregnant or breastfeeding patients, and children younger than age 13.

### Adverse reactions

**CNS:** confusion, dizziness, hallucinations, headache, malaise, peripheral neuritis

**EENT:** optic neuritis, blurred vision, decreased visual acuity, eye pain, red-green color blindness

**GI:** nausea, vomiting, abdominal pain, anorexia

**Hematologic: thrombocytopenia**

**Hepatic: hepatitis**

**Metabolic:** hyperuricemia

**Musculoskeletal:** joint pain, gouty arthritis

**Respiratory:** bloody sputum

**Skin:** rash, toxic epidermal necrolysis

**Other:** fever, anaphylaxis

### Patient monitoring

- Monitor vital signs (especially blood pressure), ECG, CBC, urinalysis, liver and kidney function tests, and periodic eye exams.

## antiulcer drugs

**Histamine<sub>2</sub> (H<sub>2</sub>)-receptor antagonists:** cimetidine hydrochloride, famotidine, nizatidine, ranitidine hydrochloride

**Proton pump inhibitors:** dexlansoprazole, esomeprazole magnesium, lansoprazole, omeprazole, pantoprazole sodium, rabeprazole sodium

**Other:** bismuth subsalicylate, misoprostol

### Action

Reduce gastric acid level either by blocking H<sub>2</sub> receptors or by inhibiting the proton pump

### Indications

Short-term treatment of active duodenal ulcer or benign gastric ulcer; prophylaxis of duodenal ulcer (at lower doses); treatment of gastroesophageal reflux disease, heartburn, acid indigestion, and gastric hypersecretory states (such as Zollinger-Ellison syndrome); prevention and treatment of stress-induced upper GI bleeding in critically ill patients

### Contraindications and precautions

- Contraindicated in hypersensitivity to any antiulcer drug and in alcohol intolerance
- Use cautiously in renal impairment, elderly patients, pregnant or breastfeeding patients, and children.

### Adverse reactions

**CNS:** confusion, dizziness, drowsiness, hallucinations, headache, peripheral neuropathy, **brain stem dysfunction**

**CV:** hypotension, **arrhythmias, cardiac arrest**

**GI:** nausea, diarrhea, constipation

**GU:** decreased sperm count, erectile dysfunction, gynecomastia

**Hematologic:** anemia, **neutropenia, thrombocytopenia, agranulocytosis, aplastic anemia**

**Hepatic: hepatitis**

**Other:** altered taste, pain at I.M. injection site, hypersensitivity reaction

### Patient monitoring

- Monitor for resolution of GI symptoms.
- Assess CBC and liver function tests.

## antivirals and antiretrovirals

**Antivirals:** acyclovir, acyclovir sodium, amantadine hydrochloride, boceprevir, cidofovir, entecavir, famciclovir, foscarnet sodium, ganciclovir, interferon alfacon-1, interferon beta-1a, interferon beta-1b recombinant, oseltamivir phosphate, ribavirin, rimantadine hydrochloride, valacyclovir hydrochloride, valganciclovir hydrochloride, zanamivir

**Antiretrovirals:** abacavir sulfate, adefovir dipivoxil, atazanavir, darunavir, delavirdine mesylate, didanosine, efavirenz, emtricitabine, enfurvitide, etravirine, fosamprenavir calcium, indinavir sulfate, lamivudine, nelfinavir mesylate, nevirapine, raltegravir, ritonavir, saquinavir mesylate, stavudine, tenofovir disoproxil fumarate, tipranavir, zalcitabine, zidovudine

### Action

*Antivirals* kill viral cells by inhibiting release of enzymes required for DNA synthesis; inhibiting viral nucleic acid, DNA, or protein synthesis; inhibiting viral replication; or inhibiting protease reaction.

*Antiretrovirals* inhibit activity of human immunodeficiency virus (HIV) protease or HIV-1 reverse transcriptase, or bind directly to reverse transcriptase and block RNA- and DNA-dependent DNA polymerase activities. These actions inhibit HIV replication.

### Indications

Genital herpes, herpes simplex, varicella zoster, herpes zoster (shingles),

influenza type A virus, hepatitis, cytomegalovirus, HIV

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug or its components, use with drugs primarily metabolized by CYP3A and UGT1A1, and with St. John's wort
- Use cautiously in renal or hepatic impairment; conduction abnormalities; concomitant use of drugs that may prolong PR interval, antiarrhythmics, antidepressants, high doses of ketoconazole and itraconazole, calcium channel blockers, hormonal contraceptives, proton pump inhibitors, antifungals, antigout agents, efavirenz, inhaled beta agonists, endothelin-receptor antagonists, inhaled nasal steroid, opioids, and drugs highly dependent on CYP2C8 with narrow indices without ritonavir (atazanavir); peripheral neuropathy; phenylketonuria; hyperuricemia; hypercholesterolemia; amylase elevation; history of mental illness, substance abuse, or hepatic impairment (including hepatitis B or C infection); sodium-restricted diet; elderly or debilitated patients; pregnant or breastfeeding patients; and children.

### Adverse reactions

**CNS:** dizziness, asthenia, anxiety, abnormal thinking, hypoesthesia, agitation, confusion, hypertonia, **seizures, coma**

**CV:** hypotension, palpitations, bradycardia, weak pulse, pseudoaneurysm, **embolism, thrombophlebitis, nodal arrhythmias, atrioventricular block, ventricular tachycardia**

**EENT:** ocular hypotony, iritis, retinal detachment, diplopia

**GI:** nausea, vomiting, diarrhea, abdominal distention, dyspepsia, gastroesophageal reflux, hematemesis, dysphagia, dry mouth, **paralytic ileus**

**GU:** urinary retention, frequency, or incontinence; dysuria; prostatitis;  
**nephrotoxicity**

**Hematologic:** anemia, petechiae, leukocytosis, thrombocytopenia, neutropenia, bleeding

**Hepatic:** hepatomegaly

**Metabolic:** diabetes mellitus, hyperkalemia

**Musculoskeletal:** muscle contractions

**Respiratory:** bronchitis, dyspnea, wheezing, pneumonia, pleurisy, **pleural effusion, pulmonary edema, bronchospasm, pulmonary embolism**

**Skin:** rash, diaphoresis, urticaria, pruritus, bullous eruptions, pallor

**Other:** pain, peripheral coldness, edema, drug toxicity

### Patient monitoring

- Monitor CBC and liver and kidney function tests.
- As indicated, monitor viral load and T-cell levels.

## anxiolytics

**Benzodiazepines:** alprazolam, chlor-diazepoxide hydrochloride, clonazepam, clorazepate, diazepam, lorazepam, oxazepam

**Other:** buspirone hydrochloride, doxepin, hydroxyzine hydrochloride, hydroxyzine pamoate

### Action

**Benzodiazepines** potentiate effects of gamma-aminobutyric acid (GABA) and other inhibitory transmitters by binding to specific benzodiazepine receptor sites.

Other anxiolytics have unknown actions. They are thought to act on brain by inhibiting neuronal firing and reducing serotonin transmission.

### Indications

Anxiety disorders

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug, psychosis, acute angle-closure glaucoma, significant hepatic disease, intra-arterial use (lorazepam injection), concurrent use of ketoconazole or itraconazole, breastfeeding (diazepam), and children younger than 6 months

- Use cautiously in hepatic disease, asthma, severe pulmonary disease, open-angle glaucoma, obesity, or concurrent use of CNS depressants.

### Adverse reactions

**CNS:** sedation, somnolence, depression, lethargy, apathy, fatigue, hypoactivity, light-headedness, dizziness, memory impairment, disorientation, anterograde amnesia, restlessness, confusion, crying, sobbing, delirium, agitation, headache, slurred speech, aphonia, dysarthria, stupor, syncope, vertigo, euphoria, nervousness, irritability, poor concentration, inability to perform complex mental functions, rigidity, tremor, dystonia, akathisia, hemiparesis, paresthesia, hypotonia, unsteadiness, ataxia, incoordination, weakness, vivid dreams, psychomotor retardation, extrapyramidal symptoms, paradoxical reactions, behavior problems, hysteria, psychosis, **seizures, coma, suicidal tendency**

**CV:** bradycardia, tachycardia, hypertension, hypotension, palpitations, decreased systolic pressure, **cardiovascular collapse**

**EENT:** visual disturbances, diplopia, nystagmus, decreased hearing, auditory disturbances, nasal congestion

**GI:** nausea, vomiting, diarrhea, constipation, gastritis, coated tongue, difficulty swallowing, increased salivation, dry mouth, anorexia

**GU:** urinary incontinence or retention, menstrual irregularities, gynecomastia, galactorrhea, libido changes

**Hematologic:** anemia, eosinophilia, leukopenia, agranulocytosis, thrombocytopenia

**Hepatic:** hepatic dysfunction

**Metabolic:** dehydration

**Musculoskeletal:** muscle disturbances, joint pain

**Respiratory:** respiratory disturbances, partial airway obstruction

**Skin:** urticaria; pruritus; morbilliform, urticarial, or maculopapular rash; dermatitis; alopecia; hirsutism; ankle or facial edema; diaphoresis

**Other:** sore gums; appetite and weight changes; glassy-eyed appearance; fever; hiccups; edema; lymphadenopathy; pain, burning, and redness at I.M. injection site; phlebitis and thrombosis at I.V. site

### Patient monitoring

- Monitor CBC and kidney and liver function tests.
- Taper dosage gradually to termination; do not withdraw quickly.

## beta-adrenergic blockers

*Alpha/beta-adrenergic blockers:*  
carvedilol, labetalol

*Beta-adrenergic blockers:* atenolol, bisoprolol fumarate, carteolol hydrochloride, esmolol hydrochloride, metoprolol, nadolol, nebivolol, pindolol, propranolol hydrochloride, sotalol hydrochloride, timolol maleate

### Action

*Alpha/beta-adrenergic blockers* combine selective competitive postsynaptic alpha<sub>1</sub>-adrenergic blockade with nonselective, competitive beta-adrenergic

blockade, causing blood pressure to decrease.

*Beta-adrenergic blockers* combine reversibly with beta-adrenergic receptors, blocking responses to sympathetic nerve impulses, catecholamines, or adrenergic drugs. Beta<sub>1</sub> blockade decreases heart rate, myocardial contractility, and cardiac output while slowing atrioventricular conduction. Beta<sub>2</sub> blockade increases bronchiolar airway resistance and enhances the inhibitory effect of catecholamines on peripheral vessels.

### Indications

Hypertension; angina pectoris; myocardial infarction (MI); stable, symptomatic (class II or III) heart failure of ischemic, hypertensive, or cardiomyopathic origin; ventricular arrhythmias or tachycardia; tremors; chronic intraocular glaucoma; aggressive behavior; drug-induced akathisia; anxiety; migraine prophylaxis

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug, heart failure (unless secondary to tachyarrhythmia treatable with specific beta-adrenergic blocker), shock, sinus bradycardia, and heart block greater than first degree. Alpha/beta-adrenergic blockers are contraindicated in bronchial asthma and symptomatic hepatic impairment.
- Use cautiously in renal or hepatic impairment, pulmonary disease (especially asthma), pulmonary edema, diabetes mellitus, thyrotoxicosis, history of severe allergic reactions, elderly patients, pregnant or breastfeeding patients, and children (safety not established).

### Adverse reactions

**CNS:** insomnia, headache, hyperactivity, malaise, CNS stimulation, dizziness, drowsiness, syncope, tremor,

restlessness, nervousness, apprehension, anxiety, hyperkinesia, asthenia, vertigo, paresthesia

**CV:** hypertension, hypotension, tachycardia, angina, chest pain, palpitations, **arrhythmias**

**EENT:** abnormal vision, dry eyes, epistaxis, nasal congestion, sore throat (inhaled drug form), nasal dryness and irritation, hoarseness

**GI:** nausea, vomiting, heartburn, cholestasis, anorexia

**GU:** acute urinary bladder retention, difficulty voiding, ejaculation failure, erectile dysfunction, priapism, Peyronie's disease

**Metabolic:** hypokalemia, **hypoglycemia**

**Musculoskeletal:** muscle cramps

**Respiratory:** cough, wheezing, dyspnea, bronchitis, increased sputum, paradoxical airway resistance (with repeated, excessive use of inhaled form), **pulmonary edema, bronchospasm**

**Skin:** pallor; flushing; diaphoresis; generalized maculopapular, lichenoid, urticarial, or psoriaform rash; bullous lichen planus; facial erythema; reversible alopecia

**Other:** bad or unusual taste, increased appetite, edema, fever, antimitochondrial antibodies, hypersensitivity reaction, **systemic lupus erythematosus**

### Patient monitoring

- Monitor CBC, ECG, blood glucose and electrolyte levels, and liver and kidney function tests.
- Assess vital signs, fluid intake and output, and weight.

## bisphosphonates

alendronate sodium, etidronate disodium, pamidronate disodium, risendronate, zoledronic acid

### Action

Inhibit normal and abnormal bone resorption

### Indications

Osteoporosis in postmenopausal women and men, glucocorticoid-induced osteoporosis, Paget's disease, heterotopic ossification, hypercalcemia of malignancy, breast cancer, multiple myeloma, bone metastases of solid tumors

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug, hypocalcemia, esophageal abnormalities, clinically overt osteomalacia, renal impairment (class Dc and higher), inability to stand or sit upright for at least 30 minutes after dosing, and pregnancy
- Use cautiously in renal impairment less than class Dc; history of hypoparathyroidism or aspirin-sensitive asthma; or concurrent use of loop diuretics, aminoglycosides, or other nephrotoxic drugs.

### Adverse reactions

**CNS:** agitation, anxiety, confusion, asthenia, depression, dizziness, headache, hypertonia, hypoesthesia, insomnia, neuralgia, fatigue, paresthesia, psychosis, somnolence, vertigo, **seizures**

**CV:** angina pectoris, cardiovascular disorder, chest pain, hypertension, hypotension, syncope, vasodilation, tachycardia, **atrial flutter or fibrillation, heart failure**

**EENT:** amblyopia, cataract, conjunctivitis, dry eyes, tinnitus, rhinitis, sinusitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, abdominal distention, acid reflux, belching, colitis, dyspepsia, gastritis, gastroenteritis, dysphagia, flatulence, esophageal ulcer, dry mouth, anorexia, **GI hemorrhage**

**Hematologic:** anemia, ecchymosis, **granulocytopenia, leukopenia, neutropenia, thrombocytopenia**

**Metabolic:** dehydration, **fluid overload**

**Musculoskeletal:** arthralgia, arthritis, arthrosis, back or neck pain, bone disorder, bone fracture, bone or skeletal pain, bursitis, joint disorder, leg or other muscle cramps, myalgia

**Respiratory:** bronchitis, cough, dyspnea, pneumonia, crackles, upper respiratory infection, **pleural effusion**

**Skin:** alopecia, dermatitis, pruritus, rash

**Other:** taste perversion, weight loss, pain, edema, fever, flulike symptoms, infection, infusion-site reaction, allergic reaction

### Patient monitoring

- Watch for signs and symptoms of GI irritation, including ulcers.
- Monitor blood pressure and calcium, potassium, phosphate, and creatinine levels.

## bronchodilators

albuterol, albuterol sulfate, aminophylline, epinephrine, epinephrine hydrochloride, formoterol fumarate, ipratropium bromide, isoproterenol hydrochloride, levalbuterol hydrochloride, salmeterol xinafoate, terbutaline sulfate, theophylline, tiotropium

*Leukotriene receptor antagonist:*  
montelukast sodium, zafirlukast

### Action

Inhibit phosphodiesterase, an enzyme that degrades cyclic adenosine monophosphate (cAMP) by stimulating cAMP release and inhibiting release of slow-reacting substance of anaphylaxis

and histamine. These actions cause bronchodilation, produce CNS and cardiac stimulation, promote diuresis, and increase gastric acid secretion.

### Indications

Prevention of exercise-induced bronchospasm, prevention and treatment of bronchospasm in reversible obstructive airway disease

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug, angina, arrhythmias associated with tachycardia, ventricular arrhythmias that warrant inotropic therapy, cardiac dilatation or insufficiency, cerebral arteriosclerosis, organic brain damage, angle-closure glaucoma, local anesthesia of certain areas (such as toes or fingers), and labor
- Use cautiously in heart failure or other cardiac or circulatory impairment, hypertension, chronic obstructive pulmonary disease, renal or hepatic disease, hyperthyroidism, peptic ulcer, severe hypoxemia, diabetes mellitus, seizure disorders, glaucoma, elderly patients, pregnant or breast-feeding patients, young children, and infants.

### Adverse reactions

**CNS:** insomnia, headache, hyperactivity, asthenia, malaise, dizziness, apprehension, anxiety, restlessness, CNS stimulation, nervousness, hyperkinesia, vertigo, drowsiness, tremor  
**CV:** hypertension, hypotension, tachycardia, angina, chest pain, palpitations, **arrhythmias**  
**EENT:** nasal congestion, nasal dryness and irritation, epistaxis, sore throat (with inhaled drug), hoarseness  
**GI:** nausea, vomiting, heartburn, anorexia  
**Metabolic:** hypokalemia, **hypoglycemia**  
**Musculoskeletal:** muscle cramps

**Respiratory:** cough, wheezing, dyspnea, bronchitis, paradoxical airway resistance (with repeated, excessive use of inhaled drug), increased sputum,

**bronchospasm, pulmonary edema**

**Skin:** pallor, flushing, diaphoresis

**Other:** unusual or bad taste, increased appetite, hypersensitivity reaction

### Patient monitoring

- Monitor vital signs, ECG, and fluid intake and output.

## calcium channel blockers

amlodipine, diltiazem hydrochloride, felodipine, isradipine, nifedipine hydrochloride, nifedipine, nimodipine, nisoldipine, verapamil hydrochloride

### Action

Inhibit calcium influx through membranes of cardiac and smooth-muscle cells; this action depresses automaticity and conduction velocity in cardiac muscle, reducing myocardial contractility. Also decrease depolarization rate, atrial conduction, and total peripheral resistance.

### Indications

Hypertension, angina pectoris, vasospastic (Prinzmetal's) angina, supraventricular tachyarrhythmias, rapid ventricular rate in atrial flutter or fibrillation

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug, sick sinus syndrome, second- or third-degree atrioventricular block (unless patient has artificial pacemaker in place), and systolic pressure below 90 mm Hg

- Use cautiously in severe renal or hepatic impairment, advanced aortic stenosis, cardiogenic shock (unless associated with supraventricular tachyarrhythmias), history of serious ventricular arrhythmias or heart failure, concurrent use of I.V. beta-adrenergic blockers, elderly patients, pregnant or breastfeeding patients, and children (safety not established).

### Adverse reactions

**CNS:** headache, abnormal dreams, anxiety, confusion, dizziness, syncope, drowsiness, nervousness, paresthesia, tremor, asthenia, psychiatric disturbances

**CV:** peripheral edema, chest pain, hypotension, palpitations, bradycardia, tachycardia, **arrhythmias, heart failure**

**EENT:** blurred vision, disturbed equilibrium, tinnitus, epistaxis

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, dry mouth, anorexia

**GU:** dysuria, nocturia, polyuria, sexual dysfunction, gynecomastia

**Hematologic:** anemia, **leukopenia, thrombocytopenia**

**Metabolic:** hyperglycemia

**Musculoskeletal:** joint stiffness, muscle cramps

**Respiratory:** cough, dyspnea

**Skin:** rash, dermatitis, pruritus, urticaria, flushing, diaphoresis, photosensitivity reaction, **erythema multiforme, Stevens-Johnson syndrome**

**Other:** gingival hyperplasia, altered taste, weight gain

### Patient monitoring

- Monitor blood glucose and electrolyte levels, fluid intake and output, and liver and kidney function tests.
- Assess vital signs, ECG, weight, and blood pressure in both arms (with patient lying down, sitting, and standing).

## cholinergics

bethanechol chloride, cevimeline hydrochloride, neostigmine, pyridostigmine bromide

### Action

Stimulate cholinergic receptors, causing urinary bladder contraction, decreased bladder capacity, more frequent ureteral peristaltic waves, increased GI tone and peristalsis, increased lower esophageal sphincter pressure, and increased gastric secretions

### Indications

Postpartum or postoperative nonobstructive urinary retention, urinary retention caused by neurogenic bladder, diagnosis of myasthenia gravis (Tensilon test), antidote for curare (to reverse nondepolarizing neuromuscular blockade)

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug or sulfites, hyperthyroidism, peptic ulcer, latent or active bronchial asthma, pronounced bradycardia or atrioventricular (AV) conduction defects, vasomotor instability, coronary artery disease, coronary occlusion, hypotension, hypertension, seizure disorders, parkinsonism, GI or GU tract obstruction, impaired GI or GU wall integrity, spastic GI disturbances, acute inflammatory GI tract lesions, peritonitis, marked vagotonia, and when GI tract or urinary bladder activity is undesirable (for instance, postoperatively)
- Use cautiously in arrhythmias, toxic megacolon, poor GI motility, and pregnant patients.

### Adverse reactions

**CNS:** asthenia, dysarthria, dysphonia, dizziness, drowsiness, headache, syncope, **loss of consciousness, seizures**

**CV:** hypotension, AV block, bradycardia, **cardiac arrest, thrombophlebitis** (with I.V. use)

**EENT:** diplopia, miosis, conjunctival hyperemia, excessive lacrimation and salivation

**GI:** nausea, vomiting, diarrhea, abdominal cramps, dysphagia

**GU:** urinary frequency or incontinence

**Musculoskeletal:** muscle cramps, fasciculations

**Respiratory:** dyspnea, **respiratory muscle paralysis, central respiratory paralysis, laryngospasm, bronchospasm, respiratory arrest**

**Skin:** rash, diaphoresis, flushing

**Other:** anaphylaxis

### Patient monitoring

- Monitor ECG, glucose and electrolyte levels, urinalysis, and liver and kidney function tests.
- ☞ Assess platelet count in long-term use. Report unusual bleeding or bruising, petechiae, skin disorders, and signs and symptoms of diabetes mellitus.

## CNS stimulants

amphetamine, dexamethylphenidate hydrochloride, dextroamphetamine sulfate, doxapram, lisdexamphetamine dimesylete, methylphenidate hydrochloride, modafinil, pemoline

### Action

Cause norepinephrine release from central adrenergic neurons and increase central stimulation, which enhances motor activity and mental alertness, lifts mood, and suppresses appetite

## Indications

Attention deficit hyperactivity disorder, narcolepsy

## Contraindications and precautions

- Contraindicated in hypersensitivity to drug or tartrazine, advanced arteriosclerosis, cardiovascular disease, moderate to severe hypertension, agitation, hyperexcitable states (including hyperthyroidism), glaucoma, history of Tourette's syndrome or drug abuse, suicidal or homicidal tendency, concurrent MAO inhibitor use, breastfeeding, and children younger than age 6
- Use cautiously in mild hypertension, diabetes mellitus, depression, seizures, psychosis, long-term amphetamine use, elderly or debilitated patients, and pregnant patients.

## Adverse reactions

**CNS:** nervousness, insomnia, dizziness, headache, dyskinesia, chorea, drowsiness, hyperactivity, restlessness, tremor, depression, Tourette's syndrome, **toxic psychosis**

**CV:** angina, palpitations, hypertension, hypotension, tachycardia, **arrhythmias**

**EENT:** blurred vision, poor accommodation

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain and cramps, anorexia, dry mouth

**GU:** erectile dysfunction, increased libido

**Hematologic:** anemia, **leukopenia**, **thrombocytopenia**

**Hepatic:** **hepatic dysfunction**, **hepatic coma**

**Skin:** rash, alopecia, exfoliative dermatitis

**Other:** metallic taste, weight loss, fever, psychological or physical drug dependence, drug tolerance, abnormal behavior (with abuse)

## Patient monitoring

- Watch for and report fever, excitation, delirium, tremors, and twitching.
- 🔊 Monitor vital signs. Stay alert for arrhythmias, tachycardia, hypertension, and cardiovascular changes with psychotic syndrome.
- Watch for and report signs of drug abuse.

## corticosteroids

beclomethasone dipropionate, betamethasone, betamethasone acetate and sodium phosphate, budesonide, dexamethasone, dexamethasone sodium sulfate, flunisolide, fluticasone propionate, fluticasone furoate, hydrocortisone, hydrocortisone acetate, hydrocortisone butyrate, hydrocortisone sodium succinate, hydrocortisone valerate, methylprednisolone, methylprednisolone acetate, methylprednisolone sodium succinate, prednisolone, prednisolone acetate, prednisolone sodium phosphate, prednisone, triamcinolone triamcinolone acetonide, triamcinolone hexacetonide

## Action

Reduce the immune response by inhibiting prostaglandin synthesis, macrophage and leukocyte accumulation at inflammation site, phagocytosis, and lysosomal enzyme release. Also reduce numbers of T lymphocytes, monocytes, and eosinophils and interfere with immunoglobulin binding to cell-surface receptors. Some corticosteroids regulate metabolic pathways involving protein, carbohydrate, and fat; others regulate electrolyte and water balance.

## Indications

Adrenocortical insufficiency; adrenal, inflammatory, allergic, hematologic, neoplastic, and autoimmune disorders; asthma; cerebral edema; Crohn's disease; hypercalcemia; acute spinal cord injury; nausea and vomiting caused by chemotherapy; prevention of organ rejection in transplant patients; prevention of neonatal respiratory distress in high-risk pregnancies

## Contraindications and precautions

- Contraindicated in hypersensitivity to drug or intolerance of alcohol, bisulfites, or tartrazine and in active untreated infections
- Use cautiously in hypertension, osteoporosis, diabetes mellitus, glaucoma, immunosuppression, seizure disorders, renal disease, hypothyroidism, cirrhosis, diverticulitis, active or latent peptic ulcer, inflammatory bowel disease, ulcerative colitis, thromboembolic disorder or tendency, myasthenia gravis, heart failure, metastatic cancer, emotional instability, recent GI surgery, pregnant or breastfeeding patients, and children younger than age 6 (safety not established).

## Adverse reactions

**CNS:** headache, nervousness, restlessness, depression, euphoria, personality changes, psychosis, vertigo, paresthesia, insomnia, **increased intracranial pressure, seizures**

**CV:** hypotension, hypertension, Churg-Strauss syndrome, **heart failure, thrombophlebitis, thromboembolism, fat embolism, arrhythmias, shock**

**EENT:** glaucoma (with long-term use), increased intraocular pressure, cataract, nasal congestion and irritation, perforated nasal septum, epistaxis, nasopharyngeal or oropharyngeal fungal infection, sneezing, dysphonia, hoarseness, throat irritation

**GI:** nausea, vomiting, abdominal distention, peptic ulcer, esophageal candidiasis or ulcer, pancreatitis, dry mouth, anorexia

**GU:** amenorrhea, irregular menses  
**Metabolic:** decreased growth (in children), diabetes mellitus, cushingoid state, sodium and fluid retention, hyperglycemia, hypokalemia, hypocalcemia, hypercholesterolemia, **adrenal suppression, hypothalamic-pituitary-adrenal suppression** (with systemic use for more than 5 days)

**Musculoskeletal:** muscle wasting, muscle pain and weakness, myopathy, spontaneous fractures, aseptic joint necrosis, tendon rupture, osteoporosis, osteonecrosis

**Respiratory:** cough, wheezing, **bronchospasm**

**Skin:** rash, pruritus, contact dermatitis, acne, decreased wound healing, bruising, hirsutism, thin and fragile skin, petechiae, purpura, striae, subcutaneous fat atrophy, injection site atrophy, angioedema

**Other:** bad taste, increased appetite (with long-term use), weight gain, facial edema, increased susceptibility to infection, aggravation or masking of infection, immunosuppression, hypersensitivity reaction

## Patient monitoring

- Monitor ECG, blood glucose and electrolyte levels, urinalysis, and kidney and liver function tests.

 Assess platelet count in long-term therapy. Report unusual bleeding or bruising, petechiae, skin disorders, and signs and symptom of diabetes mellitus.

- Monitor appearance for changes that suggest Cushing's syndrome.

## diuretics

**Carbonic anhydrase inhibitor:** acetazolamide

**Loop diuretics:** bumetanide, furosemide, torsemide

**Osmotic diuretics:** mannitol

**Potassium-sparing diuretics:** spironolactone, triamterene

**Thiazide and thiazide-like diuretics:** chlorthalidone, hydrochlorothiazide, indapamide, metolazone

### Action

**Carbonic anhydrase inhibitors** inhibit carbonic anhydrase in kidneys, decreasing reabsorption of water, sodium, potassium, and bicarbonate.

**Loop diuretics** inhibit reabsorption of sodium and chloride (and therefore water) in proximal and distal tubules and loop of Henle. **Osmotic diuretics** increase plasma osmolality, drawing water from body tissues into extracellular fluid and then out through the kidney. **Potassium-sparing diuretics** inhibit sodium reabsorption in distal renal tubule, causing sodium and water loss. **Thiazide and thiazide-like diuretics** decrease rate of sodium and chloride reabsorption by distal renal tubule and increase water excretion.

### Indications

Hypertension or edema secondary to heart failure or other causes, cerebral edema, hemolytic transfusion reaction, drug toxicity, prevention of oliguria or acute renal failure

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug, alcohol intolerance (some liquid furosemide forms), anuria, renal

decompensation, hepatic coma or precoma, severe electrolyte depletion, severe pulmonary congestion or edema, severe dehydration, and active intracranial bleeding (except during craniotomy)

- Use cautiously in severe hepatic disease accompanied by cirrhosis or ascites, electrolyte depletion, worsening azotemia, renal insufficiency (blood urea nitrogen above 30 mg/dl or creatinine clearance below 30 ml/minute), diabetes mellitus, elderly or debilitated patients, pregnant or breastfeeding patients, and children younger than age 18.

### Adverse reactions

**CNS:** dizziness, headache, insomnia, nervousness, vertigo, asthenia, paresthesia, confusion, fatigue, drowsiness, **encephalopathy**

**CV:** hypotension, chest pain, volume depletion, **thrombophlebitis, arrhythmias**

**EENT:** blurred vision, nystagmus, hearing loss, tinnitus

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, gastric irritation, dry mouth, anorexia, **acute pancreatitis**

**GU:** polyuria, nocturia, glycosuria, premature ejaculation, erectile dysfunction, nipple tenderness, **renal failure, oliguria**

**Hematologic:** leukopenia, other blood dyscrasias

**Hepatic:** jaundice

**Metabolic:** dehydration, hyperglycemia, hyperuricemia, hypokalemia, hypomagnesemia, **hypochloremic alkalosis**

**Musculoskeletal:** joint pain, muscle cramps, myalgia

**Skin:** rash, pruritus, urticaria, diaphoresis, photosensitivity

**Other:** weight gain

### Patient monitoring

- Monitor fluid intake and output and weight.

- Monitor CBC and blood glucose, blood urea nitrogen, creatinine, carbon dioxide, and electrolyte levels (especially potassium).
- Assess vital signs during rapid diuresis.

## erectile dysfunction agents

### *Phosphodiesterase type 5 (PDE5)*

*inhibitors:* avanafil, sildenafil citrate, tadalafil, vardenafil hydrochloride

*Other:* alprostadil

### Action

PDE5 inhibitors cause degradation of cyclic guanylic acid in smooth-muscle cells of corpus cavernosum, enhancing effects of nitric oxide released during sexual stimulation. These actions increase blood flow to penis and induce erection.

Alprostadil relaxes the trabecular smooth muscle and dilates cavernosal arteries, causing expansion of lacunar spaces and blood entrapment from compression of venules against the tunica albuginea. These effects induce erection.

### Indications

Erectile dysfunction

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug or its components and in concurrent use of nitrates (regularly or intermittently), nitric oxide donors, or alpha-adrenergic blockers
- Use cautiously in anatomic penile deformation, conditions that predispose to priapism (such as sickle cell anemia, multiple myeloma, leukemia), bleeding disorders, active peptic ulcer, retinitis pigmentosa or other retinal abnormality, coronary ischemia, heart failure, multidrug antihypertensive regimen, or concurrent use of

erythromycin, cimetidine, or other drugs that could prolong the half-life of erectile dysfunction agent.

### Adverse reactions

**CNS:** dizziness, headache, fainting, hypoesthesia

**CV:** abnormal ECG, hypertension, hypotension, vasodilation, vasovagal reaction, peripheral vascular disorder, supraventricular extrasystoles

**EENT:** abnormal vision, mydriasis, nasal congestion, rhinitis, sinusitis

**GI:** nausea, diarrhea, dyspepsia, dry mouth

**GU:** urinary frequency and urgency, impaired urination, hematuria, urinary tract infection, inguinal hernia, prostate disorder, scrotal disorder or edema, testicular pain

**Metabolic:** hyperglycemia

**Musculoskeletal:** back or limb pain, leg cramps, myalgia

**Respiratory:** cough

**Skin:** rash, nonapplication site pruritus, diaphoresis, flushing, skin disorder or neoplasm

**Other:** accidental injury, flulike symptoms, infection, localized pain

### Patient monitoring

- Monitor cardiovascular status and vision.
- Assess for drug efficacy. Watch for priapism or erections lasting beyond 4 hours, which may permanently damage penile tissue.

## hematopoietic agents

*Colony-stimulating factors:* filgrastim, pegfilgrastim, sargramostim

*Erythropoiesis-stimulating agent (synthetic):* peginesatide

*Human erythropoietins:* darbepoetin alfa, epoetin alfa

## Action

Varies with specific drug. See individual monographs.

## Indications

*Colony-stimulating factors*—to reduce incidence of infection in myelosuppressive chemotherapy; to reduce time to neutrophil recovery and fever duration in patients with acute myelogenous leukemia and nonmyeloid cancer who are undergoing myeloablative chemotherapy followed by bone marrow transplant; mobilization of peripheral blood progenitor cell collection; severe chronic neutropenia  
*Human erythropoietins*—anemia associated with chronic renal failure, zidovudine therapy in patients with human immunodeficiency virus, cancer patients on chemotherapy, reduction of allogeneic blood transfusions in surgery patients

## Contraindications and precautions

- Contraindicated in hypersensitivity to drug or human albumin and in uncontrolled hypertension
- Use cautiously in cardiac disease, hypertension, seizures, and porphyria.

## Adverse reactions

**CNS:** fatigue, headache, generalized weakness

**CV:** chest pain, hypertension, tachycardia

**GI:** nausea, vomiting, diarrhea, constipation, mucositis, stomatitis, anorexia

**Metabolic:** hyperkalemia

**Musculoskeletal:** skeletal pain, arthralgia, myalgia

**Hematologic:** neutropenic fever

**Respiratory:** dyspnea, cough, sore throat

**Skin:** alopecia, rash, urticaria

**Other:** fever, stinging at injection site, flulike symptoms, hypersensitivity reaction

## Patient monitoring

- Monitor CBC before and frequently throughout therapy. Also monitor liver function tests and uric acid levels.
- Assess for signs and symptoms of splenic rupture, such as left upper quadrant abdominal pain, shoulder pain, and splenic enlargement.
- Watch for signs and symptoms of infection, sepsis, adult respiratory distress syndrome, and neutropenic fever.

## immunosuppressants

azathioprine, basiliximab, cyclosporine, glatiramer acetate, lenalidomide, lymphocyte immune globulin, methotrexate, methotrexate sodium, muromonab-CD3, mycophenolate mofetil, mycophenolate mofetil hydrochloride, mycophenolate sodium, sirolimus, tacrolimus, thalidomide

## Action

Inhibit binding of interleukin (IL)-1 to IL-1 receptors; prevent proliferation and differentiation of activated B and T cells; inhibit lymphokine production and IL-2 release; react with T-lymphocyte membranes, depleting blood of CD3+ T cells; and bind to intracellular proteins to prevent T-cell activation

## Indications

Moderate to severely active rheumatoid arthritis, prevention of organ transplant rejection

## Contraindications and precautions

- Contraindicated in hypersensitivity to drug or its components, fluid overload, uncompensated heart failure, seizure disorders, and pregnant patients with rheumatoid arthritis

- Use cautiously in renal or hepatic disease, cancer, diabetes mellitus, hyperkalemia, hyperuricemia, infection, hypertension, pregnant patients (except those with rheumatoid arthritis), breastfeeding patients, and children younger than age 13.

### Adverse reactions

**CNS:** headache, insomnia, paresthesia, dizziness, tremor, drowsiness, anxiety, confusion, agitation, rigors, asthenia, **coma, seizures**

**CV:** hypotension, hypertension, tachycardia, palpitations, chest pain, ECG abnormalities, **torsades de pointes, prolonged QT interval**

**EENT:** blurred vision, painful red eye, dry and irritated eyes, eyelid edema, earache, tinnitus, nasopharyngitis, epistaxis, postnasal drip, sinusitis, sore throat

**GI:** nausea, vomiting, diarrhea, constipation, fecal incontinence, dyspepsia, abdominal pain, dry mouth, oral blisters, oral candidiasis, anorexia, **GI hemorrhage**

**GU:** urinary incontinence, breakthrough bleeding, **vaginal hemorrhage, renal impairment, oliguria, renal failure**

**Hematologic:** anemia, **thrombocytopenia, neutropenia, hemorrhage, disseminated intravascular coagulation**

**Metabolic:** hypomagnesemia, hyperglycemia, hypokalemia, **hyperkalemia, hypoglycemia, acidosis**

**Musculoskeletal:** myalgia; joint, bone, back, neck, or limb pain

**Respiratory:** dyspnea, cough, hypoxia, wheezing, tachypnea, decreased or abnormal breath sounds, hemoptysis, upper respiratory infection, **pleural effusion**

**Skin:** pruritus, dermatitis, bruising, dry skin, diaphoresis, night sweats, flushing, erythema, petechiae, hyperpigmentation, urticaria, skin lesions, pallor, local exfoliation

**Other:** weight changes, fever, lymphadenopathy, edema, facial edema, bacterial infection, herpes simplex infection, pain, hypersensitivity reaction, **sepsis**

### Patient monitoring

- Assess for signs and symptoms of infection and injection site reaction.
- Monitor vital signs, CBC with platelet count, fluid intake and output, electrolyte and blood glucose levels, and liver and kidney function tests.

## inotropics

digoxin, milrinone lactate

### Action

Inhibit sodium- and potassium-activated adenosine triphosphatase phosphodiesterase, which raises intracellular and extracellular calcium levels. These effects increase myocardial contractility, prolong atrioventricular (AV) node refractory period, decrease conduction through sinoatrial and AV nodes, and relax and dilate vascular smooth muscle to reduce preload and afterload.

### Indications

Heart failure, tachyarrhythmias, atrial fibrillation or flutter, paroxysmal atrial tachycardia

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug, known alcohol intolerance (elixir only), and ventricular fibrillation
- Use cautiously in electrolyte abnormalities (such as hypokalemia, hypercalcemia, hypomagnesemia), myocardial infarction, AV block, idiopathic hypertrophic subaortic stenosis, constrictive pericarditis, renal

impairment, obesity, elderly patients, pregnant or breastfeeding patients, and children.

### Adverse reactions

**CNS:** fatigue, headache, asthenia

**CV:** bradycardia, ECG changes, **arrhythmias**

**EENT:** blurred or yellow vision

**GI:** nausea, vomiting, diarrhea, anorexia

**GU:** gynecomastia

**Hematologic:** thrombocytopenia

### Patient monitoring

- Monitor vital signs, weight, electrolyte levels, fluid intake and output, drug blood level, and kidney function tests.

## laxatives

bisacodyl, calcium polycarboxophil, docusate calcium, docusate sodium, lactulose, magnesium salts, methylcellulose, psyllium, senna, sennosides

### Action

Stimulate smooth muscle of bowel, increasing intestinal contractions; increase stool bulk by causing water retention and inhibiting digestion in stomach. Also soften hard feces, promoting their passage through lower intestine.

### Indications

Treatment of constipation, prevention of constipation in patients who should not strain during defecation (for example, after anorectal surgery or myocardial infarction), colonic evacuation for rectal and bowel examination

## Contraindications and precautions

- Contraindicated in hypersensitivity to drug or its components, intestinal obstruction, undiagnosed abdominal pain, suspected appendicitis, and fecal impaction
- Use cautiously in severe cardiovascular disease, anal or rectal fissures, enteritis, ulcerative colitis, diverticulitis, pregnant or breastfeeding patients, and children younger than age 2.

### Adverse reactions

**GI:** nausea; vomiting; diarrhea; esophageal, gastric, small-intestine, or rectal obstruction (with dry form of drug); abdominal cramps in severe constipation; anorexia

**GU:** reddish-pink discoloration of alkaline urine, yellow-brown discoloration of acidic urine

**Metabolic:** alkalosis, fluid and electrolyte imbalances

**Musculoskeletal:** tetany

**Other:** laxative dependence (with excessive long-term use)

### Patient monitoring

- Monitor fluid and electrolyte balance.

## neuromuscular blockers

*Depolarizing blocker:* succinylcholine chloride

*Nondepolarizing blockers:* atracurium besylate, botulinum toxin type A, cisatracurium besylate, doxacurium chloride, mivacurium chloride, pancuronium bromide, rocuronium bromide, tubocurarine chloride, vecuronium bromide

### Action

*Depolarizing* neuromuscular blockers initially excite skeletal muscle, then

prevent muscle contraction by prolonging the refractory period. *Nondepolarizing* (competitive) neuromuscular blockers bind competitively to cholinergic receptors on motor end plates, preventing muscle contraction.

### Indications

Adjunct to anesthesia to facilitate endotracheal intubation; skeletal and smooth muscle relaxation; to facilitate orthopedic manipulation; reduction of muscle contractions during pharmacologically or electrically induced seizures; myasthenia gravis diagnosis

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug, low plasma pseudocholinesterase level, angle-closure glaucoma, myopathy with elevated creatine kinase level, penetrating eye injury, and personal or family history of malignant hyperthermia
- Use cautiously in heart disease; electrolyte imbalance; dehydration; neuromuscular, respiratory, or hepatic disease; pregnant or breastfeeding patients, and children younger than age 2.

### Adverse reactions

**CV:** hypotension, bradycardia, **arrhythmias, cardiac arrest**

**Musculoskeletal:** profound and prolonged muscle relaxation, residual muscle weakness

**Respiratory:** cyanosis, **prolonged apnea, bronchospasm, respiratory depression**

**Skin:** rash, flushing, pruritus, urticaria

**Other:** hypersensitivity reaction

### Patient monitoring

🔊 Monitor vital signs, pulmonary status, and temperature continuously.

## nonopioid analgesics

acetaminophen, acetylsalicylic acid, celecoxib, diclofenac, potassium, diclofenac sodium, etodolac, ibuprofen, indomethacin, ketorolac tromethamine, meloxicam, nabumetone, naproxen, naproxen sodium, oxaprozin, oxaprozin potassium, phenazopyridine hydrochloride, piroxicam, propoxyphene hydrochloride, propoxyphene napsylate

### Action

Inhibit cyclooxygenase, an enzyme needed for prostaglandin synthesis. This inhibition stimulates the anti-inflammatory response and blocks pain impulses.

### Indications

Inflammatory conditions (such as osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis), dysmenorrhea, actinic keratoses, fever

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug or sulfonamides and in history of asthma, urticaria, or allergic reaction to aspirin or other nonsteroidal anti-inflammatory drugs
- Use cautiously in severe cardiovascular, renal, or hepatic disease; GI disorders; cardiac decompensation; active GI bleeding or ulcer; asthma; history of ulcer disease; and chronic alcohol use or abuse.

### Adverse reactions

**CNS:** dizziness, headache, insomnia, fatigue, paresthesia, tremor, vertigo, syncope, anxiety, confusion, depression, nervousness, drowsiness, malaise, **seizures**

**CV:** palpitations, tachycardia, angina pectoris, hypertension, hypotension, **arrhythmias, heart failure, myocardial infarction**

**EENT:** abnormal vision, conjunctivitis, hearing loss, tinnitus, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, flatulence, colitis, duodenal or gastric ulcer, gastritis, gastroesophageal reflux, esophagitis, dry mouth, **GI hemorrhage, pancreatitis**

**GU:** albuminuria, hematuria, urinary frequency, urinary tract infection, **renal failure**

**Hematologic:** anemia, purpura, **leukopenia, thrombocytopenia, other blood dyscrasias**

**Hepatic:** **hepatitis**

**Metabolic:** dehydration

**Musculoskeletal:** myalgia, joint or back pain

**Respiratory:** dyspnea, cough, asthma, upper respiratory infection, **bronchospasm**

**Skin:** rash, urticaria, diaphoresis, pruritus, alopecia, bullous eruption, angioedema, photosensitivity

**Other:** altered taste, increased appetite, weight changes, flulike symptoms, edema, accidental injury, fever, allergic reaction

### Patient monitoring

- Monitor CBC and liver and kidney function tests.

## opioid analgesics

buprenorphine hydrochloride, butorphanol tartrate, codeine sulfate, fentanyl citrate, fentanyl transdermal system, fentanyl transmucosal, hydrocodone bitartrate and acetaminophen, hydrocodone bitartrate and aspirin, hydrocodone bitartrate and ibuprofen, hydrocodone

bitartrate and homatropine methylbromide, hydromorphone hydrochloride, levorphanol tartrate, meperidine hydrochloride, methadone hydrochloride, methylnaltrexone bromide, morphine hydrochloride, morphine sulfate, nalbuphine hydrochloride, oxycodone hydrochloride, oxymorphone hydrochloride, pentazocine lactate, pentazocine hydrochloride and acetaminophen, pentazocine hydrochloride and naloxone hydrochloride, tapentadol, tramadol hydrochloride

### Action

Attach to specific CNS receptors, decreasing cell membrane permeability, slowing pain impulse transmission, and altering response to pain

### Indications

Moderate to severe pain, intraoperative anesthesia, labor, cough, diarrhea

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug, significant respiratory depression, paralytic ileus, MAO inhibitor use within last 14 days, diarrhea caused by poisoning, acute bronchial asthma, and upper airway obstruction
- Use cautiously in severe cardiovascular, renal, or hepatic disease; cardiac decompensation; GI disorders; history of ulcer disease; chronic alcohol use or abuse; respiratory depression; severe obesity; sleep apnea syndrome; myxedema; kyphoscoliosis; CNS depression; coma; biliary tract disease, including pancreatitis; head injury, other intracranial injuries, increased intracranial pressure, seizures; concurrent use of other CNS depressants or serotonergic agents; elderly patients; pregnant or breastfeeding patients; and children younger than age 13.

**Adverse reactions**

**CNS:** drowsiness, sedation, dizziness, tremor, irritability, syncope, stimulation (in children)

**CV:** hypertension, hypotension, palpitations, bradycardia, tachycardia, extrasystole, **arrhythmias**

**EENT:** blurred vision, nasal dryness and congestion, dry or sore throat

**GI:** nausea, vomiting, constipation, epigastric distress, dry mouth, anorexia, **intestinal obstruction**

**GU:** urinary retention or hesitancy, dysuria, early menses, decreased libido, erectile dysfunction

**Hematologic:** hemolytic anemia, hypoplastic anemia, thrombocytopenia, agranulocytosis, leukopenia, pancytopenia

**Respiratory:** thickened bronchial secretions, chest tightness, wheezing

**Skin:** urticaria, rash, diaphoresis

**Other:** hypersensitivity reaction (with I.V. use), **anaphylactic shock**

**Patient monitoring**

- Assess vital signs and respiratory status.
- Monitor CBC, electrolyte levels, and liver and kidney function tests.

**potassium channel blockers**

dalfampridine

**Action**

Unknown. May increase conduction of action potentials in demyelinated axons through inhibition of potassium channels

**Indications**

To improve walking in patients with multiple sclerosis

**Contraindications and precautions**

- Contraindicated in history of seizures and moderate or severe renal impairment
- Use cautiously in mild renal impairment, pregnant or breastfeeding patients, and children younger than age 18 (safety and efficacy not established).

**Adverse reactions**

**CNS:** insomnia, dizziness, headache, asthenia, balance disorder, paresthesia, seizures

**EENT:** nasopharyngitis, pharyngolaryngeal pain

**GI:** nausea, constipation, dyspepsia

**GU:** urinary tract infection

**Musculoskeletal:** back pain

**Other:** multiple sclerosis relapse

**Patient monitoring**

- Monitor renal function tests regularly (especially creatinine clearance).
- Discontinue drug if seizure occurs.

**renin-angiotensin system antagonists**

*Angiotensin-converting enzyme (ACE) inhibitors:* benazepril hydrochloride, captopril, enalapril maleate, enalaprilat, fosinopril sodium, lisinopril, moexipril, perindopril erbumine, quinapril hydrochloride, ramipril, trandolapril

*Angiotensin II receptor antagonists:* candesartan cilexetil, eprosartan mesylate, irbesartan, losartan potassium, olmesartan medoxomil, telmisartan, valsartan

*Selective aldosterone receptor antagonist:* eplerenone

## Action

*ACE inhibitors* lower blood pressure by preventing conversion of angiotensin I to angiotensin II, a potent vasoconstrictor that decreases peripheral resistance and aldosterone secretion.

*Angiotensin II receptor antagonists* block vasoconstrictive and aldosterone-secreting effects of angiotensin II by selectively blocking binding of angiotensin II to angiotensin I receptors in vascular smooth muscle, adrenal, and other tissues.

*Selective aldosterone receptor antagonists* bind to mineralocorticoid receptors and block binding of aldosterone, a component of the renin-angiotensin-aldosterone system. This effect decreases blood pressure.

## Indications

Hypertension, heart failure, left ventricular dysfunction, multiple sclerosis, diabetic neuropathy

## Contraindications and precautions

- Contraindicated in hypersensitivity to drug
- Use cautiously in renal or hepatic impairment, hypovolemia, hyponatremia, aortic stenosis and hypertrophic cardiomyopathy, cerebrovascular or cardiac insufficiency, surgery and anesthesia, concurrent diuretic therapy, family history of angioedema, Black patients with hypertension, elderly patients, pregnant or breastfeeding patients, and children (safety not established for most ACE inhibitors).

## Adverse reactions

**CNS:** dizziness, fatigue, headache, insomnia, asthenia, drowsiness, vertigo

**CV:** hypotension, angina pectoris, tachycardia, **myocardial infarction**

**EENT:** sinusitis

**GI:** nausea, diarrhea, anorexia

**GU:** proteinuria, erectile dysfunction, decreased libido, **renal failure**

**Hematologic:** bone marrow depression, agranulocytosis

**Hepatic:** cholestatic jaundice progressing to **hepatic necrosis and death**

**Metabolic:** hyperkalemia

**Respiratory:** cough, bronchitis, dyspnea, asthma, **eosinophilic pneumonitis**

**Skin:** rash, angioedema

**Other:** taste disturbances, fever, **anaphylaxis**

## Patient monitoring

- Monitor vital signs, including blood pressure in both arms with patient lying down, standing, and sitting.
- Assess fluid intake and output, electrolyte levels, CBC, and kidney and liver function tests.
- Evaluate urine for protein.
- Watch for microalbuminuria, especially in diabetic patients.

## sedative-hypnotics

*Barbiturates:* pentobarbital, phenobarbital

*Nonbarbiturates:* dexmedetomidine hydrochloride, flurazepam hydrochloride, temazepam, triazolam, zaleplon, zolpidem tartrate

## Action

*Barbiturates* cause drowsiness, sedation, and hypnosis by depressing the sensory cortex, decreasing motor activity, and altering cerebellar function.

*Nonbarbiturates* produce sedative, anxiolytic, muscle relaxant, and anti-convulsant effects by interacting with the gamma-aminobutyric acid–benzodiazepine receptor complex.

## Indications

Short-term treatment of insomnia, sedation, preanesthesia

## Contraindications and precautions

- Contraindicated in hypersensitivity to drug, barbiturate sensitivity, manifest or latent porphyria, marked hepatic dysfunction, severe respiratory disease, and nephritis
- Use cautiously in depression, respiratory compromise, pulmonary insufficiency, seizure disorders, hepatic or severe renal impairment, anxiety, elderly or debilitated patients, or history of drug abuse.

## Adverse reactions

**CNS:** headache, nervousness, talkativeness, slurred speech, apprehension, irritability, anxiety, light-headedness, dizziness, euphoria, relaxed feeling, weakness, poor concentration, incoordination, confusion, memory impairment, depression, abnormal dreams, nightmares, insomnia, paresthesia, restlessness, fatigue, dysesthesia, drowsiness, somnolence, staggering, falling, ataxia, agitation, hyperkinesia, psychiatric disturbances, hallucinations, abnormal thinking, vertigo, lethargy, hangover effect

**CV:** palpitations, chest pain, tachycardia, hypotension, bradycardia, **circulatory collapse, thrombophlebitis** (with I.V. use)

**EENT:** blurred vision, burning eyes, difficulty focusing, visual disturbances, tinnitus

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, GI pain, dry mouth, excessive salivation, glossitis, stomatitis, anorexia

**Hepatic:** jaundice, **hepatic failure** (in patients also receiving diuretics)

**Hematologic:** leukopenia, granulocytopenia

**Musculoskeletal:** joint pain

**Respiratory:** shortness of breath, hypoventilation, **respiratory depression**

**Skin:** dermatitis, diaphoresis, flushing, pruritus, rash, angioedema, exfoliative dermatitis

**Other:** altered taste, body pain, pain at I.M. injection site, fever (especially with long-term phenobarbital use)

## Patient monitoring

- Monitor vital signs, respiratory status, CBC with white cell differential, liver function tests, and blood urea nitrogen, creatinine, and electrolyte levels. Stay alert for hyperkalemia.
- Assess neurologic status. Watch for signs and symptoms of drug dependence.

## sex hormones

**5-alpha reductase inhibitors:** dutasteride, finasteride

**Androgens:** fluoxymesterone, nandrolone, testosterone

**Estrogens:** conjugated estrogens, esterified estrogens, estradiol, estrogens, etonogestrel and ethinyl estradiol vaginal ring, norelgestromin/ethinyl estradiol, norethindrone acetate, norgestrel

**Progestins:** medroxyprogesterone, megestrol acetate, progesterone

**Selective estrogen receptor modulator:** raloxifene

## Action

Varies with specific drug. See individual monographs.

## Indications

Vary with specific drug. See individual monographs.

## Contraindications and precautions

- Contraindicated in hypersensitivity to drug or its components; known or suspected breast cancer or estrogen-dependent neoplasia; undiagnosed abnormal genital bleeding; porphyria; active

deep-vein thrombosis, pulmonary embolism, or history of these conditions; active or recent arterial thromboembolic disease; active thrombophlebitis or thromboembolic disorders; history of thrombophlebitis, thrombosis, or thromboembolic disorders associated with previous estrogen use; and pregnancy

- Use cautiously in endometrial or ovarian cancer, endometriosis, gallbladder disease, vision disturbances, hypertension, familial hyperlipoproteinemia, hypothyroidism, conditions that predispose to fluid retention, hypocalcemia, asthma, diabetes mellitus, seizure disorders, migraine, hepatic or renal disease, and elderly patients.

### Adverse reactions

**CNS:** headache, migraine, syncope, depression, insomnia, vertigo, neuralgia, hypoesthesia

**CV:** chest pain, varicose veins

**EENT:** conjunctivitis, neuro-ocular lesions (such as retinal thrombosis, optic neuritis), steepened corneal curvature, contact lens intolerance, sinusitis, rhinitis, laryngitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, dyspepsia, flatulence, abdominal pain, GI disorder, gastroenteritis

**GU:** urinary tract infection, cystitis, leukorrhea, uterine or endometrial disorder, urinary tract disorder, breast tenderness or pain, breast enlargement, decreased lactation, amenorrhea, vaginal candidiasis, vaginitis, **vaginal hemorrhage, invasive cervical cancer**

**Musculoskeletal:** arthralgia, myalgia, leg cramps, arthritis, tendon disorder

**Respiratory:** cough, bronchitis, pneumonia

**Skin:** rash, diaphoresis, hot flashes

**Other:** fever, infection, flulike symptoms

### Patient monitoring

- Monitor liver function tests, fluid intake and output, and phosphatase, calcium glucose, and folic acid levels.
- Assess abdomen for liver enlargement.

- Monitor for breast tenderness and swelling.
- Assess bone density annually.

## skeletal muscle relaxants

baclofen, carisoprodol, chlorzoxazone, cyclobenzaprine hydrochloride, dantrolene sodium, diazepam, methocarbamol, tizanidine hydrochloride

### Action

Unknown. Thought to cause muscle relaxation through sedative properties and by inhibiting activity in descending reticular formation and spine. Also decrease muscle tone and involuntary movements.

### Indications

Muscle spasms (as from trauma or inflammation), hyperreflexia and hypertonia (as in parkinsonism), tetanus, cerebral palsy, multiple sclerosis, tension headache

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug or polyethylene glycol (parenteral forms), renal impairment (parenteral forms), active hepatic disease, upper motor neuron disorder, and patients who use spasticity to maintain posture or balance
- Use cautiously in cardiac, hepatic, or renal dysfunction; history of allergies; seizure disorders (parenteral forms); pregnant or breastfeeding patients; and children (safety not established).

### Adverse reactions

**CNS:** dizziness, anxiety, abnormal thinking, hyperesthesia, agitation, confusion, hypertonia, **seizures, coma**

**CV:** palpitations, hypotension, bradycardia, weak pulse, fistula, pseudoaneurysm, **thrombophlebitis,**

**complete or incomplete atrioventricular block, pulmonary embolism, nodal arrhythmias, ventricular tachycardia**

**EENT:** diplopia

**GI:** nausea, vomiting, diarrhea, dyspepsia, gastroesophageal reflux, hematemesis, dysphagia, **paralytic ileus, GI bleeding**

**GU:** urinary frequency or incontinence, dysuria, cystalgia, prostatitis, **renal dysfunction**

**Hepatic:** hepatitis

**Musculoskeletal:** muscle rigidity

**Respiratory:** abnormal breath sounds, dyspnea, wheezing, bronchitis, pneumonia, pleurisy, **pleural effusion, pulmonary edema, pulmonary embolism, bronchospasm**

**Skin:** rash, urticaria, pruritus, edema

**Other:** chills, fever

### Patient monitoring

- Monitor vital signs and liver function tests.

## thrombolytics

alteplase, anistreplase, drotrecogin alfa, reteplase, streptokinase, tenecteplase, urokinase

### Action

Convert plasminogen to plasmin, an enzyme that degrades fibrin clots and lyses thrombi and emboli

### Indications

Acute massive pulmonary embolism, acute ischemic cerebrovascular accident (CVA), thrombotic coronary arterial obstruction in acute myocardial infarction, deep-vein thrombosis, arterial emboli or thromboses, occlusion of venous access device

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug or other thrombolytics, active internal bleeding, bleeding diathesis,

severe uncontrolled hypertension, intracranial neoplasm, arteriovenous malformation or aneurysm, recent CVA, or recent intracranial or intraspinal surgery or trauma

- Use cautiously in GI or GU bleeding, hypertension, left-sided cardiac thrombus (including mitral stenosis), acute pericarditis, subacute bacterial endocarditis, hemostatic defects, diabetic hemorrhagic retinopathy, septic thrombophlebitis, previous puncture of non-compressible vessels, trauma, obstetric delivery, organ biopsy, major surgery, patients older than age 75, and pregnant or breastfeeding patients.

### Adverse reactions

**CNS:** intracranial hemorrhage

**CV:** hypotension, arrhythmias, **cholesterol embolization, venous thrombosis**

**GI:** nausea, vomiting, **GI or retroperitoneal bleeding**

**GU:** hematuria

**Hematologic:** anemia, **bone marrow depression, hemorrhage, bleeding tendency**

**Respiratory:** respiratory depression, apnea

**Skin:** bruising, urticaria

**Other:** fever, edema, phlebitis or hemorrhage at I.V. site, hypersensitivity reactions including **anaphylaxis, sepsis**

### Patient monitoring

- Monitor vital signs and neurologic status closely.

🔊 Assess for unusual bleeding or bruising.

- Monitor International Normalized Ratio, prothrombin time, and partial thromboplastin time.

## thyroid hormones

levothyroxine sodium; liothyronine sodium; liotrix; thyroid, desiccated

**Action**

Regulate growth and development by controlling protein synthesis; stimulate normal metabolism by oxygenating body tissues

**Indications**

Hypothyroidism, euthyroid or multinodular goiter, subacute or chronic lymphocytic thyroiditis

**Contraindications and precautions**

- Contraindicated in hypersensitivity to drug, recent myocardial infarction, adrenal insufficiency, and thyrotoxicosis
- Use cautiously in cardiovascular disease, severe renal insufficiency, uncorrected adrenocortical disorders, angina pectoris, ischemia, diabetes mellitus, myxedema, elderly patients, and pregnant or breastfeeding patients.

**Adverse reactions**

**CNS:** insomnia, irritability, nervousness, tremor, headache

**CV:** tachycardia, angina pectoris, hypotension, hypertension, increased cardiac output, palpitations, **arrhythmias, cardiovascular collapse**

**GI:** vomiting, diarrhea, abdominal cramps

**GU:** menstrual irregularities

**Metabolic:** hyperthyroidism

**Musculoskeletal:** accelerated bone maturation in children

**Skin:** alopecia (in children), diaphoresis

**Other:** weight loss, appetite changes, heat intolerance

**Patient monitoring**

- Monitor vital signs, weight, ECG, and thyroid function tests.

## thyroid hormone antagonists

methimazole, potassium iodide, propylthiouracil, sodium iodide <sup>131</sup>I

**Action**

Rapidly inhibit iodine release and synthesis in thyroid gland, decreasing thyroid vascularity and preventing iodine uptake

**Indications**

Hyperthyroidism, thyroid cancer, thyrotoxicosis, to control hyperthyroidism before thyroidectomy or radioactive iodine therapy

**Contraindications and precautions**

- Contraindicated in hypersensitivity to thyroid hormone antagonists and in breastfeeding
- Use cautiously in bone marrow depression, tuberculosis, bronchitis, hyperkalemia, renal impairment, recent myocardial infarction, large nodular goiter, vomiting and diarrhea, patients younger than age 30, and pregnant patients.

**Adverse reactions**

**CNS:** headache, vertigo, paresthesia, neuritis, neuropathy, CNS stimulation, depression, drowsiness

**CV:** chest pain, tachycardia

**EENT:** pain on swallowing, sore throat

**GI:** nausea, vomiting, diarrhea, constipation, epigastric distress, GI irritation, dry mouth, salivary gland enlargement, anorexia, **paralytic ileus**

**GU:** nephritis

**Hematologic:** anemia, eosinophilia, **bone marrow depression, leukopenia, thrombocytopenia, leukemia, agranulocytosis**

**Hepatic:** jaundice, **hepatic dysfunction, hepatitis**

**Metabolic:** hypothyroidism, thyroid hyperplasia, **hyperkalemia**

**Musculoskeletal:** joint pain, myalgia

**Respiratory:** cough

**Skin:** rash, urticaria, skin discoloration, pruritus, erythema nodosum, exfoliative dermatitis, alopecia, acneiform eruption

**Other:** taste loss, fullness in neck, fever, lupuslike syndrome, lymphadenopathy, lymphedema, **radiation sickness** (with sodium iodide <sup>131</sup>I)

### Patient monitoring

- Monitor CBC and thyroid function tests.

## vasodilators

bosentan, hydralazine hydrochloride, isosorbide dinitrate, isosorbide mononitrate, minoxidil, nesiritide, nitroglycerin, nitroprusside sodium

### Action

Relax vascular smooth muscle by stimulating intracellular production of cyclic guanosine monophosphate

### Indications

Acute angina, prophylaxis and long-term management of recurrent angina, heart failure associated with acute myocardial infarction (MI), to control blood pressure in perioperative hypertension associated with surgery

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug, severe anemia, angle-closure glaucoma, orthostatic hypotension, early MI, head trauma, cerebral hemorrhage, and as primary therapy in cardiogenic shock or systolic pressure below 90 mm Hg
- Use cautiously in acute MI (associated with hypertension, tachycardia, or congestive heart failure), cerebral hemorrhage, gastric hypermotility or malabsorption syndrome (with sustained-release forms), head trauma, hyperthyroidism, hypertrophic cardiomyopathy, increased intraocular

pressure, orthostatic hypotension, volume depletion, and alcohol use.

### Adverse reactions

**CNS:** headache, apprehension, malaise, rigors, restlessness, weakness, asthenia, vertigo, dizziness, agitation, anxiety, confusion, insomnia, nervousness, nightmares, incoordination, hypoaesthesia, hypokinesia

**CV:** tachycardia, retrosternal discomfort, palpitations, orthostatic hypotension, rebound hypertension, hypotension, syncope, crescendo angina, premature ventricular contractions

**arrhythmias, atrial fibrillation**

**EENT:** blurred vision, diplopia

**GI:** nausea, vomiting, diarrhea, dyspepsia, abdominal pain, tenesmus, fecal incontinence

**GU:** dysuria, urinary frequency, urinary incontinence, erectile dysfunction

**Hematologic: methemoglobinemia, hemolytic anemia**

**Musculoskeletal:** arthralgia, muscle twitching, stiff neck

**Respiratory:** bronchitis, pneumonia, upper respiratory infection

**Skin:** pallor; cold sweats; increased perspiration; rash; contact or exfoliative dermatitis; cutaneous vasodilation with flushing; crusty skin lesions; pruritus; topical allergic reaction; erythematous, vesicular, or pruritic lesions; local burning or tingling sensation in oral cavity (with sublingual forms); **anaphylactoid reactions** with oral mucosal and conjunctival edema

**Other:** tooth disorder, increased appetite, edema

### Patient monitoring

- Closely monitor ECG and vital signs (especially blood pressure).
- In suspected overdose, assess for signs and symptoms of increased intracranial pressure.
- Check arterial blood gas values and methemoglobin levels.

# Vitamins and minerals

## ascorbic acid (vitamin C)

Cecon, Cevi-Bid, Dull-C, Vita-C

### Action

Water-soluble vitamin with antioxidant properties; stimulates collagen formation and enhances tissue repair

### Availability

*Capsules:* 500 mg

*Crystals:* 1,000 mg/½ tsp

*Injection:* 250 mg/ml, 500 mg/ml

*Liquid:* 50 mg/ml, 500 mg/5 ml

*Powder:* 60 mg/½ tsp, 1,060 mg/½ tsp

*Solution:* 100 mg/ml

*Tablets:* 25 mg, 50 mg, 100 mg, 125 mg,

250 mg, 500 mg, 1,000 mg, 1,500 mg

*Tablets (chewable):* 60 mg, 100 mg,

250 mg, 500 mg, 1,000 mg

*Tablets (timed-release):* 500 mg,

1,000 mg, 1,500 mg

### Indications and dosages

➤ Recommended dietary allowance

**Adults:** 60 mg daily

➤ Scurvy

**Adults:** 300 mg to 1 g P.O., subcutaneously, I.M., or I.V. daily

**Children:** 100 to 300 mg P.O., subcutaneously, I.M., or I.V. daily depending on severity

### Contraindications and precautions

- Prolonged use of excessive doses contraindicated in diabetes mellitus, sodium-restricted diet, concurrent

anticoagulant use, and history of recurrent renal calculi

- Use cautiously in hypersensitivity to tartrazine or sulfites (if product contains these compounds), before tests for occult blood in stool, and in breast-feeding patients. Don't exceed recommended amount in pregnant patients.
- Avoid rapid I.V. infusion.

### Adverse reactions

Transient mild soreness at I.M. or subcutaneous injection site; transient light-headedness or dizziness (with rapid I.V. administration)

## cholecalciferol (vitamin D<sub>3</sub>)

Delta-D

### Action

Biologically active vitamin D metabolite; controls intestinal absorption of dietary calcium, tubular reabsorption of calcium by kidney, and (in conjunction with parathyroid hormone [PTH]), calcium mobilization from skeleton. Acts directly on bone cells to stimulate skeletal growth and on parathyroid glands to suppress PTH synthesis and secretion.

### Availability

*Tablets:* 400 international units, 1,000 international units

### Indications and dosages

➤ Recommended dietary allowance (RDA)

**Adults:** 400 to 1,000 international units/day

**Children:** 400 international units/day

### Contraindications and precautions

- Contraindicated in hypercalcemia, vitamin D toxicity, malabsorption

syndrome, and abnormal sensitivity to vitamin D effects

- Don't exceed RDA during normal pregnancy. Use cautiously in breast-feeding patients. Safety and efficacy of dosages exceeding RDA have not been established for children.

### Adverse reactions

Nausea, vomiting, constipation, pancreatitis, weakness, headache, irritability, drowsiness, overt psychosis, dry mouth, metallic taste, muscle or bone pain, hypertension, hypotension, polyuria, polydipsia, anorexia, weight loss, hypercalciuria, reversible azotemia, nephrocalcinosis, conjunctivitis, photophobia, pruritus, albuminuria, elevated liver function tests results, **arrhythmias**

## chromium (chromic chloride)

Chroma-Pak

### Action

Serves as a component of glucose tolerance factor, which activates insulin-mediated reactions; helps maintain normal glucose metabolism and peripheral nerve function

### Availability

*Injection:* 4 mcg/ml (as 20.5 mcg chromic chloride hexahydrate), 20 mcg/ml (as 102.5 mcg chromic chloride hexahydrate)

### Indications and dosages

➤ Supplement to I.V. solutions used in total parenteral nutrition

**Adults:** 10 to 15 mcg/day. For metabolically stable adults with intestinal fluid loss, 20 mcg/day.

**Children:** 0.14 to 0.2 mcg/kg/day

### Contraindications and precautions

- Preparations containing benzyl alcohol contraindicated in premature infants (may cause fatal gasping syndrome)
- Avoid use or adjust dosage in patients with renal or GI dysfunction.
- Use cautiously in pregnant patients.
- Multiple trace element solutions may cause overdose if patient's requirement for one element in formulation exceeds that for others. Chromium may need to be given separately.

### Adverse reactions

Toxicity is rare at recommended dosages; hypersensitivity reaction to iodide may occur.

## copper

Cupric Sulfate

### Action

Serves as cofactor for ceruloplasmin, an oxidase needed for proper formation of transferrin (an iron carrier protein); helps maintain normal rate of red and white blood cell formation

### Availability

*Injection:* 0.4 mg/ml, 2 mg/ml

### Indications and dosages

➤ Supplement to I.V. solutions used in total parenteral nutrition

**Adults:** 0.5 to 1.5 mg/day to prevent deficiency; 3 mg/day to treat deficiency

**Children:** 20 mcg/kg/day to prevent deficiency; 20 to 30 mcg/kg/day to treat deficiency

### Contraindications and precautions

- Multidose preparations contraindicated in patients with sensitivity to benzyl alcohol (such as premature

infants, who may experience fatal gasping syndrome)

- Use cautiously in renal or GI dysfunction, Wilson's disease, and pregnant patients.
- Be aware that giving copper without zinc (or vice versa) may decrease blood level of the other mineral. Monitor levels before giving subsequent doses.
- Multiple trace element solutions may cause overdose if patient's requirement for one element in formulation exceeds that for others. Copper may need to be given separately.

### Adverse reactions

None known

## cyanocobalamin (vitamin B<sub>12</sub>)

Big Shot B-12, Cyanoject, Rubramin

## hydroxocobalamin, crystalline (vitamin B<sub>12</sub>)

Hydro-Crysti-12, LA-12

### Action

Essential to growth, cell reproduction, hematopoiesis, and nucleoprotein and myelin synthesis; also participates in nucleic acid synthesis. Plays a role in red blood cell formation through activation of folic acid coenzymes.

### Availability cyanocobalamin

*Injection:* 100 mcg/ml, 1,000 mcg/ml

*Intranasal gel:* 500 mcg/0.1 ml

*Tablets:* 25 mcg, 50 mcg, 100 mcg, 200 mcg, 250 mcg, 500 mcg, 1,000 mcg, 1,500 mcg

*Tablets (extended-release):* 100 mcg, 200 mcg, 500 mcg, 1,000 mcg

### hydroxocobalamin

*Injection:* 1,000 mcg/ml

## Indications and dosages

➤ Recommended dietary allowance

**Adults and children older than age 11:**

2 mcg cyanocobalamin daily

**Children ages 9 to 11:** 1.8 mcg daily

**Children ages 4 to 8:** 1.2 mcg daily

**Children ages 1 to 3:** 0.9 mcg daily

➤ Vitamin B<sub>12</sub> deficiency

**Adults:** 30 mcg hydroxocobalamin I.M. daily for 5 to 10 days, depending on cause and severity; for maintenance, 100 to 200 mcg I.M. monthly

**Children:** Total dosage of 1 to 5 mg hydroxocobalamin I.M. given over 2 or more weeks in divided doses of 100 mcg; then a maintenance dosage of 30 to 50 mcg I.M. q 4 weeks

➤ Pernicious anemia

**Adults:** 100 mcg cyanocobalamin subcutaneously or I.M. daily for 7 days; then 100 mcg subcutaneously or I.M. every other day for 14 days; then 100 mcg subcutaneously or I.M. q 3 to 4 days for 2 to 3 weeks or until remission; then 100 mcg I.M. monthly or 1,000 to 2,000 mcg P.O. daily

➤ Vitamin B<sub>12</sub> deficiency and malabsorption in patients in remission

**Adults:** 500 mcg nasal gel intranasally once weekly

## Contraindications and precautions

- Contraindicated in hypersensitivity to vitamin B<sub>12</sub>, cobalt, or product components

## Adverse reactions

Mild transient diarrhea, nausea, vomiting, dyspepsia, headache, anxiety, dizziness, nervousness, hypoesthesia, sore throat, severe and rapid optic nerve atrophy, back pain, myalgia, arthritis, paresthesia, abnormal gait, dyspnea, rhinitis, itching, rash, polycythemia vera; with parenteral forms—**injection site pain, pulmonary edema, heart failure, peripheral vascular thrombosis, anaphylactic shock**

**doxercalciferol**

Hectorol

**Action**

Synthetic vitamin D analogue; acts directly on parathyroid gland to stimulate and suppress parathyroid hormone (PTH) synthesis and secretion

**Availability**

*Capsules:* 0.5 mcg, 2.5 mcg

*Injection:* 2 mcg/vial

**Indications and dosages**

➤ Elevated intact PTH levels (iPTH) in secondary hyperparathyroidism caused by chronic renal dialysis

**Adults:** Dosage individualized. Recommended initial dosage is 10 mcg P.O. three times weekly at dialysis (approximately every other day). Adjust as needed to lower blood iPTH level to 150 to 300 pg/ml. Maximum dosage is 20 mcg P.O. three times weekly.

**Contraindications and precautions**

- Contraindicated in hypersensitivity to product components, hypercalcemia, and evidence of vitamin D toxicity
- Use cautiously in elderly patients with coronary disease, renal impairment, or arteriosclerosis.

**Adverse reactions**

Nausea, vomiting, constipation, dyspepsia, headache, malaise, dizziness, sleep disorder, weight gain, anorexia, edema, arthralgia, abscess, dyspnea, pruritus, bradycardia

**folic acid**

Folvite

**Action**

Stimulates production of red and white blood cells and platelets in some megaloblastic anemias

**Availability**

*Injection:* 5 mg/ml

*Tablets:* 0.4 mg, 0.8 mg, 1 mg

**Indications and dosages**

➤ Recommended dietary allowance

**Adults and children older than age 11:**

150 to 400 mcg

**Children younger than age 11:** 25 to 100 mcg

➤ Megaloblastic anemia related to folic acid deficiency in sprue, nutritional deficiency, pregnancy, childhood, or infancy

**Adults:** Up to 1 mg/day P.O., I.M., I.V., or subcutaneously (given P.O. except in severe disease or severely impaired GI absorption). Higher dosages may be needed in severe cases, with a maintenance dosage of 0.4 mg/day. In pregnant or breastfeeding patients, 0.8 mg/day.

**Children older than age 4:** Maintenance dosage of 0.4 mg/day P.O., I.M., or subcutaneously (given P.O. except in severe disease or severely impaired GI absorption)

**Children younger than age 4:** Maintenance dosage of up to 0.3 mg/day P.O., I.M., or subcutaneously (given P.O. except in severe disease or severely impaired GI absorption)

**Contraindications and precautions**

- Contraindicated in pernicious, aplastic, or normocytic anemia
- Use cautiously in breastfeeding patients.

**Adverse reactions**

Altered sleep pattern, malaise, poor concentration, impaired judgment, hyperactivity, anorexia, nausea, flatulence, bitter taste, allergic reaction (including rash, pruritus, erythema), bronchospasm

**manganese, chelated****manganese chloride****Action**

Serves as a cofactor in various enzyme systems; stimulates hepatic cholesterol and fatty acid synthesis and influences mucopolysaccharide synthesis

**Availability**

*Injection:* 0.1 mg/ml (as 0.36 mg manganese chloride)

*Tablets:* 20 mg and 50 mg of chelated manganese

**Indications and dosages**

➤ Recommended dietary allowance

**Adults:** 1.9 to 2.3 mg/day in males; 1.6 to 1.8 mg/day in females

➤ Supplement to I.V. solutions used for total parenteral nutrition

**Adults:** 0.15 to 0.8 mg/day

**Children:** 2 to 10 mcg/kg/day

**Contraindications and precautions**

- Use cautiously in pregnant patients and premature infants (may reach toxic levels in kidney).
- Reduce dosage in renal or GI dysfunction.
- Multiple trace element solutions may cause overdose if patient's requirement for one element in formulation exceeds that for others. Manganese may need to be given separately.

**Adverse reactions**

None known

**niacin (nicotinic acid, vitamin B<sub>3</sub>)**

Slo-Niacin

**niacinamide (nicotinamide)****Action**

Serves as a component of two coenzymes essential to oxidation-reduction reactions

**Availability**

*Capsules (extended-release):* 100 mg, 250 mg, 400 mg, 500 mg

*Capsules (sustained-release):* 125 mg, 500 mg

*Capsules (timed-release):* 250 mg, 500 mg

*Tablets:* 25 mg, 50 mg, 100 mg, 125 mg, 250 mg, 400 mg, 500 mg

*Tablets (extended-release):* 250 mg, 500 mg, 750 mg, 1,000 mg

*Tablets (sustained-release):* 500 mg

*Tablets (timed-release):* 250 mg, 500 mg

**Indications and dosages**

➤ Recommended dietary allowance (RDA)

**Adults:** 15 to 20 mg P.O. daily in males; 13 to 15 mg P.O. daily in females

➤ Pellagra

**Adults:** Up to 500 mg daily P.O. given in divided doses

➤ Niacin deficiency

**Adults:** Up to 100 mg P.O. daily

➤ Hyperlipidemia

**Adults:** Initially, 250 mg P.O. daily; increase up to 1 or 2 g/day (given in divided doses) at 4- to 7-day intervals. Don't exceed 6 g/day.

## Contraindications and precautions

- Contraindicated in hypersensitivity to niacin, hepatic dysfunction, active peptic ulcer, severe hypotension, and arterial bleeding
- Use cautiously in heart disease (give only under doctor's supervision), gout, regular consumption of large amounts of alcohol, history of hepatic disease, and pregnant or breastfeeding patients. Don't exceed RDA in children (safety and efficacy not established).

## Adverse reactions

Flushing, pruritus, urticaria, rash, dry skin, tingling, acanthosis nigricans, hyperpigmentation, diaphoresis, nausea, vomiting, diarrhea, dyspepsia, GI distress, abdominal pain, peptic ulcer, hyperuricemia, gout, decreased glucose tolerance, chills, dizziness, insomnia, migraine, transient headache, toxic amblyopia, cystoid macular edema, orthostasis, edema, hypotension, palpitations, syncope, dyspnea, abnormal liver function tests, **fulminant hepatic necrosis, hepatotoxicity, atrial fibrillation, other arrhythmias**

## paricalcitol

Zemiplar

## Action

Synthetic vitamin D analog; suppresses parathyroid hormone in patients with chronic renal failure

## Availability

*Injection:* 2 mcg/ml, 5 mcg/ml

## Indications and dosages

➤ Hyperparathyroidism associated with chronic renal failure

**Adults:** 0.04 to 0.1 mcg/kg (2.8 to 7 mcg) as a single I.V. bolus dose given no more often than every other day

during dialysis. Dosage may be increased by 2 to 4 mcg at 2- to 4-week intervals.

## Contraindications and precautions

- Contraindicated in hypersensitivity to components of formulation, hypercalcemia, and vitamin D toxicity
- Use cautiously in breastfeeding patients.

## Adverse reactions

Nausea, vomiting, dry mouth, pruritus, allergic reaction, rash, urticaria, edema, light-headedness, chills, fever, flulike symptoms, malaise, palpitations, pneumonia, **GI bleeding, sepsis**

## phytonadione (vitamin K<sub>1</sub>)

AquaMEPHYTON, Mephyton

## Action

Promotes hepatic synthesis of active prothrombin, proconvertin, plasma thromboplastin component, and Stuart factor

## Availability

*Aqueous colloidal solution for injection:* 2 mg/ml

*Tablets:* 5 mg

## Indications and dosages

➤ Hypoprothrombinemia caused by anticoagulant therapy

**Adults:** Initially, 2.5 to 10 mg P.O., I.M., subcutaneously, or I.V. (at doses not exceeding 1 mg/minute); repeat if needed within 12 to 48 hours after P.O. dose or within 6 to 8 hours of I.M., subcutaneous, or I.V. dose. Subsequent dosages determined by prothrombin time or clinical condition.

➤ Hypoprothrombinemia secondary to other causes

**Adults:** 2.5 to 25 mg (rarely, up to 50 mg); dosage and administration route depend on severity and response.

**Children:** 5 to 10 mg; dosage and administration route depend on severity and response.

➤ Prevention and treatment of hemorrhagic disease of newborn

**Neonates:** For prevention, 0.5 to 1 mg I.M. as a single dose within 1 hour of birth. For treatment, 1 mg I.M. or subcutaneously if mother received oral anticoagulants.

### Contraindications and precautions

- Contraindicated in hypersensitivity to drug or its components. (Life-threatening reactions resembling hypersensitivity or anaphylaxis have occurred during and immediately after I.V. injection.)
- Use cautiously in pregnant or breastfeeding patients, children, and neonates (if product contains benzyl alcohol).
- Avoid P.O. use in disorders that may prevent adequate absorption.

### Adverse reactions

Hyperbilirubinemia (in infants); with parenteral administration—pain, swelling, tenderness at injection site; itchy rash after repeated injections; transient flushing sensations; peculiar taste; **anaphylactoid reactions**

## pyridoxine hydrochloride (vitamin B<sub>6</sub>)

Beesix, Doxetine, Nestrex, Rodex

### Action

Converts to physiologically active forms of vitamin B<sub>6</sub> (pyridoxal phosphate and pyridoxamine phosphate), which promote metabolic functions affecting carbohydrate, protein, and lipid use

### Availability

*Capsules (extended-release):* 150 mg

*Injection:* 100 mg/ml

*Tablets:* 10 mg, 25 mg, 50 mg, 100 mg, 200 mg, 250 mg, 500 mg

*Tablets (enteric-coated):* 20 mg

*Tablets (extended-release):* 100 mg, 200 mg, 500 mg

### Indications and dosages

➤ Recommended dietary allowance (RDA)

**Adults:** 1.7 to 2 mg daily in males; 1.4 to 1.6 mg daily in females

➤ Prophylaxis or treatment of pyridoxine deficiency, including drug-induced deficiency (as from isoniazid, hydralazine, or hormonal contraceptives)

**Adults:** For prophylaxis, 25 to 100 mg daily P.O., I.V., or I.M. For established neuropathy, 200 mg daily.

### Contraindications and precautions

- Contraindicated in hypersensitivity to pyridoxine or components of formulation
- Don't exceed RDA in children (safety and efficacy not established).
- Use cautiously in breastfeeding patients.
- Be aware that drug abuse and dependence have occurred after withdrawal from dosage of 200 mg/day.

### Adverse reactions

Sensory neuropathic syndrome (including unstable gait, ataxia, clumsiness of hands, pedal and perioral numbness, paresthesia, and decreased sensation to touch, temperature, and vibration), photoallergic reaction, nausea, headache, decreased folic acid level, aspartate aminotransferase elevation, **seizures**

## retinol (vitamin A)

Aquasol A, Palmitate-A 5000

### Action

Stimulates and supports retinal function, reproduction, bone growth, epithelial tissue differentiation, and embryonic development

### Availability

*Capsules:* 10,000 international units, 15,000 international units, 25,000 international units

*Injection:* 50,000 international units/ml

*Tablets:* 5,000 international units

### Indications and dosages

➤ Recommended dietary allowance (RDA)

**Adults:** 1,000 mcg retinol equivalents (RE) daily in males; 800 mcg RE daily in females

➤ Severe vitamin A deficiency with corneal changes

**Adults and children older than age 8:** 100,000 international units I.M. daily for first 3 days, followed by 50,000 international units I.M. daily for 2 weeks. Or 500,000 international units P.O. for 3 days, followed by 50,000 international units P.O. daily for 14 days, then 10,000 to 20,000 international units P.O. daily for 60 days. Or 50,000 to 100,000 international units P.O. daily for 1 to 7 days, followed by 5,000 to 75,000 international units daily for several weeks.

➤ Vitamin A deficiency with xerophthalmia

**Children:** 5,000 to 15,000 international units (1,500 to 4,500 RE) I.M. for 10 days or 5,000 international units/kg P.O. for 5 days or until recovery

### Contraindications and precautions

- Hypersensitivity to vitamin A or components of formulation, hypervitaminosis A

- Don't exceed RDA during normal pregnancy.
- Use cautiously in patients with renal failure and in I.V. use.

### Adverse reactions

Headache, irritability, vertigo, lethargy, malaise, fever, headache, hypercalcemia, weight loss, vision changes, anorexia, sticky skin, hypervitaminosis A, **increased intracranial pressure, anaphylactic shock and death** (with I.V. use)

## riboflavin (lactoflavin, vitamin B<sub>2</sub>)

### Action

Serves as two coenzymes that catalyze oxidation-reduction reactions, such as glucose oxidation, amino acid deamination, and fatty acid breakdown

### Availability

*Tablets:* 10 mg, 25 mg, 50 mg, 100 mg, 250 mg

### Indications and dosages

➤ Recommended dietary allowance (RDA)

**Adults:** 1.4 to 1.8 mg in males; 1.2 to 1.3 mg in females

➤ Riboflavin deficiency

**Adults:** 5 to 30 mg P.O. daily in divided doses

### Contraindications and precautions

- Use cautiously when giving more than RDA to pregnant or breastfeeding women.

### Adverse reactions

None known

## selenium

Sele-Pak, Selepen

### Action

Guards cell components against oxidative damage caused by peroxides generated during cellular metabolism

### Availability

*Injection:* 40 mcg/ml

### Indications and dosages

➤ Recommended dietary allowance

**Adults:** 40 to 70 mcg in males; 45 to 55 mcg in females

➤ Supplement to I.V. solutions used in total parenteral nutrition for prophylaxis and treatment of selenium deficiency

**Adults and adolescents:** 20 to 40 mcg daily for prophylaxis; 100 mcg daily for 24 to 31 days for treatment

**Children:** 3 mcg/kg daily (for prophylaxis or treatment)

### Contraindications and precautions

- Use cautiously in renal or GI dysfunction, pregnant patients, or premature infants (if product contains benzyl alcohol, which is associated with fatal gasping syndrome). May need to decrease dosage in renal or GI dysfunction.
- Multiple trace element solutions may cause overdose if patient's requirement for one element in formulation exceeds that for others. Selenium may need to be given separately.

### Adverse reactions

Lethargy, alopecia, hair discoloration, vomiting, abdominal pain, garlic breath, tremor, diaphoresis

## thiamine (vitamin B<sub>1</sub>)

Biamine, Thiamilate, Thiamine Hydrochloride

### Action

Water-soluble vitamin; combines with adenosine triphosphate and thiamine diphosphokinase to form thiamine pyrophosphate, a coenzyme essential for normal growth and aerobic metabolism, nerve impulse transmission, and acetylcholine synthesis

### Availability

*Injection:* 100 mg/ml

*Tablets:* 5 mg, 10 mg, 25 mg, 50 mg, 100 mg, 250 mg, 500 mg

*Tablets (enteric-coated):* 20 mg

### Indications and dosages

➤ Recommended dietary allowance

**Adults:** 1.2 to 1.5 mg/day in males; 1 to 1.1 mg/day in females

➤ Thiamine deficiency (beriberi)

**Adults:** 10 to 20 mg I.M. t.i.d. for 2 weeks, then 5 to 30 mg P.O. daily for 1 month

➤ Wernicke's encephalopathy

**Adults:** Initially, 100 mg I.V., followed by 50 to 100 mg daily I.M. until patient can consume a regular balanced diet

### Contraindications and precautions

- Contraindicated in thiamine hypersensitivity
- Use cautiously in pregnant or breast-feeding patients.

### Adverse reactions

Warm sensation, pruritus, urticaria, weakness, diaphoresis, tenderness and induration (with I.M. use), hypersensitivity reaction, **cyanosis, pulmonary edema, GI tract hemorrhage, cardiovascular collapse, angioedema, anaphylactic shock, death**

## tocopherols (alpha tocopherols, vitamin E)

Aquavit E, d'Apha E, Nutr-E-Sol, Vita-Plus E

### Action

Protects cellular components from oxidation, prevents formation of toxic oxidation products, maintains integrity of red blood cell (RBC) wall, protects RBCs against hemolysis, stimulates steroid metabolism, suppresses prostaglandin production, and inhibits platelet aggregation

### Availability

*Capsules:* 100, 200, 400, 600, and 1,000 international units

*Drops:* 15 international units/0.3 ml

*Liquid:* 15 international units/30 ml

*Solution (water-miscible):* 50 international units/ml

*Tablets:* 100, 200, 400, 500, 600, 800, and 1,000 international units

### Indications and dosages

➤ Recommended dietary allowance

**Adults:** 15 international units in males; 12 international units in females

➤ To prevent or treat vitamin E deficiency

**Adults:** 60 to 75 international units P.O. daily, to a maximum of 1,000 international units daily

### Contraindications and precautions

None

### Adverse reactions

Hypervitaminosis E, nausea, vomiting, diarrhea, fatigue, weakness, blurred vision, headache, rash, gonadal dysfunction, **bleeding, necrotizing enterocolitis** (in infants)

## zinc chloride

## zinc gluconate

## zinc sulfate

Zinca-Pak

### Action

Serves as cofactor for more than 70 enzymes; promotes wound healing and helps maintain normal growth rate, normal skin hydration, and taste and smell sensations

### Availability

*Capsules:* 220 mg

*Injection:* 1 mg/ml (as 2.09 mg chloride)

*Tablets (gluconate):* 10 mg, 15 mg, 50 mg

*Tablets (sulfate):* 66 mg, 110 mg

### Indications and dosages

➤ Recommended dietary allowance

**Adults:** 12 to 15 mg

➤ Dietary supplement

**Adults:** 25 to 50 mg P.O. daily

➤ Supplement to I.V. solution used in total parenteral nutrition (TPN)

**Metabolically stable adults:** 2.5 to 4 mg/day; may give additional 2 mg/day in acute catabolic states. In patients with fluid loss from small bowel, give additional 12.2 mg/L of TPN solution.

### Contraindications and precautions

- Use cautiously in renal or GI dysfunction, pregnant patients, and premature infants (if product contains benzyl alcohol, which is associated with fatal gasping syndrome).
- Dosage may need to be decreased in renal or GI dysfunction.

- Multiple trace element solutions may cause overdose if patient's requirement for one element in formulation exceeds that for others. Zinc may need to be given separately.

**Adverse reactions**

Restlessness, dizziness, nausea, vomiting, diarrhea, gastric ulcer

# Herbs and supplements

The information provided in these monographs reflects commonly held beliefs about the actions and uses of common herbs and nutritional supplements. However, not all of these beliefs have been confirmed by clinical trials. Although herbal remedies have been used for thousands of years, few have undergone well-designed scientific studies to determine how they work, if they're safe, and whether they're effective in treating the medical conditions for which they're commonly used. Advise patients to consult a health care practitioner before using herbs or supplements to help determine if such use may be safe.

## aloe

### Purported action

With topical use, exerts a moisturizing effect on burns and wounds, which prevents air from drying the wound and increases blood flow to stimulate healing. With internal use, may exert a laxative effect by stimulating the large intestine and increasing peristalsis.

### Reported uses

Used topically (as a gel) to inhibit infection and promote healing of minor burns, abrasions, wounds, and frostbite and to treat certain skin diseases (such as psoriasis and seborrheic dermatitis). Used internally (as liquid extract

concentrate, capsules, or dried aloe latex) as a strong laxative.

### Contraindications and precautions

Internal use is contraindicated in inflammatory bowel disease, elderly patients with suspected intestinal obstruction, pregnant or breastfeeding patients, and children younger than age 12.

### Adverse reactions

- With topical use: redness, itching, and burning sensation in dermabraded skin
- With P.O. use: edema, cramps, diarrhea, weight loss, electrolyte abnormalities, **arrhythmias**

### Interactions

*Antiarrhythmics, corticosteroids, licorice, stimulant laxatives, thiazide diuretics:* hypokalemia

*Cardiac glycosides:* increased effects of these drugs

## bilberry

### Purported action

Relieves mild GI tract inflammation, easing diarrhea; reduces oral mucous membrane irritation; increases microcirculation by redistributing new capillary formation; strengthens capillary walls; promotes overall health of circulatory system; and exerts a protective effect on stomach and liver (possibly through increased prostaglandin production)

### Reported uses

Nonspecific diarrhea, mouth and throat irritation, to improve visual acuity and accommodation. Further studies are needed to confirm that

bilberry promotes circulatory, GI, or hepatic health.

### Contraindications and precautions

Contraindicated in bleeding disorders, pregnancy, and breastfeeding

### Adverse reactions

- At typical dosages: GI distress, rash, drowsiness
- At higher dosages: unknown

### Interactions

*Anticoagulants, antiplatelet drugs, salicylates*: potentiated effects, causing increased prothrombin time

*Hypoglycemics*: reduced blood glucose level

## black cohosh

### Purported action

Binds to estrogen receptors, directly or indirectly influencing luteinizing hormone release. Studies show black cohosh increases bone mineral density in rats but not in humans.

### Reported uses

Menopause symptoms (as alternative to hormone replacement therapy), premenstrual syndrome, dysmenorrhea, arthritis, renal problems, malaria, sore throat

### Contraindications and precautions

Contraindicated in pregnancy (may cause premature birth or miscarriage)

### Adverse reactions

Headache, dizziness, CNS and visual disturbances, GI distress, nausea, vomiting, reduced heart rate, increased perspiration, weight gain

### Interactions

*Antihypertensives*: additive hypotension

*Docetaxel*: increased docetaxel blood level

*Hepatotoxic drugs*: increased risk of hepatotoxicity

## cat's claw

### Purported action

Stimulates the immune system, enhances phagocytosis, dilates peripheral vessels, inhibits sympathetic nervous system activity, slows heart rate, decreases cholesterol levels, promotes diuresis, inhibits urinary bladder contraction, relaxes smooth muscle, and exerts local anesthetic effects. Studies show cat's claw has some anticancer and immunostimulant properties.

### Reported uses

AIDS; inflammation; GI disorders (including colitis, inflammatory bowel disease, Crohn's disease); as an astringent, antiviral, anti-infective, and general tonic

### Contraindications and precautions

Contraindicated in multiple sclerosis, tuberculosis, autoimmune disease, pregnancy, and breastfeeding. Use cautiously in GI disease (increases stomach acid secretion).

### Adverse reactions

- Hypotension
- With decoction: few known risks

### Interactions

*Anticoagulants, antiplatelets*: inhibited platelet aggregation, prolonged bleeding time

*Antihypertensives*: potentiated antihypertensive effects

*Benzodiazepines*: increased CNS depression

*CYP450-3A4 substrates (such as amiodarone, amlodipine, fentanyl, flutamide, imipramine)*: increased levels of these drugs

*Food*: enhanced cat's claw absorption

*Immunosuppressants*: negated immunosuppressant effects

## chamomile

### Purported action

Reduces inflammation and fever, promotes healing of burns, and prevents ulcer formation. May also exert antispasmodic, anxiolytic, and sedative effects through action on CNS receptors.

### Reported uses

Vomiting, flatulence, colic, fever, cystitis, parasitic worm infections, spasms, inflammation, anxiety; as an antibacterial, astringent, deodorant, or skin wash (to increase sloughing of necrotic tissue and promote granulation and epithelialization)

### Contraindications and precautions

Contraindicated in ragweed allergy, hepatic or renal disease, pregnancy, and breastfeeding. Use cautiously in patients receiving anticoagulants.

### Adverse reactions

Contact dermatitis in patients allergic to ragweed, asters, chrysanthemums, or other members of the Compositae family (such as arnica, feverfew, tansy, and yarrow), **anaphylaxis, other severe hypersensitivity reactions**

### Interactions

*Anticoagulants*: increased anticoagulant effect

*Concurrently administered drugs*: delayed drug absorption

*Sedatives (such as benzodiazepines)*: enhanced sedative effects

## chondroitin

### Purported action

A glycosaminoglycan (complex polysaccharide) found in extracellular matrix of connective tissue, including cornea and cartilage; thought to have protective properties (as for corneal endothelial cells and other ocular structures) without interfering with epithelialization and healing

### Reported uses

Osteoarthritis, hyperlipidemia, ischemic heart disease, dry eyes, surgical aid in cataract extraction or lens implantation

### Contraindications and precautions

Contraindicated in clotting disorders, prostate cancer, risk factors for prostate cancer, and patients receiving anticoagulants. Use cautiously in asthma.

### Adverse reactions

Allergic reactions, alopecia, nausea, diarrhea, constipation, epigastric pain, extrasystoles, edema

### Interactions

*Warfarin*: increased warfarin effects (with high chondroitin doses)

## coenzyme Q10

### Purported action

Fat-soluble, vitamin-like compound present in cells (especially concentrated

in heart, liver, kidney, and pancreas). Exerts antioxidant activity, stabilizes membranes, and serves as cofactor in many metabolic pathways, especially adenosine triphosphate production in oxidative respiration.

**Reported uses**

Mitochondrial cytopathies (FDA-approved claim), cardiac risk reduction, heart failure, hypertension, prophylaxis of doxorubicin-induced cardiotoxicity, diabetes mellitus, immunostimulation, muscular dystrophy, statin-induced myopathy, chronic fatigue syndrome, breast cancer, Huntington’s disease, Parkinson’s disease, periodontal disease

**Contraindications and precautions**

Use cautiously in biliary obstruction, hepatic insufficiency, hypertension, diabetes mellitus, patients receiving anti-hypertensives, and patients undergoing chemotherapy or radiation therapy.

**Adverse reactions**

Anxiety, nausea, vomiting, diarrhea, flatulence, headache, mania or hypomania

**Interactions**

*Antihypertensives:* additive blood pressure reduction

*Chemotherapy:* possible cancer-cell protection

*Warfarin:* reduced warfarin effects

**dong quai**

**Purported action**

Exerts antispasmodic effect on smooth muscles, including those of airway and uterus. Forms containing coumarin have anticoagulant effects.

**Reported uses**

Asthma, allergies, menstrual disorders, menopausal symptoms, rheumatic pain, anemia, constipation, hypertension, psoriasis, skin depigmentation, ulcers; as an antispasmodic, anti-inflammatory, and anticoagulant

**Contraindications and precautions**

Contraindicated in patients receiving warfarin concurrently and in pregnant or breastfeeding patients (may influence uterine contractions or cause unknown effects in fetus)

**Adverse reactions**

- With authentic dong quai: no known reactions
- With other dong quai forms: increased risk of phototoxicity, abortion, uterine stimulation, and altered menstrual cycle

**Interactions**

*Anticoagulants:* increased anticoagulant effect

**echinacea**

**Purported action**

Stimulates immune system; with topical use, may have mild antibacterial and antiviral properties

**Reported uses**

Urinary tract and yeast infections, promotion of wound healing, prevention and treatment of upper respiratory infections (including colds and flu), allergic rhinitis, psoriasis, herpes simplex infection (topical form)

## Contraindications and precautions

Contraindicated in patients receiving immunosuppressant therapy (because of immune-stimulating properties)

## Adverse reactions

Nausea, mild GI upset, allergic reactions, **anaphylaxis**

*Note:* Adverse reactions may be more common in patients with allergies to daisy-type plants.

## Interactions

*Corticosteroids:* interference with chemotherapeutic effects of these drugs

*CYP450-3A4 substrates (such as amiodarone, amlodipine, fentanyl, flutamide, imipramine):* increased levels of these drugs

*Immunosuppressants:* interference with immunosuppressant effects

## evening primrose oil

### Purported action

Contains essential fatty acids (EFAs) that may improve cellular structural elements and serve as precursors to prostaglandins, which help regulate metabolic functions (including cervical ripening)

### Reported uses

Disorders thought to stem from EFA deficiency or disturbed EFA metabolism, including cardiovascular disease, premenstrual syndrome, mastalgia and other breast disorders, rheumatoid arthritis, multiple sclerosis, atopic dermatitis and other dermatologic disorders, Raynaud's disease, Sjögren's syndrome, Alzheimer's disease, schizophrenia, and attention deficit hyperactivity disorder

## Contraindications and precautions

Contraindicated in pregnancy, breast-feeding, and history of seizures or allergy to evening primrose oil

## Adverse reactions

Headache, nausea, vomiting, diarrhea, abdominal pain, indigestion, flatulence, allergic reaction

## Interactions

*Anesthetics, phenothiazines:* lowered seizure threshold

*Anticoagulants:* bleeding, bruising

*Anticonvulsants:* lowered seizure threshold, decreased anticonvulsant efficacy

## feverfew

### Purported action

Inhibits prostaglandin synthesis and serotonin release from platelets and polymorphonuclear leukocyte granules; extract may inhibit phagocytosis and platelet deposition on collagen surfaces. Exhibits antithrombotic potential and in vitro antibacterial activity, inhibits mast cell release of histamine, exerts cytotoxic activity, and suppresses enzyme release from white blood cells in inflamed joints and skin. May promote contraction and relaxation of vascular smooth muscle.

### Reported uses

Menstrual pain, allergies, tinnitus, vertigo, asthma, dermatitis, psoriasis, arthritis, fever, migraine prophylaxis

## Contraindications and precautions

Contraindicated in pregnancy, breast-feeding, and children younger than age 2

### Adverse reactions

- Hypersensitivity reaction, increased heart rate, oral mucosa and tongue inflammation
- After withdrawal: cluster of CNS reactions (rebound migraine, anxiety, disturbed sleep pattern), muscle and joint stiffness

### Interactions

*Anticoagulants, aspirin:* increased antithrombotic effect of these drugs

### fish oils

#### Purported action

Contain omega-3 fatty acids, which exert anti-inflammatory and antithrombotic effects by competing with arachidonic acid in cyclooxygenase and lipoxygenase pathways and which also may suppress cyclooxygenase-2, interleukin-1 alpha, and tumor necrosis factor-alpha. Also inhibit arachidonic acid synthesis of thromboxane A<sub>2</sub>, which causes platelet aggregation and vasoconstriction; and increase production of prostacyclin, a prostaglandin that causes vasoconstriction and reduces platelet aggregation.

#### Reported uses

Coronary heart disease, cardiovascular disease, cerebrovascular accident, hypertension, asthma, Crohn's disease, type 2 (non-insulin-dependent) diabetes mellitus, dysmenorrhea, fatigue, headache, herpes simplex virus type 2, hypercholesterolemia, hypertriglyceridemia, multiple sclerosis, rheumatoid arthritis, acne, rosacea, eczema, psoriasis, scleroderma, immune support; to improve circulation; to enhance cognitive performance and memory

### Contraindications and precautions

Avoid large doses (more than 3 g/day) in diabetes mellitus and immunodeficiency. Use cautiously in aspirin sensitivity, bleeding disorders, cirrhosis, familial adenomatous polyposis, major depressive disorders, bipolar disorder, and concurrent antihypertensive use.

### Adverse reactions

- Belching, halitosis, heartburn, increased low-density lipoprotein level, weight gain
- With large doses: bleeding, hemorrhagic stroke, immunosuppression, loose stools, nausea, hyperglycemia

### Interactions

*Anticoagulants, antiplatelet drugs, salicylates:* increased risk of bleeding  
*Antihypertensives:* additive hypotension  
*Hormonal contraceptives:* interference with triglyceride-lowering effects of fish oils

### flaxseed oil

#### Purported action

Contains linolenic, linoleic, and alpha-linolenic acid. Linoleic acid and alpha-linolenic acid are required for structural integrity of cell membranes. Alpha-linolenic acid increases blood levels of omega-3 polyunsaturated fatty acids, including eicosapentaenoic acid and docosahexaenoic acid.

#### Reported uses

Atherosclerosis, hyperlipidemia, benign prostatic hypertrophy, constipation, diverticulitis, enteritis, gastritis, irritable bowel syndrome, menopausal symptoms, skin inflammation, systemic lupus erythematosus, nephritis, cancer prevention

## Contraindications and precautions

Contraindicated in bowel obstruction, breast cancer, endometriosis, esophageal stricture, intestinal inflammation, ovarian cancer, uterine cancer, and uterine fibroids. Avoid medicinal doses in pregnant patients. Use cautiously in bleeding disorders or diabetes mellitus.

## Adverse reactions

Diarrhea, allergic reactions, **anaphylactoid reactions**, **intestinal obstruction**

## Interactions

*Anticoagulants, antiplatelet drugs, salicylates*: increased risk of bleeding

*Hypoglycemics, insulins*: increased risk of hypoglycemia

## garlic

## Purported action

Inactivates thiol enzymes (such as coenzyme A and HMG-CoA reductase) and oxidizes glutamate synthase complex, both of which are required for lipid synthesis. Also may exert mild antibacterial, antifungal, and hypotensive activity.

## Reported uses

To reduce blood lipid levels (transient effect); as an antibacterial, antiseptic, or antithrombotic. Insufficient data exist regarding effects of garlic on clinical cardiovascular conditions, such as claudication and myocardial infarction.

## Contraindications and precautions

Pregnant and breastfeeding patients should avoid large amounts. Use

cautiously in severe renal or hepatic disease and in children.

## Adverse reactions

Headache, insomnia, fatigue, vertigo, GI distress, shortness of breath, facial flushing, contact dermatitis, allergic reaction

## Interactions

*Anticoagulants, antiplatelet drugs, nonsteroidal anti-inflammatory drugs, other drugs and herbs with anticoagulant effects*: increased prothrombin time, bleeding time, and International Normalized Ratio

*Cyclosporine*: decreased cyclosporine efficacy

*Hormonal contraceptives*: decreased contraceptive efficacy

*Nonnucleoside reverse-transcriptase inhibitors, protease inhibitors*: decreased efficacy of these drugs

## ginger

## Purported action

Inhibits prostaglandin and thromboxane biosynthesis and promotes platelet aggregation. Also possesses antiemetic, antithrombotic, antibacterial, antioxidant, antihepatotoxic, anti-inflammatory, antimutagenic, stimulant, cardiogenic, immunostimulant, diuretic, and spasmolytic properties.

## Reported uses

Dyspepsia, colic, anorexia, bronchitis, and rheumatism; to stimulate digestion, increase intestinal peristalsis, promote gastric secretions, reduce cholesterol level, raise blood glucose level, and stimulate peripheral circulation; to treat nausea and vomiting associated with motion sickness, hyperemesis gravidarum, and migraine

## Contraindications and precautions

Large amounts are controversial in pregnant patients. Avoid use in gallstones, bleeding disorders, hypertension, hypotension, and diabetes mellitus.

## Adverse reactions

CNS depression, interference with cardiac function or anticoagulant activity

## Interactions

*Anticoagulants:* increased bleeding time

*Antacids, histamine<sub>2</sub> blockers, hypoglycemics, insulin, proton pump inhibitors:* interference with actions of these drugs

*Barbiturates:* enhanced barbiturate effects

## ginkgo

### Purported action

Exerts antioxidant and neuroprotective activity, including arteriolar vasodilation, increased tissue perfusion and cerebral blood flow, decreased arterial spasms, and reduced platelet aggregation

### Reported uses

Raynaud's disease, cerebral insufficiency, anxiety, stress, tinnitus, dementia, circulatory disorders, asthma, memory impairment, headache, depression, impotence; as an adjunct in schizophrenia treatment

## Contraindications and precautions

Pregnant or breastfeeding patients should avoid ginkgo. Use cautiously in diabetes mellitus, hypertension, and in patients receiving antiplatelet drugs or anticoagulants.

## Adverse reactions

- Headache, dizziness, palpitations, GI and skin disorders
- With excessive use: **seizures, subdural hematoma**
- Ginkgo pollen can be strongly allergenic; contact with fleshy fruit pulp causes allergic dermatitis similar to that from poison ivy.

## Interactions

*Anticonvulsants:* decreased efficacy of these drugs, increased risk of seizures

*Buspirone, fluoxetine:* hypomania

*Drugs that lower seizure threshold:* increased risk of seizures

*Insulin:* altered insulin metabolism and excretion

*Thiazide diuretics:* increased blood pressure

*Trazodone:* possible coma

## ginseng

### Purported action

Increases natural "killer" cell activity, stimulates interferon production, accelerates nuclear RNA synthesis, decreases blood glucose level, and increases high-density lipoprotein level; also possesses depressant, anticonvulsant, and analgesic properties

### Reported uses

Fatigue, poor concentration, nervousness, hypertension or hypotension, erectile dysfunction, gastritis, cancer, some CNS and endocrine conditions

## Contraindications and precautions

Contraindicated in pregnant or breastfeeding patients. Patients taking MAO inhibitors should avoid ginseng. Use cautiously in hypertension or diabetes mellitus.

### Adverse reactions

Nervousness, stimulation, hypoglycemia, diffuse mammary nodules, vaginal bleeding, ginseng abuse

### Interactions

*Alcohol*: increased alcohol clearance  
*Antipsychotics, MAO inhibitors*: inhibition of antipsychotic effect  
*Caffeine-containing preparations, stimulants*: stimulant potentiation  
*Hypoglycemics, insulin*: increased hypoglycemic effect  
*Immunosuppressants*: decreased immunosuppressant activity  
*Loop diuretics*: poor diuretic response  
*Warfarin*: decreased warfarin efficacy

## glucosamine

### Purported action

Serves as a building block for cartilage glycosaminoglycans (GAG), aiding treatment of osteoarthritis (marked by progressive GAG degeneration). Also may possess chondroprotective, anti-inflammatory, and antiarthritic properties.

### Reported uses

Osteoarthritis, joint pain and inflammation, temporomandibular joint syndrome, glaucoma; to aid weight loss

### Contraindications and precautions

Diabetic patients should consult health care professional before using glucosamine because it may increase blood glucose level.

### Adverse reactions

Gastric discomfort (such as nausea, vomiting, diarrhea, heartburn), headache, drowsiness, insomnia, tachycardia, pruritus

### Interactions

*Acetaminophen*: interference with glucosamine activity  
*Antimitotic therapy*: resistance to chemotherapeutic effects of these drugs  
*Diuretics*: decreased glucosamine effects

## goldenseal

### Purported action

Contains alkaloids (hydrastine and berberine) that exert modest antimicrobial activity. May have cardiostimulatory, anti-inflammatory, peripheral vasoconstrictive, antihemorrhagic, and muscle relaxant effects.

### Reported uses

Topical infections (such as wounds and herpes labialis lesions), conjunctivitis, inflamed mucous membranes (as an ingredient in cold and flu preparations), postpartum hemorrhage; as a diuretic or laxative

### Contraindications and precautions

Contraindicated in hypertension, heart disease (especially arrhythmias), heart failure, and pregnancy

### Adverse reactions

Rash, headache, insomnia, nausea, vomiting, abdominal pain, tachycardia, bradycardia, **seizures, respiratory depression** (with high doses)

### Interactions

*Antacids, histamine<sub>2</sub> antagonists, proton pump inhibitors*: decreased effects of these drugs  
*Antihypertensives*: decreased antihypertensive effect  
*CNS depressants*: additive sedation

## grapeseed

### Purported action

Exerts antioxidant, anticarcinogenic, cytoprotective, and vascular activity; also inhibits proteolytic enzymes, causing collagen stabilization

### Reported uses

Prevention of cancer, cardiovascular disease, and dental caries; treatment of venous insufficiency, edema, and allergic rhinitis

### Contraindications and precautions

Contraindicated in known hypersensitivity to grapeseed. Use cautiously in hepatic disease. Safety during pregnancy has not been established.

### Adverse reactions

#### Hepatotoxicity

### Interactions

*Warfarin*: increased risk of bleeding

## green tea

### Purported action

Maintains significant blood levels of catechin, which may exert antioxidant activity against lipoproteins. Delays lipid peroxidation, exerts antimicrobial effects against oral bacteria and diarrhea-causing bacteria, and contributes antimutagenic potential against dietary carcinogens.

### Reported uses

Atherosclerosis, headache, diarrhea, stomach disorders, cancer, elevated lipid levels, wounds, dental caries prophylaxis

### Contraindications and precautions

Because of caffeine content, green tea should be avoided by pregnant or breastfeeding patients and by females who may become pregnant. Use cautiously in cardiac disease, renal disease, and hyperthyroidism.

### Adverse reactions

Nervousness, insomnia, tachycardia, constipation, diarrhea, increased blood glucose and cholesterol levels, impaired iron metabolism, **asthma**, **esophageal cancer** (with heavy use)

### Interactions

*Hypoglycemics, insulin*: interference with blood glucose control  
*Stimulants*: increased stimulant effect  
*Warfarin*: increased risk of bleeding

## hawthorn

### Purported action

Increases coronary blood flow and heart rate; exerts antiarrhythmic and positive inotropic effects

### Reported uses

Atherosclerosis, angina pectoris; to regulate blood pressure and heart rhythm; as an antispasmodic or sedative

### Contraindications and precautions

Contraindicated in severe renal or hepatic disease and in pregnancy and breastfeeding

### Adverse reactions

Agitation, dizziness, hypotension, sedation, nausea, sweating, **toxicity** (with high doses)

## Interactions

*Antiarrhythmics*: enhanced antiarrhythmic action

*Antihypertensives, nitrates*: increased effects of these drugs

*Cardiac glycosides*: increased risk of cardiac glycoside toxicity

*CNS depressants*: increased CNS effects

## kava

### Purported action

Produces mild anxiolytic and anticonvulsant effects; also may exert antithrombotic effect on platelets

### Reported uses

Anxiety, stress, restlessness, seizure disorders, headache, infection, local anesthesia

### Contraindications and precautions

Contraindicated in history of hepatic problems. Pregnant or breastfeeding patients should avoid kava. Use cautiously in neutropenia, renal disease, and thrombocytopenia.

### Adverse reactions

Morning fatigue, headache, drowsiness, mydriasis, mild GI disturbances, diarrhea, hematuria, hypertension, shortness of breath, visual disturbances, scaly rash (with heavy use)

### Interactions

*CNS depressants*: potentiation of CNS effects

*Hepatotoxic drugs*: increased hepatotoxicity

*Levodopa*: reduced levodopa efficacy

## licorice

### Purported action

Licorice root derivative (carbenoxolone) soothes inflamed mucous membranes, increases life span of gastric epithelial cells by stimulating secretin release, and inhibits peptic and prostaglandin activity

### Reported uses

GI complaints, cough, asthma, gastric and duodenal ulcers; used investigatively in lupus and inflammation

### Contraindications and precautions

Contraindicated in renal, hepatic, and cardiovascular disease. Pregnant or breastfeeding patients should avoid licorice.

### Adverse reactions

- Headache, lethargy, water retention, hypokalemia, hypernatremia, visual disturbances, hypertension, **pulmonary edema**
- With prolonged, daily use of large amounts: reactions ranging from muscle weakness to quadriplegia

### Interactions

*Antihypertensives, corticosteroids, diuretics*: increased blood pressure

*Corticosteroids, furosemide, thiazide diuretics*: increased potassium loss

*Digoxin*: increased risk of digoxin toxicity

*Estrogen*: interference with estrogen therapy

*Ethacrynic acid*: increased mineralocorticoid activity

*Insulin*: hypokalemia, sodium retention

## lutein

### Purported action

Serves as antioxidant and blue light filter, protecting underlying ocular tissues from photodamage. Evidence links high dietary lutein intake with reduced risk of age-related macular degeneration and cataracts. Also, serum lutein level may be inversely related to breast cancer risk.

### Reported uses

Cataracts, macular degeneration, colorectal cancer

### Contraindications and precautions

Use with caution in bleeding disorders and diabetes mellitus.

### Adverse reactions

None reported

### Interactions

*Beta carotene*: interference with lutein availability

## melatonin

### Purported action

Endogenous melatonin plays a role in circadian rhythms: light inhibits melatonin synthesis and darkness stimulates it. Exogenous melatonin increases melatonin blood levels without affecting endogenous melatonin production; also affects body temperature regulation, cardiovascular function, and reproduction.

### Reported uses

Short-term sleep pattern regulation, jet lag, tinnitus, depression, cluster

headaches, cancer, thrombocytopenia caused by chemotherapy

### Contraindications and precautions

Contraindicated in hepatic insufficiency, cerebrovascular disease, depression, and neurologic disorders

### Adverse reactions

Headache, depression, confusion, tachycardia, pruritus

### Interactions

*Anticoagulants, antiplatelet drugs*: increased risk of bleeding

*Benzodiazepines*: decreased endogenous melatonin

*CNS depressants*: additive sedation  
*Flumazenil*: inhibition of melatonin effects

*Fluvoxamine*: increased melatonin blood level and effects

*Hormonal contraceptives*: increased melatonin effects

*Hypoglycemics, insulin*: increased insulin resistance, impaired glucose use

*Immunosuppressants*: interference with immunosuppressant effects

*Nifedipine*: interference with antihypertensive effect, increased heart rate

*Verapamil*: increased melatonin excretion

## milk thistle

### Purported action

Exerts a hepatoprotective effect, possibly by stimulating RNA and DNA synthesis. Thought to scavenge prooxidant free radicals and increase intracellular concentrations of glutathione (a substance needed to detoxify hepatic cell reactions). Also alters the outer membrane of hepatic cells and may produce an anti-inflammatory effect on platelets.

### Reported uses

Hepatic dysfunction (including damage caused by acute viral hepatitis and long-term phenothiazine or butyrophenone use), dyspepsia, gallbladder and spleen disorders; antidote for Amanita mushroom poisoning; to reduce increased total cholesterol and low-density lipoprotein levels

### Contraindications and precautions

Contraindicated in pregnancy and breastfeeding

### Adverse reactions

Brief GI disturbances, diarrhea, cramping, mild allergic reactions, urticaria

### Interactions

*Estrogens, glucuronidated drugs:* increased clearance of these drugs

## red yeast rice

### Purported action

Contains mevinic acids (including lovastatin), which competitively inhibit HMG-CoA reductase, thereby blocking cholesterol biosynthesis

### Reported uses

Diarrhea, indigestion, hyperlipidemia, poor blood circulation; to improve spleen and stomach health

### Contraindications and precautions

Contraindicated in pregnancy and breastfeeding. Use cautiously in hepatic dysfunction, abnormal liver function tests, concurrent use of hepatotoxic drugs, and in persons who consume more than two alcoholic drinks daily.

### Adverse reactions

Gastritis, abdominal discomfort, heartburn, flatulence, dizziness, hepatic

enzyme and creatine kinase elevations, **anaphylaxis**

### Interactions

*Cyclosporine:* increased risk of myopathy

*CYP450-3A4 inhibitors:* increased red yeast blood level, increased adverse reactions

*Gemfibrozil, niacin:* increased risk of myopathy

*Grapefruit juice, HMG-CoA inhibitors (statins):* increased risk of adverse reactions

*Levothyroxine:* abnormal thyroid function

## S-adenosylmethionine (SAM-e)

### Purported action

Naturally occurring molecule; plays an essential role in biochemical reactions involving enzymatic transmethylation. Contributes to synthesis, activation, and metabolism of hormones, neurotransmitters, nucleic acids, proteins, phospholipids, and some drugs.

### Reported uses

Cardiovascular disease, fibromyalgia, headache, insomnia, hepatic disease, osteoarthritis, rheumatoid arthritis, depression

### Contraindications and precautions

Contraindicated in concurrent use of MAO inhibitors. Use cautiously in bleeding disorders and diabetes mellitus.

### Adverse reactions

Anxiety, nausea, vomiting, diarrhea, flatulence, headache, mania or hypomania

## Interactions

*Antidepressants:* additive effects (including additive serotonergic effects)

## saw palmetto

### Purported action

Reduces enlarged prostate by inhibiting testosterone 5-alpha reductase (an enzyme that converts testosterone to 5-alpha-testosterone in prostate). Inhibits cell proliferation induced by prolactin and growth factor; also may exert anti-inflammatory, immunostimulant, antiandrogenic, antiestrogenic, and astringent activity.

### Reported uses

Symptomatic treatment of benign prostatic hypertrophy, including urinary frequency, reduced urinary flow, and nocturia; bronchitis; asthma

### Contraindications and precautions

Contraindicated in pregnancy and in patients receiving concurrent hormone therapy (including hormonal contraceptives and hormone replacement therapy). Use cautiously in patients receiving drugs that may alter immunostimulant or anti-inflammatory activity.

### Adverse reactions

Headache, hypertension, nausea, diarrhea, constipation, abdominal pain, GI upset, urinary retention

### Interactions

*Anticoagulants, antiplatelet drugs:* increased risk of bleeding

*Estrogens:* interference with estrogen activity

*Hormonal contraceptives:* interference with contraceptive activity

## shark cartilage

### Purported action

Helps control cancer by inhibiting new blood vessel formation (angiogenesis) in tumors; also may have anti-inflammatory effects

### Reported uses

Prostate cancer, AIDS-associated Kaposi's sarcoma, arthritis, eczema

### Contraindications and precautions

Contraindicated in pregnancy or breastfeeding and in children. Use cautiously in hepatic disease.

### Adverse reactions

Hepatitis

### Interactions

None known

## soy

### Purported action

Isoflavones (phytoestrogens found in soybean) produce effects similar to those of estradiol (a female hormone). They also limit cholesterol absorption in intestine by binding to cholesterol and may enhance immune function, produce antioxidant effects, and exert beneficial effects on GI function.

### Reported uses

Menopausal symptoms, osteoporosis, minor GI problems; to reduce total cholesterol and low-density lipoprotein levels. Also serves as source of fiber, protein, and minerals.

### Contraindications and precautions

Contraindicated in estrogen-dependent tumors and peanut allergy (cross-sensitivity may occur)

### Adverse reactions

Some experts are concerned that phytoestrogens in soy-based infant formulas may influence CNS and psychomotor development.

### Interactions

*Antibiotics:* decreased action of isoflavones

*Estrogens:* interference with hormone replacement therapy

*Tamoxifen:* antagonism of tamoxifen

*Warfarin:* decreased International Normalized Ratio, inhibited platelet aggregation

---

## St. John's wort

---

### Purported action

Inhibits postsynaptic serotonin reuptake or antagonizes MAO

### Reported uses

Depression, wounds, muscle pain, burns; used investigationally to treat human immunodeficiency virus and certain other viruses

### Contraindications and precautions

Contraindicated in concurrent use of antidepressants, in pregnant patients, and in patients planning pregnancy

### Adverse reactions

Abdominal pain, constipation, other GI symptoms, dry mouth, dizziness, confusion, fatigue, mania, photosensitivity

### Interactions

*Bexarotene:* decreased effects of St. John's wort and bexarotene  
*Cyclosporine, digoxin, paclitaxel, protease inhibitors, telithromycin, theophylline, tricyclic antidepressants, vinca alkaloids, warfarin:* decreased efficacy of these drugs

*Hormonal contraceptives:* breakthrough bleeding

*MAO inhibitors, selective serotonin reuptake inhibitors, serotonin agonists:* increased risk of serotonin syndrome

---

## valerian

---

### Purported action

Binds to gamma-aminobutyric acid (GABA) and benzodiazepine receptors, stimulating release of these substances. Glutamine, a free amino acid in valerian extract, can cross the blood-brain barrier and may be metabolized to GABA, causing sedation.

### Reported uses

Anxiety, nervousness, attention deficit hyperactivity disorder, depression, seizures, menopausal symptoms, menstrual cramps, tremors, restlessness, sleep disorders; as an antispasmodic

### Contraindications and precautions

Avoid use in hepatic dysfunction and in pregnant or breastfeeding patients.

### Adverse reactions

With overdose or prolonged use: excitability, headache, insomnia, nausea, blurred vision, **cardiac dysfunction**, **hepatotoxicity**

### Interactions

*Alcohol, antihistamines, CNS depressants:* additive sedation

## Common anesthetic drugs

This chart describes the indications, dosages, administration, and patient monitoring for commonly used anesthetic drugs. Although these potent and potentially dangerous drugs are usually given by specially trained personnel (such as anesthesiologists or anesthesiologists), the nurse is responsible for monitoring the patient during and after administration.

Drug	Indications and dosages
<b>atracurium besylate</b> Tracrium	<p>➤ Adjunct to general anesthesia to promote endotracheal intubation and relax skeletal muscles during surgery</p> <p><b>Adults and children ages 2 and older:</b> Initially, 0.4 to 0.5 mg/kg by I.V. bolus. For prolonged surgery, give maintenance dosage of 0.08 to 0.1 mg/kg within 20 to 45 minutes of initial dose; may repeat q 15 to 25 minutes p.r.n. During prolonged procedures, give an initial infusion of 9 to 10 mcg/kg/minute to rapidly counteract spontaneous recovery of neuromuscular function, as required; thereafter, administer at a rate of 5 to 9 mcg/kg/minute by I.V. infusion.</p> <p><b>Children ages 1 month to 2 years:</b> 0.3 to 0.4 mg/kg I.V. Repeat if needed.</p>
<b>etomidate</b> Amidate	<p>➤ To induce general anesthesia</p> <p><b>Adults and children older than age 10:</b> Individualized, 0.2 to 0.6 mg/kg I.V. Usual dosage is 0.3 mg/kg I.V.</p> <p>➤ Adjunct to anesthesia with subpotent anesthetics, such as nitrous oxide in oxygen, during maintenance of anesthesia for short operative procedures</p> <p><b>Adults:</b> Individualized in smaller increments than induction dosage.</p>

---

### Administration and patient monitoring

---

- 🔊 Before giving, make sure emergency respiratory equipment is at hand and that patient receives a sedative or general anesthetic.
  - Give by I.V. route only (bolus, intermittent infusion, or continuous infusion). Never give I.M.
  - Know that patient can hear while drug is in effect. Explain events as they occur and provide ongoing reassurance.
  - Be ready to reverse drug's effects with anticholinesterase drug once spontaneous recovery begins.
  - 🔊 Watch for anaphylaxis and injection site reaction.
  - Check vital signs and airway patency until patient recovers completely from drug effects.
  - Assess for pain; give analgesics p.r.n. Be aware that patient may be unable to verbalize pain while drug is in effect.
  - Be aware that effect of this drug is potentiated by inhalation anesthesia; consider reduction of atracurium besylate infusion rate.
  - Evaluate patient's recovery with muscle strength tests, nerve stimulation, and train-of-four monitoring.
- 
- Before giving, ask patient about other drug usage.
  - Administer slowly over 30 to 60 seconds.
  - Know that solution may cause venous pain; more frequently when smaller, more distal, hand or wrist veins are used.
  - Know that drug may cause cardiac depression in elderly patients, particularly those with hypertension.
  - Know that drug may cause a brief period of apnea.
  - Monitor respiratory status (for conscious sedation, including pulse oximetry), cardiovascular status, and CNS status.
  - Know that drug isn't intended for prolonged infusion due to hazards associated with prolonged suppression of endogenous cortisol and aldosterone.

---

*(continued)*

## Common anesthetic drugs (continued)

Drug	Indications and dosages
<b>fentanyl citrate</b> Sublimaze <b>fentanyl transmucosal</b> Actiq, Fentanyl Oralet	<p>➤ Short-term analgesia during anesthesia and immediate preoperative and postoperative periods</p> <p><b>Adults:</b> 0.05 to 0.1 mg I.M. 30 to 60 minutes before surgery as adjunct to general anesthesia.</p> <p><b>Low dose:</b> 0.002 mg/kg for minor, but painful surgical procedures; maintenance dosages are rarely needed.</p> <p><b>Moderate dose:</b> 0.002 to 0.02 mg/kg, when surgery becomes major; 0.025 to 0.1 mg may be administered I.V. or I.M. as maintenance dosage.</p> <p><b>High dose:</b> 0.02 to 0.05 mg/kg during open heart surgery and certain more complicated neurosurgical and orthopedic procedures where surgery is more prolonged; 0.025 mg to one half the initial loading dose as maintenance dosage.</p> <p><b>Children ages 2 to 12:</b> 2 to 3 mcg/kg I.V., depending on vital signs; or 5 to 15 mcg/kg transmucosally</p> <p>➤ Adjunct to regional anesthesia</p> <p><b>Adults:</b> 0.05 to 0.1 mg I.M. or slow I.V. over 1 to 2 minutes</p>
<b>ketamine</b>	<p>➤ To induce anesthesia</p> <p><b>Adults:</b> Individualized, with initial dosage range of 1 to 4.5 mg/kg I.V. (average amount needed to produce 5 to 10 minutes of surgical anesthesia is usually 2 mg/kg). Or, 1 to 2 mg/kg I.V. at rate of 0.5 mg/kg/minute may be used. Or, initial dosage may range from 6.5 to 13 mg/kg I.M. Dose of 10 mg/kg will usually produce 12 to 25 minutes of surgical anesthesia.</p> <p>➤ To maintain anesthesia</p> <p><b>Adults:</b> Maintenance dosage should be adjusted according to patient's anesthetic needs and whether an additional anesthetic is used. Increments of one-half to full induction dose may be repeated as needed for anesthesia maintenance. For patients receiving I.V. diazepam-augmented anesthesia: 0.1 to 0.5 mg/minute by slow I.V. microdrip infusion augmented with diazepam 2 to 5 mg I.V. as needed.</p>

---

## Administration and patient monitoring

---

- Know that I.V. dose is given slowly over 1 to 2 minutes.
-  Keep narcotic antagonist (naloxone) and emergency equipment at hand when giving I.V.
- Know that drug is not recommended for control of mild or intermittent pain.
-  Assess for muscle rigidity in patients receiving high doses. Discuss need for neuromuscular blocker with prescriber. If blocker is given, patient will require ventilator.
- Monitor respiratory and cardiovascular functions and urinary output.
- If patient develops fever, assess for signs and symptoms of opioid toxicity, because more drug is absorbed at higher body temperatures.
- Carefully monitor hematologic studies and hepatic enzyme levels.

- 
- Be aware that atropine, scopolamine, or another drying agent should be given at an appropriate interval before induction.
  - Be aware that the 100-mg/ml concentration shouldn't be given I.V. without proper dilution.
  - Dilute with an equal volume of sterile water for injection, normal saline for injection, or D<sub>5</sub>W.
  - Administer slowly over 60 seconds. Know that more rapid administration may result in respiratory depression and enhanced pressor response.
  - Continually monitor cardiac function during procedure in patients with hypertension or cardiac decompensation.
  - Know that if ketamine is augmented with diazepam, the two drugs must be given separately. Don't mix ketamine and diazepam in syringe or infusion bag.
  - To prepare a dilute solution containing 1 mg ketamine/ml, transfer 10 ml (50-mg/ml vial) or 5 ml (100-mg/ml vial) to 500 ml of D<sub>5</sub>W or normal saline for injection to obtain a 1-mg/ml solution.
  - Know that during ketamine administration, resuscitative equipment should be present and ready for use.
  - Use with caution in patient with chronic alcoholism and the acutely alcohol-intoxicated patient.
  - An increase in cerebrospinal fluid pressure has occurred after ketamine administration. Use with extreme caution in patients with preanesthesia elevated cerebrospinal fluid pressure.

---

## Common anesthetic drugs (continued)

Drug	Indications and dosages
<b>midazolam hydrochloride</b> Apo-Midazolam <sup>†</sup> , Versed	<ul style="list-style-type: none"> <li>➤ To induce general anesthesia</li> <li><b>Adults younger than age 55:</b> 0.3 to 0.35 mg/kg I.V. over 20 to 30 seconds if patient is not premedicated, or 0.15 to 0.35 mg/kg (usual dosage of 0.25 mg/kg) I.V. over 20 to 30 seconds if patient is premedicated. Wait 2 minutes to evaluate effect. Additional increments of 25% of initial dosage may be needed to complete induction.</li> <li><b>Adults older than age 55 who have not been premedicated:</b> Initially, 300 mcg/kg I.V. for induction</li> <li>➤ Continuous infusion to initiate sedation</li> <li><b>Adults:</b> For rapid sedation, loading dose of 0.01 to 0.05 mg/kg by slow I.V.; repeat dose q 10 to 15 minutes until adequate sedation occurs. To maintain sedation, infuse at initial rate of 0.02 to 0.10 mg/kg/hour (1 to 7 mg/hour); adjust rate as needed.</li> </ul>
<b>nalbuphine hydrochloride</b> Nubain	<ul style="list-style-type: none"> <li>➤ Adjunct to balanced anesthesia</li> <li><b>Adults:</b> 0.3 mg to 3 mg/kg I.V. over 10 to 15 minutes, followed by a maintenance dosage of 0.25 mg to 0.50 mg/kg I.V. in single doses p.r.n.</li> </ul>
<b>pancuronium bromide</b> Pavulon	<ul style="list-style-type: none"> <li>➤ Adjunct to balanced anesthesia to relax skeletal muscles for intubation</li> <li><b>Adults and children ages 1 month and older:</b> Initially, 0.04 to 0.1 mg/kg I.V.; may follow with 0.01 mg/kg q 25 to 60 minutes if needed. (Dosage and infusion rates are based on type of anesthesia used and patient needs and response. Dosages listed here are typical.)</li> </ul>
<b>pentazocine lactate</b> Talwin lactate	<ul style="list-style-type: none"> <li>➤ Preoperative or preanesthetic medication; adjunct to surgical anesthesia</li> <li><b>Adults:</b> 30 mg subcutaneously, I.M., or I.V. q 3 to 4 hours (not to exceed 30 mg I.V. or 60 mg I.M. or subcutaneously)</li> <li><b>Children ages 1 year and older:</b> 0.5 mg/kg I.M.</li> <li>➤ Labor</li> <li><b>Adults:</b> 20 mg I.V. for two or three doses at 2- to 3-hour intervals, or 30 mg I.M. as a single dose</li> </ul>

---

## Administration and patient monitoring

---

- 🔊 Keep oxygen and resuscitation equipment at hand in case severe respiratory depression occurs.
- Inject I.M. deep into large muscle mass.
- Know that drug may be mixed in same syringe as atropine, meperidine, morphine, or scopolamine.
- Dilute concentrate for I.V. infusion to 0.5 mg/ml using dextrose 5% in water or normal saline solution. Infuse over at least 2 minutes; wait at least 2 minutes before giving second dose. Be aware that excessive dose or rapid I.V. delivery may cause severe respiratory depression.
- Monitor vital signs, ECG, respiratory status, and oxygen saturation.
- Assess neurologic status closely, especially in children.
- Monitor for nausea and vomiting.

- 
- 🔊 Make sure emergency resuscitation equipment and naloxone (antidote) are at hand before administration begins.
  - Monitor vital signs. Watch for respiratory depression and heart rate changes.
  - Evaluate patient for CNS changes. Institute safety measures as needed to prevent injury.
  - Watch for hypersensitivity reactions, such as anaphylaxis.
  - In patients receiving morphine, meperidine, codeine, or other opiate agonists with a similar duration of action, reduce to 25% of usual initial dose.

- 
- 🔊 Know that drug should be given only by specially trained personnel in settings where respiratory support is available.
  - Administer through established I.V. line containing normal saline solution, lactated Ringer's solution, or dextrose 5% in water.
  - Know that neostigmine can reverse drug's effects.
  - 🔊 Make sure patient's analgesic and sedative needs are met; drug doesn't relieve pain or provide sedation.
  - Monitor heart rhythm, vital signs, and pulse oximetry during and after administration.
  - Evaluate fluid intake and output and potassium level.
  - Assess muscle recovery using peripheral nerve stimulator and train-of-four monitoring.

- 
- Inject each 5-mg dose over 1 minute by slow, direct I.V. infusion, with patient lying supine.
  - Use subcutaneous route only when necessary (may cause tissue damage).
  - Don't mix in the same syringe with barbiturates because precipitation may occur.
  - 🔊 Monitor vital signs. Stay alert for shock, dyspnea, and circulatory or respiratory depression.
  - Monitor drug efficacy.

---

(continued)

## Common anesthetic drugs (continued)

Drug	Indications and dosages
<b>procaine hydrochloride</b> Novocain	<ul style="list-style-type: none"> <li>➤ Infiltration anesthesia <b>Adults:</b> 350 to 600 mg of 0.25% to 0.5% of diluted solution injected as a single dose into area to be anesthetized</li> <li>➤ Peripheral nerve block <b>Adults:</b> 100 ml of 1% diluted solution or 50 ml of 2% solution injected into area where peripheral nerve block is needed, or up to 200 ml of 0.5% diluted solution</li> <li>➤ Spinal anesthesia <b>Adults:</b> 0.5, 1, or 2 ml of 10% solution injected into spinal area to be anesthetized, diluted in 0.5, 1, or 2 ml (respectively) of normal saline solution, sterile distilled water, or spinal fluid. Administer at 1 ml/5 seconds.</li> </ul>
<b>remifentanyl hydrochloride</b> Ultiva	<ul style="list-style-type: none"> <li>➤ To induce anesthesia through intubation <b>Adults:</b> 0.5 to 1 mcg/kg/minute I.V., given with a hypnotic or volatile drug. May administer 1 mcg/kg I.V. over 30 to 60 seconds if endotracheal intubation will occur less than 8 minutes after drug infusion starts.</li> <li>➤ To maintain anesthesia <b>Adults:</b> 0.25 to 0.4 mcg/kg/minute I.V. Increase dosage by 25% to 100% or decrease by 25% to 50% q 2 to 5 minutes p.r.n. If rate exceeds 1 mcg/kg/minute, consider increasing dosage of concomitant anesthetics to increase the depth of anesthesia. Supplemental I.V. bolus of remifentanyl 1 mcg/kg may be given. <b>Children ages 1 to 12:</b> 0.25 mcg/kg/min I.V. in conjunction with halothane, sevoflurane, or isoflurane; may administer supplemental bolus of 1 mcg/kg. <b>Infants birth to 2 months:</b> 0.4 mcg/kg/minute with nitrous oxide; may administer supplemental bolus of 1 mcg/kg.</li> <li>➤ To continue analgesic effect during immediate postoperative period <b>Adults:</b> Initially, 0.1 mcg/kg/minute I.V. Adjust in increments of 0.025 mcg/kg/minute q 5 minutes p.r.n.</li> <li>➤ Analgesic component of monitored anesthesia care <b>Adults:</b> 0.5 to 1 mcg/kg I.V. over 30 to 60 seconds, given 90 seconds before anesthetic. As a continuous infusion, 0.05 to 0.1 mcg/kg/minute I.V. 5 minutes before anesthetic. After anesthetic is given, titrate rate to 0.025 to 0.05 mcg/kg/minute, then adjust by 0.025 mcg/kg/minute q 5 minutes p.r.n.</li> </ul>

---

## Administration and patient monitoring

---

- ▶ Know that drug should be given only by specially trained personnel with expertise in avoiding intravascular injections and in assessing and managing dose-related toxicities and other acute emergencies that may arise.
  - ▶ Make sure emergency resuscitation equipment is at hand before drug is given.
  - Follow label directions to reconstitute drug for selected route.
  - Be aware that if necessary, epinephrine may be added to slow procaine absorption, prolong its action, or maintain hemostasis.
  - ▶ Monitor vital signs and ECG closely, especially when drug is used for spinal anesthesia. Stay alert for evidence of impending cardiac arrest.
  - ▶ Watch for signs and symptoms of status asthmaticus and anaphylaxis.
  - ▶ Monitor patient's position carefully, especially after spinal anesthesia, to help prevent damage to nerves and other body tissues.
  - Inspect infusion site for extravasation.
- 
- ▶ Keep emergency resuscitation equipment and naloxone at hand in case of respiratory arrest.
  - Add 1 ml of diluent/mg of drug. Shake well to produce a clear, colorless solution of 1 mg/ml.
  - Dilute drug further in normal or half-normal saline solution, dextrose 5% in water, dextrose 5% in normal saline solution, or dextrose 5% in lactated Ringer's solution.
  - Drug is for I.V. use only.
  - Use infusion control pump for continuous infusion. Choose site close to venous cannula. After administering, flush I.V. tubing to clear.
  - Know that delivery rates above 0.2 mcg/kg/minute may cause respiratory depression.
  - ▶ When giving high doses, assess for muscle rigidity. Be prepared to stop therapy.
  - Continuously monitor respiratory and cardiovascular function, oxygenation, and vital signs.
  - Assess fluid intake and output. Watch for urinary retention.

---

(continued)

## Common anesthetic drugs (continued)

Drug	Indications and dosages
<b>rocuronium bromide</b> Zemuron (P/F)	<p>➤ Adjunct to general anesthesia to allow endotracheal intubation and relax skeletal muscles during mechanical ventilation or surgery</p> <p><b>Adults:</b> Initially, I.V. bolus of 0.6 to 1.2 mg/kg (usually allows endotracheal intubation within 2 minutes and paralyzes muscles for 30 minutes). Boluses of 0.1 to 0.2 mg/kg may be given at 25% recovery for maintenance. For continuous I.V. infusion, 0.01 to 0.012 mg/kg/minute only after early evidence of recovery from intubating dose.</p>
<b>ropivacaine hydrochloride</b> Naropin	<p>➤ Lumbar epidural block</p> <p><b>Adults:</b> 15 to 30 ml (75 to 150 mg) I.V. of 0.5% solution, or 15 to 25 ml (113 to 188 mg) I.V. of 0.75% solution, or 15 to 20 ml (150 to 200 mg) of a 1% solution</p> <p>➤ Lumbar epidural block during labor</p> <p><b>Adults:</b> 10 to 20 ml (20 to 40 mg) of 0.2% solution, then 6 to 14 ml/hour (12 to 28 mg/hour) as a continuous I.V. infusion; or 10 to 15 ml/hour (20 to 30 mg/hour) of 0.2% solution as an incremental "top-up" injection</p> <p>➤ Lumbar epidural block for cesarean section</p> <p><b>Adults:</b> 20 to 30 ml (100 to 150 mg) I.V. of 0.5% solution, or 15 to 20 ml (113 to 150 mg) of 0.75% solution</p>
<b>succinylcholine chloride</b> Anectine, Quelicin	<p>➤ Adjunct to anesthesia to relax skeletal muscles during short surgical procedures; endotracheal intubation with mechanical ventilation; electrically induced convulsive therapy</p> <p><b>Adults:</b> 0.6 mg/kg I.V. over 10 to 30 seconds, or a continuous I.V. infusion at 0.5 to 10 mg/minute, or 0.04 to 0.07 mg/kg I.V. intermittently p.r.n.</p> <p><b>Older children and adolescents:</b> 1 mg/kg I.V. over 10 to 30 seconds</p> <p><b>Infants and young children:</b> 2 mg/kg I.V. over 10 to 30 second</p>

---

## Administration and patient monitoring

---

-  Keep emergency resuscitation equipment at hand when giving.
  -  Be aware that drug should be given only by personnel who are specially trained in administering anesthesia and neuromuscular blockers.
    - Verify that patient has received a sedative or general anesthetic before therapy begins.
    - Give by rapid I.V. injection or continuous I.V. infusion in compatible solution (dextrose 5% in water or normal saline solution, normal saline solution, sterile water for injection, or lactated Ringer's solution).
    - Know that maintenance dose of 0.1 mg/kg provides an extra 12 minutes of muscle relaxation; 0.15 mg/kg, an extra 17 minutes; and 0.2 mg/kg, an extra 24 minutes.
    - Assess respiratory status frequently.
    - Monitor vital signs and ECG continuously until patient recovers fully from neuromuscular blockade. Closely monitor recovery with nerve stimulator and train-of-four monitoring.
- 
-  Know that drug should be given only by personnel specially trained in use of epidural blocks.
    - Be aware that test dose (containing epinephrine) should be given.
    - Use small, incremental doses for titration. Avoid rapid I.V. infusion.
    - Monitor vital signs, ECG, and cardiovascular status continuously.
    - Assess neurologic status. Stay alert for signs and symptoms of impending seizure.
  -  Watch carefully for warning signs of allergic reaction and respiratory distress.
- 
-  Make sure patient has received a sedative or general anesthetic before administering.
  -  Verify that emergency resuscitation equipment is at hand before giving.
    - As ordered, give test dose of 5 to 10 mg I.V. after anesthesia administration. Drug may be given if test dose does not cause respiratory depression or if such depression lasts no longer than 5 minutes.
    - For I.V. use, reconstitute with dextrose 5% in water or normal saline solution; administer via intermittent or continuous I.V. infusion. Don't mix with alkaline solution, such as sodium bicarbonate, barbiturates, or thiopental sodium.
    - Be aware that continuous I.V. infusion isn't recommended for children or adolescents.
  -  Watch for life-threatening adverse reactions, including anaphylaxis, malignant hyperthermia, and hypersensitivity reaction.
    - Monitor ECG and vital signs (especially respirations) until patient recovers fully.
    - Assess recovery by checking hand grip, head lift, and voluntary cough response.

---

*(continued)*

### Common anesthetic drugs (continued)

---

#### Drug

#### Indications and dosages

---

##### sufentanil

Sufenta

➤ As a primary anesthetic to induce and maintain anesthesia

**Adults:** Initially, 8 to 30 mcg/kg I.V., given with oxygen and a muscle relaxant. Maintenance dosage is 0.5 to 10 mcg/kg p.r.n.

➤ Analgesic adjunct to maintain balanced general anesthesia

**Adults:** 1 to 8 mcg/kg I.V., with 75% of dose given immediately before intubation. Remainder can be given as 10- to 50-mcg bolus doses to maintain analgesia.

➤ Epidural analgesia during labor and delivery

**Adults:** 10 to 15 mcg epidurally with bupivacaine, with or without epinephrine. May repeat twice at intervals of less than 1 hour, for a total of three doses.

---

##### vecuronium bromide

Norcuron

➤ Adjunct to anesthesia to facilitate endotracheal intubation and relax skeletal muscles during surgery or mechanical ventilation

**Adults and children older than age 9:** Initially, 0.08 to 0.1 mg/kg by I.V. bolus. During prolonged surgery, maintenance dose of 0.01 to 0.015 mg/kg is given by continuous I.V. infusion within 25 to 40 minutes of initial dose. In patients receiving balanced anesthesia, maintenance dose may be given q 12 to 15 minutes.

---

### Administration and patient monitoring

---

-  Know that drug should be given only by personnel who are specially trained in using I.V. and epidural anesthetics and in managing respiratory effects of potent opioids.
  -  Keep oxygen and resuscitation and intubation equipment at hand.
  - Be aware that dosage is based on mean body weight.
  -  Monitor ECG and vital signs. Stay alert for signs and symptoms of shock and impending cardiac arrest.
  - Assess airway patency closely. Watch for respiratory depression and airway spasms.
  - Monitor neurologic status during and after administration. Institute safety measures as needed to prevent injury.
  - Monitor fluid intake and output. Check for oliguria or urinary retention.
- 
-  Know that drug should be given by specially trained personnel and only when respiratory support is available.
  - When giving by I.V. bolus, administer over 1 to 2 minutes.
  - When giving by continuous I.V. infusion, reconstitute by adding bacteriostatic water for injection to yield a concentration of 1 mg/ml. Dilute further with dextrose 5% in water, normal saline solution, or lactated Ringer's solution. Administer with infusion-control device.
  - Monitor heart rhythm, blood pressure, and pulse oximetry during and after administration.
  - Monitor fluid intake and output and measure temperature.
  - Assess muscle recovery using peripheral nerve stimulator and train-of-four monitoring.
  -  Make sure patient's analgesic and sedative needs are met. (Drug doesn't relieve pain or provide sedation.)
-

## Common combination drug products

---

Many drugs (especially over-the-counter preparations) are combination products that contain several active ingredients and are sold under a discrete trade name. The combination products below are listed by trade name, followed by active ingredients and therapeutic class.

**Acanya**

benzoyl peroxide, clindamycin phosphate

Therapeutic class: Anti-infective, keratologic agent

**Accuretic**

hydrochlorothiazide, quinapril hydrochloride

Therapeutic class: Antihypertensive

**Actifed**

codeine phosphate, pseudoephedrine hydrochloride, triprolidine hydrochloride

Therapeutic class: Adrenergic, antihistamine, antitussive

**Activella Tablets**

estradiol, norethindrone acetate

Therapeutic class: Estrogen, progestin

**Actonel with Calcium**

risedronate sodium tablets with calcium carbonate tablets

Therapeutic class: Bone resorption inhibitor

**Actoplus Met**

metformin hydrochloride, pioglitazone hydrochloride

Therapeutic class: Antidiabetic agent

**Adderall**

amphetamine aspartate, amphetamine sulfate, dextroamphetamine saccharate, dextroamphetamine sulfate

Therapeutic class: CNS stimulant

**Advair HFA**

fluticasone propionate, salmeterol xinafoate

Therapeutic class: Corticosteroid, bronchodilator

**Advicor**

lovastatin, niacin

Therapeutic class: Antihyperlipidemic

**Aggrenox**

aspirin, dipyridamole

Therapeutic class: Antiplatelet drug

**Aldactazide**

hydrochlorothiazide, spironolactone

Therapeutic class: Diuretic

**Aldoril**

hydrochlorothiazide, methyl dopa

Therapeutic class: Antihypertensive

**Allegra-D**

fexofenadine hydrochloride, pseudoephedrine hydrochloride

Therapeutic class: Antihistamine, adrenergic

**Apri**

desogestrel, ethinyl estradiol

Therapeutic class: Estrogen, progestin

**Arthrotec**

diclofenac sodium, misoprostol

Therapeutic class: Anti-inflammatory, gastric protectant

**Atacand HCT**

candesartan cilexetil, hydrochlorothiazide

Therapeutic class: Antihypertensive

**Atripla**

efavirenz, emtricitabine, tenofovir disoproxil fumarate

Therapeutic class: Antiviral

**Augmentin**

amoxicillin, clavulanate potassium

Therapeutic class: Anti-infective

---

**Avalide**

hydrochlorothiazide, irbesartan  
Therapeutic class: Antihypertensive

**Avandamet**

rosiglitazone maleate, metformin hydrochloride  
Therapeutic class: Hypoglycemic

**Avandaryl**

rosiglitazone maleate and glimepiride  
Therapeutic class: Hypoglycemic

**Azor**

amlodipine, olmesartan medoxomil  
Therapeutic class: Antihypertensive

**Bactrim**

sulfamethoxazole, trimethoprim  
Therapeutic class: Anti-infective

**Caduet**

amlodipine besylate, atorvastatin calcium  
Therapeutic class: Antihypertensive, antihyperlipidemic

**Capozide**

captopril, hydrochlorothiazide  
Therapeutic class: Antihypertensive

**Ciprodex**

ciprofloxacin, dexamethasone  
Therapeutic class: Anti-infective, anti-inflammatory drug

**Clarinet-D 12 hour**

desloratadine and pseudoephedrine  
Therapeutic class: Antihistamine and vasoconstrictor

**Claritin-D**

loratadine, pseudoephedrine sulfate  
Therapeutic class: Antihistamine, adrenergic

**Coartem**

artemether, lumefantrine  
Therapeutic class: Antimalarial

**CombiPatch**

estradiol, norethindrone acetate  
Therapeutic class: Estrogen, progestin

**Combivent**

albuterol sulfate, ipratropium bromide  
Therapeutic class: Bronchodilator

**Combivir**

lamivudine, zidovudine  
Therapeutic class: Antiviral

**Combunox**

ibuprofen, oxycodone hydrochloride  
Therapeutic class: Opioid analgesic

**Corzide**

bendroflumethiazide, nadolol  
Therapeutic class: Antihypertensive

**Cosopt**

dorzolamide, timolol maleate  
Therapeutic class: Antihypertensive, carbonic anhydrase inhibitor

**Darvocet N-100**

acetaminophen, propoxyphene  
Therapeutic class: Opioid analgesic

**Duetact**

glimepiride, pioglitazone  
Therapeutic class: Antihyperglycemic

**Dyazide**

hydrochlorothiazide, triamterene  
Therapeutic class: Diuretic

**EMLA Cream**

lidocaine, prilocaine  
Therapeutic class: Anesthetic

**Endocet**

acetaminophen, oxycodone hydrochloride  
Therapeutic class: Opioid analgesic

**Epzicom**

abacavir sulfate, lamivudine  
Therapeutic class: Antiviral

**Exforge**

amlodipine, valsartan  
Therapeutic class: Antihypertensive

**Exforge HCT**

amlodipine, valsartan, hydrochlorothiazide  
Therapeutic class: Antihypertensive

**Femhrt**

ethinyl estradiol, norethindrone acetate  
Therapeutic class: Estrogen, progestin

**Fioricet**

acetaminophen, butalbital, caffeine  
Therapeutic class: Barbiturate analgesic

**Fiorinal**

aspirin, butalbital, caffeine  
Therapeutic class: Barbiturate analgesic

*(continued)*

**Common combination drug products (continued)****Fosamax Plus D**

alendronate sodium, cholecalciferol  
Therapeutic class: Bone resorption inhibitor

**Glucovance**

glyburide, metformin hydrochloride  
Therapeutic class: Hypoglycemic

**Helidac**

bismuth subsalicylate, metronidazole, tetracycline hydrochloride  
Therapeutic class: Anti-infective

**Humulin 70/30**

insulin, recombinant human; insulin suspension, isophane  
Therapeutic class: Hypoglycemic

**Hycodan**

homatropine methylbromide, hydrocodone bitartrate  
Therapeutic class: Opioid analgesic

**Hydrocet**

acetaminophen, hydrocodone bitartrate  
Therapeutic class: Opioid analgesic

**Hyzaar**

hydrochlorothiazide, losartan potassium  
Therapeutic class: Antihypertensive

**Inderide**

hydrochlorothiazide, propranolol hydrochloride  
Therapeutic class: Antihypertensive

**Janumet**

metformin hydrochloride, sitagliptin  
Therapeutic class: Antihyperglycemic

**Kaletra**

lopinavir, ritonavir  
Therapeutic class: Antiviral

**Librax**

chlordiazepoxide hydrochloride, clidinium bromide  
Therapeutic class: Anxiolytic

**Loestrin 24 FE**

norethindrone acetate/ethinyl estradiol and ferrous fumarate  
Therapeutic class: Hormonal contraceptive with iron

**Lomotil**

atropine sulfate, diphenoxylate hydrochloride  
Therapeutic class: Antidiarrheal, anticholinergic

**Lopressor HCT**

hydrochlorothiazide, metoprolol tartrate  
Therapeutic class: Antihypertensive

**Lortab**

acetaminophen, hydrocodone bitartrate  
Therapeutic class: Opioid analgesic

**Lotensin HCT**

benazepril hydrochloride, hydrochlorothiazide  
Therapeutic class: Antihypertensive

**Lotrel**

amlodipine besylate, benazepril hydrochloride  
Therapeutic class: Antihypertensive

**Maxzide**

hydrochlorothiazide, triamterene  
Therapeutic class: Antihypertensive, diuretic

**Moduretic**

amiloride hydrochloride, hydrochlorothiazide  
Therapeutic class: Diuretic

**NovoLog Mix 70/30**

insulin aspart (recombinant), insulin aspart protamine  
Therapeutic class: Hypoglycemic

**NuLYTELY**

polyethylene glycol, potassium chloride, sodium bicarbonate, sodium chloride  
Therapeutic class: Laxative

**Ortho-Cyclen**

ethinyl estradiol, norgestimate  
Therapeutic class: Contraceptive

**Pediazole**

erythromycin ethylsuccinate, sulfisoxazole acetyl  
Therapeutic class: Anti-infective

**Percocet**

acetaminophen, oxycodone hydrochloride

Therapeutic class: Opioid analgesic

**Percodan**

aspirin, oxycodone hydrochloride, oxycodone terephthalate

Therapeutic class: Opioid analgesic

**Premphase**

conjugated estrogens, medroxyprogesterone acetate

Therapeutic class: Contraceptive

**Primaxin**

cilastatin sodium, imipenem

Therapeutic class: Anti-infective

**Qsymia**

phentermine and topiramate extended-release

Therapeutic class: Adjunct for weight management

**Rifamate**

isoniazid, rifampin

Therapeutic class: Antitubercular

**Rifater**

isoniazid, pyrazinamide, rifampin

Therapeutic class: Antitubercular

**Roxicet**

acetaminophen, oxycodone hydrochloride

Therapeutic class: Opioid analgesic

**Sepra**

sulfamethoxazole, trimethoprim

Therapeutic class: Anti-infective

**Sinemet**

carbidopa, levodopa

Therapeutic class: Antiparkinsonian

**Solage**

mequinol, tretinoin

Therapeutic class: Antineoplastic

**Stalevo**

carbidopa, entacapone, levodopa

Therapeutic class: Antiparkinsonian

**Stribild**

elvitegravir, cobicistat, emtricitabine, tenofovir disoproxil fumarate

Therapeutic class: Antiviral

**Symbicort**

budesonide, formoterol

Therapeutic class: Antiasthmatic, bronchodilator

**Symbyax**

fluoxetine hydrochloride, olanzapine

Therapeutic class: Mood stabilizer

**Taclonex**

calcipotriene and betamethasone

Therapeutic class: Topical agent for psoriasis vulgaris

**Tarka**

trandolapril, verapamil hydrochloride

Therapeutic class: Antihypertensive

**Tenoretic**

atenolol, chlorthalidone

Therapeutic class: Antihypertensive

**Trizivir**

abacavir sulfate, lamivudine, zidovudine

Therapeutic class: Antiviral

**Truvada**

emtricitabine, tenofovir disoproxil fumarate

Therapeutic class: Antiviral

**Tussionex**

chlorpheniramine polistirex, hydrocodone polistirex

Therapeutic class: Antitussive, antihistamine

**Twynsta**

telmisartan, amlodipine

Therapeutic class: Antihypertensive

**Tylox**

acetaminophen, oxycodone hydrochloride

Therapeutic class: Opioid analgesic

**Ultracet**

acetaminophen, tramadol hydrochloride

Therapeutic class: Nonopioid analgesic

**Ultrase**

amylase, lipase, protease

Therapeutic class: Digestive enzyme

**Unasyn**

ampicillin sodium, sulbactam sodium

Therapeutic class: Anti-infective

### Common combination drug products (continued)

---

**Valturna**

aliskiren, valsartan

Therapeutic class: Antihypertensive

**Vaseretic**

enalapril maleate, hydrochlorothiazide

Therapeutic class: Antihypertensive, diuretic

**Vicodin**

acetaminophen, hydrocodone bitartrate

Therapeutic class: Opioid analgesic

**Vimovo**

naproxen, esomeprazole magnesium

Therapeutic class: Nonsteroidal anti-inflammatory drug, antiulcer drug

**Vusion**

miconazole, sodium bicarbonate

Therapeutic class: Steroid-free agent for diaper dermatitis

**Vytorin**

ezetimibe, simvastatin

Therapeutic class: Antihyperlipidemic

**Zestoretic**

hydrochlorothiazide, lisinopril

Therapeutic class: Antihypertensive

**Ziac**

bisoprolol fumarate, hydrochlorothiazide

Therapeutic class: Antihypertensive

**Ziana Gel**

clindamycin phosphate, tretinoin

Therapeutic class: Antibiotic, retinoid

**Zyrtec-D**

cetirizine hydrochloride, pseudoephedrine hydrochloride

Therapeutic class: Antihistamine/decongestant

---

## Adult immunization schedule by age group

This 2012 schedule shows the recommended age groups for routine administration of vaccines for adults ages 19 and older. A person may receive a combination vaccine if any components of the combination are indicated (unless the vaccine's other components are contraindicated). Consult the package insert for detailed recommendations.

For more information about recommended vaccines and contraindications for immunization, visit [www.cdc.gov/vaccines](http://www.cdc.gov/vaccines) or call the CDC-INFO Contact Center at 800-232-4636.

Vaccine	Ages	19-21	22-26	27-49	50-59	60-64	≥65	
Tetanus, diphtheria pertussis (Td/Tdap)		Substitute 1-time dose of Tdap for Td booster; then boost with Td every 10 yrs						Td/Tdap
Influenza		1 dose annually						
Pneumococcal (polysaccharide)		1 to 2 doses						1 dose
Hepatitis B		3 doses						
Hepatitis A		2 doses						
Measles, Mumps, Rubella (MMR)		1 or 2 doses			1 dose			
Varicella		2 doses						
Meningococcal (polysaccharide)		1 or more doses						
Zoster								1 dose
Human papilloma virus (HPV), female		3 doses						
Human papilloma virus (HPV), male		3 doses						

### KEY

For all persons in this age group and who lack documentation of vaccination or have no evidence of previous infection

For those with some other risk factor (medical, occupational, lifestyle, or other indications)

For patients age 65 and older if in contact with child age 12 months or younger. Td or Tdap if no infant contact.

The Adult, Childhood, and Adolescent immunization schedules (Appendices C, D, and E) have been approved by the Centers for Disease Control and Prevention's Advisory Committee on Immunization Practices, the American Academy of Family Physicians, the American College of Obstetricians and Gynecologists, the American College of Physicians, and the American College of Nurse-Midwives. Recommended adult immunization schedule-United States, 2012. MMWR 2012;61(04).

## Childhood immunization schedule by age group

This 2012 schedule shows recommended ages for routine administration of childhood vaccines for children from birth through 6 years of age. A child who doesn't receive a given dose at the recommended age should receive it at a subsequent visit. Consult the package insert for detailed recommendations.

For more information about recommended vaccines, visit [www.cdc.gov/vaccines](http://www.cdc.gov/vaccines) or call the CDC-INFO Contact Center at 800-232-4636.

Vaccine	Birth	Age 1 mo	2 mo	4 mo	6 mo	12 mo	15 mo	18 mo	19-23 mo	2-3 yr	4-6 yr
Hepatitis B	HepB	HepB			HepB						
Diphtheria, tetanus, pertussis		DTaP	DTaP	DTaP		DTaP					DTaP
<i>Haemophilus influenzae</i> type b		Hib	Hib	Hib	Hib						
Inactivated poliovirus		IPV	IPV	IPV							IPV
Measles, Mumps, Rubella					MMR						MMR
Rotavirus		RV	RV	RV							
Varicella					Varicella						Varicella
Meningococcal					MCV4						
Pneumococcal		PCV	PCV	PCV	PCV						PPSV
Influenza					Influenza (Yearly)						
Hepatitis A					Dose 1					HepA series	

### KEY

For all persons in this age group and who lack documentation of vaccination or have no evidence of previous infection

For those with some other risk factor (medical, occupational, lifestyle, or other indications)

DTaP: Diphtheria, tetanus, pertussis

HepA: Hepatitis A vaccine

HepB: Hepatitis B vaccine

Hib: *Haemophilus influenzae* type b conjugate vaccine

IPV: Inactivated poliovirus

MMR: Measles, Mumps, Rubella

MCV4: Meningococcal conjugate vaccines, quadrivalent

PCV: Pneumococcal conjugate vaccine

PPSV: Pneumococcal polysaccharide vaccine

## Adolescent immunization schedule by age group

This 2012 schedule shows recommended ages for routine administration of currently licensed vaccines to adolescent children ages 7 to 18. An adolescent who doesn't receive a given dose at the recommended age should receive it at a subsequent visit. Consult the package insert for detailed recommendations.

For more information about recommended vaccines (including precautions and contraindications for immunization and vaccine shortages), visit [www.cdc.gov/vaccines](http://www.cdc.gov/vaccines) or call the CDC-INFO Contact Center at 800-232-4636.

Vaccine	Ages 7-10	11-12	13-18
Tetanus, diphtheria pertussis	1 dose (if indicated)	1 dose	1 dose (if indicated)
Human papilloma virus		3 doses	Complete 3-dose series
Hepatitis B	Complete 3-dose series		
Inactivated poliovirus	Complete 3-dose series		
Measles, Mumps, Rubella	Complete 2-dose series		
Varicella	Complete 2-dose series		
Meningococcal		Dose 1	Booster at age 16
Pneumococcal			
Influenza	Influenza (yearly)		
Hepatitis A	Complete 2-dose series		

### KEY

 For all persons in this age group and who lack documentation of vaccination or have no evidence of previous infection

 Catch-up immunization

 For patients age 65 and older if in contact with child age 12 months or younger. Td or Tdap if no infant contact.

DTaP: Diphtheria, Tetanus, Pertussis

HepA: Hepatitis A vaccine

HepB: Hepatitis B vaccine

HPV: Human papillomavirus

IPV: Inactivated poliovirus

MCV4: Meningococcal conjugate vaccine

MMR: Measles, Mumps, Rubella

MPSV4: Meningococcal polysaccharide vaccine

PPV: Pneumococcal polysaccharide vaccine

## Normal laboratory values for blood tests

The table below shows normal laboratory values for commonly ordered blood tests. Results may vary slightly among laboratories. Many of these values are monitored regularly to assess patient response and drug efficacy.

### Hematology

#### White blood cell count

4,100 to 10,900/mm<sup>3</sup>

#### Red blood cell count

Men: 4.5 to 6.2

million/mm<sup>3</sup>

Women: 4.2 to 5.4

million/mm<sup>3</sup>

#### Hemoglobin

Men: 14 to 18 g/dl

Women: 12 to 16 g/dl

#### Hematocrit

Men: 42% to 54%

Women: 38% to 46%

#### Platelet count

140,000 to 400,000/mm<sup>3</sup>

#### Red blood cell indices

MCH: 26 to 32 pg

MCHC: 32 to 36 g/dl

MCV: 80 to 95 μm<sup>3</sup>

#### Reticulocyte count

0.5% to 2% of total red blood cell count

#### White blood cell differential

Basophils: 0.3% to 2%

Eosinophils: 0.3% to 7%

Lymphocytes: 16.2% to 43%

Monocytes: 4% to 10%

Neutrophils: 47.6% to 76.8%

### Coagulation studies

#### Partial thromboplastin time

60 to 70 seconds

#### Prothrombin time

10 to 14 seconds

#### International Normalized Ratio

2.0 to 3.0 in patients receiving warfarin

#### Bleeding time

3 to 6 minutes (template and Ivy methods)

1 to 3 minutes (Duke method)

#### D-Dimer

< 250 μg/L

#### Fibrinogen

215 to 519 mg/dl

#### Fibrinogen degradation products

< 1:10

### Chemistry

#### Glucose

70 to 100 mg/dl

#### Blood urea nitrogen (BUN)

8 to 20 mg/dl

#### Creatinine

Men: 0.8 to 1.2 mg/dl

Women: 0.6 to 1.1 mg/dl

#### BUN/creatinine ratio

6 to 22 (calculated)

### Chemistry (continued)

#### Globulin

2.3 to 3.5 g/dl

#### Sodium

135 to 145 mEq/L

#### Potassium

3.5 to 5.0 mEq/L

#### Anion gap

8 to 16 mEq/L

#### Chloride

100 to 108 mEq/L

#### Carbon dioxide

22 to 34 mEq/L

#### Albumin

3.3 to 4.5 g/dl

#### Calcium

9 to 10.5 mg/dl

#### Magnesium

1.5 to 2.5 mEq/L

#### Phosphorus

2.5 to 4.5 mg/dl

#### Amylase

60 to 180 units/L

#### Lipase

0 to 110 units/L

#### Lactate dehydrogenase

48 to 115 IU/L

#### Lactic acid

3 to 12 mg/dl

#### Protein

6.0 to 8.5 g/dl

#### Uric acid

Men: 4.0 to 8.5 mg/dl

Women: 2.5 to 7.5 mg/dl

KEY MCH: Mean corpuscular hemoglobin

MCHC: Mean corpuscular hemoglobin concentration

MCV: Mean corpuscular volume

(continued)

**Chemistry (continued)****Erythrocyte sedimentation rate**

Men: 0 to 15 mm/hour  
 Women: 0 to 20 mm/hour

**Glucose-6-phosphate dehydrogenase**

5 to 13 units/g hemoglobin

**Hemoglobin A1c**

< 6.0% of total hemoglobin

**B-Type natriuretic peptide**

< 100 pg/ml

**Zinc**

60 to 130 mcg/dl

**Serotonin**

Men: 21 to 321 ng/ml  
 Women: 0 to 420 ng/ml

**Arterial blood gases****pH**

7.35 to 7.45 mmHg

**Paco<sub>2</sub>**

35 to 45 mmHg

**Pao<sub>2</sub>**

75 to 100 mmHg

**HCO<sub>3</sub><sup>-</sup>**

22 to 26 mEq/L

**Sao<sub>2</sub>**

94% to 100%

**Lipid studies****Low-density lipoproteins**

Optimal: < 100 mg/dl  
 Near optimal: 100 to 129 mg/dl

**High-density lipoproteins**

Desirable: ≥ 60 mg/dl

**Total cholesterol**

Desirable: < 200 mg/dl

**Triglycerides**

Desirable: < 200 mg/dl

**Liver function studies****Alanine aminotransferase**

Men: 10 to 35 units/L  
 Women: 9 to 24 units/L

**Alkaline phosphatase**

39 to 117 units/L

**Aspartate aminotransferase**

Men: 8 to 20 units/L  
 Women: 5 to 40 units/L

**Serum bilirubin**

Direct: ≤ 0.4 mg/dl  
 Indirect: ≤ 1.3 mg/dl  
 Total: ≤ 1.3 mg/dl

**Cardiac studies****Cardiac troponin I**

< 1.0 µg/ml

**Creatine kinase (CK)**

Total CK—  
 Men: 54 to 186 IU/L  
 Women: 41 to 117 IU/L

**Isoenzymes—**

CK-MM: 96% to 100% of total  
 CK-MB: 0% to 4% of total  
 CK-BB: 0% of total

**High sensitivity C-reactive protein**

Low cardiovascular risk:  
 < 1.0 mg/L  
 Average cardiovascular risk:  
 1.0 to 3.0 mg/L

**Tumor-related marker studies****Carbohydrate antigen (CA) 15.3**

> 25 U/ml

**CA 19-9 (Siemens Chemiluminescent Method)**

< 37 U/ml

**CA 125 (Siemens Chemiluminescent Method)**

< 21 U/ml

**Carcinoembryonic antigen**

< 3 ng/ml, individualized and variable (non-smokers)

< 5 ng/ml, individualized and variable (smokers)

**Prostate-specific antigen**

≤ 4 ng/ml

**Prostatic acid phosphatase**

< 0 to 2.7 ng/ml

**Lymphocyte surface markers****CD3**

Absolute: 840 to 3,060 cells/µL

Percentage: 57% to 85%

**CD4**

Absolute: 490 to 1,740 cells/µL

Percentage: 30% to 61%

**CD8**

Absolute: 180 to 1,170 cells/µL

Percentage: 12% to 42%

**Helper: suppressor (CD4: CD8) ratio**

0.86 to 5

## Normal laboratory values for blood tests (continued)

### Iron studies

#### Serum iron

40 to 180 mcg/dl

#### Ferritin

Men: 18 to 270 µg/ml

Women: 18 to 160 µg/ml

#### Iron-binding capacity

200 to 450 mcg/dl

#### Transferrin

88 to 341 mg/dl

#### Transferrin saturation

12% to 57%

### Hormone studies

#### Cortisol, free

8:00 to 10:00 A.M. 0.07 to 0.93 mcg/dl

4:00 to 6:00 P.M. 0.04 to 0.45 mcg/dl

10:00 to 10:00 P.M. 0.04 to 0.35 mcg/dl

#### Cortisol, total

8:00 to 10:00 A.M. 4.6 to 20.6 mcg/dl

4:00 to 6:00 P.M. 1.8 to 13.6 mcg/dl

#### Estradiol

Men: < 50 pg/ml

Women: Menstruating (day of cycle relative to LH peak) —

Follicular (−12): 19 to 83 pg/ml

Follicular (−4): 64 to 183 pg/ml

Midcycle (−1): 150 to 528 pg/ml

Luteal (+2): 58 to 157 pg/ml

Luteal (+6): 60 to 211 pg/ml

Luteal (+12): 55 to 150 pg/ml

Postmenopausal (no treatment):

0 to 31 pg/ml

#### Free thyroxine

0.7 to 1.9 ng/dl

#### Free thyroxine fraction

0.03% to 0.005%

#### Growth hormone

Age 1 day: 5 to 53 ng/ml

Age 1 week: 5 to 27 ng/ml

Age 1 to 12 months: 2 to 10 ng/ml

Age 1 year and older: < 5 ng/ml

### Hormone studies (continued)

#### 17-Hydroxyprogesterone

Men: 0.06 to 3.0 mg/L

Women (follicular phase): 0.2 to 1.0 mg/L

#### Parathyroid hormone, intact

Ages 2 to 20 years: 9 to 52 pg/ml

Older than age 20: 8 to 97 pg/ml

#### Radioactive iodine uptake

10% to 30%

#### Testosterone

Males > age 18: 241 to 827 ng/dl

Females > age 18: 14 to 76 ng/dl

#### Triiodothyronine (T<sub>3</sub>)

60 to 181 ng/dl

#### Thyroxine (T<sub>4</sub>)

4.5 to 12.5 mcg/dl

#### Thyroid hormone binding ratio

0.9 to 1.1

#### Thyroid-stimulating hormone

0.5 to 4.70 microIU/ml

## Drug infusion rates

The tables below show infusion rates for common drug infusions. Before using these tables as your administration guide, make sure the concentration of the prescribed infusion matches the concentration shown in the table.

### Adenosine (Adenoscan) infusion rates

Using this table, you can determine that the appropriate infusion rate is corrected for total body weight.

Patient's weight		Infusion rate (ml/minute)
kg	lb	
45	99	2.1
50	110	2.3
55	121	2.6
60	132	2.8
65	143	3
70	154	3.3
75	165	3.5
80	176	3.8
85	187	4.0
90	198	4.2

### Aminophylline infusion rates

Although aminophylline infusion rates are highly individualized, this table can help you determine the infusion rate for an infusion containing aminophylline 500 mg (= 400 mg theophylline) in 500 ml D<sub>5</sub>W that must be controlled by an automated infusion control device.

Dosage (mg/hour)		Rate (ml/hour)
Aminophylline	Theophylline	
10	8	10
15	12	15
20	16	20
25	20	25
30	24	30
35	28	35
40	32	40
45	36	45
50	40	50
55	44	55
60	48	60
65	52	65
70	56	70
75	60	75
80	64	80

**Drug infusion rates (continued)****Argatroban infusion rates**

Using this table, you can determine the infusion rate for argatroban (for a 2-mcg/kg/minute dose) that has been diluted in normal saline solution, D<sub>5</sub>W, or lactated Ringer's solution to a concentration of 1 mg/ml.

Patient's weight (kg)	Dosage (mcg/minute)	Infusion rate (ml/hour)
50	100	6
60	120	7
70	140	8
80	160	10
90	180	11
100	200	12
110	220	13
120	240	14
130	260	16
140	280	17

**Clindamycin phosphate infusion rates**

Using this table, you can determine dilution and infusion rates after diluting I.V. solution to a concentration of not more than 18 mg/ml using normal saline solution, D<sub>5</sub>W, or lactated Ringer's solution.

**Dilution and infusion rates**

Dosage (mg)	Diluent (ml)	Infusion rate (minutes)
300	50	10
600	50	20
900	50 to 100	30
1,200	100	40

**Dobutamine infusion rates**

Using this table, you can determine the infusion rate for an infusion containing dobutamine 250 mg mixed in 250 ml of dextrose 5% in water (1,000 mcg/ml).

Dosage (mcg/kg/minute)	Patient's weight (kg)															
	40	45	50	55	60	65	70	75	80	85	90	95	100	105	110	
0.5	1	1	2	2	2	2	2	2	2	3	3	3	3	3	3	
1.5	4	4	5	5	5	6	6	7	7	8	8	9	9	9	10	
2.5	6	7	8	8	9	10	11	11	12	13	14	14	15	16	17	
5.0	12	14	15	17	18	20	21	23	24	26	27	29	30	32	33	
7.5	18	20	23	25	27	29	32	34	36	38	41	43	45	47	50	
10.0	24	27	30	33	36	39	42	45	48	51	54	57	60	63	66	
12.5	30	34	38	41	45	49	53	56	60	64	68	71	75	79	83	
15.0	36	41	45	50	54	59	63	68	72	77	81	86	90	95	99	
20.0	48	54	60	66	72	78	84	90	96	102	108	114	120	126	132	
25.0	60	68	75	83	90	98	105	113	120	128	135	143	150	158	165	
30.0	72	81	90	99	108	117	126	135	144	153	162	171	180	189	198	
35.0	84	95	105	116	126	137	147	158	168	179	189	200	210	221	231	
40.0	96	108	120	132	144	156	168	180	192	204	216	228	240	252	264	

*(continued)*

### Dopamine infusion rates

Using this table, you can determine the infusion rate for an infusion containing dopamine 400 mg in 250 ml of dextrose 5% in water (1,600 mcg/ml).

Dosage (mcg/kg/ minute)	Patient's weight (kg)													
	40	45	50	55	60	65	70	75	80	85	90	95	100	105
	Infusion rate (ml/hour)													
0.5	1	1	1	1	1	1	1	1	2	2	2	2	2	2
1.5	2	3	3	3	3	4	4	4	5	5	5	6	6	6
2.5	4	4	5	5	6	6	7	7	8	8	8	9	9	10
5.0	8	8	9	10	11	12	13	14	15	16	17	18	19	20
7.5	11	13	14	15	17	18	20	21	23	24	25	27	28	30
10.0	15	17	19	21	23	24	26	28	30	32	34	36	38	39
12.5	19	21	23	26	28	30	33	35	38	40	42	45	47	49
15.0	23	25	28	31	34	37	39	42	45	48	51	53	56	59
20.0	30	34	38	41	45	49	53	56	60	64	68	71	75	79
25.0	38	42	47	52	56	61	66	70	75	80	84	89	94	98
30.0	45	51	56	62	67	73	79	84	90	96	101	107	113	118
35.0	53	59	66	72	79	85	92	98	105	112	118	125	131	138
40.0	60	68	75	83	90	98	105	113	120	128	135	143	150	158
45.0	68	76	84	93	101	110	118	127	135	143	152	160	169	177
50.0	75	84	94	103	113	122	131	141	150	159	169	178	188	197

### Epinephrine infusion rates

Use this table to determine the rate at which to infuse epinephrine 1 mg in 250 ml of dextrose 5% in water (4 mcg/ml).

Dosage (mcg/minute)	Infusion rate (ml/hour)
1	15
2	30
3	45
4	60
5	75
6	90
7	105
8	120
9	135
10	150
15	225

**Drug infusion rates (continued)****Nitroglycerin infusion rates**

When infusing nitroglycerin, first find the prescribed concentration and then determine the infusion rate in ml/hour.

Dosage (mcg/minute)	Nitroglycerin	Nitroglycerin
	25 mg/250 ml D <sub>5</sub> W (100 mcg/ml) Infusion rate (ml/hour)	50 mg/250 ml D <sub>5</sub> W (200 mcg/ml) Infusion rate (ml/hour)
5	3	2
10	6	3
15	9	5
20	12	6
25	15	8
30	18	9
40	24	12
50	30	15
60	36	18
70	42	21
80	48	24
90	54	27
100	60	30

KEY D<sub>5</sub>W: dextrose 5% in water

**Nitroprusside infusion rates**

Using this table, you can determine the infusion rate for an infusion containing nitroprusside 50 mg in 250 ml of dextrose 5% in water (200 mcg/ml).

Dosage (mcg/kg/ minute)	Patient's weight (kg)														
	40	45	50	55	60	65	70	75	80	85	90	95	100	105	110

(continued)

**Phenylephrine infusion rates**

Using this table, you can determine the infusion rate for an infusion containing phenylephrine 20 mg in 250 ml of dextrose 5% in water or normal saline solution (80 mcg/ml).

Dosage (mcg/minute)	Rate (ml/hour)	Dosage (mcg/minute)	Rate (ml/hour)
9	7	25	19
11	8	27	20
12	9	29	22
13	10	32	24
15	11	35	26
16	12	37	28
17	13	40	30
19	14	43	32
20	15	45	34
21	16	48	36
23	17	51	38
24	18	53	40

## Identifying life-threatening adverse reactions

Early recognition of a life-threatening adverse drug reaction is a crucial aspect of patient care and safety. This appendix helps you identify life-threatening adverse reactions that are relatively rare or cause symptoms you may not be readily familiar with. Some reactions are potentially lethal from the onset; others can become lethal if they progress.

### Acute pancreatitis

Inflammation of the pancreas

**Signs and symptoms:** sudden onset of epigastric pain, nausea, and vomiting

### Acute respiratory distress syndrome (ARDS)

Respiratory insufficiency in which abnormal permeability of the alveolar-capillary membrane causes fluid to fill the alveoli, disrupting gas exchange

**Signs and symptoms:** dyspnea, tachypnea, and progressive hypoxemia despite oxygen therapy; pulmonary edema

### Adrenal suppression

Condition marked by inhibition of one or more of the enzymes essential to adrenocortical hormone production

**Signs and symptoms:** weakness, fatigue, abdominal pain, appetite and weight loss, dizziness, orthostatic hypotension, increased skin pigmentation

### Adynamic ileus

Intestinal obstruction caused by a reduction in intestinal motility

**Signs and symptoms:** nausea, vomiting, decreased or absent bowel sounds, abdominal distention

### Agranulocytopenia

Acute condition caused by deficiencies of neutrophils, basophils, and eosinophils in the blood

**Signs and symptoms:** chills, fever, headache, malaise, weakness, fatigue

### Alkalosis

Increase in blood alkalinity caused by buildup of alkalis or reduction of acids

**Signs and symptoms:** in metabolic alkalosis—apathy, confusion, stupor (when severe); in respiratory alkalosis—air hunger, muscle twitching, numbness or tingling of extremities or circumoral area

### Amyloidosis

Metabolic disorder caused by deposition of protein-containing fibrils in tissues, which may attack the heart and blood vessels, brain, kidneys, liver, spleen, intestines, or endocrine glands

**Signs and symptoms:** vary with area of invasion

### Anaphylactoid shock

Hypersensitivity reaction marked by acute airway obstruction and vascular collapse within minutes of exposure to an antigen

**Signs and symptoms:** edema, rash, tachycardia, hypotension, respiratory distress, seizures, unconsciousness

### Anaphylaxis

Hypersensitivity reaction to an antigen to which the patient has been previously sensitized, causing sudden release of immunologic mediators either locally or throughout the body

**Signs and symptoms:** urticaria, angioedema, flushing, wheezing, dyspnea, increased mucus production, nausea, vomiting

(continued)

**Angioedema**

Vascular reaction involving deep dermal, submucosal, or subcutaneous tissues in which capillaries become dilated and more permeable; also called angioneurotic edema

**Signs and symptoms:** edema of skin, mucous membranes, and internal organs; urticaria; giant wheals; respiratory distress

**Autoimmune phenomena**

Immunologic responses, such as serum sickness, lupus, vasculitis, and hepatitis, associated with development of antibodies (as to a particular drug)

**Signs and symptoms:** possibly none; or signs and symptoms specific to the particular autoimmune condition

**Bone marrow depression**

Disruption of healthy blood cell development in the bone marrow (including red and white blood cells and platelets), which impairs or weakens the body's defense against pathogenic organisms, toxins, and irritants

**Signs and symptoms:** increased susceptibility to infection, fever, weakness

**Cardiac tamponade**

Condition marked by increased cardiac pressure, which inhibits filling of the heart chambers during diastole

**Signs and symptoms:** chest pain, weak peripheral pulses, distended neck veins, dyspnea, orthopnea, diaphoresis, anxiety, restlessness, pallor

**Cardiomyopathy**

Any disease or disorder of the heart that impairs normal cardiac performance

**Signs and symptoms:** shortness of breath, orthopnea, fatigue, chest pain, syncope

**Cardiotoxicity**

The quality of being poisonous or harmful to the heart (as with certain drugs)

**Signs and symptoms:** variable cardiac-related symptoms

**Cardiovascular collapse**

Sudden loss of effective blood flow to body tissues

**Signs and symptoms:** hypotension, vasovagal syncope, cardiogenic shock, cardiac arrest

**Cerebral ischemia**

Temporary lack of arterial or circulatory blood flow to the brain, possibly causing localized tissue death

**Signs and symptoms:** persistent focal neurologic deficit in the area of distribution of the involved cerebral artery

**Chemical arachnoiditis**

Inflammation of the arachnoid (middle) layer of the meninges of the brain and spinal cord in response to exposure to a toxic substance

**Signs and symptoms:** mild nausea or vomiting, headache, fever, neck or back pain and stiffness

**Cholesterol embolism**

Sudden obstruction of a blood vessel by cholesterol-containing plaques

**Signs and symptoms:** hypotension, sudden shortness of breath, weak pulse, cyanosis, chest pain, decreased level of consciousness

***Clostridium difficile*–associated diarrhea**

Antibiotic-associated diarrhea caused by *Clostridium difficile*, a spore-forming, gram-positive, anaerobic bacillus that produces two exotoxins: toxin A and toxin B

**Signs and symptoms:** watery diarrhea, fever, loss of appetite, nausea, abdominal pain, abdominal tenderness, colon perforation, sepsis, and death (rarely)

**Identifying life-threatening adverse reactions (continued)****Disseminated intravascular coagulation**

Disorder marked by abnormal activation of coagulation factors in the blood, causing hemostasis, thrombosis, and possibly, organ damage

**Signs and symptoms:** bleeding (possibly from multiple sites), hematomas, thrombosis, petechiae, ecchymosis, cutaneous oozing

**Disulfiram-like reaction**

Acute, unpleasant reaction to alcohol ingestion in a patient taking disulfiram (Antabuse) for alcohol aversion therapy

**Signs and symptoms:** flushing, dyspnea, headache, nausea, copious vomiting, blood pressure fluctuations

**Drug rash with eosinophilia and systemic symptoms (DRESS)**

Rare, severe adverse reaction presenting as generalized rash, marked eosinophilia, fever, and dysfunction of one or more organ systems, including liver failure

**Signs and symptoms:** generalized rash, fever, and internal organ involvement weeks to months, reportedly, after starting such drugs as sulfonamides, phenobarbital, sulfasalazine, carbamazepine, phenytoin, and possibly celecoxib and ethambutol

**Encephalopathy**

Generalized dysfunction of the brain

**Signs and symptoms:** impaired speech, orientation, or cognition; sluggish reaction to stimuli

**Eosinophilic pneumonitis**

Infiltration of pulmonary alveoli by large numbers of eosinophils and mononuclear cells, causing inflammation

**Signs and symptoms:** dyspnea, cough, fever, night sweats, pulmonary edema, weight loss

**Epileptiform seizures**

Sudden, uncontrolled electrical discharge from the cerebral cortex caused by epilepsy

**Signs and symptoms:** variable; may include a cry, a fall, unconsciousness, overt seizure, amnesia, or incontinence

**Erythema multiforme**

Hypersensitivity reaction of the skin and mucous membranes; may take a severe multisystemic form

**Signs and symptoms:** rash, macules, papules, or blisters on the face, palms, and extremities

**Fanconi syndrome**

Congenital form of anemia caused by excessive amino acids in the blood secondary to renal tubular failure

**Signs and symptoms:** polyuria; growth impairment; soft, flexible, brittle bones

**Granulocytopenia**

Abnormal reduction in the number of granulocytes in the blood

**Signs and symptoms:** increased susceptibility to infection

**Heart block**

Interference with the normal electrical impulses of the heart, classified by the level of impairment that results (first-, second-, or third-degree block)

**Signs and symptoms:** prolonged PR interval, widened QRS interval, and delayed or dropped beats on ECG; other symptoms vary with the degree of heart block and may include dizziness, syncope, shortness of breath, fatigue, and orthostatic hypotension

**Hepatomegaly**

Liver enlargement

**Signs and symptoms:** possibly none; or abdominal distention, abdominal pain, and constipation

(continued)

**Hepatotoxicity**

Liver inflammation caused by exposure to a toxin or a toxic amount of a substance in the body

**Signs and symptoms:** jaundice, fatigue, weakness, altered mental status

**Hyperkalemia**

A condition marked by an excessive amount of potassium in the blood

**Signs and symptoms:** possibly none; with severe hyperkalemia—muscle weakness, arrhythmias

**Hypertensive crisis**

Severe blood pressure elevation, usually defined as diastolic pressure higher than 130 mmHg

**Signs and symptoms:** severe headache, dizziness, light-headedness

**Hypertonia**

Excessive tension or pressure within a muscle or an artery

**Signs and symptoms:** muscle pain and spasms

**Hypervolemia**

Abnormal increase in volume of circulating body fluid

**Signs and symptoms:** weight gain, peripheral edema, ascites, dyspnea, pulmonary edema, paroxysmal nocturnal dyspnea

**Immune reconstitution syndrome**

Enhanced immunologic response, especially during the initial phase of combination antiretroviral treatment, when patients whose immune systems respond may develop an inflammatory response to indolent or residual opportunistic infections (such as *Mycobacterium avium* infection, cytomegalovirus, *Pneumocystis jiroveci* pneumonia, or tuberculosis).

**Signs and symptoms:** possibly nonspecific, including new or worsening fever, persistent or cyclic fever, new pleural effusions, new or worsening lymphadenopathy, fatigue, weakness, night sweats, anorexia, weight loss, chronic diarrhea, abdominal pain, and vulnerability to infection

**Impaired myocardial contractility**

Decreased contractile ability of the middle layer of the heart muscle wall

**Signs and symptoms:** shortness of breath, chest pain, edema

**Increased intracranial pressure**

Increased pressure within the brain, as from increased cerebrospinal fluid pressure or a brain lesion or swelling; also called intracranial hypertension

**Signs and symptoms:** in infants—bulging fontanel, separated sutures, lethargy, vomiting; in older children and adults—lethargy, vomiting, headache, behavior changes, seizures, neurologic deficits, progressive decrease in level of consciousness

**Interstitial pneumonia**

Chronic, noninfectious inflammation of the pulmonary alveolar walls

**Signs and symptoms:** shortness of breath, either with activity or at rest

**Ischemic colitis**

Inflammation of the colon caused by lack of blood supply to mesenteric arteries of the small intestine

**Signs and symptoms:** abdominal pain, weight loss

**Lactic acidosis**

Accumulation of lactic acid in the blood caused by reduced oxygenation and perfusion to tissues, muscles, and major organs

**Signs and symptoms:** muscle pain, fatigue, hyperventilation, nausea, vomiting, dizziness, light-headedness

## Identifying life-threatening adverse reactions (continued)

### Leukocytosis

Abnormal increase in the number of white blood cells (leukocytes) in the blood

**Signs and symptoms:** fever, hemorrhage

### Leukopenia

Abnormal reduction (below 5,000 cells/mm<sup>3</sup>) in circulating white blood cells, as from drug-induced impairment of blood cell production

**Signs and symptoms:** infection, fever, stomatitis, sinusitis

### Lupuslike syndrome

A syndrome similar to systemic lupus erythematosus that occurs in response to drug therapy and resolves when the drug is withdrawn

**Signs and symptoms:** fever; red, scaly, macular skin rash; joint inflammation

### Lupus nephritis

Kidney inflammation associated with systemic lupus erythematosus (SLE), marked by deposition of antigen-antibody complexes in the mesangium and basement membrane

**Signs and symptoms:** hypertension, peripheral edema, proteinuria, renal failure, cardiac decompensation, other symptoms of active SLE (such as fatigue, fever, rash, arthritis, CNS disease)

### Megaloblastic anemia

Anemia marked by production and proliferation of megaloblasts (large immature red blood cells) in the bone marrow or circulation

**Signs and symptoms:** weakness, fatigue, light-headedness, headache, rapid pulse, breathlessness

### Metabolic acidosis

Increase in blood acidity caused by buildup of acids or loss of bicarbonate

**Signs and symptoms:** lethargy, drowsiness, headache, diminished muscle tone and reflexes, hyperventilation,

arrhythmias, nausea, vomiting, diarrhea, abdominal pain

### Methemoglobinemia

Condition in which a portion of the iron component of hemoglobin has been oxidized to the ferric state, making it incapable of transporting oxygen

**Signs and symptoms:** cyanosis, dizziness, drowsiness, headache

### Neoplasm

Abnormal growth of new tissue, such as a tumor

**Signs and symptoms:** vary with tumor site

### Nephrotoxicity

The quality of causing damage to the kidney (as from a drug); usually leads to increased permeability to proteins, which results in edema and hypoalbuminemia

**Signs and symptoms:** proteinuria, hematuria, fluid retention

### Neuroleptic malignant syndrome

Reaction to a drug that alters the brain's dopamine level or to withdrawal of a drug that increases the dopamine level

**Signs and symptoms:** sweating, altered mental status, seizures, renal failure

### Neutropenia

Abnormal decrease in the level of neutrophils in the blood (usually below 1,500 per  $\mu\text{L}$ )

**Signs and symptoms:** infection, fever, mouth and throat sores

### Osmotic nephrosis

Disruption of osmotic pressure in the kidney's renal tubule

**Signs and symptoms:** fluid retention, edema

### Pancytopenia

Deficiency of all cellular elements of the blood, including red blood cells, white blood cells, and platelets

**Signs and symptoms:** bleeding from the nose and gums, easy bruising, fatigue, shortness of breath

(continued)

**Papilledema**

Swelling and inflammation of the optic nerve

**Signs and symptoms:** severe headache, visual disturbances, blindness

**Pericardial effusion**

Escape of fluid from blood vessels into the pericardium

**Signs and symptoms:** hypotension, tachycardia, muffled heart sounds, decreased breath sounds, distended jugular vein, pulsus paradoxus, widened pulse pressure, weak peripheral pulses, pericardial friction rub, tachypnea, edema, cyanosis

**Pseudomembranous colitis**

Condition in which an inflammatory exudate forms on epithelial tissues of the colon

**Signs and symptoms:** diarrhea with blood and mucus, abdominal cramps

**Pseudotumor cerebri**

Benign intracranial hypertension without evidence of a brain tumor

**Signs and symptoms:** headache, papilledema, elevated cerebrospinal fluid pressure

**Pulmonary toxicity**

The quality of causing damage to the lungs and alveoli (as from certain drugs)

**Signs and symptoms:** any respiratory sign or symptom

**Renal acidosis**

Acidosis caused by accumulation of phosphoric and sulfuric acids in the body, which the kidneys fail to excrete

**Signs and symptoms:** appetite loss, altered level of consciousness, altered respiratory rate or effort

**Renal failure**

Condition marked by a serum creatinine increase of 25% or more, which impairs the kidney's ability to excrete wastes, concentrate urine, and conserve electrolytes

**Signs and symptoms:** dehydration, fluid overload, altered neurologic status, appetite loss, weight gain, bleeding

**Respiratory acidosis**

Acidosis resulting from accumulation and retention of carbon dioxide in the lungs

**Signs and symptoms:** dyspnea, diaphoresis, tremors, decreased reflexes, decreased level of consciousness

**Rhabdomyolysis**

Acute disorder in which byproducts of skeletal muscle destruction accumulate in the renal tubules, causing renal failure

**Signs and symptoms:** See "Hyperkalemia" and "Metabolic acidosis."

**Salicylate toxicity**

Toxic condition caused by overdose of a salicylate, such as aspirin or an aspirin derivative

**Signs and symptoms:** rapid breathing, irritability, headache, vomiting, and (if extreme) seizures and respiratory failure

**Sarcoidosis**

Multisystemic disease that causes granulomatous lesions of organs or tissues throughout the body

**Signs and symptoms:** fatigue, weight loss, shortness of breath, anorexia, skin lesions, cough, skeletal changes (in later stages)

**Sepsis**

Systemic inflammatory response caused by pathogenic microorganisms or their toxins

**Signs and symptoms:** tachycardia, fever, rapid breathing, hypothermia, evidence of reduced blood flow to major organs

**Serum sickness**

Hypersensitivity reaction to administration of a nonprotein drug

**Signs and symptoms:** fever, rash, joint pain, edema, lymphadenopathy

**Steatosis**

Fatty liver degeneration

**Signs and symptoms:** possibly none; or right upper abdominal quadrant pain, abdominal discomfort, fatigue, malaise

---

**Identifying life-threatening adverse reactions (continued)**

---

**Stevens-Johnson syndrome**

Severe allergic reaction marked by severe skin and mucous membrane lesions, most often in response to a drug

**Signs and symptoms:** respiratory tract infection, fever, sore throat, chills, headache, malaise, vomiting, diarrhea, tachycardia, hypotension, corneal ulcers, conjunctivitis, epistaxis, dysuria, erosive vulvovaginitis, balanitis, seizures, altered level of consciousness, coma

**Syndrome of inappropriate anti-diuretic hormone secretion**

Metabolic disturbance marked by an increase in antidiuretic hormone, which causes a decrease in serum sodium concentration

**Signs and symptoms:** weakness, fatigue, malaise, headache, altered mental status, lethargy, irritability, delirium, psychosis, personality changes, anorexia, nausea, vomiting, thirst, abdominal and muscle cramps

**Tardive dyskinesia**

Disorder marked by slow, rhythmic involuntary movements of the face, limbs, and torso in patients who have received long-term dopaminergic antagonist therapy

**Signs and symptoms:** involuntary, repetitive facial grimacing and twisting; tongue protrusion; lip puckering and smacking; chewing or sucking motions; involuntary, snakelike writhing movements (such as wiggling or twisting); excessive blinking; involuntary flexion and extension movements of the fingers and hands

**Tetany**

Hyperexcitability of nerves and muscles caused by a decrease in extracellular calcium

**Signs and symptoms:** muscle twitching, cramps, sharp flexion of wrist and ankle joints, seizures

**Thrombocytopenia**

Abnormal decrease in the number of platelets caused by destruction of erythroid tissue in the bone marrow

**Signs and symptoms:** purpura, ecchymosis, petechiae, internal hemorrhage, hematuria, abdominal distention, melena

**Torsade de pointes**

Rapid form of ventricular tachycardia that appears as twisting or shifting QRS complexes on the ECG

**Signs and symptoms:** pallor, diaphoresis, rapid pulse, low or normal blood pressure, transient or prolonged loss of consciousness

**Toxic epidermal necrolysis**

Exfoliative skin condition that represents a severe cutaneous reaction (as to a drug, infection, or chemical exposure)

**Signs and symptoms:** scalded appearance of the skin, skin erosion and redness

**Tumor lysis syndrome**

Complication that usually follows chemotherapy treatment of myelolymphoproliferative diseases in which a metabolic derangement produced by rapid tumor breakdown is a consequence of therapy

**Signs and symptoms:** possibly no symptoms in early stages, but progression of the syndrome may lead to cardiac arrhythmias, shortness of breath, hyperkalemia, hyperuricemia, hyperphosphatemia, hypocalcemia, impaired mental ability, and renal failure

---

## Potentially inappropriate drugs for elderly patients

Drug-drug interactions can have potentially life-threatening consequences in older adults, who often take several drugs at once for multiple diseases. Elderly patients are more susceptible to drug interactions than younger patients because of the physiologic changes associated with aging and the sheer number of drugs older patients are taking. Beers criteria, developed by Dr. Mark Beers, originally published in the *Archives of Internal Medicine* in 1991, with updated articles in 1997, 2003, 2007, and again in 2012, identified several drugs that adults ages 65 and older should avoid. This list (although not inclusive) is based on those criteria. Also refer to the manufacturer's complete package insert.

Generic drug or class	Brand names
alprazolam	Niravam, Xanax, Xanax X
amiodarone hydrochloride	Cordarone, Pacerone
amitriptyline hydrochloride	
aripiprazole	Abilify
asenapine	Saphris
aspirin > 325 mg/day	
barbiturates (except phenobarbital for seizure control)	Butisol Sodium, Luminal Sodium, Mebaral, Nembutal Sodium, Seconal Sodium
benztropine (oral)	Cogentin
brompheniramine	Bromfenac, Dimetapp Allergy, Lodrane 24, LoHist 12, Nasahist B, ND-Stat, TanaCof-XR, Vazol
carisoprodol	Soma
chlordiazepoxide hydrochloride	
chlorpheniramine maleate	Ahist, Aller-Chlor, Chlorphen, Chlor-Trimeton, CPM-12, Diabetic Tussin Allergy Relief, QDALL AR, Teldrin HBP
chlorpromazine	
chlorpropamide	Diabinese
chlorzoxazone	Parafon Forte DSC
clonazepam	Klonopin
clomipramine	
clonidine	Catapres-TTS
clonidine hydrochloride	Catapres
clorazepate	Tranxene

## Potentially inappropriate drugs for elderly patients (continued)

clozapine	Clozaril
cyclobenzaprine hydrochloride	Amrix, Fexmid, Flexeril
cyproheptadine hydrochloride	
dexchlorpheniramine	
diazepam	Valium
diclofenac potassium	Cambia, Cataflam, Zipsor
diclofenac sodium	Pennsaid, Voltaren, Voltaren XR
dicyclomine	Bentyl
diflunisal	
digoxin	Digitek, Lanoxin (> 0.125 mg/day)
diphenhydramine hydrochloride (oral)	Aler-Cap, Aler-Dryl, Aler-Tab, AllerMax, Altaryl, Banophen, Benadryl, Compoz, Diphen, Diphenhist, Genahist, Hydramine, Nytol, Siladryl, Silphen, Simply Sleep, Sleep-ettes D, Sleepinal, Somnex, Twilite, Unisom
dipyridamole (oral, short-acting)	Persantine
disopyramide	Norpace, Norpace CR
dofetilide	
doxazosin mesylate	Cardura, Cardura XR
doxepin hydrochloride (> 6 mg/day)	
dronedarone	Multaq
ergot mesyloids	
estrogens (with or without progestins)	Premarin, Premarin Intravenous
eszopiclone	Lunesta
etodolac	
ferrous sulfate (> 325 mg/day)	Feosol, Feratab, Fer-Gen-Sol, Fer-In-Sol, Fer-Iron, Slow FE
flecainide	Tambacor
fluphenazine	
fluoxetine hydrochloride (daily)	Prozac, Sarafem, Selfemra
glyburide	DiaBeta, Glynase PresTab
growth hormone	
haloperidol	

(continued)

hydroxyzine	Atarax, Vistaril
hyoscyamine sulfate	Levsin
ibuprofen	Advil, Advil Migraine, Advil Pediatric Drops, Caldolor, Children's Advil, Children's Motrin, Junior Strength Advil, Junior Strength Motrin, Motrin, Motrin IB, Motrin Infant
ibutilide	Corvert
iloperidone	Fanapt
imipramine	Tofranil
indomethacin	Indocin, Indocin SR
insulin, sliding scale	
isoxsuprine	
ketoprofen	
ketorolac tromethamine (includes parenteral)	
lorazepam	Ativan
loxapine succinate	
megestrol	Megace, Megace ES
meloxicam	
meperidine hydrochloride	Demerol
metaxalone	Skelaxin
methocarbamol	Robaxin
methyl dopa	
metoclopramide hydrochloride	Reglan
mineral oil	
nabumetone	
nifedipine (short-acting)	Procardia
nitrofurantion	Furadantin, Macrobid, Macrochantin
non-COX-selective NSAIDs (long-term use of full dose):	
naproxen	Aleve, Anaprox, Naprosyn
oxaprozin	Daypro
piroxicam	Feldene
olanzapine	Zyprexa
oxaprozin	Daypro
oxazepam	
paliperidone	Invega
pentazocine	Talwin

(continued)

## Potentially inappropriate drugs for elderly patients (continued)

perphenazine	
procainamide hydrochloride	
promethazine hydrochloride	Phenadoz, Phenergan, Promethagan
propafenone hydrochloride	Rythmol
quetiapine	Seroquel, Seroquel XR
quinidine	
risperidone	Risperdal, Risperdal Consta, Risperdal M-Tab
scopolamine	
sotalol hydrochloride	Betapace, Sorine
spironolactone (> 25 mg/ day)	Aldactone
temazepam	Restoril
terazosin	Hytrin
thyroid, desiccated	Armour Thyroid, Nature-Throid, Westhroid
ticlopidine hydrochloride	Ticlid
triazolam	Halcion
trifluoperazine	
trihexyphenidyl hydrochloride	
trimethobenzamide hydrochloride	Tigan
zaleplon	Sonata
ziprasidone	Geodon
zolpidem	Ambien, Ambien CR

Source: Potentially inappropriate drugs for the elderly (Beers List). *MPR*. [www.empr.com/potentially-inappropriate-drugs-for-the-elderly-beers-list/article/125908/](http://www.empr.com/potentially-inappropriate-drugs-for-the-elderly-beers-list/article/125908/).

## Hazardous drugs

The drugs listed below have been designated as hazardous by the National Institute for Occupational Safety and Health, Centers for Disease Control and Prevention, and/or the American Society of Health-System Pharmacists. The list doesn't include all hazardous drugs. The agents listed here meet one or more of the following criteria: carcinogenicity, teratogenicity or other developmental toxicity, reproductive toxicity, organ toxicity at low doses, genotoxicity, or structure and toxicity profiles that mimic existing drugs determined to be hazardous by the above criteria. All health care workers handling these drugs must follow appropriate precautions along with recommendations included in the manufacturer's complete package insert.

acitretin	dacarbazine
aldesleukin	dactinomycin
alitretinoin	dasatinib
altretamine	daunorubicin HCl
amsacrine	degarelix
anastrozole	denileukin
arsenic trioxide	diethylstilbestrol
asparaginase	dinoprostone
azacitidine	docetaxel
azathioprine	doxorubicin
bacillus Calmette-Guerin vaccine	dronedarone HCl
bendamustine hydrochloride	dutasteride
bexarotene	entecavir
bicalutamide	epirubicin
bleomycin	ergonovine/methylegonovine
bortezomib	estradiol
bosentan	estramustine phosphate sodium
busulfan	estrogen-progestin combinations
capecitabine	estrogens, conjugated
carbamazepine	estrogens, esterified
carboplatin	estrone
carmustine	estropipate
cetorelix acetate	etoposide
chlorambucil	everolimus
chloramphenicol	exemestane
choriogonadotropin alfa	finasteride
cidofovir	floxuridine
cisplatin	fludarabine
cladribine	fluorouracil
clofarabine	fluoxymerone
clonazepam	flutamide
colchicine	fulvestrant
cyclophosphamide	ganciclovir
cyclosporine	ganirelix acetate
cytarabine	gemcitabine

(continued)

gemtuzumab ozogamicin	podofilox
gonadotropin, chorionic	podophyllum resin
goserelin	procarbazine
hydroxyurea	progesterone
idarubicin	progestins
ifosfamide	raloxifene
imatinib mesylate	rasagiline mesylate
irinotecan HCl	ribavirin
leflunomide	risperidone
lenalidomide	sirolimus
letrozole	sorafenib
leuprolide acetate	streptozocin
lomustine	sunitinib malate
mechlorethamine	tacrolimus
medroxyprogesterone	tamoxifen
megestrol	televancin
melphalan	temozolomide
menotropins	teniposide
mercaptopurine	testolactone
methotrexate	testosterone
methyltestosterone	tetracycline HCl
mifepristone	thalidomide
mitomycin	thioguanine
mitotane	thiotepa
mitoxantrone HCl	topotecan
mycophenolate mofetil	toremifene citrate
nafarelin	tretinoin
nelarabine	trifluridine
nilotinib	triptorelin
nilutamide	uracil mustard
oxaliplatin	valganciclovir
oxcarbazepine	valproic acid/divalproex sodium
oxytocin	valrubicin
paclitaxel	vidarabine
palifermin	vinblastine sulfate
paroxetine	vincristine sulfate
pegaspargase	vindesine
pemetrexed	vinorelbine tartrate
pentamidine isethionate	zidovudine
pentostatin	ziprasidone HCl
pipobroman	zoledronic acid
piritrexim isethionate	zonisamide

---

## Drugs that prolong the QT interval

The drugs listed below are known to possibly cause QT-interval prolongation; and there is some evidence to show that when used as directed in labeling, these drugs can cause torsades de pointes. Other drugs or substances not listed here may also cause this problem, and the list doesn't include several drugs that have been withdrawn from the market in the United States. Monitor patients closely when administering drugs associated (some more than others) with QT-interval prolongation.

Generic name	Brand name
alfuzosin	—
amantadine hydrochloride	—
atazanavir	Reyataz
clozapine	Clozaril
dolasetron mesylate	Anzemet
dronedarone	Multaq
eribulin	Halaven
escitalopram	Lexapro
famotidine	Pepcid
fingolimod	Gilenya
flecainide acetate	Tambacor
foscarnet	—
fosphenytoin sodium	Cerebyx
gemifloxacin mesylate	Factive
granisetron hydrochloride	Granisol, Kytril, Sancuso
iloperidone	Fanapt
indapamide	Lozol
isradipine	DynaCirc CR
lapatinib	Tykerb
levofloxacin	Iquix, Levaquin, Quixin
lithium carbonate	Lithane, Lithobid
lithium citrate	—
mirtazapine	Remeron
moexipril and hydrochlorothiazide	Uniretic
nicardipine hydrochloride	Cardene, Cardene IV, Cardene SR
nilotinib	Tasigna
octreotide acetate	Sandostatin, Sandostatin LAR

(continued)

## 1448 Appendix K: Drugs that prolong the QT interval

---

<b>Generic name</b>	<b>Brand name</b>
ofloxacin	Floxin, Ocuflox
ondansetron hydrochloride	Zofran, Zofran ODT, Zofran Preservative Free
oxytocin	Pitocin
paliperidone	Invega
pentamidine isethionate	NebuPent, Pentam
quetiapine fumarate	Seroquel, Seroquel XR
ranolazine	Ranexa
risperidone	Risperdal, Risperdal Consta, Risperdal M-Tab
sunitinib maleate	Sutent
tacrolimus	Prograf, Protopic
tamoxifen citrate	Nolvadex, Soltamox, Tamofen
telithromycin	Ketek
ildenafil hydrochloride	Levitra
venlafaxine hydrochloride	Effexor, Effexor XR
voriconazole	Vfend
ziprasidone hydrochloride	Geodon

## Most commonly used drugs in nursing specialties

Nurses are often required to float to units in which they're not accustomed to working, where they might have to administer unfamiliar drugs. If you know ahead of time which drugs are most commonly used in the various nursing specialties, you'll be able to increase your confidence—and reduce the chance of making a drug error. The table below shows the 10 most commonly used drugs in nine nursing specialties.

Specialty	Top 10 drugs
Critical care nursing	amiodarone hydrochloride diltiazem hydrochloride dopamine hydrochloride epinephrine hydrochloride furosemide insulin lorazepam morphine sulfate nitroglycerin propofol
Emergency care nursing	acetaminophen aspirin diltiazem hydrochloride diphtheria and tetanus toxoids famotidine ibuprofen ketorolac levofloxacin metoclopramide nitroglycerin
Home care nursing	acetaminophen acetaminophen/oxycodone acetaminophen/propoxyphene napsylate digoxin diltiazem hydrochloride docusate sodium furosemide metformin hydrochloride potassium chloride warfarin
Long-term care nursing	carbidopa/levodopa digoxin docusate sodium donepezil hydrochloride enalapril maleate furosemide metoprolol tartrate mirtazapine pantoprazole sodium potassium chloride
Medical-surgical nursing	diltiazem hydrochloride furosemide

(continued)

Specialty	Top 10 drugs
Medical-surgical nursing (continued)	heparin sodium insulin levofloxacin lisinopril metformin metoprolol tartrate morphine sulfate simvastatin
Obstetric nursing	acetaminophen/codeine acetaminophen/oxycodone dinoprostone ibuprofen magnesium sulfate nalbuphine hydrochloride oxytocin penicillin promethazine hydrochloride terbutaline sulfate
Pediatric nursing	albuterol amoxicillin/clavulanate potassium amoxicillin trihydrate azithromycin co-trimoxazole fluticasone propionate gentamicin sulfate ibuprofen methylphenidate hydrochloride montelukast sodium
Post-anesthesia care nursing	bupivacaine hydrochloride fentanyl citrate hydromorphone hydrochloride lidocaine hydrochloride lorazepam meperidine hydrochloride metoclopramide hydrochloride midazolam hydrochloride morphine sulfate ondansetron hydrochloride
Psychiatric nursing	bupropion hydrochloride carbamazepine divalproex sodium escitalopram oxalate fluoxetine hydrochloride lithium carbonate olanzapine risperidone sertraline hydrochloride venlafaxine hydrochloride

## Top 200 most commonly prescribed drugs

The table below lists the top 200 drugs ranked by the number of prescriptions sold in the United States in 2011.

1. Lipitor	37. Enoxaparin
2. Plavix	38. Geodon
3. Nexium	39. Zetia
4. Abilify	40. Tricor
5. Advair Diskus	41. Vyvanse
6. Seroquel	42. Suboxone
7. Singulair	43. Lidoderm
8. Crestor	44. Procrit
9. Cymbalta	45. Eloxatin
10. Humira	46. Niaspan
11. Enbrel	47. Provigil
12. Remicade	48. Aranesp
13. Actos	49. Androgel
14. Neulasta	50. Combivent
15. Rituxan	51. Lovenox
16. Zyprexa	52. Rebif
17. Copaxone	53. Vytorin
18. Lexapro	54. Nasonex
19. OxyContin	55. Viagra
20. Epogen	56. Symbicort
21. Avastin	57. Seroquel XR
22. Atripla	58. Alimta
23. Spiriva Handihaler	59. Novolog
24. Januvia	60. Lovaza
25. Lantus	61. Humalog
26. Truvada	62. Adderall XR
27. Diovan	63. Neupogen
28. Lyrica	64. Flovent HFA
29. Celebrex	65. Proair HFA
30. Lucentis	66. Reyataz
31. Herceptin	67. Aciphex
32. Diovan HCT	68. Concerta
33. Avonex	69. Budesonide
34. Lantus Solostar	70. Levemir
35. Gleevec	71. Incivek
36. Namenda	72. Varivax

*(continued)*

---

73. Prevnar	114. Dexilant
74. Lunesta	115. Trilipix
75. Cialis	116. Focalin XR
76. Solodyn	117. Avodart
77. Novolog Flexpen	118. Xolair
78. Isentress	119. Strattera
79. Levaquin	120. Byetta
80. Janumet	121. Humalog Kwipken
81. Methylphenidate ER	122. Pegasys Convenience Pack
82. Synagis	123. Gammagard Liquid
83. Venlafaxine	124. Prograf
84. Restasis	125. Treanda
85. Zyvox	126. Risperdal Consta
86. Betaseron	127. Colcrys
87. Evista	128. Norvir
88. Erbitux	129. Premarin
89. Benicar	130. Nuvaring
90. Velcade	131. Xopenex
91. Zometa	132. Travatan
92. Synthroid	133. Epzicom
93. Vesicare	134. Aloxi
94. Xeloda	135. Amphetamine Salts ER
95. Detrol LA	136. Fentanyl
96. Opana ER	137. Actos Plus Met
97. Orencia	138. Aggrenox
98. Prezista	139. Viread
99. Ventolin HFA	140. Metoprolol succinate
100. Benicar HCT	141. Forteo
101. Cubicin	142. Avapro
102. Boniva	143. Mirena
103. Sandostatin LAR	144. Victoza 3-Pak
104. Actonel	145. Zosyn
105. Sensipar	146. Exelon
106. Amphetamine Salts ER	147. Privilen
107. Asacol	148. Revlimid
108. Loestrin 24 FE	149. Lexiscan
109. Tarceva	150. Stelara
110. Pradaxa	151. Adacel
111. Renvela	152. Ortho-Tri-Cyclen Lo 28
112. Gamunex-C	153. Welchol
113. Pristiq	154. Angiomax

---

155. Gardasil	178. Nutropin AQ
156. Lumigan	179. Fluticasone Propionate
157. Pulmozyme	180. Avelox
158. Invega	181. Yervoy
159. Reclast	182. Exforge
160. Temodar	183. Onglyza
161. Xifaxan	184. Abraxane
162. Atorvastatin Calcium	185. Hydrocodone/APAP
163. NovoSeven RT	186. Synvisc-One
164. Bystolic	187. Zyprexa Zydis
165. Invega	188. Bupropion HCL XL
166. Lialda	189. QVAR
167. Gilenya	190. NovoLog Flexpen Mix
168. Pneumovax	191. Maxalt MLT
169. Effexor	192. Zemplar
170. Kaletra	193. Docetaxel
171. Zostavax	194. Vancocin
172. Metoprolol Succinate	195. Lamictal
173. Taxotere	196. Menactra
174. Tysabri	197. Vidaza
175. Donepezil HCL	198. Valcyte
176. Chantix	199. Omnipaque
177. Xgeva	200. Ranexa

## Current drug shortages

In recent years, drug shortages in the United States have reached critical levels, adversely affecting drug therapy, delaying medical procedures and treatment, and contributing to medication errors. Shortages primarily affect older, sterile, injectable drugs, such as analgesics, sedatives and chemotherapeutics.

Despite the U.S. Food and Drug Administration's (FDA) efforts, drug shortages continue for a number of reasons, including a lack of raw materials, patent expirations, manufacturing costs, and manufacturing capacity. When shortages occur, the FDA provides information and helps restore availability.

Nurses should keep informed about current drug shortages and, when appropriate, take an active role in developing their facility's contingency plans. By knowing which drugs are expected to be in short supply and discussing workable alternatives with physicians and pharmacists, nurses can ease the adverse effects of ongoing drug shortages.

This list was last updated December 12, 2012. For more recent information, go to [www.fda.gov/Drugs/DrugSafety/DrugShortages/default.htm](http://www.fda.gov/Drugs/DrugSafety/DrugShortages/default.htm).

### A

Acetylcysteine Inhalation Solution  
 Acyclovir Sodium Injection  
 Alfentanil (Alfenta) Injection  
 Amikacin Injection  
 Amino Acid Products  
 Ammonium Chloride Injection  
 Atracurium besylate  
 Atropine Sulfate Injection

### B

Bacteriostatic 0.9% Sodium Chloride  
 Barium Sulfate for Suspension  
 Bismuth subsalicylate/tetracycline  
 hydrochloride/metronidazole (Helidac)  
 Bumetanide Injection  
 Bupivacaine Hydrochloride (Marcaine,  
 Sensorcaine) Injection  
 Buprenorphine hydrochloride (Buprenex)  
 Injection  
 Butorphanol (Stadol) Injection

### C

Caffeine, anhydrous (125 mg/ml) and Sodium  
 benzoate (125 mg/ml)  
 Caffeine and Ergotamine Tartrate Tablet  
 Cetorelix Acetate for Injection (Cetrotide)  
 Chloroprocaine (Nesacaine) Injection  
 Chromic Chloride Injection  
 Citric Acid; Gluconolactone; Magnesium Car-  
 bonate Solution (Renacidin); Irrigation  
 Corticorelin Ovine Triflutate

### D

D Daunorubicin Hydrochloride Solution for  
 Injection  
 Denileukin diftitox (Ontak) Injection  
 Desmopressin Injection (DDAVP)  
 Dexrazoxane (Zincard) Injection  
 Dextroamphetamine (Dexedrine) Tablets  
 Dextrose Injection  
 Diazepam Injection  
 Dipyridamole Injection  
 Doxorubicin (Adriamycin) lyophilized powder  
 Doxorubicin Liposomal (Doxil) Injection

### E

Edetate Calcium Disodium (Calcium Disodium  
 Versenate) Injection  
 Epinephrine Injection  
 Epinephrine 1 mg/ml (Preservative Free)  
 Erythromycin Lactobionate Injection  
 Ethiodol (ETHIODIZED OIL) ampules  
 Etomidate (Amidate) Injection

### F

Fentanyl Citrate (Sublimaze) Injection  
 Fluticasone Propionate and Salmeterol (Advair  
 HFA) Inhalation Powder  
 Foscarnet Sodium (Foscavir) Injection  
 Fosphenytoin Sodium (Cerebyx) Injection  
 Fospropofol disodium (Lusedra) Injection  
 Furosemide Injection

### G

Gallium Nitrate (Ganite) Injection

**H**

Heparin Sodium Premixes  
Hydromorphone Hydrochloride (Dilaudid) Injection

**I**

Ibandronate sodium (Boniva) Injection  
Intravenous Fat Emulsion  
Isoniazid Tablets

**K**

Ketorolac Tromethamine Injection

**L**

Leucovorin Calcium Lyophilized Powder for Injection  
Leuprolide Acetate Injection  
Lidocaine (Xylocaine) Hydrochloride Injection  
Lidocaine Hydrochloride, 4% Topical Solution (Laryng-O-Jet, LTA kit)  
Liotrix (Thyrolar) Tablets  
Lorazepam (Ativan) Injection

**M**

Magnesium Sulfate Injection  
Mannitol (Osmitol, Resectisol) Injection  
Methadone Injection  
Methazolamide (Glauctabs, Neptazane) Tablets  
Methotrexate Injection  
Methoxsalen (Oxsoalene) 1% topical lotion  
Methyldopate Hydrochloride Injection  
Metoclopramide (Reglan) Injection  
Midazolam Hydrochloride (Versed) Injection  
Mitomycin Powder for Injection  
Morphine Sulfate Injection  
Morphine Sulfate (Astramorph PF, Duramorph, Infumorph) Injection (Preservative Free)  
Multi-Vitamin Infusion (Adult and pediatric)

**N**

Nalbuphine Hydrochloride (Nubain) Injection  
Naloxone (Narcan) Injection  
Naltrexone (Revia) Oral Tablets  
Nefazodone (Serzone) Tablets  
Nitroglycerin Ointment USP, 2% (Nitro-Bid)  
Norethindrone and Ethinyl Estradiol Tablets, USP (Ovcon 50 Tablets)

**O**

Ondansetron (Zofran) Injection 2 mg/ml  
Ondansetron Injection 32 mg/50 ml premixed  
Oxymorphone Hydrochloride (Opana) Tablet

**P**

Pancuronium Bromide Injection

Peginterferon Alfa-2a (Pegasys) Injection, Pre-filled Syringes

Pentamidine isethionate inhalant (NebuPent)  
Pentamidine isethionate for injection (Pentam 300)

Pentostatin for Injection (Nipent)  
Perflutren Lipid Microsphere (DEFINITY) Injection  
Phentolamine Mesylate (Regitine) Injection  
Pilocarpine Hydrochloride Ophthalmic Gel 4% (Pilopine HS)

Potassium Chloride Injection 2 mEq/ml  
Potassium Phosphate Injection  
Procainamide Hydrochloride Injection  
Prochlorperazine Injection  
Promethazine Injection  
Propofol (Diprivan) Injection

**S**

Secretin Synthetic Human (ChiRhoStim) Injection  
Selenium Injection  
Sodium Acetate Injection  
Sodium benzoate and Sodium phenylacetate (Ammonul) Injection  
Sodium Bicarbonate Injection  
Sodium Chloride 0.9% (5.8 ml and 20 ml)  
Sodium Chloride 23.4%  
Succinylcholine (Anectine, Quelicin) Injection  
Sufentanil Citrate (Sufenta) Injection  
Sulfamethoxazole 80 mg/trimethoprim 160 mg/ml Injection (SMX/TMP) (Bactrim)

**T**

Technetium Tc 99m Biscitate for Injection  
Technetium Tc 99m Sestamibi Kit for Injection  
Telavancin (Vibativ) Injection  
Tetracycline Capsules  
Thiotepa (Thioplex) for Injection  
Thyrotropin alfa (Thyrogen) Injection  
Ticarcillin disodium/Clavulanic Potassium Injection (Timentin)  
Ticlopidine (Ticlid) Tablets  
Tobramycin Solution for Injection  
Tromethamine (Tham) Injection

**V**

Viaspan Cold Storage Solution 1000 ml Bag  
Vinblastine Sulfate Injection  
Vitamin A Palmitate (Aquisol A) Injection  
Vitamin K1 (Phytonadione) Injectable Emulsion

**Z**

Zinc Chloride Injection

- Heart failure  
 acetazolamide for, 13  
 candesartan for, 195  
 captopril for, 198  
 carvedilol for, 212  
 chlorthalidone for, 260  
 digoxin for, 370  
 dobutamine for, 382  
 dopamine for, 389  
 enalapril for, 420  
 eplerenone for, 433  
 foscarnil for, 541  
 hydrochlorothiazide for, 589  
 indapamide for, 628  
 lisinopril for, 724  
 metolazone for, 794  
 metoprolol for, 796  
 milrinone for, 811  
 nesiritide for, 865  
 nitroglycerin for, 883  
 quinapril for, 1068  
 ramipril for, 1082  
 spironolactone for, 1167  
 torsemide for, 1255  
 trandolapril for, 1260  
 valsartan for, 1292
- Heart transplant rejection, preventing  
 cyclosporine for, 312  
 muromonab-CD3 for, 834  
 mycophenolate for, 836  
 tacrolimus for, 1184
- Heart transplantation, valganciclovir for, 1286
- Heartburn. *See also* Acid indigestion  
 bismuth for, 152  
 cimetidine for, 267  
 famotidine for, 487  
 lansoprazole for, 682  
 nizatidine for, 887  
 omeprazole for, 911
- Heartburn Relief, 911
- Heat cramps, sodium chloride for, 1155
- Hectorol, 1382
- Hedex Ibuprofen, 609
- Helicobacter pylori* infection  
 clarithromycin for, 278  
 rabeprazole for, 1077  
 tetracycline for, 1215
- Helidac, 1420
- Hematologic disorders  
 betamethasone for, 144  
 hydrocortisone for, 594  
 methylprednisolone for, 789  
 prednisolone for, 1030
- Hematopoietic agents, 1366–1367
- Hemodialysis, sodium chloride for, 1155
- Hemodynamic imbalance, dopamine for, 389
- Hemofil M, 89
- Hemophilia  
 antihemophilic factor for, 89  
 coagulation factor VIIa (recombinant) for, 296  
 desmopressin for, 347  
 factor IX for, 484
- Hemorrhage, antihemophilic factor for, 89
- Hemorrhagic cystitis, mesna for, 766
- Hemorrhagic disease of newborn, phytonadione for, 1385
- Hep-Lock, 586
- Hep-Lock U/P, 586
- Hepalean, 586
- heparin cofactor 1, 90–91
- Heparin Leo, 586
- Heparin overdose, managing, **S35**
- heparin sodium, 586–588
- Hepatic encephalopathy, neomycin for, 862
- Hepatic encephalopathy, reduction of risk  
 rifaximin for, 1101

## 1482 Hepatitis A immunization schedule

---

- Hepatitis A immunization schedule  
for adolescents, 1425t  
for adults, 1423t  
for children, 1424t
- Hepatitis A virus infection, immune globulin for, 625
- Hepatitis B immunization schedule  
for adolescents, 1425t  
for adults, 1423t  
for children, 1424t
- Hepatitis B virus infection  
adefovir for, 30  
entecavir for, 427  
interferon alfa-2b for, 643  
lamivudine for, 675  
peginterferon alfa-2a for, 963  
tenofovir for, 1205
- Hepatitis C virus infection  
boceprevir for, 158  
interferon alfa-2b for, 643  
interferon alfacon-1 for, 646  
peginterferon alfa-2a for, 962, 963  
peginterferon alfa-2b for, 965  
ribavirin for, 1094
- Hepatocellular carcinoma, sorafenib for, 1163
- Hepatomegaly, 1436
- Hepatotoxicity, 1437
- Hepsal, 586
- Hepsera, 30
- Heptovir, 674
- Herbs and supplements, 1390–1404
- Herceptin, 1261
- Herpes labialis  
acyclovir for, 26  
famciclovir for, 485  
valacyclovir for, 1285
- Herpes simplex virus infection  
acyclovir for, 26  
famciclovir for, 485
- Herpes zoster immunization schedule  
for adults, 1423t
- Herpes zoster infection  
acyclovir for, 26  
famciclovir for, 485  
valacyclovir for, 1285
- Hexit Lotion, 712
- Hexit Shampoo 1, 712
- Hi-Cor, 593
- Hiccups, chlorpromazine for, 258
- High-alert drugs, xix
- High-altitude sickness, acetazolamide for, 15
- Hipfix, 484
- Histac, 1084
- Histamine<sub>2</sub>-receptor antagonists, 1355
- Histantil, 1049
- Histapryn, 377
- Histergan, 377
- Histiocytosis X, vinblastine for, 1304
- Histoplasmosis  
amphotericin B for, 74  
itraconazole for, 664  
ketoconazole for, 667
- Hives, desloratadine for, 346
- Hizentra, 625
- HMG-CoA reductase inhibitors, 1344–1345
- Hodgkin's disease  
bleomycin for, 156  
brentuximab vedotin for, 166  
carmustine for, 208  
chlorambucil for, 251  
cyclophosphamide for, 309  
dacarbazine for, 318  
doxorubicin for, 399  
lomustine for, 728  
procarbazine for, 1043  
vinblastine for, 1304
- Hold DM, 358
- Home care nursing, most commonly used drugs in, 1449
- Homozygous sitosterolemia  
ezetimibe for, 482
- Horizant, 549
- Hormonal antineoplastics, 1348–1351
- Humalog, 636
- Humalog Mix 50/50, 636
- Humalog Mix 75/25, 636
- Humalog Pen, 636
- Human erythropoietins, 1366–1367
- Human immunodeficiency virus infection  
abacavir for, 3  
atazanavir for, 106  
cidofovir for, 265  
darunavir for, 327  
delavirdine for, 340  
didanosine for, 368  
efavirenz for, 415  
emtricitabine for, 418  
enfuvirtide for, 422  
etravirine for, 471  
fosamprenavir for, 538  
ganciclovir for, 553  
immune globulin for, 627  
indinavir for, 629  
lamivudine for, 675  
nelfinavir for, 859  
nevirapine for, 866  
raltegravir for, 1079  
rifabutin for, 1096  
ritonavir for, 1109  
saquinavir for, 1128  
stavudine for, 1169  
tenofovir for, 1205  
tipranavir for, 1237  
zidovudine for, 1318
- Human papillomavirus immunization schedule  
for adults, 1423t
- Humatrope, 1160
- Humira, 28
- Humulin 70/30, 636, 1420
- Humulin 70/30 PenFill, 636
- Humulin N, 636
- Humulin R, 636
- Humulin-R Regular U-500 (concentrate), 636
- Hycamtin, 1253
- Hycodan, 591, 1420
- Hycort, 593
- Hydatidiform mole  
methotrexate for  
dinoprostone for, 376
- Hydatidiform mole,  
methotrexate for, 777
- hydralazine hydrochloride, 588–589
- Hydramine, 377
- Hydration, sodium chloride for, 1155
- Hydrea, 599
- Hydro-Crysti-12, 1381
- Hydro-Par, 589
- Hydrocet, 591, 1420
- hydrochlorothiazide, 589–591
- Hydrocil Instant, 1059

- hydrocodone bitartrate and acetaminophen, 591–593
- hydrocodone bitartrate and aspirin, 591–593
- hydrocodone bitartrate and homatropine methylybromide, 591–593
- hydrocodone bitartrate and ibuprofen, 591–593
- hydrocortisone, 593–596
- hydrocortisone acetate, 593–596
- hydrocortisone butyrate, 593–596
- hydrocortisone sodium succinate, 593–596
- hydrocortisone valerate, 593–596
- Hydrocotisab, 593
- Hydromorph Contin, 596
- Hydromorph-IR, 596
- hydromorphone  
hydrochloride, 596–598  
therapeutic and toxic blood levels for, **S20**
- hydroxocobalamin crystalline, 1381
- hydroxychloroquine sulfate, 598–599
- hydroxyurea, 599–601
- hydroxyzine hydrochloride, 601–602
- hydroxyzine pamoate, 601–602
- Hygroton, 260
- hyoscine, 1133–1135
- hyoscine hydrobromide, 1133–1135
- hyoscyamine, 602–604
- hyoscyamine sulfate, 602–604
- Hyospaz, 602
- Hyperacidity, aluminum hydroxide for, 53
- Hyperactivity, haloperidol for, 584
- Hyperadrenocorticism  
potassium acetate for, 1013  
potassium chloride for, 1016
- Hypercalcemia  
calcitonin for, 189  
cinacalcet for, 269  
etidronate for, 464
- hydrocortisone for, 594  
pamidronate for, 945  
zoledronic acid for, 1322
- Hypercalcemic emergency, managing, **S35**
- Hypercholesterolemia  
atorvastatin for, 114  
cholestyramine for, 263  
colesevelam for, 301  
colestipol for, 302  
ezetimibe for, 482  
fenofibrate for, 491  
fluvastatin for, 530  
lovastatin for, 736  
pravastatin for, 1028  
rosuvastatin for, 1122  
simvastatin for, 1145
- Hyper eosinophilic syndrome/chronic eosinophilic leukemia, imatinib for, 619
- Hyperglycemia  
mifepristone for, 805
- Hyperhidrosis  
onabotulinumtoxinA for, 914
- Hyperkalemia, 1437  
sodium polystyrene sulfonate for, 1158
- Hyperlipidemia  
cholestyramine for, 263  
ezetimibe for, 482  
fenofibric acid for, 493  
gemfibrozil for, 558  
niacin for, 1383  
pitavastatin for, 1009  
rosuvastatin for, 1121  
simvastatin for, 1145
- Hyperosmolar diabetes, sodium chloride for, 1155
- Hyperparathyroidism  
cinacalcet for, 268  
doxercalciferol for, 1382  
paricalcitol for, 1384
- Hyperphosphatemia, calcium for, 191
- Hyperpigmentation, tretinoin for, 1269
- Hyperprolactinemia, bromocriptine for, 169
- Hypersecretory conditions  
atropine for, 116  
cimetidine for, 267  
esomeprazole for, 451
- famotidine for, 487  
hyoscyamine for, 603  
lansoprazole for, 682  
omeprazole for, 911  
pantoprazole for, 949  
rabeprazole for, 1076  
ranitidine for, 1084, 1085
- Hypersensitivity reaction  
brompheniramine for, 171  
epinephrine for, 428  
promethazine for, 1050
- Hypertension  
aliskiren for, 42  
amlodipine for, 69  
atenolol for, 110  
azilsartan medoxomil for, 128  
benazepril for, 139  
bisoprolol for, 153  
bosentan for, 165  
bumetanide for, 175  
candesartan for, 194  
captopril for, 198  
carteolol for, 210  
carvedilol for, 211  
chlorthalidone for, 260  
clonidine for, 288  
diltiazem for, 372  
doxazosin for, 394  
enalapril for, 420  
eplerenone for, 433  
eprosartan for, 437  
esmolol for, 449  
felodipine for, 489  
fosinopril for, 541  
gemfibrozil for, 547  
guanfacine for, 581  
hydralazine for, 588  
hydrochlorothiazide for, 589  
indapamide for, 628  
irbesartan for, 652  
isradipine for, 663  
labetalol for, 671  
lisinopril for, 724  
losartan for, 734  
methyldopa for, 781  
metolazone for, 794  
metoprolol for, 795  
minoxidil for, 814  
moexipril for, 824  
nadolol for, 842  
neбиволol for, 854  
nicardipine for, 868  
nifedipine for, 873  
nisoldipine for, 879  
nitroglycerin for, 883

- Hypertension (*Cont.*):  
 olmesartan for, 907  
 perindopril for, 986  
 phentolamine, 995  
 propranolol for, 1054  
 quinapril for, 1068  
 ramipril for, 1082  
 sildenafil for, 1141  
 spironolactone for, 1167  
 tadalafil for, 1187  
 telmisartan for, 1198  
 terazosin for, 1207  
 timolol for, 1232  
 torsemide for, 1255  
 trandolapril for, 1260  
 valsartan for, 1292  
 verapamil for, 1301
- Hypertensive crisis, 1437  
 labetalol for, 671  
 nitroprusside for, 885
- Hyperthyroidism  
 methimazole for, 773  
 propylthiouracil for, 1057  
 sodium iodide 1311 for, 1156
- Hypertonia, 1437
- Hypertriglyceridemia  
 fenofibrate for, 491  
 fenofibric acid for, 493  
 lovastatin for, 736  
 omega-3-acid ethyl esters for, 910  
 pravastatin for, 1028  
 rosuvastatin for, 1121
- Hypertrophic subaortic stenosis, propranolol for, 1054
- Hyperuricemia  
 febuxostat for, 488  
 probenecid for, 1040  
 rasburicase for, 1090
- Hypervolemia, 1437
- Hypnotic effect, phenobarbital for, 993
- Hypnovel, 801
- Hypocalcemic emergency, calcium for, 191
- Hypocalcemic tetany, calcium for, 191
- Hypochloremia, sodium chloride for, 1155
- Hypogammaglobulinemia, immune globulin for, 626
- Hypoglycemia  
 dextrose for, 359  
 glucagon for, 571
- Hypoglycemics, 1339–1340
- Hypogonadism  
 estradiol for, 453  
 estrogens, conjugated for, 455  
 estrogens, esterified for, 457  
 testosterone for, 1212
- Hypokalemia, spironolactone for, 1167
- Hypolar Retard, 872
- Hypomagnesemia, magnesium for, 743
- Hyponatremia, sodium chloride for, 1155
- Hypoprothrombinemia, phytonadione for, 1384
- Hypotension  
 dopamine for, 389  
 nitroprusside for, 885  
 norepinephrine for, 891  
 phenylephrine for, 997
- Hypotensive emergency, phenylephrine for, 997
- Hypothyroidism  
 levothyroxine for, 707  
 liothyronine for, 716  
 liotrix for, 718  
 thyroid, desiccated for, 1223, 1224
- Hytone, 593
- Hytrin, 1206
