## Common abbreviations

The abbreviations below are commonly used by nurses. Not all of them, however, are acceptable. Those in red marked with a Clinical Alert logo  were identified as contributing to medication errors in the National Patient Safety Goals of the Joint Commission and by the Institute for Safe Medication Practices. To avoid mistakes and to ensure Joint Commission compliance, spell out the entire term.

 @	at	cm	centimeter
ABG	arterial blood gas	CMV	cytomegalovirus
a.c.	before meals	CNS	central nervous system
ACE	angiotensin-converting enzyme	COPD	chronic obstructive pulmonary disease
ACLS	advanced cardiac life support	CR	controlled release
ACTH	adrenocorticotropic hormone	CV	cardiovascular
 AD	right ear	CVA	cerebrovascular accident
ADH	antidiuretic hormone	CYP	cytochrome
ADLs	activities of daily living	D <sub>5</sub> W	dextrose 5% in water
AICD	automatic implantable cardiac defibrillator	DIC	disseminated intravascular coagulation
AIDS	acquired immunodeficiency syndrome	 D/C	discharge, discontinue
ALP	alkaline phosphatase	dl	deciliter
ALT	alanine aminotransferase	DNA	deoxyribonucleic acid
APTT	activated partial thromboplastin time	ECG	electrocardiogram
 AS	left ear	EEG	electroencephalogram
AST	aspartate aminotransferase	EENT	eyes, ears, nose, and throat
 AU	each ear	F	Fahrenheit
AV	atrioventricular	FDA	Food and Drug Administration
B <sub>1</sub>	beta <sub>1</sub>	g	gram
B <sub>2</sub>	beta <sub>2</sub>	G	gauge
BCLS	basic cardiac life support	GABA	gamma-aminobutyric acid
b.i.d.	twice daily	GFR	glomerular filtration rate
BSA	body surface area	GI	gastrointestinal
 B.T.	bedtime	GnRH	gonadotropin-releasing hormone
BUN	blood urea nitrogen	gr	grain
̄	with	gtt	drops
C	Celsius	G6PD	glucose-6-phosphate dehydrogenase
cAMP	cyclic 3', 5' adenosine monophosphate	GU	genitourinary
CBC	complete blood count	H <sub>1</sub>	histamine <sub>1</sub>
 cc	cubic centimeter	H <sub>2</sub>	histamine <sub>2</sub>
CI	cardiac index	HCL	hydrochloride
CK	creatin kinase	HCT	hematocrit
		HDL	high-density lipoprotein
		Hg	mercury

 Clinical alert. Do not use.

Hgb	hemoglobin	🔊 O.D.	right eye
HIT	heparin-induced thrombocytopenia	🔊 OJ	orange juice
HIV	human immunodeficiency virus	🔊 O.S.	left eye
HMG-CoA	3-hydroxy-3-methylglutaryl coenzyme A	OTC	over the counter
HR	heart rate	🔊 O.U.	each eye
🔊 h.s.	at bedtime	oz	ounce
🔊 H.S.	half-strength	p.c.	after meals
🔊 I.J.	injection	PCA	patient-controlled analgesia
I.M.	intramuscular	per	through, by
🔊 I.N.	intranasal	P.O.	by mouth
INR	International Normalized Ratio	P.R.	by rectum
IPPB	intermittent positive-pressure breathing	p.r.n.	as needed
🔊 IU	international unit	PT	prothrombin time
I.V.	intravenous	PTT	partial thromboplastin time
K	potassium	PVC	premature ventricular contraction
kg	kilogram	q	every
KVO	keep vein open	🔊 Q.D.	every day
L	liter	🔊 q.h.s.	at bedtime
LD	lactate dehydrogenase	q.i.d.	four times daily
LDL	low-density lipoprotein	🔊 Q.O.D.	every other day
LMW	low-molecular-weight	RBC	red blood cell
m	meter	RDA	recommended dietary allowance
m <sup>2</sup>	square meters	RNA	ribonucleic acid
🔊 µg	microgram	RSV	respiratory syncytial virus
MAO	monoamine oxidase	SA	sinoatrial
mcg	microgram	🔊 S.C.	subcutaneous
MDI	metered-dose inhaler	SI	International System of Units
mEq	milliequivalent	SIADH	syndrome of inappropriate antidiuretic hormone secretion
mg	milligram	S.L.	sublingual
🔊 MgSO <sub>4</sub>	magnesium sulfate	🔊 S.Q.	subcutaneous
ml	milliliter	SSRI	selective serotonin reuptake inhibitor
mm	millimeter	T <sub>3</sub>	triiodothyronine
mm <sup>3</sup>	cubic millimeters	T <sub>4</sub>	thyroxine
mm Hg	millimeters of mercury	TCA	tricyclic antidepressant
mmol	millimole	t.i.d.	three times daily
🔊 MS	morphine sulfate	🔊 T.I.W.	three times a week
🔊 MSO <sub>4</sub>	morphine sulfate	tRNA	transfer ribonucleic acid
Na	sodium	tsp	teaspoon
NA	not applicable	🔊 U	unit
NaCl	sodium chloride	USP	United States Pharmacopeia
ng	nanogram	VMA	vanillylmandelic acid
NG	nasogastric	WBC	white blood cell
N.P.O.	nothing by mouth		
NSAID	nonsteroidal anti-inflammatory drug

### **Notice**

Medicine is an ever-changing science. As new research and clinical experience broaden our knowledge, changes in treatment and drug therapy are required. The authors and the publisher of this work have checked with sources believed to be reliable in their efforts to provide information that is complete and generally in accord with the standards accepted at the time of publication. However, in view of the possibility of human error or changes in medical sciences, neither the authors nor the publisher nor any other party who has been involved in the preparation or publication of this work warrants that the information contained herein is in every respect accurate or complete, and they disclaim all responsibility for any errors or omissions or for the results obtained from use of the information contained in this work. Readers are encouraged to confirm the information contained herein with other sources. For example and in particular, readers are advised to check the product information sheet included in the package of each drug they plan to administer to be certain that the information contained in this work is accurate and that changes have not been made in the recommended dose or in the contraindications for administration. This recommendation is of particular importance in connection with new or infrequently used drugs.

## Foreword

---

Errors can and do occur at all phases of the medication delivery process, but more than 60% of them occur during drug administration, which is primarily the responsibility of nurses. That means nurses are the last line of defense against patient harm, and have a real opportunity to make medication delivery significantly safer.

To prevent errors, nurses must follow current and sanctioned safety guidelines, including the five rights of medication administration. But today nurses are doing more than that. They are spearheading efforts to prevent errors by improving the medication management process, using safety practices associated with fewer medication errors. These safety practices include questioning a patient's medication orders, clarifying unclear orders, reconciling patient medications from admission to discharge, and avoiding interruptions during administration.

Despite the implementation of these error-reduction strategies, protecting patients from medication errors continues to be a formidable task and a daily challenge. Nurses must stay on guard, especially as high-risk drugs appear on the market and are often prescribed for the sickest patients. And many newly approved drugs are being marketed directly to consumers.

To meet these challenges and protect patients, nurses need to use their skills and their smarts, and they need a clear nursing drug guide that focuses on patient safety from cover to cover. Since the first edition, the *McGraw-Hill Nurse's Drug Handbook* has done just that.

This handbook promotes safety by providing detailed administration guidelines and vital information for each drug, including adverse reactions, patient monitoring with a special emphasis on elderly and pediatric patients, patient education, clinical alerts, and Food and Drug Administration Boxed Warnings. Plus, the hallmark of the handbook, the special section called "Safe Drug Administration" (now 36 pages), is packed with invaluable information, such as drug compatibilities, drug names that look or sound alike, Tall Man letters, conversions and calculations, and much more.

In this seventh edition, the "Safe Drug Administration" section has a new feature, Guidelines for Timely Medication Administration, which addresses the most common violation of the five rights, the wrong time. This new feature provides the most current and authoritative guidelines for *defining* the right time for drug administration based on the nature of each prescribed drug and the relevant patient and clinical considerations. Because national regulations now require medication reconciliation to reduce errors and ensure patients understand their medications at discharge, the "Safe Drug Administration" section now also includes an updated algorithm on the steps nurses can take to reconcile patient medications.

Called the safest drug handbook for nurses by its users, this guide will help you meet the ongoing challenge of avoiding medication errors in today's complex clinical environment. With its emphasis on safe, effective drug administration in both the A-to-Z drug monographs and the full-color "Safe Drug Administration" section, the *McGraw-Hill Nurse's Drug Handbook* stands alone in the crowded, look alike, sound alike world of drug guides for nurses.

## About the author

---

Patricia Dwyer Schull has more than 20 years' experience in nursing publishing. She is the editor and author of popular nursing journals, books, websites, and other publications and the President of MedVantage Publishing. She has held executive management positions with the top nursing publishers in the world. Before entering the publishing industry, she practiced as a professional nurse and held nursing positions in direct patient care, staff education, and hospital management. She has a Master of Science degree in Nursing, a Bachelor of Science degree, and a Registered Nurse Diploma in Nursing.

## Preface and user's guide

---

Despite ongoing and carefully considered efforts to curtail medication administration errors, medication errors continue to occur in all areas of health care—errors that affect all patient populations, resulting in increased attention by both health care professionals and consumers. Awareness of errors committed by nurses continues to increase due to numerous reports on their frequency. Consumer awareness of medication errors has also increased due to unfortunate and very publicized events at hospitals across the country, especially several cases of heparin overdose, causing deaths in infants.

The national attention focused on these upsetting events has shed light on the urgent need to develop new strategies to prevent medication errors. In response, many initiatives have been introduced to reduce the number of medication errors, and nurses are spearheading many of these endeavors.

At the same time, pharmaceutical companies continue to create powerful medications whose advanced pharmacologic features offer the promise of faster and more effective cures. Not only are many patients receiving these more powerful drugs but they're also receiving more drugs than ever before. Frequently, these patients are the sickest patients, and the patients most vulnerable to adverse drug reactions, interactions, and the life-threatening consequences of a medication error.

Further, public opinion polls consistently portray nursing as the most trusted profession, and patients look to us for guidance about their medications. Consequently, patient protection and advocacy related to drug therapy have become major challenges for nurses.

With all these challenges, nurses will always have an ongoing need to obtain more knowledge about current and newly approved medications, as well as a duty to use evidence-based best practices when giving drugs. To meet this challenge, you need a current, reliable, and practical source of drug information written especially for nurses.

*McGraw-Hill Nurse's Drug Handbook*, Seventh edition, fits the bill precisely.

From its first edition, this book has focused on safe medication use. With each subsequent edition, we've added new safety-centered components and features to address newly introduced drugs, new uses for existing drugs, new drug concerns, and new evidence about the best medication administration practices. Over the past few years, as studies have shed more light on the causes of medication errors, as new drugs have been introduced, and as postmarketing ADE reports have been collected and analyzed, *McGraw-Hill Nurse's Drug Handbook* has been refined, updated, and augmented accordingly.

### Targeting excellence

The quality, relevance, and success of any book for nurses hinge on whether it meets its audience's needs. To help us refine and update the book for this seventh edition, we took the same approach as with past editions, asking many practicing nurses, student nurses, nursing school deans, nursing executives, and pharmacists to review the previous edition. We also took to heart the valuable comments submitted by nurses who purchased the book. Most importantly, we've continually monitored the literature for pharmacotherapeutic research advances and

innovations and emerging safety concerns.

### Outstanding features

*McGraw Hill Nurse's Drug Handbook, seventh edition* continues to offer the outstanding features of previous editions while introducing new features reflecting recent research, readers' and reviewers' feedback, and the Joint Commission's patient safety goals and other mandates. You'll find alphabetically arranged drug monographs for approximately 1,000 generic drugs and 3,000 trade drugs. The information in these monographs has been reviewed and updated by dozens of practicing nurses and pharmacists, and then edited by our team of clinical and editorial experts. Features of this edition include:

- new monographs for newly approved drugs and certain other medications
- new indications, dosages, off-label uses, and safety warnings for preexisting drugs
- generic and trade-name drugs available in Canada (marked by a maple leaf) and the United Kingdom (UK), which are marked with a special icon (🌿)
- red "Clinical Alert" logos (🚨), which call attention to critical administration and safety considerations (especially for high-alert drugs)
- a scored tablet icon (📄) to instantly guide your eye to the "Indications and dosages" section
- Food and Drug Administration (FDA) boxed warnings in the monographs of all drugs that have such warnings
- special icons in the monographs of every hazardous drug (☠️) or high-alert drug (⊗)
- detailed administration guidelines for each drug, with specific instructions on oral, I.M., I.V., subcutaneous, and other routes when applicable
- life-threatening adverse reactions shown in boldface
- interactions with other drugs, diagnostic tests, foods, herbs and nutritional supplements, and behaviors

- patient monitoring guidelines, including ongoing assessment, follow-up laboratory test results that indicate adverse reactions, and warning signs of an untoward event
- crucial information to consider when giving the drug to elderly or pediatric patients
- drug-altering laboratory values
- an enhanced version of our popular full-color "Safe drug administration" insert, which includes the FDA's list of recommended "tall man" names to distinguish drugs with look-alike or sound-alike names, along with guidelines for managing, preparing, and administering hazardous drugs, and a new algorithm on the steps nurses can take to reconcile patient medications and new sanctioned guidelines for timely administration of scheduled drugs
- updated and new appendices, including one on current drug shortages
- a comprehensive index so you can look up a drug by its generic name, trade name, or indications.

### Drug administration guidelines

From the time a prescriber orders a drug to the time the patient receives it, the process of drug administration may involve anywhere from 80 to 200 individual steps. Missteps can happen at any point in this process—but you can help prevent some of these errors long before the dose is prepared.

### Evidence-based best practices of drug administration

Best practices for preventing and detecting medication errors always starts with patient assessment at the time of admission and should be performed whenever the patient's symptoms change or a new symptom develops. During the initial patient evaluation, review the patient's current drug regimen, obtain drug allergy information, measure

height and weight, and check the diagnosis and other baseline data to help determine the patient's risk of an adverse reaction. Also, make sure you're familiar with the drug's action, expected benefits, adverse reactions, and interaction potential in light of such patient factors as diagnosis and medical condition.

To further gauge your patient's risk of an ADE, ask yourself these questions:

- Is the patient elderly? Advanced age increases the risk of an ADE.
- Is the drug you're administering a high-alert or hazardous one? If so, find out what precautions you can take to reduce the chance of an ADE.
- Is the drug appropriate for the patient's diagnosis? Is it the drug of choice for this diagnosis—or just the prescriber's preference for reasons other than evidence, contraindications to alternative drugs, or a positive outcome?
- Is the patient receiving multiple drugs? Polypharmacy is extremely common, especially among older patients. The addition of each new drug increases the chance of an ADE by 10%. The more daily drugs, daily doses, and different prescribers and pharmacies involved in a patient's regimen, the greater the risk of ADEs.
- Is the patient especially vulnerable to a harmful interaction, such as a drug-drug, drug-food, drug-herb, drug-alcohol, or drug-behavior interaction?
- Has the drug been prescribed based on an altered laboratory value caused by another drug?
- Is the patient a child? Pediatric patients are at increased risk for ADEs. Drug formulations and labeling generally are geared to adults; to administer a drug to a child, you may need to calculate the pediatric dosage or mix the drug in a certain way, which increases the risk of error. Also, a child's body isn't completely developed and thus less able to overcome the effects of an overdose or interaction.

### ***The "five rights" of drug administration***

Nurses are legally responsible for applying and ensuring the "five rights" of drug administration. To help achieve these goals, use the following strategies:

- **Right patient.** Always confirm the patient's identity before administering a drug. Check his ID bracelet and ask him to state his name; then confirm his name, age, and allergies. The Joint Commission requires the use of two identifiers, such as the patient number, his telephone number, or his Social Security number. Ideally, match the ordered treatment to the patient using his name bracelet and ID number, comparing it to the drug order transcribed in the medication administration record (MAR). Be especially cautious if your patient is confused, because he may answer to the wrong name.
- **Right drug.** Giving the wrong drug is the most common type of medication error. It typically results from such factors as look-alike and sound-alike drug names, similar drug labels and packaging, and poor communication. Never try to decipher an illegible drug order, and never give a drug if you're not sure why it was prescribed.

To make sure you give the right drug, match the drug label against the order in the MAR *three times*—once when you remove the container from the patient's drug drawer, again before you remove the dose from the container and, finally, before you return the container to the drawer or discard it. Never give a drug from a container that is unlabeled or has an unreadable label, and never borrow a drug from another patient.

In an effort to reduce "wrong-drug" and other medication errors, many hospitals have adopted newer technologies, such as bar-code point-of-care drug administration systems. When using such a system, keep in mind that it must be monitored regularly for

---

problems and that staff members must receive adequate training in its use.

- **Right dosage.** Check the dosage against the order in the MAR. Determine if it's appropriate based on the patient's age, size, vital signs, and condition. If the dose needs to be measured, use appropriate equipment—for instance, an oral syringe rather than a parenteral syringe to measure an oral liquid drug. Be on the lookout for misinterpretation of orders, incorrect calculation of volumes and infusion rates, misreading of decimal points, and labeling errors.

When administering a drug that can cause serious harm if given incorrectly (such as I.V. insulin or heparin) or when giving an infusion to a pediatric patient, always double-check the dosage and pump settings; then verify these with a colleague.

- **Right time.** The most common violation of the five rights of drug administration is giving a drug at the wrong time. For as long as many nurses can remember, the *right time* has been defined as up to 30 minutes before or after the scheduled administration time. In 2008, the Centers for Medicare & Medicaid Services (CMS) made this 30-minute rule part of their *Regulations and Interpretive Guidance for Hospitals*, which spells out the conditions of participation for receiving Medicare and Medicaid payments. In a 2010 survey by the Institute for Safe Medication Practices (ISMP), nurses described the CMS rule as unsafe, impossible to follow, and largely unnecessary.

The shortcuts and workarounds nurses used in their attempts to comply were eye-opening, and in November of 2011, recognizing the rule was no longer the standard of practice, the CMS removed it. The CMS now requires hospitals to develop their own drug administration policies and

procedures based on established standards of practice and directs hospitals to consider the nature of each prescribed drug and the relevant patient and clinical considerations. In response to this new direction, we have included *Guidelines for Timely Administration of Medication* in the “Safe Drug Administration” insert, page S-8.

- **Right route.** Many drugs can be given by multiple routes. The prescriber chooses the route based on such factors as the patient's condition and the desired onset of action. In turn, the prescribed dosage is based on the administration route. Generally, oral dosages of a given drug are greater than injected dosages, so a serious overdose may occur if a dose intended for oral administration is given by injection instead.

Also, keep in mind that most serious error outcomes occur when the I.V. route is used. (Only a few high-risk drugs, such as warfarin, some chemotherapy drugs, and a few sedatives, are given orally.)

Finally, be aware that some drugs or drug forms (for instance, sustained-release tablets or capsules) should never be crushed. Crushing can alter the dosage delivered, causing the patient to receive a bolus of a drug that's meant to be released slowly over several hours.

### **Additional nursing responsibilities**

Of course, nursing responsibilities don't stop with these five rights. Documentation, monitoring, and patient teaching are also crucial.

After giving the drug, always document that it was administered. Document the dose as soon as it is given—never before. When documenting, use only accepted abbreviations and avoid those that are used rarely or that could be misread or misinterpreted. (See *Avoiding dangerous abbreviations*,

## Avoiding dangerous abbreviations

To help reduce medication errors, all health care team members must use abbreviations correctly. The Joint Commission mandates that health care organizations standardize a list of abbreviations, acronyms, and symbols that should not be used. A minimum required list of prohibited abbreviations, which includes the first five items shown below. The Joint Commission also advises organizations to consider adding the remaining items to their "Do not use" list.

Abbreviation	Potential problem	Solution
U (for "unit")	Mistaken as "0," "4," or "cc"	Write "unit."
IU (for "international unit")	Mistaken as "IV" ("intra-venous") or 10 ("ten")	Write "international unit."
Q.D., Q.O.D. (for "once daily," "every other day")	Mistaken for each other. Period after "Q" may be mistaken for "I"; "O" may be mistaken for "l."	Write "daily" or "every other day."
Trailing zero (X.0 mg) (prohibited only for drug-related notations); lack of leading zero (.X mg)	Decimal point is missed.	Never write a zero by itself after decimal point (X mg); always use a zero before decimal point (0.X mg).
MS MSO <sub>4</sub> MgSO <sub>4</sub>	Confused for one another. May mean "morphine sulfate" or "magnesium sulfate."	Write "morphine sulfate" or "magnesium sulfate."
> (greater than) or < (less than)	Misinterpreted as the number "7" or the letter "L"	Write "greater than" or "less than"
@	Mistaken for the number "2"	Write "at"
µg (for "microgram")	Mistaken for "mg" (milligrams), resulting in 1,000-fold overdose	Write "mcg."
H.S. (for "half-strength" or "at bedtime")	Mistaken for "half-strength" or "hour of sleep" ("at bedtime")	Write "half-strength" or "at bedtime."
q.H.S. (for "at bedtime")	Mistaken for "every hour"	Write "at bedtime."
T.I.W. (for "3 times a week")	Mistaken for "3 times a day" or "twice weekly"	Write "3 times weekly" or "three times weekly."
S.C. or S.Q. (for "subcutaneous")	Mistaken for "S.L." (sublingual) or "5 every"	Write "Sub-Q," "subQ," or "subcutaneously."
D/C (for "discharge")	Misinterpreted as "discontinue"	Write "discharge."
cc (for "cubic centimeters")	Mistaken for "U" (units) if poorly written	Write "ml" for milliliters.

## Understanding pregnancy risk categories

Whenever possible, pregnant women should avoid drug therapy. The risks of taking drugs during pregnancy range from relatively minor fetal defects (such as ear tags or extra digits) to fetal death.

When drug therapy is considered, the drug's benefits to the mother must be weighed against the risk to the fetus. Ideally, the drug should provide clear benefits to the mother without harming the fetus. To help prescribers and pregnant patients assess a drug's risk-to-benefit ratio, the Food and Drug Administration assigns one of five pregnancy risk categories to each drug. In addition, certain drugs are not rated.

**Category A:** No evidence of risk exists. Adequate, well-controlled studies in pregnant women don't show an increased risk of fetal abnormalities during any trimester.

**Category B:** The risk of fetal harm is possible but remote. Animal studies show no fetal risk; however, controlled studies haven't been done in humans. Or animal studies do show a risk to the fetus, but adequate studies in pregnant women haven't shown such a risk.

**Category C:** Fetal risk can't be ruled out. Although animal studies show risks, adequate, well-controlled human studies are lacking. Despite the potential fetal risks, use of the drug may be acceptable because of benefits to the mother.

**Category D:** Positive evidence of fetal risk exists. Nevertheless, potential benefits from the drug may outweigh the risk. For example, the drug may be acceptable in a life-threatening situation or serious disease if safer drugs can't be used or are ineffective.

**Category X:** Contraindicated during pregnancy. Studies in animals or humans or reports of adverse reactions show evidence of fetal risk that clearly outweighs any possible benefit to the patient.

**Category NR:** Not rated.

page xvi, and the inside front cover, *Common abbreviations*.)

If the patient refuses a medication, report this to the prescriber immediately. Then record his refusal on both the MAR and the patient's record; include your initials, full name, and credentials on both records.

During the course of drug therapy, monitor the patient to determine drug efficacy and detect signs and symptoms of an adverse reaction or interaction. Teach the patient the name of the prescribed drug, its dosage, administration route, dosing frequency and times, and duration of therapy. Make sure he knows how to recognize the drug's therapeutic effects, adverse reactions, and interactions with other drugs, foods, herbs, and behaviors.

Be aware that the Joint Commission's 2009 National Patient Safety Goals mandate that health care facilities (and by extension, nurses) implement applicable practices that will improve or bring about the following:

- better communication among caregivers
- creation of a standardized list of abbreviations, symbols, and dose designations *not* to be used
- improved safety of drug use
- verification of all labels both verbally and visually by two qualified individuals, if the person preparing the drug is not the same person who will administer it
- accurate and complete medication reconciliation across the continuum of care
- reduction of the risk of patient harm stemming from falls caused by medications
- active involvement of patients in their own care (including teaching them about their drugs).

## User's guide to McGraw-Hill Nurse's Drug Handbook

This book is organized in three main parts.

### Part 1: A to Z drug monographs

Part 1 presents individual drug monographs in alphabetical order by generic name.

Where applicable, the top banner of the monograph includes an icon or logo denoting that the drug is a high-alert drug (⊗) or a hazardous drug (⊛). As defined by the Institute of Safe Medication Practices, *high-alert* drugs are those that can cause an increased risk of significant patient harm when used in error, and deserve special attention, caution, and safeguards.

Drugs designated as *hazardous* by the National Institute for Occupational Safety and Health, American Society of Health-System Pharmacists, and the Centers for Disease Control and Prevention include cancer chemotherapy agents, some antivirals, certain hormones, some bioengineered drugs, and selected miscellaneous drugs. These agents meet one or more of the following criteria: carcinogenicity, teratogenicity or other developmental toxicity, reproductive toxicity, organ toxicity at low doses, genotoxicity, or structure and toxicity profiles that mimic existing drugs determined to be hazardous by the above criteria. These drugs must be handled within an established safety program (see "Guidelines for preparing, handling, and administering hazardous drugs," in the "Safe drug administration" insert).

Below the banner, each monograph is presented in the following order:

**Generic name.** A drug's generic name is the nonproprietary name, typically assigned by the manufacturer. When more than one therapeutic form of the drug is available, generic names of these forms are listed alphabetically.

## Schedules of controlled substances

The Controlled Substances Act of 1970 regulates the production and distribution of stimulants, narcotics, depressants, hallucinogens, and anabolic steroids. Drugs regulated by this law fall into five categories, or schedules, based on their abuse potential, medicinal value, and harmfulness. Schedule I drugs are the most hazardous; schedule V drugs, the least hazardous.

**Schedule I:** High potential for abuse; no currently accepted medical use in the United States. Using the drug even under medical supervision is thought to be unsafe.

**Schedule II:** High potential for abuse; currently accepted medical use in the United States (or currently accepted medical use with severe restrictions). Abuse may lead to severe psychological or physical dependence. Emergency telephone orders for limited quantities may be authorized, but the prescriber must provide a written, signed prescription order.

**Schedule III:** Lower abuse potential than schedule I and II drugs; currently accepted medical use in the United States. Abuse may lead to a moderate or low degree of physical dependence or high psychological dependence. Telephone orders are permitted.

**Schedule IV:** Lower abuse potential than schedule I, II, or III drugs; currently accepted medical use in the United States. Abuse may lead to limited physical dependence or to psychological dependence. Telephone orders are permitted.

**Schedule V:** Low abuse potential compared to drugs in other schedules; currently accepted medical use in the United States. Abuse may lead to limited physical dependence or to psychological dependence. Some schedule V drugs may be available in limited quantities without a prescription (if state law permits).

## High-alert drugs

Certain drugs expose patients to an increased risk of significant harm when used in error. In 2008, the Institute for Safe Medication Practices (ISMP) updated its list of high-alert drugs based on voluntary medication error reports, harmful medication errors described in the literature, practitioner feedback, and expert reviews. The ISMP has identified both high-alert drug classes (or categories) and specific high-alert drugs.

### High-alert drug classes and categories

- adrenergic agonists, I.V.
- adrenergic antagonists, I.V.
- anesthetic agents, general, inhaled and I.V.
- antiarrhythmics, I.V.
- antithrombotic agents, including anticoagulants, Factor Xa inhibitors, direct thrombin inhibitors, thrombolytics, and glycoprotein IIb/IIIa inhibitors
- cardioplegic solutions
- chemotherapeutic agents
- dextrose (20% or greater)
- dialysis solutions
- epidural and intrathecal drugs
- hypoglycemics, oral
- inotropic drugs, I.V.
- liposomal drug forms
- moderate sedation agents, I.V. (or oral agents for children)
- narcotics and opioids
- neuromuscular blocking agents
- radiocontrast agents, I.V.
- total parenteral nutrition preparations

### Specific high-alert drugs

- epoprostenol
- insulin, subcutaneous and I.V.
- magnesium sulfate injection
- methotrexate, oral nononcologic use
- opium tincture
- oxytocin
- potassium chloride for injection
- potassium phosphates injection
- promethazine, I.V.
- sodium chloride injection
- sodium nitroprusside for injection
- sterile water for injection, inhalation, and irrigation in containers of 100 ml or more
- Vasopressin, I.V. or intraosseous

**Trade names.** A drug's common trade, or brand, name is the proprietary, trademarked name under which it's marketed. Trade-name and generic drugs are therapeutically equivalent in strength, quality, performance, and use; when interchanged, they have the same effects and no differences. However, they may vary in preservatives, color, shape, labeling and, possibly, scoring. In the monographs, trade-name drugs available in Canada are marked with a maple leaf, and those available in the UK are marked with a ⚔ for easy identification.

### Pharmacologic and therapeutic classes.

This section specifies the drug's pharmacologic class (based on its pharmacologic properties and action—for example, sulfonamide or corticosteroid) and therapeutic class (based on approved therapeutic uses of the drug—for instance, antineoplastic or antihypertensive). Many drugs fall into multiple therapeutic classes.

**Pregnancy risk category.** This section lists the category assigned by the FDA to indicate the drug's potential danger to the fetus when taken during

pregnancy. (See *Understanding pregnancy risk categories*, page xvii.)

**Controlled substance schedule.** Narcotics, stimulants, and certain other drugs fall under the Controlled Substances Act. The Drug Enforcement Agency assigns each of these drugs a category, or schedule, based on its abuse potential and other factors. (See *Schedules of controlled substances*, page xviii.) When applicable, this section lists the drug's assigned schedule.

**FDA boxed warning.** The FDA assigns a boxed warning if:

- the drug may cause an adverse reaction so serious (relative to the drug's potential benefit) that prescribers must carefully weigh risk against benefit
- a serious adverse reaction can be prevented or reduced through careful patient selection, rigorous monitoring, avoiding certain concomitant therapy, adding another drug, managing the patient in a specific way, or avoiding use in a specific clinical situation
- the FDA approved the drug with restrictions to assure its safe use because it concluded that the drug can be used safely only if its distribution or use is restricted.

In this book, boxed warnings have been condensed and edited for space reasons. Be sure to review the complete package insert before administering the drug in question.

**Action.** This section summarizes how the drug achieves its therapeutic effect—the action that takes place when it reaches its target site and combines with cellular drug receptors to cause certain physiologic responses. When a drug's action isn't known or when researchers have proposed theories for the action but haven't clarified it definitively, we state this fact.

**Availability.** This section lists the physical forms in which the drug is produced and dispensed, plus available strengths (the amount of active ingredient present) for each form.

**Indications and dosages.** Marked with a red scored tablet icon  for quick identification, this section details the drug's FDA-approved indications for adults, children, infants, and neonates (when appropriate), along with recommended dosages, administration routes, and dosing frequency for each indication. The indications and dosages shown reflect current clinical trends, not unequivocal standards, and must be considered in light of the patient's condition and diagnosis. (Although we've made every effort to ensure the accuracy of all dosages, we urge you to become familiar with the official package insert for each drug you administer.)

**Dosage adjustment.** This section tells which patient groups (such as children or elderly patients), diseases, or disorders (such as renal or hepatic dysfunction) may necessitate dosage adjustment.

**Off-label uses.** Here you'll find a list of off-label (unlabeled or unapproved) uses of the drug, when applicable. Off-label drug use has become increasingly common as clinical research moves ahead of the FDA's approval process. In some cases, off-label use has become the standard of care.

**Contraindications.** This section lists conditions that contraindicate use of the drug, such as preexisting diseases. As a rule, never give a drug to a patient who has a history of hypersensitivity to that drug.

Drugs commonly implicated in hypersensitivity reactions include antibiotics, histamines, iodides, phenothiazines, tranquilizers, anesthetics, diagnostic agents (such as iodinated contrast media), and biologic agents (such as insulin, vaccines, and antitoxins).

**Precautions.** For some patients, a specific drug may pose an increased risk of untoward effects—yet the physician prescribes it because, in his judgment, the potential benefits outweigh the

---

risks. For instance, many drugs can be dangerous for elderly patients, pregnant or breastfeeding women, young children, and patients with renal or hepatic dysfunction. This section tells you which patients to whom you must administer the drug cautiously. Precautions can be especially important if you're administering a high-alert drug. (See *High-alert drugs*, page xix.)

**Administration.** Here you'll find information to help you prepare the drug and administer it correctly and safely, regardless of the route—including whether to give it with or without food, how to mix it for I.V. or I.M. use, and what flow rate to use.

**Route, onset, peak, and duration.** Presented in table form, this section provides a pharmacokinetic profile—onset of action, peak blood level, and duration of action—for each route by which the drug is administered.

**Adverse reactions.** Occurring in roughly 30% of hospital patients, reactions can range from mild to life-threatening. They may arise immediately and suddenly, or take weeks or even months to develop.

Adverse reactions can be especially dangerous if a medication error occurs in a patient who's receiving a high-alert drug. The sickest patients—those in intensive care—typically receive anywhere from 20 to 40 different drugs. These patients are the most vulnerable to adverse reactions, drug interactions, and life-threatening consequences of a medication error. In this section, we list the most commonly reported adverse reactions by body system. Life-threatening reactions appear in **boldface**. **Interactions.** With Americans taking more prescription and nonprescription drugs than ever, you're likely to encounter patients experiencing the effects of drug interactions. Many people also take herbs and nutritional supplements that can interact with drugs to cause dangerous effects or to impede

a drug's intended effect. This section presents documented and clinically significant interactions that may occur if the drug is used concurrently with other drugs, specific foods, and certain herbs or supplements, or if it's combined with certain behaviors (for instance, smoking or alcohol use). It also describes the drug's effects on diagnostic test results, which can be especially important for hospital patients.

**Patient monitoring.** Close patient monitoring is essential during drug therapy (and in some cases, even after therapy ends) to help gauge whether the drug is effective and to detect untoward reactions or interactions. Early detection of troublesome side effects or drug inefficacy allows timely adjustments in therapy and may prevent patient injury or avoid a treatment delay.

To monitor your patient effectively, you must be familiar with the drug you're administering and its intended outcome. You must also determine whether this drug might interact with other drugs that your patient is receiving, and determine whether his medical condition, vital signs, or recent laboratory findings make him more vulnerable to interactions or adverse effects. This section discusses important nursing assessments and interventions to perform, such as monitoring blood drug levels to help determine the correct dosage and to prevent toxicity.

**Patient teaching.** The nurse's responsibility for teaching patients about their care has never been greater. What's more, patients are now demanding more information about their treatment. This section describes key teaching points you should cover with a patient who's receiving the drug, including essential information needed to create a patient teaching plan and protect your patient even after discharge.

### **Part 2: Drug classes, vitamins and minerals, herbs and supplements**

Part 2 presents collective monographs on therapeutic drug classes and abbreviated monographs on vitamins, minerals, herbs, and nutritional supplements. Monographs on therapeutic drug classes familiarize you with the overall attributes of an entire drug class. These monographs also tell you which drugs the prescriber may order if a particular drug in the same class is unsuitable for your patient.

The use of herbal remedies and supplements is soaring—yet many users and health care practitioners are in the dark about these products' adverse effects and potential interactions with prescription and over-the-counter drugs. This section gives basic information that may help your patients use herbs more safely.

### **Part 3: Appendices, references, and index**

Appendices serve as handy references on important drug topics and related issues—everything from normal laboratory values for monitoring and detecting drug levels to the top 200 most commonly prescribed drugs.

This seventh edition of *McGraw-Hill Nurse's Drug Handbook* includes a new appendix on Current Drug Shortages. In recent years, drug shortages in the United States have reached critical levels, adversely affecting drug therapy, delaying medical procedures and treatment, and contributing to medication errors. Nurses should keep informed about current drug shortages. By knowing which drugs are expected to be in short supply and

discussing workable alternatives with physicians and pharmacists, nurses can ease the adverse effects of ongoing drug shortages.

### **Author Acknowledgments**

A project of this scope and intensity demands incredible effort, hard work, and the expertise of a dedicated team. I'm indeed fortunate to work with such a group, the MedVantage Publishing team. I want to thank them all; in particular, Minnie Rose, our clinical manager, whose patience, knowledge, and attention to detail add so much to the success of this project; also Karen Comerford, editorial and copyedit project manager; Joseph John Clark, design manager; and Julia Knipe, administrator and editorial supervisor.

The entire McGraw-Hill team deserve a heartfelt thank you. Their continued support is, as always much appreciated.

I also wish to thank our advisors, contributors, and reviewers for continuing to share their expertise—and their valuable time. A project like this wouldn't be possible without them.

And a most-important thank you to all you wonderful nurses who give unselfishly of yourselves to ensure the best care and protection of your patients. I'm especially grateful to those of you who've written or e-mailed me with kind words. I appreciate your enthusiastic support.

I'm certain *McGraw-Hill Nurse's Drug Handbook* will continue to enhance your practice and help you continue to make drug therapy safer and more effective for your patients.

## abacavir sulfate

Ziagen

**Pharmacologic class:** Carbocyclic nucleoside reverse transcriptase

**Therapeutic class:** Antiretroviral

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug may cause serious and potentially fatal hypersensitivity reactions, including multi-organ syndrome marked by fever, rash, GI distress, malaise, fatigue, achiness, dyspnea, cough, and pharyngitis. Discontinue immediately if you suspect such a reaction. If hypersensitivity can't be ruled out, discontinue permanently, even if other diagnoses are possible.
- After hypersensitivity reaction, never restart drug or other agents containing it, because more severe symptoms (including severe hypotension and death) may arise within hours.

### Action

Converts via intracellular enzymes to active metabolite carbovir triphosphate, which inhibits activity of human immunodeficiency virus-1 (HIV-1) reverse transcriptase. Inhibits viral reproduction by interfering with DNA and RNA synthesis.

### Availability

*Oral solution:* 20 mg/ml

*Tablets:* 300 mg

### Indications and dosages

➤ HIV-1 infection

**Adults:** 300 mg P.O. b.i.d. or 600 mg P.O. daily

**Children ages 3 months to 16 years:** 8 mg/kg P.O. b.i.d., to a maximum dosage of 300 mg b.i.d.

### Contraindications

- Hypersensitivity to drug
- Hepatic disease, lactic acidosis
- Breastfeeding
- Children younger than age 3 months

### Precautions

Use cautiously in:

- impaired renal function, bone marrow suppression
- risk factors for hepatic disease
- elderly patients
- pregnant patients.

### Administration

• Always give in combination with other antiretrovirals.

⚠ Be aware that drug may cause fatal hypersensitivity reactions.

- Give with food if GI upset occurs.

Route	Onset	Peak	Duration
P.O.	Unknown	0.5-1.7 hr	Unknown

### Adverse reactions

**CNS:** headache, weakness, insomnia

**GI:** nausea, vomiting, diarrhea, poor appetite, pancreatitis

**Hematologic:** neutropenia, severe anemia

**Hepatic:** hepatic failure

**Metabolic:** mild hyperglycemia, lactic acidosis

**Skin:** rash, erythema multiforme, toxic epidermal necrolysis

**Other:** body fat redistribution, Stevens-Johnson syndrome, fatal hypersensitivity reaction, immune reconstitution syndrome

### Interactions

**Drug-drug.** *Methadone:* Increased oral methadone clearance

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, creatine phosphokinase, gamma-glutamyltransferase, glucose, triglycerides:* increased levels

## 4 abatacept

**Drug-herbs.** *St. John's wort*: decreased drug blood level and reduced drug effect

**Drug-behaviors.** *Alcohol use*: increased drug half-life and concentration

### Patient monitoring

🔊 Assess for severe lactic acidosis, especially in women and obese patients.

🔊 Evaluate closely for signs and symptoms of hypersensitivity reaction, which can be fatal. These include fever, rash, fatigue, nausea, vomiting, diarrhea, abdominal pain, dyspnea, cough, and pharyngitis.

🔊 Be aware that immune reconstitution syndrome may occur in patients receiving combination antiretroviral therapy. During initial phase of therapy, patient whose immune system responds may develop inflammatory response to indolent or residual opportunistic infections (such as *Mycobacterium avium* complex, cytomegalovirus, *Pneumocystis jiroveci* pneumonia, and tuberculosis), which may necessitate further evaluation and treatment.

🔊 Never restart therapy if patient has experienced a previous hypersensitivity reaction to this drug.

- Check for liver enlargement.
- Monitor CBC, serum electrolytes, and liver and kidney function test results.

### Patient teaching

• Advise patient to take drug with food to minimize GI upset.

• Instruct patient to refrigerate drug but not to freeze it.

🔊 Teach patient how to recognize hypersensitivity reaction. Instruct him to stop taking drug and contact prescriber immediately if signs or symptoms of such a reaction occur.

🔊 Tell patient to contact prescriber if he develops a rash (possible sign of Stevens-Johnson syndrome).

🔊 Instruct patient to immediately report signs and symptoms of immune reconstitution syndrome (such as new signs and symptoms of a previously subclinical infection, worsening or progression of a known infection despite treatment, a new infection or illness, or failure of antiretroviral therapy).

- Inform patient that drug doesn't cure HIV but lowers viral count.
- Instruct patient to obtain medication guide and warning card with each refill.
- Tell patient he'll undergo frequent blood and urine testing during therapy.
- Advise patient to consult prescriber before drinking alcohol or using herbs.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## abatacept

Orencia

**Pharmacologic class:** Selective costimulation modulator

**Therapeutic class:** Antirheumatic

**Pregnancy risk category C**

### Action

Inhibits T-cell activation by binding to CD80 and CD86, blocking interaction with CD28. (This interaction triggers costimulatory signal necessary for full activation of T cells, which are implicated in rheumatoid arthritis pathogenesis.)

### Availability

**Injection:** 125 mg/ml in prefilled syringes

**Powder for infusion (lyophilized):** 250 mg/15 ml in single-use vial

## Indications and dosages

➤ Moderate to severe adult rheumatoid arthritis as monotherapy or concomitantly with disease-modifying antirheumatic drugs other than tumor necrosis factor (TNF) antagonists

**Adults weighing less than 60 kg (132 lb):** 500 mg I.V. given over 30 minutes at weeks 0, 2, and 4; thereafter, give every 4 weeks. Or, 500 mg I.V. as a loading dose followed by 125 mg subcutaneously within a day, followed by 125 mg subcutaneously once weekly. For patients unable to receive an infusion, initiate weekly injections subcutaneously without an I.V. loading dose.

**Adults weighing 60 to 100 kg (132 to 220 lb):** 750 mg I.V. given over 30 minutes at weeks 0, 2, and 4; thereafter, give every 4 weeks. Or 750 mg I.V. as a loading dose followed by 125 mg subcutaneously within a day, followed by 125 mg subcutaneously once weekly. For patients unable to receive an infusion, may initiate weekly injections subcutaneously without an I.V. loading dose.

**Adults weighing more than 100 kg:** 1 g I.V. given over 30 minutes at weeks 0, 2, and 4; thereafter, give every 4 weeks. Or 1 g I.V. as a loading dose followed by 125 mg subcutaneously within a day, followed by 125 mg subcutaneously once weekly. For patients unable to receive an infusion, may initiate weekly injections subcutaneously without an I.V. loading dose.

➤ Moderately to severely active polyarticular juvenile idiopathic arthritis as monotherapy or concomitantly with methotrexate

**Children age 6 and older weighing less than 75 kg:** 10 mg/kg I.V. at weeks 0, 2, and 4; thereafter give every 4 weeks. Not to exceed a maximum dosage of 1 g.

## Contraindications

- Hypersensitivity to drug or its components

## Precautions

Use cautiously in:

- increased risk of infection or history of recurrent infections, immunocompromised state, chronic obstructive pulmonary disease (COPD)
- concurrent use of concomitant TNF antagonists
- patients older than age 65
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

## Administration

 Reconstitute each vial with 10 ml sterile water for injection, using only silicone-free disposable syringe included with product.

 During reconstitution, rotate vial by swirling gently. Avoid prolonged or vigorous agitation. Don't shake.

- Further dilute reconstituted solution to volume of 100 ml with normal saline solution.
- Use silicone-free syringe to add drug to infusion bag or bottle, and mix gently. Resulting drug concentration should be 5 mg/ml for two vials, 7.5 mg/ml for three vials, or 10 mg/ml for four vials, respectively.
- Administer infusion over 30 minutes using infusion set and nonpyrogenic, low protein-binding filter.
- Complete infusion within 24 hours of vial reconstitution.
- Don't infuse other drugs concurrently through same I.V. line.
- Watch for infusion-related reactions (hypotension or hypertension, dyspnea, nausea, dizziness, headache, flushing, urticaria, pruritus, rash, cough, or wheezing), which usually occur within 1 hour of administration. Be prepared to intervene appropriately.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

**Adverse reactions**

**CNS:** headache, dizziness

**CV:** hypertension, hypotension

**EENT:** nasopharyngitis

**GI:** nausea, dyspepsia, diverticulitis

**GU:** urinary tract infection, acute pyelonephritis

**Musculoskeletal:** back pain, extremity pain

**Respiratory:** cough, upper respiratory tract infection, pneumonia, wheezing, bronchitis, dyspnea

**Skin:** rash, flushing, urticaria, pruritus

**Other:** herpes zoster, pain, injection-site reactions, **malignancies**, infusion-related reactions, hypersensitivity reaction

**Interactions**

**Drug-drug.** *Immunizations:* possible decrease in immunization efficacy

**Patient monitoring**

- Continue to monitor patient for infusion-related events.
- Assess patient's overall health at each visit to evaluate infection status.
- Closely monitor COPD patient because of increased likelihood of adverse events.

**Patient teaching**

- If patient will self-administer drug, tell him to follow exact directions for injection and proper disposal of needles and syringes.
- Instruct patient to report signs and symptoms of infection.
- Caution patient to avoid immunizations during or within 3 months of stopping drug.
- Tell female with childbearing potential that pregnancy and breastfeeding aren't recommended during therapy.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

**abciximab**

ReoPro<sup>®</sup>

**Pharmacologic class:** Platelet aggregation inhibitor

**Therapeutic class:** Antithrombotic, antiplatelet drug

**Pregnancy risk category C**

**Action**

Inhibits fibrinogen binding and platelet-platelet interaction by impeding fibrinogen binding to platelet receptor sites, thereby prolonging bleeding time

**Availability**

**Injection:** 2 mg/ml (5-ml vials containing 10 mg)

**Indications and dosages**

➤ Adjunct to aspirin and heparin to prevent acute cardiac ischemic complications in patients undergoing percutaneous coronary intervention (PCI)

**Adults:** 0.25 mg/kg I.V. bolus given 10 to 60 minutes before start of PCI, followed by infusion of 0.125 mcg/kg/minute for 12 hours. Maximum dosage is 10 mcg/minute.

➤ Adjunct to aspirin and heparin in patients with unstable angina who haven't responded to conventional medical therapy and will undergo PCI within 24 hours

**Adults:** 0.25 mg/kg I.V. bolus, followed by 18- to 24-hour infusion of 10 mcg/minute, ending 1 hour after PCI

**Contraindications**

- Hypersensitivity to drug or murine proteins
- Active internal bleeding
- Bleeding diathesis
- Severe, uncontrolled hypertension

- Thrombocytopenia (< 100,000 cells/mm<sup>3</sup>)
- Neutropenia
- Aneurysm
- Arteriovenous malformation
- History of cerebrovascular accident
- Oral anticoagulant therapy within past 7 days (unless prothrombin time is < 1.2 times control)

## Precautions

Use cautiously in:

- patients receiving drugs that affect hemostasis (such as thrombolytics, anticoagulants, or antiplatelet drugs)
- pregnant or breastfeeding patients.

## Administration

- I.V. bolus dose may be given undiluted. For I.V. infusion, further dilute the desired dose with normal saline or D<sub>5</sub>W.
- Give through separate I.V. line with no other drugs.
- Avoid noncompressible I.V. sites, such as subclavian or jugular vein.
-  Stop continuous infusion after failed PCI.
- Restrict patient to bed rest for 6 to 8 hours after drug withdrawal or 4 hours after heparin withdrawal (whichever occurs first).
- After catheter removal, apply pressure to femoral artery for at least 30 minutes.

Route	Onset	Peak	Duration
I.V.	Rapid	30 min	48 hr

## Adverse reactions

**CNS:** dizziness, anxiety, agitation, abnormal thinking, hypoesthesia, difficulty speaking, confusion, weakness, **cerebral ischemia, coma**  
**CV:** pseudoaneurysm, palpitations, vascular disorders, arteriovenous fistula, hypotension, peripheral edema, weak pulse, intermittent claudication, bradycardia, **ventricular or supraventricular tachycardia, atrial fibrillation**

**or flutter, atrioventricular block, nodal arrhythmias, pericardial effusion, embolism, thrombophlebitis**

**EENT:** abnormal or double vision

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, ileus, gastroesophageal reflux, enlarged abdomen, dry mouth

**GU:** urinary tract infection, urine retention or urinary incontinence, painful or frequent urination, abnormal renal function, cystalgia, prostatitis

**Hematologic:** anemia, **leukocytosis, thrombocytopenia, bleeding**

**Metabolic:** diabetes mellitus,

**hyperkalemia**

**Musculoskeletal:** myopathy, myalgia, increased muscle tension, reduced muscle stretching ability

**Respiratory:** pneumonia, crackles, rhonchi, bronchitis, pleurisy, **pleural effusion, bronchospasm, pulmonary edema, pulmonary embolism**

**Skin:** pallor, cellulitis, petechiae, pruritus, bullous eruptions, diaphoresis

**Other:** abscess, peripheral coldness, development of human antichimeric antibodies

## Interactions

**Drug-drug.** *Drugs that affect hemostasis (such as aspirin, dextran, dipyridamole, heparin, nonsteroidal anti-inflammatory drugs, oral anticoagulants, thrombolytics, and ticlopidine):* increased bleeding risk

**Drug-diagnostic tests.** *Activated partial thromboplastin time (APTT), clotting time, prothrombin time (PT):* increased values

*Platelets:* decreased count

## Patient monitoring

• Assess platelet count before, during, and after therapy.

•  Monitor catheter insertion site frequently for bleeding.

•  During catheter insertion and for 6 hours after catheter removal, frequently

monitor digital pulse in leg where catheter was inserted.

- Monitor CBC, PT, APTT, and International Normalized Ratio.
- Minimize arterial or venous punctures, automatic blood pressure cuff use, I.M. injections, nasotracheal or nasogastric intubation, and urinary catheterization.
- Use indwelling venipuncture device, such as heparin lock, to draw blood.

### Patient teaching

- Tell patient what to expect during and after drug administration.
- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
-  Instruct patient to immediately report unusual bleeding or bruising.
- Caution patient to avoid activities that may cause injury. Advise him to use soft toothbrush and electric razor to avoid gum and skin injury.
- Inform patient that he'll undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## abiraterone acetate

Zytiga

**Pharmacologic class:** CYP17 inhibitor

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** X

### Action

Converts from abiraterone acetate in vivo to abiraterone, an androgen biosynthesis inhibitor that inhibits 17 $\alpha$ -hydroxylase/C17,20-lyase (CYP17), an enzyme that's expressed in testicular, adrenal, and prostatic tumor tissues and is required for

androgen biosynthesis, thereby causing androgen-sensitive prostatic carcinoma to respond to such treatment that decreases androgen levels

### Availability

Tablets: 250 mg

### Indications and dosages

 Metastatic castration-resistant prostate cancer in combination with prednisone in patients who have received prior chemotherapy containing docetaxel

**Adults:** 1,000 mg P.O. daily in combination with prednisone 5 mg P.O. b.i.d.

### Dosage adjustment

- Baseline moderate hepatic impairment (Child-Pugh Class B)

### Contraindications

- Pregnancy
- Women of childbearing age

### Precautions

Use cautiously in:

- mild to moderate hepatic disease, mineralocorticoid excess, adrenocortical insufficiency, CV disease
- co-administration of CYP2D6 substrates with a narrow therapeutic index (avoid use or if alternative treatments can't be used, consider a dosage reduction of the concomitant CYP2D6 substrate)
- co-administration of strong inhibitors and inducers of CYP3A4 (avoid or use with caution)
- breastfeeding women
- children (safety and efficacy not established).

### Administration

 Be aware that pregnant women and women of childbearing age shouldn't handle drug without wearing gloves.

- Control hypertension and correct hypokalemia before starting drug.

- Give tablets whole and be aware that patient shouldn't eat for at least 2 hours before drug is administered and for at least 1 hour after drug is administered.

🚫 Don't use in patients with baseline severe hepatic impairment (Child-Pugh Class C).

- Withhold drug in patients who develop hepatotoxicity during treatment until recovery. May restart drug at a reduced dosage.

🚫 Discontinue drug if patient develops severe hepatotoxicity.

- Be aware that safety isn't established in patients with left ventricular ejection fraction less than 50% or New York Heart Association Class III or IV heart failure.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

### Adverse reactions

**CV:** hypertension, arrhythmia, **heart failure**

**GI:** diarrhea, dyspepsia

**GU:** urinary tract infection, urinary frequency, nocturia

**Hepatic:** **hepatotoxicity**

**Metabolic:** hypokalemia, mineralocorticoid excess with fluid retention, adrenocortical insufficiency,

**hyperosmolar coma or death**

**Musculoskeletal:** joint swelling or discomfort, muscle discomfort, fractures, musculoskeletal and connective tissue disorders

**Respiratory:** cough, upper respiratory tract infection

**Other:** fluid retention, edema, hot flushes, chest pain or discomfort

### Interactions

**Drug-drug.** *CYP2D6 substrates with a narrow therapeutic index (such as thioridazine):* increased CYP2D6 substrate  $C_{max}$  and area under the curve (AUC) *CYP3A4 inducers (such as carbamazepine, phenobarbital,*

*phenytoin, rifabutin, rifapentine, rifampin):* unknown effects

*Strong CYP3A4 inhibitors (such as atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, voriconazole):* unknown effects

**Drug-diagnostic tests.** *ALT, AST, triglycerides, total bilirubin):* increased levels

*Potassium:* reduced level

**Drug-food.** *Any food:* increased abiraterone AUC

### Patient monitoring

- Monitor hepatic function tests closely and modify, interrupt, or discontinue dosing as prescribed.
- Monitor blood pressure, serum potassium level, and signs and symptoms of fluid retention at least monthly.
- Monitor patient for signs and symptoms of adrenocortical insufficiency (such as hypoglycemia, hypotension, orthostatic hypotension, dehydration, weight loss, and nausea and vomiting); be aware that increased dosage of corticosteroids may be indicated before, during, and after stressful situations.

### Patient teaching

- Tell patient to swallow tablets whole with water on an empty stomach (don't eat for at least 2 hours before taking drug and for at least 1 hour after taking drug).
- Instruct patient to take drug with prednisone as prescribed and not to interrupt or stop either drug without consulting prescriber.
- Instruct patient to report joint or muscle discomfort, urinary or respiratory tract infection, urinating more frequently or during the night, dizziness on standing, extreme thirst, or weight loss.

 Advise pregnant women and women of childbearing age not to handle drug without wearing gloves.

- Advise male patient of child-producing age to use a condom and another effective contraceptive during therapy if having sex with a woman of childbearing potential.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and food mentioned above.

## acamprosate calcium

Campral

*Pharmacologic class:* Gamma-

aminobutyric acid (GABA) analogue

*Therapeutic class:* Detoxification agent

*Pregnancy risk category C*

### Action

Unclear. May interact with glutamate and GABA neurotransmitter systems centrally, restoring balance between neuronal excitation and inhibition (which is altered by chronic alcoholism).

### Availability

Tablets (*enteric-coated*): 333 mg

### Indications and dosages

➤ To maintain abstinence from alcohol in patients with alcohol dependence who are abstinent when treatment begins

**Adults:** 2 tablets P.O. t.i.d.

### Dosage adjustment

- Moderate renal impairment

### Contraindications

- Hypersensitivity to drug
- Severe renal impairment

### Precautions

Use cautiously in:

- mild to moderate renal impairment
- suicidal ideation or behavior
- elderly patients
- breastfeeding patients
- children.

### Administration

- Give without regard to meals.
- Don't crush or break enteric-coated tablet.
- Know that drug helps maintain alcohol abstinence only when used as part of treatment program that includes counseling and support.

Route	Onset	Peak	Duration
P.O.	Unknown	3-8 hr	Unknown

### Adverse reactions

**CNS:** apathy, confusion, agitation, neurosis, malaise, somnolence, abnormal thinking, vertigo, asthenia, anxiety, depression, dizziness, insomnia, paresthesia, tremor, withdrawal syndrome headache, migraine, abnormal dreams, hallucinations, **seizures**, **suicidal ideation or suicide attempt**  
**CV:** chest pain, palpitations, syncope, hypotension, angina pectoris, varicose veins, phlebitis, peripheral edema, orthostatic hypotension, vasodilation, tachycardia, hypertension, **myocardial infarction**

**EENT:** abnormal vision, amblyopia, hearing loss, tinnitus, rhinitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, flatulence, belching, gastroenteritis, gastritis, esophagitis, hematemesis, dry mouth, anorexia, pancreatitis, **rectal hemorrhage**, **GI hemorrhage**

**GU:** urinary frequency, urinary tract infection, urinary incontinence, erectile dysfunction, increased or decreased libido, metrorrhagia, vaginitis

**Hematologic:** anemia, ecchymosis, eosinophilia, lymphocytosis, **thrombocytopenia**

**Hepatic:** hepatic cirrhosis

**Metabolic:** hyperglycemia, diabetes mellitus, hyperuricemia, gout, avitaminosis

**Musculoskeletal:** joint, muscle, neck, or back pain

**Respiratory:** cough, dyspnea, bronchitis, epistaxis, pneumonia, **asthma**

**Skin:** pruritus, sweating

**Other:** abnormal taste, increased thirst, increased appetite, weight gain or loss, pain, infection, flulike symptoms, chills, abscess, hernia, allergic reaction, accidental or intentional injury, **intentional overdose**

## Interactions

**Drug-drug.** *Naltrexone:* increased acamprosate blood level

**Drug-diagnostic tests.** *Bilirubin, eosinophils, lymphocytes:* increased levels

*Liver function tests:* abnormal results

*Red blood cells:* decreased count

## Patient monitoring

 Monitor patient for depression or expressed suicidal ideation.

- Monitor creatinine clearance during therapy.

## Patient teaching

- Instruct patient to swallow tablet whole, with or without food.
- Advise patient to keep taking drug exactly as prescribed, even if he has a relapse. Encourage him to discuss any renewed alcohol consumption with prescriber.

 Instruct patient to contact prescriber immediately if he experiences seizure, chest pain, suicidal thoughts, or symptoms of liver problems (such as unusual tiredness or yellowing of skin or eyes).

- Caution patient to move slowly to a sitting or standing position, to avoid dizziness or light-headedness from a sudden blood pressure decrease.
- Advise patient to avoid driving and other hazardous activities until he

knows how drug affects concentration, alertness, vision, coordination, and physical dexterity.

- Instruct female patient to notify prescriber if she becomes or intends to become pregnant or to breastfeed during therapy.
- Inform patient that drug helps maintain abstinence from alcohol only when used as part of treatment program that includes counseling and support.
- Emphasize that drug doesn't eliminate or diminish alcohol withdrawal symptoms.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## acarbose

Glucobay<sup>®</sup>, Prandase<sup>®</sup>, Precose

**Pharmacologic class:** Alpha-glucosidase inhibitor

**Therapeutic class:** Hypoglycemic

**Pregnancy risk category B**

## Action

Improves blood glucose control by slowing carbohydrate digestion in intestine and prolonging conversion of carbohydrates to glucose

## Availability

*Tablets:* 25 mg, 50 mg, 100 mg

## Indications and dosages

 Treatment of type 2 (non-insulin-dependent) diabetes mellitus when diet alone doesn't control blood glucose

**Adults:** Initially, 25 mg P.O. t.i.d. Increase q 4 to 8 weeks as needed until maintenance dosage is reached. Maximum dosage is 100 mg P.O. t.i.d. for

adults weighing more than 60 kg (132 lb); 50 mg P.O. t.i.d. for adults weighing 60 kg or less.

### Contraindications

- Hypersensitivity to drug
- Renal dysfunction
- Type 1 diabetes mellitus, diabetic ketoacidosis
- GI disease
- Cirrhosis
- Colonic ulcers
- Inflammatory bowel disease
- Intestinal obstruction
- Pregnancy or breastfeeding

### Precautions

Use cautiously in:

- patients receiving concurrent hypoglycemic drugs
- children.

### Administration

- Give with first bite of patient's three main meals.
- Know that drug prevents breakdown of table sugar (sucrose). Thus, mild hypoglycemia must be corrected with oral glucose (such as D-glucose or dextrose), and severe hypoglycemia may warrant I.V. glucose or glucagon injection.
- Be aware that drug may be used alone or in combination with insulin, metformin, or sulfonylureas (such as glipizide, glyburide, or glimepiride).

Route	Onset	Peak	Duration
P.O.	Rapid	1 hr	Unknown

### Adverse reactions

**GI:** diarrhea, abdominal pain, flatulence

**Metabolic: hypoglycemia** (when used with insulin or sulfonylureas)

**Other:** edema, hypersensitivity reaction (rash)

### Interactions

**Drug-drug.** *Activated charcoal, calcium channel blockers, corticosteroids, digestive enzymes, diuretics, estrogen, hormonal contraceptives, isoniazid,*

*nicotinic acid, phenothiazines, phenytoin, sympathomimetics, thyroid products:* decreased therapeutic effect of acarbose

*Digoxin:* decreased digoxin blood level and reduced therapeutic effect

*Insulin, sulfonylureas:* hypoglycemia

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase:* increased levels

*Calcium, vitamin B<sub>6</sub>:* decreased levels

*Hematocrit:* decreased

### Patient monitoring

- Monitor patient for hypoglycemia if he's taking drug concurrently with insulin or sulfonylureas.
- Stay alert for hyperglycemia during periods of increased stress.
- Assess GI signs and symptoms to differentiate drug effects from those caused by paralytic ileus.
- Check 1-hour postprandial glucose level to gauge drug's efficacy.
- Monitor liver function test results. Report abnormalities so that dosage adjustments may be made as needed.

### Patient teaching

- Inform patient that drug may cause serious interactions with many common medications, so he should tell all prescribers he's taking it.
- Teach patient about other ways to control blood glucose level, such as recommendations regarding diet, exercise, weight reduction, and stress management.
- Stress importance of testing urine and blood glucose regularly.
- Teach patient about signs and symptoms of hypoglycemia. Tell him that although this drug doesn't cause hypoglycemia when used alone, hypoglycemic symptoms may arise if he takes it with other hypoglycemics.
- Urge patient to keep oral glucose on hand to correct mild hypoglycemia; inform him that sugar in candy won't correct hypoglycemia.

- Inform patient that GI symptoms such as flatulence may result from delayed carbohydrate digestion in intestine.
- Advise patient to obtain medical alert identification and to carry or wear it at all times.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## acetaminophen

Abenol<sup>✳</sup>, Acephen, Anadin  
 Paracetamol<sup>⚡</sup>, Apo-Acetaminophen<sup>✳</sup>,  
 Aspirin Free Anacin, Atasol<sup>✳</sup>, Calpol<sup>⚡</sup>,  
 Cetaphen, Children's Tylenol Soft  
 Chews, Disprol<sup>⚡</sup>, Feverall, Galpamol<sup>⚡</sup>,  
 Genapap, Little Fevers,  
 Mandanol<sup>⚡</sup>, Mapap, Nortemp,  
 Nortemp Children's, Novo-Gesic<sup>✳</sup>,  
 Pain Eze, Panadol<sup>⚡</sup>, Pediatrix<sup>✳</sup>,  
 Silapap, Tempra<sup>✳</sup>, Tycolene, Tylenol 8  
 Hour, Tylenol, Tylenol Arthritis, Tylenol  
 Extra Strength, Valorin

**Pharmacologic class:** Synthetic non-opioid *p*-aminophenol derivative

**Therapeutic class:** Analgesic, antipyretic

**Pregnancy risk category B**

### Action

Unclear. Pain relief may result from inhibition of prostaglandin synthesis in CNS, with subsequent blockage of pain impulses. Fever reduction may result from vasodilation and increased peripheral blood flow in hypothalamus, which dissipates heat and lowers body temperature.

### Availability

Caplets (extra-strength): 500 mg  
 Caplets, capsules: 160 mg, 500 mg,  
 650 mg (extended-release)

Drops: 100 mg/ml  
 Elixir: 80 mg/2.5 ml, 80 mg/5 ml,  
 120 mg/5 ml, 160 mg/5 ml  
 Gelcaps: 500 mg  
 Liquid: 160 mg/5 ml, 500 mg/15 ml  
 Solution: 80 mg/1.66 ml, 100 mg/1 ml,  
 120 mg/2.5 ml, 160 mg/5 ml, 167 mg/5 ml  
 Suppositories: 80 mg, 120 mg, 125 mg,  
 300 mg, 325 mg, 650 mg  
 Suspension: 32 mg/ml, 160 mg/5 ml  
 Syrup: 160 mg/5 ml  
 Tablets (chewable): 80 mg, 160 mg  
 Tablets (extended-release): 160 mg,  
 325 mg, 500 mg, 650 mg  
 Tablets (film-coated): 160 mg, 325 mg,  
 500 mg

### Indications and dosages

➤ Mild to moderate pain caused by headache, muscle ache, backache, minor arthritis, common cold, toothache, or menstrual cramps or fever  
**Adults and children age 12 and older:** 325 to 650 mg P.O. q 4 to 6 hours, or 1,000 mg three or four times daily. Or two extended-release caplets or tablets P.O. q 8 hours, to a maximum dosage of 4,000 mg/day. Or 650 mg P.R. q 4 to 6 hours, to a maximum dosage of 4,000 mg/day. Or, two extra-strength caplets q 6 hours, to a maximum dosage of six caplets/day.

**Children:** 10 to 15 mg/kg, or as indicated below:

#### Oral use

Age	Usual dosage	Maximum dosage
11-12 years	480 mg q 4 hr	5 doses in 24 hr
9-10 years	400 mg q 4 hr	5 doses in 24 hr
6-8 years	320 mg q 4 hr	5 doses in 24 hr
4-5 years	240 mg q 4 hr	5 doses in 24 hr
2-3 years	160 mg q 4 hr	5 doses in 24 hr
1 year	120 mg q 4 hr	5 doses in 24 hr
4-11 months	80 mg q 4 hr	5 doses in 24 hr
0-3 months	40 mg q 4 hr	5 doses in 24 hr

**Rectal use**

Age	Usual dosage	Maximum dosage
12 years and older	325-650 mg q 4 hr	4,000 mg/day
11-12 years	320-480 mg q 4 hr	2,880 mg/day
6-11 years	325 mg q 4 hr	2,600 mg/day
3-6 years	120-125 mg q 6 hr	720 mg/day
1-3 years	80 mg q 4 hr	
3-11 months	80 mg q 6 hr	

**Dosage adjustment**

- Renal or hepatic impairment

**Contraindications**

- Hypersensitivity to drug

**Precautions**

Use cautiously in:

- anemia, hepatic or renal disease
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 2.

**Administration**

- Be aware that although most patients tolerate drug well, toxicity can occur with a single dose.
- Know that acetylcysteine may be ordered to treat acetaminophen toxicity, depending on patient's blood drug level. Activated charcoal is used to treat acute, recent acetaminophen overdose (within 1 hour of ingestion).
- Determine overdose severity by measuring acetaminophen blood level no sooner than 4 hours after overdose ingestion (to ensure that peak concentration has been reached).

Route	Onset	Peak	Duration
P.O.	0.5-1 hr	10-60 min	3-8 hr (dose dependent)
P.R.	0.5-1 hr	10-60 min	3-4 hr

**Adverse reactions**

**Hematologic:** thrombocytopenia, hemolytic anemia, neutropenia, leukopenia, pancytopenia

**Hepatic:** jaundice, hepatotoxicity

**Metabolic:** hypoglycemic coma

**Skin:** rash, urticaria

**Other:** hypersensitivity reactions (such as fever)

**Interactions**

**Drug-drug.** *Activated charcoal, cholestyramine, colestipol:* decreased acetaminophen absorption  
*Barbiturates, carbamazepine, diflunisal, hydantoin, isoniazid, rifabutin, rifampin, sulfipyrazone:* increased risk of hepatotoxicity

*Hormonal contraceptives:* decreased acetaminophen efficacy

*Oral anticoagulants:* increased anti-coagulant effect

*Phenothiazines (such as chlorpromazine, fluphenazine, thioridazine):* severe hypothermia

*Zidovudine:* increased risk of granulocytopenia

**Drug-diagnostic tests.** *Home glucose measurement systems:* altered results  
*Urine 5-hydroxyindole acetic acid:* false-positive result

**Drug-behaviors.** *Alcohol use:* increased risk of hepatotoxicity

**Patient monitoring**

 Observe for acute toxicity and overdose. Signs and symptoms of acute toxicity are as follows—*Phase 1:* Nausea, vomiting, anorexia, malaise, diaphoresis. *Phase 2:* Right upper quadrant pain or tenderness, liver enlargement, elevated bilirubin and hepatic enzyme levels, prolonged prothrombin time, oliguria (occasional). *Phase 3:* Recurrent anorexia, nausea, vomiting, and malaise; jaundice; hypoglycemia; coagulopathy; encephalopathy; possible renal failure and cardiomyopathy. *Phase 4:* Either recovery or progression to fatal complete hepatic failure.

## Patient teaching

- Caution parents or other caregivers not to give acetaminophen to children younger than age 2 without consulting prescriber first.
- Tell patient, parents, or other caregivers not to use drug concurrently with other acetaminophen-containing products or to use more than 4,000 mg of regular-strength acetaminophen in 24 hours.
- Inform patient, parents, or other caregivers not to use extra-strength caplets in dosages above 3,000 mg (six caplets) in 24 hours because of risk of severe liver damage.
- Advise patient, parents, or other caregivers to contact prescriber if fever or other symptoms persist despite taking recommended amount of drug.
- Inform patients with chronic alcoholism that drug may increase risk of severe liver damage.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## acetazolamide

Acetazolam<sup>✳</sup>, AK-Zol,  
Apo-Acetazolamide<sup>✳</sup>, Diamox<sup>✳</sup>,  
Diamox Sequels

**Pharmacologic class:** Carbonic anhydrase inhibitor

**Therapeutic class:** Diuretic, antiglaucoma drug, anticonvulsant, altitude agent, urinary alkalinizer

**Pregnancy risk category C**

## Action

Inhibits carbonic anhydrase in kidney, decreasing water reabsorption and increasing excretion of sodium,

potassium, and bicarbonate. Lowers intraocular pressure by decreasing aqueous humor production. May raise seizure threshold by reducing carbonic anhydrase in CNS, thereby decreasing neuronal conduction.

## Availability

*Capsules (sustained-release):* 500 mg

*Injection:* 500 mg/vial

*Tablets:* 125 mg, 250 mg

## Indications and dosages

➤ Open-angle (chronic simple) glaucoma (given with miotics)

**Adults:** 250 mg P.O. one to four times daily, or 500-mg sustained-release capsule P.O. once or twice daily. Don't exceed total daily dosage of 1 g.

➤ Preoperative treatment of closed-angle (secondary) glaucoma

**Adults:** 250 mg P.O. q 4 hours or 250 mg P.O. b.i.d.; in acute cases only, 500 mg P.O. followed by 125 to 250 mg P.O. q 4 hours. For rapid relief of increased intraocular pressure, 500 mg I.V., repeated in 2 to 4 hours; then 125 to 250 mg P.O. q 4 to 6 hours.

**Children:** 10 to 15 mg/kg/day P.O. in divided doses q 6 to 8 hours, or 5 to 10 mg/kg I.V. q 6 hours

➤ Seizure disorder (given with other anticonvulsants)

**Adults and children:** 250 mg P.O. daily when given with another anticonvulsant, or 8 to 30 mg/kg daily P.O. in one to four divided doses. Usual dosage range is 375 mg to 1 g daily.

➤ Drug-induced edema or edema secondary to heart failure

**Adults:** Initially, 250 to 375 mg P.O. daily. If diuresis fails, give dose on alternate days, or give for 2 days alternating with day of rest.

**Children:** 5 mg/kg P.O. daily, or 150 mg/m<sup>2</sup> P.O. or I.V. once daily in morning

➤ Acute high-altitude (mountain) sickness

**Adults:** 500 mg to 1 g P.O. daily in divided doses, or sustained-release

capsule q 12 to 24 hours. Dosing should begin 24 to 48 hours before ascent and continue during ascent and for 48 hours after reaching desired altitude. For rapid ascent, 1-g P.O. dose is recommended.

### Dosage adjustment

- Mild renal failure

### Off-label uses

- Acute pancreatitis
- Alkalosis after open-heart surgery
- Hereditary ataxia
- Peptic ulcer
- Periodic paralysis
- Renal calculi
- Phenobarbital or lithium overdose
- Hydrocephalus in infants

### Contraindications

- Hypersensitivity to drug or sulfonamides
- Adrenocortical insufficiency
- Closed-angle glaucoma
- Severe pulmonary obstruction
- Severe renal disease, hypokalemia, hyponatremia
- Hepatic disease

### Precautions

Use cautiously in:

- respiratory, renal, or hepatic disease; diabetes mellitus, hypercalcemia, gout, adrenocortical insufficiency
- pregnant or breastfeeding patients.

### Administration

 Before giving, ask if patient is pregnant. Drug may cause fetal toxicity.

- Direct I.V. administration is preferred. When giving by direct I.V. route, reconstitute 500-mg vial with more than 5 ml of sterile water for injection; administer over 1 minute.
- When giving drug intermittently by I.V. infusion, further dilute with normal saline solution or dextrose solution and infuse over 4 to 8 hours.

- Be aware that I.M. administration is painful because solution is alkaline.
- If necessary, crush tablets and mix in nonsweet, nonalcoholic syrup or non-glycerin solution.

Route	Onset	Peak	Duration
P.O.	1 hr	2-4 hr	8-12 hr
P.O. (sustained)	2 hr	8-12 hr	18-24 hr
I.V., I.M.	1-2 min	15-18 min	4-5 hr

### Adverse reactions

**CNS:** weakness, nervousness, irritability, drowsiness, confusion, dizziness, depression, tremor, headache, paresthesia, flaccid paralysis, **seizures**  
**EENT:** transient myopia, tinnitus, hearing dysfunction, sensation of lump in throat

**GI:** nausea, vomiting, diarrhea, constipation, melena, abdominal distention, dry mouth, anorexia

**GU:** dysuria, hematuria, glycosuria, polyuria, crystalluria, renal colic, renal calculi, **uremia, sulfonamide-like renal lesions, renal failure**

**Hematologic:** **thrombocytopenia, leukopenia, agranulocytosis, hemolytic anemia, thrombocytopenic purpura, pancytopenia, bone marrow depression with aplastic anemia**

**Hepatic:** **hepatic insufficiency**

**Metabolic:** hypokalemia, hyperglycemia and glycosuria, hyperuricemia and gout, **metabolic acidosis, hyperchloremic acidosis**

**Respiratory:** hyperpnea

**Skin:** rash, pruritus, urticaria, photosensitivity, hirsutism, cyanosis

**Other:** altered taste and smell, weight loss, fever, excessive thirst, pain at I.M. injection site, hypersensitivity reaction, **Stevens-Johnson syndrome**

### Interactions

**Drug-drug.** *Amphetamines, procainamide, quinidine, tricyclic antidepressants:* decreased excretion and

enhanced or prolonged effect of these drugs, leading to toxicity

*Amphotericin B, corticosteroids, corticotrophin, other diuretics*: increased risk of hypokalemia

*Lithium, phenobarbital, salicylates*: increased excretion of these drugs, possibly reducing their efficacy

*Methenamine compounds*: inactivation of these drugs

*Phenytoin, primidone*: severe osteomalacia

*Salicylates*: increased risk of salicylate toxicity

**Drug-diagnostic tests.** *Ammonia, bilirubin, calcium, chloride, glucose, uric acid*: increased levels

*Thyroid iodine uptake*: decreased in patients with hyperthyroidism or normal thyroid function

*Urinary protein (with some reagents)*: false-positive result

**Drug-behaviors.** *Sun exposure*: increased risk of photosensitivity

### Patient monitoring

🚨 Evaluate for signs and symptoms of sulfonamide sensitivity; drug can cause fatal hypersensitivity.

🚨 Monitor laboratory test results for hematologic changes; blood glucose, potassium, bicarbonate, and chloride levels; and liver and kidney function changes.

- Observe for signs and symptoms of bleeding tendency.
- Monitor fluid intake and output.

### Patient teaching

- Advise patient to take drug with food if GI upset occurs.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Tell patient to eat potassium-rich foods (such as seafood, bananas, and oranges) if taking drug long term or receiving other potassium-depleting drugs.

- Advise patient to avoid activities that can cause injury. Advise him to use soft toothbrush and electric razor to avoid gum and skin injury.

- Tell patient to report significant numbness or tingling.

- Inform patient that he'll undergo regular blood testing during therapy.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## acetylcysteine (N-acetylcysteine)

Acetadote, Mucomyst<sup>®</sup>,  
Mucosil-10, Mucosil-20,  
Parovelex<sup>®</sup>Ⓔ

**Pharmacologic class:** N-acetyl derivative of naturally occurring amino acid (L-cysteine)

**Therapeutic class:** Mucolytic, acetaminophen antidote

**Pregnancy risk category B**

### Action

Decreases viscosity of secretions, promoting secretion removal through coughing, postural drainage, and mechanical means. In acetaminophen overdose, maintains and restores hepatic glutathione, needed to inactivate toxic metabolites.

### Availability

*Injection:* 200 mg/ml

*Solution:* 10%, 20%

### Indications and dosages

➤ Mucolytic agent in adjunctive treatment of acute and chronic bronchopulmonary disease (bronchitis, bronchiectasis, chronic asthmatic

bronchitis, emphysema, pneumonia, primary amyloidism of lungs, tuberculosis, tracheobronchitis), pulmonary complications of cystic fibrosis, atelectasis, or pulmonary complications related to surgery, posttraumatic chest conditions, tracheostomy care, or use during anesthesia

**Adults and children:** *Nebulization (face mask, mouthpiece, tracheostomy)*—6 to 10 ml of 10% solution or 3 to 5 ml of 20% solution three or four times daily. Dosage range is 2 to 20 ml of 10% solution or 1 to 10 ml of 20% solution q 2 to 6 hours.

*Nebulization (tent or croupette)*—Volume of 10% or 20% solution that will maintain heavy mist for desired period

*Instillation (direct)*—1 to 2 ml of 10% to 20% solution q 1 hour p.r.n.

*Instillation via syringe attached to percutaneous intratracheal catheter*—2 to 4 ml of 10% solution or 1 to 2 ml of 20% solution q 1 to 4 hours

➤ Diagnostic bronchial studies

**Adults and children:** Two to three doses of 2 to 4 ml of 10% solution or 1 to 2 ml of 20% solution by nebulization or intratracheal instillation before procedure

➤ Acetaminophen overdose

**Adults, elderly patients, children:** Give immediately if 24 hours or less have elapsed since acetaminophen ingestion. Use the following protocol: empty stomach by lavage or emesis induction, and then have patient drink copious amounts of water. If activated charcoal has been given, perform lavage before giving acetylcysteine. Draw blood for acetaminophen plasma assay and baseline aspartate aminotransferase (AST), alanine aminotransferase (ALT), prothrombin time, bilirubin, blood glucose, blood urea nitrogen, electrolyte, and creatinine clearance levels. If ingested acetaminophen dose is in toxic range, give acetylcysteine 140 mg/kg P.O. as loading dose from 20% solution. Administer

17 maintenance doses of 70 mg/kg P.O. q 4 hours, starting 4 hours after loading dose. Repeat procedure until acetaminophen blood level is safe. If patient vomits loading dose or any maintenance dose within 1 hour of administration, repeat that dose.

### Off-label uses

- Unstable angina

### Contraindications

- Hypersensitivity to drug (except with antidotal use)
- Status asthmaticus (except with antidotal use)

### Precautions

Use cautiously in:

- renal or hepatic disease, Addison's disease, alcoholism, brain tumor, bronchial asthma, seizure disorder, hypothyroidism, respiratory insufficiency, psychosis
- elderly patients
- pregnant or breastfeeding patients.

### Administration

- Separate administration times of this drug and antibiotics.
- Use plastic, glass, or stainless steel container when giving by nebulizer, because solution discolors on contact with rubber and some metals.
- Once solution is exposed to air, use within 96 hours.
- Dilute solution before administering for acetaminophen overdose, to reduce risk of vomiting, drug's unpleasant odor, and irritating or sclerosing properties.
- Chill solution and have patient sip through straw, or, if necessary, give by nasogastric tube when administering for acetaminophen overdose.

Route	Onset	Peak	Duration
P.O.	30-60 min	1-2 hr	Unknown
Instillation, 1 min inhalation		5-10 min	2-3 hr

**Adverse reactions**

**CNS:** dizziness, drowsiness, headache

**CV:** hypotension, hypertension, tachycardia

**EENT:** severe rhinorrhea

**GI:** nausea, vomiting, stomatitis, constipation, anorexia

**Hepatic: hepatotoxicity**

**Respiratory:** hemoptysis, tracheal and bronchial irritation, increased secretions, wheezing, chest tightness,

**bronchospasm**

**Skin:** urticaria, rash, clamminess, angioedema

**Other:** tooth damage, chills, fever, hypersensitivity including anaphylaxis

**Interactions**

**Drug-drug.** *Activated charcoal:* increased absorption and decreased efficacy of acetylcysteine

*Nitroglycerin:* increased nitroglycerin effects, causing hypotension and headache

**Drug-diagnostic tests.** *Liver function tests:* abnormal results

**Patient monitoring**

- Monitor respirations, cough, and character of secretions.

**Patient teaching**

- Instruct patient to report worsening cough and other respiratory symptoms.
- Advise patient to mix oral form with juice or cola to mask bad taste and odor.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

**acetylsalicylic acid (aspirin)**

Alka<sup>Ⓢ</sup>, Angettes<sup>Ⓢ</sup>, Apo-Asa<sup>Ⓢ</sup>, Apo-ASEN<sup>Ⓢ</sup>, Arthrinol<sup>Ⓢ</sup>, Arthrisin<sup>Ⓢ</sup>, Artria S.R.<sup>Ⓢ</sup>, ASA, Aspercin, Aspergum, Aspir-Low, Aspiatab, Astrin<sup>Ⓢ</sup>, Bayer, Caprin<sup>Ⓢ</sup>, Coryphen<sup>Ⓢ</sup>, Dispirin<sup>Ⓢ</sup>, Easprin, Ecotrin, Enpirin<sup>Ⓢ</sup>, Entrophen<sup>Ⓢ</sup>, Halfprin, Headache Tablet<sup>Ⓢ</sup>, Micoprin<sup>Ⓢ</sup>, Novasen<sup>Ⓢ</sup>, Nu-Seals<sup>Ⓢ</sup>, PMS-ASA<sup>Ⓢ</sup>, PostMI<sup>Ⓢ</sup>, Sal-Adult<sup>Ⓢ</sup>, Sal-Infant<sup>Ⓢ</sup>, St. Joseph, Supasa<sup>Ⓢ</sup>, ZORprin

**Pharmacologic class:** Nonsteroidal anti-inflammatory drug (NSAID)

**Therapeutic class:** Nonopioid analgesic, antipyretic, antiplatelet drug

**Pregnancy risk category C** (with full dose in third trimester: **D**)

**Action**

Reduces pain and inflammation by inhibiting prostaglandin production. Fever reduction mechanism unknown; may be linked to decrease in endogenous pyrogens in hypothalamus resulting from prostaglandin inhibition. Exerts antiplatelet effect by inhibiting synthesis of prostacyclin and thromboxane A<sub>2</sub>.

**Availability**

*Gum (chewable):* 227 mg

*Suppositories:* 60 mg, 120 mg, 200 mg, 300 mg, 325 mg, 600 mg, 650 mg

*Tablets:* 81 mg, 325 mg, 500 mg

*Tablets (chewable):* 81 mg

*Tablets (enteric-coated, delayed-release):*

81 mg, 162 mg, 325 mg, 500 mg,

650 mg, 975 mg

*Tablets (extended-release):* 650 mg,

800 mg

*Tablets (film-coated):* 325 mg, 500 mg

## Indications and dosages

➤ Mild pain or fever

**Adults:** 325 to 500 mg P.O. q 3 hours, or 325 to 650 mg P.O. q 4 hours, or 650 to 1,000 mg P.O. q 6 hours, to a maximum dosage of 4,000 mg/day.

*Extended-release tablets*—650 mg to 1,300 mg q 8 hours, not to exceed 3,900 mg/day; or 800 mg q 12 hours.

**Children:** 10 to 15 mg/kg P.O. or P.R. q 4 hours, not to exceed total daily dosage of 3.6 g, or up to 60 to 80 mg/kg/day. See chart below.

Age (years)	Dosage (q 4 hr)
12-14	648 mg
11-12	486 mg
9-10	405 mg
6-8	324 mg
4-5	243 mg
2-3	162 mg

➤ Mild to moderate pain caused by inflammation (as in rheumatoid arthritis or osteoarthritis)

**Adults:** Initially, 2,400 to 3,600 mg P.O. daily in divided doses. Dosage may be increased by 325 to 1,200 mg daily at intervals of at least 1 week. Usual maintenance dosage is 3.6 to 5.4 g/day P.O. in divided doses, to a maximum dosage of 6 g/day.

➤ Juvenile rheumatoid arthritis

**Children:** 60 to 130 mg/kg/day P.O. in children weighing 25 kg (55 lb) or less, or 2,400 to 3,600 mg P.O. daily in children weighing more than 25 kg P.O.; give in divided doses q 6 to 8 hours.

➤ Acute rheumatic fever

**Adults:** 5 to 8 g/day P.O. in divided doses

**Children:** Initially, 100 mg/kg/day P.O. in individual doses for first 2 weeks; then maintenance dosage of 75 mg/kg/day P.O. in divided doses for next 4 to 6 weeks

➤ To reduce the risk of transient ischemic attacks (TIAs) or cerebrovascular

accident in men with a history of TIAs caused by emboli

**Adults:** 650 mg P.O. b.i.d. or 325 mg P.O. q.i.d.

➤ To reduce the risk of myocardial infarction (MI) in patients with a history of MI or unstable angina

**Adults:** 75 to 325 mg/day P.O.

➤ Kawasaki disease

**Children:** Initially during acute febrile period, 80 to 180 mg/kg/day P.O. in four divided doses. Maintenance dosage is 3 to 10 mg/kg/day given as a single dose for up to 8 weeks or until platelet count and erythrocyte sedimentation rate return to normal.

➤ Thromboembolic disorders

**Adults:** 325 to 650 mg P.O. once or twice daily

## Contraindications

- Hypersensitivity to salicylates, other NSAIDs, or tartrazine
- Renal impairment
- Severe hepatic impairment
- Hemorrhagic states or blood coagulation defects
- Vitamin K deficiency caused by dehydration
- Concurrent anticoagulant use
- Pregnancy (third trimester) or breastfeeding

## Precautions

Use with extreme caution, if at all, in:

- hepatic disorders, anemia, asthma, gastritis, Hodgkin's disease
- heart failure or other conditions in which high sodium content is harmful (buffered aspirin)
- patients receiving other salicylates or NSAIDs concurrently
- elderly patients
- children and adolescents.

## Administration

 Never administer to child or adolescent who has signs or symptoms of chickenpox or flulike illness.

⚠ Don't give within 6 weeks after administration of live varicella virus vaccine, because of risk of Reye's syndrome.

- Give with food or large amounts of water or milk to minimize GI irritation.
- Know that extended-release and enteric-coated forms are best for long-term therapy.
- Be aware that aspirin should be discontinued at least 1 week before surgery because it may inhibit platelet aggregation.

Route	Onset	Peak	Duration
P.O. (tablets)	15-30 min	1-2 hr	4-6 hr
P.O. (chewable)	Rapid	Unknown	1-4 hr
P.O. (enteric-coated)	5-30 min	2-4 hr	8-12 hr
P.O. (extended)	5-30 min	1-4 hr	3-6 hr
P.R.	5-30 min	3-4 hr	1-4 hr

## Adverse reactions

**EENT:** hearing loss, tinnitus, ototoxicity

**GI:** nausea, vomiting, abdominal pain, dyspepsia, epigastric distress, heartburn, anorexia, **GI bleeding**

**Hematologic:** thrombocytopenia, hemolytic anemia, leukopenia, agranulocytosis, shortened red blood cell life span

**Hepatic:** hepatotoxicity

**Metabolic:** hyponatremia, hypokalemia, hypoglycemia

**Respiratory:** wheezing, hyperpnea, pulmonary edema with toxicity

**Skin:** rash, urticaria, bruising, angioedema

**Other:** hypersensitivity reactions, **salicylism or acute toxicity**

## Interactions

**Drug-drug.** *Acidifying drugs (such as ammonium chloride):* increased salicylate blood level

*Activated charcoal:* decreased salicylate absorption

*Alkalinizing drugs (such as antacids):* decreased salicylate blood level

*Angiotensin-converting enzyme (ACE) inhibitors:* decreased antihypertensive effect

*Anticoagulants, NSAIDs, thrombolytics:* increased bleeding risk

*Carbonic anhydrase inhibitors (such as acetazolamide):* salicylism

*Corticosteroids:* increased salicylate excretion and decreased blood level

*Furosemide:* increased diuretic effect

*Live varicella virus vaccine:* increased risk of Reye's syndrome

*Methotrexate:* decreased methotrexate excretion and increased blood level, causing greater risk of toxicity

*Nizatidine:* increased salicylate blood level

*Spiroinolactone:* decreased spiroinolactone effect

*Sulfonylureas (such as chlorpropamide, tolbutamide):* enhanced sulfonylurea effects

*Tetracycline (oral):* decreased absorption of tetracycline (with buffered aspirin)

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, amylase, aspartate aminotransferase, coagulation studies, PaCO<sub>2</sub>, uric acid:* increased values

*Cholesterol, glucose, potassium, protein-bound iodine, sodium, thyroxine, triiodothyronine:* decreased levels

*Pregnancy test, protirelin-induced thyroid stimulating hormone, radionuclide thyroid imaging, serum theophylline*

*(Schack and Waxler method), urine catecholamines, urine glucose, urine hydroxyindoleacetic acid, urine ketones*

*(ferric chloride method), urine vanillylmandelic acid:* test interference

*Tests using phenosulfonphthalein as diagnostic agent:* decreased urinary excretion of phenosulfonphthalein

*Urine protein:* increased level

**Drug-food.** *Urine-acidifying foods:* increased salicylate blood level

**Drug-herbs.** *Anise, arnica, cayenne, chamomile, clove, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng, horse chestnut, kelpware, licorice:*

increased bleeding risk

**Drug-behaviors.** *Alcohol use:* increased bleeding risk

### Patient monitoring

 Watch for signs and symptoms of hypersensitivity and other adverse reactions, especially bleeding tendency.

- Stay alert for signs and symptoms of acute toxicity, such as diplopia, ECG abnormalities, generalized seizures, hallucinations, hyperthermia, oliguria, acute renal failure, incoherent speech, irritability, restlessness, tremor, vertigo, confusion, disorientation, mania, lethargy, laryngeal edema, anaphylaxis, and coma.

- Monitor elderly patients carefully because they're at greater risk for salicylate toxicity.
- With prolonged therapy, frequently assess hemoglobin, hematocrit, International Normalized Ratio, and kidney function test results.
- Check salicylate blood levels frequently.
- Evaluate patient for signs and symptoms of ototoxicity (hearing loss, tinnitus, ataxia, and vertigo).

### Patient teaching

- Tell patient to report ototoxicity symptoms, unusual bleeding, and bruising.
- Caution patient to avoid activities that may cause injury. Advise him to use soft toothbrush and electric razor to avoid gum and skin injury.
- Instruct patient to tell all prescribers he's taking the drug, because it may cause serious interactions with many common medications.
- Tell patient not to take other over-the-counter preparations containing aspirin.

- Inform patient that he may need to undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## acitretin

Neotigason , Soriatane

**Pharmacologic class:** Second-generation retinoid

**Therapeutic class:** Antipsoriatic

**Pregnancy risk category** X

### FDA **BOXED WARNING**

- Drug may harm fetus and must not be used by pregnant patients, those who intend to become pregnant, or those who may not use reliable contraception during therapy and for at least 3 years afterward.
- Patient must commit to using two effective contraceptive forms simultaneously. At least one form must be primary, unless patient chooses absolute abstinence, has had a hysterectomy, or is postmenopausal.
- Drug should be prescribed only by clinicians with special competence in diagnosing and treating severe psoriasis, experience using systemic retinoids, and understanding of teratogenicity risk.
- Consider drug only for women with severe psoriasis unresponsive to other therapies or whose clinical condition contraindicates other therapies.
- Instruct patient not to donate blood during therapy and for at least 3 years afterward.

## Action

Unclear. Promotes normal growth cycle of skin cells, possibly by targeting retinoid receptors in these cells and adjusting factors that affect epidermal proliferation and synthesis of RNA and DNA.

## Availability

Capsules: 10 mg, 17.5 mg, 25 mg

## Indications and dosages

➤ Severe psoriasis

**Adults and elderly patients:** Initially, 25 to 50 mg/day P.O. as a single dose with main meal. If initial response is satisfactory, give maintenance dosage of 25 to 50 mg/day P.O.

## Off-label uses

- Darier's disease (keratosis follicularis)
- Lamellar ichthyosis (in children)
- Lichen planus
- Nonbullous and bullous ichthyosiform erythroderma
- Palmoplantar pustulosis
- Sjögren-Larsson syndrome

## Contraindications

- Hypersensitivity to drug or paraben (used as preservative in gelatin capsule)
- Pregnancy or anticipated pregnancy within 3 years after drug discontinuation (drug has teratogenic and embryotoxic effects)
- Women of childbearing age who may not use reliable contraception during therapy and for at least 3 years after drug discontinuation
- Breastfeeding

## Precautions

Use cautiously in:

- hepatic or renal impairment, diabetes mellitus, obesity
- elevated cholesterol or triglyceride levels
- elderly patients.

## Administration

 Verify that patient isn't pregnant before giving drug.

- Give as a single dose with main meal.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** headache, depression, insomnia, drowsiness, fatigue, migraine, rigors, abnormal gait, nerve inflammation, hyperesthesia, paresthesia, **pseudotumor cerebri**

**EENT:** abnormal or blurred vision, dry eyes, eye irritation, eyebrow and eyelash loss, eyelid inflammation, cataract, conjunctivitis, corneal epithelial abnormality, reduced night vision, photophobia, recurrent styes, earache, tinnitus, hearing loss, epistaxis, rhinitis, sinusitis, **papilledema**

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, gastritis, stomatitis, esophagitis, melena, painful straining at stool, pancreatitis, lip inflammation and cracking, dry mouth, anorexia

**GU:** abnormal urine, dysuria, atrophic vaginitis, leukorrhea

**Hepatic:** abnormal hepatic function, jaundice, **hepatitis**

**Metabolic:** poor blood glucose control  
**Musculoskeletal:** joint, muscle, back, and bone pain; arthritis; bone disorders; spinal bone overgrowth; increased muscle tone or rigidity; tendinitis

**Respiratory:** coughing, increased sputum, laryngitis

**Skin:** dry skin, pruritus, skin atrophy, skin peeling, abnormal skin odor, sticky skin, seborrhea, dermatitis, diaphoresis, cold clammy skin, skin infection, rash, pyrogenic granuloma, skin ulcers, skin fissures, sunburn, flushing, purpura, nail disorder, inflammation of tissue surrounding nails, abnormal hair texture, alopecia

**Other:** abnormal taste, glossitis, tongue ulcers, gingival bleeding, gingivitis, edema, thirst, hot flashes

### Interactions

**Drug-drug.** *Glyburide:* increased blood glucose clearance

*Methotrexate:* increased risk of hepatotoxicity

*Oral contraceptives (“minipill”):* decreased contraceptive efficacy

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, triglycerides:* increased levels

*Low-density lipoproteins:* decreased level

**Drug-behaviors.** *Alcohol use:* interference with acitretin elimination, possible drug toxicity

### Patient monitoring

- Monitor patient who has early signs or symptoms of pseudotumor cerebri, such as headache, nausea, vomiting, and visual disturbances. Discontinue drug immediately if papilledema occurs.
- Check blood lipid levels before therapy begins and every 1 to 2 weeks during therapy.
- Monitor blood glucose levels and kidney and liver function test results.
- If drug causes open skin lesions resulting from dermatitis or blisters, watch for signs and symptoms of infection.
- Assess for pain, stinging, and itching. Apply cool compresses as needed for relief.
-  Be aware that women taking this drug must avoid alcohol-containing foods, beverages, medications, and over-the-counter products during therapy and for 2 months afterward.

### Patient teaching

- Instruct patient to take drug with main meal to minimize GI upset.
- Tell patient to avoid driving and other hazardous activities until he

knows how drug affects concentration, alertness, and vision.

- Caution patient not to drink alcohol during therapy.

-  Advise females to use effective contraception for at least 1 month before starting drug, throughout entire course of therapy, and for 3 years after discontinuing drug.

- Explain that disease may seem to worsen at start of therapy.

- Tell contact lens wearers that lens intolerance may develop.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## activated charcoal

Actidose, Actidose-Aqua, Bragg’s Medicinal Charcoal , Carbomix , Charcadote , Char-Caps, Charco Caps, EZ-Char

**Pharmacologic class:** Carbon residue

**Therapeutic class:** Antiflatulent, antidote

**Pregnancy risk category** C

### Action

Binds to poisons, toxins, irritants, and drugs, forming a barrier between particulate material and GI mucosa that inhibits absorption of this material in GI tract. As an antiflatulent, reduces intestinal gas volume and relieves related discomfort.

### Availability

*Capsules:* 260 mg

*Granules:* 15 g/120 ml

*Liquid:* 15 g/120 ml, 50 g/240 ml, 208 mg/1 ml

*Oral suspension:* 12.5 g/60 ml, 15 g/75 ml, 25 g/120 ml, 30 g/120 ml, 50 g/240 ml

*Powder:* 15, 30, 40, 130, 240 g/container

## Indications and dosages

### ➤ Poisoning

**Adults:** 25 to 100 g P.O. (or 1 g/kg, or about 10 times the amount of poison ingested) as a suspension in 120 to 240 ml (4 to 8 oz) of water

**Children:** Initially, 1 to 2 g/kg P.O. (or 10 times the amount of poison ingested) as a suspension in 120 to 240 ml (4 to 8 oz) of water

### ➤ Flatulence

**Adults:** 600 mg to 5 g P.O. as a single dose, or 975 mg to 3.9 g in divided doses

## Off-label uses

- Diarrhea
- GI distress
- Hypercholesterolemia

## Contraindications

None

## Precautions

Use cautiously in:

- patients who have aspirated corrosives or hydrocarbons and are vomiting.

## Administration

 Don't try to give activated charcoal to semiconscious patient.

 If signs of aspiration occur, stop giving drug immediately to avoid fatal airway obstruction or infection.

- Administer by large-bore nasogastric tube after gastric lavage, as needed.
- Give within 30 minutes of poison ingestion when possible.
- Mix powder with tap water to form thick syrup. Add fruit juice or flavoring to improve taste.
- Be aware that drug inactivates ipecac syrup.
- Know that drug is ineffective in poisoning from ethanol, methanol, and iron salts.

- Don't give children more than one dose of drug product containing sorbitol (sweetener).

- When used for indications other than as antidote, give drug at least 2 hours before or 1 hour after other drugs.

Route	Onset	Peak	Duration
P.O.	Immediate	Unknown	Unknown

## Adverse reactions

**GI:** nausea, vomiting, diarrhea, constipation, black stools, **intestinal obstruction**

## Interactions

**Drug-drug.** *Acetaminophen, barbiturates, carbamazepine, digitoxin, digoxin, furosemide, glutethimide, hydantoins, methotrexate, nizatidine, phenothiazines, phenylbutazones, propoxyphene, salicylates, sulfonamides, sulfonylurea, tetracycline, theophyllines, tricyclic antidepressants, valproic acid:* decreased absorption of these drugs

*Ipecac syrup:* ipecac absorption and inactivation

**Drug-food.** *Milk, ice cream, sherbet:* decreased absorptive activity of drug

## Patient monitoring

- Monitor patient for constipation.
- If patient vomits soon after receiving dose, ask prescriber if dose should be repeated.

## Patient teaching

- Instruct patient to drink six to eight glasses of fluid daily to prevent constipation.
- Tell patient that stools will be black as charcoal is excreted from body.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and foods mentioned above.

## acyclovir

### acyclovir sodium

Zovirax

**Pharmacologic class:** Acyclic purine nucleoside analogue

**Therapeutic class:** Antiviral

**Pregnancy risk category B**

#### Action

Inhibits viral DNA polymerase, thereby inhibiting replication of viral DNA. Specific for herpes simplex types 1 (HSV-1) and 2 (HSV-2), varicella-zoster virus, Epstein-Barr virus, and cytomegalovirus (CMV).

#### Availability

*Capsules:* 200 mg

*Cream:* 5% in 2-g tube

*Injection:* 50 mg/ml

*Ointment:* 5% in 15-g tube

*Powder for injection:* 500 mg/vial, 1,000 mg/vial

*Suspension:* 200 mg/5 ml

*Tablets:* 400 mg, 800 mg

#### Indications and dosages

➤ Acute treatment of herpes zoster (shingles)

**Adults:** 800 mg P.O. q 4 hours while awake (five times/day) for 7 to 10 days

➤ Initial episode of genital herpes

**Adults:** 200 mg P.O. q 4 hours while awake (1,000 mg/day) for 10 days

➤ Chronic suppressive therapy for recurrent genital herpes episodes

**Adults:** 400 mg P.O. b.i.d., or 200 mg P.O. three to five times daily for up to 12 months

➤ Intermittent therapy for recurrent genital herpes episodes

**Adults:** 200 mg P.O. q 4 hours while awake (five times/day) for 5 days,

initiated at first sign or symptom of recurrence

➤ Management of initial episodes of genital herpes and limited, non-life-threatening mucocutaneous herpes simplex virus infections in immunocompromised patients

**Adults:** Apply approximately ½" ribbon of ointment per 4 square inches of surface area to sufficiently cover all lesions q 3 hours, six times daily for 7 days.

➤ Treatment of recurrent herpes labialis (cold sores)

**Adults and adolescents ages 12 and older:** Apply cream to infected area

five times daily for 4 days.

➤ Varicella (chickenpox)

**Adults and children weighing more than 40 kg (88 lb):** 800 mg P.O. q.i.d. for 5 days

**Children older than age 2:** 20 mg/kg P.O. q.i.d. for 5 days

➤ Mucosal and cutaneous HSV-1 and HSV-2 in immunocompromised patients

**Adults and children older than age 12:** 5 mg/kg I.V. infusion over 1 hour given q 8 hours for 7 days

**Children younger than age 12:** 10 mg/kg I.V. infusion over 1 hour given q 8 hours for 7 days

➤ Herpes simplex encephalitis

**Adults and children older than age 12:** 10 mg/kg I.V. over 1 hour given q 8 hours for 10 days

**Children ages 3 months to 12 years:** 20 mg/kg I.V. over 1 hour given q 8 hours for 10 days

**Children from birth to 3 months:** 10 mg/kg I.V. over 1 hour given q 8 hours for 10 days

➤ Varicella zoster infections in immunocompromised patients

**Adults and adolescents older than age 12:** 10 mg/kg I.V. over 1 hour given q 8 hours for 7 days

**Children younger than age 12:** 20 mg/kg I.V. over 1 hour given q 8 hours for 7 days

## Dosage adjustment

- Renal impairment
- Obesity (adult dosage based on ideal weight)
- Elderly patients

## Off-label uses

- Herpes zoster encephalitis
- CMV and HSV infection after bone marrow or kidney transplantation
- Infectious mononucleosis
- Varicella pneumonia

## Contraindications

- Hypersensitivity to drug or valacyclovir

## Precautions

Use cautiously in:

- preexisting serious neurologic, hepatic, pulmonary, or fluid or electrolyte abnormalities
- renal impairment
- obesity
- pregnant or breastfeeding patients.

## Administration

- Make sure patient is adequately hydrated before starting therapy.
- Give single I.V. dose by infusion over at least 1 hour to minimize renal damage.
- Don't give by I.V. bolus or by I.M. or subcutaneous route.
- Be aware that absorption of topical acyclovir is minimal.

Route	Onset	Peak	Duration
P.O.	Variable	1.5-2 hr	4 hr
I.V.	Immediate	1 hr	8 hr
Topical	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** aggressive behavior, dizziness, malaise, weakness, paresthesia, headache; with I.V. use—**encephalopathic changes** (lethargy, tremors, obtundation, confusion, hallucinations, agitation, seizures, coma)

**CV:** peripheral edema

**EENT:** vision abnormalities

**GI:** nausea, vomiting, diarrhea

**GU:** proteinuria, hematuria, crystalluria, vaginitis, candidiasis, changes in menses, vulvitis, oliguria, renal pain, **renal failure, glomerulonephritis**

**Hematologic:** anemia, lymphadenopathy, **thrombocytopenia, thrombotic thrombocytopenic purpura/hemolytic uremic syndrome** (in immunocompromised patients), **disseminated intravascular coagulation, hemolysis, leukopenia, leukoclastic vasculitis**

**Hepatic:** jaundice, **hepatitis**

**Musculoskeletal:** myalgia

**Skin:** photosensitivity rash, pruritus, angioedema, alopecia, urticaria, severe local inflammatory reactions (with I.V. extravasation), **toxic epidermal necrolysis, erythema multiforme**

**Other:** gingival hyperplasia, fever, excessive thirst, pain at injection site, **anaphylaxis, Stevens-Johnson syndrome**

## Interactions

**Drug-drug.** *Interferon:* additive effect

*Nephrotoxic drugs:* increased risk of nephrotoxicity

*Probenecid:* increased acyclovir blood level

*Zidovudine:* increased CNS effects, especially drowsiness

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, bilirubin, blood urea nitrogen:* increased levels

## Patient monitoring

- Monitor fluid intake and output.
- Assess for signs and symptoms of encephalopathy.
- Evaluate patient frequently for adverse reactions, especially bleeding tendency.
- Monitor CBC with white cell differential and kidney function test results.

## Patient teaching

- Instruct patient to keep taking drug exactly as prescribed, even after symptoms improve.
- Advise patient to drink enough fluids to ensure adequate urinary output.
- Tell patient to monitor urine output and report significant changes.
-  Instruct patient to immediately report unusual bleeding or bruising.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- Tell patient to use soft toothbrush and electric razor to avoid injury to gums and skin.
- Advise patient to avoid sexual intercourse when visible herpes lesions are present.
- Inform patient that he may need to undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## adalimumab

Humira

**Pharmacologic class:** Biological modifier

**Therapeutic class:** Antirheumatic (disease-modifying), immunomodulator

**Pregnancy risk category B**

### FDA **BOXED WARNING**

- There is increased risk of serious infections with drug use (including tuberculosis [TB], bacterial sepsis,

invasive fungal infections [such as histoplasmosis], and infections due to other opportunistic pathogens) leading to hospitalization or death.

- Discontinue adalimumab if a serious infection or sepsis develops during treatment.
- Perform test for latent TB; if positive, start treatment for TB before starting adalimumab.
- Monitor all patients for active TB during treatment, even if initial latent TB test is negative.
- Lymphoma and other malignancies, some fatal, have been reported in children and adolescents treated with tumor necrosis factor (TNF) blockers, including adalimumab.
- Postmarketing cases of hepatosplenic T-cell lymphoma (HSTCL), a rare type of T-cell lymphoma, have been reported in patients treated with TNF blockers, including adalimumab. These cases have had a very aggressive disease course and have been fatal. The majority of reported TNF blocker cases have occurred in patients with Crohn's disease or ulcerative colitis, and the majority were in adolescent and young adult males. Almost all these patients had received azathioprine or 6-mercaptopurine concomitantly with a TNF blocker at or before diagnosis. It's uncertain whether the occurrence of HSTCL is related to use of a TNF blocker or a TNF blocker in combination with these other immunosuppressants.

## Action

Human immunoglobulin (Ig) G1 monoclonal antibody that binds to human tumor necrosis factor (TNF), which plays a role in inflammation and immune responses. Also modulates biological responses induced or modulated by TNF.

## Availability

*Injection (preservative-free):* 20 mg/0.4 ml in single-use prefilled glass syringe, 40 mg/0.8 ml in a single-use prefilled pen or single-use prefilled glass syringe

## Indications and dosages

➤ To reduce signs and symptoms, slow disease progression, and improve physical function of moderately to severely active rheumatoid arthritis and to reduce signs and symptoms of psoriatic arthritis

**Adults:** 40 mg subcutaneously every other week alone or in combination with methotrexate or other disease-modifying antirheumatic drugs

➤ Moderate to severe chronic plaque psoriasis in patients who are candidates for systemic therapy or phototherapy and when other systemic therapies are medically less appropriate

**Adults:** Initially, 80 mg subcutaneously followed by 40 mg every other week starting 1 week after initial dose

➤ To reduce signs and symptoms of ankylosing spondylitis

**Adults:** 40 mg subcutaneously every other week

➤ Crohn's disease

**Adults:** Initially, 160 mg subcutaneously (four 40-mg injections in one day or two 40-mg injections per day for two consecutive days), followed by 80 mg subcutaneously 2 weeks later (day 15). Two weeks later (day 29), begin a maintenance dose of 40 mg subcutaneously every other week.

➤ Moderately to severely active polyarticular juvenile idiopathic arthritis as monotherapy or concomitantly with methotrexate

**Children age 4 and older weighing 15 kg (33 lb) to less than 30 kg (66 lb):** 20 mg subcutaneously every other week

**Children age 4 and older weighing 30 kg (66 lb) or more:** 40 mg subcutaneously every other week

## Contraindications

- Hypersensitivity to drug
- Active infection, including chronic or localized infection

## Precautions

Use cautiously in:

- preexisting or recent onset of demyelinating disorders, immunosuppression, or lymphoma
- elderly patients
- pregnant or breastfeeding patients
- children.

## Administration

- Give subcutaneously; rotate injection sites.
- Be aware that patients not receiving methotrexate concurrently may benefit from dosage increase to 40 mg weekly.
- Store in refrigerator and protect from light.

Route	Onset	Peak	Duration
Subcut.	Slow	75-187 hr	Unknown

## Adverse reactions

**CNS:** headache, **demyelinating disease**

**CV:** hypertension, **arrhythmias**

**EENT:** sinusitis

**GI:** nausea, vomiting, abdominal pain

**GU:** urinary tract infection, hematuria

**Metabolic:** hyperlipidemia, hypercholesterolemia

**Musculoskeletal:** back pain

**Respiratory:** upper respiratory tract infection

**Skin:** rash

**Other:** accidental injury, pain and swelling at injection site, flulike symptoms, lupuslike syndrome, fungal infection, allergic reactions, **tuberculosis reactivation, malignancies**

## Interactions

**Drug-drug.** *Immunosuppressants (including corticosteroids):* serious infection  
*Live-virus vaccines:* serious illness

**Drug-diagnostic tests.** *Alkaline phosphatase:* elevated level

**Patient monitoring**

📢 Monitor for signs and symptoms of infection if patient is receiving concurrent corticosteroids or other immunosuppressants (because of risk that infection may progress).

- Monitor CBC.

**Patient teaching**

- Teach patient how to recognize and report signs and symptoms of allergic response and other adverse reactions.
- Inform patient that drug lowers resistance to infection. Instruct him to immediately report fever, cough, breathing problems, and other infection symptoms.
- Instruct patient to minimize GI upset by eating small, frequent servings of healthy food and drinking plenty of fluids.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

**adefovir dipivoxil**

Hepsera

**Pharmacologic class:** Nucleotide reverse transcriptase inhibitor

**Therapeutic class:** Antiviral

**Pregnancy risk category C**

**FDA BOXED WARNING**

- Severe acute hepatitis exacerbations have occurred after drug withdrawal. Monitor hepatic function closely for at least several months in patients who discontinue drug or other anti-hepatitis B therapy; if appropriate, resume such therapy.
- Long-term therapy may cause nephrotoxicity in patients with or at

risk for underlying renal dysfunction. Monitor renal function closely and adjust dosage as needed.

- Human immunodeficiency virus (HIV) resistance may occur during therapy in patients with chronic hepatitis B infection who have unrecognized or untreated HIV infection.
- Lactic acidosis and severe hepatomegaly with steatosis (including fatal cases) may occur with use of drug alone or combined with other antiretrovirals.

**Action**

Inhibits hepatitis B virus (HBV) DNA polymerase and suppresses HBV replication

**Availability**

Tablets: 10 mg

**Indications and dosages**

➤ Chronic HBV with active viral replication plus persistent elevations in alanine aminotransferase (ALT) or aspartate aminotransferase (AST) or histologically active disease

**Adults:** 10 mg P.O. daily

**Dosage adjustment**

- Renal impairment

**Contraindications**

- Hypersensitivity to drug

**Precautions**

Use cautiously in:

- lactic acidosis, renal or hepatic impairment
- elderly patients
- pregnant or breastfeeding patients
- children.

**Administration**

- Offer HIV testing before starting therapy. (Drug may increase resistance to antiretrovirals in HIV patients.)
- Give with or without food.

Route	Onset	Peak	Duration
P.O.	Rapid	0.6-4 hr	Unknown

### Adverse reactions

**CNS:** headache

**GI:** nausea, vomiting, diarrhea, abdominal pain, flatulence, dyspepsia, anorexia, pancreatitis

**GU: renal dysfunction**

**Hepatic: severe hepatomegaly with steatosis, hepatitis exacerbation**

(if therapy is withdrawn)

**Metabolic: lactic acidosis**

**Respiratory:** pneumonia

**Other:** fever, infection, pain, antiretroviral resistance in patients with unrecognized HIV

### Interactions

**Drug-drug.** *Acetaminophen, aspirin, indomethacin:* granulocytopenia  
*Acyclovir, adriamycin, amphotericin B, benzodiazepines, cimetidine, dapsone, doxorubicin, experimental nucleotide analogue, fluconazole, flucytosine, ganciclovir, indomethacin, interferon, morphine, phenytoin, probenecid, sulfonamide, trimethoprim, vinblastine, vincristine:* increased risk of nephrotoxicity  
**Drug-diagnostic tests.** *Amylase, blood glucose, blood urea nitrogen, creatine kinase, hepatic enzymes, lipase:* elevated levels

### Patient monitoring

- Monitor fluid intake and output.
- Watch for hematuria.
- Assess for signs and symptoms of lactic acidosis, especially in women and overweight patients.
- Check for liver enlargement.
- Monitor liver and kidney function test results.
- After therapy ends, monitor patient for evidence of serious hepatitis exacerbation.

### Patient teaching

- Advise patient to take drug with or without food.

- Instruct patient to drink plenty of fluids to ensure adequate urine output.
- Advise patient to monitor urine output and color and to report significant changes.
- Tell patient that drug may cause weakness. Discuss appropriate lifestyle adjustments.
- Caution patient not to take over-the-counter analgesics without prescriber's approval.
- Inform patient that he'll undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## adenosine

Adenacor , Adenocard, Adenoscan

**Pharmacologic class:** Endogenous nucleoside

**Therapeutic class:** Antiarrhythmic

**Pregnancy risk category C**

### Action

Converts paroxysmal supraventricular tachycardia (PSVT) to normal sinus rhythm by slowing conduction through atrioventricular (AV) node and interrupting reentry pathway. Also used as a diagnostic agent in thallium scanning.

### Availability

**Injection:** 3 mg/ml

### Indications and dosages

*Adenocard*—

➤ PSVT, including that associated with Wolff-Parkinson-White syndrome (after attempting vagal maneuvers, when appropriate)

**Adults and children weighing more than 50 kg (110 lb):** Initially, 6 mg by rapid I.V. bolus over 1 to 2 seconds.

If desired effect isn't achieved within 1 to 2 minutes, give 12 mg by rapid I.V. bolus; may repeat 12-mg I.V. bolus dose as needed. Maximum single dosage is 12 mg.

**Children weighing less than 50 kg (110 lb):** 0.05 to 0.1 mg/kg by rapid I.V. bolus. If this dosage proves ineffective, increase in 1 to 2 minutes by 0.05 mg/kg q 2 minutes, to a maximum single dosage of 0.3 mg/kg. Maximum single dosage is 12 mg.

*Adenoscan*—

➤ Diagnosis of coronary artery disease in conjunction with thallium-201 myocardial perfusion scintigraphy in patients unable to exercise adequately during testing

**Adults:** 140 mcg/kg/minute by I.V. infusion over 6 minutes, for a total dosage of 0.84 mg/kg. Required dose of thallium-201 is injected at midpoint (after first 3 minutes) of Adenoscan infusion.

### Off-label uses

- Diagnosis of supraventricular arrhythmias
- Pulmonary hypertension

### Contraindications

- Hypersensitivity to drug
- Second- or third-degree AV block
- Sinus node disease
- Bronchoconstrictive lung disease

### Precautions

Use cautiously in:

- asthma, angina
- elderly patients
- pregnant patients
- children.

### Administration

- Don't administer through central line (may cause asystole).
- Don't give more than 12 mg Adenocard as a single dose.
- Don't dilute Adenocard. Administer Adenocard by I.V. injection as a rapid

bolus directly into vein whenever possible during cardiac monitoring.

- After administering Adenocard, flush I.V. line immediately and rapidly with normal saline solution to drive drug into bloodstream.
- Dilute a single dose of Adenoscan in sufficient normal saline solution to be given by continuous infusion over 6 minutes.

Route	Onset	Peak	Duration
I.V.	Immediate	10 sec	20-30 sec

### Adverse reactions

**CNS:** light-headedness, dizziness, apprehension, headache, tingling in arms, numbness

**CV:** chest pain, palpitations, hypotension, ST-segment depression, **first- or second-degree AV block, atrial tachyarrhythmias, other arrhythmias**

**EENT:** blurred vision, tightness in throat

**GI:** nausea, pressure in groin

**Musculoskeletal:** discomfort in neck, jaw, and arms

**Respiratory:** chest pressure, dyspnea and urge to breathe deeply, hyperventilation

**Skin:** burning sensation, facial flushing, sweating

**Other:** metallic taste

### Interactions

**Drug-drug.** *Carbamazepine:* worsening of progressive heart block

*Digoxin, verapamil:* increased risk of ventricular fibrillation

*Dipyridamole:* increased adenosine effect

*Theophylline:* decreased adenosine effect

**Drug-food.** *Caffeine:* decreased adenosine effect

**Drug-herbs.** *Aloe, buckthorn bark or berry, cascara sagrada, rhubarb root, senna leaf or fruits:* increased adenosine effect

*Guarana:* decreased adenosine effect

**Drug-behaviors.** *Smoking:* increased risk of tachycardia

## Patient monitoring

- Monitor heart rhythm for new arrhythmias after administering dose.
- Check vital signs. Assess for chest pain or pressure, dyspnea, and sweating.
- 🔊 Watch for bronchoconstriction in patients with asthma, emphysema, or bronchitis.
- Ask patient if he has recently used aloe, buckthorn, cascara sagrada, guarana, rhubarb root, or senna. If response is positive, notify prescriber.

## Patient teaching

- Advise patient to report problems at infusion site.
- Tell patient he may experience 1 to 2 minutes of flushing, chest pain and pressure, and breathing difficulty during administration. Assure him that these effects will subside quickly.
- Advise patient to minimize GI upset by eating small, frequent servings of healthy food and drinking plenty of fluids.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, foods, herbs, and behaviors mentioned above.

## aflibercept

Eylea

**Pharmacologic class:** Vascular endothelial growth factor (VEGF) inhibitor

**Therapeutic class:** Ophthalmic agent

**Pregnancy risk category** C

## Action

VEGF-A and placental growth factor (PlGF) are members of the VEGF family of angiogenic factors that can act as mitogenic, chemotactic, and vascular permeability factors for endothelial cells. VEGF acts via two receptor

tyrosine kinases, VEGFR-1 and VEGFR-2, present on the surface of endothelial cells. PlGF binds only to VEGFR-1, which is also present on the surface of leucocytes. Activation of these receptors by VEGF-A can result in neovascularization and vascular permeability. Aflibercept acts as a soluble decoy receptor that binds VEGF-A and PlGF, and thereby can inhibit the binding and activation of these cognate VEGF receptors.

## Availability

*Solution for ophthalmic injection:* 40 mg/ml in 3-ml (0.278-ml fill) single-use vials

## Indications and dosages

➤ Neovascular (wet) age-related macular degeneration

**Adults:** 2 mg (0.05 ml) by intravitreal injection into affected eye q 4 weeks for the first 3 months, followed by 2 mg (0.05 ml) once q 8 weeks

## Contraindications

- Hypersensitivity to drug or its components
- Ocular or periocular infection
- Active intraocular inflammation

## Precautions

Use cautiously in:

- pregnant or breastfeeding patients
- children (safety and efficacy not established).

## Administration

- Be aware that drug should be administered by ophthalmic intravitreal injection only under controlled aseptic conditions by a qualified health care professional.
- Provide adequate anesthesia and a topical broad-spectrum anti-infective before the injection, as prescribed.
- Inspect drug for particulate matter and discoloration before administering.

- Use a filter needle to draw up the prescribed dose; remove the filter needle from syringe, and attach a 30G, 1/2-inch injection needle for the intravitreal injection. Discard unused drug after injection.
- Be aware that each vial should only be used for the treatment of a single eye. If the contralateral eye requires treatment, use a new vial and change all equipment.
- Immediately following the intravitreal injection, assess patient for increased intraocular pressure (IOC).

Route	Onset	Peak	Duration
Intravitreal	Unknown	1-3 days	Unknown

### Adverse reactions

**CNS: nonfatal stroke**

**CV: nonfatal MI, vascular death**

**EENT:** conjunctival hyperemia, conjunctival hemorrhage, eye pain, cataract, vitreous detachment, vitreous floaters, increased IOC, endophthalmitis, corneal erosion, corneal edema, retinal detachment, retinal tear, retinal pigment epithelium tear, injection-site pain, injection-site hemorrhage, foreign body sensation in eye, increased lacrimation, blurred vision, eyelid edema

**Other:** hypersensitivity

### Interactions

None

### Patient monitoring

- Continue to monitor patient for increased IOP, endophthalmitis, retinal detachment, and arterial thromboembolic events and be prepared to treat appropriately.

### Patient teaching

 Instruct patient to contact ophthalmologist immediately if treated eye becomes red, light sensitive, or painful, or if vision change occurs.

 Instruct patient to immediately report signs and symptoms of stroke (such as weakness on one side of body or slurred speech), chest pain, or other new signs and symptoms.

- Caution patient to avoid driving and other hazardous activities until visual function has recovered sufficiently.
- As appropriate, review all other significant and life-threatening adverse reactions mentioned above.

## agalsidase beta

Fabrazyme, Fabrazyme

**Pharmacologic class:** Homodimeric glycoprotein

**Therapeutic class:** Recombinant human alpha-galactosidase enzyme

**Pregnancy risk category B**

### Action

Provides exogenous source of alpha-galactosidase A (which is deficient in Fabry disease) and reduces deposits of globotriaosylceramide in kidney and other body tissues

### Availability

*Powder for reconstitution: for injection, lyophilized: 5 mg, 35 mg*

### Indications and dosages

 Fabry disease

**Adults:** 1 mg/kg I.V. q 2 weeks. Infuse no faster than 0.25 mg/minute; if tolerated, increase rate by 0.05 to 0.08 mg/minute in subsequent infusions.

### Contraindications

None

### Precautions

Use cautiously in:

- advanced Fabry disease, cardiac dysfunction

- pregnant or breastfeeding patients
- children.

### Administration

- Premedicate with antipyretics, as prescribed.
- To reconstitute, slowly inject 7.2 ml of sterile water for injection into vial; then roll and tilt vial gently to mix drug.
- Don't shake drug, and don't use filter needles.
- Dilute reconstituted solution with normal saline injection to a final volume of 500 ml.
- Infuse through separate I.V. line; don't mix with other drugs.

Route	Onset	Peak	Duration
I.V.	End of infusion	90 min	Up to 5 hr

### Adverse reactions

**CNS:** anxiety, depression, dizziness, paresthesias

**CV:** dependent edema, chest pain, **cardiomegaly**

**EENT:** rhinitis, sinusitis, laryngitis, pharyngitis

**GI:** nausea, dyspepsia

**GU:** testicular pain

**Musculoskeletal:** arthrosis, bone pain

**Respiratory:** bronchitis, **bronchospasm**

**Skin:** pallor

**Other:** pain, allergic reactions, **infusion reactions** (hypertension, chest tightness, dyspnea, fever, rigors, hypotension, abdominal pain, pruritus, myalgia, headache, urticaria)

### Interactions

**Drug-drug.** *Amiodarone, chloroquine, gentamicin, monobenzone:* inhibition of intracellular agalsidase activity

### Patient monitoring

- Watch closely for signs and symptoms of allergic or infusion reaction.
- Monitor vital signs and fluid intake and output. Stay alert for dependent edema, blood pressure changes, and chest pain.

- Measure temperature. Watch for signs and symptoms of infection (particularly EENT and respiratory infections).
- Evaluate patient's mood. Report significant anxiety or depression.

### Patient teaching

- Teach patient to recognize and immediately report signs and symptoms of allergic or infusion reaction.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects mood, balance, and blood pressure.
- Advise patient to report signs and symptoms of infection (particularly EENT and respiratory infections).
- Inform patient that drug can cause depression and anxiety. Instruct him to notify prescriber if these effects occur.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## albuterol (salbutamol)

Proventil

### albuterol sulfate (salbutamol sulfate)

AccuNeb, Gen-Salbutamol<sup>Ⓢ</sup>, Nu-Salbutamol<sup>Ⓢ</sup>, ProAir HFA, Proventil HFA, Ventolin HFA, Vospire-ER

**Pharmacologic class:** Sympathomimetic (beta<sub>2</sub>-adrenergic agonist)

**Therapeutic class:** Bronchodilator, antiasthmatic

**Pregnancy risk category C**

### Action

Relaxes smooth muscles by stimulating beta<sub>2</sub>-receptors, thereby causing bronchodilation and vasodilation

**Availability**

*Aerosol*: 90 mcg/actuation,

108 mcg/inhalation

*Oral solution*: 2 mg/5 ml

*Solution for inhalation*: 0.083% (3 ml),

0.5% (0.5 and 20 ml), 0.63 mg/3 ml,

1.25 mg/3 ml

*Syrup*: 2 mg/5 ml

*Tablets*: 2 mg, 4 mg

*Tablets (extended-release)*: 4 mg, 8 mg

**Indications and dosages**

➤ To prevent and relieve bronchospasm in patients with reversible obstructive airway disease

**Adults and children ages 12 and older:**

*Tablets*—2 to 4 mg P.O. three or four times daily, not to exceed 32 mg daily.

*Extended-release tablets*—4 to 8 mg P.O. q 12 hours, not to exceed 32 mg daily in divided doses. *Syrup*—2 to 4 mg (1 to 2 tsp or 5 to 10 ml) three or four times daily, not to exceed 8 mg q.i.d.

*Aerosol*—one to two inhalations q 4 to 6 hours to relieve bronchospasm; two inhalations q.i.d. to prevent bronchospasm. *Solution for inhalation*—2.5 mg three to four times daily by nebulization, delivered over 5 to 15 minutes.

**Children ages 6 to 12:** *Tablets*—2 mg P.O. three or four times daily; maximum daily dosage is 24 mg, given in divided doses. *Extended-release tablets*—4 mg q 12 hours; maximum daily dosage is 24 mg/kg given in divided doses. *Syrup*—2 mg (1 tsp or 5 ml) three or four times daily, not to exceed 24 mg.

**Adults and children age 4 and older (with ProAir HFA):** Two inhalations q 4 to 6 hours to treat acute bronchospasm

**Children ages 2 to 12 weighing more than 15 kg (33 lb):** *Solution for inhalation*—2.5 mg three to four times/day by nebulization

**Children ages 2 to 6:** *Syrup*—Initially, 0.1 mg/kg P.O. t.i.d., not to exceed

2 mg (1 tsp) t.i.d. Maximum dosage is 4 mg (2 tsp) t.i.d.

➤ To prevent exercise-induced bronchospasm

**Adults and children older than age 4 (older than age 12 with Proventil):**

Two inhalations 15 minutes before exercise

**Adults and children age 4 and older (with ProAir HFA):** Two inhalations q 15 to 30 minutes before exercise

**Dosage adjustment**

- Sensitivity to beta-adrenergic stimulants
- Elderly patients

**Off-label uses**

- Chronic obstructive pulmonary disease
- Hyperkalemia with renal failure
- Preterm labor management

**Contraindications**

- Hypersensitivity to drug

**Precautions**

Use cautiously in:

- cardiac disease, hypertension, diabetes mellitus, glaucoma, seizure disorder, hyperthyroidism, exercise-induced bronchospasm, prostatic hypertrophy
- elderly patients
- pregnant or breastfeeding patients
- children.

**Administration**

- Give extended-release tablets whole; don't crush or mix with food.
- Administer solution for inhalation by nebulization over 5 to 15 minutes, after diluting 0.5 ml of 0.5% solution with 2.5 ml of sterile normal saline solution.
- Know that children weighing less than 15 kg (33 lb) who require less than 2.5 mg/dose should receive 0.5% inhalation solution.

Route	Onset	Peak	Duration
P.O.	15-30 min	2-3 hr	6-12 hr
P.O. (extended)	30 min	2-3 hr	12 hr
Aerosol	6-10 min	30 min-1 hr	2-4 hr
Inhalation	5 min	30 min-1 hr	2-4 hr

### Adverse reactions

**CNS:** dizziness, excitement, headache, hyperactivity, insomnia

**CV:** hypertension, palpitations, tachycardia, chest pain

**EENT:** conjunctivitis, dry and irritated throat, pharyngitis

**GI:** nausea, vomiting, anorexia, heartburn, GI distress, dry mouth

**Metabolic:** hypokalemia

**Musculoskeletal:** muscle cramps

**Respiratory:** cough, dyspnea, wheezing, **paradoxical bronchospasm**

**Skin:** pallor, urticaria, rash, angioedema, flushing, sweating

**Other:** tooth discoloration, increased appetite, **hypersensitivity reaction**

### Interactions

**Drug-drug.** *Beta-adrenergic blockers:* inhibited albuterol action, possibly causing severe bronchospasm in asthmatic patients

*Digoxin:* decreased digoxin blood level

*MAO inhibitors:* increased cardiovascular adverse effects

*Oxytoxics:* severe hypotension

*Potassium-wasting diuretics:* ECG changes, hypokalemia

*Theophylline:* increased risk of theophylline toxicity

**Drug-food.** *Caffeine-containing foods and beverages (such as coffee, tea, chocolate):* increased stimulant effect

**Drug-herbs.** *Cola nut, ephedra (ma huang), guarana, yerba maté:* increased stimulant effect

### Patient monitoring

☞ Stay alert for hypersensitivity reactions and paradoxical bronchospasm. Stop drug immediately if these occur.

- Monitor serum electrolyte levels.

### Patient teaching

- Tell patient to swallow extended-release tablets whole and not to mix them with food.
- Follow manufacturer's directions supplied with inhalation drugs.
- ☞ Teach patient signs and symptoms of hypersensitivity reaction and paradoxical bronchospasm. Tell him to stop taking drug immediately and contact prescriber if these occur.
- ☞ Instruct patient to notify prescriber immediately if prescribed dosage fails to provide usual relief, because this may indicate seriously worsening asthma.
- Advise patient to limit intake of caffeine-containing foods and beverages and to avoid herbs unless prescriber approves.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Advise patient to establish effective bedtime routine and to take drug well before bedtime to minimize insomnia.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, foods, and herbs mentioned above.

## aldesleukin (interleukin-2, IL-2)

Proleukin

**Pharmacologic class:** Interleukin-2 (IL-2), human recombinant (cytokine)

**Therapeutic class:** Antineoplastic (miscellaneous)

**Pregnancy risk category C**

Reactions in **bold** are life-threatening.

☞ Clinical alert

**FDA BOXED WARNING**

- Give only to patients with normal cardiac and pulmonary function, as shown by thallium stress testing and pulmonary function testing. Use extreme caution when giving to patients with normal thallium stress test and normal pulmonary function tests who have a history of cardiac or pulmonary disease.
- Give under supervision of physician experienced in cancer chemotherapy, in setting where intensive care facilities and cardiopulmonary or intensive care specialists are available.
- Drug is linked to capillary leak syndrome, which causes hypotension and reduced organ perfusion (possibly severe and resulting in death).
- Before starting drug, preexisting bacterial infections must be treated, because drug may impair neutrophil function and increase disseminated infection risk. Patients with indwelling central lines are at special risk for infection with gram-positive microorganisms. Prophylactic antibiotics can help prevent staphylococcal infections.
- Withhold drug in patients who develop moderate to severe lethargy or somnolence; continued administration may cause coma.

**Action**

Activates cellular immunity and inhibits tumor growth by increasing lymphocytes and cytokines, which lyse tumor cells

**Availability**

*Injection:* 22 million international units/vial

**Indications and dosages**

➤ Metastatic renal cell carcinoma and metastatic melanoma

**Adults older than age 18:** 600,000 international units/kg I.V. given over 15 minutes q 8 hours for a maximum of 14 doses, followed by 9 days of rest. Repeat for another 14 doses, for a maximum of 28 doses per course.

**Off-label uses**

- Colorectal cancer
- Kaposi's sarcoma
- Non-Hodgkin's lymphoma

**Contraindications**

- Hypersensitivity to drug
- Arrhythmias, cardiac tamponade, seizures, severe GI bleeding, coma or toxic psychosis lasting more than 48 hours
- Organ allograft
- Abnormal thallium stress test or pulmonary function test results

**Precautions**

Use cautiously in:

- anemia, bacterial infections, heart disease, CNS metastases, hepatic disease, pulmonary disease, renal disease, thrombocytopenia
- pregnant or breastfeeding patients
- children.

**Administration**

- Make sure patient's thallium stress test and pulmonary function test results are normal before giving.
- ⚠ Don't give if patient is drowsy or severely lethargic; contact prescriber immediately.
- Reconstitute drug according to label directions with 1.2 ml of sterile water for injection by injecting diluent against side of vial (to prevent excessive foaming).
- Further dilute reconstituted dose with 50 ml of 5% dextrose injection.
- Administer I.V. infusion over 15 minutes.
- Don't use in-line filter.

Route	Onset	Peak	Duration
I.V.	5 min	13 min	3-4 hr

### Adverse reactions

**CNS:** dizziness, mental status changes, syncope, sensory or motor dysfunction, headache, fatigue, rigors, weakness, malaise, poor memory, depression, sleep disturbances, hallucinations

**CV:** bradycardia, sinus tachycardia, premature atrial complexes, premature ventricular contractions, **arrhythmias, myocardial ischemia, cardiac arrest, capillary leak syndrome and severe hypotension, myocardial infarction**

**EENT:** reversible vision changes, conjunctivitis

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, abdominal pain, stomatitis, anorexia, **intestinal perforation, ileus, GI bleeding**

**GU:** hematuria, proteinuria, dysuria, **renal failure, oliguria or anuria**

**Hematologic:** anemia, purpura, eosinophilia, **thrombocytopenia, coagulation disorders, leukopenia, leukocytosis**

**Hepatic:** jaundice, ascites

**Metabolic:** hyperglycemia, **hypoglycemia, acidosis, alkalosis**

**Musculoskeletal:** joint and back pain, myalgia

**Respiratory:** cough, chest pain, tachypnea, wheezing, dyspnea, pulmonary congestion, **pulmonary edema, respiratory failure, apnea, pleural effusion**

**Skin:** erythema, pruritus, rash, dry skin, petechiae, urticaria, exfoliative dermatitis

**Other:** weight gain or loss, fever, chills, edema, infection, pain or reaction at injection site, hypersensitivity reaction

### Interactions

**Drug-drug.** *Aminoglycosides, asparaginase, cytotoxic chemotherapy agents, doxorubicin, indomethacin, methotrexate:* increased toxicity

*Antihypertensives:* increased hypotensive effect

*Glucocorticoids:* reduced antitumor effects

**Drug-diagnostic tests.** *Alkaline phosphatase, bilirubin, glucose, blood urea nitrogen, creatinine, potassium, transaminases:* increased levels

*Calcium, glucose, magnesium, phosphorus, potassium, protein sodium, uric acid:* decreased levels

### Patient monitoring

- Monitor heart rate and rhythm, vital signs, and fluid intake and output.
- Assess for signs and symptoms of hypersensitivity reaction and infection.
- Monitor for adverse CNS effects. Report these immediately.
- Evaluate chest X-rays.
- Monitor CBC, electrolyte levels, and liver and kidney function test results.

### Patient teaching

 Tell patient that drug lowers resistance to infections. Advise him to immediately report fever, cough, breathing problems, and other signs or symptoms of infection.

 Advise patient to immediately report chest pain, irregular or fast heart beats, easy bruising or bleeding, or abdominal pain.

- Instruct patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- Provide dietary counseling. Refer patient to dietitian if adverse GI effects significantly limit food intake.
- Notify patient that he'll undergo blood testing and have chest X-rays taken during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## alendronate sodium

Apo-Alendronate\*, Co Alendronate\*, Dom-Alendronate\*, Fosamax, Gen-Alendronate\*, Ratio-Alendronate\*, Sandoz Alendronate

**Pharmacologic class:** Bisphosphonate

**Therapeutic class:** Bone-resorption inhibitor

**Pregnancy risk category C**

### Action

Impedes bone resorption by inhibiting osteoclast activity, absorbing calcium phosphate crystal in bone, and directly blocking dissolution of hydroxyapatite crystal of bone

### Availability

Tablets: 5 mg, 10 mg, 35 mg, 40 mg, 70 mg

### Indications and dosages

➤ Paget's disease of bone (men and women)

**Adults:** 40 mg P.O. daily for 6 months

➤ Prevention of osteoporosis in postmenopausal women

**Adults:** 5 mg P.O. daily or 35 mg P.O. once weekly for up to 7 years

➤ Glucocorticoid-induced osteoporosis in men and women

**Adults:** 5 mg P.O. daily. For postmenopausal women not receiving estrogen, recommended dosage is 10 mg P.O. once daily.

➤ Treatment of osteoporosis in postmenopausal women; treatment to increase bone mass in men with osteoporosis

**Adults:** 70-mg tablet or 70 mg oral solution P.O. weekly or 10-mg tablet P.O. daily

### Contraindications

- Hypersensitivity to drug or its components
- Hypocalcemia

- Esophageal abnormalities such as stricture or achalasia that delay esophageal emptying
- Inability to stand or sit upright for 30 minutes
- Increased risk of aspiration (oral solution)

### Precautions

Use cautiously in:

- Severe renal insufficiency (creatinine clearance less than 35 ml/minute), esophageal disease, GI ulcers, gastritis, osteonecrosis of jaw
- pregnant or breastfeeding patients
- children.

### Administration

- Give with 6 to 8 oz of water 30 minutes before first food, beverage, or medication of day.
- Don't give at bedtime or before patient arises for the day.
- Don't give food, other beverages, or oral drugs for at least 30 minutes after giving tablets.
- Keep patient upright for at least 30 minutes after giving dose to avoid serious esophageal irritation.
- Follow oral solution with at least 60 ml (2 oz) of water to facilitate gastric emptying.
- Be aware that patients should receive supplemental calcium and vitamin D if dietary intake is inadequate.
- Be aware that aspirin and nonsteroidal anti-inflammatory drugs (NSAIDs) may worsen GI upset. Discuss alternative analgesics with prescriber.

Route	Onset	Peak	Duration
P.O.	1 mo	3-6 mo	3 wk-7 mo

### Adverse reactions

**CNS:** headache

**CV:** hypertension

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, acid regurgitation, esophageal ulcer, flatulence, dyspepsia, abdominal distention, dysphagia

**GU:** urinary tract infection

**Hematologic:** anemia

**Metabolic:** hypomagnesemia, hypophosphatemia, hypokalemia, **fluid overload**

**Musculoskeletal:** bone or muscle pain

**Skin:** rash, redness, photosensitivity

**Other:** abnormal taste

## Interactions

**Drug-drug.** *Antacids, calcium supplements:* decreased alendronate absorption  
*NSAIDs, salicylates:* increased risk of GI upset

*Ranitidine:* increased alendronate effect

**Drug-diagnostic tests.** *Calcium, phosphate:* decreased levels

**Drug-food.** *Any food, caffeine (as in coffee, tea, cocoa), mineral water, orange juice:* decreased drug absorption

## Patient monitoring

- Monitor for signs and symptoms of GI irritation, including ulcers.
- Monitor blood pressure.
- Evaluate blood calcium and phosphate levels.

## Patient teaching

📣 Tell patient to immediately report serious vomiting, severe chest or abdominal pain, difficulty swallowing, or abdominal swelling.

- Instruct patient to take tablets first thing in the morning on an empty stomach, with 6 to 8 oz of water only.
- Instruct patient to follow oral solution with at least 60 ml (2 oz) of water.
- Tell patient not to lie down, eat, drink, or take other oral medications for 30 minutes after taking dose.
- Advise patient to take only those pain relievers suggested by prescriber. Inform him that some over-the-counter pain medications (such as aspirin and NSAIDs) may worsen drug's adverse effects.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially

those related to the drugs, tests, and foods mentioned above.

## alfuzosin

Besavar<sup>Ⓢ</sup>, Uroxatral, Xatral<sup>Ⓢ</sup>

**Pharmacologic class:** Alpha<sub>1</sub>-adrenergic receptor blocker

**Therapeutic class:** Benign prostatic hyperplasia agent

**Pregnancy risk category B**

## Action

Selectively inhibits alpha<sub>1</sub>-adrenergic receptors in lower urinary tract, relaxing smooth muscle in bladder neck and prostate

## Availability

*Tablets (extended-release):* 10 mg

## Indications and dosages

➤ Signs and symptoms of benign prostatic hyperplasia

**Adults:** 10 mg P.O. once daily with food, given at same meal each day

## Contraindications

- Hypersensitivity to drug or its components
- Moderate or severe hepatic impairment
- Concomitant use of potent CYP-4503A4 inhibitors (such as itraconazole, ketoconazole, or ritonavir)

## Precautions

Use cautiously until prostate cancer is ruled out. Also use cautiously in:

- severe renal impairment
- mild hepatic impairment
- angina pectoris, orthostatic hypotension, syncope, or concomitant treatment with phosphodiesterase-5 (PDE-5) inhibitors, antihypertensives or nitrates

- concomitant use of other alpha blockers (use not recommended)
- QT prolongation, concomitant use of drugs that prolong QT interval
- cataract surgery.

### Administration

- Administer with food.
- Don't crush or break tablet.
- Be aware that prostate carcinoma should be ruled out before starting therapy.

Route	Onset	Peak	Duration
P.O.	Unknown	8 hr	Unknown

### Adverse reactions

**CNS:** dizziness, headache, fatigue

**EENT:** sinusitis, pharyngitis

**GI:** nausea, constipation, abdominal pain, dyspepsia

**GU:** priapism

**Respiratory:** upper respiratory tract infection, bronchitis

**Other:** pain

### Interactions

**Drug-drug.** *Alpha adrenergic antagonists, antihypertensives, PDE-5 inhibitors:* increased risk of symptomatic hypotension, orthostatic hypotension, or syncope *CYP3A4 inhibitors (such as itraconazole, ketoconazole, ritonavir):* increased alfuzosin blood level

*Other alpha adrenergic antagonists:* increased antagonistic effect

**Drug-food.** *Any food:* increased alfuzosin absorption

### Patient monitoring

🚫 Discontinue drug if signs or symptoms of angina pectoris appear or worsen.

### Patient teaching

- Instruct patient to take drug with food at same time each day.
- Tell patient not to break, chew, or crush tablet.

- Caution patient to avoid driving and other hazardous activities until he knows if drug makes him dizzy.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and foods mentioned above.

## aliskiren

Tekturna

**Pharmacologic class:** Direct renin inhibitor

**Therapeutic class:** Antihypertensive

**Pregnancy risk category C** (first trimester), **D** (second and third trimesters)

### FDA BOXED WARNING

- Drugs that act directly on the renin-angiotensin system can cause injury and death to a developing fetus.
- Discontinue drug as soon as possible when pregnancy is detected.

### Action

Decreases plasma renin activity and inhibits conversion of angiotensinogen to angiotensin

### Availability

*Tablets:* 150 mg, 300 mg

### Indications and dosages

➤ Hypertension (alone or in combination with other antihypertensives)

**Adults:** Initially, 150 mg P.O. once daily; may increase to 300 mg if blood pressure isn't adequately controlled

### Contraindications

- Concurrent use of angiotensin receptor blockers (ARBs) or ACE inhibitors in patients with diabetes

## Precautions

Use cautiously in:

- patients with severe renal dysfunction, nephrotic syndrome, renovascular hypertension, or history of dialysis
- angioedema (laryngeal edema)
- concurrent use of ACE inhibitors or ARBs in patients with renal impairment (GFR less than 60 ml/minute; avoid use)
- concurrent use of NSAIDs including selective COX-2 inhibitors, potassium-sparing diuretics, potassium supplements, salt substitutes containing potassium, or other drugs that increase potassium levels
- females of childbearing age
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

## Administration

- Give consistently with or without food, but not with high-fat foods.

Route	Onset	Peak	Duration
P.O.	Unknown	1-3 hr	Unknown

## Adverse reactions

**CNS:** headache, fatigue

**CV:** dizziness, hypotension

**EENT:** nasopharyngitis

**GI:** diarrhea, gastroesophageal reflux

**Musculoskeletal:** back pain

**Respiratory:** upper respiratory tract infection, cough

**Skin:** rash

**Other:** edema, angioedema

## Interactions

**Drug-drug.** *ACE inhibitors, ARBs:* increased risk of renal impairment, hypotension, and hyperkalemia  
*Cyclosporine, itraconazole:* significantly increased aliskiren level  
*NSAIDs (including selective COX-2 inhibitors):* increased risk of deterioration of renal function, including possible acute renal failure, and increased aliskiren antihypertensive effect

**Drug-diagnostic tests.** *BUN, creatine kinase, potassium, serum creatinine, serum uric acid:* increased values  
*Hematocrit, hemoglobin:* decreased values  
**Drug-food.** *High-fat meals:* decreased drug absorption

## Patient monitoring

- Stay alert for signs and symptoms of renal dysfunction, especially in patients receiving NSAIDs.
- 🔊 Monitor patient for signs and symptoms of angioedema; discontinue drug if signs and symptoms are present.

## Patient teaching

- Instruct patient to take drug consistently with or without food, but not with high-fat foods.
- Instruct patient not to stop drug suddenly because doing so could result in uncontrolled high blood pressure.
- Advise female to tell prescriber if she's pregnant or breastfeeding before taking drug.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## alitreinoin

Panretin

**Pharmacologic class:** Second-generation retinoid

**Therapeutic class:** Topical antineoplastic

**Pregnancy risk category D**

## Action

Binds to and activates intracellular retinoid receptor subtypes, regulating expression of genes that control cellular differentiation and proliferation

## Availability

*Topical gel:* 0.1%

## Indications and dosages

➤ Treatment of cutaneous lesions in patients with AIDS-related Kaposi's sarcoma

**Adults:** Apply to lesions b.i.d., gradually increasing to t.i.d. or q.i.d. according to individual lesion tolerance

## Contraindications

- Hypersensitivity to retinoids or other drug components

## Precautions

Use cautiously in:

- photosensitivity
- concomitant use of insecticides containing diethyltoluamide (DEET)
- elderly patients
- pregnant or breastfeeding patients
- children.

## Administration

- Apply generous amount of gel to affected area. Let it dry for 3 to 5 minutes before covering with clothing.

Route	Onset	Peak	Duration
Topical	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** paresthesia

**Skin:** rash, pruritus, exfoliative dermatitis, skin disorder at application site (such as abrasion, burning, blisters, excoriation, scab, cracking, crusting, drainage, eschar, fissure, oozing, peeling, redness, or swelling), edema

**Other:** pain, increased sensitivity to sunlight or sun lamps

## Interactions

**Drug-behaviors.** *DEET-containing insect repellents:* increased adverse reactions to DEET

## Patient monitoring

- Monitor patient for serious adverse effects, especially burns caused by exposure to sunlight or sun lamps.

## Patient teaching

- Instruct patient to apply generous amount of gel to affected skin area and let dry for 3 to 5 minutes before covering area with clothing.

- Caution patient to avoid applying gel to mucous membranes or to normal skin surrounding lesions.

🔊 Inform patient that drug increases sensitivity to sunlight and that exposure to sunlight or sun lamps (even through window glass or on a cloudy day) may cause serious burn of treated areas. Caution him to avoid such exposure.

- Tell patient to avoid insect repellents containing DEET during therapy.

- Emphasize importance of keeping all medical appointments so prescriber can check progress and monitor for unwanted drug effects.

- Advise females of childbearing potential to avoid becoming pregnant while using this drug.

- As appropriate, review all other significant adverse reactions and interactions, especially those related to the behaviors mentioned above.

## allopurinol

Apo-Allopurinol<sup>✳</sup>, Caplenol<sup>⚡</sup>, Cosuric<sup>⚡</sup>, Nu-purol<sup>✳</sup>, Rimapurinol<sup>⚡</sup>, Zyloprim, Zyloprim<sup>✳</sup>

## allopurinol sodium

Aloprim

**Pharmacologic class:** Xanthine oxidase inhibitor

**Therapeutic class:** Antigout drug

**Pregnancy risk category C**

## Action

Inhibits conversion of xanthine to uric acid and increases reutilization of hypoxanthine and xanthine for nucleic

acid synthesis, thereby decreasing uric acid levels in both serum and urine

### Availability

*Powder for injection:* 500-mg vial

*Tablets:* 100 mg, 300 mg

### Indications and dosages

➤ Gout in patients with frequent disabling attacks; gout resulting from hyperuricemia, acute or chronic leukemia, psoriasis, or multiple myeloma

**Adults:** 200 to 300 mg P.O. daily in mild cases or 400 to 600 mg P.O. daily in severe cases, to a maximum dosage of 800 mg/day; or 200 to 400 mg/m<sup>2</sup>/day I.V. as a single infusion or in equally divided doses q 6, 8, or 12 hours to a maximum dosage of 600 mg/day

**Children ages 6 to 10:** 300 mg P.O. daily

**Children younger than age 6:** 150 mg P.O. daily

➤ To prevent acute gout attacks

**Adults:** 100 mg P.O. daily; increase by 100 mg at weekly intervals without exceeding maximum dosage of 800 mg, until uric acid level falls to 6 mg/dl or less

➤ Recurrent calcium oxalate calculi

**Adults:** 200 to 300 mg P.O. daily in single dose or divided doses

➤ To prevent uric acid nephropathy during cancer chemotherapy

**Adults:** 600 to 800 mg P.O. daily for 2 to 3 days, accompanied by high fluid intake

### Dosage adjustment

- Renal impairment

### Off-label uses

- Hematemesis caused by gastritis induced by nonsteroidal anti-inflammatory drugs
- Pain from acute pancreatitis
- Seizures refractory to standard therapy

### Contraindications

- Hypersensitivity to drug

### Precautions

Use cautiously in:

- acute gout attack, renal insufficiency, dehydration
- pregnant or breastfeeding patients.

### Administration

- Reconstitute single-dose vial with 25 ml sterile water for injection. Further dilute with normal saline solution or D<sub>5</sub>W to a concentration of 6 mg/ml or less.
- Infuse over 30 to 60 minutes.
- Don't mix I.V. form with other drugs or give through same I.V. port as drugs that may be incompatible.
- Divide oral doses larger than 300 mg.
- Give oral form with or right after meals.
- Don't give oral form with mineral water, orange juice, or caffeinated beverages.

Route	Onset	Peak	Duration
P.O.	2-3 days	0.5-2 hr	1-2 wk
I.V.	Unknown	0.5 hr	Unknown

### Adverse reactions

**CNS:** drowsiness, dizziness, headache, peripheral neuropathy, neuritis, paresthesia

**CV:** hypersensitivity vasculitis, **necrotizing vasculitis**

**EENT:** retinopathy, cataract, epistaxis

**GI:** nausea, vomiting, diarrhea, abdominal pain, dyspepsia, gastritis

**GU:** exacerbation of gout and renal calculi, **uremia, renal failure**

**Hematologic:** eosinophilia, anemia, **thrombocytopenia, bone marrow depression, agranulocytosis, leukocytosis, aplastic anemia, leukopenia**

**Hepatic:** cholestatic jaundice, **hepatomegaly, hepatitis, hepatic necrosis**

**Musculoskeletal:** myopathy, joint pain

**Skin:** rash; alopecia; maculopapular, urticarial, or purpuric lesions; severe furunculosis of nose; ichthyosis; bruising; **scaly or exfoliative erythema multiforme; toxic epidermal necrolysis**

**Other:** abnormal taste, loss of taste, fever, chills

### Interactions

**Drug-drug.** *Amoxicillin, ampicillin, bacampicillin:* increased risk of rash  
*Anticoagulants (except warfarin):* increased anticoagulant effect  
*Antineoplastics:* increased risk of myelosuppression  
*Azathioprine, mercaptopurine:* inhibition of allopurinol metabolism  
*Chlorpropamide:* increased hypoglycemic effects  
*Diazoxide, diuretics, mecamlamine, pyrazinamide:* increased uric acid levels  
*Ethacrynic acid, thiazide diuretics:* increased risk of allopurinol toxicity  
*Uricosurics:* increased uric acid excretion  
*Urine-acidifying drugs (ammonium chloride, ascorbic acid, potassium or sodium phosphate):* increased risk of renal calculi  
*Xanthines:* increased theophylline levels  
**Drug-diagnostic tests.** *Alanine aminotransferase, alanine phosphatase, aspartate aminotransferase, bilirubin, eosinophils:* increased levels  
*Granulocytes, hemoglobin, platelets, white blood cells:* decreased levels  
**Drug-food.** *Caffeine-containing beverages and foods, mineral water, orange juice:* decreased drug absorption, increased uric acid level  
**Drug-behaviors.** *Alcohol use:* increased uric acid level

### Patient monitoring

- Assess fluid intake and output. Intake should be sufficient to yield daily output of at least 2 L of slightly alkaline urine.
- Monitor uric acid level to help evaluate drug efficacy.

### Patient teaching

 Instruct patient to promptly report painful urination, bloody urine, rash, eye irritation, or swelling of lips and mouth.

- Tell patient to take drug with food or milk, exactly as prescribed.
- Explain that gout attacks may not ease significantly until 2 to 6 weeks of therapy.
- Caution patient to avoid driving and other hazardous tasks until he knows how drug affects concentration and alertness.
- Advise patient to avoid alcohol, caffeine-containing beverages and foods, mineral water, and orange juice during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

## almotriptan malate

Axert

**Pharmacologic class:** Serotonin (5-hydroxytryptamine [5-HT]) receptor agonist

**Therapeutic class:** Vascular headache suppressant, antimigraine drug

**Pregnancy risk category C**

### Action

Promotes vascular constriction and relieves migraine by stimulating specific 5-HT receptors in intracranial blood vessels and sensory trigeminal nerves

### Availability

*Tablets:* 6.25 mg, 12.5 mg

### Indications and dosages

 Acute migraine

**Adults:** Single dose of 6.25 to 12.5 mg P.O. at first sign or symptom of migraine; may be repeated after 2 hours. Don't exceed two doses in a 24-hour period.

## Dosage adjustment

- Severe renal or hepatic impairment

## Contraindications

- Hypersensitivity to drug
- Ischemic heart disease, history of myocardial infarction (MI), documented silent ischemia, symptoms or findings consistent with ischemic heart disease, cerebrovascular accident, uncontrolled hypertension, coronary artery vasospasm
- Ischemic bowel disease
- Basilar or hemiplegic migraine
- MAO inhibitor use in past 14 days
- Use of other 5-HT agonists or ergotamine-containing or ergot-type drugs within past 24 hours

## Precautions

Use cautiously in:

- impaired renal or hepatic function
- cardiovascular risk factors
- pregnant or breastfeeding patients
- children younger than age 18 (use not recommended).

## Administration

- Give with or without food.
- Wait at least 2 hours after initial dose before giving repeat dose.
- Don't exceed two doses in 24 hours.
- ⚠ Don't give within 14 days of MAO inhibitors or within 24 hours of other 5-HT agonists or ergotamine-containing or ergot-type drugs.

Route	Onset	Peak	Duration
P.O.	Variable	1-3 hr	Unknown

## Adverse reactions

**CNS:** headache, anxiety, dizziness, fatigue, malaise, weakness, cold or hot sensations, sedation, numbness, burning or tingling sensations

**CV:** blood pressure changes, palpitations, tachycardia, **coronary artery vasospasm, MI, ventricular fibrillation, ventricular tachycardia**

**EENT:** vision changes; nasal, throat, and mouth discomfort

**GI:** nausea, abdominal distress, dysphagia, dry mouth

**Musculoskeletal:** weakness, stiff neck, muscle pain

**Respiratory:** chest tightness or pressure

**Skin:** sweating, flushing

## Interactions

**Drug-drug.** *CYP2D6 inhibitors (erythromycin, itraconazole, ritonavir):*

increased almotriptan effect

*Ergot derivatives, other 5-HT agonists:* prolonged vasoactive action

*Ketoconazole and other CYP3A inhibitors:* increased almotriptan blood level, leading to toxicity

*MAO inhibitors:* decreased almotriptan absorption

*Selective serotonin reuptake inhibitors:* weakness, hyperreflexia, poor coordination

## Patient monitoring

- Assess patient's cardiovascular status, noting chest tightness or pressure.
- Monitor vital signs.

## Patient teaching

⚠ Tell patient to immediately report chest tightness or pressure.

- Inform patient that he may take drug with or without food.

- If second dose is needed, tell patient to take it at least 2 hours after first.

- Caution patient not to take more than two doses in 24 hours.

- Instruct patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## alosetron hydrochloride

Lotronex

**Pharmacologic class:** Serotonin receptor antagonist

**Therapeutic class:** Agent for irritable bowel syndrome

**Pregnancy risk category B**

### FDA BOXED WARNING

- Infrequent but serious GI problems have occurred, resulting in hospitalization and, rarely, blood transfusions, surgery, and death.
- Only physicians enrolled in Glaxo-SmithKline's Prescribing Program for Lotronex should prescribe Lotronex.
- Drug is indicated only for women with severe, diarrhea-predominant irritable bowel syndrome who don't respond adequately to conventional therapy. Patient must read and sign agreement before receiving initial prescription.
- Discontinue immediately if patient develops constipation or ischemic colitis symptoms. Don't resume therapy in patients who developed ischemic colitis. Patients with resolved constipation should resume only on advice of physician.

### Action

Inhibits activation of nonselective cation channels, resulting in modulation of enteric nervous system

### Availability

Tablets: 0.5 mg, 1 mg

### Indications and dosages

➤ Women with severe, diarrhea-predominant irritable bowel syndrome (IBS) who have chronic symptoms not

caused by anatomic or biochemical abnormalities and who are unresponsive to conventional therapy

**Adult women:** Initially, 0.5 mg P.O. b.i.d. If after 4 weeks dose is well tolerated but doesn't adequately control IBS, may increase to 1 mg P.O. b.i.d.; therapy should be discontinued in patients not responding to 1 mg P.O. b.i.d. after 4 weeks.

### Contraindications

- Concurrent use of fluvoxamine
- Severe hepatic impairment
- Current constipation or history of chronic or severe constipation
- History of complications related to constipation
- History of intestinal obstruction, stricture, toxic megacolon, GI perforation, or adhesion
- History of ischemic colitis, impaired intestinal circulation, thrombophlebitis, or hypercoagulable state
- Current Crohn's disease or ulcerative colitis, active diverticulitis, or history of these disorders
- Inability to understand or comply with patient-physician agreement for drug

### Precautions

Use cautiously in:

- hepatic insufficiency
- moderate CYP/A2 inhibitors, such as quinolone antibiotics and cimetidine (avoid use)
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

⚠ Before administering, know that drug is approved with the following marketing restrictions: Ensure that patient understands that drug has serious risks, patient reads and signs patient-physician agreement, and patient follows directions in accompanying medication guide.

- Know that anatomical and biochemical abnormalities of GI tract should be ruled out before drug therapy starts.
- Give with or without food.
- 🔊 Don't administer drug if patient is constipated.
- 🔊 Stop therapy immediately if patient develops constipation or signs or symptoms of ischemic colitis.

Route	Onset	Peak	Duration
P.O.	Rapid	1 hr	Unknown

### Adverse reactions

**CNS:** anxiety, malaise

**CV:** increased blood pressure, extrasystoles, tachyarrhythmias, **arrhythmias**

**GI:** nausea; constipation; GI pain, discomfort, or spasms; abdominal distention; regurgitation or gastroesophageal reflux; hemorrhoids; decreased salivation; dyspepsia; **ischemic colitis**; **GI perforation**; **small-bowel mesenteric ischemia**

**GU:** urinary frequency

**Hematologic:** **hemorrhage**

**Respiratory:** breathing disorders

**Skin:** sweating, urticaria

**Other:** fatigue, cramps, disturbed temperature regulation

### Interactions

**Drug-drug.** *CYP450 inducers or inhibitors:* altered alosetron clearance

*Fluvoxamine:* increased alosetron concentration and half-life

**Drug-diagnostic tests.** *Blood glucose, calcium, phosphate:* increased or decreased level

### Patient monitoring

🔊 Monitor patient closely for adverse reactions, especially such GI reactions as constipation and signs or symptoms of ischemic colitis.

### Patient teaching

🔊 Make sure patient knows about drug's marketing restrictions, which stipulate that she understands drug has

serious risks, that she reads and signs patient-physician agreement, and that she follows directions in accompanying medication guide.

• Tell patient to take drug exactly as prescribed, with or without food.

🔊 Instruct patient to contact prescriber immediately if she develops constipation or symptoms of insufficient blood flow to bowel (such as new or worsening pain in bowels or bloody bowel movements).

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## alprazolam

Apo-Alpraz<sup>Ⓢ</sup>, Niravam, Novo-Alprazol<sup>Ⓢ</sup>, Nu-Alpraz<sup>Ⓢ</sup>, Xanax, Xanax TS<sup>Ⓢ</sup>, Xanax XR

**Pharmacologic class:** Benzodiazepine

**Therapeutic class:** Anxiolytic

**Controlled substance schedule IV**

**Pregnancy risk category D**

### Action

Unclear. Thought to act at limbic, thalamic, and hypothalamic levels of CNS to produce sedative, anxiolytic, skeletal muscle relaxant, and anticonvulsant effects.

### Availability

**Solution:** 1 mg/ml

**Tablets (extended-release):** 0.5 mg, 1 mg, 2 mg, 3 mg

**Tablets (immediate-release):** 0.25 mg, 0.5 mg, 1 mg, 2 mg

**Tablets (orally disintegrating):** 0.25 mg, 0.5 mg, 1 mg, 2 mg

## Indications and dosages

➤ Anxiety disorders

**Adults:** Initially, 0.25 to 0.5 mg P.O. t.i.d. Maximum dosage is 4 mg daily in divided doses.

**Elderly patients:** Initially, 0.25 mg P.O. two or three times daily. Maximum dosage is 4 mg daily in divided doses.

➤ Panic disorders

**Adults:** *Immediate-release or orally disintegrating tablets*—Initially, 0.5 mg P.O. t.i.d. *Extended-release tablets*—Initially, 0.5 to 1 mg P.O. daily. Usual dosage is 3 to 6 mg daily, with a maximum dosage of 10 mg daily. For all dosage forms, increase by a maximum of 1 mg daily at intervals of 3 to 4 days, with a maximum of 10 mg daily in divided doses.

## Dosage adjustment

- Hepatic impairment

## Off-label uses

- Agoraphobia
- Depression
- Premenstrual syndrome

## Contraindications

- Hypersensitivity to benzodiazepines
- Narrow-angle glaucoma
- Labor and delivery
- Pregnancy or breastfeeding

## Precautions

Use cautiously in:

- hepatic dysfunction
- history of attempted suicide or drug dependence
- elderly patients.

## Administration

- Don't give with grapefruit juice.
- Make sure patient swallows extended-release tablets whole without chewing or crushing.
- Mix oral solution with liquids or semisolid foods and instruct patient to consume entire amount immediately.
- Administer orally disintegrating tablets by placing tablet on patient's tongue. If only one-half of scored

tablet is used, discard unused portion immediately.

 Don't withdraw drug suddenly. Seizures and other withdrawal symptoms may occur unless dosage is tapered carefully.

Route	Onset	Peak	Duration
P.O.	30 min	1-2 hr	4-6 hr

## Adverse reactions

**CNS:** dizziness, drowsiness, depression, fatigue, light-headedness, disorientation, anger, hostility, euphoria, hypomanic episodes, restlessness, confusion, crying, delirium, headache, stupor, rigidity, tremor, paresthesia, vivid dreams, extrapyramidal symptoms  
**CV:** bradycardia, tachycardia, hypertension, hypotension, palpitations, **CV collapse**

**EENT:** blurred or double vision, nystagmus, nasal congestion

**GI:** gastric disorders, dysphagia, anorexia, increased salivation, dry mouth

**GU:** menstrual irregularities, urinary retention, urinary incontinence, libido changes, gynecomastia

**Hematologic:** blood dyscrasias such as eosinophilia, **agranulocytosis, leukopenia, and thrombocytopenia**

**Hepatic:** hepatic dysfunction (including hepatitis)

**Musculoskeletal:** muscle rigidity, joint pain

**Skin:** dermatitis, rash, pruritus, urticaria, increased sweating

**Other:** weight loss or gain, hiccups, fever, edema, psychological drug dependence, drug tolerance

## Interactions

**Drug-drug.** *Antidepressants, antihistamines, opioids, other benzodiazepines:* increased CNS depression

*Barbiturates, rifampin:* increased metabolism and decreased efficacy of alprazolam

*Cimetidine, disulfiram, erythromycin, fluoxetine, hormonal contraceptives, isoniazid, ketoconazole, metoprolol, propoxyphene, propranolol, valproic acid:* decreased metabolism and increased action of alprazolam  
*Digoxin:* increased risk of digoxin toxicity

*Levodopa:* decreased antiparkinsonian effect

*Theophylline:* increased sedative effect  
*Tricyclic antidepressants (TCAs):*

increased TCA blood levels

**Drug-diagnostic tests.** *Itraconazole, ketoconazole:* increased alprazolam plasma level

**Drug-food.** *Grapefruit juice:* decreased drug metabolism and increased blood level

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

*Smoking:* decreased alprazolam efficacy

### Patient monitoring

- Watch for excessive CNS depression if patient is concurrently taking antidepressants, other benzodiazepines, antihistamines, or opioids.
- If patient is taking TCAs concurrently, watch for increase in adverse TCA effects.
- Monitor CBC and liver and kidney function test results.
- Monitor vital signs and weight.
- Report signs of drug abuse, including frequent requests for early refills.

### Patient teaching

- Instruct patient to swallow extended-release tablets whole without crushing or chewing.
- 🔊 Tell patient that drug may make him more depressed, angry, or hostile. Urge him to contact prescriber immediately if he thinks he's dangerous to himself or others.

- Inform patient that drug may cause tremors, muscle rigidity, and other movement problems. Advise him to report these effects to prescriber.

🔊 Caution patient not to stop taking drug suddenly. Withdrawal symptoms, including seizures, may occur unless drug is tapered carefully.

- Advise patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## alteplase (tissue plasminogen activator, recombinant)

Actilyse<sup>®</sup>, Activase, Activase rt-PA<sup>®</sup>, Cathflo Activase

**Pharmacologic class:** Plasminogen activator

**Therapeutic class:** Thrombolytic

**Pregnancy risk category** C

### Action

Converts plasminogen to plasmin, which in turn breaks down fibrin and fibrinogen, thereby dissolving thrombus

### Availability

*Injection:* 2-mg single-patient vials; 50-mg, 100-mg vials

### Indications and dosages

➤ Lysis of thrombi obstructing coronary arteries in acute myocardial infarction (MI)

*3-hour infusion—*

**Adults:** 100 mg I.V. over 3 hours as follows: 60 mg over first hour (give 6 to 10 mg as bolus over first 1 to 2 minutes), then 20 mg I.V. over second hour, then 20 mg I.V. over third hour

**Adults weighing less than 65 kg**

**(143 lb):** 1.25 mg/kg I.V. in divided doses over 3 hours, not to exceed 100 mg

*Accelerated infusion—***Adults weighing more than 67 kg**

**(147 lb):** Give total dosage of 100 mg as follows: 15 mg I.V. bolus over 1 to 2 minutes, then 50 mg I.V. over next 30 minutes, then 35 mg I.V. over next 60 minutes.

**Adults weighing 67 kg (147 lb) or less:**

15 mg I.V. bolus over 1 to 2 minutes, followed by 0.75 mg/kg I.V. over next 30 minutes (not to exceed 50 mg), followed by 0.5 mg/kg I.V. over next hour, not to exceed 35 mg

➤ Acute ischemic cerebrovascular accident (CVA)

**Adults:** 0.9 mg/kg I.V. over 1 hour, to a maximum dosage of 90 mg, with 10% of total dosage given as I.V. bolus within first minute

➤ Acute massive pulmonary embolism

**Adults:** 100 mg I.V. over 2 hours, followed by heparin

➤ Restoration of function of central venous access device

**Adults weighing 30 kg (66 lb) or**

**more:** *Cathflo Activase*—2 mg/2-ml concentration instilled in dysfunctional catheter. If catheter function isn't restored in 120 minutes after first dose, may give second dose.

**Adults weighing 10 kg (22 lb) to less**

**than 30 kg:** *Cathflo Activase*—Use 110% of catheter lumen volume not to exceed 2 mg/2-ml concentration instilled in dysfunctional catheter. If catheter function isn't restored in 120 minutes after first dose, may give second dose.

**Off-label uses**

- Small-vessel occlusion by microthrombi
- Peripheral arterial thromboembolism

**Contraindications**

- Hypersensitivity to drug or its components (*Cathflo Activase*)
- Seizures, stroke, aneurysm, intracranial neoplasm, bleeding diathesis

**Precautions**

Use cautiously in:

- hypersensitivity to anistreplase or streptokinase
- GI or genitourinary bleeding, ophthalmic hemorrhage, organ biopsy, severe hepatic or renal disease
- elderly patients
- pregnant or breastfeeding patients
- children.

**Administration**

⚠ Be aware that intracranial hemorrhage must be ruled out before therapy begins.

⚠ To treat acute ischemic CVA, give within 3 hours of initial signs or symptoms.

⚠ If uncontrolled bleeding occurs, stop infusion and notify prescriber immediately.

- Give I.V. only, using controlled-infusion pump.

- Reconstitute with unpreserved sterile water for injection. May be further diluted with normal saline solution or D<sub>5</sub>W.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

**Adverse reactions**

**CNS:** cerebral hemorrhage, cerebral edema, CVA (with accelerated infusion)

**CV:** hypotension, bradycardia, recurrent ischemia, pericardial effusion, pericarditis, mitral regurgitation, electromechanical dissociation,

arrhythmias, cardiogenic shock, heart failure, cardiac arrest, cardiac tamponade, myocardial rupture, embolization, venous thrombosis

**GI:** nausea, vomiting, GI bleeding

**GU:** GU tract bleeding

**Hematologic:** spontaneous bleeding, bone marrow depression

**Musculoskeletal:** musculoskeletal pain

**Respiratory:** pulmonary edema

**Skin:** bruising, flushing

**Other:** fever, edema, phlebitis or bleeding at I.V. site, hypersensitivity reaction (including rash, anaphylactic reaction, laryngeal edema), sepsis

### Interactions

**Drug-drug.** *Aspirin, drugs affecting platelet activity (such as abciximab, heparin, dipyridamole, oral anticoagulants, vitamin K antagonists):* increased risk of bleeding

**Drug-diagnostic tests.** *Blood urea nitrogen:* elevated level

### Patient monitoring

- Monitor vital signs, ECG, and neurologic status.
- Maintain strict bed rest.
- Watch for signs and symptoms of bleeding tendency and hemorrhage.
- Monitor patient on Cathflo Activase for GI bleeding, venous thrombosis, and sepsis.
- Evaluate results of clotting studies.

### Patient teaching

- As appropriate, explain therapy and monitoring to patient and family.

## aluminum hydroxide

AlternaGEL, Alu-Cap, Alu-Tab

**Pharmacologic class:** Inorganic salt

**Therapeutic class:** Antacid

**Pregnancy risk category** NR

### Action

Dissolves in acidic gastric secretions, releasing anions that partially neutralize gastric hydrochloric acid. Also elevates gastric pH, inhibiting the action of pepsin (an effect important in peptic ulcer disease).

### Availability

*Capsules:* 400 mg, 475 mg, 500 mg

*Oral suspension:* 320 mg/5 ml, 450 mg/5 ml, 600 mg/5 ml, 675 mg/5 ml

*Tablets:* 300 mg, 500 mg, 600 mg

### Indications and dosages

➤ Hyperacidity

**Adults:** 500 to 1,500 mg (tablet or capsule) P.O. 1 hour after meals and at bedtime; or 5 to 30 ml (oral suspension) between meals and at bedtime, as needed or directed

### Off-label uses

- Bleeding from stress ulcers
- Gastroesophageal reflux disease

### Contraindications

- Signs or symptoms of appendicitis or inflamed bowel

### Precautions

Use cautiously in:

- gastric outlet obstruction, hypercalcemia, hypophosphatemia, massive upper GI hemorrhage
- patients using other aluminum products concurrently
- patients on dialysis
- pregnant or breastfeeding patients.

### Administration

- Administer with water or fruit juice.
- Give 1 hour after meals and at bedtime.
- In reflux esophagitis, administer 20 to 40 minutes after meals and at bedtime.
- Don't give within 1 to 2 hours of antibiotics, histamine<sub>2</sub> (H<sub>2</sub>) blockers, iron preparations, corticosteroids, or enteric-coated drugs.

- Provide care as appropriate if patient becomes constipated.

Route	Onset	Peak	Duration
P.O.	15-30 min	30 min	30 min-3 hr

### Adverse reactions

**CNS:** malaise (with prolonged use), **neurotoxicity, encephalopathy**

**GI:** constipation, anorexia (with prolonged use), **intestinal obstruction**

**Metabolic:** hypophosphatemia (with prolonged use)

**Musculoskeletal:** osteomalacia and chronic phosphate deficiency with bone pain, malaise, muscle weakness (with prolonged use)

**Other:** aluminum toxicity

### Interactions

**Drug-drug.** *Allopurinol, anti-infectives (including quinolones, tetracyclines), corticosteroids, diflunisal, digoxin, ethambutol, H<sub>2</sub> blockers, hydantoin, iron salts, isoniazid, penicillamine, phenothiazines, salicylates, thyroid hormone, ticlopidine:* decreased effects of these drugs

*Enteric-coated drugs:* premature release of these drugs in stomach

**Drug-diagnostic tests.** *Gastrin:* increased level

*Phosphate:* decreased level

*Some imaging studies:* test interference

**Drug-food.** *Milk, other foods high in vitamin D:* milk-alkali syndrome (nausea, vomiting, distaste for food, headache, confusion, hypercalcemia, hypercalciuria)

### Patient monitoring

- Monitor long-term use of high doses if patient is on sodium-restricted diet. (Drug contains sodium.)
- Assess for GI bleeding.
- Watch for constipation.
- With long-term use, monitor blood phosphate level and assess for signs and symptoms of hypophosphatemia

(anorexia, malaise, muscle weakness). Also monitor bone density.

### Patient teaching

- Tell patient to take drug 1 hour after meals and at bedtime.
- Caution patient not to take drug within 1 to 2 hours of anti-infectives, H<sub>2</sub> blockers, iron, corticosteroids, or enteric-coated drugs.
- Advise patient to take drug with water or fruit juice.
- Instruct patient to report signs and symptoms of GI bleeding and hypophosphatemia (appetite loss, malaise, muscle weakness).
- Recommend increased fiber and fluid intake and regular physical activity to help ease constipation.
- Inform patient that drug contains sodium, so he should discuss drug therapy with health care providers if he's later told to consume a low-sodium diet.
- Advise patient that he'll need to undergo periodic blood testing and bone mineral density tests if he's receiving long-term therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## amantadine hydrochloride

Dom-Amantadine<sup>✳</sup>, Gen-Amantadine<sup>✳</sup>, Lysovir<sup>⚠</sup>, PMS-Amantadine<sup>✳</sup>

**Pharmacologic class:** Anticholinergic-like agent

**Therapeutic class:** Antiviral, anti-parkinsonian

**Pregnancy risk category C**

## Action

Antiviral action unclear; may prevent penetration of influenza A virus into host cell. Antiparkinsonian action unknown; may ease parkinsonian symptoms by increasing dopamine release, preventing dopamine reuptake into presynaptic neurons, stimulating dopamine receptors, or enhancing dopamine sensitivity.

## Availability

*Capsules (liquid-filled):* 100 mg

*Syrup:* 50 mg/5 ml

*Tablets:* 100 mg

## Indications and dosages

➤ Symptomatic treatment or prophylaxis of influenza type A virus in patients with respiratory conditions

**Adults older than age 65 with normal renal function:** 100 mg P.O. once daily

**Adults to age 64 with normal renal function:** 200 mg (tablets) or 4 tsp of syrup P.O. daily in a single dose, or 100 mg tablet or 2 tsp of syrup P.O. b.i.d.

**Children ages 9 to 12:** 100 mg P.O. q 12 hours

**Children ages 1 to 9 or weighing less than 45 kg (99 lb):** 4.4 to 8.8 mg/kg/day of syrup P.O. q 12 hours, not to exceed 150 mg daily

➤ Parkinson's disease

**Adults:** Initially, 100 mg P.O. daily, increased to 100 mg b.i.d. if needed. If patient doesn't respond adequately, give 200 mg b.i.d., up to 400 mg/day.

➤ Drug-induced extrapyramidal reactions

**Adults:** 100 mg P.O. b.i.d.; may increase dosage to maximum of 300 mg daily in divided doses

## Dosage adjustment

- Renal impairment

## Contraindications

- Hypersensitivity to drug

## Precautions

Use cautiously in:

- cardiac disease, hepatic disease, renal impairment, seizure disorder, psychiatric problems
- untreated closed-angle glaucoma (use not recommended)
- elderly patients
- pregnant or breastfeeding patients.

## Administration

• For antiviral use, start therapy within 24 to 48 hours of symptom onset and continue for 24 to 48 hours after symptoms resolve.

• When giving as prophylactic antiviral, start therapy as soon as possible and continue for at least 10 days after exposure to virus.

• When giving with influenza vaccine, continue drug for 2 to 3 weeks while patient develops antibody response to vaccine.

Route	Onset	Peak	Duration
P.O.	48 hr	2 wk	Unknown

## Adverse reactions

**CNS:** depression, dizziness, drowsiness, insomnia, light-headedness, anxiety, irritability, hallucinations, confusion, ataxia, headache, nervousness, abnormal dreams, agitation, fatigue, delusions, aggressive behavior, manic reaction, psychosis, slurred speech, euphoria, abnormal thinking, amnesia, increased or decreased motor activity, paresthesia, tremor, abnormal gait, delirium, stupor, **coma**

**CV:** orthostatic hypotension, tachycardia, peripheral edema, **heart failure**, **cardiac arrest**, **arrhythmias**

**EENT:** blurred vision, mydriasis, keratitis, photosensitivity, optic nerve palsy, nasal congestion

**GI:** nausea, vomiting, diarrhea, constipation, dry mouth, dysphagia, anorexia

**GU:** urine retention, decreased libido

**Hematologic:** leukocytosis

**Musculoskeletal:** involuntary muscle contractions

**Respiratory:** tachypnea, **acute respiratory failure, pulmonary edema**

**Skin:** purplish skin discoloration, rash, pruritus, diaphoresis

**Other:** edema, fever, allergic reactions including **anaphylaxis**

## Interactions

**Drug-drug.** *Anticholinergics, antihistamines, phenothiazines, quinidine, tricyclic antidepressants:* increased atropine-like adverse effects  
*CNS stimulants:* increased CNS stimulation

*Hydrochlorothiazide, triamterene:* increased amantadine effects

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatine kinase, creatinine, gamma-glutamyltransferase, lactate dehydrogenase:* increased levels

**Drug-herbs.** *Angel's trumpet, jimsonweed, scopolia:* increased cardiac and anticholinergic-like effects

**Drug-behaviors.** *Alcohol use:* increased CNS adverse reactions

## Patient monitoring

🔊 Monitor patient for depression and suicidal ideation.

- Watch for mental status changes, especially in elderly patients.
- Stay alert for worsening of psychiatric problems if patient has a history of such problems or substance abuse.
- Monitor for orthostatic hypotension.
- Evaluate for signs and symptoms of fluid overload.
- Monitor kidney and liver function test results.

## Patient teaching

🔊 Caution patient that taking more than prescribed dosage may lead to serious adverse reactions or even death.

- Advise patient to establish effective bedtime routine and to take drug several hours before bedtime to minimize insomnia.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- Advise patient to minimize GI upset by eating small, frequent servings of foods and drinking plenty of fluids.

- Instruct patient to contact prescriber if he develops signs or symptoms of depression.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## amifostine

Ethylol

**Pharmacologic class:** Organic thiophosphate cytoprotective drug

**Therapeutic class:** Cytoprotectant

**Pregnancy risk category** C

## Action

Undergoes conversion to free thiol, an active metabolite that reduces toxic effects of cisplatin on renal tissue

## Availability

*Powder for injection:* 500-mg anhydrous base and 500 mg mannitol in 10-ml vials

## Indications and dosages

➤ To reduce cumulative renal toxicity of cisplatin therapy in patients with ovarian cancer or non-small-cell lung cancer

**Adults:** 910 mg/m<sup>2</sup> I.V. daily as a 15-minute infusion, starting 30 minutes before chemotherapy

➤ To reduce moderate to severe xerostomia in patients undergoing postoperative radiation treatment for head or neck cancer

**Adults:** 200 mg/m<sup>2</sup> I.V. daily as a 3-minute infusion, starting 15 to 30 minutes before standard fraction radiation therapy

### Off-label uses

- Protection against cisplatin- and paclitaxel-induced neurotoxicity

### Contraindications

- Hypersensitivity to drug
- Hypotension

### Precautions

Use cautiously in:

- arrhythmias, heart failure, ischemic heart disease, renal impairment, hearing impairment, hypocalcemia, myasthenia gravis, nausea, vomiting, hypotension, obesity
- history of cerebrovascular accident or transient ischemic attacks
- concurrent antihypertensive therapy that can't be discontinued for 24 hours before amifostine therapy (not recommended)
- definitive radiotherapy (not recommended)
- elderly patients
- pregnant patients (safety and efficacy not established)
- breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Ensure that patient is adequately hydrated before starting drug.
- Give antiemetics before and during therapy.
- Reconstitute single-dose vial with 9.7 ml of sterile normal saline injection. May be further diluted with normal

saline solution up to a concentration of 40 mg/ml.

- Don't mix with other drugs or solutions.
- Know that drug also can be prepared in polyvinyl chloride bags.
- Don't infuse longer than 15 minutes; doing so increases risk of adverse reactions.

🔊 Keep patient supine during administration.

Route	Onset	Peak	Duration
I.V.	5-8 min	Unknown	Unknown

### Adverse reactions

**CNS:** dizziness, drowsiness, rigors

**CV:** hypotension

**GI:** nausea, vomiting

**Metabolic:** hypocalcemia

**Respiratory:** dyspnea, sneezing

**Skin:** flushing, rash, urticaria,

**erythema multiforme**

**Other:** chills, warm sensation, hiccups, allergic reactions

### Interactions

**Drug-drug.** *Antihypertensives:*

increased risk of hypotension

**Drug-diagnostic tests.** *Calcium:* decreased level

### Patient monitoring

- Monitor blood pressure every 5 minutes during infusion and immediately after infusion as clinically indicated.
- Assess for severe nausea and vomiting.
- Monitor fluid intake and output.
- Monitor blood calcium level. Give calcium supplements as ordered.

### Patient teaching

- Emphasize importance of remaining supine during drug administration to prevent hypotension.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- Provide dietary counseling. Refer patient to dietitian if adverse GI effects significantly limit food intake.
- Inform patient that sneezing is a normal effect of drug.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## amikacin sulfate

**Pharmacologic class:** Aminoglycoside

**Therapeutic class:** Anti-infective

**Pregnancy risk category D**

### FDA BOXED WARNING

- Observe patient closely because of potential ototoxicity and nephrotoxicity. Safety isn't established for treatment exceeding 14 days.
- Neuromuscular blockade and respiratory paralysis have occurred after parenteral injection, topical use (as in orthopedic and abdominal irrigation), and oral use.
- Monitor renal function and eighth-nerve function closely, especially in patients with known or suspected renal impairment at onset of therapy, as well as those with initially normal renal function who develop signs of renal dysfunction during therapy.
- Avoid concurrent use with potent diuretics (such as furosemide and ethacrynic acid) because diuretics may cause ototoxicity. Also, I.V. diuretics may increase aminoglycoside toxicity by altering antibiotic serum and tissue levels.
- Avoid concurrent and sequential systemic, oral, or topical use of other

neurotoxic or nephrotoxic products and other aminoglycosides. Advanced age and dehydration also may increase toxicity risk.

### Action

Interferes with protein synthesis in bacterial cells by binding to 30S ribosomal subunit, leading to bacterial cell death

### Availability

**Injection:** 50 mg/ml, 250 mg/ml

### Indications and dosages

➤ Severe systemic infections caused by sensitive strains of *Pseudomonas aeruginosa*, *Escherichia coli*, or *Proteus*, *Klebsiella*, *Serratia*, *Enterobacter*, *Actinobacter*, *Providencia*, *Citrobacter*, or *Staphylococcus* species

#### Adults, children, and older infants:

15 mg/kg/day I.V. or I.M. in two to three divided doses q 8 to 12 hours in 100 to 200 ml of dextrose 5% in water (D<sub>5</sub>W) over 30 to 60 minutes. Maximum dosage is 1.5 g/day.

**Neonates:** Initially, 10 mg/kg I.M., then 7.5 mg/kg I.M. q 12 hours

➤ Uncomplicated urinary tract infections caused by susceptible organisms

#### Adults, children, and older infants:

250 mg I.M. or I.V. twice daily

### Dosage adjustment

- Renal impairment (adults)
- Patients undergoing hemodialysis

### Off-label uses

• *Mycobacterium avium-intracellulare* infection

### Contraindications

- Hypersensitivity to aminoglycosides
- Breastfeeding

### Precautions

Use cautiously in:

- decreased renal function, neuromuscular disorders
- parkinsonism, myasthenia gravis

- concurrent or serial use of other nephrotoxic and ototoxic drugs
- elderly patients
- pregnant patients.

### Administration

- Don't physically mix amikacin with other drugs. Administer separately.
- For I.V. use, dilute in 100 to 200 ml of normal saline solution or D<sub>5</sub>W and give over 30 to 60 minutes.
- Ensure adequate fluid intake to avoid dehydration.
- Draw peak blood level 1 hour after I.M. infusion or 30 to 60 minutes after I.V. infusion.
- Draw trough blood level just before next dose.

Route	Onset	Peak	Duration
I.V.	Immediate	30 min	8-12 hr
I.M.	Variable	1 hr	8-12 hr

### Adverse reactions

**CNS:** dizziness, vertigo, tremor, numbness, depression, confusion, lethargy, headache, paresthesia, ataxia,

**neuromuscular blockade, seizures, neurotoxicity**

**CV:** hypotension, hypertension, palpitations

**EENT:** nystagmus and other visual disturbances, ototoxicity, hearing loss, tinnitus

**GI:** nausea, vomiting, splenomegaly, stomatitis, increased salivation, anorexia

**GU:** azotemia, increased urinary excretion of casts, polyuria, painful urination, impotence, **nephrotoxicity**

**Hematologic:** purpura, eosinophilia, leukemoid reaction, **aplastic anemia, neutropenia, agranulocytosis, leukopenia, thrombocytopenia, pancytopenia, hemolytic anemia**

**Hepatic:** hepatomegaly, hepatic necrosis, **hepatotoxicity**

**Musculoskeletal:** joint pain, muscle twitching

**Respiratory:** **apnea**

**Skin:** rash, alopecia, urticaria, itching, exfoliative dermatitis

**Other:** weight loss, superinfection, pain and irritation at I.M. site

### Interactions

**Drug-drug.** *Acyclovir, amphotericin B, cephalosporin, cisplatin, diuretics, vancomycin:* increased risk of ototoxicity and nephrotoxicity

*Depolarizing and nondepolarizing neuromuscular junction blockers, general anesthetics:* increased amikacin effect, possibly leading to respiratory depression

*Dimenhydrinate:* masking of ototoxicity signs and symptoms

*Indomethacin:* increased trough and peak amikacin levels

*Parenteral penicillin:* amikacin inactivation

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, lactate dehydrogenase, nonprotein nitrogen, nitrogen compounds (such as urea):* increased levels

*Calcium, potassium, magnesium, sodium:* decreased levels

*Reticulocytes:* increased or decreased count

### Patient monitoring

- Monitor kidney function test results and urine cultures, output, protein, and specific gravity.

- Monitor results of peak and trough drug blood levels.

- Evaluate for signs and symptoms of ototoxicity (hearing loss, tinnitus, ataxia, and vertigo).

- Assess for secondary superinfections, particularly upper respiratory tract infections.

### Patient teaching

 Inform patient that drug may cause hearing loss, seizures, and other neurologic problems. Tell him to report these symptoms immediately.

- Instruct patient to immediately report fever, cough, breathing problems, sore throat, and other signs and symptoms of infection.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Instruct patient to notify prescriber if he's urinating much more or much less than normal.
- Advise patient to minimize GI upset by eating small, frequent servings of food, and drinking plenty of fluids.
- Inform patient that he'll undergo regular blood and urine testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## aminocaproic acid

Amicar

**Pharmacologic class:** Carboxylic acid derivative

**Therapeutic class:** Antihemorrhagic, antifibrinolytic

**Pregnancy risk category C**

### Action

Interferes with plasminogen activator substances and blocks action of fibrinolysin (plasmin)

### Availability

*Injection:* 250 mg/ml

*Syrup:* 250 mg/ml

*Tablets:* 500 mg, 1,000 mg

### Indications and dosages

➤ Excessive bleeding caused by fibrinolysis

**Adults:** 5 g P.O. during first hour; then 1 to 1.25 g/hour until drug blood level of 0.13 mg/ml is reached and sustained and bleeding is controlled. Or 4 to 5 g in 250 ml of compatible diluent I.V. over 1 hour, followed by continuous infusion of 1 g/hour in 50 ml of diluent. Continue for 8 hours or until bleeding stops. Maximum daily dosage is 30 g.

### Off-label uses

- Dental extractions
- Hemorrhage

### Contraindications

- Hypersensitivity to drug
- Disseminated intravascular coagulation
- Neonates (injectable form)

### Precautions

Use cautiously in:

- heart, hepatic, or renal failure
- upper urinary tract bleeding.

### Administration

- Dilute I.V. form in normal saline solution, dextrose 5% in water, or Ringer's solution for injection. Give at prescribed rate.
- Know that oral and I.V. doses are the same.

Route	Onset	Peak	Duration
P.O.	1 hr	2 hr	Unknown
I.V.	1 hr	Unknown	3 hr

### Adverse reactions

**CNS:** dizziness, malaise, headache, delirium, hallucinations, weakness, seizures

**CV:** hypotension, ischemia, **thrombophlebitis, cardiomyopathy, bradycardia, arrhythmias**

**EENT:** conjunctival suffusion, tinnitus, nasal congestion

**GI:** nausea, vomiting, diarrhea, abdominal pain, dyspepsia

**GU:** intrarenal obstruction, renal failure

**Hematologic:** bleeding tendency, generalized thrombosis, agranulocytosis, leukopenia, thrombocytopenia

**Musculoskeletal:** myopathy, rhabdomyolysis

**Respiratory:** dyspnea, pulmonary embolism

**Skin:** rash, pruritus

## Interactions

**Drug-drug.** *Estrogens, hormonal contraceptives:* increased risk of hypercoagulation

*Activated prothrombin, prothrombin complex concentrates:* increased signs of active intravascular clotting

**Drug-diagnostic tests.** *Alanine aminotransferase, aldolase, aspartate aminotransferase, blood urea nitrogen, creatinine, creatine kinase, potassium:* increased levels

**Drug-herbs.** *Alfalfa, anise, arnica, astragalus, bilberry, black currant seed oil, capsaicin, cat's claw, celery, chaparral, clove oil, dandelion, dong quai, evening primrose oil, feverfew, garlic, ginger, ginkgo, papaya extract, rhubarb, safflower oil, skullcap:* increased anticoagulant effect

*Coenzyme Q10, St. John's wort:* reduced anticoagulant effect

## Patient monitoring

• Monitor vital signs, fluid intake and output, and ECG.

🔊 Assess for signs and symptoms of thrombophlebitis and pulmonary embolism.

🔊 Monitor neurologic status, especially for signs of impending seizure.

• Monitor kidney and liver function test results, serum electrolyte levels, and CBC with white cell differential.

• Evaluate for blood dyscrasias, particularly bleeding tendencies.

## Patient teaching

• Tell patient that drug may significantly affect many body systems. Assure him that he'll be monitored closely.

🔊 Instruct patient to immediately report signs and symptoms of thrombophlebitis, pulmonary embolism, or unusual bleeding.

• Tell patient he'll undergo frequent blood testing during therapy.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## aminophylline (theophylline, ethylenediamine)

Amnivent<sup>®</sup>, Phyllocontin<sup>®</sup>

**Pharmacologic class:** Xanthine

**Therapeutic class:** Bronchodilator

**Pregnancy risk category C**

## Action

Unclear. Thought to directly relax smooth muscle of bronchial airways and increase pulmonary blood flow by inhibiting phosphodiesterase.

## Availability

*Injection:* 250 mg/10 ml

*Oral liquid:* 105 mg/5 ml

*Tablets:* 100 mg, 200 mg

## Indications and dosages

➤ Symptomatic relief of bronchospasm in patients with acute symptoms who require rapid theophyllinization

**Adults (nonsmokers):** 0.7 mg/kg/hour I.V. for first 12 hours. Maintenance dosage is 0.5 mg/kg/hour I.V.

**Children ages 9 to 16:** 1 mg/kg/hour I.V. for first 12 hours. Maintenance dosage is 0.8 mg/kg/hour I.V.

**Children ages 6 months to 9 years:** 1.2 mg/kg/hour I.V. for first 12 hours. Maintenance dosage is 1 mg/kg/hour I.V.

➤ Chronic bronchial asthma

**Adults and children:** Dosage is highly individualized. Common initial dosage is 16 mg/kg/24 hours I.V. or 400 mg/24 hours I.V. in divided doses at 6- or 8-hour intervals. If needed, dosage may be increased 25% at 3-day intervals.

### Dosage adjustment

- Heart failure
- Hepatic disease
- Elderly patients
- Smokers

### Off-label uses

- Dyspnea in patients with chronic obstructive pulmonary disease (COPD)

### Contraindications

- Hypersensitivity to xanthine compounds or ethylenediamine
- Seizure disorders

### Precautions

Use cautiously in:

- COPD, diabetes mellitus, glaucoma, renal or hepatic disease, heart failure or other cardiac or circulatory impairment, hypertension, hyperthyroidism, peptic ulcer, severe hypoxemia
- active peptic ulcer disease
- elderly patients
- neonates, infants, and young children.

### Administration

- For I.V. use, dilute according to label directions and infuse at a rate no faster than 25 mg/minute.
- Don't give in I.V. solutions containing invert sugar, fructose, or fat emulsions.

- Give oral form at meals with 8 oz of water.

Route	Onset	Peak	Duration
P.O. (extended)	Variable	Variable	Variable
P.O. (liquid)	15-60 min	1-7 hr	Variable
I.V.	Immediate	Immediate	6-8 hr

### Adverse reactions

**CNS:** irritability, dizziness, nervousness, restlessness, headache, insomnia, stammering speech, abnormal behavior, mutism, unresponsiveness alternating with hyperactivity,

#### seizures

**CV:** palpitations, sinus tachycardia, extrasystoles, **marked hypotension, arrhythmias, circulatory failure**

**GI:** nausea, vomiting, diarrhea, epigastric pain, hematemesis, gastroesophageal reflux, anorexia

**GU:** urine retention (in men with enlarged prostate), diuresis, increased excretion of renal tubular cells and red blood cells, proteinuria

**Metabolic:** hyperglycemia

**Musculoskeletal:** muscle twitching

**Respiratory:** tachypnea, **respiratory arrest**

**Skin:** flushing

**Other:** fever, hypersensitivity reactions (including exfoliative dermatitis and urticaria)

### Interactions

**Drug-drug.** *Adenosine:* decreased antiarrhythmic effect of adenosine  
*Barbiturates, nicotine, phenytoin, rifampin:* decreased aminophylline blood level

*Beta-adrenergic blockers:* antagonism of aminophylline effects

*Calcium channel blockers, cimetidine, ciprofloxacin, disulfiram, erythromycin, hormonal contraceptives, influenza vaccine, interferon, methotrexate:* elevated aminophylline blood level

*Carbamazepine, isoniazid, loop diuretics (such as furosemide):* increased or decreased aminophylline blood level

*Ephedrine, other sympathomimetics:* toxicity, arrhythmias

*Lithium:* increased lithium excretion

**Drug-diagnostic tests.** *Aspartate aminotransferase, glucose:* increased levels

**Drug-herbs.** *Cayenne:* increased risk of aminophylline toxicity

**Drug-behaviors.** *Smoking:* increased aminophylline elimination

### Patient monitoring

 Monitor aminophylline blood level. Adjust dosage if patient has signs or symptoms of toxicity (tachycardia, headache, anorexia, nausea, vomiting, diarrhea, restlessness, and irritability).

- Assess for arrhythmias, especially after giving loading dose.
- Check vital signs and fluid intake and output.
- Monitor patient's response to drug, and assess pulmonary function test results.

### Patient teaching

- Advise patient to take oral doses at meals with 8 oz of water.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Tell patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- Advise patient to establish effective bedtime routine to minimize insomnia.
- Caution patient not to change aminophylline brands.
- If patient smokes, tell him to notify prescriber if he stops smoking; dosage may need to be adjusted.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions,

especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## amiodarone hydrochloride

Amyben , Cordarone, Cordarone X , Nexterone, Pacerone

**Pharmacologic class:** Benzofuran derivative

**Therapeutic class:** Antiarrhythmic (class III)

**Pregnancy risk category D**

### FDA BOXED WARNING

#### Oral products

- Because of substantial toxicity, drug is indicated only in patients with life-threatening arrhythmias.
- Drug may cause potentially fatal pulmonary toxicities, including hypersensitivity pneumonitis and interstitial/alveolar pneumonitis. Pulmonary toxicity is fatal about 10% of time.
- Hepatic injury is common but usually mild, manifesting only as abnormal liver enzyme levels. However, overt hepatic disease can occur and, in rare cases, is fatal.
- Drug may exacerbate arrhythmias by reducing tolerance for them or making them harder to reverse. Arrhythmias and significant heart block or sinus bradycardia occur in 2% to 5% of patients.
- Even in patients at high risk for arrhythmic death in whom toxicity is an acceptable risk, drug poses major management problems. Therefore, other agents should be tried first whenever possible.
- Difficulty of using drug effectively and safely poses significant risk. Patients with indicated arrhythmias

must be hospitalized to receive loading dose; response generally takes at least 1 week, but usually 2 or more.

### Action

Prolongs duration and refractory period of action potential. Slows electrical conduction, electrical impulse generation from sinoatrial node, and conduction through accessory pathways. Also dilates blood vessels.

### Availability

*Injection:* 50 mg/ml in 3-ml ampules

*Injection, premixed in dextrose:*

1.5 mg/ml (150 mg/100 ml), 1.8 mg/ml (360 mg/200 ml) in single-use plastic containers

*Tablets:* 100 mg, 200 mg, 400 mg

### Indications and dosages

➤ Life-threatening ventricular arrhythmias

**Adults:** 150 mg in 100 ml of dextrose 5% in water (D<sub>5</sub>W) by rapid I.V. infusion over 10 minutes; then dilute 900 mg in 500 ml of D<sub>5</sub>W and administer 360 mg by slow I.V. infusion over next 6 hours; then 540-mg I.V. maintenance infusion over next 18 hours. Or 800 to 1,600 mg P.O. daily in one to two doses for 1 to 3 weeks; then 600 to 800 mg P.O. daily in one to two doses for 1 month; then 400-mg P.O. daily as maintenance dosage. All dosages are titrated to individual patient's clinical needs.

➤ Frequently recurring ventricular fibrillation (VF), hemodynamically unstable ventricular tachycardia (VT)

**Adults:** Initially, 1,000 mg I.V. infusion over first 24 hours, by following infusion regimen: 150 mg/100 ml (1.5 mg/ml) rapid I.V. infusion over 10 minutes, followed by 360 mg (1 mg/minute) by slow I.V. infusion over 6 hours; then 540 mg (0.5 mg/minute) by slow I.V. infusion over remaining 18 hours as maintenance infusion. For breakthrough

episodes of VF or hemodynamically unstable VT, repeat initial loading dose of 150 mg/100 ml I.V. infusion over 10 minutes as needed. After first 24 hours, continue maintenance infusion of 720 mg/24 hours (0.5 mg/minute) for up to 3 weeks. Increase maintenance infusion rate to achieve effective arrhythmia suppression as needed.

### Off-label uses

- Atrioventricular (AV) nodal reentry tachycardia (with parenteral use)
- Conversion of atrial fibrillation to normal sinus rhythm

### Contraindications

- Hypersensitivity to drug or its components, including iodine
- Cardiogenic shock
- Second- or third-degree AV block
- Marked sinus bradycardia
- Breastfeeding
- Neonates

### Precautions

Use cautiously in:

- electrolyte imbalances, severe pulmonary or hepatic disease, thyroid disorders
- history of heart failure
- elderly patients
- pregnant patients
- children.

### Administration

 Know that I.V. amiodarone is a high-alert drug.

 Give loading dose only in hospital setting with continuous ECG monitoring.

- Administer oral loading dose in two equal doses with meals. Give maintenance dose daily or in two divided doses to minimize GI upset.
- Don't give I.V. unless patient is on continuous ECG monitoring.
- Dilute I.V. drug (except premixed drug) with dextrose 5% in water and use an in-line filter. Drug isn't compatible with normal saline solution.

- Don't combine premixed drug with any other product in the same I.V. line or premixed container.
- 🔊 Don't use plastic containers in series connections because of risk of air embolism.
- Use central venous catheter when giving repeated doses. If possible, use dedicated catheter for drug.

Route	Onset	Peak	Duration
P.O.	Variable	3-7 hr	Wks-mos
I.V.	Hrs	Unknown	Variable

### Adverse reactions

**CNS:** dizziness, fatigue, headache, insomnia, paresthesia, peripheral neuropathy, poor coordination, involuntary movements, tremor, sleep disturbances

**CV:** hypotension, **heart failure, worsening arrhythmia, AV block, sinoatrial node dysfunction, bradycardia, asystole, cardiac arrest, cardiogenic shock, electromechanical dissociation, ventricular tachycardia**

**EENT:** corneal microdeposits, corneal or macular degeneration, visual disturbances, dry eyes, eye discomfort, optic neuritis or neuropathy, scotoma, lens opacities, photophobia, visual halos, **papilledema**

**GI:** nausea, vomiting, constipation, abdominal pain, abnormal salivation, anorexia

**GU:** decreased libido

**Hematologic:** **coagulation abnormalities, thrombocytopenia**

**Hepatic:** nonspecific hepatic disorders, **hepatic dysfunction**

**Metabolic:** hypothyroidism, hyperthyroidism

**Respiratory:** cough, **adult respiratory distress syndrome, pulmonary inflammation or fibrosis, pulmonary edema**

**Skin:** flushing, photosensitivity, toxic epidermal necrolysis

**Other:** abnormal taste and smell, edema, fever, **Stevens-Johnson syndrome**

### Interactions

**Drug-drug.** *Anticoagulants:* increased prothrombin time (PT)

*Azole antifungals, fluoroquinolones, loratadine, macrolide antibiotics, trazodone:* increased risk of life-threatening arrhythmias

*Beta-adrenergic blockers:* increased risk of bradycardia and hypotension

*Calcium channel blockers:* increased risk of AV block (with verapamil, diltiazem) or hypotension (with any calcium channel blocker)

*Cholestyramine:* decreased amiodarone blood level

*Cimetidine, ritonavir:* increased amiodarone blood level

*Class I antiarrhythmics (disopyramide, flecainide, lidocaine, mexiletine, procainamide, quinidine):* increased blood levels of these drugs, leading to toxicity

*Cyclosporine:* elevated cyclosporine and creatinine blood levels

*Dextromethorphan:* impaired dextromethorphan metabolism (with amiodarone therapy of 2 weeks or longer)

*Digoxin:* increased digoxin blood level, leading to toxicity

*Fentanyl:* increased bradycardia, hypotension

*Methotrexate:* impaired methotrexate metabolism, possibly causing toxicity (with amiodarone use longer than 2 weeks)

*Phenytoin:* decreased amiodarone blood level or increased phenytoin blood level (with amiodarone use longer than 2 weeks)

*Protease inhibitors (atazanavir, indinavir, nelfinavir):* possible increased amiodarone concentration

*Rifampin:* decreased amiodarone concentration

*Theophylline:* increased theophylline blood level (with amiodarone use longer than 1 week)

**Drug-diagnostic tests.** *Kidney function tests:* abnormal results

**Drug-food.** *Grapefruit juice:* increased drug concentration

**Drug-herb.** *St. John's wort*: decreased drug blood level

### Patient monitoring

 Monitor patient closely. Drug may cause serious or life-threatening adverse reactions.

 Watch for slow onset of life-threatening arrhythmias, especially after giving loading dose.

 Monitor ECG continuously during loading dose and when dosage is changed.

- Check patient's blood pressure, pulse, and heart rhythm regularly.
- Assess for signs and symptoms of lung inflammation.
- Monitor baseline and subsequent chest X-rays, as well as pulmonary, liver, and thyroid function test results.
- Closely monitor patient who's receiving other drugs concurrently because amiodarone can interact with many drugs. Check digoxin blood level if patient is receiving digoxin; monitor PT or International Normalized Ratio if patient is receiving anticoagulants.

### Patient teaching

 Inform patient that drug may cause serious adverse reactions. Instruct him to report these immediately.

- Tell patient to take oral doses with meals. Advise him to divide daily dose into two doses if drug causes GI upset.
- Tell patient that adverse reactions are most common with high doses and may become more frequent after 6 months of therapy.
- Inform patient that he'll undergo regular blood testing, eye examinations, chest X-rays, and pulmonary function tests during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## amitriptyline hydrochloride

Apo-Amitriptyline, Levate<sup>®</sup>, Novotriptyn<sup>®</sup>

**Pharmacologic class:** Tricyclic compound

**Therapeutic class:** Antidepressant

**Pregnancy risk category D**

### FDA BOXED WARNING

- Drug may increase risk of suicidal thinking and behavior in children and adolescents with major depressive disorder and other psychiatric disorders. Risk is greater during first few months of treatment, and must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family to observe patient closely and communicate with prescriber as needed.
- Drug isn't approved for use in pediatric patients.

### Action

Unclear. Inhibits norepinephrine and serotonin reuptake at presynaptic neuron, increasing levels of these neurotransmitters in brain. Also has sedative, anticholinergic, and mild peripheral vasodilating effects.

### Availability

*Tablets:* 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg

### Indications and dosages

 Depression (often given in conjunction with psychotherapy)

**Adults:** 75 mg P.O. daily in divided doses; may increase gradually to 150 mg/day. Or start with 50 to 100 mg P.O. at bedtime and increase by 25 to

50 mg as needed, to a total dosage of 150 mg. Hospitalized patients initially may receive 100 mg P.O. daily, with gradual increases as needed to a total dosage of 300 mg P.O.

### Dosage adjustment

- Elderly patients
- Adolescents
- Outpatients

### Off-label uses

- Analgesic adjunct for phantom limb pain or chronic pain

### Contraindications

- Hypersensitivity to drug or other tricyclic antidepressants (TCAs)
- Acute recovery phase after myocardial infarction
- MAO inhibitor use within past 14 days
- Children younger than age 12

### Precautions

Use cautiously in:

- seizures, cardiovascular disease, renal or hepatic impairment, urinary retention, hyperthyroidism, increased intraocular pressure, closed-angle glaucoma, prostatic hypertrophy, bipolar disorder, schizophrenia, paranoia
- elderly patients
- pregnant or breastfeeding patients.

### Administration

- Administer full dose at bedtime to minimize orthostatic hypotension.
- Don't withdraw drug suddenly. Instead, taper dosage gradually.
- If patient is scheduled for surgery, discuss dosage tapering with prescriber.
- Be aware that drug is often used in conjunction with psychotherapy.

Route	Onset	Peak	Duration
P.O.	2-4 wk	2-6 wk	Unknown

### Adverse reactions

**CNS:** headache, fatigue, agitation, numbness, paresthesia, peripheral

neuropathy, weakness, restlessness, panic, anxiety, dizziness, drowsiness, difficulty speaking, excitement, hypomania, psychosis exacerbation, extrapyramidal effects, poor coordination, hallucinations, insomnia, nightmares, **seizures, coma, suicidal behavior or ideation (especially in children and adolescents)**

**CV:** ECG changes, tachycardia, hypertension, orthostatic hypotension, **arrhythmias, heart block, myocardial infarction**

**EENT:** blurred vision, dry eyes, mydriasis, abnormal visual accommodation, increased intraocular pressure, tinnitus

**GI:** nausea, vomiting, constipation, dry mouth, epigastric pain, anorexia, **paralytic ileus**

**GU:** urinary retention, delayed voiding, urinary tract dilation, gynecomastia

**Hematologic:** **agranulocytosis, thrombocytopenia, thrombocytopenic purpura, leukopenia**

**Metabolic:** changes in blood glucose level

**Skin:** photosensitivity rash, urticaria, flushing, diaphoresis

**Other:** increased appetite, weight gain, high fever, edema, hypersensitivity reaction

### Interactions

**Drug-drug.** *Activated charcoal:* decreased amitriptyline absorption  
*Adrenergics, anticholinergics, anticholinergic-like drugs:* increased anticholinergic effects

*Amiodarone, cimetidine, quinidine, ritonavir:* increased amitriptyline effects

*Barbiturates:* decreased amitriptyline blood level, increased CNS and respiratory effects

*Clonidine:* hypertensive crisis

*CNS depressants (including antihistamines, opioids, sedative-hypnotics):* increased CNS depression

*Drugs metabolized by CYP-4502D6 (such as other antidepressants,*

*phenothiazines, carbamazepine, class IC antiarrhythmics*): decreased amitriptyline clearance, possibly causing toxicity

*Guanethidine*: antagonism of antihypertensive action

*Levodopa*: delayed or decreased levodopa absorption, hypertension

*MAO inhibitors*: hypotension, tachycardia, potentially fatal reactions

*Rifabutin, rifampin, rifapentine*: decreased amitriptyline blood level and effects

*Selective serotonin reuptake inhibitors*: increased risk of toxicity

*Sympathomimetics*: increased pressor effect of direct-acting sympathomimetics (epinephrine, norepinephrine), possibly causing arrhythmias; decreased pressor effect of indirect-acting sympathomimetics (ephedrine, metaraminol)

**Drug-diagnostic tests.** *Eosinophils, liver function tests*: increased values  
*Glucose, granulocytes, platelets, white blood cells*: increased or decreased levels

**Drug-herbs.** *Angel's trumpet, jimsonweed, scopolia*: increased anticholinergic effects

*Chamomile, hops, kava, skullcap, valerian*: increased CNS depression

*St. John's wort*: decreased drug blood level and reduced efficacy

**Drug-behaviors.** *Alcohol use*: increased CNS sedation

*Smoking*: increased drug metabolism and altered effects

*Sun exposure*: increased risk of photosensitivity reaction

### Patient monitoring

- Evaluate for signs and symptoms of psychosis. If present, discuss possible dosage change with prescriber.
- Assess for changes in patient's mood or mental status.

📣 Monitor for signs and symptoms of depression and assess for suicidal ideation (especially in child or adolescent).

- Check blood pressure for orthostatic hypertension.

- Monitor CBC with white cell differential, glucose levels, and liver function test results.

### Patient teaching

📣 Instruct patient, parent, or caregiver to contact prescriber if severe mood changes or suicidal thoughts occur (especially if patient is child or adolescent).

- Tell patient that drug may cause temporary blood pressure decrease if he stands up suddenly. Advise him to rise slowly and carefully.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.

- Inform patient that he'll undergo frequent blood testing during therapy.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## amlodipine besylate

Norvasc

**Pharmacologic class:** Calcium channel blocker

**Therapeutic class:** Antihypertensive

**Pregnancy risk category C**

### Action

Inhibits influx of extracellular calcium ions, thereby decreasing myocardial contractility, relaxing coronary and vascular muscles, and decreasing peripheral resistance

**Availability**

Tablets: 2.5 mg, 5 mg, 10 mg

**Indications and dosages**

➤ Essential hypertension, chronic stable angina pectoris, and vasospastic angina (Prinzmetal's angina)

**Adults:** 5 to 10 mg P.O. once daily

**Dosage adjustment**

- Hepatic impairment
- Elderly patients

**Off-label uses**

- Pulmonary hypertension
- Raynaud's disease

**Contraindications**

- Hypersensitivity to drug

**Precautions**

Use cautiously in:

- aortic stenosis, severe hepatic impairment, heart failure
- elderly patients
- pregnant or breastfeeding patients
- children.

**Administration**

- Be aware that this drug may be given alone or with other drugs to relieve hypertension or angina.

Route	Onset	Peak	Duration
P.O.	Unknown	6-9 hr	24 hr

**Adverse reactions**

**CNS:** headache, dizziness, drowsiness, light-headedness, fatigue, weakness, lethargy

**CV:** peripheral edema, angina, bradycardia, hypotension, palpitations

**GI:** nausea, abdominal discomfort

**Musculoskeletal:** muscle cramps, muscle pain or inflammation

**Respiratory:** shortness of breath, dyspnea, wheezing

**Skin:** rash, pruritus, urticaria, flushing

**Interactions**

**Drug-drug.** *Beta-adrenergic blockers:* increased risk of adverse effects

*Fentanyl, nitrates, other antihypertensives, quinidine:* additive hypotension

**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension

**Patient monitoring**

🔊 Monitor patient for worsening angina.

- Monitor heart rate and rhythm and blood pressure, especially at start of therapy.

🔊 Assess for heart failure; report signs and symptoms (peripheral edema, dyspnea) to prescriber promptly.

🔊 Give sublingual nitroglycerin, as prescribed, if patient has signs or symptoms of acute myocardial infarction (especially when dosage is increased).

**Patient teaching**

- If patient also uses sublingual nitroglycerin, tell him he can take nitroglycerin as needed for acute angina.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant adverse reactions, especially those related to the drugs and behaviors mentioned above.

**amoxicillin****amoxicillin trihydrate**

Amix<sup>®</sup>, Amox<sup>™</sup>, Amoxident<sup>®</sup>, Amoxil, Apo-Amoxil<sup>™</sup>, Moxatag<sup>™</sup>, Novamoxin<sup>™</sup>, Nu-Amoxil<sup>™</sup>, Trimox

**Pharmacologic class:** Aminopenicillin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

**Action**

Inhibits cell-wall synthesis during bacterial multiplication, leading to cell death. Shows enhanced activity toward gram-negative bacteria compared to natural and penicillinase-resistant penicillins.

**Availability**

*Capsules:* 250 mg, 500 mg

*Powder for oral suspension:* 50 mg/ml and 125 mg/5 ml (pediatric), 200 mg/5 ml, 250 mg/5 ml, 400 mg/5 ml

*Tablets:* 500 mg, 875 mg

*Tablets for oral suspension:* 200 mg, 400 mg

*Tablets (chewable):* 125 mg, 200 mg, 250 mg, 400 mg

**Indications and dosages**

➤ Uncomplicated gonorrhoea

**Adults and children weighing at least 40 kg (88 lb):** 3 g P.O. as a single dose

**Children ages 2 and older weighing less than 40 kg (88 lb):** 50 mg/kg P.O. given with probenecid 25 mg/kg P.O. as a single dose

➤ Bacterial endocarditis prophylaxis for dental, GI, and GU procedures

**Adults:** 2 g P.O. 1 hour before procedure

**Children:** 50 mg/kg P.O. 1 hour before procedure

➤ Lower respiratory tract infections caused by streptococci, pneumococci, non-penicillinase-producing staphylococci, and *Haemophilus influenzae*

**Adults and children weighing more than 20 kg (44 lb):** 875 mg P.O. q 12 hours or 500 mg P.O. q 8 hours

**Children weighing less than 20 kg (44 lb):** 45 mg/kg/day P.O. in divided doses q 12 hours or 40 mg/kg/day P.O. in divided doses q 8 hours

➤ Ear, nose, and throat infections caused by streptococci, pneumococci, non-penicillinase-producing staphylococci, and *H. influenzae*; GU infections caused by *Escherichia coli*, *Proteus mirabilis*, and *Streptococcus faecalis*

**Adults and children weighing more than 20 kg (44 lb):** 500 mg P.O. q 12 hours or 250 mg P.O. q 8 hours

**Children weighing less than 20 kg (44 lb):** 45 mg/kg/day P.O. in divided doses q 12 hours or 20 to 40 mg/kg P.O. in divided doses q 8 hours

➤ Eradication of *Helicobacter pylori* to reduce risk of duodenal ulcer recurrence

**Adults:** 1 g P.O. q 12 hours for 14 days in combination with clarithromycin and lansoprazole, or in combination with lansoprazole alone as 1 g t.i.d. for 14 days

➤ Postexposure anthrax prophylaxis

**Adults:** 500 mg P.O. t.i.d. for 60 days

**Children:** 80 mg/kg/day P.O. t.i.d. for 60 days

➤ Skin and skin-structure infections caused by streptococci (alpha- and beta-hemolytic strains), staphylococci, and *E. coli*

**Adults:** 500 mg P.O. q 12 hours to 250 mg P.O. q 8 hours. For severe infections, 875 mg P.O. q 12 hours or 500 mg P.O. q 8 hours.

**Children older than age 3 months:** 25 mg/kg/day P.O. in divided doses q 12 hours or 20 mg/kg/day P.O. in divided doses every 8 hours. For severe infections, 45 mg/kg/day P.O. in divided doses q 12 hours or 40 mg/kg/day P.O. in divided doses every 8 hours.

**Dosage adjustment**

- Renal impairment
- Hemodialysis
- Infants ages 3 months and younger

**Off-label uses**

- *Chlamydia trachomatis* infection in pregnant patients

**Contraindications**

- Hypersensitivity to drug or any penicillin

## Precautions

Use cautiously in:

- severe renal insufficiency, infectious mononucleosis, hepatic dysfunction
- pregnant patients.

## Administration

 Ask about history of penicillin allergy before giving.

- Give with or without food.
- Store liquid form in refrigerator when possible.
- Know that maximum dosage for infants ages 3 months and younger is 30 mg/kg/day divided q 12 hours.

Route	Onset	Peak	Duration
P.O.	30 min	1-2 hr	8-12 hr

## Adverse reactions

**CNS:** lethargy, hallucinations, anxiety, confusion, agitation, depression, dizziness, fatigue, hyperactivity, insomnia, behavioral changes, **seizures** (with high doses)

**GI:** nausea, vomiting, diarrhea, bloody diarrhea, abdominal pain, gastritis, stomatitis, glossitis, black “hairy” tongue, furry tongue, enterocolitis, **pseudomembranous colitis**

**GU:** vaginitis, nephropathy, **interstitial nephritis**

**Hematologic:** eosinophilia, anemia, **thrombocytopenia, thrombocytopenic purpura, leukopenia, hemolytic anemia, agranulocytosis, bone marrow depression**

**Hepatic:** cholestatic jaundice, hepatic cholestasis, **cholestatic hepatitis, non-specific hepatitis**

**Respiratory:** wheezing

**Skin:** rash

**Other:** superinfections (oral and rectal candidiasis), fever, **anaphylaxis**

## Interactions

**Drug-drug.** *Allopurinol:* increased risk of rash

*Chloramphenicol, macrolides, sulfonamides, tetracycline:* decreased amoxicillin efficacy

*Hormonal contraceptives:* decreased contraceptive efficacy

*Probenecid:* decreased renal excretion

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, eosinophils, lactate dehydrogenase:* increased levels

*Granulocytes, hemoglobin, platelets, white blood cells:* decreased values

*Direct Coombs' test, urine glucose, urine protein:* false-positive results

**Drug-food.** *Any food:* delayed or reduced drug absorption

**Drug-herbs.** *Khat:* decreased antimicrobial efficacy

## Patient monitoring

• Monitor for signs and symptoms of hypersensitivity reaction.

 Evaluate for seizures when giving high doses.

• Monitor patient's temperature and watch for other signs and symptoms of superinfection (especially oral or rectal candidiasis).

## Patient teaching

 Instruct patient to immediately report signs and symptoms of hypersensitivity reactions, such as rash, fever, or chills.

• Tell patient he may take drug with or without food.

• Tell patient not to chew or swallow tablets for suspension, because they're not meant to be dissolved in mouth.

• Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.

• Tell patient taking hormonal contraceptives that drug may reduce contraceptive efficacy. Suggest she use alternative birth control method.

• Inform patient that drug lowers resistance to other types of infections. Instruct him to report new signs and symptoms of infection, especially in mouth or rectum.

- Tell parents they may give liquid form of drug directly to child or may mix it with foods or beverages.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## amoxicillin and clavulanate potassium

Apo-Amoxi-Clav<sup>✳</sup>, Augmentin, Augmentin-Duo<sup>⚠</sup>, Augmentin XR, Clavulin<sup>✳</sup>, Novo-Clavamoxin<sup>✳</sup>

**Pharmacologic class:** Aminopenicillin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

### Action

Amoxicillin inhibits transpeptidase, preventing cross-linking of bacterial cell wall and leading to cell death. Addition of clavulanate (a beta-lactam) increases drug's resistance to beta-lactamase (an enzyme produced by bacteria that may inactivate amoxicillin).

### Availability

**Oral suspension:** 125 mg amoxicillin with 31.25 mg clavulanic acid/5 ml, 200 mg amoxicillin with 28.5 mg clavulanic acid/5 ml, 250 mg amoxicillin with 62.5 mg clavulanic acid/5 ml, 400 mg amoxicillin with 57 mg clavulanic acid/5 ml, 600 mg amoxicillin with 42.9 mg clavulanic acid/5 ml  
**Tablets (chewable):** 200 mg amoxicillin with 28.5 mg clavulanate, 400 mg amoxicillin with 57 mg clavulanate  
**Tablets (extended-release):** 1,000 mg amoxicillin with 62.5 mg clavulanate  
**Tablets (film-coated):** 250 mg amoxicillin with 125 mg clavulanate, 500 mg amoxicillin with 125 mg clavulanate, 875 mg amoxicillin with 125 mg clavulanate

### Indications and dosages

➤ Lower respiratory tract infections, otitis media, sinusitis, skin and skin-structure infections, and urinary tract infections (UTIs) caused by susceptible strains of gram-negative and gram-positive organisms

**Adults and children weighing more than 40 kg (88 lb):** 500 mg q 12 hours or 250 mg P.O. q 8 hours (based on amoxicillin component). For severe infections, 875 mg P.O. q 12 hours or 500 mg P.O. q 8 hours.

➤ Serious infections and community-acquired pneumonia

**Adults and children weighing more than 40 kg (88 lb):** 875 mg P.O. q 12 hours or 500 mg P.O. q 8 hours

**Infants and children ages 3 months and older weighing less than 40 kg (88 lb):** 20 to 45 mg/kg/day P.O. in divided doses q 12 hours or 20 or 25 to 40 mg/kg/day in divided doses q 8 hours, based on severity of infection and amoxicillin component (125 mg/5 ml or 250 mg/5 ml suspension)

**Infants younger than 3 months:** 30 mg/kg/day P.O. (based on amoxicillin component) divided q 12 hours. (125 mg/5 ml oral suspension is recommended.)

➤ Recurrent or persistent acute otitis media caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, or *Moraxella catarrhalis* in children ages 2 and younger and in children who have received antibiotic therapy within last 3 months

**Children ages 3 months to 12 years:** 90 mg/kg/day of Augmentin ES-600 P.O. q 12 hours for 10 days

### Dosage adjustment

- Severe renal impairment
- Hemodialysis
- Infants ages 3 months and younger

### Contraindications

- Hypersensitivity to drug or any penicillin
- Phenylketonuria (some products)

- History of cholestatic jaundice or hepatic dysfunction associated with this drug

### Precautions

Use cautiously in:

- severe renal insufficiency, infectious mononucleosis
- pregnant patients.

### Administration

 Ask about history of penicillin allergy before giving.

- Give with or without food.
- Know that maximum dosage for infants ages 3 months and younger is 30 mg/kg/day divided q 12 hours.
- Be aware that 12-hour dosing is recommended to reduce diarrhea.

Route	Onset	Peak	Duration
P.O.	Unknown	1-2.5 hr	6-8 hr
P.O. (extended)	Unknown	1-4 hr	Unknown

### Adverse reactions

**CNS:** lethargy, hallucinations, anxiety, confusion, agitation, depression, dizziness, fatigue, hyperactivity, insomnia, behavioral changes, **seizures** (with high doses)

**GI:** nausea, vomiting, diarrhea, abdominal pain, stomatitis, glossitis, gastritis, black “hairy” tongue, furry tongue, enterocolitis, **pseudomembranous colitis**

**GU:** vaginitis, nephropathy, **interstitial nephritis**

**Hematologic:** anemia, **thrombocytopenia**, **thrombocytopenic purpura**, **leukopenia**, **hemolytic anemia**, **agranulocytosis**, **bone marrow depression**, **eosinophilia**

**Hepatic:** **cholestatic hepatitis**

**Respiratory:** wheezing

**Skin:** rash

**Other:** superinfections (oral and rectal candidiasis), fever, **anaphylaxis**

### Interactions

**Drug-drug.** *Any food:* enhanced clavulanate absorption

*Chloramphenicol, macrolides, sulfonamides, tetracycline:* decreased amoxicillin efficacy

*Hormonal contraceptives:* decreased contraceptive efficacy

*Probenecid:* decreased renal excretion and increased blood level of amoxicillin

**Drug-food.** *Any food:* enhanced clavulanate absorption

**Drug-herbs.** *Khat:* decreased antimicrobial effect

### Patient monitoring

- Monitor patient carefully for signs and symptoms of hypersensitivity reaction.

 Monitor for seizures when giving high doses.

- Check patient’s temperature and watch for other signs and symptoms of superinfection, especially oral or rectal candidiasis.

### Patient teaching

 Instruct patient to immediately report signs or symptoms of hypersensitivity reaction, such as rash, fever, or chills.

- Tell patient he may take drug with or without food.

• Inform patient that drug lowers resistance to some types of infections. Instruct him to report new signs or symptoms of infection (especially of mouth or rectum).

• Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.

• Tell patient taking hormonal contraceptives that drug may reduce contraceptive efficacy. Suggest she use alternative birth control method.

• Inform parents that they may give liquid form of drug directly to child or may mix it with foods or beverages.

• As appropriate, review all other significant and life-threatening adverse

reactions and interactions, especially those related to the drugs, foods, and herbs mentioned above.

## amphotericin B cholesteryl sulfate

Amphocil , Amphotec

## amphotericin B desoxycholate

Fungilin , Fungizone Intravenous

## amphotericin B lipid complex

Abelcet

## amphotericin B liposome

AmBisome

**Pharmacologic class:** Systemic polyene antifungal

**Therapeutic class:** Antifungal

**Pregnancy risk category B**

### FDA **BOXED WARNING**

- Amphotericin B desoxycholate should be used mainly to treat progressive and potentially life-threatening fungal infections. It shouldn't be used to treat noninvasive forms of fungal disease (such as oral thrush, vaginal candidiasis, or esophageal candidiasis) in patients with normal neutrophil counts.

### Action

Binds to sterols in fungal cell membrane, increasing permeability. This allows potassium to exit the cell, causing fungal impairment or death.

### Availability

Amphotericin B cholesteryl sulfate—

*Injection:* 50 mg, 100 mg

Amphotericin B desoxycholate—

*Injection:* 50-mg vial

*Oral suspension:* 100 mg/ml in 24-ml bottles

Amphotericin B lipid complex—

*Suspension for injection:* 100 mg/20-ml vials

Amphotericin B liposome—

*Injection:* 50 mg

### Indications and dosages

**>** Invasive aspergillosis

**Adults:** *Amphotericin B desoxycholate*—For patients with good cardiovascular function who tolerate test dose, give 0.25 to 0.3 mg/kg daily by slow I.V. infusion (0.1 mg/ml over 2 to 6 hours). Gradually increase to 0.5 to 0.6 mg/kg daily. Patients with neutropenia or rapidly progressing, potentially fatal infections may require higher dosages (1 to 1.5 mg/kg daily).

**Adults and children ages 1 month and older:** *Amphotericin B liposome*—3 to 5 mg/kg I.V. daily

**>** Invasive aspergillosis in patients with renal impairment or unacceptable toxicity who can't tolerate or don't respond to amphotericin B desoxycholate in effective doses

**Adults and children:** *Amphotericin B cholesteryl sulfate*—3 to 4 mg/kg daily reconstituted in sterile water for injection and diluted in dextrose 5% in water (D<sub>5</sub>W) and give by continuous infusion at 1 mg/kg/hour. *Amphotericin B lipid complex*—5 mg/kg daily I.V. prepared as 1-mg/ml infusion and delivered at a rate of 2.5 mg/kg/hour.

**>** Systemic histoplasmosis

**Adults:** *Amphotericin B desoxycholate*—If patient tolerates test dose, gradually increase from initial recommended dosage of 0.25 to 0.3 mg/kg daily by slow I.V. infusion (0.1 mg/ml over 2 to 6 hours) to usual dosage of

0.5 to 0.6 mg/kg daily I.V. for 4 to 8 weeks; higher dosages (0.7 to 1 mg) may be necessary for rapidly progressing, potentially fatal infections.

➤ Systemic coccidioidomycosis and blastomycosis

**Adults:** *Amphotericin B desoxycholate*—If patient tolerates test dose, gradually increase from initial recommended dosage of 0.25 to 0.3 mg/kg daily by slow I.V. infusion (0.1 mg/ml over 2 to 6 hours) to usual dosage of 0.5 to 1 mg/kg daily I.V. for 4 to 12 weeks.

➤ Systemic cryptococcosis

**Adults:** *Amphotericin B desoxycholate*—If patient tolerates test dose, gradually increase from initial recommended dosage of 0.25 to 0.3 mg/kg daily by slow I.V. infusion (0.1 mg/ml over 2 to 6 hours) to usual dosage of 0.3 to 1 mg/kg daily I.V. (with or without flucytosine) for 2 weeks to several months. For patients with human immunodeficiency virus (HIV) infection, usual dosage is 0.7 mg/kg daily I.V. for 4 weeks, followed by 0.7 mg/kg I.V. given on alternate days for 4 additional weeks. If patient can't tolerate or doesn't respond to amphotericin B desoxycholate, give amphotericin B cholesteryl sulfate at a dosage of 3 to 6 mg/kg daily I.V.

**Adults and children ages 1 month and older:** *Amphotericin B liposome*—3 to 5 mg/kg daily I.V.

➤ Cryptococcal meningitis in HIV-infected patients

**Adults:** *Amphotericin B desoxycholate*—If patient tolerates test dose, gradually increase from initial recommended dosage of 0.25 to 0.3 mg/kg daily by slow I.V. infusion (0.1 mg/ml over 2 to 6 hours) to usual dosage of 0.3 to 1 mg/kg daily I.V. (with or without flucytosine) for 2 weeks to several months. *Amphotericin B lipid complex*—5 mg/kg I.V. infusion daily for 6 weeks, followed by 12 weeks of oral fluconazole therapy. *Amphotericin B liposome*—6 mg/kg I.V. infusion daily.

➤ Disseminated candidiasis

**Adults:** *Amphotericin B desoxycholate*—If patient tolerates test dose, gradually increase from initial recommended dosage of 0.25 to 0.3 mg/kg daily by slow I.V. infusion (0.1 mg/ml over 2 to 6 hours) to usual dosage of 0.4 to 0.6 mg/kg daily by slow I.V. infusion for 7 to 14 days (low-risk patients) or for 6 weeks (high-risk patients). For hepatosplenic candidiasis, 1 mg/kg daily I.V. given with oral flucytosine; for severe or refractory esophageal candidiasis in HIV-infected patients, 0.3 mg/kg daily I.V. for at least 5 to 7 days; for candiduria, 0.3 mg/kg daily I.V. for 3 to 5 days.

**Adults and children ages 1 month and older:** *Amphotericin B liposome*—3 to 5 mg/kg/day I.V. for 5 to 7 days

➤ Systemic zygomycosis, including mucormycosis

**Adults:** *Amphotericin B desoxycholate*—If patient tolerates test dose, gradually increase from initial recommended dosage of 0.25 to 0.3 mg/kg daily by slow I.V. infusion (0.1 mg/ml over 2 to 6 hours) to usual dosage of 1 to 1.5 mg/kg daily I.V. for 2 to 3 months. For rhinocerebral phycomycosis form, total dosage is 3 g I.V.

➤ Systemic disseminated sporotrichosis

**Adults:** *Amphotericin B desoxycholate*—If patient tolerates test dose, gradually increase from initial recommended dosage of 0.25 to 0.3 mg/kg daily by slow I.V. infusion (0.1 mg/ml over 2 to 6 hours) to usual dosage of 0.4 to 0.5 mg/kg daily I.V. for 2 to 3 months.

➤ Cutaneous leishmaniasis

**Adults and children:** *Amphotericin B desoxycholate*—If patient tolerates test dose, gradually increase from initial recommended dosage of 0.25 to 0.5 mg/kg/day given by slow I.V. infusion (0.1 mg/ml over 2 to 6 hours) until 0.5 to 1 mg/kg/day is reached; then give every other day. Usual duration is 3 to 12 weeks.

➤ Visceral leishmaniasis in immunocompetent patients

**Adults and children ages 1 month and older:** *Amphotericin B liposome*—3 mg/kg given I.V. over 2 hours on days 1 through 5, 14, and 21. Repeat course if initial treatment fails to clear parasites.

➤ Visceral leishmaniasis in immunocompromised patients

**Adults and children ages 1 month and older:** *Amphotericin B liposome*—4 mg/kg given I.V. over 2 hours on days 1 through 5, 10, 17, 24, 31, and 38

➤ Empiric therapy for presumed fungal infection in febrile, neutropenic patients

**Adults:** *Amphotericin B desoxycholate*—If patient tolerates test dose, gradually increase from initial recommended dosage of 0.25 to 0.3 mg/kg daily by slow I.V. infusion (0.1 mg/ml over 2 to 6 hours) to usual dosage of 0.25 to 1 mg/kg daily I.V. *Amphotericin B liposome*—3 mg/kg daily given I.V. over 120 minutes for 2 weeks.

### Off-label uses

- Chemoprophylaxis in immunocompromised patients
- Coccioidial arthritis
- Prophylaxis of fungal infections in bone-marrow transplant recipients, patients with primary amoebic meningoencephalitis caused by *Naegleria fowleri*, and patients with ocular aspergillosis

### Contraindications

- Hypersensitivity to drug and its components
- Severe respiratory distress

### Precautions

Use cautiously in:

- renal impairment, electrolyte abnormalities
- pregnant or breastfeeding patients
- children.

### Administration

• Know that amphotericin B should be given only by health care professionals thoroughly familiar with drug, its administration, and adverse reactions.

⚠ Before giving first dose of conventional amphotericin B (desoxycholate form), test dose may be ordered (due to widely varying tolerance and clinical status) as follows: 1 mg in 20 ml of D<sub>5</sub>W over 20 to 30 minutes; monitor vital signs every 30 minutes for next 2 hours.

• Know that if desoxycholate form is discontinued for 1 week or longer, drug should be restarted at 0.25 mg/kg daily, with dosage then increased gradually.

• Pretreat with antihistamines, antipyretics, or corticosteroids, as prescribed.

• Give through separate I.V. line, using infusion pump and in-line filter with pores larger than 1 micron.

• Choose distal vein for I.V. site. Alternate sites regularly.

• Mix with sterile water to reconstitute. Don't mix with sodium chloride, other electrolytes, or bacteriostatic products.

• Flush I.V. line with 5% dextrose injection before and after infusion.

• Keep dry form of drug away from light. Once mixed with fluid, solution can be kept in light for up to 8 hours.

⚠ Know that total daily dosage of amphotericin B desoxycholate form should never exceed 1.5 mg/kg.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown
I.V.	Rapid	End of infusion	24 hr

### Adverse reactions

**CNS:** anxiety, confusion, headache, insomnia, weakness, depression, dizziness, drowsiness, hallucinations, speech difficulty, ataxia, vertigo, stupor, psychosis, **seizures**

**CV:** hypotension, hypertension, tachycardia, phlebitis, chest pain, orthostatic hypotension, vasodilation, **asystole, atrial fibrillation, bradycardia, cardiac arrest, shock, supraventricular tachycardia**

**EENT:** double or blurred vision, amblyopia, eye hemorrhage, hearing loss, tinnitus, epistaxis, rhinitis, sinusitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, melena, abdominal pain, abdominal distention, dry mouth, oral inflammation, oral candidiasis, anorexia, **GI hemorrhage**

**GU:** painful urination, hematuria, albuminuria, glycosuria, excessive urea buildup, urine of low specific gravity, nephrocalcinosis, **renal failure, renal tubular acidosis, oliguria, anuria**

**Hematologic:** eosinophilia; normochromic, normocytic, or hypochromic anemia; **leukocytosis; thrombocytopenia; leukopenia; agranulocytosis; coagulation disorders**

**Hepatic:** jaundice, **acute hepatic failure, hepatitis**

**Metabolic:** hypomagnesemia, hypokalemia, hypocalcemia, hypernatremia, hyperglycemia, dehydration, hypoproteinemia, hypervolemia, hyperlipidemia, **acidosis**

**Musculoskeletal:** muscle, joint, neck, or back pain

**Respiratory:** increased cough, hypoxia, lung disorders, hyperventilation, wheezing, dyspnea, hemoptysis, tachypnea, **asthma, bronchospasm, respiratory failure, pulmonary edema, pleural effusion**

**Skin:** discoloration, bruising, flushing, pruritus, urticaria, acne, rash, sweating, nodules, skin ulcers, alopecia, maculopapular rash

**Other:** gingivitis, fever, infection, peripheral or facial edema, weight changes, pain or reaction at injection site, tissue damage with extravasation, hypersensitivity reactions including **anaphylaxis**

## Interactions

**Drug-drug.** *Antineoplastics (such as mechlorethamine):* renal toxicity, bronchospasm, hypotension

*Cardiac glycosides:* increased risk of digitalis toxicity (in potassium-depleted patients)

*Corticosteroids:* increased potassium depletion

*Cyclosporine, tacrolimus:* increased creatinine levels

*Flucytosine:* increased flucytosine toxicity

*Imidazoles (clotrimazole, fluconazole, ketoconazole, miconazole):* antagonism of amphotericin B effects

*Leukocyte transfusion:* pulmonary reactions

*Nephrotoxic drugs (such as antibiotics, pentamidine):* increased risk of renal toxicity

*Thiazides:* increased electrolyte depletion

*Skeletal muscle relaxants:* increased skeletal muscle relaxation

*Zidovudine:* increased myelotoxicity and nephrotoxicity

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, gamma-glutamyltransferase, lactate dehydrogenase, nitrogenous compounds (urea), uric acid:* increased levels

*Calcium, hemoglobin, magnesium, platelets, potassium, protein:* decreased levels

*Eosinophils, glucose, white blood cells:* increased or decreased levels

*Liver function tests:* abnormal results

*Prothrombin time:* prolonged

**Drug-herbs.** *Gossypol:* increased risk of renal toxicity

## Patient monitoring

🚨 Monitor for infusion-related reactions (fever, chills, hypotension, GI symptoms, breathing difficulties, and headache). Stop infusion and notify prescriber immediately if reaction occurs.

 After giving test dose, monitor vital signs and temperature every 30 minutes for 2 to 4 hours, as ordered.

- Assess fluid intake and output.
- Monitor kidney and liver function test results and serum electrolyte levels.
- Assess for signs and symptoms of ototoxicity (hearing loss, tinnitus, ataxia, and vertigo).

### Patient teaching

-  Advise patient to contact prescriber immediately if he has fever, chills, headache, vomiting, diarrhea, cough, or breathing problems.
- Instruct patient to report hearing loss, dizziness, or unsteady gait.
  - Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, alertness, and vision.
  - Instruct patient to drink plenty of fluids.
  - Tell patient to monitor urine output and report significant changes.
  - Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
  - As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## ampicillin sodium

Apo-Ampi<sup>✳</sup>, Novo-Ampicillin<sup>✳</sup>, Nu-Ampi<sup>✳</sup>, Penbritin<sup>✳</sup> , Rimacillin 

**Pharmacologic class:** Aminopenicillin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

### Action

Destroys bacteria by inhibiting bacterial cell-wall synthesis during microbial multiplication

### Availability

*Capsules:* 250 mg, 500 mg

*Oral suspension:* 125 mg/5 ml, 250 mg/5 ml

*Powder for injection:* 125 mg, 250 mg, 500 mg, 1 g, 2 g, 10 g

### Indications and dosages

 Respiratory tract, skin, and soft-tissue infections caused by *Haemophilus influenzae*, staphylococci, and streptococci

**Adults and children weighing 40 kg (88 lb) or more:** 250 to 500 mg I.V. or I.M. q 6 hours

**Adults and children weighing less than 40 kg (88 lb):** 25 to 50 mg/kg/day I.M. or I.V. in divided doses q 6 to 8 hours

**Adults and children weighing more than 20 kg (44 lb):** 250 mg P.O. q 6 hours

**Children weighing 20 kg (44 lb) or less:** 50 mg/kg/day P.O. in divided doses q 6 to 8 hours

 Bacterial meningitis caused by *Neisseria meningitidis*, *Escherichia coli*, group B streptococci, or *Listeria monocytogenes*; septicemia caused by *Streptococcus* species, penicillin G-susceptible staphylococci, enterococci, *E. coli*, *Proteus mirabilis*, or *Salmonella* species

**Adults:** 150 to 200 mg/kg/day by continuous I.V. infusion or I.M. injection in equally divided doses q 3 to 4 hours, to a maximum dosage of 14 g

**Children:** 100 to 200 mg/kg/day I.V. in divided doses q 3 to 4 hours

 GI or urinary tract infections, including *Neisseria gonorrhoeae* infection in women

**Adults and children weighing more than 40 kg (88 lb):** 500 mg I.M. or I.V. q 6 hours

**Adults and children weighing 40 kg (88 lb) or less:** 50 to 100 mg/kg/day I.M. or I.V. in equally divided doses q 6 to 8 hours

➤ Endocarditis prophylaxis for dental, oral, or upper respiratory tract procedures

**Adults:** 2 g I.M. or I.V. within 30 minutes before procedure

**Children:** 50 mg/kg I.V. or I.M. within 30 minutes before procedure

➤ Prevention of bacterial endocarditis before GI or GU surgery or instrumentation

**High-risk adults:** 2 g I.M. or I.V. with gentamicin 1.5 mg/kg I.M. or I.V. within 30 minutes before procedure. Six hours later, give ampicillin 1 g I.M. or I.V., or amoxicillin 1 g P.O.

**High-risk children:** 50 mg/kg I.M. or I.V. with 1.5 mg/kg of gentamicin I.M. or I.V. within 30 minutes before procedure; 6 hours later, give ampicillin 25 mg/kg I.M. or I.V. or ampicillin 25 mg/kg P.O.

**Moderate-risk adults:** 2 g I.M. or I.V. within 30 minutes before procedure

**Moderate-risk children:** 50 mg/kg I.M. or I.V. within 30 minutes before procedure

➤ Prophylaxis for neonatal group B streptococcal disease

**Adult women:** During labor, loading dose of 2 g I.V.; then 1 g I.V. q 4 hours until delivery

➤ *N. gonorrhoeae* infections

**Adults:** Single dose of 3.5 g P.O. given with 1 g probenecid

**Children weighing 40 kg (88 lb) or more:** 500 mg I.M. or I.V. q 6 hours

**Children weighing less than 40 kg (88 lb):** 50 mg/kg/day in divided doses q 6 to 8 hours

➤ Urethritis caused by *N. gonorrhoeae* (in males)

**Adults and children weighing 40 kg (88 lb) or more:** 500 mg I.V. or I.M., repeated 8 to 12 hours later

➤ Prophylaxis against sexually transmitted diseases in adult rape victims

**Adults:** 3.5 g P.O. with 1 g probenecid as a single dose

## Dosage adjustment

- Renal impairment

## Contraindications

- Hypersensitivity to penicillins, cephalosporins, imipenem, or other beta-lactamase inhibitors

## Precautions

Use cautiously in:

- severe renal insufficiency, infectious mononucleosis
- pregnant or breastfeeding patients.

## Administration

- Ask patient about history of penicillin allergy before giving.
- For I.V. use, mix powder with bacteriostatic water for injection in amount listed on label.
- For direct I.V. injection, give over 10 to 15 minutes. Don't exceed 100 mg/minute.
- For intermittent I.V. infusion, mix with 50 to 100 ml of normal saline solution and give over 15 to 30 minutes.
- Change I.V. site every 48 hours.
- Give oral doses 1 hour before or 2 hours after meals.

Route	Onset	Peak	Duration
P.O.	30 min	2 hr	6-8 hr
I.V.	Immediate	5 min	6-8 hr
I.M.	15 min	1 hr	6-8 hr

## Adverse reactions

**CNS:** lethargy, hallucinations, anxiety, confusion, agitation, depression, fatigue, dizziness, **seizures**

**CV:** vein irritation, **thrombophlebitis, heart failure**

**EENT:** blurred vision, itchy eyes

**GI:** nausea, vomiting, diarrhea, abdominal pain, enterocolitis, gastritis, stomatitis, glossitis, black "hairy" tongue, furry tongue, oral or rectal candidiasis, **pseudomembranous colitis**

**GU:** vaginitis, nephropathy, **interstitial nephritis**

**Hematologic:** anemia, eosinophilia, **agranulocytosis, hemolytic anemia, leukopenia, thrombocytopenic purpura, thrombocytopenia, neutropenia**

**Hepatic: nonspecific hepatitis**

**Musculoskeletal:** arthritis exacerbation

**Respiratory:** wheezing, dyspnea, hypoxia, **apnea**

**Skin:** rash, urticaria, fever, diaphoresis

**Other:** pain at injection site, superinfections, hyperthermia, hypersensitivity reaction, **anaphylaxis, serum sickness**

## Interactions

**Drug-drug.** *Allopurinol:* increased risk of rash

*Chloramphenicol:* synergistic or antagonistic effects

*Hormonal contraceptives:* decreased contraceptive effect, increased risk of breakthrough bleeding

*Probenecid:* decreased renal excretion of ampicillin, increased ampicillin blood level

*Tetracyclines:* reduced bactericidal effect

**Drug-diagnostic tests.** *Conjugated estrone, estradiol, estriol-glucuronide, total conjugated estriols:* increased levels in pregnant patients

*Granulocytes, hemoglobin, platelets, white blood cells:* decreased levels

*Coombs' test, urine glucose:* false-positive results

*Eosinophils:* increased count

**Drug-food.** *Any food:* reduced ampicillin efficacy

## Patient monitoring

- Watch for signs and symptoms of hypersensitivity reaction.
- 🚨 Monitor for seizures when giving high doses.
- Frequently measure patient's temperature and check for signs and

symptoms of superinfection, especially oral or rectal candidiasis.

- Monitor for bleeding tendency or hemorrhage.

## Patient teaching

- Tell patient to take oral dose with 8 oz of water 1 hour before or 2 hours after a meal.

🚨 Instruct patient to immediately report signs and symptoms of hypersensitivity reaction, such as rash, fever, or chills.

- Inform patient that drug lowers resistance to certain other infections. Tell him to report new signs or symptoms of infection, especially in mouth or rectum.

- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.

🚨 Instruct patient to promptly report unusual bleeding or bruising.

- Tell patient to avoid activities that can cause injury. Advise him to use soft toothbrush and electric razor to avoid gum and skin injury.

- Inform patient taking hormonal contraceptives that drug may reduce contraceptive efficacy. Advise her to use alternative birth control method.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## ampicillin sodium and sulbactam sodium

Unasyn

**Pharmacologic class:** Aminopenicillin/beta-lactamase inhibitor

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

## Action

Destroys bacteria by inhibiting bacterial cell-wall synthesis during microbial multiplication. Addition of sulbactam enhances drug's resistance to beta-lactamase, an enzyme that can inactivate ampicillin.

## Availability

*Injection:* Vials; piggyback vials containing 1.5 g (1 g ampicillin sodium and 0.5 g sulbactam sodium), 3 g (2 g ampicillin sodium and 1 g sulbactam sodium), and 15 g (10 g ampicillin sodium and 5 g sulbactam sodium)

## Indications and dosages

➤ Intra-abdominal, gynecologic, and skin-structure infections caused by susceptible beta-lactamase-producing strains

**Adults and children weighing 40 kg (88 lb) or more:** 1.5 to 3 g (1 g ampicillin and 0.5 g sulbactam to 2 g ampicillin and 1 g sulbactam) I.M. or I.V. q 6 hours. Maximum dosage is 4 g sulbactam daily.

**Children ages 1 year and older:** 300 mg/kg/day (200 mg ampicillin/100 mg sulbactam) by I.V. infusion q 6 hours in equally divided doses

## Dosage adjustment

- Renal impairment

## Contraindications

- Hypersensitivity to penicillins, cephalosporins, imipenem, or other beta-lactamase inhibitors

## Precautions

Use cautiously in:

- severe renal insufficiency, infectious mononucleosis
- pregnant or breastfeeding patients.

## Administration

- Ask patient about history of penicillin allergy before giving.

- Let vial stand several minutes until foam has evaporated before administering drug.
- Don't mix I.V. form with other I.V. drugs.
- Give direct I.V. dose over 10 to 15 minutes.
- Give intermittent infusion in 50 to 100 ml of compatible solution over 15 to 30 minutes.
- Change I.V. site every 48 hours.
- Don't give I.M. to children.

Route	Onset	Peak	Duration
I.V.	Immediate	End of infusion	6-8 hr
I.M.	Rapid	1 hr	6-8 hr

## Adverse reactions

**CNS:** lethargy, hallucinations, anxiety, confusion, agitation, depression, fatigue, dizziness, **seizures**

**CV:** vein irritation, **thrombophlebitis, heart failure**

**EENT:** blurred vision, itchy eyes

**GI:** nausea, vomiting, diarrhea, abdominal pain, enterocolitis, gastritis, stomatitis, glossitis, black "hairy" tongue, furry tongue, oral and rectal candidiasis, **pseudomembranous colitis**

**GU:** hematuria, hyaline casts in urine, vaginitis, nephropathy, **interstitial nephritis**

**Hematologic:** anemia, eosinophilia, **agranulocytosis, hemolytic anemia, leukopenia, thrombocytopenic purpura, thrombocytopenia, neutropenia**

**Hepatic:** **nonspecific hepatitis**

**Musculoskeletal:** arthritis exacerbation

**Respiratory:** wheezing, dyspnea,

hypoxia, **apnea**

**Skin:** rash, urticaria, diaphoresis

**Other:** pain at injection site, fever, hyperthermia, superinfections, hypersensitivity reactions, **anaphylaxis, serum sickness**

## Interactions

**Drug-drug.** *Allopurinol*: increased risk of rash

*Chloramphenicol*: synergistic or antagonistic effects

*Hormonal contraceptives*: decreased contraceptive efficacy, increased risk of breakthrough bleeding

*Probenecid*: decreased renal excretion and increased blood level of ampicillin

*Tetracyclines*: reduced bactericidal effect

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatine kinase, creatinine, gamma-glutamyltransferase, eosinophils, lactate dehydrogenase*: increased levels

*Estradiol, estriol-glucuronide, granulocytes, hemoglobin, lymphocytes, neutrophils, platelets, white blood cells*: decreased levels

*Coombs' test*: false-positive result

*Urinalysis*: red blood cells, hyaline casts

## Patient monitoring

- Monitor for signs and symptoms of hypersensitivity reaction.
- Check for signs and symptoms of infection at injection site.
- 🔊 Monitor for seizures when giving high doses.
- Watch for bleeding tendency and hemorrhage.
- Check patient's temperature and watch for other signs and symptoms of superinfection, especially oral or rectal candidiasis.
- Monitor CBC and liver function test results.

## Patient teaching

- 🔊 Instruct patient to immediately report signs and symptoms of hypersensitivity reaction, such as rash, fever, or chills.
- Tell patient to report signs and symptoms of infection or other problems at injection site.

- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- Inform patient that drug lowers resistance to certain infections. Instruct him to report new signs or symptoms of infection, especially in mouth or rectum.
- 🔊 Tell patient to promptly report unusual bleeding or bruising.
- Inform patient taking hormonal contraceptives that drug may reduce contraceptive efficacy. Advise her to use alternative birth control method.
- Instruct patient to avoid activities that can cause injury. Advise him to use soft toothbrush and electric razor to avoid gum and skin injury.
- Inform patient that he may need to undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## amyl nitrite

### Amyl Nitrite

**Pharmacologic class:** Coronary vasodilator

**Therapeutic class:** Antianginal

**Pregnancy risk category** C

## Action

Relaxes vascular smooth muscle, thereby dilating large coronary vessels, decreasing systemic vascular resistance, reducing afterload, decreasing cardiac output, and relieving angina

## Availability

*Ampules*: 0.3 ml

## Indications and dosages

➤ Acute angina attack

**Adults:** 0.18 to 0.3 ml by inhalation, repeated in 3 to 5 minutes if needed

➤ Antidote for cyanide poisoning

**Adults and children:** 0.3 ml by inhalation for 15 to 30 seconds q 5 minutes until sodium nitrite infusion is available

## Contraindications

- Hypersensitivity to drug

## Precautions

Use cautiously in:

- glaucoma, hypotension, hyperthyroidism, severe anemia, early myocardial infarction
- elderly patients
- pregnant or breastfeeding patients.

## Administration

- Crush ampule and wave under patient's nose one to six times. If needed, repeat in 3 to 5 minutes.

Route	Onset	Peak	Duration
Inhalation	30 sec	Unknown	3-5 min

## Adverse reactions

**CNS:** headache, dizziness, weakness, syncope, restlessness

**CV:** orthostatic hypotension, flushing, palpitations, **tachycardia**

**EEENT:** increased intraocular pressure

**GI:** nausea, vomiting, fecal incontinence

**GU:** urinary incontinence

**Hematologic:** **hemolytic anemia, methemoglobinemia**

**Skin:** cutaneous vasodilation, rash, pallor, facial and neck flushing

## Interactions

**Drug-drug.** *Aspirin:* increased amyl nitrite blood level and action

*Calcium channel blockers:* increased risk of symptomatic orthostatic hypotension

*Sildenafil:* increased risk of hypotension

*Sympathomimetics:* decreased antianginal effects, hypotension, tachycardia

**Drug-behaviors.** *Alcohol use:* severe hypotension, cardiovascular collapse

## Patient monitoring

- Monitor vital signs. Stay alert for tachycardia and orthostatic hypotension.
- Assess for bowel and bladder incontinence.
- Monitor neurologic response. Watch closely for dizziness and syncope.
- Assess level of headache pain.
- In long-term therapy, monitor CBC.

## Patient teaching

- Teach patient to crush capsule and wave it under his nose until angina is relieved (usually after one to six inhalations).
- Tell patient that drug often causes dizziness, orthostatic hypotension, and syncope. Advise him to sit or lie down until these effects subside.
- Inform patient that drug often causes headache. Instruct him to follow prescriber's recommendations for pain relief.
- Tell patient that drug may cause fecal or urinary incontinence. Encourage him to use bathroom frequently to avoid accidents.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and behaviors mentioned above.

## anagrelide hydrochloride

Agrylin, Xagrid<sup>®</sup>

**Pharmacologic class:** Hematologic drug

**Therapeutic class:** Antiplatelet drug

**Pregnancy risk category** C

**Action**

Unclear. May reduce platelet production by decreasing megakaryocytic hypermaturation, thereby decreasing platelet count and inhibiting platelet aggregation (at higher doses).

**Availability**

*Capsules:* 0.5 mg, 1 mg

**Indications and dosages**

➤ Essential thrombocythemia

**Adults:** 0.5 mg P.O. q.i.d. or 1 mg P.O. b.i.d. for 1 week. Adjust as needed to lowest effective dosage that maintains platelet count below 600,000/mm<sup>3</sup>. Maximum dosage is 10 mg daily or 2.5 mg as a single dose.

**Dosage adjustment**

- Hepatic or renal disease

**Contraindications**

- Prolonged exposure to sunlight
- Women who are or may become pregnant

**Precautions**

Use cautiously in:

- renal, hepatic, or cardiac dysfunction
- pregnant or breastfeeding patients
- children younger than age 16.

**Administration**

- Give 1 hour before or 2 hours after meals.

Route	Onset	Peak	Duration
P.O.	Immediate	1 hr	48 hr

**Adverse reactions**

**CNS:** amnesia, confusion, depression, dizziness, drowsiness, weakness, headache, syncope, insomnia, migraine, nervousness, pain, paresthesia, malaise, **seizures, cerebrovascular accident**  
**CV:** angina, chest pain, hypertension, palpitations, orthostatic hypotension, peripheral edema, vasodilation, **arrhythmias, tachycardia, heart**

**failure, hemorrhage, myocardial infarction, cardiomyopathy, cardiomegaly, atrial fibrillation, complete heart block, pericarditis**

**EENT:** amblyopia, abnormal or double vision, visual field abnormalities, tinnitus, epistaxis, rhinitis, sinusitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, melena, gastric or duodenal ulcers, dyspepsia, aphthous stomatitis, anorexia, flatulence, gastritis, pancreatitis, **GI hemorrhage**

**GU:** painful urination, hematuria

**Hematologic:** lymphadenoma, **bleeding tendency, anemia, thrombocytopenia**

**Metabolic:** dehydration

**Musculoskeletal:** leg cramps; joint, back, muscle, neck pain

**Respiratory:** bronchitis, dyspnea, pneumonia, respiratory disease, **asthma, pulmonary infiltrates,**

**pulmonary fibrosis, pulmonary hypertension**

**Skin:** bruising, pruritus, rash, alopecia, urticaria, skin disease, photosensitivity reaction

**Other:** chills, fever, flulike symptoms, edema

**Interactions**

**Drug-drug.** *Sucralfate:* interference with anagrelide absorption

**Drug-diagnostic tests.** *Hemoglobin, platelets:* decreased values

*Hepatic enzymes:* elevated values

**Drug-food.** *Any food:* decreased drug bioavailability

**Drug-herbs.** *Evening primrose oil, feverfew, garlic, ginger, ginkgo biloba, ginseng, grapeseed:* increased anti-platelet effect

**Patient monitoring**

🔊 Watch for signs and symptoms of vasodilation, heart failure, and arrhythmias in patients with cardiovascular disease.

- For first 2 weeks, monitor CBC and liver and kidney function test results.

- Monitor platelet count regularly until maintenance dosage is established.
- Check regularly for adverse reactions, especially bleeding tendency.
- Monitor blood pressure for orthostatic hypertension.

### Patient teaching

- Instruct patient to take drug 1 hour before or 2 hours after meals.
- Tell patient that drug may cause a temporary blood pressure decrease if he sits or stands up suddenly. Tell him to rise slowly and carefully.
- 📣 Instruct patient to report unusual bleeding or bruising or difficulty breathing.
- 📣 Tell patient to avoid prolonged exposure to sunlight.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, alertness, and vision.
- Inform patient using hormonal contraceptives that drug may interfere with contraceptive efficacy. Advise her to use alternative birth control method.
- Tell patient to avoid activities that may cause injury. Tell him to use soft toothbrush and electric razor to avoid gum and skin injury.
- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- Notify patient that he'll undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

Reactions in **bold** are life-threatening.

a

## anakinra

Kineret

**Pharmacologic class:** Interleukin-1 (IL-1) blocker

**Therapeutic class:** Immunomodulator, antirheumatic

**Pregnancy risk category B**

### Action

Inhibits binding of IL-1 with IL type I receptors, thereby mediating immunologic, inflammatory, and other physiologic responses

### Availability

*Prefilled glass syringes:* 100 mg/0.67 ml

### Indications and dosages

➤ Moderately to severely active rheumatoid arthritis in patients ages 18 and older who don't respond to disease-modifying antirheumatics alone

**Adults:** 100 mg/day subcutaneously, given at same time each day

### Contraindications

- Hypersensitivity to drug or *Escherichia coli*-derived protein
- Serious infections

### Precautions

Use cautiously in:

- immunosuppression, active infection, chronic illness, renal impairment
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

📣 Withhold drug and notify prescriber if patient shows signs or symptoms of active infection.

📣 Clinical alert

 Use extreme caution if patient is concurrently receiving drugs that block tumor necrosis factor (TNF), because of increased risk of serious infection.

- Give entire dose from prefilled syringe.
- Don't freeze or shake syringe.

Route	Onset	Peak	Duration
Subcut.	Slow	3-7 hr	Unknown

### Adverse reactions

**CNS:** headache

**EENT:** sinusitis

**GI:** nausea, diarrhea, abdominal pain

**Hematologic:** thrombocytopenia, neutropenia

**Respiratory:** upper respiratory tract infection

**Skin:** rash, pruritus, injection site reaction or bruising, rash, erythema, inflammation

**Other:** flulike symptoms, infections

### Interactions

**Drug-drug.** *Etanercept, infliximab, other drugs that block TNF:* increased risk of serious infection

*Live-virus vaccines:* vaccine inefficacy

**Drug-diagnostic tests.** *Neutrophils:* decreased count

### Patient monitoring

- Monitor CBC with white cell differential.
- Assess injection site for reactions.

### Patient teaching

 Tell patient to immediately report signs or symptoms of infection.

- Advise patient to report signs and symptoms of allergic response.
- Instruct patient to take drug at same time each day for best response.
- Teach patient about proper drug disposal (in puncture-resistant container). Also caution him against reusing needles, syringes, and drug product.

- Tell patient not to freeze or shake drug.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## anastrozole

Arimidex

**Pharmacologic class:** Nonsteroidal aromatase inhibitor

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

### Action

Reduces serum estradiol levels with no significant effect on adrenocorticoid or aldosterone level; decreases stimulating effect of estrogen on tumor growth

### Availability

*Tablets:* 1 mg

### Indications and dosages

 Postmenopausal women with hormone receptor-unknown or hormone receptor-positive advanced breast cancer or with advanced breast cancer after tamoxifen therapy; adjuvant treatment for hormone receptor-positive breast cancer

**Adults:** 1 mg P.O. daily

### Contraindications

- Hypersensitivity to drug or its components
- Women of childbearing age

### Precautions

Use cautiously in:

- ischemic heart disease
- breastfeeding patients
- children (safety and efficacy not established).

## Administration

- Verify that patient isn't pregnant before giving drug.

Route	Onset	Peak	Duration
P.O.	>24 hr	Unknown	<6 days

## Adverse reactions

**CNS:** headache, weakness, dizziness, depression, paresthesia, lethargy

**CV:** chest pain, peripheral edema, vasodilation, hypertension, **thromboembolic disease**

**EENT:** pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, anorexia, dry mouth

**GU:** vaginal bleeding, leukorrhea, vaginal dryness, pelvic pain

**Musculoskeletal:** decreased bone mineral density, fractures, bone or back pain, muscle weakness

**Respiratory:** dyspnea, cough

**Skin:** rash

**Other:** food distaste, weight gain, swelling, hot flashes, flulike symptoms, tumor flare **hypersensitivity reactions** (including **anaphylaxis, angioedema, urticaria**)

## Interactions

**Drug-diagnostic tests.** *Hepatic enzymes, low-density lipoproteins, total cholesterol:* increased levels

## Patient monitoring

- Monitor patient closely for hypersensitivity reactions.
- Check regularly for signs and symptoms of thromboembolic disease, especially dyspnea and chest pain.
- Monitor for circulatory overload (suggested by peripheral edema, cough, and dyspnea).
- Assess for signs and symptoms of depression. Evaluate patient for suicidal ideation.
- Monitor liver function test results.

## Patient teaching

- Instruct patient to immediately notify prescriber if signs and symptoms of hypersensitivity occur (such as itching or swelling of face, lips, or throat).
- Advise patient to immediately report signs and symptoms of thromboembolic disease and circulatory overload.
- Emphasize importance of preventing pregnancy during therapy.
- Tell patient to contact prescriber if she develops signs or symptoms of depression.
- Caution patient to avoid driving and other hazardous activities until she knows how drug affects concentration and alertness.
- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- Inform patient that she'll undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## anidulafungin

Eraxis

**Pharmacologic class:** Semisynthetic echinocandin

**Therapeutic class:** Antifungal

**Pregnancy risk category C**

## Action

Inhibits glucan synthase, an enzyme present in fungal (but not mammalian) cells; this action inhibits formation of 1,3-beta-D-glucan, an essential component of fungal cell wall.

## Availability

*Powder for injection (lyophilized):* 50-mg single-use vial

## Indications and dosages

➤ Candidemia and other *Candida* infections (intra-abdominal abscess, peritonitis)

**Adults:** Single 200-mg loading dose by I.V. infusion on day 1, followed by 100 mg I.V. daily thereafter. Duration depends on clinical response; generally, therapy continues at least 14 days after last positive culture.

➤ Esophageal candidiasis

**Adults:** Single 100-mg loading dose by I.V. infusion on day 1, followed by 50 mg I.V. daily thereafter. Treatment should continue for at least 14 days, and for at least 7 days after symptoms resolve; duration depends on clinical response. Due to risk of esophageal candidiasis relapse in patients with human immunodeficiency virus, suppressive antifungal therapy may be considered after treatment ends.

## Contraindications

- Hypersensitivity to drug, its components, or other echinocandins

## Precautions

Use cautiously in:

- hepatic impairment
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

## Administration

 Don't give by I.V. bolus.

- Reconstitute only with supplied diluent (20% dehydrated alcohol in water for injection).
- Further dilute only with 5% dextrose injection or normal saline solution, to yield infusion solution concentration of 0.5 mg/ml.
- Give by I.V. infusion within 24 hours of reconstitution.

 Don't infuse at a rate exceeding 1.1 mg/minute.

- Don't dilute with other solutions or infuse through same I.V. line with other drugs or electrolytes.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** headache

**CV:** hypotension, phlebitis

**GI:** aggravated dyspepsia, nausea, vomiting

**Hematologic:** neutropenia, leukopenia

**Respiratory:** dyspnea

**Skin:** rash, urticaria, pruritus, flushing

**Other:** fever

## Interactions

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, gamma glutamyltransferase:* increased

## Patient monitoring

- If patient has abnormal liver function tests during therapy, monitor for evidence of worsening hepatic function and weigh risks and benefits of continuing therapy.
- Monitor for rash, urticaria, flushing, dyspnea, and hypotension. (However, these are rare when drug is administered slowly.)

## Patient teaching

-  Instruct patient to report rash, itching, unusual bruising or bleeding, unusual tiredness, or yellowing of skin or eyes.
- Advise patient to report troublesome side effects such as GI upset.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the tests mentioned above.

## antihemophilic factor (AHF, factor VIII)

Advate, Alphanate, Hemofil M, Koate-DVI, Kogenate FS, Monarc-M, Monoclate-P, Recombinate, ReFacto

**Pharmacologic class:** Hemostatic

**Therapeutic class:** Antihemophilic

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug is made from human plasma and may contain infectious agents. Plasma donor screening, testing, and inactivation or removal methods reduce this risk.

### Action

Promotes conversion of prothrombin to thrombin (necessary for hemostasis and blood clotting). Also replaces missing or deficient clotting factors, thereby controlling or preventing bleeding.

### Availability

*I.V. injection:* 250, 500, 1,000, or 1,500 international units/vial in numerous preparations

### Indications and dosages

➤ Spontaneous hemorrhage in patients with hemophilia A (factor VIII deficiency)

**Adults and children:** Dosage is highly individualized, calculated as follows: AHF required (international units) equals weight (kg) multiplied by desired factor VIII increase (% of normal) multiplied by 0.5.

To control bleeding, desired factor VIII level is 20% to 40% of normal for minor hemorrhage; 30% to 60% of normal for moderate hemorrhage; or

60% to 100% of normal for severe hemorrhage. To prevent spontaneous hemorrhage, desired factor VIII level is 5% of normal.

### Contraindications

- Hypersensitivity to drug or to mouse, hamster, or bovine protein

### Precautions

Use cautiously in:

- hepatic disease
- blood types A, B, and AB
- patients receiving factor VIII inhibitors
- pregnant patients
- neonates and infants.

### Administration

- Before giving, verify that patient has no history of hypersensitivity to drug or to mouse, hamster, or bovine protein.
- Follow prescriber's instructions regarding hepatitis B prophylaxis before starting therapy.
- Refrigerate concentrate until ready to reconstitute drug; then warm to room temperature before mixing.
- Roll bottle gently between hands until drug is well-mixed.
- Give a single dose over 5 to 10 minutes at rate of 2 to 10 ml/minute, as appropriate.
- After drug is reconstituted, don't refrigerate, shake, or store near heat.
- Don't mix with other I.V. solutions.
- Use plastic (not glass) syringe and filter.

Route	Onset	Peak	Duration
I.V.	Immediate	1-2 hr	Unknown

### Adverse reactions

**CNS:** headache; lethargy; fatigue; dizziness; jitteriness; drowsiness; depersonalization; tingling in arms, ears, and face

**CV:** chest tightness, angina pectoris, tachycardia, slight hypotension, **thrombosis**

**EENT:** blurred or abnormal vision, eye disorder, otitis media, epistaxis, rhinitis, sore throat

**GI:** nausea, vomiting, diarrhea, constipation, stomachache, abdominal pain, gastroenteritis, anorexia,

**Hematologic:** forehead bruises, **increased bleeding tendency, thrombocytopenia, hemolytic anemia, intravascular hemolysis, hyperfibrinogenemia**

**Hepatic:** hepatitis B transmission

**Musculoskeletal:** myalgia, muscle weakness, bone pain, finger pain

**Respiratory:** dyspnea, coughing, wheezing, **bronchospasm**

**Skin:** rash, acne, flushing, diaphoresis, urticaria

**Other:** taste changes, allergic reaction, fever, chills, cold feet, cold sensations, infected hematoma, stinging at injection site, **anaphylaxis, human immunodeficiency virus transmission**

## Interactions

**Drug-diagnostic tests.** *Bilirubin, creatine kinase:* increased levels

*Hemoglobin, platelets:* decreased values

## Patient monitoring

🚨 Monitor for signs and symptoms of anaphylaxis and hemolysis.

🚨 Watch for bleeding tendency and hemorrhaging.

- Check vital signs regularly.
- Monitor CBC and coagulation studies.

🚨 Assess for severe headache (may indicate intracranial hemorrhage).

## Patient teaching

🚨 Tell patient to immediately report signs and symptoms of allergic response or bleeding tendency.

- Caution patient not to use aspirin during therapy.
- Instruct patient to contact prescriber if drug becomes less effective.

- Tell patient to report signs or symptoms of hepatitis B.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, alertness, and vision.

- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.

- Notify patient that he'll undergo regular blood testing during therapy.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## antithrombin III, human (AT-III, heparin cofactor 1)

Thrombate III

**Pharmacologic class:** Blood derivative, coagulation inhibitor

**Therapeutic class:** Antithrombin

**Pregnancy risk category B**

## Action

Inactivates thrombin and activated forms of factors IXa, Xa, XIa, and XIIa, thereby inhibiting coagulation and thromboembolism formation

## Availability

**Injection:** 500 international units, 1,000 international units

## Indications and dosages

➤ Thromboembolism related to AT-III deficiency

**Adults:** Initial dosage is individualized to amount required to increase AT-III activity to 120% of normal (determined 20 minutes after administration). Usual infusion rate is 50 to

a maximum of 100 international units/minute I.V. Dosage calculation is based on anticipated 1.4% increase in plasma AT-III activity produced by 1 international unit/kg of body weight.

Use this formula to calculate dosage: Required dosage (international units) equals desired activity (%) minus base-line AT-III activity (%) multiplied by weight (kg) divided by 1.4 (international units/kg).

Maintenance dosage is individualized to amount required to maintain AT-III activity at 80% of normal.

### Contraindications

None

### Precautions

Use cautiously in:

- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Reconstitute drug concentrate with 10 ml of sterile water, normal saline solution, or dextrose 5% in water.
- Use filter needle provided by manufacturer to draw up solution.
- Don't shake vial.
- Know that drug may be diluted further in same solution if desired.
- Don't mix with other solutions.
- Infuse over 10 to 20 minutes.
- Administer within 3 hours of reconstitution.

 If adverse reactions occur, decrease infusion rate or, if indicated, stop infusion until symptoms disappear.

Route	Onset	Peak	Duration
I.V.	Immediate	Unknown	4 days

### Adverse reactions

**CNS:** dizziness, light-headedness, headache

**CV:** vasodilation, reduced blood pressure, chest pain

**EENT:** perception of "film" over eyes

**GI:** nausea, sensation of intestinal fullness

**GU:** diuresis

**Musculoskeletal:** muscle cramps

**Respiratory:** dyspnea, shortness of breath

**Skin:** urticaria, oozing lesions, hives, hematoma

**Other:** foul taste, chills, fever

### Interactions

**Drug-drug:** *Heparin:* increased anticoagulant effect

### Patient monitoring

- Monitor AT-III activity levels regularly.
-  Watch for signs and symptoms of too-rapid infusion, such as dyspnea and hypertension.
- Monitor vital signs and temperature.
- Assess fluid intake and output to detect dehydration.

### Patient teaching

-  Instruct patient to immediately report chest tightness, dizziness, and fever.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Advise patient to minimize GI upset and unpleasant taste by eating small, frequent servings of healthy food and drinking plenty of fluids.
- Tell patient that he'll undergo regular blood testing during therapy.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

## apomorphine hydrochloride

APO-go , Apokyn

**Pharmacologic class:** Dopaminergic, dopamine-receptor agonist

**Therapeutic class:** Antiparkinsonian

**Pregnancy risk category C**

### Action

Unclear. May stimulate postsynaptic dopamine D<sub>2</sub>-type receptors in caudate-putamen of brain.

### Availability

*Ampules:* 10 mg/ml in 2- and 3-ml cartridges

### Indications and dosages

➤ Acute intermittent treatment of hypomobility and “off” (“end-of-dose wearing off” and unpredictable “on/off”) episodes associated with Parkinson’s disease

**Adults:** 0.2-ml (2-mg) test dose injected subcutaneously during “off” state in setting where medical personnel can monitor blood pressure. If patient tolerates test dose, give 0.2 ml subcutaneously p.r.n. to treat “off” episodes no sooner than 2 hours after previous dose. Establish dosage based on tolerance and efficacy; increase in 0.1-ml (1 mg) increments, usually to 0.3 to 0.4 ml. Maximum dosage, 0.6 ml up to five times daily.

Patient who tolerates but doesn’t respond to test dose may receive 0.4 ml (4 mg) at next observed “off” period, but no sooner than 2 hours after initial 0.2-ml test dose. If patient tolerates 0.4-ml test dose, give starting dosage of 0.3 ml (3 mg) p.r.n. to treat “off” episodes. If needed, increase in increments of 0.1 ml every few days on outpatient basis.

If patient doesn’t tolerate 0.4-ml test dose, 0.3-ml test dose may be given during separate “off” period no sooner than 2 hours after 0.4-ml test dose.

If patient tolerates 0.3-ml test dose, starting dosage should be 0.2 ml p.r.n. to treat existing “off” episodes. If needed and if patient tolerates 0.2-ml dose, dosage can be increased to 0.3 ml after several days; in this case, it ordinarily shouldn’t be increased to 0.4 ml on outpatient basis.

### Dosage adjustment

- Mild or moderate renal impairment

### Contraindications

- Hypersensitivity to drug or its components
- Concurrent use of 5-hydroxytryptamine<sub>3</sub> (5-HT<sub>3</sub>) antagonists (such as alosetron, dolasetron, granisetron, ondansetron, palonosetron)

### Precautions

Use cautiously in:

- renal or hepatic impairment
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- If prescribed, give trimethobenzamide (antiemetic) for 3 days before starting apomorphine and continuing throughout therapy.
- Give only by subcutaneous injection.
-  Don’t give I.V. because this may cause serious adverse events, such as I.V. crystallization of apomorphine, leading to thrombus formation and pulmonary embolism.
- Titrate dosage based on efficacy and patient tolerance.
- Check supine and standing blood pressure before giving test dose and 20, 40, and 60 minutes after. If patient experiences clinically significant

orthostatic hypotension in response to test dose, don't give drug.

Route	Onset	Peak	Duration
Subcut.	Unknown	10-60 min	Unknown

### Adverse reactions

**CNS:** drowsiness, somnolence, dizziness, hallucinations, confusion, syncope, dyskinesias

**CV:** orthostatic hypotension, chest pain, chest pressure, angina, cardiac valvulopathy

**EENT:** rhinorrhea

**GI:** nausea, vomiting, retroperitoneal fibrosis

**GU:** priapism

**Respiratory:** pulmonary infiltrates, pleural effusion, pleural thickening

**Other:** yawning, edema of extremities, injection site reactions, abuse potential, allergic reactions

### Interactions

**Drug-drug.** *Antihypertensive agents, vasodilators:* increased incidence of hypotension, myocardial infarction, serious pneumonia, serious falls, bone and joint injuries

*Dopamine antagonists:* decreased apomorphine efficacy

*5-HT<sub>3</sub> antagonists:* profound hypotension

**Drug-behaviors.** *Alcohol use:* additive drowsiness and somnolence

### Patient monitoring

- Monitor for serious cardiovascular and respiratory adverse reactions.
- Monitor for unexpected somnolence, which may interfere with daily activities.

### Patient teaching

- Instruct patient to take drug as described in patient instruction leaflet.
- Make sure patient knows that dosages are in milliliters, not milligrams.
- Instruct patient to rotate injection site.

- Inform patient that drug may cause hallucinations and unexpected sleepiness.

- Tell patient that drug may cause blood pressure to drop. Caution him to rise slowly from sitting or lying position.

- Urge patient to consult prescriber before taking other drugs.

- Caution patient not to use alcohol during therapy.

- Advise patient to avoid driving and other hazardous activities until drug effects are known.

- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

## aprepitant fosaprepitant dimeglumine

Emend, Emend for Injection

**Pharmacologic class:** Substance P and neurokinin-1 antagonist

**Therapeutic class:** Adjunctive antiemetic

**Pregnancy risk category B**

### Action

Augments antiemetic activity of ondansetron (a 5-hydroxytryptamine<sub>3</sub>-receptor antagonist) and dexamethasone. Also inhibits cisplatin-induced emesis.

### Availability

*Capsules:* 40 mg, 80 mg, 125 mg

*Powder for injection, lyophilized:*

115 mg, 150 mg in single-dose vials

### Indications and dosages

➤ To prevent acute and delayed nausea and vomiting caused by highly emetogenic cancer chemotherapy

**a**

**Adults:** 125 mg P.O. 1 hour before chemotherapy on day 1; then 80 mg P.O. once daily in morning on days 2 and 3. Give with 12 mg dexamethasone P.O. and 32 mg ondansetron I.V. on day 1, and with 8 mg dexamethasone P.O. on days 2 to 4.

**Adults:** Single-dose regimen: 150 mg (fosaprepitant dimeglumine) by I.V. infusion over 20 to 30 minutes starting 30 minutes before chemotherapy, with 12 mg dexamethasone P.O. once daily and 32 mg ondansetron I.V. 30 minutes before chemotherapy once daily on day 1. On day 2, give dexamethasone 8 mg P.O. once daily in the morning. On days 3 and 4, give dexamethasone 8 mg P.O. b.i.d.

**Adults:** Three-day dosing regimen; 115 mg (fosaprepitant dimeglumine) by I.V. infusion over 15 minutes starting 30 minutes before chemotherapy, with 12 mg dexamethasone P.O. 30 minutes before chemotherapy once daily and 32 mg ondansetron I.V. once daily on day 1. On days 2 and 3, give 80 mg (aprepitant) capsules P.O. once daily and dexamethasone 8 mg P.O. once daily. On day 4, give dexamethasone 8 mg P.O. once daily.

➤ To prevent nausea and vomiting caused by moderately emetogenic cancer chemotherapy

**Adults:** Three-day dosing regimen; 115 mg (fosaprepitant dimeglumine) by I.V. infusion over 15 minutes starting 30 minutes before chemotherapy, with 12 mg dexamethasone P.O. 30 minutes before chemotherapy once daily and 8 mg ondansetron P.O. b.i.d. (one capsule 30 to 60 minutes before chemotherapy and one capsule 8 hours after first dose) on day 1. Give 80 mg (aprepitant) capsules P.O. once daily on days 2 and 3.

➤ Prevention of postoperative nausea and vomiting

**Adults:** 40 mg P.O. once within 3 hours before induction anesthesia

## Contraindications

- Hypersensitivity to drug
- Concurrent pimozone, terfenadine, astemizole, or cisapride therapy
- Breastfeeding

## Precautions

Use cautiously in:

- patients receiving concurrent warfarin or CYP3A4 inhibitors
- pregnant patients.

## Administration

- Give with other antiemetics as prescribed.
- For the 115-mg and 150-mg I.V. dose, reconstitute powder with 5 ml normal saline solution in vial and inject in infusion bag containing 110 ml and 145 ml normal saline solution, respectively, to yield a final concentration of 1 mg/ml. Then gently invert I.V. bag two or three times. Don't mix with other solutions, including lactated Ringer's and Hartmann's solutions.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** dizziness, neuropathy, headache, insomnia, asthenia, fatigue

**EENT:** tinnitus

**GI:** nausea, vomiting, constipation, diarrhea, epigastric discomfort, gastritis, heartburn, abdominal pain, anorexia

**Hematologic: neutropenia**

**Other:** fever, dehydration, hiccups

## Interactions

**Drug-drug.** *CYP3A4 inducers (carbamazepine, phenytoin, rifampin):* decreased aprepitant blood level  
*CYP3A4 inhibitors (azole antifungals, clarithromycin, nefazodone, ritonavir):* increased aprepitant blood level  
*Dexamethasone, methylprednisolone:* increased steroid exposure

*Docetaxel, etoposide, ifosfamide, imatinib, irinotecan, paclitaxel, vinblastine, vincristine, vinorelbine:* increased blood levels of these drugs

*Hormonal contraceptives:* decreased contraceptive efficacy

*Paroxetine:* decreased efficacy of either drug

*Pimozide:* increased blood level and toxic effects of aprepitant

*Tolbutamide, warfarin:* CYP2C9 induction, decreased efficacy of these drugs

### Patient monitoring

- Monitor neurologic status. Institute measures to prevent injury as needed.
- Assess nutritional and hydration status.
- Monitor CBC.

### Patient teaching

- Tell patient that drug may cause CNS effects. Explain that he'll be monitored to ensure his safety.
- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, hearing, strength, balance, and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## argatroban

Acova

**Pharmacologic class:** L-arginine-derived thrombin inhibitor

**Therapeutic class:** Anticoagulant

**Pregnancy risk category B**

### Action

Binds rapidly to site of thrombi, neutralizing conversion of fibrinogen to fibrin, activation of coagulation factors, and platelet aggregation (processes required for thrombus formation)

### Availability

*Injection:* 100 mg/ml in 2.5-ml vials

### Indications and dosages

➤ Treatment or prophylaxis of thrombosis in patients with heparin-induced thrombocytopenia

**Adults:** 2 mcg/kg/minute as a continuous I.V. infusion, to a maximum dosage of 10 mcg/kg/minute. Adjust dosage as needed to maintain activated partial thromboplastin time (APTT) at 1.5 to 3 times initial baseline value (not to exceed 100 seconds).

➤ Anticoagulation during percutaneous coronary intervention in patients who have or are at risk for heparin-induced thrombocytopenia

**Adults:** Start continuous I.V. infusion at 25 mcg/kg/minute and give loading dose of 350 mcg/kg by I.V. bolus over 3 to 5 minutes. Check activated clotting time (ACT) 5 to 10 minutes after bolus dose is given; adjust dosage until ACT is between 300 and 450 seconds. If ACT is below 300 seconds, give additional I.V. bolus dose of 150 mcg/kg; then increase infusion rate to 30 mcg/kg/minute, and check ACT after 5 to 10 minutes. If ACT exceeds 450 seconds, decrease infusion rate to 15 mcg/kg/minute, and check ACT after 5 to 10 minutes. Maintain adjusted infusion dosage once therapeutic ACT has been reached.

### Dosage adjustment

- Hepatic impairment

### Contraindications

- Hypersensitivity to drug
- Overt major bleeding

## Precautions

Use cautiously in:

- hepatic impairment or disease, intracranial bleeding
- pregnant or breastfeeding patients
- children younger than age 18.

## Administration

- Stop all parenteral anticoagulants before starting argatroban.
- Dilute in normal saline solution, dextrose 5% in water, or lactated Ringer's solution to a concentration of 1 mg/ml.
- Inject contents of 2.5-ml vial into 250-ml bag of diluent.
- Protect solution from direct sunlight.

Route	Onset	Peak	Duration
I.V.	Rapid	1-3 hr	Duration of infusion

## Adverse reactions

**CNS:** headache

**CV:** hypotension, unstable angina, **atrial fibrillation, cardiac arrest, ventricular tachycardia, cerebrovascular disorders**

**GI:** nausea, vomiting, diarrhea, abdominal pain, anorexia, **GI bleeding**

**GU:** urinary tract infection, minor GU tract bleeding and hematuria, **renal dysfunction**

**Hematologic:** groin bleeding, brachial bleeding, **hypoprothrombinemia, thrombocytopenia, bleeding or hemorrhage**

**Respiratory:** cough, dyspnea, pneumonia, hemoptysis

**Skin:** rash, bleeding at puncture site

**Other:** allergic reaction, pain, infection, fever, **sepsis, anaphylaxis**

## Interactions

**Drug-drug.** *Oral anticoagulants:* prolonged prothrombin time, increased International Normalized Ratio, increased risk of bleeding

*Thrombolytics:* increased risk of intracranial bleeding

**Drug-diagnostic tests.** *Hematocrit, hemoglobin:* decreased values

## Patient monitoring

- ☞ Monitor patient for signs and symptoms of anaphylaxis.
- ☞ Evaluate patient for bleeding tendency and hemorrhage.
- Assess neurologic status and vital signs frequently.
- Monitor CBC and coagulation studies, especially partial thromboplastin time.
- ☞ Check for signs and symptoms of serious arrhythmias and hypotension.

## Patient teaching

- ☞ Instruct patient to immediately report allergic reaction and unusual bleeding or bruising.
- Tell patient to avoid activities that can cause injury. Advise him to use a soft toothbrush and electric razor to avoid gum and skin injury.
- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- Tell patient that he'll undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## aripiprazole

Abilify

**Pharmacologic class:** Quinolone-derived atypical antipsychotic agent

**Therapeutic class:** Antipsychotic, neuroleptic

**Pregnancy risk category C**

**FDA BOXED WARNING**

- Drug increased mortality in elderly patients with dementia-related psychosis. Although causes of death were varied, most appeared to be cardiovascular or infectious. Drug isn't approved to treat dementia-related psychosis.
- Children, adolescents, and young adults taking antidepressants for major depressive disorder and other psychiatric disorders are at increased risk for suicidal thinking and behavior.
- Drug isn't approved for use in children with depression.

**Action**

Unclear. Thought to exert partial agonist activity at central dopamine D<sub>2</sub> and type 1A serotonin (5-HT<sub>1A</sub>) receptors and antagonistic activity at serotonin 5-HT<sub>2A</sub> receptors. Also has alpha-adrenergic and histamine<sub>1</sub>-blocking properties.

**Availability**

*Injection:* 9.75 mg/1.3 ml (7.5 mg/ml)

*Oral solution:* 1 mg/ml

*Tablets:* 2 mg, 5 mg, 10 mg, 15 mg, 20 mg, 30 mg

*Tablets (orally disintegrating):* 10 mg, 15 mg

**Indications and dosages**

➤ Schizophrenia

**Adults:** 10 to 15 mg P.O. daily. If needed, increase to 30 mg daily after 2 weeks.

**Adolescents ages 13 to 17:** Initially, 2 mg P.O. daily; increase to 5 mg P.O. after 2 days. Then increase to 10 mg P.O. after 2 additional days. Subsequent dosage intervals should occur in increments no greater than 5 mg, up to a maximum of 30 mg.

➤ To maintain stability in schizophrenic patients

**Adults:** 15 mg P.O. daily. Therapy may continue for up to 26 weeks with periodic evaluations.

**Adolescents ages 13 to 17:** General recommendation, continue responding patients beyond the acute response but at the lowest dosage needed to maintain remission.

➤ Acute manic and mixed episodes associated with bipolar disorder

**Adults:** 30 mg P.O. daily for up to 3 weeks

➤ Agitation associated with schizophrenia or bipolar mania

**Adults:** Usual dosage, 5.25 to 15 mg I.M. as single dose. Recommended dosage is 9.75 mg I.M. as single dose.

No additional benefit was demonstrated for 15 mg compared to 9.75 mg. Lower dosage of 5.25 mg may be considered when clinical factors warrant.

If agitation warranting second dose persists following initial dose, cumulative dosages up to total of 30 mg/day may be given. However, efficacy of repeated doses in agitated patients hasn't been systematically evaluated in controlled clinical trials. Also, safety of total daily doses greater than 30 mg or injections given more frequently than every 2 hours hasn't been adequately evaluated in clinical trials. If ongoing aripiprazole therapy is clinically indicated, oral aripiprazole ranging from 10 to 30 mg/day P.O. should replace aripiprazole injection as soon as possible.

➤ Adjunctive treatment of major depressive disorder

**Adults:** Initially, 2 to 5 mg P.O. daily. May increase up to 15 mg daily at increments of up to 5 mg/day at intervals of no less than 1 week.

**Dosage adjustment**

- Concurrent use of potent CYP3A4 inhibitors (such as ketoconazole), CYP2D6 inhibitors (such as fluoxetine, paroxetine, quinidine), or CYP3A4 inducers (such as carbamazepine)

## Contraindications

- Hypersensitivity to drug

## Precautions

Use cautiously in:

- cerebrovascular disease, hypotension, seizure disorder, suicidal ideation
- high risk for aspiration pneumonia
- neuroleptic malignant syndrome, tardive dyskinesia, diabetes mellitus
- leukopenia, neutropenia, agranulocytosis
- pregnant or breastfeeding patients
- elderly patients (with dementia-related psychosis)
- children, adolescents, and young adults with major depressive disorder

## Administration

- Give with or without food.
- Don't administer with grapefruit juice.
- Be aware that oral solution may be substituted for tablets on a mg-to-mg basis up to 25-mg dose. Patients receiving 30 mg of tablets should receive 25 mg of oral solution.

Route	Onset	Peak	Duration
I.M.	Unknown	1-3 hr	Unknown
P.O.	Slow	3-5 hr	Unknown

## Adverse reactions

**CNS:** dizziness, insomnia, akathisia, agitation, anxiety, headache, light-headedness, drowsiness, tremor, tardive dyskinesia, **seizures, neuroleptic malignant syndrome, increased suicide risk**

**CV:** orthostatic hypotension, hypertension, peripheral edema, chest pain, **bradycardia, tachycardia**

**EENT:** rhinitis

**GI:** nausea, vomiting, diarrhea, constipation, jaundice, abdominal pain, esophageal motility disorders, dysphagia

**GU:** urinary incontinence

**Respiratory:** cough

**Skin:** rash

**Other:** fever, **hypersensitivity reactions** (including **anaphylaxis**)

## Interactions

**Drug-drug.** *CNS depressants:* increased sedation

*Drugs that induce CYP3A4:* decreased aripiprazole effect

*Drugs that inhibit CYP3A4 or CYP2D6:* serious toxic effects

*Other antipsychotic agents:* increased extrapyramidal effects

**Drug-diagnostic tests.** *Granulocytes, leukocytes, neutrophils:* decreased values

*Serum glucose:* increased level

**Drug-herbs.** *Kava:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased sedation

## Patient monitoring

⚠ Watch for signs and symptoms of depression, and evaluate patient for suicidal ideation.

- Monitor neurologic status closely. Watch for tardive dyskinesia.

⚠ Evaluate patient for neuroleptic malignant syndrome (fever, altered mental status, rigid muscles, arrhythmia, tachycardia, sweating).

Stop drug and notify prescriber if these signs and symptoms occur.

- Monitor blood pressure, pulse, CBC with differential, and weight.

⚠ Monitor blood glucose level closely; be aware that in patients with diabetes mellitus or risk factors for diabetes, serious hyperglycemia possibly associated with coma or death may occur.

## Patient teaching

⚠ Instruct patient to immediately contact prescriber if he experiences depression or has suicidal thoughts, altered mental status, rigid muscles, irregular heart beat, excessive sweating,

rash, itching, difficulty breathing, or excessive thirst or urination.

- Inform patient that symptoms will subside slowly over several weeks.
- Tell patient he may take drug with or without food.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Tell patient that drug may cause urinary incontinence.
- Caution patient to avoid strenuous exercise and hot environments whenever possible.
- Instruct patient to move slowly when rising to avoid dizziness from sudden blood pressure decrease.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, herbs, and behaviors mentioned above.

## arsenic trioxide

Trisenox

**Pharmacologic class:** Nonmetallic element, white arsenic

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

- Give under supervision of physician experienced in managing patients with acute leukemia.
- Some patients with acute promyelocytic leukemia (APL) treated with drug have had symptoms similar to retinoic-acid-acute promyelocytic leukemia (RA-APL) or APL differentiation syndrome, marked by fever, dyspnea, weight gain, pulmonary infiltrates, and pleural or pericardial effusions. Syndrome can be fatal; at first sign, give

high-dose steroids immediately, regardless of patient's white blood cell count; continue steroids for at least 3 days or longer until signs and symptoms abate. Most patients don't require arsenic trioxide termination during treatment of APL differentiation syndrome.

- Drug may prolong QT interval and cause complete atrioventricular block. QT prolongation can lead to torsades de pointes-type ventricular arrhythmia, which can be fatal.
- Before starting therapy, obtain 12-lead ECG and assess serum electrolyte (potassium, calcium, and magnesium) and creatinine levels. Correct electrolyte abnormalities and, if possible, discontinue drugs known to cause QT prolongation. During therapy, maintain potassium level above 4 mEq/L and magnesium level above 1.8 mg/dL. If patient reaches absolute QT interval value above 500 msec, reassess and take immediate action to correct concomitant risk factors.

### Action

Unclear. May cause morphologic changes and DNA fragmentation in promyelocytic leukemia cells, causing cell death and degradation of or damage to PML/RAR alpha (a fusion protein).

### Availability

*Injection:* 1 mg/ml

### Indications and dosages

➤ APL in patients who have relapsed or are refractory to retinoid and anthracycline chemotherapy

#### Adults and children ages 5 and older:

*Induction phase*—0.15 mg/kg I.V. daily until bone marrow remission occurs, to a maximum of 60 doses. *Consolidation phase*—0.15 mg/kg I.V. daily for 25 doses over 5 weeks, starting 3 to 6 weeks after completion of induction phase.

## Contraindications

- Hypersensitivity to drug
- Pregnancy

## Precautions

Use cautiously in:

- renal impairment, cardiac abnormalities
- elderly patients
- breastfeeding patients
- children.

## Administration

 Know that drug is carcinogenic. Follow facility policy for preparing and handling antineoplastics.

- Dilute in 100 to 250 ml of dextrose 5% in water or normal saline solution.
- Don't mix with other drugs.
- Infuse over 1 to 2 hours (may infuse over 4 hours if patient has vasomotor reaction).

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** headache, insomnia, paresthesia, dizziness, tremor, drowsiness, anxiety, confusion, agitation, rigors, weakness, **seizures, coma**

**CV:** ECG abnormalities, palpitations, chest pain, hypotension, hypertension, tachycardia, **prolonged QT interval, torsades de pointes**

**EENT:** blurred vision, painful red eye, dry eyes, eye irritation, swollen eyelids, tinnitus, earache, nasopharyngitis, postnasal drip, epistaxis, sinusitis, sore throat

**GI:** nausea, vomiting, constipation, diarrhea, abdominal pain, fecal incontinence, dyspepsia, dry mouth, mouth blisters, oral candidiasis, anorexia, **GI hemorrhage**

**GU:** urinary incontinence, intermenstrual bleeding, renal impairment, **oliguria, renal failure, vaginal hemorrhage**

**Hematologic:** anemia, lymphadenopathy, **leukocytosis, thrombocytopenia, neutropenia, disseminated intravascular coagulation, hemorrhage**

**Metabolic:** hypokalemia, hypomagnesemia, hyperglycemia, acidosis, **hypoglycemia, hyperkalemia**

**Musculoskeletal:** joint, muscle, bone, back, neck, or limb pain

**Respiratory:** dyspnea, cough, hypoxia, wheezing, crackles, tachypnea, decreased breath sounds, crepitation, hemoptysis, rhonchi, upper respiratory tract infection, **pleural effusion**

**Skin:** flushing, erythema, pallor, bruising, petechiae, pruritus, dermatitis, dry skin, hyperpigmentation, urticaria, skin lesions, herpes simplex infection, local exfoliation, diaphoresis, night sweats

**Other:** fever, facial edema, weight gain or loss, bacterial infection, pain and edema at injection site, **hypersensitivity reaction, sepsis**

## Interactions

**Drug-drug.** *Drugs that can cause electrolyte abnormalities (such as amphotericin B, diuretics):* increased risk of electrolyte abnormalities

*Drugs that can prolong QT interval (antiarrhythmics, thioridazines, some quinolones):* increased QT-interval prolongation

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, calcium, magnesium, white blood cells:* increased levels

*Glucose, potassium:* altered levels

*Hemoglobin, neutrophils, platelets:* decreased values

## Patient monitoring

 Watch for signs and symptoms of APL differentiation syndrome (fever, dyspnea, weight gain, pulmonary infiltrates, and pleural or pericardial effusions).

- Evaluate vital signs and neurologic status.

 Obtain baseline ECG; monitor ECG at least weekly.

- Assess for arrhythmias and conduction disorders.

 Discontinue drug and notify prescriber if patient develops syncope, tachycardia, or arrhythmias.

- Monitor serum electrolyte levels, CBC, and coagulation studies.
- Assess for hypoglycemia and hyperglycemia if patient is diabetic.

### Patient teaching

 Watch for signs and symptoms of APL differentiation syndrome.

- Tell patient that drug increases risk of serious infection. Instruct him to report signs or symptoms of infection.

 Emphasize importance of avoiding pregnancy during therapy.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Tell patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- Advise patient to establish effective bedtime routine to minimize insomnia.
- Notify patient that he'll undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## asenapine

Saphris

**Pharmacologic class:** Dibenzoxepino pyrrole

**Therapeutic class:** Atypical antipsychotic

**Pregnancy risk category** C

### FDA BOXED WARNING

**a**

- Elderly patients with dementia-related psychosis treated with antipsychotics are at increased risk for death. Analyses of 17 placebo-controlled trials (modal duration of 10 weeks), largely in patients taking atypical antipsychotics, revealed a risk of death in the drug-treated patients of between 1.6 and 1.7 times that seen in placebo-treated patients. Over the course of a typical 10-week controlled trial, the rate of death in drug-treated patients was about 4.5%, compared to a rate of about 2.6% in the placebo group. Although causes of death were varied, most deaths appeared to be either cardiovascular (for example, heart failure, sudden death) or infectious (for example, pneumonia) in nature.
- Observational studies suggest that, similar to atypical antipsychotics, treatment with conventional antipsychotics may increase mortality.
- The extent to which findings of increased mortality in observational studies may be attributed to the antipsychotic as opposed to some characteristic(s) of the patients isn't clear.
- Asenapine isn't approved for treatment of patients with dementia-related psychosis.

### Action

Unknown. May be mediated through a combination of antagonistic activity at D<sub>2</sub> and 5-HT<sub>2A</sub> receptors.

### Availability

*Tablet (sublingual):* 5 mg, 10 mg

### Indications and dosages

 Acute treatment of schizophrenia in adults

**Adults:** 5 mg S.L. b.i.d.

➤ Acute treatment of manic or mixed episodes associated with bipolar I disorder in adults

**Adults:** Initially, 10 mg S.L. b.i.d.; may be decreased to 5 mg S.L. b.i.d. if adverse reactions occur

### Dosage adjustment

- Hypotension
- Severe neutropenia

### Contraindications

None

### Precautions

Use cautiously in:

- severe hepatic impairment (use not recommended)
- neuroleptic malignant syndrome, tardive dyskinesia, history of seizures or conditions that potentially lower seizure threshold (such as Alzheimer's dementia)
- diabetes mellitus
- dysphagia, patients at risk for aspiration pneumonia (avoid use)
- leukopenia, neutropenia
- antipsychotic-naïve patients
- cerebrovascular or cardiovascular disease; patients with risk factors for prolonged QT interval; concomitant use of drugs known to prolong QT interval, including Class 1A and Class III antiarrhythmics, other antipsychotics, and some antibiotics (avoid use)
- concomitant use of fluvoxamine (a CYP1A2 inhibitor), drugs that are both substrates and inhibitors of CYP2D6 (such as paroxetine), other centrally acting drugs, certain antihypertensives, alcohol
- patients who experience conditions that may contribute to core body temperature elevation (such as strenuous exercise, exposure to extreme heat, concomitant medication with anticholinergic activity, dehydration)

- elderly patients with dementia-related psychosis
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Don't give within 10 minutes of a meal.
- Don't give water for at least 10 minutes following sublingual dose.

Route	Onset	Peak	Duration
S.L.	Rapid	0.5-1.5 hr	Unknown

### Adverse reactions

**CNS:** headache, somnolence, insomnia, fatigue, anxiety, depression, irritability, dizziness, syncope, akathisia, extrapyramidal symptoms other than akathisia (including dystonia, oculogyration, dyskinesia, tardive dyskinesia, muscle rigidity, parkinsonism, tremor), **neuroleptic malignant syndrome, seizures**

**CV:** hypertension, orthostatic hypotension, **QT-interval prolongation**

**GI:** constipation, dry mouth, oral hypoesthesia, dysphagia, salivary hypersecretion, vomiting, increased appetite, dyspepsia

**Hematologic:** leukopenia, neutropenia, **agranulocytosis**

**Metabolic:** hyperglycemia, hyperprolactinemia

**Musculoskeletal:** arthralgia, extremity pain

**Other:** weight gain, toothache, dysgeusia

### Interactions

**Drug-drug.** *Antibiotics (such as gatifloxacin, moxifloxacin), antipsychotics (such as chlorpromazine, thioridazine, ziprasidone), Class 1A antiarrhythmics (such as procainamide, quinidine), Class III antiarrhythmics (such as amiodarone, sotalol):* increased risk of QT-interval prolongation

*Antihypertensives:* possible enhanced effects of these agents  
*CYP1A2 inhibitors (such as fluvoxamine), other centrally acting drugs:* possible increased asenapine plasma concentration  
*CYP2D6 substrates and inhibitors (such as paroxetine):* possible enhanced inhibitory effects of paroxetine on its own metabolism  
**Drug-food.** *Any food:* decreased asenapine effect  
**Drug-behaviors.** *Alcohol:* possible enhanced alcohol effects

**Patient monitoring**

- 🔊 Immediately discontinue drug and closely monitor patient if signs and symptoms of neuroleptic malignant syndrome occur, such as hyperpyrexia, muscle rigidity, altered mental status, and evidence of autonomic instability (irregular pulse or blood pressure, tachycardia, diaphoresis, and cardiac arrhythmia). Additional signs and symptoms may include elevated creatine kinase level, myoglobinuria (rhabdomyolysis), and acute renal failure.
- 🔊 Discontinue drug if signs and symptoms of tardive dyskinesia occur (syndrome of potentially irreversible, involuntary, dyskinetic movement).
- 🔊 Watch closely for suicide attempt in patients with inherent psychotic illnesses and bipolar disorder.
- Monitor blood glucose level closely in patient with or at risk for diabetes mellitus.
- Carefully monitor CBC with differential for neutropenia (fever or other signs and symptoms of infection) and treat promptly if such signs or symptoms occur. Discontinue drug immediately if WBC count decreases in absence of other causative factors or if severe neutropenia occurs (absolute neutrophil count less than 1,000/mm<sup>3</sup>).
- Carefully evaluate patient for history of drug abuse; if history exists, observe

patient for signs and symptoms of misuse or abuse (such as drug-seeking behavior and increases in dosage).  
 • Monitor liver function tests closely.

**Patient teaching**

- Instruct patient not to remove tablet from packet until ready to take.
- Instruct patient to gently remove medication from packaging by peeling back tab with dry hands and not to push tablet through packaging.
- Tell patient to place tablet under the tongue and allow it to dissolve completely; caution patient not to chew, crush, or swallow tablet whole.
- Instruct patient not to eat or drink anything for 10 minutes after taking this medication.
- 🔊 Instruct patient to immediately discontinue drug and notify prescriber if the following signs or symptoms occur: overheating, muscle rigidity, altered mental status, irregular pulse or blood pressure, rapid or irregular heart beat, excessive sweating, or involuntary muscle movements.
- 🔊 Advise patient or caregiver to immediately notify prescriber if suicidal thoughts or behavior develops.
- Advise patient to avoid alcoholic beverages.
- Caution patient to avoid driving and other hazardous activities until drug's effects on concentration and alertness are known.
- Inform patient that drug may elevate body temperature and to avoid activities that may cause overheating and dehydration (such as strenuous work or exercise in hot weather, using hot tubs) and to seek immediate medical attention if fever, mental or mood change, headache, or dizziness occurs.
- Inform patient to move slowly when rising to avoid dizziness from sudden blood pressure decrease.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, foods, and behaviors mentioned above.

## asparaginase

Elspar, Kidrolase\*

**Pharmacologic class:** Enzyme

**Therapeutic class:** Antineoplastic (miscellaneous)

**Pregnancy risk category C**

### Action

Hydrolyzes asparagine (an amino acid needed for malignant cell growth in acute lymphocytic leukemia), resulting in leukemic cell death

### Availability

**Injection:** 10,000 international units/vial (with mannitol)

### Indications and dosages

➤ Acute lymphocytic leukemia (given with other drugs, such as prednisone or vincristine, as part of antineoplastic regimen)

**Children:** 1,000 international units/kg I.V. daily for 10 successive days, with asparaginase initiated on day 22 of regimen, or 6,000 international units/m<sup>2</sup> I.M. on days 4, 7, 10, 13, 16, 19, 22, 25, and 28

➤ Sole agent used to induce remission of acute lymphocytic leukemia

**Adults and children:** 200 international units/kg I.V. daily for 28 days

➤ Drug desensitization regimen

**Adults and children:** Initially, 1 international unit I.V. Then double the dosage q 10 minutes until total planned daily dosage has been given.

### Contraindications

- Hypersensitivity to drug
- Pancreatitis or history of pancreatitis

### Precautions

Use cautiously in:

- bone marrow depression, hepatic or renal disease, CNS depression, clotting abnormalities, infection
- pregnant or breastfeeding patients
- women of childbearing age.

### Administration

📣 Administer intradermal skin test as ordered at start of therapy and when drug hasn't been given for 1 week or more.

• Follow prescriber's orders for drug desensitization when indicated (usually before therapy starts and again during retreatment).

📣 Know that drug may be carcinogenic, mutagenic, or teratogenic. Follow appropriate facility policy for handling and preparing.

• Before starting drug, give allopurinol as prescribed to lower risk of neuropathy.

• Add sterile water or normal saline solution (5 ml for I.V. dose, 2 ml for I.M. dose) to powdered drug in vial.

• Filter through 5-micron filter.

• For I.V. use, inject into normal saline solution or dextrose 5% in water and infuse over 30 minutes.

• For I.M. use, give a maximum of 2 ml at any one site.

• Don't use solution unless it's clear.

📣 If drug touches skin or mucous membranes, rinse with copious amounts of water for at least 15 minutes.

• Provide adequate fluid intake to prevent tumor lysis.

Route	Onset	Peak	Duration
I.V.	Immediate	Immediate	23-33 days
I.M.	Immediate	14-24 hr	23-33 days

## Adverse reactions

**CNS:** confusion, drowsiness, depression, hallucinations, fatigue, agitation, headache, lethargy, irritability, **seizures, coma, intracranial hemorrhage and fatal bleeding**

**GI:** nausea, vomiting, anorexia, abdominal cramps, stomatitis, **hemorrhagic pancreatitis, fulminant pancreatitis**

**GU:** glycosuria, polyuria, uric acid nephropathy, **uremia, renal failure**

**Hematologic:** anemia, **leukopenia, hypofibrinogenemia, depression of clotting factor synthesis, bone marrow depression**

**Hepatic:** fatty liver changes, **hepatotoxicity**

**Metabolic:** hyperglycemia, hyperuricemia, hypocalcemia, hyperammonemia, **hypoglycemia**

**Musculoskeletal:** joint pain

**Skin:** rash, urticaria

**Other:** chills, fever, weight loss, hypersensitivity reactions, **anaphylaxis, fatal hyperthermia**

## Interactions

**Drug-drug.** *Methotrexate:* decreased methotrexate efficacy

*Prednisone:* hyperglycemia, increased drug toxicity

*Vincristine:* hyperglycemia, increased drug toxicity, increased risk of neuropathy

**Drug-diagnostic tests.** *Alanine aminotransferase, ammonia, aspartate aminotransferase, blood urea nitrogen, glucose, uric acid:* increased levels

*Calcium, hemoglobin, white blood cells:* decreased levels

*Thyroid function tests:* interference with test interpretation

## Patient monitoring

🚨 Observe for signs and symptoms of anaphylaxis.

🚨 Monitor for bleeding and hemorrhage. Watch closely for signs and symptoms of intracranial hemorrhage.

- Assess vital signs, temperature, and neurologic status.
- Monitor CBC, blood and urine glucose levels, and liver, kidney, and bone marrow function test results.
- Monitor fluid intake and output.

## Patient teaching

🚨 Instruct patient to immediately report allergic response, severe abdominal pain, and unusual bleeding or bruising.

• Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

• Advise patient to drink plenty of fluids to ensure adequate urine output.

• Tell patient to monitor urine output and report significant changes.

• Instruct patient to avoid activities that can cause injury. Tell him to use soft toothbrush and electric razor to avoid injury to gums and skin.

• Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.

• Tell patient that he'll undergo regular blood testing during therapy.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## atazanavir

Reyataz

**Pharmacologic class:** HIV-1 protease azapeptide inhibitor

**Therapeutic class:** Antiretroviral

**Pregnancy risk category B**

## Action

Selectively inhibits the virus-specific processing of viral Gag and Gag-Pol

polyproteins in human immunodeficiency virus (HIV)-1 infected cells, preventing formation of mature virions

### Availability

*Capsules:* 100 mg, 150 mg, 200 mg, 300 mg

### Indications and dosages

➤ Treatment-naïve patients with HIV-1 infection in combination with ritonavir

**Adults:** 300 mg with ritonavir 100 mg P.O. daily. When administered with tenofovir, H<sub>2</sub>-receptor antagonists, or proton pump inhibitors, give 300 mg with ritonavir 100 mg P.O. daily. When administered with efavirenz, give 400 mg with ritonavir 100 mg P.O. daily. Give 400 mg P.O. daily if patient is unable to tolerate ritonavir.

**Adults and children at least age 13 weighing at least 40 kg (88 lb) who are unable to tolerate ritonavir:** 400

mg (without ritonavir) P.O. daily (For patients at least age 13 and at least 40 kg receiving concomitant tenofovir, H<sub>2</sub>-receptor antagonists, or proton pump inhibitors, atazanavir should not be administered without ritonavir.)

➤ Treatment-experienced patients with HIV-1 infection in combination with other antiretrovirals

**Adults:** 300 mg with ritonavir 100 mg P.O. daily. When administered with an H<sub>2</sub>-receptor antagonist, give 300 mg with ritonavir 100 mg P.O. daily. When administered with tenofovir and an H<sub>2</sub>-receptor antagonist, give 400 mg with ritonavir 100 mg P.O. daily.

➤ HIV-1 infection

**Children ages 6 to younger than 18 weighing at least 40 kg (88 lb):** 300 mg with ritonavir 100 mg P.O. daily

**Children ages 6 to younger than 18 weighing at least 20 kg (44 lb) to less than 40 kg:** 200 mg with ritonavir 100 mg P.O. daily

**Children ages 6 to younger than 18 weighing at least 15 kg (33 lb) to less than 20 kg:** 150 mg with ritonavir 100 mg P.O. daily

### Dosage adjustment

- Hepatic impairment
- Administration with sildenafil citrate, tadalafil, or vardenafil
- Treatment-experienced pregnant women during second or third trimester, when administered with either an H<sub>2</sub>-receptor antagonist or tenofovir

### Contraindications

- Hypersensitivity to drug or its components
- Administration with alfuzosin, triazolam, oral midazolam, ergot derivatives, rifampin, irinotecan, lovastatin, simvastatin, indinavir, cisapride, pimozide, sildenafil (Revatio), or St. John's wort

### Precautions

Use cautiously in:

- hepatic impairment (use not recommended)
- renal impairment (drug shouldn't be administered to HIV treatment-experienced patients with end-stage renal disease managed with hemodialysis)
- conduction abnormalities and coadministration of drugs that may prolong PR interval, especially those metabolized by CYP3A (such as verapamil)
- concomitant use of antiarrhythmics (such as amiodarone, bepridil, systemic lidocaine, quinidine); antidepressants (such as trazodone, tricyclic antidepressants); high doses of ketoconazole and itraconazole (above 200 mg/day); calcium channel blockers; hormonal contraceptives
- concomitant use of endothelin-receptor antagonist (such as bosentan) without ritonavir (use not recommended)

# *Safe drug administration*

*The following guidelines on preparing, administering,  
and monitoring drug therapy will help you ensure  
patient safety and drug effectiveness.*

## Drug compatibilities

Use the table below to determine if you can safely mix two drugs together in the same syringe or administer them together through the same I.V. line.

## Conversions and calculations

Accurate conversions and calculations are crucial to ensuring safe drug administration. Use the tables below when you need to convert one unit to another, find equivalent measures, convert temperatures between Celsius and Fahrenheit, or calculate dosages or administration rates.

### Metric measures

#### Solids

1 milligram (mg) = 1,000 micrograms (mcg)

1 gram (g) = 1,000 mg

1 kilogram (kg) = 1,000 g

#### Liquids

1 milliliter (ml) = 1 cubic centimeter (cc)

1 ml = 1,000 microliters (mcl)

1 cc = 1,000 mcl

1 liter (L) = 1,000 ml

1 L = 1,000 cc

#### Household to metric equivalents

1 teaspoon (tsp) = 5 ml

1 tablespoon (tbs) = 15 ml

1 ounce (oz) = 30 ml

2 tbs = 30 ml

1 oz = 30 g

1 pound (lb) = 454 g

2.2 lb = 1 kg

1 inch = 2.54 centimeters (cm)

### Temperature conversions

#### To convert Celsius (°C) to Fahrenheit (°F)

Use the following equation:

$$(^{\circ}\text{C} \times 9/5) + 32 = ^{\circ}\text{F}$$

*Example:* 38 °C times 9/5 is 68.4; 68.4 plus 32 equals 100.4 °F.

#### To convert °F to °C

$$(^{\circ}\text{F} - 32) \times 5/9 = ^{\circ}\text{C}$$

*Example:* 98.6 °F minus 32 is 66.8; 66.8 times 5/9 equals 37 °C.

### Calculating dosages and administration rates

$$\text{Concentration of solution in mg/ml} = \frac{\text{mg of drug}}{\text{ml of solution}}$$

$$\text{Infusion rate in mg/minute} = \frac{\text{mg of drug}}{\text{ml of solution}} \times \text{flow rate (ml/hour)} \div 60 \text{ minutes}$$

$$\text{Concentration of solution in mcg/ml} = \frac{\text{mg of drug} \times 1,000}{\text{ml of solution}}$$

$$\text{Infusion rate in mcg/minute} = \frac{\text{mg of drug} \times 1,000}{\text{ml of solution}} \times \text{flow rate (ml/hour)} \div 60 \text{ minutes}$$

$$\text{Infusion rate in mcg/kg/minute} = \frac{\text{mg of drug} \times 1,000}{\text{ml of solution}} \times \text{flow rate (ml/hour)} \div 60 \text{ minutes} \div \text{weight in kg}$$

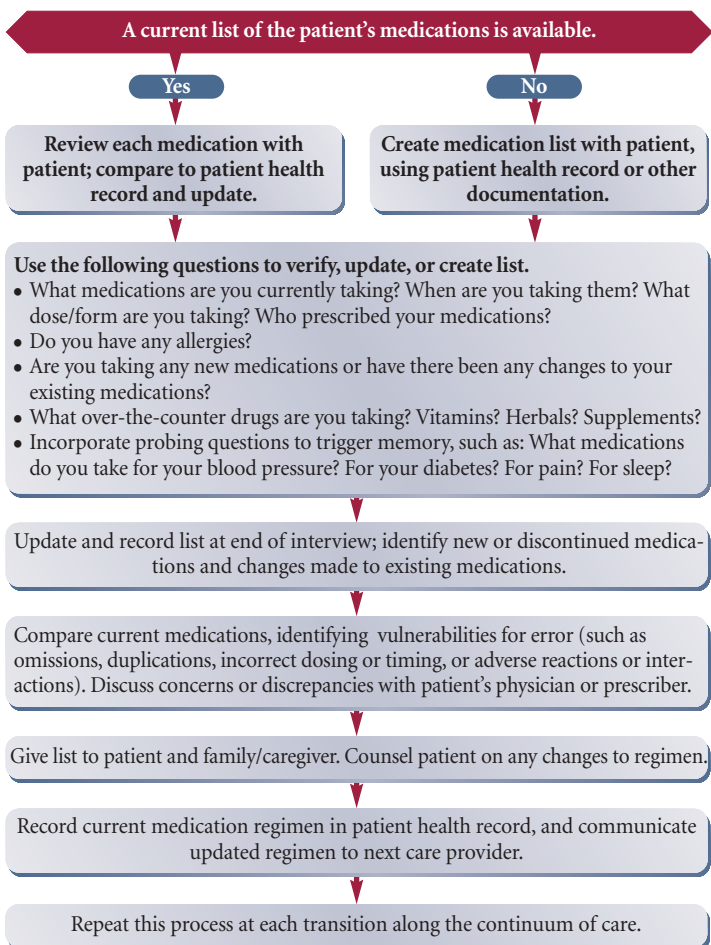

$$\text{Infusion rate in ml/hour} = \text{ml of solution} \div 60 \text{ minutes}$$

$$\text{Infusion rate in gtt/minutes} = \frac{\text{ml of solution}}{\text{time in minutes}} \times \text{drip factor (gtt/ml)}$$

## Medication Reconciliation

Changes to patients' medication regimens make inadvertent duplication, omission, and other unintended inconsistencies possible during admission, transfer, and discharge handoffs. To correct this problem, the Joint Commission made medication reconciliation across the care continuum a National Patient Safety Goal in 2005. Medication reconciliation helps avoid potentially dangerous inconsistencies through review and comparison of the complete medication regimen on admission, transfer, and discharge. To conduct a patient medication interview and verify, clarify, and reconcile any inconsistencies, use the algorithm below.

## Guidelines for timely administration of scheduled drugs

The most common violation of the five rights of drug administration is giving a drug at the wrong time. For as long as many nurses can remember, the *right time* has been defined as up to 30 minutes before or after the scheduled administration time. In 2008, the Centers for Medicare & Medicaid Services (CMS) made this 30-minute rule part of their *Regulations and Interpretive Guidance for Hospitals*, which spells out the conditions of participation for receiving Medicare and Medicaid payments.

In a 2010 survey by the Institute for Safe Medication Practices (ISMP), nurses described the CMS rule as unsafe, impossible to follow, and largely unnecessary. Of 17,500 responding nurses, 70% said their organizations mandated the 30-minute rule. Only 5% said they were able to comply with it. The shortcuts and workarounds nurses used in their attempts to comply were eye-opening, and in November of 2011, recognizing the rule was no longer the standard of practice, the CMS removed it.

The CMS now requires hospitals to develop their own drug administration policies and procedures based on established standards of practice and directs hospitals to consider the nature of each prescribed drug and the relevant patient and clinical considerations. In response to this new direction, ISMP formed an interdisciplinary advisory group and developed the *Acute Care Guidelines for Timely Administration of Medication*. The following guidelines are based on and adapted from the ISMP Acute Care Guidelines.

### How to use the guidelines

In acute-care organizations, an interdisciplinary team that includes nurses should translate these general guidelines into policies and procedures based on specific patient populations and drug systems, including available technology.

### Definitions

**Scheduled drugs** include all drugs prescribed in maintenance doses and given according to a standard, repeated cycle of frequency, such as q 4 hours, q.i.d., t.i.d., b.i.d., daily, weekly, monthly, and annually. Scheduled drugs, as defined here, do not include the following types of drugs or drugs given in the following doses:

- STAT and now doses
- p.r.n. drugs
- First doses and loading doses
- One-time doses

- Specifically timed doses (for example, a preoperative antibiotic dose given a specified amount of time before incision and drug desensitization protocols)
- On-call doses (for example, preprocedure sedation)
- Time-sequenced or concomitant drugs (for example, chemotherapy and rescue agents or *n*-acetylcysteine and iodinated contrast media)
- Drugs given at specific times to ensure accurate peak or trough serum drug levels
- Investigational drugs in clinical trials.

**Time-critical scheduled drugs** are drugs that may result in harm or substantially suboptimal therapy or pharmacologic effect when given more than 30 minutes early or late.

**Non-time-critical scheduled drugs** are drugs that should not result in harm or

substantially suboptimal therapy or pharmacologic effect when given more than 30 minutes early or late.

## Time-critical scheduled drugs

As a member of the interdisciplinary team, you will participate in creating a list of time-critical scheduled drugs and establishing appropriate guidelines.

### 1. Create a list

Based on the patient population of a unit or an entire hospital, create a list of time-critical scheduled drugs.

For all hospitals, include these drugs:

- All prescribed drugs given more than every 4 hours
- Scheduled (not prn) opioids for chronic pain or palliative care
- Immunosuppressants for preventing solid-organ transplant rejection or treating myasthenia gravis
- Drugs that must be administered at different times, such as antacids and fluoroquinolones
- Drugs given with meals or within a certain period before or after meals—for example, rapid-, short-, or ultra-short-acting insulins; certain oral antidiabetics, such as acarbose, nateglinide, repaglinide, and glimepiride; alendronate; and pancrelipase.

Administration times of drugs given around meals require nursing judgment because they vary based on meal delivery, meal consumption, and patient condition.

Be sure to include drugs that are time-critical for a specific diagnosis or indication—for example, parenteral anti-infectives for patients with worsening sepsis. Also, allow prescribers, pharmacists, and nurses to include the designation of “time-critical” with the medication order or medication administration record

(MAR) entry for any scheduled drug.

### 2. Establish guidelines

Create guidelines that promote timely administration of time-critical drugs and exact-time administration of drugs such as rapid-, short-, and ultra-short-acting insulins. Ensure that MAR entries remind staff members of the need for timely or exact-time administration.

## Non-time-critical scheduled drugs

As a member of the interdisciplinary team, you will participate in creating guidelines for all drugs given less than every 4 hours.

### 1. Establish guidelines for daily, weekly, and monthly drugs

Create guidelines that allow staff members to give these drugs up to 2 hours before or after the scheduled time. Though exceeding this 4-hour window may be safe, it may also increase the risk of failing to give a dose at all.

### 2. Establish guidelines for drugs given between 4 and 24 hours

Create guidelines that allow staff members to give these drugs up to 1 hour before or after the scheduled time.

## First doses and subsequent doses

Define the time limits for giving a first dose or loading dose of critically needed drugs, such as I.V. anti-infectives, I.V. anticoagulants, and I.V. antiepileptics. Also, define the time limits for giving subsequent, less urgent doses. Include procedures that help achieve the administration time goals.

## Technologic challenges

Be aware that your hospital’s bar-coding software may need an update

to trigger an alert for delayed and early doses when a dosage has more than one time interval. Software for electronic medication administration records (eMARs) also may require updates to change the appearance of a medication entry for delayed doses and to set different time limits for removing scheduled drugs from automated dispensing cabinets. Highlighting time-critical scheduled drugs on eMARs and differentiating between first and subsequent doses also present technologic challenges.

### Approval

After establishing new policies and procedures based on the patient population, and current drug systems, the interdisciplinary team must obtain the approval of the medical staff.

### Operational support guidelines

To enhance safe, timely drug administration, follow these operational support guidelines:

- Base staffing levels in the pharmacy and patient-care units on workload and patient acuity.
- When assigning nurses, consider the total number of drugs given daily, the types of drugs prescribed, the number of time-critical drugs, the complexity and frequency of drug administration, and the ability of patients to swallow oral drugs.
- Ensure that the number of automated dispensing cabinets on patient-care units facilitates safe and timely drug administration.
- Define acceptable reasons for administering doses early or late.

- Require staff members to document the exact time they administer drug doses. Ensure MARs provide sufficient space and prompts.
- Require staff members to check the MAR for the time of the last dose before giving the next dose.
- Create eMAR alerts indicating that a dose will soon be overdue or is overdue.
- Adhere to standard drug administration schedules based on the prescribed dosing frequency whenever possible.
- Establish a procedure for staff members who will administer or have administered a time-critical scheduled drug early or late. Include prescriber notification when an adverse outcome is anticipated or has occurred, documentation of the reason for untimely administration, and evaluation of the need to change the timing of future doses.
- Establish a streamlined process for reporting untimely administration of time-critical scheduled drugs, even if the reason is documented and justifiable. Use these reports to learn the causes of untimely administration and make improvements
- Review data from event reports, end-of-shift reports, and aggregate data collection to identify the causes of early or late drug administration, revise the list of time-critical drugs, and make system-based changes.

## Drug names that look or sound alike

The drug names below can easily be confused, either verbally or in writing, because they either sound alike or have similar spellings. Generic names of these drugs appear in regular type; trade names are capitalized and in **boldface**.

<b>Accupril, Accutane</b>	<b>Calan, Colace</b>
<b>Accutane, Anturane</b>	calcifediol, calcitriol
acetazolamide, acetohexamide	<b>Capitol</b> , captopril
acetylcholine, acetylcysteine	carboplatin, cisplatin
<b>Aciphex, Aricept</b>	<b>Cardene, Cardizem</b>
<b>Adderall, Inderal</b>	<b>Cardene</b> , codeine
albuterol, atenolol	cefazolin, cefprozil
<b>Aldactazide, Aldactone</b>	cefotaxime, ceftizoxime
<b>Aldomet, Aldoril</b>	cefuroxime, deferoxamine
<b>Aldoril, Elavil</b>	<b>Cefzil, Kefzol</b>
alfentanil, fentanyl, <b>Sufenta, sufentanil</b>	<b>Celexa, Cerebryx</b>
<b>Allegra, Viagra</b>	chlorpromazine, promethazine
alprazolam, diazepam, lorazepam,	ciprofloxacin, ofloxacin
midazolam	<b>Clinoril, Clozaril</b>
<b>Altace</b> , alteplase	clofazimine, clonidine, clozapine
<b>Alupent, Atrovent</b>	clomiphene, clomipramine
amantadine, rimantadine	clonazepam, clorazepate
<b>Ambien, Amen</b>	clonidine, quinidine
<b>Amicar, Amikin</b>	clotrimazole, co-trimoxazole
amiloride, amiodarone, amlodipine	codeine, <b>Lodine</b>
amitriptyline, nortriptyline	<b>Coreg, Zomig</b>
amoxicillin, <b>Augmentin</b>	<b>Cozaar, Zocor</b>
<b>Anafranil</b> , enalapril	cyclobenzaprine, cyproheptadine
<b>Apresazide, Apresoline</b>	cycloserine, cyclosporine
<b>ASA, 5-ASA</b>	dacarbazine, procarbazine
<b>Asacol, Os-Cal</b>	dactinomycin, daunorubicin
<b>Asacol, Os-Cal, Oxytrol</b>	<b>Dantrium</b>
<b>Atarax, Ativan</b>	<b>Darvon, Diovan</b>
atenolol, timolol	daunorubicin, idarubicin
avanafil, <b>Avandia, Avandryl</b>	<b>Decadron, Percodan</b>
<b>Avinza, Invanz</b>	desipramine, imipramine
azithromycin, erythromycin	<b>Desogen</b> , desonide
baclofen, <b>Bactroban</b>	desoximetasone, dexamethasone
<b>Benadryl, Bentyt, Benylin, Betalin</b>	<b>Desoxyn</b> , digitoxin, digoxin
bepidil, <b>Prepidil</b>	<b>Diabeta, Zebeta</b>
<b>Betagan, BetaGen</b>	diazepam, <b>Ditropan</b>
<b>Bumex, Buprenex</b>	dimenhydrinate, diphenhydramine
bupivacaine, ropivacaine	
bupropion, buspirone	

## Drug names that look or sound alike (continued)

<b>Diprivan, Ditropan</b> dipyridamole, disopyramide dobutamine, dopamine doxapram, doxazosin, doxepin, doxycycline	<b>Hycodan, Vicodin</b> hydralazine, hydroxyzine hydromorphone, morphine
<b>Doxil, Paxil, Plavix</b> dronabinol, droperidol dyclonine, dicyclomine	<b>Hyperstat, Nitrostat</b> imipenem, <b>Omnipen</b> imipramine, <b>Norpramin</b>
<b>Dynacin, DynaCirc</b>	<b>Inderal, Inderide, Isordil</b>
<b>Echogen, Epogen</b>	<b>Intropin, Isoptin</b> Keflex, Ketek
<b>Elavil, Equanil, Mellaril</b>	<b>Klonopin, Clonidine</b>
<b>Eldepryl, enalapril</b>	<b>Lamasil, Lomotil</b>
<b>Elmiron, Imuran</b> eloxatin, <b>Exelon</b> enalapril, ramipril	<b>Lamictal, Lamisil</b> lamivudine, lamotrigine
<b>Entex, Tenex, Xanax</b> ephedrine, epinephrine esmolol, <b>Osmitrol</b>	<b>Lanoxin, Lasix, Lonox</b>
<b>Estraderm, Estratab, Estratest</b>	<b>Levator, Lipitor</b>
<b>Estraderm, Testoderm</b> ethosuximide, methsuximide etidronate, etretinate	<b>Levbid, Lithobid</b>
<b>Eurax, Urex</b>	<b>Levitra, Raptiva</b>
<b>Evista, E-vista</b>	<b>Librax, Librium</b>
<b>Femara, FemHRT</b> fenoprofen, flurbiprofen fentanyl, sulfentanil	<b>Loniten, Lotensin, lovastatin</b>
<b>Fioricet, Fiorinal</b>	<b>Lorabid, Slo-bid</b> losartan, valsartan
<b>Flaxedil, Flexeril</b>	<b>Mandol, nadolol</b>
<b>Flomax, Fosamax</b> flunisolide, fluocinonide fluoxetine, fluvastatin, fluvoxamine, paroxetine	<b>Maxidex, Maxzide</b>
flurazepam, temazepam	<b>Mazicon, Mevacor, Mivacron</b> methimazole meclizine, memantine
<b>Folotyn, folic acid, folinic acid</b>	melphalan, <b>Mephyton</b>
<b>Foradil, Toradol</b> fosinopril, lisinopril, <b>Risperdal</b> fosphenytoin, phenytoin furosemide, torsemide	meperidine, meprobamate
glimepiride, glipizide, glyburide	<b>Mesantoin, Mestinon</b> methicillin, mezlocillin
<b>Granulex, Regranex</b> guaifenesin, guanfacine	methotrexate, metolazone
<b>Haldol, Stadol</b> heparin, <b>Hepsera, Hespan</b>	metoprolol, misoprostol minoxidil, <b>Monopril</b> mithramycin, mitomycin nadolol, neviranol naloxone, naltrexone
	<b>Naprelan, Naprosyn</b>
	<b>Navane, Nubain</b> nelfinavir, nevirapine
	<b>Neurontin, Noroxin</b> niacinamide, nicardipine nicardipine, nifedipine, nimodipine
	<b>Norpace, Norpramin</b>
	<b>Ocufen, Ocuflox</b>

(continued)

**Zocor, Zoloft**  
**Zofran, Zosyn**  
**Zymar, Zyprexa, Zyrtec**

## Identifying injection sites

Injection sites vary with administration route. The instructions below describe proper identification sites for I.M., subcutaneous, and I.V. drugs.

To begin, wash your hands, put on gloves, and locate the appropriate site. Clean the site with an alcohol pad, and administer the injection as described here.

### I.M. injections

You can administer an I.M. injection into the muscles shown below. In these illustrations, specific injection sites are shaded.

#### Deltoid site

- Locate the lower edge of the acromial process.
- Insert the needle 1" to 2" below the acromial process at a 90-degree angle.

#### Dorsogluteal site

- Draw an imaginary line from the posterior superior iliac spine to the greater trochanter.
- Insert the needle at a 90-degree angle above and outside the drawn line.
- You can administer a Z-track injection through this site. After drawing up the drug, change the needle, displace the skin lateral to the injection site, withdraw the needle, and then release the skin.

#### Ventrogluteal site

- With the palm of your hand, locate the greater trochanter of the femur.
- Spread your index and middle fingers posteriorly from the anterior superior iliac spine to the furthest area possible. This is the correct injection site.
- Remove your fingers and insert the needle at a 90-degree angle.

#### Vastus lateralis and rectus femoris sites

- Find the lateral quadriceps muscle for the vastus lateralis, or the anterior thigh for the rectus femoris.
- Insert the needle at a 90-degree angle into the middle third of the muscle, parallel to the skin surface.

## Subcutaneous injections

Subcutaneous drugs can be injected into the fat pads on the abdomen, buttocks, upper back, and lateral upper arms and thighs (shaded in the illustrations below). If your patient requires frequent subcutaneous injections, make sure to rotate injection sites.

- Gently gather and elevate or spread subcutaneous tissue.
- Insert the needle at a 45- or 90-degree angle, depending on the drug or the amount of subcutaneous tissue at the site.

## I.V. injections

I.V. drugs can be injected into the veins of the arms and hands. The illustration on the right shows commonly used sites.

- Locate the vein using a tourniquet.
- Insert the catheter at a slight angle (about 10 degrees).
- Release the tourniquet when blood appears in the syringe or tubing.
- Slowly inject the drug into the vein.

## Tall Man letters

In 2001, the Office of Generic Drugs requested manufacturers of some look-alike name pairs to voluntarily differentiate the drug names by using “Tall Man” letters to minimize medication errors. The list below shows the revisions that highlight dissimilar letters by using upper and lower case for drugs that have similar letters.

Established name	Recommended name
acetazolamide	acetaZOLAMIDE
acetohexamide	acetaHEXAMIDE
bupropion	buPROPion
buspirone	busPIRone
chlorpromazine	chlorproMAZINE
chlorpropamide	chlorproPAMIDE
clomiphene	clomiPHENE
clomipramine	clomiPRAMINE
cycloserine	cycloSERINE
cyclosporine	cycloSPORINE
daunorubicin	DAUNOrubicin
doxorubicin	DOXOrubicin
dimenhydrinate	dimenhyDRINATE
diphenhydramine	diphenhydrAMINE
dobutamine	DOBUtamine
dopamine	DOPamine
glipizide	glipiZIDE
glyburide	glyBURIDE
hydralazine	hydrALAZINE
hydromorphone	HYDRomorphone
hydroxyzine	hydroXYzine
medroxyprogesterone	medroxyPROGESTERone
methylprednisolone	methylPREDNISolone
methyltestosterone	methylTESTOSTERone
mitoxantrone	mitoXANTRONE
nicardipine	NiCARDipine
nifedipine	NIFEdipine
prednisolone	prednisoLONE
prednisone	predniSONE
risperidone	risperiDONE
ropinirole	rOPINIRole
solu-medrol	solu-medrol
sulfadiazine	sulfaDIAZINE
sulfisoxazole	sulfiSOXAZOLE
tolazamide	TOLAZamide
tolbutamide	TOLBUtamide
vinblastine	vinBLAStine
vincristine	vinCRIStine

## Tablets and capsules *not* to crush

Crushing extended-release or other long-acting oral drug forms can cause the ingredients to be released all at once instead of gradually. Similarly, crushing can break the coating of enteric-coated drugs, leading to GI irritation. Other drugs may taste bad or have carcinogenic or teratogenic potential when crushed. Never crush the trade-name drugs listed below.

Aciphex	Cefuroxime
Actiq	CellCept
Actonel	Charcoal Plus
Adalat CC	Chlor-Trimeton
Adderall XR	Cipro XR
Afeditab CR	Claritin-D
Afinitor	Claritin-D 24 Hour
Aggrenox	Colace
Allegra D	Colestid
Alprazolam ER	Concerta
Altoprev	Cotazym-S
Ambien CR	Covera-HS
Amibid DM	Creon
Amitiza	Crixivan
Ampyra	Cymbalta
Amrix	Cytovene
Aplenzin	Cytosan
Apriso	Depakene
Aptivus	Depakote, Depakote ER, Depakote Sprinkles
Aricept 23 mg	Detrol LA
Arthrotec	Dexilant
Asacol	Dilacor XR
Aspirin EC	Dilatrate-SR
Atelvia	Dilt CD
Augmentin XR	Diltia XT
Avinza	Ditropan XL
Avodart	Divalproex ER
Azulfidine EN	Doxidan
Biaxin XL	Drisdol
Bisacodyl	Droxia
Boniva	Dulcolax
Bromfed PD	DynaCirc CR
Budeprion SR	EC-Naprosyn
Calan SR	Ecotrin
Carbatrol	E.E.S. 400
Cardene SR	Effer K
Cardizem CD, LA, SR	Effervescent Potassium
Carvedilol	Effexor XR
Cefaclor ER	Embeda
Ceftin	

## S-18 Safe drug administration

E-Mycin	Isoptin SR
Enablex	Isordil Sublingual
Entocort EC	Isosorbide Dinitrate Sublingual
Equetro	Isosorbide SR
Ergomar	ISOTretinoin
Erievedge	Jakafi
Ery-Tab	Jalyn
Erythromycin Base	Janumet XR
Erythromycin stearate	Kadian
Erythromycin Delayed-Release	Kaletra
Evista	Kapidex
Exalgo	Kapvay
Extendryl	K-Dur
Factive	Keppra
Feen-a-mint	Keppra XL
Feldene	Ketex
FentaNYL	Klor-Con, Klor-Con M
Fentora	K-Lyte, K-Lyte CL, DS
Feosol	Kombiglyze XR
Feratab	K-Tab
Fergon	LaMICtal XR
Ferro-Grad 500	Lescol XL
Ferro-Sequel	Letairis
Flagyl ER	Levbid
Fleet Laxative	Levsinex
Flomax	Lialda
Focalin XR	Liquibid
Fosamax	Lithobid
Gleevec	Lodrane 24, 24D
Glucophage XR	LoHIST 12 Hour
Glucotrol XL	Lovaza
Glumetza	Luvox CR
Gralise	Maxifed DM, DMX
Guaifed, Guaifed PD	Maxifen DM
Guaifenesin and pseudoephedrine	Mestinon ER
Guaifenex DM, GP, PSE	Metadate CD, ER
Guaimax D	Methylin ER
Halprin 81	Metoprolol ER
Horizant	Micro-K Extencaps
Hista-Vent DA	Mirapex ER
Hydrea	Morphine sulfate extended release
Imdur	Motrin
Inderal LA	Moxatag
Indocin SR	MS Contin
Indomethacin SR	Mucinex, Mucinex DM
InnoPran XL	Myfortic
Intelence	Namenda XR
Intermezzo	Naprelan
Intuniv	Nexium
Invega	Niaspan

Nicotinic Acid	Seroquel XR
Nifediac CC	Sinemet CR
Nifedical XL	Sinuvent PE
Nitrostat	Slo-Niacin
Norflex ER	Solodyn
Norpace CR	Somnote
Norvir	Sprycel
Nucynta ER	Strattera
Oleptro	Sudafed 12 Hour
Opana ER	Sular
Oracea	Symax Duotab, Symax XR
Oramorph SR	Tasigna
Orphenadrine citrate ER	Taztia XT
OxyContin	Tegretol-XR
Oxymorphone ER	Temodar
Pancrease Delayed-Release	Tessalon Perles
Pancrecarb	Theochron
Pancrelipase	Theo-24
Paxil CR	Tiazac
Pentasa	Topamax
Plendil	Toprol XL
Pradaxa	Touro CC-LD, Touro LA-LD
Pre-Hist-D	Toviaz
Prevacid	Tracleer
Prevacid SoluTab	Trental
Prilosec	Treximet
Pristiq	Tripix
Procardia XL	Tylenol Arthritis
Propecia	Ultram ER
Proquin XR	Ultrase
Proscar	Uniphyl
Protonix	Urocit-K
Prozac Weekly	Uroxatral
Qdall, Qdall AR	Valcyte
Ranexa	Verapamil SR
Rapamune	Verelan, Verelan PM
Rayos	Videx EC
Razadyne ER	Vimovo
Renagel	Viramune XR
Renvela	VolSpire ER
Requip XL	Voltaren, XR
Rescon, Rescon JR, MX	Voltrient
Respahist	Wellbutrin SR, XL
Respaire SR	Xanax-XR
Revlimid	Zegerid OTC
Ritalin LA, Ritalin-SR	Zenpep
R-Tanna	Zolinza
Rythmol SR	Zortress
Ryzolt	Zyban
Sensipar	Zyflo CR

## Monitoring blood levels

The table below shows therapeutic and toxic blood levels for selected drugs. Keep in mind that such levels may vary slightly among laboratories.

Drug	Therapeutic blood level	Toxic blood level
acetaminophen	10 to 20 mcg/ml	> 150 mcg/ml
alprazolam	0.025 to 0.102 mcg/ml	Not defined
amikacin	Peak: 25 to 35 mcg/ml Trough: 5 to 10 mcg/ml	> 35 mcg/ml > 10 mcg/ml
aminophylline	10 to 20 mcg/ml	> 20 mcg/ml
amiodarone	1 to 2.5 mcg/ml	> 2.5 mcg/ml
amitriptyline	120 to 250 ng/ml	> 500 ng/ml
amobarbital	1 to 5 mcg/ml	> 10 mcg/ml
atenolol	0.2 to 0.7 mcg/ml	35 mcg/ml
bepidil	1 to 2 ng/ml	> 2 ng/ml
calcium	9 to 10.5 mg/dl	> 12 mg/dl
carbamazepine	4 to 14 mcg/ml	> 15 mcg/ml
clonazepam	10 to 80 ng/ml	> 100 ng/ml
creatinine	0.6 to 1.2 mg/dl	> 4 mg/dl
cyclosporine	50 to 300 ng/ml	> 400 ng/ml
desipramine	115 to 300 ng/ml	> 400 ng/ml
diazepam	0.5 to 2 mcg/ml	> 3 mcg/ml
digoxin	0.8 to 2 ng/ml Trough (> 12 hours after dose): Heart failure: 0.8 to 1.5 ng/ml Arrhythmias: 1.5 to 2 ng/ml	Adults: > 2.5 ng/ml Children: > 3 ng/ml
diltiazem	0.05 to .40 mcg/ml	3.7 to 6.1 mcg/ml
diphenylhydantoin	10 to 20 mcg/ml	20 to 50 mcg/ml
disopyramide	2 to 8 mcg/ml	> 8 mcg/ml
ethosuximide	40 to 100 mcg/ml	> 100 mcg/ml
flecainide	0.2 to 1 mcg/ml	> 1 mcg/ml
fluconazole	5 to 15 mcg/ml	Not defined
fluoxetine	0.09 to 0.40 mcg/ml	Not defined
gentamicin	Peak: 4 to 12 mcg/ml Trough: 1 to 2 mcg/ml	> 12 mcg/ml > 2 mcg/ml
glucose	70 to 110 mg/dl	> 300 mg/dl
glutethimide	2 to 6 mcg/ml	> 5 mcg/ml
haloperidol	5 to 20 ng/ml	> 20 ng/ml
hydromorphone	0.008 to 0.049 mcg/ml	Not defined

Drug	Therapeutic blood level	Toxic blood level
imipramine	225 to 300 ng/ml	> 500 ng/ml
lidocaine	1.5 to 6 mcg/ml	> 6 mcg/ml
lithium	0.6 to 1.2 mEq/L	> 1.5 mEq/L
lorazepam	50 to 240 ng/ml	300 to 600 ng/ml
magnesium	12 to 32 mcg/ml	80 to 120 mcg/ml
meperidine	100 to 550 ng/ml	> 1,000 ng/ml
meprobamate	6 to 12 mcg/ml	> 60 mcg/ml
methotrexate	> 0.01 mcml	> 10 mcml/24 hr
methsuximide	10 to 40 mcg/ml	> 44 mcg/ml
methylphenidate	0.01 to 0.06 mcg/ml	0.8 mcg/ml
metoprolol	0.03 to 0.27 mcg/ml	Not defined
mezlocillin	35 to 45 mcg/ml	> 45 mcg/ml
milrinone	150 to 250 ng/ml	> 250 ng/ml
nifedipine	0.025 to 0.1 mcg/ml	> 0.1 mcg/ml
nortriptyline	50 to 140 ng/ml	> 300 ng/ml
oxazepam	0.2 to 1.4 mcg/ml	> 2 mcg/ml
paroxetine	0.031 to 0.062 mcg/ml	Not defined
phenobarbital	10 to 40 mcg/ml	> 40 mcg/ml
phenytoin	10 to 20 mcg/ml	> 20 mcg/ml
potassium	3.5 to 5.0 mEq/L	> 6 mEq/L
primidone	4 to 12 mcg/ml	> 12 mcg/ml
procainamide	4 to 8 mcg/ml	> 10 mcg/ml
propranolol	50 to 200 ng/ml	> 200 ng/ml
quinidine	2 to 5 mcg/ml	> 5 mcg/ml
salicylates	100 to 300 mcg/ml	> 300 mcg/ml
sertraline	0.055 to 0.25 mcg/ml	Not defined
sodium	135 to 145 mEq/L	> 160 mEq/L
streptomycin	25 mcg/ml	> 25 mcg/ml
tacrolimus	0.005 to 0.02 mcg/ml	> 0.03 mcg/ml
theophylline	10 to 20 mcg/ml	> 20 mcg/ml
tobramycin	Peak: 4 to 12 mcg/ml Trough: 1 to 2 mcg/ml	> 12 mcg/ml > 2 mcg/ml
tocainide	4 to 10 mcg/ml	Not defined
valproic acid	50 to 100 mcg/ml	> 100 mcg/ml
vancomycin	Peak: 20 to 40 mcg/ml Trough: 5 to 15 mcg/ml	> 40 mcg/ml > 15 mcg/ml
verapamil	0.08 to 0.3 mcg/ml	Not defined
zolpidem	0.003 to 0.018 mcg/ml	Not defined

## Effects of dialysis on drug therapy

A patient receiving a drug that's removed by hemodialysis (HD) or peritoneal dialysis (PD) will need supplemental doses of that drug. The chart below shows which drugs are removed by dialysis and therefore will necessitate supplemental dosing during or after dialysis. Drugs listed as "unlikely" haven't been studied; however, because of their chemical properties, dialysis is unlikely to remove them.

Generic drug	Removed by HD	Removed by PD	Generic drug	Removed by HD	Removed by PD

## Anaphylaxis: Treatment guidelines

A hypersensitivity reaction may occur when a patient comes in contact with a certain agent, such as a drug, food, or other foreign protein. In some patients, this reaction progresses to life-threatening anaphylaxis, marked by sudden development of urticaria and respiratory distress. If this reaction continues, it may precipitate vascular collapse, leading to shock and, occasionally, death.

### Hypersensitivity reaction

**Adults:** Epinephrine 0.2 to 0.5 ml of 1:1,000 solution subcutaneously or intramuscularly; repeat q 10 to 15 minutes to maximum dosage of 1 mg.

**Children:** Epinephrine 10 mcg/kg of 1:1,000 solution subcutaneously or intramuscularly, to maximum of 500 mcg/dose; may repeat q 15 minutes for 2 doses, then q 4 hours p.r.n.

**Adults or children:** Diphenhydramine 1 to 2 mg/kg I.V. or I.M.

**Adults:** Hydrocortisone 100 mg I.V. initially; then administer as indicated.

**Children:** Hydrocortisone 0.16 to 1 mg/kg I.V. given once or twice daily.

If poor response, use anaphylaxis algorithm.

### Anaphylaxis

Administer CPR if patient loses circulation or breathing; follow Advanced Cardiac Life Support guidelines.

If hypotension occurs, give vasopressors (such as dopamine, norepinephrine, or neosynephrine). Provide fluid resuscitation with large volumes of normal saline or lactated Ringer's solution.

**Adults and children:** If bronchospasm occurs, give 1 to 2 nebulized treatments of inhaled bronchodilator and consider loading dose of 6 mg/kg theophylline I.V., followed by maintenance dose as indicated.

**Adults:** Epinephrine 0.2 to 0.5 ml of 1:1,000 solution subcutaneously or intramuscularly; repeat q 10 to 15 minutes to maximum dosage of 1 mg.

**Children:** Epinephrine 10 mcg/kg of 1:1,000 solution subcutaneously or intramuscularly; to maximum of 500 mcg/dose; may repeat dose q 15 minutes for 2 doses, then q 4 hours as needed.

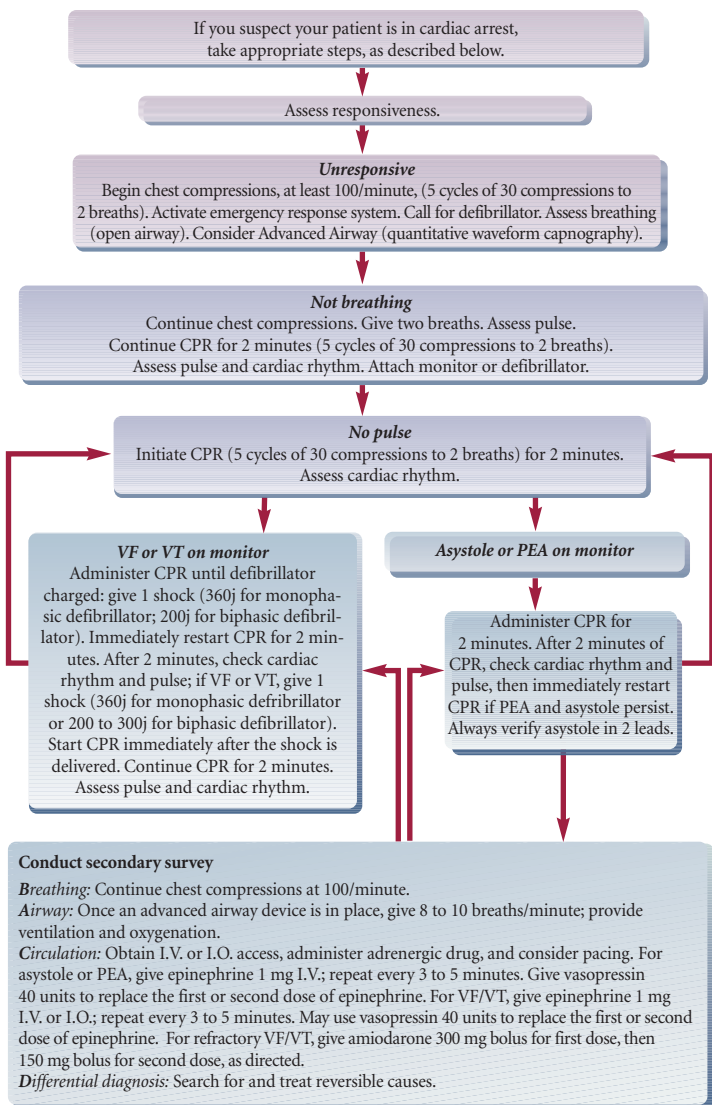

If patient doesn't respond, dilute epinephrine to yield 1:10,000 solution. For adults, infuse at 1 mcg/minute; may titrate to 2 to 10 mcg/minute. For children, infuse at 0.1 mcg/kg/minute.

KEY

CPR: cardiopulmonary resuscitation

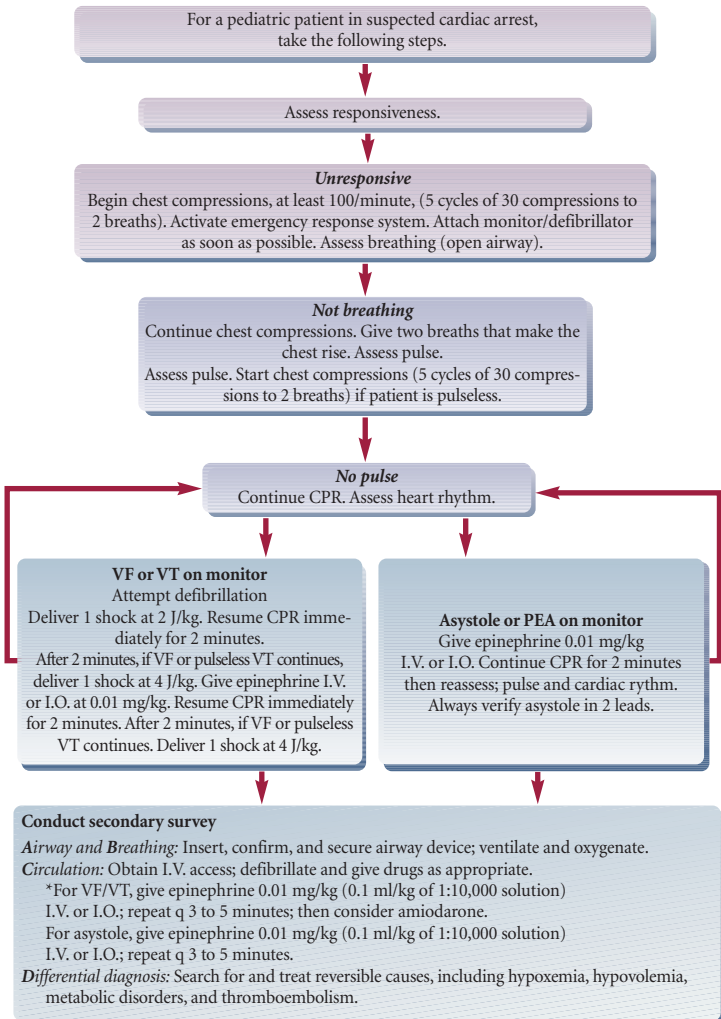

## Adult cardiac arrest: Treatment guidelines

KEY CPR: cardiopulmonary resuscitation VF: ventricular fibrillation  
I.O.: intraosseous VT: ventricular tachycardia  
PEA: pulseless electrical activity

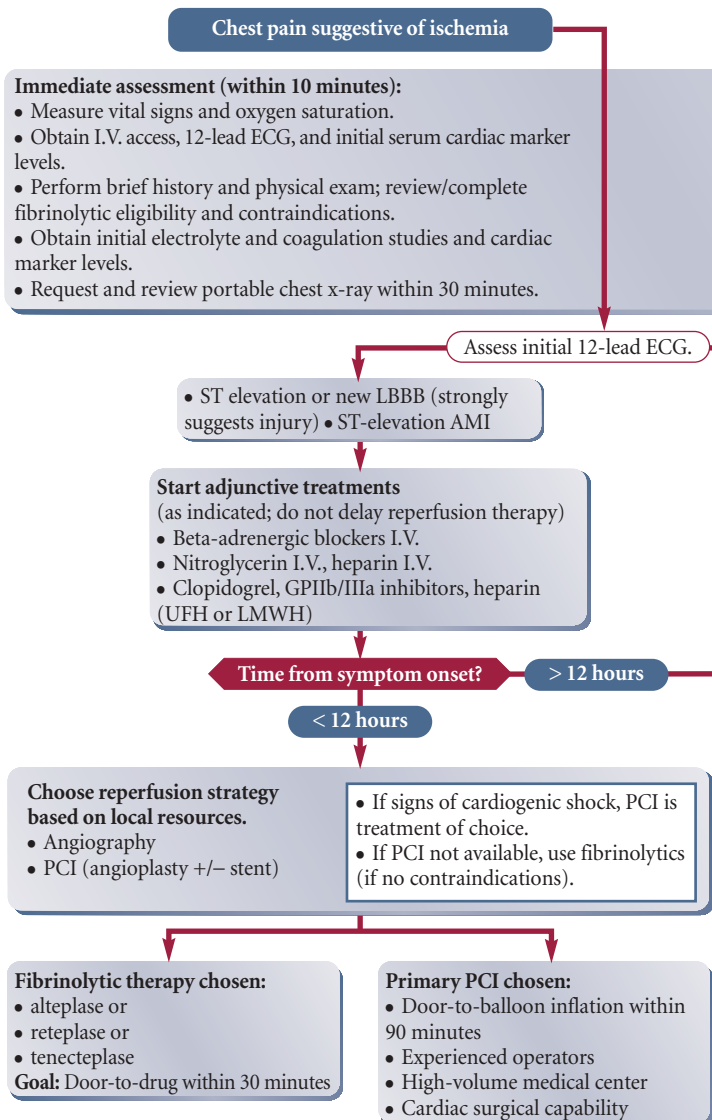

## Pediatric cardiac arrest: Treatment guidelines

KEY CPR: cardiopulmonary resuscitation  
I.O.: intraosseus  
J: joules

PEA: pulseless electrical activity  
VF: ventricular fibrillation  
VT: ventricular tachycardia

## Acute coronary syndrome: Treatment guidelines

## KEY

ACE: angiotensin-converting enzyme  
AMI: acute myocardial infarction

APSAC: anisoylated plasminogen streptokinase activator complex  
LBBB: left bundle-branch block; O<sub>2</sub>: Oxygen  
PCI: percutaneous coronary intervention

**Immediate general treatment:**

- O<sub>2</sub> not needed if oxyhemoglobin saturation is ≥ 94% in absence of respiratory distress
- Aspirin 160 to 325 mg (may be given by EMS).
- Nitroglycerin S.L. or by spray or I.V.
- Morphine I.V. (if nitroglycerin does not relieve pain).

Use **MONA** as memory aid: **M**orphine, **O**xygen, **N**itroglycerin, **A**spirin.

EMS personnel can perform immediate assessment and treatment, including 12-lead ECG and review for fibrinolytic eligibility and administering aspirin, nitroglycerin and morphine.

- ST depression or dynamic T-wave inversion (strongly suggests ischemia)
- High-risk unstable angina/non-ST-elevation AMI

- Non-diagnostic ECG: no ST segment or T-wave changes
- Intermediate- or low-risk unstable angina

- Start adjunctive treatments** (as indicated, no contraindications):
- Heparin (UFH or LMWH)
  - Clopidogrel
  - Glycoprotein IIb/IIIa inhibitors
  - Nitroglycerin I.V.
  - Beta-adrenergic receptor blockers

Meets criteria for unstable or new-onset angina? Or troponin positive?

Yes

No

**Assess clinical status.**

- High-risk patient, defined by:**
- persistent symptoms
  - recurrent ischemia
  - depressed left ventricular function
  - widespread ECG changes
  - previous AMI, PCI, or CABG

- Admit to monitored bed.**
- Obtain serial serum markers (including troponin).
  - Repeat ECG/continuous ST monitoring.
  - Consider imaging study.

**Perform cardiac catheterization.**  
Anatomy suitable for revascularization?

Clinically stable?

Evidence of ischemia or infarction?

Yes

No

Yes

No

- Revascularization:**
- PCI
  - CABG

- Admit to critical care unit.**
- Continue or start treatment.
  - Obtain serial cardiac markers and ECG.
  - Consider imaging study.

- Discharge acceptable**
- Arrange follow-up

## Preventing and treating extravasation

Extravasation—escape of a vesicant drug into surrounding tissues—can result from a damaged vein or from leakage around a venipuncture site. Vesicant drugs (such as daunorubicin and vincristine) can cause severe tissue damage if extravasation occurs.

To help prevent extravasation, make sure the existing I.V. line is patent before you administer a drug by the I.V. route. Check patency by:

- inspecting the site for edema or pain
- flushing the I.V. line with 0.9% sodium chloride solution
- gently aspirating blood from the catheter.

Alternatively, you may insert a new I.V. catheter to ensure correct catheter placement. For vesicant drugs, consider using a central venous catheter.

If extravasation occurs, stop the infusion at once. Notify the physician to obtain treatment orders. Administer the antidote as ordered. Aspirate the remaining drug from the catheter before removing the I.V. line (unless you need the catheter to administer an antidote). *If you're unable to aspirate from the catheter, don't instill the antidote through the existing I.V.* If the extravasated drug was daunorubicin or doxorubicin, apply a cold compress to the area for 24 to 48 hours; if it was vinblastine or vincristine, apply a warm compress. Then elevate the affected extremity.

### Administering antidotes

Antidotes for extravasation typically are either given through the existing I.V. line or injected subcutaneously around the infiltrated site using a 1-ml tuberculin syringe. Be sure to use a new needle for each antidote injection.

Extravasated drug	Antidote and dosage
<ul style="list-style-type: none"> <li>• aminophylline</li> <li>• calcium solutions</li> <li>• contrast media</li> <li>• dextrose solutions (concentrations of 10% or more)</li> <li>• etoposide</li> <li>• nafcillin</li> <li>• potassium solutions</li> <li>• teniposide</li> <li>• total parenteral nutrition solutions</li> <li>• vinblastine</li> <li>• vincristine</li> </ul>	<b>hyaluronidase:</b> 15 units/ml, as 0.2 ml subcutaneous injection near extravasation site
<ul style="list-style-type: none"> <li>• dactinomycin</li> </ul>	<b>ascorbic acid injection:</b> 50 mg
<ul style="list-style-type: none"> <li>• daunorubicin</li> <li>• doxorubicin</li> </ul>	<b>hydrocortisone sodium succinate:</b> 100 mg/ml: 50 to 200 mg
<ul style="list-style-type: none"> <li>• dopamine</li> <li>• epinephrine</li> <li>• metaraminol</li> <li>• norepinephrine</li> </ul>	<b>phentolamine:</b> 5 to 10 mg diluted in 10 to 15 ml of normal saline solution, administered within 12 hours of extravasation
<ul style="list-style-type: none"> <li>• mechlorethamine</li> </ul>	<b>sodium thiosulfate 10%:</b> 10 ml

## Guidelines for handling, preparing, and administering hazardous drugs

Health care professionals who work with or near hazardous drugs may be exposed to these agents in the air; on work surfaces, clothing, or medical equipment; or through contact with patient urine or feces. Hazardous drugs include many cancer chemotherapy agents, antivirals, hormones, and certain miscellaneous drugs. (Follow these hazardous drug guidelines for handling, preparation, and administration of all drugs with the special “hazardous drug” icon [  ] at the top of the monograph.)

The safety of health care workers who handle hazardous drugs is an ongoing concern. More than 5 million health care workers, including nurses, pharmacists, and physicians, are thought to be at risk. The greatest exposure occurs during preparation, administration, and disposal of these agents. In 2004, the National Institute for Occupational Safety and Health (NIOSH) issued an alert to inform workers of the possible risks of hazardous drugs. The alert included the following:

**Warning! Working with or near hazardous drugs in health care settings may cause skin rashes, infertility, miscarriage, birth defects, and possibly leukemia or other cancers.**

In 2006, the American Society of Health-System Pharmacists (ASHP) published revised guidelines on handling hazardous drugs. The following guidelines reflect the latest recommendations of ASHP, NIOSH, and the Centers for Disease Control and Prevention.

### General preparation

- Read all material safety data sheets for each hazardous drug you handle.
- Prepare hazardous drugs in a controlled area designated for that purpose alone and restricted to authorized

personnel. Identify these areas clearly with warning signs.

- Prepare hazardous drugs inside a ventilated cabinet with negative air pressure, to avoid spread of airborne drug contaminants and protect drugs that require sterile handling.
- Always work below eye level, within easy reach of a spill kit and a hazardous drug waste container.
- Wash hands with soap and water immediately before and after preparation.
- Use stringent sterile technique during any procedure in which sterile dosage forms are manipulated with needles and syringes.
- Whenever possible, use luer-lock syringes, I.V. administration sets, and connections, as these are less likely to separate during preparation.
- When supplemental protection is needed, use closed-system drug-transfer devices, glove bags, and needleless systems inside the ventilated cabinet.
- Know that hazardous drugs must be clearly labeled. Preparation and cleaning areas also need to be identified with warning signs or labels that are clear to non-English readers.

### Personal protective equipment

Always wear personal protective equipment (PPE) during any activity involving

hazardous drugs, including:

- reconstituting or admixing these drugs
- handling vials or finished products
- opening drug packaging
- assembling the delivery system
- administering these drugs
- labeling hazardous containers
- disposing of drug-related waste
- handling excretions from patients who have received hazardous drugs.

### Gloves

- Wear two pairs of powder-free gloves. Make sure the inner pair is beneath the cuff of your gown and the outer pair covers the outside cuff.
- Before donning gloves, inspect them for defects.
- Remove the outer gloves after wiping down the final drug preparation but before labeling or removing it from the designated area. Place these gloves in a containment bag.
- Use clean gloves (the inner pair) to wipe the surface of the container, put the label on the final preparation, and place the drug container into the pass-through.
- Don fresh gloves to complete the final check and place the container for transport.
- Change gloves every 30 minutes during compounding, or immediately if damaged or contaminated.

### Gown

Wear a disposable, nonabsorbent gown made of polypropylene material with a closed front, long sleeves, and elastic cuffs.

### Face and eye shield

Wear a face or eye shield (as appropriate) if splashes, sprays, or aerosolizations to the eyes, nose, or mouth are possible during drug handling or administration.

### Proper sequence for donning PPE

After washing your hands, don the first pair of gloves, then the gown and face shield (as appropriate), and then the second pair of gloves (which should extend beyond the cuff of your gown).

## Dose reconstitution

- Avoid pressurizing vial contents, as this may cause the drug to spray out around or through the needle. To avoid pressurization, draw air into the syringe to create negative pressure in the vial.
- Transfer small amounts of diluent slowly as equal volumes of air are removed.
- Keeping the needle in the vial, swirl contents slowly until they dissolve.
- Make sure the syringe is no more than three-quarters full when it holds the final drug dosage.

## Dose withdrawal and transfer

- Keeping the vial inverted, withdraw only the proper amount of drug solution.
- Remove the needle with the vial upright, making sure the needle hub is clear.
- To withdraw a dose from an ampule, gently tap the neck of the ampule. Then wipe the neck with alcohol and attach a 5-micron filter needle to a syringe. Draw the solution through the needle, clearing it from the needle and hub.
- If the drug will be dispensed in the syringe, draw back the plunger to clear fluid from the needle and hub. Replace the needle with a locking cap, and then wipe and lock the syringe.
- When using a needleless system, use gauze pads at connection points to contain leaks.
- If the drug will be transferred to an I.V. bag or bottle, prime the I.V. set before adding the drug. Puncture only the septum of the injection port. After injecting the drug solution into the bag, wipe the port, container, and I.V. set (if attached).
- Once drug preparation is complete, seal the final product in a plastic bag or other sealable container for transport

before taking it out of the ventilated cabinet; then label it with a unique identifier. Seal and wipe all waste containers inside the ventilated cabinet before removal. Finally, remove your outer gloves and sleeve covers (if used) and bag them while still inside the ventilated cabinet.

### Administration

- Wash your hands and don gloves and gown. If spraying, splashing, or aerosolization is anticipated, wear a face shield or goggles.
- Visually examine the drug dose while it's still in the transport bag. If it appears intact, remove it from the bag.
- Place an absorbent pad on the work or administration area to contain spills or contamination.

#### Oral (noninjectable or nonparenteral) administration

- Oral hazardous drugs should be dispensed in the final dosage and form whenever possible.
- Avoid crushing tablets or opening capsules; instead, use liquid forms whenever possible.
- Never crush or compound an oral drug in an unprotected environment.
- Be aware that liquid hazardous drugs should be dispensed and maintained in sealable plastic bags.

#### I.M. or subcutaneous administration

- Remove the syringe cap and connect the appropriate safety needle.
- Don't expel air from the syringe or prime the safety needle.
- After administering the dose, discard the syringe (with safety needle attached) directly into an appropriate waste container.

#### I.V. administration

- If priming is necessary at the administration site, prime the I.V. tubing with an I.V. solution that doesn't contain a hazardous drug, or by using the backflow method.

- Place gauze pads under the connections at injection ports to catch leaks during administration.
- Use the transport bag as a containment bag for contaminated materials. Discard hazardous drug bags and bottles with their administration sets attached.

### Disposal and clean-up

- Handle hazardous wastes and contaminated materials separately from other trash.
- Wash surfaces contaminated with hazardous drugs with detergent, hypochlorite solution, and neutralizer, as appropriate.
- Clean and decontaminate work areas before and after each hazardous drug-handling activity and at the end of each shift. Clean up small spills immediately.
- Dispose of drug-contaminated syringes and needles in puncture-proof containers labeled "Chemotherapy waste" or "Hazardous waste."
- Never push or force materials contaminated with hazardous drugs into waste containers.

### After exposure to a hazardous drug

- In case of skin contact with a cytotoxic drug, immediately remove contaminated clothing and wash the affected area with soap and water. Don't scrub, because this will abrade the skin. Rinse the area thoroughly, and consult a physician for further treatment and monitoring.
- In case of eye contact, flush the affected eye with water or normal saline solution continuously for 15 minutes. Consult a physician for further treatment and monitoring.
- Document the exposure incident in your employee record and your facility's medical surveillance log.

## Managing poisonings and overdoses

This chart serves as a quick reference for managing poisonings and drug overdoses. For more detailed instructions, consult your local poison control center. To find your local center, call the American Association of Poison Control Centers at 1-800-222-1222 or visit <http://www.aapcc.org/findyour.htm>.

Poison or drug	Antidote and dosage
acetaminophen	<p><b>acetylcysteine (Acetadote, Mucomyst)</b>            Give P.O. as 5% solution by diluting with carbonated beverage or fruit juice.            Loading dose: 140 mg/kg followed by 17 additional doses of 70 mg/kg q 4 hours. Repeat dose if patient vomits within 1 hour of administration.            I.V. dose: 150 mg/kg over 15 minutes.            Maintenance dose: 50 mg/kg infused over 4 hours, followed by 100 mg/kg infused over 16 hours.</p>
anticholinergic agents antihistamines atropine	<p><b>physostigmine (Antilirium)</b>  <i>Adults:</i> 0.5 to 2 mg slow I.V. injection (not to exceed 1 mg/minute). May repeat q 20 minutes until response or adverse effects occur.            If initial dose is effective, additional doses of 1 to 4 mg may be given q 30 to 60 minutes as life-threatening signs (arrhythmias, seizures, deep coma) recur.  <i>Children:</i> 0.02 mg/kg I.M. or slow I.V. injection (not to exceed 0.5 mg/minute). May repeat q 5 to 10 minutes until therapeutic response occurs or maximum dosage of 2 mg is given.</p>
arsenic trioxide	<p><b>dimercaprol (BAL)</b>  <i>Adults:</i> 3 mg/kg I.M. q 4 hours until immediate life-threatening toxicity has subsided. Thereafter, give penicillamine 250 mg P.O. up to maximum frequency of four times daily (maximum: 1 g/day).</p>
benzodiazepines	<p><b>flumazenil (Romazicon)</b>  <i>Adults:</i> Initially, 0.2 mg I.V. injected over 30 seconds; follow with 0.3 mg if desired level of consciousness isn't reached. May give further doses of 0.5 mg at 60-second intervals until therapeutic response occurs or cumulative dosage of 3 mg is given. If partial response is achieved at 3 mg, patients may rarely need additional doses up to a total of 5 mg. If sedation recurs, repeat dose at 20-minute intervals. Maximum dosage is 3 mg/hour.  <i>Children:</i> Initially 0.01 mg/kg (maximum dosage 0.2 mg) with repeat doses of 0.01 mg/kg (maximum dosage 0.2 mg) given q minute to maximum cumulative dosage of 1 mg.</p>
calcium channel blockers	<p><b>activated charcoal</b>            Consider prehospital administration of activated charcoal as a slurry in patient with potentially toxic ingestion who is awake and able to protect airway. Use minimum of 240 ml water/30 g charcoal.  <i>Adults and adolescents:</i> Usual dosage, 25 to 100 g P.O.  <i>Children ages 1 to 12:</i> 25 to 50 g P.O. (or 0.5 to 1 g/kg)  <i>Children &lt; age 1:</i> 0.5 to 1 g/kg P.O.</p>

Poison or drug	Antidote and dosage
	<p><b>calcium chloride</b>  <i>Adults:</i> If massive overdose occurs with hypotension remaining unresponsive to supportive measures, administer vasopressors (such as phenylephrine) as prescribed. Calcium gluconate 2 g/hour I.V. titrated to maintain blood pressure has been used successfully.</p>
cholinergic agonists	<p><b>activated charcoal</b>  Administer charcoal as a slurry (240 ml water/30 g charcoal).  <i>Adults and adolescents:</i> Usual dosage, 25 to 100 g P.O.  <i>Children ages 1 to 12:</i> 25 to 50 g P.O.  <i>Children &lt; age 1:</i> 1 g/kg P.O.</p> <p><b>atropine sulfate</b>  Atropine is the drug of choice for significant muscarinic symptoms.  <i>Adults:</i> 2 to 4 mg I.V., repeated q 3 to 60 minutes as needed to control symptoms, then p.r.n. for 24 to 48 hours  <i>Children:</i> 0.04 to 0.08 mg/kg I.V. (up to 4 mg), repeated q 5 to 60 minutes as needed</p> <p><b>epinephrine</b>  Epinephrine may help overcome severe cardiovascular or bronchoconstrictor responses.  <i>Adults:</i> 0.1 to 1 mg subcutaneously</p>
digoxin	<p><b>digoxin immune Fab (Digibind, DigiFab)</b>  Calculate dosage as number of 38-mg vials, using this formula: Digoxin level (in ng) <math>\times</math> patient's weight (in kg) divided by 100. Usual dosage range is four to six vials.  If ingested amount of digoxin is unknown, give 10 to 20 vials (380 to 800 mg) I.V. over 30 minutes through a 0.22-micron filter. May give bolus dose if cardiac arrest is imminent.</p>
ethylene glycol	<p><b>fomepizole (Antizol)</b>  Loading dose: 15 mg/kg I.V. over 30 minutes, followed by 10 mg/kg I.V. over 30 minutes q 12 hours for four doses  Maintenance dose: 15 mg/kg I.V. over 30 minutes q 12 hours until ethylene glycol level falls below 20 mg/dl</p>
heparin	<p><b>protamine sulfate</b>  Dosage is based on partial thromboplastin time; usually, 1 mg for each 100 units of heparin. Give I.V. over 10 minutes (maximum rate of 5 mg/minute) in doses not exceeding 50 mg. Patients allergic to fish, vasectomized or infertile men, and patients taking protamine-insulin products are at increased risk for protamine hypersensitivity.</p>
hypercalcemic emergency	<p><b>edetate disodium (Endrate)</b>  <i>Adults:</i> 50 mg/kg/day by slow I.V. infusion over at least 3 hours, up to a maximum of 3 g/day.  <i>Children:</i> 40 mg/kg/day by slow I.V. infusion over at least 3 hours, up to a maximum of 70 mg/kg/day.  Dilute with normal saline solution or dextrose 5% in water; don't infuse rapidly. Keep patient in bed for 15 minutes after infusion to avoid orthostatic hypotension. Keep I.V. calcium readily available, because drug may cause profound hypocalcemia, leading to tetany, seizures, arrhythmias, and respiratory arrest. Alternate I.V. sites daily to decrease risk of thrombophlebitis.  <b>Alert:</b> Do not confuse drug with edetate calcium disodium, used as lead poisoning antidote.</p>

(continued)

## Managing poisonings and overdoses (continued)

Poison or drug	Antidote and dosage
iron	<p><b>deferoxamine (Desferal)</b>  <b>Acute iron intoxication:</b> Initially, 1 g I.M., followed by 500 mg q 4 hours for two doses depending on clinical response, and then 500 mg q 4 to 12 hours, up to 6 g/day. May give I.V. infusion of 10 to 15 mg/kg/hour for first 1 g. Subsequent doses shouldn't exceed 125 mg/hour. Maximum dosage is 6 g in 24 hours.  <b>Chronic iron intoxication:</b> In adults, 1 to 2 g/day subcutaneously. In children, maximum dosage of 2 g/day subcutaneously.</p>
opioid overdose and dependence	<p><b>naloxone hydrochloride (Narcan)</b>  <b>Opioid overdose</b>  <i>Adults:</i> 0.4 to 2 mg I.V., I.M., or subcutaneously; repeat q 2 to 3 minutes, p.r.n., up to 10 mg            If ordered, give initial adult dose of 0.1 mg I.V. to assess patient's response. Give subsequent doses of 0.4 mg or less (undiluted) by direct injection over 15 seconds, or titrate based on response. As needed, give continuous I.V. infusion, diluting 2 mg of naloxone with 500 ml of normal saline solution or dextrose 5% in water for a final concentration of 4 mcg/ml; titrate based on patient's response.  <i>Children &gt; age 5 or ≥ 20 kg:</i> 2 mg/dose; repeat q 2 to 3 minutes.  <i>Children &lt; age 5 or &lt; 20 kg:</i> 0.1 mg/kg; repeat q 2 to 3 minutes.  <b>Postoperative opioid-induced respiratory depression</b>  <i>Adults:</i> 0.1 to 0.2 mg I.V. q 2 to 3 minutes, p.r.n.  <i>Children:</i> 0.005 to 0.01 mg/kg q 2 to 3 minutes.  <b>Opioid dependence</b>  <b>naltrexone (Depade, ReVia)</b>  <i>Adults:</i> Initially, 25 mg P.O.; give an additional dose of 25 mg if no withdrawal symptoms occur within 1 hour. When patient is receiving 50 mg q 24 hours, a maintenance schedule of 50 to 150 mg/day P.O. may be used. Don't initiate therapy until patient has been opiate-free for 7 to 10 days; do not begin for opioid dependence until a naloxone challenge test has been given.  <b>Alert:</b> Do not confuse naltrexone with naloxone.</p>
organophosphate insecticides	<p><b>pralidoxime (Protopam)</b>  <i>Adults:</i> 1 to 2 g I.V. in 100 ml of normal saline solution infused over 15 to 30 minutes. If pulmonary edema occurs, may give as 5% solution I.V. over 5 minutes. May repeat dose in 1 hour if muscle weakness persists; may give additional doses at 10- to 12-hour intervals cautiously if muscle weakness continues.  <i>Children:</i> 20 to 50 mg/kg (up to 1 g) in 250 ml normal saline solution I.V. over 30 minutes</p>
warfarin	<p><b>phytonadione (Vitamin K)</b>  <i>Adults:</i> 2.5 to 10 mg subcutaneously based on prothrombin time/International Normalized Ratio; may repeat in 6 to 8 hours as needed. In emergency, 2.5 to 25 mg slow I.V. (no faster than 1 mg/minute); may repeat 6 to 8 hours after first dose.</p>
miscellaneous drug overdose	<p><b>activated charcoal</b>  <i>Adults:</i> 1 to 2 g/kg with at least a 10:1 ratio of activated charcoal to intoxicant (usual dose is 25 to 100 g charcoal in water or sorbitol) and administered P.O. or by nasogastric tube. Do not give doses greater than 100 g.  <i>Children:</i> 1 to 2 g/kg or 25 to 50 g charcoal.            The use of repeated oral charcoal with sorbitol doses is not recommended.</p>

- concomitant use of inhaled nasal steroid (such as fluticasone propionate) and atazanavir without ritonavir
- concomitant use of inhaled nasal steroid (such as fluticasone propionate) and atazanavir with ritonavir (use not recommended unless potential benefit to patient outweighs risk of systemic corticosteroid adverse effects)
- concomitant use of proton pump inhibitors (such as omeprazole) (shouldn't be used in treatment-experienced patients receiving atazanavir)
- concomitant use of opioid (such as buprenorphine) and atazanavir without ritonavir (shouldn't be coadministered)
- administration of drugs highly dependent on CYP2C8 with narrow indices (such as paclitaxel, repaglinide) when atazanavir is administered without ritonavir
- concomitant use of antifungal (such as voriconazole) (shouldn't be administered with atazanavir/ritonavir unless benefit/risk assessment justifies use of voriconazole)
- concomitant use of antigout agent (such as colchicine) (shouldn't be administered with atazanavir to patients with hepatic or renal impairment)
- concomitant use of atazanavir with efavirenz in treatment-experienced patients (don't coadminister)
- concomitant use of inhaled beta agonist (such as salmeterol) (use not recommended)
- pregnant (avoid use without ritonavir) or breastfeeding patients
- patients less than 40 kg (88 lb) receiving concomitant tenofovir, H<sub>2</sub>-receptor antagonists, or proton-pump inhibitors (not recommended)
- children younger than age 13 (avoid use without ritonavir)
- children ages 3 months to 6 years (safety and efficacy not established)

- children younger than age 3 months (avoid use).

### Administration

- Perform liver function tests before starting therapy.
- Administer drug with food.
- 🔊 Be aware that drug isn't recommended for treatment-experienced patients with prior virologic failure.
- 🔊 Don't administer to patient with severe hepatic impairment or treatment-experienced patient who is receiving dialysis for end-stage renal disease.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

### Adverse reactions

- CNS:** headache, insomnia, dizziness, peripheral neurologic symptoms, depression
- CV:** cardiac conduction abnormalities
- EENT:** scleral icterus
- GI:** nausea, vomiting, diarrhea, abdominal pain
- GU:** nephrolithiasis
- Hematologic:** neutropenia, thrombocytopenia, leukopenia, **increased bleeding (in patients with hemophilia A and B)**
- Hepatic:** jaundice, **hepatotoxicity**
- Metabolic:** hyperbilirubinemia, hyperglycemia, possible exacerbation of or new-onset diabetes mellitus
- Musculoskeletal:** myalgia
- Respiratory:** cough
- Skin:** rash, **erythema multiforme, toxic skin eruptions, Stevens-Johnson syndrome**
- Other:** fever, body fat redistribution or accumulation, **immune reconstitution syndrome**

### Interactions

- Drug-drug:** *Antacids, buffered drugs, H<sub>2</sub>-receptor antagonists, proton pump inhibitors:* decreased atazanavir plasma concentration

*Antiarrhythmics (such as amiodarone, bepridil, systemic lidocaine, quinidine), tricyclic antidepressants*): increased risk of serious or life-threatening adverse reactions

*Atorvastatin, rosuvastatin*: increased risk of myopathy including rhabdomyolysis

*Bosentan*: decreased atazanavir level, increased bosentan level

*Buprenorphine*: increased buprenorphine and its active metabolite nor-buprenorphine plasma concentrations, decreased atazanavir level

*Calcium channel blockers (such as diltiazem, felodipine, nifedipine, nicardipine, verapamil)*: increased calcium channel blocker effect

*Clarithromycin*: increased atazanavir and clarithromycin levels resulting in prolonged QTc interval; significantly reduced active clarithromycin metabolite level

*Colchicine*: increased colchicine effect

*Cyclosporine, sirolimus, tacrolimus*: increased immunosuppressant levels

*Didanosine (buffered tablets)*: marked decrease in atazanavir exposure

*Drugs primarily metabolized by CYP3A, UGT1A1, other drugs (such as alfuzosin, cisapride, ergot derivatives, indinavir, irinotecan, lovastatin, oral midazolam, pimozone, rifampin, sildenafil [Revatio], simvastatin, triazolam)*: increased plasma concentration of these drugs resulting in serious or life-threatening adverse reactions

*Drugs that prolong PR interval (beta blockers other than atenolol, digoxin, verapamil)*: expected additive effect of atazanavir

*Efavirenz*: decreased atazanavir exposure

*Ethinyl estradiol with norgestimate*: decreased ethinyl estradiol level, increased norgestimate level

*Ethinyl estradiol with norethindrone*: increased ethinyl estradiol and norethindrone levels

*Fluticasone*: increased fluticasone plasma concentration

*Fluticasone and atazanavir/ritonavir*: increased fluticasone plasma concentration resulting in significantly reduced cortisol levels

*H<sub>2</sub>-receptor antagonists*: decreased atazanavir plasma concentration resulting in loss of therapeutic effect and development of resistance

*Itraconazole, ketoconazole*: increased atazanavir area under the curve (AUC) and C<sub>max</sub>; increased itraconazole and ketoconazole effects

*Midazolam (parenteral)*: increased midazolam plasma concentrations, risk of respiratory depression and prolonged sedation

*Nevirapine*: markedly decreased atazanavir effect; increased nevirapine effect with risk of nevirapine-associated toxicity

*Other protease inhibitors*: expected increased effect of these drugs

*Rifabutin*: increased risk of rifabutin-associated adverse reactions

*Ritonavir*: increased atazanavir effect

*Salmeterol*: increased risk of cardiovascular adverse reactions including prolonged QT interval, palpitations, and sinus tachycardia

*Sildenafil, tadalafil, vardenafil*: possible increased phosphodiesterase inhibitor-associated adverse reactions (hypotension, syncope, visual disturbances, priapism)

*Tenofovir*: decreased atazanavir AUC and C<sub>min</sub>; increased tenofovir level

*Trazodone*: increased trazodone plasma level

*Warfarin*: increased risk of serious or life-threatening bleeding

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, amylase, blood glucose, creatine kinase, high-density lipoproteins, lipase, low-density lipoproteins, total bilirubin, total cholesterol, triglycerides*: increased levels  
*Hemoglobin, neutrophils, platelets*: decreased levels

**Drug-food.** *Any food:* enhanced bioavailability and reduced pharmacokinetic variability

**Drug-herbs.** *St. John's wort:* decreased atazanavir plasma concentrations

### Patient monitoring

🔊 Monitor patient closely and discontinue drug if severe rash occurs (possible sign of Stevens-Johnson syndrome).

🔊 Be aware that immune reconstitution syndrome may occur in patients receiving combination antiretroviral therapy. During initial phase of therapy, patient whose immune system responds may develop inflammatory response to indolent or residual opportunistic infections (such as *Mycobacterium avium* complex, cytomegalovirus, *Pneumocystis jirovecii* pneumonia, tuberculosis), which may necessitate further evaluation and treatment.

🔊 Temporarily interrupt or discontinue drug if signs or symptoms of nephrolithiasis occur.

- Monitor blood glucose level during therapy; watch for signs or symptoms of new-onset or exacerbation of diabetes mellitus and redistribution or accumulation of body fat.

- Monitor CBC with differential and liver and kidney function tests closely.

### Patient teaching

- Instruct patient to take drug by mouth with food, to swallow capsules whole, and not to crush or chew them.

- Instruct patient to take drug 2 hours before or 1 hour after taking antacids or a buffered form of drugs.

🔊 Instruct patient to immediately report severe rash, changes in pulse or heart beat, signs or symptoms of kidney stones (pain in the side, blood in urine, or pain when urinating), yellowing of eyes, or signs and symptoms of immune reconstitution syndrome (such as new signs or symptoms of a

previously subclinical infection, worsening or progression of a known infection despite treatment, a new infection or illness, or failure of antiretroviral therapy).

- Inform patient that drug may cause increase in blood glucose level and redistribution or accumulation of body fat.

- Advise patient to consult prescriber before using other prescription or over-the-counter drugs or herbs.

- Advise male patient taking sildenafil, tadalafil, or vardenafil to promptly report hypotension, visual changes, or prolonged penile erection to prescriber.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## atenolol

Antipressan<sup>⚡</sup>, Atenix<sup>⚡</sup>, Novo-Atenol<sup>⚡</sup>, Tenormin

**Pharmacologic class:** Beta-adrenergic blocker (selective)

**Therapeutic class:** Antianginal, anti-hypertensive

**Pregnancy risk category** D

### FDA BOXED WARNING

- Caution patients with coronary artery disease (CAD) not to discontinue drug abruptly, because this may cause severe angina exacerbation, myocardial infarction, and ventricular arrhythmias. (The last two complications may occur with or without preceding angina exacerbation.) With planned drug discontinuation, observe patients carefully and advise them to

minimize physical activity; if angina worsens or acute coronary insufficiency develops, drug should be reinstated promptly, at least temporarily. Because CAD is common and may go unrecognized, abrupt withdrawal may pose a risk even in patients treated only for hypertension.

### Action

Selectively blocks beta<sub>1</sub>-adrenergic (myocardial) receptors; decreases cardiac output, peripheral resistance, and myocardial oxygen consumption. Also depresses renin secretion without affecting beta<sub>2</sub>-adrenergic (pulmonary, vascular, uterine) receptors.

### Availability

Tablets: 25 mg, 50 mg, 100 mg

### Indications and dosages

➤ Hypertension

**Adults:** Initially, 50 mg P.O. once daily, increased to 100 mg after 7 to 14 days if needed

➤ Angina pectoris

**Adults:** Initially, 50 mg P.O. once daily, increased to 100 mg after 7 days if needed. Some patients may require up to 200 mg daily.

➤ Acute myocardial infarction

**Adults:** 50 mg tablet P.O., then give 50 mg P.O. in 12 hours. Maintenance dosage is 100 mg P.O. daily or 50 mg b.i.d. for 6 to 9 days.

### Dosage adjustment

- Renal impairment
- Elderly patients

### Contraindications

- Cardiogenic shock
- Sinus bradycardia
- Greater than first-degree heart block
- Heart failure (unless secondary to tachyarrhythmia treatable with beta-adrenergic blockers)

### Precautions

Use cautiously in:

- renal failure, hepatic impairment, pulmonary disease, diabetes mellitus, thyrotoxicosis
- pregnant or breastfeeding patients
- children.

### Administration

⚠ Adjust initial and subsequent dosages downward depending on clinical observations, including pulse rate and blood pressure.

⚠ Don't discontinue drug suddenly. Instead, taper dosage over 2 weeks.

Route	Onset	Peak	Duration
P.O.	1 hr	2 hr	24 hr

### Adverse reactions

**CNS:** fatigue, lethargy, vertigo, drowsiness, dizziness, depression, disorientation, short-term memory loss

**CV:** hypertension, intermittent claudication, cold arms and legs, orthostatic hypotension, **bradycardia, arrhythmias, heart failure, cardiogenic shock, myocardial reinfarction**

**EENT:** blurred vision, dry eyes, eye irritation, conjunctivitis, stuffy nose, rhinitis, pharyngitis, **laryngospasm**

**GI:** nausea, vomiting, diarrhea, constipation, gastric pain, flatulence, anorexia, **ischemic colitis, retroperitoneal fibrosis, acute pancreatitis, mesenteric arterial thrombosis**

**GU:** impotence, decreased libido, dysuria, nocturia, Peyronie's disease, **renal failure**

**Hematologic:** agranulocytosis

**Hepatic:** hepatomegaly

**Metabolic:** hypoglycemia

**Musculoskeletal:** muscle cramps, back and joint pain

**Respiratory:** dyspnea, wheezing, respiratory distress, **bronchospasm, bronchial obstruction, pulmonary emboli**

**Other:** decreased exercise tolerance, allergic reaction, fever, development of antinuclear antibodies, hypersensitivity reaction

## Interactions

**Drug-drug.** *Amiodarone, cardiac glycosides, diltiazem, verapamil:* increased myocardial depression, causing excessive bradycardia and heart block  
*Amphetamines, cocaine, ephedrine, nor-epinephrine, phenylephrine, pseudo-ephedrine:* excessive hypertension, bradycardia

*Ampicillin, calcium salts:* decreased antihypertensive and antianginal effects

*Aspirin, bismuth subsalicylate, magnesium salicylate, nonsteroidal anti-inflammatory drugs:* decreased anti-hypertensive effect

*Clonidine:* life-threatening blood pressure increase after clonidine withdrawal or simultaneous withdrawal of both drugs

*Dobutamine, dopamine:* decrease in beneficial beta-cardiovascular effects

*Lidocaine:* increased lidocaine levels, greater risk of toxicity

*MAO inhibitors:* bradycardia

*Prazosin:* increased risk of orthostatic hypotension

*Reserpine:* increased hypotension, marked bradycardia

*Theophylline:* decreased theophylline elimination

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, antinuclear antibody titer, blood urea nitrogen, creatinine, lactate dehydrogenase, platelets, potassium, uric acid:* increased levels  
*Glucose:* increased or decreased level  
*Insulin tolerance test:* false result

**Drug-behaviors.** *Alcohol use:* increased hypotension

## Patient monitoring

- Watch for signs and symptoms of hypersensitivity reaction.
- Monitor vital signs (especially blood pressure), ECG, and exercise tolerance.
- Check closely for hypotension in hemodialysis patients.

- Monitor blood glucose level regularly if patient is diabetic; drug may mask signs and symptoms of hypoglycemia.

## Patient teaching

- 📣 Instruct patient to immediately report signs and symptoms of allergic response, breathing problems, and chest pain.
- Advise patient to take drug at same time every day.
- 📣 Inform patient that he may experience serious reactions if he stops taking drug suddenly. Advise him to consult prescriber before discontinuing.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Tell patient that drug may cause a temporary blood pressure decrease if he stands or sits up suddenly. Instruct him to rise slowly and carefully.
- Inform women that drug shouldn't be taken during pregnancy. Urge them to report planned or suspected pregnancy.
- Tell men that drug may cause erectile dysfunction. Advise them to discuss this issue with prescriber.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## atomoxetine hydrochloride

Strattera

**Pharmacologic class:** Selective norepinephrine reuptake inhibitor

**Therapeutic class:** Central nervous system agent

**Pregnancy risk category C**

**FDA BOXED WARNING**

- Drug may increase risk of suicidal ideation in children or adolescents with attention deficit hyperactivity disorder (ADHD). Risk must be balanced with clinical need. Observe patient closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family to observe patient closely and communicate with prescriber as needed.
- Drug is approved for ADHD in pediatric and adult patients. It's not approved for major depressive disorder.

**Action**

Unclear. May block norepinephrine reuptake at neuronal synapse.

**Availability**

*Capsules:* 10 mg, 18 mg, 25 mg, 40 mg, 60 mg, 80 mg, 100 mg

**Indications and dosages**

➤ Acute treatment of ADHD

**Children and adolescents weighing 70 kg (154 lb) or less:** Initially, total daily dose of approximately 0.5 mg/kg P.O.; increase after minimum of 3 days to target total daily dose of approximately 1.2 mg/kg given either as single daily dose in morning or as evenly divided doses in morning and late afternoon or early evening. Total daily dosage in children and adolescents shouldn't exceed 1.4 mg/kg or 100 mg, whichever is less.

**Children, adolescents, and adults weighing more than 70 kg (154 lb):** Initially, total daily dose of 40 mg P.O.; increase after minimum of 3 days to target total daily dose of approximately 80 mg given either as single daily dose in morning or as evenly divided doses in morning and late afternoon or early evening. After 2 to 4 additional weeks, dosage may be increased to maximum of

100 mg in patients who haven't achieved optimal response. Maximum recommended total daily dosage is 100 mg.

➤ Maintenance and extended treatment of ADHD

**Children ages 6 to 15:** In general, continue dosage at which patient experienced continuous response.

**Dosage adjustment**

- Hepatic impairment
- Concurrent use of potent CYP2D6 inhibitors (such as fluoxetine, paroxetine, quinidine) in children weighing less than 70 kg (154 lb)

**Contraindications**

- Hypersensitivity to drug
- Closed-angle glaucoma, pheochromocytoma or history of pheochromocytoma, severe CV disorders
- MAO inhibitor use within past 14 days

**Precautions**

Use cautiously in:

- hypotension; impaired renal, cerebrovascular, hepatic, or endocrine function
- serious cardiac structural or heart rhythm abnormalities, cardiomyopathy (use not recommended)
- patients whose underlying medical conditions could be worsened by increased heart rate or blood pressure
- pregnant or breastfeeding patients
- children younger than age 6.

**Administration**

- Give as a single dose in morning, or give half of total daily dose in morning and other half in late afternoon or early evening.
- Check patient's baseline pulse and blood pressure.
- ⚠ Don't give to patient who has taken MAO inhibitors within past 14 days.

Route	Onset	Peak	Duration
P.O.	Rapid	1-2 hr	Unknown

## Adverse reactions

**CNS:** aggression, insomnia, dizziness, drowsiness, headache, irritability, crying, mood swings, fatigue, rigors, **cerebrovascular accident, suicidal ideation**

**CV:** orthostatic hypotension, palpitations, tachycardia, Raynaud's phenomenon, **MI, sudden death**

**EENT:** rhinorrhea, sinusitis

**GI:** nausea, vomiting, constipation, upper abdominal pain, flatulence, dyspepsia, dry mouth

**GU:** urinary retention, urinary hesitancy, dysmenorrhea, erectile problems, ejaculation failure, impotence, prostatitis, priapism

**Hepatic: severe liver injury**

**Musculoskeletal:** muscle pain

**Respiratory:** cough

**Skin:** dermatitis, sweating

**Other:** fever, hot flashes, growth retardation (in children), decreased appetite, weight loss, **hypersensitivity reactions (including angioedema)**

## Interactions

**Drug-drug.** *Albuterol:* increased cardiovascular effects

*MAO inhibitors:* hyperthermia, myoclonus, rapid changes in vital signs

*Potent CYP2D6 inhibitors:* increased atomoxetine effects in children weighing less than 70 kg (154 lb)

*Vasopressors:* hypertensive crisis

**Drug-diagnostic tests.** *Liver enzymes:* elevated levels

## Patient monitoring

Monitor liver function tests closely; discontinue drug, and don't restart if liver enzymes are elevated or jaundice occurs.

- Monitor growth in children.
- Assess for weight loss.
- Check blood pressure and pulse, especially after dosage changes.

Monitor for changes in mood, sleep patterns, and behavior (especially aggressive behavior or hostility) and

consider discontinuing drug if psychotic or manic symptoms occur.

- Evaluate for urinary hesitancy or urinary retention and sexual dysfunction.
- Provide dietary counseling. Refer patient to dietician if adverse GI effects significantly limit food intake.

## Patient teaching

Instruct patient to immediately report difficulty breathing, swelling of lips or throat, itching, dark urine, yellowing of skin or eyes, right upper quadrant tenderness, or flulike symptoms.

Instruct patient or caregiver to immediately report depression or suicidal thoughts.

To minimize insomnia, advise patient to establish effective bedtime routine and to take drug in single morning dose or in divided half-doses in morning and late afternoon or early evening.

Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.

As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

## atorvastatin calcium

Lipitor

**Pharmacologic class:** HMG-CoA reductase inhibitor

**Therapeutic class:** Lipid-lowering agent

**Pregnancy risk category** X

## Action

Inhibits HMG-CoA reductase, which catalyzes first step in cholesterol synthesis; this action reduces concentrations of

serum cholesterol and low-density lipoproteins (LDLs), linked to increased risk of coronary artery disease (CAD). Also moderately increases concentration of high-density lipoproteins (HDLs), associated with decreased risk of CAD.

### Availability

Tablets: 10 mg, 20 mg, 40 mg, 80 mg

### Indications and dosages

➤ Adjunct to diet for controlling LDL, total cholesterol, apo-lipoprotein B, and triglyceride levels and to increase HDL levels in patients with primary hypercholesterolemia and mixed dyslipidemia; primary dysbetalipoproteinemia in patients unresponsive to diet alone; adjunct to diet to reduce elevated triglyceride levels

**Adults:** Initially, 10 mg P.O. daily; increase to 80 mg P.O. daily if needed. Adjust dosage according to patient's cholesterol level.

➤ Adjunct to other lipid-lowering treatments in patients with homozygous familial hypercholesterolemia

**Adults:** 10 to 80 mg P.O. daily

➤ Adjunct to diet to decrease total cholesterol, LDL, and apo-lipoprotein B levels in boys and postmenarchal girls ages 10 to 17 with familial and nonfamilial heterozygous hypercholesterolemia

**Boys and girls:** Initially, 10 mg P.O. daily; adjust dosage upward or downward based on lipid levels. Maximum dosage is 20 mg daily.

➤ Prevention of cardiovascular disease in patients without clinically evident coronary heart disease (CHD) but with multiple CHD risk factors

**Adults:** 10 mg P.O. daily

➤ Prevention of stroke and myocardial infarction in patients with type 2 diabetes who have multiple risk factors for CHD but without clinically evident CHD

**Adults:** Dosage individualized according to patient characteristics, such as goal of therapy and response according to National Cholesterol Education Program guidelines

### Contraindications

- Hypersensitivity to drug or its components
- Active hepatic disease or unexplained, persistent serum transaminase elevations
- Pregnancy or breastfeeding

### Precautions

Use cautiously in:

- hypotension, uncontrolled seizures, myopathy, alcoholism
- severe metabolic, endocrine, or electrolyte disorders
- concurrent use of cyclosporine, HIV protease inhibitors tipranavir or lopinavir plus ritonavir, hepatitis C protease inhibitor telaprevir, HMG-CoA reductase inhibitor gemfibrozil (avoid use)
- concurrent use of colchicine, fibric acid products, lipid-modifying doses (1 g/day or more) of niacin, clarithromycin and itraconazole (with atorvastatin dose above 20 mg), or grapefruit juice (more than 1.2 L/day)
- women of childbearing age
- children younger than age 18.

### Administration

- Give with or without food.
- Don't give with grapefruit juice or antacids.
- If patient is also taking a CYP450 3A4 inducer (such as efavirenz or rifampin), give simultaneously with atorvastatin because delayed atorvastatin administration after rifampin administration has been associated with a significant reduction in atorvastatin plasma concentration.

Route	Onset	Peak	Duration
P.O.	Unknown	1-2 hr	Unknown

## Adverse reactions

**CNS:** amnesia, abnormal dreams, emotional lability, headache, hyperactivity, poor coordination, malaise, paresthesia, peripheral neuropathy, drowsiness, syncope, weakness

**CV:** orthostatic hypotension, palpitations, phlebitis, vasodilation,

### arrhythmias

**EENT:** amblyopia, altered refraction, glaucoma, eye hemorrhage, dry eyes, hearing loss, tinnitus, epistaxis, sinusitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal cramps, abdominal or biliary pain, colitis, indigestion, dyspepsia, flatulence, stomach ulcers, gastroenteritis, melena, tenesmus, glossitis, mouth sores, dry mouth, dysphagia, esophagitis, pancreatitis, **rectal hemorrhage**

**GU:** hematuria, nocturia, dysuria, urinary frequency or urgency, urinary retention, cystitis, nephritis, renal calculi, abnormal ejaculation, decreased libido, erectile dysfunction, epididymitis

**Hematologic:** anemia, **thrombocytopenia**

**Hepatic:** jaundice, **hepatic failure, hepatitis**

**Metabolic:** hyperglycemia, **hypoglycemia**

**Musculoskeletal:** bursitis, joint pain, back pain, leg cramps, gout, muscle pain or aches, myositis, myasthenia gravis, neck rigidity, torticollis, **rhabdomyolysis**

**Respiratory:** dyspnea, pneumonia, bronchitis

**Skin:** alopecia, acne, contact dermatitis, eczema, dry skin, pruritus, rash, urticaria, skin ulcers, seborrhea, photosensitivity, diaphoresis, **toxic epidermal necrolysis**

**Other:** taste loss, gingival bleeding, fever, facial paralysis, facial or generalized edema, flulike symptoms, infection, appetite changes, weight gain,

allergic reaction, **Stevens-Johnson syndrome**

## Interactions

**Drug-drug.** *Antacids, colestipol, CYP450 3A4 (such as efavirenz, rifampin):* decreased atorvastatin blood level

*Azole antifungals, colchicine, cyclosporine, erythromycin, fibric acid derivatives, HIV protease inhibitors, lipid-modifying doses of niacin, other HMG-CoA reductase inhibitors, strong CYP3A4 inhibitors (such as clarithromycin, itraconazole):* protease inhibitors: increased risk of myopathy or rhabdomyolysis

*Digoxin:* increased digoxin level, greater risk of toxicity

*Hormonal contraceptives:* increased levels of these drugs

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, creatine kinase:* increased levels

**Drug-food.** *Grapefruit juice:* increased drug blood level, greater risk of adverse effects

## Patient monitoring

- Monitor patient for signs and symptoms of allergic response.

-  Evaluate for muscle weakness (a symptom of myositis and possibly rhabdomyolysis).

- Be aware that reduction in dosage and periodic monitoring of creatine kinase level may be considered for patients taking drugs that may increase atorvastatin level.

- Monitor liver function test results and blood lipid levels.

## Patient teaching

- Tell patient he may take drug with or without food.

-  Advise patient to immediately report allergic response, irregular heart beats, unusual bruising or bleeding, unusual tiredness, yellowing of skin or eyes, or muscle weakness.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, alertness, and vision.
- Inform patient taking hormonal contraceptives that drug increases estrogen levels. Instruct her to tell all prescribers she's taking drug.
- Tell men that drug may cause erectile dysfunction and abnormal ejaculation. Encourage them to discuss these issues with prescriber.
- Tell patient he'll undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## atropine sulfate

AtroPen

## atropine sulfate ophthalmic

**Pharmacologic class:** Anticholinergic (antimuscarinic)

**Therapeutic class:** Antiarrhythmic

**Pregnancy risk category** C

### Action

Inhibits acetylcholine at parasympathetic neuroeffector junction of smooth muscle and cardiac muscle, blocking sinoatrial (SA) and atrioventricular (AV) nodes. These actions increase impulse conduction and raise heart rate. In ophthalmic use, blocks cholinergic stimulation to iris and ciliary bodies, causing pupillary dilation and accommodation paralysis.

### Availability

**Injection:** 0.05 mg/ml, 0.1 mg/ml, 0.3 mg/ml, 0.4 mg/ml, 0.5 mg/ml, 0.8 mg/ml, 1 mg/ml

**Ophthalmic solution:** 0.5%, 1%, 2%

**Tablets:** 0.4 mg

### Indications and dosages

➤ Bradyarrhythmias, symptomatic bradycardia

**Adults:** 0.5 to 1 mg by I.V. push repeated q 3 to 5 minutes as needed, to a maximum dosage of 2 mg

**Children:** 0.01 mg/kg I.V. to a maximum dosage of 0.4 mg or 0.3 mg/m<sup>2</sup>. May repeat I.V. dose q 4 to 6 hours.

➤ Antidote for anticholinesterase insecticide poisoning

**Adults:** 2 to 3 mg I.V. repeated q 5 to 10 minutes until symptoms disappear or a toxic level is reached. For severe poisoning, 6 mg q hour.

**Children:** 0.05 mg/kg I.M. or I.V. repeated q every 10 to 30 minutes until symptoms disappear or a toxic level is reached

➤ Preoperatively to diminish secretions and block cardiac vagal reflexes

**Adults and children weighing more than 40.8 kg (90 lb):** 0.4 to 0.6 mg I.M., I.V., or subcutaneously 30 to 60 minutes before anesthesia

**Children weighing 29.5 to 40.8 kg (65 to 90 lb):** 0.4 mg I.M., I.V., or subcutaneously 30 to 60 minutes before anesthesia

**Children weighing 18.1 to 29.5 kg (40 to 65 lb):** 0.3 mg I.M., I.V., or subcutaneously 30 to 60 minutes before anesthesia

**Children weighing 10.9 to 18.1 kg (24 to 40 lb):** 0.2 mg I.M., I.V., or subcutaneously 30 to 60 minutes before anesthesia

**Children weighing 7.3 to 10.9 kg (16 to 24 lb):** 0.15 mg I.M., I.V., or subcutaneously 30 to 60 minutes before anesthesia

**Children weighing 3.2 to 7.3 kg (7 to 16 lb):** 0.1 mg I.M., I.V., or subcutaneously 30 to 60 minutes before anesthesia

➤ Peptic ulcer disease, functional GI disorders (such as hypersecretory states)

**Adults:** 0.4 to 0.6 mg P.O. q 4 to 6 hours

**Children:** 0.01 mg/kg or 0.3/m<sup>2</sup> P.O. q 4 to 6 hours

➤ Parkinsonism

**Adults:** 0.1 to 0.25 mg P.O. q.i.d.

➤ Antidote for muscarine-induced mushroom toxicity

**Adults:** 1 to 2 mg/hour I.M. or I.V. until respiratory function improves

➤ Pupillary dilation in acute inflammatory conditions of iris and uveal tract

**Adults:** Instill one or two drops of 0.5% or 1% solution into eye(s) up to q.i.d.

**Children:** Instill one or two drops of 0.5% solution into eye(s) up to t.i.d.

➤ To produce mydriasis and cycloplegia for refraction

**Adults:** Instill one or two drops of 1% solution into eye(s) 1 hour before refraction.

**Children:** Instill one or two drops of 0.5% solution into eye(s) b.i.d. for 1 to 3 days before examination.

### Off-label uses

- Cholinergic-mediated bronchial asthma

### Contraindications

- Hypersensitivity to drug or other belladonna alkaloids
- Acute narrow-angle glaucoma
- Adhesions between iris and lens (ophthalmic form)
- Obstructive GI tract disease
- Unstable cardiovascular status
- Asthma
- Myasthenia gravis
- Thyrotoxicosis
- Infants ages 3 months and younger

### Precautions

Use cautiously in:

- chronic renal, hepatic, pulmonary, or cardiac disease
- intra-abdominal infection, prostatic hypertrophy
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

- For I.V. dose, infuse directly into large vein or I.V. tubing over at least 1 minute.
- Be aware that doses of 0.5 mg may cause paradoxical bradycardia because of central or peripheral parasympathomimetic effects of low doses in adults.
- Don't administer oral dose within 1 hour of giving antacids.
- Be aware that patients with Down syndrome may be unusually sensitive to drug.

Route	Onset	Peak	Duration
P.O.	0.5-2 hr	1-2 hr	4-6 hr
I.V.	Immediate	2-4 min	4-6 hr
I.M., subcut.	Rapid	15-50 min	4-6 hr

### Adverse effects

**CNS:** headache, restlessness, ataxia, disorientation, delirium, insomnia, dizziness, drowsiness, agitation, nervousness, confusion, excitement

**CV:** palpitations, **bradycardia**, **tachycardia**

**EENT:** photophobia, blurred vision, increased intraocular pressure, mydriasis, cycloplegia, nasal congestion

**GI:** nausea, vomiting, constipation, bloating, dyspepsia, ileus, abdominal distention (in infants), dysphagia, dry mouth

**GU:** urinary retention, urinary hesitancy, impotence

**Skin:** decreased sweating, flushing, urticaria, dry skin

**Other:** thirst, **anaphylaxis**

### Interactions

**Drug-drug.** *Amantadine, antiarrhythmics, anticholinergics, antihistamines, antiparkinsonian drugs, glutethimide, meperidine, muscle relaxants, phenothiazines, tricyclic antidepressants:* increased atropine effects  
*Antacids, antidiarrheals:* decreased atropine absorption

*Antimyasthenics*: decreased intestinal motility

*Cyclopropane*: ventricular arrhythmias

*Ketoconazole, levodopa*: decreased absorption of these drugs

*Metoclopramide*: decreased effect of atropine on GI motility

*Potassium chloride wax-matrix tablets*: increased severity of mucosal lesions

**Drug-herbs.** *Jaborandi tree, pill-bearing spurge*: decreased drug effect

*Jimsonweed*: changes in cardiovascular function

*Squaw vine*: reduced metabolic breakdown of drug

**Drug-behaviors.** *Sun exposure*: increased risk of photophobia

### Patient monitoring

🚨 Watch closely for signs and symptoms of anaphylaxis.

- Monitor heart rate for bradycardia or tachycardia.
- Evaluate fluid intake and output.
- Assess for urine retention or urinary hesitancy.
- Monitor for signs and symptoms of glaucoma.

### Patient teaching

🚨 Instruct patient to immediately report allergic response.

🚨 Inform patient that headache, eye pain, and blurred vision may signal glaucoma. Tell him to report these symptoms at once.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, alertness, and vision.
- Encourage patient to establish an effective bedtime routine to minimize insomnia.
- Tell patient to apply pressure to inside corner of eye during instillation of ophthalmic solution and for 1 to 2 minutes afterward.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially

those related to the drugs, herbs, and behaviors mentioned above.

## avanafil

Stendra

**Pharmacologic class:** Phosphodiesterase type 5 (PDE5) inhibitor

**Therapeutic class:** Erectile dysfunction agent

**Pregnancy risk category C**

### Action

Enhances the effect of nitric oxide by inhibiting PDE5, which is responsible for degradation of cyclic guanosine monophosphate in the corpus cavernosum. Because sexual stimulation is required to initiate the local release of nitric oxide, the inhibition of PDE5 has no effect in the absence of sexual stimulation.

### Availability

Tablets: 50 mg, 100 mg, 200 mg

### Indications and dosages

➤ Erectile dysfunction

**Adults:** Initially, 100 mg P.O. approximately 30 minutes before sexual activity on an as-needed basis. May increase dosage to 200 mg or decrease to 50 mg based on efficacy or tolerability; use the lowest dosage that provides benefit. Not to exceed one dose daily.

### Dosage adjustment

- Concurrent use of moderate CYP3A4 inhibitors
- Concurrent use of alpha blockers

### Contraindications

- Hypersensitivity to drug or its components

- Concurrent use of any form of organic nitrates

## Precautions

Use cautiously in:

- severe hepatic or renal impairment (avoid use)
- mild to moderate hepatic or renal impairment
- patients in whom sexual activity is inadvisable due to CV status (particularly those with left ventricular outflow obstruction, such as aortic stenosis or idiopathic hypertrophic subaortic stenosis, and those with severely impaired autonomic blood pressure control)
- patients who have suffered MI, stroke, life-threatening arrhythmia, or coronary revascularization within the last 6 months; patients with resting hypotension (blood pressure less than 90/50 mm Hg) or hypertension (blood pressure greater than 170/100 mm Hg); patients with unstable angina, angina with sexual intercourse, or New York Heart Association Class 2 or greater congestive heart failure; patients with known hereditary degenerative retinal disorders, including retinitis pigmentosa (use not recommended)
- patients with anatomical deformation of the penis (such as angulation, cavernosal fibrosis, or Peyronie's disease); patients who have conditions that may predispose them to priapism (such as sickle cell anemia, multiple myeloma, or leukemia); patients with bleeding disorders or active peptic ulceration
- concurrent use of strong CYP3A4 inhibitors, CYP 450 inducers, or other PDE5 inhibitors, or erectile dysfunction therapies (use not recommended)
- concurrent use of moderate CYP3A4 inhibitors
- concurrent use of CYP3A4 inducers (not recommended)

- concurrent use of alpha blockers or other antihypertensives or substantial amounts of alcohol
- elderly patients
- women (not indicated)
- children younger than age 18 (safety and efficacy not established).

## Administration

 Don't give concurrently with nitrates. In a patient who has taken this drug, where nitrate administration is deemed medically necessary in a life-threatening situation, allow at least 12 hours to elapse after the last dose of avanafil before considering nitrate administration. In such circumstances, administer nitrates under close medical supervision with appropriate hemodynamic monitoring.

Route	Onset	Peak	Duration
P.O.	Unknown	30-45 min	Unknown

## Adverse reactions

**CNS:** headache, dizziness

**CV:** hypertension, ECG abnormality

**EENT:** sudden decrease or loss of hearing, tinnitus, nasal congestion, nasopharyngitis, sinusitis, sinus congestion

**GI:** dyspepsia, nausea, constipation, diarrhea

**GU:** priapism

**Musculoskeletal:** back pain, arthralgia

**Respiratory:** upper respiratory tract infection, bronchitis

**Skin:** flushing, rash, pruritus

**Other:** influenza, hypersensitivity

## Interactions

**Drug-drug.** *Alpha blockers (such as alfuzosin, tamsulosin), antihypertensives, nitrates (such as isosorbide, nitroglycerin):* increased risk of hypotension  
*Amlodipine:* increased avanafil  $C_{max}$  and area under the curve (AUC)  
*CYP2C8 substrates (rosiglitazone):* increased rosiglitazone AUC and decreased rosiglitazone  $C_{max}$

*Desipramine, omeprazole*: increased AUC and  $C_{\max}$  of these drugs

*Moderate CYP3A4 inhibitors (such as amprenavir, aprepitant, diltiazem, erythromycin, fluconazole, fosamprenavir, verapamil), strong CYP3A4 inhibitors (such as atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, ritonavir, saquinavir, telithromycin)*: increased avanafil plasma concentration

**Drug-food.** Grapefruit juice: potentially increased avanafil exposure  
*High-fat diet*: reduced drug absorption, decreased peak level

**Drug-behaviors.** *Alcohol use (substantial amounts)*: increased risk of hypotension

### Patient monitoring

- Monitor CV status carefully.
- Monitor patient's hearing.

### Patient teaching

- Tell patient to take tablets with or without food but not to take with grapefruit juice.
- Tell patient that high-fat diet may interfere with drug efficacy.
- Advise patient to take drug 30 minutes before sexual activity.
- Tell patient not to exceed prescribed dosage or take more than one dose daily.
- 🔊 Instruct patient to stop sexual activity and contact prescriber immediately if chest pain, dizziness, or nausea occurs.
- 🔊 Teach patient to recognize and immediately report serious cardiac and vision problems, and sudden decrease in or loss of hearing.
- 🔊 Caution patient never to take drug with nitrates, because of risk of significant hypotension.
- Advise patient to avoid or limit alcohol use, because substantial use may cause increase in heart rate, decrease in standing blood pressure, dizziness, and headache.

- Inform patient that this drug can cause serious interactions with many common drugs. Instruct him to tell all prescribers he's taking avanafil.
- Instruct patient not to take other erectile dysfunction drugs while taking this drug.
- Instruct patient to report priapism (persistent, painful erection) or erections lasting more than 4 hours.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, foods, and behaviors mentioned above.

## axitinib

Inlyta

**Pharmacologic class:** Kinase inhibitor

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### Action

Inhibits receptor tyrosine kinases, including vascular endothelial growth factor receptors (VEGFR)-1, VEGFR-2, and VEGFR-3 at therapeutic plasma concentrations that are implicated in pathologic angiogenesis, tumor growth, and cancer progression

### Availability

*Tablets:* 1 mg, 5 mg

### Indications and dosages

➤ Advanced renal cell carcinoma after failure of one prior systemic therapy  
**Adults:** Initially, 5 mg P.O. b.i.d., with dosage adjustments based on individual safety and tolerability

## Dosage adjustment

- Moderate hepatic impairment
- Moderate to severe proteinuria
- Concurrent use of strong CYP3A4/5 inhibitors

## Contraindications

None

## Precautions

Use cautiously in:

- moderate hepatic impairment, proteinuria, end-stage renal disease (creatinine clearance less than 15 ml/minute)
- severe hepatic impairment (safety and efficacy not established)
- persistent hypertension, hypothyroidism, reversible posterior leukoencephalopathy syndrome
- patient at increased risk for arterial and venous thrombotic events or GI perforation or fistula
- patient with untreated brain metastasis or recent active GI bleeding (avoid use)
- patient undergoing surgery
- concurrent use of moderate or strong CYP3A4/5 inducers or strong CYP3A4/5 inhibitors, grapefruit, grapefruit juice (avoid use)
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

## Administration

- Administer tablets whole with a glass of water approximately 12 hours apart with or without food.
- Don't give with grapefruit juice.
- Ensure that blood pressure is well controlled and assess thyroid function before starting drug.
- Watch for proteinuria before starting drug; reduce dosage or temporarily interrupt treatment if moderate to severe proteinuria occurs during treatment.
- Evaluate patient for elevated ALT, AST, and bilirubin levels; decrease

starting dosage as appropriate in patients with moderate hepatic impairment.

 Permanently discontinue drug if signs or symptoms of posterior leukoencephalopathy syndrome occur (such as headache, seizures, lethargy, confusion, blindness, or other visual and neurologic disturbances).

- Stop drug at least 24 hours before scheduled surgery.

Route	Onset	Peak	Duration
P.O.	Unknown	2.5-4.1 hr	Unknown

## Adverse reactions

**CNS:** headache, fatigue, asthenia, **posterior leukoencephalopathy syndrome**

**CV:** hypertension

**GI:** nausea, vomiting, diarrhea, constipation, stomatitis, abdominal pain, dyspepsia, **GI perforation or fistula**

**GU:** proteinuria

**Hematologic: hemorrhagic events**

**Hepatic:** increased ALT, AST, and bilirubin levels

**Metabolic:** hypothyroidism, hypocalcemia, hyperglycemia, hypoglycemia, hyperkalemia, hyponatremia, hypophosphatemia

**Musculoskeletal:** arthralgia, extremity pain

**Respiratory:** cough, dyspnea

**Skin:** rash, dry skin, pruritus, erythema, alopecia

**Other:** decreased appetite, dysphonia, dysgeusia, weight loss, mucosal inflammation, palmar-plantar erythrodysesthesia syndrome

## Interactions

**Drug-drug.** *Antacids (such as rabeprazole):* decreased axitinib area under the curve and  $C_{max}$

*Moderate CYP3A4/5 inducers (such as bosentan, efavirenz, etravirine, modafinil, nafcillin):* possibly decreased axitinib plasma exposure

*Strong CYP3A4/5 inducers (such as carbamazepine, dexamethasone,*

*phenobarbital, phenytoin, rifabutin, rifampin, rifapentin*): decreased axitinib plasma exposure

*Strong CYP3A4/5 inhibitors (such as ketoconazole)*: increased axitinib plasma exposure

**Drug-diagnostic tests.** *Albumin, bicarbonate, calcium, hemoglobin, lymphocytes, phosphorus, platelets, WBCs*: decreased levels

*Alkaline phosphatase, ALT, amylase, AST, creatinine, lipase, potassium, sodium*: increased levels

*Serum glucose*: increased or decreased level

**Drug-food.** *Grapefruit, grapefruit juice*: increased axitinib plasma exposure

**Drug-herbs.** *St. John's wort*: decreased axitinib plasma exposure

### Patient monitoring

- Monitor CBC with differential and renal function (especially for proteinuria) and hepatic function tests closely.
- Continue to monitor thyroid function periodically throughout treatment.

 Closely monitor patient at risk for arterial and venous thrombotic events, hemorrhagic events, and GI perforation and fistula.

 Continue to monitor patient for posterior leukoencephalopathy syndrome.

### Patient teaching

- Tell patient to take tablets whole with a glass of water approximately 12 hours apart with or without food.
- Tell patient not to take drug with grapefruit juice or grapefruit products.
- Advise patient that hypertension may develop during treatment and that blood pressure should be monitored regularly.
-  Instruct patient to immediately report signs or symptoms of arterial and venous thromboembolic events (such as chest pain or pressure, shortness of breath, numbness or weakness

on one side of body, difficulty speaking, or vision changes), bleeding, or persistent or severe abdominal pain.

- Advise patient to report signs and symptoms of decreased thyroid function (such as fatigue, weight gain, depression, sensitivity to cold, brittle hair and nails, and thinning hair).
- Instruct patient to report signs and symptoms of palmar-plantar erythrodysesthesia syndrome (such as redness, swelling, tingling or burning, tenderness, or skin tightness on palms of hands or soles of feet).
- Instruct patient to tell prescriber about all drugs he's taking, because some drugs have potential for serious drug interactions.
- Advise female patient of childbearing age to avoid pregnancy and breastfeeding while taking this drug.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## azacitidine

Vidaza

**Pharmacologic class:** Pyrimidine antimetabolite

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### Action

Unclear. Thought to exert antineoplastic effect by causing DNA hypomethylation and direct cytotoxicity on abnormal hematopoietic bone marrow cells. Cytotoxicity causes death of rapidly growing cells, including cancer cells no longer responsive to normal growth control mechanisms.

## Availability

Powder for injection (lyophilized): 100-mg single-use vials

## Indications and dosages

➤ Treatment of the following myelodysplastic syndrome subtypes: refractory anemia or refractory anemia with ringed sideroblasts (if accompanied by neutropenia or thrombocytopenia or requiring transfusion), refractory anemia with excess blasts, refractory anemia with excess blasts in transformation, and chronic myelomonocytic leukemia

**Adults:** For first treatment cycle: 75 mg/m<sup>2</sup> subcutaneously or I.V. daily for 7 days; for subsequent treatment cycles, repeat cycle every 4 weeks. Dosage may be increased to 100 mg/m<sup>2</sup> if beneficial effect doesn't occur after two cycles and no toxicity (other than nausea and vomiting) develops. Patient should be treated for at least four cycles. Continue therapy as long as patient benefits from it.

## Dosage adjustment

- Based on hematologic response (after administration of recommended dosage for first cycle)
- Unexplained serum bicarbonate reduction below 20 mEq/L
- Unexplained blood urea nitrogen or serum creatinine elevation

## Off-label uses

- Acute myeloid leukemia

## Contraindications

- Hypersensitivity to drug or mannitol
- Advanced malignant hepatic tumor

## Precautions

Use cautiously in:

- impaired renal or hepatic function, myelodysplastic syndrome
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

## Administration

- Obtain CBC, liver function tests, and serum creatinine level before starting drug.
- For subcutaneous administration, reconstitute with 4 ml sterile water for injection. Inject diluent slowly into vial; invert vial two or three times and rotate gently until uniform suspension appears. Resulting suspension (which will be cloudy) contains azacitidine 25 mg/ml.
- Invert syringe two to three times and gently roll between palms for 30 seconds immediately before administration.
- When giving subcutaneously, divide doses above 4 ml equally in two syringes, and inject subcutaneously in separate sites.
- Administer within 1 hour after reconstitution.
- When giving subcutaneously, rotate sites for each injection (thigh, abdomen, or upper arm). Give new injection at least 1" from old site and never into tender, bruised, red, or hard area.
- For I.V. administration, reconstitute each vial with 10 ml sterile water for injection. Vigorously shake or roll bottle until all solids have dissolved.
- Prepare I.V. solution by adding reconstituted drug to 50- to 100-ml infusion bag of normal saline solution injection or lactated Ringer's injection.
- Administer I.V. solution over 10 to 40 minutes; administration must be completed within 1 hour of vial reconstitution.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown
Subcut.	Unknown	30 min	Unknown

## Adverse reactions

**CNS:** fatigue, headache, confusion, dizziness, anxiety, depression, insomnia,

a

lethargy, weakness, rigors, malaise, hypoesthesia, **cerebral hemorrhage**  
**CV:** chest pain, cardiac murmur, tachycardia, hypotension, peripheral edema, syncope

**EENT:** rhinorrhea, epistaxis, sinusitis, nasopharyngitis, pharyngitis, postnasal drip, **eye hemorrhage**

**GI:** nausea, vomiting, diarrhea, constipation, anorexia, abdominal pain or tenderness, abdominal distention, dyspepsia, hemorrhoids, dysphagia, gingival bleeding, oral mucosal petechiae, stomatitis, tongue ulcers, **mouth hemorrhage**

**GU:** dysuria, urinary tract infection

**Hematologic:** anemia, thrombocytopenia, leukopenia, neutropenia, febrile neutropenia, lymphadenopathy, aggravated anemia, **postprocedural hemorrhage, pancytopenia, bone marrow failure**

**Musculoskeletal:** myalgia, muscle cramps, arthralgia, limb pain, back pain  
**Respiratory:** cough (possibly productive), dyspnea, exertional or exacerbated dyspnea, upper respiratory tract infection, pneumonia, crackles, wheezing, decreased breath sounds, pleural effusion, rhonchi, atelectasis

**Skin:** lesion, rash, pruritus, herpes simplex, increased sweating, urticaria, dry skin, skin nodule, erythema, pallor, cellulitis

**Other:** decreased appetite, weight loss, fever, pitting edema, hematoma, night sweats, peripheral swelling, injection-site reactions, tumor lysis syndrome, Sweet's syndrome (acute febrile neutrophilic dermatosis) transfusion reaction, chest-wall pain, postprocedural or other pain, **neutropenic sepsis, septic shock**

## Interactions

**Drug-diagnostic tests.** *Potassium:* decreased

## Patient monitoring

- Monitor CBC during therapy.
- Monitor liver function tests and serum creatinine frequently.

- Watch for renal tubular acidosis (serum bicarbonate level below 20 mEq/L associated with alkaline urine and hypokalemia, and serum potassium level below 3 mEq/L).
- Monitor patient for signs and symptoms of tumor lysis syndrome (such as irregular heartbeat, shortness of breath, high potassium level, high uric acid level, impaired mental ability, kidney failure).

## Patient teaching

- 📣 Instruct patient to call prescriber immediately if shortness of breath, high potassium level, impaired mental ability, rash, easy bruising or bleeding, or respiratory symptoms develop.
- Advise male patient not to father a child during therapy.
- Caution female of childbearing potential to avoid pregnancy and breastfeeding during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions, especially those related to the tests mentioned above.

## azathioprine

Apo-Azathioprine<sup>☼</sup>, Azasan, Gen-Azathioprine<sup>☼</sup>, Immunoprin<sup>☼</sup>, Imuran, Novo-Azathioprine<sup>☼</sup>

**Pharmacologic class:** Purine antagonist

**Therapeutic class:** Immunosuppressant

**Pregnancy risk category D**

## FDA BOXED WARNING

- Drug may cause chronic immunosuppression, increasing neoplasia risk. Physicians using it should be familiar with this risk and with possible

hematologic toxicities and mutagenic potential in both sexes.

### Action

Prevents proliferation and differentiation of activated B and T cells by interfering with synthesis of purine, DNA, and RNA

### Availability

*Injection:* 100-mg vial

*Tablets:* 50 mg, 75 mg, 100 mg

### Indications and dosages

➤ To prevent rejection of kidney transplant

**Adults and children:** Initially, 3 to 5 mg/kg/day P.O. or I.V. as a single dose. Give on day of transplantation or 1 to 3 days before day of transplantation; then 3 to 5 mg/kg/day I.V. after surgery until patient can tolerate P.O. route. Maintenance dosage is 1 to 3 mg/kg/day P.O.

➤ Rheumatoid arthritis

**Adults and children:** Initially, 1 mg/kg P.O. or I.V. in one or two daily doses. Increase dosage in steps at 6 to 8 weeks and thereafter at 4-week intervals; use dosage increments of 0.5 mg/kg/day, to a maximum dosage of 2.5 mg/kg/day. Once patient stabilizes, decrease in decrements of 0.5 mg/kg/day to lowest effective dosage.

### Dosage adjustment

- Renal disease
- Concurrent allopurinol therapy
- Elderly patients

### Off-label uses

- Crohn's disease
- Myasthenia gravis
- Chronic ulcerative colitis

### Contraindications

- Hypersensitivity to drug
- Pregnancy or breastfeeding

### Precautions

Use cautiously in:

- chickenpox, herpes zoster, impaired hepatic or renal function, decreased bone marrow reserve
- previous therapy with alkylating agents (cyclophosphamide, chlorambucil, melphalan) for rheumatoid arthritis
- elderly patients
- women of childbearing age.

### Administration

- Give after meals.
- Be aware that I.V. administration is intended for use only when patients can't tolerate oral medications.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown
P.O.	6-8 wks	12 wks	Unknown

### Adverse reactions

**CNS:** malaise

**EENT:** retinopathy

**GI:** nausea, vomiting, diarrhea, stomatitis, esophagitis, anorexia, mucositis, pancreatitis

**Hematologic:** anemia, **thrombocytopenia, leukopenia, pancytopenia**

**Hepatic:** jaundice, **hepatotoxicity**

**Musculoskeletal:** muscle wasting, joint and muscle pain

**Skin:** rash, alopecia

**Other:** chills, fever, **serum sickness, neoplasms, serious infection**

### Interactions

**Drug-drug.** *Allopurinol:* increased therapeutic and adverse effects of azathioprine

*Angiotensin-converting enzyme (ACE) inhibitors, co-trimoxazole:* severe leukopenia

*Anticoagulants, cyclosporine:* decreased actions of these drugs

*Atracurium, pancuronium, tubocurarine, vecuronium:* reversal of these drugs' actions

*Drugs affecting bone marrow and bone marrow cells (such as ACE inhibitors, co-trimoxazole):* severe leukopenia

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, amylase, aspartate aminotransferase, bilirubin:* increased levels

*Albumin, hemoglobin, uric acid:* decreased levels

*Urine uric acid:* decreased level

**Drug-herbs.** *Astragalus, echinacea, melatonin:* interference with immunosuppressant action

### Patient monitoring

🔊 Monitor CBC, platelet level, and liver function test results.

- Assess for signs and symptoms of hepatotoxicity (clay-colored stools, pruritus, jaundice, and dark urine).
- Watch for signs and symptoms of infection.
- Monitor for bleeding tendency and hemorrhage.

### Patient teaching

🔊 Tell patient that drug lowers resistance to infection. Instruct him to immediately report fever, cough, breathing problems, chills, and other symptoms.

🔊 Instruct patient to immediately report unusual bleeding or bruising.

- Tell patient that drug effects may not be obvious for up to 8 weeks in immunosuppression and up to 12 weeks for rheumatoid arthritis relief.

🔊 Emphasize importance of avoiding pregnancy during therapy and for 4 months afterward.

- Caution patient to avoid activities that may cause injury. Tell him to use soft toothbrush and electric razor to avoid gum and skin injury.
- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- Tell patient he'll undergo regular blood testing during therapy.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## azelastine

Astelin, Astepro, Optivar

**Pharmacologic class:** Histamine 1 (H<sub>1</sub>)-receptor antagonist

**Therapeutic class:** Respiratory inhalant, ophthalmologic agent

**Pregnancy risk category C**

### Action

Selectively antagonizes H<sub>1</sub> and inhibits release of histamine and other mediators from cells (such as mast cells) involved in allergic response. Based on in vitro studies using human cell lines, inhibition of other mediators involved in allergic reactions (such as leukotrienes and platelet-aggregating factor) has also been demonstrated. Decreased chemotaxis and activation of eosinophils has also been demonstrated.

### Availability

*Nasal spray (Astepro):* 0.15% (205.5 mcg in each 0.137-ml spray)

*Nasal spray, metered (Astelin):* 137-mcg spray

*Ophthalmic solution (Optivar):* 0.05%

### Indications and dosages

➤ Seasonal and allergic rhinitis

**Adults and children age 12 and older:**

1 or 2 sprays (Astelin, Astepro) per nostril b.i.d. or 2 sprays (Astepro) per nostril once daily

**Children ages 5 to 11:** 1 spray (Astelin) per nostril b.i.d.

➤ Perennial allergic rhinitis, vasomotor rhinitis

**Adults and adolescents age 12 and older:** 2 sprays (Astelin) per nostril b.i.d.

➤ Allergic conjunctivitis

**Adults and adolescents age 3 and older:** 1 drop (Optivar) in each eye b.i.d.

### Contraindications

- Hypersensitivity to drug or its components (Astelin, Optivar)
- None (Astepro)

### Precautions

Use cautiously in:

- concurrent use of alcohol and CNS depressants (avoid Astepro use)
- pregnant or breastfeeding patients
- children (safety and efficacy not established for those younger than age 3 [Optivar]; age 5 [Astelin]; age 12 [Astepro]).

### Administration

- Follow manufacturer's directions and prime Astelin nasal spray before use.
- Prime Astepro nasal spray before initial use and when it hasn't been used for 3 or more days.
- Be aware that patient shouldn't wear contact lenses when the eyes are red and that Optivar shouldn't be used to treat redness caused by contact lenses.
- Wait 10 minutes before allowing patient to put soft contact lenses back in after Optivar administration, because the preservative benzalkonium chloride may be absorbed.

Route	Onset	Peak	Duration
Nasal	Unknown	2-3 hr	Unknown
Ophthalmic	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** dizziness (with Astelin); headache, fatigue, somnolence (with Astelin, Astepro)

**EENT:** transient eye burning or stinging (with Optivar); nasal burning,

nasal discomfort, sneezing (with Astepro); pharyngitis, paroxysmal sneezing, rhinitis, epistaxis (with Astelin)

**GI:** nausea, dry mouth (with Astelin); nasal discomfort (with Astepro); epistaxis (with Astelin, Astepro)

**Other:** weight increase (with Astelin); bitter taste

### Interactions

**Drug-drug.** *Cimetidine:* increased mean  $C_{max}$  and area under the curve of orally administered azelastine  
*CNS depressants:* additional decreased alertness and impairment of CNS performance (with Astelin, Astepro)

**Drug-behaviors.** *Alcohol use:* decreased alertness and impairment of CNS performance (with Astelin, Astepro)

### Patient monitoring

- Monitor patient for bothersome adverse reactions.

### Patient teaching

- Instruct patient on proper use of nasal spray and eyedrops.
- Advise patient to avoid other antihistamines, alcohol, and other CNS depressants such as sedatives while using nasal spray.
- Instruct patient to avoid spraying nasal spray into the eyes.
- Advise patient not to wear contact lenses if the eyes are red. Instruct the patient who wears soft contact lenses and whose eyes aren't red to wait at least 10 minutes after instilling eyedrops before inserting contact lenses.
- Caution patient to avoid driving and other hazardous activities until drug's effects on concentration and alertness are known.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and behaviors mentioned above.

## azilsartan medoxomil

Edarbi

**Pharmacologic class:** Angiotensin II receptor blocker

**Therapeutic class:** Antihypertensive

**Pregnancy risk category D**

### FDA BOXED WARNING

- When pregnancy is detected, discontinue drug as soon as possible.
- Drugs that act directly on the renin-angiotensin system can cause injury and death to a developing fetus.

### Action

Inhibits the pressor effects of an angiotensin II infusion in a dose-related manner. Effects of angiotensin II, the principal pressor agent of the renin-angiotensin system, include vasoconstriction, aldosterone release, and sodium reabsorption from the kidneys.

### Availability

Tablets: 40 mg, 80 mg

### Indications and dosages

➤ Hypertension alone or in combination with other antihypertensives

**Adults:** 80 mg P.O. daily. Consider a starting dose of 40 mg for patients who are being treated with high-dose diuretics

### Contraindications

None

### Precautions

Use cautiously in:

- renal impairment, renal artery stenosis

- hypotension in volume- or salt-depleted patients
- patients whose renal function may depend on activity of the renin-angiotensin system
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

### Administration

- Administer with or without food.
- Correct volume or salt depletion before starting drug.

Route	Onset	Peak	Duration
P.O.	Unknown	1.5-3 hr	Unknown

### Adverse reactions

**CV:** hypotension, orthostatic hypotension

**GI:** diarrhea

**GU: oliguria or progressive azotemia with acute renal failure (rare)**

**Other: death (rare)**

### Interactions

**Drug-drug.** NSAIDs, including selective COX-2 inhibitors: deteriorated renal function, including possible acute renal failure in patients who are elderly, volume-depleted, or who have compromised renal function; attenuated azilsartan antihypertensive effect

**Drug-diagnostic tests.** Serum creatinine: small reversible increases

### Patient monitoring

- Watch for hypotension in volume- or salt-depleted patients, such as those receiving high-dose diuretics.
- Observe for increasing serum creatinine level in patients with moderate to severe renal impairment and worsening renal function in elderly patients and those receiving NSAIDs, including COX-2 inhibitors.
- 🚫 Watch for oliguria or progressive azotemia that could possibly lead to

acute renal failure and death in patients whose renal function depends on the activity of the renin-angiotensin system (such as patients with severe congestive heart failure, renal artery stenosis, or volume depletion).

### Patient teaching

- Tell patient to take drug with or without food.
- 🔊 Instruct patient to promptly report changes in urinary function.
- Advise female patient of childbearing age to immediately notify prescriber if she becomes pregnant.
- Because of the potential for adverse effects in the breastfeeding infant, a decision should be made whether to discontinue breastfeeding or discontinue drug, taking into account importance of drug to the mother.
- As appropriate, review all significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## azithromycin, azithromycin dihydrate

Azasite, Zithromax, Zmax

**Pharmacologic class:** Macrolide

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

### Action

Bactericidal and bacteriostatic; inhibits protein synthesis after binding with 50S ribosomal subunit of susceptible organisms. Demonstrates cross-resistance to erythromycin-resistant gram-positive strains and resistance to most strains of *Enterococcus faecalis* and methicillin-resistant *Staphylococcus aureus*.

### Availability

**Oral suspension:** 100 mg/5 ml in 15-ml bottles; 200 mg/5 ml in 15-ml, 22.5-ml, and 30-ml bottles

**Oral suspension (Zmax extended-release):** 2-g bottle

**Powder for injection:** 500 mg in 10-ml vials

**Powder for oral suspension:** 100 mg/5 ml, 200 mg/5 ml, 1,000 mg/packet

**Solution (ophthalmic):** 1% in 5-ml bottle filled with 2.5 ml solution

**Tablets:** 250 mg, 500 mg, 600 mg

**Tablets (Tri-Pak):** three 500-mg tablets

**Tablets (Z-Pak):** six 250-mg tablets

### Indications and dosages

➤ Bacterial conjunctivitis caused by CDC coryneform group G, *H. influenzae*, *S. aureus*, *Streptococcus mitis* group, and *S. pneumoniae*

**Adults:** Instill 1 drop in affected eye(s) b.i.d., 8 to 12 hours apart for first 2 days; then instill 1 drop in affected eye(s) once daily for next 5 days

➤ Mild community-acquired pneumonia

**Adults:** 500 mg P.O. on first day, then 250 mg/day for next 4 days. Or, 2 g P.O. as single dose (extended-release oral suspension).

**Children ages 6 months and older:**

10 mg/kg P.O. (no more than 500 mg/dose) on day 1, then 5 mg/kg (no more than 250 mg/dose) for 4 more days

➤ Community-acquired pneumonia caused by *Chlamydia pneumoniae*, *Haemophilus influenzae*, *Mycoplasma pneumoniae*, *Streptococcus pneumoniae*, *Legionella pneumophila*, *Moraxella catarrhalis*, and *S. aureus*

**Adults and adolescents ages 16 and older:**

500 mg I.V. daily for at least two doses, then 500 mg P.O. daily for a total of 7 to 10 days

**Children ages 6 months to 16 years:**

10 mg/kg P.O. as a single dose on day 1, then 5 mg/kg P.O. on days 2 through 5

## ➤ Pharyngitis and tonsillitis

**Adults:** 500 mg P.O. on day 1, then 250 mg/day for next 4 days, to a total dosage of 1.5 g

**Children ages 2 and older:** 12 mg/kg P.O. daily for 5 days. Maximum dosage is 500 mg.

## ➤ Skin and skin-structure infections

**Adults:** 500 mg P.O. on first day, then 250 mg/day for next 4 days, to total dosage of 1.5 g

## ➤ Acute bacterial sinusitis

**Adults:** 500 mg P.O. daily for 3 days; or, 2 g P.O. as single dose (extended-release oral suspension)

**Children ages 6 months and older:** 10 mg/kg (maximum, 500 mg) P.O. daily for 3 days

## ➤ Mild to moderate acute exacerbation of chronic obstructive pulmonary disease

**Adults:** 500 mg/day for 3 days or 500 mg P.O. on day 1, then 250 mg P.O. daily on days 2 through 5; or, 2 g P.O. (extended-release oral suspension) as single dose

➤ Pelvic inflammatory disease caused by *Chlamydia trachomatis*, *Neisseria gonorrhoeae*, or *Mycoplasma hominis*

**Adults:** 500 mg I.V. daily on days 1 and 2, then 250 mg P.O. daily for a total of 7 days. If anaerobes are suspected, give continually with appropriate anti-anaerobic antibiotic, as ordered.

➤ Nongonococcal urethritis or cervicitis caused by *C. trachomatis*; genital ulcers caused by *Haemophilus ducreyi* (chancroid)

**Adults:** 1 g P.O. as a single dose

➤ Urethritis and cervicitis caused by *N. gonorrhoeae*

**Adults:** 2 g P.O. as a single dose

➤ To prevent disseminated *Mycobacterium avium* complex disease in patients with advanced human immunodeficiency virus

**Adults:** 1.2 g P.O. once weekly (given alone or with rifabutin)

## ➤ Acute otitis media

**Children ages 6 months and older:**

30 mg/kg as a single dose or 10 mg/kg once daily for 3 days; or 10 mg/kg as a single dose on day 1, followed by 5 mg/kg on days 2 through 5

**Off-label uses**

- Uncomplicated gonococcal infections of cervix, urethra, rectum, and pharynx

**Contraindications**

- Hypersensitivity to drug, erythromycin, or other macrolide anti-infectives
- None (ophthalmic solution)

**Precautions**

Use cautiously in:

- severe hepatic impairment, severe renal insufficiency, prolonged QT interval
- breastfeeding patients.

**Administration**

- Obtain specimens for culture and sensitivity testing before starting therapy.

- Administer tablets and single-dose packets with or without food.

- Give oral suspension 1 hour before meals or 2 hours afterward. With 1-g packet, or single 2-g bottles, mix entire contents in 2 oz of water.

- ⚠ Don't administer as I.V. bolus or I.M. injection.

- For I.V. use, reconstitute 500-mg vial with 4.8 ml of sterile water for injection.

- As appropriate, dilute solution further using normal or half-normal saline solution, dextrose 5% in water, or lactated Ringer's solution.

- Infuse injection over no less than 60 minutes. Infuse 1 mg/ml over 3 hours or 2 mg/2 ml over 1 hour.

- Know that 1,000-mg packet and extended-release oral suspension aren't for pediatric use.

Route	Onset	Peak	Duration
P.O.	Rapid	2.5-3.2 hr	24 hr
I.V.	Rapid	End of infusion	24 hr

### Adverse reactions

**CNS:** dizziness, drowsiness, fatigue, headache, vertigo

**CV:** chest pain, palpitations

**EENT:** eye irritation (with ophthalmic use)

**GI:** nausea, diarrhea, abdominal pain, cholestatic jaundice, dyspepsia, flatulence, melena, **pseudomembranous colitis**

**GU:** nephritis, vaginitis, candidiasis

**Metabolic:** hyperglycemia, **hyperkalemia**

**Skin:** photosensitivity, rashes, angioedema

**Other:** overgrowth of nonsusceptible organisms (with prolonged use)

### Interactions

**Drug-drug.** *Antacids containing aluminum or magnesium:* decreased peak azithromycin blood level

*Arrhythmias (such as amiodarone, quinidine):* increased risk of life-threatening arrhythmias

*Carbamazepine, cyclosporine, digoxin, dihydroergotamine, ergotamine, hexobarbital, phenytoin, theophylline, triazolam:* increased blood levels of these drugs

*HMG-CoA reductase inhibitors (such as atorvastatin, lovastatin):* increased risk of myopathy or rhabdomyolysis

*Pimozide:* prolonged QT interval, ventricular tachycardia

*Warfarin:* increased International Normalized Ratio

**Drug-food.** *Any food:* decreased absorption of multidose oral suspension

**Drug-behaviors.** *Sun exposure:* photosensitivity

### Patient monitoring

- Monitor temperature, white blood cell count, and culture and sensitivity results.

- Assess for signs and symptoms of infection.

- Monitor patients at risk for cardiac arrhythmia.

### Patient teaching

- Tell patient he may take tablets with or without food.

- Advise patient to take suspension 1 hour before or 2 hours after meals.

- Remind patient to complete entire course of therapy as ordered, even after symptoms improve.

- Advise patient not to wear contact lenses if signs or symptoms of bacterial conjunctivitis exist.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, foods, and behaviors mentioned above.

## aztreonam, aztreonam lysine

Azactam, Cayston

**Pharmacologic class:** Monobactam

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

### Action

Inhibits bacterial cell-wall synthesis during active multiplication by binding with penicillin-binding protein 3, resulting in cell-wall destruction

### Availability

*Inhalation solution:* 75-mg single-use vial

*Powder for injection:* 500-mg vial, 1-g vial, 2-g vial, 1 g/50-ml I.V. bag, 2 g/50-ml I.V. bag

## Indications and dosages

➤ Cystic fibrosis in patients with *Pseudomonas aeruginosa*

### Adults and children age 7 and older:

75 mg t.i.d. at least 4 hours apart for 28-day course, followed by 28 days off

➤ Infections caused by susceptible gram-negative organisms

**Adults:** For urinary tract infections, 500 mg or 1 g I.M. or I.V. q 8 or 12 hours; for moderately severe systemic infections, 1 or 2 g I.M. or I.V. q 8 or 12 hours; for severe or life-threatening infections, 2 g I.M. or I.V. q 6 or 8 hours. Maximum dosage is 8 g/day.

**Children:** For mild to moderate infections, 30 mg/kg I.M. or I.V. q 8 hours; for moderate to severe infections, 30 mg/kg I.M. or I.V. q 6 or 8 hours. Maximum dosage is 120 mg/kg/day.

## Dosage adjustment

- Severe renal failure

## Contraindications

- Hypersensitivity to drug or its components

## Precautions

Use cautiously in:

- renal or hepatic impairment
- elderly patients
- pregnant or breastfeeding patients.

## Administration

- Flush I.V. tubing with compatible solution before and after giving drug.
- Compatible solutions include 0.9% sodium chloride injection, 5% or 10% dextrose injection, Ringer's or lactated Ringer's injection, 5% dextrose and 0.9% sodium chloride injection, and 5% dextrose and 0.45% sodium chloride injection.
- After adding diluent to vial or infusion bottle, shake immediately and vigorously.
- For I.V. bolus injection, reconstitute powder for injection by adding 6 to

10 ml of sterile water for injection. Inject prescribed dosage into tubing of compatible I.V. solution slowly over 3 to 5 minutes.

- For intermittent I.V. infusion, reconstitute powder for injection by adding compatible I.V. solution to yield a concentration not exceeding 20 mg/ml. Administer prescribed dosage over 20 to 60 minutes.

 Thaw commercially available frozen drug at room temperature and give by intermittent I.V. infusion only.

- For I.M. injection, reconstitute powder for injection by adding 3 ml of sterile water for injection or 0.9% sodium chloride injection.
- Give I.M. injection deep into large muscle mass.
- Reconstitute inhalation solution with 1 ml sterile diluent supplied and administer only with nebulizer supplied. Don't reconstitute until ready to administer.
- Know that patient should use a bronchodilator as prescribed before using inhalation solution.

Route	Onset	Peak	Duration
I.V., I.M.	Organism & dose dependent	1 hr	4-12 hr
Inhalation	Unknown	1 hr	Unknown

## Adverse reactions

**CNS:** dizziness, confusion, **seizures**

**CV:** phlebitis, **thrombophlebitis**

**EENT:** diplopia, tinnitus

**GI:** nausea, vomiting, diarrhea (including diarrhea associated with *Clostridium difficile*), **pseudomembranous colitis**

**Hematologic:** **neutropenia, pancytopenia**

**Hepatic:** **hepatitis**

**Respiratory:** **bronchospasm**

**Skin:** rash, **toxic epidermal necrolysis**

**Other:** altered taste, angioedema, **anaphylaxis**

## Interactions

**Drug-drug.** *Aminoglycosides*: increased risk of nephrotoxicity and ototoxicity  
*Beta-lactamase-inducing antibiotics* (such as cefoxitin, imipenem): antagonism with aztreonam

*Furosemide, probenecid*: increased aztreonam levels

**Drug-diagnostic tests.** *Alanine aminotransferase (ALT), aspartate aminotransferase (AST), creatinine, eosinophils, platelets, prothrombin time (PT), partial thromboplastin time (PTT)*: increased values  
*Coombs' test*: positive result  
*Neutrophils*: decreased count

## Patient monitoring

🚨 Assess patient closely for signs and symptoms of pseudomembranous colitis.

🚨 Monitor patient carefully for hypersensitivity reaction, especially if he's allergic to penicillin, carbapenems, or cephalosporins.

- Monitor CBC with differential, AST, ALT, PT, PTT, and serum creatinine values.
- Monitor renal and hepatic function.

## Patient teaching

• Show patient how to reconstitute inhalation solution using diluent supplied and tell patient not to reconstitute until ready to use. Advise patient to use only the nebulizer supplied and to use a bronchodilator as prescribed before using inhalation solution.

🚨 Instruct patient to immediately report severe diarrhea or signs or symptoms of hypersensitivity reaction, such as rash or difficulty breathing.

- Tell female patient to notify prescriber if she is pregnant or breastfeeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

b

## baclofen

Apo-Baclofen<sup>★</sup>, Baclofen, Gen-Baclofen<sup>★</sup>, Kemstro, Lioresal, Lioresal Intrathecal, Liotec<sup>★</sup>, Lyflex<sup>★</sup>, Nu-Baclo<sup>★</sup>, PMS-Baclofen<sup>★</sup>

**Pharmacologic class:** Skeletal muscle relaxant

**Therapeutic class:** Antispasmodic

**Pregnancy risk category C**

## FDA BOXED WARNING

- With intrathecal form, abrupt withdrawal may cause high fever, altered mental status, exaggerated rebound spasticity, and muscle rigidity; in rare cases, patient progresses to rhabdomyolysis, multisystem failure, and death. To prevent abrupt withdrawal, pay careful attention to programming and monitoring of infusion system, refill scheduling and procedures, and pump alarms. Advise patients and caregivers of importance of keeping scheduled refill visits, and teach about early drug withdrawal symptoms. Give special attention to patients at apparent risk (those with spinal cord injuries at T6 or above, communication problems, or history of withdrawal symptoms from oral or intrathecal baclofen).

## Action

Relaxes muscles by acting specifically at spinal end of upper motor neurons

## Availability

*Intrathecal injection:* 10 mg/20 ml (500 mcg/ml), 10 mg/5 ml (2,000 mcg/ml)

*Tablets:* 10 mg, 20 mg

## Indications and dosages

➤ Reversible spasticity associated with multiple sclerosis or spinal cord lesions

**Adults:** Initially, 5 mg P.O. t.i.d. May increase by 5 mg q 3 days to a maximum dosage of 80 mg/day.

**Children ages 4 and older:** 25 to 1,200 mcg/day by intrathecal infusion; (average is 275 mcg/day); dosage determined by response during screening phase.

➤ Severe spasticity in patients who don't respond to or can't tolerate oral baclofen

**Adults: Screening phase**—Before pump implantation and intrathecal infusion, give test dose to check responsiveness. Administer 1 ml of 50 mcg/ml dilution over 1 minute by barbotage into intrathecal space. Within 4 to 8 hours, muscle spasms should become less severe or frequent and muscle tone should decrease; if patient's response is inadequate, give second test dose of 75 mcg/1.5 ml 24 hours after first dose. If patient is still unresponsive, may give final test dose of 100 mcg/2 ml 24 hours later. Patients unresponsive to 100-mcg dose aren't candidates for intrathecal baclofen. Following appropriate responsiveness, adjust dosage to twice the screening dose and give over 24 hours. If screening dose efficacy is maintained for 12 hours, don't double the dosage. After 24 hours, increase dosage slowly as needed and tolerated by 10% to 30% daily.

**Maintenance therapy**—During prolonged maintenance therapy, adjust daily dosage by 10% to 40% as needed and tolerated to maintain adequate control of symptoms. Maintenance dosage ranges from 12 mcg to 2,000 mcg daily.

## Dosage adjustment

- Renal impairment
- Seizure disorders
- Elderly patients

## Off-label uses

- Cerebral palsy
- Tardive dyskinesia
- Trigeminal neuralgia

## Contraindications

- Hypersensitivity to drug
- Rheumatic disorders

## Precautions

Use cautiously in:

- renal impairment
- epilepsy
- patients who use spasticity to maintain posture and balance
- elderly patients
- pregnant or breastfeeding patients
- children.

## Administration

- Give oral doses with food or milk.
- Dilute only with sterile, preservative-free sodium chloride for injection.
- Know that intrathecal infusion should be performed only by personnel who have been trained in the procedure.

Route	Onset	Peak	Duration
P.O.	Unknown	2-3 hr	Unknown
Intrathecal	0.5-1 hr	4 hr	4-8 hr

## Adverse reactions

**CNS:** dizziness, drowsiness, fatigue, confusion, depression, headache, insomnia, hypotonia, difficulty speaking, **seizures**

**CV:** edema, hypotension, hypertension, palpitations

**EENT:** blurred vision, tinnitus, nasal congestion

**GI:** nausea, vomiting, constipation

**GU:** urinary frequency, dysuria, erectile dysfunction

**Metabolic:** hyperglycemia

**Skin:** pruritus, rash, sweating

**Other:** weight gain, hypersensitivity reactions

## Interactions

**Drug-drug.** *CNS depressants:* increased baclofen effect

**MAO inhibitors:** increased CNS depression, hypotension

**Tricyclic antidepressants, drugs causing CNS depression:** hypotonia, increased CNS depression

**Drug-diagnostic tests.** *Alkaline phosphatase, aspartate aminotransferase, glucose:* increased levels

**Drug-behaviors.** *Alcohol use:* CNS depression

### Patient monitoring

- During intrathecal infusion, check pump often for proper functioning and check catheter for patency.
- Monitor patient's response continually to determine appropriate dosage adjustment.

 Observe closely for signs and symptoms of overdose (drowsiness, light-headedness, dizziness, respiratory depression), especially during initial screening and titration. No specific antidote exists. Immediately remove any solution from pump; if patient has respiratory depression, intubate until drug is eliminated.

### Patient teaching

- Advise patient to take oral dose with food or milk.
- Instruct patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Caution patient not to discontinue drug therapy abruptly. Doing so may cause hallucinations and rebound spasticity.
- Advise patient to avoid alcohol and other depressants such as sedatives while taking drug.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## balsalazide disodium

Colazal, Colazide<sup>®</sup>

**Pharmacologic class:** GI agent

**Therapeutic class:** Anti-inflammatory

**Pregnancy risk category B**

### Action

Metabolized in colon to mesalamine and then to 5-aminosalicylic acid, both of which are thought to exert local anti-inflammatory effect by inhibiting prostaglandin and acid metabolites.

### Availability

*Capsules:* 750 mg

### Indications and dosages

➤ Mildly to moderately active ulcerative colitis

**Adults:** Usual dosage, three 750-mg capsules P.O. t.i.d. (6.75 g daily) for up to 8 weeks; some patients may require 12 weeks

**Children ages 5 to 17:** Usual dosage, either three 750-mg capsules P.O. t.i.d. (6.75 g daily) for up to 8 weeks, or one 750-mg capsule P.O. t.i.d. (2.25 g daily) for up to 8 weeks

### Contraindications

- Hypersensitivity to balsalazide, salicylates, or mesalamine

### Precautions

Use cautiously in:

- renal impairment
- pyloric stenosis
- breastfeeding patients
- children younger than age 5 (safety and efficacy not established).

### Administration

- Advise patient to swallow capsules whole, either always with or always without food.

- For those patients who can't swallow capsules whole, carefully open capsules and sprinkle contents on applesauce and have patient swallow contents immediately without chewing.

Route	Onset	Peak	Duration
P.O.	Unknown	1-2 hr	Unknown

### Adverse reactions

**CNS:** headache, insomnia, dizziness, anxiety, confusion, agitation, **coma**

**EENT:** blurred vision, eye irritation, tinnitus, earache, epistaxis, sinusitis, sore throat, nasopharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, anorexia, oral blisters, oral candidiasis,

**GI hemorrhage**

**GU:** urinary tract infection

**Musculoskeletal:** arthralgia; myalgia; bone, back, neck, or limb pain

**Respiratory:** cough, upper respiratory tract infection

**Skin:** erythema

**Other:** generalized pain

### Interactions

**Drug-drug.** *Oral antibiotics:* interference with balsalazide action

### Patient monitoring

- Assess character and frequency of stools.
- Monitor CBC and liver and kidney function test results.

### Patient teaching

- Instruct patient to take drug only as directed.
- Instruct patient to carefully open capsules and sprinkle contents on applesauce and swallow contents immediately without chewing if patient can't swallow capsules whole.
- Tell patient that teeth and tongue staining may occur when drug is taken by sprinkling on applesauce.
- As appropriate, review all other significant and life-threatening adverse

reactions and interactions, especially those related to the drugs mentioned above.

## basiliximab

Simulect

**Pharmacologic class:** Monoclonal antibody

**Therapeutic class:** Immunosuppressant

**Pregnancy risk category B**

### FDA BOXED WARNING

- Give under supervision of physician experienced in immunosuppressive therapy and management of organ transplant recipients, in facility with adequate diagnostic and treatment resources.

### Action

Blocks specific interleukin-2 (IL-2) receptor sites on activated T lymphocytes. Specific binding competitively inhibits IL-2-mediated activation and differentiation of lymphocytes responsible for cell-mediated immunity. Also impairs immunologic response to antigenic challenges.

### Availability

*Powder for injection:* 10 mg, 20 mg in single-use vials

### Indications and dosages

➤ Prevention of acute organ rejection in kidney transplantation

**Adults and children weighing 35 kg (77 lb) or more:** 20 mg I.V. 2 hours before transplantation surgery, then 20 mg I.V. 4 days after surgery. Withhold second dose if complications, hypersensitivity reaction, or graft loss occurs.

**Children weighing less than 35 kg (77 lb):** 10 mg I.V. 2 hours before transplantation surgery, then 10 mg I.V. 4 days after surgery. Withhold second dose if complications, hypersensitivity reaction, or graft loss occurs.

### Contraindications

- Hypersensitivity to drug
- Pregnancy or breastfeeding

### Precautions

Use cautiously in:

- elderly patients
- females of childbearing age.

### Administration

 Give by central or peripheral I.V. route only.

- Reconstitute by adding 5 ml of sterile water for injection to vial for bolus injection, or dilute with normal saline solution or dextrose 5% in water to a volume of 50 ml and infuse over 20 to 30 minutes. Discard any remaining product after preparing each dose.
- Don't infuse other drugs simultaneously through same I.V. line.
- Know that drug should be used only as part of regimen that includes cyclosporine and corticosteroids.

Route	Onset	Peak	Duration
I.V.	2 hr	Unknown	36 days

### Adverse reactions

**CNS:** headache, insomnia, paresthesia, dizziness, drowsiness, tremor, anxiety, confusion, **coma**, **seizures**

**CV:** palpitations, edema, chest pain, ECG abnormalities, hypotension, hypertension, **prolonged QT interval**

**EENT:** blurred vision, eye irritation, tinnitus, earache, epistaxis, nasopharyngitis, sinusitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, anorexia, oral blisters, oral candidiasis, **GI hemorrhage**

**GU:** urinary incontinence, intermenstrual bleeding, **oliguria**, **renal failure**

**Hematologic:** anemia, **disseminated intravascular coagulation**, **hemorrhage**, **neutropenia**, **thrombocytopenia**

**Metabolic:** hypokalemia, hypomagnesemia, hyperglycemia, **acidosis**, **hypoglycemia**, **hyperkalemia**

**Musculoskeletal:** bone, back, neck, or limb pain

**Respiratory:** dyspnea, cough, hypoxia, tachypnea, hemoptysis, upper respiratory tract infection, **pleural effusions**

**Skin:** bruising, pruritus, dermatitis, skin lesions, diaphoresis, night sweats, erythema, hyperpigmentation, urticaria

**Other:** fever, lymphadenopathy, facial edema, bacterial infection, herpes simplex infection, injection site erythema, hypersensitivity reaction, **sepsis**

### Interactions

**Drug-drug.** *Immunosuppressants:* additive immunosuppression

**Drug-diagnostic tests.** *Calcium, glucose, potassium:* increased or decreased levels

*Hemoglobin, neutrophils, platelets:* decreased values

*Triglycerides:* increased levels

*White blood cells:* decreased levels

**Drug-herbs.** *Astragalus, echinacea, melatonin:* interference with immunosuppressant action

### Patient monitoring

 Watch for signs and symptoms of hypersensitivity reaction. Keep emergency drugs at hand in case these occur.

- Monitor vital signs and observe patient frequently during I.V. infusion.
- Monitor laboratory values and drug blood level.

### Patient teaching

- Teach patient about purpose of therapy. Explain that drug decreases the risk of acute organ rejection.

- Tell patient he may be more susceptible to infection because of drug's immunosuppressant effect.
- Inform patient that he'll need lifelong immunosuppressant drug therapy.
- Advise women of childbearing age to use reliable contraception before, during, and for 2 months after therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## beclomethasone dipropionate

AeroBec<sup>⚡</sup>, Apo-Beclomethasone<sup>⚡</sup>, Asmabec<sup>⚡</sup>, Beclodisk<sup>⚡</sup>, Becloforte<sup>⚡</sup>, Beconase AQ Nasal Spray, Filair<sup>⚡</sup>, Hayfever Relief<sup>⚡</sup>, Nasobec<sup>⚡</sup>, Pollenase Nasal<sup>⚡</sup>, QVAR, Rivanase<sup>⚡</sup>

**Pharmacologic class:** Corticosteroid

**Therapeutic class:** Anti-inflammatory agent

**Pregnancy risk category C**

### Action

Unclear. May decrease inflammation by stabilizing leukocytic lysosomal membrane, decreasing number and activity of inflammatory cells, inhibiting bronchoconstriction (leading to direct smooth muscle relaxation), and reducing airway hyperresponsiveness.

### Availability

**Inhalation aerosol:** 40-mcg metered inhalation in 7.3-g canister; 80-mcg metered inhalation in 7.3-g canister  
**Inhalation capsules:** 100 mcg, 200 mcg  
**Nasal spray:** 0.042% (25-g bottle containing 180 metered inhalations)

### Indications and dosages

➤ Maintenance treatment of asthma as prophylaxis; asthma patients who require systemic steroids for whom adding an inhaled steroid may reduce or eliminate the need for systemic steroids  
**Adults and children ages 12 and older:** When previous therapy was bronchodilator alone, 40 to 80 mcg by oral inhalation (QVAR) b.i.d.; maximum of 320 mcg b.i.d. When previous therapy was inhaled steroid, 40 to 160 mcg by oral inhalation (QVAR) b.i.d.; maximum of 320 mcg b.i.d.

**Children ages 5 to 11:** When previous therapy was bronchodilator alone, 40 mcg by oral inhalation (QVAR) b.i.d.; maximum of 80 mcg b.i.d. When previous therapy was inhaled steroid, 40 mcg by oral inhalation (QVAR) b.i.d.; maximum of 80 mcg b.i.d.

➤ Seasonal or perennial rhinitis  
**Adults and children ages 12 and older:** One or two inhalations (42 to 84 mcg Beconase AQ Nasal Spray) in each nostril b.i.d.

**Children ages 6 to 12:** One inhalation (42 mcg Beconase AQ Nasal Spray) in each nostril b.i.d.

### Contraindications

- Hypersensitivity to drug
- Status asthmaticus

### Precautions

Use cautiously in:

- active untreated infections, diabetes mellitus, glaucoma, underlying immunosuppression
- patients receiving concurrent systemic corticosteroids
- pregnant or breastfeeding patients
- children younger than age 6.

### Administration

- Use spacer device to ensure proper delivery of dose and to help prevent candidiasis and hoarseness.

- After inhalation, tell patient to hold his breath for a few seconds before exhaling.
- For greater efficacy, wait 1 minute between inhalations.
- If patient is also receiving a bronchodilator, administer it at least 15 minutes before beclomethasone.
- Discontinue drug after 3 weeks if symptoms don't improve markedly.

Route	Onset	Peak	Duration
Inhalation (nasal)	5-7 days	3 wk	Unknown
Inhalation (oral)	1-4 wk	Unknown	Unknown

### Adverse reactions

**CNS:** headache

**EENT:** cataracts, nasal irritation or congestion, epistaxis, perforated nasal septum, nasopharyngeal or oropharyngeal fungal infections, hoarseness, throat irritation

**GI:** esophageal candidiasis

**Metabolic:** adrenal suppression

**Respiratory:** cough, wheezing, bronchospasm

**Skin:** urticaria, angioedema

**Other:** anosmia, Churg-Strauss syndrome, hypersensitivity reactions

### Interactions

None significant

### Patient monitoring

- Assess patient's mouth daily for signs of fungal infection.
- Observe patient for proper inhaler use.

### Patient teaching

- Instruct patient to hold inhaled drug in airway for several seconds before exhaling and to wait 1 minute between inhalations.
- Advise patient to rinse mouth after using inhaler and to wash and dry inhaler thoroughly to help prevent fungal infections and sore throat.

- Encourage patient to document use of drug and his response in a diary.
- If patient is also using a bronchodilator, teach him to use it at least 15 minutes before beclomethasone.
- As appropriate, review all other significant and life-threatening adverse reactions.

## benazepril hydrochloride

Apo-Benazepril<sup>Ⓢ</sup>, Lotensin

**Pharmacologic class:** Angiotensin-converting enzyme (ACE) inhibitor

**Therapeutic class:** Antihypertensive

**Pregnancy risk category C** (first trimester), **D** (second and third trimesters)

### FDA BOXED WARNING

- When used during second or third trimester of pregnancy, drug may cause fetal injury and death. Discontinue as soon as possible when pregnancy is detected.

### Action

Inhibits conversion of angiotensin I to angiotensin II, a vasoconstrictor that stimulates adrenal glands and promotes aldosterone secretion, thereby reducing sodium and water reabsorption and ultimately decreasing blood pressure. Decreased angiotensin also causes increased potassium level and fluid loss.

### Availability

Tablets: 5 mg, 10 mg, 20 mg, 40 mg

### Indications and dosages

➤ Hypertension

**Adults:** Initially, 5 to 10 mg/day P.O. as a single dose. Increase gradually to a maintenance dosage of 20 to 40 mg/day

as a single dose or in two divided doses. (Start with 5 mg/day in patients receiving diuretics.)

### Dosage adjustment

- Renal impairment

### Off-label uses

- Myocardial infarction
- Nephropathy

### Contraindications

- Hypersensitivity to drug or to other ACE inhibitors
- Angioedema with or without previous ACE inhibitor treatment

### Precautions

Use cautiously in:

- renal or hepatic impairment, hypovolemia, hyponatremia, aortic stenosis, hypertrophic cardiomyopathy, cerebrovascular or cardiac insufficiency
- patients receiving concurrent diuretics
- black patients
- elderly patients
- pregnant patients (use not recommended, particularly in second and third trimesters)
- breastfeeding patients
- children.

### Administration

 Use extreme caution if patient has family history of angioedema.

- When giving concurrently with diuretics, know that drug may cause excessive hypotension. If possible, stop diuretic therapy 2 to 3 days before starting benazepril.
- Give with or without food.
- Know that drug may be used alone or in conjunction with other antihypertensives.

Route	Onset	Peak	Duration
P.O.	0.5-1 hr	3-4 hr	24 hr

### Adverse reactions

**CNS:** dizziness, drowsiness, fatigue, syncope, light-headedness, headache, insomnia

**CV:** angina pectoris, hypotension, tachycardia

**EENT:** sinusitis

**GI:** diarrhea, nausea, anorexia

**GU:** proteinuria, erectile dysfunction, decreased libido, **renal failure**

**Hematologic:** agranulocytosis

**Metabolic:** hyperkalemia

**Respiratory:** cough, dyspnea, bronchitis, **asthma, eosinophilic pneumonitis**

**Skin:** rash, **angioedema**

**Other:** fever, altered taste

### Interactions

**Drug-drug.** *Allopurinol:* increased risk of hypersensitivity reaction

*Antacids:* decreased benazepril absorption

*Antihypertensives, diuretics, general anesthetics, nitrates, phenothiazines:* excessive hypotension

*Cyclosporine, indomethacin, potassium-sparing diuretics, potassium supplements:* hyperkalemia

*Lithium:* increased lithium blood level, greater risk of lithium toxicity

*Nonsteroidal anti-inflammatory drugs:* blunting of antihypertensive response

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, potassium:* increased levels

*Antinuclear antibodies:* positive result

*Sodium:* decreased level

**Drug-food.** *Salt substitutes containing potassium:* hyperkalemia

**Drug-herbs.** *Capsaicin:* cough

**Drug-behaviors.** *Acute alcohol ingestion:* increased hypotension

### Patient monitoring

 Monitor for signs and symptoms of angioedema, including laryngeal edema and shock.

- Measure blood pressure regularly.

- Monitor CBC, electrolyte levels, kidney and liver function test results, and urinary protein level.

### Patient teaching

- 🔊 Tell patient to immediately report change in urination pattern, difficulty breathing, or swelling of throat or lips.
- Instruct patient to record blood pressure at various intervals daily.
- Tell patient to report dizziness, fainting, or light-headedness during initial therapy.
- Advise patient to increase fluid intake during exercise and in hot weather.
- Caution patient to avoid salt substitutes, which may cause hyperkalemia.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## bendamustine hydrochloride

Treanda

**Pharmacologic class:** Alkylating agent

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

### Action

Unclear. Dissociates into electrophilic alkyl groups, which form covalent bonds with electron-rich nucleophilic moieties; bifunctional covalent linkage may cause cell death via several pathways. Acts against both quiescent and dividing cells.

### Availability

Lyophilized powder for injection: 100 mg in 20-ml single-use vials (with mannitol)

### Indications and dosages

- Chronic lymphocytic leukemia
- Adults:** 100 mg/m<sup>2</sup> by I.V. infusion over 30 minutes on days 1 and 2 of 28-day cycle for up to six cycles

### Dosage adjustment

- Grade 4 hematologic toxicity or clinically significant nonhematologic toxicity at above grade 2

### Off-label uses

- Non-Hodgkin's lymphoma

### Contraindications

- Hypersensitivity to drug or mannitol

### Precautions

Use cautiously in:

- mild or moderate renal impairment (not recommended in creatinine clearance less than 40 ml/minute)
- mild hepatic impairment (not recommended in moderate or severe hepatic impairment)
- myelosuppression
- concurrent use of CYP1A2 inhibitors or inducers
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Give drug by I.V. infusion only.
- Reconstitute with 20 ml sterile water for injection. Wait until powder dissolves completely (approximately 5 minutes).
- Immediately transfer (within 30 minutes of reconstitution) to 500-ml infusion bag of normal saline injection. After transferring, thoroughly mix infusion bag contents. Admixture should be clear and colorless to slightly yellow.
- 🔊 Stay alert for infusion reactions. Signs and symptoms include fever, chills, pruritus, and rash. Rarely, severe anaphylactic and anaphylactoid

reactions have occurred. Monitor patient and discontinue drug if severe reaction arises. Consider measures to prevent severe reactions, including antihistamines, antipyretics, and corticosteroids in subsequent cycles if patient had previous infusion reaction.

- Check I.V. site frequently to avoid extravasation.

Route	Onset	Peak	Duration
I.V.	Unknown	End of infusion	Unknown

### Adverse reactions

**CNS:** asthenia, fatigue, malaise, weakness, somnolence, headache

**CV:** worsening hypertension

**EENT:** nasopharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, dry mouth, mucosal inflammation, stomatitis

**Hematologic:** myelosuppression (**anemia, leukopenia, lymphopenia, neutropenia, thrombocytopenia**)

**Metabolic:** hyperuricemia

**Respiratory:** cough, pneumonia

**Skin:** rash, pruritus, toxic skin reactions, bullous exanthema, **Stevens-Johnson syndrome, toxic epidermal necrolysis**

**Other:** fever, chills, infection, herpes simplex, weight loss, **other malignancies, tumor lysis syndrome, sepsis, infusion reactions and anaphylaxis, hypersensitivity reaction**

### Interactions

**Drug-drug.** *Allopurinol:* possible increased risk of skin reactions  
*CYP1A2 inducers (such as omeprazole):* potentially decreased bendamustine blood level and increased active metabolite levels

*CYP1A2 inhibitors (such as ciprofloxacin, fluvoxamine):* potentially increased bendamustine blood level and decreased active metabolite levels

**Drug-diagnostic tests.** *ALT, AST, bilirubin, uric acid:* increased levels  
*Creatinine:* altered level

*Hemoglobin, lymphocytes, neutrophils, platelets, white blood cells:* decreased levels

*Potassium, uric acid:* increased levels

**Drug-behaviors.** *Smoking:* potentially decreased bendamustine blood level and increased active metabolite levels

### Patient monitoring

- Closely monitor complete blood count with differential and renal and hepatic function test results.

 Monitor for skin reactions, including rash, toxic reactions, and bullous exanthema. Such reactions may be progressive and worsen with further treatment. In severe or progressive skin reaction, withhold or discontinue drug.

 Watch for tumor lysis syndrome, especially during first treatment cycle. Signs and symptoms include irregular heartbeat, shortness of breath, high potassium level, high uric acid level, and impaired mental ability. Without intervention, acute renal failure and death may occur. Take preventive measures, as ordered, including maintaining adequate volume status, close monitoring of blood chemistry, and allopurinol administration during first 2 weeks of therapy in high-risk patients. However, be aware that concomitant use of allopurinol may increase risk of severe skin toxicity.

### Patient teaching

- Instruct patient to report unusual bleeding or bruising, fever, chills, and lip or mouth sores.
- Inform patient that drug may increase risk of infection. Advise patient to wash hands frequently, wear mask in public places, and avoid people with infections.
- Advise female that drug may harm fetus; caution her to avoid becoming pregnant. If patient is pregnant during therapy or becomes pregnant, inform her of risk to fetus.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## benztropine mesylate

Apo-Benztropine\*, Cogentin, PMS Benztropine\*

**Pharmacologic class:** Anticholinergic

**Therapeutic class:** Antiparkinsonian

**Pregnancy risk category C**

### Action

Inhibits cholinergic excitatory pathways and restores balance of dopamine and acetylcholine in CNS, thereby decreasing excess salivation, rigidity, and tremors (parkinsonian symptoms)

### Availability

**Injection:** 1 mg/ml in 2-ml ampules

**Tablets:** 0.5 mg, 1 mg, 2 mg

### Indications and dosages

➤ Parkinsonism

**Adults:** Initially, 1 to 2 mg/day P.O. or I.M. at bedtime or in two or four divided doses. Dosage range is 0.5 to 6 mg/day.

➤ Acute dystonic reactions

**Adults:** Initially, 1 to 2 mg I.M. or I.V., then 1 to 2 mg P.O. b.i.d.

➤ Drug-induced extrapyramidal reactions (except tardive dyskinesia)

**Adults:** 1 to 4 mg P.O. or I.M. once or twice daily

### Dosage adjustment

- Elderly patients

### Off-label uses

- Excessive salivation

### Contraindications

- Hypersensitivity to drug
- Angle-closure glaucoma
- Tardive dyskinesia
- Children younger than age 3

### Precautions

Use cautiously in:

- seizure disorders, arrhythmias, tachycardia, hypertension, hypotension, hepatic or renal dysfunction, alcoholism, prostatic hypertrophy
- elderly patients
- pregnant or breastfeeding patients.

### Administration

- Give after meals to prevent GI upset.
- Crush tablets if patient has difficulty swallowing them.
- Know that I.V. route is seldom used.
- Be aware that entire dose may be given at bedtime. (Drug has long duration of action.)

Route	Onset	Peak	Duration
P.O.	1-2 hr	Unknown	24 hr
I.V., I.M.	15 min	Unknown	24 hr

### Adverse reactions

**CNS:** confusion, depression, dizziness, hallucinations, headache, weakness, memory impairment, nervousness, delusions, euphoria, paresthesia, sensation of heaviness in limbs, **toxic psychosis**

**CV:** hypotension, palpitations, **tachycardia, arrhythmias**

**EENT:** blurred vision, diplopia, mydriasis, angle-closure glaucoma

**GI:** nausea, constipation, dry mouth, **ileus**

**GU:** urinary hesitancy or retention, dysuria, difficulty maintaining erection

**Musculoskeletal:** paratonia, muscle weakness and cramps

**Skin:** rash, urticaria, decreased sweating, dermatoses

### Interactions

**Drug-drug.** *Antacids, antidiarrheals:* decreased benztropine absorption

*Antihistamines, bethanechol, disopyramide, phenothiazines, quinidine, tricyclic antidepressants:* additive anticholinergic effects

**Drug-herbs.** *Angel's trumpet, jimsonweed, scopolia:* increased anticholinergic effects

**Drug-behaviors.** *Alcohol use:* increased sedation

### Patient monitoring

- Monitor blood pressure closely, especially in elderly patients.
- Monitor fluid intake and output; check for urinary retention.
- Assess for signs and symptoms of ileus, including constipation and abdominal distention.

### Patient teaching

- Advise patient to use caution during activities that require physical or mental alertness, because drug causes sedation.
- Tell patient to avoid increased heat exposure.
- 🔊 Caution patient not to stop therapy abruptly.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, herbs, and behaviors mentioned above.

## betamethasone

Betnelan<sup>✳</sup>, Celestone

## betamethasone acetate and sodium phosphate

Celestone Soluspan

**Pharmacologic class:** Glucocorticoid (inhalation)

**Therapeutic class:** Antiasthmatic, anti-inflammatory (steroidal)

**Pregnancy risk category** C

### Action

Stabilizes lysosomal neutrophils and prevents their degranulation, inhibits synthesis of lipoxygenase products and prostaglandins, activates anti-inflammatory genes, and inhibits various cytokines

### Availability

*Solution for injection:* 3 mg betamethasone sodium phosphate with 3 mg betamethasone acetate/ml

*Suspension for injection (acetate, phosphate):* 6 mg (total)/ml

*Syrup:* 0.6 mg/5 ml

*Tablets:* 0.6 mg

*Tablets (effervescent):* 0.5 mg

*Tablets (extended-release):* 1 mg

### Indications and dosages

➤ Inflammatory, allergic, hematologic, neoplastic, autoimmune, and respiratory diseases; prevention of organ rejection after transplantation surgery

**Adults:** 0.6 to 7.2 mg/day P.O. as single daily dose or in divided doses; or up to 9 mg I.M. of betamethasone acetate and sodium phosphate suspension.

➤ Bursitis or tenosynovitis

**Adults:** 1 ml of suspension intrabursally

➤ Rheumatoid arthritis or osteoarthritis

**Adults:** 0.5 to 2 ml of suspension intra-articularly

### Off-label uses

- Respiratory distress syndrome

### Contraindications

- Hypersensitivity to drug
- Breastfeeding

### Precautions

Use cautiously in:

- systemic infections, hypertension, osteoporosis, diabetes mellitus, glaucoma, renal disease, hypothyroidism, cirrhosis, diverticulitis, thromboembolic disorders, seizures, myasthenia

gravis, heart failure, ocular herpes simplex, emotional instability

- patients receiving systemic corticosteroids
- pregnant patients
- children younger than age 6.

### Administration

- Give as a single daily dose before 9:00 A.M.
- Give oral dose with food or milk.
- Administer I.M. injection deep into gluteal muscle (may cause tissue atrophy).
- 🚫 Don't give betamethasone acetate I.V.
- Be aware that typical suspension dosage ranges from one-third to one-half of oral dosage given q 12 hours.
- 🚫 To avoid adrenal insufficiency, taper dosage slowly and under close supervision when discontinuing.
- Know that drug may be given with other immunosuppressants.

Route	Onset	Peak	Duration
P.O.	Unknown	1-2 hr	3-25 days
I.M. (acetate/ phosphate)	1-3 hr	Unknown	1 wk

### Adverse reactions

**CNS:** headache, nervousness, depression, euphoria, psychoses, **increased intracranial pressure**

**CV:** hypertension, **thrombophlebitis, thromboembolism**

**EENT:** cataracts, burning and dryness of eyes, rebound nasal congestion, sneezing, epistaxis, nasal septum perforation, difficulty speaking, oropharyngeal or nasopharyngeal fungal infections

**GI:** nausea, vomiting, anorexia, dry mouth, esophageal candidiasis, peptic ulcers

**Metabolic:** decreased growth, hyperglycemia, cushingoid appearance, **adrenal insufficiency or suppression**

**Musculoskeletal:** muscle wasting, muscle pain, osteoporosis, aseptic joint necrosis

**Respiratory:** cough, wheezing, **bronchospasm**

**Skin:** facial edema, rash, contact dermatitis, acne, ecchymosis, hirsutism, petechiae, urticaria, **angioedema**

**Other:** loss of taste, bad taste, weight gain or loss, Churg-Strauss syndrome, increased susceptibility to infection, hypersensitivity reaction

### Interactions

**Drug-drug.** *Amphotericin B, loop and thiazide diuretics, ticarcillin:* additive hypokalemia

*Barbiturates, phenytoin, rifampin:* stimulation of betamethasone metabolism, causing decreased drug effects

*Digoxin:* increased risk of digoxin toxicity  
*Fluoroquinolones (such as ciprofloxacin, norfloxacin):* increased risk of tendon rupture

*Hormonal contraceptives:* blockage of betamethasone metabolism

*Insulin, oral hypoglycemics:* increased betamethasone dosage requirement, diminished hypoglycemic effects

*Live-virus vaccines:* decreased antibody response to vaccine, increased risk of neurologic complications

*Nonsteroidal anti-inflammatory drugs:* increased risk of adverse GI effects

**Drug-diagnostic tests.** *Calcium, potassium:* decreased levels

*Cholesterol, glucose:* increased levels  
*Nitroblue tetrazolium test for bacterial infection:* false-negative result

**Drug-herbs.** *Echinacea:* increased immune-stimulating effects

*Ginseng:* increased immune-modulating effects

**Drug-behaviors.** *Alcohol use:* increased risk of gastric irritation and GI ulcers

### Patient monitoring

- Monitor weight daily and report sudden increase, which suggests fluid retention.

- Monitor blood glucose level for hyperglycemia.
- Assess serum electrolyte levels for sodium and potassium imbalances.
- Watch for signs and symptoms of infection (which drug may mask).

### Patient teaching

- Advise patient to report signs and symptoms of infection.
- Tell patient to report visual disturbances (long-term drug use may cause cataracts).
- Instruct patient to eat low-sodium, high potassium diet.
- 🔊 Advise patient to carry medical identification describing drug therapy.
- Inform female patients that drug may cause menstrual irregularities.
- 🔊 Caution patient not to stop taking drug abruptly.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## bethanechol chloride

Duvoid<sup>☼</sup>, Myotonachol<sup>☼</sup>, Myotonine<sup>☼</sup>, PMS-Bethanecol Chloride<sup>☼</sup>, Urecholine

**Pharmacologic class:** Cholinergic

**Therapeutic class:** Urinary and GI tract stimulant

**Pregnancy risk category C**

### Action

Stimulates parasympathetic nervous system and cholinergic receptors, leading to increased muscle tone in bladder and increased frequency of ureteral peristaltic waves. Also stimulates gastric motility, increases gastric tone, and restores rhythmic GI peristalsis.

### Availability

Tablets: 5 mg, 10 mg, 25 mg, 50 mg

### Indications and dosages

➤ Postpartal and postoperative non-obstructive urinary retention; urinary retention caused by neurogenic bladder  
**Adults:** 10 to 50 mg P.O. three to four times daily; dosage may be determined by giving 5 or 10 mg q hour until response occurs or a total of 50 mg has been given.

### Contraindications

- Hypersensitivity to drug
- GI or GU tract obstruction
- Hyperthyroidism
- Active or latent asthma
- Bradycardia
- Hypotension
- Atrioventricular conduction defects
- Coronary artery disease
- Seizure disorders
- Parkinsonism
- Peptic ulcer disease

### Precautions

Use cautiously in:

- sensitivity to cholinergics or their effects and tartrazine (some products)
- pregnant or breastfeeding patients
- children.

### Administration

- Give drug on empty stomach 1 hour before or 2 hours after a meal to help prevent nausea and vomiting.

Route	Onset	Peak	Duration
P.O.	30-90 min	1 hr	6 hr

### Adverse reactions

**CNS:** headache, malaise, seizures  
**CV:** bradycardia, hypotension, **heart block, syncope with cardiac arrest**  
**EENT:** excessive lacrimation, miosis  
**GI:** nausea, vomiting, diarrhea, abdominal discomfort, belching  
**GU:** urinary urgency

**Respiratory:** increased bronchial secretions, **bronchospasm**

**Skin:** diaphoresis, flushing

**Other:** hypothermia

### Interactions

**Drug-drug.** *Anticholinergics:* decreased bethanechol efficacy

*Cholinesterase inhibitors:* additive cholinergic effects

*Depolarizing neuromuscular blockers:* decreased blood pressure

*Ganglionic blockers:* severe hypotension

*Procainamide, quinidine:* antagonism of cholinergic effects

**Drug-herbs.** *Angel's trumpet, jimsonweed, scopolia:* antagonism of cholinergic effects

### Patient monitoring

- Monitor blood pressure. Be aware that hypertensive patients may experience sudden blood pressure drop.
- Stay alert for orthostatic hypotension, a common adverse effect.
- Monitor fluid intake and output and residual urine volume.

### Patient teaching

- Tell patient that drug is usually effective within 90 minutes of administration.
- Advise patient to take drug on empty stomach 1 hour before or 2 hours after a meal to avoid GI upset.
- Instruct patient to move slowly when sitting up or standing, to avoid dizziness or light-headedness from blood pressure decrease.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## bevacizumab

Avastin

**Pharmacologic class:** Monoclonal antibody

**Therapeutic class:** Immunologic agent

**Pregnancy risk category** C

### FDA BOXED WARNING

- Drug may cause GI perforation, in some cases leading to death. Include such perforation in differential diagnosis of patients who experience abdominal pain during therapy. Discontinue permanently in patients with GI perforation.
- Drug may lead to potentially fatal wound dehiscence. Discontinue permanently in patients with wound dehiscence requiring medical intervention.
- Serious and, in some cases fatal, hemoptysis has occurred in patients with non-small-cell lung cancer who received chemotherapy and bevacizumab. Don't give to patients with recent hemoptysis.

### Action

Binds to vascular endothelial growth factor, preventing or reducing microvascular formation and growth and inhibiting metastatic disease progression

### Availability

*Solution for injection:* 25 mg/ml in 4-ml and 16-ml vials

### Indications and dosages

- First-line treatment of metastatic cancer of colon or rectum (used in combination with 5-fluorouracil [5-FU]-based chemotherapy)

**Adults:** 5 mg/kg I.V. infusion q 14 days until disease progression occurs when used with 5-FU, irinotecan, and leucovorin or 10 mg/kg I.V. infusion q 14 days until disease progression occurs when used with 5-FU, oxaliplatin, and leucovorin

➤ Unresectable, locally advanced, recurrent or metastatic nonsquamous, non-small-cell lung cancer

**Adults:** 15 mg/kg I.V. infusion q 3 weeks

## Contraindications

None

## Precautions

Use cautiously in:

- hypersensitivity to drug
- cardiovascular disease
- development of immunogenicity
- patients sensitive to infusion reactions
- patients recovering from major surgery, nongastrointestinal fistula
- recent history of hemoptysis (Don't administer drug.)
- patients with proteinuria
- elderly patients
- pregnant or breastfeeding patients
- children.

## Administration

- Withdraw necessary amount to obtain required dose, and dilute in 100 ml of 0.9% sodium chloride injection.
- ⚠ Don't mix or administer drug with dextrose solutions.
- ⚠ Don't deliver by I.V. push or bolus.
- Initially, infuse drug over 90 minutes. If patient tolerates infusion well, infuse over 60 minutes the second time; if he continues to tolerate it well, infuse each dose over 30 minutes thereafter.
- ⚠ Withhold dose if hypertension occurs.
- ⚠ Stop infusion if patient develops infusion reaction, hypertensive crisis, severe bleeding, abdominal pain (may signal intra-abdominal abscess or GI

perforation), wound dehiscence, or urinary problems.

- Be aware that drug shouldn't be given within 28 days after major surgery and that therapy should be suspended several weeks before elective surgery.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** asthenia, dizziness, headache, confusion, syncope, abnormal gait, transient ischemia attack, **reversible leukoencephalopathy syndrome, cerebral infarction**

**CV:** hypotension, hypertension, angina, **hypertensive crisis, heart failure, deep-vein thrombosis, intra-abdominal thrombosis, thromboembolism, MI**

**EENT:** excess lacrimation, visual disturbances, rhinitis, **severe epistaxis**

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, stomatitis, dyspepsia, flatulence, colitis, dry mouth, anorexia, **GI perforation, intra-abdominal abscess, rectal hemorrhage**

**GU:** proteinuria, urinary frequency or urgency, **nephrotic syndrome**

**Hematologic:** leukopenia, **neutropenia, hemorrhage**

**Hepatic:** bilirubinemia

**Metabolic:** hypokalemia, hyponatremia

**Musculoskeletal:** myalgia, back pain

**Respiratory:** upper respiratory tract infection, dyspnea, **massive hemoptysis**

**Skin:** wound-healing complications, dry skin, **exfoliative dermatitis, wound dehiscence**

**Other:** abnormal taste, altered voice, pain, weight loss, **infusion reaction**

## Interactions

**Drug-drug.** *Irinotecan:* increased concentration of irinotecan metabolite

**Drug-diagnostic tests.** *Leukocytes, potassium, sodium:* decreased levels  
*Urine protein:* increased level

### Patient monitoring

- 🔊 Monitor patient closely and discontinue drug if signs and symptoms of thromboembolism and GI perforation (such as abdominal pain, vomiting, and constipation), serious bleeding, nephrotic syndrome, or hypertensive crisis develops.
- 🔊 Stay alert for and discontinue drug if nongastrointestinal fistula formation, delayed wound healing, or wound dehiscence requiring medical intervention occurs.
- 🔊 Stay alert for and discontinue drug if signs and symptoms of leukoencephalopathy occur (such as headache, seizures, lethargy, confusion, or blindness).
- Assess blood pressure frequently.
- Monitor CBC with differential and urine protein and serum electrolyte levels.

### Patient teaching

- 🔊 Tell patient to call prescriber immediately if he experiences dizziness, severe bleeding, stomach pain, or urinary problems or if a wound opens.
- Instruct patient to tell prescriber if he has been exposed to chickenpox or if he has gout, heart disease, viral infection, urinary problems, hepatic disease, or another form of cancer.
- Advise patient to tell prescriber if he has surgery planned; drug may delay wound healing.
- Caution patient not to get immunizations unless prescriber approves.
- Inform female patients of childbearing potential risk of ovarian failure before starting drug.
- Instruct female patient to tell prescriber if she is pregnant, plans to become pregnant, or is breast-feeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially

those related to the drugs and tests mentioned above.

b

## bicalutamide

Apo-Bicalutamide<sup>✳</sup>, Casodex, Dom-Bicalutamide<sup>✳</sup>, Gen-Bicalutamide<sup>✳</sup>, Novo-Bicalutamide<sup>✳</sup>, PHL-Bicalutamide<sup>✳</sup>, PMS-Bicalutamide<sup>✳</sup>, Ratio-Bicalutamide<sup>✳</sup>, Sandoz Bicalutamide<sup>✳</sup>

**Pharmacologic class:** Nonsteroidal antiandrogen

**Therapeutic class:** Antineoplastic

**Pregnancy risk category X**

### Action

Antagonizes effects of androgen at cellular level by binding to androgen receptors on target tissues

### Availability

Tablets: 50 mg

### Indications and dosages

➤ Metastatic prostate cancer  
**Adults:** 50 mg P.O. once daily

### Contraindications

- Hypersensitivity to drug
- Women who are or may become pregnant

### Precautions

Use cautiously in:

- previous hypersensitivity or serious adverse reaction to flutamide or nilutamide
- moderate to severe hepatic impairment
- children.

### Administration

- Know that drug is given in combination with luteinizing hormone-releasing hormone (LHRH).
- Administer at same time each day.

Reactions in **bold** are life-threatening.

🔊 Clinical alert

Route	Onset	Peak	Duration
P.O.	Unknown	31 hr	Unknown

### Adverse reactions

**CNS:** headache, weakness, dizziness, depression, hypertonia, paresthesia, lethargy

**CV:** chest pain, peripheral edema, vasodilation, hypertension, **thromboembolic disease**

**EENT:** pharyngitis, bronchitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, anorexia, dry mouth

**GU:** urinary tract infection, impotence

**Musculoskeletal:** bone and back pain

**Respiratory:** dyspnea, cough

**Skin:** rash, alopecia

**Other:** food distaste, weight gain, edema, pain, hot flashes, flulike symptoms

### Interactions

**Drug-drug.** *Warfarin:* increased bicalutamide effects

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, cholesterol, BUN, creatinine:* increased levels  
*Hemoglobin, white blood cells:* decreased values

### Patient monitoring

- Monitor prostate-significant antigen levels, CBC, and liver and kidney function test results.
- If patient is receiving warfarin concurrently, evaluate prothrombin time and International Normalized Ratio.

### Patient teaching

- Instruct patient to take drug at same time each day, along with prescribed LHRH analog.
- Tell patient that any drug-related hair loss should reverse once therapy ends.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially

those related to the drugs and tests mentioned above.

## bisacodyl

Alophen, Apo-bisacodyl<sup>☛</sup>, Biolax<sup>☞</sup>, Bisac-Evac, Biscolax, Carter's Little Pills<sup>☛</sup>, Correctol, Dacodyl, Doxidan, Dulcolax, Ex-Lax Ultra, Femilax, Fleet Bisacodyl, Fleet Stimulant Laxative, Gentlax<sup>☛</sup>, Laxoberal<sup>☞</sup>, Veracolate

**Pharmacologic class:** Stimulant laxative

**Therapeutic class:** Laxative

**Pregnancy risk category B**

### Action

Unclear. Thought to stimulate colonic mucosa, producing parasympathetic reflexes that enhance peristalsis and increase water and electrolyte secretion, thereby causing evacuation of colon.

### Availability

*Enema:* 0.33 mg/ml, 10 mg/ml

*Powder for rectal solution:* 1.5 mg

bisacodyl and 2.5 g tannic acid

*Suppositories (rectal):* 5 mg, 10 mg

*Tablets (enteric-coated):* 5 mg

### Indications and dosages

➤ Constipation; bowel cleansing for childbirth, surgery, and endoscopic examination

**Adults and children ages 12 and older:** 5 to 15 mg P.O. or 10 mg P.R. as a single dose

**Children older than age 3:** 5 to 10 mg or 0.3 mg/kg P.O. as a single dose

**Children ages 2 and older:** 5 to 10 mg P.R. as a single dose

**Children younger than age 2:** 5 mg P.R. as a single dose

## Contraindications

- Hypersensitivity to drug
- Intestinal obstruction
- Gastroenteritis
- Appendicitis

## Precautions

Use cautiously in:

- hypersensitivity to tannic acid
- severe cardiovascular disease, anal or rectal fissures
- pregnant or breastfeeding patients.

## Administration

- Make sure patient swallows tablets whole without chewing.
- Don't give tablets within 1 hour of dairy products or antacids (may break down enteric coating).
- Know that drug should be used only for short periods.

Route	Onset	Peak	Duration
P.O.	6-12 hr	Variable	Variable
P.R.	15-60 min	Variable	Variable

## Adverse reactions

**CNS:** dizziness, syncope

**GI:** nausea, vomiting, diarrhea (with high doses), abdominal pain, burning sensation in rectum (with suppositories), laxative dependence, protein-losing enteropathy

**Metabolic:** hypokalemia, fluid and electrolyte imbalances, **tetany**, **alkalosis**

**Musculoskeletal:** muscle weakness (with excessive use)

## Interactions

**Drug-drug.** *Antacids:* gastric irritation, dyspepsia

**Drug-diagnostic tests.** *Calcium, magnesium, potassium:* decreased levels

*Phosphate, sodium:* increased levels

**Drug-food.** *Dairy products:* gastric irritation

## Patient monitoring

- Assess stools for frequency and consistency.
- Monitor patient for electrolyte imbalances and dehydration.

## Patient teaching

- Instruct patient to swallow (not chew) enteric-coated tablets no sooner than 1 hour before or after ingesting antacids or dairy products. Tell him not to chew tablets.
- Advise patient not to use bisacodyl or other laxatives habitually because this may lead to laxative dependence.
- Suggest other ways to prevent constipation, such as by eating more fruits, vegetables, and whole grains to increase dietary bulk and by drinking 8 to 10 glasses of water daily.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## bismuth subsalicylate

Bismatrol, Bismatrol Maximum Strength, Diotame, Kao-Tin, Kaopectate, Kaopectate Extra Strength, Kapectolin, Maalox Total Stomach Relief, Pepto-Bismol, Pepto-Bismol Bismuth Maximum Strength, Pink Bismuth

**Pharmacologic class:** Adsorbent

**Therapeutic class:** Antidiarrheal, antibiotic, antiulcer drug

**Pregnancy risk category C**

## Action

Promotes intestinal adsorption of fluids and electrolytes and decreases synthesis of intestinal prostaglandins.

Adsorbent action removes irritants from stomach and soothes irritated bowel lining. Also shows antibacterial activity to eradicate *Helicobacter pylori*.

### Availability

*Liquid*: 130 mg/15 ml, 262 mg/15 ml, 525 mg/15 ml (maximum strength)

*Tablets*: 262 mg

*Tablets (chewable)*: 262 mg, 300 mg

### Indications and dosages

➤ Adjunctive therapy for mild to moderate diarrhea, nausea, abdominal cramping, heartburn, and indigestion accompanying diarrheal illnesses

**Adults**: Two tablets or 30 ml P.O. (15 ml of maximum strength) q 30 minutes, or two tablets or 60 ml (30 ml of extra/maximum strength) q 60 minutes as needed. Don't exceed 4.2 g in 24 hours.

**Children ages 9 to 12**: One tablet or 15 ml P.O. (7.5 ml of maximum strength) q 30 to 60 minutes. Don't exceed 2.1 g in 24 hours.

**Children ages 6 to 9**: 10 ml (5 ml of maximum strength) P.O. q 30 to 60 minutes. Don't exceed 1.4 g in 24 hours.

**Children ages 3 to 6**: 5 ml (2.5 ml of maximum strength) P.O. q 30 to 60 minutes. Don't exceed 704 mg in 24 hours.

➤ Ulcer disease caused by *H. pylori*

**Adults**: Two tablets or 30 ml P.O. q.i.d. (15 ml of maximum strength)

### Off-label uses

- Chronic infantile diarrhea
- Norwalk virus-induced gastroenteritis

### Contraindications

- Hypersensitivity to aspirin
- Elderly patients with fecal impaction
- Children or adolescents during or after recovery from chickenpox or flu-like illness

### Precautions

Use cautiously in:

- diabetes mellitus, gout

- patients taking concurrent aspirin
- elderly patients
- pregnant or breastfeeding patients
- infants.

### Administration

- Know that tablets should be chewed or dissolved in mouth before swallowing.
- Be aware that drug is usually given with antibiotics (such as tetracycline or amoxicillin) when prescribed for ulcer disease.

Route	Onset	Peak	Duration
P.O.	1 hr	Unknown	Unknown

### Adverse reactions

**EENT**: tinnitus, tongue discoloration

**GI**: nausea, vomiting, diarrhea, constipation, gray-black stools, fecal impaction

**Respiratory**: tachypnea

**Other**: salicylate toxicity

### Interactions

**Drug-drug**. *Aspirin, other salicylates*: salicylate toxicity

*Corticosteroids, probenecid (large doses), sulfapyrazone*: decreased bismuth efficacy

*Enoxacin*: decreased enoxacin bioavailability

*Methotrexate*: increased risk of bismuth toxicity

*Tetracycline*: decreased tetracycline absorption

**Drug-diagnostic tests**. *Radiologic GI tract examination*: test interference

### Patient monitoring

- Monitor fluid intake and electrolyte levels.
- Monitor stool frequency and appearance.
- Assess infants and debilitated patients for fecal impaction.

## Patient teaching

- Instruct patient to chew tablets or dissolve them in mouth before swallowing.
- Inform patient that drug may turn stools gray-black temporarily.
- Tell patient to notify prescriber if he has diarrhea with fever for more than 48 hours.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## bisoprolol fumarate

Apo-Bisoprolol, Bisoprolol<sup>⚡</sup>, Cardicor<sup>⚡</sup>, Emcor<sup>⚡</sup>, Emcor LS<sup>⚡</sup>, Monacor<sup>⚡</sup>, Novo-Bisoprolol<sup>⚡</sup>, PMS-Bisoprolol<sup>⚡</sup>, Sandoz Bisoprolol<sup>⚡</sup>, Zebeta

**Pharmacologic class:** Beta<sub>1</sub>-adrenergic blocker

**Therapeutic class:** Antihypertensive

**Pregnancy risk category C**

## Action

Blocks beta<sub>1</sub>-adrenergic receptors of sympathetic nervous system in heart and kidney, thereby decreasing myocardial excitability, myocardial oxygen consumption, cardiac output, and renin release from kidney. Also lowers blood pressure without affecting beta<sub>2</sub>-adrenergic (pulmonary, vascular, and uterine) receptor sites.

## Availability

Tablets: 5 mg, 10 mg

## Indications and dosages

➤ Hypertension

**Adults:** Initially, 2.5 to 5 mg P.O. daily. Dosages up to 20 mg P.O. daily have been used.

## Dosage adjustment

- Renal or hepatic impairment

## Contraindications

- Hypersensitivity to drug
- Sinus bradycardia
- Second- or third-degree heart block
- Cardiogenic shock
- Heart failure
- Children (safety and efficacy not established)

## Precautions

Use cautiously in:

- renal or hepatic impairment, pulmonary disease, asthma, diabetes mellitus, thyrotoxicosis, peripheral vascular disease
- patients undergoing anesthesia or major surgery
- elderly patients
- pregnant or breastfeeding patients.

## Administration

- Give with or without food, but be consistent to minimize variations in absorption.
- Be aware that drug may be given alone or added to diuretic therapy.

Route	Onset	Peak	Duration
P.O.	30-60 min	2 hr	12-15 hr

## Adverse reactions

**CNS:** dizziness, depression, paresthesia, sleep disturbances, hallucinations, memory loss, slurred speech

**CV:** bradycardia, peripheral vascular insufficiency, claudication, hypotension, sinoatrial or atrioventricular (AV) node block, **second- or third-degree heart block, heart failure, pulmonary edema, cerebrovascular accident, arrhythmias**

**EENT:** blurred vision, dry eyes, conjunctivitis, tinnitus, rhinitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, gastric pain, gastritis, flatulence, anorexia, **ischemic colitis, acute**

**pancreatitis, renal and mesenteric arterial thrombosis**

**GU:** dysuria, polyuria, nocturia, erectile dysfunction, Peyronie's disease, decreased libido

**Hematologic:** eosinophilia, **agranulocytosis, thrombocytopenia**

**Hepatic:** hepatomegaly

**Metabolic:** hyperglycemia, hypoglycemia

**Musculoskeletal:** arthralgia, muscle cramps

**Respiratory:** dyspnea, cough, **bronchial obstruction, bronchospasm**

**Skin:** rash, purpura, pruritus, dry skin, excessive sweating

**Interactions**

**Drug-drug.** *Amphetamines, ephedrine, epinephrine, norepinephrine, phenylephrine, pseudoephedrine:* unopposed alpha-adrenergic stimulation

*Antihypertensives:* increased hypotension

*Digoxin:* additive bradycardia

*Dobutamine, dopamine:* decrease in beneficial beta<sub>1</sub>-adrenergic cardiovascular effects

*General anesthetics, I.V. phenytoin, verapamil:* additive myocardial depression

*MAO inhibitors:* hypertension (when taken within 14 days of bisoprolol)

*Nonsteroidal anti-inflammatory drugs:* decreased antihypertensive effect

*Thyroid preparations:* decreased bisoprolol efficacy

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, blood urea nitrogen, glucose, low-density lipoproteins, potassium, uric acid:* increased levels

*Antinuclear antibodies:* increased titers

*Insulin tolerance test:* test interference

**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension

*Cocaine use:* unopposed alpha-adrenergic stimulation

**Patient monitoring**

- Closely monitor blood glucose levels in diabetic patients.

- Assess for signs and symptoms of heart failure, including weight gain.
- Stay alert for blood pressure variations. Low blood pressure may indicate overdose.

**Patient teaching**

- Tell patient to weigh himself daily at same time and to report gain of 3 to 4 lb/day.
- Instruct patient to move slowly when sitting up or standing, to avoid dizziness or light-headedness from blood pressure decrease.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Advise patient to restrict salt intake to help avoid fluid retention.
- Caution patient not to discontinue drug abruptly unless prescriber approves.
- Tell patient to carry medical identification stating that he's taking a beta blocker.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

**bivalirudin**

Angiomax, Angiox<sup>®</sup>

**Pharmacologic class:** Thrombin inhibitor

**Therapeutic class:** Anticoagulant

**Pregnancy risk category B**

**Action**

Selectively inhibits thrombin by binding to its receptor sites, causing inactivation of coagulation factors V, VIII, and XII and thus preventing conversion of fibrinogen to fibrin

## Availability

Powder for injection: 250 mg/vial

## Indications and dosages

➤ Patients with unstable angina who are undergoing percutaneous transluminal coronary angioplasty (PTCA); patients with or at risk for heparin-induced thrombocytopenia or heparin-induced thrombocytopenia and thrombosis syndrome undergoing percutaneous coronary intervention  
**Adults:** 0.75 mg by I.V. bolus followed by 1.75 mg/kg/hour by I.V. infusion for duration of procedure. Five minutes after bolus is administered, an activated clotting time should be obtained and an additional bolus of 0.3 mg/kg should be given if needed. Continuation of infusion for up to 4 hours post-procedure is optional, and at discretion of treating physician. After 4 hours, an additional I.V. infusion may be initiated at rate of 0.2 mg/kg/hour for up to 20 hours if needed.

## Dosage adjustment

- Renal impairment
- Dialysis patients

## Off-label uses

- PCTA (regardless of history of unstable angina)
- Anticoagulation during orthopedic surgery

## Contraindications

- Hypersensitivity to drug
- Active major bleeding

## Precautions

Use cautiously in:

- renal impairment, severe hepatic dysfunction, bacterial endocarditis, cerebrovascular accident, severe hypertension, heparin-induced thrombocytopenia, thrombosis syndrome
- diseases associated with increased risk of bleeding

- concurrent use of other platelet aggregation inhibitors
- pregnant or breastfeeding patients
- children.

## Administration

- For I.V. injection and infusion, add 5 ml of sterile water to each 250-mg vial; gently mix until dissolved. Further dilute in 50 ml of dextrose 5% in water or normal saline solution for injection to a final concentration of 5 mg/ml.
- Don't mix with other drugs.
- Don't give by I.M. route.
- Know that drug is intended for use with aspirin.

Route	Onset	Peak	Duration
I.V.	Immediate	Immediate	1-2 hr

## Adverse reactions

**CNS:** headache, anxiety, nervousness, insomnia

**CV:** hypotension, hypertension, **bradycardia, ventricular fibrillation**

**GI:** nausea, vomiting, abdominal pain, dyspepsia, **severe spontaneous GI bleeding**

**GU:** urinary retention, **severe spontaneous GU bleeding**

**Hematologic:** **severe spontaneous bleeding**

**Musculoskeletal:** pelvic or back pain

**Other:** fever, pain at injection site

## Interactions

**Drug-drug.** *Abciximab, anticoagulants (including heparin, low-molecular-weight heparins, and heparinoids), thrombolytics, ticlopidine, warfarin:* increased risk of bleeding

**Drug-diagnostic tests.** *Activated partial thromboplastin time, prothrombin time:* increased

**Drug-herbs.** *Ginkgo biloba:* increased risk of bleeding

## Patient monitoring

 Monitor blood pressure, hemoglobin, and hematocrit. Be aware that

**b**

decrease in blood pressure or hematocrit may signal hemorrhagic event.

- Monitor venipuncture site closely for bleeding.

### Patient teaching

 Instruct patient to immediately report bleeding, bruising, or tarry stools.

- Tell patient to avoid activities that can cause injury. Advise him to use soft toothbrush and electric razor to avoid gum and skin injury.

## bleomycin sulfate

Blenoxane

*Pharmacologic class:* Antitumor antibiotic

*Therapeutic class:* Antineoplastic

*Pregnancy risk category D*

### FDA BOXED WARNING

- Give under supervision of physician in facility with adequate diagnostic and treatment resources.
- Pulmonary fibrosis is most severe toxicity, and most often presents as pneumonitis progressing to pulmonary fibrosis. Occurrence is highest in elderly patients and those receiving more than 400 units total dose.

### Action

Unclear. Appears to inhibit DNA synthesis and, to a lesser degree, RNA and protein synthesis. Binds to DNA, causing severing of single DNA strands.

### Availability

*Injection:* 15-unit vials, 30-unit vials

### Indications and dosages

-  Hodgkin's lymphoma

**Adults:** 10 to 20 units/m<sup>2</sup> I.V., I.M., or subcutaneously once or twice weekly. After 50% response, maintenance dosage is 1 unit/m<sup>2</sup> I.M. or I.V. daily or 5 units/m<sup>2</sup> I.M. or I.V. weekly.

 Malignant pleural effusion; prevention of recurrent pleural effusions

**Adults:** 60 units dissolved in 50 to 100 mg of normal saline solution, given through thoracostomy tube

 Squamous cell carcinoma of head, neck, skin, penis, cervix, or vulva; non-Hodgkin's lymphoma; testicular carcinoma

**Adults and children ages 12 and older:** 10 to 20 units/m<sup>2</sup> I.V., I.M., or subcutaneously once or twice weekly.

### Dosage adjustment

- Renal impairment
- Elderly patients

### Off-label uses

- Esophageal carcinoma
- Hemangioma
- AIDS-related Kaposi's sarcoma
- Osteosarcoma
- Verrucous carcinoma
- Warts

### Contraindications

- Hypersensitivity to drug
- Pregnancy or breastfeeding

### Precautions

Use cautiously in:

- renal or pulmonary impairment
- elderly patients
- females of childbearing age.

### Administration

- Wash hands before and after preparing drug; wear gloves during handling and preparation.
- For I.M. or subcutaneous use, reconstitute 15-unit vial with 1 to 5 ml and 30-unit vial with 2 to 10 ml of sterile water for injection, normal saline solution for injection, or bacteriostatic water for injection.

- For I.V. infusion, dissolve contents of 15- or 30-unit vial in 5 or 10 ml, respectively, of normal saline solution for injection.
- For intrapleural use, dissolve each 60 units in 50 to 100 ml of normal saline solution for injection, then administer through thoracostomy tube. Clamp tube after instilling drug. During next 4 hours, reposition patient from supine to right and left lateral positions several times. Then unclamp tube and restart suction.
- Premedicate patient with aspirin, as prescribed, to reduce risk of drug fever.
  - 🔊 Know that cumulative dosages above 400 units should be given with extreme caution because of increased risk of pulmonary toxicity.
  - 🔊 Know that in patients with lymphoma, anaphylactoid reaction may occur. Such patients should receive 2 units or less for the first two doses. If no reaction occurs, recommended doses may be given.

Route	Onset	Peak	Duration
I.V.	Immediate	10-20 min	Unknown
I.M., subcut.	15-20 min	30-60 min	Unknown

### Adverse reactions

**CNS:** disorientation, weakness, aggressive behavior

**CV:** hypotension, peripheral vasoconstriction

**GI:** vomiting, diarrhea, anorexia, stomatitis

**Hematologic:** anemia, **leukopenia**, **thrombocytopenia**

**Hepatic:** **hepatotoxicity**

**Metabolic:** hyperuricemia

**Respiratory:** dyspnea, crackles, **pulmonary fibrosis**, **pneumonitis**

**Skin:** alopecia, erythema, rash, urticaria, vesicles, striae, hyperpigmentation, mucocutaneous toxicity

**Other:** fever, chills, weight loss, **anaphylactic reaction**

### Interactions

**Drug-drug.** *Anesthetics:* increased oxygen requirement

*Antineoplastics:* increased risk of hematologic and pulmonary toxicity

*Cardiac glycosides:* decreased cardiac glycoside blood level

*Cisplatin:* decreased bleomycin elimination, increased risk of toxicity

*Fosphenytoin, phenytoin:* decreased blood levels of these drugs

*Vinblastine:* increased risk of Raynaud's syndrome

**Drug-diagnostic tests.** *Uric acid:* increased level

### Patient monitoring

- Assess baseline pulmonary function status before initiating therapy; monitor throughout therapy.
- Monitor chest X-rays and assess breath sounds to detect signs of pulmonary toxicity.
- Assess oral cavity for sores, ulcers, pain, and bleeding.
- Monitor infusion site for irritation, burning, and signs of infection.
- Evaluate closely for signs and symptoms of drug fever.

### Patient teaching

- Tell patient to avoid spicy, hot, or rough foods (may cause GI upset).
- Urge patient to use reliable contraceptive method during therapy.
- Tell patient not to receive vaccinations without consulting prescriber.
- 🔊 Instruct patient to immediately notify prescriber if breathing difficulties, fever, or chills occur.
- Tell patient to avoid activities that can cause injury. Advise him to use soft toothbrush and electric razor to avoid gum and skin injury.
- Inform patient that drug may cause hair loss but that hair will grow back after treatment ends.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially

those related to the drugs and tests mentioned above.

## boceprevir

Victrelis

**Pharmacologic class:** Hepatitis C NS3/4A protease inhibitor

**Therapeutic class:** Antiviral agent

**Pregnancy risk category X**

### Action

Binds to the NS3 protease active site serine (S139) through an (alpha)-ketoamide functional group to inhibit viral replication in hepatitis C virus (HCV)-infected host cells

### Availability

*Capsules:* 200 mg

### Indications and dosages

➤ Chronic hepatitis C genotype 1 in patients with compensated hepatic disease (including cirrhosis) who are previously untreated or who have failed previous interferon and ribavirin therapy

**Adults age 18 and older:** 800 mg P.O. t.i.d. (q 7 to 9 hours) in combination with peginterferon alfa and ribavirin; in patients with compensated cirrhosis, give peginterferon alfa and ribavirin for 4 weeks followed by 44 weeks boceprevir 800 mg t.i.d. (q 7 to 9 hours) in combination with peginterferon alfa and ribavirin

➤ Chronic hepatitis C genotype 1 in patients with compensated hepatic disease (without cirrhosis) who are previously untreated or are partial responders or relapsers to interferon and ribavirin therapy

**Adults age 18 and older:** Initiate therapy with peginterferon alfa and

ribavirin for 4 weeks (treatment weeks 1 to 4). Add boceprevir 800 mg P.O. t.i.d. (q 7 to 9 hours) to peginterferon alfa and ribavirin regimen after 4 weeks of treatment. Based on patient's HCV-RNA levels at treatment week 8, treatment week 12, and treatment week 24, use the following response-guided therapy guidelines below to determine duration of treatment.

#### Previously untreated patients

At treatment week 8	At treatment week 24
Undetectable	Undetectable

Complete three-drug regimen at treatment week 28.

At treatment week 8	At treatment week 24
Detectable	Undetectable

Continue all three drugs and finish through treatment week 36; then give peginterferon alfa and ribavirin and finish through treatment week 48.

#### Previous partial responders or relapsers

At treatment week 8	At treatment week 24
Undetectable	Undetectable

Complete three-drug regimen at treatment week 36.

At treatment week 8	At treatment week 24
Detectable	Undetectable

Continue all three drugs and finish through treatment week 36; then give peginterferon alfa and ribavirin and finish through treatment week 48.

#### Treatment futility

If the patient has HCV-RNA results of 100 international units/ml or greater at treatment week 12, discontinue three-drug regimen. If the patient has confirmed, detectable HCV-RNA at treatment week 24, discontinue three-drug regimen.

## Contraindications

- Contraindications to peginterferon alfa and ribavirin (because boceprevir must be administered with these drugs)
- Concurrent use of drugs that are highly dependent on CYP3A4/5 for clearance, and for which elevated plasma concentrations are associated with serious or life-threatening events, including cisapride (not available in the United States), alfuzosin, dihydroergotamine, drospirenone, ergonovine, ergotamine, lovastatin, methylergonovine, oral midazolam, pimozide, sildenafil (Revatio) and tadalafil (Adcirca) when used for pulmonary arterial hypertension, simvastatin, and triazolam
- Concurrent use of potent CYP3A4/5 inducers when significantly reduced boceprevir plasma concentrations may be associated with reduced efficacy, including carbamazepine, phenobarbital, phenytoin, rifampin, and St. John's wort
- Pregnancy and in men whose female partners are pregnant

## Precautions

Use cautiously in:

- patients with anemia or neutropenia
- patients with decompensated cirrhosis or organ transplant, co-infection with HCV and HIV, or hepatitis B virus
- patients with hepatic or renal impairment (avoid use)
- concurrent use of antidepressants such as trazodone, desipramine, or sedatives-hypnotics such as alprazolam and I.V. midazolam (requires close monitoring and consideration of dosage reduction of these drugs)
- concurrent use of antifungals (dosages of ketoconazole and itraconazole shouldn't exceed 200 mg/day if given with boceprevir)

- concurrent use of colchicine for gout flares, prophylaxis for gout flares, or familial Mediterranean fever (requires dosage reduction)
- concurrent use of rifabutin (not recommended)
- concurrent use of dihydropyridine calcium channel blockers, such as felodipine, nifedipine, and nicardipine (clinical monitoring recommended)
- concurrent use of dexamethasone (avoid use if possible or use with caution if use is necessary)
- concurrent use of inhaled corticosteroids budesonide, fluticasone (avoid use if possible, particularly for extended durations)
- concurrent use of bosentan (monitor patient closely)
- concurrent use of HIV non-nucleoside reverse transcriptase inhibitors such as efavirenz (avoid use)
- concurrent use of atazanavir/ritonavir, darunavir/ritonavir, or lopinavir/ritonavir combinations (not recommended)
- concurrent use of ritonavir
- concurrent use of atorvastatin (requires careful titration; atorvastatin dose not to exceed 20 mg daily)
- concurrent use of salmeterol (not recommended)
- concurrent use of methadone or buprenorphine (clinical monitoring recommended; may require altered methadone or buprenorphine dosage)
- concurrent use of sildenafil, tadalafil, or vardenafil when used for erectile dysfunction (don't exceed recommended reduced dosages of these drugs)
- elderly patients
- breastfeeding patients
- children (safety and efficacy not established).

## Administration

- Administer with food (a meal or light snack).

**b**

📣 Don't administer boceprevir without peginterferon alfa and ribavirin. Drug must not be used as monotherapy.

- Obtain CBC with WBC differential in all patients before starting drug. Be aware that decreased hemoglobin level or neutrophil count may require a decrease in dosage, interruption, or discontinuation of peginterferon alfa or ribavirin.
- Because this drug is given with ribavirin, ensure that a negative pregnancy test has been obtained immediately before starting therapy.
- Be aware that the Ribavirin Pregnancy Registry is available to monitor maternal-fetal outcomes of pregnancies in female patients and female partners of male patients exposed to ribavirin during treatment and for 6 months after treatment cessation.
- Be aware that boceprevir dosage reduction isn't recommended. If the patient has a serious adverse reaction potentially related to peginterferon alfa or ribavirin, the peginterferon alfa or ribavirin dosage should be reduced or discontinued.

Route	Onset	Peak	Duration
P.O.	Unknown	2 hr	Unknown

### Adverse reactions

**CNS:** fatigue, headache, asthenia, dizziness, insomnia, irritability

**GI:** nausea, vomiting, diarrhea, dry mouth

**Hematologic:** anemia, neutropenia

**Musculoskeletal:** arthralgia

**Respiratory:** exertional dyspnea

**Skin:** alopecia, dry skin, rash

**Other:** chills, dysgeusia, decreased appetite

### Interactions

**Drug-drug.** *Alpha<sub>1</sub>-adrenoreceptors (alfuzosin):* increased alfuzosin concentration, resulting in hypotension

*Antiarrhythmics (amiodarone, bepridil [not available in the United States], flecainide, propafenone, quinidine):*

increased antiarrhythmic concentration with risk of serious or life-threatening adverse events

*Anticoagulants (warfarin):* altered warfarin concentration

*Anticonvulsants (carbamazepine, phenobarbital, phenytoin), antimycobacterials (rifampin):* possible loss of virologic response to boceprevir

*Antidepressants (desipramine, trazodone):* increased trazodone and desipramine plasma concentrations, resulting in increased adverse reactions, such as dizziness, hypotension, and syncope

*Antifungals (itraconazole, ketoconazole, posaconazole, voriconazole):* increased plasma concentrations of these drugs

*Antigout drugs (colchicine):* significantly increased colchicine level, resulting in possible fatal toxicity

*Anti-infectives (clarithromycin):* increased clarithromycin concentration

*Antimycobacterials (rifabutin):* increased risk of rifabutin exposure and decreased risk of boceprevir exposure

*Beta-agonists, inhaled (salmeterol):* increased risk of salmeterol-associated CV events

*Corticosteroids, inhaled (budesonide, fluticasone):* increased budesonide and fluticasone plasma concentrations, resulting in significantly reduced serum cortisol concentration

*Corticosteroids, systemic (dexamethasone):* decreased boceprevir plasma concentration, with possible loss of boceprevir therapeutic effect

*Digoxin:* increased digoxin concentration, with risk of toxicity

*Dihydropyridine calcium channel blockers (felodipine, nicardipine, nifedipine):* increased dihydropyridine calcium channel blocker plasma concentration

*Endothelin receptor antagonists (bosentan)*: increased bosentan concentration  
*Ergot derivatives (dihydroergotamine, ergonovine, ergotamine, methylergonovine)*: increased risk of acute ergot toxicity characterized by peripheral vasospasm and ischemia of extremities and other tissues

*GI motility agents (cisapride, not available in the United States)*: increased risk of cardiac arrhythmias

*HIV non-nucleoside reverse transcriptase inhibitors (efavirenz)*: decreased boceprevir plasma trough concentration, resulting in loss of boceprevir therapeutic effect

*HIV protease inhibitor combinations (atazanavir/ritonavir)*: reduced steady-state exposure to atazanavir and ritonavir

*HIV protease inhibitor combinations (darunavir/ritonavir, lopinavir/ritonavir)*: reduced steady-state exposure to boceprevir, darunavir, lopinavir, and ritonavir

*HIV protease inhibitors (ritonavir)*: decreased boceprevir concentration  
*HMG-CoA reductase inhibitors (atorvastatin)*: increased atorvastatin concentration

*HMG-CoA reductase inhibitors (lovastatin, simvastatin)*: increased risk of myopathy, including rhabdomyolysis

*Immunosuppressants (cyclosporine, sirolimus, tacrolimus)*: significantly increased cyclosporine, sirolimus, and tacrolimus plasma concentrations

*Neuroleptics (pimozide)*: increased risk of cardiac arrhythmias

*Opioid analgesics (buprenorphine, methadone)*: possible increased or decreased methadone or buprenorphine plasma concentration

*Oral contraceptives (drospirenone)*: increased risk of hyperkalemia

*Oral contraceptives (drospirenone, ethinyl estradiol)*: increased drospirenone and decreased ethinyl estradiol concentrations (effect on

other progestins is unknown but increases in exposure are anticipated)  
*Phosphodiesterase type 5 enzyme inhibitors (sildenafil, tadalafil) when used for pulmonary arterial hypertension*: increased risk of PDE5 inhibitor-associated adverse events, including visual abnormalities, hypotension, prolonged erection, and syncope  
*Phosphodiesterase type 5 enzyme inhibitors (sildenafil, tadalafil, vardenafil) when used for erectile dysfunction*: increased sildenafil, tadalafil, and vardenafil levels, resulting in increased adverse reactions

*Sedative-hypnotics (alprazolam, I.V. midazolam)*: increased concentrations of alprazolam and midazolam, with risk of respiratory depression or prolonged sedation

*Sedative-hypnotics (triazolam, oral midazolam)*: prolonged or increased sedation or respiratory depression

**Drug-diagnostic tests.** *Hemoglobin, neutrophils, platelets*: decreased levels

**Drug-food.** *Any food*: enhanced boceprevir exposure

**Drug-herbs.** *St. John's wort*: possible loss of virologic response to boceprevir

## Patient monitoring

- Continue to monitor CBC with WBC differential at treatment weeks 4, 8, and 12; closely monitor at other times as clinically appropriate.
- Monitor HCV-RNA levels at treatment weeks 4, 8, 12, and 24, at the end of treatment, during treatment follow-up, and at other times as clinically indicated. Be aware that discontinuation of therapy is recommended in all patients with HCV-RNA level of 100 international units/ml or greater at treatment week 12 or confirmed detectable HCV-RNA level at treatment week 24.
- If patient is also receiving antiarrhythmics, bosentan, calcium channel blockers, digoxin, immunosuppressants,

or opioid analgesics, monitor therapeutic levels of these drugs.

- Monitor INR closely if patient is receiving warfarin while taking this three-drug combination.
- Closely watch for adverse reactions in patients taking erectile dysfunction drugs while also taking this three-drug combination.
- Closely watch for respiratory depression or prolonged sedation in patients also taking sedatives or hypnotics with this three-drug combination.

### Patient teaching

- Tell patient to take drug with food (a meal or light snack).
- 📢 Advise patient that boceprevir must not be used alone, because of the high probability of resistance without combination anti-HCV therapies.
- Tell patient that if he misses a dose and it's less than 2 hours before the next dose is due, he should skip the missed dose. If he misses a dose and it's 2 or more hours before the next dose is due, he should take the missed dose and then resume the normal dosing schedule.
- Tell patient that laboratory evaluations are required before starting therapy and periodically thereafter.
- Inform female patient that she must have a negative pregnancy test before starting therapy and monthly thereafter during therapy.
- Advise female patient of childbearing age and female partners of male patients to avoid pregnancy during therapy with this three-drug combination by practicing effective contraception with at least two forms of contraceptives during therapy and for 6 months after therapy ends. Tell female patient not to rely on efficacy of systemic hormonal contraceptives during this treatment. Two alternative effective methods of contraception include intrauterine devices and barrier methods.

- Tell female patient of childbearing age that breastfeeding isn't recommended during therapy.
- Instruct patient to tell prescriber about all drugs and herbal products he's taking, because many drugs and some herbs have the potential for serious drug interactions and shouldn't be taken with boceprevir.
- Inform patient that it isn't known how treatment of hepatitis C virus infection affects transmission and that appropriate precautions to prevent transmission of hepatitis C virus should be taken.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, food, and herbs mentioned above.

## bortezomib

Velcade

**Pharmacologic class:** Proteasome inhibitor

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

### Action

Inhibits proteasomes (enzyme complexes that regulate protein homeostasis within cells). Reversibly inhibits chymotrypsin-like activity at 26S proteasome, leading to activation of signaling cascades, cell-cycle arrest, and apoptosis.

### Availability

*Powder for reconstitution (preservative-free):* 3.5 mg (contains 35 mg of mannitol)

## Indications and dosages

➤ Multiple myeloma, patients with mantle cell lymphoma who have received at least one prior therapy

**Adults:** 1.3 mg/m<sup>2</sup> I.V. or subcutaneously twice weekly for 2 weeks (days 1, 4, 8, and 11), followed by 10-day rest period (days 12 to 21). Allow at least 72 hours to elapse between doses. One treatment cycle equals 21 days (3 weeks).

## Dosage adjustment

- Moderate or severe hepatic impairment
- Peripheral neuropathy
- Grade 3 nonhematologic events
- Grade 4 hematologic events

## Contraindications

- Hypersensitivity to drug, mannitol, or boron

## Precautions

Use cautiously in:

- peripheral neuropathy, dehydration, hepatic or renal impairment
- history of syncope or cardiovascular disorders
- pregnant or breastfeeding patients
- children.

## Administration

- Be aware that drug is for I.V. or subcutaneous use only. Because each route of administration has a different reconstituted concentration, use caution when calculating volume to be administered.
- Reconstitute drug in vial with 3.5 ml of normal saline for injection to yield a concentration of 1 mg/ml for I.V. use.
- Reconstitute drug in vial with 1.4 ml of normal saline for injection to yield a concentration of 2.5 mg/ml for subcutaneous use.
- Give by I.V. push over 3 to 5 seconds or subcutaneously.
- Reconstituted solution must be used within 8 hours.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown
Subcut.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** headache, insomnia, dizziness, anxiety, peripheral neuropathy,

**reversible posterior leukoencephalopathy syndrome**

**CV:** tachycardia, hypotension

**EENT:** throat tightness

**GI:** nausea, vomiting, diarrhea, abdominal pain, dyspepsia

**Hematologic:** eosinophilia, anemia, thrombocytopenia, neutropenia

**Hepatic:** hyperbilirubinemia, hepatitis, acute liver failure

**Metabolic:** dehydration, pyrexia

**Respiratory:** cough, dyspnea, upper respiratory tract infection, acute diffuse infiltrative pulmonary disease (pneumonitis, interstitial pneumonia, acute respiratory distress syndrome)

**Skin:** rash, pruritus, urticaria

**Other:** altered taste, increased or decreased appetite, fever, chills, edema, tumor lysis syndrome

## Interactions

**Drug-drug.** *CYP3A4 inducers (including amiodarone, carbamazepine, nevirapine, phenobarbital, phenytoin, and rifampin):* possible decrease in bortezomib serum level and efficacy  
*CYP3A4 inhibitors (including amiodarone, cimetidine, clarithromycin, delavirdine, diltiazem, disulfiram, erythromycin, fluoxetine, fluvoxamine, nefazodone, nevirapine, propoxyphene, quinupristin, verapamil, zafirlukast, and zileuton):* possible increase in bortezomib serum level and efficacy

**Drug-diagnostic tests.** *Liver function tests:* increased levels

**Drug-food.** *Grapefruit juice:* increased bortezomib blood level, greater risk of toxicity

### Patient monitoring

-  Monitor vital signs and temperature. Especially watch for tachycardia, fever, and hypotension.
-  Stay alert for and discontinue drug if posterior leukoencephalopathy (headache, seizures, lethargy, confusion, blindness) or tumor lysis syndrome occurs (irregular heartbeat, shortness of breath, high potassium level, high uric acid level, impairment of mental ability, kidney failure).
-  Closely monitor liver function tests and watch for signs and symptoms of hepatitis or liver failure.
- Monitor nutritional and hydration status for changes caused by GI adverse effects.
- Monitor CBC with white cell differential, and watch for signs and symptoms of blood dyscrasias.
-  Monitor respiratory status, watching for dyspnea, cough, and other signs and symptoms of upper respiratory tract infection.

### Patient teaching

-  Inform patient that drug can cause serious blood dyscrasias. Teach him which signs and symptoms to report right away.
- Tell patient that drug may cause other significant adverse reactions. Reassure him he will be closely monitored.
- Instruct patient to move slowly when sitting or standing up to avoid dizziness or light-headedness from sudden blood pressure drop.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Advise patient to minimize adverse GI effects by eating small frequent servings of healthy food and ensuring adequate fluid intake.
- Tell patient to immediately report signs and symptoms of upper respiratory tract infection.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and foods mentioned above.

## bosentan

Tracleer

**Pharmacologic class:** Endothelin-receptor antagonist, vasodilator

**Therapeutic class:** Antihypertensive

**Pregnancy risk category X**

### FDA BOXED WARNING

- Drug causes at least  $3 \times$  ULN (upper limit of normal) of alanine aminotransferase and aspartate aminotransferase levels in about 11% of patients (along with elevated bilirubin in a few cases). These changes indicate potentially serious hepatic injury. Obtain serum transaminase levels before therapy begins and then monthly.
- Transaminase elevations warrant close attention. Avoid giving drug to patients with baseline transaminase levels more than  $3 \times$  ULN, because monitoring for hepatic injury may be more difficult. Stop therapy if transaminase elevations are accompanied by indications of hepatic injury or if bilirubin level is  $2 \times$  ULN or higher.
- Rare postmarketing cases of unexplained hepatic cirrhosis occurred after prolonged therapy in patients with multiple comorbidities and drug therapies.
- Drug is contraindicated in pregnancy because it's likely to cause major birth defects. Exclude pregnancy before therapy starts, and instruct patient to use reliable contraceptive method. Caution patient not to use hormonal contraceptives alone, because drug may

render these ineffective; instruct her to use additional forms of contraception. Obtain monthly pregnancy tests.

- Because of potential hepatic injury and to reduce risk of fetal exposure, drug may be prescribed only through Tracleer Access Program.

### Action

Binds to and blocks receptor sites for endothelin A and B in endothelium and vascular smooth muscle. This action reduces elevated endothelin levels in patients with pulmonary arterial hypertension, and inhibits vasoconstriction resulting from endothelin-1 (ET-1).

### Availability

Tablets: 62.5 mg, 125 mg

### Indications and dosages

➤ Patients with pulmonary arterial hypertension (World Health Organization Group 1) to improve exercise ability and to decrease clinical worsening

**Adults:** Initially, 62.5 mg P.O. b.i.d. for 4 weeks; increase to maintenance dosage of 125 mg P.O. b.i.d. In patients older than age 12 who weigh less than 40 kg (88 lb), initial and maintenance dosages are 62.5 mg b.i.d.

### Dosage adjustment

- Aminotransferase elevations more than  $3 \times$  upper limit of normal
- Concurrent use of lopinavir/ritonavir

### Contraindications

- Hypersensitivity to drug
- Patients receiving concurrent cyclosporine or glyburide
- Pregnancy

### Precautions

Use cautiously in:

- moderate to severe hepatic impairment (avoid use)

- mild hepatic impairment
- mitral stenosis, pulmonary veno-occlusive disease
- fluid retention, decreased sperm count, decreased hemoglobin level and hematocrit
- concurrent use of a CYP2C9 inhibitor and a strong or moderate CYP3A inhibitor (not recommended)
- concurrent use of tacrolimus
- elderly patients
- breastfeeding patients
- children younger than age 12 (safety and efficacy not established).

### Administration

- Give tablets in morning and evening, with or without food.
- Consider gradual dosage reduction when discontinuing drug.

Route	Onset	Peak	Duration
P.O.	Variable	3-5 hr	Unknown

### Adverse reactions

**CNS:** headache, fatigue

**CV:** edema, hypotension, palpitations

**EENT:** nasopharyngitis

**GI:** dyspepsia

**Hepatic:** hepatic dysfunction, hepatic injury, hepatotoxicity

**Skin:** pruritus, flushing

### Interactions

**Drug-drug.** *Cyclosporine:* decreased cyclosporine blood level, increased bosentan blood level

*CYP2C9 inhibitors (such as amiodarone, fluconazole), moderate CYP3A inhibitors (such as amprenavir, diltiazem, erythromycin, fluconazole), strong CYP3A inhibitors (such as itraconazole, ketoconazole):* largely increased bosentan plasma concentration

*Drugs metabolized by CYP2C9 and CYP3A:* decreased plasma concentrations of these drugs

*Glyburide*: decreased blood levels of both drugs, increased risk of hepatic damage

*Hormonal contraceptives*: decreased bosenan efficacy

*Lopinavir/ritonavir combination*: increased bosenan trough concentration

*Simvastatin and other statins*: decreased effects of these drugs

**Drug-diagnostic tests.** *Hematocrit, hemoglobin*: decreased values

*Transaminases*: increased values

### Patient monitoring

- Assess serum transaminase levels within first 3 days of therapy and then monthly.
- Evaluate hemoglobin level 1 month after therapy and then every 3 months.
- 🔊 If signs of pulmonary edema occur, consider the possibility of underlying pulmonary veno-occlusive disease and discontinue treatment if necessary.
- Assess female patient for pregnancy every month during therapy.

### Patient teaching

- Tell patient to take drug with or without food in morning and evening.
- Caution female patient to avoid pregnancy, and discuss reliable contraceptive methods. Instruct her to contact prescriber immediately if she thinks she may be pregnant.
- Because of the potential for adverse effects in the breastfeeding infant, a decision should be made to discontinue breastfeeding or discontinue drug, taking into account the importance of drug to the mother.
- Inform patient that he'll undergo CBC measurement and liver function testing regularly during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially

those related to the drugs and tests mentioned above.

## brentuximab vedotin

Adcetris

**Pharmacologic class:** CD30-directed antibody-drug conjugate

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

- John Cunningham virus (JCV) infection resulting in progressive multifocal leukoencephalopathy (PML) and death has been reported in patients treated with brentuximab vedotin.

### Action

Brentuximab vedotin antibody is a chimeric IgG1 directed against CD30. The small molecule MMAE is a microtubule-disrupting agent. MMAE is covalently attached to the antibody via a linker. Nonclinical data suggest that the anticancer activity of brentuximab vedotin is due to the binding of the antibody-drug conjugate (ADC) to CD30-expressing cells, followed by internalization of the ADC CD30 complex, and the release of MMAE via proteolytic cleavage. Binding of MMAE to tubulin disrupts the microtubule network within the cell, subsequently inducing cell-cycle arrest and apoptotic death of the cells.

### Availability

Powder for reconstitution for injection, lyophilized: 50-mg single-use vial

### Indications and dosages

➤ Hodgkin's lymphoma after failure of autologous stem cell transplant (ASCT) or after failure of at least two

prior multi-agent chemotherapy regimens in patients who aren't ASCT candidates; systemic anaplastic large cell lymphoma after failure of at least one prior multi-agent chemotherapy regimen

**Adults:** 1.8 mg/kg I.V. infusion over 30 minutes q 3 weeks; continue treatment until a maximum of 16 cycles, disease progression, or unacceptable toxicity occurs. Calculate dosage for patients weighing more than 100 kg (220 lb) based on a weight of 100 kg.

### Dosage adjustment

- Neutropenia
- Peripheral neuropathy

### Contraindications

- Concurrent use of bleomycin

### Precautions

Use cautiously in:

- renal or hepatic impairment
- neutropenia, peripheral neuropathy, tumor lysis syndrome, Stevens-Johnson syndrome
- elderly patients (safety and efficacy not established)
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Follow facility policy for handling, preparing, and administering carcinogenic, mutagenic, and teratogenic drugs.

 Don't administer by I.V. push or bolus.

 Obtain CBC with differential before each dose. Withhold drug for Grade 3 or 4 neutropenia until resolution to baseline or Grade 2 or lower. Be aware that growth factor support should be considered for subsequent cycles in patients who experience Grade 3 or 4 neutropenia. In patients with recurrent Grade 4 neutropenia despite the use of growth factors,

consider discontinuation or dosage reduction.

- Reconstitute each 50-mg vial with 10.5 ml sterile water for injection, to yield a single-use solution containing 5 mg/ml. Direct stream toward wall of vial and not directly at powder. Gently swirl vial to aid dissolution. Don't shake.

- Reconstituted solution should be clear to slightly opalescent, colorless, and free of visible particulates.

- Following reconstitution, dilute immediately into infusion bag, or store solution at 2° to 8° C (36° to 46° F) and use within 24 hours of reconstitution. Don't freeze. Discard unused portion.

- Immediately add reconstituted solution to infusion bag containing a minimum volume of 100 ml to achieve a final concentration of 0.4 to 1.8 mg/ml in 0.9% sodium chloride injection, 5% dextrose injection, or lactated Ringer's injection. Gently invert bag to mix solution. Following dilution, infuse solution immediately, or store solution at 2° to 8° C and use within 24 hours of reconstitution. Don't freeze.

- Don't mix drug with, or administer as an infusion with, other drug products.

 Manage neuropathy by using combination of dose delay and dosage reduction as prescribed. For new or worsening Grade 2 or 3 neuropathy, withhold dose until neuropathy improves to Grade 1 or baseline; then restart at dosage prescribed. For Grade 4 peripheral neuropathy, discontinue drug.

 If infusion reaction occurs, stop infusion and initiate appropriate medical management. If anaphylaxis occurs, discontinue infusion immediately and initiate appropriate medical management.

 If Stevens-Johnson syndrome occurs, discontinue drug and initiate appropriate medical therapy.

b

📣 Consider the diagnosis of PML in any patient presenting with new-onset signs and symptoms of CNS abnormalities. Evaluation of PML includes, but isn't limited to, consultation with a neurologist, brain MRI, and lumbar puncture or brain biopsy. Withhold drug if PML is suspected; discontinue drug if PML is confirmed.

Route	Onset	Peak	Duration
I.V.	Unknown	End of infusion	Unknown

### Adverse reactions

**CNS:** headache, dizziness, insomnia, anxiety, peripheral sensory neuropathy, peripheral motor neuropathy, fatigue

**EENT:** oropharyngeal pain

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain

**Hematologic:** neutropenia, anemia, thrombocytopenia

**Musculoskeletal:** arthralgia, myalgia, back pain, extremity pain, muscle spasms

**Respiratory:** upper respiratory tract infection, cough, dyspnea

**Skin:** rash, pruritus, alopecia, dry skin,

**Stevens-Johnson syndrome**

**Other:** pyrexia, lymphadenopathy, chills, pain, peripheral edema, night sweats, decreased appetite, decreased weight, **tumor lysis syndrome, sepsis, infusion reactions and anaphylaxis**

### Interactions

**Drug-drug.** *Strong CYP3A4 inducers (such as rifampin):* reduced MMAE exposure

*Strong CYP3A4 inhibitors (such as ketoconazole):* increased MMAE exposure and risk of adverse reactions

### Patient monitoring

- Monitor renal and hepatic function tests closely.

- Monitor CBC with differential.

📣 Continue to closely monitor patient for infusion reaction and take appropriate measures.

- Monitor patient for neuropathy and manage appropriately.

📣 Be aware that concurrent use of bleomycin increases risk of pulmonary toxicity. Watch for cough, dyspnea, and other serious respiratory problems, such as interstitial infiltration or inflammation.

📣 Be aware that patients with rapidly proliferating tumor and high tumor burden are at risk for tumor lysis syndrome; closely monitor these patients for hyperphosphatemia, hypocalcemia, hyperuricemia, hyperkalemia, and acute renal failure and take appropriate measures.

📣 Continue to closely monitor neurologic function for signs and symptoms of PML (such as paresis, cognitive impairment, and problems with coordination).

📣 Continue to closely monitor patients for signs and symptoms of Stevens-Johnson syndrome (such as hives, red or purple skin, rash, blisters).

### Patient teaching

📣 Instruct patient to immediately contact prescriber if signs and symptoms of infusion reactions (including fever, chills, rash, or breathing problems) occur within 24 hours of infusion.

📣 Instruct patient to immediately contact prescriber if neurologic signs or symptoms of PML occur (such as problems with coordination, decreased strength or weakness, confusion, or problems thinking).

📣 Instruct patient to immediately seek medical attention if hives, red or purple skin, rash, or blisters occur.

- Advise patient to report numbness or tingling of the hands or feet.

- Advise patient to contact prescriber if a fever (temperature of 38° C [100.5° F] or greater) or other evidence of potential infection (such as chills, cough, or pain on urination) develops.

- Counsel female patient of childbearing age to avoid pregnancy and breastfeeding while receiving this drug.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## bromocriptine mesylate

Apo-Bromocriptine\*, Cycloset, Dom-Bromocriptine\*, Parlodel, PMS-Bromocriptine\*

**Pharmacologic class:** Ergot-derivative dopamine agonist

**Therapeutic class:** Antiparkinsonian

**Pregnancy risk category B**

### Action

Directly stimulates dopamine receptors in hypothalamus, causing release of prolactin-inhibitory factors and thereby relieving akinesia, rigidity, and tremors associated with Parkinson's disease. Also restores testicular or ovarian function and suppresses lactation. Cycloset's action in glycemic control is unknown.

### Availability

**Capsules:** 5 mg

**Tablets:** 0.8 mg, 2.5 mg

### Indications and dosages

➤ Parkinson's disease

**Adults:** Initially, 1.25 mg P.O. b.i.d. Increase by 2.5 mg/day q 14 to 28 days depending on therapeutic response. Usual therapeutic dosage is 10 to 40 mg/day.

➤ Acromegaly

**Adults:** Initially, 1.25 to 2.5 mg/day P.O. for 3 days. Increase up to 1.25 to 2.5 mg/day q 3 to 7 days. Usual therapeutic dosage is 20 to 30 mg/day; not to exceed 100 mg/day.

➤ Hyperprolactinemia

**Adults:** Initially, 1.25 to 2.5 mg/day P.O. Increase gradually q 3 to 7 days up to 2.5 mg two to three times daily.

➤ Neuroleptic malignant syndrome

**Adults:** Initially, 5 mg P.O. once daily. Increase up to 20 mg/day.

➤ Pituitary tumors

**Adults:** Initially, 1.25 mg P.O. b.i.d. to t.i.d. Adjust dosage gradually over several weeks to a maintenance dosage of 10 to 20 mg/day given in divided doses.

➤ Type 2 diabetes mellitus

**Adults:** Initially, 0.8 mg P.O. daily within 2 hours of awakening; may increase by one tablet (0.8 mg) weekly until target range (1.6 to 4.8 mg) or maximal tolerance is reached.

### Contraindications

- Hypersensitivity to drug, its components, or other ergot-related drugs
- Severe peripheral vascular disease
- Uncontrolled hypertension, syncopal migraines
- Breastfeeding

### Precautions

Use cautiously in:

- impaired hepatic or cardiac function, renal disease, hypertension, pituitary tumor
- psychiatric disorders
- galactose intolerance, severe lactose deficiency, glucose-galactose malabsorption (use not recommended)
- Concomitant use with anti-hypertensives
- Concomitant use with dopamine antagonists such as neuroleptic agents (use not recommended)
- pregnant patients
- children younger than age 15.

### Administration

- Give with meals or milk.
- If desired, give at bedtime to minimize dizziness and nausea.

- For Cycloset, administer within 2 hours of patient's waking in the morning and with food.

Route	Onset	Peak	Duration
P.O.	2 hr	8 hr	24 hr
P.O. (Cycloset)	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** asthenia, confusion, headache, dizziness, fatigue, delusions, nervousness, mania, insomnia, nightmares, **seizures, cerebrovascular accident**

**CV:** hypotension, palpitations, extrasystoles, syncope, **arrhythmias, bradycardia, acute myocardial infarction**

**EENT:** blurred vision, diplopia, burning sensation in eyes, amblyopia, rhinitis, sinusitis, nasal congestion

**GI:** dyspepsia, nausea, vomiting, diarrhea, constipation, abdominal cramps, anorexia, dry mouth, **GI hemorrhage**

**GU:** urinary incontinence, polyuria, urinary retention

**Musculoskeletal:** leg cramps

**Skin:** urticaria, coolness and pallor of fingers and toes, rash on face and arms, alopecia

**Other:** metallic taste, digital vasospasm (in acromegaly use only), infection

### Interactions

**Drug-drug.** *Amitriptyline, estrogens, haloperidol, hormonal contraceptives, imipramine, loxapine, MAO inhibitors, phenothiazines, progestins, reserpine:* interference with bromocriptine effects  
*Cyclosporine:* inhibition of cyclosporine metabolism, leading to cyclosporine toxicity

*Dopamine receptor antagonists (such as neuroleptics [including phenothiazines, butyrophenones, thioxanthenes]), metoclopramide:* diminished effectiveness of Cycloset and these drugs

*Ergot-related drugs:* increased ergot-related adverse reactions, such as nausea, vomiting, and fatigue; decreased effectiveness of these drugs

*Erythromycin:* increased bromocriptine blood level and greater risk of adverse effects

*Levodopa:* additive effects of bromocriptine

*Potent CYP3A4 inhibitors or inducers, substrates of CYP3A4 (such as azole antimycotics, HIV protease inhibitors):* increased or decreased Cycloset circulating levels

*Risperidone:* increased prolactin blood level, interference with bromocriptine effects

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, blood urea nitrogen, creatine kinase, growth hormone, uric acid:* increased levels

**Drug-herbs.** *Chaste tree fruit:* decreased bromocriptine effects

**Drug-behaviors.** *Alcohol use:* disulfiram-like reaction

### Patient monitoring

- Monitor blood pressure to detect hypotension.
- When giving drug for hyperprolactinemia, monitor serum prolactin.
- When giving drug for acromegaly, monitor growth hormone levels to help guide dosage adjustment.
- When giving drug for diabetes mellitus, monitor blood glucose and hemoglobin A1C levels.
- In long-term use, monitor respiratory, hepatic, cardiovascular, and renal function.

### Patient teaching

- Instruct patient to take Cycloset within 2 hours of waking in the morning and with food.
-  Caution patient not to drink alcohol because of risk of severe reaction.

- Advise patient to have regular dental exams. Drug causes dry mouth, possibly resulting in caries and periodontal disorders.
- To minimize constipation, instruct patient to exercise regularly, increase dietary fiber intake, and drink plenty of fluids (3,000 ml daily).
- Advise patient who doesn't desire pregnancy to use reliable contraceptive, because drug may restore fertility.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## brompheniramine

Bromfenac, Dimetapp Allergy, Lodrane 24, LoHist 12D, Nasahist B, ND-Stat, TanaCof-XR, Vazol

**Pharmacologic class:** Histamine antagonist

**Therapeutic class:** Antihistamine

**Pregnancy risk category** C

### Action

Antagonizes effects of histamine at histamine<sub>1</sub>-receptor sites, but doesn't bind to or inactivate histamine. Also shows anticholinergic, antipruritic, and sedative activity.

### Availability

*Capsules (liquigels):* 4 mg

*Elixir:* 2 mg/5 ml

*Suspension:* 12 mg/5 ml

*Tablets:* 4 mg, 8 mg, 12 mg

*Tablets (extended-release):* 8 mg, 12 mg

## Indications and dosages

➤ Symptomatic relief of allergic symptoms caused by histamine release; severe allergic or hypersensitivity reactions

**Adults and children ages 12 and older:** 4 to 8 mg P.O. three to four times daily, or 8 to 12 mg extended-release tablets P.O. two or three times daily. Maximum dosage is 36 mg/day.

**Children ages 6 to 12:** 2 mg P.O. q 4 to 6 hours as needed, not to exceed 12 mg/day

**Children ages 2 to 6:** 1 mg P.O. q 4 to 6 hours p.r.n., not to exceed 6 mg/day

### Contraindications

- Hypersensitivity to drug
- Coronary artery disease
- Urinary retention
- Pyloroduodenal obstruction
- Peptic ulcer
- MAO inhibitor use within past 14 days
- Breastfeeding

### Precautions

Use cautiously in:

- angle-closure glaucoma, hepatic disease, hyperthyroidism, hypertension, bronchial asthma
- elderly patients
- pregnant patients.

### Administration

- Give with food if GI upset occurs.
- Don't break or crush extended-release tablets.
- Shake oral suspension well before measuring dose.

⚠ Check elixir and suspension doses carefully, because the mg/ml varies widely between the two liquids.

Route	Onset	Peak	Duration
P.O.	15-60 min	2-5 hr	3-24 hr

**Adverse reactions**

**CNS:** drowsiness, sedation, dizziness, excitation, irritability, syncope, tremor

**CV:** hypertension, hypotension, palpitations, tachycardia, extrasystole, **arrhythmias, bradycardia**

**EENT:** blurred vision, nasal congestion or dryness, dry or sore throat

**GI:** nausea, vomiting, constipation, dry mouth

**GU:** urinary retention or hesitancy, dysuria, early menses, decreased libido, impotence

**Hematologic:** **hemolytic anemia, hypoplastic anemia, thrombocytopenia, agranulocytosis, leukopenia, pancytopenia**

**Respiratory:** thickened bronchial secretions, chest tightness, wheezing

**Skin:** urticaria, rash

**Other:** increased or decreased appetite, weight gain

**Interactions**

**Drug-drug.** *CNS depressants (including opioids and sedative-hypnotics):* additive CNS depression

*MAO inhibitors:* intensified, prolonged anticholinergic effects

**Drug-diagnostic tests.** *Allergy tests:* false results

*Granulocytes, platelets:* decreased counts

**Drug-behaviors.** *Alcohol use:* increased CNS depression

**Patient monitoring**

- Monitor respiratory status.
- Stay alert for urinary retention, urinary frequency, and painful or difficult urination. Discontinue drug if these problems occur.
- With long-term use, monitor CBC.
- Monitor elderly patient for dizziness, sedation, and hypotension.
- If patient takes over-the-counter antihistamines, monitor him closely to avoid potential overdose.

**Patient teaching**

- Advise patient to take drug with meals if GI upset occurs.
- Instruct patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Caution patient to avoid alcohol while taking drug.
- Urge patient to tell all prescribers which drugs and over-the-counter preparations he's taking.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

**budesonide**

Budenofalk<sup>⚠</sup>, Easyhaler Budesonide<sup>⚠</sup>, Entocort CR<sup>⚠</sup>, Entocort EC, Entocort Enema<sup>⚠</sup>, Novolizer Budesonide<sup>⚠</sup>, Pulmicort Flexhaler, Pulmicort Respules, Rhinocort Aqua

**Pharmacologic class:** Corticosteroid (inhalation)

**Therapeutic class:** Antiasthmatic, steroidal anti-inflammatory

**Pregnancy risk category B (intranasal, inhalation); C (oral)**

**FDA BOXED WARNING**

- Pulmicort Respules is meant only for inhalation by compressed air-driven jet nebulizers (not ultrasonic devices). It must not be injected. Read patient instructions before using.

**Action**

Decreases inflammation by inhibiting migration of inflammatory mediators to injury site, where it reverses dilation

and increases vessel permeability. Also decreases plasma exudation and mucus secretions within airway.

### Availability

*Capsules (extended-release):* 3 mg  
*Inhalation powder:* 90 mcg (Pulmicort Flexhaler), 180 mcg (Pulmicort Flexhaler)

*Inhalation suspension (Respules):* 0.25 mg/2 ml, 0.5 mg/2 ml, 1 mg/ml

*Nasal spray:* 32 mcg/metered spray (7-g canister)

### Indications and dosages

➤ Maintenance treatment of asthma as prophylactic therapy

**Adults:** 360 mcg (powder for oral inhalation) inhaled b.i.d. For some patients, 180 mcg inhaled b.i.d. may be appropriate. Maximum dosage is 720 mcg b.i.d.

**Children ages 6 to 17:** 180 mcg (powder for oral inhalation) inhaled b.i.d. For some patients, dosage of 360 mcg inhaled b.i.d. may be appropriate. Maximum dosage is 360 mcg b.i.d.

➤ Seasonal or perennial allergic rhinitis

**Adults and children ages 6 and older:** Two sprays in each nostril in morning and evening, or four sprays in each nostril in morning. Maintenance dosage is fewest number of sprays needed to control symptoms.

➤ Mild to moderate active Crohn's disease involving ileum, ascending colon, or both

**Adults:** 9 mg P.O. daily for up to 8 weeks. For recurring episodes of active Crohn's disease, 8-week course can be repeated and tapered to 6 mg P.O. daily for 2 weeks before complete cessation.

### Dosage adjustment

• Moderate to severe hepatic disease

### Contraindications

- Hypersensitivity to drug
- Status asthmaticus

### Precautions

Use cautiously in:

- renal disease, hepatic disease, heart failure, active untreated infections, systemic infections, hypertension, osteoporosis, diabetes mellitus, glaucoma, underlying immunosuppression, hypothyroidism, diverticulitis, nonspecific ulcerative colitis, recent intestinal anastomoses, thromboembolic disorders, seizures, myasthenia gravis, ocular herpes simplex infection
- patients receiving concurrent systemic corticosteroids
- pregnant or breastfeeding patients
- children younger than age 6.

### Administration

- If patient also uses a bronchodilator, give that drug at least 15 minutes before budesonide.
- Know that using a spacer reduces risk of candidiasis and hoarseness.
- Make sure patient swallows capsules whole without crushing or chewing them.

Route	Onset	Peak	Duration
P.O.	Unknown	0.5-10 hr	Unknown
Inhalation (nasal)	Immediate	1-2 wk	Unknown

### Adverse reactions

**CNS:** headache, nervousness, depression, euphoria, psychoses, **increased intracranial pressure**

**CV:** hypertension, Churg-Strauss syndrome, **thrombophlebitis, thromboembolism**

**EENT:** cataracts, nasal congestion, nasal burning or dryness, epistaxis, perforated nasal septum, hoarseness, nasopharyngeal and oropharyngeal fungal infections

**GI:** nausea, vomiting, peptic ulcers, anorexia, esophageal candidiasis, dry mouth

**Metabolic:** hyperglycemia, decreased growth (in children), cushingoid appearance (moon face, buffalo

hump), **adrenal suppression or insufficiency**

**Musculoskeletal:** muscle wasting, muscle pain, osteoporosis, aseptic joint necrosis

**Respiratory:** cough, wheezing, rebound congestion, **bronchospasm**

**Skin:** facial edema, rash, petechiae, contact dermatitis, acne, bruising, hirsutism, urticaria

**Other:** bad taste, anosmia, weight gain or loss, increased susceptibility to infection, **angioedema, hypersensitivity reaction**

### Interactions

**Drug-drug.** *Amphotericin B, mezlocillin, piperacillin, thiazide and loop diuretics, ticarcillin:* additive hypokalemia

*Digoxin:* increased risk of digoxin toxicity

*Erythromycin, indinavir, itraconazole, ketoconazole, ritonavir, saquinavir:* increased blood level and effects of budesonide

*Fluoroquinolones:* increased risk of tendon rupture

*Hormonal contraceptives:* blockage of budesonide metabolism

*Insulin, oral hypoglycemics:* increased budesonide requirement

*Live-virus vaccines:* decreased antibody response to vaccine, increased risk of adverse effects from budesonide

*Nonsteroidal anti-inflammatory drugs (including aspirin):* increased risk of adverse GI effects

*Phenobarbital, phenytoin, rifampin:* decreased budesonide efficacy

*Somatrem, somatropin:* decreased response to budesonide

**Drug-food.** *Grapefruit, grapefruit juice:* increased blood level and effects of budesonide

*High-fat meal:* delayed peak budesonide concentration

### Patient monitoring

- Monitor respiratory status to evaluate drug efficacy.

☚ Stay alert for hypersensitivity reactions, especially angioedema.

- Evaluate liver function test results.
- Periodically observe patient for proper inhaler use.
- Assess oral cavity for infection.

### Patient teaching

- Teach patient proper use of inhaler.
- Tell patient to swallow capsules whole without crushing or chewing them.
- ☚ Instruct patient to contact prescriber immediately if he develops itching, rash, fever, swelling of face and neck, or difficulty breathing.
- Encourage patient to document medication use and his response in diary.
- Advise patient to report signs and symptoms of fungal infections of mouth.
- Tell female patient to inform prescriber if she is pregnant or plans to become pregnant.
- Caution patient to avoid exposure to chickenpox and measles, if possible.
- Emphasize importance of rinsing mouth after each inhaler treatment and washing and drying inhaler thoroughly after each use.
- Instruct patient to avoid high-fat meals, grapefruit, and grapefruit juice.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and foods mentioned above.

## bumetanide

### Bumetanide Injection

**Pharmacologic class:** Loop diuretic

**Therapeutic class:** Antihypertensive

**Pregnancy risk category C**

**FDA BOXED WARNING**

- Drug is a potent diuretic; excessive amounts may cause profound diuresis with fluid and electrolyte depletion. Give only under careful medical supervision; adjust dosage and dosing schedule to patient's needs.

**Action**

Inhibits reabsorption of sodium and chloride in distal renal tubules and ascending limb of loop of Henle; increases renal excretion of water, sodium, chloride, magnesium, hydrogen, and calcium. Also reduces increased fluid volume caused by renal vasodilation.

**Availability**

*Injection:* 0.25 mg/ml

*Tablets:* 0.5 mg, 1 mg, 2 mg

**Indications and dosages**

- Edema caused by heart failure or hepatic or renal disease; adult nocturia

**Adults:** 0.5 to 2 mg/day P.O. as a single dose; up to two additional doses may be given q 4 to 5 hours (up to 10 mg/day). Or 0.5 to 1 mg I.V. or I.M., repeated q 2 to 3 hours as needed, up to 10 mg/day.

- Hypertension

**Adults:** 0.5 mg/day P.O. Maximum dosage is 5 mg/day.

**Dosage adjustment**

- Renal impairment
- Elderly patients

**Off-label uses**

- Drug-related edema
- Hypercalcemia

**Contraindications**

- Hypersensitivity to drug or sulfonamides
- Uncorrected electrolyte imbalances
- Hepatic coma
- Anuria and oliguria

**Precautions**

Use cautiously in:

- severe hepatic disease, electrolyte depletion, diabetes mellitus, worsening azotemia
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 18.

**Administration**

- Know that oral or I.V. route is preferred, because I.M. administration may cause pain at injection site.
- Be aware that drug may be given alone or with other antihypertensives.
- Dilute with dextrose 5% in water, normal saline solution, or lactated Ringer's injection.
- Give I.V. dose slowly over 2 minutes.
- Give P.O. form with food or milk.

Route	Onset	Peak	Duration
P.O.	30-60 min	1 hr	3-6 hr
I.V.	Within min	15-45 min	3-6 hr
I.M.	40 min	1-2 hr	4-6 hr

**Adverse reactions**

**CNS:** dizziness, headache, insomnia, nervousness, vertigo, weakness, paresthesia, confusion, fatigue, hand-flapping tremor, **encephalopathy**

**CV:** hypotension, ECG changes, chest pain, **thrombophlebitis, arrhythmias**

**EENT:** blurred vision, nystagmus, hearing loss, tinnitus

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, gastric irritation, dry mouth, anorexia, **acute pancreatitis**

**GU:** polyuria, nocturia, glycosuria, premature ejaculation, difficulty maintaining erection, **oliguria, renal failure**

**Hepatic:** jaundice

**Metabolic:** dehydration, hyperglycemia, hyperuricemia, hypokalemia, hypomagnesemia, **hypochloremic alkalosis**

**Musculoskeletal:** arthralgia; muscle cramps, aching, or tenderness

**Skin:** photosensitivity, hives, rash, pruritus, urticaria, diaphoresis

**Other:** pain, nipple tenderness

### Interactions

**Drug-drug.** *Aminoglycosides, cisplatin:* increased risk of ototoxicity  
*Amphotericin B, corticosteroids, mezlocillin, other diuretics, piperacillin, stimulant laxatives:* additive hypokalemia

*Anticoagulants, thrombolytics:*

increased bumetanide effects

*Antihypertensives, nitrates:* additive hypotension

*Cardiac glycosides:* increased risk of digoxin toxicity

*Lithium:* decreased lithium excretion, possible lithium toxicity

*Neuromuscular blockers:* prolonged neuromuscular blockade

*Nonsteroidal anti-inflammatory drugs, probenecid:* inhibition of diuretic response

**Drug-diagnostic tests.** *Blood urea nitrogen (BUN), cholesterol, creatinine, glucose, nitrogenous compounds:* increased levels

*Calcium, magnesium, platelets, potassium, sodium:* decreased levels

**Drug-herbs.** *Dandelion:* interference with diuretic activity

*Ginseng:* resistance to diuresis

*Licorice:* rapid potassium loss

**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension

### Patient monitoring

- Weigh patient at start of therapy, and monitor weight throughout therapy.
- Monitor blood pressure regularly.
- Monitor serum electrolyte, uric acid, glucose, and BUN levels.
- Monitor elderly patients for extreme blood pressure changes, orthostatic hypotension, and dehydration.

### Patient teaching

- Advise patient to take drug in morning to prevent nocturia, and to take second dose (if required) in late afternoon.

- Instruct patient to move slowly when sitting up or standing, to avoid dizziness or light-headedness from sudden blood pressure drop.

- Caution patient to avoid alcohol because of increased risk of hypotension.

- Advise patient to eat foods high in potassium. Provide other dietary counseling as appropriate to help prevent or minimize electrolyte imbalances.

- Instruct patient to weigh himself often to help detect fluid retention.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## buprenorphine hydrochloride

Buprenex, Burinex<sup>⚠</sup>, Subutex, Temgesic<sup>⚠</sup>, Transtec<sup>⚠</sup>

**Pharmacologic class:** Opioid agonist-antagonist

**Therapeutic class:** Opioid analgesic

**Controlled substance schedule III**

**Pregnancy risk category C**

### Action

Unclear. May bind to opiate receptors in CNS, altering perception of and response to painful stimuli while causing generalized CNS depression. Also has partial antagonist properties, which may lead to opioid withdrawal effects in patients with physical drug dependence.

### Availability

*Injection:* 300 mcg (0.3 mg)/ml

*Tablets (sublingual):* 2 mg, 8 mg

## Indications and dosages

➤ Moderate to severe pain

**Adults:** 0.3 mg I.M. or slow I.V. q 6 hours as needed. Repeat initial dose after 30 to 60 minutes.

**Children ages 2 to 12:** 2 to 6 mcg (0.002 to 0.006 mg)/kg I.M. or slow I.V. q 4 to 6 hours

➤ Opioid dependence

**Adults:** 12 to 16 mg/day S.L.

## Dosage adjustment

- Elderly patients

## Contraindications

- Hypersensitivity to drug
- Elderly patients
- MAO inhibitor use within 14 days

## Precautions

Use cautiously in:

- increased intracranial pressure (ICP); respiratory impairment; severe renal, hepatic, or pulmonary disease; hypothyroidism; adrenal insufficiency; undiagnosed abdominal pain; prostatic hypertrophy; systemic lupus erythematosus; gout; kyphoscoliosis; diabetes mellitus; alcoholism
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 13.

## Administration

• Mix with lactated Ringer's injection, dextrose 5% in water, or normal saline solution.

 Give I.V. dose slowly over no less than 2 minutes. Drug may cause respiratory depression (especially initial dose).

- When giving I.M., rotate injection sites to prevent induration and abscess.
- If patient is immobilized, reposition him frequently and keep head of bed elevated.

Route	Onset	Peak	Duration
I.V.	Immediate	2 min	6 hr
I.M., S.L.	15 min	1 hr	6 hr

## Adverse reactions

**CNS:** confusion, malaise, hallucinations, dizziness, euphoria, headache, unusual dreams, psychosis, slurred speech, paresthesia, depression, tremor, agitation, **seizures, coma, increased ICP**

**CV:** hypertension, hypotension, palpitations, tachycardia, Wenckebach (Mobitz Type 1) block, **bradycardia**

**EENT:** blurred vision, diplopia, amblyopia, miosis, conjunctivitis, tinnitus

**GI:** nausea, vomiting, constipation, flatulence, ileus, dry mouth

**GU:** urinary retention

**Respiratory:** hypoventilation, dyspnea, cyanosis, apnea, **respiratory depression**

**Skin:** diaphoresis, pruritus

**Other:** physical or psychological drug dependence, drug tolerance

## Interactions

**Drug-drug.** *Antidepressants, antihistamines, sedative-hypnotics:* additive CNS depression

*MAO inhibitors:* increased CNS and respiratory depression, increased hypotension

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

## Patient monitoring

- Check hepatic function before and during therapy.
- Monitor respiratory status throughout therapy. Respiratory rate of 12 breaths/minute or less may warrant withholding dose or decreasing dosage.

## Patient teaching

- Instruct patient to move slowly when sitting up or standing, to avoid dizziness or light-headedness from sudden blood pressure drop.
- Caution patient to avoid driving and other hazardous activities until he

knows how drug affects concentration and alertness.

- Advise patient to increase daily fluid intake to help prevent constipation.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, herbs, and behaviors mentioned above.

## bupropion hydrobromide

Aplenzin

## bupropion hydrochloride

Budeprion SR, Budeprion XL, Buproban, Wellbutrin, Wellbutrin SR, Wellbutrin XL, Zyban

**Pharmacologic class:** Aminoketone

**Therapeutic class:** Second-generation antidepressant, smoking-cessation aid

**Pregnancy risk category** C

### FDA BOXED WARNING

- Antidepressants increase risk of suicidal thinking and behavior in children, adolescents, and young adults with major depressive disorder and other psychiatric disorders. Risk must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, or unusual behavior changes. Advise family or caregiver to observe patient closely and communicate with prescriber as needed.
- Bupropion hydrobromide (Aplenzin) and bupropion hydrochloride (Budeprion SR, Budeprion XL, Buproban, Wellbutrin, Wellbutrin SR, and Wellbutrin XL) aren't approved for smoking cessation treatment, but bupropion hydrochloride under the

names of Buproban and Zyban is approved for this use. Serious neuropsychiatric events, including but not limited to depression, suicidal ideation, suicide attempt, and completed suicide, have been reported in patients taking Buproban and Zyban for smoking cessation. Some cases may have been complicated by the signs and symptoms of nicotine withdrawal in patients who stopped smoking. Risks should be weighed against benefits of their use in smoking cessation.

- Drug isn't approved for use in pediatric patients.

### Action

Unclear. Thought to decrease neuronal reuptake of dopamine, serotonin, and norepinephrine in CNS. Action as smoking-cessation aid may result from noradrenergic or dopaminergic activity.

### Availability

#### bupropion hydrobromide

Tablets (extended-release): 174 mg, 348 mg, 522 mg

#### bupropion hydrochloride

Tablets: 75 mg, 100 mg

Tablets (extended-release): 150 mg, 300 mg

Tablets (sustained-release): 100 mg, 150 mg, 200 mg

### Indications and dosages

#### > Depression

**Adults:** Initially, 100 mg P.O. immediate-release tablet b.i.d. (morning and evening). After 3 days, may increase to 100 mg t.i.d. After 4 weeks, may increase to a maximum dosage of 450 mg/day in divided doses. No single dose should exceed 150 mg. With total daily dosage of 300 mg, wait at least 6 hours between doses; with total daily dosage of 450 mg, wait at least 4 hours between doses. Alternatively, give one 150-mg sustained-release tablet daily;

increase to 150-mg sustained-release tablet b.i.d. based on clinical response. Or initially, 174 mg P.O. extended-release tablet daily in the morning; if 174-mg dose is adequately tolerated, increase to 348 mg extended-release tablet daily as early as day 4. An increase in dosage to maximum of 522 mg extended-release tablet daily, given as a single dose, may be considered for patients in whom no clinical improvement is noted after several weeks of treatment at 348 mg/day. Don't exceed single dose of 150 mg for immediate-release tablets, 522 mg for extended-release tablets, or 200 mg for sustained-release tablets.

#### ➤ Smoking cessation

**Adults:** 150 mg P.O. sustained-release tablet (Zyban) or 150 mg extended-release tablet (Buproban) once daily for 3 days, then 150-mg sustained-release tablet b.i.d. for 7 to 12 weeks. Space doses at least 8 hours apart. Don't exceed maximum dosage of 300 mg daily.

### Contraindications

- Hypersensitivity to drug
- Seizures
- Anorexia nervosa or bulimia
- MAO inhibitor use within past 14 days
- Acute alcohol or sedative withdrawal
- Use of other bupropion products

### Precautions

Use cautiously in:

- renal or hepatic impairment, unstable cardiovascular status
- patients with cranial trauma or other predispositions toward seizures, patients treated with other agents that lower seizure threshold (such as antipsychotics, other antidepressants, theophylline, systemic steroids)
- patients with recent history of myocardial infarction or unstable heart disease
- elderly patients

- pregnant or breastfeeding patients
- children.

### Administration

- Be aware that patients should swallow extended- and sustained-release tablets whole and not crush or chew them.
- Be aware that treatment for smoking cessation should start while patient is still smoking, since approximately 1 week of treatment is required to achieve steady-state blood levels of bupropion.
- Avoid bedtime doses because they may worsen insomnia.

 Know that drug shouldn't be withdrawn abruptly when used for depression.

Route	Onset	Peak	Duration
P.O.	Unknown	2 hr	Unknown
P.O. (extended, sustained)	Unknown	3 hr	Unknown

### Adverse reactions

**CNS:** agitation, headache, insomnia, mania, psychoses, depression, dizziness, drowsiness, tremor, anxiety, nervousness, **seizures**

**CV:** hypertension, hypotension, tachycardia, palpitations, **severe hypertension, complete AV block**

**EENT:** blurred vision, amblyopia, auditory disturbances, epistaxis, rhinitis, pharyngitis

**GI:** nausea, vomiting, dyspepsia, abdominal pain, flatulence, mouth ulcers, dry mouth

**GU:** urinary retention, urinary frequency, nocturia, vaginal irritation, testicular swelling

**Metabolic:** hyperglycemia, changes in libido, **hypoglycemia, syndrome of inappropriate antidiuretic hormone secretion**

**Musculoskeletal:** arthralgia, myalgia, leg cramps, twitching, neck pain

**Respiratory:** bronchitis, increased cough, dyspnea

**Skin:** photosensitivity, dry skin, pruritus, rash, urticaria, diaphoresis, skin temperature changes, **erythema multiforme, Stevens-Johnson syndrome**

**Other:** altered taste, increased or decreased appetite, weight gain or loss, hot flashes, fever, allergic reaction, flu-like symptoms, **anaphylactoid reactions, anaphylaxis**

## Interactions

**Drug-drug.** *Benzodiazepine withdrawal, corticosteroids, other antidepressants, over-the-counter stimulants, phenothiazines, theophylline:* increased risk of seizures  
*Cimetidine:* inhibited bupropion metabolism

*CYP2B6 substrates or inhibitors (such as clopidogrel, cyclophosphamide, orphenadrine, thiotepa, ticlopidine), efavirenz, fluvoxamine, nelfinavir, nor-fluoxetine, paroxetine, ritonavir, sertraline:* increased bupropion activity  
*Despiramine, paroxetine, ritonavir, sertraline:* possibly increased bupropion blood level

*Levodopa, MAO inhibitors:* increased risk of adverse reactions

*Nicotine transdermal system:* increased risk of severe hypertension

**Drug-diagnostic tests.** *Glucose:* increased level

**Drug-behaviors.** *Alcohol use or cessation:* increased risk of seizures

*Sun exposure:* increased risk of photosensitivity

## Patient monitoring

- Monitor blood pressure, ECG, CBC, and renal and hepatic function. Monitor tricyclic antidepressant (TCA) blood level if patient's taking TCAs concurrently.
- Be aware that if patient is also on nicotine patch for smoking cessation, the combination may cause or increase risk of hypertension.
- Check for oral and dental problems.

## Patient teaching

 Instruct patient to seek immediate medical attention if itching, hives, swelling of the throat, or difficulty breathing occurs.

 Instruct patient taking drug for smoking cessation to immediately notify prescriber if agitation, hostility, depressed mood, changes in thinking or behavior, suicidal ideation, or suicidal behavior occurs.

- Advise patient to set a “target quit date” within first 2 weeks of treatment for smoking cessation.

- Instruct patient to swallow extended- or sustained-release tablets without crushing or chewing.

 Caution patient not to discontinue drug abruptly when taking drug for depression.

- Emphasize importance of frequent oral hygiene. (Dry mouth increases risk of caries and dental problems.)

- Caution patient to avoid alcohol, because it may increase risk of seizures.
- Advise patient to keep regular appointments for periodic blood tests and hepatic and renal studies.

- Advise breastfeeding patient that she should decide whether to discontinue breastfeeding or discontinue drug, taking into account the importance of drug for her treatment.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## bupirone hydrochloride

BuSpar

**Pharmacologic class:** Azaspirodecane-dione

**Therapeutic class:** Anxiolytic

**Pregnancy risk category B**

**Action**

Unclear. Thought to bind to serotonin and dopamine receptors in CNS, increasing dopamine metabolism and impulse formation. Also thought to inhibit neuronal firing and reduce serotonin turnover.

**Availability**

Tablets: 5 mg, 7.5 mg, 10 mg, 15 mg, 30 mg

**Indications and dosages**

➤ Anxiety disorders; anxiety symptoms

**Adults:** 7.5 mg P.O. b.i.d.; increase by 5 mg/day q 2 to 3 days as needed (not to exceed 60 mg/day). Common dosage is 20 to 30 mg/day in divided doses.

**Off-label uses**

- Parkinsonian syndrome
- Symptomatic relief of depression

**Contraindications**

- Hypersensitivity to drug
- Severe renal or hepatic impairment
- MAO inhibitor use within past 14 days

**Precautions**

Use cautiously in:

- patients receiving concurrent anxiolytics or psychotropics
- pregnant or breastfeeding patients
- children.

**Administration**

- Give with food to minimize GI upset.
- Know that full benefit of drug therapy may take up to 2 weeks.

Route	Onset	Peak	Duration
P.O.	7-10 days	3-4 wk	Unknown

**Adverse reactions**

**CNS:** dizziness, drowsiness, nervousness, headache, insomnia, weakness, personality changes, numbness, paresthesia, tremor, dream disturbances

**CV:** chest pain, palpitations, tachycardia, hypertension, hypotension

**EENT:** blurred vision, conjunctivitis, tinnitus, nasal congestion, sore throat

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dry mouth

**GU:** dysuria, urinary frequency or hesitancy, menstrual irregularities, menstrual spotting, libido changes

**Musculoskeletal:** myalgia

**Respiratory:** chest congestion, hyperventilation, dyspnea

**Skin:** rash, alopecia, blisters, pruritus, dry skin, easy bruising, edema, flushing, clammy skin, excessive sweating

**Other:** altered taste or smell, fever

**Interactions**

**Drug-drug.** *Erythromycin, itraconazole:* increased buspirone blood level

*MAO inhibitors:* hypertension

*Trazodone:* increased risk of adverse hepatic effects

**Drug-food.** *Grapefruit juice:* increased buspirone blood level and effects

**Drug-herbs.** *Hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

**Patient monitoring**

- Monitor mental status closely.
- Assess hepatic and renal function regularly to detect drug toxicity.

**Patient teaching**

- Instruct patient to take drug with food.
- Advise patient not to use drug to manage everyday stress or tension.
- Instruct patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Caution patient to avoid alcohol because it increases CNS depression.
- Emphasize importance of keeping follow-up appointments to check progress.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the

drugs, foods, herbs, and behaviors mentioned above.

## busulfan

Busilvex<sup>®</sup>, Busulfex, Myleran

**Pharmacologic class:** Alkylating agent

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

• Drug causes profound myelosuppression at recommended dosage. Give under supervision of physician experienced in allogeneic hematopoietic stem cell transplantation, cancer chemotherapy, and management of severe pancytopenia, in facility with adequate diagnostic and treatment resources.

### Action

Unclear. Thought to interfere with bacterial cell-wall synthesis by cross-linking strands of DNA and disrupting RNA transcription, which causes cell to rupture and die. Exhibits minimal immunosuppressant activity.

### Availability

**Injection:** 6 mg/ml in 10-ml ampules

**Tablets:** 2 mg

### Indications and dosages

➤ Chronic myelogenous leukemia

**Adults:** 4 to 8 mg P.O. daily until white blood cell (WBC) count decreases to 15,000/mm<sup>3</sup>; then discontinue drug until WBC count rises to 50,000/mm<sup>3</sup>, and then resume as needed.

**Children:** 0.06 to 0.12 mg/kg/day P.O. or 1.8 to 4.6 mg/m<sup>2</sup>/day P.O. Adjust dosage to maintain WBC count at approximately 20,000/mm<sup>3</sup>. Drug should be withheld when WBC count

decreases to approximately 15,000/mm<sup>3</sup>.

➤ Allogeneic hematopoietic stem cell transplantation

**Adults:** 0.8 mg/kg I.V. q 6 hours for 4 days. Starting 6 hours after 16th dose of busulfan injection, give cyclophosphamide 60 mg/kg/day I.V. over 1 hour for 2 days.

### Off-label uses

- Adjunctive therapy in ovarian cancer
- Bone marrow transplantation

### Contraindications

- Hypersensitivity to drug
- Patients not definitively diagnosed with chronic myelogenous leukemia
- Pregnancy or breastfeeding

### Precautions

Use cautiously in:

- active infections, decreased bone marrow reserve, chronic debilitating disease, depressed neutrophil and platelet counts, seizure disorders, obesity
- patients receiving concurrent myelosuppressive or radiation therapy
- females of childbearing age.

### Administration

- Give oral doses on empty stomach.
- When administering I.V., withdraw dose from ampule using 5-micron filter needle. Remove filter needle and use new needle to add busulfan to diluent.
- Dilute for injection using dextrose 5% in water or normal saline solution.
- Infuse I.V. dose over 2 hours, using an infusion pump.
- Flush I.V. catheter before and after each infusion with 5 ml D<sub>5</sub>W or normal saline solution.
- ⚠ Be aware that drug is highly toxic and has a narrow therapeutic index.
- Maintain vigorous hydration to reduce risk of renal toxicity.
- Handle patient gently to avoid bruising.

Route	Onset	Peak	Duration
P.O.	1-2 wk	Wks	Up to 1 mo
I.V.	Unknown	Unknown	13 days

## Adverse reactions

**CNS:** anxiety, confusion, depression, dizziness, headache, insomnia, weakness, **encephalopathy, seizures, cerebral hemorrhage, coma**

**CV:** chest pain, hypotension, hypertension, tachycardia, ECG changes, **heart block, left-sided heart failure, thrombosis, pericardial effusion, ventricular extrasystole, atrial fibrillation, arrhythmias, cardiac tamponade, cardiomegaly**

**EENT:** cataracts, ear disorders, epis-taxis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, abdominal enlargement, pancreatitis, hematemesis, dry mouth, stomatitis, anorexia

**GU:** dysuria, hematuria, sterility, gynecomastia, **oliguria**

**Hematologic:** febrile neutropenia, thrombotic microangiopathy, profound myelosuppression

**Hepatic:** hepatitis, hepatomegaly

**Metabolic:** hypokalemia, hypomagne-semia, hypophosphatemia, hyperuricemia, hyperglycemia

**Musculoskeletal:** arthralgia, myalgia, back pain

**Respiratory:** hyperventilation, dyspnea, **pulmonary fibrosis**

**Skin:** pruritus, rash, acne, alopecia, erythema nodosum, exfoliative dermatitis, hyperpigmentation

**Other:** allergic reactions, chills, fever, injection site infection or inflammation; **severe bacterial, viral, fungal infections; sepsis; tumor lysis syndrome**

## Interactions

**Drug-drug.** *Anticoagulants, aspirin, nonsteroidal anti-inflammatory drugs:* increased risk of bleeding

*Live-virus vaccines:* decreased antibody response to vaccine, increased risk of adverse reactions

*Myelosuppressants:* additive bone marrow depression

*Nephrotoxic and ototoxic drugs (such as aminoglycosides, loop diuretics):* additive nephrotoxicity and ototoxicity

*Thioguanine:* increased risk of hepatotoxicity

**Drug-diagnostic tests.** *Alkaline phosphatase, aspartate aminotransferase, bilirubin, nitrogenous compounds (urea):* increased levels

*Hemoglobin, WBCs:* decreased values

## Patient monitoring

- Monitor patient closely for adequate hydration.
- Check for signs and symptoms of local or systemic infections.
- Assess for bleeding and excessive bruising.
- Evaluate oral hygiene regularly.
- Monitor CBC and WBC and platelet counts daily if patient is receiving I.V. busulfan.
- Monitor renal and hepatic function.
- 🚨 Know that diffuse pulmonary fibrosis (“busulfan lung”) is a rare but potentially life-threatening complication, with symptom onset as late as 10 years after therapy.

## Patient teaching

- Inform patient that drug doesn’t cure leukemia but may induce remission.
- Advise patient to drink plenty of fluids to avoid dehydration.
- 🚨 Instruct patient to immediately report inability to eat or drink. Prescriber may add another drug to improve appetite.
- Inform patient that he’s at increased risk for infection. Advise him to avoid contact with people with known infections and to avoid public transportation, if possible.
- Tell patient he’s at increased risk for bleeding and bruising.

- Advise patient to avoid activities that can cause injury and to use soft toothbrush and electric razor to avoid gum and skin injury.
- Inform patient that he'll undergo frequent blood testing to monitor drug effects.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## butorphanol tartrate

APO-Butorphanol\*, PMS-Butorphanol\*, Stadol

**Pharmacologic class:** Opioid agonist-antagonist

**Therapeutic class:** Opioid analgesic

**Controlled substance schedule IV**

**Pregnancy risk category C**

### Action

Alters perception of and emotional response to pain by binding with opioid receptors in brain, causing CNS depression. Also exerts antagonistic activity at opioid receptors, which reduces risk of toxicity, drug dependence, and respiratory depression.

### Availability

*Injection:* 1 mg/ml, 2 mg/ml

*Nasal spray:* 10 mg/ml

### Indications and dosages

➤ Moderate to severe pain

**Adults:** 1 to 4 mg I.M. q 3 to 4 hours as needed, not to exceed 4 mg/dose. Or 0.5 to 2 mg I.V. q 3 to 4 hours as needed. With nasal spray, 1 mg (one spray in one nostril) q 3 to 4 hours, repeated in 60 to 90 minutes if needed.

➤ Labor pains

**Adults:** 1 to 2 mg I.V. or I.M., repeated after 4 hours as needed

➤ Preoperative anesthesia

**Adults:** 2 mg I.M. 60 to 90 minutes before surgery

➤ Balanced anesthesia

**Adults:** 2 mg I.V. shortly before anesthesia induction, or 0.5 to 1 mg I.V. in increments during anesthesia

### Dosage adjustment

• Renal or hepatic impairment

• Elderly patients

### Off-label uses

• Headache

• Symptomatic relief of ureteral colic

### Contraindications

• Hypersensitivity to drug

### Precautions

Use cautiously in:

• head injury, ventricular dysfunction, coronary insufficiency, respiratory disease, renal or hepatic dysfunction

• history of drug abuse.

### Administration

• Make sure solution is clear and free of particulates before giving.

• When using nasal spray, insert tip of the sprayer about ¼" into nostril, point tip backwards, and administer one spray.

• Be aware that I.V. route is preferred for severe pain.

⚠ Know that drug may cause infant respiratory distress in neonate of pregnant patient, especially if given within 2 hours of delivery.

Route	Onset	Peak	Duration
I.V.	2-3 min	30-60 min	3-4 hr
I.M.	10-15 min	30-60 min	3-4 hr
Intranasal	15 min	1-2 hr	4-5 hr

## Adverse reactions

**CNS:** drowsiness, sedation, dizziness, tremor, irritability, syncope, stimulation

**CV:** hypertension, hypotension, palpitations, bradycardia, tachycardia, extrasystole, **arrhythmias**

**EENT:** blurred vision, nasal congestion or dryness, dry or sore throat

**GI:** nausea, vomiting, constipation, epigastric distress, dry mouth, **GI obstruction**

**GU:** urinary retention or hesitancy, dysuria, early menses, decreased libido, erectile dysfunction

**Hematologic:** **hemolytic anemia, hypoplastic anemia, thrombocytopenia, agranulocytosis, leukopenia, pancytopenia**

**Respiratory:** thickened bronchial secretions, chest tightness, wheezing

**Skin:** urticaria, rash, diaphoresis

**Other:** increased or decreased appetite, weight gain, local stinging, **anaphylactic shock, hypersensitivity reaction** (with I.V. use)

## Interactions

**Drug-drug.** *CNS depressants:* additive CNS effects

**Drugs-herbs.** *Kava, St. John's wort, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* additive CNS effects

## Patient monitoring

- Monitor respiratory status closely, especially after I.V. administration.
- Watch for signs and symptoms of withdrawal in long-term use and in opioid-dependent patients.
- Assess elderly patient closely for sensitivity to drug.

## Patient teaching

- Teach patient how to use nasal spray properly.
- Emphasize importance of using drug exactly as prescribed.

- Caution patient that drug may be habit-forming.
- Advise patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and behaviors mentioned above.

## cabazitaxel

Jevtana

**Pharmacologic class:** Taxane

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

## FDA BOXED WARNING

- Neutropenic deaths have been reported. Obtain frequent blood counts to monitor for neutropenia. Don't give drug if neutrophil count is 1,500 cells/mm<sup>3</sup> or less.
- Severe hypersensitivity can occur and may include generalized rash, erythema, hypotension, and bronchospasm. Discontinue drug immediately if severe reactions occur and administer appropriate therapy.
- Drug is contraindicated in patients with history of severe hypersensitivity reactions to cabazitaxel or to drugs formulated with polysorbate 80.

## Action

As a microtubule inhibitor, cabazitaxel binds to tubulin and promotes its assembly into microtubules while simultaneously inhibiting disassembly.

This leads to the stabilization of microtubules, which results in the inhibition of mitotic and interphase cellular functions.

### Availability

*Injection:* 60 mg/1.5 ml in single-use vial

### Indications and dosages

➤ Metastatic hormone-refractory prostate cancer previously treated with a docetaxel-containing treatment regimen

**Adults:** 25 mg/m<sup>2</sup> I.V. by 1-hour infusion q 3 weeks in combination with prednisone 10 mg P.O. daily throughout treatment

### Dosage adjustment

- Grade 3 or greater neutropenia for longer than 1 week despite appropriate treatment, including granulocyte-colony stimulating factor (G-CSF)
- Febrile neutropenia
- Grade 3 or greater diarrhea or persisting diarrhea despite appropriate treatment

### Contraindications

- Hypersensitivity to drug or to other drugs formulated with polysorbate 80
- Patients with neutrophil counts of 1,500 cells/mm<sup>3</sup> or less

### Precautions

Use cautiously in:

- hepatic impairment with total bilirubin at or above the upper limit of normal (ULN), or AST or ALT levels 1.5 × ULN or greater (avoid use)
- severe renal impairment (creatinine clearance less than 30 mL/minute) and end-stage renal disease
- neutropenia
- GI symptoms
- infusion reactions
- concurrent use of strong CYP3A inducers or inhibitors (avoid use)
- elderly patients

- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

• Follow facility policy for handling, preparing, and administering carcinogenic, mutagenic, and teratogenic drugs.

 Don't administer by I.V. push or bolus.

• Premedicate patient at least 30 minutes before each dose with the following I.V. drugs to reduce risk or severity of hypersensitivity: Antihistamine (dexchlorpheniramine 5 mg, or diphenhydramine 25 mg, or equivalent antihistamine), corticosteroid (dexamethasone 8 mg or equivalent steroid), H<sub>2</sub> antagonist (ranitidine 50 mg or equivalent H<sub>2</sub> antagonist).

- Give oral or I.V. antiemetic prophylaxis as needed.
- Don't use PVC infusion containers or polyurethane infusion sets for preparation or administration of drug.
- Be aware that drug requires two dilutions before administering.
- To reconstitute, use entire contents of accompanying diluent to achieve a concentration of 10 mg/ml. Withdraw only required amount of first dilution to prepare final infusion solution before administering. When transferring diluent, direct needle onto inside wall of vial and inject slowly to limit foaming. Remove syringe and needle and gently mix initial diluted solution by repeated inversions for at least 45 seconds to ensure full mixing of drug and diluent. Don't shake. Let solution stand for a few minutes to allow foam to dissipate; check that solution is homogeneous and contains no visible particulate matter.
- The second dilution should be done immediately (within 30 minutes) to obtain final infusion. Withdraw recommended dose from vial containing 10 mg/ml using calibrated syringe and

further dilute into sterile 250-ml PVC-free container of either normal saline solution or 5% dextrose solution for infusion. If dose greater than 65 mg is required, use larger volume of infusion vehicle so that a concentration of 0.26 mg/ml isn't exceeded. Concentration of final infusion solution should be between 0.10 and 0.26 mg/ml. Remove syringe and thoroughly mix final infusion solution by gently inverting bag or bottle. Final infusion solution in either normal saline solution or 5% dextrose solution should be used within 8 hours if kept at ambient temperature (including the 1-hour infusion) or within a total of 24 hours if refrigerated (including the 1-hour infusion).

- Inspect visually for particulate matter, crystals, and discoloration before administering. Discard unused portion.
- Discard first diluted solution or second (final) infusion solution if either isn't clear or appears to have precipitation.
- As final infusion solution is supersaturated, it may crystallize over time. If this occurs, don't use solution; discard it.
- Don't mix with other drugs.
- Use an in-line filter of 0.22-micrometer nominal pore size for administration.

 Reduce dosage as prescribed for Grade 3 or greater neutropenia lasting longer than 1 week despite appropriate treatment (including G-CSF), for febrile neutropenia, or for Grade 3 or greater diarrhea or persisting diarrhea despite appropriate treatment. Discontinue drug if patient continues to experience any of these reactions at prescribed lower dosage.

• Consider G-CSF and secondary prophylaxis in all patients considered to be at increased risk for neutropenia complications.

 Immediately discontinue infusion if severe hypersensitivity reactions

occur and initiate appropriate therapy. Be aware that patients with a history of severe hypersensitivity reactions shouldn't be rechallenged with this drug.

Route	Onset	Peak	Duration
I.V.	Unknown	End of infusion	Unknown

## Adverse reactions

**CNS:** headache, dizziness, asthenia, fatigue, peripheral neuropathy

**CV:** hypotension, **arrhythmia**

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, anorexia, dyspepsia, mucosal inflammation

**GU:** hematuria, urinary tract infection, dysuria, **renal failure**

**Hematologic:** neutropenia, anemia, leukopenia, thrombocytopenia

**Musculoskeletal:** back pain, arthralgia, muscle spasms

**Respiratory:** dyspnea, cough

**Skin:** alopecia

**Other:** pyrexia, dysgeusia, pain, weight loss, dehydration, peripheral edema, **hypersensitivity**

## Interactions

**Drug-drug.** *Strong CYP3A inducers (such as carbamazepine, phenobarbital, phenytoin, rifabutin, rifampin, rifapentin):* decreased cabazitaxel concentration

*Strong CYP3A inhibitors (such as atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, voriconazole):* increased cabazitaxel concentration

**Drug-diagnostic tests.** ALT, AST, bilirubin: increased levels

**Drug-herbs.** St. John's wort: decreased cabazitaxel concentration

## Patient monitoring

- Monitor CBC with differential and renal and hepatic function tests closely.
- Be aware that the incidence of Grade 3 to 4 hematologic adverse reactions,

particularly neutropenia and febrile neutropenia, is higher in patients age 65 or older compared to younger patients.

⚠ Be aware that cabazitaxel is extensively metabolized in the liver and hepatic impairment is likely to increase cabazitaxel concentration, with risk of severe and life-threatening complications in patients receiving other drugs belonging to same class.

⚠ Continue to closely monitor patients for hypersensitivity reactions, especially during first and second infusions. Hypersensitivity reactions may occur within a few minutes after initiation of infusion; therefore, have facilities and equipment available for treatment of hypotension and bronchospasm. If severe hypersensitivity occurs that includes generalized rash, erythema, hypotension, and bronchospasm, immediately discontinue infusion and initiate appropriate therapy.

- Watch for dehydration if patient has nausea, vomiting, or severe diarrhea; be aware that intensive measures may be required for severe diarrhea and electrolyte imbalance. Initiate appropriate measures, including rehydration and antidiarrheal or antiemetic medications, as needed. Delay or reduce dosage as necessary if patient has diarrhea at or above Grade 3.

⚠ Be aware that renal failure may occur in association with sepsis, dehydration, or obstructive uropathy. Immediately take appropriate measures to identify causes of renal failure and treat aggressively.

### Patient teaching

- Explain the importance of taking oral prednisone as prescribed.
- Explain the importance of routine blood cell counts and instruct patient to monitor temperature frequently.

⚠ Instruct patient to immediately contact prescriber if signs and symptoms of hypersensitivity reactions occur, including rash or itching, skin redness, dizziness or faintness, chest or throat tightness, facial swelling, or breathing problems.

⚠ Instruct patient to immediately contact prescriber if urinary tract problems, irregular heartbeat, significant vomiting or diarrhea, decreased urinary output, or blood in urine occurs.

- Advise patient to report numbness or tingling of the hands or feet or muscle problems.
- Advise patient to contact prescriber if a fever or other evidence of potential infection, such as cough or pain on urination, develops.
- Instruct patient to tell prescriber all drugs he's taking, because some drugs have potential for serious drug interactions and shouldn't be taken with cabazitaxel.
- Advise patient not to use St. John's wort without consulting prescriber.
- Advise female patient of childbearing age to avoid becoming pregnant while receiving this drug.
- Advise breastfeeding patient that she should decide whether to discontinue breastfeeding or discontinue drug, taking into account importance of drug for her treatment.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## calcitonin (salmon)

APO-Calcitonin, Calcimar, Caltine, Fortical, Miacalcic<sup>®</sup>, Miacalcin, Miacalcin Nasal Spray, Sandoz Calcitonin

**Pharmacologic class:** Hormone (calcium-lowering)

**Therapeutic class:** Hypocalcemic

**Pregnancy risk category C**

### Action

Directly affects bone, kidney, and GI tract. Decreases osteoclastic osteolysis in bone; also reduces mineral release and collagen breakdown in bone and promotes renal excretion of calcium. In pain relief, acts through prostaglandin inhibition, pain threshold modification, or beta-endorphin stimulation.

### Availability

**Injection:** 0.5 mg/ml (human), 1 mg/ml (human), 200 international units/ml in 2-ml vials (salmon)

**Nasal spray (salmon):** 200 international units/actuation, metered nasal spray in 3.7-ml-bottle

### Indications and dosages

➤ Postmenopausal osteoporosis

**Adults:** *Calcitonin (salmon)*—100 international units/day I.M. or subcutaneously, or 200 international units/day intranasally with concurrent supplemental calcium and vitamin D

➤ Paget's disease of bone (osteitis deformans)

**Adults:** *Calcitonin (salmon)*—Initially, 100 international units/day I.M. or subcutaneously; after titration, maintenance dosage is 50 to 100 international units daily or every other day (three times weekly). *Calcitonin (human)*—0.5 mg I.M. or subcutaneously daily, reduced to 0.25 mg daily.

➤ Hypercalcemia

**Adults:** *Calcitonin (salmon)*—4 international units/kg I.M. or subcutaneously q 12 hours; after 1 or 2 days, may increase to 8 international units/kg q 12 hours; after 2 more days, may increase further, if needed, to 8 international units q 6 hours.

### Contraindications

- Hypersensitivity to drug or salmon
- Pregnancy or breastfeeding

### Precautions

Use cautiously in:

- renal insufficiency, pernicious anemia
- children.

### Administration

⚠ Before salmon calcitonin therapy begins, perform skin test, if prescribed. Don't give drug if patient has positive reaction. Have epinephrine available.

- Bring nasal spray to room temperature before using.
- Give intranasal dose as one spray in one nostril daily; alternate nostrils every day.
- To minimize adverse effects, give at bedtime.
- Rotate injection sites to decrease inflammatory reactions.

Route	Onset	Peak	Duration
I.M., subcut.	15 min	4 hr	8-24 hr
Intranasal	Rapid	0.5 hr	1 hr

### Adverse reactions

**CNS:** headache, weakness, dizziness, paresthesia

**CV:** chest pain

**EENT:** epistaxis, nasal irritation, rhinitis

**GI:** nausea, vomiting, diarrhea, epigastric pain or discomfort

**GU:** urinary frequency

**Musculoskeletal:** arthralgia, back pain

**Respiratory:** dyspnea

**Skin:** rash

**Other:** altered taste, allergic reactions including facial flushing, swelling, and anaphylaxis

### Interactions

**Drug-drug.** *Previous use of bisphosphonates (alendronate, etidronate, pamidronate, risedronate):* decreased response to calcitonin

### Patient monitoring

- Monitor for adverse reactions during first few days of therapy.
- Assess alkaline phosphatase level and 24-hour urinary excretion of hydroxyproline.
- Check urine for casts.
- Monitor serum electrolyte and calcium levels.

### Patient teaching

- Instruct patient to take drug before bedtime to lessen GI upset. Tell him to call prescriber if he can't maintain his usual diet because of GI upset.
- Inform patient using nasal spray that runny nose, sneezing, and nasal irritation may occur during first several days as he adjusts to spray.
- Instruct patient to bring nasal spray to room temperature before using.
- Advise patient to blow nose before using spray, to take intranasal dose as one spray in one nostril daily, and to alternate nostrils with each dose.
- Tell patient to discard unrefrigerated bottles of calcitonin (salmon) nasal spray after 30 days.
- Encourage patient to consume a diet rich in calcium and vitamin D.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

## calcium acetate

Phos-Ex<sup>⚠</sup>, PhosLo, PhosLo Gelcap

## calcium carbonate

Adcal<sup>⚠</sup>, Alka-Mints, Cacit<sup>⚠</sup>, Calcarb 600, Calci-Chew, Calci-Mix, Caltrate 600, Children's Pepto Chooz, Florical, Maalox Regular Chewable, Mylanta Children's, Nephro-Calci, Nu-Cal<sup>⚠</sup>, Os-Cal, Os-Cal 500, Oysco, Oyst-Cal 500, Oysterical 500, Rap-eze<sup>⚠</sup>, Remegel<sup>⚠</sup>, Rennie Soft Chews<sup>⚠</sup>, Rolaid's Calcium Rich, SeapCal<sup>⚠</sup>, Setlers<sup>⚠</sup>, Tums, Tums E-X, Tums Ultra

## calcium gluconate

## calcium lactate

## tricalcium phosphate

Posture

**Pharmacologic class:** Mineral

**Therapeutic class:** Dietary supplement, electrolyte replacement agent

**Pregnancy risk category C** (calcium acetate, chloride, glubionate, gluceptate, phosphate), **NR** (calcium carbonate, citrate, gluconate, lactate)

## Action

Increases serum calcium level through direct effects on bone, kidney, and GI tract. Decreases osteoclastic osteolysis by reducing mineral release and collagen breakdown in bone.

**Availability****Calcium acetate**—*Gelcaps:* 667 mg*Tablets:* 667 mg**Calcium carbonate**—*Capsules:* 1,250 mg*Lozenges:* 600 mg*Oral suspension:* 1,250 mg*Powder:* 6.5 g*Tablets:* 650 mg, 1,250 mg, 1,500 mg*Tablets (chewable):* 750 mg, 1,000 mg, 1,250 mg*Tablets (gum):* 300 mg, 450 mg, 500 mg**Calcium chloride**—*Injection:* 10% solution**Calcium citrate**—*Tablets:* 950 mg**Calcium gluceptate**—*Injection:* 22% solution**Calcium gluconate**—*Injection:* 10% solution*Tablets:* 500 mg, 650 mg, 975 mg**Calcium lactate**—*Tablets:* 325 mg, 650 mg**Tricalcium phosphate**—*Tablets:* 600 mg**Indications and dosages**

➤ Hypocalcemic emergency

**Adults:** 7 to 14 mEq I.V. of 10% calcium gluconate solution, 2% to 10% calcium chloride solution, or 22% calcium gluceptate solution**Children:** 1 to 7 mEq calcium gluconate I.V.**Infants:** Up to 1 mEq calcium gluconate I.V.

➤ Hypocalcemic tetany

**Adults:** 4.5 to 16 mEq calcium gluconate I.V., repeated as indicated until tetany is controlled**Children:** 0.5 to 0.7 mEq/kg calcium gluconate I.V. three to four times daily as indicated until tetany is controlled**Neonates:** 2.4 mEq/kg calcium gluconate I.V. daily in divided doses

➤ Cardiac arrest

**Adults:** 0.027 to 0.054 mEq/kg calcium chloride I.V., 4.5 to 6.3 mEq calcium

gluceptate I.V., or 2.3 to 3.7 mEq calcium gluconate I.V.

**Children:** 0.27 mEq/kg calcium chloride I.V., repeated in 10 minutes if needed. Check calcium level before giving additional doses.

➤ Magnesium intoxication

**Adults:** Initially, 7 mEq I.V.; subsequent dosages based on patient response

➤ Exchange transfusions

**Adults:** 1.35 mEq calcium gluconate I.V. with each 100 ml of citrated blood

➤ Hyperphosphatemia in patients with end-stage renal disease

**Adults:** Two tablets P.O. daily, given in divided doses t.i.d. with meals. May increase gradually to bring serum phosphate level below 6 mg/dl, provided hypercalcemia doesn't develop.

➤ Dietary supplement

**Adults:** 500 mg to 2 g P.O. daily**Off-label uses**

- Osteoporosis

**Contraindications**

- Hypersensitivity to drug
- Ventricular fibrillation
- Hypercalcemia and hypophosphatemia
- Cancer
- Renal calculi
- Pregnancy or breastfeeding

**Precautions**

Use cautiously in:

- renal insufficiency, pernicious anemia, heart disease, sarcoidosis, hyperparathyroidism, hypoparathyroidism
- history of renal calculi
- children.

**Administration**

⚠ When infusing I.V., don't exceed a rate of 200 mg/minute.

- Keep patient supine for 15 minutes after I.V. administration to prevent orthostatic hypotension.
- Administer P.O. doses 1 to 1½ hours after meals.

- Know that I.M. or subcutaneous administration is never recommended.
- Be aware that I.V. route is preferred in children.
- Be alert for extravasation, which causes tissue necrosis.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown
I.V.	Immediate	Immediate	0.5-2 hr

### Adverse reactions

**CNS:** headache, weakness, dizziness, syncope, paresthesia

**CV:** mild blood pressure decrease, **bradycardia, arrhythmias, cardiac arrest** (with rapid I.V. injection)

**GI:** nausea, vomiting, diarrhea, constipation, epigastric pain or discomfort

**GU:** urinary frequency, renal calculi

**Metabolic:** hypercalcemia

**Musculoskeletal:** joint pain, back pain

**Respiratory:** dyspnea

**Skin:** rash

**Other:** altered or chalky taste, excessive thirst, allergic reactions (including facial flushing, swelling, tingling, tenderness in hands, and **anaphylaxis**)

### Interactions

**Drug-drug.** *Atenolol, fluoroquinolones, tetracycline:* decreased bioavailability of these drugs

*Calcium channel blockers:* decreased calcium effects

*Cardiac glycosides:* increased risk of cardiac glycoside toxicity

*Iron salts:* decreased iron absorption

*Sodium polystyrene sulfonate:* metabolic alkalosis

*Verapamil:* reversal of verapamil effects

**Drug-diagnostic tests.** *Calcium:* increased level

**Drug-food.** *Foods containing oxalic acid (such as spinach), phytic acid (such as whole grain cereal), or phosphorus (such as dairy products):* interference with calcium absorption

### Patient monitoring

- Monitor calcium levels frequently, especially in elderly patients.

### Patient teaching

- Instruct patient to consume plenty of milk and dairy products during therapy.
- Refer patient to dietitian for help in meal planning and preparation.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## calcium polycarbophil

Equalactin, FiberCon, Fiber-Lax, Fiber-Tabs, Konsyl

**Pharmacologic class:** Bulk-forming agent

**Therapeutic class:** Laxative

**Pregnancy risk category** NR

### Action

Absorbs water, thereby expanding and increasing bulk and moisture content of stool; increased bulk promotes peristalsis and bowel movement.

### Availability

*Tablets:* 500 mg

*Tablets (chewable):* 500 mg, 1,250 mg

### Indications and dosages

➤ Constipation

**Adults and children ages 12 and older:**

1 g P.O. q.i.d. as needed. Maximum dosage is 6 g daily.

**Children ages 7 to 12:** 500 mg P.O. one to three times daily as needed. Maximum dosage is 3 g daily.

**Children ages 3 to 6:** 500 mg P.O. b.i.d. as needed. Maximum dosage is 1.5 g daily.

➤ Diarrhea; irritable bowel syndrome  
**Adults and children ages 12 and older:** 1 g P.O. q.i.d. as needed. Maximum dosage is 6 g daily.

**Children ages 7 to 12:** 500 mg P.O. one to three times daily as needed. Maximum dosage is 3 g in a 24-hour period.

**Children ages 3 to 6:** 500 mg P.O. b.i.d. as needed. Maximum dosage is 1.5 g daily.

### Contraindications

- GI obstruction
- Difficulty swallowing

### Precautions

Use cautiously in:

- pregnant or breastfeeding patients
- children.

### Administration

- Give with at least 8 oz of water or other fluid.
- Administer at least 2 hours before or after other drugs.
- Make sure patient maintains adequate fluid intake.

Route	Onset	Peak	Duration
P.O.	12-24 hr	3 days	Variable

### Adverse reactions

**CV:** chest pain

**GI:** nausea, vomiting, abdominal pain, flatulence, rectal bleeding, **intestinal obstruction**

**Respiratory:** difficulty breathing

**Other:** laxative dependence

### Interactions

**Drug-drug.** *Tetracyclines:* impaired tetracycline absorption

**Drug-herbs.** *Lily of the valley, pheasant's eye, squill:* increased risk of adverse drug reactions

### Patient monitoring

🔊 Monitor patient for difficulty breathing and signs and symptoms of intestinal obstruction.

- Assess for rectal bleeding and for failure to respond to drug.
- Monitor fluid intake and output, and assess hydration status regularly.

### Patient teaching

- Instruct patient to take each dose with at least 8 oz of water or other fluid.
- Advise patient to space doses at least 2 hours apart from other drugs.
- 🔊 Urge patient to seek immediate medical attention if he experiences chest pain, vomiting, difficulty breathing, or rectal bleeding.
- Advise patient to tell prescriber if he's taking other drugs or if he has abdominal pain, nausea, vomiting, or a sudden change in bowel habits lasting 2 weeks or longer.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and herbs mentioned above.

## calfactant

Infasurf

**Pharmacologic class:** Natural lung surfactant

**Therapeutic class:** Lung surfactant

**Pregnancy risk category** NR

### Action

Adsorbs rapidly to air: liquid interface of lung alveoli, stabilizing and modifying surface tension. Restores adequate pressure volumes, gas exchange, and overall lung compliance.

**Availability**

*Suspension for intratracheal injection:*  
6 ml in single-dose vials

**Indications and dosages**

➤ To prevent respiratory distress syndrome (RDS) in at-risk premature infants; treatment of infants who develop RDS

**Premature infants:** 3 ml/kg at birth intratracheally q 12 hours, up to three doses. Initial dose must be administered as two 1.5-ml/kg doses.

**Contraindications**

None

**Precautions**

Use cautiously in:

- altered ventilation requirements
- risk of cyanosis, bradycardia, or airway obstruction.

**Administration**

🔊 Know that drug is intended for intratracheal administration and should be given only by neonatologists or other clinicians experienced in neonatal intubation and ventilatory management in facilities with adequate personnel, equipment, and drugs.

🔊 Don't dilute drug or shake vial.

- Be aware that drug must be drawn into syringe through 20G or larger needle, taking care to avoid excessive foaming. Needle must be removed before drug is delivered through endotracheal tube.

🔊 Know that infant must receive continuous monitoring before, during, and after drug administration.

Route	Onset	Peak	Duration
Intratrach.	Rapid	Unknown	Unknown

**Adverse reactions**

CV: bradycardia

**Respiratory:** requirement for manual ventilation or reintubation, **airway**

**obstruction, reflux of drug into endotracheal tube, cyanosis**

**Interactions**

None significant

**Patient monitoring**

🔊 Monitor infant's respiratory status continuously during and after drug administration.

**Patient teaching**

- Teach parents about treatment and assure them that infant will be monitored carefully.

**candesartan cilexetil**

Amias , Atacand

**Pharmacologic class:** Angiotensin II receptor antagonist

**Therapeutic class:** Antihypertensive  
**Pregnancy risk category D**

**FDA BOXED WARNING**

- When used during second or third trimester of pregnancy, drug may cause fetal injury and death. Discontinue as soon as possible when pregnancy is detected.

**Action**

Blocks aldosterone-producing and vasoconstrictive effects of angiotensin II at various receptor sites, including vascular smooth muscle and adrenal glands

**Availability**

*Tablets:* 4 mg, 8 mg, 16 mg, 32 mg

**Indications and dosages**

➤ Hypertension

**Adults:** 16 mg P.O. daily. Start at lower dosage if patient is receiving diuretics or is volume depleted. Range is 8 to 32 mg/day as a single dose or divided in two doses.

**Children age 6 to younger than 17 weighing more than 50 kg (110 lb):** 8 to 16 mg P.O. daily. Start at lower dosage if patient is receiving diuretics or is volume depleted. Range is 4 to 32 mg/day as a single dose or divided in two doses.

**Children age 6 to younger than 17 weighing less than 50 kg:** 4 to 8 mg P.O. daily. Start at lower dosage if patient is receiving diuretics or is volume depleted. Range is 4 to 16 mg/day as a single dose or divided in two doses.

**Children age 1 to younger than 6:** 0.20 mg/kg oral suspension P.O. daily. Start at lower dosage if patient is receiving diuretics or is volume depleted. Range is 0.05 to 0.4 mg/kg oral suspension P.O. daily as a single dose or divided in two doses.

➤ Heart failure (New York Heart Association class II-IV)

**Adults:** 4-mg tablet P.O. daily. Increase to target maintenance dosage of 32 mg P.O. daily by doubling dose q 2 weeks, as tolerated.

### Dosage adjustment

- Renal impairment
- Moderate hepatic insufficiency

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- heart failure, renal or hepatic impairment
- volume- or salt-depleted patients receiving high doses of diuretics, hyperkalemia
- pregnant or breastfeeding patients
- children younger than age 1.

### Administration

- Give with or without food.
- Be aware that pharmacist can prepare a suspension from tablets for children who can't swallow tablets.
- ⚠ Supervise patient closely if he is receiving concurrent diuretics or is otherwise at risk for intravascular volume depletion.
- Know that diuretic may be added to regimen if candesartan alone doesn't control blood pressure.

Route	Onset	Peak	Duration
P.O.	2-4 hr	6-8 hr	24 hr

### Adverse reactions

**CNS:** dizziness, syncope, fatigue, headache

**CV:** hypotension, chest pain, peripheral edema, **mitral or aortic valve stenosis**

**EENT:** ear congestion or pain, sinus disorders, sore throat

**GI:** nausea, diarrhea, constipation, abdominal pain, dry mouth

**GU:** albuminuria, **renal failure**

**Hepatic:** hepatitis

**Metabolic:** gout, **hyperkalemia**

**Musculoskeletal:** arthralgia, back pain, muscle weakness

**Respiratory:** upper respiratory tract infection, cough, bronchitis

**Other:** dental pain, fever

### Interactions

**Drug-drug.** *Diuretics, other antihypertensives:* increased risk of hypotension

*Lithium:* increased lithium blood level

*Nonsteroidal anti-inflammatory drugs:* decreased antihypertensive effect

*Potassium-sparing diuretics, potassium supplements:* increased risk of hyperkalemia

**Drug-food.** *Salt substitutes containing potassium:* increased risk of hyperkalemia

**Drug-herbs.** *Ephedra (ma huang), licorice, yohimbine:* decreased antihypertensive effect

**Patient monitoring**

- Monitor electrolyte levels and kidney and liver function test results.
- Assess blood pressure regularly to gauge drug efficacy.
- Closely monitor patient with renal dysfunction who is receiving concurrent diuretics.

**Patient teaching**

- Tell patient to take drug with or without food.
- Inform caregiver that pharmacist will prepare a suspension for child who can't swallow tablets. Shake suspension well before each dose.
- Teach patient about lifestyle changes that help control blood pressure, such as proper diet, exercise, stress reduction, smoking cessation, and moderation of alcohol intake.
- Instruct patient to use reliable birth control method and to contact prescriber and discontinue drug if she suspects she's pregnant.
- Caution patient not to take herbs without consulting prescriber.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, foods, and herbs mentioned above.

**capecitabine**

Xeloda

**Pharmacologic class:** Fluoropyrimidine, antimetabolite (pyrimidine analog)

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

**FDA BOXED WARNING**

- In patients receiving concomitant oral coumarin-derivative anticoagulants (such as warfarin and phenprocoumon), monitor International Normalized Ratio (INR) or prothrombin time (PT) frequently to allow appropriate anticoagulant dosage adjustment. Altered coagulation parameters, bleeding, and death have occurred in patients taking this drug combination. Postmarketing reports show significant INR and PT increases in patients stabilized on anticoagulants when capecitabine therapy began. Age older than 60 and cancer diagnosis independently increase coagulopathy risk.

**Action**

Enzymatically converts to 5-fluorouracil, which injures cells by interfering with DNA synthesis, cell division, RNA processing, and protein synthesis

**Availability**

Tablets: 150 mg, 500 mg

**Indications and dosages**

➤ Metastatic breast cancer resistant to both paclitaxel and a chemotherapy regimen that includes anthracycline; metastatic colorectal cancer when treatment with fluoropyrimidine therapy alone is preferred

**Adults:** Initially, 2,500 mg/m<sup>2</sup>/day P.O. in two divided doses for 2 weeks, followed by a 1-week rest period; administered in 3-week cycles

**Dosage adjustment**

- Renal impairment
- Hepatic impairment
- Elderly patients

**Contraindications**

- Hypersensitivity to drug
- Severe renal impairment
- Pregnancy or breastfeeding

## Precautions

Use cautiously in:

- mild to moderate renal impairment, hepatic impairment, severe diarrhea, coronary artery disease, intestinal disease, infection, coagulopathy
- children younger than age 18.

## Administration

- Give with water within 30 minutes after a meal.
- If dosage must be lowered because of toxicity, don't increase dosage later.

Route	Onset	Peak	Duration
P.O.	Unknown	1.5-2 hr	Unknown

## Adverse reactions

**CNS:** dizziness, fatigue, headache, insomnia, paresthesia

**CV:** edema

**EENT:** eye irritation

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, anorexia, stomatitis, **intestinal obstruction**

**Hematologic:** anemia, lymphopenia, **neutropenia, thrombocytopenia**

**Metabolic:** dehydration

**Musculoskeletal:** myalgia, limb pain

**Skin:** dermatitis, alopecia, nail disorder, hand and foot syndrome (palmar-plantar erythrodysesthesia)

**Other:** fever

## Interactions

**Drug-drug.** *Antacids:* increased capcitabine blood level

*Leucovorin:* increased cytotoxicity

*Live-virus vaccines:* impaired ability to mount an immune response to vaccine

*Phenytoin:* increased phenytoin blood level

*Warfarin:* increased risk of bleeding

**Drug-diagnostic tests.** *Bilirubin:* increased level

*Hemoglobin, neutrophils, platelets, white blood cells:* decreased levels

## Patient monitoring

- Monitor patient for signs and symptoms of toxicity. Be prepared to reduce dosage or withhold drug when indicated.
- Stay alert for signs and symptoms of infection.
- Carefully assess fluid and electrolyte status if patient has severe diarrhea.
- Monitor weight, CBC, International Normalized Ratio, prothrombin time, and kidney and liver function test results.
- Evaluate closely for adverse reactions in patients older than age 80.

## Patient teaching

• Advise patient to take drug with water within 30 minutes after a meal.

📢 Instruct patient to immediately report nausea, vomiting, diarrhea, mouth ulcers, swollen joints, temperature above 100.5 °F (38 °C), and other signs or symptoms of infection.

• Tell patient to expect dosage adjustments during therapy.

• Urge patient to use reliable birth control method because drug may harm fetus if she becomes pregnant.

• Caution patient not to breastfeed during therapy.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## captopril

Acepril<sup>Ⓢ</sup>, Apo-Capto<sup>Ⓢ</sup>, Dom-Captopril, Gen-Captopril<sup>Ⓢ</sup>, Med-Captopril

**Pharmacologic class:** Angiotensin-converting enzyme (ACE) inhibitor

**Therapeutic class:** Antihypertensive

**Pregnancy risk category C** (first trimester), **D** (second and third trimesters)

**FDA BOXED WARNING**

- When used during second or third trimester of pregnancy, drug may cause fetal injury and death. Discontinue as soon as possible when pregnancy is detected.

**Action**

Prevents conversion of angiotensin I to angiotensin II, which leads to decreased vasoconstriction and, ultimately, to lower blood pressure. Also decreases blood pressure by increasing plasma renin secretion from kidney and reducing aldosterone secretion from adrenal cortex. Decreased aldosterone secretion prevents sodium and water retention.

**Availability**

*Tablets:* 12.5 mg, 25 mg, 50 mg, 100 mg

**Indications and dosages**

- Hypertension

**Adults:** 12.5 to 25 mg P.O. two to three times daily; may be increased up to 150/mg/day at 1- to 2-week intervals. Usual dosage is 50 mg t.i.d. If patient is receiving diuretics, start with 6.25 to 12.5 mg P.O. two to three times daily. If blood pressure isn't adequately controlled after 1 to 2 weeks, add diuretic, as prescribed. If further blood pressure decrease is needed, dosage may be raised to 150 mg P.O. t.i.d. while patient continues on diuretic. Maximum dosage is 450 mg/day.

- Heart failure

**Adults:** Usual initial dosage is 25 mg P.O. t.i.d. After increasing to 50 mg P.O. t.i.d. (if indicated), do not increase dosage further for 2 weeks, to determine satisfactory response. Don't exceed 450 mg/day.

- Left ventricular dysfunction after myocardial infarction

**Adults:** 6.25 mg P.O. as a test dose, followed by 12.5 mg t.i.d. May increase up to 50 mg t.i.d.

- Diabetic nephropathy

**Adults:** 25 mg P.O. t.i.d.

**Dosage adjustment**

- Renal impairment

**Off-label uses**

- Bartter's syndrome
- Hypertension associated with scleroderma
- Management of hypertensive crisis
- Raynaud's syndrome
- Rheumatoid arthritis
- Severe childhood hypertension

**Contraindications**

- Hypersensitivity to drug or other ACE inhibitors
- Angioedema (hereditary or idiopathic)
- Pregnancy

**Precautions**

Use cautiously in:

- renal or hepatic impairment, hypovolemia, hyponatremia, aortic stenosis and hypertrophic cardiomyopathy, cardiac or cerebrovascular insufficiency, systemic lupus erythematosus
- family history of angioedema
- black patients with hypertension
- elderly patients
- breastfeeding patients
- children.

**Administration**

- Discontinue other antihypertensives 1 week before starting captopril, if possible.
- Give 1 hour before meals on empty stomach.

Route	Onset	Peak	Duration
P.O.	0.25-1 hr	1-1.5 hr	6-12 hr

## Adverse reactions

**CNS:** headache, dizziness, drowsiness, fatigue, weakness, insomnia

**CV:** angina pectoris, tachycardia,

**hypotension**

**EENT:** sinusitis

**GI:** nausea, diarrhea, anorexia

**GU:** proteinuria, erectile dysfunction, decreased libido, gynecomastia, **renal failure**

**Hematologic:** anemia, **agranulocytosis, leukopenia, pancytopenia, thrombocytopenia**

**Metabolic:** hyperkalemia

**Respiratory:** cough, asthma, bronchitis, dyspnea, **eosinophilic pneumonitis**

**Skin:** rash, **angioedema**

**Other:** altered taste, fever

## Interactions

**Drug-drug.** *Allopurinol:* increased risk of hypersensitivity reaction

*Antacids:* decreased captopril absorption

*Antihypertensives, general anesthetics*

*that lower blood pressure, nitrates,*

*phenothiazines:* additive hypotension

*Cyclosporine:* hyperkalemia

*Digoxin, lithium:* increased blood levels of these drugs, increased risk of toxicity

*Epoetin alfa:* additive hyperkalemia

*Indomethacin:* reduced antihypertensive effect of captopril

*Nonsteroidal anti-inflammatory drugs:* decreased antihypertensive response

*Potassium-sparing diuretics, potassium supplements:* hyperkalemia

*Probenecid:* decreased elimination and increased blood level of captopril

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, potassium:* increased levels

*Granulocytes, hemoglobin, platelets, red blood cells, sodium, white blood cells:*

decreased levels

*Urine acetone:* false-positive result

**Drug-food.** *Any food:* decreased captopril absorption

*Salt substitutes containing potassium:* hyperkalemia

**Drug-herbs.** *Capsaicin, yohimbine:* cough

**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension

## Patient monitoring

🔊 Monitor for sudden blood pressure drop within 3 hours of initial dose if patient is receiving concurrent diuretics and on a low-sodium diet.

- Monitor hematologic, kidney, and liver function test results.
- Check for proteinuria monthly and after first 9 months of therapy.

## Patient teaching

- Tell patient to take drug 1 hour before meals on empty stomach.
- Advise patient to report fever, rash, sore throat, mouth sores, fast or irregular heartbeat, chest pain, or cough.
- Inform patient that dizziness, fainting, and light-headedness usually disappear once his body adjusts to drug.
- Tell patient his ability to taste may decrease during first 2 to 3 months of therapy.
- Caution patient to avoid over-the-counter medications unless approved by prescriber.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## carbamazepine

Apo-Carbamazepine✳, Arbil⚠, Bio-Carbamazepine✳, Carbagen⚠, Carbamaz✳, Carbatrol, Dom-Carbamazepine✳, Epimaz⚠, Epitol, Equetro, Gen-Carbamazepine✳, Mazepine✳, Novo-Carbamazepine✳, Nu-Carbamazepine✳, PHL-Carbamazepine✳, PMS-Carbamazepine✳, Sandoz Carbamazepine✳, Tegretol, Tegretol-XR

**Pharmacologic class:** Iminostilbene derivative

**Therapeutic class:** Anticonvulsant

**Pregnancy risk category D**

### FDA BOXED WARNING

- Prescriber should be thoroughly familiar with prescribing information, particularly regarding use with other drugs (especially those that increase toxicity potential).
- Drug has been linked to aplastic anemia and agranulocytosis.
- Transient or persistent decreases in platelet or white blood cell (WBC) counts have occurred, but data aren't available to accurately estimate incidence or outcome. Rarely, leukopenia cases progressed to aplastic anemia or agranulocytosis.
- Obtain complete pretreatment hematologic tests as baseline. If WBC or platelet count drops during therapy, monitor closely. Consider withdrawing drug if evidence of significant bone marrow depression develops.

### Action

Unclear. Chemically related to tricyclic antidepressants (TCAs). Anticonvulsant

action may result from reduction in polysynaptic responses and blocking of post-tetanic potentiation.

### Availability

**Capsules (extended-release):** 100 mg, 200 mg, 300 mg

**Oral suspension:** 100 mg/5 ml

**Tablets:** 200 mg

**Tablets (chewable):** 100 mg

**Tablets (extended-release):** 100 mg, 200 mg, 400 mg

### Indications and dosages

➤ Prophylaxis of generalized tonic-clonic, mixed, and complex-partial seizures

#### Adults and children ages 12 and older:

Initially, 200 mg P.O. b.i.d. (tablets) or 100 mg q.i.d. (oral suspension).

Increase by up to 200 mg/day q 7 days until therapeutic blood levels are reached. Usual maintenance dosage is 600 to 1,200 mg/day in divided doses q 6 to 8 hours. In children ages 12 to 15, don't exceed 1 g/day. Give extended-release forms b.i.d.

#### Children ages 6 to 12:

Initially, 100 mg P.O. b.i.d. (tablets) or 50 mg q.i.d. (oral suspension). Increase by up to 100 mg weekly until therapeutic levels are reached. Usual maintenance dosage is 400 to 800 mg/day. Don't exceed 1 g/day. Give extended-release forms b.i.d.

#### Children younger than age 6:

Initially, 10 to 20 mg/kg/day P.O. in two or three divided doses. May increase by up to 100 mg/day at weekly intervals. Usual maintenance dosage is 250 to 350 mg/day. Don't exceed 400 mg/day.

➤ Trigeminal neuralgia

**Adults:** Initially, 100 mg b.i.d. (tablets) or 50 mg q.i.d. (oral suspension).

Increase by up to 200 mg/day until pain relief occurs; then give maintenance dosage of 200 to 1,200 mg/day in divided doses. Usual maintenance range is 400 to 800 mg/day.

## Off-label uses

- Alcohol, cocaine, or benzodiazepine withdrawal
- Atypical psychoses
- Central diabetes insipidus
- Mood disorders
- Neurogenic pain

## Contraindications

- Hypersensitivity to drug or TCAs
- MAO inhibitor use within past 14 days
- Bone marrow depression
- Pregnancy or breastfeeding

## Precautions

Use cautiously in:

- cardiac disease, hepatic disease, increased intraocular pressure, mixed seizure disorders, glaucoma
- elderly males with prostatic hypertrophy
- psychiatric patients.

## Administration

- Don't give within 14 days of MAO inhibitor.
- Give tablets with meals; may give extended-release capsules without regard to meals.
- Don't give with grapefruit juice.
- If desired, contents of extended-release capsules may be sprinkled over food; however, capsule and contents shouldn't be crushed or chewed.

Route	Onset	Peak	Duration
P.O.	Up to 1 mo	4-5 hr	6-12 hr
P.O. (extended)	Up to 1 mo	2-12 hr	12 hr

## Adverse reactions

**CNS:** ataxia, drowsiness, fatigue, psychosis, syncope, vertigo, headache, **worsening of seizures**

**CV:** hypertension, hypotension, **arrhythmias, atrioventricular block, aggravation of coronary artery disease, heart failure**

**EENT:** blurred vision, diplopia, nystagmus, corneal opacities, conjunctivitis, pharyngeal dryness

**GI:** nausea, vomiting, diarrhea, abdominal pain, stomatitis, glossitis, dry mouth, anorexia

**GU:** urinary hesitancy, retention, or frequency; albuminuria; glycosuria; erectile dysfunction

**Hematologic:** eosinophilia, lymphadenopathy, **agranulocytosis, aplastic anemia, thrombocytopenia, leukopenia**

**Hepatic:** hepatitis

**Metabolic:** syndrome of inappropriate antidiuretic hormone secretion

**Respiratory:** pneumonitis

**Skin:** photosensitivity, rash, urticaria, diaphoresis, **erythema multiforme, Stevens-Johnson syndrome**

**Other:** weight gain, chills, fever

## Interactions

**Drug-drug.** *Acetaminophen:* increased risk of acetaminophen-induced hepatotoxicity, decreased acetaminophen efficacy

*Anticoagulants, bupropion:* increased metabolism of these drugs, causing decreased efficacy

*Barbiturates:* decreased barbiturate blood level, increased carbamazepine blood level

*Charcoal:* decreased carbamazepine absorption

*Cimetidine, danazol, diltiazem:* increased carbamazepine blood level

*Cyclosporine, felbamate, felodipine, haloperidol:* decreased blood levels of these drugs

*Doxycycline:* shortened doxycycline half-life and reduced antimicrobial effect

*Hormonal contraceptives:* decreased contraceptive efficacy, possibly leading to pregnancy

*Hydantoins:* increased or decreased hydantoin blood level, decreased carbamazepine blood level

**Isoniazid:** increased risk of carbamazepine toxicity and isoniazid hepatotoxicity

**Lithium:** increased risk of CNS toxicity

**Macrolide antibiotics** (such as clarithromycin and erythromycin), **propoxyphene**, **selective serotonin reuptake inhibitors** (such as fluoxetine and fluvoxamine), **verapamil:** increased carbamazepine blood level, greater risk of toxicity

**MAO inhibitors:** high fever, hypertension, seizures, and possibly death

**Nondepolarizing neuromuscular blockers:** shortened carbamazepine duration of action

**TCA:** increased carbamazepine blood level and greater risk of toxicity, decreased TCA blood level

**Valproic acid:** decreased valproic acid blood level with possible loss of seizure control, variable changes in carbamazepine blood level

**Drug-diagnostic tests.** *Blood urea nitrogen, eosinophils, liver function tests:* increased values

*Granulocytes, hemoglobin, platelets, thyroid function tests, white blood cells:* decreased values

**Drug-food.** *Grapefruit juice:* increased drug blood level and effects

**Drug-herbs.** *Plantain (psyllium seed):* inhibited GI absorption of drug

### Patient monitoring

🚨 Monitor patient closely. Institute seizure precautions if drug must be withdrawn suddenly.

- Assess for history of psychosis; drug may activate symptoms.
- Monitor baseline hematologic, kidney, and liver function test results.
- During dosage adjustments, monitor vital signs and fluid intake and output. Stay alert for fluid retention, renal failure, and cardiovascular complications.
- With high doses, monitor CBC weekly for first 3 months and then

monthly to detect bone marrow depression.

### Patient teaching

- Tell patient that he may sprinkle contents of extended-release capsules over food, but that he shouldn't crush or chew capsule or contents.
- Advise patient that coating on extended-release capsules may be visible in stools because it isn't absorbed.
- Tell patient to take drug with meals to minimize GI upset.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, alertness, and vision.
- Advise patient to avoid excessive sun exposure and to wear protective clothing and sunscreen.
- Inform female patient that drug may interfere with hormonal contraception. Advise her to use alternative birth-control method.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## carbidopa-levodopa

Apo-Levocarb<sup>☼</sup>, Co-carledopa<sup>☼</sup>, Dom-Levo-Carbidopa<sup>☼</sup>, Half Sinemet<sup>☼</sup>, Novo-Levocarbidopa<sup>☼</sup>, Nu-Levocarb<sup>☼</sup>, Sinemet, Sinemet CR, Tilolec<sup>☼</sup>

**Pharmacologic class:** Dopamine agonist

**Therapeutic class:** Antiparkinsonian

**Pregnancy risk category C**

### Action

After conversion to dopamine in CNS, levodopa acts as a neurotransmitter,

relieving symptoms of Parkinson's disease. Carbidopa prevents destruction of levodopa, making more levodopa available to be decarboxylated to dopamine in brain.

**Availability**

*Tablets:* 10 mg carbidopa/100 mg levodopa, 25 mg carbidopa/100 mg levodopa, 25 mg carbidopa/250 mg levodopa

*Tablets (extended-release):* 25 mg carbidopa/100 mg levodopa, 50 mg carbidopa/200 mg levodopa

 **Indications and dosages**

➤ Idiopathic Parkinson's disease; parkinsonism; symptomatic parkinsonism

*Conventional tablets—*

**Adults not currently receiving levodopa:** Initially, 10 mg carbidopa/100 mg levodopa P.O. three to four times daily or 25 mg carbidopa/100 mg levodopa t.i.d.; may be increased q 1 to 2 days until desired effect occurs

**Adults converting from levodopa alone (less than 1.5 g/day):** Initially, 25 mg carbidopa/100 mg levodopa three to four times daily; may be increased q 1 to 2 days until desired effect occurs

**Adults converting from levodopa alone (more than 1.5 g/day):** Initially, 25 mg carbidopa/250 mg levodopa three to four times daily; may be increased q 1 to 2 days until desired effect occurs

*Extended-release tablets—*

**Adults not currently receiving levodopa:** Initially, 50 mg carbidopa/200 mg levodopa P.O. b.i.d., with doses spaced at least 6 hours apart

**Adults converting from standard carbidopa-levodopa:** Initiate therapy with at least 10% more levodopa content/day (may need up to 30% more) given at 4- to 8-hour intervals while awake; wait 3 days between dosage changes. Some patients may need

higher dosages and shorter dosing intervals.

**Contraindications**

- Hypersensitivity to drug or tartrazine
- Angle-closure glaucoma
- MAO inhibitor use within past 14 days
- Malignant melanoma
- Breastfeeding

**Precautions**

Use cautiously in:

- cerebrovascular, renal, hepatic, or endocrine disease
- history of cardiac, psychiatric, or ulcer disease
- abrupt drug discontinuation or dosage
- pregnant patients
- children ages 18 and under (safety not established).

**Administration**

- Give dose as close as possible to time ordered to ensure stable drug blood level.
- Know that giving extended-release form with food increases drug bioavailability.
- If patient needs general anesthesia, continue drug therapy as appropriate (if he's allowed to have oral fluids and drugs).

 Be aware that drug shouldn't be withdrawn abruptly.

Route	Onset	Peak	Duration
P.O.	Unknown	40-120 min	Unknown

**Adverse reactions**

**CNS:** anxiety, dizziness, hallucinations, memory loss, headache, numbness, confusion, insomnia, nightmares, delusions, psychotic changes, depression, dementia, poor coordination, worsening hand tremor

**CV:** cardiac irregularities, palpitations, orthostatic hypotension

**EENT:** blurred vision, diplopia, mydriasis, eyelid twitching, difficulty swallowing

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain or discomfort, flatulence, excessive salivation, dry

mouth, anorexia, **upper GI hemorrhage** (with history of peptic ulcer)

**GU:** urinary retention, urinary incontinence, dark urine

**Hematologic: hemolytic anemia, leukopenia**

**Hepatic: hepatotoxicity**

**Musculoskeletal:** muscle twitching, involuntary or spasmodic movements

**Respiratory:** hyperventilation

**Skin:** melanoma, flushing, rash, abnormally dark sweat

**Other:** altered or bitter taste, burning sensation of tongue, tooth grinding (especially at night), weight changes, hot flashes, hiccups

## Interactions

**Drug-drug.** *Anticholinergics:* decreased carbidopa-levodopa absorption

*Antihypertensives:* additive hypotension

*Haloperidol, papaverine, phenothiazines, phenytoin, reserpine:* reversal of carbidopa-levodopa effects

*Inhalation hydrocarbon anesthetics:* increased risk of arrhythmias

*MAO inhibitors:* hypertensive reactions

*Methyl dopa:* altered efficacy of carbidopa-levodopa, increased risk of adverse CNS reactions

*Pyridoxine:* antagonism of carbidopa-levodopa effects

*Selegiline:* increased risk of adverse reactions

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, lactate dehydrogenase, low-density lipoproteins, protein-bound iodine, uric acid:* increased levels

*Coombs' test:* false-positive result

*Granulocytes, hemoglobin, platelets, white blood cells:* decreased values

*Urine glucose, urine ketones:* test interference

**Drug-food.** *Foods rich in pyridoxine (liver, yeast, cereals):* reversal of carbidopa-levodopa effects

**Drug-herbs.** *Kava:* decreased carbidopa-levodopa efficacy

*Octacosanol:* worsening of dyskinesia

**Drug-behaviors.** *Cocaine use:* increased risk of adverse reactions to carbidopa-levodopa

## Patient monitoring

- Monitor patient for orthostatic hypotension.
- Assess patient's need for drug "holiday" if his response to drug decreases.

## Patient teaching

 Inform patient that muscle and eyelid twitching may indicate toxicity. Tell him to report these symptoms immediately.

 Caution patient not to stop taking drug abruptly.

- Instruct patient to swallow extended-release tablets whole without crushing or chewing them.

- Advise patient to move slowly when sitting up or standing, to avoid dizziness or light-headedness caused by sudden blood pressure drop.

- Tell patient that drug may darken or discolor his urine and sweat.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## carboplatin

**Pharmacologic class:** Alkylating agent

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

**FDA BOXED WARNING**

- Give under supervision of physician experienced in cancer chemotherapy, in facility with adequate diagnostic and treatment resources.
- Bone marrow suppression is dose-related and may be severe, resulting in infection and bleeding. Anemia may be cumulative and warrant transfusions.
- Vomiting is a common adverse effect.
- Anaphylactic-like reactions may occur within minutes of administration.

**Action**

Inhibits DNA synthesis by causing cross-linking of parent DNA strands; interferes with RNA transcription, causing growth imbalance that leads to cell death. Cell-cycle-phase nonspecific.

**Availability**

*Injection:* 50-mg, 150-mg, and 450-mg vials

**Indications and dosages**

➤ Initial treatment of advanced ovarian cancer or palliative treatment of ovarian cancer unresponsive to other chemotherapeutic modalities

**Adults:** Initially, 300 mg/m<sup>2</sup> I.V. (given with cyclophosphamide) at 4-week intervals. For refractory tumors, 360 mg/m<sup>2</sup> I.V. as a single dose; may be repeated at 4-week intervals, depending on response. However, single dose shouldn't be repeated until neutrophil count is at least 2,000/mm<sup>3</sup> and platelet count at least 100,000/mm<sup>3</sup>. Subsequent dosages are based on blood counts.

**Dosage adjustment**

- Renal impairment
- Reduced bone marrow reserve

**Off-label uses**

- Advanced endometrial cancer
- Advanced or recurrent squamous cell carcinoma of head and neck
- Relapsed and refractory acute leukemia
- Small-cell lung cancer
- Testicular cancer

**Contraindications**

- Hypersensitivity to drug, cisplatin, or mannitol
- Pregnancy or breastfeeding

**Precautions**

Use cautiously in:

- hearing loss, electrolyte imbalances, renal impairment, active infections, diminished bone marrow reserve
- females of childbearing age.

**Administration**

- Premedicate with antiemetics, as prescribed.
- When preparing and administering drug, follow facility protocol for handling cytotoxic drugs.
- Reconstitute powder for injection by adding sterile water for injection, 0.9% sodium chloride injection, or 5% dextrose injection, as appropriate, to provide 10-mg/ml solution. Drug may be further diluted to concentrations as low as 0.5 mg/ml.
- Don't use with needles or I.V. sets containing aluminum.
- Administer I.V. infusion over at least 15 minutes.
- Make sure patient maintains adequate fluid intake.
- Know that drug is given in combination with other agents.

Route	Onset	Peak	Duration
I.V.	Rapid	21 days	28 days

**Adverse reactions**

**CNS:** weakness, dizziness, confusion, peripheral neuropathy, **cerebrovascular accident**

**CV: heart failure, embolism**

**EENT:** visual disturbances, ototoxicity

**GI:** nausea, vomiting, constipation, diarrhea, abdominal pain, stomatitis

**GU:** gonadal suppression, nephrotoxicity

**Hematologic:** anemia, leukopenia, thrombocytopenia, neutropenia

**Hepatic:** hepatitis

**Metabolic:** hypocalcemia, hypokalemia, hypomagnesemia, hyponatremia

**Respiratory:** bronchospasm

**Skin:** alopecia, rash, urticaria, erythema, pruritus

**Other:** altered taste, hypersensitivity reactions, anaphylaxis

## Interactions

**Drug-drug.** *Live-virus vaccines:* decreased antibody response to vaccine, increased risk of adverse reactions

*Myelosuppressants:* additive bone marrow depression

*Nephrotoxic or ototoxic drugs (such as aminoglycosides, loop diuretics):* additive nephrotoxicity or ototoxicity

*Phenytoin:* decreased phenytoin blood level

**Drug-diagnostic tests.** *Alkaline phosphatase (ALP), aspartate aminotransferase (AST), blood urea nitrogen, creatinine:* increased values

*Electrolytes, hematocrit, hemoglobin, neutrophils, platelets, red blood cells, white blood cells:* decreased values

## Patient monitoring

- Assess for signs and symptoms of hypersensitivity reactions.
- Monitor CBC to help detect drug-induced anemia and other hematologic reactions.
- Monitor ALP, AST, and total bilirubin levels.
- Evaluate fluid and electrolyte balance.

## Patient teaching

- Instruct patient to report signs and symptoms of allergic response and other adverse reactions, such as

breathing problems, mouth sores, rash, itching, and reddened skin.

- Advise patient to report unusual bleeding or bruising.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Urge patient to avoid activities that can cause injury. Advise him to use soft toothbrush and electric razor to avoid gum and skin injury.
- Instruct patient to drink plenty of fluids to ensure adequate urinary output.
- Provide dietary counseling and refer patient to dietitian as needed if GI adverse effects significantly limit food intake.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## carisoprodol

Soma

**Pharmacologic class:** Carbamate derivative

**Therapeutic class:** Centrally acting skeletal muscle relaxant

**Controlled substance schedule IV** (in some states)

**Pregnancy risk category C**

## Action

Unknown. May modify central perception of pain without modifying pain reflexes. Skeletal muscle relaxation may result from sedative properties or from inhibition of activity in descending reticular formation and spinal cord.

## Availability

Tablets: 250 mg, 350 mg

## Indications and dosages

➤ Adjunctive treatment of muscle spasms associated with acute painful musculoskeletal conditions

**Adults:** 350 mg P.O. q.i.d.

➤ Relief of discomfort associated with acute painful musculoskeletal conditions

**Adults:** 250 to 350 mg P.O. t.i.d. and at bedtime

## Contraindications

- Hypersensitivity to drug or meprobamate
- Porphyria or suspected porphyria

## Precautions

Use cautiously in:

- severe hepatic or renal disease
- history of substance abuse
- pregnant or breastfeeding patients
- children ages 12 and younger.

## Administration

- Give last daily dose at bedtime.
- Administer with food if GI upset occurs.
- If patient can't swallow tablets, mix with syrup, chocolate, or jelly.

Route	Onset	Peak	Duration
P.O.	30 min	1-2 hr	4-6 hr

## Adverse reactions

**CNS:** dizziness, drowsiness, agitation, ataxia, depression, headache, insomnia, vertigo, tremor, depression

**CV:** hypotension, tachycardia

**GI:** nausea, vomiting, epigastric distress

**Hematologic:** eosinophilia, leukopenia

**Respiratory:** asthma attacks

**Skin:** flushing (especially of face), rash, pruritus, **erythema multiforme**

**Other:** hiccups, fever, psychological drug dependence, **anaphylactic shock**

## Interactions

**Drug-drug.** *Antihistamines, opioids, sedative-hypnotics:* additive CNS depression

**Drug-diagnostic tests.** *Eosinophils:* increased count

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

## Patient monitoring

- When giving to breastfeeding patient, watch for signs of sedation and GI upset in infant.
- Monitor range of motion, stiffness, and discomfort level.
- Know that drug is metabolized to meprobamate. Monitor for drug dependence, especially in patients with history of substance abuse.

## Patient teaching

- Tell patient that psychological drug dependence may occur.
- Instruct patient to avoid over-the-counter drugs and alcohol, because they may increase CNS depression.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## carmustine

Glidel Wafer

**Pharmacologic class:** Alkylating agent

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

**FDA BOXED WARNING**

- Give under supervision of physician experienced in cancer chemotherapy.
- Most common and severe toxic effect is bone marrow suppression—notably thrombocytopenia and leukopenia, which may contribute to bleeding and overwhelming infections in already compromised patient. Monitor blood counts weekly for at least 6 weeks after dose. Don't give courses more often than every 6 weeks.

**Action**

Unclear. Thought to interfere with bacterial cell-wall synthesis by cross-linking strands of DNA and disrupting RNA transcription, causing cell to rupture and die. Exhibits minimal immunosuppressant activity.

**Availability**

*Intracavitary wafer implant:* 7.7 mg (available in packages of eight wafers)  
*Powder for injection:* 100-mg vials

**Indications and dosages**

➤ Brain tumor; multiple myeloma; Hodgkin's disease; other lymphomas  
**Adults and children:** 150 to 200 mg/m<sup>2</sup> I.V. as a single dose q 6 to 8 weeks, or 75 to 100 mg/m<sup>2</sup>/day for 2 days q 6 weeks, or 40 mg/m<sup>2</sup>/day for 5 days q 6 weeks. Repeat dose q 6 weeks if platelet count exceeds 100,000/mm<sup>3</sup> and white blood cell (WBC) count exceeds 4,000/mm<sup>3</sup>.

➤ Adjunct to brain surgery  
**Adults:** Up to 61.6 mg (eight wafers) implanted in surgical cavity created during brain tumor resection

**Dosage adjustment**

- Based on WBC and platelet counts

**Off-label uses**

- Mycosis fungoides

**Contraindications**

- Hypersensitivity to drug
- Radiation therapy
- Chemotherapy
- Pregnancy or breastfeeding

**Precautions**

Use cautiously in:

- infection; depressed bone marrow reserve; respiratory, hepatic, or renal impairment
- females of childbearing age.

**Administration**

- Know that drug may be used alone or in conjunction with other treatments, such as surgery or radiation.
- Follow facility policy when preparing, administering, and handling drug.
- Reconstitute drug by dissolving vial of 100 mg with 3 ml of sterile dehydrated alcohol (provided with drug), followed by 27 ml of sterile water for injection; yields solution with concentration of 3.3 mg carmustine/ml. Solution may be further diluted with 5% dextrose injection and delivered by I.V. infusion over 1 to 2 hours.
- Know that infusion lasting less than 1 hour causes intense pain and burning at I.V. site.
- Infuse solution in glass containers only; drug is unstable in plastic I.V. bags.
- Know that skin contact with reconstituted drug may cause transient hyperpigmentation. If contact occurs, wash skin thoroughly with soap and water.
- Be aware that oxidized regenerated cellulose may be placed over wafers to secure them against surgical cavity surface.
- Know that resection cavity should be irrigated after wafer placement and that dura should be closed in water-tight fashion.

Route	Onset	Peak	Duration
I.V.	Immediate	15 min	6 wk
Intra-cavitary	Unknown	Unknown	Unknown

**Adverse reactions****CNS:** ataxia, drowsiness**GI:** nausea, vomiting, diarrhea, esophagitis, stomatitis, anorexia**GU:** azotemia, **renal failure, nephrotoxicity****Hematologic:** anemia, **leukopenia, thrombocytopenia, cumulative bone marrow depression, bone marrow dysplasia****Hepatic:** **hepatotoxicity****Respiratory:** **pulmonary fibrosis, pulmonary infiltrates****Skin:** alopecia, hyperpigmentation, facial flushing, abnormal bruising**Other:** I.V. site pain, **secondary malignancies****Interactions****Drug-drug.** *Anticoagulants, aspirin, nonsteroidal anti-inflammatory drugs:* increased risk of bleeding*Antineoplastics:* additive bone marrow depression*Cimetidine:* potentiation of bone marrow depression*Digoxin, phenytoin:* decreased blood levels of these drugs*Live-virus vaccines:* decreased antibody response to vaccines, increased risk of adverse reactions**Drug-diagnostic tests.** *Alkaline phosphatase, aspartate aminotransferase, bilirubin, nitrogenous compounds (urea):* increased levels*Hemoglobin, WBCs:* decreased values**Drug-behaviors.** *Smoking:* increased risk of respiratory toxicity**Patient monitoring**

- Assess baseline kidney and liver function tests.
- Monitor CBC for up to 6 weeks after giving dose to detect delayed bone marrow toxicity.
- Know that pulmonary function tests should be performed before therapy begins and regularly throughout therapy to assess for toxicity.

**Patient teaching**

- Instruct patient to report signs and symptoms of allergic response and other adverse reactions.
- Inform patient that severe flushing may follow I.V. dose but should subside in 2 to 4 hours.
- Tell patient to avoid activities that can cause injury. Advise him to use soft toothbrush and electric razor to avoid gum and skin injury.
- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- Instruct patient to monitor urinary output and report significant changes.
- Inform patient that drug may cause hair loss.
- Advise patient that he'll undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

**carteolol hydrochloride**Ocupress, Teoptic **Pharmacologic class:** Beta-adrenergic blocker (nonselective)**Therapeutic class:** Antianginal, anti-hypertensive**Pregnancy risk category** C**Action**

Blocks stimulation of cardiac beta<sub>1</sub>-adrenergic receptor sites and pulmonary beta<sub>2</sub>-adrenergic receptor sites. Shows intrinsic sympathomimetic activity, causing slowing of heart rate, decreased myocardial excitability, reduced cardiac output, and decreased renin release from kidney. Also reduces intraocular pressure.

**Availability***Ophthalmic solution:* 1%**Indications and dosages**

➤ Open-angle glaucoma; ocular hypertension

**Adults:** One drop (1% solution) in affected eye(s) b.i.d.**Contraindications**

- Hypersensitivity to drug or its components
- Other beta-adrenergic blockers
- Cardiogenic shock, bradycardia, second- or third-degree atrioventricular block
- Sinus bradycardia, bronchial asthma, severe obstructive pulmonary disease
- Overt heart failure

**Precautions**

Use cautiously in:

- pulmonary disease, diabetes mellitus, hypoglycemia, thyrotoxicosis, hypertension, respiratory depression, major surgery, history of bronchospasm
- angle-closure glaucoma
- pregnant or breastfeeding patients
- children.

**Administration**

- Be aware that if the patient's intraocular pressure isn't at a satisfactory level on prescribed regimen, concomitant therapy with pilocarpine and other miotics, or epinephrine or dipivefrin, or systemically administered carbonic anhydrase inhibitors such as acetazolamide may be instituted.

Route	Onset	Peak	Duration
Ophthalmic	Unknown	Unknown	Unknown

**Adverse reactions**

**CNS:** headache, fatigue, weakness, anxiety, depression, dizziness, insomnia, memory loss, nightmares, paresthesia,

hallucinations, disorientation, slurred speech

**CV:** orthostatic hypotension, peripheral vasoconstriction, conduction disturbances, **bradycardia**, **heart failure**

**EENT:** decreased night vision and stinging, blurred vision, dry eyes, tinnitus, stuffy nose, nasal congestion, pharyngitis, **laryngospasm**

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dry mouth, anorexia

**GU:** dysuria, polyuria, nocturia, dark urine, erectile dysfunction, decreased libido, Peyronie's disease

**Metabolic:** hyperglycemia, **hypoglycemia**

**Musculoskeletal:** arthralgia, back or leg pain, muscle cramps

**Respiratory:** wheezing, **bronchospasm**, **respiratory distress**, **pulmonary edema**

**Skin:** pruritus, rash, sweating

**Other:** drug-induced lupuslike syndrome, **anaphylaxis**

**Interactions**

**Drug-drug.** *Adrenergics:* antagonism of carteolol effects

*Allergen immunotherapy:* increased risk of anaphylaxis

*Amphetamines, ephedrine, epinephrine, norepinephrine, phenylephrine, pseudoephedrine:* unopposed alpha-adrenergic stimulation, causing excessive hypertension and bradycardia

*Antihypertensives, nitrates:* additive hypotension

*Clonidine:* increased hypotension and bradycardia, exaggerated withdrawal phenomenon

*Digoxin:* additive bradycardia

*Dobutamine, dopamine:* decrease in beneficial cardiovascular effects

*General anesthetics, I.V. phenytoin, verapamil:* additive myocardial depression

*Insulin, oral hypoglycemics:* altered efficacy of these drugs

*MAO inhibitors:* hypertension

*Nonsteroidal anti-inflammatory drugs:* decreased antihypertensive effect

*Thyroid preparations:* decreased carvedilol efficacy

**Drug-diagnostic tests.** *Blood urea nitrogen, lipoproteins, potassium, triglycerides, uric acid:* increased levels  
*Glucose or insulin tolerance test:* test interference

**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension  
*Cocaine use:* unopposed alpha-adrenergic stimulation, causing excessive hypertension and bradycardia  
*Sun exposure:* photophobia

### Patient monitoring

 Monitor vital signs (especially blood pressure) and ECG. Drug may alter cardiac output and cause ineffective airway clearance. Discontinue drug at first sign of heart failure.

- Monitor for disorientation, agitation, visual disturbances, dizziness, ataxia and euphoria. Symptoms usually subside over several hours.
- Weigh patient daily and measure fluid intake and output to detect fluid retention.
- Assess blood glucose level regularly if patient has diabetes mellitus.

### Patient teaching

- Instruct patient to take last dose at bedtime.
-  Instruct patient to report breathing problems immediately.
- Tell patient to report dizziness, confusion, depression, respiratory problems, or rash.
- Advise patient to move slowly when sitting up or standing to avoid dizziness or light-headedness from sudden blood pressure drop.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Teach patient proper use of eyedrops. Tell him to wash hands first, not to

touch dropper tip to any surface, and not to use drops when contact lenses are in eyes.

- Inform patient that although eyedrops commonly cause stinging and blurred vision, he should notify prescriber if these symptoms are severe.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## carvedilol

Apo-Carvedilol<sup>⚡</sup>, Coreg, Dom-Carvedilol<sup>⚡</sup>, Eucardic<sup>⚡</sup>

## carvedilol phosphate

Coreg CR, Novo-Carvedilol<sup>⚡</sup>, PHL-Carvedilol<sup>⚡</sup>, PMS-Carvedilol<sup>⚡</sup>

**Pharmacologic class:** Beta-adrenergic blocker (nonselective)

**Therapeutic class:** Antihypertensive

**Pregnancy risk category** C

### Action

Blocks stimulation of cardiac beta<sub>1</sub>-adrenergic receptor sites and pulmonary beta<sub>2</sub>-adrenergic receptor sites. Shows intrinsic sympathomimetic activity, causing slowing of heart rate, decreased myocardial excitability, reduced cardiac output, and decreased renin release from kidney.

### Availability

*Capsules (extended-release):* 10 mg, 20 mg, 40 mg, 80 mg

*Tablets:* 3.125 mg, 6.25 mg, 12.5 mg, 25 mg

### Indications and dosages

- > Hypertension

**Adults:** Initially, 6.25 mg P.O. b.i.d. (Coreg). May be increased q 7 to 14 days to a maximum dosage of 25 mg b.i.d. Or, 20 mg P.O. daily (Coreg CR). If tolerated, using standing systolic pressure about 1 hour after dosing, maintain dosage of Coreg CR for 7 to 14 days; then increase to 40 mg once daily if needed based on trough systolic standing blood pressure. Maintain this dosage for 7 to 14 days and adjust to 80 mg once daily if tolerated and needed. Total daily dose of Coreg CR shouldn't exceed 80 mg.

➤ Heart failure caused by ischemia or cardiomyopathy

**Adults:** Initially, 3.125 mg P.O. b.i.d. (Coreg) for 2 weeks. May increase to 6.25 mg b.i.d. Dosage may be doubled q 2 weeks as tolerated, not to exceed 25 mg b.i.d. in patients weighing less than 85 kg (187 lb) or 50 mg b.i.d. in patients weighing more than 85 kg. Or, 10 mg P.O. daily (Coreg CR) for 2 weeks. If tolerated, increase dosage to 20 mg, 40 mg, and 80 mg over successive intervals of at least 2 weeks.

➤ Left ventricular dysfunction following myocardial infarction

**Adults:** Initially, 6.25 mg P.O. b.i.d. (Coreg); increase after 3 to 10 days to 12.5 mg b.i.d. (based on tolerability), then increase to target dosage of 25 mg b.i.d. A lower starting dose (3.125 mg b.i.d.) or slower titration may be used if clinically indicated. Or, 20 mg P.O. once daily (Coreg CR); increase after 3 to 10 days to 40 mg daily (based on tolerability), then increase to target dose of 80 mg daily. A lower starting dose may be used (10 mg daily) or the rate of up titration may be slowed if clinically indicated.

### Off-label uses

- Angina pectoris
- Idiopathic cardiomyopathy

### Contraindications

- Hypersensitivity to drug
- Uncompensated heart failure
- Pulmonary edema
- Cardiogenic shock
- Bradycardia or heart block
- Severe hepatic impairment
- Bronchial asthma, bronchospasm

### Precautions

Use cautiously in:

- renal or hepatic impairment, pulmonary disease, diabetes mellitus, hypoglycemia, thyrotoxicosis, peripheral vascular disease, hypotension, respiratory depression
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

- Ensure that patient is hemodynamically stable and fluid retention has been minimized before starting therapy.
- Give immediate-release form with food to slow absorption and minimize orthostatic hypotension.
- Give extended-release form in the morning with food and instruct patient to swallow capsule whole.
- For patients who can't swallow capsules whole, carefully open capsules and sprinkle contents on applesauce; have patient swallow contents immediately without chewing. Don't use warm applesauce; doing so could affect the modified-release properties of this formulation.
- When drug is used to treat heart failure, check apical pulse before administering. If it's below 60 beats/minute, withhold dosage and contact prescriber.
- When drug is used for hypertension, check standing systolic pressure about 1 hour after dosing for use as a guide for patient tolerance.
- Be aware that addition of diuretic may cause additive effects and may worsen orthostatic hypotension.

- Know that full antihypertensive effect takes 7 to 14 days.
- 📣 Don't withdraw drug abruptly, because this may lead to withdrawal phenomenon (angina exacerbation, myocardial infarction, ventricular arrhythmias, and even death).

Route	Onset	Peak	Duration
P.O.	Within 1 hr	1-2 hr	12 hr

### Adverse reactions

**CNS:** dizziness, fatigue, anxiety, depression, insomnia, memory loss, nightmares, headache, pain  
**CV:** orthostatic hypotension, peripheral vasoconstriction, angina pectoris, chest pain, hypertension, **bradycardia**, **heart failure**, **atrioventricular block**  
**EENT:** blurred or abnormal vision, dry eyes, stuffy nose, rhinitis, sinusitis, pharyngitis  
**GI:** nausea, diarrhea, constipation  
**GU:** urinary tract infection, hematuria, albuminuria, decreased libido, erectile dysfunction, **renal dysfunction**  
**Hematologic:** bleeding, **purpura**, **thrombocytopenia**  
**Metabolic:** hypovolemia, hypervolemia, hyperglycemia, hyponatremia, hyperuricemia, glycosuria, gout, **hypoglycemia**  
**Musculoskeletal:** arthralgia, back pain, muscle cramps  
**Respiratory:** wheezing, upper respiratory tract infection, dyspnea, bronchitis, **bronchospasm**, **pulmonary edema**  
**Skin:** pruritus, rash  
**Other:** weight gain, lupuslike syndrome, viral infection, **anaphylaxis**

### Interactions

**Drug-drug.** *Antihypertensives:* additive hypotension  
*Calcium channel blockers, general anesthetics, I.V. phenytoin:* additive myocardial depression  
*Cimetidine:* increased carvedilol toxicity  
*Clonidine:* increased hypotension and bradycardia, exaggerated withdrawal phenomenon

*Digoxin:* additive bradycardia  
*Dobutamine, dopamine:* decrease in beneficial cardiovascular effects  
*Insulin, oral hypoglycemics:* altered efficacy of these drugs  
*MAO inhibitors:* hypertension  
*Nonsteroidal anti-inflammatory drugs:* decreased antihypertensive action  
*Rifampin, thyroid preparations:* decreased carvedilol efficacy  
*Theophyllines:* reduced theophylline elimination, antagonistic effect that decreases theophylline or carteolol efficacy  
**Drug-diagnostic tests.** *Antinuclear antibodies:* increased titers  
*Blood urea nitrogen, glucose, lipoproteins, potassium, triglycerides, uric acid:* increased levels  
**Drug-food.** *Any food:* delayed drug absorption  
**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension

### Patient monitoring

- Watch for signs and symptoms of hypersensitivity reaction.
- Assess baseline CBC and kidney and liver function test results.
- Monitor vital signs (especially blood pressure), ECG, and exercise tolerance. Drug may alter cardiac output and cause ineffective airway clearance.
- Weigh patient daily and measure fluid intake and output to detect fluid retention.
- Measure blood glucose regularly if patient has diabetes mellitus. Drug may mask signs and symptoms of hypoglycemia.

### Patient teaching

- Instruct patient to take drug with food exactly as prescribed.
- Tell patient to take extended-release capsule in the morning with food, to swallow capsule whole, and not to chew, crush, or divide its contents.
- Instruct patient who can't swallow capsule whole to carefully open

capsule, sprinkle contents on cool or cold applesauce, and swallow contents immediately without chewing. Tell patient not to store mixture for future use.

 Caution patient not to stop taking drug abruptly, because serious reactions may result.

- Advise patient to move slowly when sitting up or standing, to avoid dizziness or light-headedness from sudden blood pressure drop.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Inform male patient that drug may cause erectile dysfunction. Advise him to discuss this issue with prescriber.
- Advise patient to use soft-bristled toothbrush and electric razor to avoid gum and skin injury.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

## caspofungin acetate

Candidas

**Pharmacologic class:** Echinocandin

**Therapeutic class:** Antifungal

**Pregnancy risk category** C

### Action

Inhibits synthesis of beta (1, 3)-D-glucan, an important component of cell wall in *Aspergillus* and other fungal cells. This inhibition leads to cell rupture and death.

### Availability

*Lyophilized powder for injection:*  
50 mg and 70 mg in single-use vials

### Indications and dosages

 Invasive aspergillosis in patients - refractory to or intolerant of other therapies

**Adults ages 18 and older:** 70 mg I.V. as a single loading dose on first day, followed by 50 mg/day thereafter

**Children ages 3 months to 17 years:** 70 mg/m<sup>2</sup> I.V. as a single loading dose on first day, followed by 50 mg/m<sup>2</sup>/day thereafter. Maximum loading dosage and daily maintenance dosage shouldn't exceed 70 mg, regardless of calculated dosage.

 Esophageal candidiasis

**Adults ages 18 and older:** 50 mg I.V. daily

**Children ages 3 months to 17 years:** 70 mg/m<sup>2</sup> I.V. as a single loading dose on first day, followed by 50 mg/m<sup>2</sup>/day thereafter. Maximum loading dosage and daily maintenance dosage shouldn't exceed 70 mg, regardless of calculated dosage.

 Candidemia and other *Candida* infections (intra-abdominal abscesses, peritonitis, and pleural-space infections)

**Adults ages 18 and older:** 70 mg I.V. as a single loading dose on first day, followed by 50 mg/day thereafter. Continue therapy for at least 14 days after last positive culture. Consistently neutropenic patient may require longer course of therapy.

**Children ages 3 months to 17 years:** 70 mg/m<sup>2</sup> I.V. as a single loading dose on first day, followed by 50 mg/m<sup>2</sup>/day thereafter. Maximum loading dosage and daily maintenance dosage shouldn't exceed 70 mg, regardless of calculated dosage.

 Empirical therapy for presumed fungal infections in febrile neutropenic patients

**Adults ages 18 and older:** 70 mg I.V. as a single loading dose on first day, followed by 50 mg/day thereafter. Continue therapy until neutropenia resolves, for

at least 14 days in patients with fungal infections, or for at least 7 days after both neutropenia and symptoms resolve. If patient tolerates 50-mg dosage well but doesn't obtain adequate response, increase daily dosage to 70 mg.

**Children ages 3 months to 17 years:** 70 mg/m<sup>2</sup> I.V. as a single loading dose on first day, followed by 50 mg/m<sup>2</sup>/day thereafter. Maximum loading dosage and daily maintenance dosage shouldn't exceed 70 mg, regardless of calculated dosage.

**Dosage adjustment**

- Moderate hepatic insufficiency (adults)

**Contraindications**

- Hypersensitivity to drug or its components

**Precautions**

Use cautiously in:

- hepatic impairment
- renal insufficiency
- concurrent cyclosporine use
- pregnant or breastfeeding patients.

**Administration**

-  Don't mix with other drugs or with diluents containing dextrose.
- Reconstitute powder using 10.8 ml of normal saline solution for injection, sterile water for injection, or bacteriostatic water for injection. Mix gently until solution is clear. Add to I.V. bag or bottle containing 250 ml of normal, half-normal, or quarter-normal saline solution for injection or lactated Ringer's solution. Don't exceed concentration of 0.5 mg/ml.
-  Don't give by I.V. bolus.
- Administer by slow I.V. infusion over 1 hour.
- Know that in patients with human immunodeficiency virus, oral therapy may be given to help prevent oropharyngeal candidiasis relapse.

- Be aware that adults taking rifampin concurrently should receive 70-mg daily dosage.
- Know that dosage may need to be increased in patients receiving nevirapine, efavirenz, carbamazepine, dexamethasone, or phenytoin.

Route	Onset	Peak	Duration
I.V.	Immediate	9-11 hr	40-50 hr

**Adverse reactions**

- CNS:** headache
- CV:** tachycardia, phlebitis, hypotension, hypertension (children)
- GI:** nausea, vomiting, diarrhea, abdominal pain
- GU:** nephrotoxicity
- Hematologic:** anemia
- Metabolic:** hypokalemia, hyperkalemia
- Musculoskeletal:** pain, myalgia, back pain
- Respiratory:** tachypnea, cough, dyspnea, crackles, pneumonia, **respiratory distress (children), pleural effusion, respiratory failure**
- Skin:** erythema, pruritus (children), rash
- Other:** graft-versus-host disease, central line infection (children), chills, mucosal inflammation, peripheral edema, pyrexia, **infusion-related reactions, septic shock**

**Interactions**

- Drug-drug.** *Carbamazepine, dexamethasone, efavirenz, nelfinavir, nevirapine, phenytoin, rifampin:* reduced casprofungin blood level
- Cyclosporine:* markedly increased casprofungin blood level, transient ALT and AST increases
- Tacrolimus:* possible change in tacrolimus blood level
- Drug-diagnostic tests.** *Albumin, hematocrit, hemoglobin, magnesium, potassium, total protein (children), white blood cells:* decreased levels
- ALP, ALT, AST, bilirubin, calcium, conjugated bilirubin, creatinine,*

*eosinophils, glucose, urea*: increased levels

*Potassium*: decreased or increased level (children)

*Urinary red blood cells*: positive

### Patient monitoring

🔊 Monitor closely for signs and symptoms of infusion-related reactions (pyrexia, chills, flushing, hypotension, hypertension, tachycardia, dyspnea, tachypnea, anaphylaxis). Be prepared to provide supportive care as needed.

- Monitor I.V. site carefully for phlebitis and other complications.
- Monitor complete blood count and serum electrolyte levels. Stay alert for signs and symptoms of hypokalemia.
- Monitor vital signs, especially for tachycardia and tachypnea.
- Closely monitor liver function tests; watch for evidence of worsening hepatic function.

### Patient teaching

🔊 Instruct patient to immediately report signs or symptoms of infusion-related reaction, such as fever, chills, flushing, rapid heart beat, difficult or rapid breathing, or rash.

🔊 Tell patient drug may cause problems in vein used for infusion. Tell him to immediately report pain, swelling, or other symptoms.

- Instruct patient to report headache, nausea, or other unusual or troublesome symptoms.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## cefaclor

Apo-Cefaclor<sup>☼</sup>, Distaclor<sup>☼</sup>, PMS-Cefaclor<sup>☼</sup>, Raniclor

**Pharmacologic class:** Second-generation cephalosporin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

### Action

Interferes with bacterial cell-wall synthesis, causing cell to rupture and die

### Availability

*Capsules*: 250 mg, 500 mg

*Oral suspension*: 125 mg/5 ml, 187 mg/5 ml, 250 mg/5 ml, 375 mg/5 ml

*Tablets (extended-release)*: 500 mg

### Indications and dosages

➤ Uncomplicated skin infections caused by *Staphylococcus aureus*

**Adults and children ages 16 and older:** 375 mg P.O. (extended-release tablet) q 12 hours for 7 to 10 days

➤ Pharyngitis and tonsillitis not caused by *Haemophilus influenzae*

**Adults and children ages 16 and older:** 375 mg P.O. (extended-release tablet) q 12 hours for 10 days

➤ Chronic bronchitis and acute bronchitis not caused by *H. influenzae*

**Adults and children ages 16 and older:** 500 mg P.O. (extended-release tablet) q 12 hours for 7 days

➤ Otitis media caused by staphylococci; lower respiratory tract infections caused by *H. influenzae*, *S. pyogenes*, and *S. pneumoniae*; pharyngitis and tonsillitis caused by *S. pyogenes*; urinary tract infections caused by *Klebsiella* species, *Escherichia coli*, *Proteus mirabilis*, and coagulase-negative staphylococci

**Adults and children ages 13 to 17:** 250 mg P.O. q 8 hours. For severe infections, 500 mg P.O. q 8 hours.

**Children:** 20 mg/kg/day P.O. in divided doses q 8 hours. For serious infections, 40 mg/kg/day P.O. in divided doses q 8 hours. Maximum dosage is 1 g/day.

### Dosage adjustment

- Renal insufficiency
- Elderly patients

### Contraindications

- Hypersensitivity to cephalosporins or penicillins

### Precautions

Use cautiously in:

- renal impairment, phenylketonuria
- history of GI disease (especially colitis)
- emaciated patients
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

- Obtain specimens for culture and sensitivity testing as necessary before starting therapy.
- Be aware that cross-sensitivity to penicillins may occur.
- Give extended-release tablets with food to enhance absorption.
- Don't give antacids within 2 hours of extended-release form.

Route	Onset	Peak	Duration
P.O.	Rapid	30-60 min	6-12 hr
P.O. (extended)	Unknown	1.5-2.5 hr	12 hr

### Adverse reactions

**CNS:** headache, lethargy, paresthesia, syncope, **seizures**

**CV:** hypotension, palpitations, chest pain, vasodilation

**EENT:** hearing loss

**GI:** nausea, vomiting, diarrhea, abdominal cramps, oral candidiasis, **pseudomembranous colitis**

**GU:** vaginal candidiasis, **nephrotoxicity**

**Hematologic:** lymphocytosis, eosinophilia, **bleeding tendency, hemolytic anemia, hypoprothrombinemia, neutropenia, thrombocytopenia, agranulocytosis, bone marrow depression**

**Hepatic:** **hepatic failure, hepatomegaly**

**Musculoskeletal:** arthralgia

**Respiratory:** dyspnea

**Skin:** urticaria, maculopapular or erythematous rash

**Other:** chills, fever, superinfection, **anaphylaxis, serum sickness**

### Interactions

**Drug-drug.** *Aminoglycosides, loop diuretics:* increased risk of nephrotoxicity

*Antacids:* decreased absorption of extended-release cefaclor tablets

*Chloramphenicol:* antagonistic effect

*Probenecid:* decreased excretion and increased blood level of cefaclor

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, eosinophils, gamma-glutamyltransferase, lactate dehydrogenase:* increased levels  
*Coombs' test, urinary 17-ketosteroids, nonenzyme-based urine glucose tests (such as Clinitest):* false-positive results

*Hemoglobin, platelets, white blood cells:* decreased values

### Patient monitoring

- Assess CBC and kidney and liver function test results.

- With long-term therapy, obtain monthly Coombs' test.

- Monitor for signs and symptoms of superinfection and other serious adverse reactions.

**Patient teaching**

- Instruct patient to take drug with food or milk to reduce GI upset.
- Advise patient to complete entire course of therapy even if he feels better.
- Tell patient to report signs and symptoms of allergic response and other adverse reactions, such as rash, easy bruising, bleeding, severe GI problems, or difficulty breathing.
- Instruct patient to avoid taking antacids within 2 hours of extended-release cefaclor.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

**cefadroxil**Baxan , Novo-Cefadroxil **Pharmacologic class:** First-generation cephalosporin**Therapeutic class:** Anti-infective**Pregnancy risk category B****Action**

Interferes with bacterial cell-wall synthesis, causing cell to rupture and die

**Availability***Capsules:* 500 mg*Oral suspension:* 250 mg/5 ml,

500 mg/5 ml

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## cefazolin sodium

Ancef

**Pharmacologic class:** First-generation cephalosporin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

### Action

Interferes with bacterial cell-wall synthesis, causing cell to rupture and die

### Availability

*Powder for injection:* 500 mg, 1 g, 10 g, 20 g

*Premixed containers:* 500 mg/50 ml in dextrose 5% in water (D<sub>5</sub>W), 1 g/50 ml in D<sub>5</sub>W

### Indications and dosages

➤ Respiratory tract infections caused by group A beta-hemolytic streptococci, *Klebsiella* species, *Haemophilus influenzae*, and *Staphylococcus aureus*; skin infections caused by *S. aureus* and beta-hemolytic streptococci; biliary tract infections caused by *Escherichia coli*, *Klebsiella* species, *Proteus mirabilis*, and *S. aureus*; bone and joint infections caused by *S. aureus*; genital infections caused by *E. coli*, *Klebsiella* species, *P. mirabilis*, and strains of enterococci; septicemia caused by *E.*

*coli*, *Klebsiella* species, *P. mirabilis*, *S. aureus*, and *S. pneumoniae*; endocarditis caused by *S. aureus* or beta-hemolytic streptococci

**Adults:** For mild infections, 250 to 500 mg q 8 hours I.V. or I.M. For moderate to severe infections, 500 to 1,000 mg I.V. or I.M. q 6 to 8 hours. For life-threatening infections, 1,000 to 1,500 mg I.M. or I.V. q 6 hours, to a maximum dosage of 6 g/day.

**Children:** For mild to moderate infections, 25 to 50 mg/kg/day I.V. or I.M. in divided doses t.i.d. or q.i.d. For severe infections, 100 mg/kg/day I.V. or I.M. in divided doses t.i.d. or q.i.d.

➤ Acute uncomplicated urinary tract infections (UTIs) caused by *E. coli*, *Klebsiella* species, *P. mirabilis*, and strains of *Enterococcus* and *Enterobacter* species

**Adults:** 1 g I.V. or I.M. q 12 hours

➤ Surgical prophylaxis

**Adults:** 1g I.V. or I.M. 30 to 60 minutes before surgery, then 0.5 to 1 g I.V. or I.M. q 6 to 8 hours for 24 hours. If surgery exceeds 2 hours, another 0.5- to 1-g dose I.M. or I.V. may be given intraoperatively.

➤ Pneumococcal pneumonia

**Adults:** 500 mg I.M. or I.V. infusion q 12 hours

### Dosage adjustment

- Renal impairment
- Elderly patients

### Contraindications

- Hypersensitivity to cephalosporins or penicillins

### Precautions

Use cautiously in:

- renal impairment, phenylketonuria
- history of GI disease (especially colitis)
- emaciated patients
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

- Obtain specimens for culture and sensitivity testing as needed before starting therapy.
- For intermittent I.V. infusion, administer in volume-control set or in separate, secondary I.V. container over 30 to 60 minutes.
- For direct I.V. injection, dilute reconstituted dose in 5 ml of sterile water for injection and administer slowly over 3 to 5 minutes.
- Don't mix premixed solution with other drugs.
- ⚠ Don't use flexible container in series connections because of risk of air embolism.
- For I.M. use, reconstitute with sterile water for injection, bacteriostatic water, or normal saline solution for injection. Shake well until dissolved.
- Inject I.M. into large muscle mass.

Route	Onset	Peak	Duration
I.V.	Rapid	End of infusion	6-12 hr
I.M.	Rapid	1-2 hr	6-12 hr

### Adverse reactions

**CNS:** headache, lethargy, confusion, hemiparesis, paresthesia, syncope, **seizures**

**CV:** hypotension, palpitations, chest pain, vasodilation

**EENT:** hearing loss

**GI:** nausea, vomiting, diarrhea, abdominal cramps, oral candidiasis, **pseudomembranous colitis**

**GU:** vaginal candidiasis, **nephrotoxicity**

**Hematologic:** lymphocytosis, eosinophilia, **bleeding tendency**, **hemolytic anemia**, **hypoprothrombinemia**, **neutropenia**, **thrombocytopenia**, **agranulocytosis**, **bone marrow depression**

**Hepatic:** **hepatic failure**, **hepatomegaly**

**Musculoskeletal:** arthralgia

**Respiratory:** dyspnea

**Skin:** urticaria, maculopapular or erythematous rash

**Other:** chills, fever, superinfection, anaphylaxis, serum sickness

## Interactions

**Drug-drug.** *Aminoglycosides, loop diuretics:* increased risk of nephrotoxicity

*Anticoagulants:* increased anticoagulant effect

*Chloramphenicol:* antagonistic effect

*Probenecid:* decreased excretion and increased blood level of cefazolin

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, eosinophils, gamma-glutamyltransferase, lactate dehydrogenase:* increased levels  
*Coombs' test, urinary 17-ketosteroids, nonenzyme-based urine glucose tests (such as Clinitest):* false-positive results  
*Hemoglobin, platelets, white blood cells:* decreased values

**Drug-behaviors.** *Alcohol use:* acute alcohol intolerance (disulfiram-like reaction) if alcohol is consumed within 72 hours of drug administration

## Patient monitoring

- 🔊 If patient is receiving high doses, monitor for extreme confusion, tonic-clonic seizures, and mild hemiparesis.
- Monitor CBC, prothrombin time, and kidney and liver function test results.
- Watch for signs and symptoms of superinfection and other serious adverse reactions.
- Be aware that cross-sensitivity to penicillins may occur.

## Patient teaching

- Tell patient to report reduced urinary output, persistent diarrhea, bruising, or bleeding.
- Instruct patient to take drug exactly as prescribed and to complete full course of therapy even when he feels better.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## cefdinir

Omnicef

**Pharmacologic class:** Third-generation cephalosporin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

## Action

Interferes with bacterial cell-wall synthesis and division by binding to cell wall, causing cell to die. Active against gram-negative and gram-positive bacteria, with expanded activity against gram-negative bacteria. Exhibits minimal immunosuppressant activity.

## Availability

*Capsules:* 300 mg

*Oral suspension:* 125 mg/5 ml in 60- and 100-ml bottles

## Indications and dosages

➤ Acute bacterial otitis media caused by *Haemophilus influenzae*, *Streptococcus pneumoniae*, and *Moraxella catarrhalis*

**Adults and children ages 13 and older:** 300 mg P.O. q 12 hours or 600 mg P.O. q 24 hours for 10 days

**Children ages 6 months to 12 years:** 7 mg/kg P.O. q 12 hours for 5 to 10 days or 14 mg/kg P.O. q 24 hours for 10 days

➤ Uncomplicated skin and soft-tissue infections caused by *Staphylococcus aureus* and *Streptococcus pyogenes*

**Adults and children ages 13 and older:** 300 mg P.O. q 12 hours for 10 days. Maximum dosage is 600 mg/day.

➤ Acute maxillary sinusitis caused by *H. influenzae*, *S. pneumoniae*, and *M. catarrhalis*

**Adults and children ages 13 and older:** 300 mg P.O. q 12 hours or 600 mg P.O. q 24 hours for 10 days. Maximum dosage is 600 mg/day.

**Children ages 6 months to 12 years:** 7 mg/kg P.O. q 12 hours or 14 mg/kg P.O. q 24 hours for 10 days

➤ Pharyngitis or tonsillitis caused by *S. pyogenes*, chronic bronchitis caused by *H. influenzae*, *S. pneumoniae*, and *M. catarrhalis*

**Adults and children ages 13 and older:** 300 mg P.O. q 12 hours for 5 to 10 days or 600 mg P.O. q 24 hours for 10 days. Maximum dosage is 600 mg/day.

➤ Community-acquired pneumonia caused by *H. influenzae*, *Haemophilus parainfluenzae*, *S. pneumoniae*, and *M. catarrhalis*

**Adults and children ages 13 and older:** 300 mg P.O. q 12 hours for 10 days. Maximum dosage is 600 mg/day.

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to cephalosporins or penicillins

### Precautions

Use cautiously in:

- renal impairment, phenylketonuria
- history of GI disease (especially colitis)
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

- Obtain specimens for culture and sensitivity tests as necessary before starting therapy.
- Give with or without food.

- Administer 2 hours before or after iron supplements or antacids containing aluminum or magnesium.

- Give capsules, if possible, to diabetic patients (oral suspension contains 2.86 g of sucrose per teaspoon).

Route	Onset	Peak	Duration
P.O.	Rapid	2-4 hr	12-24 hr

### Adverse reactions

**CNS:** headache, lethargy, paresthesia, syncope, **seizures**

**CV:** hypotension, palpitations, chest pain, vasodilation

**EENT:** hearing loss

**GI:** nausea, vomiting, diarrhea, abdominal cramps, oral candidiasis,

**pseudomembranous colitis**

**GU:** vaginal candidiasis, **nephrotoxicity**

**Hematologic:** lymphocytosis, eosinophilia, **bleeding tendency, hemolytic anemia, hypoprothrombinemia, neutropenia, thrombocytopenia, agranulocytosis, bone marrow depression**

**Hepatic:** **hepatomegaly, hepatic failure**

**Musculoskeletal:** arthralgia

**Respiratory:** dyspnea

**Skin:** chills, fever, urticaria, maculopapular or erythematous rash

**Other:** superinfection, **anaphylaxis, serum sickness**

### Interactions

**Drug-drug.** *Aminoglycosides, loop diuretics:* increased risk of nephrotoxicity

*Antacids, iron-containing preparations:* decreased cefdinir absorption

*Probenecid:* decreased excretion and increased blood level of cefdinir

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, eosinophils, gamma-glutamyltransferase, lactate dehydrogenase:* increased levels  
*Coombs' test, urinary 17-ketosteroids, nonenzyme-based urine glucose tests (such as Clinitest):* false-positive results

*Hemoglobin, platelets, white blood cells:* decreased values

**Drug-herbs.** *Angelica, anise, arnica, asafetida, bogbean, boldo, celery, chamomile, clove, danshen, fenugreek, feverfew, garlic, ginger, ginkgo, horse chestnut, horseradish, licorice, meadowsweet, onion, ginseng, papain, passionflower, poplar, prickly ash, quassia, red clover, turmeric, wild carrot, wild lettuce, willow:* increased risk of bleeding

### Patient monitoring

- Monitor CBC and kidney and liver function test results.
- Monitor for signs and symptoms of superinfection and other serious adverse reactions.

### Patient teaching

- Tell patient he may take drug with or without food.
- Instruct patient to report persistent diarrhea (more than four episodes daily) and other adverse effects.
- If patient uses antacids or iron-containing preparations (such as iron supplements), tell him to take these 2 hours before or after cefdinir.
- Inform patient that drug may temporarily discolor stools.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## cefepime hydrochloride

Maxipime

**Pharmacologic class:** Fourth-generation cephalosporin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

### Action

Interferes with bacterial cell-wall synthesis and division by binding to cell wall, causing cell to die. Active against gram-negative and gram-positive bacteria, with expanded activity against gram-negative bacteria. Exhibits minimal immunosuppressant activity.

### Availability

*Powder for injection:* 500-mg vial, 1-g vial, 2-g vial; 1-g and 2-g piggyback bottles

*Solution for injection (premixed):* 1 g (50 ml in iso-osmotic dextrose), 2 g (100 ml in iso-osmotic dextrose)

### Indications and dosages

- Urinary tract infections (UTIs) caused by *Escherichia coli*, *Klebsiella pneumoniae*, and *Proteus mirabilis*  
**Adults:** 500 mg to 1g by I.V. infusion or I.M. q 12 hours for 7 to 10 days
- Severe UTIs caused by *E. coli* or *K. pneumoniae*; moderate to severe skin infections caused by *Staphylococcus aureus* or *Streptococcus pyogenes*  
**Adults:** 2 g by I.V. infusion q 12 hours for 10 days
- Febrile neutropenia  
**Adults and children ages 2 months to 16 years:** 2 g by I.V. infusion q 8 hours for 7 days
- Complicated intra-abdominal infections caused by alpha-hemolytic streptococci, *E. coli*, *K. pneumoniae*, *Pseudomonas aeruginosa*, *Enterobacter* species, or *Bacteroides fragilis*  
**Adults:** 2 g by I.V. infusion q 12 hours for 7 to 10 days (given with metronidazole)
- Moderate to severe pneumonia caused by *K. pneumoniae*, *P. aeruginosa*, *Enterobacter* species, or *Streptococcus pneumoniae*  
**Adults:** 1 to 2 g by I.V. infusion q 12 hours for 10 days

### Dosage adjustment

- Renal impairment

## Contraindications

- Hypersensitivity to cephalosporins or penicillins

## Precautions

Use cautiously in:

- renal impairment, phenylketonuria
- history of GI disease
- elderly patients
- pregnant or breastfeeding patients
- children.

## Administration

- Don't mix premixed solution with other drugs.

 Don't use flexible container in series connections because of risk of air embolism.

- Obtain specimens for culture and sensitivity testing as needed before starting therapy.
- Don't mix with ampicillin (at concentrations above 40 mg/ml), metronidazole, aminoglycosides, or aminophylline if ordered concurrently. Give each drug separately.
- For I.V. infusion, use small I.V. needle and infuse into large vein over 30 to 60 minutes.
- For I.M. administration, inject deep into large muscle.

Route	Onset	Peak	Duration
I.V.	Rapid	End of infusion	12 hr
I.M.	Rapid	1-2 hr	12 hr

## Adverse reactions

**CNS:** headache, lethargy, paresthesia, syncope, **seizures**

**CV:** phlebitis, hypotension, palpitations, chest pain, vasodilation, **thrombophlebitis**

**EENT:** hearing loss

**GI:** nausea, vomiting, diarrhea, abdominal cramps, oral candidiasis, **pseudomembranous colitis**

**GU:** vaginal candidiasis, **nephrotoxicity**

**Hematologic:** lymphocytosis, eosinophilia, **bleeding tendency, hemolytic**

**anemia, hypoprothrombinemia, neutropenia, thrombocytopenia, agranulocytosis, bone marrow depression**

**Hepatic: hepatic failure, hepatomegaly**

**Musculoskeletal:** arthralgia

**Respiratory:** dyspnea

**Skin:** urticaria, maculopapular or erythematous rash, redness, swelling, induration

**Other:** chills, fever, superinfection, pain at I.M. site, phlebitis at I.V. site, **anaphylaxis, serum sickness**

## Interactions

**Drug-drug.** *Aminoglycosides, loop diuretics:* increased risk of nephrotoxicity

*Probenecid:* decreased excretion and increased blood level of cefepime

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, eosinophils, gamma-glutamyltransferase, lactate dehydrogenase:* increased levels

*Coombs' test, urinary 17-ketosteroids, nonenzyme-based urine glucose tests (such as Clinitest):* false-positive results  
*Hemoglobin, platelets, white blood cells:* decreased values

**Drug-herbs.** *Angelica, anise, arnica, asafetida, bogbean, boldo, celery, chamomile, clove, danshen, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, horseradish, licorice, meadowsweet, onion, papain, passion-flower, poplar, prickly ash, quassia, red clover, turmeric, wild carrot, wild lettuce, willow:* increased risk of bleeding

## Patient monitoring

- Assess baseline CBC and kidney and liver function test results.
- Monitor for signs and symptoms of superinfection and other serious adverse reactions.
- Monitor for inflammation at infusion site.

- Be aware that cross-sensitivity to penicillins may occur.

### Patient teaching

- Instruct patient to report reduced urinary output, persistent diarrhea, bruising, petechiae, or bleeding.
- Caution patient not to take herbs without consulting prescriber.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## cefixime

Suprax

**Pharmacologic class:** Third-generation cephalosporin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

### Action

Interferes with bacterial cell-wall synthesis and division by binding to cell wall, causing cell to die. Active against gram-negative and gram-positive bacteria, with expanded activity against gram-negative bacteria. Exhibits minimal immunosuppressant activity.

### Availability

*Oral suspension:* 100 mg/5 ml

*Tablets:* 400 mg

### Indications and dosages

➤ Uncomplicated gonorrhea caused by *Neisseria gonorrhoeae*

**Adults and children weighing more than 50 kg (110 lb):** 400 mg P.O. daily

➤ Uncomplicated urinary tract infections caused by *Escherichia coli* and *Proteus mirabilis*; otitis media caused by *Haemophilus influenzae*, *Moraxella catarrhalis*, and *Streptococcus pyogenes*;

pharyngitis and tonsillitis caused by *S. pyogenes*; acute bronchitis and acute exacerbation of chronic bronchitis caused by *H. influenzae* and *Streptococcus pneumoniae*

**Adults and children older than age 12 or weighing more than 50 kg (110 lb):** 400 mg P.O. daily or 200 mg P.O. q 12 hours

**Children ages 12 and younger or weighing 50 kg (110 lb) or less:** 8 mg/kg P.O. daily or 4 mg/kg P.O. q 12 hours

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to cephalosporins or penicillins

### Precautions

Use cautiously in:

- renal impairment, phenylketonuria
- history of GI disease
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

- Obtain specimens for culture and sensitivity testing as necessary before starting therapy.
- Know that drug may be taken with food.
- Be aware that suspension should be given for otitis media because it provides higher serum concentration.

Route	Onset	Peak	Duration
P.O.	Rapid	2-6 hr	24 hr

### Adverse reactions

**CNS:** headache, lethargy, paresthesia, syncope, **seizures**

**CV:** hypotension, palpitations, chest pain, vasodilation

**EENT:** hearing loss

**GI:** nausea, vomiting, diarrhea, abdominal cramps, oral candidiasis, **pseudomembranous colitis**

**GU:** vaginal candidiasis, **nephrotoxicity**

**Hematologic:** lymphocytosis, eosinophilia, **bleeding tendency**, hemolytic anemia, hypoprothrombinemia, neutropenia, thrombocytopenia, agranulocytosis, bone marrow depression

**Hepatic:** hepatic failure, hepatomegaly

**Musculoskeletal:** arthralgia

**Respiratory:** dyspnea

**Skin:** urticaria, maculopapular or erythematous rash

**Other:** chills, fever, superinfection, anaphylaxis, serum sickness

### Interactions

**Drug-drug.** *Aminoglycosides*, *loop diuretics*: increased risk of nephrotoxicity  
*Probenecid*: decreased excretion and increased blood level of cefixime

**Drug-diagnostic tests.** *Alanine aminotransferase*, *alkaline phosphatase*, *aspartate aminotransferase*, *bilirubin*, *blood urea nitrogen*, *creatinine*, *eosinophils*, *gamma-glutamyltransferase*, *lactate dehydrogenase*: increased levels  
*Coombs' test*, *urinary 17-ketosteroids*, *nonenzyme-based urine glucose tests (such as Clinitest)*: false-positive results

*Hemoglobin*, *platelets*, *white blood cells*: decreased values

**Drug-herbs.** *Angelica*, *anise*, *arnica*, *asafetida*, *bogbean*, *boldo*, *celery*, *chamomile*, *clove*, *danshen*, *fenugreek*, *feverfew*, *garlic*, *ginger*, *ginkgo*, *ginseng*, *horse chestnut*, *horseradish*, *licorice*, *meadowsweet*, *onion*, *papain*, *passionflower*, *poplar*, *prickly ash*, *quassia*, *red clover*, *turmeric*, *wild carrot*, *wild lettuce*, *willow*: increased risk of bleeding

### Patient monitoring

- Monitor baseline CBC and kidney and liver function test results.
- Monitor for signs and symptoms of superinfection and other serious adverse reactions.

- Be aware that cross-sensitivity to penicillins may occur.

### Patient teaching

- Tell patient to take once-daily doses at same time each day.
- Advise patient to take drug exactly as prescribed and to continue to take full amount prescribed even when he feels better.
- Instruct patient to report signs and symptoms of allergic response and other adverse reactions, such as rash, easy bruising, bleeding, severe GI problems, or difficulty breathing.
- Caution patient not to take herbs without consulting prescriber.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## cefotaxime sodium

Claforan

**Pharmacologic class:** Third-generation cephalosporin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

### Action

Interferes with bacterial cell-wall synthesis and division by binding to cell wall, causing cell to die. Active against gram-negative and gram-positive bacteria, with expanded activity against gram-negative bacteria. Exhibits minimal immunosuppressant activity.

### Availability

*Powder for injection:* 500 mg, 1 g, 2 g, 10 g

*Premixed containers:* 1 g/50 ml, 2 g/50 ml

## Indications and dosages

➤ Perioperative prophylaxis

**Adults and children weighing more than 50 kg (110 lb):** 1 g I.V. or I.M. 30 to 90 minutes before surgery

➤ Prophylaxis in patients undergoing cesarean delivery

**Adults:** 1 g I.V. or I.M. as soon as umbilical cord is clamped

➤ Gonococcal urethritis and cervicitis

**Adults weighing more than 50 kg (110 lb):** 500 mg I.M. as a single dose

➤ Rectal gonorrhea (females)

**Adults weighing more than 50 kg (110 lb):** 500 mg I.M. as a single dose

➤ Rectal gonorrhea (males)

**Adults weighing more than 50 kg (110 lb):** 1 g I.M. as a single dose

➤ Disseminated gonorrhea

**Adults and children weighing 50 kg (110 lb) or more:** 1 g by I.V. infusion q 8 hours

➤ Uncomplicated infections caused by susceptible organisms

**Adults and children weighing 50 kg (110 lb) or more:** 1 g I.V. or I.M. q 12 hours

**Children ages 1 month to 12 years weighing less than 50 kg (110 lb):** 50 to 180 mg/kg/day I.V. or I.M. in four to six divided doses

➤ Moderate to severe infections caused by susceptible organisms

**Adults and children weighing 50 kg (110 lb) or more:** 1 to 2 g I.V. or I.M. q 8 hours

➤ Life-threatening infections caused by susceptible organisms

**Adults and children weighing 50 kg (110 lb) or more:** 2 g by I.V. infusion q 4 hours. Maximum dosage is 12 g/day.

➤ Septicemia and other infections that commonly require antibiotics in higher doses

**Adults and children weighing 50 kg (110 lb) or more:** 2 g by I.V. infusion q 6 to 8 hours

## Dosage adjustment

- Renal impairment

## Contraindications

- Hypersensitivity to cephalosporins or penicillins

## Precautions

Use cautiously in:

- renal impairment, phenylketonuria
- history of GI disease
- elderly patients
- pregnant or breastfeeding patients
- children.

## Administration

- Obtain specimens for culture and sensitivity testing as necessary before starting therapy.
- Reconstitute powder for I.V. injection with at least 10 ml of sterile water, and give over 3 to 5 minutes. For intermittent infusion, drug may be diluted further with 50 or 100 ml of normal saline solution or dextrose 5% in water (D<sub>5</sub>W) and given over 30 minutes.
- Reconstituted drug may be diluted further for a continuous I.V. infusion of up to 1,000 ml with a compatible solution, such as normal saline solution, dextrose 5% or 10% in water, or D<sub>5</sub>W and normal saline solution. Give over 6 to 24 hours, depending on concentration.
- Don't use diluents with pH above 7.5 (such as sodium bicarbonate).
- Rotate infusion sites.
- Inject I.M. deep into large muscle mass. Divide 2-g dose in half and inject into separate large muscle masses.

Route	Onset	Peak	Duration
I.V.	Rapid	End of infusion	4-12 hr
I.M.	Rapid	0.5 hr	4-12 hr

## Adverse reactions

CNS: headache, lethargy, paresthesia, syncope, **seizures**

**CV:** hypotension, palpitations, chest pain, vasodilation

**EENT:** hearing loss

**GI:** nausea, vomiting, diarrhea, abdominal cramps, oral candidiasis, **pseudomembranous colitis**

**GU:** vaginal candidiasis, **nephrotoxicity**

**Hematologic:** lymphocytosis, eosinophilia, **bleeding tendency, hemolytic anemia, hypoprothrombinemia, neutropenia, thrombocytopenia, agranulocytosis, bone marrow depression**

**Hepatic:** **hepatic failure, hepatomegaly**

**Musculoskeletal:** arthralgia

**Respiratory:** dyspnea

**Skin:** urticaria, maculopapular or erythematous rash

**Other:** chills, fever, superinfection, pain at I.M. injection site, **anaphylaxis, serum sickness**

## Interactions

**Drug-drug.** *Aminoglycosides, loop diuretics:* increased risk of nephrotoxicity

*Probenecid:* decreased excretion and increased blood level of cefotaxime

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, eosinophils, gamma-glutamyltransferase, lactate dehydrogenase:* increased levels

*Coombs' test, urinary 17-ketosteroids, nonenzyme-based urine glucose tests (such as Clinitest):* false-positive results  
*Hemoglobin, platelets, white blood cells:* decreased values

**Drug-herbs.** *Angelica, anise, arnica, asafetida, bogbean, boldo, celery, chamomile, clove, danshen, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, horseradish, licorice, meadowsweet, onion, papain, passion-flower, poplar, prickly ash, quassia, red clover, turmeric, wild carrot, wild lettuce, willow:* increased risk of bleeding

## Patient monitoring

- Monitor CBC and kidney and liver function test results.
- Monitor for signs and symptoms of superinfection and other serious adverse reactions.
- Be aware that cross-sensitivity to penicillins may occur.

## Patient teaching

- Advise patient to report reduced urinary output, persistent diarrhea, bruising, and bleeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## cefoxitin sodium

**Pharmacologic class:** Second-generation cephalosporin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

## Action

Interferes with bacterial cell-wall synthesis and division by binding to cell wall, causing cell to die. Active against gram-negative and gram-positive bacteria, with expanded activity against gram-negative bacteria. Exhibits minimal immunosuppressant activity.

## Availability

*Powder for injection:* 1 g, 2 g

*Premixed containers:* 1 g/50 ml in dextrose 5% in water (D<sub>5</sub>W), 2 g/50 ml in D<sub>5</sub>W

## Indications and dosages

- Respiratory tract infections, skin infections, bone and joint infections, urinary tract infections, gynecologic infections, septicemia

**Adults:** For most infections, 1 g I.M. or I.V. q 6 to 8 hours. For severe infections, 1 g I.M. or I.V. q 4 hours or 2 g I.M. or I.V. q 6 to 8 hours. For life-threatening infections, 2 g I.V. q 4 hours or 3 g I.V. q 6 hours.

**Children ages 3 months and older:**

For most infections, 13.3 to 26.7 mg/kg I.M. or I.V. q 4 hours or 20 to 40 mg/kg q 6 hours.

➤ Preoperative prophylaxis

**Adults:** 1 to 2 g I.V. within 60 minutes of incision, then q 6 hours for up to 24 hours

### Dosage adjustment

- Renal failure

### Contraindications

- Hypersensitivity to cephalosporins or penicillins

### Precautions

Use cautiously in:

- renal impairment, hepatic disease, or biliary obstruction
- history of GI disease
- elderly patients
- children.

### Administration

- Obtain specimens for culture and sensitivity testing as necessary before starting therapy.
- Reconstitute 1-g dose with 10 ml of sterile water; reconstitute 2-g dose with 10 to 20 ml.
- For direct I.V. injection, give 10 ml of sterile water with each gram of cefoxitin over 3 to 5 minutes. Inject into large vein and rotate sites, or give through existing I.V. tubing.
- For intermittent or continuous I.V. infusion, add reconstituted drug to compatible solution, such as D<sub>5</sub>W, normal saline solution, or D<sub>5</sub>W and normal saline solution.
- For I.M. injection, reconstitute each gram with 2 ml of sterile water or 2 ml

of 0.5% lidocaine hydrochloride (without epinephrine).

- Inject I.M. deep into large muscle mass; divide 2-g dose in half and inject into separate large muscle masses.
- Know that dry powder and solution may darken, but this does not alter drug efficacy.

Route	Onset	Peak	Duration
I.V.	Rapid	End of infusion	4-8 hr
I.M.	Rapid	30 min	4-8 hr

### Adverse reactions

**CNS:** headache, lethargy, paresthesia, syncope, **seizures**

**CV:** hypotension, palpitations, chest pain, vasodilation, **thrombophlebitis**

**EENT:** hearing loss

**GI:** nausea, vomiting, diarrhea, abdominal cramps, oral candidiasis,

**pseudomembranous colitis**

**GU:** vaginal candidiasis, **nephrotoxicity**

**Hematologic:** lymphocytosis, eosinophilia, **bleeding tendency, hemolytic anemia, hypoprothrombinemia, neutropenia, thrombocytopenia, agranulocytosis, bone marrow depression**

**Hepatic:** **hepatic failure, hepatomegaly**

**Musculoskeletal:** arthralgia

**Respiratory:** dyspnea

**Skin:** urticaria, maculopapular or erythematous rash

**Other:** chills, fever, superinfection, pain at I.M. site, **anaphylaxis, serum sickness**

### Interactions

**Drug-drug.** *Aminoglycosides, loop diuretics:* increased risk of nephrotoxicity

*Probenecid:* decreased excretion and increased blood level of cefoxitin

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine,*

eosinophils, gamma-glutamyltransferase, lactate dehydrogenase: increased levels  
Coombs' test, urinary 17-ketosteroids, nonenzyme-based urine glucose tests (such as Clinitest): false-positive results

Hemoglobin, platelets, white blood cells: decreased values

### Patient monitoring

- Assess CBC and kidney and liver function test results.
- Monitor fluid intake and output. Report significant decrease in output.
- Monitor for signs and symptoms of superinfection and other serious adverse reactions.
- Be aware that cross-sensitivity to penicillins may occur.

### Patient teaching

- Instruct patient to report reduced urinary output, persistent diarrhea, bruising, and bleeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## cefpodoxime proxetil

Orelox , Vantin

**Pharmacologic class:** Third-generation cephalosporin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

### Action

Interferes with bacterial cell-wall synthesis and division by binding to cell wall, causing cell to die. Active against gram-negative and gram-positive bacteria, with expanded activity against gram-negative bacteria. Exhibits minimal immunosuppressant activity.

### Availability

Oral suspension: 50 mg/5 ml, 100 mg/5 ml

Tablets: 100 mg, 200 mg

### Indications and dosages

➤ Acute community-acquired pneumonia caused by *Haemophilus influenzae* or *Streptococcus pneumoniae*

**Adults and children ages 13 and older:**

200 mg P.O. q 12 hours for 14 days

➤ Acute bacterial or chronic bronchitis

**Adults and children ages 13 and older:**

200 mg P.O. q 12 hours for 10 days

➤ Uncomplicated gonorrhea; rectal gonococcal infection caused by *Neisseria gonorrhoeae*

**Adults:** 200 mg P.O. as a single dose

➤ Uncomplicated urinary tract infections caused by *Escherichia coli*, *Klebsiella pneumoniae*, *Proteus mirabilis*, and *Staphylococcus saprophyticus*

**Adults:** 100 mg P.O. q 12 hours for 7 days

➤ Skin and soft-tissue infections caused by *Staphylococcus aureus* and *Streptococcus pyogenes*

**Adults and children ages 13 and older:**

400 mg P.O. q 12 hours for 7 to 14 days

➤ Acute otitis media caused by *H. influenzae*, *S. pneumoniae*, and *Moraxella catarrhalis*

**Children ages 5 months to 12 years:**

5 mg/kg P.O. q 12 hours (maximum of 200 mg/dose) or 10 mg/kg q 24 hours (maximum of 400 mg/dose) for 10 days

➤ Tonsillitis and pharyngitis caused by *S. pyogenes*

**Adults and children ages 13 and older:**

100 mg P.O. q 12 hours for 5 to 10 days

**Children ages 2 months to 12 years:**

5 mg/kg P.O. q 12 hours for 5 to 10 days

### Dosage adjustment

- Renal impairment

## Contraindications

- Hypersensitivity to cephalosporins or penicillins

## Precautions

Use cautiously in:

- renal impairment, phenylketonuria
- history of GI disease
- elderly patients
- pregnant or breastfeeding patients
- children.

## Administration

- Obtain specimens for culture and sensitivity testing as necessary before starting therapy.
- Give tablets with food to enhance absorption. Oral suspension may be given with or without food.
- Don't give antacids within 2 hours of cefpodoxime.

Route	Onset	Peak	Duration
P.O.	Unknown	2-3 hr	12 hr

## Adverse reactions

**CNS:** headache, lethargy, paresthesia, syncope, **seizures**

**CV:** hypotension, palpitations, chest pain, vasodilation

**EENT:** hearing loss

**GI:** nausea, vomiting, diarrhea, abdominal cramps, oral candidiasis,

**pseudomembranous colitis**

**GU:** vaginal candidiasis, **nephrotoxicity**

**Hematologic:** lymphocytosis, eosinophilia, **bleeding tendency, hemolytic anemia, hypoprothrombinemia, neutropenia, thrombocytopenia, agranulocytosis, bone marrow depression**

**Hepatic:** **hepatic failure, hepatomegaly**

**Musculoskeletal:** arthralgia

**Respiratory:** dyspnea

**Skin:** urticaria, maculopapular or erythematous rash

**Other:** chills, fever, superinfection, **anaphylaxis, serum sickness**

## Interactions

**Drug-drug.** *Aminoglycosides, loop diuretics:* increased risk of nephrotoxicity

*Antacids:* decreased cefpodoxime absorption

*Probenecid:* decreased excretion and increased blood level of cefpodoxime

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, eosinophils, gamma-glutamyltransferase, lactate dehydrogenase:* increased levels

*Coombs' test, urinary 17-ketosteroids, nonenzyme-based urine glucose tests (such as Clinitest):* false-positive results  
*Hemoglobin, platelets, white blood cells:* decreased values

**Drug-herbs.** *Angelica, anise, arnica, asafetida, bogbean, boldo, celery, chamomile, clove, danshen, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, horseradish, licorice, meadowsweet, onion, papain, passionflower, poplar, prickly ash, quassia, red clover, turmeric, wild carrot, wild lettuce, willow:* increased risk of bleeding

## Patient monitoring

- Assess CBC and kidney and liver function test results.
- Monitor for signs and symptoms of superinfection and other serious adverse reactions.
- Be aware that cross-sensitivity to penicillins may occur.

## Patient teaching

- Instruct patient to take drug with food or milk to reduce GI distress and enhance absorption.
- Advise patient not to take antacids within 2 hours of drug.
- Tell patient to continue to take full amount prescribed even when he feels better.
- Instruct patient to report signs and symptoms of allergic response and other adverse reactions, such as rash,

easy bruising, bleeding, severe GI problems, or difficulty breathing.

- If patient is being treated for gonorrhea, instruct him to have partner tested and treated (as needed) and to use barrier contraception to prevent reinfection.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## cefprozil

Apo-Cefprozil\*, Cefzil, Ran-Cefprozil\*, Sandoz Cefprozil\*

**Pharmacologic class:** Second-generation cephalosporin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

### Action

Interferes with bacterial cell-wall synthesis and division by binding to cell wall, causing cell to die. Active against gram-negative and gram-positive bacteria, with expanded activity against gram-negative bacteria. Exhibits minimal immunosuppressant activity.

### Availability

*Powder for suspension:* 125 mg/5 ml, 250 mg/5 ml

*Tablets:* 250 mg, 500 mg

### Indications and dosages

➤ Uncomplicated skin infections caused by *Staphylococcus aureus* and *Streptococcus pyogenes*

**Adults and children ages 13 and older:**

250 to 500 mg P.O. q 12 hours or 500 mg P.O. daily for 10 days

➤ Pharyngitis or tonsillitis caused by *S. pyogenes*

**Adults and children ages 13 and older:**

500 mg P.O. daily for at least 10 days

➤ Acute bronchitis; acute bacterial chronic bronchitis caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, and *Moraxella catarrhalis*

**Adults and children ages 13 and older:**

500 mg P.O. q 12 hours for 10 days

➤ Acute sinusitis caused by *S. pneumoniae*, *H. influenzae*, and *M. catarrhalis*

**Adults and children ages 13 and older:**

250 mg P.O. q 12 hours for 10 days; for moderate to severe infections, 500 mg P.O. q 12 hours for 10 days

**Children ages 6 months to 12 years:**

7.5 mg/kg P.O. q 12 hours for 10 days; for moderate to severe infections,

15 mg/kg P.O. q 12 hours for 10 days

➤ Otitis media caused by *S. pneumoniae*, *H. influenzae*, and *M. catarrhalis*

**Children ages 6 months to 12 years:**

15 mg/kg P.O. q 12 hours for 10 days

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to cephalosporins or penicillins
- Renal failure

### Precautions

Use cautiously in:

- renal or hepatic impairment
- pregnant or breastfeeding patients
- children.

### Administration

- Obtain specimens for culture and sensitivity testing as necessary before starting therapy.
- Give drug with food.

Route	Onset	Peak	Duration
P.O.	Unknown	6-10 hr	24-28 hr

## Adverse reactions

**CNS:** headache, dizziness, drowsiness, hyperactivity, hypotonia, insomnia, confusion, **seizures**

**GI:** nausea, vomiting, diarrhea, abdominal pain, dyspepsia, **pseudomembranous colitis**

**GU:** hematuria, vaginal candidiasis, genital pruritus, **renal dysfunction, toxic nephropathy**

**Hematologic:** eosinophilia, **aplastic anemia, hemolytic anemia, hemorrhage, bone marrow depression, hypoprotrombinemia**

**Hepatic:** **hepatic dysfunction**

**Skin:** toxic epidermal necrolysis, diaper rash, **erythema multiforme, Stevens-Johnson syndrome**

**Other:** allergic reactions, carnitine deficiency, drug fever, superinfection, **serum sickness–like reaction, anaphylaxis**

## Interactions

**Drug–drug.** *Aminoglycosides:* increased risk of nephrotoxicity

*Antacids containing aluminum or magnesium, histamine<sub>2</sub>-receptor antagonists:* increased ceftazidime absorption

*Probenecid:* decreased excretion and increased blood level of ceftazidime

**Drug–diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, eosinophils, gamma-glutamyltransferase, lactate dehydrogenase, white blood cells in urine:* increased levels

*Blood glucose, Coombs' test, urine glucose tests using Benedict's solution:* false-positive results

*Platelets, white blood cells:* decreased counts

**Drug–food.** *Moderate- or high-fat meal:* increased drug bioavailability

## Patient monitoring

☞ Stay alert for life-threatening reactions, including anaphylaxis, serum

sickness–like reaction, Stevens-Johnson syndrome, and pseudomembranous colitis.

- Monitor neurologic status, particularly for signs and symptoms of impending seizures.

- Monitor kidney and liver function test results and assess fluid intake and output.

- Monitor CBC with white cell differential, prothrombin time, and bleeding time. Watch for signs and symptoms of blood dyscrasias, especially hypoprotrombinemia.

- Monitor temperature. Stay alert for signs and symptoms of superinfection.

## Patient teaching

☞ Advise patient to immediately report rash, bleeding tendency, or CNS changes.

- Teach patient to recognize signs and symptoms of superinfection, and instruct him to report these right away.

- Tell patient to take drug with food.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## ceftazidime

Fortaz, Fortum<sup>®</sup>, Tazicef

**Pharmacologic class:** Third-generation cephalosporin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

## Action

Interferes with bacterial cell-wall synthesis and division by binding to cell wall, causing cell to die. Active against gram-negative and gram-positive bacteria, with expanded activity against gram-negative

bacteria. Exhibits minimal immunosuppressant activity.

### Availability

*Powder for injection:* 500 mg, 1 g, 2 g, 6 g

*Premixed containers:* 1 g/50 ml, 2 g/50 ml

### Indications and dosages

➤ Skin infections; bone and joint infections; urinary tract and gynecologic infections, including gonorrhoea; respiratory tract infections; intra-abdominal infections; septicemia

#### Adults and children ages 12 and older:

For most infections, 500 mg to 2 g I.V. or I.M. q 8 to 12 hours. For pneumonia and skin infections, 0.5 to 1 g I.V. or I.M. q 8 to 12 hours. For bone and joint infections, 2 g I.V. or I.M. q 12 hours. For severe and life-threatening infections, 2 g I.V. q 8 hours. For complicated urinary tract infections (UTIs), 500 mg q 8 to 12 hours. For uncomplicated UTIs, 250 mg I.M. or I.V. q 12 hours.

#### Children ages 1 month to 12 years:

30 to 50 mg/kg I.V. q 8 hours

#### Neonates younger than 4 weeks:

30 mg/kg I.V. q 12 hours

### Dosage adjustment

- Renal impairment

### Off-label uses

- Febrile neutropenia
- Prophylaxis of perinatal infections

### Contraindications

- Hypersensitivity to cephalosporins or penicillins

### Precautions

Use cautiously in:

- renal impairment, hepatic disease, biliary obstruction, phenylketonuria
- history of GI disease
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

- Obtain specimens for culture and sensitivity testing as necessary before starting therapy.
- Reconstitute powder for injection with sterile water, following manufacturer's directions for amount of diluent to use.
- For I.V. injection, dilute in sterile water as directed, and give single dose over 3 to 5 minutes. Inject into large vein; rotate injection sites.
- For intermittent I.V. infusion, dilute further with 100 ml of sterile water or another compatible fluid, such as normal saline solution or dextrose 5% in water. Infuse over 30 minutes.
- Don't dilute with sodium bicarbonate.
- For I.M. injection, reconstitute with sterile water, bacteriostatic water, or 0.5% or 1% lidocaine hydrochloride.
- When giving I.M., inject deep into large muscle mass.

Route	Onset	Peak	Duration
I.V.	Rapid	End of infusion	6-12 hr
I.M.	Rapid	1 hr	6-12 hr

### Adverse reactions

**CNS:** headache, confusion, hemiparesis, lethargy, paresthesia, syncope, asterixis, neuromuscular excitability (with increased drug blood levels in renally impaired patients), **seizures, encephalopathy**

**CV:** hypotension, palpitations, chest pain, vasodilation

**EENT:** hearing loss

**GI:** nausea, vomiting, diarrhea, abdominal cramps, oral candidiasis, **pseudomembranous colitis**

**GU:** vaginal candidiasis, **nephrotoxicity**

**Hematologic:** lymphocytosis, eosinophilia, **bleeding tendency, hemolytic anemia, hypoprothrombinemia, neutropenia, thrombocytopenia, agranulocytosis, bone marrow depression**  
**Hepatic:** **hepatic failure, hepatomegaly**

**Musculoskeletal:** arthralgia

**Respiratory:** dyspnea

**Skin:** urticaria, maculopapular or erythematous rash

**Other:** chills, fever, superinfection, I.M. site pain, **anaphylaxis, serum sickness**

## Interactions

**Drug-drug.** *Aminoglycosides, loop diuretics:* increased risk of nephrotoxicity

*Chloramphenicol:* antagonism of ceftazidime's effects

*Probenecid:* decreased excretion and increased blood level of ceftazidime

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, eosinophils, gamma-glutamyltransferase, lactate dehydrogenase:* increased levels  
*Hemoglobin, platelets, white blood cells:* decreased values

*Coombs' test, urinary 17-ketosteroids, nonenzyme-based urine glucose tests (such as Clinitest):* false-positive results

**Drug-herbs.** *Angelica, anise, arnica, asafetida, bogbean, boldo, celery, chamomile, clove, danshen, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, horseradish, licorice, meadowsweet, onion, papain, passionflower, poplar, prickly ash, quassia, red clover, turmeric, wild carrot, wild lettuce, willow:* increased risk of bleeding

## Patient monitoring

🚨 Monitor for extreme confusion, tonic-clonic seizures, and mild hemiparesis when giving high doses.

- Assess CBC and kidney and liver function test results.
- Monitor for signs and symptoms of superinfection and other serious adverse reactions.

- Be aware that cross-sensitivity to penicillins may occur.

## Patient teaching

- Instruct patient to report reduced urine output, persistent diarrhea, bruising, and bleeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## ceftibuten

Cedax

**Pharmacologic class:** Third-generation cephalosporin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

## Action

Interferes with bacterial cell-wall synthesis and division by binding to cell wall, causing cell to die. Active against gram-negative and gram-positive bacteria, with expanded activity against gram-negative bacteria. Exhibits minimal immunosuppressant activity.

## Availability

*Capsules:* 400 mg

*Oral suspension:* 90 mg/5 ml

## Indications and dosages

- Acute bacterial exacerbations of chronic bronchitis caused by *Haemophilus influenzae*, *Moraxella catarrhalis*, and *Streptococcus pneumoniae*; pharyngitis and tonsillitis caused by *Streptococcus pyogenes*; acute bacterial otitis media caused by *H. influenzae*, *M. catarrhalis*, and *S. pyogenes*
- Adults and children ages 12 and older:** 400 mg P.O. q 24 hours for 10 days

**Children ages 12 and younger:** 9 mg/kg P.O. daily for 10 days. Maximum dosage shouldn't exceed 400 mg daily.

### Dosage adjustment

- Renal impairment

### Off-label uses

- Urinary tract infections

### Contraindications

- Hypersensitivity to cephalosporins and penicillins

### Precautions

Use cautiously in:

- renal impairment, hepatic disease, biliary obstruction, phenylketonuria
- history of GI disease
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

- Obtain specimens for culture and sensitivity testing as necessary before starting therapy.
- Give oral suspension at least 1 hour before or 2 hours after a meal.

Route	Onset	Peak	Duration
P.O.	Rapid	3 hr	24 hr

### Adverse reactions

**CNS:** headache, lethargy, paresthesia, syncope, **seizures**

**CV:** hypotension, palpitations, chest pain, vasodilation

**EENT:** hearing loss

**GI:** nausea, vomiting, diarrhea, abdominal cramps, oral candidiasis, **pseudomembranous colitis**

**GU:** vaginal candidiasis, **nephrotoxicity**

**Hematologic:** lymphocytosis, eosinophilia, **bleeding tendency, hemolytic anemia, hypoprothrombinemia, neutropenia, thrombocytopenia, agranulocytosis, bone marrow depression**

**Hepatic:** **hepatic failure, hepatomegaly**

**Musculoskeletal:** arthralgia

**Respiratory:** dyspnea

**Skin:** urticaria, easy bruising, maculopapular or erythematous rash

**Other:** chills, fever, superinfection, **anaphylaxis, serum sickness**

### Interactions

**Drug-drug.** *Aminoglycosides, loop diuretics:* increased risk of nephrotoxicity

*Probenecid:* decreased excretion and increased blood level of ceftibuten

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, eosinophils, gamma-glutamyltransferase, lactate dehydrogenase:* increased levels

*Coombs' test, urinary 17-ketosteroids, nonenzyme-based urine glucose tests (such as Clinitest):* false-positive results  
*Hemoglobin, platelets, white blood cells:* decreased values

**Drug-herbs.** *Angelica, anise, arnica, asafetida, bogbean, boldo, celery, chamomile, clove, danshen, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, horseradish, licorice, meadowsweet, onion, papain, passionflower, poplar, prickly ash, quassia, red clover, turmeric, wild carrot, wild lettuce, willow:* increased risk of bleeding

### Patient monitoring

- Assess CBC and kidney and liver function test results.
- Monitor for signs and symptoms of superinfection and other serious adverse reactions.
- Be aware that cross-sensitivity to penicillins may occur.

### Patient teaching

- Instruct patient to take oral suspension at least 1 hour before or 2 hours after a meal.

- Inform diabetic patient that oral suspension contains 1 g sucrose per teaspoon.
- Advise patient to continue to take full amount prescribed even when he feels better.
- Tell patient to report signs and symptoms of allergic response and other adverse reactions, such as rash, easy bruising, bleeding, severe GI problems, or difficulty breathing.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## ceftriaxone sodium

Rocephin

**Pharmacologic class:** Third-generation cephalosporin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

### Action

Interferes with bacterial cell-wall synthesis and division by binding to cell wall, causing cell to die. Active against gram-negative and gram-positive bacteria, with expanded activity against gram-negative bacteria. Exhibits minimal immunosuppressant activity.

### Availability

*Powder for injection:* 250 mg, 500 mg, 1 g, 2 g

*Premixed containers:* 1 g/50 ml, 2 g/50 ml

### Indications and dosages

➤ Infections of respiratory system, bones, joints, and skin; septicemia

**Adults:** 1 to 2 g/day I.M. or I.V. or in equally divided doses q 12 hours. Maximum daily dosage is 4 g.

➤ Uncomplicated gonorrhea

**Adults:** 250 mg I.M. as a single dose

➤ Surgical prophylaxis

**Adults:** 1 g I.V. as a single dose within 1 hour before start of surgical procedure

➤ Meningitis

**Adults:** 1 g to 2 g I.V. q 12 hours for 10 to 14 days

**Children:** Initially, 100 mg/kg/day I.M. or I.V. (not to exceed 4 g). Then 100 mg/kg/day I.M. or I.V. once daily or in equally divided doses q 12 hours (not to exceed 4 g) for 7 to 14 days.

➤ Otitis media

**Children:** 50 mg/kg I.M. as a single dose; maximum of 1 g/dose.

➤ Skin and skin-structure infections

**Children:** 50 to 75 mg/kg/day I.V. or I.M. once or twice daily. Maximum dosage is 2 g daily.

➤ Other serious infections

**Children:** 50 to 75 mg/kg/day I.V. or I.M. once or twice daily

### Dosage adjustments

- Hepatic dysfunction with significant renal impairment

### Off-label uses

- Disseminated gonorrhea
- Endocarditis
- Epididymitis
- Gonorrhea-associated meningitis
- Lyme disease
- *Neisseria meningitidis* carriers
- Pelvic inflammatory disease

### Contraindications

- Neonates (28 days or younger)

### Precautions

Use cautiously in:

- hypersensitivity to cephalosporins or penicillins, allergies
- renal impairment, hepatic disease, gallbladder disease, phenylketonuria

- history of GI disease, diarrhea following antibiotic therapy
- pregnant or breastfeeding patients.

### Administration

- Obtain specimens for culture and sensitivity testing as necessary before starting therapy.
- 📢 Be aware that drug mustn't be given with or within 48 hours of calcium-containing I.V. solutions, including calcium-containing continuous infusions such as parenteral nutrition, because of risk of precipitation of ceftriaxone calcium salt (particularly in neonates).
- Know that drug for I.V. injection is compatible with sterile water, normal saline solution, dextrose 5% in water (D<sub>5</sub>W), half-normal saline solution, and D<sub>5</sub>W and normal saline solution.
- After reconstituting, dilute further to desired concentration for intermittent I.V. infusion. Infuse over 30 minutes.
- For I.M. use, reconstitute powder for injection with compatible solution by adding 0.9 ml of diluent to 250-mg vial, 1.8 ml to 500-mg vial, 3.6 ml to 1-g vial, or 7.2 ml to 2-g vial, to yield a concentration averaging 250 mg/ml.
- Divide high I.M. doses equally and administer in two separate sites. Inject deep into large muscle mass.

Route	Onset	Peak	Duration
I.V.	Rapid	End of infusion	12-24 hr
I.M.	Rapid	1-2 hr	12-24 hr

### Adverse reactions

**CNS:** headache, confusion, hemiparesis, lethargy, paresthesia, syncope, **seizures**  
**CV:** hypotension, palpitations, chest pain, vasodilation  
**EENT:** hearing loss  
**GI:** nausea, vomiting, diarrhea, abdominal cramps, oral candidiasis, **pseudomembranous colitis**,

**pancreatitis, Clostridium difficile**–associated diarrhea

**GU:** vaginal candidiasis

**Hematologic:** lymphocytosis, eosinophilia, **bleeding tendency, hemolytic anemia, hypoprothrombinemia, neutropenia, thrombocytopenia, agranulocytosis, bone marrow depression**

**Hepatic:** jaundice, **hepatomegaly**

**Musculoskeletal:** arthralgia

**Respiratory:** dyspnea

**Skin:** urticaria, maculopapular or erythematous rash

**Other:** chills, fever, superinfection, pain at I.M. injection site, **anaphylaxis, serum sickness**

### Interactions

**Drug-drug.** *Aminoglycosides, loop diuretics:* increased risk of nephrotoxicity

*Calcium-containing solutions:* possibly fatal reactions caused by ceftriaxone calcium precipitates

*Probenecid:* decreased excretion and increased blood level of ceftriaxone

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, eosinophils, gamma-glutamyltransferase, lactate dehydrogenase:* increased levels  
*Coombs' test, urinary 17-ketosteroids, nonenzyme-based urine glucose tests (such as Clinitest):* false-positive results

*Hemoglobin, platelets, white blood cells:* decreased values

**Drug-herbs.** *Angelica, anise, arnica, asafetida, bogbean, boldo, celery, chamomile, clove, danshen, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, horse chestnut, horseradish, licorice, meadowsweet, onion, papain, passion-flower, poplar, prickly ash, quassia, red clover, turmeric, wild carrot, wild lettuce, willow:* increased risk of bleeding.

## Patient monitoring

🚨 Monitor for extreme confusion, tonic-clonic seizures, and mild hemiparesis when giving high doses.

- Monitor coagulation studies.
- Assess CBC and kidney and liver function test results.
- Monitor for signs and symptoms of superinfection and other serious adverse reactions.
- Be aware that cross-sensitivity to penicillins and cephalosporins may occur.

## Patient teaching

- Instruct patient to report persistent diarrhea, bruising, or bleeding.
- Caution patient not to use herbs unless prescriber approves.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## cefuroxime axetil

Apo-Cefuroxime<sup>⚡</sup>, Ceftin,  
Ratio-Cefuroxime<sup>⚡</sup>, Zinnat<sup>⚡</sup>

## cefuroxime sodium

Zinacef

**Pharmacologic class:** Second-generation cephalosporin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

## Action

Interferes with bacterial cell-wall synthesis and division by binding to cell wall, causing cell to die. Active against gram-negative and gram-positive bacteria, with expanded activity against gram-negative bacteria.

Exhibits minimal immunosuppressant activity.

## Availability

*Oral suspension:* 125 mg/5 ml, 250 mg/5 ml

*Powder for injection:* 750 mg, 1.5 g, 7.5 g

*Premixed containers:* 750 mg/50 ml, 1.5 g/50 ml

*Tablets:* 125 mg, 250 mg, 500 mg

## Indications and dosages

➤ Moderate to severe infections, including those of skin, bone, joints, urinary or respiratory tract, gynecologic infections

**Adults and children ages 12 and older:**

750 mg to 1.5 g I.M. or I.V. q 8 hours for 5 to 10 days or 250 to 500 mg P.O. q 12 hours

**Children ages 3 months to 12 years:**

50 to 100 mg/kg/day I.V. or I.M. in divided doses q 6 to 8 hours

➤ Gonorrhea

**Adults:** 750 mg to 1.5 g I.M. or I.V. as a single dose, or 1.5 g I.M. (750 mg in two separate sites), given with 1 g probenecid P.O.

➤ Bacterial meningitis

**Adults and children ages 12 and older:**

Up to 3 g I.V. or I.M. q 8 hours

**Children ages 3 months to 12 years:**

200 to 240 mg/kg I.V. daily in divided doses q 6 to 8 hours

➤ Otitis media

**Children ages 3 months to 12 years:**

15 mg/kg P.O. q 12 hours (oral suspension) for 10 days, or 250 mg (tablets) P.O. q 12 hours for 10 days

➤ Pharyngitis; tonsillitis

**Adults and children ages 13 and older:**

250 mg P.O. b.i.d. for 10 days

**Children ages 3 months to 12 years:**

125 mg P.O. q 12 hours for 10 days, or 20 mg/kg/day P.O. in two divided doses for 10 days as oral suspension (maximum 500 mg/day)

**Dosage adjustment**

- Renal impairment (for injectable formulation)

**Contraindications**

- Hypersensitivity to cephalosporins or penicillins
- Carnitine deficiency

**Precautions**

Use cautiously in:

- renal or hepatic impairment
- pregnant or breastfeeding patients
- children.

**Administration**

- Reconstitute drug in vial with sterile water for injection.
- Give by direct I.V. injection over 3 to 5 minutes into large vein or flowing I.V. line.
- For intermittent I.V. infusion, reconstitute drug with 100 ml of dextrose 5% in water or normal saline solution; administer over 15 minutes to 1 hour. For continuous infusion, give in 500 to 1,000 ml of compatible solution; infuse over 6 to 24 hours.
- Inject I.M. doses deep into large muscle mass.
- Give oral form with food.
- Be aware that tablets and oral suspension are exchangeable on a milligram-for-milligram basis.

Route	Onset	Peak	Duration
P.O.	Unknown	2 hr	8-12 hr
I.V., I.M.	Rapid	End of infusion	6-12 hr

**Adverse reactions**

**CNS:** headache, hyperactivity, hypertonia, **seizures**

**GI:** nausea, vomiting, diarrhea, abdominal pain, dyspepsia, **pseudomembranous colitis**

**GU:** hematuria, vaginal candidiasis, **renal dysfunction, acute renal failure**

**Hematologic:** hemolytic anemia, aplastic anemia, hemorrhage

**Hepatic:** hepatic dysfunction

**Metabolic:** hyperglycemia

**Skin:** toxic epidermal necrolysis, **erythema multiforme, Stevens-Johnson syndrome**

**Other:** allergic reaction, drug fever, superinfection, **anaphylaxis**

**Interactions**

**Drug-drug.** *Antacids containing aluminum or magnesium, histamine<sub>2</sub>-receptor antagonists:* increased cefuroxime absorption

*Probenecid:* decreased excretion and increased blood level of cefuroxime

**Drug-diagnostic tests.** *Blood glucose, Coombs' test, urine glucose tests using Benedict's solution:* false-positive results  
*Glucose, hematocrit:* decreased levels  
*White blood cells in urine:* increased level

**Drug-food.** *Moderate- or high-fat meal:* increased drug bioavailability

**Patient monitoring**

- Monitor patient for life-threatening adverse effects, including anaphylaxis, Stevens-Johnson syndrome, and pseudomembranous colitis.
- Monitor neurologic status, particularly for signs of impending seizures.
- Monitor kidney and liver function test results and intake and output.
- Monitor CBC with differential and prothrombin time; watch for signs and symptoms of blood dyscrasias.
- Monitor temperature; watch for signs and symptoms of superinfection.

**Patient teaching**

- Advise patient to immediately report rash or bleeding tendency.
- Instruct patient to take drug with food every 12 hours as prescribed.
- Teach patient how to recognize signs and symptoms of superinfection. Instruct him to report these right away.
- Advise patient to report CNS changes.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## celecoxib

Celebrex

**Pharmacologic class:** Nonsteroidal cyclooxygenase-2 (COX-2) inhibitor, nonsteroidal anti-inflammatory drug (NSAID)

**Therapeutic class:** Antirheumatic

**Pregnancy risk category** C

### FDA BOXED WARNING

- Drug may increase risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke (which can be fatal). Risk may increase with duration of use, and may be greater in patients who have cardiovascular disease or risk factors for it.
- Drug is contraindicated for perioperative pain in setting of coronary artery bypass graft surgery.
- Drug increases risk of serious GI adverse events, including bleeding, ulcers, and stomach or intestinal perforation, which can be fatal. These events can occur at any time during therapy and without warning. Elderly patients are at greater risk.

### Action

Exhibits anti-inflammatory, analgesic, and antipyretic action due to inhibition of COX-2 enzyme

### Availability

**Capsules:** 50 mg, 100 mg, 200 mg, 400 mg

### Indications and dosages

- Ankylosing spondylitis, osteoarthritis  
**Adults:** 200 mg/day P.O. as a single dose or 100 mg P.O. b.i.d.
- Rheumatoid arthritis  
**Adults:** 100 to 200 mg P.O. b.i.d.
- Adjunctive treatment in familial adenomatous polyposis to decrease the number of adenomatous colorectal polyps  
**Adults:** 400 mg P.O. b.i.d.
- Acute pain or primary dysmenorrhea  
**Adults:** 400 mg P.O. once, plus one additional 200 mg-dose as needed on first day; then 200 mg b.i.d. as needed
- Juvenile rheumatoid arthritis  
**Children age 2 and older weighing 10 to 25 kg (22 to 55 lb):** 50 mg P.O. b.i.d.
- Children age 2 and older weighing 25 kg or more:** 100 mg P.O. b.i.d.

### Dosage adjustment

- Hepatic impairment
- Patients weighing less than 50 kg (110 lb)

### Contraindications

- Hypersensitivity to drug, sulfonamides, or other NSAIDs
- Advanced renal disease
- Severe hepatic impairment
- Sensitivity precipitated by aspirin
- Third trimester of pregnancy
- Breastfeeding

### Precautions

Use cautiously in:

- renal insufficiency, hypertension
- history of asthma, urticaria, renal disease, hepatic dysfunction, heart failure
- patients on long-term NSAID therapy
- elderly patients
- pregnant patients in first or second trimester
- children younger than age 18 (safety not established).

## Administration

- When administering doses higher than 200/mg daily, give with food or milk to improve drug absorption.

Route	Onset	Peak	Duration
P.O.	Unknown	3 hr	Unknown

## Adverse reactions

**CNS:** dizziness, drowsiness, headache, insomnia, fatigue, **stroke**

**CV:** angina, tachycardia, peripheral edema, **myocardial infarction**

**EENT:** ophthalmic effects, tinnitus, epistaxis, pharyngitis, rhinitis, sinusitis

**GI:** nausea, diarrhea, constipation, abdominal pain, dyspepsia, flatulence, dry mouth, **GI bleeding**

**GU:** menorrhagia, **renal failure**

**Hematologic:** eosinophilia, ecchymosis, **neutropenia, leukopenia, pancytopenia, thrombocytopenia, agranulocytosis, granulocytopenia, aplastic anemia, bone marrow depression**

**Hepatic:** **hepatotoxicity**

**Metabolic:** hyperchloremia, hypophosphatemia

**Musculoskeletal:** back pain, leg cramps

**Respiratory:** upper respiratory tract infection

**Skin:** rash

**Other:** **anaphylaxis**

## Interactions

**Drug-drug.** *Angiotensin-converting enzyme inhibitors, furosemide, thiazides:* reduced celecoxib efficacy

*Antacids containing aluminum and magnesium:* decreased celecoxib blood level

*Aspirin (regular doses):* increased risk of GI bleeding and GI ulcers

*Fluconazole, lithium:* increased blood levels of these drugs

*Warfarin:* increased risk of bleeding

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, blood urea nitrogen:* increased levels

*Hematocrit, hemoglobin:* decreased values

**Drug-herbs.** *Dong quai, feverfew, garlic, ginger, horse chestnut, red clover:* increased risk of bleeding

*White willow:* increased risk of GI ulcers

**Drug-behaviors.** *Long-term alcohol use, smoking:* GI irritation and bleeding

## Patient monitoring

- Monitor CBC, electrolyte levels, creatinine clearance, occult fecal blood test, and liver function test results every 6 to 12 months.

## Patient teaching

📣 Advise patient to immediately report bloody stools, vomiting of blood, or signs or symptoms of liver damage (nausea, fatigue, lethargy, pruritus, yellowing of eyes or skin, tenderness in upper right abdomen, or flulike symptoms).

- Instruct patient to take drug with food or milk.
- Tell patient to avoid aspirin and other NSAIDs (such as ibuprofen and naproxen) during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## cephalexin

Apo-Cephalexin<sup>✳</sup>, Biocef, Dom-Cephalexin<sup>✳</sup>, Keflex, Novo-Lexin<sup>✳</sup>, Nu-Cephalex<sup>✳</sup>, Panixine DisperDose, PMS-Cephalexin<sup>✳</sup>

**Pharmacologic class:** First-generation cephalosporin

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

## Action

Interferes with bacterial cell-wall synthesis, causing cell to rupture and die. Active against many gram-positive bacteria; shows limited activity against gram-negative bacteria.

## Availability

*Capsules:* 250 mg, 500 mg, 750 mg

*Oral suspension:* 125 mg/ 5 ml, 250 mg/5 ml

*Tablets:* 250 mg, 500 mg

## Indications and dosages

➤ Respiratory tract infections caused by streptococci; skin and skin-structure infections caused by methicillin-sensitive staphylococci and streptococci; bone infections caused by methicillin-sensitive staphylococci or *Proteus mirabilis*; genitourinary infections caused by *Escherichia coli*, *P. mirabilis*, and *Klebsiella* species; *Haemophilus influenzae*, methicillin-sensitive staphylococcal, streptococcal, and *Moraxella catarrhalis* infections

**Adults:** 1 to 4 g P.O. daily in divided doses (usually 250 mg P.O. q 6 hours).

For uncomplicated cystitis, skin and soft-tissue infections, and streptococcal pharyngitis, 500 mg P.O. q 12 hours.

**Children:** 25 to 50 mg/kg/day P.O. in divided doses

➤ Otitis media caused by *S. pneumoniae*

**Children:** 75 to 100 mg/kg/day P.O. in four divided doses

## Dosage adjustment

- Renal impairment

## Contraindications

- Hypersensitivity to cephalosporins or penicillin

## Precautions

Use cautiously in:

- renal impairment, phenylketonuria
- history of GI disease
- debilitated or emaciated patients

- elderly patients
- pregnant or breastfeeding patients.

## Administration

- Give with or without food.
- Refrigerate oral suspension.

Route	Onset	Peak	Duration
P.O.	Rapid	1 hr	6-12 hr

## Adverse reactions

**CNS:** fever, headache, lethargy, paresis, syncope, **seizures**

**CV:** edema, hypotension, vasodilation, palpitations, chest pain

**EENT:** hearing loss

**GI:** nausea, vomiting, diarrhea, abdominal cramps, oral candidiasis,

**pseudomembranous colitis**

**GU:** vaginal candidiasis, **nephrotoxicity**

**Hematologic:** lymphocytosis, eosinophilia, **bleeding tendency, hemolytic anemia, neutropenia, thrombocytopenia, agranulocytosis, bone marrow depression**

**Musculoskeletal:** joint pain

**Respiratory:** dyspnea

**Skin:** rash, maculopapular and erythematous urticaria

**Other:** superinfection, chills, pain, allergic reaction, hypersensitivity reactions including **anaphylaxis, serum sickness**

## Interactions

**Drug-drug.** *Aminoglycosides, loop diuretics:* increased risk of nephrotoxicity

*Chloramphenicol:* antagonistic effect

*Probenecid:* increased cephalexin blood level

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, eosinophils, lactate dehydrogenase, lymphocytes:* increased values

*Coombs' test:* false-positive result (especially in neonates whose mothers received drug before delivery)

*Granulocytes, neutrophils, white blood cells:* decreased counts

**Patient monitoring**

- Assess for signs and symptoms of serious adverse reactions, including hypersensitivity, severe diarrhea, and bleeding.
- During long-term therapy, monitor CBC and liver and kidney function test results.

**Patient teaching**

- 📣 Instruct patient to stop taking drug and contact prescriber immediately if he develops rash or difficulty breathing.
- Tell patient to take drug with full glass of water.
- Advise patient to report severe diarrhea.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

**cetirizine hydrochloride**

All-Day Allergy, Aller-Relief<sup>⚡</sup>, Allergy Relief<sup>⚡</sup>, Benadryl Allergy Oral Solution<sup>⚡</sup>, Benadryl One a Day<sup>⚡</sup>, Piriteze<sup>⚡</sup>, Pollenshield Hayfever<sup>⚡</sup>, Reactine<sup>⚡</sup>, Zirtec<sup>⚡</sup>, Zyrtec

**Pharmacologic class:** Histamine<sub>1</sub>-receptor antagonist (peripherally selective)

**Therapeutic class:** Allergy, cold, and cough agent; antihistamine

**Pregnancy risk category B**

**Action**

Antagonizes histamine's effects at histamine<sub>1</sub>-receptor sites, preventing allergic response. Also has mild bronchodilatory effects and blocks histamine-induced bronchoconstriction in asthma.

**Availability**

*Syrup:* 5 mg/5 ml

*Tablets:* 5 mg, 10 mg

**Indications and dosages**

➤ Allergic symptoms caused by histamine release

**Adults and children older than age 6:** 5 to 10 mg P.O. daily

**Children ages 2 to 5:** 2.5 to 5 mg P.O. daily

**Dosage adjustment**

- Renal impairment
- Hepatic impairment

**Contraindications**

- Hypersensitivity to drug or hydroxyzine
- Acute asthma attacks
- Angle-closure glaucoma
- Pyloroduodenal obstruction
- Breastfeeding

**Precautions**

Use cautiously in:

- renal impairment, significant hepatic dysfunction
- elderly patients
- pregnant patients
- children younger than age 2 (safety not established).

**Administration**

- Give with or without food.
- Administer at same time each day.

Route	Onset	Peak	Duration
P.O.	30 min	1-4 hr	24 hr

**Adverse reactions**

**CNS:** dizziness, drowsiness, fatigue

**CV:** palpitations, edema

**EENT:** pharyngitis

**GI:** nausea, vomiting, abdominal distress, dry mouth

**Musculoskeletal:** myalgia, joint pain

**Respiratory:** bronchospasm

**Skin:** photosensitivity, rash, angioedema

**Other:** fever

## Interactions

**Drug-drug.** *CNS depressants:* additive CNS effects

*Theophylline:* decreased cetirizine clearance

**Drug-diagnostic tests.** *Allergy skin tests:* false-negative results

**Drug-behaviors.** *Alcohol use:* additive CNS effects

*Sun exposure:* photosensitivity

## Patient monitoring

- Monitor creatinine levels in patients with renal dysfunction.
- Assess hepatic enzyme levels in patients with hepatic disease.

## Patient teaching

- Tell patient to take with full glass of water.
- Inform patient that drug may impair alertness and that alcohol may exaggerate this effect.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## certolizumab pegol

Cimzia

**Pharmacologic class:** Tumor necrosis factor (TNF) blocker

**Therapeutic class:** Immunomodulator

**Pregnancy risk category B**

### FDA BOXED WARNING

#### Serious infections

- Patients treated with certolizumab are at increased risk for developing

serious infections that may lead to hospitalization or death. Most patients who developed these infections were taking concomitant immunosuppressants, such as methotrexate or corticosteroids.

- Discontinue drug if patient develops serious infection or sepsis.
- Reported infections include active tuberculosis (TB), including reactivation of latent TB. Patients with TB have frequently presented with disseminated or extrapulmonary disease. Perform test for latent TB and if positive, start treatment for TB before starting drug. Monitor all patients for active TB during treatment, even if initial latent TB test is negative.
- Invasive fungal infections, including histoplasmosis, coccidioidomycosis, candidiasis, aspergillosis, blastomycosis, and pneumocystosis, have been reported. Patients with histoplasmosis or other invasive fungal infections may present with disseminated, rather than localized, disease. Antigen and antibody testing for histoplasmosis may be negative in some patients with active infection. Consider empiric antifungal therapy in patients at risk for invasive fungal infections who develop severe systemic illness.
- Bacterial, viral, and other infections due to opportunistic pathogens, including *Legionella* and *Listeria* species, have occurred.
- Carefully consider risks and benefits of treatment with certolizumab before initiating therapy in patients with chronic or recurrent infection.
- Closely monitor patients for signs and symptoms of infection during and after treatment with certolizumab.
- Lymphoma and other malignancies, some fatal, have been reported in children and adolescents treated with TNF blockers, of which certolizumab is a member.

- Drug isn't indicated for use in children.

### Action

Binds to human TNF with a dissociation constant of 90 pM. TNF is a key proinflammatory cytokine with a central role in inflammatory processes. Selectively neutralizes TNF (IC<sub>90</sub> of 4 ng/ml for inhibition of human TNF in the in vitro L929 murine fibrosarcoma cytotoxicity assay) but doesn't neutralize lymphotoxin.

### Availability

*Powder for reconstitution, lyophilized:* 200 mg in single-use vials

*Prefilled syringe:* 200 mg/ml in 1-ml single-use prefilled syringes

### Indications and dosages

➤ Moderate to severe Crohn's disease in patients with inadequate response to conventional therapy

**Adults:** Initially, 400 mg subcutaneously (given as two 200-mg injections), then at weeks 2 and 4. In patients with a clinical response, maintenance dosage is 400 mg q 4 weeks.

➤ Moderate to severe rheumatoid arthritis

**Adults:** Initially, 400 mg subcutaneously (given as two 200-mg injections), then at weeks 2 and 4 followed by 200 mg q other week. Consider 400 mg q 4 weeks for maintenance dosing.

### Contraindications

None

### Precautions

Use cautiously in:

- hypersensitivity reactions
- congestive heart failure (CHF)
- chronic or recurrent infection, serious infections
- chronic hepatitis B virus (HBV) carriers

- preexisting or recent-onset central or peripheral nervous system demyelinating disorders
- significant hematologic abnormalities
- development of positive antinuclear antibody (ANA) titers
- concurrent use of anakinra, abatacept, rituximab, natalizumab, other TNF blockers, or other biological disease-modifying antirheumatics (use not recommended)
- concurrent use of live or attenuated vaccines (don't use)
- immunosuppression and concurrent use of immunosuppressants, such as corticosteroids or methotrexate
- elderly patients (don't use)
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

 Be aware that patients with active infections shouldn't start treatment with certolizumab. Also, consider risks and benefits of treatment before starting drug in patients with chronic or recurrent infection; in those who have been exposed to TB; in those with history of opportunistic infection; in those who have resided or traveled in areas of endemic TB or endemic mycoses, such as histoplasmosis, coccidioidomycosis, or blastomycosis; and in those with underlying conditions that may predispose to infection.

• Evaluate patients for TB risk factors and test for latent infection before starting drug.

 Evaluate patients at risk for HBV infection before initiating TNF-blocker therapy. Discontinue drug in patients who develop HBV reactivation and initiate effective antiviral therapy with appropriate supportive treatment. Know that safety of resuming TNF-blocker therapy after HBV reactivation has been controlled isn't known;

exercise caution when considering resumption of therapy.

- 🔊 Discontinue drug in patients who develop other serious infections or sepsis.
- 🔊 Discontinue drug in patients who develop signs and symptoms suggestive of a lupus-like syndrome following treatment.
- Consider discontinuing drug in patients with confirmed significant hematologic abnormalities.
- 🔊 Immediately discontinue drug if severe hypersensitivity reactions occur and initiate appropriate therapy.

Route	Onset	Peak	Duration
Subcutaneous	Unknown	54-171 hr	Unknown

### Adverse reactions

**CNS:** headache, fatigue, anxiety, bipolar disorder, **suicide attempt, transient ischemic attack, stroke**

**CV:** hypertension, hypertensive heart disease, angina pectoris, **MI, myocardial ischemia, pericardial effusion, pericarditis, arrhythmias, atrial fibrillation, CHF**

**EENT:** optic neuritis, uveitis, retinal hemorrhage, nasopharyngitis, pharyngitis

**GU:** menstrual disorder, urinary tract infection, **nephrotic syndrome, renal failure**

**Hematologic:** anemia, leukopenia, pancytopenia, thrombophilia, bleeding, thrombophlebitis, vasculitis

**Hepatic:** elevated liver enzyme levels, **hepatitis**

**Musculoskeletal:** arthralgia, back pain

**Respiratory:** upper respiratory tract infection, acute bronchitis

**Skin:** rash, alopecia totalis, dermatitis, erythema nodosum, urticaria

**Other:** pyrexia, injection-site reactions, lymphadenopathy, **serious infections, malignancies, lupus-like syndrome, hypersensitivity**

### Interactions

**Drug-drug.** *Abatacept, anakinra, natalizumab, rituximab, TNF blockers or other biological disease-modifying antirheumatics:* increased risk of serious infections

*Live vaccines:* increased risk of secondary transmission of disease and unknown response

**Drug-diagnostic tests.** ANA titers: increased risk of developing positive titers

APPT: elevated results

### Patient monitoring

🔊 Continue to closely monitor patients for hypersensitivity reactions and treat appropriately.

- Closely monitor patients for infection during and after treatment. Know that patients who develop new infection during treatment should be closely monitored, undergo prompt and complete diagnostic workup appropriate for an immunocompromised patient, and be given appropriate antimicrobial therapy.

- Continue to evaluate patients for TB risk factors; test for latent infection periodically during therapy.

- For patients who reside or travel in regions where mycoses are endemic, suspect invasive fungal infection if serious systemic illness develops. Consider appropriate empiric antifungal therapy while a diagnostic workup is being performed. Antigen and antibody testing for histoplasmosis may be negative in some patients with active infection. When feasible, the decision to institute empiric antifungal therapy in these patients should be made in consultation with a physician with expertise in diagnosis and treatment of invasive fungal infections and should take into account both the risk of severe fungal infection and the risks of antifungal therapy.

- Observe for signs and symptoms of malignancies; be aware that

lymphomas, including Hodgkin's and non-Hodgkin's lymphoma, and leukemia have been reported.

 Closely monitor patients with CHF during therapy.

- Closely monitor patients who are carriers of HBV and require treatment with certolizumab for clinical and laboratory signs of active HBV infection throughout therapy and for several months following termination of therapy.

 Be aware that pancytopenia, including aplastic anemia, has been reported (rare) with TNF-blocker use. Watch for leukopenia, pancytopenia, or thrombocytopenia.

 Watch for neurologic complications (rare), including new-onset or exacerbation of clinical symptoms or radiographic evidence of CNS demyelinating disease (including multiple sclerosis), peripheral demyelinating disease (including Guillain-Barré syndrome), seizure disorder, optic neuritis, and peripheral neuropathy.

### Patient teaching

- Instruct patient who may self-inject on proper use of prefilled syringe, suitable injection sites (including thigh or abdomen), rotation of sites, and appropriate handling and disposal of syringe. Instruct patient to discard unused portions remaining in syringe.

 Advise patient to seek immediate medical attention if signs or symptoms of severe allergic reactions occur.

- Advise patient to report new or worsening medical conditions, such as heart disease, neurologic disease, or autoimmune disorders, and to promptly report signs and symptoms suggestive of a cytopenia (such as bruising, bleeding, or persistent fever).

- Inform patient that drug may lower ability of immune system to fight infections. Instruct patient of importance of informing prescriber about

new or previous infections, including TB and reactivation of HBV infection.

- Counsel patient about possible risk of lymphoma and other malignancies while taking certolizumab.

- Tell patient to avoid taking live vaccines while using this drug.

- Advise breastfeeding patient that she should decide whether to discontinue breastfeeding or discontinue drug, taking into account importance of drug for her treatment.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## cetuximab

Erbixux

**Pharmacologic class:** Epidermal growth factor receptor (EGFR) inhibitor

**Therapeutic class:** Antineoplastic

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug may cause severe infusion reactions. If severe reaction occurs, stop infusion immediately and discontinue therapy permanently.

- Cardiopulmonary arrest, sudden death, or both occurred in 2% of patients with squamous-cell carcinoma of head and neck who received drug plus radiation therapy and in 3% of patients with squamous-cell carcinoma of head and neck treated with European-approved cetuximab in combination with platinum-based therapy with 5-fluorouracil. Monitor serum electrolyte levels closely during and after therapy.

## Action

Binds to EGFR, competitively inhibiting binding of epidermal growth factor and other ligands and blocking phosphorylation and activation of receptor-associated kinases. These actions lead to cell growth inhibition, apoptosis induction, and decreased matrix metalloproteinases and vascular endothelial growth factor.

## Availability

*Solution for injection:* 50-ml single-use vial containing 100 mg (2 mg/ml), 100-ml single-use vial containing 200 mg (2 mg/ml)

## Indications and dosages

➤ EGFR-expressing metastatic colorectal carcinoma, used alone in patients intolerant to irinotecan-based chemotherapy or in combination with irinotecan in patients refractory to irinotecan-based therapy

**Adults:** 400 mg/m<sup>2</sup> initial loading dose given as 120-minute I.V. infusion followed by maintenance dose of 250 mg/m<sup>2</sup> infused I.V. over 60 minutes

➤ Locally or regionally advanced squamous-cell carcinoma of head and neck, in combination with radiation therapy

**Adults:** 400 mg/m<sup>2</sup> as initial loading dose (first infusion) given as 120-minute I.V. infusion 1 week before initiation of radiation therapy. For recommended weekly maintenance dose (all other infusions), 250 mg/m<sup>2</sup> infused I.V. over 60 minutes weekly for duration of radiation therapy (6 to 7 weeks) given 1 hour before radiation therapy.

➤ Locally or regionally advanced squamous-cell carcinoma of head and neck in combination with platinum-based therapy plus 5-fluorouracil (5-FU)

**Adults:** Initially, 400 mg/m<sup>2</sup> on day of initiation of platinum-based therapy with 5-FU as a 120-minute I.V. infusion. Complete cetuximab

administration 1 hour before platinum-based therapy with 5-FU. For recommended subsequent weekly doses (all other infusions), 250 mg/m<sup>2</sup> I.V. infusion over 60 minutes for duration of radiation therapy (6 to 7 weeks) or until disease progression or unacceptable toxicity occurs.

➤ Recurrent or metastatic squamous-cell carcinoma of head and neck (used alone) in patients for whom platinum-based therapy has failed

**Adults:** Initially, 400-mg/m<sup>2</sup> I.V. infusion followed by 250 mg/m<sup>2</sup> I.V. weekly until disease progresses or unacceptable toxicity occurs

## Off-label uses

- Cancers that overexpress EGFR

## Dosage adjustment

- Mild to moderate infusion (Grade 1 or 2) reaction
- Severe acneiform rash
- Acute onset or worsening of pulmonary symptoms

## Contraindications

None

## Precautions

Use cautiously in:

- hypersensitivity to murine proteins or drug components
- dermatologic or pulmonary toxicities
- patients receiving concurrent radiation therapy and cisplatin
- patients receiving concurrent radiation therapy who have history of coronary artery disease, arrhythmias, and congestive heart failure
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

## Administration

- As ordered, premedicate with histamine<sub>1</sub>-antagonist (such as 50 mg diphenhydramine I.V.).

- Use low-protein-binding, 0.22 micrometer in-line filter placed as close to patient as possible.
- 🔊 Don't give by I.V. push or bolus.
- 🔊 Don't shake or dilute vial.
- Administer by I.V. infusion pump or syringe pump.
- Piggyback drug to patient's infusion line.
- Give initial dose over 2 hours at a rate of 10 mg/minute; give subsequent weekly doses over 1 hour. Maximum infusion rate shouldn't exceed 10 mg/minute.
- At end of infusion, flush I.V. lines with normal saline solution.
- 🔊 Be aware that 90% of infusion reactions occur with first infusion. Observe patient closely for 1 hour after infusion (or longer in patients who have experienced infusion reactions). Severe and life-threatening infusion reactions have occurred, including rapid-onset airway obstruction (bronchospasm, stridor, hoarseness), urticaria, and hypotension.
- 🔊 Permanently reduce infusion rate by 50% if patient experiences mild or moderate infusion reaction. Immediately and permanently discontinue drug in patient who experiences severe (Grade 3 or 4) infusion reaction.
- Make sure appropriate medical resources for treatment of severe infusion reactions are available during infusion.
- Expect patients with colorectal cancer to undergo immunohistochemical testing for EGFR expression using DakoCytomation EGFR pharmDx test kit.
- Interrupt therapy if patient develops acute onset or worsening of pulmonary symptoms. Discontinue therapy if pneumonitis or lung infiltrates are confirmed.
- For first occurrence of severe acneiform rash, delay infusion 1 to 2 weeks; if condition improves, continue therapy at 250 mg/m<sup>2</sup>; if no improvement occurs, withdraw drug. For second occurrence, delay infusion

1 to 2 weeks; if condition improves, reduce dosage to 200 mg/m<sup>2</sup>; if no improvement occurs, withdraw drug. For third occurrence, delay infusion for 1 to 2 weeks; if condition improves, reduce dosage to 150 mg/m<sup>2</sup>; if no improvement occurs, withdraw drug. On fourth occurrence, withdraw drug.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache, insomnia, depression, malaise, asthenia

**CV:** cardiopulmonary arrest

**EENT:** conjunctivitis

**GI:** abdominal pain, diarrhea, nausea, vomiting, constipation, stomatitis, dyspepsia, anorexia

**GU:** renal failure

**Hematologic:** leukopenia, anemia

**Metabolic:** dehydration, electrolyte abnormalities

**Musculoskeletal:** back pain

**Respiratory:** dyspnea, increased cough, **interstitial lung disease, pulmonary embolus**

**Skin:** acneiform rash, alopecia, skin disorder, nail disorder, pruritus

**Other:** weight loss, fever, pain, infection, peripheral edema, **severe infusion reaction**

### Interactions

**Drug-diagnostic tests.** *Calcium, magnesium:* decreased

**Drug-behaviors.** *Sun exposure:* exacerbated skin reactions

### Patient monitoring

- Watch for signs and symptoms of infusion reaction.
- Monitor patient for hypomagnesemia and hypocalcemia during therapy and for 8 weeks afterward.
- Closely monitor serum electrolytes (including serum magnesium, potassium, and calcium) during therapy and after combination drug and radiation

therapy in patients with history of coronary artery disease, arrhythmias, and heart failure.

- Monitor patient with dermatologic toxicities for inflammatory or infectious sequelae.
- Watch for pulmonary toxicities in patient with history of interstitial pneumonitis or pulmonary fibrosis. Be prepared to interrupt or discontinue therapy and intervene appropriately.
- Monitor for potentially serious cardiotoxicity if patient is receiving drug in combination with radiation therapy and cisplatin.
- Stay alert for severe diarrhea and electrolyte depletion.

### Patient teaching

- 📣 Urge patient to immediately report rash, which may indicate skin toxicity.
- 📣 Instruct patient to immediately report new or worsening respiratory or cardiovascular symptoms.
- Advise patient to use sunscreen and wear a hat when outdoors and to limit sun exposure, because sunlight can exacerbate skin reactions.
- Caution female with childbearing potential that drug may cause pregnancy loss or pose hazard to fetus.
- Advise female to discontinue breastfeeding during therapy and for 60 days after last dose.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests and behaviors mentioned above.

## chlorambucil

Leukeran

**Pharmacologic class:** Alkylating agent, nitrogen mustard

**Therapeutic class:** Antineoplastic, immunosuppressant

**Pregnancy risk category** D

### FDA BOXED WARNING

- Drug may suppress bone marrow function severely and is carcinogenic.
- Drug causes infertility and is probably mutagenic and teratogenic.

### Action

Interacts with cellular DNA to produce cytotoxic cross-linkage, which disrupts cell function. Cell-cycle-phase nonspecific.

### Availability

Tablets: 2 mg

### Indications and dosages

➤ Chronic lymphocytic leukemia, malignant lymphoma, Hodgkin's disease

**Adults:** Initially, 0.1 to 0.2 mg/kg/day P.O. for 3 to 6 weeks as a single dose or in divided doses. Maintenance dosage is based on CBC but shouldn't exceed 0.1 mg/kg/day.

### Off-label uses

- Idiopathic membranous nephropathy
- Meningoencephalitis associated with Behçet's disease
- Rheumatoid arthritis

### Contraindications

- Hypersensitivity to drug or other alkylating agents
- Pregnancy or breastfeeding

## Precautions

Use cautiously in:

- hematopoietic depression, infection, other chronic debilitating diseases
- history of seizures or head trauma
- patients who have undergone radiation or other chemotherapy
- elderly patients
- females of childbearing age
- children (safety and efficacy not established).

## Administration

- Before starting therapy, assess for history of seizures or head trauma.
- After full-course radiation or chemotherapy, wait 4 weeks before giving full doses (because of bone marrow vulnerability).
- To minimize GI effects, drug may be given at bedtime with antiemetic, especially if high dosage is prescribed.

Route	Onset	Peak	Duration
P.O.	Unknown	1 hr	Unknown

## Adverse reactions

**CNS:** peripheral neuropathy, tremor, confusion, agitation, ataxia, flaccid paresis, **seizures**

**EENT:** keratitis

**GI:** nausea, vomiting, diarrhea

**GU:** sterile cystitis, amenorrhea, sterility, decreased sperm count

**Hematologic:** anemia, **leukopenia**, **thrombocytopenia**, **neutropenia**, **bone marrow depression**

**Hepatic:** jaundice, **hepatotoxicity**

**Metabolic:** hyperuricemia

**Musculoskeletal:** muscle twitching

**Respiratory:** **interstitial pneumonitis**, **pulmonary fibrosis**

**Skin:** rash, **erythema multiforme**, **epidermal necrolysis**, **Stevens-Johnson syndrome**

**Other:** drug fever, allergic reaction, **secondary malignancies**

## Interactions

**Drug-drug.** *Anticoagulants, aspirin:* increased risk of bleeding

*Immunosuppressants, myelosuppressants:* additive bone marrow depression  
*Live-virus vaccines:* decreased antibody response to vaccine, increased risk of adverse reactions

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, uric acid:* increased levels (may reflect hepatotoxicity)

*Granulocytes, hemoglobin, neutrophils, platelets, red blood cells, white blood cells (WBCs):* decreased counts

**Drug-herbs.** *Astragalus, echinacea, melatonin:* interference with immunosuppressant action

## Patient monitoring

 Monitor CBC with white cell differential and platelet count weekly.

- Monitor WBC count every 3 to 4 days.
- Assess liver function test results.

## Patient teaching

- Instruct patient to immediately report unusual bleeding or bruising, fever, nausea, vomiting, rash, chills, sore throat, cough, shortness of breath, seizures, amenorrhea, unusual lumps or masses, flank or stomach pain, joint pain, lip or mouth sores, or yellowing of skin or sclera.

- Tell patient to take drug with full glass of water.

- Inform patient that drug may increase his risk for infection. Advise him to wash hands frequently, wear a mask in public places, and avoid people with infections.

- Instruct patient to contact prescriber before receiving vaccines.

- Advise female patient to use reliable contraception.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## chlordiazepoxide hydrochloride

Apo-Chlordiazepoxide\*

**Pharmacologic class:** Benzodiazepine

**Therapeutic class:** Anxiolytic, sedative-hypnotic

**Controlled substance schedule IV**

**Pregnancy risk category D**

### Action

Unknown. May potentiate effects of gamma-aminobutyric acid (an inhibitory neurotransmitter) by increasing neuronal membrane permeability; may depress CNS at limbic and subcortical levels of brain. Anxiolytic effect occurs at doses well below those that cause sedation or ataxia.

### Availability

**Capsules:** 5 mg, 10 mg, 25 mg

**Injection:** 100-mg ampules

### Indications and dosages

➤ Mild to moderate anxiety

**Adults:** 5 to 10 mg P.O. three to four times daily

➤ Severe anxiety

**Adults:** Initially, 50 to 100 mg I.M. or I.V.; then 25 to 50 mg P.O. three to four times daily as needed

➤ Preoperative apprehension or anxiety

**Adults:** 5 to 10 mg P.O. three to four times daily for several days before surgery or 50 to 100 mg I.M. 1 hour before surgery

➤ Acute alcohol withdrawal

**Adults:** Initially, 50 to 100 mg I.V. or I.M. Repeat dose as needed up to 300 mg/day.

### Dosage adjustment

- Hepatic impairment
- Age 65 or older

### Contraindications

- Hypersensitivity to drug, other benzodiazepines, or tartrazine
- CNS depression
- Uncontrolled severe pain
- Porphyria
- Pregnancy or breastfeeding
- Children younger than age 6

### Precautions

Use cautiously in:

- hepatic dysfunction, severe renal impairment
- debilitated or elderly patients.

### Administration

- Dilute I.V. preparation with 5 ml of normal saline solution. Administer slowly over at least 1 minute.
- When giving I.M., use 2 ml of special I.M. diluent. Inject slowly and deeply into gluteus muscle.
- Don't use I.M. diluent for I.V. preparation.
- After I.V. or I.M. administration, observe patient closely and enforce bedrest for at least 3 hours.

Route	Onset	Peak	Duration
P.O.	Rapid	0.5-4 hr	Up to 24 hr
I.V.	1-5 min	Unknown	0.25-1 hr
I.M.	15-30 min	Unknown	Unknown

### Adverse reactions

**CNS:** dizziness, drowsiness, hangover, headache, depression, paradoxical stimulation

**EENT:** blurred vision

**GI:** nausea, vomiting, constipation, diarrhea

**Hematologic:** agranulocytosis

**Hepatic:** jaundice

**Skin:** rash

**Other:** physical or psychological drug dependence, drug tolerance, pain at I.M. site

## Interactions

**Drug-drug.** *Antidepressants, antihistamines, opioids:* additive CNS depression  
*Barbiturates, rifampin:* decreased

chlordiazepoxide efficacy

*Cimetidine, disulfiram, fluoxetine, hormonal contraceptives, isoniazid, ketoconazole, metoprolol, propoxyphene, propranolol, valproic acid:* enhanced chlordiazepoxide effect

*Levodopa:* decreased levodopa efficacy

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, bilirubin:* increased levels

*Granulocytes:* decreased count

*Metyrapone test:* decreased response

*Radioactive iodine uptake test (<sup>123</sup>I or <sup>131</sup>I):* decreased uptake

*Urine 17-ketogenic steroids, urine 17-ketosteroids:* altered test results

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

## Patient monitoring

- Monitor CBC and hepatic enzyme levels in prolonged therapy.
- Monitor renal and hepatic studies.
- Assess patient for apnea, bradycardia, and hypotension.

## Patient teaching

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Advise patient to avoid alcohol during therapy.
- Tell patient not to stop taking drug abruptly. Instruct him to discuss dosage-tapering schedule with prescriber.
- Caution female patient not to take drug if she's pregnant or might become pregnant during therapy. Advise her to use reliable contraception.
- As appropriate, review all other significant and life-threatening adverse

reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## chloroquine phosphate

**Pharmacologic class:** 4-aminoquinolone derivative

**Therapeutic class:** Antimalarial, amebicide

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug is indicated for treating malaria and extraintestinal amebiasis.
- Before prescribing, clinician should be familiar with complete package insert contents.

## Action

Unknown. Antimalarial action may occur through inhibition of protein synthesis and alteration of DNA in susceptible parasites.

## Availability

*Tablets:* 250 mg (150-mg base), 500 mg (300-mg base)

## Indications and dosages

➤ Uncomplicated acute malarial attacks

**Adults:** Initially, 1 g (600-mg base) P.O., then an additional 500 mg (300-mg base) P.O. 6 hours later and a single dose of 500 mg (300-mg base) P.O. on second and third days. Or initially, 160- to 200-mg base I.M., repeated in 6 hours (800-mg base maximum dosage during first 24 hours); continue for 3 days until total dosage of 1.5-g base has been given. Switch to oral therapy as soon as possible.

**Children:** Initially, 10 mg (base)/kg P.O., then 5 mg (base)/kg 6 hours, 24 hours, and 36 hours later; don't exceed recommended adult dosage. Or initially, 5 mg (base)/kg I.M. repeated 6 hours later, 18 hours after second dose, and then 24 hours after third dose; don't exceed recommended adult dosage.

➤ Malaria prophylaxis

**Adults:** 500 mg (300-mg base) P.O. weekly 1 to 2 weeks before visiting endemic area and continued for 4 weeks after leaving area. If therapy starts after malaria exposure, initial dosage is 600-mg base P.O. in two divided doses given 6 hours apart.

**Children:** 5 mg (base)/kg P.O. weekly for 1 to 2 weeks before visiting endemic area and continued for 4 weeks after leaving area, to a maximum dosage of 300 mg weekly. If treatment starts after exposure, 10 mg (base)/kg P.O. in two divided doses 6 hours apart and continued for 8 weeks after leaving area.

➤ Extraintestinal amebiasis

**Adults:** Initially, 1 g (600-mg base) P.O. daily for 2 days, then 500 mg (300-mg base) daily for 2 to 3 weeks. When oral therapy isn't tolerated, give 160- to 200-mg base I.M. daily for 10 to 12 days; switch to oral therapy as soon as possible.

**Children:** 10 mg (base)/kg P.O. once daily for 2 to 3 weeks, to a maximum dosage of 300 mg (base) daily

### Off-label uses

- Lupus erythematosus
- Rheumatoid arthritis

### Contraindications

- Hypersensitivity to drug
- Retinal and visual field changes
- Porphyria

### Precautions

Use cautiously in:

- severe GI, neurologic, or blood disorders; hepatic impairment; G6PD

deficiency; neurologic disease; eczema; alcoholism

- pregnant patients
- children.

### Administration

- For obese patient, determine weight-based dosages from lean body weight. (Drug is stored in body tissues and eliminated slowly.)

Route	Onset	Peak	Duration
P.O.	Unknown	1-3 hr	Unknown

### Adverse reactions

**CNS:** mild and transient headache, personality changes, dizziness, vertigo neuropathy, **seizures**

**CV:** hypotension, ECG changes

**EENT:** blurred vision, difficulty focusing, reversible corneal changes, irreversible retinal damage leading to vision loss, scotomas, ototoxicity, tinnitus, nerve deafness

**GI:** nausea, vomiting, diarrhea, abdominal pain, stomatitis, anorexia

**Hematologic:** **agranulocytosis, aplastic anemia, hemolytic anemia, thrombocytopenia**

**Skin:** lichen planus eruptions, skin and mucosal pigmentation changes, pruritus, pleomorphic skin eruptions

### Interactions

**Drug-drug.** *Aluminum and magnesium salts, kaolin:* decreased GI absorption of chloroquine

*Ampicillin:* reduced ampicillin bioavailability

*Cimetidine:* decreased hepatic metabolism of chloroquine

*Cyclosporine:* sudden increase in cyclosporine blood level

**Drug-diagnostic tests.** *Granulocytes, hemoglobin, platelets:* decreased values

**Drug-behaviors.** *Sun exposure:* exacerbation of drug-induced dermatoses

### Patient monitoring

- Monitor hepatic enzyme levels in patients with hepatic disease.

- Assess creatinine levels in patients with renal insufficiency or failure.
- In long-term therapy (as for lupus or rheumatoid arthritis), be aware that desired effects may be delayed for up to 6 months.
- Be aware that drug is secreted in breast milk but not in sufficient amounts to prevent malaria in infant.

### Patient teaching

- Tell patient to take drug with food at evenly spaced intervals.
-  Instruct patient to immediately report blurred vision or hearing changes.
- In areas where malaria is endemic, advise pregnant patient to consult prescriber about taking drug.
- Inform patient on long-term therapy that beneficial effects may take up to 6 months.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## chlorpheniramine maleate

Ahist, Allercalm , Allerief , Calimol , Chlorphen, Chlor-Trimeton, Chlor-Trimeton Allergy 4 Hour, Chlor-Trimeton Allergy 8 Hour, Chlor-Trimeton Allergy 12 Hour, Chlor-Tripolon , Diabetic Tussin Allergy Relief, Novo-Pheniram , Piriton , Teldrin HBP

**Pharmacologic class:** Propylamine (nonselective)

**Therapeutic class:** Antihistamine; allergy, cold, and cough remedy

**Pregnancy risk category B**

### Action

Antagonizes effects of histamine at histamine<sub>2</sub>-receptor sites, preventing histamine-mediated responses

### Availability

*Capsules (sustained-release):* 8 mg, 12 mg  
*Syrup:* 1 mg/5 ml, 2 mg/5 ml, 2.5 mg/5 ml

*Tablets:* 4 mg, 8 mg, 12 mg

*Tablets (chewable):* 2 mg

*Tablets (timed-release):* 8 mg, 12 mg

### Indications and dosages

➤ Allergy symptoms; management of anaphylaxis and transfusion reactions

**Adults:** 4 mg q 4 to 6 hours P.O. or 8 to 12 mg P.O. of sustained-release form q 8 to 12 hours. Maximum dosage is 24 mg/day.

**Children ages 6 to 12:** 2 mg P.O. q 4 to 6 hours daily. Maximum dosage is 12 mg/day.

### Dosage adjustment

- Glaucoma
- Gastric ulcer
- Hyperthyroidism
- Heart disease

### Contraindications

- Hypersensitivity to drug
- Acute asthma attacks
- Stenosing peptic ulcer
- Breastfeeding

### Precautions

Use cautiously in:

- hepatic or renal disease, asthma, angle-closure glaucoma, prostatic hypertrophy
- elderly patients
- pregnant patients (safety not established).

### Administration

- Don't crush or break timed-release tablets or sustained-release capsules.
- Discontinue drug 4 days before allergy skin tests. (Drug may cause false-negative reactions.)

Route	Onset	Peak	Duration
P.O.	15-30 min	1-2 hr	4-12 hr
P.O. (sustained)	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** dizziness, drowsiness, excitation (in children), sedation, poor coordination, fatigue, confusion, restlessness, nervousness, tremor, headache, hysteria, tingling sensation, sensation of heaviness and weakness in hands

**CV:** palpitations, hypotension, bradycardia, tachycardia, extrasystoles, **arrhythmias**

**EENT:** blurred vision, diplopia, vertigo, tinnitus, acute labyrinthitis, nasal congestion, dry nose, dry throat, sore throat

**GI:** nausea, vomiting, diarrhea, constipation, epigastric distress, anorexia, dry mouth, **GI obstruction**

**GU:** urinary retention, urinary hesitancy, dysuria, early menses, decreased libido, erectile dysfunction

**Hematologic:** **hemolytic anemia, hypoplastic anemia, thrombocytopenia, leukopenia, pancytopenia, agranulocytosis**

**Respiratory:** thickened bronchial secretions, chest tightness, wheezing

**Skin:** urticaria, rash, photosensitivity, diaphoresis

**Other:** chills, increased appetite, weight gain, **anaphylactic shock**

### Interactions

**Drug-drug.** *Anticholinergics, anticholinergic-like drugs (such as some antidepressants, atropine, haloperidol, phenothiazines, quinidine, disopyramide):* additive anticholinergic effects

*CNS depressants (such as opioids, sedative-hypnotics):* additive CNS depression  
*MAO inhibitors:* intensified, prolonged anticholinergic effects

**Drug-diagnostic tests.** *Allergy skin tests:* false-negative reactions

**Drug-behaviors.** *Alcohol use:* additive CNS depression

*Sun exposure:* photosensitivity

### Patient monitoring

- Assess for urinary retention and frequency.
- Monitor respiratory status throughout therapy.

### Patient teaching

- Advise patient to take with full glass of water.
- Tell patient not to crush timed-release tablets or sustained-release capsules. Instruct him to swallow them whole.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Advise parents to give dose to children in evening, because morning doses may cause inattention in school.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## chlorpromazine hydrochloride

Apo-Chlorpromazine<sup>✳</sup>,  
Novo-Chlorpromazine<sup>✳</sup>

**Pharmacologic class:** Phenothiazine

**Therapeutic class:** Antipsychotic, anxiolytic, antiemetic

**Pregnancy risk category** C

### Action

Unknown. May block postsynaptic dopamine receptors in brain and depress areas involved in wakefulness and emesis. Also possesses

anticholinergic, antihistaminic, and adrenergic-blocking properties.

### Availability

*Capsules (sustained-release):* 30 mg, 75 mg, 150 mg, 200 mg, 300 mg

*Injection:* 25 mg/ml

*Tablets:* 10 mg, 25 mg, 50 mg, 100 mg, 200 mg

### Indications and dosages

➤ Acute schizophrenia or mania

**Adults:** *Hospitalized patients*—Initially, 25 mg I.M.; if necessary, give an additional 25 to 50 mg in 1 hour. Increase dosage gradually, as needed, for several days (up to 400 mg q 4 to 6 hours in exceptionally severe cases) until symptoms are controlled; then give 500 mg P.O. daily. In less acutely disturbed patients, 25 mg P.O. t.i.d., increased gradually until effective dosage is reached (usually 400 mg P.O. daily). *Acutely disturbed outpatients*—Initially, 10 mg P.O. three or four times daily or 25 mg P.O. two or three times daily. In more severe cases, 25 mg P.O. t.i.d.; after 1 or 2 days, increase daily dosage by 20 to 50 mg at semiweekly intervals until effective dosage is reached.

**Children ages 6 months to 12 years:** 0.55 mg/kg P.O. (15 mg/m<sup>2</sup>) q 4 to 6 hours as needed, or 0.55 mg/kg I.M. (15 mg/m<sup>2</sup>) q 6 to 8 hours (not to exceed 40 mg/day in children ages 6 months to 5 years, or 75 mg/day in children ages 6 to 12)

➤ Nausea and vomiting

**Adults:** 10 to 25 mg P.O. q 4 to 6 hours, increased if necessary; or 25 mg I.M. If no hypertension occurs, give 25 to 50 mg I.M. q 3 to 4 hours as needed until vomiting stops; then switch to oral dosing

➤ Nausea and vomiting during surgery

**Adults:** 12.5 mg I.M., repeated in 30 minutes p.r.n. if no hypotension

occurs; or 2 mg I.V. at 2-minute intervals (not to exceed 25 mg)

**Children ages 6 months to 12 years:**

0.275 mg/kg I.M.; may repeat in 30 minutes as needed

➤ Preoperative sedation

**Adults:** 25 to 50 mg P.O. 2 to 3 hours before surgery, or 12.5 to 25 mg I.M. 1 to 2 hours before surgery

**Children ages 6 months to 12 years:**

0.55 mg/kg P.O. (15 mg/m<sup>2</sup>) 2 to 3 hours before surgery, or 0.55 mg/kg

I.M. 1 to 2 hours before surgery

➤ Intractable hiccups

**Adults:** 25 to 50 mg P.O. three to four times daily. If symptoms continue for 2 to 3 days, give 25 to 50 mg I.M.; if symptoms still persist, give 25 to 50 mg by slow I.V. infusion with patient positioned flat in bed.

➤ Acute intermittent porphyria

**Adults:** 25 to 50 mg P.O. three to four times daily. Drug is usually discontinued after several weeks, but some patients require maintenance doses. Or 25 mg I.M. t.i.d. until patient can tolerate oral doses.

➤ Tetanus

**Adults:** 25 to 50 mg P.O. three to four times daily (given with barbiturates, as prescribed). Total dosage and frequency determined by patient response.

**Children ages 6 months to 12 years:** 0.55 mg/kg I.M. or 0.55 mg/kg I.V. q 6 to 8 hours

### Dosage adjustment

- Age over 60

### Off-label uses

- Anxiety disorders
- Migraine
- Phencyclidine (PCP) psychosis

### Contraindications

- Hypersensitivity to drug, other phenothiazines, sulfites (injection), benzyl alcohol (sustained-release capsules)
- Angle-closure glaucoma

- Bone marrow depression
- Severe hepatic or cardiovascular disease

**Precautions**

Use cautiously in:

- cardiac disease, diabetes mellitus, respiratory disease, prostatic hypertrophy, CNS tumors, epilepsy, intestinal obstruction
- elderly patients
- pregnant or breastfeeding patients
- children.

**Administration**

 Know that I.V. infusion is recommended only for severe hiccups.

- When giving by I.V. infusion for intractable hiccups, dilute in 500 to 1,000 ml of normal saline solution and infuse slowly.
- For direct I.V. injection, dilute to 1 mg/ml using normal saline solution. Administer at a rate of at least 1 mg/minute for adults or 2 mg/minute for children.
- When giving I.M., use Z-track injection method to minimize tissue irritation.
- Don't inject subcutaneously.
- Know that in preoperative use, drug increases risk of neuromuscular excitation and hypotension when followed by barbiturate anesthetics.

Route	Onset	Peak	Duration
P.O.	30-60 min	Unknown	4-6 hr
P.O. (sustained)	30-60 min	Unknown	10-12 hr
I.V.	Rapid	Unknown	Unknown
I.M.	Unknown	Unknown	4-8 hr
P.R.	1-2 hr	Unknown	3-4 hr

**Adverse reactions**

**CNS:** sedation, drowsiness, extrapyramidal reactions, tardive dyskinesia, pseudoparkinsonism, **neuroleptic malignant syndrome, seizures**

**CV:** tachycardia, hypotension (especially with I.M. or I.V. use)

**EENT:** blurred vision, dry eyes, lens opacities, nasal congestion

**GI:** constipation, ileus, anorexia, dry mouth

**GU:** urinary retention, menstrual irregularities, galactorrhea, gynecomastia, inhibited ejaculation, priapism

**Hematologic:** eosinophilia, **agranulocytosis, leukopenia, hemolytic anemia, aplastic anemia, thrombocytopenia**

**Hepatic:** jaundice, **hepatitis**

**Skin:** rash, photosensitivity, pigmentation changes, sterile abscess

**Other:** allergic reactions, hyperthermia, pain at injection site

**Interactions**

**Drug-drug.** *Activated charcoal, adsorbent antidiarrheals, antacids:* decreased chlorpromazine absorption  
*Antidepressants, antihistamines, general anesthetics, MAO inhibitors, opioids, sedative-hypnotics:* additive CNS depression

*Antihistamines, disopyramide, quinidine, tricyclic antidepressants (TCAs):* increased anticholinergic effects

*Antihypertensives:* additive hypotension  
*Barbiturates:* increased metabolism and decreased efficacy of chlorpromazine

*Bromocriptine:* decreased bromocriptine efficacy

*Epinephrine:* antagonism of peripheral vasoconstriction, epinephrine reversal  
*Guanethidine:* inhibition of antihypertensive effects

*Lithium:* disorientation, loss of consciousness, extrapyramidal symptoms  
*Meperidine:* excessive sedation and hypotension

*Norepinephrine:* reduced pressor effect, elimination of bradycardia

*Phenytoin:* altered phenytoin blood level, lowered seizure threshold

*Pimozide:* increased risk of potentially serious CV reactions

*Propranolol*: increased blood levels of both drugs

*TCAs*: increased TCA blood levels and effects

*Valproic acid*: decreased elimination and increased effects of valproic acid

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin*: increased levels

*Granulocytes, hematocrit, hemoglobin, platelets, white blood cells*: decreased values

*Pregnancy tests*: false-positive or false-negative result

*Urine bilirubin*: false-positive result

**Drug-herbs.** *Angel's trumpet, jimsonweed, scopolia*: increased anticholinergic effects

*Chamomile, hops, kava, skullcap, valerian*: increased CNS depression

*St. John's wort*: photosensitivity

*Yohimbe*: increased risk of toxicity

**Drug-behaviors.** *Alcohol use*: increased CNS depression

*Sun exposure*: increased risk of photosensitivity

### Patient monitoring

- Monitor blood pressure closely during I.V. infusion.
- ☞ Stay alert for signs and symptoms of neuroleptic malignant syndrome (hyperpyrexia, muscle rigidity, altered mental status, irregular pulse or blood pressure, tachycardia, diaphoresis, and arrhythmias). Stop drug immediately if these occur.
- Assess for extrapyramidal symptoms.

### Patient teaching

- Tell patient to take capsules or tablets with a full glass of water, with or without food.
- Instruct patient not to crush sustained-release capsules.
- Tell patient to mix oral concentrate in juice, soda, applesauce, or pudding.
- Caution patient to avoid driving and other hazardous activities until he

knows how drug affects concentration and alertness.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## chlorthalidone

Apo-Chlorthalidone<sup>✳</sup>, Hygroton<sup>☼</sup>, Novo-Thalidone<sup>✳</sup>, Thalitone, Uridon<sup>✳</sup>

**Pharmacologic class:** Thiazide-like diuretic

**Therapeutic class:** Diuretic, antihypertensive

**Pregnancy risk category B**

### Action

Unclear. Enhances excretion of sodium, chloride, and water by interfering with transport of sodium ions across renal tubular epithelium. Also may dilate arterioles.

### Availability

*Tablets:* 15 mg, 25 mg, 50 mg, 100 mg

### Indications and dosages

➤ Edema associated with heart failure, renal dysfunction, cirrhosis, corticosteroid therapy, and estrogen therapy

**Adults:** 50 to 100 mg/day (30 to 60 mg Thalitone) P.O. or 100 mg every other day (60 mg Thalitone) P.O., up to 200 mg/day (120 mg Thalitone) P.O.

➤ Management of mild to moderate hypertension

**Adults:** 25 mg/day (15 mg Thalitone) P.O. Based on patient response, may increase to 50 mg/day (30 to 50 mg Thalitone) P.O., then up to 100 mg/day (except Thalitone) P.O.

## Contraindications

- Hypersensitivity to drug, other thiazides, sulfonamides, or tartrazine
- Renal decompensation

## Precautions

Use cautiously in:

- renal or severe hepatic disease, abnormal glucose tolerance, gout, systemic lupus erythematosus, hyperparathyroidism, bipolar disorder
- elderly patients
- pregnant or breastfeeding patients.

## Administration

- Know that dosages above 25 mg/day are likely to increase potassium excretion without further increasing sodium excretion or reducing blood pressure.

Route	Onset	Peak	Duration
P.O.	2 hr	4 hr	48-72 hr

## Adverse reactions

**CNS:** dizziness, vertigo, drowsiness, lethargy, confusion, headache, insomnia, nervousness, paresthesia, asterixis, nystagmus, **encephalopathy**

**CV:** hypotension, ECG changes, chest pain, **arrhythmias, thrombophlebitis**

**GI:** nausea, vomiting, cramping, anorexia, pancreatitis

**GU:** polyuria, nocturia, erectile dysfunction, loss of libido

**Hematologic: blood dyscrasias**

**Metabolic:** gout attack, dehydration, hyperglycemia, hypokalemia, hypocalcemia, hypomagnesemia, hyponatremia, hypophosphatemia, hyperuricemia, hyperlipidemia,

**hypochloremic alkalosis**

**Musculoskeletal:** muscle cramps, muscle spasms

**Skin:** flushing, photosensitivity, hives, rash, exfoliative dermatitis, **toxic epidermal necrolysis**

**Other:** fever, weight loss, hypersensitivity reactions

## Interactions

**Drug-drug.** *Allopurinol:* increased risk of hypersensitivity reaction

*Amphotericin B, corticosteroids, mezlocillin, piperacillin, ticarcillin:* additive hypokalemia

*Antihypertensives, barbiturates, nitrates, opiates:* increased hypotension

*Cholestyramine, colestipol:* decreased chlorthalidone blood level

*Digoxin:* increased risk of hypokalemia

*Lithium:* increased risk of lithium toxicity

*Nonsteroidal anti-inflammatory drugs:* decreased diuretic effect

**Drug-diagnostic tests.** *Bilirubin, calcium, creatinine, uric acid:* increased levels

*Glucose (in diabetic patients):* increased blood and urine levels

*Magnesium, potassium, protein-bound iodine, sodium, urine calcium:*

decreased levels

**Drug-herbs.** *Ginkgo:* decreased antihypertensive effects

*Licorice, stimulant laxative herbs (aloe, cascara sagrada, senna):* increased risk of potassium depletion

**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension

*Sun exposure:* increased risk of photosensitivity

## Patient monitoring

- Closely monitor patient with renal insufficiency.
- Assess for signs and symptoms of hematologic disorders.
- Monitor CBC with white cell differential and serum uric acid and electrolyte levels.
- Assess for signs and symptoms of hypersensitivity reactions, especially dermatitis.
- Watch for fluid and electrolyte imbalances.

## Patient teaching

- Instruct patient to consume a low-sodium diet containing plenty of

potassium-rich foods and beverages (such as bananas, green leafy vegetables, and citrus juice).

- Caution patient to avoid driving and other hazardous activities until he knows whether drug makes him dizzy or affects concentration and alertness.
- Tell patient with diabetes to check urine or blood glucose level frequently.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## chlorzoxazone

Parafon Forte DSC, Strifon Forte<sup>✳</sup>

**Pharmacologic class:** Autonomic nervous system agent

**Therapeutic class:** Skeletal muscle relaxant (centrally acting)

**Pregnancy risk category C**

### Action

Unclear. Thought to act on spinal cord and subcortical levels of brain, inhibiting multisynaptic reflex arcs responsible for skeletal muscle activity.

### Availability

Caplets: 500 mg

Tablets: 250 mg, 500 mg

### Indications and dosages

➤ Adjunct to rest and physical therapy in treatment of muscle spasms associated with acute, painful musculoskeletal conditions

**Adults:** 250 to 750 mg P.O. three to four times daily

### Contraindications

- Hypersensitivity to drug
- Hepatic impairment

### Precautions

Use cautiously in:

- underlying cardiovascular disease, renal impairment
- children (safety not established).

### Administration

- If desired, crush tablets and mix contents with food or water.
- Don't withdraw drug abruptly.

Route	Onset	Peak	Duration
P.O.	30-60 min	1-2 hr	3-4 hr

### Adverse reactions

**CNS:** dizziness, drowsiness, light-headedness, malaise, headache, overstimulation, tremor

**GI:** nausea, vomiting, constipation, diarrhea, heartburn, abdominal distress, anorexia

**GU:** orange or purplish-red urine

**Hepatic:** hepatic dysfunction

**Skin:** allergic dermatitis, urticaria, erythema, pruritus, petechiae, ecchymosis, angioedema

**Other:** allergic reactions

### Interactions

**Drug-drug.** *CNS depressants (including antihistamines, antidepressants, opioids, sedative-hypnotics):* increased risk of CNS depression

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, bilirubin:* increased levels

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased sedation

### Patient monitoring

🔊 Stay alert for signs and symptoms of hepatic dysfunction. Withhold drug and notify prescriber if these occur.

- Monitor hepatic enzyme and serum electrolyte levels.

## Patient teaching

- 🔊 Instruct patient to promptly report yellowing of eyes or skin.
- Caution patient not to consume alcohol during therapy.
- Instruct patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Tell patient that drug may turn his urine orange or purplish-red.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## cholestyramine

LoCHOLEST, LoCHOLEST Light, Novo-Cholamine<sup>✳</sup>, Novo-Cholamine Light<sup>✳</sup>, Prevalite, Questran, Questran Light

**Pharmacologic class:** Bile acid sequestrant

**Therapeutic class:** Lipid-lowering agent

**Pregnancy risk category C**

## Action

Combines with bile acid in GI tract to form insoluble complex excreted in feces. Complex regulates and increases cholesterol synthesis, thereby decreasing serum cholesterol and low-density lipoprotein levels.

## Availability

*Powder for suspension; powder for suspension with aspartame:* 4 g cholestyramine/packet or scoop

## Indications and dosages

➤ Primary hypercholesterolemia and pruritus caused by biliary obstruction; primary hyperlipidemia

**Adults:** Initially, 4 g P.O. once or twice daily. May increase as needed and tolerated, up to 24 g/day in six divided doses.

## Off-label uses

- Antibiotic-induced pseudomembranous colitis
- Adjunct in infantile diarrhea
- Digoxin toxicity

## Contraindications

- Hypersensitivity to drug, its components, or other bile-acid sequestering resins
- Complete biliary obstruction
- Phenylketonuria (suspension containing aspartame)

## Precautions

Use cautiously in:

- history of constipation or abnormal intestinal function
- pregnant patients
- children.

## Administration

- Mix powder with soup, cereal, pulpy fruit, juice, milk, or water.
- Administer 1 hour before or 4 to 6 hours after other drugs.
- Be aware that fat-soluble vitamin supplements may be necessary with long-term drug use.

Route	Onset	Peak	Duration
P.O.	24-48 hr	1-3 wk	2-4 wk

## Adverse reactions

**CNS:** headache, anxiety, vertigo, dizziness, insomnia, fatigue, syncope

**EENT:** tinnitus

**GI:** nausea, vomiting, constipation, abdominal discomfort, fecal impaction, flatulence, hemorrhoids, perianal irritation, steatorrhea

**GU:** hematuria, dysuria, diuresis, burnt odor to urine

**Hematologic:** anemia, ecchymosis

**Hepatic:** hepatic dysfunction

**Metabolic:** vitamin A, D, E, and K deficiencies; **hyperchloremic acidosis**

**Musculoskeletal:** joint pain, arthritis, back pain, muscle pain

**Respiratory:** wheezing, asthma

**Skin:** hypersensitivity reaction (irritation, rash, urticaria)

**Other:** tongue irritation

## Interactions

**Drug-drug.** *Acetaminophen, amiodarone, clindamycin, clofibrate, corticosteroids, digoxin, diuretics, fat-soluble vitamins (A, D, E, and K), gemfibrozil, glipizide, imipramine, methotrexate, methyl dopa, mycophenolate, niacin, nonsteroidal anti-inflammatory drugs, penicillin, phenytoin, phosphates, propranolol, tetracyclines, tolbutamide, thyroid preparations, ursodiol, warfarin:* decreased absorption and effects of these drugs

**Drug-diagnostic tests.** *Alkaline phosphatase:* increased level

*Hemoglobin:* decreased value

*Prothrombin time:* increased

## Patient monitoring

- Monitor CBC with white cell differential and liver function test results.
- If bleeding or bruising occurs, monitor prothrombin time. Drug may reduce vitamin K absorption.
- Watch for constipation, especially in patients with coronary artery disease. Take appropriate steps to prevent this problem.

## Patient teaching

- 📣 Instruct patient to immediately report yellowing of skin or eyes or easy bruising or bleeding.
- Tell patient to take drug 1 hour before or 4 to 6 hours after other drugs.
- Teach patient about role of diet in controlling cholesterol level and preventing constipation.

- Instruct patient to avoid inhaling or ingesting raw powder. Tell him to mix powder with food, juice, or milk before consuming.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## cidofovir

Vistide

**Pharmacologic class:** Purine nucleotide cytosine analog

**Therapeutic class:** Antiviral

**Pregnancy risk category C**

## FDA BOXED WARNING

- Drug is indicated only for treatment of cytomegalovirus (CMV) retinitis in patients with AIDS.
- Renal impairment is major toxicity. As few as one or two doses have caused acute renal failure resulting in dialysis or contributing to death. To reduce possible nephrotoxicity, prehydrate with I.V. normal saline solution and give probenecid with each drug infusion. Monitor renal function within 48 hours before each dose, and modify dosage as indicated.
- Drug is contraindicated in patients receiving other nephrotoxic agents.
- Drug may cause neutropenia. Monitor neutrophil counts during therapy.
- In animal studies, drug was carcinogenic and teratogenic and caused hypospermia.

## Action

Exerts antiviral effect by interfering with DNA synthesis of CMV, thereby inhibiting viral replication

### Availability

Solution for injection: 75 mg/ml in 5-ml, single-use vials

### Indications and dosages

➤ CMV retinitis in AIDS patients

**Adults:** 5 mg/kg I.V. infused over 1 hour q week for 2 continuous weeks; then 5 mg/kg I.V. once q 2 weeks as a maintenance dose

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to drug, probenecid, or other sulfa-containing agents
- Creatinine level above 1.5 mg/dl, calculated creatinine clearance of 55 ml/minute or less, or urine protein level of 100 mg/dl or higher
- Concurrent use of nephrotoxic drugs

### Precautions

Use cautiously in:

- renal impairment
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 12 (safety and efficacy not established).

### Administration

⚠ Be aware that drug carries a high risk of nephrotoxicity. Follow administration instructions carefully, including preinfusion and postinfusion hydration with I.V. normal saline solution.

- Premedicate with probenecid 2 g P.O., as prescribed, 3 hours before starting cidofovir infusion.
- Before starting infusion, give 1 L of normal saline solution over 1 to 2 hours.
- Mix I.V. dose in 100 ml of normal saline solution and infuse over 1 hour using infusion pump.
- Give 1 L of normal saline solution during or immediately after cidofovir infusion (unless contraindicated).

- Administer probenecid 1 g 2 hours and 8 hours after infusion ends, as prescribed.

⚠ If drug touches skin, flush thoroughly with water.

Route	Onset	Peak	Duration
I.V.	Rapid	End of infusion	Unknown

### Adverse reactions

**CNS:** headache, **seizures, coma**

**EENT:** decreased intraocular pressure

**GI:** nausea, vomiting, diarrhea, anorexia, oral candidiasis

**GU:** proteinuria, **nephrotoxicity**

**Hematologic:** **neutropenia**

**Hepatic:** **hepatomegaly**

**Metabolic:** **metabolic acidosis**

**Musculoskeletal:** muscle contractions

**Respiratory:** dyspnea, increased cough

**Skin:** rash, alopecia

**Other:** pain, fever, chills, infection, pain at I.V. site

### Interactions

**Drug-drug.** *Nephrotoxic drugs:*

increased risk of nephrotoxicity

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, blood urea nitrogen, creatinine, lactate dehydrogenase:* increased values

*Bicarbonate, creatinine clearance, hemoglobin, neutrophils, platelets:* decreased values

### Patient monitoring

- Assess white blood cell count and creatinine and urine protein levels within 48 hours of each dose.
- Closely monitor intraocular pressure and visual acuity.
- Monitor hepatic enzyme levels in patients with hepatic disease.

### Patient teaching

⚠ Tell patient to immediately report fever, vision changes, nausea, vomiting, rash, or urinary output changes.

- Instruct patient to take probenecid, as prescribed, before each dose and to have regular eye examinations.
- Urge female patient of childbearing age to use effective contraception during and for 1 month after therapy.
- Instruct male patients to use barrier contraception during and for 3 months after therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## cilostazol

Pletal

**Pharmacologic class:** Quinolone derivative

**Therapeutic class:** Antiplatelet agent

**Pregnancy risk category** C

### FDA BOXED WARNING

• Drug and several of its metabolites inhibit phosphodiesterase III. Several drugs with this effect decreased survival in patients with class III-IV congestive heart failure (CHF). Drug is contraindicated in patients with CHF of any severity.

### Action

Unclear. Thought to inhibit phosphodiesterase III by increasing cyclic adenosine monophosphate in platelets and blood vessels, causing vasodilation and enhancing cardiac contractility and coronary blood flow.

### Availability

Tablets: 50 mg, 100 mg

### Indications and dosages

➤ Intermittent claudication

**Adults:** 100 mg P.O. b.i.d. at least 30 minutes before or 2 hours after breakfast and dinner

### Dosage adjustment

• Concurrent use of diltiazem, erythromycin, itraconazole, ketoconazole, or omeprazole

### Contraindications

- Hypersensitivity to drug
- Heart failure

### Precautions

Use cautiously in:

- cardiovascular disorders
- patients receiving other antiplatelet agents concurrently
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Give with water 30 minutes before or 2 hours after patient consumes food or milk.
- Don't give with grapefruit juice.
- Be aware that although response may occur within 2 to 3 weeks, patient should continue therapy for up to 12 weeks or as prescribed.

Route	Onset	Peak	Duration
P.O.	Gradual	4-6 hr	Unknown

### Adverse reactions

**CNS:** dizziness, headache, vertigo

**CV:** tachycardia

**GI:** abdominal pain, abnormal stools, dyspepsia, flatulence

**EENT:** rhinitis, pharyngitis

**Musculoskeletal:** back pain, myalgia

**Respiratory:** increased cough

**Other:** infection

### Interactions

**Drug-drug.** CYP3A4 and CYP2C19 inhibitors, diltiazem, erythromycin,

*macrolides, omeprazole*: increased cilostazol blood level

**Drug-food.** *Grapefruit juice, high-fat meals*: increased cilostazol blood level

**Drug-behaviors.** *Smoking*: decreased exposure to cilostazol

### Patient monitoring

- Monitor cardiovascular status.
- Closely monitor patient if he's receiving other antiplatelet drugs.

### Patient teaching

- Instruct patient to take drug with full glass of water, 30 minutes before or 2 hours after food or milk.
- Advise patient to report nausea, vomiting, or abdominal pain.
- Instruct patient not to smoke, because smoking impedes drug effects.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, foods, and behaviors mentioned above.

## cimetidine

Apo-Cimetidine<sup>✳</sup>, *Dyspamet*<sup>⚡</sup>, *Galenmet*<sup>⚡</sup>, *Novo-Cimetidine*<sup>✳</sup>, *Nu-Cimet*<sup>✳</sup>, *Tagamet HB*

**Pharmacologic class:** Histamine<sub>2</sub>-receptor antagonist

**Therapeutic class:** Antiulcer drug

**Pregnancy risk category B**

### Action

Competitively inhibits histamine action at histamine<sub>2</sub>-receptor sites of gastric parietal cells, thereby inhibiting gastric acid secretion

### Availability

*Oral liquid*: 200 mg/5 ml, 300 mg/5 ml

*Tablets*: 200 mg, 300 mg, 400 mg, 600 mg, 800 mg

## Indications and dosages

➤ Active duodenal ulcer (short-term therapy)

**Adults and children older than age 16:** 800 mg P.O. at bedtime, or 300 mg P.O. q.i.d. with meals and at bedtime, or 400 mg P.O. b.i.d. Maintenance dosage is 400 mg P.O. at bedtime.

➤ Active benign gastric ulcer (short-term therapy)

**Adults and children older than age 16:** 800 mg P.O. at bedtime or 300 mg P.O. q.i.d. with meals and at bedtime

➤ Gastric hypersecretory conditions (such as Zollinger-Ellison syndrome); intractable ulcers

**Adults and children older than age 16:** 300 mg P.O. q.i.d. with meals and at bedtime

➤ Erosive gastroesophageal reflux disease

**Adults and children older than age 16:** 1,600 mg P.O. daily in divided doses (800 mg b.i.d. or 400 mg q.i.d.) for 12 weeks

➤ Heartburn; acid indigestion

**Adults and children older than age 16:** 200 mg (two tablets of over-the-counter product only) P.O. up to b.i.d. Give maximum dosage no longer than 2 weeks continuously, unless directed by prescriber.

### Dosage adjustment

- Renal impairment

### Off-label uses

- Acetaminophen overdose
- Adjunctive therapy in burns
- Barrett's esophagus
- Renal cancer
- Anaphylaxis

### Contraindications

- Hypersensitivity to drug
- Alcohol intolerance

### Precautions

Use cautiously in:

- renal impairment

- elderly patients
- pregnant or breastfeeding patients.

### Administration

- Give with meals.

Route	Onset	Peak	Duration
P.O.	30 min	45-90 min	4-5 hr

### Adverse reactions

**CNS:** confusion, dizziness, drowsiness, hallucinations, agitation, psychosis, depression, anxiety, headache

**GI:** diarrhea

**GU:** reversible erectile dysfunction, gynecomastia

### Interactions

**Drug-drug.** *Calcium channel blockers, carbamazepine, chloroquine, lidocaine, metformin, metronidazole, moricizine, pentoxifylline, phenytoin, propafenone, quinidine, quinine, some benzodiazepines, some beta-adrenergic blockers (chlordiazepoxide, diazepam, midazolam), sulfonyleureas, tacrine, theophylline, triamterene, tricyclic antidepressants, valproic acid, warfarin:* decreased metabolism of these drugs, possible toxicity

**Drug-diagnostic tests.** *Creatinine, transaminases:* increased levels

*Parathyroid hormone:* decreased level  
*Skin tests using allergenic extracts:* false-negative results (drug should be discontinued 24 hours before testing)

**Drug-food.** *Caffeine-containing foods and beverages (such as coffee, chocolate):* increased cimetidine blood level, increased risk of toxicity

**Drug-herbs.** *Pennyroyal:* change in formation rate of herb's toxic metabolite  
*Yerba maté:* decreased yerba maté clearance, possible toxicity

**Drug-behaviors.** *Alcohol use:* increased blood alcohol level

*Smoking:* reversed cimetidine effects

### Patient monitoring

- Monitor creatinine levels in patients with renal insufficiency or failure.

- Assess elderly or chronically ill patients for confusion (which usually resolves once drug therapy ends).

### Patient teaching

- Inform patient with gastric ulcer that ulcer may take up to 2 months to heal. Advise him not to discontinue therapy, even if he feels better, without first consulting prescriber. Ulcer may recur if therapy ends too soon.

- Advise patient not to take over-the-counter cimetidine for more than 2 weeks continuously, except with prescriber's advice and supervision.

- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## cinacalcet hydrochloride

Mimpara<sup>®</sup>, Sensipar

**Pharmacologic class:** Calcimimetic

**Therapeutic class:** Endocrine and metabolic agent

**Pregnancy risk category C**

### Action

Directly lowers parathyroid hormone (PTH) levels by increasing sensitivity of calcium-sensing receptors to extracellular calcium

### Availability

*Tablets:* 30 mg, 60 mg, 90 mg

### Indications and dosages

➤ Secondary hyperparathyroidism in patients with chronic renal disease who are on dialysis

**Adults:** Dosage individualized; recommended starting dosage is 30 mg P.O. daily. Measure serum calcium and phosphorus levels within 1 week and

intact parathyroid hormone (iPTH) 1 to 4 weeks after initiation or dosage adjustment; titrate dosage no more often than every 2 to 4 weeks through sequential doses of 60 mg, 90 mg, 120 mg, and 180 mg P.O. once daily to recommended target iPTH for chronic renal disease patients on dialysis of 150 to 300 pg/ml.

➤ Hypercalcemia in patients with parathyroid carcinoma

**Adults:** Recommended starting dosage is 30 mg P.O. twice daily, titrated every 2 to 4 weeks through sequential doses of 60 mg and 90 mg twice daily, and 90 mg three or four times daily as needed to normalize serum calcium level.

### Dosage adjustment

- Decreased calcium or iPTH level
- Concurrent use or discontinuation of strong CYP3A4 inhibitors (such as erythromycin, itraconazole, or ketoconazole)

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- decreased serum calcium level, moderate or severe hepatic impairment
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Don't initiate therapy if serum calcium level is less than lower limit of normal range (8.4 mg/dl).
- Administer tablets whole with food or shortly after a meal.
- If iPTH level decreases below recommended target range (150 to 300 pg/ml), reduce dosage of cinacalcet and vitamin D sterols or discontinue therapy.
- During titration, monitor serum calcium level frequently; if level drops below normal, take appropriate

measures to increase it, such as providing supplemental calcium, initiating or increasing dosage of calcium-based phosphate binder or vitamin D sterols, or withholding cinacalcet temporarily.

- Adjust dosage and closely monitor iPTH and calcium levels if patient is receiving or discontinuing a strong CYP3A4 inhibitor.

Route	Onset	Peak	Duration
P.O.	Unknown	2-6 hr	Unknown

### Adverse reactions

**CNS:** dizziness, asthenia

**CV:** hypertension

**GI:** nausea, vomiting, diarrhea, anorexia

**Musculoskeletal:** myalgia

**Other:** chest pain (noncardiac)

### Interactions

**Drug-drug.** *Amitriptyline:* increased amitriptyline and nortriptyline (active metabolite) exposure

*Drugs metabolized by CYP4502D6 (such as flecainide, thioridazine, most tricyclic antidepressants, vinblastine):* increased blood levels of either drug

*Ketoconazole and other strong CYP3A4 inhibitors:* increased cinacalcet exposure

**Drug-diagnostic tests.** *Calcium:* decreased

### Patient monitoring

- Closely monitor iPTH and serum calcium levels throughout therapy in patients with moderate to severe hepatic impairment and in those who start or discontinue therapy with strong CYP3A4 inhibitor.
- Monitor iPTH level carefully to ensure that it doesn't fall below 100 pg/ml because adynamic bone disease may develop.
- Measure serum calcium and phosphorus levels within 1 week and iPTH level 1 to 4 weeks after initiation or dosage adjustment. Once maintenance dosage is established, measure serum

calcium and phosphorus levels approximately monthly and iPTH level every 1 to 3 months.

- Monitor serum calcium level closely in patient with history of seizure disorders.

### Patient teaching

- Instruct patient to take tablets whole with food or shortly after a meal.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## ciprofloxacin hydrochloride

Cetralax, Ciloxan, Cipro, Cipro I.V., Ciproxin 

**Pharmacologic class:** Fluoroquinolone

**Therapeutic class:** Anti-infective

**Pregnancy risk category C**

### FDA BOXED WARNING

- Fluoroquinolones for systemic use are associated with an increased risk of tendinitis and tendon rupture in all ages. This risk is further increased in patients usually over age 60, with concomitant use of corticosteroids, and in kidney, heart, and lung transplant recipients.

### Action

Inhibits bacterial DNA synthesis by inhibiting DNA gyrase in susceptible gram-negative and gram-positive organisms

### Availability

**Injection:** 200 mg/20 ml, 400 mg/40 ml, 200 mg/100 ml premixed in dextrose

5% in water (D<sub>5</sub>W), 400 mg/200 ml premixed in D<sub>5</sub>W, 1,200 mg/120-ml bulk package

**Ophthalmic ointment:** 3.5-g tube

**Ophthalmic solution:** 2.5-ml and 5-ml plastic dispensers

**Otic solution:** 0.2% (0.5 mg in 0.25 ml) in single-use container

**Tablets:** 250 mg, 500 mg, 750 mg

### Indications and dosages

> Acute sinusitis

**Adults:** 500 mg P.O. q 12 hours or 400 mg I.V. q 12 hours for 10 days

> Prostatitis

**Adults:** 500 mg P.O. q 12 hours or 400 mg I.V. q 12 hours for 28 days

> Intra-abdominal infections

**Adults:** 500 mg P.O. q 12 hours or 400 mg I.V. q 12 hours for 7 to 14 days

> Febrile neutropenic patients

**Adults:** 400 mg I.V. q 8 hours for 7 to 14 days

> Gonorrhea

**Adults:** 500 mg P.O. as a single dose

> Infectious diarrhea

**Adults:** 500 mg P.O. q 12 hours for 5 to 7 days

> Inhalation anthrax (postexposure)

**Adults:** 500 mg P.O. q 12 hours for 60 days or 400 mg I.V. q 12 hours for 60 days

**Children:** 15 mg/kg P.O. q 12 hours for 60 days (not to exceed 500 mg/dose), or 10 mg/kg I.V. q 12 hours for 60 days, not to exceed 400 mg/dose

> Infections of lower respiratory tract, skin and skin structures, bones, and joints

**Adults:** 500 to 750 mg P.O. q 12 hours or 400 mg I.V. q 8 hours for 7 to 14 days. Severe bone and joint infections may necessitate up to 6 weeks of therapy.

> Nosocomial pneumonia

**Adults:** 400 mg I.V. q 8 hours for 10 to 14 days

> Typhoid fever

**Adults:** 500 mg P.O. q 12 hours for 10 days

➤ Urinary tract infections

**Adults:** 250 to 500 mg P.O. q 12 hours or 200 to 400 mg I.V. q 12 hours for 3 days in acute uncomplicated infection or for 7 to 14 days in acute complicated infection

➤ Complicated urinary tract infections or pyelonephritis

**Children ages 1 to 17:** 6 to 10 mg/kg I.V. q 8 hours for 10 to 21 days (maximum, 400 mg/dose; not to be exceeded, even in patients weighing more than 51 kg [112 lb]). Or, 10 to 20 mg/kg P.O. q 12 hours for 10 to 21 days (maximum, 750 mg/dose; not to be exceeded, even in patients weighing more than 51 kg).

➤ Acute otitis externa

**Adults:** Instill contents of one single-use otic solution container (0.5 mg) into affected ear b.i.d. (approximately 12 hours apart) for 7 days

➤ Bacterial conjunctivitis caused by susceptible organisms

**Adults:** 0.5" ribbon of ophthalmic ointment applied to conjunctival sac t.i.d. on first 2 days, then 0.5" ribbon b.i.d. for 5 days. Or one to two drops of ophthalmic solution applied to conjunctival sac q 2 hours while awake for 2 days, then one or two drops q 4 hours while awake for 5 days.

➤ Corneal ulcers caused by susceptible organisms

**Adults:** Two drops of ophthalmic solution instilled into affected eye q 15 minutes for first 6 hours, then two drops into affected eye q 30 minutes for remainder of first day. On second day, two drops of ophthalmic solution hourly; on days 3 through 14, two drops q 4 hours.

### Dosage adjustment

- Renal impairment or insufficiency

### Off-label uses

- Chancroid
- Cystic fibrosis
- Pseudomembranous colitis caused by anti-infectives

### Contraindications

- Hypersensitivity to drug or other fluoroquinolones
- Comcomitant administration of tizanidine

### Precautions

Use cautiously in:

- cirrhosis, renal impairment, underlying CNS disease
- concurrent use of theophylline (risk of serious or fatal reactions, such as cardiac arrest, seizures, status epilepticus, and respiratory failure)
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 18 (except for complicated urinary tract infection, pyelonephritis, and postexposure inhalation anthrax only).

### Administration

- Administer oral drug with or without food but not with dairy products or calcium-fortified juices alone; however, drug may be taken with a meal that contains these products.
- Infuse I.V. dose over at least 1 hour, using pump to ensure 1-hour duration.
- ⚠ Know that too-rapid I.V. infusion increases risk of anaphylaxis and other adverse reactions.
- ⚠ Know that treatment with ophthalmic solution may be continued after 14 days if corneal re-epithelialization hasn't occurred.

Route	Onset	Peak	Duration
P.O.	Rapid	1-2 hr	12 hr
I.V.	Rapid	End of infusion	12 hr
Ophthal.	Unknown	Unknown	Unknown
Otic	NA	NA	NA

### Adverse reactions

**CNS:** agitation, headache, restlessness, confusion, delirium, peripheral neuropathy, **toxic psychosis**

**CV:** orthostatic hypotension, vasculitis

**EENT:** nystagmus; with ophthalmic use—blurred vision; burning, stinging, irritation, itching, tearing, and redness of eyes; eyelid itching, swelling, or crusting; sensitivity to light

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain or discomfort, dyspepsia, dysphagia, flatulence, pancreatitis, **pseudomembranous colitis**

**GU:** albuminuria, candiduria, renal calculi

**Hematologic:** methemoglobinemia, agranulocytosis, hemolytic anemia

**Hepatic:** jaundice, **hepatic necrosis**

**Metabolic:** hyperglycemia, **hyperkalemia**

**Musculoskeletal:** myalgia, myoclonus, tendinitis, tendon rupture

**Skin:** rash, exfoliative dermatitis, toxic epidermal necrolysis, **erythema**

**multiforme** photosensitivity

**Other:** injection-site reaction, altered taste, anosmia, exacerbation of myasthenia gravis, overgrowth of nonsusceptible organisms, hypersensitivity reactions including **anaphylaxis** and **Stevens-Johnson syndrome**

## Interactions

**Drug-drug.** *Antacids, bismuth subsalicylate, iron salts, sucralfate, zinc salts:* decreased ciprofloxacin absorption  
*Cyclosporine:* transient creatinine increase

*Hormonal contraceptives:* reduced contraceptive efficacy

*Oral anticoagulants:* increased anticoagulant effects

*Phenytoin:* increased or decreased phenytoin blood level

*Probenecid:* decreased renal elimination of ciprofloxacin, causing increased blood level

*Theophylline:* increased theophylline blood level, greater risk of toxicity

*Tizanidine:* significantly elevated tizanidine plasma level

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase,*

*aspartate aminotransferase, bilirubin, cholesterol, glucose, lactate dehydrogenase, potassium, triglycerides:* increased levels  
*Prothrombin time:* prolonged

**Drug-food.** *Caffeine:* interference with caffeine clearance

*Concurrent tube feedings, milk or yogurt (when consumed alone with ciprofloxacin):* impaired drug absorption

**Drug-herbs.** *Fennel:* decreased drug absorption

## Patient monitoring

- In patients with renal insufficiency, assess creatinine level before giving first dose and at least once a week during prolonged therapy. Monitor drug blood level closely.

 Watch for signs and symptoms of serious adverse reactions, including GI problems, jaundice, tendon problems, and hypersensitivity reactions.

## Patient teaching

- Tell patient to take drug with or without food at the same time each day.

- Advise patient not to take drug with dairy products or calcium-fortified juices alone or with caffeinated beverages.

- Advise patient to drink 8 oz of water every hour while awake to ensure adequate hydration.

 Instruct patient to stop taking drug and notify prescriber at first sign of burning, numbness, or tingling in hands or feet; yellow eyes or skin; unusual tiredness; persistent diarrhea; rash; or tendon pain, swelling, or inflammation.

- Advise patient to avoid excessive exposure to sun or ultraviolet light and to discontinue drug and notify prescriber if phototoxicity (burning, erythema, exudation, vesicles, blistering, edema) occurs.

- Advise patient taking hormonal contraceptives to use supplemental birth control method, such as condoms,

because drug reduces contraceptive efficacy.

- Inform breastfeeding patient that drug is excreted in breast milk and can affect infant's bone growth. Advise her to consult prescriber before using drug.
- Teach patient how to use eye ointment or solution and tell patient not to touch eye dropper tip to any surface, to avoid contamination.
- Instruct patient how to use ear solution and to lie with affected ear upward for at least 1 minute after instilling solution.
- Caution patient with bacterial conjunctivitis not to wear contact lenses.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## cisplatin

Platinex 

**Pharmacologic class:** Alkylating agent, platinum coordination complex

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

- Give under supervision of physician experienced in cancer chemotherapy, in facility with adequate diagnostic and treatment resources.
- Drug may cause severe cumulative renal toxicity. Other major dose-related toxicities are myelosuppression, nausea, and vomiting.
- Drug may lead to significant ototoxicity (which may be more pronounced in children), high-frequency hearing loss, and deafness.

- Anaphylactic-like reactions may occur within minutes of administration.
- Use caution to prevent inadvertent overdose. Doses above 100 mg/m<sup>2</sup>/cycle once every 3 to 4 weeks are rarely used. Avoid inadvertent overdose stemming from confusion with Paraplatin (carboplatin) or failure to differentiate daily doses from total dose per cycle.

### Action

Inhibits DNA synthesis by causing intrastrand and interstrand cross-linking of DNA

### Availability

**Injection:** 1 mg/ml in 50-mg and 100-mg multidose vials

### Indications and dosages

➤ Metastatic testicular tumors

**Adults:** 20 mg/m<sup>2</sup> I.V. daily for 5 days/cycle, repeated q 3 to 4 weeks

➤ Metastatic ovarian cancer

**Adults:** 75 to 100 mg/m<sup>2</sup> I.V., repeated q 4 weeks in combination with cyclophosphamide; or 100 mg/m<sup>2</sup> q 4 weeks as a single agent

➤ Advanced bladder cancer

**Adults:** 50 to 70 mg/m<sup>2</sup> I.V. q 3 to 4 weeks as a single agent; dosage depends on whether patient has undergone radiation or chemotherapy.

### Off-label uses

- Cervical cancer
- Squamous cell carcinoma

### Contraindications

- Hypersensitivity to drug or other platinum-containing compounds
- Severe impairment of renal function
- Severe myelosuppression
- Hearing impairment
- Pregnancy or breastfeeding

## Precautions

Use cautiously in:

- mild to moderate renal impairment, active infection, myelosuppression, chronic debilitating illness, heart failure, electrolyte abnormalities
- females of childbearing age.

## Administration

- Prepare drug with equipment that doesn't contain aluminum.
- Give 2 L of I.V. fluids, as prescribed, 8 to 12 hours before drug infusion to help prevent toxicity.
- Dilute each dose in 2 L of dextrose 5% in 1/4 or 1/2 saline solution or 0.9% normal saline solution. Do not use dextrose 5% in water.
- Infuse each liter over 3 to 4 hours to minimize toxicity. In well-hydrated patients with good renal function, infusions of 100 to 500 ml may be given over 30 minutes.
- Follow facility policy for handling and disposal of antineoplastics.
- ☞ If solution contacts skin, wash immediately and thoroughly with soap and water. If solution contacts mucosa, flush with water immediately.
- Protect drug from light.

Route	Onset	Peak	Duration
I.V.	Unknown	18-23 days	39 days

## Adverse reactions

**CNS:** malaise, weakness, **seizures**

**EENT:** ototoxicity, tinnitus

**GI:** severe nausea, vomiting, diarrhea

**GU:** sterility, **nephrotoxicity**

**Hematologic:** anemia, **leukopenia**, **thrombocytopenia**

**Hepatic:** **hepatotoxicity**

**Metabolic:** hypocalcemia, hypokalemia, hypomagnesemia, hyperuricemia

**Skin:** alopecia

**Other:** phlebitis at I.V. site, **anaphylaxis**

## Interactions

**Drug-drug.** *Amphotericin B, loop diuretics:* increased risk of hypokalemia and hypomagnesemia

*Antineoplastics:* additive bone marrow depression

*Live-virus vaccines:* decreased antibody response to vaccine, increased risk of adverse reactions

*Nephrotoxic drugs (such as aminoglycosides):* additive nephrotoxicity

*Ototoxic drugs (such as loop diuretics):* additive ototoxicity

*Phenytoin:* reduced phenytoin blood level

**Drug-diagnostic tests.** *Aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, uric acid:* increased levels

*Calcium, magnesium, phosphate, potassium, sodium:* decreased levels

*Coombs' test:* positive result

## Patient monitoring

- Before starting therapy and before each subsequent dose, assess renal function test results and CBC with white cell differential.
- Monitor neurologic status, hepatic enzyme and uric acid levels, and audiogram results.
- Monitor urine output closely.

## Patient teaching

- Instruct patient to drink 8 oz of water every hour while awake.

☞ Advise patient to promptly report bleeding, bruising, hearing loss, yellowing of skin or eyes, decreased urine output, or suspected infection.

- Tell patient that drug may cause hair loss.
- Instruct female patient to use reliable contraception; drug can harm fetus.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## citalopram hydrobromide

Celexa

**Pharmacologic class:** Selective serotonin reuptake inhibitor

**Therapeutic class:** Antidepressant

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug may increase risk of suicidal thinking and behavior in children and adolescents with major depressive disorder and other psychiatric disorders, especially during first few months of therapy. Risk must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family to observe patient closely and communicate with prescriber as needed.
- Drug isn't approved for use in pediatric patients.

### Action

Unclear. Thought to potentiate serotonergic activity in CNS by inhibiting neuronal uptake of serotonin.

### Availability

*Oral solution:* 10 mg/5 ml

*Tablets:* 10 mg, 20 mg, 40 mg

### Indications and dosages

➤ Depression

**Adults:** Initially, 20 mg P.O. daily; may increase to maximum recommended dosage of 40 mg/day at an interval of no less than 1 week.

### Dosage adjustment

- Hepatic impairment
- CYP2C19 poor metabolizers or concurrent use of cimetidine or another CYP2C19 inhibitor
- Elderly patients

### Off-label uses

- Alcoholism
- Panic disorder
- Premenstrual dysphoria
- Social phobia

### Contraindications

- Hypersensitivity to drug or its components
- Concurrent use of MAO inhibitors or pimozone

### Precautions

Use cautiously in:

- severe renal impairment, hepatic impairment
- bradycardia, hypokalemia, hypomagnesemia, hyponatremia, recent acute myocardial infarction, congenital long QT syndrome, or uncompensated heart failure (avoid use)
- concurrent use of drugs that prolong QTc interval (avoid use)
- concurrent use of serotonin precursors such as tryptophan (not recommended)
- concurrent use of aspirin, NSAIDs, warfarin, and other anticoagulants
- history of mania or seizure disorder
- elderly patients
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

• Administer drug in the morning or evening, with or without food.

🔊 Don't give within 14 days of MAO inhibitor; life-threatening interactions may occur.

🔊 Be aware that drug shouldn't be given at doses above 40 mg/day because of risk of QTc-interval prolongation.

 Gradually reduce dosage rather than abruptly stopping drug.

Route	Onset	Peak	Duration
P.O.	1-4 wk	Unknown	Unknown

### Adverse reactions

**CNS:** apathy, confusion, drowsiness, insomnia, migraine, weakness, agitation, amnesia, anxiety, dizziness, fatigue, poor concentration, tremor, paresthesia, deepening of depression, **suicide attempt, neuroleptic malignant syndrome-like reactions**

**CV:** orthostatic hypotension, tachycardia, ECG changes

**Metabolic:** hyponatremia

**EENT:** abnormal visual accommodation

**GI:** nausea, vomiting, diarrhea, abdominal pain, dyspepsia, flatulence, increased saliva, dry mouth, increased appetite, anorexia

**GU:** polyuria, amenorrhea, dysmenorrhea, ejaculatory delay, erectile dysfunction, decreased libido

**Musculoskeletal:** joint pain, myalgia

**Respiratory:** cough

**Skin:** rash, pruritus, diaphoresis, photosensitivity

**Other:** altered taste, fever, yawning, weight changes, **serotonin syndrome-like reactions**

### Interactions

**Drug-drug.** *Aspirin, NSAIDs, warfarin, other anticoagulants:* increased risk of bleeding

*Anti-infectives (such as gatifloxacin, moxifloxacin), antipsychotics (such as chlorpromazine, thioridazine), Class IA antiarrhythmics (such as procainamide, quinidine), Class III antiarrhythmics (such as amiodarone, sotalol), CYP2C19 inhibitors (such as cimetidine), methadone, pentamidine:* risk of prolonged QTc interval

*Carbamazepine:* decreased citalopram blood level

*Centrally acting drugs (such as antihistamines, opioids, sedative-hypnotics):* additive CNS effects

*Erythromycin, itraconazole, ketoconazole, omeprazole:* increased citalopram blood level

*5-hydroxytryptamine<sub>1</sub> receptor agonists (such as sumatriptan, zolmitriptan):* increased risk of adverse reactions

*Lithium:* potentiation of serotonergic effects

*MAO inhibitors:* life-threatening reactions

*Tricyclic antidepressants (TCAs):* altered TCA pharmacokinetics

**Drug-diagnostic tests.** *Serum sodium:* decreased level

**Drug-herbs.** *St. John's wort, S-adenosylmethionine (SAM-e):* increased risk of serotonergic reactions, including serotonin syndrome

**Drug-behaviors.** *Alcohol use:* additive CNS depression

*Sun exposure:* photosensitivity

### Patient monitoring

- If patient is receiving lithium concurrently, watch closely for potentiation of serotonergic effects.
- Monitor patient for signs of mania or hypomania, bleeding, serotonin syndrome-like reactions (including mental status changes, such as agitation, hallucinations, coma), autonomic instability (such as tachycardia, labile blood pressure, hyperthermia), neuromuscular aberrations (such as hyperreflexia, incoordination), GI symptoms (such as nausea, vomiting, diarrhea) or neuroleptic malignant syndrome-like reactions (fever, muscle rigidity, mental status changes, irregular pulse or blood pressure, rapid heartbeats, excessive sweating).
- Monitor ECG and electrolyte levels in patients with cardiac conditions that may lead to QT-interval prolongation. Discontinue drug in patients with persistent QTc measurements of more than 500 ms.
- Be aware that drug should be discontinued in patients with symptomatic hyponatremia (headache, difficulty

concentrating, memory impairment, confusion, weakness, unsteadiness). Signs and symptoms associated with more severe or acute cases have included hallucinations, syncope, seizures, coma, respiratory arrest, and death).

- When discontinuing drug, monitor patient for dysphoria, irritability, agitation, dizziness, sensory disturbances, anxiety, confusion, headache, lethargy, emotional lability, insomnia, and hypomania.

### Patient teaching

- Instruct patient to take drug with full glass of water with or without food at same time every day.

-  Advise patient or caregiver (especially if drug is given to a child or adolescent) to immediately report suicidal thoughts or extreme depression.

- Instruct patient to move slowly when sitting up or standing, to avoid dizziness or light-headedness caused by sudden blood pressure decrease.

- Tell patient several weeks may pass before he starts to feel better.

- Instruct patient to immediately report irregular or rapid heartbeats, dizziness, fainting, palpitations, agitation, hallucinations, incoordination, nausea, vomiting, diarrhea, fever, muscle rigidity, altered mental status (including catatonic signs), excessive sweating, headache, difficulty concentrating, memory impairment, confusion, weakness, and unsteadiness.

- Tell patient about risk of bleeding associated with concomitant use of this drug and NSAIDs, aspirin, or other drugs that affect coagulation; tell patient to report bruising or other signs or symptoms of bleeding.

- Caution patient to avoid driving and other hazardous activities until drug's effects on concentration and alertness are known.

- Advise patient to avoid alcohol during therapy.
- Tell male patient he may experience inadequate filling of penile erectile tissue. Advise him to consult prescriber if he experiences adverse sexual effects.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## clarithromycin

Biaxin Filmtab, Biaxin Granules, Biaxin XL Filmtab, Clarosip , Klaricid 

**Pharmacologic class:** Macrolide

**Therapeutic class:** Anti-infective, antiulcer drug

**Pregnancy risk category B**

### Action

Reversibly binds to 50S ribosomal subunit of susceptible bacterial organisms, blocking protein synthesis

### Availability

*Granules for oral suspension:* 125 mg/5 ml, 250 mg/5 ml

*Tablets:* 250 mg, 500 mg

*Tablets (extended-release):* 500 mg

### Indications and dosages

➤ Pharyngitis or tonsillitis caused by *Streptococcus pyogenes*

**Adults:** 250 mg P.O. q 12 hours for 10 days

➤ Acute maxillary sinusitis caused by *Haemophilus influenzae*, *Moraxella catarrhalis*, or *Streptococcus pneumoniae*

**Adults:** 500 mg P.O. q 12 hours for 14 days or two 500-mg extended-release tablets P.O. q 24 hours for 14 days

**Children:** 7.5 mg/kg P.O. q 12 hours for 10 days

➤ Acute exacerbation of chronic bronchitis caused by *H. influenzae*, *Haemophilus parainfluenzae*, *M. catarrhalis*, or *S. pneumoniae*

**Adults:** 500 mg P.O. q 12 hours for 7 to 14 days or two 500-mg extended-release tablets P.O. q 24 hours for 7 days

➤ Community-acquired pneumonia caused by *S. pneumoniae*, *Mycoplasma pneumoniae*, or *Chlamydia pneumoniae*; acute exacerbation of chronic bronchitis caused by *S. pneumoniae* or *M. catarrhalis*

**Adults:** 250 mg P.O. q 12 hours for 7 to 14 days or two 500-mg extended-release tablets P.O. q 24 hours for 7 days

**Children:** 7.5 mg/kg P.O. q 12 hours for 10 days

➤ Community-acquired pneumonia caused by *H. influenzae*

**Adults:** 250 mg P.O. q 12 hours for 7 days or two 500-mg extended-release tablets P.O. q 24 hours for 7 days

➤ Community-acquired pneumonia caused by *H. parainfluenzae* or *M. catarrhalis*

**Adults:** Two 500-mg extended-release tablets P.O. q 24 hours for 7 days

➤ Uncomplicated skin and skin-structure infections

**Adults:** 250 mg P.O. q 12 hours for 7 to 14 days

➤ Eradication of *Helicobacter pylori* as part of triple therapy with amoxicillin and omeprazole or lansoprazole

**Adults:** 500 mg P.O. q 12 hours for 10 to 14 days

➤ Eradication of *H. pylori* as part of dual therapy with omeprazole or ranitidine

**Adults:** 500 mg P.O. t.i.d. for 14 days

➤ Mycobacterial infections

**Adults:** 500 mg P.O. b.i.d.

**Children:** 7.5 mg/kg P.O. b.i.d., up to 500 mg b.i.d.

➤ Acute otitis media

**Children:** 7.5 mg/kg P.O. q 12 hours for 10 days

## Dosage adjustment

- Renal or hepatic impairment

## Off-label uses

- *Borrelia burgdorferi* infection

## Contraindications

- Hypersensitivity to drug, erythromycin, or other macrolide anti-infectives
- Concurrent use of astemizole, cisapride, or pimozone
- Cardiac disease

## Precautions

Use cautiously in:

- severe renal or hepatic impairment
- pregnant or breastfeeding patients.

## Administration

- Obtain specimens for culture and sensitivity testing as appropriate before starting therapy.

- Give with or without food.

- ⚠ Don't give concurrently with astemizole (no longer available in United States), cisapride, or pimozone.
- Don't refrigerate oral suspension.

Route	Onset	Peak	Duration
P.O.	Unknown	2 hr	12 hr
P.O. (extended)	Unknown	4 hr	24 hr

## Adverse reactions

**CNS:** headache

**CV:** ventricular arrhythmias

**GI:** nausea, diarrhea, abdominal pain or discomfort, dyspepsia

**Other:** abnormal taste

## Interactions

**Drug-drug.** *Astemizole*, *cisapride*, *pimozone*: increased risk of arrhythmias and sudden death

*Carbamazepine*, *digoxin*, *theophylline*: increased blood levels of these drugs, greater risk of toxicity

*Digoxin*: increased digoxin blood level, causing digoxin toxicity

*HMG-CoA reductase inhibitors (such as lovastatin, simvastatin)*: rhabdomyolysis

*Zidovudine*: increased or decreased peak zidovudine blood level

**Drug-diagnostic tests.** *Alkaline phosphatase, blood urea nitrogen*: increased values

*Prothrombin time*: increased

*White blood cells*: decreased count

### Patient monitoring

- Monitor hepatic enzyme and creatinine levels during long-term therapy.
- Assess cardiovascular status.

### Patient teaching

- Advise patient to take drug with full glass of water, either with food or on an empty stomach.
- Tell patient using oral suspension not to refrigerate it, and to discard it 14 days after mixing.
- Tell patient to swallow extended-release tablets whole.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## clindamycin hydrochloride

Apo-Clindamycin<sup>✱</sup>, Cleocin, Dalacin C

## clindamycin palmitate hydrochloride

Cleocin Pediatric, Dalacin C Flavored Granules<sup>✱</sup>

## clindamycin phosphate

Cleocin Phosphate, Cleocin T, Clindagel, ClindaMax, Clindesse, Clindets, Dalacin C Phosphate<sup>✱</sup>, Dalacin T<sup>✱</sup> , Evoclin, Zindaclin<sup>Ⓢ</sup>

**Pharmacologic class:** Lincosamide

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

### FDA BOXED WARNING

• *Clostridium difficile*-associated diarrhea (CDAD) has been reported with use of nearly all antibacterial agents, including *Cleocin*, and may range in severity from mild diarrhea to fatal colitis. Treatment with antibacterial agents alters the normal flora of the colon, leading to overgrowth of *C. difficile*.

• Because *Cleocin* therapy has been associated with severe colitis that may be fatal, it should be reserved for serious infections for which less toxic *antimicrobials* are inappropriate. It shouldn't be used in patients with non-bacterial infections such as most upper respiratory tract infections.

• *C. difficile* produces toxins A and B, which contribute to the development of CDAD. Hypertoxin-producing strains of *C. difficile* cause increased morbidity and mortality because these infections can be refractory to antimicrobial therapy and may require *colectomy*. CDAD must be considered in all patients who present with diarrhea following antibiotic use. Careful medical history is necessary because CDAD has occurred more than 2 months after administration of antibacterial agents.

• If CDAD is suspected or confirmed, ongoing antibiotic use not directed against *C. difficile* may need to be discontinued. Appropriate fluid and electrolyte management, protein supplementation, antibiotic treatment of *C. difficile*, and surgical evaluation should be instituted as clinically indicated.

### Action

Inhibits protein synthesis in susceptible bacteria at level of 50S ribosome, thereby inhibiting peptide bond formation and causing cell death

### Availability

*Aerosol foam*: 1%

*Capsules*: 75 mg, 150 mg, 300 mg

Granules for oral suspension: 75 mg/5 ml

Injection: 150 mg base/ml

Topical: 1% gel, lotion, single-use applicators, solution, and suspension

Vaginal cream: 2%

Vaginal suppositories (ovules): 100 mg

## Indications and dosages

➤ Severe infections caused by sensitive organisms (such as *Bacteroides fragilis*, *Clostridium perfringens*, *Fusobacterium*, pneumococci, staphylococci, and streptococci)

**Adults:** 300 to 450 mg P.O. q 6 hours, or (for other than *C. perfringens*) 1.2 to 2.7 g/day I.M. or I.V. in two to four equally divided doses

**Children:** 16 to 20 mg/kg/day P.O. (hydrochloride) in three to four equally divided doses, or 13 to 25 mg/kg/day P.O. (palmitate hydrochloride) in three to four equally divided doses

**Neonates younger than 1 month:** 15 to 20 mg/kg/day I.M. or I.V. in three to four equally divided doses

➤ Acute pelvic inflammatory disease  
**Adults:** 900 mg I.V. q 8 hours (given with gentamicin)

➤ Acne vulgaris

**Adults and children older than age 12:**

Apply a thin film of topical gel, lotion, or solution locally to affected area b.i.d.

## Off-label uses

- Bacterial vaginosis (phosphate)
- *Chlamydia trachomatis* infection in females
- CNS toxoplasmosis in AIDS patients (given with pyrimethamine)
- *Pneumocystis jiroveci* pneumonia (given with primaquine)
- Rosacea (lotion)

## Contraindications

- Hypersensitivity to drug or lincomycin

## Precautions

Use cautiously in:

- renal or hepatic impairment

- known alcohol intolerance
- pregnant patients
- neonates.

## Administration

- Give oral doses with full glass of water, with or without food.
- ⚠ Don't give as I.V. bolus injection.
- Dilute I.V. solution to a concentration of 18 mg/ml using normal saline solution, dextrose 5% in water, or lactated Ringer's solution. Infuse no faster than 30 mg/minute.
- Don't administer I.M. dosages above 600 mg.
- Inject I.M. doses deep into large muscle mass to prevent induration and sterile abscess.

Route	Onset	Peak	Duration
P.O.	Rapid	45 min	6-8 hr
I.V.	Rapid	End of infusion	6-8 hr
I.M.	Rapid	1-3 hr	6-8 hr
Topical, vaginal	Unknown	Unknown	Unknown

## Adverse reactions

**GI:** nausea, vomiting, diarrhea, abdominal pain, esophagitis, **pseudomembranous colitis**

**Hematologic:** neutropenia, leukopenia, agranulocytosis, thrombocytopenia purpura

**Hepatic:** jaundice, **hepatic dysfunction**

**Skin:** maculopapular rash, generalized morbilliform-like rash

**Other:** bitter taste (with I.V. use), phlebitis at I.V. site, induration and sterile abscess (with I.M. use), **anaphylaxis**

## Interactions

**Drug-drug.** *Erythromycin:* antagonistic effect

*Kaolin/pectin:* decreased GI absorption of clindamycin

*Hormonal contraceptives:* decreased contraceptive efficacy

*Neuromuscular blockers:* enhanced neuromuscular blockade

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, creatine kinase:* increased levels

*Platelets, white blood cells:* transient decrease in counts

### Patient monitoring

- Monitor creatinine level closely in patients with renal insufficiency.
- Monitor hepatic enzyme levels in patients with hepatic disease.
- Assess for signs and symptoms of hypersensitivity reactions, including anaphylaxis.
- Assess for diarrhea and signs and symptoms of colitis.

### Patient teaching

- Tell patient to take drug with food if it causes stomach upset.
- 📢 Urge patient to contact prescriber immediately if he develops rash, unusual fatigue, or yellowing of skin or eyes or if diarrhea occurs during or after treatment.
- Tell patient that I.V. use may cause bitter taste. Reassure him that this effect will resolve on its own.
- Caution patient not to rely on condoms or diaphragm for contraception for 72 hours after using vaginal preparation; drug may weaken latex products and cause breakage.
- Instruct patient taking hormonal contraceptives to use supplemental birth control method, such as condoms (unless she's using a vaginal preparation); drug may reduce hormonal contraceptive efficacy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## clofarabine

Clolar, Evoltra

**Pharmacologic class:** Purine nucleoside antimetabolite

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

### Action

Inhibits DNA synthesis by decreasing cellular deoxynucleotide triphosphate pools through inhibitory action on ribonucleotide reductase, terminating DNA chain elongation, and inhibiting repair through incorporation into DNA chain by competitive inhibition of DNA polymerases. Drug is cytotoxic to rapidly proliferating and quiescent cancer cell types in vitro.

### Availability

*Solution for injection:* 1 mg/ml (20 mg in 20-ml flint vials)

### Indications and dosages

➤ Relapsed or refractory acute lymphoblastic leukemia after at least two previous regimens

**Children and adults ages 1 to 21:** 52 mg/m<sup>2</sup>/day by I.V. infusion over 2 hours daily for 5 consecutive days every 2 to 6 weeks, depending on toxicity and response

### Dosage adjustment

- Hypotension
- Systemic inflammatory response syndrome (SIRS)
- Capillary leak syndrome (CLS)
- Substantial creatinine and bilirubin elevations

### Contraindications

None

## Precautions

Use cautiously in:

- renal or hepatic impairment, active infection, dehydration, hypotension
- adults older than age 21
- pregnant or breastfeeding patients.

## Administration

- Filter through sterile 0.2-micron syringe filter, and dilute further with D<sub>5</sub>W or normal saline solution for injection before I.V. infusion. Resulting admixture may be stored at room temperature but must be used within 24 hours of preparation.
- To prevent incompatibilities, don't give other drugs through same I.V. line.
- Administer continuous I.V. fluids throughout 5 days of treatment to reduce effects of tumor lysis and other adverse events. Give allopurinol, as ordered, if hyperuricemia is expected.
- Prophylactic steroids (such as 100 mg/m<sup>2</sup> hydrocortisone on days 1 through 3) may help prevent SIRS and CLS. If early signs or symptoms of these life-threatening syndromes occur, stop drug immediately and start appropriate supportive measures.
- Withdraw drug immediately if patient develops significant signs or symptoms of SIRS or CLS (such as hypotension); consider giving steroids, diuretics, and albumin. Drug may be reinstated (generally at lower dosage) when patient is stable.
- Stop drug if hypotension occurs during 5 days of treatment. If hypotension is transient and resolves without pharmacologic intervention, reinstitute drug (generally at lower dosage).
- If creatinine or bilirubin level rises substantially, discontinue drug. Drug may be reinstated (possibly at lower dosage) when patient is stable and organ function returns to baseline.
- Know that after recovery or return to baseline organ function, treatment cycles are repeated about every 2 to 6 weeks. Dosage is based on body surface

area, calculated using actual height and weight before start of each cycle.

- Avoid concurrent administration of hepatotoxic or renotoxic drugs during 5 days of treatment.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** dizziness, headache, somnolence, tremor, anxiety, depression, lethargy, fatigue, irritability, rigors

**CV:** tachycardia, flushing, hypertension, hypotension

**EENT:** sore throat, epistaxis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, anorexia, gingival bleeding, oral candidiasis

**GU:** hematuria

**Hematologic:** febrile neutropenia, neutropenia, anemia, thrombocytopenia

**Hepatic:** hepatomegaly, jaundice

**Musculoskeletal:** arthralgia, back pain, myalgia, limb pain

**Respiratory:** pneumonia, cough, dyspnea, pleural effusion, respiratory distress

**Skin:** contusion, dermatitis, herpes simplex, dry skin, erythema, palmar-plantar erythrodysesthesia, petechiae, pruritus, cellulitis

**Other:** decreased appetite, weight loss, edema, injection site pain, mucosal inflammation, pain, fever, bacteremia, sepsis, staphylococcal infection, transfusion reaction

## Interactions

**Drug-drug.** *Hepatotoxic or renotoxic drugs:* additive toxicity

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, bilirubin:* increased

**Drug-herbs.** *Alpha-lipoic acid, coenzyme Q10:* decreased chemotherapeutic efficacy

*Glutamine:* possible increase in tumor growth

### Patient monitoring

- Assess hepatic and renal function before and during therapy.
- Closely monitor respiratory status and blood pressure during infusion.
- Monitor hematologic status carefully during therapy; drug may cause severe bone marrow depression, resulting in neutropenia, anemia, and thrombocytopenia.
- Monitor for signs and symptoms of tumor lysis syndrome or cytokine release (such as tachypnea, tachycardia, hypotension, and pulmonary edema), which could progress to SIRS, CLS, or organ dysfunction.
- Closely monitor patients receiving drugs that affect blood pressure or cardiac function.

### Patient teaching

- Teach patient about appropriate measures to avoid dehydration caused by vomiting and diarrhea. Tell patient to seek medical advice if signs and symptoms of dehydration occur (such as dizziness, light-headedness, fainting spells, or decreased urine output).
- Advise female with childbearing potential to avoid pregnancy during therapy.
- Caution breastfeeding patient to discontinue breastfeeding during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## clomiphene citrate (clomifene )

Clomid, Serophene

**Pharmacologic class:** Chlorotrianisene derivative

**Therapeutic class:** Fertility drug, ovulation stimulant

**Pregnancy risk category X**

### Action

Binds with estrogen receptors in cytoplasm, increasing secretion of follicle-stimulating hormone, luteinizing hormone, and gonadotropin in hypothalamus and pituitary gland. These actions induce ovulation.

### Availability

Tablets: 50 mg

### Indications and dosages

➤ Ovarian failure

**Adults:** 50 mg/day P.O. for 5 days starting any time in patients with no recent uterine bleeding; or 50 mg/day P.O. starting on fifth day of menstrual cycle. If ovulation doesn't occur, increase to 100 mg/day P.O. for 5 days. Start next course of therapy as early as 30 days after previous course. If patient doesn't respond after three courses, no further doses are recommended.

### Off-label uses

- Male sterility (controversial)

### Contraindications

- Hepatic disease
- Organic intracranial lesions
- Uncontrolled thyroid or adrenal dysfunction
- Ovarian cyst
- Abnormal uterine bleeding or bleeding of undetermined origin
- Pregnancy

**Precautions**

None

**Administration**

- Obtain pregnancy test before therapy begins.
- Be aware that patient should undergo pelvic and eye examinations before starting therapy.

Route	Onset	Peak	Duration
P.O.	5-8 days	Unknown	6 wk

**Adverse reactions**

**CNS:** nervousness, insomnia, dizziness, light-headedness

**CV:** vasomotor flushing

**EENT:** visual disturbances

**GI:** nausea; vomiting; abdominal discomfort, distention, and bloating

**GU:** breast tenderness, ovarian

enlargement, multiple pregnancies, birth defects in resulting pregnancies, **ovarian hyperstimulation syndrome, uterine bleeding**

**Interactions**

None significant

**Patient monitoring**

- Monitor patient for bleeding and other adverse reactions.

**Patient teaching**

-  Instruct patient to immediately report signs and symptoms of ovarian hyperstimulation syndrome, including nausea, vomiting, diarrhea, abdominal or pelvic pain, and swelling in hands or legs.
- Tell patient to report bleeding.
- Advise patient not to take drug if she is or may become pregnant.
- Inform patient that drug increases risk of multiple births, which heightens maternal risk.
- As appropriate, review all other significant and life-threatening adverse reactions.

**clomipramine hydrochloride**

Anafranil, Anafranil SR , Apo-Clomipramine , Co Clomipramine , Dom-Clomipramine, Gen-Clomipramine , Med-Clomipramine , Novo-Clopramine , PHL-Clomipramine , PMS-Clomipramine , Ratio Clomipramine 

**Pharmacologic class:** Tricyclic anti-depressant (TCA)

**Therapeutic class:** Antiobsessional agent, antidepressant

**Pregnancy risk category C**

**FDA BOXED WARNING**

- Drug may increase risk of suicidal thinking and behavior in children and adolescents with major depressive disorder and other psychiatric disorders. Risk must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family to observe patient closely and communicate with prescriber as needed.
- Drug isn't approved for use in pediatric patients, except those with obsessive-compulsive disorder.

**Action**

Unknown. Selectively inhibits norepinephrine and serotonin reuptake at presynaptic neurons in brain; also possesses moderate anticholinergic properties.

**Availability**

*Aerosol foam:* 1%

*Capsules:* 25 mg, 50 mg, 75 mg

## Indications and dosages

➤ Obsessive-compulsive disorder

**Adults:** Initially, 25 mg/day P.O., increased over 2 weeks to 100 mg/day given in divided doses. May be increased further over several weeks, up to 250 mg/day given in divided doses.

**Children ages 10 to 17:** Initially, 25 mg/day P.O., increased over 2 weeks to 3 mg/kg/day or 100 mg/day (whichever is smaller) given in divided doses. May be increased further to 3 mg/kg/day or 200 mg/day (whichever is smaller) given in divided doses.

## Dosage adjustment

- Elderly patients

## Off-label uses

- Panic disorder

## Contraindications

- Hypersensitivity to drug or other TCAs
- Recent myocardial infarction (MI)
- Concurrent MAO inhibitor or clonidine use

## Precautions

Use cautiously in:

- glaucoma, hyperthyroidism, prostatic hypertrophy, preexisting cardiovascular disease
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 10 (safety not established).

## Administration

- Don't give with grapefruit juice.
- Once stabilizing dosage is reached, entire daily dose may be given at bedtime.

Route	Onset	Peak	Duration
P.O.	Unknown	2-6 hr	Unknown

## Adverse reactions

**CNS:** lethargy, sedation, weakness, aggressive behavior, extrapyramidal

reactions, poor concentration, feeling of unreality, delusions, anxiety, restlessness, panic, asthenia, syncope, insomnia, **seizures, suicidal ideation or behavior (especially in child or adolescent)**

**CV:** orthostatic hypotension, hypertension, ECG changes, tachycardia, palpitations, vasculitis, **arrhythmias, MI, precipitation of heart block**

**EENT:** blurred vision, dry eyes, vestibular disorder, nasal congestion, laryngitis

**GI:** nausea, vomiting, constipation, abdominal cramps, belching, epigastric distress, flatulence, dysphagia, increased salivation, stomatitis, parotid gland swelling, black tongue, dry mouth, **paralytic ileus**

**GU:** urinary retention, urinary hesitancy, urinary tract dilation, male sexual dysfunction, testicular swelling, gynecomastia, breast enlargement, menstrual irregularities, galactorrhea, libido changes

**Hematologic:** eosinophilia, purpura, anemia, **bone marrow depression, agranulocytosis, thrombocytopenia, leukopenia**

**Metabolic:** hyperthermia, hypothermia, **syndrome of inappropriate antidiuretic hormone secretion**

**Musculoskeletal:** muscle weakness

**Skin:** sweating, dry skin, photosensitivity, rash, pruritus, petechiae, flushing

**Other:** abnormal taste, chills, edema, increased appetite, weight gain

## Interactions

**Drug-drug.** *Adrenergics, anticholinergics:* additive adrenergic or anticholinergic effects

*Cimetidine, hormonal contraceptives, phenothiazines, selective serotonin reuptake inhibitors:* increased clomipramine effects, greater risk of toxicity

*Clonidine:* hypertensive crisis

*CNS depressants (including antihistamines, opioid analgesics, sedative-hypnotics):* additive CNS depression

*Disulfiram:* transient delirium

*Guanethidine:* interference with anti-hypertensive response

*MAO inhibitors:* severe or life-threatening adverse reactions

*Levofloxacin, moxifloxacin:* increased risk of adverse cardiovascular reactions

**Drug-diagnostic tests.** *Blood glucose, prolactin:* elevated levels

**Drug-food.** *Grapefruit juice:*

increased clomipramine blood level and effects

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

*S-adenosylmethionine (SAM-e), St. John's wort:* increased serotonergic effects, possibly causing serotonin syndrome

**Drug-behaviors.** *Alcohol use:* additive CNS depression

*Nicotine use:* increased metabolism and decreased efficacy of clomipramine

*Sun exposure:* photosensitivity

### Patient monitoring

- Monitor patient for cardiovascular, CNS, and hematologic adverse reactions.

📢 Assess for suicidal ideation. If necessary, institute suicide precautions.

### Patient teaching

📢 Advise patient (especially children or their parents) to immediately report suicidal thoughts or severe depression.

- Instruct patient not to drink grapefruit juice during therapy.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- Instruct patient to avoid alcohol, because it increases drowsiness.

- Tell patient to move slowly when sitting up or standing, to avoid dizziness

or light-headedness caused by sudden blood pressure drop.

- Caution patient not to stop taking drug abruptly, because this may cause nausea, headache, or malaise.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## clonazepam

Alti-Clonazepam<sup>✳</sup>, Apo-Clonazepam<sup>✳</sup>, Clonapam<sup>✳</sup>, Co-Clonazepam<sup>✳</sup>, Dom-Clonazepam<sup>✳</sup>, Gen-Clonazepam<sup>✳</sup>, Klonopin, Novo-Clonazepam<sup>✳</sup>, PHL-Clonazepam<sup>✳</sup>, PMS-Clonazepam<sup>✳</sup>, Ratio-Clonazepam<sup>✳</sup>, Rivotril<sup>✳</sup>🌿

**Pharmacologic class:** Benzodiazepine

**Therapeutic class:** Anticonvulsant

**Controlled substance schedule IV**

**Pregnancy risk category D**

### Action

Unknown. May enhance activity of gamma-aminobutyric acid, an inhibitory neurotransmitter in CNS.

### Availability

*Tablets:* 0.5 mg, 1 mg, 2 mg

### Indications and dosages

➤ Absence seizures (Lennox-Gastaut syndrome); akinetic and myoclonic seizures

**Adults:** Initially, 1.5 mg/day P.O. in three divided doses; may increase by 0.5 to 1 mg q 3 days until seizures are adequately controlled or drug intolerance occurs. Maximum dosage is 20 mg/day.

**Infants and children ages 10 and younger or weighing 30 kg (66 lb) or**

**less:** Initially, 0.01 to 0.03 mg/kg/day P.O. Give total dosage (not to exceed 0.05 mg/kg/day) in two to three equally divided doses. Increase by no more than 0.25 to 0.5 mg q 3 days until dosage of 0.1 to 0.2 mg/kg/day is reached, seizures are adequately controlled, or drug intolerance occurs.

### Off-label uses

- Acute manic episodes of bipolar disorder
- Multifocal tic disorders
- Neuralgias
- Parkinsonian dysarthria
- Periodic leg movements occurring during sleep
- Adjunctive treatment of schizophrenia

### Contraindications

- Hypersensitivity to drug or other benzodiazepines
- Severe hepatic disease
- Acute angle-closure glaucoma

### Precautions

Use cautiously in:

- renal impairment, chronic respiratory disease, open-angle glaucoma
- history of porphyria
- pregnant or breastfeeding patients
- children.

### Administration

 Be aware that overdose may cause fatal respiratory depression or cardiovascular collapse.

- Give tablets with water, and make sure patient swallows them whole.

Route	Onset	Peak	Duration
P.O.	20-60 min	1-2 hr	6-12 hr

### Adverse reactions

**CNS:** ataxia, fatigue, drowsiness, behavioral changes, depression, dizziness, nervousness, reduced intellectual ability

**CV:** palpitations

**EENT:** abnormal eye movements, blurred vision, diplopia, nystagmus, sinusitis, rhinitis, pharyngitis

**GI:** constipation, diarrhea, hypersalivation

**GU:** dysuria, nocturia, urinary retention, dysmenorrhea, delayed ejaculation, erectile dysfunction

**Hematologic:** anemia, eosinophilia, leukopenia, thrombocytopenia

**Hepatic:** hepatitis

**Musculoskeletal:** myalgia

**Respiratory:** increased respiratory secretions, upper respiratory tract infection, cough, bronchitis, **respiratory depression**

**Other:** appetite changes, fever, physical or psychological drug dependence, drug tolerance, allergic reaction

### Interactions

**Drug-drug.** *Antidepressants, antihistamines, opioids, other benzodiazepines:* additive CNS depression

*Barbiturates, rifampin:* increased metabolism and decreased efficacy of clonazepam

*Cimetidine, disulfiram, fluoxetine, hormonal contraceptives, isoniazid, ketoconazole, metoprolol, propoxyphene, propranolol, valproic acid:* decreased clonazepam metabolism

*Phenytoin:* decreased clonazepam blood level

**Drug-diagnostic tests.** *Eosinophils, liver function tests:* increased values  
*Platelets, white blood cells:* decreased counts

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

### Patient monitoring

- Monitor patient for respiratory depression. Assess respiratory rate and quality, oxygen saturation (using pulse oximetry), and mental status.

- Monitor hematologic and liver function test results.

### Patient teaching

 Instruct patient to immediately report easy bleeding or bruising or yellowing of skin or eyes.

- Advise patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

 Caution patient not to stop taking drug abruptly. Advise him to consult prescriber for dosage-tapering schedule if he wishes to discontinue drug.

- Advise patient not to drink alcohol, which may increase drowsiness, dizziness, and risk of seizures.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## clonidine

Catapres-TTS

### clonidine hydrochloride

Apo-Clonidine<sup>✳</sup>, Catapres, Dixarit<sup>✳</sup>, Dom-Clonidine<sup>✳</sup>, Duraclon<sup>⚠</sup>, Novo-Clonidine<sup>✳</sup>, Nu-Clonidine<sup>✳</sup>

**Pharmacologic class:** Centrally acting sympatholytic

**Therapeutic class:** Antihypertensive

**Pregnancy risk category C**

#### FDA BOXED WARNING

- Before use, dilute clonidine hydrochloride 500- $\mu$ g/mL strength product in appropriate solution.
- Epidural form (clonidine hydrochloride) isn't recommended for obstetric,

postpartum, or perioperative pain management. In these cases, risk of hemodynamic instability may be unacceptable, except in rare patients for whom potential benefits may outweigh possible risks.

### Action

Stimulates alpha-adrenergic receptors in CNS, decreasing sympathetic outflow, inhibiting vasoconstriction, and ultimately reducing blood pressure. Also prevents transmission of pain impulses by inhibiting pain pathway signals in brain.

### Availability

*Solution for epidural injection:* 100 mcg/ml in 10-ml vials, 500 mcg/ml in 10-ml vials

*Tablets:* 100 mcg (0.1 mg), 200 mcg (0.2 mg), 300 mcg (0.3 mg)

*Transdermal systems:* 2.5 mg total released as 0.1 mg/24 hours (TTS 1), 5 mg total released as 0.2 mg/24 hours (TTS 2), 7.5 mg total released as 0.3 mg/24 hours (TTS 3)

### Indications and dosages

**>** Mild to moderate hypertension

**Adults:** 0.1 mg P.O. b.i.d. (morning and bedtime) alone or with other antihypertensives; increase in increments of 0.1 mg/day q week until desired response occurs. Or, one transdermal system applied once q 7 days to hairless area of intact skin on upper outer arm or chest.

**>** Severe pain in cancer patients unresponsive to opioids alone

**Adults:** Initially, 30 mcg/hour by continuous epidural infusion, titrated upward or downward depending on patient response

### Dosage adjustment

- Renal impairment

## Off-label uses

- Acute alcohol withdrawal
- Akathisia
- Diarrhea
- Prolonged surgical anesthesia

## Contraindications

- Hypersensitivity to drug
- Hypersensitivity to components of adhesive layer (transdermal form)
- Infection at epidural injection site, bleeding problems (epidural use)
- Concurrent anticoagulant therapy

## Precautions

Use cautiously in:

- renal insufficiency, serious cardiac or cerebrovascular disease
- elderly patients
- pregnant or breastfeeding patients.

## Administration

- For epidural use, dilute drug solution in normal saline solution, as ordered.
- To minimize sedative effects, give largest portion of maintenance P.O. dose at bedtime.

Route	Onset	Peak	Duration
P.O.	30-60 min	2-4 hr	8-12 hr
Epidural	Rapid	19 min	Variable
Transdermal	Slow	2-3 days	7 days

## Adverse reactions

**CNS:** drowsiness, depression, dizziness, nervousness, nightmares

**CV:** hypotension (especially with epidural use), palpitations, bradycardia

**GI:** nausea, vomiting, constipation, dry mouth

**GU:** urinary retention, nocturia, erectile dysfunction

**Metabolic:** sodium retention

**Skin:** rash, sweating, pruritus, dermatitis

**Other:** weight gain, withdrawal phenomenon

## Interactions

**Drug-drug.** *Amphetamines, beta-adrenergic blockers, MAO inhibitors, prazosin, tricyclic antidepressants:*

decreased antihypertensive effect  
*Beta-adrenergic blockers:* increased withdrawal phenomenon

*CNS depressants (including antihistamines, opioids, sedative-hypnotics):* additive sedation

*Epidurally administered local anesthetics:* prolonged clonidine effects

*Levodopa:* decreased levodopa efficacy  
*Myocardial depressants (including beta-adrenergic blockers):* additive bradycardia

*Other antihypertensives, nitrates:* additive hypotension

*Verapamil:* increased risk of adverse cardiovascular reactions

**Drug-herbs.** *Capsicum:* reduced antihypertensive effect

**Drug-behaviors.** *Alcohol use:* increased sedation

## Patient monitoring

- Monitor patient for signs and symptoms of adverse cardiovascular reactions.
- Frequently assess vital signs, especially blood pressure and pulse.
- Monitor patient for drug tolerance and efficacy.

## Patient teaching

- Instruct patient to move slowly when sitting up or standing, to avoid dizziness or light-headedness caused by sudden blood pressure decrease.

 Caution patient not to stop taking drug abruptly.

- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, herbs, and behaviors mentioned above.

## clopidogrel bisulfate

Plavix

**Pharmacologic class:** Platelet aggregation inhibitor

**Therapeutic class:** Antiplatelet drug

**Pregnancy risk category B**

### FDA BOXED WARNING

- Effectiveness of clopidogrel depends on activation to an active metabolite by the cytochrome P(CYP) 450 system, principally CYP2C19.
- Patients identified as CYP2C19 poor metabolizers treated with clopidogrel at recommended dosages exhibit higher cardiovascular event rates following acute coronary syndrome or percutaneous coronary intervention than patients with normal CYP2C19 function.
- Tests are available to identify a patient's CYP2C19 genotype and can be used as an aid in determining therapeutic strategy.
- Consider alternative treatment or treatment strategies in patients identified as CYP2C19 poor metabolizers.

### Action

Inhibits platelet aggregation by blocking binding of adenosine diphosphate to platelets, thereby preventing thrombus formation

### Availability

Tablets: 75 mg, 300 mg

### Indications and dosages

➤ Recent myocardial infarction (MI) or stroke or established peripheral arterial disease

**Adults:** 75 mg/day P.O.

➤ Acute coronary syndrome (ACS)

**Adults:** 300 mg P.O. as a loading dose, then 75 mg/day P.O. in combination with aspirin (75 to 325 mg once daily) for patients with non-ST-segment elevation ACS (unstable angina, non-ST-elevation MI)

**Adults:** 75 mg P.O. once daily in combination with aspirin (75 to 325 mg once daily), with or without a loading dose and with or without thrombolytics for patients with ST-elevation MI

### Contraindications

- Hypersensitivity to drug
- Active pathologic bleeding

### Precautions

Use cautiously in:

- thrombotic thrombocytopenic purpura
- increased risk of bleeding
- concomitant use of drugs that inhibit CYP2C19 (such as esomeprazole, omeprazole)
- concomitant use of aspirin in patients with recent transient ischemic attack or cerebrovascular accident
- premature discontinuation of drug
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Give with or without food.
- Know that drug may need to be discontinued 5 days before surgery.

Route	Onset	Peak	Duration
P.O.	Variable	60 min	3-4 hr

### Adverse reactions

**CNS:** depression, dizziness, fatigue, headache

**CV:** chest pain, hypertension

**EENT:** epistaxis, rhinitis

**GI:** diarrhea, abdominal pain, dyspepsia, gastritis, **GI bleeding**

**Hematologic: bleeding, neutropenia, thrombotic thrombocytopenic purpura**

**Metabolic:** hypercholesterolemia, gout

**Musculoskeletal:** joint pain, back pain

**Respiratory:** cough, dyspnea, bronchitis, upper respiratory tract infection, bronchospasm

**Skin:** pruritus, rash, angioedema

**Other:** hypersensitivity reactions, **anaphylactic reactions**

## Interactions

**Drug-drug.** *Abciximab, aspirin, eptifibatide, heparin, heparinoids, nonsteroidal anti-inflammatory drugs (NSAIDs), thrombolytics, ticlopidine, tirofiban, warfarin:* increased risk of bleeding  
*CYP2C19 inhibitors (such as esomeprazole, omeprazole):* significantly reduced clopidogrel antiplatelet activity

*Fluvastatin, many NSAIDs, phenytoin, tamoxifen, tolbutamide, toremide:* interference with metabolism of these drugs

**Drug-diagnostic tests.** *Bilirubin, hepatic enzymes, nonprotein nitrogen, total cholesterol, uric acid:* increased levels

*Platelets:* decreased count

**Drug-herbs.** *Anise, arnica, chamomile, clove, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng:* increased risk of bleeding

## Patient monitoring

- Monitor hemoglobin and hematocrit periodically.
- Monitor patient for unusual bleeding or bruising; drug significantly increases risk of bleeding.
- Assess for occult GI blood loss if patient is receiving naproxen concurrently with clopidogrel.

## Patient teaching

- Tell patient to take tablets with or without food.
- 🔊 Advise patient to immediately report unusual or acute chest pain, respiratory difficulty, rash, purplish bruises on skin or in mouth, purple skin patches, unusual fatigue, fast heart rate, confusion, signs and symptoms of stroke (including weakness on one

side, speech changes), low urine output, unresolved bleeding, diarrhea, GI distress, nosebleed, or acute headache.

🔊 Instruct patient not to discontinue drug without consulting prescriber.

- Instruct patient to tell all health care providers that he's taking clopidogrel, especially if surgery is scheduled or new drugs are prescribed.

- Advise patient to contact prescriber before taking over-the-counter products, particularly nonsteroidal anti-inflammatory drugs.

- Tell patient drug may cause headache and dizziness. Caution him to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- Advise patient to minimize adverse GI effects by eating small, frequent meals or chewing gum.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## clorazepate dipotassium

Apo-Clorazepate<sup>✳</sup>, Novo-Clopat<sup>✳</sup>, Tranxene, Tranxene-SD, Tranxene-SD Half Strength, Tranxene-T

**Pharmacologic class:** Benzodiazepine

**Therapeutic class:** Anticonvulsant, anxiolytic

**Controlled substance schedule IV**

**Pregnancy risk category D**

## Action

Unclear. Thought to potentiate effects of gamma-aminobutyric acid and other neurotransmitters, promoting inhibitory neurotransmission at excitatory synapses.

**Availability**

Tablets: 3.75 mg, 7.5 mg, 15 mg

**Indications and dosages**

➤ Anxiety

**Adults:** 7.5 to 15 mg P.O. two to four times daily

➤ Adjunctive therapy in partial seizure disorder

**Adults and children older than age 12:**

Initially, 7.5 mg P.O. t.i.d.; increase by no more than 7.5 mg/week. Don't exceed 90 mg/day.

**Children ages 9 to 12:** Initially, 7.5 mg P.O. b.i.d.; increase by no more than 7.5 mg/week. Don't exceed 60 mg/day.

➤ Management of alcohol withdrawal

**Adults:** Initially, 30 mg P.O., followed by 15 mg P.O. two to four times daily on first day. On second day, give 45 to 90 mg P.O. in divided doses, then decrease gradually over subsequent days to 7.5 mg to 15 mg P.O. daily.

**Dosage adjustment**

- Elderly or debilitated patients

**Contraindications**

- Benzodiazepine hypersensitivity
- Acute angle-closure glaucoma
- Psychosis
- Concurrent ketoconazole or itraconazole therapy
- Children younger than age 9

**Precautions**

Use cautiously in:

- depression or suicidal ideation
- psychotic reaction
- elderly patients
- females of childbearing age
- pregnant or breastfeeding patients.

**Administration**

- If GI upset occurs, give with food.
- When discontinuing therapy after long-term use, taper dosage gradually over 4 to 8 weeks to avoid withdrawal symptoms.
- Take suicide precautions if patient is depressed or anxious.

Route	Onset	Peak	Duration
P.O.	Rapid	1-2 hr	Days

**Adverse reactions**

**CNS:** dizziness, drowsiness, lethargy, sedation, depression, fatigue, nervousness, confusion, irritability, headache, slurred speech, difficulty articulating words, stupor, rigidity, tremor, poor coordination

**CV:** hypertension, hypotension, palpitations

**EENT:** blurred or double vision

**GI:** dry mouth

**Hematologic:** neutropenia

**Hepatic:** jaundice

**Skin:** rash, diaphoresis

**Other:** weight gain or loss, drug dependence or tolerance

**Interactions**

**Drug-drug.** *Antacids:* altered clorazepate absorption rate

*Antidepressants, antihistamines, opioids:* additive CNS depression

*Barbiturates, MAO inhibitors, other antidepressants, phenothiazines:* potentiation of clorazepate effects

*Cimetidine, disulfiram, fluoxetine, hormonal contraceptives, isoniazid, itraconazole, ketoconazole, metoprolol, propoxyphene, propranolol, valproic acid:* decreased clorazepate metabolism, causing enhanced drug action or markedly increased CNS effects

*Levodopa:* decreased antiparkinsonian effect

*Probenecid:* rapid onset or prolonged action of clorazepate

*Rifampin:* increased metabolism and decreased efficacy of clorazepate

*Theophylline:* decreased sedative effect of clorazepate

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase:* increased levels

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

*Smoking:* decreased drug absorption

### Patient monitoring

- Assess for pregnancy before initiating therapy.
- Evaluate patient for depression, drug dependence, and drug tolerance.
- Monitor blood counts and liver function test results during long-term therapy; drug may cause neutropenia and jaundice.

### Patient teaching

- Instruct patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Tell patient to avoid smoking and use of alcohol or other CNS depressants.
- 📢 Caution patient not to stop therapy abruptly, because withdrawal symptoms may occur.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## clozapine

Apo-Clozapine<sup>✳</sup>, Clozaril, Denzapine<sup>⚡</sup>, Fazacllo ODT, Gen-Clozapine<sup>✳</sup>, PMS-Clozapine<sup>✳</sup>, Zaponex<sup>⚡</sup>

**Pharmacologic class:** Dibenzodiazepine derivative

**Therapeutic class:** Antipsychotic agent

**Pregnancy risk category** B

### FDA BOXED WARNING

- Because of significant agranulocytosis risk, use only to treat severely ill patients with schizophrenia who don't

respond to standard antipsychotic drugs, or to reduce risk of recurrent suicidal behavior in patients with schizophrenia or schizoaffective disorder who risk reexperiencing suicidal behavior. Obtain baseline white blood cell (WBC) and absolute neutrophil counts before therapy, regularly during therapy, and for at least 4 weeks afterward.

- Drug is associated with seizures; likelihood increases at higher doses. Use caution when giving to patients with history of seizures or other predisposing factors. Instruct patient not to engage in activities in which sudden loss of consciousness could cause serious risk to self or others.
- Drug may increase risk of fatal myocarditis, especially during first month of therapy. Discontinue promptly if myocarditis is suspected.
- Orthostatic hypotension with or without syncope may occur. Rarely, collapse is profound and accompanied by respiratory or cardiac arrest, or both. Orthostatic hypotension is more likely during initial titration when dosage is raised rapidly. In patients who've had even brief interval off drug (2 or more days since last dose), start with 12.5 mg once or twice daily.
- During initial therapy, collapse and respiratory and cardiac arrest may occur. Use caution when initiating therapy.
- Drug increased risk of death in elderly patients with dementia-related psychosis; most deaths have been cardiovascular or infectious. Drug isn't approved for dementia-related psychosis.

### Action

Unclear. Thought to interfere with dopamine binding in limbic system of CNS, with high affinity for dopamine<sub>4</sub> receptors. May antagonize adrenergic, cholinergic, histaminergic, and serotonergic receptors.

**Availability**

Tablets: 25 mg, 50 mg, 100 mg, 200 mg  
 Tablets (orally disintegrating): 12.5 mg, 25 mg, 100 mg

**Indications and dosages**

➤ Schizophrenia in patients unresponsive to other therapies

**Adults:** 12.5 mg P.O. daily or b.i.d.; increase daily in 25- to 50-mg increments, as tolerated, to target dosage of 300 to 450 mg/day by end of second week. Make subsequent dosage increases once or twice weekly in increments of 100 mg or less, to a maximum dosage of 900 mg/day P.O. in divided doses.

**Dosage adjustment**

- Renal impairment
- Elderly patients

**Contraindications**

- Hypersensitivity to drug
- Uncontrolled seizures
- Severe CNS depression or coma
- Paralytic ileus, myeloproliferative disorders, history of clozapine-induced agranulocytosis or severe granulocytopenia
- Concurrent use of drugs that cause agranulocytosis or bone marrow depression

**Precautions**

Use cautiously in:

- hypersensitivity to phenothiazines
- cardiac, hepatic, or renal impairment; CNS tumors; diabetes mellitus; history of seizures; prostatic hypertrophy; intestinal obstruction; angle-closure glaucoma, patients with a history of long QT syndrome or prolonged QT interval or other conditions that may increase risk of prolonged QT interval or sudden death
- elderly patients
- pregnant or breastfeeding patients
- children.

**Administration**

📢 Obtain WBC count before starting therapy. Don't give drug if WBC count is below 3,500/mm<sup>3</sup>.

- When discontinuing drug, taper dosage gradually over 1 to 2 weeks.
- Be aware that orally disintegrating tablets are meant to dissolve in mouth.

Route	Onset	Peak	Duration
P.O.	Unknown	2.5 hr	4-12 hr
P.O. (orally disint.)	Unknown	Unknown	Unknown

**Adverse reactions**

**CNS:** sedation, drowsiness, dizziness, vertigo, headache, tremor, insomnia, disturbed sleep, nightmares, agitation, lethargy, fatigue, weakness, confusion, anxiety, parkinsonism, slurred speech, depression, restlessness, extrapyramidal reactions, tardive dyskinesia, akathisia, syncope, **neuroleptic malignant syndrome, autonomic disturbances, seizures**

**CV:** hypotension, tachycardia, ECG changes, chest pain, **QT-interval prolongation, myocarditis**

**EENT:** blurred vision, dry eyes, nasal congestion, sinusitis

**GI:** nausea, vomiting, constipation, dyspepsia, salivation, dry mouth, anorexia

**GU:** urinary retention, urinary incontinence, urinary frequency and urgency, inhibited ejaculation

**Musculoskeletal:** muscle spasms, rigidity, back and muscle pain

**Hematologic:** agranulocytosis, leukopenia, hemolytic anemia, aplastic anemia, thrombocytopenia, neutropenia, eosinophilia

**Respiratory:** dyspnea, **respiratory arrest**

**Skin:** rash, sweating, **Stevens-Johnson syndrome**

**Other:** weight gain, fever

**Interactions**

**Drug-drug.** *Anticholinergics, antihypertensives, digoxin, warfarin:* increased effects of these drugs

*Cimetidine, erythromycin*: increased therapeutic and toxic effects of clozapine

*Epinephrine*: increased hypotension

*Fluoxetine, fluvoxamine, paroxetine, sertraline*: increased clozapine blood level

*Phenytoin, rifampin*: decreased clozapine blood level

*Psychoactive drugs*: additive psychoactive effect

**Drug-diagnostic tests.** *Granulocytes, hematocrit, hemoglobin, platelets, white blood cells*: decreased values

*Liver function tests*: abnormal values

*Pregnancy test*: false-positive result

**Drug-food.** *Caffeine*: increased clozapine blood level

**Drug-herbs.** *Angel's trumpet, Jimsonweed, scopolia*: increased anticholinergic effects

*Nutmeg*: decreased clozapine efficacy

*St. John's wort*: decreased clozapine blood level

**Drug-behaviors.** *Alcohol use*: increased CNS depression

*Smoking*: decreased clozapine blood level

### Patient monitoring

📣 Monitor WBC count weekly for first 6 months of therapy; if it's normal, WBC testing can be reduced to every other week. Notify prescriber immediately if WBC count decreases or agranulocytosis occurs.

- Monitor ECG and liver function test results.
- If drug must be withdrawn abruptly, monitor patient for psychosis and cholinergic rebound (headache, nausea, vomiting, diarrhea).
- Continue to monitor WBC count weekly for 4 weeks after therapy ends.

### Patient teaching

- Tell patient to allow orally disintegrating tablet to dissolve in mouth.
- Teach patient about significant risk of agranulocytosis; tell him he'll need to undergo weekly blood testing to check for this blood disorder. Mention

that clozapine tablets are available only through a special program that ensures required blood monitoring.

📣 Advise patient to immediately report new onset of lethargy, weakness, fever, sore throat, malaise, mucous membrane ulcers, flulike symptoms, or other signs and symptoms of infection.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## coagulation factor VIIa (recombinant)

NovoSeven RT

**Pharmacologic class:** Coagulation factor VIIa

**Therapeutic class:** Antihemophilic agent

**Pregnancy risk category C**

### FDA BOXED WARNING

- Arterial and venous thrombotic and thromboembolic events following administration of NovoSeven RT have been reported during postmarketing surveillance. Clinical studies have shown an increased risk of arterial thromboembolic adverse events with NovoSeven RT when administered outside the current approved indications. Fatal and nonfatal thrombotic events have been reported.
- Discuss the risks and explain the signs and symptoms of thrombotic and thromboembolic events to patients who will receive NovoSeven RT.
- Monitor patients for signs or symptoms of activation of the coagulation system and for thrombosis.

- Safety and efficacy of NovoSeven RT haven't been established outside the approved indications.

### Action

Promotes hemostasis by activating intrinsic pathway of coagulation cascade to form fibrin

### Availability

*Lyophilized powder for injection:*  
1 mg/vial, 2 mg/vial, 5 mg/vial

### Indications and dosages

➤ Bleeding episodes in patients with hemophilia A or B who have inhibitors to factor VIII or IX and in patients with acquired hemophilia

**Adults:** For hemostatic dosing, 90 mcg/kg I.V. bolus q 2 hours until hemostasis occurs or therapy is deemed ineffective. For posthemostatic dosing, appropriate dosing duration hasn't been determined. For severe bleeds, continue dosing at 3- to 6-hour intervals after hemostasis is achieved, to maintain hemostatic plug.

➤ Prevention of bleeding in surgical interventions or invasive procedures in patients with hemophilia A or B who have inhibitors to factor VIII or IX and in patients with acquired hemophilia

**Adults:** Initially, 90 mcg/kg I.V. immediately before intervention and repeated at 2-hour intervals for duration of surgery. For minor surgery, administer postsurgical doses by I.V. bolus injection at 2-hour intervals for first 48 hours and then at 2- to 6-hour intervals until healing has occurred. For major surgery, administer postsurgical doses by I.V. injection at 2-hour intervals for 5 days, followed by 4-hour intervals until healing has occurred. Administer additional bolus doses, if required.

➤ Bleeding episodes or prevention of bleeding in surgical intervention or

invasive procedures in patients with congenital factor VII deficiency  
**Adults:** 15 to 30 mcg/kg I.V. q 4 to 6 hours until hemostasis is achieved. Effective treatment has been achieved with dosages as low as 10 mcg/kg.

➤ Bleeding episodes or surgery in patients with acquired hemophilia  
**Adults:** 70 to 90 mcg/kg I.V., repeated q 2 to 3 hours until hemostasis is achieved

### Contraindications

None

### Precautions

Use cautiously in:

- hypersensitivity to drug, its components, or mouse, hamster, or bovine products
- prolonged use of drug
- concomitant use of activated or non-activated prothrombin complex concentrates (avoid use)
- patients with increased risk of thromboembolic complications (including advanced atherosclerotic disease, crush injury, septicemia, history of coronary heart disease, liver disease, disseminated intravascular coagulation, postoperative immobilization, elderly patients and neonates)
- pregnant or breastfeeding patients
- children.

### Administration

• Monitor factor VII-deficient patients for prothrombin time and factor VII coagulant activity before administering drug.

 Give by I.V. bolus only over 2 to 5 minutes, depending on dosage.

• Reconstitute only with specified volume of diluent supplied.

 Don't mix with sterile water for injection or infusion solutions.

 Don't inject diluent directly on the powder.

• Administer within 3 hours of reconstituting. If line needs to be flushed

before or after administering drug, use normal saline solution.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache, **cerebral artery occlusion, cerebrovascular accident**

**CV:** hypertension, hypotension, bradycardia, angina, superficial thrombophlebitis, **thrombophlebitis, deep vein thrombosis, coagulation disorder, disseminated intravascular coagulation (DIC), increased fibrinolysis, purpura**

**GI:** nausea, vomiting

**GU:** renal dysfunction

**Hematologic:** purpura, **hemorrhage, hemarthrosis, disseminated intravascular coagulation, coagulation disorders, decreased fibrinogen plasma, thrombosis**

**Musculoskeletal:** arthrosis, arthralgia

**Respiratory:** pneumonia, **pulmonary embolism**

**Skin:** pruritus, rash, urticaria

**Other:** fever, edema, pain, redness or reaction at injection site, **hypersensitivity reaction**

### Interactions

**Drug-drug.** *Activated prothrombin complex concentrates, prothrombin complex concentrates:* risk of potential interaction (though not evaluated)

### Patient monitoring

Monitor for signs and symptoms of coagulation activation or thrombosis. If DIC or thrombosis is confirmed, reduce dosage or discontinue drug, depending on patient's symptoms.

- Monitor factor VII-deficient patients for prothrombin time and factor VII coagulant activity before and after administering drug. If factor VIIa activity fails to reach expected level, prothrombin time isn't corrected, or

bleeding isn't controlled after treatment with recommended dosages, antibody formation may be suspected and analysis for antibodies should be performed.

- Be aware that laboratory coagulation parameters may be used as adjunct to clinical evaluation of hemostasis to monitor drug efficacy and treatment schedule. However, these parameters lack direct correlation with achievement of hemostasis.

- Monitor renal function tests.

### Patient teaching

Instruct patient to immediately report signs and symptoms of hypersensitivity reactions (including hives, urticaria, chest tightness, or wheezing) and thrombosis (including new-onset swelling and pain in limbs or abdomen, new-onset chest pain, shortness of breath, loss of sensation, or altered consciousness or speech).

- Instruct patient to report swelling, pain, burning, or itching at infusion site.

- Tell patient to inform prescriber if she's pregnant or intends to become pregnant.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

c

## codeine sulfate

**Pharmacologic class:** Opioid agonist

**Therapeutic class:** Opioid analgesic, antitussive

**Controlled substance schedule II**

**Pregnancy risk category C**

**Action**

Binds to opioid receptors in CNS, altering perception of painful stimuli. Causes generalized CNS depression, decreases cough reflex, and reduces GI motility.

**Availability**

Tablets: 15 mg, 30 mg, 60 mg

**Indications and dosages**

➤ Mild to moderately severe pain

**Adults:** 15 to 60 mg P.O. q 4 hours as needed. Doses above 60 mg may fail to give commensurate pain relief, and may be associated with an increased incidence of undesirable adverse effects.

**Dosage adjustment**

- Renal or hepatic impairment
- Elderly or debilitated patients

**Contraindications**

- Hypersensitivity to drug, its components, or other opioids
- Respiratory depression, severe bronchial asthma, hypercarbia
- Paralytic ileus or suspected paralytic ileus

**Precautions**

Use cautiously in:

- severe renal, hepatic, or pulmonary disease
- adrenal insufficiency, circulatory shock, hypotension, pancreatic or biliary tract disease, urethral stricture, seizures, head trauma, hypothyroidism, increased intracranial pressure, prostatic hypertrophy, undiagnosed abdominal pain, alcoholism
- concomitant use of alcohol, other opioids, illicit drugs
- elderly or debilitated patients
- pregnant or breastfeeding patients
- labor and delivery patients
- children younger than age 18 (safety and efficacy not established).

**Administration**

- If GI upset occurs, give with food.
- Titrate dosage for appropriate analgesic effect.
- 📣 If overdose occurs, give naloxone I.V. as prescribed. Repeat administration as needed (up to manufacturer's recommended maximum dosage) to reverse toxic effects.

Route	Onset	Peak	Duration
P.O.	30-45 min	1-2 hr	4 hr

**Adverse reactions**

**CNS:** confusion, sedation, malaise, agitation, euphoria, floating feeling, headache, hallucinations, unusual dreams, apathy, mood changes

**CV:** hypotension, bradycardia, peripheral vasodilation, reduced peripheral resistance

**EENT:** blurred or double vision, miosis, reddened sclera

**GI:** nausea, vomiting, constipation, decreased gastric motility

**GU:** urinary retention, urinary tract spasms, urinary urgency

**Respiratory:** suppressed cough reflex, respiratory depression

**Skin:** flushing, sweating

**Other:** physical or psychological drug dependence, drug tolerance

**Interactions**

**Drug-drug.** *Antidepressants, antihistamines, sedative-hypnotics:* additive CNS depression

*Nalbuphine, pentazocine:* decreased analgesic effect

*Opioid partial agonists (buprenorphine, butorphanol, nalbuphine, pentazocine):* precipitation of opioid withdrawal in physically dependent patients

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

## Patient monitoring

- Monitor vital signs and CNS status.
- Assess pain level and efficacy of pain relief.
- Evaluate patient for adverse reactions.
- 🔊 Stay alert for overdose signs and symptoms, such as CNS and respiratory depression, GI cramping, and constipation.
- Assess other drugs in patient's drug regimen for those that could cause additive or adverse interactions.
- Monitor patient for signs and symptoms of drug dependence or tolerance.

## Patient teaching

- Teach patient to minimize adverse GI effects by taking doses with food or milk.
- 🔊 Tell patient to notify prescriber promptly if he experiences shortness of breath or difficulty breathing or if nausea, vomiting, or constipation become pronounced.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, alertness, vision, coordination, and physical dexterity.
- Instruct patient to move slowly when sitting up or standing, to avoid dizziness or light-headedness from sudden blood pressure decrease.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, herbs, and behaviors mentioned above.

## colchicine

Colcrys

**Pharmacologic class:** Colchicum alkaloid

**Therapeutic class:** Antigout drug

**Pregnancy risk category C**

## Action

Unclear. Antigout action may occur through white blood cell (WBC) migration and reduced lactic acid production by WBCs. This action in turn decreases uric acid deposition, kinetin formation, and phagocytosis, leading to reduction in inflammatory response.

## Availability

Tablets: 0.6 mg

## Indications and dosages

➤ Prophylaxis of gout flares

**Adults and adolescents age 16 and older:** 0.6 mg P.O. daily or b.i.d. Maximum dosage, 1.2 mg/day.

➤ Treatment of gout flares

**Adults and adolescents age 16 and older:** 1.2 mg P.O. at first sign of a gout flare, followed by 0.6 mg 1 hour later. Wait 12 hours; then resume prophylactic dose.

➤ Familial Mediterranean fever

**Adults and adolescents age 12 and older:** 1.2 to 2.4 mg P.O. in one or two divided doses. Increase or decrease dosage as indicated and as tolerated in increments of 0.3 mg/day; not to exceed the maximum recommended daily dosage.

**Children ages 6 to 12:** 0.9 to 1.8 mg P.O. as a single dose or as divided doses b.i.d.

**Children ages 4 to 6:** 0.3 to 1.8 mg P.O. as a single dose or as divided doses b.i.d.

## Dosage adjustment

- Mild hepatic or renal impairment

## Off-label uses

- Hepatic cirrhosis
- Chronic progressive multiple sclerosis
- Pyoderma gangrenosum associated with Crohn's disease
- Psoriasis
- Dermatitis herpetiformis

## Contraindications

- Hypersensitivity to drug
- Blood dyscrasias
- Serious GI, renal, hepatic, or cardiac disorders
- Concurrent use of P-glycoprotein or strong CYP3A4 inhibitors (including all protease inhibitors except fosamprenavir)

## Precautions

Use cautiously in:

- renal impairment
- elderly or debilitated patients
- pregnant or breastfeeding patients
- children (safety not established).

## Administration

- Give tablets without regard to meals.
- Know that GI reactions may be troublesome in patients with peptic ulcer or irritable bowel.

Route	Onset	Peak	Duration
P.O.	12 hr	24-72 hr	Unknown
I.V.	Rapid	Rapid	Rapid

## Adverse reactions

**CNS:** peripheral neuritis, neuropathy

**GI:** nausea, vomiting, diarrhea, abdominal pain

**GU:** anuria, hematuria, reversible azoospermia, renal impairment

**Hematologic:** purpura, **agranulocytosis**, **aplastic anemia**, **thrombocytopenia**

**Metabolic:** vitamin B<sub>12</sub> malabsorption

**Musculoskeletal:** myopathy

**Skin:** dermatosis, alopecia

**Other:** hypersensitivity reactions

## Interactions

**Drug-drug.** *Cyclosporine:* colchicine-induced myopathy

*Vitamin B<sub>12</sub>:* reversible vitamin malabsorption

**Drug-diagnostic tests.** *Alkaline phosphatase, aspartate aminotransferase:* increased levels

*Hematocrit, hemoglobin, platelets:* decreased values

*Urine hemoglobin, urinary red blood cells:* false-positive results

**Drug-food.** *Caffeine-containing foods and beverages:* decreased colchicine effect

**Drug-herbs.** *Herbal teas, St. John's wort:* decreased drug effect

**Drug-behaviors.** *Alcohol use:* increased uric acid level

## Patient monitoring

 Monitor patient for signs and symptoms of toxicity (nausea, vomiting, abdominal pain, bloody diarrhea, burning sensation, muscle weakness, oliguria, hematuria, ascending paralysis, delirium, and seizures). Discontinue drug if these occur.

- Monitor CBC and renal function test results regularly.
- Be aware that patient may need opioids to control drug-induced diarrhea (especially if he's receiving maximum colchicine dosage).

## Patient teaching

- Tell patient to take tablets with or without food.
- Instruct patient to report rash, sore throat, fever, tiredness, weakness, numbness, or tingling.
-  Tell patient to immediately report muscle tremors, weakness, fatigue, bruising, bleeding, yellowing of eyes or skin, pale stools, dark urine, severe vomiting, watery or bloody diarrhea, or abdominal pain.
- Advise patient to increase fluid intake to prevent renal calculi (unless prescriber wants him to restrict fluids).

- Instruct patient to avoid alcohol, herbal teas, and caffeine during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## colesevelam hydrochloride

Cholestagel<sup>®</sup>, Welchol

**Pharmacologic class:** Bile acid sequestrant

**Therapeutic class:** Antihyperlipidemic

**Pregnancy risk category B**

### Action

Binds bile acids in GI tract and forms insoluble complex, impeding bile acid reabsorption and promoting its excretion. As a result, cholesterol and low-density lipoprotein (LDL) levels decrease.

### Availability

**Oral suspension:** 3.75 g packet

**Tablets:** 625 mg

### Indications and dosages

➤ Adjunct to diet and exercise to reduce LDL cholesterol in patients with primary hypercholesterolemia

#### Adults and children ages 10 to 17:

Three tablets (1,875 mg) P.O. b.i.d., or six tablets (3,750 mg) once daily; or, one 3.75-g packet P.O. once daily.

➤ Adjunct to diet and exercise to improve glycemic control in adults with type 2 diabetes mellitus

**Adults:** Three tablets (1,875 mg) P.O. b.i.d., or six tablets (3,750 mg) P.O. once daily; or, one 3.75-g packet P.O. once daily

### Contraindications

- Hypersensitivity to drug
- Bowel obstruction
- Serum triglyceride level above 500 mg/dl or history of hypertriglyceridemia-induced pancreatitis

### Precautions

Use cautiously in:

- susceptibility to vitamin K deficiency (such as patients on warfarin or those with malabsorption syndrome), concomitant use of fat-soluble vitamins
- patients with dysphagia or swallowing disorders, gastroparesis, other GI motility disorders; those who have had major GI tract surgery and who may be at risk for bowel obstruction
- children (safety and efficacy not established).

### Administration

- Give with meals and fluids.
- Ensure that patient swallows tablets whole without crushing or chewing.
- Mix prescribed powder packet with 4 to 8 ounces of water, fruit juice, or diet soft drinks.
- Know that drug may be used alone or with HMG-CoA reductase inhibitor.

Route	Onset	Peak	Duration
P.O.	Unknown	2 wk	Unknown

### Adverse reactions

**CNS:** headache, anxiety, vertigo, dizziness, insomnia, fatigue, syncope

**EENT:** tinnitus

**GI:** nausea, vomiting, diarrhea, constipation, abdominal discomfort, flatulence, fecal impaction, loose stools, fatty stools, rectal or hemorrhoidal bleeding, **other GI bleeding**

**GU:** increased libido

**Hematologic:** anemia, **bleeding tendency**

**Metabolic:** malabsorption of vitamins A, D, E, and K

**Musculoskeletal:** back, muscle, or joint pain

**Skin:** bruising

### Interactions

**Drug-drug.** *Fat-soluble vitamins (A, D, E, and K):* decreased vitamin absorption

### Patient monitoring

- Monitor lipid levels before starting therapy and periodically thereafter.

### Patient teaching

- Instruct patient to take drug with meals as directed.
- Instruct patient to mix powder packet for oral suspension with 4 to 8 ounces of water, fruit juice, or diet soft drinks; stir well, and drink. Tell patient not to take powder in its dry form.
- Instruct patient to take any vitamins at least 4 hours before taking this drug.
- Tell patient to report persistent GI upset, back or muscle pain or weakness, and respiratory problems.
- If drug causes constipation, instruct patient to increase exercise, drink plenty of fluids, consume more fruits and fiber, or take a stool softener.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## colestipol hydrochloride

Colestid

**Pharmacologic class:** Bile acid sequestrant

**Therapeutic class:** Antihyperlipidemic

**Pregnancy risk category** NR

### Action

Binds bile acids in GI tract and forms insoluble complex, impeding bile acid reabsorption and promoting its

excretion. As a result, cholesterol and low-density lipoprotein levels decrease.

### Availability

*Granules for suspension:* 5 g/packet or scoop

*Tablets:* 1 g

### Indications and dosages

➤ Primary hypercholesterolemia  
**Adults:** *Granules*—5 g P.O. once or twice daily; may increase q 1 to 2 months up to 30 g/day P.O. given in one or two divided doses. *Tablets*—2 g P.O. once or twice daily; may increase q 1 to 2 months up to 16 g/day P.O. given in one or two divided doses.

### Off-label uses

- Digoxin toxicity

### Contraindications

- Hypersensitivity to drug

### Precautions

Use cautiously in:

- history of constipation
- breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Mix granules with at least 90 ml of liquid, and stir until completely mixed.
- Give tablets with large amount of water.
- Administer other drugs 1 hour before or 4 hours after colestipol.

Route	Onset	Peak	Duration
P.O.	24-48 hr	1 mo	1 mo

### Adverse reactions

**CNS:** dizziness, headache, vertigo, anxiety, syncope, fatigue

**CV:** chest pain

**GI:** nausea, vomiting, constipation, abdominal discomfort, fecal impaction, flatulence, fatty stools, hemorrhoids, perianal irritation, tongue irritation

**Metabolic:** deficiency of vitamins A, D, E, and K and folic acid, **hyperchloremic acidosis**

**Musculoskeletal:** osteoporosis, backache, muscle and joint pain, arthritis  
**Skin:** irritation, rashes

## Interactions

**Drug-drug.** *Amiodarone, corticosteroids, digoxin, diuretics, fat-soluble vitamins (A, D, E, K), folic acid, gemfibrozil, imipramine, methotrexate, mycophenolate, nonsteroidal anti-inflammatory drugs, penicillin G, phosphates, propranolol, tetracyclines, thyroid preparations, ursodiol:* decreased absorption of these drugs (when given orally)

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, phosphorus:* increased levels

*Prothrombin time:* prolonged

## Patient monitoring

- Monitor lipid levels frequently during first few months of therapy and periodically thereafter.
- Evaluate patient for signs and symptoms of abnormal bleeding.
- Be aware that prolonged use may increase bleeding tendency (from hypoprothrombinemia resulting from vitamin K deficiency). As prescribed and needed, give oral or parenteral vitamin K to reverse this effect.

## Patient teaching

- Instruct patient to take granules with 3 to 4 oz of water, fruit juice, soup with high fluid content, cereal, or pulpy fruits (crushed).
- Tell patient to swallow tablets whole, one at a time, and not to crush, cut, or chew them.
- Inform patient that drug may interfere with absorption of many other drugs. Advise him to take other drugs 1 hour before or 4 hours after colestipol.
- As appropriate, review all other significant and life-threatening adverse

reactions and interactions, especially those related to the drugs and tests mentioned above.

## crizotinib

Xalkori

**Pharmacologic class:** Receptor tyrosine kinase inhibitor

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

## Action

Inhibits receptor tyrosine kinases, including ALK, hepatocyte growth factor receptor, and recepteur d'origine nantais. Translocations can affect the ALK gene, resulting in expression of oncogenic fusion proteins. Formation of ALK fusion proteins results in activation and dysregulation of the gene's expression and signaling, which can contribute to increased cell proliferation and survival in tumors expressing these proteins.

## Availability

*Capsules:* 200 mg, 250 mg

## Indications and dosages

- Anaplastic lymphoma kinase-positive locally advanced or metastatic non-small-cell lung cancer (NSCLC)
- Adults:** 250 mg P.O. b.i.d. Dosing interruption or reduction to 200 mg P.O. b.i.d. may be required based on individual safety and tolerability; then 250 mg P.O. daily if further reduction is necessary.

## Dosage adjustment

- Hepatotoxicity
- Hematologic toxicities
- Grade 3 QT interval prolongation

## Contraindications

None

## Precautions

Use cautiously in:

- hepatic impairment, severe renal impairment (creatinine clearance less than 30 ml/minute), end-stage renal disease
- congenital long QT syndrome (avoid use), congestive heart failure, bradyarrhythmias, electrolyte abnormalities, pulmonary disease
- concurrent use of drugs known to prolong QT interval (such as alfuzosin, amiodarone, ibutilide, or quetiapine)
- concurrent use of moderate CYP3A inhibitors
- concurrent use of strong CYP3A inducers or inhibitors (avoid use)
- concurrent use of CYP3A substrates with narrow therapeutic indices (avoid use)
- grapefruit, grapefruit juice, St. John's wort (avoid use)
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

## Administration

- Be aware that detection of ALK-positive NSCLC using an FDA-approved test is necessary before starting drug.
- Administer with or without food. Don't crush, dissolve, or open capsules.

Route	Onset	Peak	Duration
P.O.	Unknown	4-6 hr	Unknown

## Adverse reactions

**CNS:** headache, fatigue, dizziness, neuropathy, insomnia

**CV:** bradycardia, **prolonged**

**QT interval**

**EENT:** vision disorder

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, esophageal disorder, stomatitis

**GU:** complex renal cysts

**Hematologic:** neutropenia, thrombocytopenia, lymphopenia

**Hepatic:** **hepatotoxicity**

**Musculoskeletal:** arthralgia, back pain

**Respiratory:** upper respiratory tract infection, dyspnea, cough, **pneumonia**,

**pulmonary embolism**

**Skin:** rash

**Other:** edema, chest pain or discomfort, fever, decreased appetite, dysgeusia

## Interactions

**Drug-drug.** *CYP3A substrates with narrow therapeutic indices (such as alfentanil, cyclosporine, dihydroergotamine, ergotamine, fentanyl, pimozide, quinidine, sirolimus, tacrolimus):* inhibited metabolism of these drugs, leading to potential for serious adverse reactions

*Moderate CYP3A inhibitors (such as diltiazem):* possible increased crizotinib plasma concentration

*Strong CYP3A inducers (including but not limited to carbamazepine, phenobarbital, phenytoin, rifabutin, rifampin):* decreased crizotinib plasma concentration

*Strong CYP3A inhibitors (such as atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, troleandomycin, voriconazole):* increased crizotinib plasma concentration

**Drug-diagnostic tests.** *ALT, AST:* increased levels

*Lymphocytes, neutrophils, platelets:* decreased levels

**Drug-food.** *Grapefruit, grapefruit juice:* increased crizotinib plasma concentration

*High-fat meal:* decreased crizotinib area under the curve and  $C_{max}$ .

**Drug-herbs.** *St. John's wort:* decreased crizotinib plasma concentration

## Patient monitoring

- 🔊 Monitor liver function tests (including ALT and total bilirubin) monthly and as clinically indicated, with more frequent testing in patients who develop transaminase elevations. Temporarily suspend drug, reduce dosage, or permanently discontinue drug as indicated.
- Monitor CBC with differential and renal function tests closely.
- 🔊 Monitor patient for pulmonary signs and symptoms indicative of pneumonitis; permanently discontinue drug in patients diagnosed with treatment-related pneumonitis.
- 🔊 Consider periodic ECGs and electrolyte monitoring in patients who have QT-interval prolongation or predisposition for QT-interval prolongation, or who are taking drugs known to prolong QT interval. Withhold drug in patients with Grade 3 QT-interval prolongation until recovery to Grade 1 or less; then resume at prescribed reduced dosage. Permanently discontinue drug if Grade 3 QT-interval prolongation recurs and in patients with Grade 4 QT-interval prolongation.

## Patient teaching

- Tell patient to take drug with or without food, to avoid grapefruit and grapefruit juice, and not to crush, dissolve, or open capsules.
- 🔊 Instruct patient to immediately report signs and symptoms of liver disorder (such as weakness, fatigue, nausea, vomiting, right upper abdominal pain, jaundice, yellowing of skin or eyes, or dark urine).
- 🔊 Instruct patient to immediately report swelling of hands or feet, abnormal heartbeats, dizziness, or faintness.
- Inform patient that visual changes, such as perceived flashes of light, blurry vision, light sensitivity, and floaters, may occur and to report flashes or floaters to prescriber.

- Caution patient to use caution while driving and performing other hazardous activities, because of the risk of developing a vision disorder, dizziness, or fatigue while taking drug.
- Instruct patient to tell prescriber about all drugs he's taking, because some drugs have potential for serious drug interactions and shouldn't be taken with crizotinib.
- Advise patient not to use St. John's wort or other herbal supplements without consulting prescriber.
- Advise female patient of childbearing age to avoid becoming pregnant during treatment.
- Advise breastfeeding patient that she should decide whether to discontinue breastfeeding or discontinue drug, taking into account importance of drug for her treatment.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## cromolyn sodium

Apo-Cromolyn<sup>®</sup>, Gastrocrom, Nalcrom<sup>®</sup>, Nasalcrom, Nu-Cromolyn<sup>®</sup>, Solu-Crom<sup>®</sup>

**Pharmacologic class:** Chromone derivative

**Therapeutic class:** Mast cell stabilizer, antiasthmatic, ophthalmic decongestant

**Pregnancy risk category B**

## Action

Inhibits release of histamine and reacting substances of anaphylaxis from mast cells, stabilizing the cell membrane and reducing the allergic response and inflammatory reaction

**Availability**

*Nasal solution:* 40 mg/ml (5.2 mg/spray) in 13-ml container (100 sprays) or 26-ml container (200 sprays)

*Ophthalmic solution:* 4%

*Oral solution:* 100 mg/5 ml

*Solution for nebulization:* 10 mg/ml

**Indications and dosages**

➤ Mastocytosis

**Adults and children ages 13 and older:** 200 mg P.O. q.i.d.

**Children ages 2 to 12:** 100 mg P.O. q.i.d.

➤ Vernal keratoconjunctivitis, vernal conjunctivitis, and vernal keratitis

**Adults and children ages 4 and older:**

One to two drops of ophthalmic solution in each eye four to six times daily at regular intervals

➤ To prevent and relieve nasal symptoms of hay fever and other nasal allergies

**Adults and children ages 2 and older:**

Spray once into each nostril. To prevent nasal allergy symptoms, use up to 1 week before contact with cause of allergy. To relieve nasal symptoms, repeat three to four times daily q 4 to 6 hours. If needed, may use up to six times per day. Use every day while in contact with allergen.

➤ Prevention of acute bronchospasm

**Adults and children ages 2 and older:**

20 mg q.i.d. via nebulization at regular intervals or no more than 1 hour before exposure to triggering event

➤ Management of bronchial asthma

**Adults and children ages 2 and older:**

20 mg via nebulization q.i.d. at regular intervals

**Off-label uses**

- Proctitis
- Ulcerative colitis
- Urticaria

**Contraindications**

- Hypersensitivity to drug
- Status asthmaticus

**Precautions**

Use cautiously in:

- renal or hepatic impairment, acute bronchospasm attacks
- pregnant or breastfeeding patients
- children younger than age 5.

**Administration**

- Administer oral form 30 minutes before meals and at bedtime.
- Before using nasal spray, have patient clear nasal passages by blowing nose.
- Don't expose solutions to direct sunlight.

Route	Onset	Peak	Duration
P.O., nasal, ophthalmic	<1 wk	2-4 wk	Unknown

**Adverse reactions**

**CNS:** headache, drowsiness, dizziness

**EENT:** nasal irritation, sneezing, epistaxis, postnasal drip (with nasal solution); stinging of eyes, lacrimation (with ophthalmic solution)

**GI:** nausea, diarrhea, stomachache, swollen parotid glands

**GU:** difficult or painful urination, urinary frequency

**Musculoskeletal:** myopathy

**Respiratory:** wheezing, cough, bronchospasm

**Skin:** erythema, rash, urticaria, angioedema

**Other:** altered taste, substernal burning, allergic reactions including anaphylaxis, serum sickness

**Interactions**

None significant

**Patient monitoring**

- Monitor pulmonary function periodically.

- Evaluate patient for signs and symptoms of overdose, including bronchospasm and difficult or painful urination.

### Patient teaching

#### With nasal form—

- Teach patient how to instill nasal spray as directed.
- Tell patient that drug may cause unpleasant taste, but that rinsing mouth and performing frequent oral care may help. Also inform him that drug may cause headache.
- Advise patient to report increased sneezing; nasal burning, stinging, or irritation; sore throat; hoarseness; or nosebleed.

#### With oral form—

- Tell patient to take oral form 30 minutes before meals.

#### With ophthalmic form—

- Instruct patient to wash hands before using.
- Teach patient how to instill drops: Instruct him to tilt his head back and look up, place drops inside lower eyelid, close his eye, and roll eyeball in all directions. Tell him not to blink for about 30 seconds, and then to apply gentle pressure to inner corner of eye for 30 seconds.
- Caution patient not to let applicator tip touch eye or any other surface.
- Tell patient drug may cause temporary stinging of eye or blurred vision.
- Advise patient not to wear contact lenses during therapy.

#### With all forms—

- As appropriate, review all other significant adverse reactions.

## cyclobenzaprine hydrochloride

Amrix, Apo-Cyclobenzaprine<sup>✳</sup>, Dom-Cyclobenzaprine<sup>✳</sup>, Fexmid, Flexeril, Novo-Cycloprine<sup>✳</sup>, PHL-Cyclobenzaprine<sup>✳</sup>, PMS-Cyclobenzaprine<sup>✳</sup>, Ratio-Cyclobenzaprine<sup>✳</sup>, Riva-Cyclobenzaprine<sup>✳</sup>

**Pharmacologic class:** Autonomic nervous system drug

**Therapeutic class:** Skeletal muscle relaxant (centrally acting)

**Pregnancy risk category B**

### Action

Unclear. Thought to act primarily at brain stem (and to a lesser extent at spinal cord level) to relieve skeletal muscle spasms of local origin without altering muscle function.

### Availability

*Capsules (extended-release):* 15 mg, 30 mg

*Tablets:* 5 mg, 7.5 mg, 10 mg

### Indications and dosages

➤ Adjunct to rest and physical therapy to relieve muscle spasm associated with acute, painful musculoskeletal conditions

**Adults:** 5 mg P.O. t.i.d. (immediate-release tablet). May increase to 10 mg P.O. t.i.d. (immediate-release tablet) as needed. Or, 15 mg (extended-release capsule) P.O. daily; some patients may need up to 30 mg/day, given as one 30-mg (extended-release capsule) P.O. daily or two 15-mg (extended-release capsules) P.O. daily.

### Contraindications

- Hypersensitivity to drug
- Acute recovery phase after myocardial infarction (MI)

- Heart failure
- Arrhythmias
- Hyperthyroidism
- MAO inhibitor use within past 14 days

### Precautions

Use cautiously in:

- cardiovascular disease, closed-angle glaucoma, hepatic impairment, increased intraocular pressure, urinary retention
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 15.

### Administration

 Don't give within 14 days of MAO inhibitor. Drug interaction may cause hypertensive crisis and severe seizures.

- Give extended-release capsule at approximately the same time each day.
- Know that drug shouldn't be used for more than 3 weeks.
- Be aware that drug may not be first-line agent for elderly patients because of its anticholinergic effects.

Route	Onset	Peak	Duration
P.O. (capsules)	Unknown	7-8 hr	Unknown
P.O. (tablets)	1 hr	4-6 hr	12-24 hr

### Adverse reactions

**CNS:** dizziness, drowsiness, syncope, confusion, fatigue, headache, nervousness, decreased mental acuity, irritability, weakness, insomnia, depression, disorientation, delusions, peripheral neuropathy, abnormal gait, Bell's palsy, EEG changes, extrapyramidal symptoms, **cerebrovascular accident**

**CV:** vasodilation, tachycardia, chest pain, hypotension, **MI, heart block**

**EENT:** blurred vision

**GI:** nausea, constipation, dyspepsia, swollen parotid glands, mouth inflammation, discolored tongue, dry mouth, **paralytic ileus**

**GU:** galactorrhea, urinary retention, urinary frequency, gynecomastia, testicular swelling, libido changes, erectile dysfunction

**Hematologic:** purpura, eosinophilia, bone marrow depression, leukopenia, thrombocytopenia

**Metabolic:** hyperglycemia, hypoglycemia, syndrome of inappropriate diuretic hormone secretion

**Musculoskeletal:** muscle ache

**Respiratory:** dyspnea

**Skin:** photosensitization, alopecia, angioedema

**Other:** unpleasant taste, weight gain or loss, edema

### Interactions

**Drug-drug.** *Anticholinergics, anticholinergic-like drugs (including antidepressants, antihistamines, disopyramide, haloperidol, phenothiazines):* additive anticholinergic effects

*Antihistamines, CNS depressants, opioids, sedative-hypnotics:* additive CNS depression

*Guanadrel, guanethidine:* reduction in or blockage of these drugs' actions  
*MAO inhibitors:* hyperpyretic crisis, seizures, death

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

### Patient monitoring

- Assess for adverse CNS effects, such as drowsiness, dizziness, and decreased mental acuity.
- Monitor patient for evidence of drug interactions, especially when giving drug with CNS depressants.

### Patient teaching

- Tell patient to take extended-release capsule at approximately the same time each day.
- Tell patient that drug may cause dry mouth.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, alertness, and vision.
- Advise patient not to use alcohol, sedatives, pain medications, over-the-counter preparations, or herbs without consulting prescriber.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, herbs, and behaviors mentioned above.

## cyclophosphamide

Endoxana<sup>®</sup>, Procytox<sup>®</sup>

**Pharmacologic class:** Alkylating agent, nitrogen mustard

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

### Action

Unclear. Thought to prevent cell division by cross-linking DNA strands, thereby interfering with growth of susceptible cancer cells.

### Availability

*Powder for injection:* 500 mg, 1 g, 2 g

*Tablets:* 25 mg, 50 mg

### Indications and dosages

➤ Hodgkin's disease; malignant lymphoma; multiple myeloma; leukemia; advanced mycosis fungoides; neuroblastoma; ovarian cancer; breast cancer; and certain other tumors

**Adults:** Initially, 40 to 50 mg/kg I.V. in divided doses over 2 to 5 days, or 10 to 15 mg/kg I.V. q 10 days, or 3 to 5 mg/kg I.V. twice weekly.

**Children:** Initially, 2 to 8 mg/kg or 60 to 250 mg/m<sup>2</sup> P.O. or I.V. daily in divided doses for 6 or more days.

Maintenance dosage is 2 to 5 mg/kg or 50 to 150 mg/m<sup>2</sup> P.O. twice weekly.

➤ Biopsy-proven nephrotic syndrome in children

**Children:** 2.5 to 3 mg/kg/day P.O. for 60 to 90 days

### Off-label uses

- Severe rheumatologic conditions
- Selected cases of severe progressive rheumatoid arthritis and systemic lupus erythematosus

### Contraindications

- Hypersensitivity to drug
- Severe bone marrow depression

### Precautions

Use cautiously in:

- renal or hepatic impairment, adrenalectomy, mild to moderate bone marrow depression, other chronic debilitating illnesses
- females of childbearing age
- pregnant patients
- breastfeeding patients (use not recommended).

### Administration

- Verify that patient isn't pregnant before administering.
- Follow facility procedures for safe handling, administration, and disposal of chemotherapeutic drugs.
- Administer tablets on empty stomach. If drug causes severe GI upset, give with food.
- Don't cut or crush tablets.
- Know that dosage may need to be decreased if drug is given with other antineoplastics.
- Dilute each 100 mg of powder with 5 ml of sterile water for injection, to yield 20 mg/ml. Further dilute with compatible fluid, such as 5% dextrose injection, 5% dextrose and normal saline solution for injection, 5% dextrose and Ringer's injection, lactated Ringer's injection, or half-normal saline solution for injection.

- For I.V. injection, give each 100 mg over at least 1 minute. When giving dosages above 500 mg diluted in 100 to 250 ml of compatible solution, administer over 20 to 60 minutes.
- Use solution prepared with bacteriostatic water for injection within 24 hours if stored at room temperature or within 6 days if refrigerated.
- To minimize bladder toxicity, increase patient's fluid intake during therapy and for 1 to 2 days afterward. Most adults require fluid intake of at least 2 L/day.

Route	Onset	Peak	Duration
P.O., I.V.	7 days	7-15 days	21 days

### Adverse reactions

#### CV: cardiotoxicity

**GI:** nausea, vomiting, diarrhea, abdominal pain or discomfort, stomatitis, oral mucosal ulcers, anorexia,

#### hemorrhagic colitis

**GU:** urinary bladder fibrosis, hematuria, amenorrhea, decreased sperm count, sterility, **acute hemorrhagic cystitis, renal tubular necrosis, hemorrhagic ureteral inflammation**

**Hematologic:** anemia, **leukopenia, thrombocytopenia, bone marrow depression, neutropenia**

**Hepatic:** jaundice

**Metabolic:** hyperuricemia

**Respiratory:** **interstitial pulmonary fibrosis**

**Skin:** nail and pigmentation changes, alopecia

**Other:** poor wound healing, infections, allergic reactions including **anaphylaxis, secondary cancer**

### Interactions

**Drug-drug.** *Allopurinol, thiazide*

*diuretics:* increased risk of leukopenia

*Digoxin:* decreased digoxin blood level

*Cardiotoxic drugs (such as cytarabine, daunorubicin, doxorubicin):* additive cardiotoxicity

*Chloramphenicol:* prolonged cyclophosphamide half-life

*Phenobarbital:* increased risk of cyclophosphamide toxicity

*Quinolones:* decreased antimicrobial effect

*Succinylcholine:* prolonged neuromuscular blockade

*Warfarin:* increased anticoagulant effect

**Drug-diagnostic tests.** *Hemoglobin, platelets, pseudocholinesterase, red blood cells (RBCs), white blood cells:* decreased values

*Uric acid:* increased level

### Patient monitoring

- Assess infusion site for signs of extravasation.
- Monitor hematologic profile to determine degree of hematopoietic suppression. Be aware that leukopenia is an expected drug effect and is used to help determine dosage.
- Monitor urine regularly for RBCs, which may precede hemorrhagic cystitis.

### Patient teaching

- Tell patient to take tablets on empty stomach. However, if GI upset occurs, instruct him to take them with food.
- 🚫 Advise patient to promptly report unusual bleeding or bruising, fever, chills, sore throat, cough, shortness of breath, seizures, lack of menstrual flow, unusual lumps or masses, flank or stomach pain, joint pain, mouth or lip sores, or yellowing of skin or eyes.
- Instruct patient to drink 2 to 3 L of fluids daily (unless prescriber has told him to restrict fluids).
- Tell patient that drug may cause hair loss, but that hair usually grows back after treatment ends.
- Advise female patient to use barrier contraception during therapy and for 1 month afterward.
- Advise breastfeeding women not to breastfeed while taking this drug.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## cyclosporine

Apo-Cyclosporine<sup>®</sup>, Gengraf, Neoral, Sandimmune, Sandoz Cyclosporine

## cyclosporine ophthalmic emulsion

Restasis, Sandimmun<sup>®</sup>

**Pharmacologic class:** Polypeptide antibiotic

**Therapeutic class:** Immunosuppressant

**Pregnancy risk category** C

### FDA BOXED WARNING

- Drug should be prescribed only by physicians experienced in managing systemic immunosuppressive therapy for indicated disease. At doses used for solid-organ transplantation, it should be prescribed only by physicians experienced in immunosuppressive therapy and management of organ transplant recipients. Patient should be managed in facility with adequate laboratory and medical resources. Physician responsible for maintenance therapy should have complete information needed for patient follow-up.
- Neoral may increase susceptibility to infection and neoplasia. In kidney, liver, and heart transplant patients, drug may be given with other immunosuppressants.
- Sandimmune should be given with adrenal corticosteroids but not other immunosuppressants. In transplant

patients, increased susceptibility to infection and development of lymphoma and other neoplasms may result from increased immunosuppression.

- Sandimmune and Neoral aren't bioequivalent. Don't use interchangeably without physician supervision.
- In patients receiving Sandimmune soft-gelatin capsules and oral solution, monitor at repeated intervals (due to erratic absorption).

## Action

Unclear. Thought to act by specific, reversible inhibition of immunocompetent lymphocytes in G<sub>0</sub>-G<sub>1</sub> phase of cell cycle. Preferentially inhibits T lymphocytes; also inhibits lymphokine production. Ophthalmic action is unknown.

## Availability

**Capsules:** 25 mg, 100 mg

**Injection:** 50 mg/ml

**Oral solution:** 100 mg/ml

**Solution (ophthalmic):** 0.05% (0.4 ml in 0.9 ml single-use vial)

## Indications and dosages

➤ Psoriasis

**Adults:** *Neoral only*—1.25 mg/kg P.O. b.i.d. for 4 weeks. Based on patient response, may increase by 0.5 mg/kg/day once q 2 weeks, to a maximum dosage of 4 mg/kg/day.

➤ Severe active rheumatoid arthritis

**Adults:** *Neoral only*—1.25 mg/kg P.O. b.i.d. May adjust dosage by 0.5 to 0.75 mg/kg/day after 8 weeks and again after 12 weeks, to a maximum dosage of 4 mg/kg/day. If no response occurs after 16 weeks, discontinue therapy. *Gengraf only*—2.5 mg/kg P.O. daily given in two divided doses; after 8 weeks, may increase to a maximum dosage of 4 mg/kg/day.

➤ To prevent organ rejection in kidney, liver, or heart transplantation

**Adults and children:** *Sandimmune only*—Initially, 15 mg/kg P.O. 4 to 12 hours before transplantation, then daily for 1 to 2 weeks postoperatively. Reduce dosage by 5% weekly to a maintenance level of 5 to 10 mg/kg/day. Or 5 to 6 mg/kg I.V. as a continuous infusion 4 to 12 hours before transplantation.

➤ To increase tear production in patients whose tear production is presumed to be suppressed due to ocular inflammation associated with keratoconjunctivitis sicca

**Adults:** 1 drop in each eye b.i.d. given 12 hours apart

### Off-label uses

- Aplastic anemia
- Atopic dermatitis

### Contraindications

- Hypersensitivity to drug and any ophthalmic components
- Rheumatoid arthritis, psoriasis in patients with abnormal renal function, uncontrolled hypertension, cancer (Gengraf, Neoral)
- Active ocular infections (ophthalmic use)

### Precautions

Use cautiously in:

- hepatic impairment, renal dysfunction, active infection, hypertension
- herpes keratitis (ophthalmic use)
- pregnant or breastfeeding patients
- children younger than age 16 (safety and efficacy not established for ophthalmic use).

### Administration

- For I.V. infusion, dilute as ordered with dextrose 5% in water or 0.9% normal saline solution. Administer over 2 to 6 hours.
- Mix Neoral solution with orange juice or apple juice to improve its taste.

- Dilute Sandimmune oral solution with milk, chocolate milk, or orange juice. Be aware that grapefruit and grapefruit juice affect drug metabolism.

- In postoperative patients, switch to P.O. dosage as tolerance allows.

- Be aware that Sandimmune and Neoral aren't bioequivalent. Don't use interchangeably.

- Before administering eyedrops, invert unit-dose vial a few times to obtain a uniform, white, opaque emulsion.

- Know that eyedrops can be used concomitantly with artificial tears, allowing a 15-minute interval between products.

Route	Onset	Peak	Duration
P.O.	Unknown	1.5-3.5 hr	Unknown
I.V.	Rapid	1-2 hr	Unknown
Ophthal. (undetected blood levels)			

### Adverse reactions

**CNS:** tremor, headache, confusion, paresthesia, insomnia, anxiety, depression, lethargy, weakness

**CV:** hypertension, chest pain, **myocardial infarction**

**EENT:** visual disturbances, hearing loss, tinnitus, rhinitis; (with ophthalmic use) ocular burning, conjunctival hyperemia, discharge, epiphora, eye pain, foreign body sensation, itching, stinging, blurring

**GI:** nausea, vomiting, diarrhea, constipation, abdominal discomfort, gastritis, peptic ulcer, mouth sores, difficulty swallowing, anorexia, **upper GI bleeding, pancreatitis**

**GU:** gynecomastia, hematuria, **nephrotoxicity, renal dysfunction, glomerular capillary thrombosis**

**Hematologic:** anemia, **leukopenia, thrombocytopenia**

**Metabolic:** hyperglycemia, hypomagnesemia, hyperuricemia, **hyperkalemia, metabolic acidosis**

**Musculoskeletal:** muscle and joint pain

**Respiratory:** cough, dyspnea, *Pneumocystis jiroveci* pneumonia, bronchospasm

**Skin:** acne, hirsutism, brittle fingernails, hair breakage, night sweats

**Other:** gum hyperplasia, flulike symptoms, edema, fever, weight loss, hiccups, **anaphylaxis**

## Interactions

The following interactions pertain to oral and I.V. routes only.

**Drug-drug.** *Acyclovir, aminoglycosides, amphotericin B, cimetidine, diclofenac, gentamicin, ketoconazole, melphalan, naproxen, ranitidine, sulindac, sulfamethoxazole, tacrolimus, tobramycin, trimethoprim, vancomycin:* increased risk of nephrotoxicity

*Allopurinol, amiodarone, bromocriptine, clarithromycin, colchicine, danazol, diltiazem, erythromycin, fluconazole, imipenem and cilastatin, itraconazole, ketoconazole, methylprednisolone, nicardipine, prednisolone, quinupristin/dalfopristin, verapamil:* increased cyclosporine blood level

*Azathioprine, corticosteroids, cyclophosphamide:* increased immunosuppression  
*Carbamazepine, isoniazid, nafcillin, octreotide, orlistat, phenobarbital, phenytoin, rifabutin, rifampin, ticlopidine:* decreased cyclosporine blood level

*Digoxin:* decreased digoxin clearance  
*Live-virus vaccines:* decreased antibody response to vaccine

*Lovastatin:* decreased lovastatin clearance, increased risk of myopathy and rhabdomyolysis

*Potassium-sparing diuretics:* increased risk of hyperkalemia

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, glucose, low-density lipoproteins:* increased levels

*Hemoglobin, platelets, white blood cells:* decreased values

**Drug-food.** *Grapefruit, grapefruit juice:* decreased cyclosporine metabolism, increased cyclosporine blood level  
*High-fat diet:* decreased drug absorption (Neoral)

**Drug-herbs.** *Alfalfa sprouts, astragalus, echinacea, licorice:* interference with immunosuppressant action

*St. John's wort:* reduced cyclosporine blood level, possibly leading to organ rejection

## Patient monitoring

- Observe patient for first 30 to 60 minutes of infusion. Monitor frequently thereafter.
- Monitor cyclosporine blood level, electrolyte levels, and liver and kidney function test results.
- Assess for signs and symptoms of hyperkalemia in patients receiving concurrent potassium-sparing diuretic.

## Patient teaching

- Advise patient to dilute Neoral oral solution with orange or apple juice (preferably at room temperature) to improve its flavor.
- Instruct patient to use glass container when taking oral solution. Tell him not to let solution stand before drinking, to stir solution well and then drink all at once, and to rinse glass with same liquid and then drink again to ensure that he takes entire dose.
- Tell patient taking Neoral to avoid high-fat meals, grapefruit, and grapefruit juice.
- Advise patient to dilute Sandimmune oral solution with milk, chocolate milk, or orange juice to improve its flavor.
- Instruct patient to invert vial a few times to obtain a uniform, white, opaque emulsion before using

eyedrops and to discard vial immediately after use.

- Inform patient that eyedrops can be used with artificial tears but to allow 15-minute interval between products.
- Caution patient not to wear contact lenses because of decreased tear production; however, if contact lenses are used, advise patient to remove them before administering eyedrops and to reinsert 15 minutes after administration.
- Inform patient that he's at increased risk for infection. Caution him to avoid crowds and exposure to illness.
- Instruct patient not to take potassium supplements, herbal products, or dietary supplements without consulting prescriber.
- Tell patient he'll need to undergo repeated laboratory testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## cyproheptadine hydrochloride

Periactin , PMS-Cyproheptadine 

**Pharmacologic class:** Piperidine (nonselective)

**Therapeutic class:** Antihistamine

**Pregnancy risk category B**

### Action

Antagonizes effects of histamine at histamine<sub>1</sub>-receptor sites, preventing histamine-mediated responses. Also blocks effects of serotonin, causing increased appetite.

### Availability

*Syrup:* 2 mg/5 ml

*Tablets:* 4 mg

### Indications and dosages

> Allergy symptoms caused by histamine release (including seasonal and perennial allergic rhinitis); chronic urticaria; angioedema; dermographism; cold urticaria; adjunctive therapy for anaphylactic reactions

**Adults:** Initially, 4 mg P.O. q 8 hours. Maintenance dosage is 4 to 20 mg/day in three divided doses, to a maximum dosage of 0.5 mg/kg/day.

**Children ages 7 to 14:** 2 to 4 mg P.O. q 12 hours. Don't exceed 16 mg/day.

**Children ages 2 to 6:** 2 mg P.O. q 12 hours. Don't exceed 12 mg/day.

### Off-label uses

- Vascular cluster headaches
- Anorexia nervosa
- Cushing's syndrome

### Contraindications

- Hypersensitivity to drug
- Alcohol intolerance (syrup only)
- Bladder neck obstruction
- Angle-closure glaucoma
- Ulcer disease
- Symptomatic prostatic hypertrophy
- MAO inhibitor use within past 14 days

### Precautions

Use cautiously in:

- hepatic impairment
- elderly patients
- pregnant patients (safety not established)
- breastfeeding patients.

### Administration

- Give with food or milk to decrease GI upset.

Route	Onset	Peak	Duration
P.O.	15-60 min	1-2 hr	8 hr

**Adverse reactions**

**CNS:** drowsiness, dizziness, excitation (especially in children), fatigue, sedation, hallucinations, disorientation, tremor

**CV:** palpitations, hypotension, arrhythmias

**EENT:** blurred vision, nasal dryness and congestion, dry throat

**GI:** constipation, dry mouth

**GU:** urinary retention, urinary frequency, ejaculatory inhibition, early menses

**Respiratory:** thickened bronchial secretions

**Skin:** rash, photosensitivity

**Other:** weight gain

**Interactions**

**Drug-drug.** *CNS depressants (including opioid analgesics, sedative-hypnotics):*

increased CNS depression

*MAO inhibitors:* intensified, prolonged anticholinergic effects

**Drug-diagnostic tests.** *Allergy skin tests:* false-negative reactions

**Drug-behaviors.** *Alcohol use:* increased CNS depression

**Patient monitoring**

- Monitor patient for excessive anticholinergic effects.
- Assess for excessive CNS depression.
- Discontinue drug 4 days before diagnostic skin testing.

**Patient teaching**

- Advise patient to take drug with food to minimize GI upset.
- Caution patient not to use other CNS depressants, sleep aids, or alcohol during therapy.
- Instruct patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially

those related to the drugs, tests, and behaviors mentioned above.

C

**cytarabine**

Cytosar\*, Cytosar-U,

**cytarabine injection, lipid complex**

DepoCyt, DepoCyt<sup>®</sup>

**Pharmacologic class:** Antimetabolite, pyrimidine analog

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

**FDA BOXED WARNING**

- Drug should be given only by physicians experienced in cancer chemotherapy. For induction therapy, patients should be in facility with adequate resources to monitor drug tolerance and treat drug toxicity. Main toxic effect is bone marrow suppression with leukopenia, thrombocytopenia, and anemia. Less serious toxicities include nausea, vomiting, diarrhea, abdominal pain, oral ulcers, and hepatic dysfunction.
- Prescriber must weigh possible benefit against known toxic effects and should be familiar with complete package insert information.
- Give DepoCyt (liposomal injection) only under supervision of physician experienced with intrathecal cancer chemotherapy, in facility with adequate diagnostic and treatment resources. In all clinical studies, chemical arachnoiditis (manifested mainly by nausea, vomiting, headache, and fever) was common adverse event; unless treated, it may be fatal. Patients receiving DepoCyt should receive

dexamethasone concurrently to mitigate arachnoiditis symptoms.

### Action

Unclear. Cytotoxic effect may stem from inhibition of DNA polymerase by drug's active metabolite.

### Availability

*Injection (conventional form):* 20 mg  
*Liposomal injection for intrathecal use (sustained-release):* 50 mg/5-ml vial  
*Powder for injection (conventional form):* 100 mg, 500 mg, 1g, 2 g

### Indications and dosages

➤ To induce remission of acute non-lymphocytic leukemia

**Adults:** Injection (conventional form)—100 mg/m<sup>2</sup>/day by continuous I.V. infusion on days 1 through 7, or 100 mg/m<sup>2</sup> I.V. q 12 hours on days 1 through 7, given with other antineoplastics

➤ Meningeal leukemia

**Adults:** Injection (conventional form)—5 to 75 mg/m<sup>2</sup>/day intrathecally for 4 days, or once q 4 days. Most common dosage is 30 mg/m<sup>2</sup> q 4 days until cerebrospinal fluid is normal.

➤ Lymphomatous meningitis

**Adults:** Liposomal injection—50 mg intrathecally q 14 days for two doses (at weeks 1 and 3); then q 14 days for three doses (at weeks 5, 7, and 9), with one additional dose at week 13; then q 28 days for four doses

### Contraindications

- Hypersensitivity to drug
- Active meningeal infection (liposomal form)

### Precautions

Use cautiously in:

- renal or hepatic disease, active infection, decreased bone marrow reserve, other chronic illnesses
- pregnant or breastfeeding patients.

### Administration

• Follow facility procedures for safe handling, administration, and disposal of chemotherapeutic drugs.

• For I.V. injection, reconstitute each 100 mg with 5 ml of diluent (if necessary), and give each 100-mg dose over 1 to 3 minutes. For I.V. infusion, dilute further with 50 to 100 ml of dextrose 5% in water or normal saline solution, and infuse over 30 minutes to 24 hours (depending on dosage and concentration).

• Be aware that conventional and liposomal forms can be administered intrathecally.

⚠ Don't use intrathecal route for formulations containing benzyl alcohol.

• When giving conventional form intrathecally, reconstitute with autologous spinal fluid or preservative-free normal saline solution for injection. Use immediately.

• Patients receiving intrathecal cytarabine should be treated concurrently with dexamethasone to mitigate symptoms of chemical arachnoiditis.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown
Intrathecal	Rapid	5 hr	14-28 hr

### Adverse reactions

**CNS:** malaise, dizziness, headache, neuritis, **neurotoxicity, chemical arachnoiditis**

**CV:** chest pain, **thrombophlebitis**

**EENT:** conjunctivitis, **visual disturbances including permanent blindness (with liposomal form)**

**GI:** nausea, vomiting, diarrhea, abdominal pain, anal ulcers, esophagitis, esophageal ulcers, oral ulcers (in 5 to 10 days), anorexia, **bowel necrosis**

**GU:** urinary retention, **renal dysfunction**

**Hematologic:** anemia, **megaloblastosis, reticulocytopenia, leukopenia, thrombocytopenia**

**Hepatic:** hepatic dysfunction

**Metabolic:** hyperuricemia

**Musculoskeletal:** muscle ache, bone pain

**Respiratory:** pneumonia, shortness of breath

**Skin:** rash, pruritus, freckling, skin ulcers, urticaria, alopecia

**Other:** flulike symptoms, edema, infection, fever, cellulitis at injection site, **anaphylaxis, infection (mild to fatal)**

### Interactions

**Drug-drug.** *Digoxin:* decreased digoxin blood level

*Fluorocytosine:* decreased fluorocytosine blood level

*Gentamicin:* decreased gentamicin effects

**Drug-diagnostic tests.** *Hemoglobin, platelets, red blood cells, reticulocytes, white blood cells:* decreased values  
*Megaloblasts, uric acid:* increased levels

### Patient monitoring

• Observe for signs and symptoms of cytarabine syndrome (malaise, fever, muscle ache, bone pain, occasional chest pain, maculopapular rash, and conjunctivitis).

📣 When giving liposomal form, assess for signs and symptoms of chemical arachnoiditis, such as neck rigidity and pain, nausea, vomiting, headache, fever, and back pain.

• Monitor liver function test results, CBC with differential, platelet count, blood urea nitrogen, and serum creatinine and uric acid levels.

📣 Observe closely for signs and symptoms of infection, which could become severe and fatal.

### Patient teaching

📣 Tell patient to contact prescriber immediately if he develops signs or symptoms of infection, cytarabine

syndrome (malaise, fever, muscle ache, bone pain, chest pain, rash, eye infection), or chemical arachnoiditis (neck rigidity or pain, nausea, vomiting, headache, fever, or back pain).

📣 Tell patient that drug makes him more susceptible to infection. Advise him to avoid crowds and exposure to illness.

• Advise patient to increase fluid intake, to promote uric acid excretion.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## dacarbazine

DTIC<sup>☛</sup>, DTIC-Dome

**Pharmacologic class:** Alkylating drug, triazene

**Therapeutic class:** Antineoplastic

**Pregnancy risk category C**

### FDA BOXED WARNING

- Give under supervision of physician experienced in cancer chemotherapy.
- Hematopoietic depression is most common toxicity; hepatic necrosis has also occurred.
- Drug is carcinogenic and teratogenic in animals.
- Prescriber must weigh potential benefit against toxicity risk.

### Action

Unclear. Thought to inhibit DNA synthesis by acting as purine analog. Also causes alkylation and may interact with sulfhydryl groups.

**Availability**

*Injection:* 100-mg and 200-mg vials

**Indications and dosages**

➤ Hodgkin's disease

**Adults:** 150 mg/m<sup>2</sup> I.V. daily for 5 days in combination with other drugs, repeated q 4 weeks. Or 375 mg/m<sup>2</sup> I.V. on first day of combination therapy, repeated q 15 days.

➤ Metastatic malignant melanoma

**Adults:** 2 to 4.5 mg/kg I.V. daily for 10 days, repeated q 4 weeks. Or 250 mg/m<sup>2</sup> I.V. daily for 5 days, repeated q 3 weeks.

**Off-label uses**

- Malignant pheochromocytoma

**Contraindications**

- Hypersensitivity to drug

**Precautions**

Use cautiously in:

- hepatic dysfunction, impaired bone marrow function
- pregnant or breastfeeding patients
- children.

**Administration**

- Follow facility procedures for safe handling, administration, and disposal of chemotherapeutic drugs.
- Reconstitute with sterile water for injection according to manufacturer's directions.

- Further dilute reconstituted drug with 5% dextrose in water or normal saline solution.

 Administer over 30 to 60 minutes by I.V. infusion only.

 Take steps to prevent extravasation, which may cause tissue damage and severe pain.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

**Adverse reactions**

**CNS:** malaise, paresthesia

**GI:** nausea, vomiting, dyspepsia, anorexia

**Hematologic:** anemia, leukopenia, thrombocytopenia, bone marrow depression

**Musculoskeletal:** myalgia

**Skin:** dermatitis, erythematous or urticarial rash, alopecia, flushing, photosensitivity

**Others:** flulike symptoms, fever, hypersensitivity reactions including anaphylaxis

**Interactions**

**Drug-diagnostic tests.** *Platelets, red blood cells, white blood cells:* decreased counts

**Drug-behaviors.** *Sun exposure:* photosensitivity reaction

**Patient monitoring**

-  Frequently monitor CBC with white cell differential and platelet count. Know that hematopoietic depression is the most common toxicity and can be fatal.
- Assess infusion site closely for extravasation.

**Patient teaching**

-  Instruct patient to immediately report pain, burning, or swelling at infusion site; numbness in arms or legs; gait changes; respiratory distress; difficulty breathing; rash; or easy bruising or bleeding.
- Advise patient to minimize GI distress by eating small, frequent servings of healthy food and drinking plenty of fluids.
- Tell patient he'll undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests and behaviors mentioned above.

## dalfampridine

Ampyra

**Pharmacologic class:** Potassium channel blocker

**Therapeutic class:** Multiple sclerosis agent

**Pregnancy risk category C**

### Action

Unknown. May increase conduction of action potentials in demyelinated axons through inhibition of potassium channels.

### Availability

Tablets (extended release): 10 mg

### Indications and dosages

➤ To improve walking in patients with multiple sclerosis

**Adults:** 10 mg P.O. q 12 hours

### Dosage adjustments

- Mild renal impairment

### Contraindications

- History of seizures
- Moderate or severe renal impairment

### Precautions

Use cautiously in:

- mild renal impairment
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

### Administration

- Check creatinine clearance before starting drug.
- Administer with or without food.

Route	Onset	Peak	Duration
P.O.	Unknown	3-4 hr	Unknown

### Adverse reactions

**CNS:** insomnia, dizziness, headache, asthenia, balance disorder, paresthesia, seizures

**EENT:** nasopharyngitis, pharyngolaryngeal pain

**GI:** nausea, constipation, dyspepsia

**GU:** urinary tract infection

**Musculoskeletal:** back pain

**Other:** multiple sclerosis relapse

### Interactions

None

### Patient monitoring

🔊 Discontinue drug if seizure occurs.

- Monitor renal function tests regularly (especially creatinine clearance).

### Patient teaching

- Instruct patient to take drug with or without food.
- Instruct patient to swallow tablet whole and not to break, crush, chew, or dissolve it.
- 🔊 Advise patient to discontinue drug and immediately report to prescriber if seizures occur.
- Instruct patient to promptly report urinary tract problems.
- As appropriate, review all other significant and life-threatening adverse reactions.

d

## dalteparin sodium

Fragmin

**Pharmacologic class:** Low-molecular-weight heparin

**Therapeutic class:** Anticoagulant

**Pregnancy risk category B**

**FDA BOXED WARNING**

- Epidural or spinal hematomas may occur in patients who are anticoagulated with low-molecular-weight heparins or heparinoids and are receiving neuraxial anesthesia or undergoing spinal puncture. These hematomas may result in long-term or permanent paralysis. Consider these risks when scheduling patients for spinal procedures. Risk increases with use of indwelling epidural catheters, concomitant use of drugs affecting hemostasis (such as nonsteroidal anti-inflammatory drugs, platelet inhibitors, or other anticoagulants), traumatic or repeated epidural or spinal puncture, or history of spinal deformity or spinal surgery.
- Monitor patient frequently for signs and symptoms of neurologic impairment. If these occur, provide urgent treatment.
- Consider benefits and risks before neuraxial intervention in patients anticoagulated or to be anticoagulated for thromboprophylaxis.

**Action**

Inhibits thrombus and clot formation by blocking factor Xa and thrombin

**Availability**

*Solution for injection (prefilled syringes):* 12,500 units/0.5 ml, 15,000 units/0.6 ml, 18,000 units/0.72 ml, 5,000 units/0.2 ml, 7,500 units/0.3 ml, 10,000 units/0.4 ml

*Solution for injection (multidose vials):* 95,000 units/3.8 ml, 95,000 units/9.5 ml

*Solution for injection (single-dose graduated syringe):* 10,000 units/1 ml

**Indications and dosages**

➤ Extended treatment of symptomatic venous thromboembolism (VTE), including proximal deep vein

thrombosis (DVT) and pulmonary embolism (PE) to reduce recurrence of VTE in patients with cancer

**Adults:** Recommended dosing: for first 30 days of treatment, give 200 international units/kg total body weight subcutaneously once daily. Give at dose of approximately 150 international units/kg subcutaneously once daily during months 2 through 6. Safety and efficacy beyond 6 months not established. Total daily dose shouldn't exceed 18,000 international units.

➤ To prevent DVT, which can lead to PE in patients undergoing hip and abdominal surgery who are at risk for thromboembolic complications

**Adults:** *Abdominal surgery*—2,500 international units subcutaneously 1 to 2 hours before surgery; then once daily for 5 to 10 days. For high-risk patients, 5,000 international units subcutaneously on evening before surgery; then once daily for 5 to 10 days. For cancer patients, 2,500 international units subcutaneously 1 to 2 hours before surgery; repeat dose 12 hours later, then give 5,000 international units subcutaneously every day for 5 to 10 days.

*Hip replacement surgery*—5,000 international units subcutaneously 10 to 14 hours before surgery; repeat dose 4 to 8 hours after surgery; then give 5,000 international units daily for 5 to 10 days. Or, 2,500 international units subcutaneously within 2 hours before surgery, followed by 2,500 international units subcutaneously 4 to 8 hours after surgery (allowing at least 6 hours between doses), followed by 5,000 international units subcutaneously daily for 5 to 10 days. Or, 2,500 international units subcutaneously 4 to 8 hours after surgery, followed by 5,000 international units subcutaneously daily for 5 to 10 days.

➤ Patients with severely restricted mobility during acute illness

**Adults:** 5,000 international units subcutaneously daily for 12 to 14 days

➤ Extended treatment of symptomatic venous thromboembolism in patients with cancer

**Adults:** For first 30 days of treatment, 200 international units/kg subcutaneously daily. Total daily dosage shouldn't exceed 18,000 international units. Give approximately 150 international units/kg subcutaneously daily during months 2 through 6. Total daily dosage shouldn't exceed 18,000 international units.

➤ To prevent ischemic complications in patients with unstable angina and non-Q-wave myocardial infarction

**Adults:** 120 international units/kg (not to exceed 10,000 international units) subcutaneously q 12 hours (concurrently with aspirin P.O.) for 5 to 8 days

### Dosage adjustment

- Renal insufficiency
- Thrombocytopenia

### Off-label uses

- Systemic anticoagulation

### Contraindications

- Hypersensitivity to drug, heparin, pork products, sulfites, or benzyl alcohol
- Active major bleeding
- Thrombocytopenia
- Patients with unstable angina or non-Q-wave myocardial infarction who are undergoing regional anesthesia; cancer patients with symptomatic VTE who are undergoing regional anesthesia

### Precautions

Use cautiously in:

- bacterial endocarditis, bleeding disorders, hemorrhagic stroke, severe uncontrolled hypertension, GI ulcer,

severe renal or hepatic insufficiency, hypertensive or diabetic retinopathy

- history of thrombocytopenia from heparin use
- history of congenital or acquired bleeding disorder
- recent CNS or ophthalmologic surgery
- recent GI disease
- spinal or epidural anesthesia
- pregnant or breastfeeding patients
- children (safety not established).

### Administration

🚫 Know that dalteparin sodium is a high-alert drug.

🚫 Administer by subcutaneous route only. Don't give by I.M. or I.V. route.

- To minimize bruising at injection site, massage site with ice before giving injection.
- To give subcutaneous injection, have patient either sit up or lie down. Inject in U-shaped area around navel, upper outer side of thigh, or upper outer quadrangle of buttock. Rotate injection sites daily.
- Don't use interchangeably with heparin or other low-molecular-weight heparins.

Route	Onset	Peak	Duration
Subcut.	20-60 min	3-5 hr	12 hr

### Adverse reactions

**Hematologic:** anemia, ecchymosis, bleeding, thrombocytopenia, hemorrhage

**Skin:** rash, urticaria

**Other:** pain, irritation, and hematoma at injection site; fever; edema

### Interactions

**Drug-drug.** *Antiplatelet drugs (aspirin, clopidogrel, dipyridamole, ticlopidine), thrombolytics, warfarin:* increased risk of bleeding

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase:* increased levels

*Platelets:* decreased count

**Drug-herbs.** *Anise, arnica, chamomile, clove, feverfew, garlic, ginger, ginkgo, ginseng:* increased risk of bleeding

### Patient monitoring

 Monitor patient for increased risk of bleeding if he's receiving concomitant drugs that affect platelet function.

- Monitor CBC and platelet count.
- Monitor stools for occult blood.

### Patient teaching

- Teach patient proper injection technique if self-administering at home.
- Tell patient that drug may cause him to bleed easily. To avoid injury, advise him to brush teeth with soft toothbrush, use electric razor, and avoid scissors and sharp knives.

 Advise patient to immediately report bleeding, bruising, dizziness, light-headedness, itching, rash, fever, swelling, or difficulty breathing.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

likely to cause fatal and nonfatal hepatitis than daily doses above 800 mg. Overt hepatitis is most common during months 3 and 12, but may occur at any time; females, patients older than age 35, and those receiving concurrent therapy are at higher risk. Use only in conjunction with liver monitoring. Monitor liver function at baseline and regularly during therapy. Discontinue drug if values are abnormal.

- Use lowest possible effective dose. If no benefit occurs after 45 days, discontinue.

### Action

Relaxes skeletal muscle by affecting excitation-contraction coupling response at site beyond myoneural junction, probably by interfering with calcium release from sarcoplasmic reticulum

### Availability

*Capsules:* 25 mg, 50 mg, 100 mg

*Powder for injection:* 20 mg/vial

### Indications and dosages

 Chronic spasticity resulting from upper motor neuron disorders, such as multiple sclerosis, cerebral palsy, or spinal cord injury

**Adults:** Initially, 25 mg P.O. daily, increased gradually in 25-mg increments, if needed, up to 100 mg two or three times daily, to a maximum dosage of 400 mg P.O. daily. Maintain dosage level for 4 to 7 days to gauge patient response.

**Children:** Initially, 0.5 mg/kg P.O. daily for 7 days, increased to 0.5 mg/kg P.O. t.i.d. for 7 days; then 1 mg/kg P.O. t.i.d. for 7 days; then 2 mg/kg t.i.d., as needed. Don't exceed 100 mg P.O. q.i.d.

 Malignant hyperthermic crisis  
**Adults and children:** Initially, 1 mg/kg by I.V. push, repeated as needed up to a cumulative dosage of 10 mg/kg/day

## dantrolene sodium

Dantrium, Dantrium Intravenous

**Pharmacologic class:** Hydantoin derivative

**Therapeutic class:** Skeletal muscle relaxant (direct-acting), malignant hyperthermia agent

**Pregnancy risk category C**

### **FDA** BOXED WARNING

- Drug may be hepatotoxic and should be used only for recommended conditions. Daily doses of 400 mg are less

➤ To prevent or minimize malignant hyperthermia in patients who require surgery

**Adults and children:** 4 to 8 mg/kg P.O. daily in three or four divided doses for 1 to 2 days before surgery; give last dose 3 to 4 hours before surgery. Or 2.5 mg/kg I.V. infused over 1 hour before anesthetics are given.

➤ To prevent recurrence of malignant hyperthermic crisis

**Adults:** 4 to 8 mg/kg daily P.O. in four divided doses for up to 3 days after initial hyperthermic crisis

### Off-label uses

- Heat stroke
- Neuroleptic malignant syndrome

### Contraindications

- Active hepatic disease (oral form)
- Patients who use spasticity to maintain posture or balance (oral form)
- Breastfeeding

### Precautions

Use cautiously in:

- cardiac, hepatic, or respiratory dysfunction or impairment
- women (especially pregnant women)
- adults older than age 35
- children younger than age 5.

### Administration

- For I.V. use, add 60 ml of sterile water for injection to each vial; shake until solution is clear. Protect from direct light and use within 6 hours.
- Give therapeutic or emergency dose by rapid I.V. push. Administer follow-up dose over 2 to 3 minutes.
- Prevent extravasation when giving I.V. Drug has high pH and causes tissue irritation.

Route	Onset	Peak	Duration
P.O.	Slow	Unknown	6-12 hr
I.V.	Rapid	Unknown	Unknown

### Adverse reactions

**CNS:** dizziness, drowsiness, fatigue, malaise, weakness, confusion, depression, insomnia, nervousness, headache, light-headedness, speech disturbances, **seizures**

**CV:** tachycardia, blood pressure fluctuations, phlebitis, **heart failure**

**EENT:** double vision, excessive tearing

**GI:** nausea, vomiting, diarrhea, constipation, abdominal cramps, GI reflux and irritation, hematemesis, difficulty swallowing, anorexia, **GI bleeding**

**GU:** urinary frequency, dysuria, nocturia, urinary incontinence, hematuria, crystalluria, prostatitis

**Hematologic:** aplastic anemia, leukopenia, thrombocytopenia, lymphocytic lymphoma

**Hepatic:** hepatitis

**Musculoskeletal:** myalgia, backache

**Respiratory:** suffocating sensation, **respiratory depression, pleural effusion with pericarditis**

**Skin:** rash, urticaria, pruritus, eczema-like eruptions, sweating, photosensitivity, abnormal hair growth

**Other:** altered taste, chills, fever, edema

### Interactions

**Drug-drug.** *CNS depressants:* increased CNS depression

*Estrogen:* increased risk of hepatotoxicity  
*Verapamil (I.V.):* cardiovascular collapse (when given with I.V. dantrolene)

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen:* increased values

**Drug-behaviors.** *Alcohol use:* increased CNS depression

*Sun exposure:* phototoxicity

### Patient monitoring

- Obtain baseline liver function test results; monitor periodically during therapy.

- Monitor ECG, serum electrolytes, and urine output regularly.

 With long-term oral therapy, monitor patient for signs and symptoms of hepatotoxicity. Be prepared to discontinue drug if these occur.

- Assess for muscle weakness, poor coordination, and reduced reflexes before and during therapy. Drug may weaken muscles and impair ambulation.

### Patient teaching

 Instruct patient receiving prolonged oral therapy to immediately report weakness, malaise, fatigue, nausea, rash, itching, severe diarrhea, bloody or black tarry stools, or yellowing of skin or eyes.

- Inform patient that drug may cause drowsiness, dizziness, or light-headedness.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## darbepoetin alfa

Aranesp

**Pharmacologic class:** Recombinant human erythropoietin

**Therapeutic class:** Hematopoietic

**Pregnancy risk category** C

### FDA BOXED WARNING

- In patients with chronic kidney disease, drug increases risk of death, serious cardiovascular events, and stroke when given to target hemoglobin level above 11 g/dl.

- No trial has identified a hemoglobin target level, darbepoetin alfa dosage, or dosing strategy that doesn't increase these risks.

- Use lowest dose sufficient to reduce need for red blood cell (RBC) transfusions.
- Drug may shorten overall survival or increase risk of tumor progression or recurrence in patients with breast, non-small-cell lung, head and neck, lymphoid, and cervical cancers.
- Prescribers and hospitals must enroll in and comply with the ESA APPRISE Oncology Program to prescribe or dispense this drug to patients with cancer.
- Use drug only for treatment of anemia due to myelosuppressive chemotherapy.
- Drug isn't indicated for patients receiving myelosuppressants when the anticipated outcome is cure.
- Discontinue drug following completion of a chemotherapy course.

### Action

Stimulates erythropoiesis in bone marrow, increasing red blood cell production

### Availability

*Solution for injection:* 25 mcg/ml, 40 mcg/ml, 60 mcg/ml, 100 mcg/ml, 200 mcg/ml, 300 mcg/ml, 500 mcg/ml, 150 mcg/0.75 ml in single-dose vials; 25 mcg/0.42ml, 40 mcg/0.4 ml, 60 mcg/0.3 ml, 100 mcg/0.5 ml, 150 mcg/0.3 ml, 200 mcg/0.4 ml, 300 mcg/0.6 ml, 500 mcg/1 ml in single-dose prefilled syringes

### Indications and dosages

- Anemia caused by chronic kidney disease (CKD) in patients on dialysis
- Adults:** Initially, 0.45 mcg/kg I.V. or subcutaneously weekly, or 0.75 mcg/kg I.V. or subcutaneously q 2 weeks
- Anemia caused by CKD in patients not on dialysis

**Adults:** 0.45 mcg/kg I.V. or subcutaneously at 4-week intervals

➤ Chemotherapy-induced anemia in patients with nonmyeloid malignancies

**Adults:** 2.25 mcg/kg subcutaneously q week, or 500 mcg subcutaneously q 3 weeks.

### Contraindications

- Serious allergic reactions to drug
- Uncontrolled hypertension
- Pure red cell aplasia that begins after treatment with darbepoetin alfa or other erythropoietin protein drugs

### Precautions

Use cautiously in:

- latex allergy (needle cover of prefilled syringe contains dry natural rubber, a derivative of latex)
- anemia; thalassemia; porphyria; seizures; underlying hematologic disease, including hemolytic and sickle cell anemia
- lack or loss of response to drug
- pregnant or breastfeeding patients
- children.

### Administration

- Give by subcutaneous or I.V. injection only. (I.V. route is recommended for patients on hemodialysis.)
- Evaluate iron status for all patients before and during treatment to ensure effective erythropoiesis.
- For patients with CKD on dialysis, start drug when hemoglobin level is less than 10 g/dl. If hemoglobin level approaches or exceeds 11 g/dl, reduce dosage or interrupt therapy.
- For patients with CKD not on dialysis, consider starting drug only when hemoglobin level is less than 10 g/dl and the following considerations apply: Rate of hemoglobin decline indicates likelihood of requiring an RBC transfusion and, reducing risk of alloimmunization or other RBC transfusion-related risks is a goal.

If hemoglobin level exceeds 10 g/dl, reduce dosage or interrupt therapy and use lowest dose sufficient to reduce need for RBC transfusions.

- Don't increase dosage more frequently than once q 4 weeks; dosage decreases can occur more frequently. Avoid frequent dosage adjustments.
- Don't dilute or give with other drug solutions.

🔊 Don't shake. Vigorous shaking may denature drug, making it biologically inactive.

- Give single I.V. dose over 1 minute.
- Discard unused portion. (Drug contains no preservative.)

Route	Onset	Peak	Duration
I.V., subcut.	2-6 wk	Unknown	Unknown

### Adverse reactions

**CNS:** dizziness, headache, fatigue, weakness, **seizures, transient ischemic attack, cerebrovascular accident**

**CV:** hypertension, hypotension, chest pain, peripheral edema, **arrhythmias, heart failure, cardiac arrest, myocardial infarction, vascular access thrombosis**

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain

**Metabolic: fluid overload**

**Musculoskeletal:** myalgia; joint, back, and limb pain

**Respiratory:** cough, upper respiratory tract infection, dyspnea, bronchitis

**Skin:** pruritus

**Other:** fever, flulike symptoms, infection, pain at injection site

### Interactions

None significant

### Patient monitoring

- Assess hemoglobin concentration before starting therapy and then weekly during therapy.
- Observe closely for serious CNS and cardiovascular adverse reactions.

- Closely monitor blood pressure and renal function during therapy.
- Know that supplemental iron is recommended for patients with serum ferritin level below 100 mcg/ml or serum transferrin saturation below 20%.

### Patient teaching

- Tell patient to report chest pain or other pain, muscle tremors, weakness, and cough or other respiratory symptoms.
- If patient will self-administer drug, tell him to follow exact directions for injection and needle disposal.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Advise patient to minimize GI upset by eating small, frequent servings of healthy food and drinking plenty of fluids.
- Tell patient he'll undergo frequent blood testing during therapy to help determine correct dosage.
- As appropriate, review all other significant and life-threatening adverse reactions.

## darifenacin hydrobromide

Emselex<sup>®</sup>, Enablex

**Pharmacologic class:** Anticholinergic

**Therapeutic class:** Renal and genitourinary agent

**Pregnancy risk category C**

### Action

Competitively antagonizes muscarinic receptors, reducing contractions of urinary bladder smooth muscle

### Availability

Tablets (extended-release): 7.5 mg, 15 mg

## Indications and dosages

➤ Overactive bladder with symptoms of urge urinary incontinence, urgency, and frequency

**Adults:** Initially, 7.5 mg P.O. daily; may increase to 15 mg P.O. daily as early as 2 weeks after therapy begins

### Dosage adjustment

- Moderate hepatic impairment
- Concurrent use of potent CYP3A4 inhibitors (such as clarithromycin, itraconazole, ketoconazole, nefazodone, nelfinavir, and ritonavir)

### Contraindications

- Hypersensitivity to drug or its components
- Urinary retention, gastric retention, uncontrolled angle-closure glaucoma, or increased risk for these conditions

### Precautions

Use cautiously in:

- decreased GI motility (such as severe constipation, ulcerative colitis, or myasthenia gravis), controlled angle-closure glaucoma, hepatic impairment
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Administer tablets whole with liquid (with or without food) once daily.
- Make sure patient doesn't chew, crush, or divide them.
- Know that drug isn't recommended for patients with severe hepatic impairment.

Route	Onset	Peak	Duration
P.O.	Unknown	5.2-7.6 hr	Unknown

### Adverse reactions

**CNS:** dizziness, asthenia

**CV:** hypertension

**EENT:** dry eyes, abnormal vision, dry throat, bronchitis, pharyngitis, rhinitis, sinusitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, dry mouth

**GU:** urinary tract infection or disorder, vaginitis

**Musculoskeletal:** back pain, arthralgia

**Skin:** dry skin, rash, pruritus

**Other:** abnormal taste, weight gain, accidental injury, flulike syndrome, pain, peripheral edema, heat prostration

## Interactions

**Drug-drug.** *Anticholinergics:* increased frequency or severity of adverse reactions

*CYP4502D6 inhibitors:* increased darifenacin exposure and blood level

*Drugs metabolized by CYP2D6 (such as flecainide, thioridazine, and tricyclic antidepressants):* increased blood levels of these drugs

## Patient monitoring

- Monitor liver function tests frequently; withdraw drug if liver function tests show severe hepatic impairment.
- Monitor urinary function periodically.

## Patient teaching

- Instruct patient to take tablets whole with liquid, with or without food. Tell him not to chew, divide, or crush them.
- Inform patient that some over-the-counter products such as antihistamines may increase risk of side effects.
- Caution patient that drug may cause heat prostration; describe signs and symptoms.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

## darunavir ethanolate

Prezista

**Pharmacologic class:** Protease inhibitor

**Therapeutic class:** Antiretroviral

**Pregnancy risk category B**

## Action

Inhibits human immunodeficiency virus-1 (HIV-1) protease, preventing formation of mature virus particles

## Availability

*Oral suspension:* 100 mg/ml

*Tablets:* 75 mg, 150 mg, 400 mg, 600 mg

## Indications and dosages

➤ HIV infection in treatment-naïve and treatment-experienced patients with no darunavir resistance-associated substitutions

**Adults:** 800 mg (two 400-mg tablets) or 8 ml (two 4-ml doses) oral suspension P.O. with ritonavir 100 mg P.O. daily

➤ HIV infection in treatment-experienced patients with at least one darunavir resistance-associated substitution

**Adults:** 600 mg (one 600-mg tablet) or 6 ml oral suspension P.O. b.i.d. with ritonavir 100 mg P.O. b.i.d.

➤ HIV infection (with ritonavir and other retrovirals)

**Children age 3 to younger than 18 weighing 40 kg (88 lb) or more:** 600 mg (tablets) or 6 ml (oral suspension) P.O. b.i.d. with ritonavir 100 mg (capsules or tablets) or 1.25 ml (oral solution) P.O. b.i.d.

**Children age 3 to younger than 18 weighing 30 kg (66 lb) to less than 40 kg:** 450 mg (tablets) or 4.6 ml (oral suspension) P.O. b.i.d. with ritonavir

60 mg (0.75 ml oral solution) P.O. b.i.d.

**Children age 3 to younger than**

**18 weighing 15 kg (33 lb) to less than 30 kg:** 375 mg (tablets) or 3.8 ml (oral suspension) P.O. b.i.d. with ritonavir 50 mg (0.6 ml oral solution) P.O. b.i.d.

**Children age 3 to younger than 18 weighing 14 kg (31 lb) to less than**

**15 kg:** 280 mg (2.8 ml oral suspension) P.O. b.i.d. with ritonavir 48 mg (0.6 ml oral solution) P.O. b.i.d.

**Children age 3 to younger than**

**18 weighing 13 kg (29 lb) to less than 14 kg:** 260 mg (2.6 ml oral suspension) P.O. b.i.d. with ritonavir 40 mg (0.5 ml oral solution) P.O. b.i.d.

**Children age 3 to younger than**

**18 weighing 12 kg (26 lb) to less than 13 kg:** 240 mg (2.4 ml oral suspension) P.O. b.i.d. with ritonavir 40 mg (0.5 ml oral solution) P.O. b.i.d.

**Children age 3 to younger than**

**18 weighing 11 kg (24 lb) to less than 12 kg:** 220 mg (2.2 ml oral suspension) P.O. b.i.d. with ritonavir 32 mg (0.4 ml oral solution) P.O. b.i.d.

**Children age 3 to younger than**

**18 weighing 10 kg (22 lb) to less than 11 kg:** 200 mg (2 ml oral suspension) P.O. b.i.d. with ritonavir 32 mg (0.4 ml oral solution) P.O. b.i.d.

Children's dosage shouldn't exceed treatment-experienced adult dosage.

### Contraindications

- Concurrent administration with drugs (including alfuzosin, cisapride, dihydroergotamine, ergonovine, ergotamine, lovastatin, methylergonovine, midazolam, pimozone, rifampin, sildenafil, simvastatin, terfenadine, triazolam, and St. John's wort)

### Precautions

Use cautiously in:

- hypersensitivity to drug or its components (including sulfa)
- severe hepatic impairment (use not recommended)

- diabetes mellitus, hemophilia, hepatic dysfunction or disease
- concurrent use of carbamazepine, phenobarbital, phenytoin (use not recommended)
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 3 (safety and efficacy not established; don't use).

### Administration

- Give with ritonavir and food.
- Before administering, assess children weighing 15 kg (33 lb) or more for the ability to swallow tablets. If a child is unable to reliably swallow a tablet, consider using oral suspension. Give 8-ml dose as two 4-ml administrations using the oral dosing syringe included.
- 🚫 Don't give concurrently with alfuzosin, cisapride, dihydroergotamine, ergonovine, ergotamine, methylergonovine, midazolam, pimozone, rifampin, sildenafil, simvastatin, terfenadine, terfenadine, or St. John's wort.
- Don't use once-daily dosing in children.

Route	Onset	Peak	Duration
P.O.	Unknown	2.5-4 hr	Unknown

### Adverse reactions

**CNS:** asthenia, fatigue, headache, transient ischemic attack, confusion, disorientation, anxiety, irritability, altered mood, memory impairment, vertigo, rigors, peripheral neuropathy, paresthesia, hypoesthesia, somnolence, nightmares

**CV:** tachycardia, hypertension,

**myocardial infarction**

**EENT:** nasopharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, abdominal distention, flatulence, dry mouth, anorexia

**GU:** renal insufficiency, nephrolithiasis, polyuria, gynecomastia, **acute renal failure**

**Metabolic:** diabetes mellitus, polydipsia, obesity

**Musculoskeletal:** arthralgia, myalgia, extremity pain, osteopenia, osteoporosis

**Respiratory:** dyspnea, cough

**Skin:** allergic dermatitis, eczema, inflammation, toxic skin eruption, dermatitis medicamentosa, hyperhidrosis, folliculitis, maculopapular rash, alopecia, **erythema multiforme**, **Stevens-Johnson syndrome**

**Other:** body fat redistribution, lipotrophy, decreased appetite, hiccups, pyrexia, night sweats, hyperthermia, peripheral edema, immune reconstitution syndrome (inflammatory response to indolent or residual opportunistic infections)

## Interactions

**Drug-drug.** *Amiodarone, atorvastatin, bepridil, clarithromycin, cyclosporine, felodipine, fluticasone propionate (inhalation), lidocaine (systemic), nicardipine, nifedipine, pravastatin, quinidine, sildenafil, sirolimus, tacrolimus, tadalafil, trazodone, vardenafil:* increased blood levels of these drugs

*Astemizole, cisapride, terfenadine:* increased risk of serious or life-threatening reactions (such as arrhythmias)

*Carbamazepine, dexamethasone (systemic), phenobarbital, phenytoin, rifampin:* decreased darunavir blood level

*Efavirenz:* decreased blood levels of both drugs

*Ergot derivatives (dihydroergotamine, ergonovine, ergotamine, methylergonovine):* increased risk of acute ergot toxicity

*Hormonal contraceptives:* decreased ethinyl estradiol blood level; may decrease contraceptive efficacy

*Itraconazole, ketoconazole:* increased blood levels of these drugs and darunavir

*Lopinavir/ritonavir, saquinavir:*

decreased effects of these drugs

*Lovastatin, pimoziide, simvastatin:*

increased risk of myopathy

*Methadone, voriconazole, warfarin:*

decreased blood levels of these drugs

*Midazolam, triazolam:* increased risk of respiratory depression or increased sedation

*Paroxetine, sertraline:* decreased effects of these drugs

*Rifabutin:* increased rifabutin blood level, decreased darunavir blood level (when given with ritonavir)

*Voriconazole:* decreased voriconazole and increased darunavir blood levels

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, amylase, aspartate aminotransferase, gamma-glutamyltransferase, lipase, lipids, partial thromboplastin time, plasma prothrombin time, total cholesterol, triglycerides, uric acid:* increased levels

*Bicarbonate, calcium, lymphocytes, platelets, total absolute neutrophils, white blood cells:* decreased levels

*Bilirubin, serum glucose, sodium:* increased or decreased levels

**Drug-food.** *Any food:* increased drug absorption

**Drug-herbs.** *St. John's wort:* decreased darunavir blood level

## Patient monitoring

- During initial treatment phase, stay alert for immune reconstitution syndrome.
- Monitor liver function studies frequently in patients with preexisting hepatic dysfunction or disease.
- Monitor blood glucose levels frequently in patients with diabetes mellitus.
- Carefully monitor patient receiving antiarrhythmics and HMG-CoA reductase inhibitors while taking this drug.

- Monitor International Normalized Ratio when giving drug with warfarin.

### Patient teaching

- Instruct patient to take drug with ritonavir and food, as prescribed.
- Advise patient to inform prescriber of other drugs and supplements he's taking (including vitamins and herbs) before starting drug or taking new medication.
- 📢 Urge patient to immediately report side effects (especially rash).
- Emphasize that drug doesn't cure HIV infection.
- Advise patient using hormonal contraceptives to use alternative contraceptive method while taking this drug.
- Advise patients who are pregnant or recently gave birth not to breastfeed because of risk of passing HIV infection to infant and potentially serious adverse drug reactions.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## dasatinib

Sprycel

**Pharmacologic class:** Tyrosine kinase inhibitor

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### Action

Inhibits growth of chronic myeloid leukemia (CML) and acute lymphoblastic leukemia (ALL) cell lines overexpressing BCR-ABL; this inhibition allows bone marrow to resume production of normal red cells, white cells, and platelets.

### Availability

**Tablets:** 20 mg, 50 mg, 70 mg, 80 mg, 100 mg, 140 mg (film-coated)

### Indications and dosages

➤ Newly diagnosed Philadelphia chromosome-positive (Ph+) chronic phase of CML

**Adults:** 100 mg P.O. daily in morning or evening; may increase dosage to 140 mg daily in patients who don't achieve a hematologic or cytogenetic response

➤ Chronic, accelerated or myeloid or lymphoid blast phase Ph+ CML in patients with resistance or intolerance to prior therapy, including imatinib; Philadelphia chromosome-positive acute lymphoblastic leukemia (Ph+ ALL) in patients with resistance or intolerance to prior therapy

**Adults:** 140 mg P.O. daily in two divided doses (70 mg b.i.d.) in morning and evening; may increase dosage to 180 mg daily in patients who don't achieve a hematologic or cytogenetic response

### Dosage adjustment

- Myelosuppression
- Strong CYP3A4 inducers or inhibitors

### Contraindications

None

### Precautions

Use cautiously in:

- hepatic impairment
- myelosuppression
- concomitant use of anticoagulants, aspirin, or NSAIDs
- patients with underlying cardiopulmonary disease
- concurrent use of strong CYP3A4 inducers or inhibitors (avoid use if possible)
- patients at risk for fluid retention or QT interval prolongation (including those with hypokalemia, hypomagnesemia, or congenital long-QT)

syndrome; those taking antiarrhythmics or other drugs that lead to QT prolongation; and cumulative high-dose anthracycline therapy)

- concurrent use of histamine-2 ( $H_2$ ) antagonists or proton pump inhibitors (not recommended)
- concurrent use of drugs that inhibit platelet function or anticoagulants
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

### Administration

 Evaluate patients for signs and symptoms of underlying cardiopulmonary disease before starting drug. If pulmonary arterial hypertension (PAH) is confirmed, permanently discontinue drug.

- Correct hypokalemia or hypomagnesemia before starting drug.
- Know that patients with CML or Ph+ ALL should have shown resistance to or intolerance of imatinib mesylate.
- Don't crush or cut tablets. Administer whole with or without food, but not with grapefruit juice.
- If tablets are inadvertently crushed or broken, wear disposable chemotherapy gloves. Pregnant personnel should avoid exposure to crushed or broken tablets.
- If patient needs antacid, give antacid at least 2 hours before or 2 hours after dasatinib.
- Know that hematopoietic growth factor may be used in patients with resistant myelosuppression.

Route	Onset	Peak	Duration
P.O.	Unknown	0.5-6 hr	Unknown

### Adverse reactions

**CNS:** headache, fatigue, asthenia, neuropathy, peripheral neuropathy, dizziness, somnolence, insomnia, depression, malaise, **CNS bleeding**

**CV:** palpitations, flushing, hypertension, **prolonged QT interval, congestive heart failure, pericardial effusion, arrhythmia**

**EENT:** visual disorder, dry eye

**GI:** diarrhea, nausea, vomiting, mucositis, stomatitis, dyspepsia, abdominal distention, constipation, gastritis, oral soft-tissue disorder, colitis, enterocolitis, anorexia, appetite disturbances, dysphagia, abdominal pain, anal fissure, upper GI ulcer, esophagitis

**Hematologic:** myelosuppression (anemia, **neutropenia, thrombocytopenia, pancytopenia**), febrile neutropenia, **hemorrhage, GI bleeding**

**Metabolic:** fluid retention

**Musculoskeletal:** arthralgia, myalgia, inflammation, weakness

**Respiratory:** dyspnea, upper respiratory tract infection, pneumonia, pneumonitis, cough, lung infiltration, **pleural effusion, pulmonary edema, pulmonary hypertension**

**Skin:** rash, pruritus, acne, alopecia, dry skin, hyperhidrosis, urticaria, dermatitis

**Other:** fever, chills, infection, herpesvirus infection, ascites, generalized edema, pain, chest pain, dysgeusia, weight changes, temperature intolerance, contusion, **sepsis**

### Interactions

**Drug-drug.** *Antacids:* reduced dasatinib plasma concentration

*Anticoagulants, platelet inhibitors (such as aspirin, NSAIDs):* increased risk of bleeding

*CYP3A4 substrates with narrow therapeutic index (such as alfentanil, astemizole, cisapride, cyclosporine, ergot alkaloids, fentanyl, pimozone, quinidine, simvastatin, sirolimus, tacrolimus, terfenadine):* potentially increased concentration of these drugs

*H<sub>2</sub> antagonists or proton-pump inhibitors (such as famotidine, omeprazole), strong CYP3A4 inducers (such as carbamazepine, dexamethasone,*

*phenobarbital, phenytoin, rifabutin, rifampin*: reduced dasatinib blood level  
*Strong CYP3A4 inhibitors (such as atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, voriconazole)*: increased dasatinib blood level

**Drug-diagnostic tests.** *Calcium, neutrophils, phosphorus, platelets*: decreased levels

*ALT, AST, bilirubin, creatinine*:

increased levels

**Drug-food.** *Grapefruit juice*: increased dasatinib blood level

**Drug-herbs.** *St. John's wort*: unpredictable decrease in dasatinib blood level

### Patient monitoring

 Monitor patient for QT prolongation and hemorrhage.

- Be aware that severe thrombocytopenia, neutropenia, and anemia are more common in patients with advanced-phase CML or Ph+ ALL than in those with chronic-phase CML. Monitor complete blood count weekly for first 2 months and then monthly thereafter, or as indicated.

- Monitor hepatic function tests.
- Be prepared to manage transaminase or bilirubin elevations with dosage reduction or therapy interruption.
- Stay alert for fluid retention. Be prepared to manage with supportive care measures, such as diuretics or short courses of steroids.
- Monitor calcium levels. Some patients who develop Grade 3 or 4 hypocalcemia during therapy may recover with oral calcium supplementation.

 Monitor patient for signs and symptoms of PAH (dyspnea, fatigue, hypoxia, fluid retention), which may occur anytime after initiation, including after more than 1 year of treatment.

### Patient teaching

- Instruct patient to take tablet whole with or without food. Caution patient not to break, crush, or cut tablet.

- Advise patient to avoid grapefruit juice.

- Tell patient to take antacids (if needed) at least 2 hours before or 2 hours after dasatinib.

 Instruct patient to immediately report fever or chills (and other signs or symptoms of infection), unusual bleeding or bruising, shortness of breath, fatigue, fluid retention, swelling, or weight gain.

- Instruct patient to report troublesome nausea, vomiting, diarrhea, headache, musculoskeletal pain, fatigue, or rash.

- Teach patient that drug may increase risk of infection. Advise patient to wash hands frequently, wear a mask in public places, and avoid people with infections.

- Inform lactose-intolerant patient that drug contains lactose.

- Advise patient to avoid St. John's wort, NSAIDs (such as ibuprofen), and over-the-counter drugs that contain aspirin during therapy.

- Advise female patient that drug may harm fetus. Caution her to avoid becoming pregnant. If drug is used during pregnancy or patient becomes pregnant while taking it, inform her of potential hazard to fetus.

- Advise breastfeeding patient to discuss with prescriber whether to discontinue breastfeeding or drug, taking into account importance of drug to mother.

- Advise male taking drug to use condom, to avoid getting partner pregnant.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, food, and herbs mentioned above.

## daunorubicin citrate liposome

DaunoXome

**Pharmacologic class:** Anthracycline glycoside

**Therapeutic class:** Antibiotic antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

- Monitor cardiac function regularly during therapy, because of potential cardiotoxicity and congestive heart failure. Also monitor cardiac function in patients who have cardiac disease or received previous anthracyclines.
- Severe myelosuppression may occur.
- Give under supervision of experienced physician.
- Reduce dosage in patients with hepatic impairment.
- Drug may cause triad of back pain, flushing, and chest tightness. Triad usually occurs within first 5 minutes of infusion, subsides with infusion interruption, and doesn't recur when infusion resumes at slower rate.

### Action

Inhibits DNA synthesis and DNA-dependent RNA synthesis through intercalation. Formulation increases selectivity of daunorubicin for solid tumors; may increase permeability of tumor neovasculature to some particles in drug's size range.

### Availability

*Injection:* 2 mg/ml

### Indications and dosages

➤ First-line cytotoxic therapy for advanced Kaposi's sarcoma associated

with human immunodeficiency virus (HIV)

**Adults:** 40 mg/m<sup>2</sup> I.V. over 1 hour.

Repeat q 2 weeks until evidence of disease progression or other complications occur.

### Dosage adjustment

- Renal or hepatic impairment

### Contraindications

- Hypersensitivity to drug

### Precautions

Use cautiously in:

- renal or hepatic impairment, bone marrow depression, cardiac disease, gout, infections
- pregnant or breastfeeding patients.

### Administration

- Follow facility policy for preparing and handling antineoplastics.
- Dilute 1:1 with 5% dextrose injection.
- Don't use in-line filter for I.V. infusion.
- If prescribed, premedicate with allopurinol to help prevent hyperuricemia.
- Take steps to prevent extravasation.
- Protect solution from light.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache, fatigue, malaise, confusion, depression, dizziness, drowsiness, emotional lability, anxiety, hallucinations, syncope, tremors, rigors, insomnia, neuropathy, amnesia, hyperactivity, abnormal thinking, **meningitis, seizures**

**CV:** hypertension, chest pain, palpitations, **myocardial infarction, cardiac arrest**

**EENT:** abnormal vision, conjunctivitis, eye pain, hearing loss, earache, tinnitus, rhinitis, sinusitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia,

gastritis, enlarged spleen, fecal incontinence, hemorrhoids, tenesmus, melena, difficulty swallowing, dry mouth, mouth inflammation, **GI hemorrhage**

**GU:** dysuria, nocturia, polyuria

**Hematologic:** thrombocytopenia, neutropenia

**Hepatic:** hepatomegaly

**Metabolic:** hyperuricemia, dehydration

**Musculoskeletal:** joint pain, myalgia, muscle rigidity, back pain, abnormal gait

**Respiratory:** dyspnea, cough, hemoptysis, increased sputum, **pulmonary infiltrations, pulmonary hypertension**

**Skin:** pruritus, dry skin, seborrhea, folliculitis, alopecia, sweating

**Other:** bleeding gums, dental caries, altered taste, lymphadenopathy, opportunistic infections, fever, hot flashes, hiccups, thirst, infusion site inflammation, edema, allergic reactions

## Interactions

**Drug-diagnostic tests.** *Granulocytes:* decreased count

*Uric acid:* increased level

## Patient monitoring

- Assess cardiac, renal, and hepatic function before each course of treatment.
- Determine left ventricular ejection fraction before and during therapy.
- Evaluate CBC with white cell differential before each dose. Withhold dose if granulocyte count is below 750 cells/mm<sup>3</sup>.
- Monitor serum uric acid level.

## Patient teaching

 Instruct patient to immediately report swelling, pain, burning, or redness at infusion site, as well as persistent nausea, vomiting, diarrhea, chest pain, arm or leg swelling, difficulty breathing, palpitations, rapid heart-beat, yellowing of skin or eyes, abdominal pain, or bloody stools.

- Tell patient drug makes him more susceptible to infection. Advise him to avoid crowds and exposure to illness.
- Advise patient to minimize GI upset by eating small, frequent servings of healthy food, drinking plenty of fluids, and chewing gum.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## daunorubicin hydrochloride

Cerubidine

**Pharmacologic class:** Anthracycline glycoside

**Therapeutic class:** Antibiotic anti-neoplastic

**Pregnancy risk category D**

## FDA BOXED WARNING

- Administer into rapidly flowing I.V. infusion; never give I.M. or subcutaneously. Severe local tissue necrosis results if extravasation occurs.
- Myocardial toxicity (manifested most severely as potentially fatal congestive heart failure) may occur during therapy or months to years afterward. Incidence increases with total cumulative dose exceeding 550 mg/m<sup>2</sup> in adults, 300 mg/m<sup>2</sup> in children older than age 2, or 10 mg/kg in children younger than age 2.
- Therapeutic doses cause severe myelosuppression. Drug should be given only by physician experienced in leukemia chemotherapy, in facility with adequate diagnostic and treatment resources for monitoring drug tolerance and treating toxicity. Physician and facility must be capable of

responding rapidly and completely to severe hemorrhagic conditions and overwhelming infection.

- Reduce dosage in patients with hepatic or renal impairment.

### Action

Antimitotic and cytotoxic. Forms complexes with DNA by intercalation between base pairs. Inhibits topoisomerase II activity by stabilizing topoisomerase II complex; causes breaks in single- and double-stranded DNA. May also inhibit polymerase activity, influence regulation of gene expression, and cause free radical damage to DNA.

### Availability

*Injection:* 5 mg/ml

*Lyophilized powder for injection:*  
21.4 mg, 53.5 mg

### Indications and dosages

➤ Acute nonlymphocytic leukemia  
**Adults older than age 60:** 30 mg/m<sup>2</sup>/day I.V. on days 1, 2, and 3 of first course and on days 1 and 2 of subsequent courses; given with cytarabine I.V. infusion (7 days for first course, 5 days for subsequent courses)

**Adults younger than age 60:** 45 mg/m<sup>2</sup>/day I.V. on days 1, 2, and 3 of first course and on days 1 and 2 of subsequent courses; given with cytarabine I.V. infusion (7 days for first course, 5 days for subsequent courses)

➤ Acute lymphocytic leukemia  
**Adults:** 45 mg/m<sup>2</sup>/day I.V. on days 1, 2, and 3; vincristine I.V. on days 1, 8, and 15; prednisone P.O. on days 1 through 22, then tapered between days 22 and 29; then asparaginase I.V. on days 22 to 32

**Children ages 2 and older:** 25 mg/m<sup>2</sup>/day I.V. on first day every week; may be given in combination with vincristine I.V. on first day every week and prednisone P.O. daily

### Dosage adjustment

- Renal or hepatic impairment

### Contraindications

- Hypersensitivity to drug

### Precautions

Use cautiously in:

- renal or hepatic impairment, bone marrow depression, cardiac disease, gout, infections
- elderly patients
- pregnant or breastfeeding patients.

### Administration

- Follow facility policy for preparing and handling antineoplastics.
- If prescribed, premedicate with allopurinol to help prevent hyperuricemia.

🔊 Give by I.V. route only.

- Reconstitute vial contents with 4 ml of sterile water for injection to yield 5 mg/ml solution.

- Don't mix with other drugs or heparin.
- Withdraw desired dosage into syringe containing 10 to 15 ml of normal saline solution; then inject into tubing or sidearm of compatible, rapidly flowing I.V. solution over 3 to 5 minutes. For intermittent infusion, mix with 100 ml of normal saline solution and infuse over 30 to 45 minutes.

🔊 Take care to prevent extravasation, because drug causes severe local tissue necrosis. If extravasation occurs, stop infusion immediately; according to facility policy, intervene to avoid severe tissue necrosis, severe cellulitis, thrombophlebitis, and painful induration.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

### Adverse reactions

**CV:** cardiotoxicity

**GI:** acute nausea, vomiting, GI mucosal inflammation

**GU:** urine discoloration

**Hematologic:** bone marrow depression

**Metabolic:** hyperuricemia

**Skin:** rash, contact dermatitis, urticaria, reversible alopecia

### Interactions

**Drug-drug.** *Other antineoplastic, hepatotoxic, or myelosuppressive drugs:* increased risk of toxicity

**Drug diagnostic tests.** *Granulocytes:* decreased count

*Uric acid:* increased level

### Patient monitoring

 Observe I.V. site closely for extravasation.

- Monitor cardiac, renal, and hepatic function before each course of treatment.
- Evaluate CBC with white cell differential before each dose. Withhold dose if granulocyte count is below 750 cells/mm<sup>3</sup>.
- Monitor serum uric acid level.

### Patient teaching

 Instruct patient to immediately report swelling, pain, burning, or redness at infusion site, as well as persistent nausea, vomiting, diarrhea, bloody stools, abdominal or chest pain, swollen arm or leg, difficulty breathing, palpitations, rapid heartbeat, or yellowing of skin or eyes.

- Inform patient that drug makes him more susceptible to infection. Caution him to avoid crowds and exposure to illness.
- Advise patient to minimize GI upset by eating small, frequent servings of healthy food, drinking plenty of fluids, and chewing gum.
- Tell patient that drug may redden his urine.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## deferasirox

Exjade

**Pharmacologic class:** Iron-chelating agent

**Therapeutic class:** Antidote

**Pregnancy risk category** B

### FDA BOXED WARNING

- Deferasirox may cause renal and hepatic impairment (including failure) and GI hemorrhage. In some reported cases, these reactions were fatal and were more frequently observed in patients with advanced age, high-risk myelodysplastic syndromes, underlying renal or hepatic impairment, or low platelet count (less than  $50 \times 10^9/L$ ).
- Deferasirox therapy requires close patient monitoring, including measurement of serum creatinine and creatinine clearance before starting therapy and monthly thereafter.
- In patients with underlying renal impairment or risk factors for renal impairment, monitor serum creatinine and creatinine clearance weekly for the first month, then monthly thereafter.
- In patients with underlying hepatic impairment, monitor serum transaminase and bilirubin levels before starting therapy, every 2 weeks during first month, and monthly thereafter.

### Action

Binds selectively to iron

### Availability

*Tablets for oral suspension:* 125 mg, 250 mg, 500 mg

## Indications and dosages

➤ Chronic iron overload caused by blood transfusions

### Adults and children ages 2 and older:

Initially, 20 mg/kg (calculated to nearest whole tablet) P.O. daily on empty stomach at least 30 minutes before a meal, preferably at same time each day. Don't exceed 30 mg/kg daily.

## Dosage adjustment

- Serum creatinine elevation
- Severe, persistent liver enzyme elevations; moderate (Child-Pugh B) hepatic impairment
- Administration with potent UDP-glucuronosyltransferase (UGT) inducers or cholestyramine

## Contraindications

- Hypersensitivity to drug or its components
- Creatinine clearance below 40 ml/minute or serum creatinine level above two times age-appropriate upper limit of normal
- Poor performance status and high-risk myelodysplastic syndromes or advanced malignancies
- Platelet count below  $50 \times 10^9/L$

## Precautions

Use cautiously in:

- serum creatinine elevation, liver enzyme elevation, severe rash
- severe hepatic impairment (Child-Pugh C) (avoid use)
- concurrent use of drugs with ulcerogenic or hemorrhagic potential, such as nonsteroidal anti-inflammatory drugs, corticosteroids, oral bisphosphonates, anticoagulants; or drugs metabolized by CYP3A4
- potent UGT inducers or cholestyramine (avoid use if possible)
- pregnant or breastfeeding patients.

## Administration

 Make sure patient doesn't swallow tablets whole.

- Disperse tablets completely in water, orange juice, or apple juice; have patient consume suspension immediately. If residue remains, resuspend it in small amount of liquid and have patient swallow it. Disperse doses lower than 1 g in 3.5 oz liquid; disperse doses higher than 1 g in 7 oz liquid.
- Adjust dosage every 3 to 6 months in increments of 5 to 10 mg/kg based on ferritin levels, treatment goals, and response.

Route	Onset	Peak	Duration
P.O.	Unknown	1.5-4 hr	Unknown

## Adverse reactions

**CNS:** headache, fatigue, dizziness

**EENT:** cataract, retinal disorder, increased intraocular pressure, ear infection, hearing loss, rhinitis, nasopharyngitis, pharyngolaryngeal pain, pharyngitis, acute tonsillitis

**GI:** nausea, vomiting, diarrhea, abdominal pain, irritation, ulceration, **hemorrhage**

**GU:** renal dysfunction

**Hematologic:** **cytopenias (agranulocytosis, neutropenia, thrombocytopenia)**

**Hepatic:** **liver dysfunction**

**Musculoskeletal:** arthralgia, back pain

**Respiratory:** cough, respiratory tract infection, bronchitis

**Skin:** rash, urticaria, erythema multiforme

**Other:** fever, influenza **hypersensitivity reactions** (including **anaphylaxis, angioedema**)

## Interactions

**Drug-drug.** *Aluminum-containing antacids:* possible binding with antacid  
*Cholestyramine, potent UGT inducers (such as phenobarbital, phenytoin, rifampin, ritonavir):* decreased deferasirox systemic exposure (area under the curve)

*Drugs metabolized by CYP3A4 (such as cyclosporine, hormonal contraceptives, simvastatin):* possible decrease in CYP3A4 substrate concentration and

potential loss of effectiveness of these drugs

**Drug-diagnostic tests.** *Liver function tests, serum creatinine:* increased

**Drug-food.** *Any food:* increased deferasirox bioavailability

### Patient monitoring

 Discontinue drug if hypersensitivity reactions are severe and institute appropriate medical intervention.

- Perform baseline auditory and ophthalmic testing; repeat every 12 months.
- Monitor serum ferritin levels monthly. If levels fall consistently below 500 mcg/L, consider temporarily interrupting therapy.

- Monitor serum creatinine level and creatinine clearance before starting drug and monthly thereafter. In patients with additional renal risk factors, monitor serum creatinine level and creatinine clearance weekly during first month after initiation or modification of therapy and monthly thereafter. Consider dosage reduction, therapy interruption, or drug discontinuation if levels increase.

- Monitor serum transaminase and bilirubin levels before starting drug, every 2 weeks during first month of therapy, and monthly thereafter. Consider dosage modifications or interruption of treatment for severe or persistent elevations.

- Monitor CBC regularly. Consider interrupting treatment in patients who develop unexplained cytopenia.

 Stay alert for signs and symptoms of GI ulceration and hemorrhage during therapy; promptly initiate additional evaluation and treatment if serious GI adverse event is suspected.

### Patient teaching

- Instruct patient to take drug on empty stomach at least 30 minutes before food, preferably at same time each day.
- Instruct patient to place tablets in water, orange juice, or apple juice and

stir until completely dissolved. Tell him not to chew or swallow them.

- Advise patient not to take aluminum-containing antacids during therapy.

- Tell patient drug may cause vision and hearing disturbances, necessitating routine ophthalmic and auditory testing.

- Caution patient to avoid driving and other hazardous activities until drug effects are known.

- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## degarelix

### Firmagon

**Pharmacologic class:** Gonadotropin-releasing hormone (GnRH) receptor antagonist

**Therapeutic class:** Antineoplastic

**Pregnancy risk category X**

### Action

Binds reversibly to the pituitary GnRH receptors, thereby reducing the release of gonadotropins and consequently testosterone

### Availability

*Powder for injection:* 80 mg/vial, 120 mg/vial

### Indications and dosages

 Advanced prostate cancer

**Adults:** Initially, 240 mg subcutaneously given as two injections of 120 mg each, followed by maintenance dose of 80 mg subcutaneously as a single injection every 28 days

## Contraindications

- Hypersensitivity to drug or its components
- Females of childbearing potential

## Precautions

Use cautiously in:

- moderate or severe renal impairment (creatinine clearance less than 50 ml/minute)
- severe hepatic dysfunction
- congenital long QT syndrome, electrolyte abnormalities, congestive heart failure, and in patients taking Class IA (such as quinidine, procainamide) or Class III (such as amiodarone, sotalol) antiarrhythmics
- children (safety and efficacy not established).

## Administration

- Be aware that drug is intended for deep subcutaneous administration only and isn't to be administered I.V.
- Wear gloves during preparation and administration.
- Reconstitute powder with sterile water for injection. Don't use other solutions.
- Be aware that the treatment initiation pack contains two vials of Firmagon 120 mg that must be prepared for two subcutaneous injections; therefore, the instructions below need to be repeated a second time.
- For initial 120-mg dose, draw up 3 ml sterile water for injection using supplied reconstitution needle (21G, 2 inches) and slowly inject sterile water for injection into 120-mg vial to yield a concentration of 40 mg/ml.
- For 80-mg maintenance dose, draw up 4.2 ml sterile water for injection using supplied reconstitution needle (21G, 2 inches) and slowly inject sterile water for injection into 80-mg vial to yield a concentration of 20 mg/ml.
- Hold vial upright and swirl it very gently until liquid is clear and without undissolved powder or particles. If powder adheres to vial over the liquid

surface, vial can be tilted slightly to dissolve powder. Don't shake vial, to prevent foam formation. A ring of small air bubbles on the surface of the liquid is acceptable. The reconstitution procedure may take up to 15 minutes.

- Tilt vial slightly and keep needle in lowest part of vial. Withdraw 3 ml of drug (120-mg dose) and 4 ml (80-mg dose) without turning vial upside down.
- Exchange reconstitution needle with administration needle for deep subcutaneous injection (27G, 1<sup>1</sup>/<sub>4</sub> inches). Remove any air bubbles.
- Use reconstituted drug within 1 hour after addition of sterile water for injection.
- Give injection in abdomen in area that won't be exposed to pressure (such as not close to waistband or belt or close to ribs).

Route	Onset	Peak	Duration
Subcut.	Unknown	2 days	Unknown

## Adverse reactions

**CNS:** fatigue, asthenia, dizziness, headache, insomnia

**CV:** hypertension, **prolonged QT interval**

**GI:** nausea, constipation

**GU:** urinary tract infection

**Hepatic:** abnormal hepatic function

**Musculoskeletal:** decreased bone density (with long-term therapy), back pain, arthralgia

**Other:** injection-site reactions, hot flashes, weight gain, fever, chills, night sweats, anti-degarelix antibody development

## Interactions

**Drug-diagnostic tests.** *Gamma-glutamyltransferase, serum transaminases:* increased levels

## Patient monitoring

- Monitor renal and hepatic function tests closely.

 Monitor patient on long-term androgen deprivation therapy for prolonged QT interval.

- Monitor testosterone concentration monthly until medical castration is achieved in patients with hepatic impairment; then consider every-other-month testosterone concentration measurement.
- Because this drug may suppress pituitary gonadal system, periodically monitor drug's therapeutic effect by measuring serum concentration of prostate-specific antigen (PSA). If PSA increases, measure serum testosterone concentration.

### Patient teaching

- Advise patient to make sure injection site is free of pressure from belts, waistbands, or other types of clothing.
-  Instruct patient to immediately report abnormal heartbeats, dizziness, or faintness.
- Tell patient that drug isn't indicated for use in women.
- Inform patient of possible adverse effects of androgen deprivation (hot flashes, skin flushing, increased weight, decreased sex drive, erectile dysfunction).
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## delavirdine mesylate

### Rescriptor

**Pharmacologic class:** Nonnucleoside reverse transcriptase inhibitor

**Therapeutic class:** Antiretroviral

**Pregnancy risk category** C

### Action

Binds to reverse transcriptase enzyme, blocking RNA-dependent and DNA-dependent DNA polymerase synthesis

### Availability

Tablets: 100 mg, 200 mg

### Indications and dosages

 Human immunodeficiency virus (HIV)-1 infection

**Adults:** 400 mg P.O. t.i.d.

### Contraindications

- Hypersensitivity to drug
- Concurrent use of alprazolam, astemizole, ergot derivatives, midazolam, pimozone, terfenadine, or triazolam

### Precautions

Use cautiously in:

- hepatic impairment
- pregnant or breastfeeding patients
- children younger than age 16 (safety and efficacy not established).

### Administration

- Know that drug is usually given with at least two other antiretrovirals.
- If patient can't swallow tablets, dissolve 100-mg tablets in water by adding four tablets to at least 3 oz of water; let stand for a few minutes and then stir until completely dissolved. Have patient swallow entire mixture immediately. Then add small amount of water to glass and have him swallow this mixture to ensure that he consumes entire dose.
- Give 200-mg tablets intact; don't dissolve in water.
- If patient has achlorhydria, give drug with acidic beverage, such as orange juice.
-  Don't give concurrently with alprazolam, astemizole or terfenadine (no longer available in United States), ergot derivatives, midazolam, pimozone, or triazolam.

Route	Onset	Peak	Duration
P.O.	Unknown	1 hr	Unknown

### Adverse reactions

**CNS:** confusion, disorientation, dizziness, drowsiness, agitation, amnesia, changes in dreams, hallucinations, hyperesthesia, poor concentration, mania, nervousness, restlessness, paranoia, paresthesia, tremor, migraine, neuropathy, paralysis, **seizures**

**CV:** abnormal heart rate and rhythm, peripheral vascular disorder, peripheral edema, hypertension, orthostatic hypotension, cardiac insufficiency, **cardiomyopathy**

**EENT:** blurred or double vision, nystagmus, conjunctivitis, dry eyes, scleral yellowing, ear pain, otitis media, tinnitus, epistaxis, rhinitis

**GI:** nausea, diarrhea, constipation, abdominal pain or cramps, dyspepsia, abdominal distention, bloody stools, colitis, diverticulitis, enteritis, gastroenteritis, gastroesophageal reflux, mouth and tongue irritation and ulcers, increased saliva, difficulty swallowing, **GI bleeding, pancreatitis**

**GU:** hematuria, polyuria, chromaturia, proteinuria, nocturia, urinary tract infection, renal calculi, kidney pain, gynecomastia, erectile dysfunction, epididymitis, hemospermia, testicular pain, vaginal candidiasis, amenorrhea, irregular uterine bleeding

**Hematologic:** purpura, spleen disorders, eosinophilia, **granulocytosis, disseminated intravascular coagulation, leukopenia, neutropenia, pancytopenia, hemolytic anemia**

**Hepatic:** hepatotoxicity, hepatic failure, **hepatomegaly**

**Metabolic:** hypomagnesemia, hyperglycemia, hyperuricemia, hypocalcemia, hyponatremia, **hypoglycemia, hyperkalemia, metabolic acidosis**

**Musculoskeletal:** joint pain, arthritis, bone disorders, myalgia, muscle cramps, muscle weakness, bone pain,

bone disorders, tendon disorders, tenosynovitis, neck pain and rigidity, limb pain, **tetany, rhabdomyolysis**

**Respiratory:** pulmonary congestion, dyspnea, pneumonia

**Skin:** pallor, bruising, yellowing of skin, dermal leukocytoblastic vasculitis, dermatitis, skin dryness and discoloration, erythema, folliculitis, herpes zoster or herpes simplex infection, petechiae, petechial or pruritic rash, seborrhea, alopecia, skin nodules, urticaria, sebaceous or epidermal cyst, angioedema, **erythema multiforme**

**Other:** tooth abscess, toothache, gingivitis, gum hemorrhage, weight gain or loss, fever, lymphadenopathy, adenopathy, increased thirst, hiccups, facial edema, pain, abscess, bacterial infection, *Mycobacterium tuberculosis* infection, body fat redistribution, hypersensitivity reaction, **sepsis, Stevens-Johnson syndrome**

### Interactions

**Drug-drug.** *Alprazolam, astemizole, cispripide, ergot derivatives, midazolam, pimozone, terfenadine:* increased risk of serious or life-threatening adverse reactions

*Antacids, histamine<sub>2</sub>-receptor antagonists:* reduced delavirdine absorption  
*Bepridil, clarithromycin, estrogen, hormonal contraceptives, indinavir, lopinavir-ritonavir, saquinavir, sildenafil, warfarin:* increased blood levels of these drugs

*Carbamazepine, phenobarbital, phenytoin, rifabutin, rifampin:* loss of virologic response, resistance to delavirdine  
*Cholesterol-lowering HMG-CoA reductase inhibitors cleared by the CYP3A4 pathway:* increased risk of myopathy and rhabdomyolysis

*Dexamethasone:* decreased delavirdine blood level

*Didanosine:* decreased blood levels of both drugs

*Fluoxetine, ketoconazole:* 50% increase in delavirdine blood level

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, creatinine, lipase, gamma-glutamyl transpeptidase, triglycerides:* increased levels  
*Granulocytes, hemoglobin, neutrophils, platelets, red blood cells, white blood cells:* decreased values

*Partial thromboplastin time, prothrombin time:* increased

**Drug-herbs.** *St. John's wort:* loss of virologic response or resistance to delavirdine

### Patient monitoring

- Monitor liver function test results frequently when giving drug concurrently with saquinavir.
- Check electrolyte and uric acid levels regularly.
- 📣 Monitor patient for serious hepatic, cardiovascular, and CNS problems and hypersensitivity reactions.

### Patient teaching

- Tell patient he can take drug with or without food.
- If patient can't swallow tablets, teach him how to dissolve 100-mg tablets in water.
- 📣 Tell patient to discontinue drug and consult prescriber immediately if he develops severe rash accompanied by fever, blistering, oral lesions, conjunctivitis, swelling, or muscle aches.
- 📣 Tell patient to promptly report unusual fatigue, yellowing of skin or eyes, unusual bruising or bleeding, muscle weakness, or signs and symptoms of infection.
- 📣 Advise patient that rash is a major adverse effect, usually occurring 1 to 3 weeks after therapy starts and resolving in 3 to 14 days. Instruct him to report rash promptly.
- Inform patient that drug doesn't cure HIV or reduce its transmission.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially

those related to the drugs, tests, and herbs mentioned above.

## denileukin diftotox

Ontak

**Pharmacologic class:** Biological response modifier

**Therapeutic class:** Antineoplastic

**Pregnancy risk category C**

### FDA BOXED WARNING

- Give only under supervision of physician experienced in cancer chemotherapy, in facility equipped and staffed for cardiopulmonary resuscitation where patient can be monitored closely.

### Action

Recombinant DNA-derived cytotoxic protein. Interacts with interleukin-2 (IL-2) receptors on cell surface and inhibits cellular protein synthesis, causing cell death.

### Availability

*Frozen solution for injection:* 150 mcg/ml

### Indications and dosages

➤ Persistent or recurrent cutaneous T-cell lymphoma that expresses CD25 component of IL-2 receptor

**Adults:** 9 or 18 mcg/kg/day I.V. infused over 15 minutes for 5 consecutive days q 21 days

### Contraindications

- Hypersensitivity to drug, its components, diphtheria toxin, or IL-2

### Precautions

Use cautiously in:

- cardiovascular disease
- elderly patients

- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

• Follow facility procedures for safe handling, administration, and disposal of chemotherapeutic agents.

☞ Administer by I.V. infusion only. Don't give by I.V. bolus.

• Dilute I.V. dose further with normal saline to concentration of at least 15 mcg/ml. Infuse over at least 15 minutes.

• Premedicate with acetaminophen, nonsteroidal anti-inflammatory drugs, and antihistamines, as ordered, to minimize infusion-related events.

• Gently swirl vial to mix, but avoid vigorous agitation.

• Don't mix with other drugs.

• Don't deliver through in-line filter.

• Infuse over at least 15 minutes.

☞ During infusion, observe closely for signs and symptoms of hypersensitivity reaction.

Route	Onset	Peak	Duration
I.V.	Variable	Variable	Variable

### Adverse reactions

**CNS:** dizziness, paresthesia, nervousness, confusion, insomnia, syncope, headache

**CV:** hypotension, hypertension, vasodilation, tachycardia, chest pain,

**capillary leak syndrome** (with extravasation), **thrombosis,**

**arrhythmias**

**EENT:** rhinitis, pharyngitis, **laryngospasm**

**GI:** nausea, vomiting, diarrhea, constipation, flatulence, dyspepsia, difficulty swallowing, anorexia

**GU:** hematuria, albuminuria, pyuria

**Hematologic:** anemia, **thrombocytopenia, leukopenia**

**Musculoskeletal:** myalgia, back or joint pain

**Metabolic:** hypoalbuminemia, hypocalcemia, hypokalemia, dehydration  
**Respiratory:** dyspnea, cough, lung disorder

**Skin:** rash, pruritus, sweating

**Other:** weight loss, edema, flulike symptoms, injection site reaction, **hypersensitivity reactions** including **anaphylaxis**

### Interactions

**Drug-drug.** *Live-virus vaccines:* decreased antibody reaction

**Drug-diagnostic tests.** *Albumin, calcium, potassium:* decreased levels

*Urine creatinine:* increased level

### Patient monitoring

• Monitor patient closely during first infusion and for 24 hours afterward.

• Evaluate patient for vascular leak syndrome (marked by at least two of the following: edema, hypotension, hypoalbuminemia).

• Monitor CBC, blood chemistry panel, renal and hepatic function, and albumin level. Repeat all tests weekly during therapy.

### Patient teaching

☞ Instruct patient to immediately report chest pain, difficulty breathing, chills, burning at infusion site, or throat tightness, redness, swelling, or pain.

• Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

• Inform patient that drug makes him more susceptible to infection. Advise him to avoid crowds and exposure to illness.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## desipramine hydrochloride

Apo-Desipramine✳, Dom-Desipramine✳, Norpramin, Novo-Desipramine✳, Nu-Desipramine✳, PHL-Desipramine✳, PMS-Desipramine✳, Ratio-Desipramine✳

**Pharmacologic class:** Tricyclic anti-depressant

**Therapeutic class:** Antidepressant

**Pregnancy risk category** C

### FDA BOXED WARNING

- Drug may increase risk of suicidal thinking and behavior in children and adolescents with major depressive disorder and other psychiatric disorders. Risk must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family to observe patient closely and communicate with prescriber as needed.
- Drug isn't approved for use in pediatric patients.

### Action

Inhibits norepinephrine or serotonin reuptake at presynaptic neuron

### Availability

**Tablets:** 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg

### Indications and dosages

➤ Depression

**Adults:** Initially, 100 to 200 mg/day P.O. Increase gradually if needed to a maximum dosage of 300 mg/day.

**Adolescents and elderly adults:** 25 to 100 mg/day P.O. as a single dose or in divided doses. Increase gradually if

needed to a maximum dosage of 150 mg/day.

### Off-label uses

- Arthritis pain
- Cancer pain
- Diabetic or peripheral neuropathy
- Tic douloureux

### Contraindications

- Hypersensitivity to drug
- Recovery phase of myocardial infarction (MI)
- MAO inhibitor use within past 14 days

### Precautions

Use cautiously in:

- cardiovascular disorders, glaucoma, thyroid disorders, history of seizure disorders, mania, hypomania, adults with major depressive disorder
- urinary retention
- adolescents and children.

### Administration

- Before giving drug, measure patient's sitting and supine blood pressure to assess for orthostasis.
- Give full dose at bedtime to avoid daytime drowsiness.
- Discontinue drug 2 days before surgery.

🔊 Don't give within 14 days of MAO inhibitor, because potentially fatal reaction may occur.

Route	Onset	Peak	Duration
P.O.	Unknown	4-6 hr	Unknown

### Adverse reactions

**CNS:** sedation, weakness, anxiety, restlessness, insomnia, delusions, confusion, agitation, hallucinations, disorientation, extrapyramidal reactions, EEG changes, **neuroleptic malignant syndrome, seizures, suicidal behavior or ideation (especially in child or adolescent)**

**CV:** hypotension, hypertension, tachycardia, palpitations, **arrhythmias, MI, heart block**

**EENT:** blurred vision, dry eyes, laryngitis

**GI:** nausea, vomiting, constipation, abdominal cramps, epigastric distress, difficulty swallowing, parotid gland swelling, mouth inflammation, dry mouth, black tongue

**GU:** urinary retention, delayed voiding, urinary tract dilation, testicular swelling, erectile or other male sexual dysfunction, gynecmastia, menstrual irregularities, galactorrhea, increased or decreased libido

**Hematologic:** purpura, eosinophilia, **bone marrow depression, agranulocytosis, thrombocytopenia**

**Metabolic:** syndrome of inappropriate antidiuretic hormone secretion

**Musculoskeletal:** muscle weakness

**Skin:** dry skin, photosensitivity, rash, pruritus, petechiae, sweating

**Other:** peculiar taste, weight gain, edema, hypothermia, flushing, withdrawal symptoms with abrupt drug cessation (dizziness, nausea, vomiting, headache, malaise, sleep disturbances, hyperthermia, irritability, worsening of depression), **sudden death (in children)**

## Interactions

**Drug-drug.** *Adrenergics, anticholinergics:* additive adrenergic or anticholinergic effects

*Cimetidine, phenothiazines, quinidine, selective serotonin reuptake inhibitors:* increased desipramine effects, possible toxicity

*Clonidine:* hypertensive crisis

*CNS depressants (antihistamines, opioid analgesics, sedative-hypnotics):* additive CNS depression

*MAO inhibitors:* hyperpyretic crisis, severe seizures, death

*Sparfloxacin:* increased risk of adverse cardiovascular reactions

**Drug-diagnostic tests.** *Glucose:* increased or decreased level

**Drug-food.** *Grapefruit juice:* increased drug blood level and effects

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

*S-adenosylmethionine (SAM-e), St.*

*John's wort:* adverse serotonergic effects, including serotonin syndrome

**Drug-behaviors.** *Alcohol use:* increased response to alcohol

*Smoking:* increased metabolism and decreased efficacy of desipramine

## Patient monitoring

📢 Assess for suicidal tendencies before starting therapy.

- Monitor blood glucose level and CBC with white cell differential during therapy.

- Watch for severe CNS, cardiovascular, and hematologic adverse reactions.

## Patient teaching

- Tell patient to take full dose at bedtime to avoid daytime drowsiness.

📢 Urge patient to promptly report chest pain or easy bruising or bleeding.

- Inform patient that desired therapeutic effect may take 2 to 3 weeks.

📢 Instruct patient or parent to immediately report increasing depression or suicidal ideation (especially in child or adolescent).

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects alertness, vision, and coordination.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## desloratadine

Aerius<sup>✳</sup>, Clarinex, Clarinex Reditabs, Neoclarityn<sup>⊕</sup>

**Pharmacologic class:** Peripherally selective piperidine, selective histamine<sub>1</sub>-receptor antagonist

**Therapeutic class:** Antihistamine (nonsedating, second generation)

**Pregnancy risk category C**

### Action

Suppresses histamine release at peripheral histamine<sub>1</sub>-receptor sites

### Availability

*Syrup:* 2.5 mg/5 ml

*Tablets:* 5 mg

*Tablets (orally disintegrating):* 2.5 mg, 5 mg

### Indications and dosages

➤ Seasonal and perennial allergic rhinitis; chronic idiopathic urticaria and allergies caused by indoor and outdoor allergens; pruritus; to reduce number and size of hives

**Adults and children ages 12 and older:** 5 mg/day P.O.

**Children ages 6 to 11:** 1 tsp (2.5 mg/5 ml syrup) P.O. once daily

**Children ages 12 months to 5 years:** ½ tsp (1.25 mg in 2.5 ml syrup) P.O. once daily

**Children ages 6 to 11 months:** 2 ml (1 mg syrup) P.O. once daily

### Dosage adjustment

- Hepatic or renal impairment

### Contraindications

- Hypersensitivity to drug, its components, or loratadine

### Precautions

Use cautiously in:

- renal or hepatic impairment
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 12 (safety and efficacy not established, except syrup).

### Administration

- Give with or without food.

Route	Onset	Peak	Duration
P.O.	1 hr	3 hr	24 hr

### Adverse reactions

**CNS:** dizziness, drowsiness, fatigue, headache

**CV:** tachycardia, palpitations

**EENT:** pharyngitis, dry throat

**GI:** nausea, dyspepsia, dry mouth

**GU:** dysmenorrhea

**Musculoskeletal:** myalgia

**Other:** flulike symptoms, hypersensitivity reaction

### Interactions

**Drug-diagnostic tests.** *Bilirubin, hepatic enzymes:* increased values  
*Skin tests:* interference with positive reaction to dermal reactivity indicators

### Patient monitoring

- Monitor hepatic and renal function test results.

### Patient teaching

- Tell patient he may take drug with or without food.
- Instruct patient to report rapid heart-beat, shortness of breath, rash, persistent flulike symptoms, or muscle ache.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant adverse reactions and

interactions, especially those related to the tests mentioned above.

## desmopressin acetate (1-deamino-8-D-arginine vasopressin)

Apo-Desmopressin<sup>✳</sup>, DDAVP,  
DesmoMelt<sup>⚡</sup>, Desmospray<sup>⚡</sup>,  
Stimate

**Pharmacologic class:** Posterior pituitary hormone

**Therapeutic class:** Antidiuretic hormone

**Pregnancy risk category B**

### Action

Enhances water reabsorption by increasing permeability of renal collecting ducts to adenosine monophosphate and water, thereby reducing urinary output and increasing urine osmolality. Also increases factor VIII (antihemophilic factor) activity.

### Availability

**Injection:** 4 mcg/ml in single-dose 1-ml ampules and multidose 10-ml vials

**Intranasal solution:** 0.1 mg/ml, 1.5 mg/ml

**Intranasal spray (DDAVP):** 0.1 mg/ml (10 mcg/spray) in 5-ml spray pump bottle

**Tablets:** 0.1 mg, 0.2 mg

### Indications and dosages

➤ Diabetes insipidus

**Adults and children older than age 12:** 0.05 mg P.O. b.i.d.; adjust dosage based on patient response. Or 0.1 to 0.4 ml (10 to 40 mcg) daily intranasally as a single dose or in two or three divided doses. Or 0.5 ml (2 mcg) to 1 ml (4 mcg) daily I.V. or subcutaneously, usually in two divided doses.

**Children ages 3 months to 12 years:** 0.05 to 0.3 ml/day intranasally in one or two divided doses

➤ Hemophilia A; von Willebrand's disease type I

**Adults and children:** 0.3 mcg/kg I.V.; may repeat dose if needed. Or 300 mcg of intranasal solution containing 1.5 mcg/ml; for patients weighing less than 50 kg (110 lb), total dosage of 150 mcg (one spray of solution containing 1.5 mg/ml into a single nostril) is usually sufficient. If needed to maintain hemostasis during surgery, give intranasal dose 2 hours before surgery or give I.V. dose 30 minutes before surgery.

### Off-label uses

- Chronic autonomic failure (such as nocturnal polyuria, overnight weight loss, morning orthostatic hypotension)

### Contraindications

- Hypersensitivity to drug
- Moderate to severe renal impairment
- Hemophilia A with factor VIII levels less than or equal to 5%
- Von Willebrand's disease type IIB
- Impaired level of consciousness (intranasal form)

### Precautions

Use cautiously in:

- coronary artery disease, hypertensive cardiovascular disease, fluid and electrolyte imbalances
- breastfeeding patients.

### Administration

- Adjust morning and evening dosages as appropriate to minimize frequent urination and risk of water intoxication.
- Give I.V. dose (diluted in normal saline solution) by infusion over 15 to 30 minutes.
- Monitor pulse and blood pressure throughout I.V. infusion
- ⚠ When giving to child with diabetes insipidus, carefully restrict fluid intake

to prevent hyponatremia and water intoxication.

Route	Onset	Peak	Duration
P.O.	1 hr	1-5 hr	8-12 hr
I.V.	15-30 min	Unknown	4-12 hr
Intranasal	1 hr	1-1.5 hr	8-12 hr

### Adverse reactions

**CNS:** headache, dizziness, insomnia

**CV:** slight blood pressure increase, chest pain, palpitations

**EENT:** rhinitis, epistaxis, sore throat

**GI:** nausea, abdominal pain

**GU:** vulvar pain

**Respiratory:** cough

**Other:** local erythema, flushing, swelling or burning after injection

### Interactions

**Drug-drug.** *Carbamazepine, chlorpromamide, pressor drugs:* potentiation of desmopressin effects

### Patient monitoring

- Monitor urine volume and specific gravity, plasma and urine osmolality, and electrolyte levels in patients with diabetes insipidus.

- Monitor factor VIII antigen levels, activated partial thromboplastin time, and bleeding time in patients with hemophilia.

 When giving to child with diabetes insipidus, carefully monitor fluid intake and output.

### Patient teaching

- Instruct patient to take drug exactly as prescribed and not to interchange strengths or delivery systems.
- Teach patient how to use prescribed delivery system if taking drug by other than oral route.
- Instruct patient with diabetes insipidus to avoid overhydration and to weigh himself daily. Tell him to report weight gain or swelling of arms or legs.

- If patient is using nasal spray, teach him to inspect nasal membranes regularly and to report increased nasal congestion or swelling.
- Caution elderly patient not to increase fluid intake beyond that sufficient to satisfy thirst.
- Instruct patient to report headache, respiratory difficulty, nausea, or abdominal pain to prescriber.
- As appropriate, review all significant adverse reactions and interactions, especially those related to the drugs mentioned above.

## desvenlafaxine

Pristiq

**Pharmacologic class:** Selective serotonin reuptake inhibitor

**Therapeutic class:** Antidepressant

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug may increase risk of suicidal thinking and behavior in children and adolescents with major depressive disorder and other psychiatric disorders. Risk must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family and caregivers to observe patient closely and communicate with prescriber as needed.
- Drug isn't approved for use in children.

### Action

Potentiates serotonin and norepinephrine in CNS

**Availability**

Tablets (*extended-release*): 50 mg, 100 mg

**Indications and dosages**

➤ Major depressive disorder

**Adults:** 50 mg P.O. daily

**Dosage adjustment**

- Severe renal impairment and end-stage renal disease
- Hepatic impairment (dosages above 100 mg daily not recommended)

**Contraindications**

- Hypersensitivity to drug, its components, or venlafaxine
- Within 14 days of an MAO inhibitor

**Precautions**

Use cautiously in:

- renal impairment, hypertension, cardiovascular or cerebrovascular disease, lipid metabolism disorders, abnormal bleeding, interstitial lung disease, eosinophilic pneumonia, seizure disorder, bipolar disorder or family history of mania or hypomania, increased intraocular pressure, increased risk of angle-closure glaucoma
- concurrent use of selective serotonin reuptake inhibitors (SSRIs) or serotonin norepinephrine reuptake inhibitors (SNRIs) (use not recommended)
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

**Administration**

- Make sure hypertension is controlled before therapy starts.
- Give tablets whole with or without food at same time each day. Don't break, dissolve, or divide tablets.
- Reduce dosage gradually when discontinuing drug.

Route	Onset	Peak	Duration
P.O.	Unknown	7.5 hr	Unknown

**Adverse reactions**

**CNS:** dizziness, insomnia, somnolence, anxiety, fatigue, irritability, abnormal dreams, hypomania, mania, **seizures**

**CV:** hypertension

**EENT:** mydriasis, blurred vision, tinnitus

**GI:** nausea, vomiting, diarrhea, constipation, dry mouth

**GU:** male sexual function disorder

**Hematologic:** abnormal bleeding

**Respiratory:** **interstitial lung disease, eosinophilic pneumonia**

**Skin:** hyperhidrosis

**Other:** decreased appetite, weight loss

**Interactions**

**Drug-drug.** *Aspirin, NSAIDs, other drugs that affect coagulation:* increased risk of bleeding

*Drugs metabolized by CYP2D6 (such as despiramine):* increased blood levels of these drugs

*Drugs metabolized by CYP3A4 (such as midazolam):* decreased blood levels of these drugs

*MAO inhibitors, serotonergics (lithium, SNRIs, SSRIs, tricyclic antidepressants, triptans), tramadol:* potentially life-threatening serotonin syndrome

*Potent CYP3A4 inhibitors:* increased desvenlafaxine blood level

**Drug-diagnostic tests.** *Cholesterol, triglycerides:* increased levels

*Sodium:* decreased level

*Urine protein:* transient elevation

**Drug-food.** *Tryptophan supplements:* potentially life-threatening serotonin syndrome

**Drug-herb.** *St. John's wort:* potentially life-threatening serotonin syndrome

**Patient monitoring**

- Monitor patient's blood pressure regularly during therapy.

- Monitor cholesterol and triglyceride levels.

⚠ Monitor patient closely for clinical worsening, suicidality, and unusual behavior changes, especially during

first few months of therapy and after dosage changes.

 Monitor for progressive dyspnea, cough, or chest discomfort, which may signal serious lung disorders.

- Observe for signs and symptoms of hyponatremia (headache, poor concentration, memory impairment, confusion, weakness, and unsteadiness), especially in elderly patients.

 After discontinuing drug, monitor for dysphoric mood, irritability, agitation, dizziness, paresthesia, anxiety, confusion, headache, lethargy insomnia, tinnitus, and seizures.

### Patient teaching

- Instruct patient to take tablets whole with or without food at same time each day. Caution patient not to chew, break, crush, dissolve, or divide tablets.

- Tell patient that full drug effects may take several weeks; advise patient not to stop taking drug.

- Caution patient not to discontinue drug abruptly.

 Advise patient's family or caregiver to monitor patient, especially for suicidality or new or worsening symptoms.

 Instruct patient to immediately report unusual bruising or bleeding.

- Advise patient not to take over-the-counter drugs containing aspirin or NSAIDs without consulting prescriber.

- Instruct patient to avoid herbs (especially St. John's wort) unless prescriber approves.

- Caution patient to avoid hazardous activities until drug's effects on concentration and alertness are known.

- Tell patient that inert matrix tablet may appear in stool, but active drug has already been absorbed.

- Advise female patient to notify prescriber if she is pregnant, intends to become pregnant, or is breastfeeding.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially

those related to the drugs, tests, foods, and herbs mentioned above.

## dexamethasone

Apo-Dexamethasone<sup>®</sup>, Dexasone, Ozurdex

## dexamethasone sodium phosphate

*Pharmacologic class:* Glucocorticoid

*Therapeutic class:* Anti-inflammatory

*Pregnancy risk category:* C

### Action

Unclear. Reduces inflammation by suppressing polymorphonuclear leukocyte migration, reversing increased capillary permeability, and stabilizing leukocyte lysosomal membranes. Also suppresses immune response (by reducing lymphatic activity), stimulates bone marrow, and promotes protein, fat, and carbohydrate metabolism.

### Availability

*Elixir:* 0.5 mg/5 ml

*Intravitreal implant:* 0.7 mg

*Oral solution:* 0.5 mg/5 ml, 1 mg/ml

*Solution for injection (sodium phosphate):* 4 mg/ml, 10 mg/ml, 20 mg/ml, 24 mg/ml

*Tablets:* 0.25 mg, 0.5 mg, 0.75 mg, 1 mg, 1.5 mg, 2 mg, 4 mg, 6 mg

### Indications and dosages

 Macular edema following branch retinal vein occlusion or central retinal vein occlusion; noninfectious uveitis affecting posterior segment of eye

**Adults:** 0.7 mg by intravitreal implant

 Allergic and inflammatory conditions  
**Adults:** 0.75 to 9 mg/day (dexamethasone) P.O. as a single dose or in divided doses; in severe cases, much higher dosages may be needed. Dosage

requirements vary and must be individualized based on disease and patient response.

➤ **Cerebral edema**

**Adults:** Initially, 10 mg (sodium phosphate) I.V., followed by 4 mg I.M. q 6 hours. Then reduce dosage gradually over 5 to 7 days.

➤ **Suppression test for Cushing's syndrome**

**Adults:** 1 mg P.O. at 11 P.M. or 0.5 mg P.O. q 6 hours for 48 hours (with urine collection testing, as ordered)

### Off-label uses

- Acute altitude sickness
- Bacterial meningitis
- Bronchopulmonary dysplasia in preterm infants
- Hirsutism
- Suppression test for detection, diagnosis, or management of depression

### Contraindications

- Hypersensitivity to drug, benzyl alcohol, bisulfites, EDTA, creatinine, polysorbate 80, or methylparaben
- Systemic fungal infections
- Active or suspected ocular or periocular infections, advanced glaucoma (intravitreal implant)

### Precautions

Use cautiously in:

- renal insufficiency, cirrhosis, diabetes mellitus, diverticulitis, GI disease, cardiovascular disease, hypoprothrombinemia, hypothyroidism, myasthenia gravis, glaucoma, osteoporosis, infections, underlying immunosuppression, psychotic tendencies
- pregnant or breastfeeding patients
- children.

### Administration

- Give P.O. dose with food or milk.
- When giving I.M., inject deep into gluteal muscle; rotate sites as needed.
- For I.V. use, drug may be given undiluted as a single dose over 1 minute or

added to dextrose or I.V. saline solutions and given as an intermittent infusion at prescribed rate.

Route	Onset	Peak	Duration
P.O.	Unknown	1-2 hr	2.75 days
I.V.	1 hr	1 hr	Variable
I.M. (sodium phosphate)	1 hr	1 hr	6 days
Intravitreal implant	NA	NA	NA

### Adverse reactions

**CNS:** headache, malaise, vertigo, psychiatric disturbances, **increased intracranial pressure, seizures**

**CV:** hypotension, **thrombophlebitis, myocardial rupture after recent myocardial infarction, thromboembolism**

**EENT:** cataracts; elevated intraocular pressure (IOP), conjunctival hemorrhage (with intravitreal implant)

**GI:** nausea, vomiting, abdominal distention, dry mouth, anorexia, **peptic ulcer, bowel perforation, pancreatitis, ulcerative esophagitis**

**Metabolic:** decreased carbohydrate tolerance, hyperglycemia, cushingoid appearance (moon face, buffalo hump), decreased growth (in children), latent diabetes mellitus, sodium and fluid retention, negative nitrogen balance, **adrenal suppression, hypokalemic alkalosis**

**Musculoskeletal:** muscle wasting, muscle pain, osteoporosis, aseptic joint necrosis, tendon rupture, long bone fractures

**Skin:** diaphoresis, angioedema, erythema, rash, pruritus, urticaria, contact dermatitis, acne, decreased wound healing, bruising, skin fragility, petechiae

**Other:** facial edema, weight gain or loss, increased susceptibility to infection, hypersensitivity reactions

## Interactions

**Drug-drug.** *Barbiturates, phenytoin, rifampin:* decreased dexamethasone effects

*Digoxin:* increased risk of digoxin toxicity

*Ephedrine:* increased dexamethasone clearance

*Estrogen, hormonal contraceptives:* blocking of dexamethasone metabolism

*Fluoroquinolones:* increased risk of tendon rupture

*Itraconazole, ketoconazole:* increased dexamethasone blood level and effects

*Live-virus vaccines:* decreased antibody response to vaccine, increased risk of adverse reactions

*Loop and thiazide diuretics:* additive hypokalemia

*Nonsteroidal anti-inflammatory drugs:* increased risk of GI adverse effects

*Somatrem, somatropin:* decreased response to these drugs

**Drug-diagnostic tests.** *Calcium, potassium:* decreased levels

*Cholesterol, glucose:* increased levels

*Nitroblue tetrazolium test:* false-negative result

**Drug-herbs.** *Echinacea:* increased immune-stimulating effect

*Ginseng:* potentiation of immunomodulating response

**Drug-behaviors.** *Alcohol use:* increased risk of gastric irritation and GI ulcers

## Patient monitoring

- Monitor blood glucose level closely in diabetic patients receiving drug orally.
- Monitor hemoglobin and potassium levels.
- Assess for occult blood loss.
- 🔊 In long-term therapy, never discontinue drug abruptly. Dosage must be tapered gradually.
- Monitor patient for increased IOP after intravitreal injection.

## Patient teaching

- 🔊 Instruct patient to immediately report sudden weight gain, swelling of

face or limbs, excessive nervousness or sleep disturbances, excessive body hair growth, vision changes, difficulty breathing, muscle weakness, persistent abdominal pain, or change in stool color.

- Tell patient to take oral drug with or after meals.
- Advise patient to report vision changes and if eye becomes red, sensitive to light, or painful after intravitreal implant, to promptly report this to ophthalmologist.
- Inform patient that drug makes him more susceptible to infection. Advise him to avoid crowds and exposure to illness.
- 🔊 Caution patient not to stop taking drug abruptly.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## dexlansoprazole

Dexilant

**Pharmacologic class:** Proton pump inhibitor

**Therapeutic class:** GI agent

**Pregnancy risk category B**

## Action

Suppresses gastric acid secretion by specific inhibition of (H<sup>+</sup>, K<sup>+</sup>)-ATPase in the gastric parietal cell.

## Availability

*Capsule:* 30 mg, 60 mg

## Indications and dosages

- Healing of all grades of erosive esophagitis (EE)

**Adults:** 60 mg P.O. daily for up to 8 weeks

➤ Maintaining healing of EE

**Adults:** 30 mg P.O. daily for up to 6 months

➤ Symptomatic nonerosive gastroesophageal reflux disease (GERD)

**Adults:** 30 mg P.O. daily for up to 4 weeks

## Dosage adjustment

- Moderate hepatic impairment

## Contraindications

- Hypersensitivity to drug or its components

## Precautions

Use cautiously in:

- moderate renal impairment
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

## Administration

- Administer with or without food.

Route	Onset	Peak	Duration
P.O.	Unknown	1-2 hr and 4-5 hr (dual peaks)	Unknown

## Adverse reactions

**CNS:** asthenia, dizziness, headache, migraine headache, memory impairment, paresthesia, psychomotor hyperactivity, tremor, trigeminal neuralgia, abnormal dreams, anxiety, depression, insomnia, **seizures**

**CV:** angina, bradycardia, chest pain, palpitations, tachycardia, hypertension, **deep vein thrombosis, arrhythmias, myocardial infarction**

**EENT:** eye irritation, eye swelling, ear pain, tinnitus, vertigo, nasopharyngitis, pharyngitis, sinusitis

**GI:** nausea; vomiting; diarrhea; abdominal pain, discomfort, tenderness; flatulence; abnormal feces; anal discomfort; Barrett's esophagus;

bezoar; abnormal bowel sounds; breath odor; microscopic colitis; colon and gastric polyps; constipation; dry mouth; duodenitis; dyspepsia; dysphagia; enteritis; eructation; esophagitis; gastritis; gastroenteritis; GI disorders; GI hypermotility disorders; GERD; ulcers and perforation; hematemesis; hematochezia; hemorrhoids; impaired gastric emptying; irritable bowel syndrome; mucus stools; oral mucosa blistering; painful defecation; proctitis; oral paresthesia; oral herpes; **rectal hemorrhage**

**GU:** vulvovaginal infection, libido changes, dysuria, micturition urgency, dysmenorrhea, dyspareunia, menorrhagia, menstrual disorder

**Hematologic:** anemia, lymphadenopathy

**Hepatic:** biliary colic, cholelithiasis, hepatomegaly

**Metabolic:** goiter

**Musculoskeletal:** arthralgia, arthritis, cramps, musculoskeletal pain, myalgia; hip, wrist, spine fracture (with long-term daily use)

**Respiratory:** upper respiratory tract infection, aspiration, asthma, bronchitis, cough, dyspnea, hyperventilation, respiratory tract congestion, sore throat

**Skin:** rash, sunburn, acne, dermatitis, erythema, pruritus, lesions, urticaria

**Other:** edema, chills, abnormal feeling, inflammation, mucosal inflammation, nodule, pain, pyrexia, candidal infection, viral infection, influenza, falls, overdose, procedural pain, weight gain, appetite changes, altered taste, hiccups, hot flushes, hypersensitivity

## Interactions

**Drug-drug.** *Atazanavir:* decreased atazanavir level

*Drugs with pH-dependent absorption (such as ampicillin esters, digoxin, iron salts, ketoconazole):* interference with absorption of these drugs

*Tacrolimus*: increased tacrolimus whole blood concentration

*Warfarin*: increased International Normalized Ratio and prothrombin time

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, blood glucose, gastrin, potassium, serum creatinine, total protein*: increased levels

*Bilirubin*: increased or decreased level

*Liver function tests*: abnormal results

*Platelets, serum calcium*: decreased levels

### Patient monitoring

- Monitor renal function tests closely.

### Patient teaching

- Instruct patient to take drug with or without food.
- Tell patient to swallow capsule whole or open capsule and sprinkle contents on 1 tablespoon of applesauce and swallow immediately.
- Instruct patient to report allergic reactions (such as rash or itching) to prescriber.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## dexamethylphenidate hydrochloride

Focalin, Focalin XR

**Pharmacologic class:** Methylphenidate derivative

**Therapeutic class:** CNS stimulant

**Controlled substance schedule II**

**Pregnancy risk category C**

### FDA BOXED WARNING

- Give cautiously to patient with history of drug dependence or alcoholism. Chronic abuse can cause marked tolerance and psychological dependence with abnormal behavior. Frank psychotic episodes may occur, especially with parenteral abuse. During withdrawal from abusive use, provide careful supervision, as severe depression may occur.
- Withdrawal after prolonged therapeutic use may unmask symptoms of underlying disorder that may require follow-up.

### Action

Thought to block norepinephrine and dopamine reuptake, increasing the concentration of these neurotransmitters in extraneuronal space

### Availability

*Capsules (extended-release)*: 5 mg, 10 mg, 15 mg, 20 mg, 25 mg, 30 mg, 35 mg, 40 mg

*Tablets*: 2.5 mg, 5 mg, 10 mg

### Indications and dosages

➤ Attention deficit hyperactivity disorder

#### Adults and children older than age 6:

*Tablets*—In patients not receiving methylphenidate concurrently, 2.5 mg P.O. b.i.d. at least 4 hours apart; increase as needed in 2.5- to 5-mg increments to a maximum of 10 mg b.i.d. (Individualize dosage according to patient needs and response.) In patients receiving methylphenidate concurrently, start with half of methylphenidate dosage; maximum dosage is 10 mg P.O. b.i.d.

*Capsules*—In adults not receiving methylphenidate concurrently, 10 mg P.O. daily in morning; increase as needed in 10-mg increments

approximately weekly to maximum of 20 mg daily. In children not receiving methylphenidate concurrently, 5 mg daily in morning; increase as needed in 5-mg increments approximately weekly to maximum of 20 mg daily. In adults and children receiving methylphenidate concurrently, start with half of methylphenidate total daily dosage.

### Contraindications

- Hypersensitivity to drug
- Glaucoma
- Anxiety, agitation, tension
- Family history or diagnosis of Tourette syndrome
- MAO inhibitor use within past 14 days

### Precautions

Use cautiously in:

- hypertension, depression, seizures, cardiovascular disorders, psychosis, drug abuse
- pregnant or breastfeeding patients
- children under age 6 (safety and efficacy not established).

### Administration

- Administer at same time each day without regard to meals.
- Give last dose at least 8 hours before bedtime to prevent insomnia.
- Know that regular-release tablets may be switched to same daily dosage as extended-release capsules.
- If necessary, open capsules, sprinkle contents over spoonful of applesauce, and administer immediately.
- Don't give within 14 days of MAO inhibitor use.

Route	Onset	Peak	Duration
P.O. (capsules)	Unknown	1.5-6.5 hr	Unknown
P.O. (tablets)	Variable	1-1.5 hr	Unknown

### Adverse reactions

**CNS:** nervousness, insomnia, dizziness, drowsiness, headache, dyskinesia, chorea, Tourette syndrome, **toxic psychosis**

**CV:** increased or decreased heart rate and blood pressure, tachycardia, angina, palpitations, **arrhythmias**

**EENT:** blurred vision, **visual accommodation problems**

**GI:** nausea, abdominal pain

**Hematologic:** anemia, **leukopenia, thrombocytopenia**

**Hepatic:** **hepatic dysfunction, hepatic coma**

**Skin:** rash, alopecia

**Other:** fever, decreased appetite, weight loss, psychological drug dependence, drug tolerance, growth suppression in children (with long-term use)

### Interactions

**Drug-drug.** *Anticoagulants, phenobarbital, phenytoin, primidone, selective serotonin reuptake inhibitors, tricyclic antidepressants:* inhibited metabolism and additive effects of these drugs  
*Antihypertensives, pressor agents (dopamine, epinephrine):* decreased efficacy of these drugs  
*MAO inhibitors:* severe hypertensive crisis

### Patient monitoring

-  Monitor blood pressure closely, especially in patients receiving antihypertensives concurrently.
- Evaluate cardiac status. Report palpitations and other signs and symptoms of arrhythmias.
- During prolonged therapy, regularly monitor CBC with white cell differential and platelet count.

### Patient teaching

- Advise patient or parents that drug should be taken at same time each day.
- Instruct patient not to crush or chew capsule. If patient is unable to swallow capsules whole, advise him to open

capsules, sprinkle contents over spoonful of applesauce, and take immediately.

- Tell patient or parents that drug usually is discontinued if symptoms don't improve within 1 month.
- Instruct parents to monitor child's height and weight, because CNS stimulants have been associated with growth suppression.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## dextroamphetamine sulfate

Dexedrine Spansule, DextroStat

**Pharmacologic class:** Amphetamine

**Therapeutic class:** Sympathomimetic amine, CNS stimulant

**Controlled substance schedule II**

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug has high abuse potential. Prolonged use may lead to drug dependence. Stay alert for possibility of patient obtaining drug for nontherapeutic use or distribution. Drug should be prescribed sparingly.
- Misuse may cause sudden death and serious cardiovascular events.

### Action

Produces CNS and respiratory stimulation by promoting release of norepinephrine from nerve terminals

### Availability

*Capsules (sustained-release):* 5 mg, 10 mg, 15 mg

*Oral solution:* 5 mg/ml

*Tablets:* 5 mg, 10 mg

### Indications and dosages

➤ Attention deficit hyperactivity disorder

**Adults:** 5 to 60 mg P.O. daily in divided doses until optimal response is obtained

**Children ages 6 and older:** 5 mg (capsules, oral solution, or tablets) P.O. once or twice daily, increased by 5 mg at weekly intervals until optimal response is obtained

**Children ages 3 to 5:** 2.5 mg (oral solution) P.O. daily, increased by 2.5 mg at weekly intervals until optimal response is obtained

➤ Narcolepsy

**Adults:** 5 to 60 mg P.O. daily as a single dose or in divided doses

**Children ages 12 and older:** 10 mg P.O. daily, increased by 10 mg at weekly intervals until desired response occurs or adult dosage is reached

**Children ages 6 to 11:** 5 mg P.O. daily, increased by 5 mg at weekly intervals until desired response occurs or adult dosage is reached

### Contraindications

- Hypersensitivity to drug or tartrazine
- Glaucoma
- Psychotic disorders, agitated states
- Advanced arteriosclerosis, symptomatic cardiovascular disease, moderate to severe hypertension
- Hyperthyroidism
- MAO inhibitor use within past 14 days
- Pregnancy or breastfeeding

### Precautions

Use cautiously in:

- cardiovascular disease, hypertension, diabetes mellitus
- history of substance abuse
- elderly patients.

### Administration

- Make sure patient swallows sustained-release capsules whole without chewing or crushing.

- Before starting therapy, perform complete cardiac evaluation, including ECG and echocardiogram.
- Give last daily dose at least 6 hours before patient's bedtime.
- 🔊 Don't give within 14 days of MAO inhibitor, because potentially fatal reaction may occur.

Route	Onset	Peak	Duration
P.O.	1-2 hr	Unknown	2-10 hr
P.O. (sustained)	Unknown	Unknown	Up to 24 hr

### Adverse reactions

**CNS:** hyperactivity, insomnia, restlessness, tremor, depression, dizziness, headache, irritability

**CV:** palpitations, tachycardia, hypertension, hypotension, **arrhythmias**

**GI:** nausea, vomiting, constipation, diarrhea, abdominal cramps, dry mouth

**GU:** erectile dysfunction, increased libido

**Skin:** urticaria

**Other:** metallic taste, decreased appetite, physical or psychological drug dependence

### Interactions

**Drug-drug.** *Acetazolamide, sodium bicarbonate:* urine alkalization, leading to increased dextroamphetamine effects

*Adrenergic blockers:* additive effects

*Ammonium chloride, ascorbic acid (large doses):* urine acidification, leading to decreased dextroamphetamine effects

*Beta-adrenergic blockers, tricyclic antidepressants:* increased risk of adverse cardiovascular effects

*Guanethidine:* reversal of hypotensive effect

*MAO inhibitors:* hypertensive crisis

*Phenothiazines:* decreased dextroamphetamine effects

*Selective serotonin reuptake inhibitors:* increased risk of serotonin syndrome

**Drug-diagnostic tests.** *Plasma corticosteroids:* increased levels

**Drug-food.** *Caffeine:* increased stimulant effect

**Drug-herbs.** *Caffeine-containing herbs, ephedra (ma huang):* increased stimulant effect

### Patient monitoring

- Interrupt therapy or reduce dosage periodically to assess drug efficacy in patients with behavior disorders.
- Monitor patient for new or worsening aggressive behavior.
- Monitor blood and urine glucose levels carefully in diabetic patient. Drug may alter regular insulin requirements.

### Patient teaching

- Tell patient to swallow sustained-release capsules whole with liquid without chewing or crushing.
- Advise patient to take drug early in day to avoid insomnia.
- 🔊 Instruct patient to immediately notify prescriber if chest pain, irregular pulse, or worsening aggressive behavior occurs.
- Instruct patient to avoid driving and other hazardous activities until he knows how drug affects him.
- Caution patient not to stop therapy abruptly but to taper dosage gradually.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## dextromethorphan hydrobromide

Adult Dry Cough , Balminil DM , Broncho-Grippol-DM , Calmylin #1 , Creo-Terpin, Creomulsion, Delsym, DexAlone, Hold DM, Koffex-DM , Neo-DM , Robitussin Children's Cough Long-Acting, Robitussin for Dry Coughs , Robitussin Maximum Strength Cough Suppressant, Scot-Tussin Diabetes, Sedatus , Triaminic Children's Long-Acting Cough, Trocal, Vicks DayQuil Cough, Vicks Vaporsyrup for Dry Cough , Vicks 44 Cough Relief

**Pharmacologic class:** Levorphanol derivative

**Therapeutic class:** Antitussive (nonnarcotic)

**Pregnancy risk category** C

### Action

Depresses cough reflex through direct effect on cough center in medulla. Has no expectorant action and does not inhibit ciliary action. Although related to opioids structurally, lacks analgesic and addictive properties.

### Availability

*Gelcaps:* 15 mg, 30 mg

*Liquid:* 3.5 mg/5 ml, 5 mg/5 ml,

7.5 mg/5 ml, 15 mg/5 ml

*Lozenges:* 5 mg, 7.5 mg

*Oral suspension (extended-release):*

30 mg/5 ml

*Syrup:* 7.5 mg/5 ml, 10 mg/15 ml

### Indications and dosages

➤ Cough caused by minor viral upper respiratory tract infections or inhaled irritants

**Adults and children over age 12:** 10 to 20 mg P.O. q 4 hours, or 30 mg P.O. q 6

to 8 hours, or 60 mg of extended-release form P.O. b.i.d. (not to exceed 120 mg/day)

**Children ages 6 to 12:** 5 to 10 mg P.O. q 4 hours, or 15 mg P.O. q 6 to 8 hours, or 30 mg of extended-release form P.O. q 12 hours (not to exceed 60 mg/day)

**Children ages 4 to 6:** 2.5 to 7.5 mg (syrup) P.O. q 4 to 8 hours or 15 mg (extended-release form) P.O. b.i.d. Not to exceed 30 mg/day.

### Dosage adjustment

- Elderly patients

### Contraindications

- Hypersensitivity to drug
- Chronic productive cough
- MAO inhibitor use within past 14 days

### Precautions

Use cautiously in:

- tartrazine sensitivity
- diabetes mellitus (with sucrose-containing drug products)
- pregnant or breastfeeding patients
- children younger than age 2 (safety not established).

### Administration

- Don't administer lozenges to children younger than age 6.

 Don't give within 14 days of MAO inhibitors.

Route	Onset	Peak	Duration
P.O.	15-30 min	Unknown	3-6 hr
P.O. (extended)	Unknown	Unknown	9-12 hr

### Adverse reactions

**CNS:** dizziness and sedation

**GI:** nausea, vomiting, stomach pain

### Interactions

**Drug-drug.** *Amiodarone, fluoxetine, quinidine:* increased dextromethorphan blood level, greater risk of adverse reactions

*Antidepressants, antihistamines, opioids, sedative-hypnotics:* additive CNS depression

*MAO inhibitors, sibutramine:* serotonin syndrome (nausea, confusion, blood pressure changes)

**Drug-behaviors.** *Alcohol use:* additive CNS depression

### Patient monitoring

- Monitor cough frequency and type, and assess sputum characteristics.
- Assess hydration status. Increase patient's fluid input to help moisten secretions.

### Patient teaching

- Advise patient to avoid irritants, such as smoking, dust, and fumes. Suggest use of humidifier to filter air pollutants.
- Inform patient that treatment aims to decrease coughing frequency and intensity without completely eliminating protective cough reflex.
- Instruct patient to contact health care provider if cough lasts more than 7 days.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and behaviors mentioned above.

## dextrose (d-glucose)

BD Glucose, Glucose, Insta-Glucose

**Pharmacologic class:** Monosaccharide

**Therapeutic class:** Carbohydrate caloric nutritional supplement

**Pregnancy risk category C**

### Action

Prevents protein and nitrogen loss; promotes glycogen deposition and ketone accumulation (through osmotic diuretic action)

### Availability

*Injection:* 2.5%, 5%, 10%, 20%, 25%, 30%, 40%, 50%, 60%, 70%

*Oral gel:* 40%

*Tablets (chewable):* 5 g

### Indications and dosages

➤ Insulin-dependent hypoglycemia

**Adults and children:** Initially, 10 to 20 g P.O., repeated in 10 to 20 minutes if needed based on blood glucose level; or 20 to 50 ml by I.V. infusion or injection of 50% solution given at 3 ml/minute. Maintenance dosage is 10% to 15% solution by continuous I.V. infusion until blood glucose level reaches therapeutic range.

**Infants and neonates:** 2 ml/kg of 10% to 25% solution by slow I.V. infusion until blood glucose level reaches therapeutic range

➤ Calorie replacement

**Adults and children:** 2.5%, 5%, or 10% solution given through peripheral I.V. line, with dosage tailored to patient's need for fluid or calories; or 10% to 70% solution given through large central vein if needed (typically mixed with amino acids or other solution)

### Off-label uses

- Varicose veins
- Insulin-secreting islet-cell adenoma

### Contraindications

- Hypersensitivity to drug
- Hyperglycemia, diabetic coma
- Hemorrhage
- Heart failure

### Precautions

Use cautiously in:

- renal, cardiac, or hepatic impairment; diabetes mellitus.

### Administration

- Use aseptic technique when preparing solution. Bacteria thrive in high-glucose environments.

⚠ Infuse concentrations above 10% through central vein.

- Don't infuse concentrated solution rapidly, because doing so may cause hyperglycemia and fluid shifts.

 Never stop infusion abruptly.

Route	Onset	Peak	Duration
P.O.	10-20 min	40 min	Unknown
I.V.	2-3 min	Unknown	Unknown

### Adverse reactions

**CNS:** confusion, loss of consciousness

**CV:** hypertension, phlebitis, **venous thrombosis, heart failure**

**GU:** glycosuria, osmotic diuresis

**Metabolic:** hyperglycemia, hypervolemia, hypovolemia, electrolyte imbalances, **hyperosmolar coma**

**Respiratory:** **pulmonary edema**

**Skin:** flushing, urticaria

**Other:** chills, fever, dehydration, injection site reaction, infection

### Interactions

**Drug-drug.** *Corticosteroids, corticotropin:* increased risk of fluid and electrolyte imbalances

**Drug-diagnostic tests.** *Glucose:* increased level

### Patient monitoring

 Monitor infusion site frequently to prevent irritation, tissue sloughing, necrosis, and phlebitis.

- Check blood glucose level at regular intervals.
- Monitor fluid intake and output.
- Weigh patient regularly.
- Assess patient for confusion.

### Patient teaching

- Teach patient how to recognize signs and symptoms of hypoglycemia and hyperglycemia.
- Provide instructions on glucose self-monitoring.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## diazepam

Apo-Diazepam<sup>★</sup>, Bio-Diazepam<sup>★</sup>, Dialar<sup>⚠</sup>, Diastat, Diazemuls<sup>★⚠</sup>, Diazepam Intensol, Novo-Dipam<sup>★</sup>, PMS-Diazepam<sup>★</sup>, Stesolid<sup>⚠</sup>, Tensium<sup>⚠</sup>, Valclair<sup>⚠</sup>, Valium, Vival<sup>★</sup>

**Pharmacologic class:** Benzodiazepine

**Therapeutic class:** Anxiolytic, anti-convulsant, sedative-hypnotic, skeletal muscle relaxant (centrally acting)

**Controlled substance schedule** IV

**Pregnancy risk category** D

### Action

Produces anxiolytic effect and CNS depression by stimulating gamma-aminobutyric acid receptors. Relaxes skeletal muscles of spine by inhibiting polysynaptic afferent pathways. Controls seizures by enhancing presynaptic inhibition.

### Availability

*Injection:* 5 mg/ml

*Oral solution:* 1 mg/ml, 5 mg/5 ml

*Tablets:* 2 mg, 5 mg, 10 mg

### Indications and dosages

➤ Anxiety disorders

**Adults:** 2 to 10 mg P.O. two to four times daily, depending on symptom severity. Alternatively, for moderate anxiety, 2 to 5 mg I.V., repeated in 3 to 4 hours if needed. For severe anxiety, 5 to 10 mg I.V., repeated in 3 to 4 hours if needed.

**Children age 6 months and older:** 1 to 2.5 mg P.O. three to four times daily; may increase gradually as needed

➤ Before cardioversion

**Adults:** 5 to 15 mg I.V. 5 to 10 minutes before cardioversion

➤ Before endoscopy

**Adults:** Usually, 10 mg I.V. is sufficient; may be increased to 20 mg I.V.

Alternatively, 5 to 10 mg I.M. 30 minutes before endoscopy.

➤ Status epilepticus and severe recurrent convulsive seizures

**Adults:** 5 to 10 mg I.V. slowly, repeated as needed q 10 to 15 minutes, to a maximum of 30 mg; may repeat regimen if needed in 2 to 4 hours. May give I.M. if I.V. delivery is impossible.

**Children ages 5 and older:** 1 mg I.V. slowly q 2 to 5 minutes, to a maximum of 10 mg; repeat in 2 to 4 hours if needed. May give I.M. if I.V. delivery is impossible.

**Children over 1 month to 5 years:** 0.2 to 0.5 mg I.V. slowly q 2 to 5 minutes, to a maximum of 5 mg I.V. May give I.M. if I.V. delivery is impossible.

➤ Muscle spasm associated with local pathology, cerebral palsy, athetosis, “stiff-man” syndrome, or tetanus

**Adults:** 2 to 10 mg P.O. three to four times daily. Or initially, 5 to 10 mg I.V. or I.M., repeated in 3 to 4 hours if needed. Tetanus may necessitate higher dosages.

**Elderly or debilitated patients:** Initially, 2 to 2.5 mg P.O. once or twice daily, increased gradually as needed and tolerated

**Children ages 5 and older:** 5 to 10 mg I.M. or I.V., repeated q 3 to 4 hours as needed to control tetanus spasm

**Children over 1 month to 5 years:** 1 to 2 mg I.M. or I.V. slowly, repeated q 3 to 4 hours as needed to control tetanus spasm

➤ Acute alcohol withdrawal

**Adults:** Initially, 10 mg P.O. three to four times during first 24 hours, decreased to 5 mg P.O. three to four times daily p.r.n. Or initially, 10 mg I.M. or I.V.; then 5 to 10 mg I.M. or I.V. in 3 to 4 hours p.r.n.

### Off-label uses

- Panic attacks
- Adjunct to general anesthesia

### Contraindications

- Hypersensitivity to drug, other benzodiazepines, alcohol, or tartrazine
- Coma or CNS depression
- Narrow-angle glaucoma

### Precautions

Use cautiously in:

- hepatic dysfunction, severe renal impairment
- elderly patients
- pregnant or breastfeeding patients (use not recommended)
- children.

### Administration

- Give P.O. dose with or without food.
- Administer I.V. infusion slowly into large vein, taking at least 1 minute for each 5 mg in adults or at least 3 minutes for each 0.25 mg/kg in children.
- Know that I.V. route is preferred over I.M. route because of slow or erratic I.M. absorption.
- Don't mix with other drugs or solutions in syringe or container.
- Enforce bed rest for at least 3 hours after I.V. injection.
- Give I.M. injection deeply and slowly into large muscle mass.
- If desired, mix oral solution with liquid or soft food.

Route	Onset	Peak	Duration
P.O.	30-60 min	1-2 hr	Up to 24 hr
I.V.	1-5 min	15-30 min	15-60 min
I.M.	Within 20 min	0.5-1.5 hr	Unknown

### Adverse reactions

**CNS:** dizziness, drowsiness, lethargy, depression, light-headedness, disorientation, anger, manic or hypomanic episodes, restlessness, paresthesia, headache, slurred speech, dysarthria, stupor, tremor, dystonia, vivid dreams, extrapyramidal reactions, mild paradoxical excitation

**CV:** bradycardia, tachycardia, hypertension, hypotension, palpitations, **cardiovascular collapse**

**EENT:** blurred vision, diplopia, nystagmus, nasal congestion

**GI:** nausea, vomiting, diarrhea, constipation, gastric disorders, difficulty swallowing, increased salivation

**GU:** urinary retention or incontinence, menstrual irregularities, gynecomastia, libido changes

**Hematologic:** blood dyscrasias including eosinophilia, **leukopenia**, **agranulocytosis**, and **thrombocytopenia**

**Hepatic: hepatic dysfunction**

**Musculoskeletal:** muscle rigidity, muscular disturbances

**Respiratory: respiratory depression**

**Skin:** dermatitis, rash, pruritus, urticaria, diaphoresis

**Other:** weight gain or loss, decreased appetite, edema, hiccups, fever, physical or psychological drug dependence or tolerance

## Interactions

**Drug-drug.** *Antidepressants, antihistamines, barbiturates, opioids:* additive CNS depression

*Cimetidine, disulfiram, fluoxetine, hormonal contraceptives, isoniazid, ketoconazole, metoprolol, propoxyphene, propranolol, valproic acid:* decreased metabolism and enhanced action of diazepam

*Digoxin:* increased digoxin blood level, possible toxicity

*Levodopa:* decreased levodopa efficacy

*Rifampin:* increased metabolism and decreased efficacy of diazepam

*Theophylline:* decreased sedative effect of diazepam

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, lactate dehydrogenase:* increased levels

*Neutrophils, platelets:* decreased counts

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

## Patient monitoring

- Monitor vital signs and respiratory and neurologic status.

- Supervise ambulation, especially in elderly patients.

- Monitor CBC and kidney and liver function test results.

 Avoid sudden drug withdrawal. Taper dosage gradually to termination of therapy.

## Patient teaching

- Inform patient he may take drug with or without food; recommend taking it with food if it causes stomach upset.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

 Tell patient to notify prescriber immediately if easy bruising or bleeding occurs.

- Instruct patient to move slowly when sitting up or standing, to avoid dizziness from blood pressure decrease.

Advise him to dangle legs briefly before getting out of bed.

 Advise patient not to stop taking drug abruptly.

- Advise patient to avoid alcohol and other depressants such as sedatives while taking drug.

- Tell female patient not to take drug if she is pregnant or plans to breastfeed.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## diclofenac epolamine

Flector Patch

## diclofenac potassium

Cambia, Cataflam, Novo-Difenac-K\*, Novo-Difenac-SR\*, Zipsor

## diclofenac sodium

Apo-Diclo\*, Dom-Diclofenac\*, Diclofex\*, Fenactol\*, Novo-Difenac\*, Nu-Diclo\*, Pennsaid, PMS-Diclofenac\*, Voltaren, Voltaren XR, Voltarol\*

**Pharmacologic class:** Cyclooxygenase inhibitor, nonsteroidal anti-inflammatory drug (NSAID)

**Therapeutic class:** Nonopioid analgesic, antiarthritic

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug may increase risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke. Risk may increase with duration of use. Patients with cardiovascular disease or risk factors for it may be at greater risk.
- Drug increases risk of serious GI adverse events, including bleeding, ulcers, and stomach or intestinal perforation. These events can occur at any time during use and without warning. Elderly patients are at greater risk.
- Drug is contraindicated for treatment of perioperative pain in setting of coronary artery bypass graft surgery.

### Action

Unclear. Thought to block activity of cyclooxygenase, thereby inhibiting inflammatory responses of vasodilation and swelling and blocking transmission of painful stimuli.

### Availability

#### diclofenac epolamine

*Flector patch:* 1.3%

#### diclofenac potassium

*Capsules, liquid-filled:* 25 mg

*Powder for oral solution:* 50 mg

*Tablets:* 50 mg

#### diclofenac sodium

*Tablets (delayed-release):* 25 mg, 50 mg, 75 mg

*Tablets (extended-release):* 100 mg

*Topical gel:* 1%

*Topical solution:* 1.5%

### Indications and dosages

- Acute migraine attacks

**Adults:** 50 mg P.O. (oral powder)

- Osteoarthritis pain of joints amenable to topical treatment

**Adults:** 2 g for each elbow, wrist, or hand; 4 g for each knee, ankle, or foot q.i.d. Maximum, 16 g daily to any single joint of lower extremities; maximum, 8 g daily to any single joint of upper extremities. Don't exceed 32 g/day over all affected joints.

- Osteoarthritis of knee

**Adults:** 40 drops on each painful knee q.i.d.

- Acute pain due to minor strains, sprains, and contusions (topical treatment)

**Adults:** One patch to most painful area b.i.d. Use lowest effective dosage for shortest duration consistent with individual patient's treatment goals.

- Analgesia; dysmenorrhea

**Adults:** Initially, 100 mg P.O., then 50 mg t.i.d. as needed

- Rheumatoid arthritis

**Adults:** Initially, 50 mg P.O. three to four times daily. After initial response, reduce to lowest dosage that controls symptoms. Usual maintenance dosage is 25 mg t.i.d.

- Osteoarthritis

**Adults:** Initially, 50 mg P.O. two to three times daily. After initial response, reduce to lowest dosage that controls symptoms.

➤ Ankylosing spondylitis

**Adults:** 25 mg P.O. four to five times daily. After initial response, reduce to lowest dosage that controls symptoms.

### Dosage adjustment

- Renal impairment
- Elderly patients

### Off-label uses

- Post-radial keratotomy symptoms
- Dental pain

### Contraindications

- Hypersensitivity to drug or its components, other NSAIDs, or aspirin
- Active GI bleeding or ulcer disease
- Aspirin-sensitive asthma, urticaria
- Use as perioperative analgesia in coronary artery bypass graft surgery
- Use on nonintact or damaged skin (patch)

### Precautions

Use cautiously in:

- severe cardiovascular (including patients taking diuretics or ACE inhibitors, patients with fluid retention, hypertension, or congestive heart failure), renal, or hepatic disease; bleeding tendency; dehydration
- advanced renal disease (not recommended)
- history of porphyria or preexisting asthma
- concurrent methotrexate or anticoagulant use; concurrent use of drugs known to be potentially hepatotoxic (such as acetaminophen, anti-infectives, or antiepileptics)
- concurrent use of aspirin (not recommended)
- concurrent use with oral NSAIDs (avoid use)
- elderly patients
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Give on empty stomach 1 hour before or after a meal.

- If drug causes GI upset, give with milk or meals. Mix and give oral powder with 30 to 60 ml of water only.
- Make sure patient swallows extended-release and delayed-release forms whole without chewing or crushing.
- Know that oral powder isn't indicated for prophylactic migraine therapy or cluster headaches.
- Know that oral powder formulation isn't interchangeable with other oral forms.
- Don't apply patch to damaged or nonintact skin.
- ☞ Avoid contact of patch with eyes and mucosa. If eye contact occurs, immediately wash eyes with water or saline solution

Route	Onset	Peak	Duration
P.O.	10 min	1 hr	8 hr
P.O. (delayed)	30 min	2-3 hr	8 hr
P.O. (extended)	Unknown	5-6 hr	Unknown
Patch	Unknown	10-20 hr	Unknown
Topical (gel, solution)	Unknown	10-14 hr	6 hr

### Adverse reactions

**CNS:** dizziness, drowsiness, headache, paresthesia

**CV:** hypertension, **thrombosis**

**EENT:** tinnitus

**GI:** dyspepsia, diarrhea, abdominal pain, dyspepsia, heartburn, peptic ulcer, **GI bleeding, GI perforation**

**GU:** dysuria, frequent urination, hematuria, proteinuria, nephritis, **acute renal failure**

**Hepatic:** liver failure

**Hematologic:** prolonged bleeding time

**Hepatic:** hepatotoxicity

**Skin:** eczema, photosensitivity, rash, contact dermatitis, dry skin, exfoliation; application-site reactions, including pruritus, dermatitis, burning (with patch); **exfoliative dermatitis,**

**Stevens-Johnson syndrome, toxic epidermal necrolysis**

**Other:** dysgeusia, pain and redness allergic reactions (including edema), anaphylaxis

**Interactions**

**Drug-drug.** *Anticoagulants, antiplatelet agents, cephalosporins, plicamycin, thrombolytics:* increased risk of bleeding  
*Antihypertensives, diuretics:* decreased efficacy of these drugs

*Antineoplastics:* increased risk of hematologic adverse reactions

*Aspirin:* increased adverse reactions

*Colchicine, corticosteroids, other*

*NSAIDs:* additive adverse GI effects

*Cyclosporine, probenecid:* increased risk of diclofenac toxicity

*Digoxin, lithium, methotrexate, phenytoin, theophylline:* increased levels of these drugs, greater risk of toxicity

*Diuretics (furosemide, thiazides):* reduced natriuretic effect of these drugs

*Potassium-sparing diuretics:* increased risk of hyperkalemia

*Voriconazole:* increased diclofenac

$C_{max}$  and area under the curve

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, blood urea nitrogen, creatinine, electrolytes, lactate dehydrogenase, urine uric acid:* increased values

*Bleeding time:* prolonged

*Hematocrit, hemoglobin, platelets,*

*serum uric acid, urine electrolytes, white blood cells:* decreased values

**Drug-herbs.** *Anise, arnica, chamomile, clove, dong quai, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, and others:* increased risk of bleeding

**Drug-behaviors.** *Alcohol use:* increased risk of adverse GI effects

**Patient monitoring**

- Monitor hepatic and renal function.
- Observe for and report signs and symptoms of bleeding.
- Assess for hypertension.

- Monitor sodium and potassium levels in patients receiving potassium-sparing diuretics.

🚫 Discontinue drug if rash or other signs of local skin reaction occur.

🚫 Discontinue drug immediately if abnormal liver test values persist or worsen.

- Weigh patient to detect fluid retention. Report gain of more than 2 lb in 24 hours.

**Patient teaching**

- Instruct patient to take drug on empty stomach 1 hour before or after a meal.

- Advise patient not to lie down for 15 to 30 minutes after taking oral drug, to minimize esophageal irritation.

- Instruct patient to mix oral powder in 1 to 2 ounces of water only before taking.

- Tell patient to measure proper amount of gel using measuring dosing card supplied and to gently massage gel into skin of entire affected foot, knee, or ankle.

- Instruct patient to apply 10 drops of topical solution to clean, dry skin and to spread evenly around front, back, and sides of knee; then repeat this procedure until 40 drops have been applied and knee is completely covered with solution.

- Instruct patient not to apply gel, patch, or topical solution to open wounds and to avoid contact with eyes and mucous membranes.

- Advise patient to avoid exposing treated sites to bath water and sunlight, external heat, occlusive dressings or clothing, sunscreens, cosmetics, lotions, moisturizers, insect repellants, or other topical drugs.

- Instruct patient to wash hands thoroughly after applying topical solution, patch, or gel except when gel is applied to the hand. If gel is applied to a hand, advise patient to avoid washing treated hands for at least 1 hour after application.

- Tell patient to discard used patches out of the reach of children and pets.
- 📣 Instruct patient to stop drug and immediately report wheezing and signs or symptoms of hypersensitivity reactions (rash, swelling of face or throat, shortness of breath) or liver impairment (unusual tiredness, weakness, nausea, yellowing of skin or eyes, tenderness on right upper side of abdomen, flulike symptoms).
- 📣 Instruct patient to stop taking drug and contact prescriber promptly if he experiences ringing or buzzing in ears, dizziness, GI discomfort, or bleeding.
- 📣 Inform patient that drug may cause serious CV side effects and to immediately report such signs and symptoms as unexplained weight gain, chest pain, shortness of breath, weakness, or slurred speech.
- Caution patient not to take over-the-counter analgesics during diclofenac therapy.
- Advise female patient to avoid pregnancy while taking this drug.
- Advise breastfeeding patient that she should decide whether to discontinue breastfeeding or discontinue drug, taking into account importance of drug for her treatment.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## dicyclomine (dicycloverine) ⚠️

Bentyl, Bentlyl<sup>⚠️</sup>, Diclophen<sup>⚠️</sup>, Formulex<sup>⚠️</sup>, Lomine<sup>⚠️</sup>, Merbentyl<sup>⚠️</sup>, Protylol<sup>⚠️</sup>

**Pharmacologic class:** Anticholinergic

**Therapeutic class:** Antispasmodic

**Pregnancy risk category B**

## Action

Thought to exert direct effect on GI smooth muscle by inhibiting acetylcholine at receptor sites, thereby reducing GI tract motility and tone

## Availability

*Capsules:* 10 mg

*Solution for injection:* 10 mg/ml

*Syrup:* 10 mg/5 ml

*Tablets:* 20 mg

## Indications and dosages

➤ Irritable bowel syndrome in patients unresponsive to usual interventions

**Adults:** 20 mg P.O. or I.M. q.i.d.; may increase up to 160 mg/day

## Contraindications

- Hypersensitivity to drug
- GI or genitourinary tract obstruction
- Severe ulcerative colitis
- Reflux esophagitis
- Unstable cardiovascular status
- Glaucoma
- Myasthenia gravis
- Breastfeeding
- Infants younger than 6 months

## Precautions

Use cautiously in:

- hepatic or renal impairment, autonomic neuropathy, cardiovascular disease, prostatic hypertrophy
- elderly patients
- pregnant patients (safety not established).

## Administration

• Give 30 to 60 minutes before meals; give bedtime dose at least 2 hours after evening meal.

- 📣 Don't administer by I.V. route.
- Don't give by I.M. route for more than 2 days.

Route	Onset	Peak	Duration
P.O., I.M.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** confusion, drowsiness, light-headedness (with I.M. use), psychosis

**CV:** palpitations, tachycardia

**EENT:** blurred vision, increased intraocular pressure

**GI:** nausea, vomiting, constipation, heartburn, decreased salivation, dry mouth, **paralytic ileus**

**GU:** urinary hesitancy or retention, erectile dysfunction, decreased lactation

**Skin:** decreased sweating, rash, itching, urticaria

**Other:** pain and redness at I.M. site, allergic reactions including **anaphylaxis**

## Interactions

**Drug-drug.** *Adsorbent antidiarrheals, antacids:* decreased dicyclomine absorption

*Cyclopropane anesthetics:* increased risk of cardiovascular adverse reactions

*Oral drugs:* altered absorption of these drugs

*Potassium (oral):* increased GI mucosal lesions

*Other anticholinergics (including antihistamines, disopyramide, quinidine):* additive anticholinergic effects

**Drug-diagnostic tests.** *Gastric acid secretion test:* antagonism of pentagastrin and histamine (testing agents)

## Patient monitoring

- 🔊 Stay alert for anaphylaxis.
- Monitor vital signs and fluid intake and output. Ask patient about palpitations.
- 🔊 Assess for light-headedness, confusion, and rash after I.M. injection.
- Evaluate patient's vision, particularly for blurring and other signs and symptoms of increasing intraocular pressure.
- Assess bowel pattern, particularly for signs and symptoms of paralytic ileus.

## Patient teaching

- Instruct patient to take drug 30 to 60 minutes before meals and to take

bedtime dose at least 2 hours after evening meal.

- Advise patient not to take antacids or adsorbent antidiarrheals within 2 hours of dicyclomine.

🔊 Urge patient to promptly report rash, abdominal pain, decreased urinary output, or absence of bowel movements.

- Caution patient to avoid driving or other hazardous activities until he knows how drug affects concentration, vision, and alertness.

🔊 Instruct patient to avoid exposure to high temperatures and to immediately notify prescriber if fever and decreased sweating occur in high environmental temperature.

- Advise patient to minimize GI upset by eating small, frequent servings of healthy food and drinking plenty of fluids.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## didanosine (ddI, 2,3-dideoxyinosine)

Videx, Videx EC

**Pharmacologic class:** Nucleoside reverse transcriptase inhibitor

**Therapeutic class:** Antiretroviral, antiviral

**Pregnancy risk category B**

### FDA BOXED WARNING

- Pancreatitis has occurred when drug was used alone or in combination regimens in treatment-naïve or treatment-experienced patients. Suspend therapy in patients with suspected pancreatitis;

discontinue in patients with confirmed pancreatitis.

- Drug may cause lactic acidosis and severe hepatomegaly with steatosis when used alone or in combination with other antiretrovirals. Fatal lactic acidosis has occurred in pregnant women receiving didanosine-stavudine combination with other antiretrovirals. In pregnant patients, use this combination with caution and only if benefit clearly outweighs risk.

### Action

Inhibits replication of human immunodeficiency virus (HIV) by disrupting synthesis of DNA polymerase, an enzyme crucial to DNA and RNA formation

### Availability

*Capsules (delayed-release)*: 125 mg, 200 mg, 250 mg, 400 mg

*Powder for oral solution (pediatric)*: 2 g in 4-oz glass bottle, 4 g in 8-oz glass bottle

### Indications and dosages

➤ HIV infection

**Adults weighing 60 kg (132 lb) or more:** 400 mg (capsules) P.O. once daily

**Adults weighing less than 60 kg (132 lb):** 250 mg (capsules) P.O. once daily

**Children:** 120 mg/m<sup>2</sup> (powder for oral solution, pediatric) P.O. q 12 hours

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to drug
- Concurrent use of allopurinol or ribavirin

### Precautions

Use cautiously in:

- renal or hepatic impairment, peripheral neuropathy, hyperuricemia

- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

- Know that drug is usually given in conjunction with other antiretrovirals.
- Give on empty stomach 30 minutes before or 2 hours after a meal.
- Don't administer with fruit juice.
- Know that pharmacist must prepare pediatric powder for oral solution by diluting with water and antacid to a concentration of 10 mg/ml.
- Be aware that delayed-release capsules aren't intended for use in children.

Route	Onset	Peak	Duration
P.O.	Unknown	0.5-1 hr	Unknown

### Adverse reactions

**CNS:** dizziness, anxiety, abnormal thinking, hypoesthesia, agitation, confusion, hypertonia, asthenia, peripheral neuropathy, **seizures, coma**  
**CV:** peripheral coldness, palpitations, hypotension, bradycardia, weak pulse, pseudoaneurysm, incomplete atrioventricular (AV) block, **complete AV block, nodal arrhythmias, ventricular tachycardia, thrombophlebitis, embolism**  
**EENT:** diplopia, abnormal vision, ocular hypotony, iritis, retinal detachment  
**GI:** nausea, vomiting, diarrhea, abdominal enlargement, dyspepsia, ileus, GI reflux, hematemesis, dysphagia, dry mouth, **pancreatitis**  
**GU:** urinary retention, frequency, or incontinence; dysuria; cystalgia; prostatitis; **renal dysfunction; nephrotoxicity**  
**Hematologic:** anemia, **leukocytosis, thrombocytopenia, bleeding, neutropenia**  
**Hepatic:** **hepatomegaly with steatosis, noncirrhotic portal hypertension**  
**Metabolic:** diabetes mellitus, **hyperkalemia, lactic acidosis, noncirrhotic portal hypertension**  
**Musculoskeletal:** muscle contractions

**Respiratory:** pneumonia, crackles, rhonchi, bronchitis, pleurisy, dyspnea, wheezing, **pleural effusion, pulmonary edema, pulmonary embolism, bronchospasm**

**Skin:** diaphoresis, pallor, rash, urticaria, pruritus, bullous eruption, petechiae, cellulitis, abscess

**Other:** edema, development of human antichimeric antibodies

## Interactions

**Drug-drug.** *Allopurinol, ganciclovir (oral), ribavirin, tenofovir:* increased didanosine blood level

*Amprenavir, delavirdine, indinavir, ritonavir, saquinavir:* altered didanosine pharmacokinetics

*Antacids, other drugs that increase gastric pH:* increased risk of didanosine toxicity  
*Co-trimoxazole, pentamidine:* increased risk of pancreatic toxicity

*Dapsone, fluoroquinolones, ketoconazole:* decreased blood levels of these drugs  
*Itraconazole:* decreased itraconazole blood level

*Methadone:* 50% decrease in didanosine blood level

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, uric acid:* increased levels

*Granulocytes, hemoglobin, platelets, white blood cells:* decreased values

**Drug-food.** *Any food:* decreased rate and extent of drug absorption

## Patient monitoring

☞ Monitor patient for signs and symptoms of pancreatitis. Withhold drug in patients with signs or symptoms of pancreatitis and discontinue drug in patients with confirmed pancreatitis.

☞ Monitor patient for early signs and symptoms of portal hypertension (thrombocytopenia, splenomegaly). Discontinue drug in patients with evidence of noncirrhotic portal hypertension.

☞ Assess carefully for signs and symptoms of lactic acidosis, such as dizziness, light-headedness, and bradycardia.

• Monitor for signs and symptoms of peripheral neuropathy.

• In patients with renal impairment, watch for drug toxicity and hypermagnesemia (suggested by muscle weakness and confusion).

## Patient teaching

• Tell patient to take drug on empty stomach.

• Advise patient using buffered powder to mix it with water, not juice, and to let powder dissolve for several minutes before taking.

☞ Instruct patient to immediately report abdominal pain, nausea, vomiting, tiredness, fast or irregular heartbeats, easy bruising, difficulty breathing, yellowing of skin or eyes, or dark urine.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

d

## digoxin

Apo-Digoxin<sup>®</sup>, Digitek, Lanoxin, PMS Digoxin

**Pharmacologic class:** Cardiac glycoside

**Therapeutic class:** Inotropic, antiarrhythmic

**Pregnancy risk category C**

## Action

Increases force and velocity of myocardial contraction and prolongs refractory period of atrioventricular (AV) node by increasing calcium entry into myocardial cells. Slows conduction

through sinoatrial and AV nodes and produces antiarrhythmic effect.

### Availability

*Oral solution (pediatric):* 0.05 mg/ml

*Injection:* 0.05 mg/ml, 0.1 mg/ml, 0.25 mg/ml

*Tablets:* 0.125 mg, 0.25 mg, 0.5 mg

### Indications and dosages

➤ Heart failure; tachyarrhythmias; atrial fibrillation and flutter; paroxysmal atrial tachycardia

**Adults:** For rapid digitalizing, 0.6 to 1 mg I.V. over 24 hours, with 50% of total dosage given initially and additional fractions given at 4- to 8-hour intervals; or digitalizing dose of 0.75 to 1.25 mg P.O. over 24 hours, with 50% of total dosage given initially and additional fractions given at 4- to 8-hour intervals. Maintenance dosage is 0.063 to 0.5 mg/day (tablets) or 0.35 to 0.5 mg/day (gelatin capsules), depending on lean body weight, renal function, and drug blood level.

**Children older than age 10:** For rapid digitalizing, 8 to 12 mcg/kg I.V. over 24 hours, with 50% of total dosage given initially and additional fractions given at 4- to 8-hour intervals; or digitalizing dose of 10 to 15 mcg/kg P.O. over 24 hours, with 50% of total dosage given initially and additional fractions given at 6- to 8-hour intervals. Maintenance dosage is 25% to 35% of loading dosage, given daily as a single dose (determined by renal function).

**Children ages 5 to 10:** For rapid digitalizing, 15 to 30 mcg/kg I.V. over 24 hours, with 50% of total dosage given initially and additional fractions given at 4- to 8-hour intervals; or digitalizing dose of 20 to 35 mcg/kg P.O. over 24 hours, with 50% of total dosage given initially and additional fractions given at 6- to 8-hour intervals. Maintenance dosage is 25% to 35% of loading

dosage, given daily in two divided doses (determined by renal function).  
**Children ages 2 to 5:** For rapid digitalizing, 25 to 35 mcg/kg I.V. over 24 hours, with 50% of total dosage given initially and additional fractions given at 4- to 8-hour intervals; or digitalizing dose of 30 to 40 mcg/kg P.O. over 24 hours, with 50% of total dosage given initially and additional fractions given at 6- to 8-hour intervals. Maintenance dosage is 25% to 35% of loading dosage, given daily in two divided doses (determined by renal function).

**Children ages 1 to 24 months:** For rapid digitalizing, 30 to 50 mcg/kg I.V. over 24 hours, with 50% of total dosage given initially and additional fractions given at 4- to 8-hour intervals; or digitalizing dose of 35 to 60 mcg/kg P.O. over 24 hours, with 50% of total dosage given initially and additional fractions given at 6- to 8-hour intervals. Maintenance dosage is 25% to 35% of loading dosage, given daily in two divided doses (determined by renal function).

**Infants (full-term):** For rapid digitalizing, 20 to 30 mcg/kg I.V. over 24 hours, with 50% of total dosage given initially and additional fractions given at 4- to 8-hour intervals; or digitalizing dose of 25 to 35 mcg/kg P.O. over 24 hours, with 50% of total dosage given initially and additional fractions given at 6- to 8-hour intervals. Maintenance dosage is 25% to 35% of loading dosage, given daily in two divided doses (determined by renal function).

**Infants (premature):** For rapid digitalizing, 15 to 25 mcg/kg I.V. over 24 hours, with 50% of total dosage given initially and additional fractions given at 4- to 8-hour intervals; or digitalizing dose of 20 to 30 mcg/kg P.O. over 24 hours, with 50% of total dosage given initially and additional fractions given at 6- to 8-hour intervals. Maintenance dosage is 20% to 30% of loading

dosage, given daily in two divided doses (determined by renal function).

### Dosage adjustment

- Renal impairment
- Hyperthyroidism
- Elderly patients

### Off-label uses

- Supraventricular tachyarrhythmias
- Intrauterine tachyarrhythmias

### Contraindications

- Hypersensitivity to drug
- Uncontrolled ventricular arrhythmias
- AV block
- Idiopathic hypertrophic subaortic stenosis
- Constrictive pericarditis

### Precautions

Use cautiously in:

- renal or hepatic impairment, electrolyte imbalances, myocardial infarction, thyroid disorders
- obesity
- elderly patients
- pregnant or breastfeeding patients.

### Administration

• Administer I.V. drug undiluted, or dilute with sterile water for injection, normal saline solution, or dextrose 5% in water as directed.

 Know that drug has narrow therapeutic index, so dosage must be monitored regularly and patient must be monitored for signs and symptoms of toxicity.

- Know that for rapid effect, initial digitalizing dose generally is given in several divided doses over 12 to 24 hours.
- Be aware that dosages used for atrial arrhythmias generally are higher than those used for inotropic effect.

Route	Onset	Peak	Duration
P.O.	0.5-2 hr	2-6 hr	2-4 days
I.V.	5-30 min	1-5 hr	2-4 days

### Adverse reactions

**CNS:** fatigue, headache, asthenia

**CV:** bradycardia, ECG changes, arrhythmias

**EENT:** blurred or yellow vision

**GI:** nausea, vomiting, diarrhea

**GU:** gynecomastia

**Hematologic:** thrombocytopenia

**Other:** decreased appetite

### Interactions

**Drug-drug.** *Amiodarone, cyclosporine, diclofenac, diltiazem, propafenone, quinidine, quinine, verapamil:* increased digoxin blood level, possibly leading to toxicity

*Amphotericin B, corticosteroids, mezolocillin, piperacillin, thiazide and loop diuretics, ticarcillin:* hypokalemia, increased risk of digoxin toxicity  
*Antacids, cholestyramine, colestipol, kaolin/pectin:* decreased digoxin absorption

*Beta-adrenergic blockers, other antiarrhythmics (including disopyramide, quinidine):* additive bradycardia  
*Laxatives (excessive use):* hypokalemia, increased risk of digoxin toxicity  
*Spironolactone:* reduced digoxin clearance, increased risk of digoxin toxicity  
*Thyroid hormones:* decreased digoxin efficacy

**Drug-diagnostic tests.** *Creatine kinase:* increased level

**Drug-food.** *High-fiber meal:* decreased digoxin absorption

**Drug-herbs.** *Coca seed, coffee seed, cola seed, guarana seed, horsetail, licorice, natural stimulants (such as aloe), yerba maté:* increased risk of digoxin toxicity and hypokalemia

*Ephedra (ma huang):* arrhythmias

*Hawthorn:* increased risk of adverse cardiovascular effects

*Indian snakeroot:* bradycardia

*Psyllium:* decreased digoxin absorption

*St. John's wort:* decreased blood level and effects of digoxin

**Patient monitoring**

- Assess apical pulse regularly for 1 full minute. If rate is less than 60 beats/minute, withhold dose and notify prescriber.

-  Monitor for signs and symptoms of drug toxicity (such as nausea, vomiting, visual disturbances, arrhythmias, and altered mental status). Be aware that therapeutic digoxin levels range from 0.5 to 2 ng/ml.

- Monitor ECG and blood levels of digoxin, potassium, magnesium, calcium, and creatinine.

- Stay alert for hypocalcemia. Know that this condition may predispose patient to digoxin toxicity and may decrease digoxin efficacy.

-  Watch closely for hypokalemia and hypomagnesemia. Know that digoxin toxicity may occur with these conditions despite digoxin blood levels below 2 ng/ml.

**Patient teaching**

- Tell patient to take drug at same time every day.

-  Instruct patient not to stop drug abruptly.

- Instruct patient not to take over-the-counter drugs without prescriber's approval.

-  Teach patient how to recognize and report signs and symptoms of digoxin toxicity.

- Stress importance of follow-up testing as directed by prescriber.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

**diltiazem hydrochloride**

Adizem<sup>Ⓢ</sup>, Angitil<sup>Ⓢ</sup>, Apo-Diltiaz<sup>Ⓢ</sup>, Apo-Diltiazem<sup>Ⓢ</sup>, Calcard<sup>Ⓢ</sup>, Cardizem, Cardizem CD, Cardizem LA, Cartia XT, Dilacor-XR, Dilcardia<sup>Ⓢ</sup>, Dilt-CD, Dilt-XR, Diltia XT, Diltzac, Dilzem<sup>Ⓢ</sup>, Disogram<sup>Ⓢ</sup>, Gen-Diltiazem<sup>Ⓢ</sup>, Med-Diltiazem<sup>Ⓢ</sup>, Novo-Diltiazem<sup>Ⓢ</sup>, Nu-Diltiaz<sup>Ⓢ</sup>, Optil<sup>Ⓢ</sup>, Ratio-Diltiazem<sup>Ⓢ</sup>, Sandoz Diltiazem<sup>Ⓢ</sup>, Slozem<sup>Ⓢ</sup>, Taztia XT, Tiazac, Tildiem<sup>Ⓢ</sup>, Viazem<sup>Ⓢ</sup>, Zemtard<sup>Ⓢ</sup>

**Pharmacologic class:** Calcium channel blocker

**Therapeutic class:** Antianginal, antiarrhythmic (class IV), antihypertensive

**Pregnancy risk category C**

**Action**

Inhibits calcium from entering myocardial and vascular smooth-muscle cells, thereby depressing myocardial and smooth-muscle contraction and decreasing impulse formation and conduction velocity. As a result, systolic and diastolic pressures decrease.

**Availability**

**Capsules (extended-release, sustained-release):** 60 mg, 90 mg, 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg

**Injection:** 5 mg/ml in 10-ml vials, 100-mg Monovial

**Tablets:** 30 mg, 60 mg, 90 mg, 120 mg

**Indications and dosages**

➤ Angina pectoris and vasospastic (Prinzmetal's) angina; hypertension; supraventricular tachyarrhythmias; atrial flutter or fibrillation

**Adults:** 30 to 90 mg P.O. three to four times daily (tablets), or 60 to 120 mg P.O.

b.i.d. (sustained-release), or 180 to 240 mg P.O. once daily (extended-release), adjusted after 14 days as needed, up to a total daily dosage of 360 mg. Or 0.25 mg/kg by I.V. bolus over 2 minutes; if response is inadequate after 15 minutes, may give 0.35 mg/kg over 2 minutes; may follow with continuous I.V. infusion at 10 mg/hour (at a range of 5 to 15 mg/hour) for up to 24 hours.

**Dosage adjustment**

- Severe hepatic or renal impairment
- Elderly patients

**Off-label uses**

- Unstable angina, coronary artery bypass graft surgery
- Tardive dyskinesia
- Migraine
- Hyperthyroidism
- Raynaud’s phenomenon

**Contraindications**

- Hypersensitivity to drug
- Atrial flutter or fibrillation associated with shortened refractory period (Wolff-Parkinson-White syndrome, with I.V. use)
- Recent myocardial infarction or pulmonary congestion
- Cardiogenic shock, concurrent I.V. beta-blocker therapy, ventricular tachycardia, neonates (with I.V. use, because of benzyl alcohol in syringe formulation)
- Sick sinus syndrome, second- or third-degree atrioventricular block (except in patients with ventricular pacemakers)
- Hypotension (systolic pressure below 90 mm Hg)

**Precautions**

Use cautiously in:

- severe hepatic or renal impairment, heart failure
- history of serious ventricular arrhythmias
- concurrent use of I.V. diltiazem and I.V. beta blockers
- elderly patients

- pregnant or breastfeeding patients
- children (safety not established).

**Administration**

- When giving I.V., dilute in dextrose 5% in water or normal saline solution.
- Give I.V. bolus dose over 2 minutes; a second bolus may be given after 15 minutes.
- Administer continuous I.V. infusion at a rate of 5 to 15 mg/hour.
-  When giving by continuous I.V. infusion, make sure emergency equipment is available and that patient has continuous ECG monitoring with frequent blood pressure monitoring.
- Don’t crush tablets or sustained-release capsules; they must be swallowed whole.
- Withhold dose if systolic blood pressure falls below 90 mm Hg, diastolic pressure is below 60 mm Hg, or apical pulse is slower than 60 beats/minute.

Route	Onset	Peak	Duration
P.O.	30 min	2-3 hr	6-8 hr
P.O. (sustained)	Unknown	Unknown	12 hr
P.O. (extended)	Unknown	14 hr	Up to 24 hr
I.V.	2-5 min	2-4 hr	Unknown

**Adverse reactions**

- CNS:** headache, abnormal dreams, anxiety, confusion, dizziness, drowsiness, nervousness, psychiatric disturbances, asthenia, paresthesia, syncope, tremor
- CV:** peripheral edema, bradycardia, chest pain, hypotension, palpitations, tachycardia, **arrhythmias, heart failure**
- EENT:** blurred vision, tinnitus, epistaxis
- GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, dry mouth
- GU:** urinary frequency, dysuria, nocturia, polyuria, gynecomastia, sexual dysfunction
- Hematologic:** anemia, **leukopenia, thrombocytopenia**
- Metabolic:** hyperglycemia

**Musculoskeletal:** joint stiffness, muscle cramps

**Respiratory:** cough, dyspnea

**Skin:** rash, dermatitis, flushing, diaphoresis, photosensitivity, pruritus, urticaria, **erythema multiforme**

**Other:** unpleasant taste, gingival hyperplasia, weight gain, decreased appetite, **Stevens-Johnson syndrome**

## Interactions

**Drug-drug.** *Beta-adrenergic blockers, digoxin, disopyramide, phenytoin:* bradycardia, conduction defects, heart failure  
*Carbamazepine, cyclosporine, quinidine:* decreased diltiazem metabolism, increased risk of toxicity

*Cimetidine, ranitidine:* increased blood level and effects of diltiazem

*Fentanyl, nitrates, other antihypertensives, quinidine:* additive hypotension  
*HMG-CoA reductase inhibitors, imipramine, sirolimus, tacrolimus:* increased blood levels of these drugs

*Lithium:* decreased lithium blood level, reduced antimanic control

*Nonsteroidal anti-inflammatory drugs:* decreased antihypertensive effect of diltiazem

*Theophylline:* increased theophylline effects

**Drug-diagnostic tests.** *Hepatic enzymes:* increased levels

**Drug-food.** *Grapefruit juice:* increased blood level and effects of diltiazem

**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension

## Patient monitoring

- Check blood pressure and ECG before starting therapy, and monitor closely during dosage adjustment period. Withhold dose if systolic pressure is below 90 mm Hg.
- 🔊 Monitor for signs and symptoms of heart failure and worsening arrhythmias.
- Supervise patient during ambulation.

## Patient teaching

- Instruct patient to swallow extended-release capsules whole and not to crush or chew them.
- Advise patient to change position slowly to minimize light-headedness and dizziness.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

## dimenhydrinate

Apo-Dimenhydrinate✳️, Arlevert⚠️, Dramamine, Dramanate✳️, Gravol✳️, PMS-Dimenhydrinate✳️, Travamine✳️, TripTone

**Pharmacologic class:** Anticholinergic

**Therapeutic class:** Antiemetic, anti-vertigo agent

**Pregnancy risk category B**

## Action

Prevents nausea and vomiting by inhibiting vestibular stimulation of chemoreceptor trigger zone and inhibiting stimulation of vomiting center in brain

## Availability

*Injection:* 50 mg/ml

*Tablets:* 50 mg

*Tablets (chewable):* 50 mg

## Indications and dosages

➤ Prevention and treatment of nausea, vomiting, dizziness, and vertigo

**Adults and children ages 12 and older:** 50 to 100 mg P.O. q 4 hours (not to exceed 400 mg/day), or 50 mg I.M. or I.V. q 4 hours p.r.n.

**Children ages 6 to 12:** 25 to 50 mg P.O. q 6 to 8 hours (not to exceed 150 mg/day), or 1.25 mg/kg I.M. (37.5 mg/m<sup>2</sup>) q 6 hours p.r.n.

**Children ages 2 to 6:** 12.5 to 25 mg P.O. q 6 to 8 hours (not to exceed 75 mg/day)

### Contraindications

- Hypersensitivity to drug or tartrazine
- Alcohol intolerance

### Precautions

Use cautiously in:

- angle-closure glaucoma, seizure disorders, prostatic hypertrophy
- children younger than age 2.

### Administration

- For I.V. use, dilute with dextrose 5% in water or normal saline solution.
- Give each 50-mg I.V. dose over 2 minutes.

 Don't administer by I.V. route to premature or low-birth-weight infants. Solution contains benzyl alcohol, which can cause fatal "gasping" syndrome.

Route	Onset	Peak	Duration
P.O.	15-60 min	1-2 hr	3-6 hr
I.V.	Rapid	Unknown	3-6 hr
I.M.	20-30 min	1-2 hr	3-6 hr

### Adverse reactions

**CNS:** drowsiness, dizziness, headache, paradoxical stimulation (in children)

**CV:** hypotension, palpitations

**EENT:** blurred vision, tinnitus

**GI:** diarrhea, constipation, dry mouth

**GU:** dysuria, urinary frequency

**Skin:** photosensitivity

**Other:** decreased appetite, pain at I.M. site

### Interactions

**Drug-drug.** *Disopyramide, quinidine, tricyclic antidepressants:* increased anticholinergic effects

**MAO inhibitors:** intensified and prolonged anticholinergic effects

*Other CNS depressants (such as antihistamines, opioids, sedative-hypnotics):* additive CNS depression

*Ototoxic drugs (such as aminoglycosides, ethacrynic acid):* masking of signs or symptoms of ototoxicity

**Drug-diagnostic tests.** *Allergy skin tests:* false-negative results

**Drug-behaviors.** *Alcohol use:* increased CNS depression

### Patient monitoring

- Assess for lethargy and drowsiness.
- Monitor for dizziness, nausea, and vomiting (possible indicators of drug toxicity).

### Patient teaching

- To prevent motion sickness, advise patient to take drug 30 minutes before traveling and to repeat dose before meals and at bedtime.
- Instruct patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Caution patient to avoid alcohol and sedative-hypnotics during therapy.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

d

## dinoprostone (prostaglandin E<sub>2</sub>, PGE<sub>2</sub>)

Cervidil Vaginal Insert, Prepidil Endocervical Gel, Propress<sup>®</sup>, Prostin E2 Vaginal Suppository

**Pharmacologic class:** Oxytocic, prostaglandin

**Therapeutic class:** Abortifacient, cervical ripening agent

**Pregnancy risk category C**

**FDA BOXED WARNING**

- Dinoprostone vaginal suppository should be given only by trained personnel who adhere strictly to recommended dosages, in hospital that can provide immediate intensive care and acute surgical facilities.

**Action**

Initiates strong contractions of uterine smooth muscle by stimulating myometrium and promoting cervical softening, effacement, and dilation

**Availability**

*Endocervical gel:* 0.5 mg in 3-g gel vehicle in prefilled syringe with catheter

*Vaginal insert:* 10 mg

*Vaginal suppositories:* 20 mg

**Indications and dosages**

➤ Cervical ripening

**Adults:** 0.5 mg endocervical gel vaginally; if response is poor, may repeat in 6 hours (not to exceed 1.5 mg in 24 hours). Or one 10-mg vaginal insert.

➤ To induce abortion

**Adults:** One 20-mg vaginal suppository; repeat q 3 to 5 hours (not to exceed total dosage of 240 mg or duration of 48 hours).

➤ Nonmetastatic gestational trophoblastic disease (benign hydatidiform mole)

**Adults:** Insert one 20-mg suppository high into vagina; may repeat at 3- to 5-hour intervals for up to 2 days if necessary.

**Contraindications**

- Hypersensitivity to prostaglandins or additives in gel or suppository
- When vaginal delivery isn't indicated, such as with vasa previa or active genital herpes infection (Prepidil)
- Acute pelvic inflammatory disease
- Ruptured membranes, placenta previa, marked cephalopelvic

disproportion, or unexplained vaginal bleeding during pregnancy

- When oxytocics are contraindicated or when prolonged contraction of uterus may be detrimental to fetal safety or uterine integrity, such as with previous cesarean section or major uterine surgery
- Concurrent use of I.V. oxytocics (Cervidil)
- Clinical suspicion or definite evidence of fetal distress when delivery isn't imminent (Cervidil, Prepidil)
- History of difficult labor or traumatic delivery, hyperactive or hypertonic uterine patterns (Prepidil)
- Obstetric emergencies in which benefit-to-risk ratio for either fetus or mother favors surgical intervention (Prepidil)
- Active cardiac, pulmonary, renal, or hepatic disease (Prostin E2 Vaginal Suppository)
- Multipara with six or more previous term pregnancies (Cervidil)
- Grand multipara with six or more previous term pregnancies with non-vertex presentation (Prepidil)

**Precautions**

Use cautiously in:

- history of pulmonary, cardiac, renal, or hepatic disease; asthma; jaundice, anemia; cervicitis; infected endocervical lesions; acute vaginitis; compromised (scarred) uterus; hypertension; hypotension; adrenal disorders; diabetes mellitus; epilepsy; glaucoma
- women age 30 or older, those with complications during pregnancy, and those with gestational age of more than 40 weeks are at increased risk of post-partum disseminated intravascular coagulation
- concurrent use of other oxytocics (not recommended).

**Administration**

- Keep patient supine for 15 to 30 minutes after gel administration and

for 10 minutes after administering suppository to prevent drug expulsion.

- Store suppositories in freezer; bring to room temperature before using.

Route	Onset	Peak	Duration
Vaginal (gel)	Rapid	30-45 min	Unknown
Vaginal (insert)	Rapid	Unknown	12 hr
Vaginal (suppository)	10 min	Unknown	2-3 hr

### Adverse reactions

**CNS:** headache, drowsiness, syncope

**CV:** hypotension, hypertension

**GI:** nausea, vomiting, diarrhea

**GU:** urinary tract infection, vaginal or uterine pain, uterine contractile abnormalities, warm vaginal sensation, **uterine hypertonicity, uterine rupture**

**Musculoskeletal:** back pain

**Respiratory:** cough, dyspnea, wheezing

**Other:** allergic reactions including chills, fever, and **anaphylaxis**

### Interactions

**Drug-drug.** *Other oxytocics:* increased oxytocic effects

### Patient monitoring

🔊 Monitor uterine contractions and observe for excessive vaginal bleeding and cramping. Record sanitary pad count.

- Monitor vital signs and assess for drug-induced fever. Report significant blood pressure and pulse changes.
- Assess for wheezing, chest pain, and dyspnea.
- Evaluate for GI upset. To minimize, give antiemetic before dinoprostone therapy.

### Patient teaching

- Advise patient to stay in supine position, as prescribed, after administration.
- Instruct patient to report fever, bleeding, or abdominal cramps.

- Tell patient to avoid douches, tampons, tub baths, and sexual intercourse for at least 2 weeks after receiving drug.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## diphenhydramine hydrochloride

Aler-Cap, Aler-Dryl, Allerdryl<sup>✳</sup>, AllerMax, Altery, Anti-Hist, Banophen, Benadryl, Benadryl Allergy, Benadryl Child Chesty Cough<sup>⚠</sup>, Benadryl Children's Allergy Fastmelt, Benadryl Dye-Free Allergy, Benadryl Itch Relief, Compoz Nighttime Sleep Aid, Dermamycin, Diphen, Diphenhist, Dytan, Genahist, Histapryn, Histergan<sup>⚠</sup>, Hydramine, Mandalyn Paediatric<sup>⚠</sup>, Nightcalm, Nytol, PMS-Diphenhydramine<sup>✳</sup>, Siladryl, Simply Sleep, Sleep-eaze<sup>⚠</sup>, Sleepettes D, Sleepinal, Sominex, Theraflu Thin Strips Multisymptom, Triaminic Thin Strips Children's Cough and Runny Nose, Twilite, Unisom Maximum Strength SleepGels

**Pharmacologic class:** Ethanolamine derivative, nonselective histamine<sub>1</sub>-receptor antagonist

**Therapeutic class:** Antihistamine, anti-tussive, antiemetic, antivertigo agent, antidyskinetic

**Pregnancy risk category B**

### Action

Interferes with histamine effects at histamine<sub>1</sub>-receptor sites; prevents but doesn't reverse histamine-mediated response. Also possesses CNS depressant and anticholinergic properties.

**Availability**

*Capsules:* 25 mg, 50 mg

*Elixir:* 12.5 mg/5 ml

*Injection:* 10 mg/ml, 50 mg/ml

*Strips (orally disintegrating):* 12.5 mg, 25 mg

*Syrup:* 12.5 mg/5 ml

*Tablets:* 25 mg, 50 mg

*Tablets (chewable):* 12.5 mg, 25 mg

*Tablets (orally disintegrating):* 12.5 mg

**Indications and dosages**

➤ Allergy symptoms caused by histamine release (including anaphylaxis, seasonal and perennial allergic rhinitis, and allergic dermatoses); nausea; vertigo

**Adults and children over age 12:** 25 to 50 mg P.O. q 4 to 6 hours, or 10 to 50 mg I.V. or I.M. q 2 to 3 hours p.r.n. (Some patients may need up to 100 mg.) Don't exceed 400 mg/day.

**Children ages 6 to 12:** 12.5 to 25 mg P.O. q 4 to 6 hours, or 1.25 mg/kg (37.5 mg/m<sup>2</sup>) I.M. or I.V. q.i.d. Don't exceed 150 mg/day.

**Children ages 2 to 5:** 6.25 mg P.O. q 4 to 6 hours. Don't exceed 37.5 mg/day.

➤ Cough

**Adults:** 25 mg P.O. q 4 hours p.r.n.

Don't exceed 150 mg/day.

**Children ages 6 to 12:** 12.5 mg P.O. q 4 hours. Don't exceed 75 mg/day.

**Children ages 2 to 5:** 6.25 mg P.O. q 4 hours. Don't exceed 37.5 mg/24 hours.

➤ Dyskinesia; Parkinson's disease

**Adults:** Initially, 25 mg P.O. t.i.d.; may be increased to a maximum of 50 mg q.i.d.

➤ Mild nighttime sedation

**Adults:** 50 mg P.O. 20 to 30 minutes before bedtime

**Dosage adjustment**

- Elderly patients

**Off-label uses**

- Drug-induced extrapyramidal reactions

**Contraindications**

- Hypersensitivity to drug
- Alcohol intolerance
- Acute asthma attacks
- MAO inhibitor use within past 14 days
- Breastfeeding
- Neonates, premature infants

**Precautions**

Use cautiously in:

- severe hepatic disease, angle-closure glaucoma, seizure disorders, prostatic hypertrophy, cardiovascular disease, hyperthyroidism
- elderly patients
- pregnant patients (safety not established)
- children younger than age 2 (safety not established).

**Administration**

- For motion sickness, administer 30 minutes before activity.
- For I.V. use, check compatibility before mixing with other drugs.
- Inject I.M. dose deep into large muscle mass; rotate sites.
- Discontinue drug 4 days before allergy skin testing to avoid misleading results.

⚠ Don't give within 14 days of MAO inhibitors.

Route	Onset	Peak	Duration
P.O.	15-60 min	1-4 hr	4-8 hr
I.V.	Rapid	Unknown	4-8 hr
I.M.	20-30 min	1-4 hr	4-8 hr

**Adverse reactions**

**CNS:** drowsiness, dizziness, headache, paradoxical stimulation (especially in children)

**CV:** hypotension, palpitations, tachycardia

**EENT:** blurred vision, tinnitus

**GI:** diarrhea, constipation, dry mouth

**GU:** dysuria, urinary frequency or retention

**Skin:** photosensitivity

**Other:** decreased appetite, pain at I.M. injection site

### Interactions

**Drug-drug.** *Antihistamines, opioids, sedative-hypnotics:* additive CNS depression

*Disopyramide, quinidine, tricyclic antidepressants:* increased anticholinergic effects

*MAO inhibitors:* intensified and prolonged anticholinergic effects

**Drug-diagnostic tests.** *Skin allergy tests:* false-negative results

*Hemoglobin, platelets:* decreased values

**Drug-herbs.** *Angel's trumpet, jimson weed, scopolia:* increased anticholinergic effects

*Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

### Patient monitoring

- Monitor cardiovascular status, especially in patients with cardiovascular disease.
- Supervise patient during ambulation. Use side rails as necessary.

### Patient teaching

- Advise patient to avoid alcohol and other depressants such as sedatives while taking drug.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## diphenoxylate hydrochloride and atropine sulfate (co-phenotrope<sup>®</sup>)

Lomotil, Lonox

**Pharmacologic class:** Anticholinergic, meperidine congener

**Therapeutic class:** Antidiarrheal

**Controlled substance schedule V**

**Pregnancy risk category C**

### Action

Acts on smooth muscle of GI tract by decreasing peristalsis, which inhibits motility. (Small amount of atropine is added to reduce abuse potential.)

### Availability

*Liquid:* 2.5 mg diphenoxylate and 0.025 mg atropine/5 ml

*Tablets:* 2.5 mg diphenoxylate and 0.025 mg atropine

### Indications and dosages

➤ Diarrhea

**Adults:** Initially, 5 mg P.O. three to four times daily, then 5 mg/day as needed (not to exceed 20 mg/day). Decrease dosage when desired response occurs.

**Children:** Initially, 0.3 to 0.4 mg/kg P.O. (liquid only) daily in four divided doses. Decrease dosage when desired response occurs.

### Dosage adjustment

- Elderly patients

### Contraindications

- Hypersensitivity to drug
- Obstructive jaundice
- Diarrhea associated with pseudo-membranous colitis or enterotoxin-producing bacteria
- Angle-closure glaucoma

- Concurrent MAO inhibitor use
- Children younger than age 2

### Precautions

Use cautiously in:

- inflammatory bowel disease; prostatic hypertrophy; severe hepatic disease (use with extreme caution)
- concurrent use of drugs that cause physical dependence; history of physical drug dependence
- elderly patients
- pregnant or breastfeeding patients
- children (safety not established in children younger than age 12).

### Administration

⚠ Don't confuse brand name Lomotil with Lamictal (an anticonvulsant). Serious errors have been reported.

- Withhold drug if patient has severe fluid or electrolyte imbalance.
- Administer with food if GI upset occurs.

⚠ Don't give within 14 days of MAO inhibitors.

Route	Onset	Peak	Duration
P.O.	45-60 min	2 hr	3-4 hr

### Adverse reactions

**CNS:** dizziness, confusion, drowsiness, headache, insomnia, nervousness

**CV:** tachycardia

**EENT:** blurred vision, dry eyes

**GI:** nausea, vomiting, constipation, epigastric distress, ileus, dry mouth

**GU:** urinary retention

**Skin:** flushing

### Interactions

**Drug-drug.** *CNS depressants (including antihistamines, sedative-hypnotics, opioids):* increased CNS depression

*Anticholinergic-like drugs (including tricyclic antidepressants, disopyramide):* increased anticholinergic effects

*MAO inhibitors:* hypertensive crisis

**Drug-diagnostic tests.** *Amylase:* increased level

**Drug-herbs.** *Angel's trumpet, jimsonweed, scopolia:* increased anticholinergic effects

**Drug-behaviors.** *Alcohol use:* increased CNS depression

### Patient monitoring

⚠ Assess for and report abdominal distention and signs or symptoms of decreased peristalsis.

- Watch for signs and symptoms of dehydration.
- Assess frequency and consistency of bowel movements.

### Patient teaching

- Instruct patient to report persistent diarrhea.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Tell patient that prolonged use may lead to dependence.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## dipyridamole

Apo-Dipyridamole FC<sup>♣</sup>, Apo-Dipyridamole SC<sup>♣</sup>, Persantin<sup>⊕</sup>, Persantine

**Pharmacologic class:** Platelet adhesion inhibitor

**Therapeutic class:** Antiplatelet agent, diagnostic agent (coronary vasodilator)

**Pregnancy risk category B**

**Action**

Unclear. May reduce platelet aggregation by inhibiting phosphodiesterase, adenosine uptake, or formation of thromboxane A<sub>2</sub>.

**Availability**

Tablets: 25 mg, 50 mg, 75 mg

**Indications and dosages**

➤ To prevent thromboembolism in patients with prosthetic heart valves

**Adults:** 75 to 100 mg P.O. q.i.d.

**Off-label uses**

- Prevention of myocardial reinfarction (given with aspirin)
- Thrombotic thrombocytopenia purpura

**Contraindications**

- Hypersensitivity to drug

**Precautions**

Use cautiously in:

- hypotension, hepatic insufficiency, severe coronary artery disease
- pregnant or breastfeeding patients
- children younger than age 12 (safety not established).

**Administration**

- Know that drug is usually given with warfarin when used to prevent thromboembolism.
- Give with a full glass of water at least 1 hour before or 2 hours after meals. If gastric distress occurs, give with food.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

**Adverse reactions**

**CNS:** dizziness, headache

**CV:** hypotension

**GI:** abdominal distress

**Hepatic:** hepatic failure

**Skin:** rash

**Interactions**

**Drug-drug.** *Adenosine:* increased adenosine plasma level and CV effects

*Cholinesterase inhibitors:* counteracts activity of cholinesterase inhibitors

**Drug-diagnostic tests.** *Hepatic enzymes:* increased levels

**Drug-behaviors.** *Alcohol use:* increased risk of hypotension

**Patient monitoring**

- Monitor for therapeutic efficacy, including improved exercise tolerance and decreased need for nitrates.
- Assess platelet and coagulation studies regularly.
- Monitor ECG and vital signs, especially blood pressure.
- Monitor hepatic function tests regularly.

**Patient teaching**

- Advise patient to take drug 1 hour before or 2 hours after meals for best absorption.
-  Instruct patient to immediately report unusual tiredness, chest pain or other cardiac symptoms, upper right abdominal pain, yellowing of skin or eyes, or dark urine.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

**dobutamine hydrochloride**

*Pharmacologic class:* Sympathomimetic, adrenergic

*Therapeutic class:* Inotropic

*Pregnancy risk category* B

**Action**

Stimulates beta<sub>1</sub>-adrenergic receptors of heart, causing a positive inotropic

effect that increases myocardial contractility and stroke volume. Also reduces peripheral vascular resistance, decreases ventricular filling pressure, and promotes atrioventricular conduction.

### Availability

*Injection:* 12.5 mg/ml in 20-ml vials

### Indications and dosages

➤ Short-term treatment of cardiac decompensation caused by depressed contractility (such as during refractory heart failure); adjunct in cardiac surgery  
**Adults:** 2.5 to 10 mcg/kg/minute I.V. as a continuous infusion, adjusted to hemodynamic response

### Dosage adjustment

- Elderly patients

### Off-label uses

- Adjunct in myocardial infarction (MI) and septic shock
- Diagnosis of coronary artery disease (echocardiography stress test, ventriculography, computed tomography)

### Contraindications

- Hypersensitivity to drug
- Idiopathic hypertrophic subaortic stenosis

### Precautions

Use cautiously in:

- hypertension, MI, atrial fibrillation, hypovolemia
- pregnant or breastfeeding patients
- children.

### Administration

- As needed, correct hypovolemia before starting therapy by giving volume expanders, as prescribed.
- Use infusion pump or microdrip I.V. infusion set.
- Dilute with dextrose 5% in water or normal saline solution to at least 50 ml of solution. Know that drug is

incompatible with alkaline solutions, such as sodium bicarbonate injection.

Route	Onset	Peak	Duration
I.V.	1-2 min	10 min	Brief

### Adverse reactions

**CNS:** headache

**CV:** hypertension, hypotension, tachycardia, premature ventricular contractions, angina, palpitations, nonspecific chest pain, phlebitis

**GI:** nausea, vomiting

**Metabolic:** hypokalemia

**Respiratory:** dyspnea, asthma attacks

**Skin:** extravasation with tissue necrosis

**Other:** hypersensitivity reactions including anaphylaxis

### Interactions

**Drug-drug.** *Beta-adrenergic blockers:*

increased alpha-adrenergic effects

*Bretylium:* potentiation of vasopressor activity

*Cyclopropane, halothane:* serious arrhythmias

*Guanethidine:* decreased hypotensive effects

*Thyroid hormone:* increased cardiovascular effects

*Tricyclic antidepressants:* potentiation of cardiovascular and vasopressor effects

**Drug-herbs.** *Rue:* increased inotropic potential

### Patient monitoring

- Monitor ECG and blood pressure continuously during administration.
- Monitor cardiac output, pulmonary capillary wedge pressure, and central venous pressure.
- Monitor fluid intake and output and watch for signs and symptoms of worsening heart failure.
- 🔊 Assess electrolyte levels. Stay especially alert for hypokalemia.

## Patient teaching

- Instruct patient to report angular pain, headache, leg cramps, and shortness of breath.
- Explain need for close observation and monitoring.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and herbs mentioned above.

## docetaxel

Taxotere

**Pharmacologic class:** Mitosis inhibitor

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

### FDA BOXED WARNING

- Give under supervision of physician experienced in cancer chemotherapy, in facility with adequate diagnostic and treatment resources.
- Treatment-related death is more likely if patient has abnormal hepatic function, is receiving higher doses, or has non-small-cell lung cancer and history of platinum-based chemotherapy and is receiving drug as a single agent at dosage of 100 mg/m<sup>2</sup>.
- Generally, drug shouldn't be given to patients with bilirubin level above upper limit of normal (ULN) or those with aspartate aminotransferase (AST) or alanine aminotransferase (ALT) above 1.5 × ULN concomitant with alkaline phosphatase (ALP) level above 2.5 × ULN. Bilirubin elevations or transaminase abnormalities concurrent with ALP abnormalities increases patient's risk for grade 4 neutropenia, febrile neutropenia, infections, severe thrombocytopenia, severe stomatitis, severe skin toxicity, and toxic death.

Patients with isolated transaminase elevations above 1.5 × ULN have higher rate of grade 4 febrile neutropenia, but without increased incidence of toxic death. Before each cycle, obtain bilirubin, ALT or AST, and ALP values and have physician review them.

- Don't give to patients with neutrophil count below 1,500 cells/mm<sup>3</sup>. Obtain frequent blood cell counts to monitor for neutropenia (which may be severe and cause infection).
- Severe hypersensitivity reactions and fatal anaphylaxis (rare) have occurred in patients who received recommended 3-day dexamethasone premedication. If hypersensitivity reaction occurs, discontinue docetaxel immediately and give appropriate therapy. Don't give drug to patients with history of severe hypersensitivity reactions to it or other drugs containing polysorbate 80. Severe fluid retention may occur despite dexamethasone premedication regimen.

## Action

Inhibits cellular mitosis by disrupting microtubular network

## Availability

*Injection concentrate:* 20 mg, 80 mg

## Indications and dosages

➤ Locally advanced or metastatic breast cancer unresponsive to previous regimens

**Adults:** 60 to 100 mg/m<sup>2</sup> I.V. over 1 hour q 3 weeks as single agent

➤ Adjuvant treatment of operable node-positive breast cancer

**Adults:** 75 mg/m<sup>2</sup> 1 hour after doxorubicin 50 mg/m<sup>2</sup> and cyclophosphamide 500 mg/m<sup>2</sup> q 3 weeks for six courses

➤ Locally advanced or metastatic non-small-cell lung cancer (NSCLC) after platinum therapy failure

**Adults:** 75 mg/m<sup>2</sup> I.V. over 1 hour q 3 weeks as single agent

➤ Unresectable locally advanced or metastatic NSCLC in chemotherapy-naïve patients

**Adults:** 75 mg/m<sup>2</sup> I.V. over 1 hour q 3 weeks followed by cisplatin as ordered

➤ Androgen-independent (hormone refractory) metastatic prostate cancer

**Adults:** 75 mg/m<sup>2</sup> I.V. over 1 hour q 3 weeks with 5 mg prednisone P.O. b.i.d. continuously

➤ Gastric adenocarcinoma cancer

**Adults:** 75 mg/m<sup>2</sup> as a 1-hour infusion, followed by cisplatin as a 1- to 3-hour infusion (both on day 1 only), followed by fluorouracil given as a 24-hour continuous I.V. infusion for 5 days, starting at the end of the cisplatin infusion. Treatment is repeated q 3 weeks.

➤ Squamous cell carcinoma of head and neck

**Adults:** *Induction chemotherapy followed by radiotherapy*—75 mg/m<sup>2</sup> I.V. as 1-hour infusion followed by cisplatin 75 mg/m<sup>2</sup> I.V. over 1 hour (both on day 1 only), followed by fluorouracil 750 mg/m<sup>2</sup> given as 24-hour continuous I.V. infusion daily for 5 days, starting at end of cisplatin infusion. Treatment is repeated q 3 weeks for four cycles.

**Adults:** *Induction chemotherapy followed by chemoradiotherapy*—75 mg/m<sup>2</sup> I.V. as 1-hour infusion on day 1, followed by cisplatin 100 mg/m<sup>2</sup> I.V. as 30-minute to 3-hour infusion, followed by fluorouracil 1,000 mg/m<sup>2</sup>/day I.V. as continuous infusion from day 1 to day 4. Treatment is repeated q 3 weeks for three cycles.

## Dosage adjustment

- Febrile neutropenia

## Contraindications

- Hypersensitivity to drug or polysorbate 80
- Hepatic impairment
- Neutrophil count below 1,500 cells/mm<sup>3</sup>

## Precautions

Use cautiously in:

- females of childbearing age
- pregnant or breastfeeding patients.

## Administration

- Assess bilirubin, ALT, AST, and ALP levels before starting each cycle of drug therapy.

- Premedicate patient with oral corticosteroids before docetaxel administration to reduce fluid retention and severity of hypersensitivity reactions.

- Premedicate patient with antiemetics and hydrate with I.V. fluids, as prescribed, before cisplatin administration.

📢 Don't let drug concentrate contact plasticized polyvinyl chloride equipment or devices.

- Know that when used for prostate cancer, drug must be given with prednisone, as prescribed.

- Dilute with accompanying diluent solution; rotate vial gently to mix. Once foam has largely dissipated, withdraw prescribed amount of drug and mix in glass or polypropylene bottle or in plastic bag with 250 ml of normal saline solution or dextrose 5% in water.

- Mix solution thoroughly and infuse over 1 hour, using polyethylene-lined infusion set.

Route	Onset	Peak	Duration
I.V.	Rapid	Unknown	7 days

## Adverse reactions

**CNS:** fatigue, asthenia, neurosensory deficits, peripheral neuropathy

**CV:** peripheral edema, **cardiac tamponade**, **pericardial effusion**

**GI:** nausea, vomiting, diarrhea, stomatitis, ascites

**Hematologic:** anemia, **thrombocytopenia**, **leukopenia**

**Musculoskeletal:** myalgia, joint pain

**Respiratory:** **bronchospasm**, **pulmonary edema**

**Skin:** alopecia, rash, dermatitis, desquamation, erythema, nail disorders

**Other:** edema, hypersensitivity reactions including **anaphylaxis**

## Interactions

**Drug-drug.** *Antineoplastics:* additive bone marrow depression

*Cyclosporine, erythromycin, ketoconazole, troleandomycin:* significant change in docetaxel effects

*Live-virus vaccines:* increased risk of infection

## Patient monitoring

🔊 Watch for signs and symptoms of anaphylaxis or other hypersensitivity reactions, especially with first two doses.

- Monitor vital signs and fluid intake and output. Watch for signs and symptoms of fluid overload and bronchospasm.
- Monitor CBC, and assess for signs and symptoms of blood dyscrasias.
- Closely monitor neutrophil and platelet counts before and during therapy.
- Observe I.V. site frequently for extravasation.
- Assess neurologic status to detect neurosensory deficits and peripheral neuropathy.

## Patient teaching

- Instruct patient to weigh himself daily and to immediately report sudden weight gain or difficulty breathing.
- 🔊 Tell patient to report signs and symptoms of blood dyscrasias. Inform him that he'll undergo frequent blood testing to monitor these effects.
- 🔊 Advise patient to immediately report rash or difficulty breathing.
- Inform patient that nail disorders and hair loss are common with docetaxel use, but that hair and nails will grow back after therapy ends.

- Advise female patient of childbearing age to use effective contraception during therapy and to notify prescriber if she suspects pregnancy.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

d

## docusate calcium

Apo-Docusate Calcium<sup>✳</sup>, Calax<sup>✳</sup>, DC Softgels, Novo-Docusate Calcium<sup>✳</sup>, PMS-Docusate Calcium<sup>✳</sup>, Ratio-Docusate Calcium<sup>✳</sup>, Soflax C<sup>✳</sup>, Stool Softener DC, Surfak Liquigels

## docusate sodium

Apo-Docusate Sodium<sup>✳</sup>, Colace, Correctol, Correctol Stool Softener<sup>✳</sup>, Diocto, Dioctyl<sup>⚡</sup>, Docusol<sup>⚡</sup>, Dom-Docusate Sodium<sup>✳</sup>, D.O.S. Softgels, Docu-Soft, DOK, D-S-S, DulcoEase<sup>⚡</sup>, Dulcolax Stool Softener, Enemeez, Genasoft Softgels, Norgalax<sup>⚡</sup>, Novo Docusate<sup>✳</sup>, PHL-Docusate Sodium<sup>✳</sup>, PMS-Docusate Sodium, Ratio-Docusate Sodium<sup>✳</sup>, Selax<sup>✳</sup>, Silace

**Pharmacologic class:** Emollient

**Therapeutic class:** Stool softener, surfactant

**Pregnancy risk category** C

## Action

Increases absorption of liquid into stool, resulting in softening of fecal mass. Also promotes electrolyte and water secretion into colon.

## Availability

**docusate calcium**

*Capsules:* 240 mg

*Capsules (soft gels):* 240 mg  
*Rectal solution:* 283 mg/5 ml

#### **docusate sodium**

*Capsules:* 50 mg, 100 mg, 250 mg  
*Capsules (soft gels):* 100 mg, 250 mg  
*Liquid:* 150 mg/15 ml  
*Syrup:* 50 mg/15 ml, 60 mg/15 ml,  
 20 mg/5 ml, 100 mg/30 ml, 150 mg/  
 15 ml  
*Tablets:* 100 mg

### **Indications and dosages**

➤ Stool softener

#### **Adults and children older than age 12:**

240 mg (docusate calcium) or 50 to 200 mg (docusate sodium) P.O. daily until bowel movements are normal

**Children ages 6 to 12:** 40 to 120 mg (docusate sodium) P.O. daily

**Children ages 3 to 6:** 20 to 60 mg (docusate sodium) P.O. daily

### **Contraindications**

- Hypersensitivity to drug
- Abdominal pain, nausea, or vomiting
- Intestinal obstruction

### **Precautions**

Use cautiously in:

- pregnant or breastfeeding patients.

### **Administration**

- Give tablets and capsules with full glass of water.
- Give liquid solution with milk or fruit juice.
- Be aware that excessive or long-term use may lead to laxative dependence.

Route	Onset	Peak	Duration
P.O.	24-48 hr (up to 5 days)	Unknown	Unknown

### **Adverse reactions**

**EENT:** throat irritation

**GI:** nausea, diarrhea, mild cramps

**Skin:** rash

**Other:** bitter taste, decreased appetite, laxative dependence

### **Interactions**

**Drug-drug.** *Mineral oil:* increased mineral oil absorption, causing toxicity  
*Warfarin:* decreased warfarin effects (with high doses)

### **Patient monitoring**

- If diarrhea occurs, withhold drug and notify prescriber.
- Know that therapeutic efficacy usually becomes apparent 1 to 3 days after first dose.

### **Patient teaching**

- Instruct patient to drink sufficient fluids with each dose and to increase fluid intake during the day.
- Advise patient to prevent constipation by increasing fluids and consuming more dietary fiber (as in fruits and bran).
- Inform patient that excessive or prolonged use may lead to laxative dependence.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

## **dolasetron mesylate**

Anzemet

**Pharmacologic class:** Selective serotonin subtype 3 (5-HT<sub>3</sub>) receptor antagonist

**Therapeutic class:** Antiemetic

**Pregnancy risk category B**

### **Action**

Blocks serotonin activation at receptor sites in vagal nerve terminals and in chemoreceptor trigger zone in CNS, decreasing the vomiting reflex

### **Availability**

*Injection:* 12.5 mg/0.625-ml ampules, 20 mg/ml in 5-ml vials

*Tablets:* 50 mg, 100 mg

## Indications and dosages

➤ Chemotherapy-induced nausea and vomiting

**Adults:** 100 mg P.O. 1 hour before chemotherapy or 1.8 mg/kg I.V. 30 minutes before chemotherapy

**Children ages 2 to 16:** 1.8 mg/kg P.O. within 1 hour before chemotherapy or 1.8 mg/kg I.V. (not to exceed 100 mg) 30 minutes before chemotherapy

➤ Prevention or treatment of post-operative nausea and vomiting

**Adults:** 100 mg P.O. within 2 hours before surgery or 12.5 mg I.V. 15 minutes before cessation of anesthesia (for prevention) or as soon as nausea or vomiting begins (for treatment)

**Children ages 2 to 16:** 1.2 mg/kg P.O. (up to 100 mg/dose) within 2 hours before surgery or 0.35 mg/kg I.V. (up to 12.5 mg) 15 minutes before cessation of anesthesia (for prevention) or as soon as nausea or vomiting begins (for treatment)

## Contraindications

- Hypersensitivity to drug
- Arrhythmias

## Precautions

Use cautiously in:

- risk factors for prolonged cardiac conduction intervals
- pregnant or breastfeeding patients (safety not established).

## Administration

- Give oral dose at least 1 hour before chemotherapy for best results.
- To prevent postoperative nausea, give oral dose within 2 hours before surgery.
- If patient has difficulty swallowing tablet, injection solution may be mixed with apple or apple-grape juice and given orally.
- For I.V. use, give 100 mg single dose undiluted over 30 seconds. For I.V. infusion, dilute in normal saline solution, dextrose 5% in water, or lactated Ringer's solution to 50 ml, and give

single dose over at least 15 minutes. Don't mix with other drugs.

- Flush I.V. line before and after infusion.

Route	Onset	Peak	Duration
P.O.	Unknown	1-2 hr	Up to 24 hr
I.V.	Unknown	15-30 min	Up to 24 hr

## Adverse reactions

**CNS:** headache (increased in cancer patients), dizziness, fatigue, syncope

**CV:** bradycardia, tachycardia, ECG changes, hypertension, hypotension

**GI:** diarrhea, constipation, dyspepsia, abdominal pain

**GU:** urinary retention, **oliguria**

**Skin:** pruritus, rash

**Other:** chills, fever, decreased appetite

## Interactions

**Drug-drug.** *Antiarrhythmics, anthracycline (high cumulative doses), diuretics,* drugs that prolong QTc interval: increased risk of conduction abnormalities

*Drugs that affect hepatic microsomal enzymes:* altered dolasetron blood level

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase:* increased levels

## Patient monitoring

- Monitor closely for excessive diuresis.
- ⚠ Watch for ECG changes, including prolonged PR interval and widened QRS complex, especially in patients receiving antiarrhythmics concurrently.

## Patient teaching

- Instruct patient to take drug 1 to 2 hours before chemotherapy.
- Inform patient that drug commonly causes headache.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## donepezil hydrochloride

Aricept

**Pharmacologic class:** Acetylcholinesterase inhibitor

**Therapeutic class:** Anti-Alzheimer's agent

**Pregnancy risk category C**

### Action

Reversibly inhibits acetylcholinesterase hydrolysis in CNS, leading to increased acetylcholine level and temporary cognitive improvement in patients with Alzheimer's disease

### Availability

Tablets: 5 mg, 10 mg, 23 mg

Tablets (orally disintegrating): 5 mg, 10 mg

### Indications and dosages

➤ Mild to moderate Alzheimer's disease

**Adults:** Initially, 5 mg P.O. daily. After 4 to 6 weeks, may increase dosage to 10 mg at bedtime.

➤ Moderate to severe Alzheimer's disease

**Adults:** Initially, 10 mg P.O. daily. After 3 months, may increase dosage to 23 mg.

### Contraindications

• Hypersensitivity to drug or piperidine derivatives

### Precautions

Use cautiously in:

• cardiovascular disease, chronic obstructive pulmonary disease (COPD), asthma, or sick sinus syndrome

• patients at risk for developing ulcers, such as those with history of ulcer disease or those concurrently receiving NSAIDs

- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Give with or without food.
- For best response, give at bedtime.

Route	Onset	Peak	Duration
P.O.	Unknown	3-4 hr	Unknown

### Adverse reactions

**CNS:** headache, dizziness, vertigo, fatigue, depression, aggression, irritability, restlessness, nervousness, paresthesia, insomnia, abnormal dreams, tremor, aphasia, **seizures**

**CV:** chest pain, bradycardia, hypertension, hypotension, vasodilation, **atrial fibrillation, heart block**

**EENT:** cataracts, blurred vision, eye irritation, sore throat

**GI:** nausea, vomiting, diarrhea, anorexia, bloating, epigastric pain, fecal incontinence, **GI bleeding**

**GU:** urinary frequency, increased libido, bladder outflow obstruction

**Metabolic:** dehydration

**Musculoskeletal:** muscle cramps, arthritis, bone fracture

**Respiratory:** dyspnea, bronchitis

**Skin:** pruritus, urticaria, bruising, diaphoresis, rash, flushing

**Other:** toothache, decreased appetite, weight loss, hot flashes, influenza

### Interactions

**Drug-drug.** *Anticholinergics:* reduced donepezil effects

*Anticholinesterases, cholinomimetics:* synergistic effects

*Carbamazepine, dexamethasone, phenobarbital, phenytoin, rifampin:* accelerated donepezil elimination

*NSAIDs:* increased risk of GI bleeding

### Patient monitoring

🔊 Watch closely for increased bronchoconstriction in patients with history of asthma or COPD.

- Assess cardiovascular status. Drug may cause bradycardia from increased vagal tone.
- Monitor closely for signs and symptoms of GI ulcers and bleeding, especially if patient takes NSAIDs concurrently.

### Patient teaching

- Advise patient to take drug at bedtime with or without food.
- Instruct patient to allow orally disintegrating tablet to dissolve under tongue and then follow with a glass of water.
- Tell patient not to split, crush, or chew 23-mg tablet.
- Inform patient that drug may slow the heart rate, leading to fainting episodes.

 Instruct patient to immediately report signs or symptoms of GI ulcers (“coffee-ground” vomitus, black tarry stools, and abdominal pain), or irregular heartbeat.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## dopamine hydrochloride

Intropin

**Pharmacologic class:** Catecholamine, adrenergic

**Therapeutic class:** Inotropic, vasopressor

**Pregnancy risk category C**

### FDA BOXED WARNING

- Dilute full-strength injection before administering.
- If extravasation occurs, infiltrate area promptly with 10 to 15 ml of saline

solution containing 5 to 10 mg phentolamine to prevent sloughing and necrosis. Use syringe with fine hypodermic needle, and infiltrate solution liberally throughout area. Give phentolamine as soon as possible; its sympathetic blockade causes immediate local hyperemic changes if area is infiltrated within 12 hours.

### Action

Causes norepinephrine release (mainly on dopaminergic receptors), leading to vasodilation of renal and mesenteric arteries. Also exerts inotropic effects on heart, which increases the heart rate, blood flow, myocardial contractility, and stroke volume.

### Availability

**Injection for dilution:** 40 mg/ml, 80 mg/ml, 160 mg/ml

**Premixed injection:** 0.8 mg/ml, 1.6 mg/ml, 3.2 mg/ml in 250 ml and 500 ml of dextrose 5% in water

### Indications and dosages

**>** Shock; hemodynamic imbalance; hypotension; heart failure

**Adults and children:** 2 to 5 mcg/kg/minute by I.V. infusion. Titrate dosage to desired response; may increase infusion by 1 to 4 mcg/kg/minute at 10- to 30-minute intervals. Maximum dosage is 50 mcg/kg/minute.

### Contraindications

- Hypersensitivity to drug or bisulfites
- Tachyarrhythmias, ventricular fibrillation
- Pheochromocytoma

### Precautions

Use cautiously in:

- hypovolemia, myocardial infarction, occlusive vascular disease, diabetic endarteritis, atrial embolism
- concurrent MAO inhibitor use
- pregnant or breastfeeding patients
- children.

## Administration

- Give I.V. infusion using metered pump or other device that controls flow.
- Add 200 to 400 mg of dopamine to 250 to 500 ml of normal saline solution, 5% dextrose injection, 5% dextrose and half-normal saline solution, or 5% dextrose in lactated Ringer's solution.
- Infuse into large (preferably central) vein to minimize extravasation.
- ⚠ Don't give concurrently with MAO inhibitors. Reduce dosage if patient has received MAO inhibitor recently.

Route	Onset	Peak	Duration
I.V.	1-2 min	Unknown	<10 min

## Adverse reactions

**CNS:** headache

**CV:** palpitations, hypotension, angina, ECG changes, tachycardia, vasoconstriction, **arrhythmias**

**EENT:** mydriasis

**GI:** nausea, vomiting

**Metabolic:** azotemia, hyperglycemia

**Respiratory:** dyspnea, asthma attacks

**Skin:** piloerection

**Other:** irritation at injection site, **gangrene of extremities** (with high doses for prolonged periods or in occlusive vascular disease)

## Interactions

**Drug-drug.** *Alpha- or beta-adrenergic blockers:* antagonism of dopamine effects

*Ergot alkaloids:* extreme blood pressure increase

*Guanethidine:* decreased cardiostimulatory effects

*Inhalation anesthetics:* increased risk of hypertension, arrhythmias

*MAO inhibitors:* hypertensive crisis

*Oxytocics:* severe, persistent hypotension

*Phenytoin:* seizures, severe hypotension, bradycardia

*Tricyclic antidepressants:* decreased pressor response

**Drug-diagnostic tests.** *Glucose, nitrogenous compounds, urine catecholamines:* increased levels

## Patient monitoring

- Monitor blood pressure, pulse, urinary output, and pulmonary artery wedge pressure during infusion.
- ⚠ Inspect I.V. site regularly for irritation. Avoid extravasation.
- ⚠ Monitor color and temperature of extremities.
- ⚠ Never stop infusion abruptly, because this may cause severe hypotension. Instead, taper gradually.

## Patient teaching

- Explain the need for close observation during infusion.
- Instruct patient to report adverse reactions and I.V. site discomfort.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## doripenem monohydrate

Doribax

**Pharmacologic class:** Carbapenem

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

## Action

Acts against aerobic and anaerobic gram-positive and gram-negative bacteria

## Availability

*Powder for reconstitution for infusion:* 500 mg single-use vials

## Indications and dosages

➤ Complicated intra-abdominal infections caused by *Escherichia coli*, *Klebsiella pneumoniae*, *Pseudomonas aeruginosa*, *Bacteroides caccae*, *Bacteroides fragilis*, *Bacteroides thetaiotaomicron*, *Bacteroides uniformis*, *Bacteroides vulgatus*, *Streptococcus intermedius*, *Streptococcus constellatus*, and *Peptostreptococcus micros*; complicated urinary tract infections (UTIs), such as pyelonephritis caused by *E. coli* (including cases with concurrent bacteremia), *K. pneumoniae*, *Proteus mirabilis*, *P. aeruginosa*, and *Acinetobacter baumannii*

**Adults ages 18 and older:** 500 mg q 8 hours by I.V. infusion over 1 hour; continue for 5 to 14 days for complicated intra-abdominal infections and 10 days for complicated UTIs, with possible extension to 14 days for patients with concurrent bacteremia

## Dosage adjustment

- Renal impairment

## Contraindications

- Serious hypersensitivity to drug or other carbapenems
- History of anaphylactic reactions to beta-lactams

## Precautions

Use cautiously in:

- renal impairment
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

## Administration

 Don't use constituted suspension for direct injection; dilute further before giving by I.V. infusion.

- To prepare 500-mg dose, constitute vial with 10 ml sterile water for injection or normal saline solution for injection, and shake gently to form suspension; resulting concentration is 50 mg/ml. Withdraw suspension using

syringe with 21G needle, and add it to infusion bag containing 100 ml normal saline solution or 5% dextrose; shake gently until clear. Final infusion solution concentration is 4.5 mg/ml.

- To prepare 250-mg dose, constitute vial with 10 ml sterile water for injection or normal saline solution for injection, and shake gently to form suspension. Resulting concentration is 50 mg/ml. Withdraw suspension using syringe with 21G needle, and add it to infusion bag containing 100 ml normal saline solution for injection or 5% dextrose; shake gently until clear. Remove 55 ml of this solution from bag and discard. Infuse remaining solution, which contains 250 mg (4.5 mg/ml).
- To prepare infusions in Baxter Mini-bag Plus infusion bags, see infusion bag manufacturer's instructions.
- Know that infusion solutions range from clear and colorless to clear and slightly yellow. Color variations within this range don't affect product potency.
- Don't mix with or physically add to solutions containing other drugs.
- Don't administer by inhalation.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** headache

**CV:** phlebitis

**GI:** nausea, diarrhea, oral candidiasis, *Clostridium difficile*-associated

**diarrhea**

**GU:** vulvomyotic infection

**Hematologic:** anemia

**Respiratory:** pneumonitis (with inhalation use)

**Skin:** rash, allergic or bullous dermatitis, erythema, macular and papular eruptions, urticaria, erythema multiforme

**Other:** hypersensitivity reactions (including anaphylaxis)

## Interactions

**Drug-drug:** *Probenecid*: reduced doripenem renal clearance

*Valproic acid*: decreased valproic acid level and loss of seizure control

**Drug-diagnostic tests.** *ALT, AST, liver enzymes, transaminases*: increased levels

### Patient monitoring

- Closely monitor patient for diarrhea.
- 🚫 If allergic reaction occurs, discontinue drug and intervene for serious anaphylactic reactions by giving epinephrine and taking other emergency measures as ordered and needed, including oxygen, I.V. fluids and antihistamines, corticosteroids, pressor amines, and airway management.
- Monitor renal function in patients with moderate to severe renal impairment.

### Patient teaching

- 🚫 Tell patient to immediately report rash, diarrhea, or difficulty breathing.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## dornase alfa

Pulmozyme

**Pharmacologic class:** Recombinant human deoxyribonuclease I

**Therapeutic class:** Cystic fibrosis agent, mucolytic enzyme, respiratory inhalant

**Pregnancy risk category B**

### Action

Selectively cleaves to DNA in sputum, decreasing viscosity of pulmonary secretions

### Availability

**Inhalation solution:** 2.5-mg ampule (1 mg/ml)

### Indications and dosages

- To reduce respiratory tract infections and improve pulmonary function in patients with cystic fibrosis
- Adults and children:** One ampule (2.5 mg) inhaled once daily; some patients may benefit from twice-daily dosing. Safety and efficacy of daily administration haven't been demonstrated for longer than 12 months.

### Contraindications

- Hypersensitivity to drug, its components, or products derived from Chinese hamster ovary cells

### Precautions

Use cautiously in:

- pregnant or breastfeeding patients.

### Administration

- Don't shake, dilute, or mix with other drugs.
- Use only with approved nebulizer.
- Discard cloudy or discolored solution.

Route	Onset	Peak	Duration
Inhalation	Unknown	Unknown	Unknown

### Adverse reactions

**CV:** chest pain

**EENT:** conjunctivitis, rhinitis, pharyngitis, hemoptysis, voice changes

**Respiratory:** dyspnea, increased sputum, wheezing

**Skin:** rash, urticaria, pruritus

**Other:** hypersensitivity reactions

### Interactions

None known

### Patient monitoring

- Assess patient periodically. Report improvement in dyspnea and sputum clearance.
- Monitor for signs and symptoms of hypersensitivity reaction.

## Patient teaching

- Teach patient how to use nebulizer.
- Instruct patient to report rash, hives, and itching.
- As appropriate, review all other significant adverse reactions mentioned above.

## doxapram hydrochloride

Dopram

**Pharmacologic class:** CNS and respiratory stimulant

**Therapeutic class:** Analeptic

**Pregnancy risk category B**

## Action

Activates peripheral carotid, aortic, and other chemoreceptors to stimulate respiration. Increases tidal volume and respiratory rate by directly stimulating respiratory center in medulla oblongata.

## Availability

*Injection:* 20 mg/ml

## Indications and dosages

➤ Respiratory depression after anesthesia

**Adults and adolescents:** 5 mg/minute by I.V. infusion until desired response occurs; then reduce to 1 to 3 mg/minute, to a maximum cumulative dosage of 4 mg/kg (or 300 mg). Or 0.5 to 1 mg/kg I.V. injection, repeated q 5 minutes, if needed, to a maximum total dosage of 1.5 mg/kg.

➤ Chronic pulmonary disease related to acute hypercapnia

**Adults:** 1 to 2 mg/minute by I.V. infusion, using a concentration of 2 mg/ml, to a maximum of 3 mg/minute. Infusion shouldn't exceed 2 hours.

➤ Drug-induced CNS depression

**Adults:** Initially, 2 mg/kg I.V., repeated in 5 minutes and then q 1 to 2 hours

until patient awakens, to a maximum daily dosage of 3 g. For infusion, priming dose of 2 mg/kg I.V.; if no response occurs, continue for 1 to 2 hours as needed; if some response occurs, give I.V. infusion of 250 mg in 250 ml of saline solution or dextrose 5% in water at 1 to 3 mg/minute until patient awakens. Don't infuse longer than 2 hours or give more than 3 g/day.

## Off-label uses

- Laryngospasm secondary to postoperative tracheal extubation
- Apnea of prematurity
- Postoperative shivering

## Contraindications

- Hypersensitivity to drug
- Cardiovascular disorders, severe hypertension
- Cerebrovascular accident
- Head injury, seizures
- Respiratory failure, restrictive respiratory disease
- Neonates

## Precautions

Use cautiously in:

- bronchial asthma, arrhythmias, increased intracranial pressure, hyperthyroidism, pheochromocytoma, metabolic disorders
- concurrent use of mechanical ventilation
- pregnant or breastfeeding patients.

## Administration

- Ensure adequate airway and oxygenation before administering.
- Give I.V. slowly to avoid hemolysis.
- Know that doxapram is compatible with 5% and 10% dextrose in water and with normal saline solution.

⚠ Don't mix with thiopental sodium, bicarbonate, or aminophylline, because precipitates or gas may form.

Route	Onset	Peak	Duration
I.V.	20-40 sec	1-2 min	5-12 min

**Adverse reactions**

**CNS:** weakness, dizziness, drowsiness, headache, dysarthria, dysphonia, disorientation, hyperactivity, paresthesia,

**loss of consciousness, seizures**

**CV:** hypotension, bradycardia, chest pain or tightness, heart rate changes, **thrombophlebitis, atrioventricular block, arrhythmias, cardiac arrest**

**EENT:** lacrimation, diplopia, miosis, conjunctival hyperemia, sneezing, **laryngospasm**

**GI:** nausea, vomiting, diarrhea, abdominal cramps, increased salivation, dysphagia

**GU:** urinary frequency or incontinence, albuminuria

**Musculoskeletal:** muscle cramps, fasciculations

**Respiratory:** dyspnea, increased secretions, cough, hyperventilation, tachypnea, rebound hypoventilation **bronchospasm**

**Skin:** rash, diaphoresis, flushing

**Other:** burning or hot sensation in genitalia and perineal areas, hiccups

**Interactions**

**Drug-drug.** *General anesthetics:* increased risk of self-limiting arrhythmias

*MAO inhibitors, sympathomimetics:* potentiation of adverse cardiovascular effects

*Skeletal muscle relaxants:* masking of residual effects of these drugs

**Drug-diagnostic tests.** *Blood urea nitrogen:* increased level

*Erythrocytes, hematocrit, hemoglobin, red blood cells, white blood cells:* decreased levels

**Patient monitoring**

- Assess blood pressure, pulse, deep tendon reflexes, airway, and arterial blood gas values before starting therapy and frequently during infusion.
- Monitor I.V. site frequently for irritation and thrombophlebitis.

⚠ Discontinue infusion immediately if hypotension or dyspnea suddenly develops.

**Patient teaching**

- Instruct patient to report adverse reactions promptly.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

**doxazosin mesylate**

Cardozin XL , Cardura, Cardura XL, Doxadura 

**Pharmacologic class:** Sympatholytic, peripherally acting antiadrenergic

**Therapeutic class:** Antihypertensive

**Pregnancy risk category C**

**Action**

Blocks alpha<sub>1</sub>-adrenergic receptors, promoting vasodilation. Also reduces urethral resistance, relieving obstruction and improving urine flow and other symptoms of benign prostatic hypertrophy (BPH).

**Availability**

*Tablets:* 1 mg, 2 mg, 4 mg, 8 mg

*Tablets (extended-release):* 4 mg, 8 mg

**Indications and dosages**

➤ Hypertension

**Adults:** 1 mg P.O. once daily. May increase dosage gradually q 2 weeks, up to 2 to 16 mg daily, as needed.

➤ BPH

**Adults:** 1 mg P.O. once daily. May increase dosage gradually, up to 8 mg daily, as needed. Or, initially 4 mg (extended-release) P.O. daily. May increase dosage to 8 mg daily, as needed, at 3- to 4-week intervals.

## Off-label uses

- Pheochromocytoma
- Syndrome X

## Contraindications

- Hypersensitivity to drug, its components, or quinazoline derivatives

## Precautions

Use cautiously in:

- renal or mild or moderate hepatic impairment, coronary insufficiency, or preexisting severe GI narrowing
- severe hepatic impairment (extended-release form not recommended)
- intraoperative floppy iris syndrome
- concurrent use of strong CYP3A4 inhibitor (such as atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, or voriconazole), phosphodiesterase-5 (PDE-5) inhibitors
- elderly patients
- pregnant or breastfeeding patients (extended-release form not recommended in breastfeeding patients)
- children (safety not established).

## Administration

- Give initial immediate-release dose at bedtime to minimize orthostatic hypotension and syncope.
- Give initial extended-release dose at breakfast.
- Be aware that extended-release tablets aren't indicated for hypertension.
- Be aware that prostate carcinoma should be ruled out before giving drug for BPH.
- Know that incidence of orthostatic hypotension increases greatly when daily dosage exceeds 4 mg and that it usually occurs within 6 hours of administration.
-  If new or worsening signs or symptoms of angina pectoris occur, discontinue drug.

Route	Onset	Peak	Duration
P.O.	1-2 hr	2-6 hr	24 hr
P.O. (extended)	Unknown	4.3-13.7 hr	Unknown

## Adverse reactions

**CNS:** dizziness, vertigo, headache, depression, drowsiness, fatigue, nervousness, weakness, asthenia

**CV:** orthostatic hypotension, chest pain, palpitations, tachycardia, **arrhythmias**

**EENT:** abnormal or blurred vision, conjunctivitis, epistaxis, rhinitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal discomfort, flatulence, dry mouth

**GU:** decreased libido, sexual dysfunction

**Respiratory:** dyspnea

**Musculoskeletal:** joint pain, arthritis, gout, myalgia

**Skin:** flushing, rash, pruritus

**Other:** edema

## Interactions

**Drug-drug.** *Clonidine, nitrates, other antihypertensives:* decreased antihypertensive effect

*Drugs that reduce GI motility leading to markedly prolonged GI retention times (such as anticholinergics):* increased systemic exposure to doxazosin

*PDE-5 inhibitors:* increased risk of symptomatic hypotension

**Drug-diagnostic tests.** *Neutrophils, white blood cells:* decreased counts

**Drug-food.** *Any food:* increased drug plasma  $C_{max}$  (extended-release form)

## Patient monitoring

- Monitor blood pressure with patient lying down and standing up every 2 to 6 hours after initial dose or after a dosage increase (when orthostatic hypotension is most likely to occur).

**Patient teaching**

- Tell patient to swallow extended-release tablets whole and not to chew, divide, cut, or crush them.
- Caution patient not to drive or perform other activities requiring alertness for 12 to 24 hours after first dose.
- Tell patient to move slowly when sitting up or standing, to avoid dizziness or light-headedness from sudden blood pressure decrease.
- Advise patient to report episodes of dizziness or palpitations.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

**doxepin hydrochloride**

Apo-Doxepin<sup>✳</sup>, Novo-Doxepin<sup>✳</sup>, Prudoxin, Silenor, Sinepin<sup>⚡</sup>, Xepin<sup>⚡</sup>, Zonalon

**Pharmacologic class:** Tricyclic antidepressant

**Therapeutic class:** Antidepressant, anxiolytic, antipruritic

**Pregnancy risk category** C

**FDA BOXED WARNING**

- Drug may increase risk of suicidal thinking and behavior in children and adolescents with major depressive disorder and other psychiatric disorders. Risk must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family and caregivers to observe patient closely and communicate with prescriber as needed.

- Drug isn't approved for use in pediatric patients.

**Action**

Unknown. May prevent reuptake of norepinephrine, serotonin, or both at presynaptic neurons, increasing levels of these neurotransmitters in CNS. Exact mechanism in pruritus also unknown, but drug is a potent histamine<sub>1</sub>- and histamine<sub>2</sub>-blocker.

**Availability**

**Capsules:** 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg

**Cream (topical):** 5% in 30-g tube

**Oral concentrate:** 10 mg/ml

**Tablets:** 3 mg, 6 mg

**Indications and dosages**

➤ Endogenous depression; anxiety

**Adults:** Initially, 25 mg P.O. t.i.d., increased as needed up to 150 mg daily in outpatients and 300 mg daily in hospitalized patients

**Elderly adults:** Initially, 25 to 50 mg P.O. daily; may be increased as needed

➤ Short-term relief of histamine-mediated pruritus of moderate severity accompanying such conditions as eczematous dermatitis

**Adults:** Apply a thin film of cream to skin q.i.d., with 3 to 4 hours between applications, for a maximum of 8 days.

➤ Insomnia

**Adults:** 6 mg P.O. daily 30 minutes before bedtime

**Dosage adjustment**

- Elderly patients

**Contraindications**

- Hypersensitivity to drug or other dibenzoxepins
- Glaucoma
- Predisposition to urinary retention
- MAO inhibitor use within past 14 days

## Precautions

Use cautiously in:

- cardiovascular disease, prostatic enlargement, seizures
- severe sleep apnea (use not recommended)
- elderly patients
- pregnant or breastfeeding patients.

## Administration

- If desired, mix contents of capsule with food.
- Dilute oral concentrate with 120 ml of water, milk, or juice. Be aware that drug is incompatible with carbonated beverages.
- Know that drug may be given at bedtime to prevent daytime sleepiness. If given for insomnia, avoid giving within 3 hours of a meal.
- 🚫 Don't give within 14 days of MAO inhibitor, because drug interaction may cause cardiovascular instability.
- 🚫 Avoid concurrent use of other CNS depressants, because inadvertent overdose may occur.
- With topical cream, don't apply to broken skin or use occlusive dressings, because doing so increases dermal absorption.
- Be aware that drug is usually given in conjunction with psychotherapy when used for depression.

Route	Onset	Peak	Duration
P.O.	Unknown	2 hr	Unknown
Topical	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** fatigue, sedation, agitation, confusion, hallucinations, drowsiness, dizziness, extrapyramidal reactions, poor concentration, syncope, **seizures, cerebrovascular accident, increased risk of suicide or suicidal ideation** (especially in child or adolescent)  
**CV:** hypotension, orthostatic hypotension, hypertension, vasculitis, ECG

changes, tachycardia, palpitations, **arrhythmias, myocardial infarction, heart block**

**EENT:** blurred vision, increased intraocular pressure, lacrimation, tinnitus, nasal congestion

**GI:** nausea, constipation, dry mouth, **paralytic ileus**

**GU:** urinary retention, delayed voiding, urinary tract dilation, gynecomastia, galactorrhea, menstrual irregularities, testicular swelling, libido changes

**Hematologic:** purpura, **bone marrow depression, eosinophilia, agranulocytosis, thrombocytopenia, leukopenia**  
**Metabolic:** hyperglycemia, **hypoglycemia**

**Skin:** photosensitivity, rash, urticaria, pruritus, diaphoresis, flushing, petechiae, alopecia, local burning, stinging, tingling, irritation, or rash (with topical use)

**Other:** increased appetite, weight gain or loss, hyperthermia, chills, edema, drug-induced fever, hypersensitivity reactions

## Interactions

**Drug-drug.** *Barbiturates, CNS depressants (including antihistamines, clonidine, opioids, sedative-hypnotics):* additive CNS depression

*Carbamazepine, class IC antiarrhythmics (flecainide, propafenone), other antidepressants, other CYP450-2D6 inhibitors (amiodarone, cimetidine, quinidine, ritonavir), phenothiazines:* increased doxepin blood level and effects

*Clonidine:* hypertensive crisis

*Guanethidine:* antagonism of antihypertensive effects

*Levodopa:* delayed or decreased levodopa absorption, hypertension

*MAO inhibitors:* tachycardia, seizures, potentially fatal reactions

*Rifamycin:* decreased doxepin effects

*Selective serotonin reuptake inhibitors:* increased risk of toxicity

**Drug-diagnostic tests.** *Bilirubin,**hepatic enzymes:* increased levels*Glucose:* increased or decreased level*Liver function tests:* altered results**Drug-herbs.** *Angel's trumpet, jimson-**weed, scopolia:* increased anticholinergic effects*Chamomile, hops, kava, skullcap, valer-**ian:* increased CNS depression*Evening primrose oil:* additive or synergistic effects*S-adenosylmethionine (SAM-e), St.**John's wort, yohimbe:* serotonin syndrome**Drug-behaviors.** *Alcohol use:* increased CNS depression*Smoking:* increased drug metabolism and altered effects*Sun exposure:* increased risk of photosensitivity reactions**Patient monitoring** Record mood changes and watch for suicidal tendencies, especially in child or adolescent.

- Assess bowel elimination pattern. Increase fluids and administer stool softeners as ordered to ease constipation.

- Monitor fluid intake and output. Report changes in voiding pattern.

- Monitor liver function test results, CBC with white cell differential, and glucose level.

**Patient teaching**

- Tell patient to take drug 30 minutes before bedtime and not within 3 hours of a meal when taking for insomnia.

- Advise patient on long-term therapy not to stop taking drug abruptly because this may lead to nausea, headache, and malaise.

 Instruct patient and significant other, as appropriate, to monitor mental status carefully and to immediately report increased depression or suicidal thoughts or behavior (especially when used in child or adolescent). Tell patient to promptly report easy bruising or bleeding.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- Instruct patient to move slowly when sitting up or standing, to avoid dizziness or light-headedness from sudden blood pressure decrease.

- Explain that drowsiness and dizziness usually subside after several weeks.

- Tell patient that using topical cream on more than 10% of body surface area may cause drowsiness.

- Caution patient using topical cream not to apply it to broken skin and not to use occlusive dressings. Also tell him to avoid contact with eyes and to rinse eyes thoroughly with warm water if contact occurs.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

**doxorubicin hydrochloride**

Adriamycin PFS, Adriamycin RDF, Rubex

**Pharmacologic class:** Anthracycline**Therapeutic class:** Antibiotic antineoplastic**Pregnancy risk category** D**FDA BOXED WARNING**

- Administer I.V. only—never I.M. or subcutaneously. Extravasation causes severe local tissue necrosis.

- Myocardial toxicity may occur during therapy or months to years afterward. Risk factors (cardiovascular disease, previous or concurrent radiotherapy to mediastinal or pericardial area, previous therapy with

doxorubicin or other anthracyclines or anthracenediones, and concomitant use of other cardiotoxic drugs) may increase myocardial toxicity risk. Toxicity may occur at higher or lower cumulative doses even in patients without cardiac risk factors. Pediatric patients have increased risk of delayed cardiotoxicity.

- Secondary acute myelogenous leukemia (AML) may occur. Refractory secondary leukemia is more common when drug is given in combination with DNA-damaging antineoplastics, when patients have been heavily pretreated with cytotoxic drugs, and with dosage escalation. Pediatric patients also are at risk for secondary AML.
- Reduce dosage in hepatic impairment.
- Drug may cause severe myelosuppression.
- Give under supervision of physician experienced in cancer chemotherapy.

### Action

Unclear. Thought to inhibit DNA and RNA synthesis by forming complex with DNA. Also exerts immunosuppressive activity. Cell-cycle-S-phase specific.

### Availability

*Injection (preservative-free):* 2 mg/ml  
*Powder for injection:* 10 mg, 20 mg, 50 mg

### Indications and dosages

➤ Solid tumors, including bladder, breast, lung, stomach, and thyroid cancers; malignant lymphomas, including Hodgkin's disease; acute leukemia; chronic lymphocytic leukemia; multiple myeloma; Wilms' tumor; neuroblastoma

**Adults:** 60 to 75 mg/m<sup>2</sup> I.V. as a single dose at 21-day cycles, or 30 mg/m<sup>2</sup> I.V. as a single daily dose on first to third days of 4-week cycle, or 20 mg/m<sup>2</sup> I.V. once weekly. Maximum cumulative dosage is 550 mg/m<sup>2</sup>.

### Dosage adjustment

- Bone marrow depression
- Impaired cardiac or hepatic function

### Off-label uses

- Endometrial carcinoma, islet cell carcinoma

### Contraindications

- Hypersensitivity to drug
- Severe bone marrow depression
- Previous treatment with maximum cumulative doses of doxorubicin, other anthracyclines, or anthracenes

### Precautions

Use cautiously in:

- cardiac disease, hepatic impairment, depressed bone marrow reserve, CNS metastases, brain tumor, malignant melanoma, renal carcinoma
- elderly patients
- females of childbearing age
- pregnant or breastfeeding patients
- children.

### Administration

- Follow facility policy for handling and preparing antineoplastics.
- ⚠ Don't dilute solution with bacteriostatic diluent. Don't mix with other drugs.
- Dilute as directed with normal saline solution to a final concentration of 2 mg/ml.
- Administer slowly over 3 to 5 minutes into tubing of free-flowing I.V. infusion of normal saline solution or dextrose 5% in water.
- Deliver into large vein using butterfly needle. Avoid veins over joints or extremities with compromised venous or lymphatic drainage.
- ⚠ Avoid rapid infusion, because this may increase risk of acute infusion-related reactions (back pain, chest tightness, flushing).
- ⚠ If extravasation occurs, stop infusion immediately, apply ice, and notify prescriber.

Route	Onset	Peak	Duration
I.V.	Rapid	2 hr	24-36 days

### Adverse reactions

**CNS:** drowsiness, dizziness, asthenia, fatigue, malaise, paresthesia, headache, depression, insomnia, anxiety, emotional lability

**CV:** chest pain, hypotension, tachycardia, peripheral edema, **cardiomyopathy, heart failure, arrhythmias, pericardial effusion**

**GI:** nausea, vomiting, diarrhea, constipation, enlarged abdomen, abdominal pain, dyspepsia, oral candidiasis, moniliasis, stomatitis, glossitis, esophagitis, dysphagia

**GU:** albuminuria, hyperuricosuria, red urine

**Hematologic:** anemia, **leukopenia, thrombocytopenia, neutropenia, bone marrow depression**

**Metabolic:** hyperglycemia, hypocalcemia

**Musculoskeletal:** myalgia, back pain

**Respiratory:** dyspnea, increased cough, pneumonia

**Skin:** rash, dry skin, pruritus, skin discoloration, alopecia, diaphoresis, exfoliative dermatitis, palmar-plantar erythrodysesthesia

**Other:** abnormal taste, infection, chills, fever, herpes zoster, injection site reactions, allergic reactions including **anaphylaxis, acute infusion-associated reactions**

### Interactions

**Drug-drug.** *Antineoplastics:* additive bone marrow depression

*Cyclophosphamide:* increased risk of hemorrhagic cystitis, increased cardiotoxicity

*Cyclosporine:* profound and prolonged hematologic toxicity, increased risk of coma and seizures

*Dactinomycin (in children):* increased risk of pneumonitis

*Live-virus vaccines:* decreased antibody response to vaccine, increased risk of adverse reactions

*Mercaptopurine:* hepatitis

*Paclitaxel (if given first):* reduced doxorubicin clearance, increased incidence and severity of neutropenia and stomatitis

*Phenobarbital:* increased clearance and decreased effects of doxorubicin

*Phenytoin:* decreased phenytoin blood level

*Progesterone:* increased incidence and severity of neutropenia and thrombocytopenia

*Streptozocin:* increased doxorubicin half-life

*Verapamil:* increased doxorubicin blood level

**Drug-diagnostic tests.** *Alkaline phosphatase, bilirubin, glucose, prothrombin time, serum and urine uric acid:* increased levels

*Calcium, hemoglobin, neutrophils, platelets, white blood cells (WBCs):* decreased levels

### Patient monitoring

🚨 Watch for acute life-threatening arrhythmias, which may occur during or within a few hours after administration.

🚨 Monitor for cardiomyopathy and subsequent heart failure with chronic overdose (more common in children).

- Stay alert for erythematous streaking along vein next to injection site, which may indicate too-rapid infusion.

- Watch for nausea and vomiting. Administer antiemetics as needed.

🚨 Check for superinfection or hemorrhage caused by persistent bone marrow depression (but expect WBC counts as low as 1,000/mm<sup>3</sup> during therapy).

🚨 Watch closely for infusion-related reactions and anaphylaxis.

- Monitor CBC, hepatic profile, coagulation tests, ejection fraction, and glucose, uric acid, bilirubin, and calcium blood levels.

### Patient teaching

🚨 Advise patient to promptly report irregular heartbeats, easy bruising or

bleeding, or signs of hypersensitivity reaction, such as a rash.

- Caution patient to avoid people with colds, flu, or other contagious illnesses.
- Explain that drug may cause complete but reversible hair loss.
- Inform patient that drug may turn urine red for 1 or 2 days.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## doxorubicin hydrochloride, liposomal

Caelyx<sup>®</sup>, Doxil, Myocet<sup>®</sup>

**Pharmacologic class:** Anthracycline

**Therapeutic class:** Antibiotic anti-neoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

- Drug may cause cardiotoxicity. Myocardial damage may lead to heart failure and may occur as total cumulative dose (which includes previous use of other anthracyclines or anthracenediones) approaches 550 mg/m<sup>2</sup>. Toxicity may occur at lower cumulative doses in patients who have had previous mediastinal irradiation or are receiving concurrent cyclophosphamides.
- Acute infusion-related reactions occur in up to 10% of patients. They usually resolve over several hours to 1 day after infusion ends; in some patients, they resolve with slower infusion rate. Serious and sometimes life-threatening allergic or anaphylactoid-like infusion reactions may occur. Keep emergency equipment and drugs to treat reaction available for immediate use.

- Drug may cause severe myelosuppression.
- Reduce dosage in hepatic impairment.
- Accidental substitution of liposomal form for doxorubicin hydrochloride may cause severe adverse effects. Don't substitute on mg-per-mg basis.

### Action

Unclear. Thought to inhibit DNA and RNA synthesis by forming complex with DNA. Also exerts immunosuppressive activity. Liposomal encapsulation increases uptake by tumors, prolongs drug action, and may decrease toxicity. Cell-cycle-S-phase specific.

### Availability

*Liposomal dispersion for injection:* 2 mg/ml in 10-ml vial, 2 mg/ml in 25-ml vials

### Indications and dosages

- AIDS-related Kaposi's sarcoma  
**Adults:** 20 mg/m<sup>2</sup> I.V. once q 3 weeks
- Metastatic ovarian carcinoma  
**Adults:** Initially, 50 mg/m<sup>2</sup> I.V. at a rate of 1 mg/minute q 4 weeks for at least four courses. If no adverse reactions occur, increase infusion rate to complete the infusion over 1 hour.

### Dosage adjustment

- Hepatic impairment

### Contraindications

- Hypersensitivity to drug
- Malignant melanoma
- CNS metastases
- Bone marrow depression
- Cardiac disease
- Breastfeeding

### Precautions

Use cautiously in:

- hepatic impairment, brain tumor, renal carcinoma, myelosuppression
- elderly patients

- females of childbearing age
- pregnant patients
- children.

### Administration

- Follow facility policy for handling and preparing antineoplastics.
- Dilute dose (up to 90 mg) in 250 ml of dextrose 5% in water. Don't use any other diluent.

⚠️ Don't dilute solution with bacteriostatic diluent. Don't mix with other drugs.

- Don't use in-line filter.
- Administer slowly by I.V. infusion at initial rate of 1 mg/minute. If no infusion reaction occurs, increase rate to complete infusion over 1 hour. Don't give as I.V. bolus.

⚠️ Avoid rapid infusion, which may increase the risk of infusion-related reactions (back pain, chest tightness, flushing).

⚠️ If extravasation occurs, stop infusion immediately, apply ice, and notify prescriber.

- Don't give I.M. or subcutaneously.
- Know that drug is a translucent red dispersion, not a clear solution.

Route	Onset	Peak	Duration
I.V.	10 days	14 days	21-24 days

### Adverse reactions

**CNS:** drowsiness, dizziness, asthenia, fatigue, malaise, paresthesia, headache, depression, insomnia, anxiety, emotional lability

**CV:** chest pain, hypotension, tachycardia, peripheral edema, **cardiomyopathy, heart failure, arrhythmias, pericardial effusion**

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, enlarged abdomen, dyspepsia, moniliasis, stomatitis, glossitis, oral candidiasis, esophagitis, dysphagia

**GU:** albuminuria, red urine

**Hematologic:** anemia, **leukopenia, thrombocytopenia, neutropenia, bone marrow depression**

**Hepatic:** jaundice

**Metabolic:** hypocalcemia, hyperglycemia

**Musculoskeletal:** myalgia, back pain, hand-foot syndrome

**Respiratory:** dyspnea, increased cough, pneumonia

**Skin:** rash, dry skin, pruritus, skin discoloration, alopecia, diaphoresis, exfoliative dermatitis, palmar-plantar erythrodysesthesia

**Other:** altered taste, fever, chills, infection, herpes zoster, injection site reactions, allergic reactions including **anaphylaxis, acute infusion reaction**

### Interactions

**Drug-drug.** *Antineoplastics:* additive bone marrow depression

*Cyclophosphamide:* increased risk of hemorrhagic cystitis

*Cyclosporine:* profound and prolonged hematologic toxicity, increased risk of coma and seizures, increased cardiotoxicity

*Dactinomycin (in children):* increased risk of pneumonitis

*Live-virus vaccines:* decreased antibody response to vaccine, increased risk of adverse reactions

*Mercaptopurine:* hepatitis

*Paclitaxel (if administered first):* reduced doxorubicin clearance, increased incidence and severity of neutropenia and stomatitis

*Phenobarbital:* increased clearance and decreased effects of doxorubicin

*Phenytoin:* decreased phenytoin blood level

*Progesterone:* increased risk and severity of neutropenia and thrombocytopenia

*Streptozocin:* prolonged doxorubicin half-life

*Verapamil:* increased doxorubicin blood level

**Drug-diagnostic tests.** *Alkaline phosphatase, bilirubin, glucose, prothrombin*

time, serum and urine uric acid:

increased levels

Calcium, hemoglobin, neutrophils, platelets, white blood cells: decreased levels

### Patient monitoring

- 🔊 Observe patient closely for anaphylaxis and bleeding problems.
- 🔊 Stay alert for acute life-threatening arrhythmias, which may occur during or within a few hours after administration.
- 🔊 Assess for cardiomyopathy and subsequent heart failure with chronic overdose (more common in children).
- 🔊 Monitor closely for acute infusion reaction.
  - Assess for and report liver engorgement and yellowing of skin or eyes.
  - Check CBC, coagulation tests, hepatic profile, and bilirubin, glucose, calcium and uric acid levels.
  - Watch for nausea and vomiting. Give antiemetics, as needed and prescribed.
  - Assess for constipation and give fluids and stool softeners, as needed and prescribed.

### Patient teaching

- 🔊 Instruct patient to immediately report shortness of breath; tingling or burning, redness, flaking, bothersome swelling, small blisters, or small sores on palms of hands or soles of feet; rash, chest pain, or palpitations.
- Advise patient to avoid people with colds, flu, or other contagious illnesses.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## doxycycline

Adoxa, Oracea, Vibramycin

## doxycycline calcium

Vibramycin Calcium

## doxycycline hyclate

Alodox, Apo-Doxy<sup>®</sup>, Doryx, Doxy 100, Doxytab, Novo-Doxylin<sup>®</sup>, Oraxyl, Periostat, Vibramycin-D<sup>®</sup>, Vibramycin Hyclate

## doxycycline monohydrate

Monodox

**Pharmacologic class:** Tetracycline

**Therapeutic class:** Anti-infective

**Pregnancy risk category:** D

### Action

Unclear. Thought to inhibit bacterial protein synthesis at 30S and 50S ribosomal subunit and to alter cytoplasmic membrane of susceptible organisms.

### Availability

*Capsules:* 50 mg, 100 mg, 150 mg

*Capsules (coated pellets):* 40 mg, 75 mg, 100 mg

*Powder for injection:* 100 mg, 200 mg

*Powder for oral suspension:* 25 mg/5 ml

*Syrup:* 50 mg

*Tablets:* 20 mg, 50 mg, 75 mg, 100 mg

### Indications and dosages

➤ Rosacea

**Adults:** 40 mg P.O. daily in the morning

➤ Infections caused by various organisms, including *Mycoplasma*, *Chlamydia*, and *Rickettsia* organisms, and *Borrelia burgdorferi*

**Adults and children weighing more than 45 kg (99 lb):** 100 mg P.O. q 12 hours on first day, followed by 100 to

200 mg P.O. once daily; or 50 to 100 mg P.O. q 12 hours; or 200 mg I.V. once daily; or 100 mg I.V. q 12 hours on first day, followed by 100 to 200 mg I.V. once daily; or 50 to 100 mg I.V. q 12 hours

**Children weighing 45 kg (99 lb) or less:** 2.2 mg/kg P.O. q 12 hours on first day, followed by 2.2 to 4.4 mg/kg/day P.O. once daily; or 1.1 to 2.2 mg/kg P.O. q 12 hours; or 4.4 mg/kg I.V. once daily; or 2.2 mg/kg I.V. q 12 hours on first day, followed by 2.2 to 4.4 mg/kg I.V. once daily; or 1.1 to 2.2 mg/kg I.V. q 12 hours  
 ➤ Gonorrhea in penicillin-allergic patients

**Adults and children weighing more than 45 kg (99 lb):** 100 mg P.O. q 12 hours for 7 days; or 300 mg P.O. initially, followed by another 300 mg P.O. 1 hour later

➤ Lyme disease

**Adults and children weighing more than 45 kg (99 lb):** 100 mg P.O. b.i.d. for 10 to 30 days

➤ Periodontitis

**Adults and children weighing more than 45 kg (99 lb):** 20 mg P.O. b.i.d. for up to 9 months

➤ Anthrax

**Adults and children weighing more than 45 kg (99 lb):** 100 mg P.O. b.i.d. for 60 days; or 100 mg I.V. q 12 hours for 60 days, changing to oral route when appropriate

**Children weighing 45 kg (99 lb) or less:** 2.2 mg/kg P.O. b.i.d. for 60 days; or 100 mg I.V. q 12 hours for 60 days, changing to oral route when appropriate

➤ Prevention of malaria caused by *Plasmodium falciparum* in short-term travelers (less than 4 months)

**Adults:** 100 mg/day P.O. starting 1 to 2 days before travel begins and continuing during and for 4 weeks after travel

**Children:** 2 mg/kg/day P.O., up to adult dosage of 100 mg/day, starting 1 to 2 days before travel begins and continuing during and for 4 weeks after travel

## Off-label uses

- Traveler's diarrhea
- Pleural effusion

## Contraindications

- Hypersensitivity to drug, other tetracyclines, or bisulfites (with some drug products)

## Precautions

Use cautiously in:

- renal disease, hepatic impairment, nephrogenic diabetes insipidus, cachexia
- pregnant or breastfeeding patients
- children younger than age 8.

## Administration

- Obtain specimens for culture and sensitivity testing, as ordered, before first dose.

⚠ Don't give in conjunction with methoxyflurane anesthetic. Severe or fatal kidney damage may result.

- Reconstitute powder for injection with dextrose 5% in water, normal saline solution, lactated Ringer's solution, or dextrose 5% in lactated Ringer's solution.

- Don't infuse solutions with concentrations above 1 mg/ml.

- Infuse 100-mg dose over at least 1 hour.

- Complete infusion within 12 hours of dilution, unless diluted with lactated Ringer's solution or dextrose 5% in lactated Ringer's solution; in this case, complete infusion within 6 hours.

⚠ Don't give during last half of pregnancy or to children under age 8 unless other drugs are likely to be ineffective or are contraindicated. Drug may retard bone growth and cause tooth discoloration and malformation.

- Be aware that capsules with coated pellets contain immediate- and delayed-release pellets.

Route	Onset	Peak	Duration
P.O.	1-2 hr	1.5-4 hr	12 hr
I.V.	Rapid	End of infusion	12 hr

### Adverse reactions

**CNS:** paresthesia, **pseudotumor cerebri**

**CV:** phlebitis, **thrombophlebitis,**

**pericarditis**

**EENT:** vestibular reactions, hoarseness, pharyngitis

**GI:** nausea, vomiting, diarrhea, esophagitis, epigastric distress, enterocolitis, anogenital lesions or inflammation, glossitis, oral candidiasis, black hairy tongue, **pancreatitis**

**GU:** dark yellow or brown urine, vaginal candidiasis

**Hematologic:** **hemolytic anemia, neutropenia, thrombocytopenia**

**Hepatic:** **hepatotoxicity**

**Musculoskeletal:** bone growth retardation (in children younger than age 8)

**Skin:** photosensitivity, maculopapular or erythematous rash, hyperpigmentation, urticaria

**Other:** tooth enamel defects, increased appetite, phlebitis at I.V. site, superinfection, hypersensitivity reactions including **anaphylaxis**

### Interactions

**Drug-drug.** *Adsorbent antidiarrheals; antacids; calcium, iron, and magnesium preparations:* decreased doxycycline absorption

*Barbiturates, carbamazepine, hormonal contraceptives containing estrogen, phenytoin, rifamycin:* decreased doxycycline efficacy

*Cholestyramine, colestipol:* decreased oral absorption of doxycycline

*Methoxyflurane:* increased

nephrotoxicity

*Penicillin:* decreased penicillin activity

*Sucralfate:* prevention of doxycycline absorption from GI tract

*Warfarin:* enhanced warfarin effects

**Drug-diagnostic tests.** *Alkaline phosphatase, alanine aminotransferase, amylase, aspartate aminotransferase, bilirubin, blood urea nitrogen (BUN), eosinophils:* increased levels

*Hemoglobin, neutrophils, platelets,*

*white blood cells:* decreased levels

*Urine catecholamines:* false elevations

**Drug-food.** *Calcium-containing foods:* decreased drug absorption

**Drug-behaviors.** *Alcohol use:* decreased anti-infective effect of doxycycline

*Sun exposure:* increased risk of photosensitivity

### Patient monitoring

- Evaluate I.V. site regularly. Apply cool compresses as needed.

- Monitor for hypersensitivity reactions, including anaphylaxis.

- Monitor hepatic profile, CBC, BUN, and creatinine levels.

- Assess for hypercoagulability in patients taking warfarin concurrently.

- Monitor for digoxin toxicity in patients taking digoxin concurrently.

### Patient teaching

- Advise patient to take with 8 oz of water to ensure passage into stomach.

- Tell patient to take on empty stomach at least 1 hour before meals or 2 hours afterwards.

- Instruct patient to take at least 1 hour before bedtime to prevent esophagitis.

- Tell patient to immediately report painful swallowing, abdominal pain, easy bruising or bleeding, or signs of hypersensitivity (such as rash).

- Advise female patient to tell prescriber if she is pregnant.

- Instruct patient to avoid alcohol use and large amounts of calcium-containing foods (such as dairy products and some green leafy vegetables, such as spinach).

- Stress importance of good oral hygiene.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

## dronabinol

Marinol

**Pharmacologic class:** Cannabinoid

**Therapeutic class:** Antiemetic

**Controlled substance III**

**Pregnancy risk category B**

### Action

Unknown. May exert antiemetic effect by inhibiting vomiting control mechanism in medulla oblongata.

### Availability

**Capsules:** 2.5 mg, 5 mg, 10 mg

### Indications and dosages

➤ Prevention of nausea and vomiting caused by chemotherapy

**Adults and children:** Initially, 5 mg/m<sup>2</sup> P.O. 1 to 3 hours before chemotherapy. Repeat dose q 2 to 4 hours after chemotherapy, up to four to six doses per day. If 5-mg/m<sup>2</sup> dose is ineffective and patient has no significant adverse reactions, dosage may be increased in increments of 2.5 mg/m<sup>2</sup> to a maximum dosage of 15 mg/m<sup>2</sup>.

➤ Appetite stimulant

**Adults and children:** Initially, 2.5 mg P.O. b.i.d. May reduce dosage to 2.5 mg/day given as a single evening or bedtime dose. Maximum dosage is 10 mg P.O. b.i.d.

### Contraindications

- Hypersensitivity to cannabinoids or sesame oil
- Breastfeeding

### Precautions

Use cautiously in:

- hypertension, heart disease, bipolar disorder, schizophrenia, drug abuse, seizures
- pregnant patients.

### Administration

- When used to stimulate appetite, give before lunch and dinner.

Route	Onset	Peak	Duration
P.O.	30-60 min	2-4 hr	4-6 hr

### Adverse reactions

**CNS:** drowsiness, anxiety, impaired coordination, irritability, depression, headache, hallucinations, memory loss, paresthesia, ataxia, paranoia, disorientation, nightmares, speech difficulties, syncope, **suicidal ideation**

**CV:** tachycardia, hypotension, hypertension

**EENT:** visual disturbances, tinnitus

**GI:** dry mouth

**Skin:** facial flushing, diaphoresis

### Interactions

**Drug-drug.** *Anticholinergics, antihistamines, tricyclic antidepressants:*

increased tachycardia and hypertension  
*CNS depressants:* increased CNS depression

*Ritonavir:* increased dronabinol blood level and risk of toxicity

**Drug-behaviors.** *Alcohol use:* increased CNS depression

### Patient monitoring

- Monitor vital signs for hypotension and tachycardia.

🚨 Check for adverse CNS reactions. Report significant depression, paranoid reaction, or emotional lability.

- Monitor nutritional status and hydration.

### Patient teaching

- Teach patient about drug's significant adverse CNS and cardiovascular

effects. Emphasize that he should take it only as prescribed and needed.

 Advise patient (and significant other) to immediately report depression, suicidal thoughts, paranoid reactions, seizures, and other serious CNS reactions.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and behaviors mentioned above.

## dronedarone

Multaq

**Pharmacologic class:** Benzofuran derivative

**Therapeutic class:** Antiarrhythmic

**Pregnancy risk category** X

### FDA BOXED WARNING

- In patients with symptomatic heart failure and recent decompensation requiring hospitalization or with New York Heart Association Class IV heart failure, dronedarone doubles risk of death and is contraindicated in these patients.
- In patients with permanent AF, dronedarone doubles risk of death, stroke, and hospitalization for heart failure. Dronedarone is contraindicated in patients with AF who won't or can't be cardioverted into normal sinus rhythm.

### Action

Unknown.

### Availability

Tablets: 400 mg

### Indications and dosages

 To reduce risk of hospitalization for atrial fibrillation (AF) in patients in sinus rhythm with a history of paroxysmal or persistent AF

**Adults:** 400 mg P.O. b.i.d. with morning and evening meals

### Contraindications

- Permanent AF (patients in whom normal sinus rhythm won't or can't be restored), symptomatic heart failure with recent decompensation requiring hospitalization or New York Heart Association Class IV symptoms, second- or third-degree atrioventricular (AV) block or sick sinus syndrome (except when used with a functioning pacemaker), bradycardia less than 50 beats/minute, QTc Bazett interval at or above 500 ms or PR interval above 280 ms
- Concomitant use of drugs or herbal products that prolong QT interval and may induce torsades de pointes (such as phenothiazine antipsychotics, tricyclic antidepressants, certain oral macrolide antibiotics, Class I and III antiarrhythmics)
- Concomitant use of a strong CYP3A inhibitor (such as clarithromycin, cyclosporine, itraconazole, ketoconazole, nefazodone, ritonavir, telithromycin, voriconazole)
- Hepatotoxicity related to the previous use of amiodarone and severe hepatic impairment
- Patients who are or may become pregnant
- Breastfeeding patients

### Precautions

Use cautiously in:

- new or worsening heart failure during treatment, QT-interval prolongation
- hypokalemia, hypomagnesemia
- increased serum creatinine level
- children younger than age 18 (safety and efficacy not established).

## Administration

⚠ Be aware that treatment with Class I or III antiarrhythmics or strong CYP3A inhibitors must be stopped before start of dronedarone.

- Note that hypokalemia or hypomagnesemia may occur with concomitant administration of potassium-depleting diuretics. Ensure that potassium levels are within normal range before starting drug.
- Administer with morning and evening meals but not with grapefruit juice.

Route	Onset	Peak	Duration
P.O.	Unknown	3-6 hr	Unknown

## Adverse reactions

**CNS:** asthenia

**CV:** bradycardia, **QT-interval prolongation, new or worsening heart failure**

**GI:** diarrhea, nausea, vomiting, abdominal pain, dyspepsia

**Hepatic: hepatocellular injury, acute liver injury**

**Metabolic:** hypokalemia, hypomagnesemia, increased creatinine

**Skin:** rash (generalized, macular, maculopapular, erythematous), pruritus, eczema, dermatitis, allergic dermatitis

## Interactions

**Drug-drug.** *Beta blockers, such as metoprolol, propranolol:* increased effects to these drugs, increased risk of bradycardia

*Calcium channel blockers, with depressant effects on sinus and AV nodes, such as diltiazem, nifedipine, verapamil:*

increased dronedarone and calcium channel blocker effects; potentiated dronedarone effects on conduction

*CYP3A inducers, such as carbamazepine, phenobarbital, phenytoin, rifampin:* significantly decreased dronedarone effect

*Digoxin:* potentiated dronedarone electrophysiologic effects (such as decreased AV node conduction); increased digoxin level; increased GI disorders

*Drugs that prolong QT interval:* risk of torsades de pointes-type ventricular tachycardia

*Other CYP2D6 substrates, such as other beta blockers, selective serotonin reuptake inhibitors, tricyclic antidepressants:* increased effects of these drugs

*Potent CYP3A inhibitors, such as clarithromycin, cyclosporine, itraconazole, ketoconazole, nefazodone, ritonavir, telithromycin, voriconazole:* increased dronedarone effect and  $C_{max}$

*HMG-CoA reductase inhibitors, such as simvastatin:* increased simvastatin effect

*Sirolimus, tacrolimus, other CYP3A substrates with narrow therapeutic range:* increased plasma concentrations of these drugs

**Drug-diagnostic tests.** *Serum creatinine:* increased level

*Magnesium, potassium:* decreased levels

**Drug-food.** *Any food:* increased drug bioavailability

*Grapefruit juice:* increased dronedarone effect and  $C_{max}$

**Drug-herbs.** *St. John's wort:* significantly decreased dronedarone effect

## Patient monitoring

⚠ Observe patient closely for worsening heart failure: If heart failure develops or worsens, consider suspending or discontinuing drug.

⚠ Discontinue drug if QT-interval prolongation occurs (QTc Bazett interval at or above 500 ms).

- Monitor patient for hypokalemia and hypomagnesemia, especially with concomitant administration of potassium-depleting diuretics. Maintain potassium and magnesium levels within normal range.

- Monitor renal function and watch for increase in serum creatinine level.

## Patient teaching

- Instruct patient to take drug with morning and evening meals and to avoid grapefruit juice.

 Advise patient to immediately notify prescriber if signs and symptoms of worsening heart failure develop, such as acute weight gain, edema in legs or feet, or increasing shortness of breath.

- Instruct patient to consult prescriber before taking other prescription or nonprescription drugs or herbal products, particularly St. John's wort.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## droperidol

Inapsine

**Pharmacologic class:** Butyrophenone

**Therapeutic class:** General anesthetic, antiemetic

**Pregnancy risk category C**

### FDA BOXED WARNING

- QT prolongation and torsades de pointes may occur at or below recommended doses, even in patients with no known risk factors. (Risk factors for prolonged QT syndrome include heart failure, bradycardia, cardiac hypertrophy, hypokalemia, hypomagnesemia, age older than 65, alcohol abuse, and use of diuretics, drugs that prolong the QT interval, benzodiazepines, volatile anesthetics, or I.V. opioids.) Some cases have been fatal. Reserve drug for patients with refractory disease. Use with extreme caution in patients at risk for prolonged QT interval.
- Drug is contraindicated in patients with known or suspected QT prolongation.

### Action

Produces marked sedation by directly blocking subcortical receptors. Produces antiemetic effect by blocking CNS receptors in chemoreceptor trigger zone.

### Availability

**Injection:** 2.5 mg/ml in 1-ml, 2-ml, and 5-ml ampules and in 2-ml, 5-ml, and 10-ml vials

### Indications and dosages

➤ Perioperative nausea and vomiting

**Adults:** Initially, 2.5 mg I.M. or I.V.

Additional doses of 1.25 mg may be given. Dosages are highly individualized according to patient's age, weight, physical status, and underlying pathologic condition.

**Children ages 2 to 12:** Initially, 0.1 mg/kg I.M. or I.V. Additional doses up to a total of 2.5 mg may be given. Dosages are highly individualized according to patient's age, weight, physical status, and underlying clinical condition.

### Dosage adjustment

- Elderly or debilitated patients
- High-risk patients (such as patients over age 65 and those with heart failure, alcohol abuse, or other factors that predispose to prolonged QT interval)
- Patients who have received other CNS depressants (such as analgesics or anesthetics)

### Contraindications

- Hypersensitivity to drug
- Known or suspected QT-interval prolongation (more than 440 millisecond in males or 450 millisecond in females)

### Precautions

Use cautiously in:

- severe cardiac or renal disease, diabetes mellitus, respiratory insufficiency, prostatic hypertrophy, angle-closure glaucoma, CNS depression, CNS tumors, intestinal obstruction, bone marrow depression

- elderly patients
- pregnant or breastfeeding patients
- children younger than age 2.

### Administration

- Know that drug is indicated to ease perioperative nausea and vomiting only in patients who don't respond adequately to other treatment.
- Be aware that drug doesn't need to be diluted for I.V. or I.M. use.
- Give by slow I.V. injection, or inject I.M. into large muscle.

Route	Onset	Peak	Duration
I.V., I.M.	3-10 min	30 min	2-4 hr

### Adverse reactions

**CNS:** weakness, dysarthria, dysphonia, dizziness, extrapyramidal reactions, headache, postoperative hallucinatory episodes with transient depression, tremor, irritability, paresthesia, aggression, vertigo, ataxia, **loss of consciousness, seizures, neuroleptic malignant syndrome**

**CV:** chest pain, hypertension, hypotension, vasodilation, **arrhythmias, atrial fibrillation**

**EENT:** cataracts, blurred vision, eye irritation, sore throat

**GI:** nausea, vomiting, diarrhea, abdominal cramps, bloating, epigastric pain, fecal incontinence, increased salivation, dysphagia

**GU:** urinary frequency, increased libido

**Hepatic: cholestatic jaundice**

**Metabolic:** dehydration

**Musculoskeletal:** muscle cramps, arthritis, bone fractures

**Respiratory:** bronchitis, dyspnea

**Skin:** bruising, rash, urticaria, facial sweating, diaphoresis, pruritus, flushing

**Other:** toothache, weight loss, hot flashes, influenza, chills

### Interactions

**Drug-drug.** *Antihypertensives, nitrates:* additive hypertension

*CNS depressants (including antidepressants, antihistamines, opioids):* additive CNS depression

*Drugs that induce hypokalemia or hypomagnesemia (such as diuretics and laxatives and supraphysiologic use of steroid hormones with mineralocorticoid activity):* possible precipitation, QT interval prolongation

*Drugs that prolong QTc interval (such as antidepressants, class I or III antiarrhythmics, antimalarials, calcium channel blockers, some antihistamines, some neuroleptics):* increased risk of conduction abnormalities

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* additive CNS depression

### Patient monitoring

 Monitor QT interval; report prolongation. Also watch for torsades de pointes.

 Know that drug may cause sudden death at high doses (above 25 mg) in patients at risk for arrhythmias.

 Monitor for signs and symptoms of neuroleptic malignant syndrome, such as hyperthermia, severe extrapyramidal symptoms, altered mental status, stupor, coma, hypertension, tachycardia, pallor, or diaphoresis. (However, this syndrome is rare.)

- Assess vital signs frequently. Stay alert for orthostatic hypotension and tachycardia. Keep I.V. fluids and vasopressors on hand to treat pronounced hypotension.

 Don't place hypotensive patient in Trendelenburg position because this may deepen anesthesia, precipitating respiratory arrest.

- Avoid abrupt position changes.

- Observe for signs and symptoms of respiratory compromise if drug is used concurrently with narcotics.

### Patient teaching

- Advise patient not to drink alcohol or take CNS depressants for 24 hours after receiving drug.

- Tell patient drug may cause extreme drowsiness for several days after administration.
- Caution patient not to drive or perform other activities requiring mental alertness.
- Instruct patient to change positions slowly.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, herbs, and behaviors mentioned above.

## duloxetine hydrochloride

Cymbalta, Yentreve 

**Pharmacologic class:** Selective serotonin and norepinephrine reuptake inhibitor

**Therapeutic class:** Antidepressant

**Pregnancy risk category** C

### FDA BOXED WARNING

- Drug may increase risk of suicidal thinking and behavior in children, adolescents, and young adults with major depressive disorder and other psychiatric disorders, especially during first few months of therapy. Risk must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family and caregivers to observe patient closely and communicate with prescriber as needed.
- Drug isn't approved for use in children.

### Action

Unknown. May potentiate serotonergic and noradrenergic activity in CNS.

### Availability

*Capsules (delayed-release):* 20 mg, 30 mg, 60 mg

### Indications and dosages

➤ Major depressive disorder

**Adults:** 40 mg/day (20 mg b.i.d.) P.O. to 60 mg/day (once daily or as 30 mg b.i.d.) P.O. If needed, start at 30 mg P.O. once daily for 1 week so patient can adjust to drug before increasing to 60 mg/day. If dosage is increased above 60 mg/day, use increments of 30 mg/day. Some patients may require maintenance dosage of 60 mg once daily for several months or longer.

➤ Generalized anxiety disorder  
**Adults:** For most patients, recommended starting dose is 60 mg P.O. once daily. If needed, start at 30 mg P.O. once daily for 1 week so patient can adjust to drug before increasing to 60 mg/day. If dosage is increased above 60 mg/day, use increments of 30 mg/day.

➤ Diabetic peripheral neuropathic pain

**Adults:** 60 mg P.O. once daily. For patients with unknown tolerance, consider starting at lower dosage.

➤ Fibromyalgia, chronic musculoskeletal pain

**Adults:** Initially, 30 mg P.O. daily for 1 week so patient can adjust to drug before increasing to 60 mg P.O. once daily. Some patients may respond to starting dosage. Base continued therapy on patient response.

### Dosage adjustment

- Renal impairment

### Contraindications

- MAO inhibitor use within past 14 days
- Uncontrolled narrow-angle glaucoma

### Precautions

Use cautiously in:

- hepatic insufficiency, severe renal impairment, or chronic hepatic disease (use not recommended)

- hyponatremia, seizure disorder, controlled narrow-angle glaucoma, conditions that slow gastric emptying, urinary hesitancy and frequency
- history of mania
- concurrent use of potent CYP1A2 inhibitors (such as fluoroquinolones, thioridazine, or serotonin precursors) (avoid use)
- concurrent use of 5-hydroxytryptamine receptor agonist (triptan) or other CNS-acting drugs
- heavy alcohol use
- pregnant patients
- breastfeeding patients (use not recommended)
- children, adolescents, and young adults.

### Administration

- Assess blood pressure before starting therapy.
- Give without regard to meals.
- Make sure patient swallows capsule whole without chewing or crushing it. Don't sprinkle contents onto food or mix with liquids.

🔊 Don't give within 14 days of MAO inhibitors; don't give MAO inhibitors within 5 days of duloxetine withdrawal.

Route	Onset	Peak	Duration
P.O.	Unknown	6 hr	Unknown

### Adverse reactions

**CNS:** fatigue, somnolence, dizziness, asthenia, headache, agitation, abnormal dreams, tremor, insomnia, anxiety, worsening of depression, increased risk of suicide or suicidal ideation (especially in child or adolescent)

**CV:** orthostatic hypotension, syncope

**EENT:** blurred vision, mydriasis,

nasopharyngitis, laryngopharyngeal pain

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, dysgeusia, dry mouth

**GU:** abnormal orgasm, erectile or

ejaculatory dysfunction, delayed

ejaculation, decreased libido, frequent daytime urination

**Hematologic:** abnormal bleeding (ecchymoses, hematomas, epistaxis, petechiae, **life-threatening hemorrhage**)

**Hepatic:** hepatotoxicity

**Musculoskeletal:** muscle cramp, pain, and spasms

**Respiratory:** cough, upper respiratory tract infection

**Skin:** increased sweating, hot flashes, rash, pruritus

**Other:** pyrexia, seasonal allergy, yawning, decreased appetite, weight loss, **serotonin syndrome**

### Interactions

**Drug-drug.** *Aspirin, NSAIDs, other drugs that affect coagulation:* increased risk of bleeding

*Drugs metabolized by CYP2D6 (such as phenothiazines, tricyclic antidepressants, type 1C antiarrhythmics):* increased blood levels of these drugs

*Highly protein-bound drugs:* increased free concentrations of these drugs, potentially causing adverse reactions  
*MAO inhibitors:* serious and potentially fatal interactions

*Potent CYP1A2 inhibitors (such as cimetidine, fluvoxamine, quinolone antibiotics), potent CYP2D6 inhibitors (such as fluoxetine, paroxetine, quini-dine):* increased duloxetine blood level

*Serotonergic drugs (such as linezolid, lithium, tramadol, triptans):* increased risk of serotonin syndrome

*Thioridazine:* increased risk of serious ventricular arrhythmias and sudden death

*Warfarin:* altered anticoagulant effect, including increased bleeding

**Drug-diagnostic tests.** *ALP, ALT, AST, creatine kinase:* increased levels

*Sodium:* decreased level

**Drug-herbs.** *St. John's wort:* increased risk of serotonin syndrome

**Drug-behaviors.** *Alcohol use:* increased risk of hepatic damage

*Smoking:* decreased duloxetine bioavailability

### Patient monitoring

- 🔊 Monitor patient's mental status carefully. Stay alert for mood changes and signs of suicidal ideation, especially in child or adolescent.
- Monitor liver function test results and creatinine level for evidence of hepatic impairment.
- 🔊 Watch for potentially life-threatening serotonin syndrome, especially with concomitant use of serotonergic drugs (including triptans) or drugs that impair serotonin metabolism (including MAO inhibitors). Signs and symptoms may include mental status changes (agitation, hallucinations, coma), autonomic instability (tachycardia, labile blood pressure, hyperthermia), neuromuscular aberrations (hyperreflexia, incoordination) and GI upset (nausea, vomiting, diarrhea).
- Monitor blood pressure periodically during therapy.
- Watch for signs and symptoms of hyponatremia, such as headache, poor concentration, memory impairment, confusion, weakness, and unsteadiness. If these occur, consider discontinuing drug and provide treatment as appropriate.
- Know that in diabetic patients, small increases in fasting blood glucose, glycosylated hemoglobin, and total cholesterol levels may occur.
- If concurrent triptan use is warranted, observe patient closely, especially at start of therapy and during dosage increases.
- Carefully monitor patient receiving warfarin when duloxetine is begun or discontinued.
- 🔊 Don't stop drug abruptly. Taper dosage gradually.

### Patient teaching

- Advise patient to take drug without regard to meals.

- Instruct patient to swallow capsules whole without chewing or crushing. Tell patient not to sprinkle contents onto food or mix with liquids.
- 🔊 Advise patient (and parent or significant other as appropriate) to monitor mental status carefully and immediately report increased depression or suicidal thoughts or behavior (especially in child or adolescent).
- 🔊 Instruct patient to report signs and symptoms of liver damage (unexplained flulike symptoms, itching, right upper abdominal tenderness, dark urine, or yellow skin).
- 🔊 Tell patient not to stop taking drug abruptly and that dosage will be tapered gradually when drug is discontinued.
- Caution patient to avoid driving and other hazardous activities until drug's effects on concentration and alertness are known.
- Advise patient to rise slowly from a sitting or lying position to avoid sudden blood pressure drop.
- Instruct patient to avoid heavy alcohol use during therapy because of increased risk of liver damage.
- Caution patient to avoid NSAIDs, aspirin, and other drugs that affect coagulation unless prescriber approves.
- Instruct patient not to use herbs, especially St. John's wort, without consulting prescriber.
- Tell female patient to notify prescriber if she is pregnant or breastfeeding or plans to become pregnant or to breastfeed.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

**d**

## dutasteride

Avodart

**Pharmacologic class:** Synthetic 4-azasteroid compound

**Therapeutic class:** 5-alpha-reductase inhibitor, sex hormone

**Pregnancy risk category** X

### Action

Inhibits 5-alpha-reductase, an intracellular enzyme present in liver, skin, and prostate that's required for conversion of testosterone to 5-alpha-dihydrotestosterone (DHT). DHT appears to be the principal androgen responsible for stimulating prostatic growth.

### Availability

**Capsules:** 0.5 mg

### Indications and dosages

➤ Symptomatic benign prostatic hypertrophy (alone or in combination with tamsulosin)

**Adults:** 0.5 mg P.O. daily

### Contraindications

- Hypersensitivity to drug, its components, other 5-alpha-reductase inhibitors, xanthines (such as coffee, theobromine), or ethylenediamine
- Women
- Children

### Precautions

Use cautiously in:

- hepatic impairment.

### Administration

- Don't handle drug if you're pregnant or plan to become pregnant.
- Don't open or crush capsule.
- Give without regard to food.

Route	Onset	Peak	Duration
P.O.	Rapid	2-3 hr	Unknown

### Adverse reactions

**GI:** dyspepsia

**GU:** decreased libido, decreased ejaculatory volume, erectile dysfunction, gynecomastia

### Interactions

**Drug-drug.** *Cimetidine, ciprofloxacin, diltiazem, ketoconazole, other drugs metabolized by CYP450-3A4 pathway, ritonavir, verapamil:* increased dutasteride blood level

**Drug-diagnostic tests.** *Prostate-specific antigen (PSA):* decreased level

*Thyroid-stimulating hormone:* increased level

### Patient monitoring

- Monitor fluid intake and output. Assess for ease of starting urine stream and for urinary urgency or frequency.
- Check baseline PSA level; reevaluate at 3 to 6 months.

### Patient teaching

- Tell patient to take drug with full glass of water without crushing or opening capsule.
- Instruct patient not to take capsule if it's cracked or leaking.
- Inform patient that drug decreases testosterone production in prostate.
- Tell patient to report dysuria and urinary urgency.
- ⚠ Advise patient not to donate blood for at least 6 months after final dose.
- Inform patient that drug may decrease ejaculatory volume.
- Explain that sexual side effects eventually will subside.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## efavirenz

Sustiva

**Pharmacologic class:** Nonnucleoside reverse transcriptase inhibitor

**Therapeutic class:** Antiretroviral

**Pregnancy risk category D**

### Action

Inhibits human immunodeficiency virus (HIV) reverse transcriptase (required for transcription of HIV-1 RNA to DNA), leading to viral cell death

### Availability

*Capsules:* 50 mg, 200 mg

*Tablets:* 600 mg

### Indications and dosages

➤ HIV infection (given with one or more additional antiretrovirals)

**Adults and children older than age 3 and weighing more than 40 kg (88 lb):** 600 mg P.O. once daily

**Children weighing 32.5 to 40 kg (71.5 to 88 lb):** 400 mg P.O. once daily

**Children weighing 25 to 32.5 kg (55 to 71.5 lb):** 350 mg P.O. once daily

**Children weighing 20 to 25 kg (44 to 55 lb):** 300 mg P.O. once daily

**Children weighing 15 to 20 kg (33 to 44 lb):** 250 mg P.O. once daily

**Children weighing 10 to 15 kg (22 to 33 lb):** 200 mg P.O. once daily

### Dosage adjustment

• Concurrent use of rifampin or voriconazole

### Contraindications

- Hypersensitivity to drug
- Concurrent use of astemizole, cispripide, midazolam, triazolam, ergot derivatives, voriconazole, or bepridil

### Precautions

Use cautiously in:

- hypercholesterolemia, hepatic impairment, concurrent use of hepatotoxic drugs, mental illness, or substance abuse
- concurrent use of St. John's wort (use not recommended)
- pregnant or breastfeeding patients
- children.

### Administration

- Give on empty stomach.
- Know that drug is given with other antiretrovirals.

Route	Onset	Peak	Duration
P.O.	Rapid	3-5 hr	24 hr

### Adverse reactions

**CNS:** dizziness, drowsiness, fatigue, insomnia, abnormal dreams, hypoaesthesia, depression, headache, poor concentration, nervousness, anxiety, CNS depression, **suicidal ideation**

**CV:** **arrhythmias**

**GI:** nausea, diarrhea, flatulence, abdominal pain, dyspepsia

**GU:** hematuria, renal calculi

**Hepatic:** **hepatotoxicity**

**Respiratory:** **respiratory depression**

**Skin:** rash, diaphoresis, pruritus, **erythema multiforme**, **toxic epidermal necrolysis**, **Stevens-Johnson syndrome**

**Other:** increased appetite

### Interactions

**Drug-drug.** *Azole antifungals (ketoconazole, voriconazole):* decreased antifungal plasma concentration, increased efavirenz plasma concentration

*Calcium channel blockers:* possible decreased calcium channel blocker concentration

*Clarithromycin, indinavir*: reduced blood levels of these drugs  
*CNS depressants (including antidepressants, antihistamines, opioids)*: increased CNS depression  
*CYP450 inducers (including phenobarbital, rifabutin, rifampin)*: increased clearance and decreased blood level of efavirenz  
*CYP450 inhibitors, ergot alkaloids, estrogen, midazolam, ritonavir, triazolam*: increased blood levels of these drugs, greater risk of serious adverse reactions (including arrhythmias, CNS and respiratory depression, and hepatotoxicity)  
*HMG-CoA reductase inhibitors*: decreased plasma concentration of atorvastatin, pravastatin, and simvastatin  
*Hormonal contraceptives*: increased ethinyl estradiol blood level  
*Protease inhibitors*: decreased plasma level and efficacy of these drugs  
*Saquinavir*: decreased saquinavir blood level  
*Warfarin*: increased or decreased warfarin effects

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, gamma-glutamyltransferase, total cholesterol, triglycerides*: increased levels  
*Urine cannabinoid test*: false-positive result

**Drug-food.** *High-fat meal*: increased drug absorption

**Drug-herbs.** *St. John's wort*: decreased efavirenz blood level and efficacy, drug resistance

**Drug-behaviors.** *Alcohol use*: increased CNS depression

### Patient monitoring

- Monitor dietary intake and hepatic and lipid profile.
- Closely monitor patients with hepatic failure.
- 🗨️ Record mood changes and stay alert for suicidal ideation or behavior.
- Be aware that drug may cause hypercholesterolemia.

- Know that amount of HIV in blood may increase if patient stops drug therapy even briefly.

### Patient teaching

- Instruct patient to take with full glass of water, preferably at bedtime to improve tolerance of CNS effects. Also tell him to avoid taking drug with high-fat meals.
- Inform patient that drug must be taken in combination with other anti-retrovirals.
- Tell patient that drug doesn't cure HIV or AIDS and that he can still transmit virus to others.
- 🗨️ Advise patient to report suicidal thoughts and other psychiatric symptoms.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- 🗨️ Tell female patient to immediately inform prescriber if she becomes pregnant.
- Advise female patient to use adequate contraceptive measures for 12 weeks after discontinuing drug.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## eletriptan hydrobromide

Relpax

**Pharmacologic class:** 5-hydroxytryptamine-1 (5-HT<sub>1</sub>) receptor agonist

**Therapeutic class:** Antimigraine agent

**Pregnancy risk category** C

### Action

Binds with serotonin 5-HT<sub>1B</sub> receptors on intracranial blood vessels and

serotonin 5-HT<sub>1D</sub> receptors on sensory nerve endings, constricting cranial arteries and thereby relieving migraine

**Availability**

Tablets: 20 mg, 40 mg

**Indications and dosages**

➤ Migraine with or without aura  
**Adults:** Initially, 20 to 40 mg P.O.; may repeat in 2 hours if headache returns after initial improvement. Maximum recommended single dosage is 40 mg.

**Contraindications**

- Hypersensitivity to drug
- Basilar and hemiplegic migraine
- Severe hepatic disease
- Ischemic heart disease
- Peripheral vascular disease
- Cerebrovascular syndromes
- Uncontrolled hypertension
- Ischemic bowel disease
- Within 24 hours of another serotonin agonist or ergot-type drug

**Precautions**

Use cautiously in:

- hepatic or renal impairment, diabetes mellitus, hypercholesterolemia, cardiac disorders
- pregnant or breastfeeding patients
- children.

**Administration**

- Give first dose as soon as migraine symptoms arise.
- 🔊 Be aware that first dose should be given under close supervision to patients with coronary artery disease.
- If headache improves but then recurs, give second dose at least 2 hours after first.
- Be aware that drug's safety in treating an average of more than three headaches within a 30-day period has not been established.

Route	Onset	Peak	Duration
P.O.	2 hr	2-3 hr	Unknown

**Adverse reactions**

**CNS:** dizziness, insomnia, drowsiness, headache, fatigue, anxiety, paresthesia, asthenia, **cerebrovascular ischemia**  
**CV:** chest pain, palpitations, hypertension, **cardiovascular ischemia**  
**GI:** nausea, vomiting, diarrhea, dry mouth  
**Musculoskeletal:** muscle weakness  
**Respiratory:** chest tightness or pressure  
**Skin:** flushing  
**Other:** hot or cold sensation

**Interactions**

**Drug-drug.** *Antihistamines, ergotamine, ergot derivatives:* increased vasospastic effects  
*CYP450-3A4 inhibitors (such as clarithromycin, ketoconazole, propranolol):* increased eletriptan blood level  
*MAO inhibitors:* increased eletriptan effects

**Patient monitoring**

- Monitor vital signs and assess for chest pain, tightness, or pressure.

**Patient teaching**

- Instruct patient to take first dose as soon as migraine symptoms occur. If headache improves but then recurs, advise him to take second dose at least 2 hours after first.
- Caution patient to avoid driving and other hazardous activities until drug no longer affects concentration and alertness.
- Tell patient to report chest pain, pressure, or tightness.
- Inform patient that drug won't prevent migraines and isn't effective against other headache types.
- As appropriate, review all other significant and life-threatening adverse

reactions and interactions, especially those related to the drugs mentioned above.

## emtricitabine

Emtriva

**Pharmacologic class:** Nucleoside reverse transcriptase inhibitor

**Therapeutic class:** Antiretroviral

**Pregnancy risk category B**

### FDA BOXED WARNING

- Drug has caused lactic acidosis and severe hepatomegaly with steatosis (including fatal cases) when used alone or in combination with other antiretrovirals.
- Drug isn't indicated for chronic hepatitis B virus (HBV) infection. Safety and efficacy haven't been established in patients co-infected with HBV and human immunodeficiency virus (HIV). Discontinuation has led to severe acute HBV exacerbations. Monitor hepatic function closely.

### Action

Inhibits activity of HIV-1 reverse transcriptase by competing with natural substrate and by its incorporation into nascent viral DNA, thereby halting viral replication

### Availability

**Capsules:** 200 mg

**Oral solution:** 10 mg/ml in 170-ml bottles

### Indications and dosages

➤ HIV-1 infection, with other antiretrovirals

**Adults ages 18 and older:** 200-mg capsule P.O. daily or 240 mg (24 ml) oral solution P.O. once daily

**Children ages 3 months to 17 years weighing more than 33 kg (73 lb):**

200-mg capsule P.O. once daily

**Children ages 3 months to 17 years weighing less than 33 kg (73 lb):** 6 mg/kg oral solution P.O. daily to maximum of 240 mg (24 ml) once daily

**Children ages 0 to 3 months:** 3 mg/kg oral solution P.O. once daily

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- renal impairment
- increased risk for lactic acidosis or hepatic impairment
- obese patients
- elderly patients
- children (safety and efficacy not established).

### Administration

- Give with or without food.
- Know that drug must be given with other antiretrovirals.
- Know that capsule can be given to child weighing more than 33 kg if child can swallow an intact capsule.

Route	Onset	Peak	Duration
P.O.	Rapid	1-2 hr	Unknown

### Adverse reactions

**CNS:** dizziness, headache, insomnia, abnormal dreams, depression, peripheral neuritis or neuropathy, paresthesia  
**EENT:** rhinitis

**GI:** nausea, vomiting, diarrhea, abdominal pain, dyspepsia

**Hepatic:** hepatotoxicity

**Metabolic:** cushingoid appearance (buffalo hump, moon face), **lactic acidosis**

**Musculoskeletal:** joint pain, myalgia

**Respiratory:** increased cough

**Skin:** rash, skin discoloration (hyperpigmentation on palms and soles)

**Other:** body fat redistribution

## Interactions

**Drug-drug.** *Tenofovir disoproxil fumarate:* increased emtricitabine effect

**Drug-diagnostic tests.** *Alanine aminotransferase, amylase, aspartate aminotransferase, bilirubin, creatine kinase, lipase, triglycerides:* increased levels  
*Glucose:* increased or decreased level  
*Neutrophils:* decreased count

## Patient monitoring

Monitor closely (especially in females and obese patients) for signs and symptoms of lactic acidosis and hepatotoxicity, even if patient doesn't have marked transaminase elevations.

- Assess neurologic status, checking especially for depression, peripheral neuropathy, and paresthesia.
- Monitor neutrophil count, lipid panel, liver function tests, and blood glucose level.

Monitor patient closely for several months after drug withdrawal. Severe, acute exacerbations of hepatitis B virus (HBV) have been reported after discontinuation in patients co-infected with HBV and HIV.

- Monitor nutritional and hydration status in light of GI adverse effects and underlying disease.
- Watch for cushingoid appearance and body fat redistribution.

## Patient teaching

- Tell patient to take a missed dose as soon as he remembers. However, if it's almost time for next dose, tell him to

skip the missed dose and take next dose as scheduled.

Instruct patient not to change dosage or stop taking drug unless prescriber approves.

- Tell patient drug should be taken only in combination with other drugs that treat HIV.

Instruct patient not to take this drug if already taking Altripla (combination of efavirenz, emtricitabine, and tenofovir), Combivir (combination of lamivudine and zidovudine), Epivir (lamivudine), Epzicom (combination of abacavir and lamivudine), Trizivir (combination of abacavir, lamivudine, and zidovudine), or Truvada (combination of emtricitabine and tenofovir), because these drugs contain the same or similar ingredients.

Tell patient to immediately report signs or symptoms of lactic acidosis—unusual tiredness or muscle pain, difficulty breathing, stomach pain with nausea and vomiting, coldness, dizziness or light-headedness, or fast or irregular heartbeat.

Instruct patient to immediately report signs or symptoms of liver problems—unusual tiredness, yellowing of skin or eyes, dark urine, light-colored feces, appetite loss, nausea, or pain in lower abdominal area.

- Advise patient to report adverse CNS reactions and to use good judgment about driving and other hazardous activities.

Caution patient that drug may cause depression. Tell him to notify prescriber if he develops symptoms.

Inform patient that drug may cause body fat redistribution, dark areas on palms and soles, and rash.

- Tell female patient to inform prescriber if she is pregnant or plans to become pregnant.

Caution HIV-positive patient not to breastfeed.

- As appropriate, review all other significant and life-threatening adverse

e

reactions and interactions, especially those related to the drugs and tests mentioned above.

## enalapril maleate

Apo-Enalapril\*, CO Enalapril\*, Gen-Enalapril\*, Innovace<sup>®</sup>, Novo-Enalapril\*, PMS-Enalapril\*, Ratio-Enalapril\*, Riva-Enalapril\*, Sandoz-Enalapril\*, Taro-Enalapril\*, Vasotec

## enalaprilat

Vasotec IV

**Pharmacologic class:** Angiotensin-converting enzyme (ACE) inhibitor

**Therapeutic class:** Antihypertensive

**Pregnancy risk category C** (first trimester), **D** (second and third trimesters)

### FDA BOXED WARNING

- When used during second or third trimester of pregnancy, drug can cause fetal injury and even death. Discontinue as soon as pregnancy is detected.

### Action

Inhibits conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; inactivates bradykinin and prostaglandins. Also increases plasma renin and potassium levels and reduces aldosterone levels, resulting in systemic vasodilation.

### Availability

*Injection:* 1.25 mg/ml

*Tablets:* 2.5 mg, 5 mg, 10 mg, 20 mg

### Indications and dosages

➤ Hypertension

**Adults:** For patients not taking concomitant diuretics—initially, 5 mg P.O.

once daily, increased after 1 to 2 weeks as needed to a maintenance dosage of 10 to 40 mg P.O. daily given as a single dose or in two divided doses; or 1.25 mg I.V. q 6 hours. For patients taking diuretics—initially, 2.5 mg P.O. or 0.625 mg I.V.

**Children:** 0.08 mg/kg P.O. once daily; may be increased based on blood pressure response up to 5 mg daily. Maximum dosage is 0.58 mg/kg/dose.

➤ Heart failure

**Adults:** Initially, 2.5 mg P.O. once or twice daily, increased after 1 to 2 weeks as needed to maintenance dosage of 5 to 40 mg P.O. daily given as a single dose or in two divided doses

➤ Asymptomatic left ventricular dysfunction

**Adults:** Initially, 2.5 mg P.O. once or twice daily, increased after 1 to 2 weeks as needed to a maximum of 20 mg/day in divided doses

### Dosage adjustment

- Renal impairment

### Off-label uses

- Diabetic nephropathy
- Hypertensive emergency

### Contraindications

- Hypersensitivity to drug or other ACE inhibitors
- Angioedema
- Pregnancy

### Precautions

Use cautiously in:

- renal or hepatic impairment, hypovolemia, hyponatremia, aortic stenosis, hypertrophic cardiomyopathy, cerebrovascular or cardiac insufficiency
- concurrent diuretic use
- elderly patients
- breastfeeding patients
- children.

## Administration

- Give oral doses with food or beverage.
- Discontinue diuretics for 2 to 3 days before starting drug, if possible.
- Know that I.V. administration is usually reserved for patients who cannot take P.O. form.
- Be aware that I.V. administration isn't recommended for pediatric patients.
- Administer I.V. dose either undiluted or diluted in 50 ml of dextrose 5% in water, normal saline solution, dextrose 5% in normal saline solution, or dextrose 5% in lactated Ringer's solution.
- Give single I.V. dose by push or piggyback over 5 minutes. If patient is at risk for hypotension, infusion may be given over 1 hour.
- Be aware that black patients have a higher risk of angioedema.

Route	Onset	Peak	Duration
P.O.	1 hr	4-6 hr	24 hr
I.V.	15 min	3-4 hr	6 hr

## Adverse reactions

**CNS:** dizziness, fatigue, headache, insomnia, drowsiness, vertigo, asthenia, paresthesia, ataxia, confusion, depression, nervousness, **cerebrovascular accident**

**CV:** orthostatic hypotension, palpitations, angina pectoris, tachycardia, peripheral edema, **arrhythmias, cardiac arrest**

**EENT:** sinusitis

**GI:** nausea, vomiting, constipation, dyspepsia, abdominal pain, dry mouth, **pancreatitis**

**GU:** proteinuria, urinary tract infection, erectile dysfunction, decreased libido, **oliguria**

**Hematologic:** agranulocytosis, **bone marrow depression**

**Hepatic:** hepatitis

**Metabolic:** hyponatremia, **hyperkalemia**

**Respiratory:** cough, upper respiratory tract infection, asthma, bronchitis, dyspnea, **eosinophilic pneumonitis**

**Skin:** rash, alopecia, photosensitivity, diaphoresis, exfoliative dermatitis, angioedema, **erythema multiforme**

**Other:** altered taste, fever, increased appetite, anaphylactoid reactions

## Interactions

**Drug-drug.** *Allopurinol:* increased risk of hypersensitivity reaction

*Antacids:* decreased enalapril absorption  
*Cyclosporine, indomethacin, potassium-sparing diuretics, potassium supplements:* hyperkalemia

*Digoxin, lithium:* increased blood levels of these drugs, possible toxicity  
*Diuretics, nitrates, other antihypertensives, phenothiazines:* additive hypotension

*Nonsteroidal anti-inflammatory drugs:* decreased antihypertensive response

*Rifampin:* decreased enalapril efficacy

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen (BUN), creatinine, potassium:* increased levels

*Antinuclear antibodies:* positive titer

*Sodium:* decreased level

**Drug-food.** *Salt substitutes containing potassium:* hyperkalemia

**Drug-herbs.** *Capsaicin:* increased incidence of cough

**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension

*Sun exposure:* photosensitivity reaction

## Patient monitoring

🚨 Assess for rapid blood pressure drop leading to cardiovascular collapse, especially when giving with diuretics.

🚨 In patient with renal insufficiency or renal artery stenosis, monitor for worsening renal function.

- After initial dose, observe patient closely for at least 2 hours until blood pressure has stabilized. Then continue to observe for additional hour.

- Monitor vital signs, fluid intake and output, and daily weight.
- Supervise patient during ambulation until effects of drug are known.
- Monitor liver function tests, BUN, and creatinine and electrolyte levels.

### Patient teaching

- Inform patient that drug's full effect may not occur for several weeks.
- Advise patient to report persistent dry cough with nasal congestion.
-  Tell patient to immediately report swelling of face, eye area, tongue, lips, hands, or feet; rash, hives, or severe itching; unexplained fever; unusual tiredness; yellowing of skin or eyes; abdominal pain; or easy bruising.
- Instruct patient to move slowly when sitting up or standing, to avoid dizziness or light-headedness from sudden blood pressure decrease.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## enfuvirtide

Fuzeon

**Pharmacologic class:** Human immunodeficiency-1 (HIV-1) fusion inhibitor

**Therapeutic class:** Antiretroviral

**Pregnancy risk category** B

### Action

Interferes with entry of HIV-1 into cells by inhibiting fusion of viral and cellular membranes

### Availability

*Powder for injection:* 90 mg/1-ml vial

### Indications and dosages

➤ HIV-1 infection in adults in combination with other antiretrovirals

**Adults:** 90 mg subcutaneously b.i.d. in upper arm, anterior thigh, or abdomen

**Children ages 6 to 16:** 2 mg/kg subcutaneously b.i.d. in upper arm, anterior thigh, or abdomen. Maximum dosage is 90 mg b.i.d.

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- increased risk of pneumonia
- injection site reaction
- concurrent use of anticoagulants
- hemophilia or other coagulant disorders
- elderly patients
- children younger than age 6 (safety and efficacy not established).

### Administration

- Rotate injection sites.
- Be aware that preferred injection sites are upper arm, anterior thigh, and abdomen.
- Reconstitute with 1.1 ml of sterile water for injection, and gently tap vial for 10 seconds. Then gently roll vial between hands or allow vial to stand until product dissolves completely (could take up to 45 minutes).
- Know that drug is usually given with other antiretrovirals.
- Use reconstituted solution immediately.

Route	Onset	Peak	Duration
Subcut.	Unknown	4 hr	Unknown

### Adverse reactions

**CNS:** fatigue, asthenia, insomnia, depression, anxiety, peripheral neuropathy

**EENT:** conjunctivitis, sinusitis

**GI:** nausea, diarrhea, upper abdominal pain, dry mouth, anorexia, pancreatitis

**Hematologic:** lymphadenopathy

**Musculoskeletal:** limb pain, myalgia

**Respiratory:** cough, pneumonia

**Skin:** folliculitis

**Other:** taste disturbance, decreased appetite, weight loss, herpes simplex infection, injection site reactions (erythema, induration, nodules, cysts, mild to moderate pain, infection), flulike illness, hypersensitivity reactions

## Interactions

**Drug-diagnostic tests.** *Alanine aminotransferase, amylase, aspartate aminotransferase, creatine kinase, eosinophils, gamma-glutamyltransferase, lipase, triglycerides:* increased levels  
*Hemoglobin:* decreased level

## Patient monitoring

- Inspect injection sites frequently for adverse reactions.
- Monitor CBC with white cell differential, lipid panel, liver function test results, and gastric enzyme levels.
- Watch for hypersensitivity reactions.
- Monitor nutritional and hydration status in light of GI adverse effects and underlying disease.

## Patient teaching

- Teach patient (or caregiver) how to reconstitute and self-administer drug, as appropriate.

🔊 Instruct patient not to change dosage or stop taking drug unless prescriber approves.

🔊 Tell patient to immediately report signs or symptoms of hypersensitivity reaction (such as rash, fever, nausea and vomiting, and chills).

- Teach patient how to recognize signs and symptoms of injection site reaction. Tell him to contact prescriber if these occur, especially if they last more than 7 days.
- Advise female patient to notify prescriber if she is pregnant or plans to become pregnant.
- Tell HIV-infected patient not to breastfeed.

- If patient misses a dose, instruct him to take it as soon as he remembers. However, if it's almost time for next dose, tell him to skip the missed dose and take next dose on schedule.

- As appropriate, review all other significant adverse reactions and interactions, especially those related to the tests mentioned above.

e

## enoxaparin sodium

Clexane , Lovenox

**Pharmacologic class:** Low-molecular-weight heparin

**Therapeutic class:** Anticoagulant

**Pregnancy risk category B**

## FDA BOXED WARNING

- During epidural or spinal anesthesia or puncture, patients receiving drug or scheduled to receive it for thromboprophylaxis are at risk for epidural or spinal hematoma, which can lead to long-term or permanent paralysis. Risk increases with use of indwelling epidural catheter for analgesia administration and with concurrent use of drugs affecting hemostasis (such as nonsteroidal anti-inflammatory drugs [NSAIDs], platelet inhibitors, and other anticoagulants). Risk also rises with traumatic or repeated epidural or spinal puncture or history of spinal deformity or spinal surgery. Before neuraxial intervention, physician should weigh drug's potential benefit against risk.
- Monitor patient frequently for signs and symptoms of neurologic impairment. If these occur, provide urgent treatment.

**Action**

Inhibits thrombus and clot formation by blocking factor Xa and factor IIa. This inhibition accelerates formation of antithrombin III-thrombin complex (a coagulation inhibitor), thereby deactivating thrombin and preventing conversion of fibrinogen to fibrin.

**Availability**

*Solution for injection:* 30 mg/0.3 ml, 40 mg/0.4 ml, 60 mg/0.6 ml, 80 mg/0.8 ml, 120 mg/0.8 ml, 100 mg/1 ml, 150 mg/1 ml (all in prefilled syringes); 300 mg/3 ml (in multidose vials)

**Indications and dosages**

➤ Patients at risk for thromboembolic complications due to severely restricted mobility during acute illness

**Adults:** 40 mg subcutaneously daily for up to 14 days

➤ Prevention of pulmonary embolism and deep-vein thrombosis (DVT) after abdominal surgery

**Adults:** 40 mg subcutaneously 2 hours before surgery, repeated 24 hours after initial dose (provided hemostasis has been established) and continued once daily for 7 to 10 days until risk of DVT has diminished

➤ Prevention of pulmonary embolism and DVT after hip or knee replacement surgery

**Adults:** 30 mg subcutaneously 12 to 24 hours after surgery (provided hemostasis has been established), repeated q 12 hours for 7 to 10 days until risk of DVT has diminished. Alternatively, hip-replacement patient may receive 40 mg subcutaneously 12 hours before surgery and then once daily for 3 weeks, for a total of 4 weeks of therapy.

➤ Prevention of ischemic complications of unstable angina or non-Q-wave myocardial infarction

**Adults:** 1 mg/kg subcutaneously q 12 hours, given with aspirin 100 to

325 mg P.O. once daily until patient is clinically stable

➤ Hospitalized patients with acute DVT with or without pulmonary embolism (PE) (given with warfarin sodium)

**Adults:** 1 mg/kg subcutaneously q 12 hours or 1.5 mg/kg subcutaneously once daily for 5 to 7 days until therapeutic effect is established. Warfarin therapy usually begins within 72 hours of enoxaparin injection.

➤ Outpatients with acute DVT without PE (given with warfarin sodium)

**Adults:** 1 mg/kg subcutaneously q 12 hours for 5 to 7 days until therapeutic effect is established. Warfarin therapy usually begins within 72 hours of enoxaparin injection.

**Dosage adjustment**

- Patients weighing less than 45 kg (99 lb)
- Creatinine clearance below 30 ml/minute

**Off-label uses**

- Prevention of clots associated with hemodialysis
- Prevention of thrombosis during pregnancy

**Contraindications**

- Hypersensitivity to drug, heparin, sulfites, benzyl alcohol, or pork products
- Thrombocytopenia
- Active major bleeding

**Precautions**

Use cautiously in:

- severe hepatic or renal disease, retinopathy (hypertensive or diabetic), uncontrolled hypertension, hemorrhagic stroke, bacterial endocarditis, GI bleeding or other bleeding disorders
- recent history of ulcer disease, history of congenital or acquired bleeding disorder, history of thrombocytopenia related to heparin use
- recent CNS surgery

- pregnant or breastfeeding patients
- children.

### Administration

- ⚠ Be aware that enoxaparin is a high-alert drug.
- Use tuberculin syringe with multi-dose vial to ensure accurate dosage.
- Don't expel air bubble from syringe before administering.
- Inject drug deep subcutaneously with patient in supine position. Alternate left and right anterolateral and posterolateral abdominal wall sites.
- Don't rub injection site.
- ⚠ Don't give by I.M. or I.V. route.

Route	Onset	Peak	Duration
Subcut.	Unknown	3-5 hr	24 hr

### Adverse reactions

**CNS:** dizziness, headache, insomnia, confusion, **cerebrovascular accident**  
**CV:** edema, chest pain, **atrial fibrillation, heart failure**  
**GI:** nausea, vomiting, constipation  
**GU:** urinary retention  
**Hematologic:** anemia, **bleeding tendency, thrombocytopenia, hemorrhage**  
**Metabolic:** hyperkalemia  
**Skin:** bruising, pruritus, rash, urticaria  
**Other:** fever; pain, irritation, or erythema at injection site

### Interactions

**Drug-drug.** *Warfarin, other drugs that affect platelet function (including abciximab, aspirin, clopidogrel, dextran, dipyridamole, eptifibatide, NSAIDs, some penicillins, ticlopidine, tirofiban):* increased risk of bleeding

**Drug-diagnostic tests.** *Hepatic enzymes:* reversible increases  
*Hemoglobin, platelets:* decreased levels  
**Drug-herbs.** *Anise, arnica, chamomile, clove, feverfew, garlic, ginger, ginkgo, ginseng:* increased risk of bleeding

### Patient monitoring

- Monitor CBC and platelet counts. Watch for signs and symptoms of bleeding or bruising.
- Monitor fluid intake and output. Watch for fluid retention and edema.

### Patient teaching

- If patient will self-administer drug, teach proper injection technique.
- ⚠ Instruct patient to promptly report irregular heart beat, unusual bleeding or bruising, rash, or hives.
- Teach patient safety measures to avoid bruising or bleeding.
- Advise patient to weigh himself regularly and to report gains.
- Instruct patient to inform dentists and other health care professionals about enoxaparin use.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## entacapone

Comtan, Comtess 

**Pharmacologic class:** Catechol O-methyltransferase (COMT) inhibitor

**Therapeutic class:** Antidyskinetic

**Pregnancy risk category** C

### Action

Inhibits COMT, the primary enzyme involved in metabolizing levodopa. This inhibition increases levodopa blood level and duration of action, easing symptoms of Parkinson's disease.

### Availability

*Tablets:* 200 mg

## Indications and dosages

➤ Adjunctive treatment of idiopathic Parkinson's disease in patients experiencing wearing off of carbidopa-levodopa effects

**Adults:** 200 mg P.O. with each carbidopa-levodopa dose, to a maximum of eight times daily (1,600 mg)

## Contraindications

- Hypersensitivity to drug

## Precautions

Use cautiously in:

- hepatic or renal dysfunction, hypertension, heart disease
- pregnant and breastfeeding patients.

## Administration

- Give without regard to food.
- Administer at same time as carbidopa-levodopa. Make sure patient swallows tablet whole.

 Don't withdraw drug abruptly.

Route	Onset	Peak	Duration
P.O.	Variable	1 hr	Unknown

## Adverse reactions

**CNS:** dizziness, depression, drowsiness, disorientation, memory loss, agitation, delusions, hallucinations, paranoia, euphoria, dyskinesia, hyperkinesia, light-headedness, paresthesia, heaviness of limbs, numbness of fingers

**CV:** tachycardia, orthostatic hypotension, hypertension

**GI:** nausea, vomiting, epigastric pain, flatulence

**GU:** urine discoloration

**Respiratory:** upper respiratory tract infection, dyspnea, sinus congestion

**Other:** fever

## Interactions

**Drug-drug.** *Ampicillin, chloramphenicol, cholestyramine, erythromycin, probenecid, rifampin:* decreased entacapone excretion

*Bitolterol, dobutamine, dopamine, epinephrine, isoetherine, isoproterenol, methyl dopa, norepinephrine:* increased heart rate, increased risk of arrhythmias, excessive blood pressure changes

*MAO inhibitors:* increased risk of toxicity

**Drug-behaviors.** *Alcohol use:* increased risk of adverse reactions

## Patient monitoring

- Monitor vital signs, watching especially for orthostatic hypotension.
- Evaluate neurologic status closely. Check for hallucinations and new onset or exacerbation of dyskinesia.
- Assess respiratory status, particularly for dyspnea and signs and symptoms of upper respiratory tract infection.
- Monitor nutritional and hydration status if patient experiences vomiting.

## Patient teaching

• Instruct patient to swallow tablet whole and to take it at same time as carbidopa-levodopa.

 Caution patient not to stop taking drug abruptly.

• Advise patient to move slowly when sitting up or standing, to avoid dizziness or light-headedness from sudden blood pressure decrease.

• Caution patient to avoid driving and other hazardous activities until drug no longer affects concentration and alertness.

 Instruct patient (and caregiver) to institute safety measures at home to prevent injury related to disease or drug's adverse CNS effects.

• As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and behaviors mentioned above.

## entecavir

Baraclude

**Pharmacologic class:** Guanosine nucleoside analogue

**Therapeutic class:** Antiviral

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug may cause lactic acidosis and severe hepatomegaly with steatosis (including fatal cases) when used alone or in combination with antiretrovirals.
- Severe acute hepatitis B exacerbations have occurred in patients who discontinued anti-hepatitis B therapy, including entecavir. Monitor hepatic function for at least several months after discontinuation. If appropriate, initiate anti-hepatitis B therapy.
- When used to treat chronic hepatitis B, drug may cause human immunodeficiency virus (HIV) resistance to HIV nucleoside reverse transcriptase inhibitors in patients with untreated HIV infection. Therapy isn't recommended for HIV/hepatitis B virus (HBV) co-infected patients except those also receiving highly active anti-retroviral therapy.

### Action

Competes with natural substrate deoxyguanosine triphosphate to inhibit HBV polymerase (reverse transcriptase)

### Availability

*Oral solution:* 0.05 mg/ml

*Tablets:* 0.5 mg, 1 mg

### Indications and dosages

➤ Chronic HBV infection with evidence of active viral replication and either persistent serum transaminase elevations or histologically active disease

**Adolescents and adults ages 16 and older:** In nucleoside-treatment-naïve patients with compensated liver disease, 0.5 mg P. O. once daily. In patients with a history of hepatitis B viremia while receiving lamivudine or known lamivudine or telbivudine resistance mutations rtM204I/V with or without rtL180M, rtL80I/V, or rtV173L, or patients with decompensated liver disease, 1 mg P.O. once daily.

### Dosage adjustment

- Creatinine clearance below 50 ml/minute

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- liver transplant recipients who are receiving or have received immunosuppressants that may affect renal function
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 16.

### Administration

- Administer at least 2 hours before or after a meal.

Route	Onset	Peak	Duration
P.O.	Unknown	0.5-1.5 hr	Unknown

### Adverse reactions

**CNS:** headache, dizziness, fatigue

**GI:** nausea, diarrhea, dyspepsia, increased GI enzymes

**Hematologic:** hematuria

**Hepatic:** HBV exacerbation, severe hepatomegaly

**Metabolic:** glycosuria, lactic acidosis

### Interactions

**Drug-drug.** *Drugs that reduce renal function or compete for active tubular secretion:* increased blood levels of either drug

**Drug-diagnostic tests.** *Alanine aminotransferase, amylase, aspartate*

*aminotransferase, lipase, glucose, serum creatinine, total bilirubin:* increased

### Patient monitoring

- Monitor renal function before and during therapy, especially in liver transplant recipients who are receiving or have received immunosuppressants that may affect renal function.

 Monitor liver function closely for evidence of HBV exacerbation for at least several months after drug discontinuation.

 Monitor for lactic acidosis (associated with nucleoside analogues).

### Patient teaching

- Instruct patient to take drug on empty stomach (at least 2 hours before or after a meal).

 Teach patient about signs and symptoms of lactic acidosis and importance of contacting prescriber if these occur.

 Instruct patient to immediately report worsening symptoms, such as increased yellowing of skin or eyes, dark urine, or fatigue.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

### Action

Stimulates alpha- and beta-adrenergic receptors, causing relaxation of cardiac and bronchial smooth muscle and dilation of skeletal muscles. Also decreases aqueous humor production, increases aqueous outflow, and dilates pupils by contracting dilator muscle.

### Availability

*Auto-injector for I.M. injection:* 1:2,000 (0.5 mg/ml)

*Injection:* 0.1 mg/ml, 0.5 mg/ml, 1 mg/ml

*Ophthalmic drops:* 0.5%, 1%, 2%

*Solution for inhalation (as racepinephrine):* 2.5% (equivalent to 1% epinephrine)

### Indications and dosages

 Bronchodilation; anaphylaxis; hypersensitivity reaction

**Adults:** 0.1 to 0.5 ml of 1:1,000 solution subcutaneously or I.M., repeated q 10 to 15 minutes p.r.n. Or 0.1 to 0.25 ml of 1:10,000 solution I.V. slowly over 5 to 10 minutes; may repeat q 5 to 15 minutes p.r.n. or follow with a continuous infusion of 1 mcg/minute, increased to 4 mcg/minute p.r.n. For emergency treatment, EpiPen delivers 0.3 mg I.M. of 1:1,000 epinephrine.

**Children:** For emergency treatment, EpiPen Jr. delivers 0.15 mg I.M. of 1:2,000 epinephrine.

 Acute asthma attack

**Adults and children ages 4 and older:**

One to three deep inhalations of inhalation solution with hand-held nebulizer, repeated q 3 hours p.r.n.

 To restore cardiac rhythm in cardiac arrest

**Adults:** 0.5 to 1 mg I.V., repeated q 3 to 5 minutes, if needed. If no response, may give 3 to 5 mg I.V. q 3 to 5 minutes.

 Chronic simple glaucoma

**Adults:** One drop in affected eye once or twice daily. Adjust dosage to meet patient's needs.

## epinephrine

Twinject

## epinephrine hydrochloride

Adrenalin Chloride<sup>☼</sup>, Anapen<sup>⚡</sup>, Epi-E-Z Pen<sup>☼</sup>, EpiPen, EpiPen Jr.

**Pharmacologic class:** Sympathomimetic (direct acting)

**Therapeutic class:** Bronchodilator, mydriatic

**Pregnancy risk category C**

➤ To prolong local anesthetic effects

**Adults and children:** 1:200,000 concentration with local anesthetic

### Contraindications

- Hypersensitivity to drug, its components, or sulfites
- Angle-closure glaucoma
- Cardiac dilatation, cardiac insufficiency
- Cerebral arteriosclerosis, organic brain syndrome
- Shock with use of general anesthetics and halogenated hydrocarbons or cyclosporine
- MAO inhibitor use within past 14 days
- Labor
- Breastfeeding

### Precautions

Use cautiously in:

- hypertension, hyperthyroidism, diabetes, prostatic hypertrophy
- elderly patients
- pregnant patients
- children.

### Administration

- In anaphylaxis, use I.M. route, not subcutaneous route, if possible.
- ☞ Inject EpiPen and EpiPen Jr. only into anterolateral aspect of thigh. Don't inject into buttocks or give I.V.
- ☞ Be aware that not all epinephrine solutions can be given I.V. Check manufacturer's label.
- For I.V. injection, give each 1-mg dose over at least 1 minute. For continuous infusion, use rate of 1 to 10 mcg/minute, adjusting to desired response.
- Use Epi-Pen Jr. for patients weighing less than 30 kg (66 lb).
- ☞ Don't give within 14 days of MAO inhibitors.

Route	Onset	Peak	Duration
I.V.	Immediate	5 min	Short
I.M.	Variable	Unknown	1-4 hr
Subcut.	5-15 min	0.5 hr	1-4 hr
Inhalation solution	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** nervousness, anxiety, tremor, vertigo, headache, disorientation, agitation, drowsiness, fear, dizziness, asthenia, **cerebral hemorrhage, cerebrovascular accident (CVA)**  
**CV:** palpitations, widened pulse pressure, hypertension, tachycardia, angina, ECG changes, **ventricular fibrillation, shock**  
**GI:** nausea, vomiting  
**GU:** decreased urinary output, urinary retention, dysuria  
**Respiratory:** dyspnea, **pulmonary edema**  
**Skin:** urticaria, pallor, diaphoresis, necrosis  
**Other:** hemorrhage at injection site

### Interactions

**Drug-drug.** *Alpha-adrenergic blockers:* hypotension from unopposed beta-adrenergic effects  
*Antihistamines, thyroid hormone, tricyclic antidepressants:* severe sympathomimetic effects  
*Beta-adrenergic blockers (such as propranolol):* vasodilation and reflex tachycardia  
*Cardiac glycosides, general anesthetics:* increased risk of ventricular arrhythmias  
*Diuretics:* decreased vascular response  
*Doxapram, mazindol, methylphenidate:* enhanced CNS stimulation or pressor effects  
*Ergot alkaloids:* decreased vasoconstriction  
*Guanadrel, guanethidine:* enhanced pressor effects of epinephrine  
*Levodopa:* increased risk of arrhythmias  
*Levothyroxine:* potentiation of epinephrine effects  
*MAO inhibitors:* increased risk of hypertensive crisis  
**Drug-diagnostic tests.** *Glucose:* transient elevation  
*Lactic acid:* elevated level (with prolonged use)

**Patient monitoring**

 Monitor vital signs, ECG, and cardiovascular and respiratory status. Watch for ventricular fibrillation, tachycardia, arrhythmias, and signs and symptoms of shock. Ask patient about anginal pain.

- Assess drug's effect on underlying problem (such as anaphylaxis or asthma attack), and repeat dose as needed.

 Monitor neurologic status, particularly for decreased level of consciousness and other signs and symptoms of cerebral hemorrhage or CVA.

- Monitor fluid intake and output, watching for urinary retention or decreased urinary output.
- Inspect injection site for hemorrhage or skin necrosis.

**Patient teaching**

- Teach patient who uses auto-injector how to use syringe correctly, when to inject drug, and when to repeat doses.

- Teach patient who uses hand-held nebulizer correct use of equipment and drug. Explain indications for both initial dose and repeat doses.

 Inform patient that drug may cause serious adverse effects. Tell him which symptoms to report.

- If patient will self-administer drug outside of health care setting, explain need for prompt evaluation by a health care provider to ensure that underlying disorder has been corrected.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## epirubicin hydrochloride

Ellence, Pharmorubicin PMS<sup>†</sup>

**Pharmacologic class:** Anthracycline

**Therapeutic class:** Antibiotic antineoplastic

**Pregnancy risk category D**

### FDA BOXED WARNING

- Extravasation during administration causes severe local tissue necrosis; don't give epirubicin hydrochloride by I.M. or subcutaneous route.
- Cardiac toxicity, including fatal congestive heart failure (CHF), may occur either during therapy or months to years after therapy ends. Probability of developing clinically evident CHF is estimated as approximately 0.9% at a cumulative dose of 550 mg/m<sup>2</sup>, 1.6% at 700 mg/m<sup>2</sup>, and 3.3% at 900 mg/m<sup>2</sup>. In adjuvant treatment of breast cancer, maximum cumulative dose used in clinical trials was 720 mg/m<sup>2</sup>. Risk of developing CHF increases rapidly with increasing total cumulative doses above 900 mg/m<sup>2</sup>; exceed this cumulative dose only with extreme caution. Active or dormant cardiovascular disease, previous or concurrent radiotherapy to mediastinal or pericardial area, previous anthracycline or anthracenedione therapy, or concurrent use of other cardiotoxic drugs may increase cardiac toxicity risk. Toxicity may occur at lower cumulative doses even if patient has no cardiac risk factors.
- Secondary acute myelogenous leukemia (AML) has been reported in breast cancer patients who have been treated with anthracyclines, including epirubicin. Refractory secondary leukemia is more common when such drugs are given in combination with

DNA-damaging antineoplastics, when patients have been heavily pretreated with cytotoxic drugs, or when epirubicin dosage has been escalated. Cumulative risk of developing treatment-related AML or myelodysplastic syndrome (MDS), in 7,110 patients with breast cancer who received adjuvant treatment with epirubicin-containing regimens, was estimated as 0.27% at 3 years, 0.46% at 5 years, and 0.55% at 8 years.

- Reduce dosage in patients with hepatic impairment.
- Drug may cause severe myelosuppression.
- Give under supervision of physician experienced in cancer chemotherapy.

### Action

Unknown. Forms complex with DNA by intercalation with nucleotide base pairs, causing inhibition of DNA, RNA, and protein synthesis.

### Availability

*Injection:* 2 mg/ml, in 5 ml-, 25 ml-, 75 ml-, and 100-ml vials

*Powder for injection (lyophilized):* 50-mg single-dose vial

### Indications and dosages

➤ Adjunctive therapy in patients with axillary-node tumor involvement after resection of primary breast cancer

**Adults:** 100 to 120 mg/m<sup>2</sup> by I.V. infusion over 3 to 5 minutes on first day of each cycle or divided equally in two doses on days 1 and 8 of each cycle; repeat cycle q 3 to 4 weeks for six cycles in conjunction with cyclophosphamide and fluorouracil.

### Dosage adjustment

- Hepatic and severe renal impairment
- Hematologic or Grade 3 or 4 non-hematologic toxicity and neutropenic fever

### Off-label uses

- Cancer of bladder, lung, nasopharynx, endometrium, and ovaries

### Contraindications

- Hypersensitivity to drug, other anthracyclines, or anthracenediones
- Severe myocardial insufficiency, recent myocardial infarction, severe arrhythmias
- Severe hepatic dysfunction
- Baseline neutrophil count below 1,500/mm<sup>3</sup>
- Previous treatment with anthracyclines up to the maximum cumulative doses

### Precautions

Use cautiously in:

- heart disease, hepatic, or renal disease
- previous or recent radiation therapy
- hyperuricemia
- concurrent use of cimetidine, other cardiotoxic drugs, or live or live-attenuated vaccines
- elderly patients (female patients age 70 and older)
- pregnant or breastfeeding patients
- children.

### Administration

- Be aware that drug may be given with antibiotics.
- Know that previous anthracycline use must be considered when determining dosage because of increased risk of heart failure.
- Follow facility policy for administration and disposal of carcinogenic drugs.
- Assess blood counts, including absolute neutrophil count, serum creatinine, and liver function before and during each cycle of therapy.
- Consider prophylactic use of antiemetics before administration,

particularly when given in conjunction with other emetogenic drugs.

-  Avoid extravasation. If patient complains of burning or stinging, switch infusion to a different vein.
- Administer premixed solution over 3 to 5 minutes into tubing of free-flowing I.V. line containing dextrose 5% in water or normal saline solution. Don't mix with other drugs in same syringe.
- Direct I.V. push is not recommended because of extravasation risk.
- If patient develops facial flushing or red streak in the vein being infused, slow infusion rate.
- Be aware that refrigerated storage of solution for injection can result in formation of a gelled product. Gelled product will return to a slightly viscous to mobile solution after 2- to a maximum of 4-hour equilibration at controlled room temperature (15° to 25° C [59° to 77° F]).

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** lethargy

**CV: cardiomyopathy, cardiotoxicity, heart failure**

**EENT:** conjunctivitis, keratitis

**GI:** nausea, vomiting, diarrhea, mucositis

**GU:** reddish urine, amenorrhea

**Hematologic:** anemia, **leukopenia, neutropenia, thrombocytopenia secondary acute myelogenous leukemia, thrombophlebitis, thromboembolic phenomena**

**Metabolic:** hyperuricemia

**Respiratory:** **pulmonary embolism**

**Skin:** alopecia; rash; pruritus; darkening of soles, palms, or nails

**Other:** increased appetite, infection, fever, hot flashes, tissue necrosis, **injection-related reactions, tumor lysis syndrome**

### Interactions

**Drug-drug.** *Cardioactive compounds that could cause heart failure (such as calcium channel blockers):* increased risk of heart failure

*Cimetidine:* increased epirubicin blood level

*Live or live-attenuated vaccines:* increased risk of serious or fatal infection

*Trastuzumab, other cardiotoxic drugs:* increased risk of cardiotoxicity

**Drug-diagnostic tests.** *Hemoglobin, neutrophils, platelets, white blood cells:* decreased values

### Patient monitoring

 Monitor vital signs, left ventricular ejection fraction, and cardiovascular status carefully. Watch for signs and symptoms of cardiomyopathy and heart failure.

- Assess nutritional status and hydration in light of GI adverse effects.

 Monitor CBC with white cell differential and watch for signs and symptoms of blood dyscrasias.

- Check temperature. Stay alert for fever and other signs or symptoms of infection.

 Consider the possibility of tumor lysis syndrome in potentially susceptible patients and monitor serum uric acid, potassium, calcium, phosphate, and creatinine levels immediately after initial chemotherapy. Be aware that hydration, urine alkalization, and prophylaxis with allopurinol to prevent hyperuricemia may minimize potential complications of tumor lysis syndrome.

- Continue to monitor serum total bilirubin, AST, and serum creatinine levels during treatment.

### Patient teaching

- Inform patient that drug may cause tissue damage at injection site. Tell him to report pain, burning, or swelling.

🔊 Instruct patient to immediately report sudden weight gain, swelling, or shortness of breath.

🔊 Tell patient to promptly report unusual bruising or bleeding, fever, or signs and symptoms of infection or tumor lysis syndrome.

- Advise patient to avoid receiving live vaccines while taking this drug.
- Explain that drug will cause hair loss but that hair should grow back within a few months after therapy.
- Advise female patient that drug may cause premature menopause or permanent cessation of menses.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## eplerenone

Inspra

**Pharmacologic class:** Aldosterone receptor blocker

**Therapeutic class:** Antihypertensive

**Pregnancy risk category B**

### Action

Binds to and blocks aldosterone receptors, disrupting normal sodium and water reabsorption and causing sodium and water excretion to increase. These actions reduce blood volume and blood pressure.

### Availability

Tablets: 25 mg, 50 mg

### Indications and dosages

➤ Hypertension

**Adults:** 50 mg/day P.O. as a single dose. After 4-week trial, may increase to 50 mg P.O. b.i.d. if necessary.

➤ Heart failure; post-myocardial infarction (MI)

**Adults:** Initially, 25 mg P.O. once daily. After 4 weeks, may increase to maximum dosage of 50 mg P.O. once daily.

### Contraindications

- Hypersensitivity to drug
- Hyperkalemia
- Potassium supplements or potassium-sparing diuretics
- Type 2 diabetes mellitus with microalbuminuria
- Severe renal impairment

### Precautions

Use cautiously in:

- hepatic impairment
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Give with or without food.
- Know that drug may be given alone or with other antihypertensives.

Route	Onset	Peak	Duration
P.O.	Slow	1.5 hr	Unknown

### Adverse reactions

**CNS:** headache, dizziness, fatigue

**CV:** angina, MI

**GI:** diarrhea, abdominal pain

**GU:** albuminuria, vaginal bleeding, changes in sexual function, gynecostasia and breast pain (in men)

**Metabolic:** hypercholesterolemia, hyperkalemia

**Respiratory:** cough

**Other:** flulike symptoms

### Interactions

**Drug-drug.** *Angiotensin-converting enzyme inhibitors, potassium-sparing diuretics, potassium supplements:* increased risk of hyperkalemia  
*CYP450-3A4 inhibitors:* serious toxic effects

*Lithium:* increased risk of toxicity

*Nonsteroidal anti-inflammatory drugs:* decreased hypertensive effect of eplerenone

### Patient monitoring

- Monitor electrolyte levels, and watch for signs and symptoms of hyperkalemia.
- Check vital signs, and ask patient about chest pain.
- Monitor lipid panel.
- Assess for new onset of persistent dry cough or flulike symptoms.

### Patient teaching

- 📣 Advise patient to immediately report chest pain, flulike symptoms, or persistent dry cough.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Inform patient that drug may affect sexual function. Encourage him to discuss this issue with prescriber.
- Advise female patient to discuss pregnancy or breastfeeding with prescriber before starting drug.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

myocardial infarction, stroke, venous thromboembolism, thrombosis of vascular access, and tumor progression or recurrence.

- In controlled trials, patients with chronic kidney disease experienced greater risks of death, serious adverse cardiovascular reactions, and stroke when administered ESAs to target a hemoglobin level of greater than 11 g/dl.
- No trial has identified a hemoglobin target level, ESA dosage, or dosing strategy that doesn't increase these risks.
- Use lowest dosage sufficient to reduce need for red blood cell (RBC) transfusions.
- ESAs shortened overall survival or increased risk of tumor progression or recurrence in clinical studies of patients with breast, non-small-cell lung, head and neck, lymphoid, and cervical cancers.
- Because of these risks, prescribers and hospitals must enroll in and comply with the ESA APPRISE Oncology Program to prescribe or dispense epoetin to patients with cancer. To enroll in the ESA APPRISE Oncology Program, visit [www.esa-apprise.com](http://www.esa-apprise.com) or call 1-866-284-8089 for further assistance.
- Because of increased risk of deep venous thrombosis (DVT), DVT prophylaxis is recommended.

## epoetin alfa

Epogen, Eprex<sup>☼</sup>, Procrit

**Pharmacologic class:** Recombinant human erythropoietin

**Therapeutic class:** Biological response modifier

**Pregnancy risk category C**

### FDA BOXED WARNING

- Erythropoiesis-stimulating agents (ESAs) increase risk of death,

### Action

Binds to erythropoietin, stimulating mitotic activity of erythroid progenitor cells in bone marrow and causing release of reticulocytes from bone marrow into bloodstream, where they become mature RBCs

### Availability

*Injection:* 2,000 units/ml, 3,000 units/ml, 4,000 units/ml, 10,000 units/ml; 10,000 units/ml and 20,000 units/ml in multidose vials

## Indications and dosages

➤ Anemia associated with chronic kidney disease (CKD) in patients on dialysis or not on dialysis

**Adults:** Initially, 50 to 100 units/kg I.V. or subcutaneously three times weekly. Don't increase dosage more frequently than once q 4 weeks. May decrease dosage more frequently but avoid frequent dosage adjustments.

➤ Anemia in children with chronic CKD who are on dialysis

### **Children ages 1 month to 16 years:**

Initially, 50 units/kg I.V. or subcutaneously three times weekly. Don't increase dosage more frequently than once q 4 weeks. May decrease dosage more frequently but avoid frequent dosage adjustments.

➤ Anemia caused by zidovudine therapy in patients with human immunodeficiency virus infection

**Adults:** 100 units/kg I.V. or subcutaneously three times weekly for 8 weeks or until hematocrit level is adequate. If desired response isn't reached after 8 weeks, dosage may be increased by 50 to 100 units/kg I.V. or subcutaneously three times weekly; after 4 to 8 weeks, dosage may be further increased, as prescribed, to a maximum dosage of 300 units/kg I.V. or subcutaneously three times weekly.

➤ Anemia due to effects of concomitant myelosuppressive chemotherapy, and upon initiation, there is a minimum of two additional months of planned chemotherapy

**Adults:** 150 units/kg subcutaneously three times weekly until completion of a chemotherapy course, or 40,000 units subcutaneously weekly until completion of a chemotherapy course

**Children ages 5 to 18:** 600 units/kg I.V. weekly until completion of a chemotherapy course

➤ To reduce need for blood transfusion in surgical patients

**Adults:** 300 units/kg subcutaneously daily for 10 days before surgery, on day of surgery, and for 4 days after surgery; or 600 units/kg subcutaneously weekly starting 3 weeks before surgery, followed by additional dose on day of surgery

## Contraindications

- Serious allergic reactions
- Uncontrolled hypertension
- Pure red cell aplasia that begins after treatment
- Use of multidose vials in neonates, infants, and pregnant and breastfeeding patients

## Precautions

Use cautiously in:

- renal insufficiency, CV disease
- pregnant or breastfeeding patients
- children younger than age 1 month (safety and efficacy not established).

## Administration

- Don't shake drug and don't use if it has been shaken or frozen.
- Don't dilute or mix with other drug solutions. However, preservative-free epoetin alfa from single-use vials may be admixed in a syringe with bacteriostatic 0.9% sodium chloride injection with benzyl alcohol 0.9% (bacteriostatic saline) in a 1:1 ratio using aseptic technique at time of administration; keep in mind that risks are associated with benzyl alcohol use in some patients.
- Don't reenter preservative-free vials.
- For patients with CKD on dialysis, start drug when hemoglobin level is less than 10 g/dl. If hemoglobin level approaches or exceeds 11 g/dl, reduce dosage or interrupt dosing.
- For patients with CKD not on dialysis, consider starting drug only when hemoglobin level is less than 10 g/dl and the following considerations

e

apply: Rate of hemoglobin decline indicates the likelihood of requiring an RBC transfusion and reducing the risk of alloimmunization or other RBC transfusion-related risks is a goal. If hemoglobin level exceeds 10 g/dl, reduce dosage or interrupt dosing and use lowest dosage sufficient to reduce the need for RBC transfusions.

- Be aware that in patients undergoing surgery, deep venous thrombosis prophylaxis is strongly recommended during epoetin alfa therapy.
- For I.V. use, give single dose by direct I.V. injection over at least 1 minute, and follow with saline flush.
- If patient is on hemodialysis, administer drug into venous return line of dialysis tubing after patient completes dialysis session.
- Know that supplemental iron may be needed to support erythropoiesis and avoid iron depletion.

 Avoid using multidose vials in neonates, infants, and pregnant and breastfeeding patients because of benzyl alcohol content, which has been associated with serious adverse events and death, including “gasping syndrome.”

Route	Onset	Peak	Duration
I.V.	Immediate	Immediate	Unknown
Subcut.	Unknown	5-24 hr	Unknown

### Adverse reactions

**CNS:** headache, paresthesia, fatigue, dizziness, asthenia, **seizures**

**CV:** hypertension, increased clotting of arteriovenous grafts

**GI:** nausea, vomiting, diarrhea

**Metabolic:** hyperuricemia, hyperphosphatemia, **hyperkalemia**

**Musculoskeletal:** joint pain

**Respiratory:** cough, dyspnea

**Skin:** rash, urticaria

**Other:** fever, edema, injection site pain

### Interactions

**Drug-diagnostic tests.** *Blood urea nitrogen, creatinine, phosphate, potassium, uric acid:* increased levels

### Patient monitoring

- Monitor vital signs and cardiovascular status, especially for hypertension and edema.
- Assess arteriovenous graft for patency, because drug may increase clotting at graft.
- Monitor electrolyte and uric acid levels. Watch closely for hyperuricemia, hyperkalemia, and hyperphosphatemia.
- Check temperature for fever.
- Monitor neurologic status for signs and symptoms of impending seizure.
- Evaluate nutritional status and hydration in light of GI adverse effects.

### Patient teaching

- Tell patient who will self-administer drug to follow exact directions for injection and needle disposal.
-  Instruct patient to monitor weight and blood pressure regularly and to immediately report hypertension, sudden weight gain, or swelling.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, motor skills, and alertness.
- Tell patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.
- Advise female patient to discuss pregnancy or breastfeeding with prescriber before starting drug.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## eprosartan mesylate

Teveten

**Pharmacologic class:** Angiotensin II receptor antagonist

**Therapeutic class:** Antihypertensive

**Pregnancy risk category C** (first trimester), **D** (second and third trimesters)

### FDA BOXED WARNING

• Drugs that act directly on the renin-angiotensin system can cause injury and death to a developing fetus. When pregnancy is detected, discontinue drug as soon as possible.

### Action

Blocks aldosterone-stimulating and vasoconstrictive effects of angiotensin II at receptor sites in vascular smooth muscles and adrenal glands, decreasing vascular resistance

### Availability

Tablets: 400 mg, 600 mg

### Indications and dosages

➤ Hypertension

**Adults:** 600 mg P.O. once daily or in divided doses b.i.d. Total daily dosage range is 400 to 800 mg.

### Contraindications

- Hypersensitivity to drug or its components
- Pregnancy or breastfeeding

### Precautions

Use cautiously in:

- hypotension, heart failure, renal or hepatic impairment, obstructive biliary disorders, volume or sodium depletion
- concurrent high-dose diuretic therapy

- females of childbearing age
- children younger than age 18 (safety not established).

### Administration

- Give initial dose in supervised medical setting, and monitor blood pressure for 2 hours after administration.
- Know that drug may be given alone or with other antihypertensives.
- Be aware that black patients have a higher risk of angioedema.
- Be prepared to treat transient hypotension by placing patient in supine position and giving I.V. normal saline infusion as needed.

Route	Onset	Peak	Duration
P.O.	Unknown	6 hr	24 hr

### Adverse reactions

**CNS:** dizziness, fatigue, headache, syncope

**CV:** hypotension, chest pain, peripheral edema

**EENT:** sinus disorders

**GI:** nausea, diarrhea, constipation, abdominal pain, dry mouth

**GU:** albuminuria, **renal failure**

**Hepatic:** hepatitis

**Metabolic:** gout, **hyperkalemia**

**Musculoskeletal:** joint pain, back pain, muscle weakness

**Respiratory:** upper respiratory tract infection, cough, bronchitis

**Skin:** angioedema

**Other:** dental pain, fever, facial edema

### Interactions

**Drug-drug.** *Antihypertensives, diuretics:* increased risk of hypotension

*Nonsteroidal anti-inflammatory drugs:* decreased antihypertensive effect of eprosartan

*Potassium-sparing diuretics, potassium supplements:* increased risk of hyperkalemia

**Drug-diagnostic tests.** *Absolute neutrophil count, hemoglobin, platelets, white blood cells:* decreased

*Albumin, creatinine, liver function tests, serum BUN:* elevated levels

**Drug-food.** *Salt substitutes containing potassium:* increased risk of hyperkalemia

**Drug-herbs.** *Ephedra (ma huang):* antagonism of eprosartan action

**Drug-behaviors.** *Alcohol use:* increased CNS depression

### Patient monitoring

- Monitor vital signs, particularly for hypotension after administration.
- Assess cardiovascular status, especially for chest pain, syncope, and edema.
- Monitor liver and kidney function test results, watching for drug-induced hepatitis or renal failure.
- Assess respiratory status. Stay alert for dry, persistent cough and signs and symptoms of respiratory infections.
- Monitor electrolyte levels, and watch for signs and symptoms of hyperkalemia.

### Patient teaching

- Instruct patient to take drug at same time each day, with or without food.
- 🔊 Inform patient that drug may cause angioedema. Instruct him to immediately report facial or lip swelling, fever, or sore throat.
- 🔊 Advise patient to immediately report chest pain, fainting, decreased urine output, unusual tiredness, yellowing of skin or eyes, or swelling.
- 🔊 Tell female patient to contact prescriber right away if she suspects she's pregnant.
- Caution female not to breastfeed while taking drug.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## eptifibatide

Integrilin

**Pharmacologic class:** Platelet aggregation inhibitor

**Therapeutic class:** Antiplatelet agent

**Pregnancy risk category B**

### Action

Decreases platelet aggregation by binding to platelet-receptor glycoprotein, preventing binding of fibrinogen to platelets, which causes thrombus formation

### Availability

**Injection:** 10-ml vial (2 mg/ml), 100-ml vial (0.75 mg/ml)

### Indications and dosages

➤ Acute coronary syndrome (unstable angina or non-Q-wave myocardial infarction)

**Adults:** 180 mcg/kg I.V. bolus over 1 to 2 minutes, followed by a continuous infusion of 2 mcg/kg/minute for up to 72 hours

➤ Prevention of thrombosis related to percutaneous coronary intervention (PCI)

**Adults:** 180 mcg/kg I.V. bolus immediately before PCI, then a continuous infusion of 2 mcg/kg/minute, followed by a second 180-mcg/kg bolus 10 minutes after first bolus. Continue infusion until discharge or for up to 24 hours.

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to drug or its components
- Severe hypertension
- Bleeding disorders or evidence of active abnormal bleeding within previous 30 days

- Renal dialysis
- Recent cerebrovascular accident
- Recent surgery
- Current or planned administration of another parenteral Gp IIb/IIIa inhibitor

### Precautions

Use cautiously in:

- renal insufficiency
- creatinine level below 2 mg/dl
- platelet count below 100,000/mm<sup>3</sup>
- elderly patients
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Withdraw single bolus dose from 10-ml vial into syringe, and give by I.V. push over 1 to 2 minutes. Follow single I.V. bolus dose with continuous I.V. infusion given undiluted from 100-ml vial spiked with infusion set connected to infusion control device.
- Don't administer through same I.V. line as furosemide.

Route	Onset	Peak	Duration
I.V.	Immediate	Immediate	4-6 hr

### Adverse reactions

**CNS:** headache, dizziness, asthenia, syncope

**CV:** hypotension

**GI:** nausea, diarrhea, constipation

**GU:** hematuria

**Hematologic:** bleeding tendency, thrombocytopenia

**Skin:** flushing

**Other:** bleeding at femoral access site

### Interactions

**Drug-drug.** *Clopidogrel, dipyridamole, nonsteroidal anti-inflammatory drugs, oral anticoagulants, thrombolytics, ticlopidine:* increased risk of bleeding  
*Other platelet aggregation inhibitors:* serious bleeding

**Drug-diagnostic tests.** *Platelets:* decreased count

**Drug-herbs.** *Most commonly used herbs:* increased anticoagulant effect of eptifibatide

### Patient monitoring

- Monitor vital signs and assess cardiovascular status, especially for syncope and hypotension.
- Monitor coagulation studies, CBC, and platelet count. Watch for signs and symptoms of abnormal bleeding or bruising and hematuria.
- Check carefully for bleeding at all sites of invasive procedures, particularly femoral access site.

### Patient teaching

- Tell patient drug may cause serious adverse effects but can help prevent a heart attack. Reassure him that he'll be closely monitored during therapy.
-  Instruct patient to immediately report fainting or abnormal bruising or bleeding.
- Teach patient safety measures to avoid bruising or bleeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

e

## eribulin

Halaven

**Pharmacologic class:** Non-taxane microtubule dynamics inhibitor

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

### Action

Inhibits growth phase of microtubules without affecting the shortening phase and sequesters tubulin into

nonproductive aggregates; exerts its effects via a tubulin-based antimitotic mechanism leading to G2/M cell-cycle block, disruption of mitotic spindles and, ultimately, apoptotic cell death after prolonged mitotic blockage

### Availability

*Injection:* 1 mg/2 ml (0.5 mg/ml) in single-use vials

### Indications and dosages

➤ Metastatic breast cancer in patients who have previously received at least two chemotherapeutic regimens for metastatic disease

**Adults:** 1.4 mg/m<sup>2</sup> I.V. over 2 to 5 minutes on days 1 and 8 of 21-day cycle

### Dosage adjustment

- Mild and moderate hepatic impairment, moderate renal impairment
- Hematologic toxicities
- Peripheral neuropathy

### Contraindications

None

### Precautions

Use cautiously in:

- hepatic or renal impairment
- neutropenia, neuropathy
- congenital long QT syndrome (avoid use)
- congestive heart failure, bradyarrhythmias, drugs known to prolong QT interval (including Class Ia and III antiarrhythmics), electrolyte abnormalities
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

### Administration

- Don't dilute with dextrose-containing solutions or mix with other drugs.
- Obtain CBC before each dose; increase frequency in patients who develop Grade 3 or 4 cytopenias.

- Correct hypokalemia or hypomagnesemia before starting therapy.

🚫 Don't administer day-1 or day-8 dose if any of the following occurs: Absolute neutrophil count less than 1,000/mm<sup>3</sup>, platelet count less than 75,000/mm<sup>3</sup>, or Grade 3 or 4 non-hematologic toxicities. Delay day-8 dose for maximum of 1 week.

- If toxicities don't resolve or improve to Grade 2 severity by day 15, omit dose. If toxicities resolve or improve to Grade 2 severity by day 15, give drug at reduced dosage and initiate next cycle no sooner than 2 weeks later.

🚫 Delay drug administration and reduce subsequent doses in patients who experience febrile neutropenia or Grade 4 neutropenia lasting longer than 7 days.

- Withhold drug in patients who experience Grade 3 or 4 peripheral neuropathy until resolution to Grade 2 or less.
- Don't reescalate dosage after it has been reduced.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache, dizziness, asthenia, fatigue, peripheral neuropathy, insomnia, depression

**CV:** prolonged QT interval

**EENT:** increased lacrimation

**GI:** nausea, vomiting, diarrhea, constipation, anorexia, dyspepsia, abdominal pain, stomatitis, dry mouth

**GU:** urinary tract infection

**Hematologic:** anemia, neutropenia, febrile neutropenia, thrombocytopenia

**Hepatic:** liver function test abnormalities

**Metabolic:** hypokalemia

**Musculoskeletal:** arthralgia, myalgia, back pain, bone pain, extremity pain, muscle spasm, muscular weakness

**Respiratory:** cough, dyspnea, upper respiratory tract infection

**Skin:** alopecia, rash

**Other:** mucosal inflammation, pyrexia, weight loss, peripheral edema, dysgeusia

## Interactions

**Drug-diagnostic tests.** *ALT:* increased level

*Potassium:* decreased level

## Patient monitoring

- Monitor CBC with differential and renal and hepatic function tests closely.
- Monitor serum magnesium and potassium levels periodically during therapy.
- Monitor ECG in patients with congestive heart failure, bradyarrhythmias, or electrolyte abnormalities, or if patients are taking drugs known to prolong QT interval, including Class Ia and III antiarrhythmics.
- Monitor patients closely for signs and symptoms of peripheral motor and sensory neuropathy.

## Patient teaching

 Instruct patient to immediately report abnormal heartbeats, dizziness, or faintness.

- Advise patient to promptly report fever, chills, burning or pain on urination, cough, or numbness, tingling, or burning of hands and feet.
- Advise female patient of childbearing age of potential hazard to fetus if drug is used during pregnancy and to inform prescriber if she becomes pregnant while taking drug.
- Advise breastfeeding patient that she should decide whether to discontinue breastfeeding or discontinue drug, taking into account importance of drug for her treatment.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## erlotinib

Tarceva

**Pharmacologic class:** Epidermal growth factor receptor (EGFR) inhibitor

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

e

## Action

Unclear. Drug inhibits intracellular phosphorylation of tyrosine kinase associated with EGFR, which is expressed on cell surface of both normal cells and cancer cells.

## Availability

*Tablets:* 25 mg, 100 mg, 150 mg

## Indications and dosages

➤ Locally advanced or metastatic non-small-cell lung cancer after failure of at least one chemotherapy regimen; maintenance treatment in patients whose disease hasn't progressed after four cycles of platinum-based first-line chemotherapy

**Adults:** 150 mg P.O. at least 1 hour before or 2 hours after food ingestion, continued until disease progresses or unacceptable toxicity occurs

➤ First-line treatment of locally advanced, unresectable, or metastatic pancreatic cancer (given with gemcitabine)

**Adults:** 100 mg P.O. daily at least 1 hour before or 2 hours after food ingestion, continued until disease progresses or unacceptable toxicity occurs

## Dosage adjustment

- Severe diarrhea
- Pretreatment with CYP3A4 inducers
- Concurrent use of potent CYP3A4 inhibitors (such as ketoconazole)
- Acute onset of new or progressing pulmonary symptoms

**Off-label uses**

- Colorectal and renal cell cancer
- Malignant glioma

**Contraindications**

None

**Precautions**

Use cautiously in:

- hepatic impairment, diarrhea
- pulmonary symptoms, suspected interstitial lung disease (such as pneumonitis, interstitial pneumonia, obliterative bronchiolitis, pulmonary fibrosis, adult respiratory distress syndrome, or lung filtration)
- concomitant use of anti-angiogenic agents, corticosteroids, nonsteroidal anti-inflammatory drugs, or taxane-based chemotherapy; prior history of peptic ulceration or diverticular disease
- concurrent warfarin therapy
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

**Administration**

- Give at least 1 hour before or 2 hours after food ingestion.

 Interrupt therapy if patient develops acute onset of new or progressing pulmonary symptoms pending diagnostic evaluation. If interstitial lung disease develops, discontinue drug and administer appropriate interventions.

 Be aware that some cases of hepatorenal syndrome, acute renal failure, and renal insufficiency may be secondary to baseline hepatic impairment while others may be associated with severe dehydration. Interrupt therapy and take appropriate measures to intensively rehydrate patient, as needed.

 Discontinue drug if total bilirubin level is above three times upper limit of normal (ULN) or transaminase levels are above five times ULN versus pretreatment values; signs and symptoms

of GI perforation occur; severe bullous, blistering, or exfoliating conditions develop; or acute or worsening ocular disorders such as eye pain occur.

Route	Onset	Peak	Duration
P.O.	Unknown	4 hr	Unknown

**Adverse reactions****CNS:** fatigue**EENT:** conjunctivitis, keratoconjunctivitis sicca **corneal perforation and ulceration****GI:** nausea, vomiting, diarrhea, abdominal pain, anorexia, stomatitis**GI perforation****GU:** renal insufficiency, acute renal failure**Hepatic:** hepatorenal syndrome, hepatic failure**Respiratory:** dyspnea, cough, interstitial lung disease**Skin:** rash, pruritus, dry skin, **Stevens-Johnson syndrome, toxic epidermal necrolysis-like reactions****Other:** infection**Interactions**

**Drug-drug.** *CYP3A4 inhibitors (such as clarithromycin, indinavir, itraconazole, ketoconazole, ritonavir, saquinavir, telithromycin):* increased erlotinib blood level

*CYP3A4 inducers (such as carbamazepine, phenobarbital, phenytoin, rifampin):* decreased erlotinib blood level

*Warfarin, other coumarin anticoagulants:* elevated INR, increased bleeding risk

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, bilirubin:* increased

*International Normalized Ratio:* increased

*Liver function tests:* abnormal

**Drug-food.** *Any food:* increased erlotinib bioavailability

**Drug-herb.** *Coenzyme Q10:* decreased chemotherapy efficacy

*St. John's wort*: decreased erlotinib blood level

**Drug-behaviors.** *Smoking*: decreased erlotinib plasma concentration

### Patient monitoring

 Perform periodic serum electrolyte measurements and renal and liver function testing.

- Advise patient not to smoke while taking drug.
- Monitor INR and prothrombin time regularly in patients receiving warfarin, other coumarin anticoagulants, or nonsteroidal anti-inflammatory drugs.

 Monitor for signs and symptoms of respiratory disorders and GI perforation.

### Patient teaching

 Advise patient to seek immediate medical attention for severe or persistent diarrhea, nausea, vomiting, anorexia, severe rash, eye pain, eye irritation, or onset or worsening of unexplained shortness of breath or cough.

- Advise patient not to smoke while taking drug.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## ertapenem

Invanz

**Pharmacologic class:** Carbapenem

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

### Action

Inhibits cell-wall synthesis in bacteria, causing cell death

### Availability

*Powder for infusion (lyophilized)*: 1 g/vial

### Indications and dosages

 Community-acquired pneumonia; skin infections; complicated genitourinary (GU) infections; complicated intra-abdominal infections; acute pelvic infections

**Adults and children older than age 13:** 1 g I.M. or I.V. daily. Length of treatment varies with type of infection: community-acquired pneumonia, 10 to 14 days; skin and skin structures, 7 to 14 days; GU, 10 to 14 days; intra-abdominal, 5 to 14 days; acute pelvic, 3 to 10 days.

**Children age 3 months to 12 years:** 15 mg/kg twice daily (not to exceed 1 g/day). May be given by I.V. infusion for up to 14 days or I.M. injection for up to 7 days.

 Prophylaxis of surgical site infection in elective colorectal surgery

**Adults:** 1 g I.V. as single dose given 1 hour before surgical incision

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to drug, its components, other carbapenems, or beta-lactams
- I.M. injection in patients allergic to lidocaine or other amide local anesthetics

### Precautions

Use cautiously in:

- seizure disorder
- pregnant or breastfeeding patients
- children (not recommended in infants younger than age 3 months).

### Administration

- Reconstitute for I.V. use by adding to vial 10 ml of sterile or bacteriostatic water or normal saline for injection. Don't use diluents containing dextrose.

- Further dilute reconstituted drug in 50 ml of normal saline solution; infuse over 30 minutes. Don't mix or infuse with other drugs.
- Reconstitute for I.M. use by adding 3.2 ml of 1% lidocaine to vial and shaking well.
- Inject I.M. dose deep into large muscle mass, such as gluteus maximus or lateral thigh.

Route	Onset	Peak	Duration
I.V.	Rapid	30 min	Unknown
I.M.	10 min	2.3 hr	Unknown

### Adverse reactions

**CNS:** headache, dizziness, asthenia, fatigue, insomnia, altered mental status, anxiety, **seizures**

**CV:** hypotension, hypertension, chest pain, phlebitis, **thrombophlebitis, arrhythmias, heart failure**

**EENT:** pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, gastroesophageal reflux disease, **pseudomembranous colitis**

**GU:** vaginitis

**Hepatic:** **hepatotoxicity**

**Respiratory:** crackles, cough, dyspnea, wheezing, **respiratory distress**

**Skin:** rash, **erythema multiforme, Stevens-Johnson syndrome, toxic epidermal necrolysis**

**Other:** fever, pain, induration, and inflammation at I.V. site; edema; hypersensitivity reactions including **anaphylaxis**

### Interactions

**Drug-drug.** *Probenecid:* increased blood level and half-life of ertapenem

### Patient monitoring

🔊 Monitor vital signs, ECG, and cardiovascular status closely. Stay alert for arrhythmias, edema, respiratory distress, and other signs and symptoms of heart failure.

🔊 Assess neurologic status, and watch for signs of impending seizure.

🔊 Monitor bowel pattern, and stay alert for signs and symptoms of pseudomembranous colitis.

• Inspect injection site for evidence of thrombophlebitis and induration.

🔊 Watch for indications of erythema multiforme (sore throat, rash, cough, iris lesions, mouth sores, fever). Report early signs before condition progresses to Stevens-Johnson syndrome, and stay alert for other hypersensitivity reactions (including anaphylaxis).

### Patient teaching

• Tell patient to notify nurse right away if drug causes pain or swelling at injection site.

• Inform patient that drug can be toxic to many organ systems. Tell him to promptly report significant adverse reactions.

• Tell female patient to inform prescriber of pregnancy or breastfeeding before taking drug.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## erythromycin

Apo-Erythro<sup>☼</sup>, Apo-Erythro-EC, Diomycin<sup>☼</sup>, Erybid<sup>☼</sup>, Erymax<sup>☼</sup>, Ery-Tab, Erythromid<sup>☼</sup>, PCE<sup>☼</sup>, Rommix<sup>☼</sup>, Tiloryth<sup>☼</sup>

## erythromycin ethylsuccinate

Apo-Erythro-ES<sup>☼</sup>, E.E.S., EryPed

## erythromycin lactobionate

Erythrocin

## erythromycin stearate

Erythrocin Stearate

**erythromycin (topical)**

Akne-Mycin, A/T/S, E-Glades,  
E-Solve 2, Erycette, Eryderm, Erygel,  
Sans-Acne<sup>⚡</sup>, Stiemycin<sup>⚡</sup>

**Pharmacologic class:** Macrolide

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

**Action**

Binds with 50S subunit of susceptible bacterial ribosomes, suppressing protein synthesis in bacterial cells and causing cell death

**Availability****erythromycin base**

*Capsules (delayed-release):* 250 mg

*Ointment (ophthalmic):* 0.5%

*Tablets:* 250 mg, 500 mg

*Tablets (delayed-release, enteric-coated):*

250 mg, 333 mg, 500 mg

*Tablets (particles in tablets):* 333 mg,  
500 mg

**erythromycin ethylsuccinate**

*Oral suspension:* 200 mg/5 ml, 400 mg/5 ml

*Powder for suspension:* 100 mg/2.5 ml,  
200 mg/5 ml, 400 mg/5 ml

*Tablets:* 400 mg

**erythromycin lactobionate**

*Powder for injection:* 500 mg, 1 g

**erythromycin stearate**

*Tablets (film-coated):* 250 mg, 500 mg

**erythromycin (topical)**

*Gel:* 2%

*Ointment:* 2%

*Solution:* 2%

*Swabs:* 2%

**Indications and dosages**

➤ Pelvic inflammatory disease

**Adults:** 500 mg (base) I.V. q 6 hours for 3 days, then 250 mg (base, estolate, or stearate) or 400 mg (ethylsuccinate) q 6 hours for 7 days

➤ Syphilis

**Adults:** 500 mg (base, estolate, or stearate) P.O. q.i.d. for 14 days

➤ Most upper and lower respiratory tract infections; otitis media; skin infections; Legionnaires' disease

**Adults:** 250 mg P.O. q 6 hours, or 333 mg P.O. q 8 hours, or 500 mg P.O. q 12 hours (base, estolate, or stearate); or 400 mg P.O. q 6 hours or 800 mg P.O. q 12 hours (ethylsuccinate); or 250 to 500 mg I.V. (up to 1 g) q 6 hours (gluceptate or lactobionate)

**Children:** 30 to 50 mg/kg/day (base, estolate, ethylsuccinate, or lactobionate) I.V. or P.O., in divided doses q 6 hours when giving I.V. and q 6 to 8 hours when giving P.O. Maximum dosage is 2 g/day for base or estolate, 3.2 g/day for ethylsuccinate, and 4 g/day for lactobionate.

➤ Intestinal amebiasis

**Adults:** 250 mg (base, estolate, or stearate) or 400 mg (ethylsuccinate) P.O. q 6 hours for 10 to 14 days

**Children:** 30 to 50 mg/kg/day (base, estolate, ethylsuccinate, or stearate) P.O. in divided doses over 10 to 14 days

➤ Prophylaxis of ophthalmia neonatorum caused by *Neisseria gonorrhoeae* or *Chlamydia trachomatis*

**Neonates:** 0.5- to 1-cm ribbon of ointment into each lower conjunctival sac once

➤ Treatment of conjunctivitis of the newborn caused by susceptible organisms

**Neonates:** 50 mg/kg/day (ethylsuccinate) P.O. in four divided doses for at least 14 days

➤ Pertussis

**Children:** 40 to 50 mg/kg/day (estolate preferred) P.O. in four divided doses for 14 days

➤ Pneumonia of infancy

**Infants:** 50 mg/kg/day (estolate or ethylsuccinate) P.O. in four divided doses for at least 3 weeks

➤ Acne

**Adults and children older than age 12:** 2% ointment, gel, or solution applied topically b.i.d.

**Dosage adjustment**

- Hepatic impairment

**Off-label uses**

- Chancroid

**Contraindications**

- Hypersensitivity to drug or tartrazine
- Concurrent use of astemizole, cisapride, pimoziide, or terfenadine
- Hepatic impairment (with estolate)
- Pregnancy (with estolate)

**Precautions**

Use cautiously in:

- myasthenia gravis
- hepatic disease.

**Administration**

 Be aware that ventricular arrhythmias and sudden death may occur if drug is given concurrently with potent CYP3A inhibitors (such as clarithromycin, diltiazem, nitroimidazole antifungal agents, protease inhibitors, verapamil, and troleandomycin).

- Give erythromycin ethylsuccinate and delayed-release products without regard to meals, but avoid giving with grapefruit juice.
- Give erythromycin base or stearate 1 hour before or 2 hours after meals for optimal absorption.
- Follow label directions to reconstitute drug for I.V. use. For intermittent infusion, infuse each 250 mg in at least 100 ml of normal saline solution over 20 to 60 minutes. Continuous infusion may be given over 6 to 24 hours as directed.

Route	Onset	Peak	Duration
P.O.	1 hr	1-4 hr	6-12 hr
I.V.	Rapid	End of infusion	6-12 hr

**Adverse reactions**

CV: torsades de pointes, arrhythmias  
EENT: ototoxicity

GI: nausea, vomiting, diarrhea, abdominal pain or cramps

Hepatic: hepatic dysfunction, hepatitis

Skin: rash

Other: increased appetite, aggravation of weakness in myasthenia gravis, allergic reactions, superinfection, phlebitis at I.V. site

**Interactions**

**Drug-drug.** *Alfentanil, alprazolam, bromocriptine, buspirone, carbamazepine, clozapine, cyclosporine, diazepam, disopyramide, ergot alkaloids, felodipine, methylprednisolone, midazolam, tacrolimus, theophylline, triazolam, vinblastine, warfarin:* increased blood levels and risk of toxicity from these drugs

*Clindamycin, lincomycin:* antagonism of erythromycin's effects

*CYP3A inhibitors:* increased erythromycin blood level, with risk of ventricular arrhythmias and sudden death

*Digoxin:* increased digoxin blood level

*HMG-CoA reductase inhibitors:* increased risk of myopathy and rhabdomyolysis

*Hormonal contraceptives:* decreased contraceptive efficacy

*Astemizole, cisapride, pimoziide, sparfloxacin, terfenadine:* increased risk of serious arrhythmias

*Rifabutin, rifampin:* decreased erythromycin effects, increased risk of adverse GI reactions

*Theophylline:* increased theophylline blood level, decreased erythromycin blood level

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin:* increased levels

*Urine catecholamines:* false elevations

**Drug-food.** *Grapefruit juice:* increased erythromycin blood level

**Patient monitoring**

- Check temperature, and watch for signs and symptoms of superinfection.

- Monitor liver function tests. Watch for signs and symptoms of hepatotoxicity.
- Assess patient's hearing for signs of ototoxicity.

### Patient teaching

- Instruct patient to take with 8 oz of water 1 hour before or 2 hours after meals, and to avoid grapefruit juice.
- If drug causes GI upset, encourage patient to take it with food.
- Tell patient not to swallow chewable tablets whole and not to chew or crush enteric-coated tablets.
- 🔊 Advise patient to immediately report irregular heart beats, unusual tiredness, yellowing of skin or eyes, or signs and symptoms of new infection.
- Tell patient he'll undergo periodic blood tests to monitor liver function.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## escitalopram oxalate

Cipralax 🌀, Lexapro

**Pharmacologic class:** Selective serotonin reuptake inhibitor

**Therapeutic class:** Antidepressant

**Pregnancy risk category:** C

### FDA BOXED WARNING

- Drug may increase risk of suicidal thinking and behavior in children and adolescents with major depressive disorder and other psychiatric disorders. Risk is greater during first few months of treatment, and must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical

worsening, suicidality, and unusual behavior changes when therapy begins. Advise family to observe patient closely and communicate with prescriber as needed.

- Drug isn't approved for use in pediatric patients.

### Action

Prevents serotonin reuptake by CNS neurons, making more serotonin available in brain and thereby relieving depression

### Availability

*Oral solution:* 5 mg/5 ml

*Tablets:* 5 mg, 10 mg, 20 mg

### Indications and dosages

➤ Major depression

**Adults:** Initially, 10 mg P.O. daily as a single dose. After at least 1 week, may increase to 20 mg P.O. daily, as needed.

**Adolescents ages 12 to 17:** Initially, 10 mg P.O. daily. After at least 3 weeks, may increase to 20 mg P.O. daily as needed.

**Elderly adults and patients with hepatic impairment:** Maximum dosage of 10 mg P.O. daily as a single dose

➤ Generalized anxiety disorder

**Adults:** Initially, 10 mg P.O. daily as a single dose. After at least 1 week, may increase to 20 mg P.O. daily as needed.

### Dosage adjustment

- Hepatic impairment
- Elderly patients

### Contraindications

- Hypersensitivity to drug
- Concurrent use of pimozide
- MAO inhibitor use within past 14 days

### Precautions

Use cautiously in:

- renal or hepatic impairment, other conditions that cause altered

metabolism or hemodynamic responses, history of mania or seizures, suicidal tendency

- concomitant use of nonsteroidal anti-inflammatory drugs (NSAIDs), aspirin, warfarin, or other drugs that affect coagulation
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 12 with major depression and younger than age 18 with generalized anxiety disorder (safety and efficacy not established).

### Administration

- Give with or without food in the morning or evening.
- 🚫 Don't give within 14 days of MAO inhibitor.

Route	Onset	Peak	Duration
P.O.	Slow	3.5-6.5 hr	Unknown

### Adverse reactions

**CNS:** drowsiness, dizziness, insomnia, fatigue, **neuroleptic malignant syndrome-like reactions, increased risk of suicide or suicidal ideation** (especially in child or adolescent)

**EENT:** rhinitis, sinusitis

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, abdominal pain, dry mouth

**GU:** ejaculatory disorders, erectile dysfunction, anorgasmia (in females), decreased libido

**Metabolic:** hyponatremia (in association with syndrome of inappropriate antidiuretic hormone secretion)

**Other:** increased appetite, flulike symptoms, **serotonin syndrome**

### Interactions

**Drug-drug.** *Aspirin, NSAIDs, warfarin:* increased risk of bleeding

*Carbamazepine, lithium:* decreased effects of escitalopram

*Citalopram:* increased risk of serious toxic effects

*MAO inhibitors:* increased escitalopram blood level and risk of toxicity

*Pimozide:* prolonged QT interval

*Triptans:* weakness, hyperreflexia, incoordination

**Drug-diagnostic tests.** *Sodium:* decreased level

**Drug-herbs.** *Ginkgo, St. John's wort:* increased risk of adverse effects

**Drug-behaviors.** *Alcohol use:* increased motor impairment

### Patient monitoring

🚫 Assess patient's mood closely. Watch for signs and symptoms of increased depression or suicidal ideation (especially in child or adolescent).

🚫 Monitor patient closely for serotonin syndrome or neuroleptic malignant syndrome-like reactions; immediately discontinue drug if these occur.

- Be aware that gradual dosage reduction rather than abrupt cessation is recommended. When drug is discontinued, monitor for dysphoric mood, irritability, agitation, dizziness, sensory disturbances, anxiety, confusion, headache, lethargy, emotional lability, and insomnia.

### Patient teaching

- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking plenty of fluids.

- Inform patient that full drug effect may take up to 4 weeks. Caution him not to overuse drug or stop drug abruptly.

🚫 Tell patient (and parent or significant other as appropriate) to contact prescriber immediately if depression worsens or suicidal thoughts develop (especially in child or adolescent).

🚫 Instruct patient to immediately discontinue drug and notify prescriber if the following symptoms occur: overheating, muscle rigidity, altered mental

status, irregular pulse or blood pressure, rapid or irregular heart beat, excessive sweating, involuntary muscle movements, fever, or seizures.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## esmolol hydrochloride

Brevibloc

**Pharmacologic class:** Beta-adrenergic blocker (cardioselective)

**Therapeutic class:** Antiarrhythmic, antihypertensive

**Pregnancy risk category C**

### Action

Blocks stimulation of beta-adrenergic receptors (primarily beta<sub>1</sub> receptors), thereby reducing atrioventricular conduction and cardiac output and decreasing blood pressure

### Availability

*Injection:* 10 mg/ml

### Indications and dosages

➤ Supraventricular tachycardia

**Adults:** Initially, a loading dose of 500 mcg/kg/minute by I.V. infusion over 1 minute, followed by a maintenance infusion of 50 mcg/kg/minute over 4 minutes. If desired response doesn't occur after 5 minutes, repeat loading dose and increase maintenance infusion to 100 mcg/kg/minute for 4 minutes. Repeat sequence as needed, with maintenance dosage increased in increments of 50 mcg/kg/minute, to a

maximum maintenance infusion of 200 mcg/kg/minute for 48 hours.

➤ Sinus tachycardia or hypertension

**Adults:** Initially, 80 mg (1 mg/kg) by I.V. bolus over 30 seconds; then, if needed, 150 mcg/kg/minute by I.V. infusion, to a maximum of 300 mcg/kg/minute

### Off-label uses

- Acute myocardial ischemia

### Contraindications

- Hypersensitivity to drug
- Heart failure
- Heart block greater than third degree
- Sinus bradycardia
- Cardiogenic shock

### Precautions

Use cautiously in:

- renal impairment, diabetes, bronchospasm, cardiac disease, cerebrovascular insufficiency, peripheral vascular disease, hyperthyroidism, myasthenic conditions
- pregnant or breastfeeding patients.

### Administration

- Be aware that compatible solutions include 5% dextrose for injection, 5% dextrose in lactated Ringer's injection, 5% dextrose in Ringer's injection, 5% dextrose in 0.45% or 0.9% sodium chloride injection, and lactated Ringer's injection.
- Don't mix with 5% sodium bicarbonate injection.
- Large fluid volumes may be needed to infuse drug. Use caution when excessive fluids could be harmful.

Route	Onset	Peak	Duration
I.V.	Immediate	30 min	30 min after infusion

### Adverse reactions

**CNS:** anxiety, depression, dizziness, drowsiness, headache, agitation, fatigue, confusion, speech disorders, asthenia

**CV:** peripheral ischemia, chest pain, bradycardia, hypotension

**GI:** nausea, vomiting, heartburn

**GU:** urinary retention

**Respiratory:** wheezing, dyspnea

**Skin:** flushing, pallor, erythema

**Other:** altered taste, fever, chills, edema, midscapular pain, inflammation or induration at infusion site

## Interactions

**Drug-drug.** *Alpha<sub>1</sub>-adrenergic blockers:* exaggerated antihypertensive effect

*Catecholamines, reserpine:* increased bradycardia and hypotension

*Digoxin:* increased digoxin blood level

*Morphine:* increased esmolol blood level

*Succinylcholine:* prolonged neuromuscular blockade

**Drug-herbs.** *Ephedra (ma huang), St. John's wort, yohimbe:* decreased anti-

hypertensive effect

## Patient monitoring

- Monitor vital signs and ECG, particularly for hypotension.
- Assess neurologic status, and institute safety measures as needed.
- Monitor fluid intake and output, watching for urinary retention.
- Check I.V. site regularly.

## Patient teaching

- Explain to patient that drug is an emergency measure to control blood pressure, arrhythmias, or heart rate.
- Ensure patient he'll be closely monitored throughout drug therapy.
- Tell patient to report pain or redness at I.V. site.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and herbs mentioned above.

## esomeprazole magnesium

Nexium

**Pharmacologic class:** Proton pump inhibitor

**Therapeutic class:** Antiulcer agent

**Pregnancy risk category** C

## Action

Reduces gastric acid production by inhibiting enzyme activity in gastric parietal cells, preventing transport of hydrogen ions into gastric lumen

## Availability

*Capsules (delayed-release):* 20 mg, 40 mg

*Powder for delayed-release oral suspension:* 2.5-mg, 5-mg, 10-mg, 20-mg, 40-mg packets

## Indications and dosages

➤ Treatment of gastroesophageal reflux disease (GERD); healing of erosive esophagitis

**Children ages 1 month to younger than 1 year weighing 3 kg (6.5 lb) to 5 kg:** 2.5 mg P.O. daily for up to 6 weeks

**Adults:** 20 to 40 mg P.O. once daily for 4 to 8 weeks

**Children ages 1 month to younger than 1 year weighing more than 7.5 kg to 12 kg (16.5 to 26 lb):** 10 mg P.O. daily for up to 6 weeks

**Children ages 1 month to younger than 1 year weighing more than 5 kg (11 lb) to 7.5 kg:** 5 mg P.O. daily for up to 6 weeks

**Children ages 1 to 11 weighing 20 kg (44 lb) or more:** 10 or 20 mg P.O. daily for 8 weeks

**Children ages 1 to 11 weighing less than 20 kg (44 lb):** 10 mg P.O. daily for 8 weeks

➤ Treatment of GERD; maintenance of healing of erosive esophagitis

**Adults:** 20 mg P.O. once daily

➤ Symptomatic GERD

**Adults:** 20 mg P.O. once daily for 4 weeks

**Children ages 12 to 17:** 20 or 40 mg P.O. daily for up to 8 weeks

**Children ages 1 to 11:** 10 mg P.O. daily for up to 8 weeks

➤ *Helicobacter pylori* eradication to decrease risk of duodenal ulcer recurrence

**Adults:** 40 mg P.O. once daily for 10 days, given in combination with amoxicillin 1,000 mg b.i.d. for 10 days and with clarithromycin 500 mg b.i.d. for 10 days

➤ Treatment of pathological hypersecretory conditions including Zollinger-Ellison syndrome

**Adults:** 40 mg P.O. b.i.d.

➤ Risk reduction of NSAID-associated gastric ulcer

**Adults:** 20 or 40 mg P.O. once daily for up to 6 months

### Contraindications

- Hypersensitivity to proton pump inhibitors

### Precautions

Use cautiously in:

- severe hepatic impairment
- increased risk of hip, wrist, and spine fractures
- pregnant or breastfeeding patients
- children younger than age 18 (safety not established).

### Administration

- Give 1 hour before or 2 hours after a meal.
- Know that contents of capsules may be mixed with applesauce.
- Don't crush capsules or pellets.
- Be aware that hypomagnesemia has been reported rarely in patients treated with proton pump inhibitors for at least 3 months. For patients expected to be on prolonged treatment or who take proton pump inhibitors with

drugs such as digoxin or drugs that may cause hypomagnesemia (such as diuretics), consider monitoring magnesium level before starting treatment.

Route	Onset	Peak	Duration
P.O.	Rapid	1.6 hr	24 hr

### Adverse reactions

**CNS:** headache, dizziness, asthenia, vertigo, apathy, anxiety, paresthesia, insomnia, abnormal dreams

**EENT:** sinusitis, epistaxis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, flatulence, dry mouth

**Metabolic:** hypomagnesemia

**Musculoskeletal:** hip, wrist, spine fractures (with long-term daily use)

**Respiratory:** upper respiratory tract infection, cough

**Skin:** rash, inflammation, urticaria, pruritus, alopecia, dry skin

### Interactions

**Drug-drug.** *CYP2C19* or *CYP3A4* inducers (such as rifampin): reduced esomeprazole level

*Digoxin, iron salts, ketoconazole:* altered absorption and effects of these drugs

*Methotrexate:* increased serum methotrexate level

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, creatinine, uric acid:* increased levels

*Hemoglobin, platelets, potassium, sodium, thyroxine, white blood cells:* altered levels

*Serum chromogranin A (CgA):* increased level (may cause false-positive results in diagnostic investigations for neuroendocrine tumors)

**Drug-herbs.** *St. John's wort:* reduced esomeprazole level

### Patient monitoring

- Monitor neurologic status, especially for dizziness, headache, paresthesia, and asthenia.

- Watch for signs and symptoms of EENT and respiratory infections.
- Assess nutritional and hydration status in light of adverse GI effects.
- Check for rash and other signs of hypersensitivity.
- Monitor liver function test results if patient is on long-term therapy.
- Continue to monitor patients periodically who are expected to be on prolonged treatment or who take proton pump inhibitors with drugs such as digoxin or drugs that may cause hypomagnesemia.

### Patient teaching

- Instruct patient to take drug 1 hour before or 2 hours after a meal.
- If patient has trouble swallowing capsule, tell him to open it, sprinkle pellets into soft food (such as applesauce), and take right away.
- Instruct patient to recognize and report signs or symptoms of hypomagnesemia.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Advise female patient to tell prescriber if she's pregnant or breastfeeding.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## estradiol

Bedol<sup>⚡</sup>, Elestrin, Elleste<sup>⚡</sup>, Elleste-Solo<sup>⚡</sup>, Estrace, Estring, Estrogel, Gynodiol, Innofem, Oestrogel<sup>⚡</sup>, Progynova<sup>⚡</sup>, Sandrena<sup>⚡</sup>, Vagifem, Zumenon<sup>⚡</sup>

Femring, Femtrace

## estradiol cypionate

Depo-Estradiol

## estradiol hemihydrate

Estrasorb

## estradiol transdermal system

Alora, Climara, Estraderm, Estradot<sup>⚡</sup>, Evorel<sup>⚡</sup>, Fematrix<sup>⚡</sup>, Femseven<sup>⚡</sup>, Menostar, Vivelle

## estradiol valerate

Climaval<sup>⚡</sup>, Delestrogen, Femogex<sup>⚡</sup>

*Pharmacologic class:* Estrogen

*Therapeutic class:* Hormone

*Pregnancy risk category:* X

### FDA BOXED WARNING

- Drug increases endometrial cancer risk in postmenopausal women.
- Drug may increase risk of cardiovascular disease, breast cancer, and dementia.
- Drug shouldn't be used during pregnancy.
- Warnings may vary somewhat among specific brands. See package insert for complete warning information.

### Action

Binds to nuclear receptors in responsive tissues (such as female genital organs, breasts, and pituitary gland), enhancing DNA, RNA, and protein synthesis. In androgen-dependent prostate cancer, competes for androgen receptor sites, inhibiting androgen activity. Also decreases pituitary release of follicle-stimulating hormone and luteinizing hormone.

### Availability

*Injection (cypionate in oil):* 5 mg/ml

*Injection (valerate in oil):* 10 mg/ml, 20 mg/ml, 40 mg/ml

*Tablets:* 0.5 mg, 1 mg, 1.5 mg, 2 mg

*Tablets (film-coated):* 25.8 mcg estradiol hemidrate (equivalent to 25 mcg estradiol)

*Transdermal system:* 25 mcg/24-hour release rate, 37.5 mcg/24-hour release rate, 50 mcg/24-hour release rate, 75 mcg/24-hour release rate, 100 mcg/24-hour release rate

*Vaginal cream:* 100 mcg/g

*Vaginal ring:* 2 mg released over 90 days

*Vaginal tablets:* 10 mcg

## Indications and dosages

➤ Symptoms of menopause, atrophic vaginitis, female hypogonadism, ovarian failure, and osteoporosis

**Adults:** 0.5 to 2 mg (estradiol) P.O. daily continuously or cyclically. Or 1 to 5 mg (cypionate) or 10 to 20 mg (valerate) I.M. monthly. Or 50- or 100-mcg/24-hour transdermal patch applied twice weekly (Alora, Estraderm) or weekly (Climara). Or 25-mcg/24-hour patch applied q 7 days (FemPatch) or 37.5- to 100-mcg transdermal patch applied twice weekly (Vivelle). Or 2 to 4 g (0.2 to 0.4 mg) vaginal cream (estradiol) applied daily for 1 to 2 weeks, then decreased to 1 to 2 g/day for 1 to 2 weeks, then a maintenance dose of 1 g one to three times weekly for 3 weeks, then off for 1 week; repeat cycle once vaginal mucosa has been restored. Or 2-mg vaginal ring q 3 months or 10-mcg vaginal tablet once daily for 2 weeks, then twice weekly.

➤ Postmenopausal breast cancer

**Adults:** 10 mg P.O. t.i.d. (estradiol)

➤ Prostate cancer

**Adults:** 1 to 2 mg P.O. t.i.d. (estradiol) or 30 mg I.M. q 1 to 2 weeks (valerate)

## Contraindications

- Hypersensitivity to drug or its components
- Thromboembolic disease (current or previous)
- Undiagnosed vaginal bleeding

- Breast or reproductive system cancer (except in metastatic disease)
- Estrogen-dependent neoplasms
- Pregnancy

## Precautions

Use cautiously in:

- cardiovascular, hepatic, or renal disease
- breastfeeding patients.

## Administration

- Inject I.M. dose deep into large muscle mass; rotate injection sites.
- If switching from oral to transdermal estrogen, apply patch 1 week after withdrawal of oral therapy.

Route	Onset	Peak	Duration
P.O.	Slow	Days	Unknown
I.M.	Unknown	Unknown	Unknown
Transdermal	Unknown	Unknown	3-4 days (Estraderm) 7 days (Climara)
Vaginal ring	Unknown	Unknown	90 days
Vaginal tablet	Unknown	Unknown	3-4 days

## Adverse reactions

**CNS:** headache, dizziness, lethargy, depression

**CV:** hypertension, **myocardial infarction (MI)**, **thromboembolism**

**EENT:** contact lens intolerance, worsening of myopia or astigmatism

**GI:** nausea, vomiting, **bowel obstruction with vaginal ring (rare)**

**GU:** amenorrhea, dysmenorrhea, breakthrough bleeding, cervical erosions, decreased libido, vaginal candidiasis, erectile dysfunction, testicular atrophy, gynecomastia, breast pain or tenderness

**Hepatic:** jaundice

**Metabolic:** sodium and fluid retention, hypercalcemia, hyperglycemia

**Musculoskeletal:** leg cramps

**Skin:** oily skin, acne, pigmentation changes, urticaria

**Other:** weight loss or gain, edema, increased appetite, **toxic shock syndrome with vaginal ring (rare)**

### Interactions

**Drug-drug.** *Insulin, oral hypoglycemics, warfarin:* altered requirements for these drugs

**Drug-diagnostic tests.** *Antithrombin III, folate, low-density lipoproteins, pyridoxine, total cholesterol, urine pregnanediol:* decreased levels

*Cortisol; factors VII, VIII, IX, and X; glucose; high-density lipoproteins; phospholipids; prolactin; prothrombin; sodium; triglycerides:* increased levels  
*Metyrapone test:* false decrease

*Thyroid function tests:* false interpretation

**Drug-behaviors.** *Smoking:* increased risk of adverse CV reactions

### Patient monitoring

🔊 Monitor vital signs and cardiovascular status, especially for hypertension, thromboembolism, and MI.

- Be aware that a few cases of ring adherence to the vaginal wall have occurred, which may require evaluation of wall ulceration and erosion.
- Assess vision.
- In diabetic patient, monitor blood glucose level and watch for signs and symptoms of hyperglycemia.

### Patient teaching

- Instruct patient to place transdermal patch on clean, dry skin area.
- Teach proper technique for use of vaginal tablet, ring, or cream, as appropriate.
- Tell patient drug may cause loss of libido (in women) or erectile dysfunction (in men). Encourage patient to discuss these issues with prescriber.

🔊 Teach patient to recognize and immediately report signs and symptoms of thromboembolism.

🔊 Caution patient not to take drug if she is or plans to become pregnant.

- Advise patient that drug may worsen nearsightedness or astigmatism and make contact lenses uncomfortable.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## estrogens, conjugated

C.E.S.🌿, Congest🌿, Premarin, Premarin Intravenous

**Pharmacologic class:** Estrogen

**Therapeutic class:** Replacement hormone, antineoplastic, antiosteoporotic

**Pregnancy risk category X**

### FDA BOXED WARNING

- Drug increases endometrial cancer risk in postmenopausal women who use unopposed estrogens. Adding a progestin to estrogen therapy has been shown to reduce risk of endometrial hyperplasia, which may be a precursor to endometrial cancer. Adequate diagnostic measures, including directed or random endometrial sampling when indicated, should be undertaken to rule out malignancy in postmenopausal women with undiagnosed persistent or recurring abnormal genital bleeding.

- Drug may increase risk of cardiovascular disease, breast cancer, and dementia. Estrogen-alone therapy shouldn't be used to prevent cardiovascular disease or dementia. The Women's Health Initiative (WHI) estrogen-alone substudy reported increased risks of stroke and deep vein thrombosis (DVT) in postmenopausal women (ages 50 to 79) during 6.8 years and 7.1 years, respectively, of treatment

with daily oral conjugated estrogens 0.625 mg, relative to placebo. The estrogen plus progestin substudy of WHI reported increased risks of myocardial infarction, stroke, invasive breast cancer, pulmonary emboli, and DVT in postmenopausal women (ages 50 to 79) during 5.6 years of treatment with daily conjugated estrogen 0.625 mg combined with medroxyprogesterone acetate 2.5 mg, relative to placebo. The WHI Memory Study estrogen-alone ancillary study, a substudy of WHI, reported an increased risk of developing probable dementia in postmenopausal women age 65 or older. It's unknown if this finding applies to younger postmenopausal women.

- In the absence of comparable data, these risks should be assumed to be similar for other dosages of conjugated estrogens and other dosage forms of estrogens. Because of these risks, estrogens with or without progestins should be prescribed at lowest effective dosages and for shortest duration consistent with treatment goals and risks for the individual woman.

### Action

Bind to nuclear receptors in responsive tissues (such as female genital organs, breasts, and pituitary gland), enhancing DNA, RNA, and protein synthesis. In androgen-dependent prostate cancer, compete for androgen receptor sites, inhibiting androgen activity. Also decrease pituitary release of follicle-stimulating and luteinizing hormones.

### Availability

*Powder for injection:* 25 mg/5 ml

*Tablets:* 0.3 mg, 0.625 mg, 0.9 mg, 1.25 mg

*Vaginal cream:* 0.625 mg/g

### Indications and dosages

➤ Ovariectomy; primary ovarian failure

**Adults:** 1.25 mg P.O. daily continuously or in cycles of 3 weeks on and 1 week off

➤ Osteoporosis and menopausal symptoms

**Adults:** 0.3 to 1.25 mg P.O. daily continuously or in cycles of 3 weeks on and 1 week off

➤ Female hypogonadism

**Adults:** 0.3 to 0.625 mg P.O. daily, given in cycles of 3 weeks on and 1 week off

➤ Inoperable breast cancer in men and postmenopausal women

**Adults:** 10 mg P.O. t.i.d. for 3 months or more

➤ Inoperable prostate carcinoma

**Adults:** 1.25 to 2.5 mg P.O. t.i.d.

➤ Uterine bleeding caused by hormonal imbalance

**Adults:** 25 mg I.M. or I.V., repeated in 6 to 12 hours if necessary

➤ Atrophic vaginitis, kraurosis vulvae  
**Adults:** 0.5 to 2 g (vaginal cream) intravaginally daily in cycles of 3 weeks on and 1 week off

➤ Moderate to severe dyspareunia

**Adults:** 0.5 g (vaginal cream) intravaginally daily in cycles of 3 weeks on and 1 week off

### Contraindications

- Hypersensitivity to drug or its components
- Thromboembolic disease (current or previous)
- Undiagnosed vaginal bleeding
- Breast or reproductive system cancer (except metastatic disease)
- Estrogen-dependent neoplasms
- Pregnancy

### Precautions

Use cautiously in:

- cardiovascular disease, severe hepatic or renal disease, asthma, bone disease, migraine, seizures, breast disease

- family history of breast or genital tract cancer
- breastfeeding patients.

### Administration

- Know that drug is compatible with dextrose 5% in water and normal saline solution.

Route	Onset	Peak	Duration
P.O., I.M.	Unknown	Unknown	6-12 hr
I.V.	Rapid	Unknown	6-12 hr
Intravaginal	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache, dizziness, lethargy, depression, asthenia, paresthesia, syncope, **cerebrovascular accident (CVA), seizures**

**CV:** hypertension, chest pain, **myocardial infarction (MI), thromboembolism**

**EENT:** contact lens intolerance, worsening of myopia or astigmatism, otitis media, sinusitis, rhinitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, abdominal cramps, bloating, enlarged abdomen, dyspepsia, flatulence, gastritis, gastroenteritis, hemorrhoids, colitis, gallbladder disease, anorexia, **pancreatitis**

**GU:** urinary incontinence, dysuria, urinary tract infection, amenorrhea, dysmenorrhea, endometrial hyperplasia, vaginal candidiasis, leukorrhea, vaginal hemorrhage, genital eruptions, gynecomastia, breast tenderness, breast enlargement or secretion, reduced libido, erectile dysfunction, testicular atrophy, **increased risk of breast cancer, endometrial cancer, hemolytic uremic syndrome**

**Hepatic:** cholestatic jaundice, **hepatic adenoma**

**Metabolic:** hyperglycemia, hypercalcemia, sodium and fluid retention, reduced carbohydrate tolerance

**Musculoskeletal:** leg cramps, back pain, skeletal pain

**Respiratory:** upper respiratory tract infection, bronchitis, **pulmonary embolism**

**Skin:** acne, oily skin, pigmentation changes, urticaria, pruritus, erythema nodosum, hemorrhagic eruption, skin hypertrophy, hirsutism, alopecia, **erythema multiforme**

**Other:** edema, weight changes, increased appetite, hypersensitivity reaction, **angioedema**

### Interactions

**Drug-drug.** *Corticosteroids:* enhanced corticosteroid effects

*CYP450 inducers (such as barbiturates, rifampin):* decreased estrogen efficacy

*Hypoglycemics, warfarin:* altered requirement for these drugs

*Phenytoin:* loss of seizure control

*Tamoxifen:* interference with tamoxifen effects

*Tricyclic antidepressants:* reduced antidepressant effects

**Drug-diagnostic tests.** *Antithrombin III, folate, low-density lipoproteins, pyridoxine, total cholesterol, urine pregnenediol:* decreased values

*Cortisol; factors VII, VIII, IX, and X;*

*glucose; high-density lipoproteins;*

*phospholipids; prolactin; prothrombin;*

*sodium; triglycerides:* increased values

*Metyrapone test:* false decrease

*Thyroid function tests:* false interpretation

**Drug-food.** *Caffeine:* increased caffeine blood level

**Drug-herbs.** *Black cohosh:* increased risk of adverse reactions

*Red clover:* interference with estrogen effects

*Saw palmetto:* antiestrogenic effects

*St. John's wort:* decreased drug blood level and effects

**Drug-behaviors.** *Smoking:* increased risk of adverse cardiovascular reactions

## Patient monitoring

- Monitor liver function test results and assess abdomen for enlarged liver.
- Evaluate patient for breast tenderness and swelling. As needed, give analgesics and apply cool compresses.
- Monitor fluid intake and output, and weigh patient daily.
- 🔊 Know that drug increases risk of thromboembolism, CVA, and MI.
- Be aware that exogenous estrogens may induce or exacerbate symptoms of angioedema, particularly in women with hereditary angioedema.
- Check serum phosphatase level in patients with prostate cancer.
- Monitor calcium, glucose, and folic acid levels.
- Evaluate bone density annually.

## Patient teaching

- 🔊 Teach patient to recognize and report signs and symptoms of thromboembolism.
- 🔊 Caution patient not to take drug if she is or plans to become pregnant.
- Tell patient to report breakthrough vaginal bleeding.
- Recommend that patient have routine breast examinations.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## estrogens, esterified

Menest

**Pharmacologic class:** Estrogen

**Therapeutic class:** Replacement hormone, antineoplastic, antiosteoporotic

**Pregnancy risk category** X

## FDA BOXED WARNING

- Drug increases endometrial cancer risk in postmenopausal women.
- Drug may increase risk of cardiovascular disease, breast cancer, and dementia.
- Drug shouldn't be used during pregnancy.
- Warnings may vary somewhat among specific brands; see package insert for complete warning information.

## Action

Bind to nuclear receptors in responsive tissues (such as female genital organs, breasts, and pituitary gland), enhancing DNA, RNA, and protein synthesis. In androgen-dependent prostate cancer, compete for androgen receptor sites, inhibiting androgen activity. Also decrease pituitary release of follicle-stimulating hormone and luteinizing hormone.

## Availability

*Tablets:* 0.3 mg, 0.625 mg, 1.25 mg, 2.5 mg

## Indications and dosages

- Moderate to severe vasomotor symptoms or atrophic vaginitis
- Adults:** 0.3 to 1.25 mg P.O. daily, adjusted to lowest effective dosage; usually given in cycles of 3 weeks on, 1 week off
- Female hypogonadism
- Adults:** 2.5 to 7.5 mg P.O. daily in divided doses for 20 days, followed by 10-day rest period. If no bleeding occurs, repeat same dosing schedule. If bleeding occurs before end of rest period, start 20-day estrogen-progestin cycle, with progestin P.O. given during last 5 days of estrogen therapy.
- Inoperable prostate cancer
- Adults:** 1.25 to 2.5 mg P.O. t.i.d.
- Selected breast cancers (inoperable, progressing)

**Adults:** 10 mg P.O. t.i.d. for at least 3 months

➤ Prevention of osteoporosis

**Adults:** Initially, 0.3 mg P.O. daily, increased as needed to a maximum of 1.25 mg/day

### Contraindications

- Hypersensitivity to drug or its components
- Thromboembolic disease (current or previous)
- Undiagnosed vaginal bleeding
- Breast and reproductive cancers (except metastatic disease)
- Estrogen-dependent neoplasms
- Pregnancy

### Precautions

Use cautiously in:

- cardiovascular disease, severe hepatic or renal disease, asthma, bone disease, migraines, seizures, breast nodules, fibrocystic breasts
- family history of breast or genital tract cancer
- breastfeeding patients.

### Administration

- Administer with food or fluids.
- Give cyclically as prescribed, except when used palliatively for cancer treatment.

Route	Onset	Peak	Duration
P.O.	Slow	Days	Unknown

### Adverse reactions

**CNS:** headache, dizziness, lethargy, depression, asthenia, paresthesia, syncope, **increased risk of cerebrovascular accident (CVA), seizures**

**CV:** hypertension, chest pain, **myocardial infarction (MI), thromboembolism**

**EENT:** contact lens intolerance, worsening of myopia or astigmatism, otitis media, sinusitis, rhinitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, dyspepsia, flatulence, gastritis, gastroenteritis, enlarged abdomen,

hemorrhoids, colitis, gallbladder disease, anorexia, **pancreatitis**

**GU:** urinary incontinence, dysuria, amenorrhea, dysmenorrhea, endometrial hyperplasia, urinary tract infection, leukorrhea, vaginal discomfort or pain, vaginal hemorrhage, genital eruptions, gynecomastia, breast tenderness, breast enlargement or secretion, reduced libido, erectile dysfunction, testicular atrophy, **increased risk of breast cancer, endometrial cancer, hemolytic uremic syndrome**

**Hepatic:** cholestatic jaundice, **hepatic adenoma**

**Metabolic:** hyperglycemia, hypercalcemia, sodium and fluid retention, reduced carbohydrate tolerance

**Musculoskeletal:** leg cramps, back pain, skeletal pain

**Respiratory:** upper respiratory tract infection, bronchitis, **pulmonary embolism**

**Skin:** acne, increased pigmentation, urticaria, pruritus, erythema nodosum, hemorrhagic eruption, alopecia, hirsutism

**Other:** increased appetite, weight changes, edema, flulike symptoms, hypersensitivity reactions

### Interactions

**Drug-drug.** *Corticosteroids:* enhanced corticosteroid effects

*CYP450 inducers (such as barbiturates, rifampin):* decreased estrogen efficacy

*Hypoglycemics, warfarin:* altered requirement for these drugs

*Phenytoin:* loss of seizure control

*Tamoxifen:* interference with tamoxifen efficacy

*Tricyclic antidepressants:* reduced antidepressant effect

**Drug-diagnostic tests.** *Antithrombin III, folate, low-density lipoproteins, pyridoxine, total cholesterol, urine pregnandiol:* decreased values

*Cortisol; factors VII, VIII, IX, and X; glucose; high-density lipoproteins;*

*phospholipids; prolactin; prothrombin; sodium; triglycerides*: increased values

*Metirapone test*: false decrease

*Thyroid function tests*: false interpretation

**Drug-food.** *Caffeine*: increased caffeine blood level

**Drug-herbs.** *Black cohosh*: increased risk of adverse reactions

*Red clover*: interference with estrogen therapy

*Saw palmetto*: antiestrogenic effects

*St. John's wort*: decreased drug blood level and effects

**Drug-behaviors.** *Smoking*: increased risk of adverse cardiovascular reactions

### Patient monitoring

- Monitor fluid intake and output, and weigh patient daily.

- Evaluate patient for breast tenderness and swelling. As needed, administer analgesics and apply cool compresses.

 Know that drug increases risk of thromboembolism, CVA, and MI.

- Monitor liver function test results, and assess abdomen for enlarged liver.

- Check serum phosphatase level in patients with prostate cancer, and adjust dosage as appropriate.

- Monitor calcium, glucose, and folic acid levels.

### Patient teaching

 Teach patient to recognize and immediately report signs and symptoms of thromboembolism.

 Caution patient not to take drug if she is or plans to become pregnant.

- Teach patient how to perform breast self-examination. Emphasize importance of monthly checks.

- Tell patient to report breakthrough vaginal bleeding.

- Mention that drug may cause contact lens intolerance. Advise patient to report vision changes.

- Inform male patient that drug may cause gynecomastia.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

e

## eszopiclone

Lunesta

**Pharmacologic class:** Nonbenzodiazepine

**Therapeutic class:** Hypnotic

**Controlled substance schedule** IV

**Pregnancy risk category** C

### Action

Unclear. Effect may result from interaction with GABA-receptor complexes at binding domains near or allosterically coupled with benzodiazepine receptors.

### Availability

*Tablets*: 1 mg, 2 mg, 3 mg

### Indications and dosages

 Insomnia

**Nonelderly adults:** 2 mg P.O. immediately before bedtime. Drug may be initiated at, or dosage may be increased to, 3 mg if indicated clinically. In patients also receiving potent CYP3A4 inhibitors, starting dosage shouldn't exceed 1 mg.

**Elderly adults:** 1 mg P.O. immediately before bedtime. Dosage may be increased to 2 mg if indicated clinically. If patient's chief complaint is difficulty staying asleep, recommended dosage is 2 mg P.O. immediately before bedtime.

### Dosage adjustment

- Hepatic impairment
- Concomitant use of other CNS depressants

## Contraindications

None

## Precautions

Use cautiously in:

- hepatic impairment, respiratory compromise, depression
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

## Administration

- Don't give with or immediately after a heavy, high-fat meal because this may slow drug absorption and reduce efficacy.

Route	Onset	Peak	Duration
P.O.	Unknown	1 hr	6 hr

## Adverse reactions

**CNS:** headache, anxiety, confusion, depression, dizziness, hallucinations, nervousness, abnormal dreams

**CV:** chest pain, peripheral edema

**GI:** nausea, vomiting, diarrhea, dyspepsia, cholelithiasis, dry mouth

**GU:** urinary tract infection, decreased libido, dysmenorrhea, gynecomastia (in males)

**Respiratory:** respiratory infection

**Skin:** rash, pruritus

**Other:** unpleasant taste, viral infection, neuralgia, facial edema, allergic reaction

## Interactions

**Drug-drug.** *CYP3A4 inhibitors (such as itraconazole, ketoconazole, ritonavir, troleanomycin):* increased eszopiclone blood level

*CYP3A4 inducers (such as rifampin):* decreased eszopiclone blood level

**Drug-food.** *Heavy, high-fat meal:* slowed drug absorption and reduced efficacy

**Drug-behaviors.** *Alcohol use:* additive effects on psychomotor performance

## Patient monitoring

- Before starting therapy, evaluate patient to help eliminate physical or psychiatric causes of insomnia.
- Know that after rapid dosage decrease or abrupt drug withdrawal, patient may experience signs and symptoms similar to those associated with withdrawal from other CNS depressants.

## Patient teaching

- Instruct patient not to take drug with or immediately after a heavy, high-fat meal.
- Advise patient to take drug immediately before bedtime; otherwise, short-term memory impairment, hallucinations, incoordination, dizziness, and light-headedness may occur.
- Caution patient not to engage in hazardous activities after taking drug.
- Tell patient drug may have some effect the next day; advise him to use extreme care when driving or performing other hazardous activities until drug effects are known.
- Caution patient not to take drug with other psychotropics, anticonvulsants, antihistamines, or other drugs that cause CNS depression.
- Advise patient not to take drug with alcohol.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, foods, and behaviors mentioned above.

## etanercept

Enbrel

**Pharmacologic class:** Immunomodulator

**Therapeutic class:** Antiarthritic

**Pregnancy risk category B**

**FDA BOXED WARNING**

- Patients treated with etanercept are at increased risk for developing serious infections that may lead to hospitalization or death. Most patients who developed these infections were taking concomitant immunosuppressants, such as methotrexate or corticosteroids. Etanercept should be discontinued if patient develops a serious infection or sepsis. Reported infections include:

Active tuberculosis (TB), including reactivation of latent TB. Patients have frequently presented with disseminated or extrapulmonary disease. Patients should be tested for latent TB before etanercept use and during therapy. Treatment for latent infection should be initiated before etanercept use.

Invasive fungal infections, including histoplasmosis, coccidioidomycosis, candidiasis, aspergillosis, blastomycosis, and pneumocystosis. Patients with histoplasmosis or other invasive fungal infections may present with disseminated, rather than localized, disease. Antigen and antibody testing for histoplasmosis may be negative in some patients with active infection. Empiric antifungal therapy should be considered in patients at risk for invasive fungal infections who develop severe systemic illness. Bacterial, viral, and other infections due to opportunistic pathogens, including *Legionella* and *Listeria* species.

- Risks and benefits of treatment with etanercept should be carefully considered before starting therapy in patients with chronic or recurrent infection.
- Closely monitor patients for signs and symptoms of infection during and after treatment with etanercept, including the possible development of TB in patients who tested negative

for latent TB before starting therapy.

- Lymphoma and other malignancies, some fatal, have been reported in children and adolescents treated with tumor necrosis factor blockers, including etanercept.

**Action**

Reacts with and deactivates free-floating tumor necrosis factor, responsible for inflammation

**Availability**

*Powder for injection:* 25 mg in multiple-use vial

*Prefilled syringe (single-use):* 50 mg/ml

**Indications and dosages**

➤ Moderately to severely active rheumatoid arthritis; ankylosing spondylitis; psoriatic arthritis

**Adults:** 50 mg subcutaneously q week given as a single injection. Dosages above 50 mg/week are not recommended.

➤ Chronic moderate to severe plaque psoriasis

**Adults ages 18 and older:** 50 mg subcutaneously twice weekly (given 3 or 4 days apart) for 3 months, followed by reduction to a maintenance dosage of 50 mg weekly

➤ Polyarticular-course juvenile rheumatoid arthritis

**Children ages 4 to 17:** 0.8 mg/kg subcutaneously q week, to a maximum of 50 mg weekly

**Contraindications**

- Hypersensitivity to drug or its components
- Sepsis

**Precautions**

Use cautiously in:

- immunosuppression, chronic infection, heart failure

e

- latex allergy (needle cover of diluent syringe contains latex)
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 4.

### Administration

- Inject subcutaneously into thigh, abdomen, or upper arm.
- For adult, use single-use, 50 mg/ml prefilled syringe.
- For child weighing 63 kg (138 lb) or more, use single-use, 50 mg/ml prefilled syringe for weekly dose; for child weighing 31 to 62 kg (68 to 137 lb), administer total weekly dose from multiple-use vial as two injections on same day or 3 or 4 days apart; for child weighing less than 31 kg (68 lb), give as a single weekly injection using multiple-use vial.
- Rotate injection sites.

Route	Onset	Peak	Duration
Subcut.	Slow	72 hr	Unknown

### Adverse reactions

**CNS:** asthenia, headache, depression, dizziness, paresthesia, fatigue, demyelinating disorders (such as multiple sclerosis and myelitis), **cerebral hemorrhage, seizures, cerebrovascular accident (CVA)**

**CV:** hypotension, hypertension, chest pain, **deep-vein thrombosis, thrombophlebitis, myocardial ischemia, myocardial infarction (MI), heart failure**

**EENT:** ocular inflammation, pharyngitis, rhinitis, sinusitis

**GI:** nausea, vomiting, diarrhea, abdominal pain, dyspepsia, anorexia, cholecystitis, **abdominal abscess, GI hemorrhage, intestinal perforation,**

**pancreatitis**

**GU:** pyelonephritis, membranous glomerulonephropathy

**Hematologic:** anemia, **aplastic anemia, leukopenia, pancytopenia, thrombocytopenia**

**Metabolic:** hypomagnesemia

**Musculoskeletal:** bursitis, polymyositis, joint pain

**Respiratory:** cough, congestion, dyspnea, bronchitis, pneumonia, **pulmonary embolism, interstitial lung disease**

**Skin:** flushing, cellulitis, pruritus, rash, cutaneous vasculitis, urticaria, alopecia, angioedema

**Other:** altered taste, weight gain, adenopathy, fever, irritation at injection site, peripheral edema, flulike symptoms, autoantibody formation, **lupus-like syndrome, serious infections, malignancies**

### Interactions

None significant

### Patient monitoring

 Watch for signs and symptoms of malignancies, pancytopenia and infection.

 Monitor for evidence of GI bleeding, lupus-like syndrome, and serious hypersensitivity reactions. Stop therapy immediately if these occur.

- Monitor CBC and coagulation studies.

 Check for signs and symptoms of cardiac compromise and cerebrovascular events.

- Monitor pulmonary function test results periodically to assess lung status.

- Assess patient's ability to self-administer drug.

- Check for irritation at injection site. As needed, apply cool compresses.

- Examine eyes for conjunctival dryness. As needed, apply artificial tears.

### Patient teaching

 Tell patient to withhold dose and contact prescriber if he develops signs or symptoms of infection or is exposed to anyone with chickenpox.

 Tell patient to immediately report hypersensitivity reaction, neurologic or respiratory problems, sudden weight gain, chest pain, or easy bruising or bleeding.

- Teach patient or caregiver how to administer drug and handle and dispose of equipment.
- Caution patient not to get live-virus vaccines.
- Tell female to inform prescriber if she is pregnant or breastfeeding.
- Advise patient to expect redness, swelling, and pain at injection site. Assure him that these problems will diminish over time.
- As appropriate, review all other significant and life-threatening adverse reactions mentioned above.

## ethambutol hydrochloride

Etibi<sup>\*</sup>, Myambutol

**Pharmacologic class:** Synthetic anti-tubercular

**Therapeutic class:** Antitubercular, antileprotic

**Pregnancy risk category B**

### Action

Unknown. Thought to interfere with RNA synthesis of bacterial metabolites, decreasing mycobacterial replication.

### Availability

Tablets: 100 mg, 400 mg

### Indications and dosages

➤ Adjunct in tuberculosis and atypical mycobacterial infection caused by *Mycobacterium tuberculosis*

**Adults and adolescents:** In patients who haven't received previous antitubercular therapy, 15 mg/kg P.O. daily. In patients who have received previous antitubercular therapy, 25

mg/kg P.O. daily, decreased after 60 days to 15 mg/kg daily.

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to drug

### Precautions

Use cautiously in:

- impaired renal or hepatic function, cataracts, optic neuritis, recurrent eye inflammation, diabetic retinopathy, gout
- pregnant patients
- children younger than age 13.

### Administration

- Obtain specimens for culture and sensitivity testing, as necessary, before starting therapy and periodically throughout therapy.
- Give with food.

Route	Onset	Peak	Duration
P.O.	Rapid	2-4 hr	24 hr

### Adverse reactions

**CNS:** confusion, disorientation, malaise, dizziness, hallucinations, headache, peripheral neuritis

**EENT:** optic neuritis, blurred vision, decreased visual acuity, red-green color blindness, eye pain

**GI:** nausea, vomiting, abdominal pain, GI upset, anorexia

**Hematologic:** eosinophilia, **thrombocytopenia**

**Hepatic:** transient hepatic impairment

**Metabolic:** hyperuricemia, **hypoglycemia**

**Musculoskeletal:** joint pain, gouty arthritis

**Respiratory:** bloody sputum, **pulmonary infiltrates**

**Skin:** rash, pruritus, toxic epidermal necrolysis

**Other:** fever, **anaphylactoid reactions**

## Interactions

**Drug-drug.** *Aluminum salts:* delayed and reduced ethambutol absorption  
*Other neurotoxic drugs:* increased risk of neurotoxicity

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, bilirubin, uric acid:* increased levels  
*Glucose:* decreased level

## Patient monitoring

 Watch for serious adverse reactions, such as thrombocytopenia, respiratory problems, and anaphylactoid reactions.

- Monitor liver function tests, CBC, and blood urea nitrogen, creatinine glucose, and serum uric acid levels.
- Give analgesics for drug-induced pain, as prescribed.
- Observe for signs and symptoms of gout.

## Patient teaching

- Instruct patient to take with 8 oz of water. If stomach upset occurs, advise him to take with food.
- If patient must take antacids, advise him to take only aluminum-free antacids.
-  Tell patient to immediately report easy bruising or bleeding, respiratory problems, or signs and symptoms of hypersensitivity reactions.
- Advise patient to report vision changes and to have annual eye exams. Reassure him that visual disturbances will subside within several weeks to months after drug is discontinued.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## etidronate disodium

Didronel, Didronel PMO 

**Pharmacologic class:** Bisphosphonate

**Therapeutic class:** Bone resorption inhibitor, hypocalcemic agent

**Pregnancy risk category B**

## Action

Blocks calcium absorption, slowing bone metabolism and reducing bone resorption and formation

## Availability

*Tablets:* 200 mg, 400 mg

## Indications and dosages

➤ Paget's disease

**Adults:** 5 to 10 mg/kg P.O. daily as a single dose for up to 6 months, or 11 to 20 mg/kg P.O. daily for up to 3 months

➤ Heterotopic ossification after hip replacement

**Adults:** 20 mg/kg P.O. daily for 1 month before and 3 months after surgery

➤ Heterotopic ossification in spinal cord injury

**Adults:** Initially, 20 mg/kg P.O. daily for 2 weeks, decreased to 10 mg/kg P.O. daily for 10 weeks

## Dosage adjustment

- Decreased glomerular filtration rate

## Contraindications

- Hypersensitivity to drug or its components
- Abnormalities of esophagus, such as stricture or achalasia, that delay esophageal emptying
- Osteomalacia

## Precautions

Use cautiously in:

- renal impairment, long bone fractures, active upper GI condition (such as Barrett's esophagus, dysphagia,

other esophageal diseases, gastritis, duodenitis, or ulcers)

- pregnant or breastfeeding patients
- children (safety not established).

### Administration

- Give with 6 to 8 oz of water 2 hours before first meal.
- Make sure patient doesn't eat for 2 hours after receiving dose.
- Know that therapy longer than 3 months is not recommended.

Route	Onset	Peak	Duration
P.O. (Paget's)	1 mo	Unknown	1 yr
P.O. (ossif.)	Unknown	Unknown	Several mo

### Adverse reactions

**GI:** nausea, constipation, stomatitis, diarrhea, esophageal irritation

**Metabolic:** hyperphosphatemia

**Musculoskeletal:** bone pain and tenderness, fractures, osteonecrosis of the jaw

**Skin:** rash

### Interactions

**Drug-drug.** *Warfarin:* increased prothrombin time

**Drug-diagnostic tests.** *Serum phosphorus:* increased level

### Patient monitoring

- Monitor fluid intake and output.
- Monitor patient for GI discomfort. Divide doses as needed to ease symptoms.
- Assess bowel pattern. If constipation occurs, increase fluids and administer stool softeners, as prescribed.
- Closely monitor renal function tests and serum phosphorus level.

### Patient teaching

- Instruct patient to take drug first thing in morning on an empty stomach, with 6 to 8 oz of water only and to

stay upright for at least 30 minutes afterward.

- Instruct patient not to take drug with food because of decreased drug absorption.

- Tell patient not to consume high-calcium products, such as milk or antacids, or vitamins and mineral supplements high in calcium, iron, magnesium, or aluminum, within 2 hours of taking dose.

 Tell patient to immediately discontinue drug and notify prescriber if severe chest pain, difficulty or painful swallowing, or new or worsening heartburn occurs.

- Advise patient to report bone pain or decreased range of motion.

- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## etodolac

Apo-Etodolac<sup>☼</sup>, Eccoxolac<sup>☼</sup>, Gen-Etodolac<sup>☼</sup>, Taro-Ultradol, Ultradol<sup>☼</sup>

**Pharmacologic class:** Pyranocarboxylic acid, nonsteroidal anti-inflammatory drug (NSAID)

**Therapeutic class:** Nonopioid analgesic

**Pregnancy risk category C** (first and second trimesters), **D** (third trimester)

### FDA BOXED WARNING

- Drug may increase risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, which can be fatal. Risk may increase with duration of use. Patients with cardiovascular disease or risk factors for it may be at greater risk.

- Drug is contraindicated for perioperative pain in setting of coronary artery bypass graft surgery.
- Drug increases risk of serious adverse GI events, including bleeding, ulcers, and perforation of stomach or intestines, which can be fatal. Elderly patients are at greater risk.

### Action

Blocks activity of cyclooxygenase (which is needed for prostaglandin synthesis), easing pain and reducing inflammation

### Availability

*Capsules:* 200 mg, 300 mg

*Tablets:* 400 mg, 500 mg

*Tablets (extended-release):* 400 mg, 500 mg, 600 mg

### Indications and dosages

➤ Osteoarthritis; rheumatoid arthritis

**Adults:** 300 mg P.O. two or three times daily; or 400 mg, 500 mg, or 600 mg P.O. b.i.d.; or 400 to 1,000 mg P.O. (extended-release tablets) once daily

➤ Mild to moderate pain

**Adults:** 200 to 400 mg P.O. q 6 to 8 hours, not to exceed 1,200 mg/day

### Contraindications

- Hypersensitivity to drug or its components
- Concurrent use of other NSAIDs
- Active GI bleeding or ulcer disease

### Precautions

Use cautiously in:

- severe cardiovascular, renal, or hepatic disease
- elderly patients
- breastfeeding patients
- children (safety not established).

### Administration

- Give with food or antacids to reduce GI upset.

- Make sure patient swallows extended-release tablets whole without crushing or chewing.
- Withhold drug several days before invasive surgery, as ordered.

Route	Onset	Peak	Duration
P.O.	30 min	1-2 hr	4-12 hr
P.O. (extended)	Unknown	3-12 hr	6-12 hr

### Adverse reactions

**CNS:** dizziness, malaise, weakness, depression, nervousness

**CV:** hypertension

**EENT:** blurred vision, tinnitus

**GI:** nausea, vomiting, constipation, diarrhea, flatulence, dyspepsia, peptic ulcer, duodenitis, intestinal ulceration, gastritis, melena

**GU:** dysuria, urinary frequency, polyuria, **renal failure**

**Hematologic: thrombocytopenia**

**Hepatic:** cholestatic jaundice, **cholestatic hepatitis, hepatic necrosis**

**Skin:** rash, skin peeling, cutaneous vasculitis with purpura, hyperpigmentation

**Other:** fluid retention, chills, fever, allergic reaction

### Interactions

**Drug-drug:** *Aminoglycosides:* elevated aminoglycoside blood level (in premature infants)

*Anticoagulants:* prolonged prothrombin time

*Beta-adrenergic blockers:* reduced anti-hypertensive effect

*Bisphosphonates:* increased risk of gastric ulcers

*Cholestyramine:* decreased etodolac absorption

*Cyclosporine:* increased risk of nephrotoxicity

*Diuretics:* decreased diuretic effect

*Lithium:* increased lithium blood level, greater risk of toxicity

*Methotrexate:* increased risk of methotrexate toxicity

*Phenylbutazone*: increased etodolac effects

*Phenytoin*: increased phenytoin blood level

*Salicylates*: decreased etodolac blood level

**Drug-diagnostic tests.** *Bleeding time*: prolonged

*Blood urea nitrogen (BUN), creatinine, hepatic enzymes*: increased levels

*Urine bilirubin, urine ketones*: false-positive results

**Drug-herbs.** *Arnica, chamomile, clove, dong quai, feverfew, garlic, ginkgo, ginseng*: increased risk of bleeding

*White willow*: increased etodolac effects

**Drug-behaviors.** *Alcohol use*: increased risk of adverse effects

*Sun exposure*: phototoxicity

### Patient monitoring

- Monitor CBC, liver function tests, BUN, creatinine level, and coagulation studies.

- Assess for GI bleeding and gastric upset. Administer antacids as needed and prescribed.

- Know that drug may cause false-positive urine bilirubin and urine ketone test results.

-  Monitor patient for signs and symptoms of thrombocytopenia and increased bleeding time.

- Assess for fluid retention and weigh patient daily.

- Watch for decreased blood pressure control in hypertensive patients.

### Patient teaching

- Instruct patient to take with meals if possible.

- Tell patient to swallow extended-release tablets whole without crushing or chewing.

-  Instruct patient to immediately report unusual bleeding or bruising, change in urination pattern, unusual tiredness, or yellowing of skin or eyes.

- Advise patient to avoid activities that can cause injury.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

e

## etonogestrel and ethinyl estradiol vaginal ring

NuvaRing

**Pharmacologic class:** Sex hormone

**Therapeutic class:** Contraceptive

**Pregnancy risk category** X

### FDA BOXED WARNING

- Cigarette smoking increases risk of serious cardiovascular adverse effects from combination oral contraceptive use. This risk increases with age and with heavy smoking (15 or more cigarettes daily) and is quite marked in women older than age 35. Women who use combination hormonal contraceptives, including NuvaRing, should be strongly advised not to smoke.

### Action

Inhibits ovulation by altering cervical mucosa and endometrium of uterus. This inhibition prevents sperm from entering the uterus, thereby preventing implantation.

### Availability

*Vaginal ring*: 0.12 mg etonogestrel and 0.015 mg ethinyl estradiol delivered daily over 3 weeks

### Indications and dosages

 To prevent pregnancy

**Adults:** Place one ring into vagina and leave in place for 3 weeks, then remove

for 1 week. Insert next ring on same day of week as in previous cycle.

### Contraindications

- Hypersensitivity to drug or its components
- Breast and uterine cancers or other known or suspected estrogen-dependent neoplasms
- Valvular heart disease with complications
- Thromboembolic disease (current or previous)
- Severe hypertension
- Diabetes with vascular involvement
- Headache with focal neurologic symptoms
- Hepatic tumors, cholestatic jaundice
- Major surgery with prolonged immobilization
- Undiagnosed vaginal bleeding
- Patients older than age 35 who smoke more than 15 cigarettes daily
- Pregnancy or breastfeeding

### Precautions

Use cautiously in:

- underlying cardiovascular disease, severe hepatic or renal disease, asthma, bone disease, migraines, breast disease, seizures, sexually transmitted diseases
- family history of breast or genital tract cancers.

### Administration

- Be aware that the best way to insert ring is with patient lying down, squatting, or standing and one leg raised.

Route	Onset	Peak	Duration
Vaginal	Rapid	Unknown	Unknown

### Adverse reactions

**CNS:** headache, migraines, dizziness, lethargy, depression, **increased risk of cerebrovascular accident, seizures**  
**CV:** hypertension, **myocardial infarction, thromboembolism**  
**EENT:** worsening of myopia or astigmatism

**GI:** nausea, vomiting, abdominal cramps, bloating, **pancreatitis**

**GU:** amenorrhea, dysmenorrhea, cervical erosion, breakthrough bleeding, loss of libido, vaginal candidiasis, erectile dysfunction, testicular atrophy, breast tenderness, breast enlargement or secretion, **increased risk of endometrial and breast cancer**

**Hepatic:** cholestatic jaundice, **hepatic adenoma**

**Metabolic:** sodium and fluid retention

**Respiratory:** **pulmonary embolism**

**Other:** increased appetite, weight changes, edema

### Interactions

**Drug-drug.** *Acetaminophen:* decreased acetaminophen blood level

*Anti-infectives, barbiturates, carbamazepine, fosphenytoin, rifampin:* decreased contraceptive efficacy

*Corticosteroids:* increased corticosteroid effects

*Cyclosporine:* increased risk of cyclosporine toxicity

*CYP3A4 inhibitors (such as itraconazole, ketoconazole):* increased hormone levels

*Dantrolene, other hepatotoxic drugs:*

increased risk of hepatotoxicity

*Hypoglycemics, warfarin:* altered requirements for these drugs

*Miconazole (vaginal capsules):* increased hormone levels

*Phenytoin:* loss of seizure control

*Protease inhibitors:* increased contraceptive metabolism

*Tamoxifen:* interference with tamoxifen efficacy

*Tricyclic antidepressants:* reduced antidepressant effects

**Drug-diagnostic tests.** *Antithrombin III, folate, low-density lipoproteins, pyridoxine, total cholesterol:* decreased levels

*Cortisol; factors VII, VIII, IX, and X; glucose; high-density lipoproteins; phospholipids; prolactin; prothrombin;*

*sodium; triglycerides:* increased levels

**Drug-food.** *Caffeine:* increased caffeine blood level

**Drug-herbs.** *Black cohosh*: increased risk of adverse reactions

*Red clover*: interference with contraceptive action

*Saw palmetto*: antiestrogenic effects

*St. John's wort*: decreased contraceptive blood level and effects

**Drug-behaviors.** *Smoking*: increased risk of adverse cardiovascular reactions

### Patient monitoring

📣 Monitor CNS status. Report adverse CNS reactions immediately.

📣 Assess blood pressure frequently. If significant elevation of blood pressure occurs, discontinue NuvaRing.

- Monitor patient for depression.

📣 Watch for jaundice and liver engorgement; be aware that combination hormonal contraceptives may worsen existing gallbladder disease and may accelerate development of this disease in previously asymptomatic women. Discontinue drug if jaundice develops.

📣 Be aware that retinal thrombosis has been associated with the use of hormonal contraceptives. Discontinue NuvaRing if unexplained partial or complete loss of vision, onset of proptosis or diplopia, papilledema, or retinal vascular lesions occur. Take appropriate diagnostic and therapeutic measures immediately.

- Monitor glucose, calcium, and electrolyte levels and lipid profile.

### Patient teaching

- Explain that for continued contraception, a new implant must be inserted exactly 1 week after old one is removed, even if patient is menstruating.

- Tell patient to insert and remove ring on same day of week and at same time of day.

- Tell patient that if ring slips out, she should replace it within 3 hours to ensure adequate contraceptive protection.

- Inform patient that smoking during therapy may increase risk of blood clots, phlebitis, and stroke.

📣 Tell patient to immediately report signs and symptoms of depression, sudden chest pain, difficulty breathing, or yellowing of skin or eyes.

📣 Tell patient to stop drug and immediately report unexplained partial or complete loss of vision, onset of proptosis or diplopia, papilledema, or retinal vascular lesions.

- Teach patient how to perform breast self-examinations. Emphasize importance of monthly checks.

- Tell patient that this product doesn't protect against HIV infection (AIDS) and other sexually transmitted diseases.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

### etoposide (VP-16-213)

Eposin , Toposar, VePesid

### etoposide phosphate

Etopophos

**Pharmacologic class:** Podophyllotoxin derivative

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

- Give under supervision of physician experienced in cancer chemotherapy. Severe myelosuppression may occur, resulting in infection or bleeding.

**Action**

Damages DNA before mitosis by inhibiting topoisomerase II enzyme. This action impairs DNA synthesis and inhibits selected cancer cell growth. Cell-cycle-phase specific.

**Availability**

*Capsules:* 50 mg

*Injection:* 20 mg/ml

*Powder for injection (phosphate):* 100 mg in single-dose vials

**Indications and dosages**

➤ Testicular cancer

**Adults:** 50 to 100 mg/m<sup>2</sup> I.V. daily for 5 days. Or 100 mg/m<sup>2</sup> I.V. on days 1, 3, and 5, with course repeated q 3 to 4 weeks.

➤ Small-cell carcinoma of lung

**Adults:** 70 mg/m<sup>2</sup> (rounded up or down to nearest 50 mg) P.O. daily for 4 days, then a maximum of 100 mg/m<sup>2</sup> (rounded up or down to nearest 50 mg) P.O. daily for 5 days every 3 to 4 weeks. Alternatively, 35 mg/m<sup>2</sup> I.V. daily for 4 days, then a maximum of 50 mg/m<sup>2</sup> I.V. daily for 5 days q 3 to 4 weeks.

**Dosage adjustment**

• Renal impairment

**Off-label uses**

- AIDS-related Kaposi's sarcoma
- Wilms' tumor
- Neuroblastoma
- Malignant lymphoma
- Hodgkin's disease
- Ovarian neoplasms

**Contraindications**

• Hypersensitivity to drug or its components

**Precautions**

Use cautiously in:

- active infections, decreased bone marrow reserve, renal or hepatic impairment
- pregnant patients and patients with childbearing potential
- breastfeeding patients

• children (safety and efficacy not established).

**Administration**

• For I.V. concentrations above 0.4 mg/ml, mix each 100 mg with 250 to 500 ml of dextrose 5% in water or normal saline solution, to help prevent crystallization.

• Give I.V. infusion over 30 to 60 minutes. Don't use in-line filter.

⚠ Avoid rapid infusion, which may cause severe hypotension and bronchospasm.

• Administer with antiemetics, as prescribed.

• Wear disposable gloves when handling. If drug comes into contact with skin, wash thoroughly with soap and water.

• Be aware that drug is given with other chemotherapeutic agents.

Route	Onset	Peak	Duration
P.O., I.V.	7-14 days	9-16 days	20 days

**Adverse reactions**

**CNS:** drowsiness, fatigue, headache, vertigo, peripheral neuropathy

**CV:** hypotension (with I.V. use), **heart failure, myocardial infarction**

**GI:** nausea, vomiting, stomatitis

**GU:** sterility

**Hematologic:** anemia, **leukopenia, thrombocytopenia, bone marrow depression**

**Hepatic:** **hepatotoxicity**

**Metabolic:** hyperuricemia

**Musculoskeletal:** muscle cramps

**Respiratory:** **pulmonary edema, bronchospasm**

**Other:** alopecia, fever, phlebitis at I.V. site, allergic reactions including **anaphylaxis**

**Interactions**

**Drug-drug.** *Live-virus vaccines:*

increased risk of adverse reactions

*Other antineoplastics:* additive bone marrow depression

**Drug-diagnostic tests.** *Hemoglobin, neutrophils, platelets, red blood cells, white blood cells:* decreased values  
*Uric acid:* increased level

### Patient monitoring

- 🔊 Monitor blood pressure during and after infusion. Stop infusion if severe hypotension occurs.
- With I.V. use, monitor infusion rate closely to prevent infusion reactions.
- Throughout infusion, check I.V. site for extravasation, which may cause thrombophlebitis.
- 🔊 Keep diphenhydramine, hydrocortisone, epinephrine, and artificial airway at hand in case anaphylaxis occurs.
- Assess for CNS adverse effects. Assist patient during ambulation as needed.
- 🔊 Monitor for signs and symptoms of bone marrow depression.
- Monitor CBC, liver function tests, and blood urea nitrogen and creatinine levels. Report platelet count below 50,000/mm<sup>3</sup> or neutrophil count below 500/mm<sup>3</sup>.

### Patient teaching

- Instruct patient to inspect mouth daily for ulcers and bleeding gums.
- 🔊 Tell patient to immediately report difficulty breathing or signs and symptoms of allergic reaction.
- 🔊 Caution female of childbearing age to avoid pregnancy and breastfeeding during drug therapy.
- Instruct patient to move slowly when sitting up or standing, to avoid lightheadedness or dizziness from sudden blood pressure decrease.
- Tell patient drug may cause hair loss.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## etravirine

Intelence

**Pharmacologic class:** Nonnucleoside reverse transcriptase inhibitor (NNRTI)

**Therapeutic class:** Antiretroviral

**Pregnancy risk category B**

### Action

Blocks human immunodeficiency virus (HIV) reverse transcriptase, an enzyme necessary for HIV replication. Blockade leads to reduced viral load and increased CD4+ cell count, which in turn help prevent other infections when drug is given with other antiretrovirals.

### Availability

*Tablets:* 25 mg, 100 mg, 200 mg

### Indications and dosages

➤ HIV-1 infection in antiretroviral treatment-experienced patients age 6 and older who have evidence of viral replication and HIV-1 strains resistant to an NNRTI and other antiretrovirals, given in combination with other antiretrovirals

**Adults and children ages 6 to younger than 18 weighing 30 kg (66 lb) or more:** 200 mg P.O. b.i.d.

**Children ages 6 to younger than 18 weighing 25 kg (55 lb) to less than 30 kg:** 150 mg P.O. b.i.d.

**Children ages 6 to younger than 18 weighing 20 kg (44 lb) to less than 25 kg:** 125 mg P.O. b.i.d.

**Children ages 6 to younger than 18 weighing 16 kg (35 lb) to less than 20 kg:** 100 mg P.O. b.i.d.

Children's dosages shouldn't exceed the recommended adult dosage.

### Contraindications

None

**Precautions**

Use cautiously in:

- elderly patients
- pregnant or breastfeeding patients
- children younger than age 6 (safety and efficacy not established).

**Administration**

- Administer after a meal.

 Don't give with tipranavir/ritonavir, fosamprenavir/ritonavir, atazanavir/ritonavir, protease inhibitors administered without ritonavir, other NNRTIs, or St. John's wort.

Route	Onset	Peak	Duration
P.O.	Unknown	2.5-4 hr	Unknown

**Adverse reactions**

**CNS:** paresthesia, somnolence, seizure, hypoesthesia, amnesia, hypersomnia, tremor, disorientation, insomnia, anxiety, sleep disorder, abnormal dreams, confusional state, nervousness, nightmares, fatigue, peripheral neuropathy, headache, **hemorrhagic stroke**

**CV:** syncope, angina pectoris, hypertension, **myocardial infarction, atrial fibrillation**

**EENT:** blurred vision, vertigo

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, gastroesophageal reflux disease, flatulence, gastritis, abdominal distention, retching, hematemesis, stomatitis, pancreatitis, anorexia, dry mouth

**GU:** gynecomastia, **renal failure**

**Hematologic:** anemia, **hemolytic anemia**

**Hepatic:** **cytolytic hepatitis, hepatic steatosis, hepatitis, hepatomegaly**

**Metabolic:** diabetes mellitus, dyslipidemia, body fat redistribution or accumulation

**Respiratory:** exertional dyspnea, bronchospasm

**Skin:** rash, hyperhidrosis, prurigo, dry skin, lipohypertrophy, lipodystrophy, **Stevens-Johnson syndrome, erythema multiforme**

**Other:** sluggishness, night sweats, facial edema, immune reconstitution syndrome, hypersensitivity reaction, **angioneurotic edema**

**Interactions**

**Drug-drug.** *Amiodarone, bepridil, disopyramide, flecainide, lidocaine (systemic), lovastatin, mexiletine, propafenone, quinidine, simvastatin:*

decreased blood levels of these drugs  
*Atazanavir/ritonavir:* significant decrease in atazanavir blood level with loss of atazanavir therapeutic effect  
*Atorvastatin:* possible increase in effects of both drugs

*Carbamazepine, dexamethasone (systemic), efavirenz, nevirapine, phenobarbital, phenytoin, rifabutin, rifampin, rifapentine, ritonavir, tipranavir/ritonavir:* significant decrease in etravirine blood level and loss of therapeutic effect  
*Clarithromycin:* decreased clarithromycin blood level

*Diazepam, fluvastatin, voriconazole, warfarin:* increased blood levels of these drugs

*Fluconazole, lopinavir/ritonavir, posaconazole:* increased etravirine blood level

*Immunosuppressants (cyclosporine, sirolimus, tacrolimus):* possible change in blood levels of these drugs

*Itraconazole, ketoconazole:* decreased blood levels of these drugs, increased etravirine blood level

*Methadone:* possible change in methadone effects

*Protease inhibitors (amprenavir, atazanavir, indinavir, nelfinavir) given without low-dose ritonavir:* significant change in blood levels of these drugs

*Saquinavir/ritonavir:* reduced etravirine blood level

*Sildenafil:* possible decrease in sildenafil effect

**Drug-diagnostic tests.** *ALP, amylase, AST, cholesterol, creatinine, glucose, lipase, low-density lipoproteins, triglycerides:* increased levels

*Hemoglobin, neutrophils, platelets:* decreased levels

**Drug-food.** *Any food:* increased etravirine levels

**Drug-herbs.** *St. John's wort:* significant decrease in etravirine blood level and loss of therapeutic effect

### Patient monitoring

🔊 Monitor patient closely for rash; discontinue therapy if severe rash develops.

- Be aware that immune reconstitution syndrome may occur in patients receiving combination antiretroviral therapy. During initial phase of therapy, patient whose immune system responds may develop inflammatory response to indolent or residual opportunistic infections (such as *Mycobacterium avium* complex, cytomegalovirus, *Pneumocystis jiroveci* pneumonia, and tuberculosis), which may necessitate further evaluation and treatment.
- Monitor International Normalized Ratio when giving drug concomitantly with warfarin.
- Watch for new-onset diabetes mellitus, exacerbation of preexisting diabetes, and hyperglycemia.

### Patient teaching

- Tell patient to take drug after a meal exactly as prescribed.
- Instruct patient unable to swallow tablets whole to disperse tablets in glass of water, stir dispersion well, drink it immediately, then rinse glass with water several times and completely swallow each rinse to ensure that entire dose is consumed.
- Inform patient that drug doesn't cure HIV infection or reduce risk of passing HIV to others through sexual

contact, needle sharing, or blood exposure.

- Advise patient that drug may interact with many other drugs and herbs (especially St. John's wort). Tell patient to discuss use of other drugs and herbs with prescriber.

🔊 Advise patient to immediately report rash or new infections.

- Inform patient that drug may lead to body fat redistribution or accumulation and that the cause and long-term effects of these conditions are unknown.
- Advise female patient to notify prescriber if she is pregnant or intends to become pregnant.
- Because of potential HIV transmission and adverse reactions in breastfeeding infants, instruct women receiving this drug not to breastfeed.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## everolimus

Afinitor, Zortress

**Pharmacologic class:** mTOR inhibitor

**Therapeutic class:** Antineoplastic, macrolide immunosuppressant

**Pregnancy risk category D (Afinitor), C (Zortress)**

### FDA BOXED WARNING

- Only physicians experienced in immunosuppressive therapy and management of transplant patients should prescribe Zortress. Manage patient receiving this drug in a facility equipped and staffed with adequate laboratory and supportive medical

resources. Physician responsible for maintenance therapy should have complete information requisite for patient follow-up.

- Increased susceptibility to infection and possible development of malignancies may result from Zortress-induced immunosuppression.
- Increased nephrotoxicity can occur with use of standard doses of cyclosporine in combination with Zortress. Therefore, reduced doses of cyclosporine should be used to reduce nephrotoxicity. Closely monitor cyclosporine and Zortress whole blood trough concentrations.
- An increased risk of kidney arterial and venous thrombosis, resulting in graft loss, was reported in patients taking Zortress, mostly within first 30 days after transplantation.
- Increased mortality, often associated with serious infections, within first 3 months after transplantation was observed in a clinical trial of de novo heart transplant patients receiving immunosuppressive regimens with or without induction therapy. Use in heart transplantation isn't recommended.

### Action

Binds to intracellular proteins, resulting in an inhibitory (Afinitor) or immunosuppressive (Zortress) complex resulting in inhibition of mTOR kinase

### Availability

Tablets (Afinitor): 2.5 mg, 5 mg, 7.5 mg, 10 mg

Tablets (Zortress): 0.25 mg, 0.5 mg, 0.75 mg

### Indications and dosages

➤ Metastatic, locally advanced, or unresectable progressive neuroendocrine tumors of pancreatic origin; advanced renal cell carcinoma after failure of treatment with sunitinib or

sorafenib; renal angiomyolipoma and tuberous sclerosis complex

**Adults:** 10 mg (Afinitor) P.O. daily continued as long as clinical benefit is observed or until unacceptable toxicity occurs

➤ Subependymal giant cell astrocytoma (SEGA) requiring intervention in patients who aren't candidates for surgical intervention

**Adults and children age 3 and older with body surface area (BSA) of 2.2 m<sup>2</sup> or more:** 7.5 mg (Afinitor) P.O. daily

**Adults and children age 3 and older with BSA of 1.3 to 2.1 m<sup>2</sup>:** 5 mg (Afinitor) P.O. daily

**Adults and children age 3 and older with BSA of 0.5 to 1.2 m<sup>2</sup>:** 2.5 mg (Afinitor) P.O. daily

➤ Prophylaxis of organ rejection in kidney transplant patients at low-to-moderate immunologic risk

**Adults:** Initially, 0.75 mg (Zortress) P.O. b.i.d. in combination with basiliximab induction and concurrently with reduced doses of cyclosporine and corticosteroids. Adjust maintenance dosage to achieve Zortress trough concentration within 3- to 8-ng/ml target range at 4- to 5-day intervals. Start doses as soon as possible after transplant.

### Dosage adjustment

- Moderate hepatic impairment (Zortress)
- Mild, moderate, or severe hepatic impairment; change in hepatic status during therapy (Afinitor)
- Patients with SEGA who have severe hepatic impairment (Afinitor not recommended)
- Concurrent use of CYP3A4 inducers or inhibitors (Afinitor, Zortress)
- Concurrent use of moderate inhibitors of CYP3A4 or p-glycoprotein (PgP) (Afinitor)
- Strong CYP3A4 inducers (Afinitor)

- When switching cyclosporine formulations or when cyclosporine dosage is reduced according to recommended target concentrations (Zortress)
- Possible dosage adjustment based on everolimus blood concentrations achieved, tolerability, individual response, and change in concomitant medications (Afinitor, Zortress)

## Contraindications

- Hypersensitivity to drug, other rapamycin derivatives, or any of its components

## Precautions

### *Afinitor*

Use cautiously in:

- moderate hepatic impairment, renal failure
- severe hepatic impairment (use not recommended)
- noninfectious pneumonitis, infection, oral ulceration
- concurrent use of strong CYP3A4 inhibitors or inducers (avoid use)
- concurrent use of moderate CYP3A4 or Pgp inhibitors
- concurrent use of live vaccines, close contact with those who have received live vaccines (avoid use)
- grapefruit, grapefruit juice, other foods known to inhibit CYP450 and Pgp activity, St. John's wort
- pregnant or breastfeeding patients
- children with SEGA younger than age 3 or with BSA less than 0.58 m<sup>2</sup> (safety and efficacy not established).

### *Zortress*

Use cautiously in:

- moderate hepatic impairment, renal dysfunction
- noninfectious pneumonitis, infection, oral ulceration
- lymphoma, other malignancies
- rare hereditary problems of galactose intolerance, Lapp lactase deficiency, glucose-galactose malabsorption (avoid use)

- wound healing, fluid accumulation, hyperlipidemia, proteinuria, polyoma virus infections, noninfectious pneumonitis, thrombotic microangiopathy, thrombotic thrombocytopenic purpura, hemolytic uremic syndrome, new-onset diabetes, male infertility
- prolonged exposure to ultraviolet light and sunlight (avoid use)
- concurrent use of CYP3A4 and CYP2D6 substrates with narrow therapeutic index
- concurrent use of strong CYP3A4 inducer rifampin (not recommended)
- concurrent use of ACE inhibitors
- concurrent use of standard doses of cyclosporine (avoid use)
- concurrent use of HMG-CoA reductase inhibitors (such as simvastatin, lovastatin) in transplant patients receiving cyclosporine
- concurrent use of live vaccines, close contact with those who have received live vaccines (avoid use)
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

## Administration

- Administer tablets whole with a glass of water and food (not grapefruit juice or grapefruit products) or give consistently without food.
- Administer Zortress consistently approximately 12 hours apart to minimize variability in absorption and at same time as cyclosporine.
- For patient unable to swallow Afinitor tablets: Immediately before administering, disperse tablets completely in a glass of water (containing approximately 30 ml) by gently stirring. Rinse glass with same volume of water and have patient completely swallow rinse to ensure entire dose is administered.
- Before starting Afinitor, obtain CBC, renal function tests (including BUN, serum creatinine, or urinary protein), and fasting serum glucose and lipid

e

profile (when possible ensure optimal glucose and lipid control).

 Discontinue Afinitor therapy in patients with signs and symptoms of severe noninfectious pneumonitis.

 Before starting Afinitor, complete treatment of preexisting invasive fungal infections. During treatment, be vigilant for signs and symptoms of infection. If diagnosis of infection is made, institute appropriate treatment promptly and consider interrupting or discontinuing therapy. If diagnosis of invasive systemic fungal infection is made, discontinue drug and treat with appropriate antifungal therapy.

- Be aware that Afinitor isn't recommended for use in patients with SEGA who have severe hepatic impairment.
- Be aware that patients with galactose intolerance, Lapp lactase deficiency, or glucose-galactose malabsorption shouldn't take Zortress as this may result in diarrhea and malabsorption of drug.

Route	Onset	Peak	Duration
P.O.	Unknown	1-2 hr	Unknown

## Adverse reactions

### Afinitor

**CNS:** headache, migraine headache, fatigue, malaise, asthenia, dizziness, insomnia, paresthesia, personality change, somnolence, anxiety, **seizures**

**CV:** hypertension, tachycardia, **deep vein thrombosis, cardiac arrest, congestive heart failure**

**EENT:** eyelid edema, conjunctivitis, ocular hyperemia, otitis media, otitis externa, nasopharyngitis, rhinitis, allergic rhinitis, epistaxis, sinusitis, oropharyngeal pain, pharyngolaryngeal pain, rhinorrhea, pharyngitis, pharyngeal inflammation, nasal congestion

**GI:** nausea, vomiting, diarrhea, abdominal pain, stomatitis, oral ulcers, constipation, dry mouth, anorexia, hemorrhoids, dysphagia, gastroenteritis, gastric infection, gastritis

**GU:** urinary tract infection, proteinuria, **nephrotoxicity, acute renal failure**

**Hematologic:** anemia, decreased hemoglobin, leukopenia, lymphopenia, neutropenia, pancytopenia, **thrombocytopenia, hemorrhage**

**Hepatic: hepatic failure**

**Metabolic:** hyperglycemia, increased ALP, hypercholesterolemia, decreased bicarbonate, hypophosphatemia, increased AST and ALT, hypertriglyceridemia, hypocalcemia, hypokalemia, hyperkalemia, hyponatremia, increased serum creatinine, decreased albumin, increased bilirubin, new-onset exacerbation of preexisting diabetes mellitus

**Musculoskeletal:** arthralgia, back pain, extremity pain, muscle spasms, jaw pain

**Respiratory:** cough, upper respiratory tract infection, dyspnea, exertional dyspnea, **pneumonia, noninfectious pneumonitis, acute respiratory distress, pulmonary embolus, respiratory failure, pleural effusion**

**Skin:** rash, nail disorders, pruritus, dry skin, impaired wound healing, erythema, skin lesion, acneiform dermatitis, cellulitis, tinea, skin infection, contact dermatitis, acne, excoriation, pityriasis rosea

**Other:** mucosal inflammation, edema, peripheral edema, fluid accumulation, dehydration, fever, infections, weight loss, decreased appetite, dysgeusia, chest pain, chills, abnormal chest X-ray, palmar-plantar erythrodysesthesia syndrome, **sepsis, death (cause unknown), hypersensitivity reactions (including, but not limited to, anaphylaxis, dyspnea, flushing, chest pain, angioedema)**

### Zortress

**CNS:** fatigue, headache, tremor, insomnia

**CV:** hypertension

**GI:** nausea, vomiting, constipation, diarrhea, abdominal pain, dyspepsia

**GU:** urinary tract infection, proteinuria, male infertility, hematuria, dysuria

**Hematologic:** anemia, leukopenia, graft thrombosis, thrombotic microangiopathy, TTP, hemolytic uremic syndrome

**Hepatic:** increased hepatic enzymes and bilirubin

**Metabolic:** hyperlipidemia, increased serum creatinine, new-onset diabetes mellitus, exacerbation of preexisting diabetes mellitus, hyperkalemia, hypokalemia, hypercholesterolemia, dyslipidemia, hypomagnesemia, hypophosphatemia, hyperglycemia

**Musculoskeletal:** back pain, extremity pain

**Respiratory:** cough, upper respiratory tract infection, **noninfectious pneumonitis**

**Skin:** impaired wound healing

**Other:** peripheral edema, incision and procedural pain, fluid accumulation, fever, **serious infections, polyoma virus infections, lymphomas and other malignancies, angioedema, hypersensitivity**

## Interactions

### *Afinitor*

**Drug-drug.** *Depot octreotide:* increased octreotide  $C_{\min}$

*Moderate CYP3A4 and Pgp inhibitors (such as amprenavir, aprepitant, diltiazem, erythromycin, fluconazole, fosamprenavir, verapamil):* significantly increased everolimus exposure

*Strong CYP3A4 inducers (such as carbamazepine, phenobarbital, phenytoin, rifabutin, rifampin, rifapentine):* decreased everolimus exposure

*Strong CYP3A4 inhibitors (such as atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, voriconazole):* significantly increased everolimus exposure

**Drug-diagnostic tests.** *ALP, ALT, AST, blood glucose, cholesterol, serum*

*bilirubin, serum creatinine, lipids, triglycerides, urine proteins:* increased levels

*Bicarbonates, calcium, hemoglobin, platelets, serum albumin, serum phosphorus, sodium, WBCs:* decreased levels

*Potassium:* decreased or increased level

**Drug-food.** *Grapefruit, grapefruit juice, other foods known to inhibit CYP450 and Pgp:* increased everolimus exposure

**Drug-herbs.** *St. John's wort:* decreased everolimus exposure

### **Zortress**

**Drug-drug.** *CYP3A substrates (such as cyclosporine) and CYP2D6 substrates with narrow therapeutic indices:* potentially increased concentrations of these drugs

*CYP3A4 and Pgp substrates (verapamil):* significantly increased everolimus  $C_{\max}$  and area under the curve

*Moderate CYP3A4 and Pgp inhibitors (such as amprenavir, diltiazem, fluconazole, indinavir, macrolide antibiotics, nicardipine):* increased everolimus blood concentration

*Pgp inhibitors (such as cyclosporine, digoxin):* increased everolimus blood concentration

*Strong CYP3A4 inducers (such as carbamazepine, efavirenz, nevirapine, phenobarbital, phenytoin, rifampin):* decreased everolimus exposure

*Strong CYP3A4 inhibitors (such as clarithromycin, itraconazole, ketoconazole, ritonavir, telithromycin, voriconazole):* significantly increased everolimus exposure

**Drug-diagnostic tests.** *Blood glucose, cholesterol, lipids, magnesium, hepatic enzymes, serum bilirubin, serum creatinine, serum phosphorus:* increased levels

*Hemoglobin, platelets:* decreased levels

*Potassium:* decreased or increased level

**Drug-food.** *Grapefruit, grapefruit juice:* increased everolimus exposure

**Drug-herbs.** *St. John's wort:* decreased everolimus exposure

## Patient monitoring

- Closely monitor CBC with differential.
- ☞ Monitor renal function, including BUN, urinary protein, and serum creatinine, closely.
- Closely monitor drug blood concentration in patients with hepatic impairment; during concomitant administration of CYP3A4 inducers/inhibitors, or Pgp substrates; when switching cyclosporine formulations; and when cyclosporine dosage is reduced according to recommended target concentrations.
- Watch for increases in serum cholesterol, triglyceride, and blood glucose levels.
- ☞ Closely monitor patients for hypersensitivity reactions, serious infections, respiratory or cardiac signs and symptoms, signs or symptoms of bleeding or thrombosis, seizures, and palmar-plantar erythrodysesthesia.
- Be aware that patients are at increased risk for delayed wound healing and fluid accumulation; particularly monitor incision sites to minimize complications.

## Patient teaching

- Tell patient to take drug at same time each day with a whole glass of water, either consistently with food or without food.
- For patient taking Afinitor: Instruct patient to swallow tablets whole and not to chew or crush them. Tell patient unable to swallow tablets to disperse drug completely (by gently stirring) in a glass of water (containing approximately 1 ounce) immediately before drinking, then rinse with same volume of water and completely swallow rinse to ensure entire dose is taken.
- Tell patient to avoid grapefruit juice and grapefruit products during therapy.
- Inform patient of the need to monitor blood chemistry and hematologic

values before starting therapy and periodically thereafter.

☞ Instruct patient to immediately seek medical attention for difficulty breathing or new or worsening respiratory signs or symptoms, flushing, chest pain, swelling of airway or tongue, fever or other signs or symptoms of infection, urinary problems, or bleeding.

- For patient taking Afinitor: Instruct patient to report signs and symptoms of palmar-plantar erythrodysesthesia (such as redness, swelling, tenderness, or tingling of palms of hands or soles of feet).

☞ For patient taking Zortress: Inform patient of increased risk of developing lymphomas and other malignancies, particularly of the skin. Tell patient to avoid prolonged exposure to ultraviolet light and sunlight during therapy.

☞ For patient taking Zortress: Inform patient of risk of a clot in the blood vessels of the transplanted kidney and to immediately seek medical attention if pain in the groin, lower back, side, or abdomen; change in urination; blood in urine or dark-colored urine; fever; nausea; or vomiting occurs.

- Advise patient to manage oral ulcerations with mouthwashes (without alcohol or peroxide) and topical treatments, as prescribed.

- Instruct patient to tell prescriber about all drugs he's taking, because some drugs have potential for serious drug interactions and shouldn't be taken with everolimus.

- Tell patient to avoid live vaccines and close contact with those who have received live vaccines during therapy.

- Advise patient to avoid use of St. John's wort during therapy.

- For patient taking Zortress: Advise female patient of childbearing age that drug may cause fetal harm and to use an effective method of contraception

during therapy and for 8 weeks after treatment ends.

- For patient taking Afinitor: Advise breastfeeding patient that she should decide whether to discontinue breastfeeding or discontinue drug, taking into account importance of the drug for her treatment.
- For patient taking Zortress: Advise female patient of childbearing age to avoid breastfeeding during therapy.
- For patient taking Zortress: Inform male patient of potential risk of infertility with therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## exemestane

Aromasin

**Pharmacologic class:** Aromatase inhibitor

**Therapeutic class:** Hormonal anti-neoplastic

**Pregnancy risk category** D

### Action

Inhibits conversion of androgens to estrogen, which reduces estrogen concentrations and limits cancer cell growth in estrogen-dependent breast tumors

### Availability

Tablets: 25 mg

### Indications and dosages

➤ Advanced breast cancer

**Adults:** 25 mg P.O. once daily after a meal

### Contraindications

- Hypersensitivity to drug or its components

- Premenopausal women, including pregnant women

### Precautions

Use cautiously in:

- moderate to severe hepatic insufficiency or renal impairment
- concurrent use of estrogen-containing drugs
- breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Administer after meals with a full glass of water.
- Know that drug shouldn't be taken by premenopausal women or by patients receiving drugs that contain estrogen.

Route	Onset	Peak	Duration
P.O.	Unknown	1-2 hr	24 hr

### Adverse reactions

**CNS:** headache, dizziness, confusion, asthenia, fatigue, weakness, hypoesthesia, paresthesia, pain, anxiety, insomnia, depression

**CV:** hypertension, chest pain

**EENT:** sinusitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, anorexia

**GU:** urinary tract infection

**Musculoskeletal:** pathologic fractures, arthritis, back pain, skeletal pain

**Respiratory:** dyspnea, cough, bronchitis, upper respiratory tract infection

**Skin:** rash, itching, alopecia, diaphoresis

**Other:** increased appetite, fever, hot flashes, infection, flulike symptoms, edema, lymphedema

### Interactions

**Drug-drug.** *CYP3A4 inducers:* decreased exemestane blood level

**Patient monitoring**

- Monitor vital signs, especially blood pressure.
- Check for adverse GI reactions. Give antiemetics, as prescribed, for nausea and vomiting.
- Assess bowel elimination pattern. Increase fluids and administer stool softeners, as needed, to ease constipation.
- Monitor pain level. Administer analgesics, as prescribed, to relieve pain.
- Monitor liver function tests, CBC, and blood urea nitrogen, creatinine, and electrolyte levels.

**Patient teaching**

- Advise patient to take with full glass of water after a meal.
- Tell patient to report depression, insomnia, or excessive anxiety.
- Instruct patient to wear cotton clothing to let skin breathe if drug causes increased sweating or hot flashes.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

**exenatide acetate**

Byetta, Bydureon

**Pharmacologic class:** Incretin mimetic**Therapeutic class:** Hypoglycemic**Pregnancy risk category C****FDA BOXED WARNING**

- It isn't known whether exenatide extended-release (Bydureon) causes thyroid C-cell tumors, including medullary thyroid carcinoma (MTC), in humans, because human relevance couldn't be determined by clinical or nonclinical studies
- Bydureon is contraindicated in patients with personal or family

history of MTC and in patients with multiple endocrine neoplasia syndrome type 2.

- Routine serum calcitonin or thyroid ultrasound monitoring is of uncertain value in patients treated with Bydureon.
- Counsel patient regarding risk and signs and symptoms of thyroid tumors.

**Action**

Enhances glucose-dependent insulin secretion by the pancreatic beta cells, suppresses inappropriately elevated glucagon secretion, and slows gastric emptying

**Availability**

*Solution for injection:* 250 mcg/ml as 60 doses in 5-mcg-per-dose/1.2-ml prefilled pen, 250 mcg/ml as 60 doses in 10-mcg-per-dose/2.4-ml prefilled pen

*Suspension for injection (extended-release):* 2 mg/vial

**Indications and dosages**

➤ Adjunct to diet and exercise to improve glycemic control in patients with type 2 diabetes mellitus

**Adults:** 5 mcg (Byetta) injected subcutaneously in thigh, abdomen, or upper arm twice daily within 60 minutes before morning and evening meals.

Dosage can be increased to 10 mcg after 1 month of therapy, based on clinical response. Or, 2 mg (Bydureon) injected subcutaneously once q 7 days (weekly) at any time of day, with or without meals.

**Dosage adjustment**

- Concurrent sulfonylurea use (Byetta)

**Contraindications**

- Hypersensitivity to drug or its components
- Personal or family history of medullary thyroid carcinoma; multiple

endocrine neoplasia syndrome type 2 (Bydureon)

### Precautions

Use cautiously in:

- severe renal impairment or end-stage renal disease, history of pancreatitis
- severe GI disease (use not recommended)
- type 1 diabetes or diabetic ketoacidosis (avoid use)
- drugs that have narrow therapeutic index or require rapid GI absorption
- concurrent use of insulin (Bydureon use not recommended); concurrent use of prandial insulin (Byetta use not recommended); or concurrent use of other glucose-independent insulin secretagogues (Byetta)
- elderly patients
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Administer oral drugs 1 hour before exenatide. For oral drugs that must be taken with food, administer these with a light meal or snack when exenatide isn't given.
- Discard pen 30 days after first use, even if some drug remains. Don't freeze, and don't use drug if it has been frozen.
- Be aware that Bydureon is intended for patient self-administration and must be administered immediately after powder is suspended.
- Don't coadminister Bydureon and Byetta

Route	Onset	Peak	Duration
Subcut. (immediate)	Unknown	2.1 hr	Unknown
Subcut. (extended)	Unknown	2-7 wk	Unknown

### Adverse reactions

**CNS:** dizziness, headache, asthenia, jitteriness

**GI:** nausea, vomiting, diarrhea, dyspepsia, gastroesophageal reflux disease, **acute pancreatitis**

**Metabolic: hypoglycemia** (especially with concurrent sulfonylurea)

**Skin:** excessive sweating

**Other:** decreased appetite, general injection site reaction, hypersensitivity reaction

### Interactions

**Drug-drug.** *Anti-infectives, hormonal contraceptives:* possible slowing of GI transit time

**Drug-behaviors.** *Alcohol use:* reduced blood glucose level

### Patient monitoring

- Monitor serum glucose level frequently, especially in patients also receiving sulfonylureas.
- Monitor renal function tests periodically.

 Be aware that Bydureon hasn't been studied with warfarin; however, postmarketing reports indicate increased INR, sometimes associated with bleeding, occurs with concomitant use of warfarin and Byetta. Monitor prothrombin time more frequently in patients taking warfarin after starting or altering therapy. Once a stable prothrombin time has been documented, prothrombin times can be monitored at intervals usually recommended for patients on warfarin.

 Be aware that exenatide has been associated with acute pancreatitis, including fatal and nonfatal hemorrhagic or necrotizing pancreatitis. If pancreatitis is suspected, promptly discontinue drug and initiate appropriate management. If pancreatitis is confirmed, don't restart drug.

## Patient teaching

- Instruct patient to take Byetta within 1 hour before morning and evening meals (or before the two main meals of the day, approximately 6 hours or more apart).
- Teach patient how to self-administer Byetta with prefilled pen. Tell patient to do a new pen set-up one time only, when starting a new prefilled pen. Advise patient to discard pen 30 days after first use, even if some drug remains.

 Instruct patient to inject Bydureon subcutaneously once every 7 days at any time of day, with or without a meal.

 Tell patient that Bydureon is provided in a single-dose tray containing one 2-mg vial of drug, one vial connector, one prefilled diluent syringe, and two needles (one provided as a spare). Instruct patient not to substitute needles or any other components in tray. Tell patient to follow manufacturer's directions precisely for preparing the drug for injection and that the drug must be injected immediately after the powder is suspended in the diluent and transferred to the syringe.

- Caution patient not to freeze drug and not to use it if it has been frozen.

 Teach patient to recognize and immediately report signs and symptoms of hypoglycemia and diabetic ketoacidosis.

 Teach patient how to recognize and to promptly report signs and symptoms of pancreatitis.

- Advise patient to avoid alcohol during therapy.
- Instruct breastfeeding patient to either discontinue breastfeeding or stop taking drug.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and behaviors mentioned above.

## ezetimibe

Ezetrol<sup>®</sup>, Zetia

**Pharmacologic class:** Cholesterol absorption inhibitor

**Therapeutic class:** Antihyperlipidemic

**Pregnancy risk category C**

## Action

Inhibits cholesterol absorption in the intestine, decreasing intestinal delivery of cholesterol to the liver and increasing systemic cholesterol clearance. Net effect is decreased serum cholesterol level.

## Availability

Tablets: 10 mg

## Indications and dosages

 Adjunct to diet to reduce elevated total cholesterol (total-C), low-density lipoprotein cholesterol (LDL-C), non-high-density lipoprotein cholesterol (non-HDL-C), and apolipoprotein B (Apo B) in patients with primary hyperlipidemia, alone or in combination with HMG-CoA reductase inhibitor; to reduce elevated total-C, LDL-C, Apo B, and non-HDL-C in patients with mixed hyperlipidemia, in combination with fenofibrate; to reduce elevated total-C and LDL-C in patients with homozygous familial hypercholesterolemia, in combination with atorvastatin or simvastatin; to reduce elevated sitosterol and campesterol in patients with homozygous sitosterolemia

**Adults:** 10 mg/day P.O.

## Contraindications

- Hypersensitivity to drug or its components

- Active hepatic disease or unexplained, persistent transaminase elevations (when given with a statin)
- Women who are pregnant or may become pregnant (when given with a statin)
- Breastfeeding patients (when given with a statin)

### Precautions

Use cautiously in:

- moderate or severe hepatic impairment (use not recommended)
- skeletal muscle toxicity
- concurrent use of cyclosporine or fibrates other than fenofibrate (use not recommended)
- elderly patients
- pregnant or breastfeeding patients not receiving HMG-CoA reductase inhibitors
- children younger than age 10.

### Administration

- Give with or without food.
- Be aware that drug may be given concurrently with HMG-CoA reductase inhibitor (such as atorvastatin or simvastatin).
- Give at least 2 hours before or 4 hours after bile acid sequestrant (if prescribed).

Route	Onset	Peak	Duration
P.O.	Moderate	4-12 hr	Unknown

### Adverse reactions

**CNS:** headache, dizziness, fatigue

**EENT:** nasopharyngitis, sinusitis

**GI:** diarrhea

**Musculoskeletal:** back pain, myalgia, joint pain, extremity pain, **rhabdomyolysis**

**Respiratory:** upper respiratory tract infection

### Interactions

**Drug-drug.** *Cholestyramine:* decreased ezetimibe blood level

*Cyclosporine, fenofibrate, gemfibrozil:*

increased ezetimibe blood level

*Fibrates:* increased risk of cholesterol excretion into gallbladder leading to cholelithiasis

**Drug-diagnostic tests.** *Liver function tests:* increased values

### Patient monitoring

- Monitor hepatic and lipid profiles.
- Monitor cyclosporine concentration in patients receiving drug concurrently with cyclosporine.
- Monitor International Normalized Ratio if patient also receiving warfarin.
- Assess for and report unexplained muscle pain.
- If cholelithiasis is suspected in patient also receiving fenofibrate, obtain gallbladder studies and consider alternative lipid-lowering therapy.

### Patient teaching

- Teach patient about the role of diet, exercise, and weight loss in lowering cholesterol levels.

 Instruct patient to immediately report unexplained muscle pain, tenderness, or weakness while taking this drug.

- Advise breastfeeding patient not to take this drug while taking a statin.
- Advise female patient of childbearing age to use effective contraception while taking this drug concurrently with a statin and if she becomes pregnant to stop taking ezetimibe and statin and call her prescriber.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## factor IX (human)

AlphaNine SD, Immune VH<sup>⚡</sup>, Mononine

## factor IX (recombinant)

BeneFix

## factor IX complex

Bebulin VH, Delfix<sup>⚡</sup>, Hipfix<sup>⚡</sup>, Octaplex<sup>⚡</sup>, Profilnine SD, Proplex T (heat-treated), Replenine<sup>⚡</sup>

**Pharmacologic class:** Blood modifier

**Therapeutic class:** Antihemophilic

**Pregnancy risk category C**

### Action

Converts fibrinogen to fibrin, increasing levels of clotting factors

### Availability

*Powder for injection:* Various strengths; units specified on label

### Indications and dosages

➤ Factor IX deficiency (hemophilia B or Christmas disease); anticoagulant overdose

**Adults and children:** Dosage individualized; drug administered I.V. Use following equations to calculate approximate units needed:

*Human product*—1 unit/kg times body weight (in kg) times desired increase in factor IX level, expressed as percentage of normal

*Recombinant product*—1.2 units/kg times body weight (in kg) times desired increase in factor IX level, expressed as percentage of normal

*Proplex T*—0.5 unit/kg times body weight (in kg) times desired increase in

factor IX level, expressed as percentage of normal

### Off-label uses

- Hepatic dysfunction
- Esophagitis
- Unspecified GI hemorrhage (human product)

### Contraindications

- Hypersensitivity to mouse or hamster protein (with BeneFix)
- Fibrinolysis

### Precautions

Use cautiously in:

- recent surgery
- pregnant patients
- children younger than age 6 (safety and efficacy not established).

### Administration

📢 Give by slow I.V. infusion. Average infusion rate is 100 units (2 to 3 ml)/minute; don't exceed 10 ml/minute.

- If prescribed, administer hepatitis B vaccine before giving factor IX.
- Know that dosage is highly individualized according to degree of factor IX deficiency, patient's weight, and bleeding severity.
- Don't use glass syringe. Don't shake reconstituted solution or mix with other I.V. solutions.

Route	Onset	Peak	Duration
I.V.	Immediate	10-30 min	Unknown

### Adverse reactions

**CNS:** light-headedness, paresthesia, headache

**CV:** blood pressure changes, **thromboembolic reactions, myocardial infarction (MI)**

**EENT:** allergic rhinitis

**GI:** nausea, vomiting

**Hematologic:** disseminated intravascular coagulation (DIC)

**Respiratory:** pulmonary embolism

**Skin:** rash, flushing, diaphoresis, pruritus, urticaria

**Other:** altered taste, fever, chills, burning sensation in jaw and skull, pain at I.V. injection site, hypersensitivity reactions including **anaphylaxis**

## Interactions

**Drug-drug.** *Aminocaproic acid:* increased risk of thrombosis

## Patient monitoring

- Be aware that factor IX complex may transmit hepatitis.
- Closely monitor vital signs during infusion.
- 🔊 Observe for hemolytic reaction. If it occurs, stop infusion, flush line with saline solution, and notify prescriber immediately.
- Monitor I.V. injection site closely.
- 🔊 Monitor coagulation studies closely. Know that drug may cause thromboembolic disorders, including MI and DIC.

## Patient teaching

- Inform patient that drug may transmit diseases.
- 🔊 Tell patient to immediately report signs and symptoms of hypersensitivity reaction, including rash, hives, tightness in chest, wheezing, shortness of breath, and swelling of throat or lips.
- 🔊 Advise patient to immediately report unusual bleeding or bruising.
- Caution patient to avoid activities that can cause injury.
- Tell patient to wear medical identification stating that he has a blood-clotting disorder.
- Instruct patient to notify surgeon or dentist of his blood-clotting disorder before surgery or invasive dental procedures.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## famciclovir

Apo-Famciclovir<sup>✳</sup>, Famvir, PMS-Famciclovir<sup>✳</sup>, Sandoz Famciclovir<sup>✳</sup>

**Pharmacologic class:** Synthetic nucleoside

**Therapeutic class:** Antiviral

**Pregnancy risk category B**

## Action

Converts to penciclovir and selectively inhibits DNA polymerase and viral DNA synthesis

## Availability

*Tablets:* 125 mg, 250 mg, 500 mg

## Indications and dosages

➤ Acute herpes zoster infection (shingles)

**Adults:** 500 mg P.O. q 8 hours for 7 days

➤ Recurrent genital herpes in immunocompetent patients

**Adults:** 1,000 mg P.O. b.i.d. for 1 day, starting as soon as symptoms appear

➤ Suppression of recurrent genital herpes

**Adults:** 250 mg P.O. b.i.d. for up to 1 year

➤ Recurrent herpes simplex infection in patients with human immunodeficiency virus

**Adults:** 500 mg P.O. b.i.d. for 7 days

➤ Herpes labialis (oral herpes simplex) in immunocompetent patients

**Adults:** 1,500 mg P.O. as a one-time dose given as soon as symptoms appear

## Dosage adjustment

- Renal impairment

## Contraindications

- Hypersensitivity to drug or its components

## Precautions

Use cautiously in:

- renal or hepatic impairment
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 18.

## Administration

- Know that for best response, therapy should begin within 6 hours of onset of genital herpes symptoms or lesions.
- Give with or without food.

Route	Onset	Peak	Duration
P.O.	Unknown	1 hr	Unknown

## Adverse reactions

**CNS:** headache, fatigue, dizziness, drowsiness, paresthesia, insomnia

**EENT:** pharyngitis, sinusitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, anorexia

**Musculoskeletal:** back pain, joint pain

**Skin:** pruritus, rash

**Other:** fever

## Interactions

**Drug-drug.** *Digoxin:* increased digoxin blood level, increased risk of toxicity

*Probenecid:* increased blood level of penciclovir (active antiviral compound of famciclovir)

## Patient monitoring

- When giving concurrently with digoxin, monitor digoxin blood level and evaluate for digoxin toxicity.
- Monitor CBC, blood urea nitrogen, creatinine, and electrolyte levels.
- Be aware that drug may take several weeks to reach therapeutic level.
- Know that renal failure may raise blood drug level, increasing the risk of adverse reactions.

- Avoid direct contact with infected areas. Wash hands frequently and wear gloves during patient contact.

## Patient teaching

- Instruct patient to take with food or milk to avoid upset stomach.
- Inform patient that drug doesn't cure herpes but only decreases pain and itching by allowing sores to heal and preventing new ones from forming.
- Advise patient to wear loose-fitting clothing to avoid irritating lesions.
- Tell patient to report rash or itching.
- Instruct female patient to tell prescriber if she is pregnant or breastfeeding.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

## famotidine

Apo-Famotidine<sup>✳</sup>, Gen-Famotidine<sup>✳</sup>, Maalox H2 Acid Controller, Mylanta AR, Novo-Famotidine<sup>✳</sup>, Nu-Famotidine<sup>✳</sup>, Pepcid, Pepcid AC, Ulcidine<sup>✳</sup>, Ultra Heartburn Relief<sup>Ⓢ</sup>

**Pharmacologic class:** Histamine<sub>2</sub>-receptor antagonist

**Therapeutic class:** Antiulcer drug

**Pregnancy risk category B**

## Action

Blocks action of histamine at histamine<sub>2</sub>-receptor sites in gastric parietal cells, inhibiting gastric acid secretion and stabilizing pepsin

## Availability

*Gelcaps:* 10 mg

*Oral suspension:* 40 mg/5 ml

*Solution for injection:* 10 mg/ml, 20 mg/50 ml of normal saline solution  
*Tablets:* 10 mg, 20 mg, 40 mg  
*Tablets (chewable):* 10 mg  
*Tablets (orally disintegrating):* 20 mg, 40 mg

### Indications and dosages

➤ Active duodenal ulcers and benign gastric ulcers

**Adults:** 40 mg P.O. once daily at bedtime or 20 mg P.O. b.i.d. for up to 8 weeks

➤ Prophylaxis of duodenal ulcers  
**Adults:** 20 mg P.O. once daily at bedtime

➤ Gastroesophageal reflux disease  
**Adults:** 20 mg P.O. b.i.d. for up to 6 weeks. Maximum dosage is 40 mg b.i.d. for up to 12 weeks.

**Children ages 1 to 16:** 1 mg/kg P.O. daily in two divided doses, to a maximum of 40 mg b.i.d.

**Infants ages 3 months to 1 year:** 0.5 mg/kg P.O. b.i.d. for up to 8 weeks

**Infants younger than age 3 months:** 0.5 mg/kg P.O. once daily for up to 8 weeks

➤ Gastric hypersecretory conditions (such as Zollinger-Ellison syndrome)

**Adults:** Initially, 20 mg P.O. q 6 hours, increased as needed to 160 mg q 6 hours

➤ Hospitalized patients with pathologic hypersecretory conditions or ulcers; patients who can't take oral drugs

**Adults:** 20 mg I.V. q 12 hours

➤ Prevention or treatment of heartburn, acid indigestion, and sour stomach (Pepcid AC only)

**Adults:** For prevention, 10 mg P.O. 1 hour before eating, or 10-mg chewable tablet 15 minutes before eating, to a maximum of 20 mg/24 hours for up to 2 weeks. For symptomatic treatment, 10 mg P.O. once or twice daily.

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to drug or other histamine<sub>2</sub>-receptor antagonists

### Precautions

Use cautiously in:

- renal impairment with prolonged QT interval and seizures (very rare)
- elderly patients
- pregnant or breastfeeding patients.

### Administration

- Be aware that drug usually is given in one daily dose to patients with renal insufficiency.
- Give P.O. form with foods or liquids.
- Dilute I.V. form with 10 ml dextrose 5% in water or normal saline solution (100 ml) for I.V. piggyback administration.
- Deliver by I.V. push over 2 minutes or intermittent infusion over 30 minutes.
- Know that drug may cause transient irritation at I.V. site.

Route	Onset	Peak	Duration
P.O.	Within 1 hr	1-4 hr	6-12 hr
I.V.	Rapid	0.5-3 hr	8-15 hr

### Adverse reactions

**CNS:** dizziness, headache, paresthesia, asthenia, fatigue, insomnia, somnolence, psychic disturbances

**CV:** palpitations, **arrhythmias, AV block**

**GI:** nausea, vomiting, diarrhea, constipation, dry mouth, anorexia, cholestatic jaundice, abdominal pain

**GU:** decreased libido

**Hematologic:** agranulocytosis, pancytopenia, leukopenia, thrombocytopenia (rare)

**Hepatic:** liver enzyme abnormalities, hepatitis

**EENT:** orbital edema, conjunctival redness, tinnitus

**Musculoskeletal:** musculoskeletal pain, muscle cramps, arthralgia

**Respiratory:** bronchospasm, interstitial pneumonia

**Skin:** flushing, acne, dry skin, rash, urticaria, alopecia, pruritus; **epidermal necrolysis and Stevens-Johnson syndrome (very rare)**

**Other:** altered taste, fever, pain at injection site, **hypersensitivity reactions including anaphylaxis and angioedema**

## Interactions

**Drug-diagnostic tests.** *Liver enzymes:* altered levels

## Patient monitoring

- Assess patient for GI signs and symptoms.
- Monitor blood urea nitrogen and creatinine levels in patients with renal impairment.
- 🔊 Monitor patient for prolonged QT interval and seizures, which have been reported very rarely in patients with impaired renal function whose famotidine dosage or dosing interval may not have been adjusted appropriately. Also monitor patient for arrhythmia and AV block.
- 🔊 Monitor patient for signs and symptoms of epidermal necrolysis, Stevens-Johnson syndrome, and hematologic or respiratory changes.

## Patient teaching

- Tell patient that drug is most effective when taken at bedtime.
- Inform patient that pain relief may not begin until several days after therapy starts.
- 🔊 Instruct patient to take drug exactly as prescribed and to immediately report cardiovascular signs and symptoms, seizures, and hematologic or respiratory changes.
- Tell female patient to inform prescriber if she is pregnant or breastfeeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## febuxostat

Uloric

**Pharmacologic class:** Xanthine oxidase inhibitor

**Therapeutic class:** Antigout agent

**Pregnancy risk category C**

## Action

Decreases serum uric acid level

## Availability

*Tablets:* 40 mg, 80 mg

## Indications and dosages

- Long-term management of hyperuricemia in patients with gout
- Adults:** Initially, 40 mg P.O. daily; for patients who don't achieve serum uric acid level of less than 6 mg/dl after 2 weeks with 40 mg, give 80 mg P.O. daily

## Contraindications

- Concomitant use of azathioprine, mercaptopurine

## Precautions

Use cautiously in:

- severe hepatic or renal impairment
- patients with greatly increased rate of urate formation, such as in malignant disease and its treatment and Lesch-Nyhan syndrome (use not recommended)
- concurrent use of theophylline
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

## Administration

- Administer with or without food.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	Unknown

**Adverse reactions**

**CNS:** dizziness, **nonfatal cerebrovascular accident (CVA)**

**CV:** cardiovascular thromboembolic events (**nonfatal myocardial infarction [MI], deaths**)

**GI:** nausea

**Hepatic:** liver function abnormalities

**Musculoskeletal:** arthralgia

**Skin:** rash

**Interactions**

**Drug-drug.** *Drugs metabolized by xanthine oxidase (such as azathioprine, mercaptopurine):* may increase plasma concentrations of these drugs, leading to severe toxicity

*Theophylline:* altered theophylline metabolism

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase:* increased levels

**Patient monitoring**

🔊 Monitor patient for signs and symptoms of MI or CVA.

- Be aware that gout flares (caused by reduction in serum uric acid levels resulting in mobilization of urate from tissue deposits) may occur. To prevent such flares, provide concurrent prophylactic treatment with a non-steroidal anti-inflammatory drug or colchicine, as prescribed.
- Monitor liver function tests 2 months and 4 months after starting therapy and periodically thereafter.

**Patient teaching**

• Instruct patient to take drug with or without food.

🔊 Instruct patient to immediately report cardiovascular symptoms (such as shortness of breath or chest pain) or strokelike symptoms (such as headache or dizziness) to prescriber.

- Tell patient to inform prescriber of increased gout symptoms or rash.
- As appropriate, review all other significant and life-threatening adverse

reactions and interactions, especially those related to the drugs and tests mentioned above.

**felodipine**

Cardiople<sup>®</sup>, Felotens<sup>®</sup>, Keloc<sup>®</sup>, Neofel<sup>®</sup>, Plendil, Renedil<sup>®</sup>, Vascalpha<sup>®</sup>

**Pharmacologic class:** Calcium channel blocker

**Therapeutic class:** Antihypertensive, antianginal

**Pregnancy risk category C**

**Action**

Impedes extracellular calcium ion movement across membranes of myocardial muscle cells, depressing myocardial contractility and impulse formation; slows impulse conduction velocity and dilates coronary arteries and peripheral arterioles. Net effect is reduced cardiac workload and lower blood pressure.

**Availability**

*Tablets (extended-release):* 2.5 mg, 5 mg, 10 mg

**Indications and dosages**

➤ Hypertension

**Adults:** Initially, 5 mg P.O. daily.

Depending on response, may decrease to 2.5 mg or increase to a maximum of 10 mg P.O. daily at 2-week intervals.

**Dosage adjustment**

- Hepatic impairment
- Elderly patients

**Off-label uses**

- Heart failure
- Angina pectoris or vasospastic (Prinzmetal's) angina

## Contraindications

- Hypersensitivity to drug

## Precautions

Use cautiously in:

- cardiac disease, arrhythmias, severe hepatic or renal impairment
- elderly patients
- pregnant or breastfeeding patients
- children (safety not established).

## Administration

- Give without regard to meals.
- Make sure patient swallows tablet whole without crushing or chewing.

Route	Onset	Peak	Duration
P.O.	1 hr	2-4 hr	Up to 24 hr

## Adverse reactions

**CNS:** headache, drowsiness, dizziness, syncope, nervousness, anxiety, psychiatric disturbances, paresthesia, insomnia, asthenia, confusion, irritability

**CV:** chest pain, peripheral edema, hypotension, palpitations, tachycardia, angina, **arrhythmias, myocardial infarction, atriocentricular block**

**EENT:** rhinorrhea, sneezing, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal discomfort, dyspepsia, abdominal cramps, flatulence, dry mouth

**Hematologic:** anemia

**Musculoskeletal:** back pain

**Respiratory:** bronchitis

**Skin:** dermatitis, rash, pruritus, urticaria, erythema

**Other:** dysgeusia, gingival hyperplasia, facial edema, thirst, warm sensation

## Interactions

**Drug-drug.** *Antifungals, cimetidine, erythromycin, propranolol, ranitidine:* increased felodipine blood level, increased risk of toxicity

*Barbiturates, hydantoins:* decreased felodipine blood level

*Beta-adrenergic blockers, digoxin, disopyramide, phenytoin:* bradycardia, conduction defects, heart failure

*Fentanyl, nitrates, other antihypertensives, quinidine:* additive hypotension  
*Nonsteroidal anti-inflammatory drugs:* decreased antihypertensive effects

**Drug-food.** *Grapefruit juice:* increased felodipine blood level and effects

**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension

## Patient monitoring

 Don't give to patient with heart block unless he has a pacemaker.

 Use extreme caution when administering to patients with pulmonary hypertension, renal insufficiency, heart failure, or compromised ventricular function (especially those receiving beta-adrenergic blockers concurrently).

- Monitor fluid intake and output, and weigh patient daily.
- Monitor ECG and vital signs. Assess for signs and symptoms of heart block.
- Assess for reflex tachycardia, angina, and sustained hypotension.
- Check hepatic profile and alkaline phosphatase level in patients with hepatic impairment.

## Patient teaching

- Tell patient drug controls but doesn't cure high blood pressure, so he should keep taking it even if he feels well.
- Instruct patient to move slowly when rising, to avoid light-headedness or dizziness from sudden blood pressure decrease.
- Explain that exercise and hot weather may increase drug's hypotensive effects.
- Tell patient to report peripheral edema, persistent headache, or flushing.
- Advise patient to use hard candy or gum if dry mouth or thirst occurs.
- Tell female patient to inform prescriber if she is pregnant or breastfeeding.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, foods, and behaviors mentioned above.

## fenofibrate

Antara, Apo-Fenofibrate<sup>✳</sup>, Fenogal<sup>⚡</sup>, Lipantil<sup>⚡</sup>, Lipofen, Lofibra, Nu-Fenofibrate<sup>✳</sup>, Tricor, Triglide, Supralip<sup>⚡</sup>

**Pharmacologic class:** Fibric acid derivative

**Therapeutic class:** Antihyperlipidemic

**Pregnancy risk category C**

### Action

Inhibits triglyceride synthesis in liver, reducing levels of low- and very-low-density lipoproteins. Also increases uric acid secretion.

### Availability

**Capsules:** 50 mg, 150 mg

**Capsules (micronized):** 43 mg, 67 mg, 130 mg, 134 mg, 200 mg

**Tablets:** 48 mg, 50 mg, 54 mg, 145 mg, 160 mg

### Indications and dosages

➤ Adjunct to dietary therapy to reduce elevated low-density lipoproteins (LDL)-C, total cholesterol, triglycerides, and apolipoprotein B; to increase high-density lipoprotein-C level in adult patients with primary hypercholesterolemia or mixed dyslipidemia (Fredrickson Types IIa and IIb)

**Adults:** 1 tablet (145 or 160 mg), 1 capsule (150 mg), or 1 micronized capsule (130 or 200 mg) P.O. daily

➤ Hypertriglyceridemia

**Adults:** Initially, 50 to 150 mg P.O. daily (capsule); 43 to 200 mg P.O. daily

(micronized capsule); 48 to 160 mg P.O. daily (tablet)

### Dosage adjustment

- Renal impairment
- Elderly patients

### Off-label uses

- Polymetabolic syndrome X

### Contraindications

- Hypersensitivity to drug
- Hepatic disease or unexplained, persistent liver function test abnormalities
- Severe renal impairment
- Gallbladder disease
- Breastfeeding

### Precautions

Use cautiously in:

- pancreatitis, cholelithiasis
- patients receiving warfarin concurrently
- pregnant patients
- children.

### Administration

⚠ Before giving, be aware of potentially serious interactions, such as with nephrotoxic drugs.

- Administer with meals.
- Give bile acid sequestrants at least 1 hour before or 4 to 6 hours after fenofibrate.

Route	Onset	Peak	Duration
P.O.	Variable	6-8 hr	Unknown

### Adverse reactions

**CNS:** drowsiness, dizziness, fatigue, headache, migraine, insomnia, depression, vertigo, nervousness, anxiety, paresthesia, hypotonia, neuralgia  
**CV:** tachycardia, varicose veins, phlebitis, angina, hypertension, hypotension, peripheral vascular disease, vasodilation, ECG abnormalities, coronary artery disease, **arrhythmias**,

**ventricular extrasystoles, myocardial infarction, atrial fibrillation**

**EENT:** conjunctivitis, abnormal vision, cataracts, refraction disorder, otitis media, rhinitis, sinusitis, pharyngitis, laryngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, flatulence, dyspepsia, gastritis, gastroenteritis, esophagitis, duodenal or peptic ulcer, colitis, cholelithiasis, cholecystitis, rectal disorder, **rectal hemorrhage**

**GU:** urinary frequency, dysuria, cystitis, urolithiasis, prostatic disorder, gynecomastia, vaginal candidiasis, decreased libido, **renal dysfunction**

**Hematologic:** eosinophilia, anemia, lymphadenopathy, **thrombocytopenia, leukopenia**

**Hepatic:** fatty liver deposits

**Metabolic:** hyperuricemia, gout, **hypoglycemia**

**Musculoskeletal:** back, muscle, or joint pain; myositis; arthritis; tenosynovitis; arthrosis; bursitis

**Respiratory:** respiratory disorders, bronchitis, increased cough, dyspnea, pneumonia, **asthma**

**Skin:** rash, pruritus, urticaria, bruising, acne, eczema, diaphoresis, dermatitis, herpes simplex, herpes zoster, alopecia, nail disorder

**Other:** weight loss or gain, edema, fever, flulike symptoms, hypersensitivity reactions

**Interactions**

**Drug-drug.** *Bile acid sequestrants (resins):* decreased absorption and efficacy of fenofibrate

*Immunosuppressants, other nephrotoxic drugs:* increased risk of renal toxicity

*Oral anticoagulants:* increased risk of bleeding

*Statins (such as simvastatin):* rhabdomyolysis, acute renal failure

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase,*

*aspartate aminotransferase, blood urea nitrogen, creatinine, gamma-glutamyltransferase, uric acid:* increased values  
*Granulocytes, hemoglobin, neutrophils, platelets, white blood cells (WBCs):* decreased values

*Liver function tests:* abnormal results

**Drug-food.** *Any food:* increased drug absorption

**Drug-behaviors.** *Alcohol use:* elevated triglyceride level

**Patient monitoring**

- Assess creatine kinase and lipid levels and liver function test results.
- Monitor CBC and WBC count. Expect these to decrease at start of therapy, then stabilize.

**Patient teaching**

- Instruct patient to take with meals for best effect.
- Remind patient that he still needs to follow a triglyceride-lowering diet.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Advise patient to minimize GI upset by eating frequent, small servings of food and drinking plenty of fluids.
- Tell patient that drug may take up to 2 months to alter lipid values.
- Inform breastfeeding patient that she must choose between taking fenofibrate and breastfeeding.
- Tell female patient to inform prescriber if she is pregnant.
- Inform patient that he'll undergo regular blood testing.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

## fenofibric acid

Trilipix

**Pharmacologic class:** Fibric acid derivative

**Therapeutic class:** Antihyperlipidemic

**Pregnancy risk category C**

### Action

Increases lipolysis and elimination of triglyceride-rich particles from plasma by activating lipoprotein lipase and reducing production of Apo CII (an inhibitor of lipoprotein lipase activity)

### Availability

*Capsules (delayed-release):* 45 mg, 135 mg

### Indications and dosages

➤ Adjunct to diet in combination with a statin in patients with mixed dyslipidemia and coronary heart disease (CHD) or a risk equivalent; adjunct to diet in patients with primary hyperlipidemia or mixed dyslipidemia

**Adults:** 135 mg P.O. daily

➤ Adjunct to diet in patients with severe hypertriglyceridemia

**Adults:** 45 to 135 mg P.O. daily

### Dosage adjustment

• Mild to moderate renal impairment

### Contraindications

- Hypersensitivity to drug, choline fenofibrate, or fenofibrate
- Severe renal impairment, including patients receiving dialysis
- Active liver disease, gallbladder disease
- Breastfeeding

### Precautions

Use cautiously in:

- myositis, myopathy
- administration with maximum dosage of a statin (avoid use unless benefit outweighs risk)
- administration with oral anticoagulants
- pregnant patients
- children (safety and efficacy not established).

### Administration

- Administer with or without food (but not with large amounts of grapefruit juice) and have patient swallow capsule whole.
- Be aware that drug isn't indicated for patients with elevated chylomicron and plasma triglyceride levels but with normal very-low-density lipoprotein level.

Route	Onset	Peak	Duration
P.O.	Unknown	4-5 hr	Unknown

### Adverse reactions

**CNS:** fatigue, dizziness, headache, insomnia

**CV:** hypertension

**EENT:** nasopharyngitis, sinusitis, pharyngolaryngeal pain, rhinitis

**GI:** nausea, constipation, diarrhea, dyspepsia, abdominal pain, **pancreatitis**

**GU:** urinary tract infection

**Musculoskeletal:** back pain, muscle spasms, extremity pain, arthralgia, myalgia, musculoskeletal pain, myositis, myopathy, **rhabdomyolysis**

**Respiratory:** upper respiratory tract infection, bronchitis, cough, respiratory disorder

**Skin:** rash, **Stevens-Johnson syndrome, toxic epidermal necrolysis (rare)**

**Other:** pain, influenza, **acute hypersensitivity**

## Interactions

**Drug-drug.** *Bile acid resins:* decreased fenofibric acid absorption

*Immunosuppressants (such as cyclosporine):* increased risk of nephrotoxicity

*Oral anticoagulants:* prolonged prothrombin time or International Normalized Ratio

**Drug-diagnostic tests.** *Alanine aminotransferase (ALT), aspartate aminotransferase, creatine kinase (CK), hepatic enzymes, serum creatinine:* elevated levels

*Hematocrit, hemoglobin, WBC:* decreased levels

**Drug-food.** *Grapefruit juice (more than 1 qt daily):* increased risk of myopathy when fenofibric acid is taken with statins

**Drug-behaviors.** *Alcohol use (excessive):* exacerbation of hypertriglyceridemia

## Patient monitoring

🔊 Monitor CK level; discontinue drug if markedly elevated CK level occurs or myopathy or myositis is diagnosed.

🔊 Regularly monitor liver function tests, including serum ALT; discontinue drug if levels persist above three times upper limit of normal.

🔊 Be aware that drug may increase cholesterol excretion into bile, potentially leading to cholelithiasis. Discontinue drug if gallstones develop.

- Monitor serum lipid levels periodically.

- Monitor renal function tests closely in patients at risk for renal insufficiency, such as elderly patients and those with diabetes mellitus.

## Patient teaching

- Instruct patient to take drug with or without food (but not with large amounts of grapefruit juice) and to swallow capsule whole.

- Instruct patient that if drug is prescribed with another cholesterol-lowering drug called a statin, these drugs should be taken together.

🔊 Instruct patient to promptly inform prescriber if unexplained muscle pain, tenderness, or weakness occurs, particularly if accompanied by malaise or fever.

🔊 Instruct patient to promptly inform prescriber if skin blistering, peeling, or loosening; red lesions; severe rash; fever; or chills occur because these signs and symptoms may signal a serious skin disorder.

- Advise patient not to take other prescription or nonprescription drugs or herbal or vitamin supplements without first discussing with prescriber.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

## fentanyl

Subsys

## fentanyl citrate

Abstral, Actiq, Duragesic, Durogesic<sup>Ⓜ</sup>, Fentanyl Oralet, Fentora, Lazanda, Matrifen<sup>Ⓢ</sup>, Onsolis, Ran-Fentanyl<sup>Ⓢ</sup>, Ratio-Fentanyl<sup>Ⓢ</sup>, Sublimaze

**Pharmacologic class:** Opioid agonist

**Therapeutic class:** Opioid analgesic, anesthesia adjunct

**Controlled substance schedule II**

**Pregnancy risk category C**

**FDA BOXED WARNING**

- Abstral, Actiq, Fentora, Lazanda, Onsolis, and Subsys are contraindicated for managing acute or postoperative pain (including headache or migraine), because life-threatening hypoventilation can arise at any dosage in patients not taking long-term opioids. Don't administer to opioid-intolerant patients, including those with only as-needed prior exposure.
- Because of differences in pharmacokinetic profiles, substitution of one transmucosal fentanyl product for another may result in fatal overdose and substitution on a mcg-per-mcg basis isn't recommended.
- Inform patients and caregivers that Actiq, Fentora, Lazanda, and Onsolis can be fatal to a child. Instruct them to keep all units out of children's reach and to discard opened units properly.
- Abstral, Fentora, Duragesic, Lazanda, Onsolis, and Subsys are for use only in opioid-tolerant patients. They contain a high concentration of potent Schedule II opioid agonist, with highest potential for abuse and risk of fatal overdose due to respiratory depression. These drugs are subject to criminal diversion. High fentanyl content in patches may be a particular target for abuse and diversion. When prescribing or dispensing these drugs, consider the increased risk of misuse, abuse, or diversion.
- Serious adverse events (including deaths) in patients treated with Abstral, Fentora, Lazanda, Onsolis, and Subsys have been reported. Deaths occurred as a result of improper patient selection (such as use in opioid-intolerant patients) or improper dosing.
- Fentanyl levels for Duragesic patch generally peak between 20 and 72 hours of treatment; serious or life-threatening hypoventilation may arise during initial Duragesic application period.

- Concomitant use of Abstral, Duragesic, Fentora, Lazanda, Onsolis, or Subsys with potent CYP450 3A4 inhibitors may raise fentanyl blood level, possibly increasing or prolonging adverse effects and causing potentially fatal respiratory depression. Closely monitor patients receiving this combination for an extended time; adjust dosage if needed.
- Duragesic safety hasn't been established in children younger than age 2. Administer only to opioid-tolerant children age 2 or older.
- Overestimating Duragesic dosage when converting patients from another opioid can lead to fatal overdose with first dose. Patients who have had serious adverse events (including overdose) must be monitored and treated for at least 24 hours.
- Use of damaged or cut Duragesic patch can lead to rapid release of contents and absorption of potentially fatal dose.
- Because of the risk of misuse, abuse, addiction, and overdose, Abstral, Actiq, Fentora, Lazanda, Onsolis, Subsys, and approved generic equivalents are available only through a restricted program required by the Food and Drug Administration called Transmucosal Immediate Release Fentanyl (TIRF) Risk Evaluation and Mitigation Strategy (REMS).

**Action**

Binds to specific opioid receptors in CNS, inhibiting pain pathways, altering pain perception, and increasing pain threshold

**Availability**

*Buccal soluble film:* 200 mcg, 400 mcg, 600 mcg, 800 mcg, 1,200 mcg  
*Buccal tablets:* 100 mcg, 200 mcg, 400 mcg, 600 mcg, 800 mcg  
*Injection:* 0.05 mg/ml  
*Nasal spray:* 100 mcg, 400 mcg in 5-ml bottle

*Sublingual spray*: 100 mcg, 200 mcg, 400 mcg, 600 mcg, 800 mcg

*Tablets (buccal)*: 100 mcg, 200 mcg,

300 mcg, 400 mcg, 600 mcg, 800 mcg

*Tablets (sublingual)*: 100 mcg, 200 mcg,

300 mcg, 400 mcg, 600 mcg, 800 mcg

*Transdermal system*: 12 mcg/hour, 25 mcg/hour, 50 mcg/hour, 75 mcg/hour, 100 mcg/hour

*Transmucosal lozenges*: 200 mcg, 400 mcg, 600 mcg, 800 mcg, 1,200 mcg, 1,600 mcg

## Indications and dosages

➤ Breakthrough pain in opioid-tolerant patients with cancer

**Adults**: One 200-mcg lozenge (Actiq) dissolved in mouth over 15 minutes; additional unit may be given 15 minutes later. If patient needs more than 1 unit per episode (evaluated over several episodes), dosage may be increased; for optimal use or titration, don't exceed 4 units daily. For patient not being converted from Actiq, give 100 mcg (Fentora). For patient being converted from Actiq, follow dosing recommendations below for Fentora.

Current Actiq (lozenges) dosage (mcg)	Initial Fentora (tablets) dosage (mcg)
200	100
400	100
600	200
800	200
1,200	2 × 200
1,600	2 × 200

If breakthrough pain doesn't ease after 30 minutes, give another dose once, using same strength previously given. Administer maximum of two doses for any breakthrough episode. Wait at least 4 hours before giving Fentora for another breakthrough episode.

For patients receiving sublingual tablets (Abstral), initially 100 mcg.

Individually titrate to a tolerable dose that provides adequate analgesia. Give no more than two doses per breakthrough pain episode. Wait at least 2 hours before treating another episode of breakthrough pain with Abstral. Limit consumption to treat four or fewer breakthrough pain episodes per day once a successful dose is found.

For patients receiving buccal soluble film (Onsolis), 200 mcg as initial starting dose; titrate using 200-mcg increments (up to a maximum of four 200-mcg films or a single 1,200-mcg film) to provide adequate analgesia without undue adverse effects. Maximum is one dose per episode, no more than four doses per day; separate by at least 2 hours.

For patients receiving sublingual spray (Subsys), initially 100 mcg. Individually titrate to a tolerable dose that provides adequate analgesia using a single dose per breakthrough pain episode. For each breakthrough pain episode treated, if pain isn't relieved after 30 minutes, patients may take only one additional dose of the same strength for that episode; patients should take a maximum of two doses of Subsys for any breakthrough pain episode. Patients must wait at least 4 hours before treating another episode of breakthrough pain. If necessary, increase dose to next highest strength (200 mcg). Subsequent titration steps are 400 mcg, 600 mcg, 800 mcg, 1,200 mcg, and 1,600 mcg. For maintenance, once dosage has been titrated to a level that provides adequate pain relief and tolerable adverse effects, patients should generally use only one dose of the appropriate strength per breakthrough pain episode.

For patients receiving nasal spray, initially 100 mcg (a single spray into one nostril or a single spray into each nostril). Individually titrate to an effective dose, from 100 mcg to 200 mcg to 400 mcg, up to a maximum of 800

mcg, that provides adequate analgesia with tolerable adverse effects. Maximum dose is a single spray into one nostril or single spray into each nostril per episode; no more than four doses per 24 hours. Wait at least 2 hours before treating another episode of breakthrough pain with Lazanda. During any episode, if adequate pain relief isn't achieved within 30 minutes, patients may use a rescue drug as directed by prescriber.

Patients must require and use around-the-clock opioids when taking Abstral, Actiq, Fentora, Lazanda, Onsolis, or Subsys.

➤ Management of chronic pain in patients requiring opioid analgesics  
**Adults:** Initially, 25 mcg/hour (transdermal system); no more than 25 mcg/hour in patients who haven't been receiving opioids. To calculate dosage for patients already receiving opioids, assess 24-hour requirement for current opioid. Using equianalgesic table in prescribing information, convert to equivalent amount of morphine per 24 hours; then convert morphine dosage to appropriate dosage of transdermal fentanyl. During initial application, keep short-acting opioids on hand to treat breakthrough pain; morphine 10 mg I.M. or 60 mg P.O. q 4 hours (60 mg/24 hours I.M. or 360 mg/24 hours P.O.) is roughly equivalent to transdermal fentanyl 100 mcg/hour. For most patients, transdermal patch lasts 72 hours, but some require new patch q 48 hours.

➤ Short-term analgesia during anesthesia and immediate preoperative and postoperative periods

**Adults:** Individualized; 0.05 to 0.1 mg (Sublimaze) I.M. 30 to 60 minutes before surgery and as adjunct to general anesthesia; total dosage is 0.002 mg/kg. Maintenance dosage during surgery is 0.025 to 0.1 mg I.V. or I.M. Postoperatively, 0.05 to 0.1 mg I.M. to control pain, tachypnea, or emergence

delirium; repeat in 1 to 2 hours if needed.

**Children ages 2 to 12:** Individualized; 2 to 3 mcg/kg (Sublimaze) I.V. depending on vital signs, or 5 to 15 mcg/kg (Fentanyl Oralet) transmucosally

➤ General anesthesia (with oxygen only)

**Adults:** Individualized; 0.05 to 0.1 mg/kg (Sublimaze) I.V. for high-dose therapy. Up to 0.12 mg/kg may be necessary.

➤ Adjunct to regional anesthesia

**Adults:** Individualized; 0.05 to 0.1 mg (Sublimaze) I.M. or slow I.V. over 1 to 2 minutes

## Dosage adjustment

- Elderly patients

## Contraindications

- Hypersensitivity to drug or transdermal adhesive (with fentanyl transdermal)
- Opioid-nontolerant patient
- Intermittent pain (on as-needed basis)
- Management of acute or mild pain
- Management of postoperative pain (except for injection form)
- Acute or severe bronchial asthma (Duragesic), significant respiratory depression, especially in unmonitored settings without resuscitation equipment
- Known or suspected paralytic ileus

## Precautions

Use cautiously in:

- diabetes mellitus, severe or chronic pulmonary or hepatic disease, cardiovascular disease, CNS tumors, adrenal insufficiency, hypothyroidism, renal impairment, head injury or increased intracranial pressure (use with extreme caution)
- concurrent use of CNS depressants
- alcoholism or drug abuse
- MAO inhibitor use within 14 days (not recommended)
- elderly patients

- pregnant patients
- labor and delivery
- breastfeeding patients (not recommended)
- children younger than age 2 (Duragesic, Sublimaze), younger than age 16 (Actiq), or younger than age 18 (Abstral, Fentora, Lazanda, Onsolis, Subsys) (safety not established).

### Administration

- Before applying transdermal patch, clip hair at site; don't use razor. Wash area with clean water only; dry well.
- Apply transdermal patch to nonirritated, nonirradiated flat surface. Press firmly in place for 30 seconds.
- In elderly patients, don't initiate fentanyl patch at dosages above 25 mcg/hour unless patient is already receiving more than 135 mg/day of oral morphine or equivalent.
- Don't open buccal tablet blister pack until ready to administer; don't push tablet through blister backing.
- Open buccal soluble film and spray packages immediately before use.
- Be aware that in some patients, dosages of both Fentora and maintenance (around-the-clock) opioid analgesic may need to be adjusted to provide ongoing relief of breakthrough pain. Generally, Fentora dosage should be increased if patient needs more than one dose per breakthrough pain episode for several consecutive episodes.
- Inject I.V. dose slowly over 3 to 5 minutes.
- 🚑 Keep opioid antagonist (naloxone) and emergency equipment available when giving drug I.V.
- Administer sublingual tablets on floor of mouth directly under tongue and allow to completely dissolve.
- Prime nasal spray device before use as directed by manufacturer.
- For patients no longer requiring opioid therapy, consider discontinuing sublingual tablets or nasal spray along with gradual downward titration of

other opioids to minimize possible withdrawal effects. For patients who continue to take long-term opioid therapy for persistent pain but no longer require treatment for breakthrough pain, sublingual tablets or nasal spray can usually be discontinued immediately.

- Be aware that drug isn't recommended for control of mild or intermittent pain.
- Be aware that fentanyl products are generally not interchangeable or substitutable on a mcg-per-mcg basis with other fentanyl products.

Route	Onset	Peak	Duration
I.V.	1-2 min	3-5 min	0.5-1 hr
I.M.	7-8 min	20-30 min	1-2 hr
Buccal film	Unknown	1 hr	Unknown
Nasal spray	Unknown	15-21 min	Unknown
Sublingual spray	Unknown	1.5 hr	Unknown
Transdermal	6 hr	12-24 hr	72 hr
Transmucosal	Rapid	15-30 min	Several hr

### Adverse reactions

**CNS:** headache, dizziness, vertigo, floating feeling, lethargy, confusion, light-headedness, nervousness, hallucinations, delirium, insomnia, anxiety, fear, mood changes, tremor, sedation, coma, seizures

**CV:** palpitations, hypotension, hypertension, tachycardia, bradycardia, **arrhythmias, circulatory depression, cardiac arrest, shock**

**EENT:** blurred vision, diplopia, pharyngolaryngeal pain, **laryngospasm**

**GI:** nausea, vomiting, constipation, biliary tract spasm, dry mouth, anorexia

**GU:** urinary retention or hesitancy, ureteral or vesical sphincter spasm, decreased libido, erectile dysfunction

**Musculoskeletal:** skeletal and thoracic muscle rigidity

**Respiratory:** epistaxis, cough, nasal discomfort, rhinorrhea, nasal congestion, postnasal drip (Lazanda), dyspnea, slow and shallow respirations, suppressed cough reflex, **apnea, bronchospasm**

**Skin:** local skin irritation (with transdermal system), rash, urticaria, pruritus, diaphoresis, flushing, erythema, cold sensitivity

**Other:** oral mucosal reactions (at application site with buccal tablets), physical or psychological drug dependence, drug tolerance, pain or phlebitis at injection site, hypersensitivity, **anaphylaxis** (with oral transmucosal forms)

## Interactions

**Drug-drug.** *Barbiturate anesthetics:* decreased effects of both drugs

*Buprenorphine, dezocine, nalbuphine:* decreased analgesic effect

*CNS depressants (antidepressants, general anesthetics, other opioid analgesics, sedating antihistamines, sedative-hypnotics, skeletal muscle relaxants),*

*CYP4503A4 inhibitors:* profound sedation, hypoventilation, and hypotension  
*CYP4503A4 inducers (such as phenytoin, rifabutin, rifapentin):* possible decrease in fentanyl blood level

*CYP4503A4 inhibitors (such as amiodarone, amprenavir, aprepitant, clarithromycin, diltiazem, erythromycin, fluconazole, fosamprenavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, troleandomycin, verapamil):* increased fentanyl blood level with increased adverse reactions, leading to greater risk of toxicity (including fatal respiratory depression)

*MAO inhibitors:* severe, unpredictable reactions

*Opioid antagonists, partial-antagonist opioid analgesics:* withdrawal in physically dependent patients

**Drug-diagnostic tests.** *Amylase, lipase:* increased levels

*Granulocytes, hemoglobin, neutrophils, platelets, white blood cells:* decreased levels

**Drug-food.** *Grapefruit, grapefruit juice:* increased fentanyl blood level, increased risk of toxicity

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* profound sedation, hypoventilation, and hypotension

## Patient monitoring

 Assess for muscle rigidity in patients receiving high doses; discuss need for neuromuscular blockers with prescriber. Patient receiving blocker will need ventilator.

- Monitor respiratory and cardiovascular function and urine output.
- With transdermal system, monitor patient's pain level often to determine if patch is effective for 72 hours or needs to be replaced after 48 hours. Know that drug level rises gradually for first 24 hours after patch is applied; supplemental analgesics may be needed then.
- If patient develops fever, assess for signs and symptoms of opioid toxicity, as more drug is absorbed at higher body temperatures.
- If adverse reactions to transdermal system occur, monitor patient for at least 12 hours after patch removal.
- Carefully monitor hematologic studies and hepatic enzyme levels.

## Patient teaching

 Caution patient to keep transmucosal (lozenge) form out of children's reach even though it is supplied in individually sealed, child-resistant

pouch. One lozenge can be fatal to a child.

- Instruct patient to place lozenge between cheek and gum and suck on it for 15 minutes without chewing or swallowing.
- Teach patient proper technique for applying and disposing of transdermal patch.
- Tell patient that transdermal form is absorbed more rapidly if skin is warm from fever or hot environment.

Instruct patient to avoid electric blankets, heating pads, heat lamps, hot tubs, and heated water beds and to promptly report fever or a move to a hot climate.

- Instruct patient not to open buccal tablet blister pack until ready to use. Teach patient to peel back blister backing to expose buccal tablet and not to push tablet through blister.
- Caution patient not to break, suck, chew, or swallow buccal tablet.
- Instruct patient to place buccal tablet between upper cheek and gum near rear molar until it dissolves, and to swallow remnants with a glass of water after 30 minutes.
- Instruct patient to use alternate sides of mouth when taking subsequent doses of buccal tablets.
- Instruct patient to open buccal soluble film or spray packages immediately before use.
- Instruct patient to rinse mouth with water to wet area for placement of buccal soluble film. Tell patient to place entire buccal soluble film near tip of a dry finger with pink side facing up and to place pink side of film against inside of cheek; then to press and hold film in place for 5 seconds, after which film should stay in place on its own. Tell patient that liquids may be consumed after 5 minutes. Instruct patient that film will dissolve in 15 to 30 minutes and not to chew, swallow, or manipulate film with tongue or fingers or eat food until film has dissolved. Advise

patient or caregiver to properly dispose of Onsolis film because drug can be fatal to children.

- Tell patient to place sublingual tablets on floor of mouth directly under tongue immediately after removal from blister unit. Tell patient not to chew, suck, or swallow tablets and allow tablets to completely dissolve in the sublingual cavity. Instruct patient not to eat or drink anything until tablets have completely dissolved. Advise patient who has a dry mouth that water may be used to moisten buccal mucosa before taking tablets.

• Instruct patient to carefully spray contents of sublingual spray unit into mouth underneath tongue. Tell patient or caregiver to dispose of used unit-dose systems immediately after use. Also tell patient to dispose of any unneeded unit-dose systems remaining from a prescription as soon as they are no longer needed. Consumed units represent a special risk because they are no longer protected by the child-resistant blister package, yet may contain enough drug to be fatal to children.

- Instruct patient on proper use of nasal spray and to press down firmly on finger grips until a “click” is heard and number in counting window advances by one. Tell patient that the fine mist spray isn’t always felt on nasal mucosal membrane and to rely on the audible click and advancement of dose counter to confirm that a spray has been administered. Advise patient or caregiver that nasal spray contains an amount of drug that could be fatal to children, to individuals for whom it isn’t prescribed, and to those who aren’t opioid-tolerant.
- Tell patient to avoid grapefruit and grapefruit juice while taking drug.
- Advise patient not to breastfeed while taking drug.
- Caution patient to avoid driving and other hazardous activities until drug’s

effects on concentration and alertness are known.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## fesoterodine fumarate

Toviaz

**Pharmacologic class:** Competitive muscarinic receptor antagonist

**Therapeutic class:** Urinary tract agent

**Pregnancy risk category C**

### Action

Inhibits muscarinic receptors, thereby inhibiting contraction of bladder smooth muscle

### Availability

Tablets (*extended-release*): 4 mg, 8 mg

### Indications and dosages

➤ Treatment of overactive bladder with symptoms of urge urinary incontinuity, urgency, and frequency

**Adults:** 4 mg P.O. daily; may increase to 8 mg daily based on response and tolerability

### Dosage adjustment

- Severe renal impairment (creatinine clearance of less than 30 ml/minute)
- Coadministration of potent CP3A4 inhibitors (such as clarithromycin, itraconazole, and ketoconazole; dosages above 4 mg not recommended)

### Contraindications

- Hypersensitivity to drug or its components
- Urinary or gastric retention

- Uncontrolled narrow-angle glaucoma

### Precautions

Use cautiously if:

- severe hepatic impairment (use not recommended)
- severe renal impairment, clinically significant bladder outlet obstruction
- decreased GI motility, such as with severe constipation
- concurrent treatment of narrow-angle glaucoma
- myasthenia gravis
- concurrent use of CYP3A4 inhibitors
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Administer with fluids and have patient swallow tablet whole.

Route	Onset	Peak	Duration
P.O.	Unknown	Approx. 5 hr	Unknown

### Adverse reactions

**CNS:** insomnia

**EENT:** blurred vision, dry eyes, dry throat

**GI:** dry mouth, constipation, dyspepsia, nausea, upper abdominal pain

**GU:** urinary retention, urinary tract infection, dysuria

**Musculoskeletal:** back pain

**Respiratory:** cough, upper respiratory tract infection

**Skin:** decreased sweating, rash

**Other:** heat prostration, peripheral edema, **angioedema**

### Interactions

**Drug-drug.** *CP3A4 inhibitors (such as clarithromycin, itraconazole, ketoconazole):* increased fesoterodine  $C_{max}$  and area under the curve (AUC)

*Rifampin:* decreased active metabolite of fesoterodine  $C_{max}$  and AUC

*Other antimuscarinics:* increased frequency or severity of adverse effects

(such as dry mouth, constipation, urinary retention)

**Drug-diagnostic tests.** *Alanine aminotransferase, gamma-glutamyltransferase:* increased levels

**Drug-behaviors.** *Alcohol use:* increased drowsiness

### Patient monitoring

- Monitor kidney and liver function tests closely.

 Be aware that life-threatening angioedema of the face, lips, tongue, and larynx has been reported with fexofenadine. In some cases, angioedema occurred after first dose. If involvement of the tongue, hypopharynx, or larynx occurs, promptly discontinue drug and initiate appropriate therapy and measures to ensure patent airway.

### Patient teaching

- Instruct patient to take drug with fluids and to swallow tablet whole.
-  Instruct patient to immediately stop drug and seek medical attention if difficulty breathing or swelling of the face, lips, or tongue occurs.
- Inform patient that drug may cause constipation and urinary retention.
- Caution patient to avoid driving and other hazardous activities until drug's effects on concentration and alertness are known.
- Advise patient to avoid excessive exercise in hot weather.
- Advise patient to avoid alcohol use while taking drug.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## fexofenadine hydrochloride

Allegra, Allegra ODT, Telfast<sup>®</sup>

**Pharmacologic class:** Peripherally selective piperidine, selective histamine<sub>1</sub>-receptor antagonist

**Therapeutic class:** Antihistamine (nonsedating type), second-generation

**Pregnancy risk category C**

### Action

Blocks effects of histamine at peripheral histamine<sub>1</sub>-receptor sites, decreasing allergy signs and symptoms

### Availability

*Capsules:* 60 mg

*Oral suspension:* 30 mg/5 ml (6 mg/ml)

*Tablets:* 30 mg, 60 mg, 180 mg

*Tablets (orally disintegrating):* 30 mg

### Indications and dosages

 Seasonal allergic rhinitis; chronic idiopathic urticaria

**Adults and children age 12 and older:** 60 mg P.O. b.i.d. or 180 mg once daily (conventional tablets)

**Children ages 6 to 11:** 30 mg P.O. b.i.d. (conventional tablets or ODT tablets)

 Seasonal allergic rhinitis

**Children ages 2 to 11:** 30 mg P.O. b.i.d. (oral suspension and ODT)

 Chronic idiopathic urticaria

**Children ages 6 months to less than 2 years:** 15 mg P.O. b.i.d. (oral suspension and ODT)

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to drug, terfenadine, or their components

## Precautions

Use cautiously in:

- renal impairment
- concurrent ketoconazole or erythromycin therapy
- elderly patients
- pregnant or breastfeeding patients.

## Administration

- Give capsules and conventional tablets with water; don't give with apple, orange, or grapefruit juice.
- Don't remove orally disintegrating tablets from original blister package until time of administration.
- Administer orally disintegrating tablets on an empty stomach; allow tablets to disintegrate on the tongue and then have patient swallow tablets with or without water.
- Don't break or use partial orally disintegrating tablets
- Know that orally disintegrating tablets contain phenylalanine.
- Don't give antacids within 2 hours of fexofenadine.

Route	Onset	Peak	Duration
P.O.	Within 1 hr	2-3 hr	12-24 hr

## Adverse reactions

**CNS:** drowsiness, fatigue, headache

**EENT:** otitis media

**GI:** nausea, dyspepsia

**Metabolic:** dysmenorrhea

**Respiratory:** upper respiratory tract infection

**Other:** viral infection

## Interactions

**Drug-drug.** *Antacids containing aluminum and magnesium:* decreased absorption and efficacy of fexofenadine

**Drug-diagnostic tests.** *Skin allergy tests:* false-negative results

**Drug-food.** *Apple, orange, and grapefruit juice:* decreased absorption and efficacy of fexofenadine

## Patient monitoring

- Monitor renal function.
- Watch for signs and symptoms of viral infection.

## Patient teaching

- Instruct patient to take conventional tablets with water, and not with apple, orange, or grapefruit juice.
- Instruct patient not to remove orally disintegrating tablets from original blister package until time of administration.
- Instruct patient to take orally disintegrating tablets on an empty stomach at least 1 hour before or 2 hours after a meal, to allow tablet to disintegrate on the tongue, and then to swallow with or without water. Advise patient not to chew tablets.
- Tell patient not to break or use partial orally disintegrating tablets.
- Tell patient to stop taking drug 4 days before diagnostic skin tests, to avoid interference with test results.
- Advise patient to report signs or symptoms of viral infection, especially upper respiratory tract infection.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Advise female patient to inform prescriber if she is pregnant or breastfeeding.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## fidaxomicin

Dificid

**Pharmacologic class:** Macrolide

**Therapeutic class:** Anti-infective

**Pregnancy risk category B**

**Action**

Bactericidal against *Clostridium difficile* in vitro, inhibiting RNA synthesis by RNA polymerases

**Availability**

Tablets: 200 mg

**Indications and dosages**

➤ *C. difficile*-associated diarrhea

**Adults:** 200-mg tablet P.O. b.i.d. for 10 days

**Contraindications**

None

**Precautions**

Use cautiously in:

- systemic infections or absence of proven or strongly suspected *C. difficile* infection
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

**Administration**

- Administer with or without food.
- Be aware that using drug in absence of proven or strongly suspected *C. difficile* infection is unlikely to provide benefit to patient and increases risk of development of drug-resistant bacteria.
- Be aware that drug has minimal systemic absorption and isn't effective in treatment of systemic infections.

Route	Onset	Peak	Duration
P.O.	Unknown	2 hr	Unknown

**Adverse reactions**

**GI:** nausea, vomiting, abdominal pain, GI hemorrhage

**Hematologic:** anemia, neutropenia

**Interactions**

**Drug-drug.** *Cyclosporine:* increased plasma concentrations of fidaxomicin and its metabolite

**Patient monitoring**

- Monitor CBC periodically.
- Observe patient for signs and symptoms of GI hemorrhage.

**Patient teaching**

- Tell patient to take drug with or without food.
- Inform patient that drug only treats *C. difficile*-associated diarrhea and shouldn't be used to treat other infections.
- Inform patient that although it's common to feel better early in the course of therapy, the drug should be taken exactly as directed. Skipping doses or not completing full course of therapy may decrease effectiveness of immediate treatment and increase likelihood that bacteria will develop resistance and won't be treatable by this drug or other antibacterials in the future.
- 📣 Instruct patient to promptly report signs and symptoms of GI bleeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

**filgrastim**

## Neupogen

**Pharmacologic class:** Granulocyte colony-stimulating factor

**Therapeutic class:** Hematopoietic stimulator, antineutropenic

**Pregnancy risk category C**

**Action**

Induces formation of neutrophil progenitor cells by binding directly to receptor on surface granulocyte, stimulating cell proliferation and differentiation. Also potentiates effects of mature neutrophils and reduces fever

and risk of infection associated with severe neutropenia.

### Availability

*SingleJect prefilled syringes:* 300 mcg, 480 mcg

*Vial for injection:* 300 mcg/ml, 480 mcg/1.6 ml

### Indications and dosages

➤ To prevent infection after myelo-suppressive chemotherapy

**Adults:** 5 mcg/kg/day by subcutaneous injection or I.V. infusion over 15 to 30 minutes, or continuous subcutaneous or continuous I.V. infusion, increased by 5 mcg/kg with each chemotherapy cycle if needed

➤ Neutropenia after bone marrow transplantation

**Adults:** 10 mcg/kg/day I.V. over 4 or 24 hours or as a continuous subcutaneous infusion over 24 hours

➤ To enhance peripheral blood progenitor cell collection in autologous hematopoietic stem cell transplantation

**Adults:** 10 mcg/kg/day by subcutaneous injection or as continuous subcutaneous infusion, starting 4 days before first leukapheresis procedure and continuing until last day of leukapheresis

➤ Neutropenia in congenital neutropenia

**Adults:** 6 mcg/kg subcutaneously b.i.d.

➤ Neutropenia in idiopathic or cyclic neutropenia

**Adults:** 5 mcg/kg/day subcutaneously

### Off-label uses

- AIDS
- Aplastic anemia
- Hairy cell leukemia
- Myelodysplasia

### Contraindications

- Hypersensitivity to drug, its components, or *Escherichia coli*-derived proteins

### Precautions

Use cautiously in:

- patients receiving lithium or other drugs that can potentiate neutrophil release
- breastfeeding patients.

### Administration

• Know that drug may be injected into venous return line of dialysis tubing after dialysis is completed.

📢 To dilute for I.V. administration, use dextrose 5% in water. Never use saline solution, because it may cause drug to precipitate.

- Administer single dose intermittently over 15 to 30 minutes or by continuous infusion over 4 to 24 hours.
- Don't mix with other drugs, and don't shake.
- Don't give within 24 hours of chemotherapy, bone marrow transplantation, or radiation therapy.

Route	Onset	Peak	Duration
I.V.	5-60 min	24 hr	1-7 days
Subcut.	5-60 min	2-8 hr	1-7 days

### Adverse reactions

**CNS:** headache, weakness

**CV:** chest pain, hypotension, transient supraventricular tachycardia, **myocardial infarction, arrhythmias**

**EENT:** sore throat

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, splenomegaly, stomatitis

**GU: bleeding**

**Hematologic:** leukocytosis, sickle cell crisis, thrombocytopenia, splenic rupture

**Metabolic:** hyperuricemia

**Musculoskeletal:** bone, joint, muscle, arm, or leg pain

**Respiratory:** dyspnea, cough

**Skin:** pruritus, rash, erythema, alopecia, **cutaneous necrotic vasculitis**

**Other:** fever, mucositis, pain at injection site, edema, hypersensitivity reactions

## Interactions

**Drug-drug.** *Lithium*: increased neutrophil production

*Topotecan*: prolonged neutropenia

*Vincristine*: increased risk of severe atypical peripheral neuropathy

**Drug-diagnostic tests.** *Alkaline phosphatase, creatinine, lactate dehydrogenase, uric acid*: increased levels

*Platelets*: decreased count

## Patient monitoring

- Obtain CBC with platelet count before starting therapy; monitor these counts often thereafter.
- Monitor cardiovascular status carefully.
- Assess for signs and symptoms of sickle cell crisis and splenic rupture.

## Patient teaching

- Teach patient how to recognize and promptly report signs and symptoms of allergic response.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Advise patient to discuss possible need for iron supplements, vitamin B<sub>12</sub>, and folic acid with prescriber.
- Teach patient how to monitor blood pressure at home.
- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking adequate fluids.
- Tell female patient to inform prescriber if she is breastfeeding.
- Inform patient that he'll undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## finasteride

Propecia, Proscar

**Pharmacologic class:** Androgen inhibitor

**Therapeutic class:** Sex hormone, hair regrowth stimulant

**Pregnancy risk category** X

## Action

Suppresses dihydrotestosterone levels by inhibiting the hepatic enzyme 5-alpha reductase, which converts testosterone to dihydrotestosterone in prostate, liver, and skin

## Availability

**Tablets:** 1 mg (Propecia), 5 mg (Proscar)

## Indications and dosages

➤ Symptomatic benign prostatic hypertrophy (BPH)

**Adults:** 5 mg P.O. daily

➤ To reduce risk of progression of BPH symptoms

**Adults:** 5 mg P.O. daily (Proscar) given with doxazosin

➤ Male-pattern baldness

**Adults:** 1 mg P.O. daily

## Off-label uses

- Acne in women
- Hirsutism

## Contraindications

- Hypersensitivity to drug or its components
- Pregnant patients, women who may potentially be pregnant

## Precautions

Use cautiously in:

- hepatic impairment, obstructive uropathy, increased risk of high-grade prostate cancer, decrease in serum prostate-specific antigen (PSA) level

- women (not indicated)
- children (not indicated).

### Administration

- Give with or without food.
- Know that female patients who are or may be pregnant shouldn't handle crushed or broken tablets. (Tablets are coated, so handling of intact tablets doesn't pose a problem.)

Route	Onset	Peak	Duration
P.O. (BPH)	Unknown	8 hr	24 hr
P.O. (baldness)	3 mo	Unknown	Unknown

### Adverse reactions

**CNS:** dizziness, headache, asthenia

**EENT:** lip swelling

**GU:** erectile dysfunction, decreased ejaculate volume, decreased libido, testicular pain, gynecomastia

**Musculoskeletal:** back pain

**Skin:** rash

### Interactions

**Drug-drug.** *Theophylline:* increased theophylline clearance

**Drug-diagnostic tests.** *PSA:* 50% decrease

### Patient monitoring

- Carefully evaluate sustained PSA increases during therapy.
- Monitor fluid intake and output closely.

### Patient teaching

- Tell patient he may take drug with or without food.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Inform patient that he may experience erectile dysfunction and decreased ejaculate. Advise him to discuss these issues with prescriber.

- Caution female caregiver or companion who is or may be pregnant not to handle crushed or broken tablets.
- Tell patient he may need at least 6 months of therapy for BPH treatment and at least 3 months to see improvement in male-pattern baldness.
- Inform patient with BPH that he'll undergo periodic digital rectal exams.
- Instruct patient not to donate blood for at least 1 month after last dose.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## fingolimod

Gilenya

**Pharmacologic class:** Sphingosine 1-phosphate receptor modulator

**Therapeutic class:** Immunologic agent

**Pregnancy risk category C**

### Action

Blocks capacity of lymphocytes to egress from lymph nodes, reducing number of lymphocytes in peripheral blood. Mechanism by which fingolimod exerts therapeutic effects in multiple sclerosis (MS) is unknown, but may involve reduction of lymphocyte migration into CNS.

### Availability

*Capsules:* 0.5 mg

### Indications and dosages

➤ Relapsing forms of MS

**Adults:** 0.5 mg P.O. daily

### Contraindications

- Recent (within last 6 months) occurrence of myocardial infarction, unstable angina, stroke, transient ischemic attack, decompensated heart failure

requiring hospitalization, Class III/IV heart failure

- History or presence of Mobitz Type II second- or third-degree AV block or sick sinus syndrome, unless patient has pacemaker
- Baseline QTc interval 500 ms or greater
- Treatment with Class Ia or Class III antiarrhythmics

### Precautions

Use cautiously in:

- hepatic or severe renal impairment
- compromised respiratory function, AV conduction abnormalities, bradycardia, hypertension
- infections, macular edema
- patients without history of chickenpox or without vaccination against varicella zoster virus (VZV)
- concurrent use of drugs that slow heart rate or AV conduction
- concurrent use of vaccines (avoid use during treatment and for 2 months after treatment)
- concurrent use of antineoplastics, immunosuppressants, or immunomodulators
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

### Administration

- Administer with or without food.
- Be aware that patients with active acute or chronic infections shouldn't start treatment until infection is resolved.
- Before starting treatment, make sure recent CBC (within 6 months) is available.
- Before starting treatment, obtain liver enzyme values, particularly transaminase and bilirubin levels (within 6 months).
- Before starting treatment, test patient without history of chickenpox or without vaccination against VZV for

antibodies to VZV. Consider VZV vaccination of antibody-negative patients before beginning treatment, after which initiation of fingolimod treatment should be postponed for 1 month to allow for full effect of vaccination.

- Be aware that decrease in heart rate and AV conduction may occur after first dose. To identify underlying risk factors for bradycardia and AV block before starting therapy: If a recent ECG (within 6 months) isn't available, obtain an ECG in patients using antiarrhythmics (including beta blockers and calcium channel blockers), in those with cardiac risk factors, and in those who on examination have a slow or irregular heartbeat.
- Obtain baseline ophthalmologic evaluation.

Route	Onset	Peak	Duration
P.O.	Unknown	12-16 hr	Unknown

### Adverse reactions

**CNS:** headache, dizziness, paresthesia, migraine, asthenia, depression, **vascular events (including posterior reversible encephalopathy syndrome)**  
**CV:** hypertension, bradycardia, AV conduction abnormalities, **vascular events (including ischemic and hemorrhagic strokes, peripheral arterial occlusive disease)**  
**EENT:** macular edema, blurred vision, eye pain, sinusitis  
**GI:** gastroenteritis, diarrhea  
**Hematologic:** lymphopenia, leukopenia, lymphomas  
**Hepatic:** increased liver enzyme levels  
**Metabolic:** increased triglyceride levels  
**Musculoskeletal:** back pain  
**Respiratory:** dyspnea, bronchitis, cough  
**Skin:** alopecia, eczema, pruritus  
**Other:** influenza-type viral infections, herpes viral infections, tinea infections

## Interactions

**Drug-drug.** *Antineoplastics, immunomodulators, immunosuppressants:* increased risk of immunosuppression

*Beta blockers (atenolol), Class Ia (such as procainamide, quinidine) or Class III (such as amiodarone, sotalol) antiarrhythmics:* decreased heart rate

*Ketoconazole:* increased fingolimod and fingolimod-phosphate blood levels

*Vaccines:* reduced vaccine effectiveness

*Live attenuated vaccines:* increased risk of infection

**Drug-diagnostic tests.** *Lymphocytes:* reduced levels

*Serum transaminases:* elevated levels

## Patient monitoring

- Continue to closely monitor CBC with differential; be aware that because drug reduces blood lymphocyte counts via redistribution in secondary lymphoid organs, peripheral blood lymphocyte counts can't be utilized to evaluate lymphocyte status during therapy.

⚠ Be aware that patient with preexisting liver disease may be at increased risk for developing elevated liver enzyme levels. Closely monitor liver enzyme levels if hepatic injury is suspected. Discontinue drug if significant hepatic injury is confirmed.

- Monitor renal function tests in patients with renal impairment.

⚠ At start of therapy, carefully watch for reduced heart rate in patients receiving concurrent beta blockers or heart rate-lowering calcium channel blockers, such as diltiazem, verapamil, or digoxin.

⚠ Observe patient for 6 hours after first dose for bradycardia. Should post-dose bradyarrhythmia-related signs and symptoms occur, initiate appropriate management and continue observation until signs and symptoms have resolved.

⚠ Closely monitor patients receiving Class Ia or Class III antiarrhythmics for bradycardia for development of torsades de pointes.

- Monitor patient for conduction abnormalities, which are usually transient and asymptomatic. Such abnormalities may resolve within first 24 hours of treatment, but occasionally may require treatment.

- Monitor blood pressure during treatment.

⚠ Monitor patient for infection during treatment and for 2 months after discontinuation of drug. Consider suspending treatment if patient develops serious infection; reassess benefits and risks before restarting therapy.

- Be aware that patients who develop unexplained dyspnea during therapy should have spirometric evaluation of respiratory function and evaluation of diffusion lung capacity for carbon monoxide if clinically indicated.

- Monitor visual acuity 3 to 4 months after treatment initiation; be aware that patients with diabetes mellitus or history of uveitis are at increased risk and should have regular ophthalmologic evaluations.

- Closely monitor patients taking fingolimod and systemic ketoconazole concomitantly, because risk of adverse reactions is greater.

## Patient teaching

- Tell patient to take drug with or without food.

- Inform patient that he will need to be observed for 6 hours after first dose.

- Advise patient who hasn't had chickenpox or VZV vaccination to consider vaccination before treatment begins.

- Advise patient to avoid live attenuated vaccines during treatment and for 2 months post treatment because of risk of infection.

- Tell patient not to discontinue drug without first discussing with prescriber.

 Advise patient to promptly report unexplained nausea, vomiting, abdominal pain, dizziness, fatigue, anorexia, dark urine, yellowing of skin or eyes, fever, infection, slow or irregular heart-beat, or unexplained shortness of breath.

 Advise patient to have eye examinations 3 to 4 months after beginning therapy and to contact prescriber if vision changes occur. Instruct patient to immediately report blurriness or shadows in center of vision, blind spot in center of vision, sensitivity to light, or unusually colored (tinted) vision.

- Instruct patient to tell prescriber about all drugs he's taking because some drugs have potential for serious drug interactions and shouldn't be taken with fingolimod.
- Advise female patient of childbearing age to use effective contraception to avoid pregnancy during therapy and for 2 months after treatment ends.
- Advise breastfeeding patient that she should decide whether to discontinue breastfeeding or discontinue drug, taking into account importance of the drug for her treatment.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## flecainide acetate

Apo-Flecainide<sup>⚠</sup>, Tambocor, Tambocor XL<sup>⚠</sup>

**Pharmacologic class:** Cardiac benzamide local anesthetic

**Therapeutic class:** Antiarrhythmic (class IC)

**Pregnancy risk category C**

### FDA BOXED WARNING

- In patients with non-life-threatening ventricular arrhythmias who had recent myocardial infarctions and were receiving drug, excessive deaths and nonfatal cardiac arrest rates occurred. Don't give to patients without life-threatening ventricular arrhythmias.
- Drug isn't recommended for patients with chronic atrial fibrillation.
- Patients who received drug for atrial flutter have experienced 1:1 atrioventricular conduction. Paradoxical increase in ventricular rate also may occur in patients with atrial fibrillation who receive drug.

### Action

Inhibits fast sodium channels of myocardial cell membrane. Also slows conduction, shortens action potential, stops paroxysmal reentrant supraventricular tachycardia, and decreases conduction in accessory pathways in Wolff-Parkinson-White syndrome.

### Availability

Tablets: 50 mg, 100 mg, 150 mg

### Indications and dosages

➤ Supraventricular tachyarrhythmias (including paroxysmal supraventricular tachycardia and paroxysmal atrial fibrillation or flutter)

**Adults:** Initially, 50 mg P.O. q 12 hours, increased by 50 mg b.i.d. q 4 days until desired response occurs or maximum daily dosage of 300 mg is reached

➤ Sustained, life-threatening ventricular tachycardia

**Adults:** Initially, 100 mg P.O. q 12 hours, increased by 50 mg b.i.d. q 4 days until desired response occurs or maximum daily dosage of 400 mg is reached

### Dosage adjustment

- Heart failure
- Renal impairment

## Off-label uses

- Ventricular arrhythmias
- Wolff-Parkinson-White syndrome

## Contraindications

- Hypersensitivity to drug
- Preexisting atrioventricular block or right bundle-branch block
- Recent MI
- Cardiogenic shock

## Precautions

Use cautiously in:

- heart failure, renal impairment
- patients taking concurrent amiodarone, beta-adrenergic blockers, disopyramide, or verapamil
- pregnant or breastfeeding patients
- children (safety not established).

## Administration

- Initiate therapy only in hospital setting with trained personnel and continuous ECG monitoring.
- Before giving, correct hypokalemia or hyperkalemia.
- Be aware that dosage may be reduced once arrhythmias have been adequately controlled.

Route	Onset	Peak	Duration
P.O.	Unknown	2-3 hr	12 hr

## Adverse reactions

**CNS:** dizziness, anxiety, fatigue, headache, depression, malaise, tremor, weakness, hypoesthesia, paresthesia

**CV:** chest pain, palpitations, **second- or third-degree heart block, heart failure, new or worsening arrhythmias**

**EENT:** blurred vision, visual disturbances, corneal deposits

**GI:** nausea, vomiting, constipation, abdominal pain, dyspepsia, anorexia

**Hepatic:** hepatitis

**Respiratory:** dyspnea

**Skin:** rash, diaphoresis

**Other:** edema, fever

## Interactions

**Drug-drug.** *Acidifying drugs:* increased renal elimination, decreased efficacy of flecainide (with urine pH below 5)

*Alkalinizing drugs:* increased flecainide blood level, possible toxicity

*Amiodarone:* doubling of flecainide blood level

*Beta-adrenergic blockers:* increased blood levels of both drugs

*Beta-adrenergic blockers, disopyramide, verapamil:* additive myocardial depressant effect

*Digoxin:* 15% to 25% increase in digoxin blood level

*Other antiarrhythmics (including calcium channel blockers):* increased risk of arrhythmias

**Drug-diagnostic tests.** *Alkaline phosphatase:* increased level (with prolonged therapy)

**Drug-food.** *Foods that decrease urine pH below 5 (such as acidic juices):*

increased renal elimination and possibly decreased efficacy of drug

*Foods that increase urine pH above 7 (as in strict vegetarian diets):* increased drug blood level

**Drug-behaviors.** *Smoking:* increased plasma clearance and decreased efficacy of drug

## Patient monitoring

 Monitor ECG for worsening arrhythmias.

- Measure pacing threshold 1 week before therapy starts and again after 1 week of therapy.

- Monitor potassium and flecainide blood levels.

- Assess respiratory status regularly.

- Monitor hepatic function tests.

## Patient teaching

 Instruct patient to immediately report cardiac or respiratory symptoms, unusual tiredness, or yellowing of skin or eyes.

- Tell patient drug may cause numbness. Advise him to avoid injury to areas with sensory impairment.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, alertness, and vision.
- Advise patient to minimize GI upset by eating small, frequent servings of food and drinking adequate fluids.
- Tell female patient to inform prescriber if she is pregnant or breastfeeding.
- Inform patient that he'll undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

## fluconazole

Apo-Fluconazole<sup>✳</sup>, Canesten Oral<sup>⚠</sup>, Co Fluconazole<sup>✳</sup>, Diflucan, Dom-Fluconazole<sup>✳</sup>, Gen-Fluconazole<sup>✳</sup>, Novo-Fluconazole<sup>✳</sup>, PHL-Fluconazole<sup>✳</sup>, PMS-Fluconazole<sup>✳</sup>, Riva-Fluconazole<sup>✳</sup>

**Pharmacologic class:** Synthetic azole

**Therapeutic class:** Systemic antifungal

**Pregnancy risk category** C

### Action

Alters cellular membrane, increasing permeability and leakage of essential elements needed for fungal growth. At higher concentrations, may be fungicidal.

### Availability

**Injection:** 2 mg/ml in 100- or 200-ml bottles or containers

**Powder for oral suspension:** 50 mg/5 ml in 35-ml bottle, 200 mg/5 ml in 35-ml bottle

**Tablets:** 50 mg, 100 mg, 150 mg, 200 mg

### Indications and dosages

➤ Oropharyngeal candidiasis

**Adults:** 200 mg P.O. or I.V. on first day, followed by 100 mg/day for at least 2 weeks

**Children:** 6 mg/kg P.O. or I.V. on first day, followed by 3 mg/kg/day for at least 2 weeks

➤ Esophageal candidiasis

**Adults:** 200 mg P.O. or I.V. on first day, followed by 100 mg/day for 3 weeks and then for 2 weeks after symptom resolution. Up to 400 mg/day may be used in severe cases.

**Children:** 6 mg/kg P.O. or I.V. on first day, followed by 3 mg/kg/day for 3 weeks and for at least 2 weeks after symptom resolution

➤ Candidal urinary tract infection; peritonitis

**Adults:** 50 to 200 mg P.O. or I.V. daily

➤ Systemic candidiasis

**Adults:** 400 mg P.O. or I.V. on first day, followed by 200 mg/day for 4 weeks and for at least 2 weeks after symptom resolution

**Children:** 6 to 12 mg/kg/day P.O. or I.V.

➤ Vaginal candidiasis

**Adults:** 150 mg P.O. as a single dose

➤ Cryptococcal meningitis

**Adults:** 400 mg P.O. or I.V. on first day, followed by 200 or 400 mg/day for 10 to 12 weeks after cerebrospinal fluid (CSF) is negative

**Children:** 12 mg/kg P.O. or I.V. on first day, followed by 6 mg/kg/day for 10 to 12 weeks after CSF is negative

➤ Suppression of cryptococcal meningitis in patients with AIDS

**Adults:** 200 mg/day P.O. or I.V.

➤ To prevent candidiasis after bone marrow transplantation

**Adults:** 400 mg/day P.O. or I.V. for several days before and 7 days after neutrophil count rises above 1,000 cells/mm<sup>3</sup>

**Dosage adjustment**

- Renal impairment
- Elderly patients

**Contraindications**

- Hypersensitivity to drug or its components
- Concurrent use of terfenadine (not available in U.S.) in patients receiving fluconazole at multiple doses of 400 mg or higher and other drugs known to prolong QT interval and that are metabolized via CYP3A4, such as cisapride, astemizole (not available in U.S.), pimozone, and quinidine

**Precautions**

Use cautiously in:

- hypersensitivity to other azole antifungals
- renal impairment or hepatic disease
- potentially proarrhythmic conditions
- concurrent use of erythromycin because of potential for increased risk of prolonged QT interval, torsades de pointes, and consequently sudden death (avoid use)
- pregnant or breastfeeding patients
- children younger than 6 months.

**Administration**

-  Limit single I.V. infusion to 200 mg/hour or less, using infusion pump.
- Don't piggyback with other I.V. infusions.
- Keep overwrap on I.V. bag until just before use.
- Know that plastic container may be opaque (from moisture absorbed during sterilization). This doesn't affect drug and will decrease over time.
- Be aware that powder for oral suspension contains sucrose and shouldn't be used in patients with hereditary fructose intolerance, glucose-galactose

malabsorption, and sucrase-isomaltase deficiency.

Route	Onset	Peak	Duration
P.O.	Slow	1-2 hr	2-4 days
I.V.	Rapid	1 hr	2-4 days

**Adverse reactions**

- CNS:** headache, dizziness
- CV:** QT interval prolongation, torsades de pointes
- GI:** nausea, vomiting, diarrhea, dyspepsia, abdominal discomfort
- Hematologic:** leukopenia, thrombocytopenia
- Hepatic:** hepatotoxicity
- Skin:** rash, pruritus, exfoliative skin disorders (including Stevens-Johnson syndrome)
- Other:** altered taste, anaphylaxis

**Interactions**

- Drug-drug.** *Alfentanil, cyclosporine, phenytoin, rifabutin, tacrolimus, theophylline, zidovudine:* increased blood levels of these drugs, greater risk of toxicity
- Benzodiazepines, buspirone, losartan, nisoldipine, tricyclic antidepressants, zolpidem:* increased blood levels and effects of these drugs
- CYP3A4 inducers:* inhibited CYP3A4 enzyme system, altered actions of CYP3A4 inducers (with fluconazole dosages above 200 mg/day)
- Glipizide, glyburide, tolbutamide:* increased hypoglycemic effect of these drugs
- Rifampin:* increased rifampin blood level, decreased fluconazole blood level
- Thiazide diuretics:* increased fluconazole blood level
- Warfarin:* increased warfarin activity
- Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, bilirubin, gamma-glutamyltransferase, hepatic enzymes:* increased levels
- Platelets, white blood cells:* decreased counts

**Patient monitoring**

- 📣 Stay alert for signs and symptoms of anaphylaxis. Stop drug immediately if these occur.
- 📣 Monitor liver function test results and hematologic studies; discontinue drug if clinical signs and symptoms consistent with liver disease develop that may be attributable to fluconazole.
- 📣 Assess for rash; if lesions develop, monitor patient. Stop drug and notify prescriber if lesions progress (may signal Stevens-Johnson syndrome).
  - Be aware that patients with human immunodeficiency virus have greater risk of adverse reactions.

**Patient teaching**

- 📣 Teach patient how to recognize and immediately report signs and symptoms of allergic response.
  - Urge patient to contact prescriber if rash occurs, to determine whether Stevens-Johnson syndrome is developing.
  - Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
  - Advise patient to minimize GI upset by eating frequent, small servings of food and drinking adequate fluids.
  - Tell female patient to inform prescriber if she is pregnant or breastfeeding.
  - As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

**flucytosine**

Ancobon, Ancotil

**Pharmacologic class:** Fluorinated pyrimidine analog**Therapeutic class:** Antifungal**Pregnancy risk category** C**FDA BOXED WARNING**

- Use with extreme caution in renal impairment. Closely monitor hematologic, renal, and hepatic status of all patients. Review instructions thoroughly before administration.

**Action**

Unclear. Thought to interfere with protein synthesis in cells of susceptible fungi after conversion to fluorouracil.

**Availability**

*Capsules:* 250 mg, 500 mg

**Indications and dosages**

➤ Severe fungal infections caused by susceptible strains of *Candida* species (including septicemia, endocarditis, urinary tract infections [UTIs]), and pulmonary infections) and *Cryptococcus* species (including meningitis, pulmonary infections, and UTIs)

**Adults:** 50 to 150 mg/kg P.O. daily in four equally divided doses q 6 hours

**Dosage adjustment**

- Renal impairment (glomerular filtration rate below 50 ml/minute)

**Off-label uses**

- Chromomycosis

**Contraindications**

- Hypersensitivity to drug or other antifungals

**Precautions**

Use cautiously in:

- renal impairment, underlying hepatic disease, bone marrow depression
- pregnant or breastfeeding patients
- children (safety not established).

**Administration**

- Give capsules a few at a time over 15 minutes to minimize nausea and vomiting.

- Know that drug is rarely used alone. Expect to give another antifungal or amphotericin B concurrently.

Route	Onset	Peak	Duration
P.O.	Variable	2 hr	10-12 hr

### Adverse reactions

**CNS:** headache, dizziness, confusion, hallucinations, vertigo, psychosis, ataxia, paresthesia, parkinsonism, peripheral neuropathy

**CV:** chest pain, **cardiac arrest**

**EENT:** hearing loss

**GI:** nausea, vomiting, diarrhea, dyspepsia, ulcerative colitis, abdominal discomfort, anorexia, duodenal ulcer, **hemorrhage**

**GU:** azotemia, crystalluria, **renal failure**

**Hematologic:** eosinophilia, anemia, **leukopenia, aplastic anemia, thrombocytopenia, bone marrow depression, agranulocytosis**

**Hepatic:** jaundice

**Metabolic:** hypokalemia, **hypoglycemia**

**Respiratory:** dyspnea, **respiratory arrest**

**Skin:** rash, pruritus, urticaria, photosensitivity

### Interactions

**Drug-drug.** *Amphotericin B:* synergistic effects, increased risk of toxicity

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, gamma-glutamyltransferase:* increased levels  
*Glucose, granulocytes, hemoglobin, platelets, potassium, white blood cells:* decreased levels

### Patient monitoring

- Monitor kidney and liver function test results.
- Carefully monitor blood glucose level and hematologic test results.
- ⚠ Assess for serious cardiovascular, renal, respiratory, and hematologic adverse reactions.
- Evaluate electrolyte levels, particularly potassium.

- Assess for signs and symptoms of bleeding.

### Patient teaching

- Advise patient to take capsules over 15-minute period to reduce GI upset.
- ⚠ Instruct patient to immediately report unusual bleeding or bruising.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Instruct patient to minimize GI upset by eating frequent, small servings of food and drinking adequate fluids.
- Advise female patient to inform prescriber if she is pregnant or breast-feeding.
- Tell patient he'll undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## flunisolide

APO-Flunisolide\*, Nasarel, PMS-Flunisolide\*, Ratio-Flunisolide\*, Rhinalar Nasal Mist\*

**Pharmacologic class:** Intranasal steroid

**Therapeutic class:** Respiratory inhalant

**Pregnancy risk category C**

### Action

Unknown. Thought to diminish capillary permeability and suppress migration of polymorphonuclear leukocytes, decreasing inflammation.

### Availability

**Spray solution:** 25 ml (each actuation delivers approximately 25 mcg)

## Indications and dosages

 Relief of seasonal or perennial rhinitis

**Adults:** Two sprays in each nostril b.i.d.; may increase to two sprays in each nostril t.i.d. Maximum daily dose is eight sprays in each nostril. For maintenance, after desired clinical effect occurs, reduce dosage to smallest amount needed to control symptoms.

**Children ages 6 to 14:** One spray in each nostril t.i.d. or two sprays in each nostril b.i.d.; maximum daily dose is four sprays in each nostril. For maintenance, after desired clinical effect occurs, reduce dosage to smallest amount needed to control symptoms.

## Contraindications

- Hypersensitivity to drug or its components
- Untreated local infections of nasal mucosa

## Precautions

Use cautiously in:

- localized *Candida albicans* infection; tuberculosis; untreated fungal, bacterial, or systemic viral infections; ocular herpes simplex
- patients receiving immunosuppressive therapy.

## Administration

- Don't increase dosage or discontinue drug abruptly.

Route	Onset	Peak	Duration
Inhalation (nasal)	Unknown	10-30 min	Unknown

## Adverse reactions

**CNS:** headache, light-headedness, nervousness, dizziness

**EENT:** cataracts; glaucoma; blurred vision; conjunctivitis; increased intraocular pressure; lacrimation; dry, irritated eyes; tinnitus; otitis; otitis media; rhinorrhea; rhinitis; nasal irritation, burning, and dryness; nasal

stuffiness and pain; sneezing; nasal ulcer; epistaxis; localized *Candida albicans* nasal infections; nasal mucosa ulcerations; nasal septum perforation; throat discomfort, soreness, and dryness; mild nasopharyngeal irritation; pharyngitis; dry mucous membranes; nasal and sinus congestion; sinusitis; hoarseness, voice changes

**GI:** nausea, vomiting, diarrhea, abdominal pain, dyspepsia, dry mouth

**Metabolic:** hyperadrenocorticism

**Musculoskeletal:** myalgia, arthralgia, aseptic necrosis of femoral head

**Respiratory:** wheezing, dyspnea, increased cough, bronchitis, **bronchospasm, asthma symptoms**

**Skin:** rash, pruritus, urticaria, contact dermatitis, alopecia, herpes simplex infection

**Other:** altered taste and smell, facial edema, fever, flulike symptoms, aches and pains, infections, **angioedema, anaphylaxis**

## Interactions

**Drug-diagnostic tests.** *Aspartate aminotransferase:* increased level

## Patient monitoring

 Monitor patient closely for serious adverse reactions, including anaphylaxis, angioedema, hyperadrenocorticism, and serious infections.

## Patient teaching

 Teach patient to recognize and immediately report serious adverse reactions.

- Teach patient proper use of drug. Caution him not to use more than prescribed amount; doing so may cause serious side effects.
- Tell patient maximum drug effects may not occur for several weeks.
- Tell patient to avoid people with measles, chickenpox, and other transmissible infections.

- Caution patient to withhold dose and contact prescriber if infection occurs.
- Instruct female patient to tell prescriber if she becomes pregnant.
- Tell female patient not to breastfeed without consulting prescriber.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## fluorouracil (5-fluorouracil, 5-FU)

Adrucil, Efudex, Fluoroplex

**Pharmacologic class:** Antimetabolite

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

### FDA BOXED WARNING

- Patient should be hospitalized during first course of treatment, as drug may cause severe toxic reactions.

### Action

Inhibits DNA and RNA synthesis, leading to death of rapid-growing neoplastic cells. Cell-cycle-S-phase specific.

### Availability

*Cream:* 1%, 5%

*Injection:* 50 mg/ml in 10-ml ampules and 10-, 20-, and 100-ml vials

*Solution:* 1%, 2%, 5%

### Indications and dosages

- Advanced colorectal cancer

**Adults:** 370 mg/m<sup>2</sup> I.V. for 5 days, preceded by leucovorin 200 mg/m<sup>2</sup> daily for 5 days; may be repeated q 4 to 5 weeks. No single daily dose should exceed 800 mg.

- Colon, rectal, breast, gastric, and pancreatic cancer

**Adults:** Initially, 12 mg/kg/day I.V. for 4 days; then 6 mg/kg I.V. on days 6, 8, 10, and 12. Maximum dosage is 800 mg/day. For maintenance, start 30 days after last dose. If no toxicity, use dosage from first course. If toxicity occurs, give 10 to 15 mg/kg/week as single dose after toxicity subsides. Don't exceed 1 g/week.

- Actinic (solar) keratoses

**Adults:** 1% solution or cream applied once or twice daily to lesions on head, neck, or chest; 2% to 5% solution or cream may be needed for other areas.

- Superficial basal cell carcinoma

**Adults:** 5% solution or cream applied b.i.d. for 3 to 6 weeks (up to 12 weeks)

### Contraindications

- Hypersensitivity to drug or its components
- Bone marrow depression
- Dihydropyrimidine dehydrogenase enzyme deficiency (with topical route)
- Poor nutritional status
- Serious infection
- Pregnancy or breastfeeding

### Precautions

Use cautiously in:

- renal or hepatic impairment, infections, edema, ascites
- obese patients.

### Administration

☚ Consult facility's cancer protocols to ensure correct dosage, administration technique, and cycle length.

- Give antiemetic before fluorouracil, as ordered, to reduce GI upset.
- Know that drug may be given without dilution by direct I.V. injection over 1 to 3 minutes.
- For I.V. infusion, dilute with dextrose 5% in water, sterile water, or normal saline solution in plastic bag (not glass

bottle). Infusion may be given over a period of 24 hours or more.

 Be aware of the importance of leucovorin rescue with fluorouracil therapy, if prescribed.

- Check infusion site frequently to detect extravasation.
- Use nonmetal applicator or appropriate gloves to apply topical form.
- Avoid applying topical form to mucous membranes or irritated skin.
- Don't use occlusive dressings over topical form.
- Know that pyridoxine may be given with fluorouracil to reduce risk of palmar-plantar erythrodysesthesia (hand-foot syndrome).

Route	Onset	Peak	Duration
I.V.	1-9 days	9-21 days	30 days
Topical	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** confusion, disorientation, euphoria, ataxia, headache, weakness, malaise, **acute cerebellar syndrome or dysfunction**

**CV:** angina, **myocardial ischemia, thrombophlebitis**

**EENT:** vision changes, photophobia, lacrimation, lacrimal duct stenosis, nystagmus, epistaxis

**GI:** nausea, vomiting, diarrhea, stomatitis, anorexia, GI ulcer, **GI bleeding**

**Hematologic:** anemia, **leukopenia, thrombocytopenia**

**Skin:** alopecia, maculopapular rash, melanosis of nails, nail loss, palmar-plantar erythrodysesthesia, photosensitivity, local inflammation reaction (with cream), dermatitis

**Other:** fever, **anaphylaxis**

### Interactions

**Drug-drug.** *Bone marrow depressants (including other antineoplastics):* additive bone marrow depression

*Irinotecan:* dehydration, neutropenia, sepsis

*Leucovorin calcium:* increased risk of fluorouracil toxicity

*Live-virus vaccines:* decreased antibody response to vaccine, increased risk of adverse reactions

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, lactate dehydrogenase, urinary 5-hydroxyindoleacetic acid:* increased levels  
*Albumin, granulocytes, platelets, red blood cells, white blood cells (WBCs):* decreased levels

**Drug-behaviors.** *Sun exposure:* increased risk of phototoxicity

### Patient monitoring

 Watch for signs and symptoms of toxicity, especially stomatitis and diarrhea. If these occur, stop drug and notify prescriber. Note that toxicity may take 1 to 3 weeks to develop.

- Monitor CBC, WBC and platelet counts, and kidney and liver function test results.
- Assess fluid intake and output.
- With long-term use, watch for serious rash on hands and feet. If it occurs, consult prescriber regarding need for pyridoxine.
- Assess for bleeding tendency.
- Monitor blood glucose level in patients at risk for hyperglycemia.

### Patient teaching

 Emphasize importance of taking leucovorin as prescribed with high-dose therapy.

 Instruct patient to report signs and symptoms of toxicity, particularly stomatitis and diarrhea. Tell him that these may not occur for 1 to 3 weeks.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Tell patient to avoid activities that can cause injury. Instruct him to use

soft toothbrush and electric razor to avoid gum and skin injury.

- Advise patient to minimize GI upset by eating frequent, small servings of food and drinking adequate fluids.
- Tell patient that drug may cause reversible hair loss.
- Inform patient that he'll undergo regular blood testing during therapy.
- 📢 Advise female to inform prescriber immediately if she is pregnant. Caution her not to breastfeed.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## fluoxetine hydrochloride

Prozac, Prozac Weekly, Proxit<sup>®</sup>, Sarafem

**Pharmacologic class:** Selective serotonin reuptake inhibitor

**Therapeutic class:** Antidepressant

**Pregnancy risk category** B

### FDA BOXED WARNING

- Drug may increase risk of suicidal thinking and behavior in children and adolescents with major depressive disorder (MDD) and other psychiatric disorders, especially during first few months of therapy. Risk must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family and caregivers to observe patient closely and communicate with prescriber as needed.

- Prozac is approved for use in pediatric patients with MDD and obsessive-compulsive disorder.

### Action

Selectively inhibits serotonin reuptake in CNS; has little to no effect on norepinephrine and dopamine reuptake

### Availability

- Capsules:* 10 mg, 15 mg, 20 mg, 40 mg
- Capsules (delayed-release):* 90 mg
- Oral solution:* 20 mg/5 ml
- Tablets:* 10 mg, 15 mg, 20 mg

### Indications and dosages

➤ Major depressive disorder (MDD)

**Adults:** 20 mg/day P.O. in morning. After several weeks, may increase by 20 mg/day at weekly intervals. Give dosages above 20 mg/day in two divided doses (morning and noon); don't exceed 80 mg/day. Patients stabilized on 20 mg/day may be switched to 90-mg/week delayed-release capsules (Prozac Weekly) 7 days after last 20-mg dose.

**Children ages 8 to 18:** Initially, 10 to 20 mg/day P.O. After 1 week at 10 mg daily, dosage should be increased to 20 mg/day. However, because of higher plasma levels in lower-weight children, starting and target dose in this group may be 10 mg/day. Dosage increase to 20 mg/day may be considered after several weeks if insufficient clinical improvement occurs.

➤ Obsessive-compulsive disorder (OCD)

**Adults:** Initially, 20 mg/day P.O. in morning. After several weeks, may increase dosage. Give doses above 20 mg/day once daily (morning) or in two divided doses b.i.d. (morning and noon). Dosage range of 20 to 60 mg/day is recommended; however, dosages of up to 80 mg/day have been well tolerated. Don't exceed 80 mg/day.

**Children ages 7 to 17:** Initially, 10 mg/day P.O. in morning in adolescents and higher-weight children; after 2 weeks, may increase dosage to 20 mg/day. Additional dosage increases may be considered after several more weeks if insufficient clinical improvement occurs. Dosage range of 20 to 60 mg/day is recommended. Initially, 10 mg/day P.O. in lower-weight children; may increase dosage after several more weeks if insufficient clinical improvement occurs. Dosage range of 20 to 30 mg/day is recommended. Experience with daily doses greater than 20 mg is very minimal; there is no experience with doses greater than 60 mg.

➤ Acute treatment of depressive episodes associated with bipolar I disorder

**Adults:** Initially, 20 mg fluoxetine P.O. with 5 mg olanzapine P.O. daily; dosage range of fluoxetine is 20 to 50 mg; olanzapine, 5 to 12.5 mg. Safety of fluoxetine doses above 75 mg and olanzapine doses above 18 mg haven't been established

➤ Bulimia nervosa

**Adults:** 60 mg/day P.O.; may be titrated upward over several days

➤ Panic disorder

**Adults:** 10 mg/day P.O. for 1 week; then, if needed, increase to 20 mg/day.

Dosage increases of up to 60 mg/day may be considered after several weeks if patient doesn't respond to lower dosage.

➤ Premenstrual dysphoric disorder

**Adults:** 20 mg/day (Sarafem) P.O., not to exceed 80 mg/day

### Dosage adjustment

- Hepatic impairment
- Concurrent disease or multiple concomitant medications
- Pregnant women during third trimester
- Elderly patients

### Off-label uses

- Diabetic peripheral neuropathy
- Alcoholism
- Bipolar II disorder
- Borderline personality disorder
- Narcolepsy
- Posttraumatic stress disorder
- Schizophrenia
- Social phobia

### Contraindications

- Hypersensitivity to drug
- MAO inhibitor use within past 14 days
- Concurrent use of thioridazine or within 5 weeks of discontinuing fluoxetine
- Concurrent use of pimozide

### Precautions

Use cautiously in:

- hepatic or renal impairment, diabetes mellitus, cardiovascular disease, concomitant illness, acute narrow-angle glaucoma
- history of seizures, serotonin syndrome or neuroleptic malignant syndrome, clinical worsening and suicidal thinking and behavior, activation of mania or hypomania
- hyponatremia in association with syndrome of inappropriate antidiuretic hormone secretion
- concurrent use of NSAIDs, aspirin, warfarin, or other drugs that affect coagulation
- concurrent use of tryptophan (use not recommended)
- pregnant patients (third trimester)
- breastfeeding patients (use not recommended)
- children younger than age 7 (in OCD use), younger than age 8 (in MDD use), younger than age 18 for all other uses (safety and efficacy not established).

### Administration

 Be aware that drug should be discontinued 5 weeks before MAO

inhibitor or thioridazine therapy begins.

- Give before 2 P.M. to prevent nighttime insomnia.
- Be aware that drug should be gradually reduced rather than abruptly stopped whenever possible.

Route	Onset	Peak	Duration
P.O.	Unknown	6-8 hr	Unknown

**Adverse reactions**

**CNS:** anxiety, drowsiness, headache, insomnia, abnormal dreams, dizziness, fatigue, nervousness, hypomania, mania, weakness, tremor, **seizures, suicidal ideation**

**CV:** chest pain, palpitations, **prolonged QTc interval**

**EENT:** visual disturbances, stuffy nose, sinusitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, dry mouth, anorexia

**GU:** urinary frequency, sexual dysfunction, dysmenorrhea

**Metabolic:** hypouricemia, hypocalcemia, hyponatremia, hyperglycemia, **hypoglycemia**

**Musculoskeletal:** joint, back, or muscle pain

**Respiratory:** cough, upper respiratory tract infection, dyspnea, **respiratory distress**

**Skin:** diaphoresis, pruritus, erythema nodosum, flushing, rash

**Other:** abnormal taste, weight loss, fever, flulike symptoms, hot flashes, **serotonin syndrome, neuroleptic malignant syndrome (NMS)**, allergic reactions, hypersensitivity reactions

**Interactions**

**Drug-drug.** *Adrenergics:* increased sensitivity to adrenergics, increased risk of serotonin syndrome

*Alprazolam:* decreased metabolism and increased effects of alprazolam

*Antihistamines, opioids, other antidepressants, sedative-hypnotics:* additive CNS depression

*Aspirin, NSAIDs, warfarin, other drugs that affect coagulation:* increased risk of GI or other bleeding

*Buspirone:* potentiation of fluoxetine effects, increased risk of seizures

*Carbamazepine, clozapine, digoxin, haloperidol, lithium, phenytoin, warfarin:* increased blood levels of these drugs, greater risk of adverse reactions

*CYP450-2D6 inducers:* increased effects of these drugs

*Cyproheptadine:* decrease in or reversal of fluoxetine effects

*Digoxin, warfarin, other highly protein-bound drugs:* increased risk of adverse reactions to either drug

*Efavirenz, ritonavir, saquinavir, other CYP450 inhibitors: serotonergics, triptans:* increased risk of serotonin syndrome

*MAO inhibitors:* confusion, agitation, seizures, hypertension, and hyperpyrexia (serotonin syndrome)

*Pimozide:* increased risk of drug interaction or QTc-interval prolongation

*Thioridazine:* increased risk of QTc-interval prolongation or potential for elevated thioridazine plasma level

*Other antidepressants, phenothiazines, risperidone, tryptophan:* increased risk of adverse reactions

*Ritonavir:* increased ritonavir blood level

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, blood urea nitrogen, creatine kinase, electrolytes, glucose:* increased levels  
*Sodium:* decreased level

**Drug-herbs.** *St. John's wort:* increased risk of serotonin syndrome

**Drug-behaviors.** *Alcohol use:* additive CNS depression

**Patient monitoring**

 Monitor patient for signs and symptoms of depression. Assess for suicidal ideation.

f

- 🔊 Evaluate neurologic status, watching especially for seizures.
- 🔊 Monitor cardiovascular status, particularly for prolonged QTc interval.
  - Assess weight regularly. Watch for signs of eating disorders.
- 🔊 Monitor patient for signs and symptoms of allergic reactions, serotonin syndrome, or NMS-like reactions. Discontinue drug immediately and initiate supportive treatment if these reactions occur.

### Patient teaching

- Encourage patient to establish effective bedtime routine to minimize sleep disorders.
- Tell patient drug may take 4 weeks or longer to be fully effective.
- 🔊 Instruct patient to contact prescriber if he develops worsening depression or has suicidal thoughts.
- 🔊 Instruct patient to immediately stop drug and report signs and symptoms of allergic reactions (rash), serotonin syndrome, or neuroleptic malignant syndrome–like reactions.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Tell female patient to inform prescriber if she is pregnant or breastfeeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## fluphenazine decanoate

Fluphenazine Omega<sup>☼</sup>, Modecate, Modecate<sup>☼</sup>

## fluphenazine hydrochloride

Apo-Fluphenazine<sup>☼</sup>, Moditen<sup>☼</sup>, PMS-Fluphenazine<sup>☼</sup>

**Pharmacologic class:** Phenothiazine, dopaminergic blocker

**Therapeutic class:** Anxiolytic, antipsychotic

**Pregnancy risk category C**

### Action

Unclear. May alter postsynaptic mesolimbic dopamine receptors in brain and reduce release of hypothalamic and hypophyseal hormones thought to depress reticular activating system, thereby preventing psychotic symptoms.

### Availability

**fluphenazine decanoate**

*Depot injection:* 25 mg/ml

**fluphenazine hydrochloride**

*Elixir:* 2.5 mg/5 ml

*Injection:* 2.5 mg/ml

*Oral concentrate:* 5 mg/ml

*Tablets:* 1 mg, 2.5 mg, 5 mg, 10 mg

### Indications and dosages

➤ Psychotic disorders

**Adults:** 2.5 to 10 mg/day (hydrochloride) P.O. in divided doses q 6 to 8 hours or as a single dose at bedtime; typical daily dosage is 1 to 5 mg; give oral doses above 20 mg/day with caution. Or initially, 1.25 mg I.M., divided and given q 6 to 8 hours. Parenteral hydrochloride dosage is one-third to one-half of oral dosage. Or 12.5 to 25 mg I.M. or subcutaneously (decanoate); base subsequent dosage and dosing intervals of 1 to 4 weeks on patient response; don't exceed 100 mg.

### Dosage adjustment

- Elderly patients

## Contraindications

- Hypersensitivity to drug, sulfites (with injectable form), or benzyl alcohol
- Angle-closure glaucoma
- Bone marrow depression
- Severe hepatic or cardiovascular disease

## Precautions

Use cautiously in:

- diabetes, respiratory disease, prostatic hypertrophy, CNS tumors
- elderly patients
- pregnant or breastfeeding patients (safety not established)
- children with acute illnesses, infections, gastroenteritis, or dehydration.

## Administration

 Be aware that parenteral form is for I.M. and subcutaneous use only.

Don't give I.V.

- Don't give parenteral form to comatose or severely depressed patient.
- Use gloves when handling. To prevent contact dermatitis, keep drug away from clothing and skin.
- Dilute concentrated oral forms in juice, milk, or semisolid food just before administering.
- Give long-acting, oil-based preparations with dry needle of at least 21G.
- Be aware that antacids and adsorbent antidiarrheals may decrease adsorption of fluphenazine. Give 1 hour before or 2 hours after fluphenazine.

Route	Onset	Peak	Duration
P.O.	<1 hr	0.5 hr	6-8 hr
I.M. (HCl)	1 hr	1.5-2 hr	6-8 hr
I.M.	24-72 hr	Unknown	1-6 wk
Subcut.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** drowsiness, sedation, extrapyramidal reactions, tardive dyskinesia, pseudoparkinsonism, **neuroleptic malignant syndrome, seizures**  
**CV:** hypotension, tachycardia

**EENT:** blurred vision, dry eyes, lens opacities, nasal congestion

**GI:** constipation, dry mouth, anorexia, **paralytic ileus**

**GU:** urinary retention, menstrual irregularities, inhibited ejaculation, priapism, gynecomastia, lactation

**Hematologic:** eosinophilia, **hemolytic anemia, aplastic anemia, agranulocytosis, leukopenia, thrombocytopenia**

**Hepatic:** jaundice, **hepatitis**

**Metabolic:** galactorrhea, hyperthermia

**Skin:** photosensitivity, rash

**Other:** allergic reactions, pain at injection site, sterile abscess

## Interactions

**Drug-drug.** *Activated charcoal, adsorbent antidiarrheals, antacids:* decreased fluphenazine adsorption

*Anticholinergics:* decreased fluphenazine effects

*Antidepressants, antihistamines, general anesthetics, MAO inhibitors, opioid analgesics, sedative-hypnotics:* additive CNS depression

*Antihistamines, disopyramide, quinidine, tricyclic antidepressants (TCAs):* increased risk of anticholinergic effects

*Antihypertensives:* additive hypotension  
*Barbiturates:* increased fluphenazine metabolism and decreased efficacy  
*Bromocriptine:* decreased bromocriptine efficacy  
*Guanethidine:* inhibition of antihypertensive effects

*Lithium:* disorientation, unconsciousness, extrapyramidal symptoms

*Meperidine:* excessive sedation and hypotension

*Ofloxacin:* increased QTc interval

*Phenytoin:* increased or decreased phenytoin blood level

*Pimozide:* increased risk of potentially serious cardiovascular reactions

*Propranolol:* increased blood levels of both drugs

*TCAs:* increased blood levels and effects of TCAs

f

**Drug-diagnostic tests.** *Alanine amino-transferase, alkaline phosphatase, aspartate aminotransferase, bilirubin:*

increased levels

*Granulocytes, hematocrit, hemoglobin, leukocytes, platelets:* decreased values

*Pregnancy tests:* false-positive or false-negative result

*Urine bilirubin:* false-positive result

**Drug-herbs.** *Angel's trumpet, jimson-weed, scopolia:* increased anticholinergic effects

*Chamomile, hops, kava, skullcap:*

increased CNS depression

*St. John's wort:* photosensitivity

*Yohimbe:* fluphenazine toxicity

**Drug-behaviors.** *Alcohol use:* increased CNS depression

*Sun exposure:* increased risk of photosensitivity

### Patient monitoring

🔊 Monitor patient for signs and symptoms of neuroleptic malignant syndrome (extrapyramidal symptoms, hyperthermia, autonomic symptoms).

🔊 Stop giving drug and notify prescriber immediately if patient shows signs or symptoms of blood dyscrasias (fever, infection, sore throat, cellulitis, or weakness).

- Observe for tardive dyskinesia.
- Watch for bleeding tendency.
- Monitor CBC, bilirubin level, and liver function test results.
- Assess kidney function and ophthalmic test results in patients on long-term therapy.

### Patient teaching

🔊 Tell patient not to stop taking drug suddenly, because serious adverse effects may occur.

- Advise patient to report urinary retention or constipation.

🔊 Instruct patient to immediately report unusual bleeding or bruising.

- Caution patient to avoid driving and other hazardous activities until he

knows how drug affects concentration, alertness, and vision.

- Tell patient to avoid activities that can cause injury. Advise him to use soft toothbrush and electric razor to avoid gum and skin injury.

• Inform patient that he'll undergo regular blood testing during therapy.

- Tell female patient to inform prescriber if she is pregnant or breastfeeding.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## flurazepam hydrochloride

Apo-Flurazepam\*, Bio-Flurazepam, Dalmane, Novo-Flupam\*, PMS-Flurazepam\*, Somnol\*, Som Pam\*

**Pharmacologic class:** Benzodiazepine

**Therapeutic class:** Sedative-hypnotic

**Controlled substance IV**

**Pregnancy risk category X**

### Action

Depresses CNS at limbic, thalamic, and hypothalamic levels by enhancing inhibitory neurotransmitter effect of gamma-aminobutyric acid on neuronal excitability

### Availability

*Capsules:* 15 mg, 30 mg

### Indications and dosages

➤ Short-term management of insomnia (less than 4 weeks)

**Adults:** 15 to 30 mg P.O. at bedtime

### Dosage adjustment

- Elderly or debilitated patients

## Contraindications

- Hypersensitivity to drug or other benzodiazepines
- Preexisting CNS depression
- Angle-closure glaucoma
- Pregnancy or breastfeeding

## Precautions

Use cautiously in:

- hepatic dysfunction
- history of suicide attempt or drug dependence
- elderly patients
- children younger than age 15 (safety not established).

## Administration

- Before starting therapy, evaluate patient's mental status and check kidney and liver function tests and CBC.

Route	Onset	Peak	Duration
P.O.	15-45 min	0.5-1 hr	7-8 hr

## Adverse reactions

**CNS:** dizziness, daytime drowsiness, headache, lethargy, confusion, poor concentration, depression, paradoxical excitation, ataxia

**EENT:** blurred vision

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, abdominal pain

**Respiratory:** sleep apnea

**Skin:** rash

**Other:** abnormal taste, hangover, physical or psychological drug dependence, drug tolerance

## Interactions

**Drug-drug.** *Antidepressants, antihistamines, opioids:* additive CNS depression  
*Barbiturates, rifampin:* increased flurazepam metabolism, decreased efficacy

*Cimetidine, disulfiram, fluoxetine, hormonal contraceptives, isoniazid, ketoconazole, metoprolol, propoxyphene, propranolol, valproic acid:* decreased flurazepam metabolism, enhanced efficacy

*Levodopa:* decreased levodopa efficacy

*Theophylline:* decreased sedative effects of flurazepam

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, total and direct bilirubin:* increased levels

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* additive CNS depression

**Drug-behaviors.** *Alcohol use:* additive CNS depression

*Smoking:* increased drug metabolism and clearance

## Patient monitoring

- With long-term use, watch for signs and symptoms of physical or psychological dependence.
- Monitor patient's mental status, especially for depression and suicidal ideation.
- Watch for signs of drug hoarding or overuse.
- Monitor CBC and liver and kidney function tests.

## Patient teaching

 Urge patient (and significant other as appropriate) to report signs and symptoms of depression or suicidal thoughts or actions.

 Advise female patient to immediately tell prescriber if she is pregnant. Caution her not to breastfeed.

- Inform patient that drug may cause physical or psychological dependence.
- Advise patient to minimize GI upset by eating frequent, small servings of food and drinking adequate fluids.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## flutamide

APO-Flutamide<sup>☼</sup>, Drogenil<sup>☼</sup>,  
Euflex<sup>☼</sup>, Novo-Flutamide<sup>☼</sup>,  
PMS-Flutamide<sup>☼</sup>

**Pharmacologic class:** Antiandrogen

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

### FDA BOXED WARNING

- Postmarketing hospitalizations and deaths from hepatic failure have occurred. Evidence of hepatic injury includes elevated serum transaminase levels, jaundice, hepatic encephalopathy, and death related to acute hepatic failure. In some patients, hepatic injury reversed after drug withdrawal. Approximately half of reported cases occurred within first 3 months of therapy.
- Measure serum transaminase levels before therapy begins. Drug isn't recommended if alanine aminotransferase (ALT) values exceed twice the upper limit of normal (ULN). Once therapy begins, measure transaminase levels monthly for first 4 months and periodically thereafter. Obtain liver function tests at first sign of hepatic dysfunction. If patient has jaundice or ALT level exceeding 2 x ULN, discontinue drug immediately and follow liver function tests closely until they resolve.

### Action

Exerts potent antiandrogenic activity at cellular level by inhibiting androgen uptake or nuclear binding of androgen

### Availability

**Capsules:** 125 mg

### Indications and dosages

- Metastatic prostate cancer

**Adults:** 250 mg P.O. t.i.d. q 8 hours, given with luteinizing hormone-releasing hormone (LHRH) analog. Total daily dosage is 750 mg.

### Off-label uses

- Benign prostatic hypertrophy

### Contraindications

- Hypersensitivity to drug
- Severe hepatic impairment
- Sleep apnea
- Women

### Precautions

None

### Administration

- Be aware that leuprolide acetate is the most common LHRH analog given with flutamide.

Route	Onset	Peak	Duration
P.O.	Variable	2 hr	72 hr

### Adverse reactions

**CNS:** drowsiness, confusion, depression, anxiety, nervousness, paresthesia  
**CV:** peripheral edema, hypertension  
**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, anorexia, dry mouth  
**GU:** erectile dysfunction, loss of libido, gynecomastia, hot flashes  
**Hematologic:** anemia, leukopenia, thrombocytopenia  
**Hepatic:** hepatitis  
**Skin:** rash, photosensitivity

### Interactions

**Drug-drug.** *Warfarin:* increased prothrombin time

**Drug-diagnostic tests.** *Alkaline phosphatase, alanine aminotransferase, aspartate aminotransferase, blood urea nitrogen, creatine kinase:* increased levels  
*Hemoglobin, platelets, white blood cells:* decreased levels

**Drug-herbs.** *Chaparral, comfrey, eucalyptus, germander, pennyroyal, skullcap, valerian:* increased risk of hepatotoxicity

**Drug-behaviors.** *Sun exposure:* increased risk of photosensitivity

## Patient monitoring

- Monitor CBC and liver function tests.
- 🔊 Watch for bleeding tendency and signs and symptoms of hepatic damage (jaundice, vomiting, dark yellow or brown urine).
- Monitor blood pressure.

## Patient teaching

- 🔊 Instruct patient to immediately report unusual bleeding or bruising.
- Tell patient to avoid activities that can cause injury. Advise him to use soft toothbrush and electric razor to avoid gum and skin injury.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Instruct patient to minimize GI upset by eating frequent, small servings of healthy food.
- Tell patient he'll undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## fluticasone propionate

Cutivate, Flixonase<sup>®</sup>, Flixotide<sup>®</sup>, Flonase, Flovent Diskus, Flovent HFA

## fluticasone furoate

Avamys<sup>®</sup>, Veramyst

**Pharmacologic class:** Corticosteroid

**Therapeutic class:** Respiratory inhalant (Flovent, Flonase), anti-inflammatory drug (Cutivate)

**Pregnancy risk category C**

## Action

Unknown. Has potent vasoconstrictive and anti-inflammatory properties.

## Availability

fluticasone propionate

*Inhalation aerosol, metered (Flovent HFA):* 44 mcg, 110 mcg, 220 mcg

*Inhalation powder, metered (Flovent Diskus):* 50 mcg, 100 mcg, 250 mcg

*Nasal spray (Flonase):* 50 mcg

*Topical cream (Cutivate):* 0.005%

*Topical ointment (Cutivate):* 0.005% fluticasone furoate

*Nasal spray (Veramyst):* 27.5 mcg fluticasone furoate in each 50-microliter spray in 10-g bottle containing 120 sprays

## Indications and dosages

➤ Prophylaxis of asthma and treatment of asthma for patients requiring oral corticosteroid therapy (Flovent HFA and Flovent Diskus)

### Adults and children age 4 and older:

Recommended starting dosage and highest recommended dosage, based on prior asthma therapy, are listed in charts below.

### Recommended Flovent HFA dosages

Previous Therapy	Starting dosage	Highest dosage
------------------	-----------------	----------------

#### For Adults and adolescents age 12 and older

Bronchodilators alone	88 mcg b.i.d.	440 mcg b.i.d.
-----------------------	---------------	----------------

Inhaled corticosteroids	88-220 mcg b.i.d. <sup>1</sup>	440 mcg b.i.d.
-------------------------	--------------------------------	----------------

Oral corticosteroids <sup>2</sup>	440 mcg b.i.d.	880 mcg b.i.d.
-----------------------------------	----------------	----------------

Children ages 4 to 11 <sup>3</sup>	88 mcg b.i.d.	88 mcg b.i.d.
------------------------------------	---------------	---------------

1. Consider starting dosages above 88 mcg b.i.d. for patients with poorer asthma control or those who have previously required doses of inhaled corticosteroids in the higher range for the specific agent.

2. For patients currently receiving long-term oral corticosteroid therapy, reduce prednisone dosage no faster than 2.5 to 5 mg/day on a weekly basis beginning after at least 1 week of therapy with Flovent HFA. Once prednisone reduction is complete, reduce dosage to lowest effective dosage.

3. Recommended pediatric dosage is 88 mcg b.i.d. regardless of prior therapy.

## Recommended Flovent Diskus dosages

Previous Therapy	Starting dosage	Highest dosage
<b>Adults and adolescents age 12 and older</b>		
Bronchodilators alone	100 mcg b.i.d.	500 mcg b.i.d.
Inhaled corticosteroids	100-250 mcg b.i.d. <sup>1</sup>	500 mcg b.i.d.
Oral corticosteroids <sup>2</sup>	500-1,000 mcg b.i.d. <sup>3</sup>	1,000 mcg b.i.d.
<b>Children ages 4 to 11<sup>4</sup></b>	50 mcg b.i.d.	100 mcg b.i.d.

1. Consider starting dosages above 100 mcg b.i.d. (adults and adolescents) and 50 mcg b.i.d. (children ages 4 to 11) for patients with poorer asthma control or who have previously required doses of inhaled corticosteroids in the higher range for the specific agent.
2. For patients currently receiving long-term oral corticosteroid therapy, reduce prednisone dosage no faster than 2.5 to 5 mg/day on a weekly basis beginning after at least 1 week of therapy with Flovent Diskus. Once prednisone reduction is complete, reduce dosage to lowest effective dosage.
3. Choose starting dosage based on individual patient assessment. Inability to decrease oral corticosteroid dosage further during corticosteroid reduction may indicate the need to increase fluticasone propionate dosage to maximum of 1,000 mcg b.i.d.
4. Because individual responses may vary, children previously maintained on other inhaled corticosteroids may require dosage adjustments upon transfer to Flovent Diskus.

➤ Seasonal and perennial allergic and nonallergic rhinitis (Flonase)

**Adults:** Two sprays in each nostril daily or one spray in each nostril b.i.d. After first few days, may reduce dosage to one spray in each nostril daily; some patients may find p.r.n. use of two sprays in each nostril daily effective for symptom control. Maximum dosage is 200 mcg daily (two sprays in each nostril).

**Adolescents and children ages 4 and older:** Initially, one spray in each nostril daily. If patient doesn't respond, may increase to two sprays in each nostril. Once adequate control is achieved, reduce dosage to one spray in each nostril daily.

➤ Symptoms of seasonal and perennial allergic rhinitis (Veramyst)

**Adults and adolescents age 12 and older:** 110 mcg (2 sprays per nostril) once daily

**Children ages 2 to 11:** 55 mcg (1 spray per nostril) once daily

➤ Inflammatory and pruritic manifestations of corticosteroid-responsive atopic dermatoses

**Adults and children ages 3 months and older:** Apply thin film of Cutivate cream to affected skin area once or twice daily.

➤ Other corticosteroid-responsive dermatoses

**Adults and children ages 3 months and older:** Apply thin film of Cutivate cream to affected skin area b.i.d.

## Contraindications

- Hypersensitivity to drug or its components
- Primary treatment of status asthmaticus or other acute asthma episodes necessitating intensive measures (Flovent FHA, Flovent Diskus)
- Severe allergy to milk proteins (Flovent Diskus)

## Precautions

Use cautiously in:

- recurrent epistaxis, recent nasal septal ulcer, nasal surgery, or trauma
- severe hepatic disease (Veramyst)
- glaucoma and cataracts
- tuberculosis; respiratory tract infection; fungal, bacterial, viral, or parasitic infections; ocular herpes simplex
- hypercorticism and adrenal suppression (when used at higher than recommended dosages or in susceptible persons)
- concurrent use of other CYP3A inhibitors (such as ketoconazole; use not recommended with ritonavir)
- *Candida albicans* infection (Flovent, Veramyst)
- elderly patients (Flonase, Veramyst)

- pregnant or breastfeeding patients (Flovent, Flonase, Veramyst)
- children younger than age 4 (Flonase, Flovent)
- children younger than age 2 (Veramyst).

### Administration

- Know that Flonase may cause immediate hypersensitivity reaction (contact dermatitis).
- Be aware that topical ointment should be used in adults only.
- Prime Veramyst nasal spray before first use, when not used for more than 30 days, or if cap has been left off bottle for 5 days or more.
- Administer inhalation powder by oral inhalation only.

Route	Onset	Peak	Duration
Oral or nasal inhalation, topical	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** *Cutivate ointment*—light-headedness; *Flonase*—headache, dizziness; *Flovent*—headache, dizziness, giddiness; *Veramyst*—headache

**EENT:** *Flonase*—cataract, glaucoma, increased intraocular pressure, epistaxis, nasal burning or irritation, bloody nasal mucus, runny nose, pharyngitis; *Flovent*—cataract, glaucoma, nasal congestion, nasal septum perforation, nasal discharge, nasal sinus pain, sinusitis, rhinitis, allergic rhinitis, pharyngitis, dysphonia; *Veramyst*—cataract, glaucoma, increased intraocular pressure, epistaxis, pharyngolaryngeal pain, nasal ulceration

**GI:** *Flonase*—nausea, vomiting, diarrhea, abdominal pain; *Flovent*—nausea, vomiting, diarrhea, dyspepsia, stomach disorder, oral candidiasis

**GU:** *Flovent*—dysmenorrhea

**Metabolic:** *Flovent, Veramyst*—hypercorticism and adrenal suppression

**Musculoskeletal:** *Flonase*—aches and pains; *Flovent*—joint pain, limb pain, sprain, strain, aches and pains, reduced bone mineral density; *Veramyst*—back pain

**Respiratory:** *Flonase*—asthma symptoms, cough, bronchitis, wheezing (rare); *Flovent*—upper respiratory tract infection, influenza, bronchitis, chest congestion, **bronchospasm**; *Veramyst*—cough

**Skin:** *Cutivate cream*—pruritus, skin dryness, skin burning, erythematous rash, dusky erythema, eczema exacerbation, skin irritation, urticaria; *Cutivate ointment*—skin burning or irritation, hypertrichosis, increased erythema, hives; *Flovent*—urticaria, rash, skin eruption

**Other:** *Cutivate cream or ointment*—numbness of fingers, facial or nonfacial telangiectasia; *Flonase*—fever, flulike symptoms, hypersensitivity reaction; *Flovent*—dental problems, fever, *C. albicans* infection, immunosuppression, immediate or delayed hypersensitivity reactions, **angioedema**; anaphylaxis; *Veramyst*—pyrexia

### Interactions

**Drug-drug.** *Ketoconazole, other strong CYP3A inhibitors:* increased fluticasone exposure (with Flonase, Flovent, Veramyst)

*Ritonavir:* increased systemic corticosteroid effects (with Flonase, Flovent, Veramyst)

**Drug-diagnostic tests.** *Adrenocorticotrophic hormone stimulation test, plasma cortisol test, urinary free cortisol test:* interference with test results

### Patient monitoring

🚨 Monitor patient for withdrawal symptoms after Flovent is discontinued.

- Stay alert for systemic corticosteroid effects when administering Flovent, Flonase, or Veramyst.

- Observe for reduced growth rate in child or adolescent using Flovent, Flonase, or Veramyst.
- When giving Flovent, watch for eosinophilic conditions, such as Churg-Strauss syndrome.
- 🚫 When giving Flonase, assess for epistaxis, wheezing, nasal septum perforation, cataracts, glaucoma, and increased intraocular pressure (rare reaction).
- 🚫 When giving Veramyst, assess for epistaxis, nasal septum perforation, cataracts, glaucoma, and increased intraocular pressure (rare reaction).

### Patient teaching

- Tell patient to take drug exactly as prescribed.
- Teach patient proper use of prescribed form.
- 🚫 Advise patient to immediately report signs of allergic reaction.
- Caution patient to avoid exposure to people with chickenpox or measles.
- Advise female patient taking Flonase, Flovent, or Veramyst to inform prescriber if she is pregnant or breastfeeding.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## fluvastatin sodium

Lescol, Lescol XL

**Pharmacologic class:** HMG-CoA reductase inhibitor

**Therapeutic class:** Antihyperlipidemic

**Pregnancy risk category** X

### Action

Competitively inhibits HMG-CoA reductase, an enzyme needed to

synthesize cholesterol. This inhibition reduces cholesterol concentration in hepatic cells, which in turn increases synthesis of low-density lipoprotein (LDL) receptors, enhances LDL uptake, and ultimately reduces plasma cholesterol concentration.

### Availability

*Capsules:* 20 mg, 40 mg

*Tablets (extended-release):* 80 mg

### Indications and dosages

➤ Adjunctive therapy to diet to reduce elevated total cholesterol (TC), LDL-C, apolipoprotein B (Apo B), and triglyceride levels; to increase HDL-C in patients with primary hypercholesterolemia and mixed dyslipidemia; to reduce risk of undergoing revascularization procedures in patients with clinically evident coronary heart disease (CHD); to slow progression of atherosclerosis in patients with CHD

**Adults:** Initially, 40 mg (capsule) P.O. in evening or b.i.d. Don't give two 40-mg capsules at one time. Or, 80 mg (extended-release tablet) P.O. as a single dose at any time of day.

➤ Adjunctive therapy to diet to reduce elevated TC, LDL-C, and Apo B levels in boys and postmenarchal girls with heterozygous familial hypercholesterolemia after failing adequate trial of diet therapy

**Children ages 10 to 16:** Initially, 20 mg (capsule) P.O. May increase dosage to maximum daily dose: 40 mg (capsule) P.O. b.i.d. or one 80-mg extended-release tablet once daily at 6-week intervals. Individualize dosages according to goal of therapy.

### Dosage adjustment

- Concurrent use of cyclosporine, fluconazole, or lipid-modifying doses (1 g/day or greater) of niacin

## Contraindications

- Hypersensitivity to drug or its components
- Active hepatic disease or unexplained, persistent serum transaminase elevations
- Patients who are pregnant or may become pregnant
- Breastfeeding patients

## Precautions

Use cautiously in:

- severe renal impairment, history of liver disease or heavy alcohol use, uncontrolled hypothyroidism
- concurrent use of gemfibrozil (avoid use)
- concurrent use of cyclosporine, other fibrates, drugs that may decrease levels of endogenous steroid hormones (such as ketoconazole, spironolactone, cimetidine)
- elderly patients (advanced age a predisposing factor for myopathy)
- children younger than age 9 (safety not established).

## Administration

- Know that before starting drug, patient should be on standard cholesterol-lowering diet and weight-control and physical exercise programs, if appropriate.
- Check liver enzyme test values before starting drug.
- Give with or without food.
- If patient is also receiving bile-acid resin, give fluvastatin at bedtime at least 4 hours after resin.

Route	Onset	Peak	Duration
P.O.	Unknown	1 hr	Unknown
P.O. (extended)	Unknown	2.5-3 hr	Unknown

## Adverse reactions

**CNS:** headache, dizziness, insomnia, fatigue

**CV:** syncope, hypertension, intermittent claudication, **atrial fibrillation**

**EENT:** sinusitis, nasopharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, flatulence, abdominal pain, gastric disorder

**GU:** urinary tract infection, **myoglobinuria, acute renal failure**

**Hepatic:** abnormal liver function tests **hepatitis** (rare), **hepatic failure**

**Metabolic:** hyperglycemia

**Musculoskeletal:** joint pain, arthritis, extremity pain, myalgia, myopathy, **rhabdomyolysis**

**Respiratory:** exertional dyspnea, bronchitis

**Other:** flulike symptoms, tooth disorder, accidental trauma, peripheral edema, allergic reaction

## Interactions

**Drug-drug.** *Cholestyramine:* decreased fluvastatin blood level

*Antifungals, erythromycin, colchicine, gemfibrozil and other fibrates, lipid-modifying doses of niacin, other HMG-CoA inhibitors:* increased risk of myopathy

*Cimetidine, diclofenac, omeprazole, ranitidine:* increased fluvastatin blood level

*Cyclosporine, fluconazole:* increased fluvastatin exposure

*Glyburide, phenytoin:* increased blood levels of both drugs

*Rifampin:* increased fluvastatin metabolism, decreased blood level

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, creatine kinase, fasting serum glucose, HbA1c:* increased levels

**Drug-behaviors.** *Alcohol use:* increased risk of hepatotoxicity

## Patient monitoring

- Watch for allergic reaction to drug.
- ☚ Assess for myositis. If patient has muscle pain, monitor CK level. Discontinue drug if myopathy is diagnosed or suspected.

- Monitor lipid levels and liver function test results, particularly in patients with history of liver disease or heavy alcohol use.
- Be aware that bleeding or increased prothrombin times have occurred in patients taking coumarin anticoagulants concurrently with other HMG-CoA reductase inhibitors. Monitor prothrombin times closely in patients receiving warfarin-type anticoagulants when fluvastatin is initiated or dosage is changed. Watch for bleeding tendencies.
- In patients receiving phenytoin, or glyburide, closely monitor drug's effects on phenytoin or glyburide levels when fluvastatin is initiated or fluvastatin dosage is changed.

### Patient teaching

- Instruct patient to take once-daily dosages in evening for best effect.
- Tell patient to take drug with or without food.
- Tell patient not to open capsules and not to break, crush, or chew extended-release tablets.
- Advise patient to maintain standard cholesterol-lowering diet and weight-control and physical exercise programs, as appropriate.
-  Instruct patient to immediately report irregular heart beat, muscle aches or pains, yellowing of eyes or skin, or unusual tiredness.
-  Teach patient how to recognize and report signs and symptoms of allergic response, renal dysfunction, or myopathy.
- Advise patient to notify prescriber if he drinks more than two glasses of alcohol daily.
- Advise women of childbearing age to use effective contraception and to stop drug immediately and notify prescriber if pregnancy occurs.
- Tell patient that full effect of drug may take up to 4 weeks.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## fluvoxamine maleate

Apo-Fluvoxamine<sup>✳</sup>, Co Fluvoxamine<sup>✳</sup>, Dom-Fluvoxamine<sup>✳</sup>, Faverin<sup>✳</sup>, Luvox CR, Novo-Fluvoxamine<sup>✳</sup>, Nu-Fluvoxamine<sup>✳</sup>, PHL-Fluvoxamine<sup>✳</sup>, PMS-Fluvoxamine<sup>✳</sup>, Ratio-Fluvoxamine<sup>✳</sup>, Riva-Fluvoxamine<sup>✳</sup>, Sandoz Fluvoxamine<sup>✳</sup>

**Pharmacologic class:** Selective serotonin reuptake inhibitor (SSRI)

**Therapeutic class:** Antidepressant, antiobsessive agent

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug may increase risk of suicidal thinking and behavior in children and adolescents with major depressive disorder and other psychiatric disorders, especially during first few months of therapy. Risk must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family and caregivers to observe patient closely and communicate with prescriber as needed.
- Drug isn't approved for use in pediatric patients except those with obsessive-compulsive disorder.

**Action**

Selectively inhibits serotonin reuptake in neurons. This inhibition is thought to relieve depression and reduce behaviors related to obsessive-compulsive disorder (OCD).

**Availability**

*Capsules (extended-release):* 100 mg, 150 mg  
*Tablets:* 25 mg, 50 mg, 100 mg

 **Indications and dosages**

➤ **OCD**

**Adults:** Initially, 50 mg P.O. daily at bedtime; may increase by 50 mg q 4 to 7 days until desired effect occurs (not to exceed 300 mg/day). If daily dosage exceeds 100 mg, give in two equally divided doses; if doses aren't equal, give larger dose at bedtime. As needed, adjust dosage periodically to maintain lowest effective dosage that controls symptoms (immediate-release formulation)

**Children ages 8 to 17:** Initially, 25 mg at bedtime; may increase by 25 mg/day q 4 to 7 days until desired effect occurs (up to 200 mg/day for patients up to age 11 or up to 300 mg for adolescents). If daily dosage exceeds 50 mg, give in divided doses, with larger dose at bedtime (immediate-release formulation).

➤ **OCD;** social anxiety disorder

**Adults:** 100 mg P.O. once daily at bedtime; titrate in 50-mg increments weekly, to a maximum of 300 mg/day (extended-release formulation).

**Dosage adjustment**

- Hepatic impairment
- Elderly patients

**Off-label uses**

- Autism
- Anxiety disorders

**Contraindications**

- Hypersensitivity to drug or other SSRIs
- MAO inhibitor use within past 14 days

**Precautions**

Use cautiously in:

- cardiovascular disease, hepatic or renal impairment, mania, seizures, suicidal tendency
- elderly patients
- labor and delivery
- pregnant or breastfeeding patients.

**Administration**

- Give with or without food.
- Discontinue 5 weeks before MAO inhibitor therapy is set to begin.

Route	Onset	Peak	Duration
P.O.	Rapid	2-8 hr	Unknown

**Adverse reactions**

**CNS:** dizziness, drowsiness, headache, insomnia, nervousness, anxiety, apathy, manic or psychotic reactions, depression, hypokinesia or hyperkinesia, tremor, **suicide or suicidal ideation** (especially in child or adolescent)

**CV:** hypertension, orthostatic hypotension, palpitations, tachycardia

**EENT:** sinusitis

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, flatulence, dry mouth, dysphagia, anorexia

**GU:** decreased libido, sexual dysfunction, anorgasmia

**Musculoskeletal:** hypertonia, myoclonus, twitching

**Respiratory:** cough, dyspnea

**Skin:** diaphoresis

**Other:** abnormal taste, tooth disorder, dental caries, edema, weight gain or loss, chills, fever, flulike symptoms, yawning, hot flashes, allergic reactions, hypersensitivity reaction

**Interactions**

**Drug-drug.** *Beta-adrenergic blockers (such as propranolol), carbamazepine, lithium, L-tryptophan, methadone, some benzodiazepines, theophylline, tolbutamide, warfarin:* decreased fluvoxamine metabolism, increased effects

*Clozapine*: increased clozapine blood level and risk of toxicity

*MAO inhibitors*: serotonin syndrome

*Tricyclic antidepressants*: increased fluvoxamine blood level

**Drug-tests.** *Hepatic enzyme levels*: increased

**Drug-behaviors.** *Smoking*: decreased fluvoxamine efficacy

### Patient monitoring

 Watch closely for signs and symptoms of depression and suicidal ideation (especially in child or adolescent).

- Assess patient's appetite. Report weight gain or loss.
- Monitor liver function test results.
- Monitor cardiovascular status, particularly blood pressure.

### Patient teaching

• Instruct patient to swallow extended-release capsules whole and not to break, crush, or chew them.

 Instruct patient or caregiver (especially with child or adolescent patient) to recognize and immediately report signs of suicidal intent or expressions of suicidal ideation.

- Inform patient that drug may take several weeks to be fully effective.
- Recommend establishing effective bedtime routine to minimize insomnia.
- Instruct female patient to notify prescriber if she becomes or intends to become pregnant. Caution her not to breastfeed.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## fondaparinux sodium

Arixtra

**Pharmacologic class:** Selective factor Xa inhibitor

**Therapeutic class:** Anticoagulant, antithrombotic

**Pregnancy risk category B**

### FDA BOXED WARNING

- During epidural or spinal anesthesia or puncture, patients receiving drug or scheduled to receive it for thromboprophylaxis are at risk for epidural or spinal hematoma, which can lead to long-term or permanent paralysis. Risk increases with use of indwelling epidural catheter for analgesia administration and with concurrent use of drugs affecting hemostasis (such as nonsteroidal anti-inflammatory drugs, platelet inhibitors, and other anticoagulants). Risk also rises with traumatic or repeated epidural or spinal puncture or history of spinal deformity or spinal surgery. Before neuraxial intervention, physician should weigh drug's potential benefit against risk.
- Monitor patient frequently for signs and symptoms of neurologic impairment. If these occur, provide urgent treatment.

### Action

Selectively inhibits factor Xa, disrupting blood coagulation and inhibiting thrombin formation and thrombus development

### Availability

*Injection:* 2.5 mg/0.5 ml in single-dose syringe

## Indications and dosages

➤ Prevention of deep-vein thrombosis after hip fracture surgery or hip or knee replacement surgery

**Adults:** 2.5 mg subcutaneously 6 to 8 hours after surgery, once hemostasis occurs; usual duration is 5 to 9 days (up to 11 days) given daily. After hip fracture surgery, extended prophylactic course of up to 24 additional days is recommended; some patients have tolerated a total course of 32 days.

➤ Deep-vein thrombosis and pulmonary emboli

**Adults:** 5 mg subcutaneously once daily for patients weighing less than 50 kg (110 lb), 7.5 mg subcutaneously for patients weighing 50 to 100 kg (110 to 220 lb) or 10 mg subcutaneously for patients weighing more than 100 kg (220 lb) for 5 days and until therapeutic oral anticoagulant effect occurs (as shown by International Normalized Ratio of 2 to 3). Usual duration of therapy is 5 to 9 days, but may continue for up to 26 days.

## Dosage adjustment

- Renal impairment

## Contraindications

- Hypersensitivity to drug
- Bacterial endocarditis
- Severe renal disease
- Active major bleeding
- Patients weighing less than 50 kg (110 lb) who have undergone hip fracture, hip replacement, or knee replacement surgery

## Precautions

Use cautiously in:

- diabetic retinopathy, hepatic disease, blood dyscrasias, heparin-induced thrombocytopenia, severe hypertension, alcoholism
- patients older than age 75
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

## Administration

 Withhold for at least 6 to 8 hours after surgery, to minimize risk of major bleeding.

 Give by subcutaneous injection only. Don't give I.M.

- Rotate injection sites among fatty tissue areas on left and right anterolateral and posterolateral abdominal walls.

- Don't expel air bubble from syringe; doing so may reduce amount of drug delivered.

- Listen for slight click when plunger is fully released. After drug has been injected, needle retracts and white safety indicator is visible.

- Don't mix with other injections or infusions.

- Know that when drug is used to treat deep-vein thrombosis and pulmonary emboli, concomitant warfarin treatment should begin as soon as possible (usually within 72 hours).

Route	Onset	Peak	Duration
Subcut.	Rapid	3 hr	72 hr

## Adverse reactions

**CNS:** depression, dizziness, asthenia, headache, abnormal thinking, confusion, insomnia, neuropathy

**CV:** hypotension

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, dry mouth, anorexia

**GU:** urinary retention, urinary tract infection

**Hematologic:** anemia, hematoma, purpura, minor bleeding, **major bleeding, thrombocytopenia, retroperitoneal hemorrhage, postoperative hemorrhage**

**Metabolic:** hypokalemia

**Skin:** bullous eruption

**Other:** increased wound drainage, injection site bleeding, pain, edema, fever

## Interactions

**Drug-drug.** *Anticoagulants:* increased risk of bleeding

**Drug-herbs.** *Anise, astragalus, bilberry, black currant, bladder wrack, bogbean, boldo, borage, buchu, capsaicin, cat's claw, celery, chaparral, cinchona, clove oil, dandelion, dong quai, fenugreek, feverfew, garlic, ginger, ginkgo, papaya, red clover, rhubarb, safflower oil, skull-cap, tan-shen:* additive anticoagulant effect

*St. John's wort:* reduced anticoagulant effect

## Patient monitoring

- Monitor CBC, platelet count, creatinine level, and renal function tests. Assess stools for occult blood.
- Monitor vital signs, temperature, and fluid intake and output.
- 🚨 Stay alert for bleeding tendency, especially postoperative hemorrhage.
- Check for increased wound drainage after surgery.
- 🚨 In patient undergoing concomitant neuraxial anesthesia or spinal puncture, watch for neurologic impairment (indicating possible spinal or epidural hematoma).
- 🚨 Discontinue drug if severe renal impairment occurs.

## Patient teaching

- 🚨 Instruct patient to immediately report bleeding.
- Caution patient to avoid activities that can cause injury. Tell him to use soft toothbrush and electric razor to avoid gum and skin injury.
- Tell patient that he'll undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and herbs mentioned above.

## formoterol fumarate

Atimos Modulite<sup>⚠️</sup>, Foradil<sup>⚠️</sup>, Foradil Aerolizer, Oxeze<sup>⚠️</sup>, Oxis<sup>⚠️</sup>, Performist

**Pharmacologic class:** Sympathomimetic; long-acting, selective beta<sub>2</sub>-adrenergic receptor agonist

**Therapeutic class:** Bronchodilator

**Pregnancy risk category C**

## FDA BOXED WARNING

- Drug may increase risk of asthma-related death. Give only as additional therapy for patients not adequately controlled on other asthma-controller medications or whose disease severity clearly warrants treatment with two maintenance therapies.
- In large placebo-controlled study, increase in asthma-related deaths occurred in patients receiving salmeterol; this finding may apply to formoterol.

## Action

Stimulates intracellular adenylate cyclase, relaxing bronchial smooth muscle and inhibiting release of mediators of immediate hypersensitivity

## Availability

*Capsules for oral inhalation (used with Aerolizer inhaler):* 12 mcg

## Indications and dosages

- Long-term maintenance of asthma; prevention or long-term maintenance of bronchospasm in patients with chronic obstructive pulmonary disease
- Adults and children ages 5 and older:** Contents of 1 capsule inhaled orally via Aerolizer q 12 hours

➤ Acute prevention of exercise-induced bronchospasm (on occasional, as-needed basis)

**Adults and children ages 5 and older:**

Contents of 1 capsule inhaled orally via Aerolizer at least 15 minutes before start of exercise. Wait 12 hours after initial dose before giving repeat dose.

**Contraindications**

- Hypersensitivity to drug or its components
- Tachyarrhythmias

**Precautions**

Use cautiously in:

- acute asthma symptoms, deteriorating asthma, cardiovascular disorders, seizure disorders, thyrotoxicosis, diabetes, possible hypokalemia
- patients older than age 75
- labor
- pregnant or breastfeeding patients
- children younger than age 5.

**Administration**

- Be aware that drug is not intended for acute asthma attacks.
- Use capsules only with Aerolizer inhaler supplied.
- Keep capsules in blister until immediately before use.

🔊 Make sure patient doesn't swallow capsules.

Route	Onset	Peak	Duration
Inhalation	Rapid	5 min	12 hr

**Adverse reactions**

**CNS:** tremor, dizziness, insomnia, anxiety

**CV:** chest pain

**EENT:** sinusitis, pharyngitis, tonsillitis

**GI:** dry mouth

**Metabolic:** hypokalemia, hyperglycemia

**Musculoskeletal:** muscle cramps, back pain, leg cramps

**Respiratory:** bronchitis, chest infection, dyspnea, upper respiratory tract infection, increased sputum

**Skin:** pruritus, rash

**Other:** dysphonia, viral infection, fever

**Interactions**

**Drug-drug.** *Adrenergics:* potentiation of formoterol's sympathomimetic effects

*Beta-adrenergic blockers:* partial or total inhibition of formoterol's effects

*Cardiac glycosides, methylxanthines, potassium-wasting diuretics, steroids:* potentiation of formoterol's hypokalemic effects, increased risk of arrhythmias

*Disopyramide, MAO inhibitors, quinidine, phenothiazines, procainamide, tricyclic antidepressants:* prolonged QTc interval, increased risk of ventricular arrhythmias

*Halogenated hydrocarbon anesthetics:* increased risk of arrhythmias

*Levodopa, levothyroxine, oxytocin:* impaired cardiac tolerance of formoterol

**Drug-diagnostic tests.** *Blood glucose:* increased level

*Potassium:* decreased level

**Drug-behaviors.** *Alcohol use:* impaired cardiac tolerance of formoterol

**Patient monitoring**

- Monitor pulmonary function test results.
- Monitor potassium and glucose levels.

**Patient teaching**

- Teach patient how to use capsules and Aerolizer inhaler provided.
- Instruct patient to keep capsules in blisters until immediately before use.
- Caution patient not to swallow capsules.
- Tell patient not to use drug for acute asthma attacks.

🔊 Instruct patient to contact prescriber immediately if difficulty in

breathing persists after using drug or if condition worsens.

- Caution patient to take drug exactly as prescribed and not to stop therapy even if he feels better.
- Tell patient to consult prescriber if he has been taking inhaled, short-acting drugs on a regular basis.
- Advise female patient to tell prescriber if she is pregnant or breastfeeding or if she plans to become pregnant.
- Caution patient to avoid alcohol during therapy.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## fosamprenavir calcium

Lexiva, Telzir<sup>☼</sup>☼

**Pharmacologic class:** Human immunodeficiency virus (HIV) protease inhibitor

**Therapeutic class:** Antiretroviral

**Pregnancy risk category C**

### Action

Blocks HIV reverse transcriptase, an enzyme necessary for HIV replication. Blockade leads to reduced viral load and increased CD4+ cell count, helping to ward off other infections when drug is given with other antiretrovirals.

### Availability

Oral suspension: 50 mg/ml

Tablets: 700 mg

### Indications and dosages

➤ HIV-1 infection, given in combination with other antiretrovirals

**Adults (therapy-naïve):** 1,400 mg P.O. b.i.d. or 1,400 mg P.O. daily given with

ritonavir 200 mg daily; or 1,400 mg P.O. daily with ritonavir 100 mg daily; or 700 mg b.i.d. with ritonavir 100 mg b.i.d.

**Adults (protease inhibitor-experienced):** 700 mg P.O. b.i.d. with ritonavir 100 mg b.i.d.

**Children ages 2 and older:** Calculate dosage based on weight, but don't exceed adult dosage. When given in combination with ritonavir, fosamprenavir tablets may be used for children weighing at least 39 kg (86 lb); ritonavir capsules may be used for those weighing at least 33 kg (73 lb). See table below for more information.

Pediatric dosages	
Therapy-naïve children ages 2 to 5	30 mg/kg (oral suspension) P.O. b.i.d., not to exceed adult dosage of 1,400 mg b.i.d.
Therapy-naïve children ages 6 and older	30 mg/kg P.O. b.i.d. or 18 mg/kg plus ritonavir 3 mg/kg b.i.d., not to exceed adult dosage of fosamprenavir 700 mg plus ritonavir 100 mg b.i.d.*
Therapy-experienced children ages 6 and older	18 mg/kg (oral suspension) P.O. plus ritonavir 3 mg/kg b.i.d., not to exceed adult dosage of fosamprenavir 700 mg b.i.d. plus ritonavir 100 mg b.i.d. Or 1,400 mg (tablets) P.O. b.i.d. for children weighing at least 47 kg when given without ritonavir.*

\*Patients weighing at least 39 kg (86 lb) who are also taking ritonavir may receive oral suspension or tablets; those weighing at least 47 kg (104 lb) who aren't taking ritonavir may receive oral suspension or tablets.

### Dosage adjustment

- Mild, moderate and severe hepatic impairment

### Contraindications

- Hypersensitivity to drug or amprenavir
- Concomitant use of drugs that depend highly on CYP3A4 for clearance and for which elevated blood levels may lead to serious or

life-threatening events (such as some antiarrhythmics, antimycobacterials, ergot derivatives, GI motility agents, HMG co-reductase inhibitors, neuroleptics, nonnucleoside reverse transcriptase inhibitors, and sedative-hypnotics)

- Coadministration with ritonavir in patients receiving flecainide or propafenone
- Concomitant use of St. John's wort

## Precautions

Use cautiously in:

- sulfa allergy
- hepatic impairment
- diabetes mellitus
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 2 (safety and efficacy not established).

## Administration

- Assess cholesterol and triglyceride levels and hepatic function tests before starting therapy.
- Give oral suspension to adults without food and to children with food.
- Administer tablets with or without food.

Route	Onset	Peak	Duration
P.O.	Unknown	1.5-4 hr	Unknown

## Adverse reactions

**CNS:** headache

**GI:** nausea, vomiting, diarrhea, abdominal pain

**GU:** nephrolithiasis

**Hematologic: spontaneous bleeding (in hemophiliacs), acute hemolytic anemia**

**Metabolic:** diabetes mellitus, body fat redistribution or accumulation

**Skin:** pruritus, maculopapular rash, **severe or life-threatening skin reactions**

**Other:** immune reconstitution syndrome

## Interactions

**Drug-drug.** *Alfuzosin:* increased alfuzosin level, resulting in hypotension

*Antimycobacterials (rifampin):* decreased fosamprenavir blood level, possible loss of virologic response and possible resistance to fosamprenavir or to its protease inhibitor class (concomitant rifampin use contraindicated)

*Amitriptyline, amlodipine, atorvastatin, benzodiazepines (alprazolam, clonazepam, diazepam, flurazepam), bepridil, cyclosporine, diltiazem, esomeprazole, felodipine, fluticasone, imipramine, isradipine, itraconazole, ketoconazole, lidocaine (systemic), nicardipine, nifedipine, nimodipine, nisoldipine, quinidine, rapamycin, rosuvastatin, tacrolimus, trazodone, verapamil:* increased blood levels of these drugs

*Carbamazepine, cimetidine, dexamethasone, efavirenz, famotidine, nizatidine, phenobarbital, phenytoin, ranitidine, saquinavir:* decreased fosamprenavir blood levels

*Cisapride, pimozide:* possible serious or life-threatening reactions, such as arrhythmias (concomitant use with fosamprenavir contraindicated)

*CYP3A4 inducers:* significant decrease in fosamprenavir blood level and reduced therapeutic effect

*CYP3A4 inhibitors:* increased fosamprenavir blood level and increased incidence of adverse effects

*Delavirdine:* possible loss of virologic response and possible resistance to delavirdine

*Ergot derivatives (dihydroergotamine, ergonovine, ergotamine, methylergonovine):* serious or life-threatening reactions such as acute ergot toxicity (concomitant use with fosamprenavir contraindicated)

*Flecainide, propafenone:* increased risk of serious, life-threatening cardiac arrhythmias (concomitant use contraindicated)

f

*HIV protease inhibitors*

(*lopinavir/ritonavir*): decreased blood levels of both drugs

*Hormonal contraceptives*: possible changes in hormone levels and liver enzyme elevations (if used in combination with fosamprenavir and ritonavir)

*Indinavir, nelfinavir*: increased fosamprenavir blood level

*Lovastatin, simvastatin*: increased risk of serious reactions such as myopathy, including rhabdomyolysis (concomitant use with fosamprenavir contraindicated)

*Methadone*: decreased methadone blood level

*Midazolam, triazolam*: serious or life-threatening reactions, such as prolonged or increased sedation or respiratory depression (concomitant use with fosamprenavir contraindicated)

*Nevirapine*: decreased fosamprenavir and increased nevirapine blood levels

*Paroxetine (in combination with fosamprenavir and ritonavir)*: decreased paroxetine blood level

*PDE5 inhibitors (such as sildenafil)*: increased risk of adverse reactions (such as hypotension, visual changes, priapism)

*Phenytoin (in combination with fosamprenavir and ritonavir)*: increased fosamprenavir, decreased phenytoin blood level

*Rifabutin*: increased rifabutin and metabolite blood levels

*Warfarin*: altered blood levels

**Drug-diagnostic tests.** *ALT, AST, glucose, lipase, triglycerides*: increased levels

**Drug-food.** *High-fat meal*: reduced fosamprenavir effect

**Drug-herbs.** *St. John's wort*: significant decrease in fosamprenavir blood level with loss of therapeutic effect and possible resistance to fosamprenavir or its protease inhibitor class (concomitant use contraindicated)

**Patient monitoring**

 Monitor patient closely for rash; discontinue drug if severe rash or moderate rash plus systemic symptoms develops.

- Be aware that immune reconstitution syndrome has occurred in patients treated with combination antiretroviral therapy. During initial phase of such therapy, patients whose immune system responds may develop inflammatory response to indolent or residual opportunistic infections (such as *Mycobacterium avium* complex, cytomegalovirus, *Pneumocystis jirovecii* pneumonia, and tuberculosis), which may necessitate further evaluation and treatment.

- Closely monitor International Normalized Ratio if patient is receiving warfarin concomitantly.

- Closely monitor hepatic function tests during therapy.

- Periodically monitor cholesterol and triglyceride levels.

- Watch for new-onset diabetes mellitus, exacerbation of preexisting diabetes, and hyperglycemia.

**Patient teaching**

- Advise adult patient to take oral suspension without food.

- Tell caregivers to give oral suspension with food to child.

- Instruct patient to shake oral suspension bottle vigorously before each use; mention that refrigeration may improve taste.

- Instruct patient to take tablets with or without food.

 Advise patient to immediately report new infections or rash, which may become severe and potentially life-threatening.

- Inform patient that drug doesn't cure HIV infection or reduce risk of passing HIV to others through sexual contact, needle sharing, or blood exposure.

- Tell patient that drug may cause body fat redistribution or

accumulation and that the cause and long-term health effects of this condition aren't known.

- Advise patient that drug may interact with many drugs and herbs (especially St. John's wort). Caution patient to discuss use of herbs and other drugs with prescriber.
- Advise male receiving PDE5 inhibitors (such as sildenafil, tadalafil, vardenafil) that he may be at increased risk for adverse events, including hypotension, visual changes, and priapism. Instruct him to promptly report symptoms.
- Advise patient taking hormonal contraceptives to use alternative contraception during therapy because hormone levels may be altered and liver enzyme levels may increase.
- Advise female to notify prescriber if she is pregnant or intends to become pregnant.
- Instruct women not to breastfeed while taking drug.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, food, and herbs mentioned above.

## fosinopril sodium

APO-Fosinopril<sup>Ⓢ</sup>, Gen-Fosinopril<sup>Ⓢ</sup>, Lin-Fosinopril<sup>Ⓢ</sup>, Monopril, Novo-Fosinopril<sup>Ⓢ</sup>, PMS-Fosinopril<sup>Ⓢ</sup>, Ran-Fosinopril<sup>Ⓢ</sup>, Ratio-Fosinopril<sup>Ⓢ</sup>, Riva-Fosinopril<sup>Ⓢ</sup>, Staril<sup>Ⓢ</sup>

**Pharmacologic class:** Angiotensin-converting enzyme (ACE) inhibitor

**Therapeutic class:** Antihypertensive

**Pregnancy risk category C** (first trimester), **D** (second and third trimesters)

### FDA BOXED WARNING

- When used during second or third trimester of pregnancy, drug may cause fetal injury or even death. Discontinue as soon as pregnancy is detected.

### Action

Prevents conversion of angiotensin I to the vasoconstrictor angiotensin II, thereby reducing sodium and water retention and enhancing blood flow in circulatory system

### Availability

Tablets: 10 mg, 20 mg, 40 mg

### Indications and dosages

➤ Hypertension

**Adults:** 10 mg P.O. daily. May increase as required up to 80 mg/day; typical range is 20 to 40 mg P.O. daily.

➤ Heart failure

**Adults:** 10 mg P.O. daily. May increase over several weeks up to 40 mg/day; typical range is 20 to 40 mg/day.

### Dosage adjustment

- Renal impairment

### Off-label uses

- Adjunct in myocardial infarction
- Nephropathy

### Contraindications

- Hypersensitivity to drug or other ACE inhibitors
- Angioedema (hereditary or idiopathic)
- Pregnancy

### Precautions

Use cautiously in:

- aortic stenosis, cardiomyopathy, cerebrovascular or cardiac insufficiency, renal or hepatic impairment, hyponatremia, hypovolemia

- black patients with hypertension
- patients receiving diuretics concurrently
- elderly patients
- breastfeeding patients (safety not established)
- children (safety not established).

### Administration

- Don't administer within 2 hours of antacids.
- Give with or without food, but avoid giving with high-potassium foods or potassium supplements.

Route	Onset	Peak	Duration
P.O.	Within 1 hr	2-6 hr	24 hr

### Adverse reactions

**CNS:** dizziness, drowsiness, fatigue, headache, insomnia, weakness, vertigo

**CV:** hypotension, angina pectoris, tachycardia

**EENT:** sinusitis

**GI:** nausea, vomiting, diarrhea, anorexia

**GU:** proteinuria, erectile dysfunction, decreased libido, **renal failure**

**Hematologic:** agranulocytosis, **bone marrow depression**

**Metabolic:** hyperkalemia

**Respiratory:** cough, bronchitis, dyspnea, **asthma, eosinophilic pneumonitis**

**Skin:** rash, **angioedema**

**Other:** altered taste, fever, hypersensitivity reactions including **anaphylaxis**

### Interactions

**Drug-drug.** *Allopurinol:* increased risk of hypersensitivity reaction

*Antacids:* decreased fosinopril absorption

*Antihypertensives, diuretics, general anesthetics, nitrates, phenothiazines:*

additive hypotension

*Cyclosporine, indomethacin, potassium-sparing diuretics, potassium supplements:* hyperkalemia

*Digoxin, lithium:* increased blood levels of these drugs, greater risk of toxicity

*Indomethacin:* decreased hypotensive effects

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, potassium:* increased levels

*Antinuclear antibody titer:* false-positive result

*Sodium:* decreased level

**Drug-food.** *Salt substitutes containing potassium:* hyperkalemia

**Drug-herbs.** *Capsaicin:* increased incidence of cough

**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension

### Patient monitoring

- Monitor cardiovascular, respiratory, and neurologic status.

- Monitor CBC and liver and kidney function tests.

- Measure blood pressure to assess drug efficacy and detect hypotension.

- Assess patient's potassium intake; monitor serum potassium level.

-  Monitor for signs and symptoms of angioedema and anaphylaxis. If these occur, withdraw drug and contact prescriber immediately.

### Patient teaching

-  Instruct patient to immediately report rash or difficulty breathing.

- Tell patient to report dizziness, fainting, bleeding tendency, change in urination pattern, swelling, or persistent cough.

- Encourage patient to drink enough fluids to stay well hydrated.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- Instruct female patient to notify prescriber if she suspects she is pregnant.

- Tell patient that he will undergo regular blood testing during therapy.

- As appropriate, review all other significant and life-threatening adverse

reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## fosphenytoin sodium

Cerebyx, Pro-Epanutin 

**Pharmacologic class:** Hydantoin

**Therapeutic class:** Anticonvulsant

**Pregnancy risk category D**

### Action

Thought to regulate neuronal membrane by promoting sodium excretion from neurons. This action prevents hyperexcitability and excessive stimulation, which inhibits spread of seizure activity. Lacks general CNS depressant effect.

### Availability

**Injection:** 150 mg in 2-ml vials (100 mg phenytoin sodium), 750 mg in 10-ml vials (500 mg phenytoin sodium)

### Indications and dosages

➤ Status epilepticus

**Adults:** 15 to 20 mg phenytoin sodium equivalent (PE)/kg I.V. at 100 to 150 mg PE/minute as a loading dose, then 4 to 6 mg (PE)/kg I.V. daily for maintenance

➤ To prevent seizures during neurosurgery

**Adults:** 10 to 20 mg PE/kg I.M. or I.V. as a loading dose, then 4 to 6 mg PE/kg I.M. or I.V. daily for maintenance

### Dosage adjustment

- Hepatic disease
- Renal impairment
- Elderly patients

### Contraindications

- Hypersensitivity to drug
- Adams-Stokes syndrome
- Arrhythmias

### Precautions

Use cautiously in:

- hepatic or renal impairment, severe cardiac or respiratory disease
- elderly patients
- pregnant or breastfeeding patients (safety not established).

### Administration

• Know that drug is a phenytoin pro-drug and is given in PE units to avoid the need to perform molecular weight-based adjustments when converting between fosphenytoin and phenytoin sodium doses.

• For I.V. use, dilute in dextrose 5% in water or normal saline solution.

• Don't give faster than 150 mg PE/minute. Too-rapid infusion causes hypotension.

 Check ECG, vital signs, and overall patient status continuously during infusion and for 10 to 20 minutes afterward.

• When giving I.M., rotate injection sites.

Route	Onset	Peak	Duration
I.V.	Rapid	Unknown	Up to 24 hr
I.M.	Unknown	30 min	Up to 24 hr

### Adverse reactions

**CNS:** ataxia, agitation, dizziness, drowsiness, dysarthria, dyskinesia, speech disorder, extrapyramidal syndrome, headache, nervousness, weakness, confusion, hyperesthesia, paresthesia, **cerebral edema, coma, intracranial hypertension**

**CV:** hypotension, tachycardia

**EENT:** diplopia, nystagmus, tinnitus

**GI:** nausea, vomiting, constipation, dry mouth, anorexia

**GU:** pink, red, or reddish-brown urine

**Hematologic:** lymphadenopathy, **aplastic anemia, agranulocytosis, leukopenia, megaloblastic anemia, thrombocytopenia**

**Hepatic:** hepatitis

**Metabolic:** hypocalcemia, hypokalemia, hyperglycemia, increased glucose tolerance

**Musculoskeletal:** back or pelvic pain, osteomalacia

**Skin:** hypertrichosis, rash, pruritus, exfoliative dermatitis, **Stevens-Johnson syndrome**

**Other:** gingival hyperplasia, altered taste, fever, facial edema, weight loss, injection site pain, allergic reactions

### Interactions

**Drug-drug.** *Amiodarone, benzodiazepines, chloramphenicol, cimetidine, disulfiram, estrogens, felbamate, fluconazole, fluoxetine, halothane, influenza vaccine, isoniazid, itraconazole, ketoconazole, methylphenidate, miconazole, omeprazole, phenothiazines, phenylbutazone, salicylates, sulfonamides, tolbutamide, trazodone:* increased fosphenytoin blood level

*Antidepressants, antihistamines, opioids, sedative-hypnotics:* additive CNS depression

*Barbiturates, carbamazepine, reserpine:* decreased fosphenytoin blood level

*Corticosteroids, cyclosporine, doxycycline, estrogens, felbamate, methadone, quinidine, rifampin:* altered effects of these drugs

*Dopamine:* additive hypotension

*Lidocaine, propranolol:* additive cardiac depression

*Streptozocin, theophylline:* decreased efficacy of these drugs

*Warfarin:* initial increase in warfarin effects in patients stabilized on warfarin therapy, followed by decreased response to warfarin

**Drug-diagnostic tests.** *Alkaline phosphatase, glucose, hepatic enzymes:* increased levels

*Dexamethasone, metyrapone:* test interference

*Glucose tolerance test:* decreased tolerance

*Potassium, thyroxine:* decreased levels

*Thyroid function tests:* decreased values

**Drug-behaviors.** *Acute alcohol ingestion:* increased drug blood level, additive CNS depression

*Chronic alcohol ingestion:* decreased drug blood level

### Patient monitoring

- Be prepared to slow administration or stop therapy if significant cardiovascular reactions occur.

- Monitor neurologic status carefully, especially for evidence of increasing intracranial pressure.

- Assess for rash. Withhold drug and notify prescriber if it occurs.

- Monitor phenytoin blood level after drug has metabolized to phenytoin (about 2 hours after I.V. dose or 4 hours after I.M. dose).

- Monitor electrolyte levels.

- Evaluate blood glucose level. Watch for hyperglycemia in patients with diabetes.

### Patient teaching

- Inform patient that he may experience sensory disturbances during I.V. administration.

- Advise patient to immediately report adverse effects, particularly rash.

- Tell patient that drug may turn his urine pink, red, or reddish brown.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## frovatriptan succinate

Frova, Migard<sup>Ⓢ</sup>

**Pharmacologic class:** Serotonin 5-hydroxytryptamine (5-HT)<sub>1</sub>-receptor agonist

**Therapeutic class:** Antimigraine agent

**Pregnancy risk category C**

**Action**

Binds selectively to serotonin receptors on cranial arteries, causing vasoconstriction and decreased blood flow

**Availability**

Tablets: 2.5 mg

**Indications and dosages**

➤ Acute migraine

**Adults:** 2.5 mg P.O. as a single dose at first symptom of migraine. If migraine returns, may repeat after 2 hours. Maximum of three doses in 24 hours (7.5 mg/day).

**Contraindications**

- Hypersensitivity to drug or its components
- Cerebrovascular disorders
- Ischemic heart disease or history of myocardial infarction
- Uncontrolled hypertension
- Peripheral vascular disease
- Hemiplegic or basilar migraine
- Within 24 hours of another 5-HT<sub>1</sub>-receptor agonist or ergotamine-containing or ergot-type drug

**Precautions**

Use cautiously in:

- patients receiving selective serotonin reuptake inhibitors (SSRIs) or serotonin norepinephrine reuptake inhibitors (SNRIs)
- pregnant or breastfeeding patients
- children (safety and efficacy not established).

**Administration**

- Give one tablet with plenty of fluids at first symptom of migraine.
- If headache returns, administer another tablet after 2 hours.
- Don't exceed three tablets in 24-hour period.
- Give first dose under close supervision if patient has coronary artery disease or other risk factors.

- Don't give within 24 hours of another 5-HT<sub>1</sub>-receptor agonist or ergotamine-containing or ergot-type drug.

Route	Onset	Peak	Duration
P.O.	Variable	2-4 hr	Unknown

**Adverse reactions**

**CNS:** dizziness, headache, anxiety, malaise, fatigue, weakness, drowsiness, paresthesia, sensation loss

**CV:** palpitations, tightness in chest, **myocardial infarction (MI)**

**EENT:** abnormal vision, tinnitus, rhinitis

**GI:** nausea, diarrhea, dyspepsia, abdominal pain

**Musculoskeletal:** skeletal or muscle pain

**Skin:** flushing, diaphoresis, photosensitivity

**Other:** altered taste, hot or cold sensations

**Interactions**

**Drug-drug.** *Ergot alkaloids, other serotonin 5-HT<sub>1</sub>-receptor agonists:* prolonged vasoactive reactions

*Hormonal contraceptives, propranolol:* increased frovatriptan bioavailability  
*SSRIs, SNRIs:* serotonin syndrome (including mental status changes, hyperreflexia, nausea, vomiting)

**Drug-behaviors.** *Sun exposure:* increased risk of photosensitivity

**Patient monitoring**

- Assess for cardiovascular reactions, especially signs and symptoms of MI.
- Monitor neurologic status, particularly for indications of cerebrovascular accident.
- Check for rash and itching.

**Patient teaching**

- Instruct patient to take one tablet with plenty of fluids at first symptom of migraine.

- Tell patient he may take second tablet 2 hours after first if migraine returns.
- 📢 Advise patient to immediately report chest pain.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and behaviors mentioned above.

## fulvestrant

Faslodex

**Pharmacologic class:** Estrogen receptor antagonist

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### Action

Inhibits cell division by binding with and downgrading estrogen receptor protein in breast cancer cells

### Availability

*Prefilled syringes:* 125 mg/2.5 ml, 250 mg/5 ml

### Indications and dosages

- Hormone receptor–positive advanced metastatic breast cancer in postmenopausal women with disease progression who have received anti-estrogen therapy
- Adults:** 250 mg I.M. q month as a single 5-ml injection or two concomitant 2.5-ml injections

### Contraindications

- Hypersensitivity to drug
- Pregnancy

### Precautions

Use cautiously in:

- bleeding disorders, hepatic dysfunction, thrombocytopenia
- breastfeeding patients.

### Administration

- Expel air bubble from syringe before giving injection.
- Administer I.M. injection slowly.

Route	Onset	Peak	Duration
I.M.	Slow	2-3 days	Unknown

### Adverse reactions

**CNS:** depression, light-headedness, dizziness, headache, hallucinations, vertigo, insomnia, paresthesia, anxiety, weakness

**CV:** chest pain, vasodilation, peripheral edema

**EENT:** pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, anorexia

**GU:** urinary tract infection, pelvic pain

**Hematologic:** anemia

**Musculoskeletal:** back pain, bone pain, arthritis

**Respiratory:** dyspnea, increased cough

**Skin:** flushing, rash, diaphoresis

**Other:** food distaste, fever, hot flashes, injection site reactions, pain, flulike symptoms

### Interactions

**Drug-drug.** *Anticoagulants:* increased bleeding risk

### Patient monitoring

- Monitor CBC.
- Assess liver function test results.

### Patient teaching

- Advise patient to report signs and symptoms of infection, especially urinary tract infection.
- Caution patient to avoid driving and other hazardous activities until she knows how drug affects concentration and alertness.

 Tell patient to notify prescriber immediately if she thinks she is pregnant.

- Teach patient comfort measures to minimize hot flashes and rash.
- Instruct patient to minimize GI upset and sore throat by eating frequent, small servings of healthy food and drinking adequate fluids.
- Tell patient that drug may cause headache, muscle aches, or bone pain. Encourage her to discuss activity recommendations and pain management with prescriber.
- Advise patient to establish effective bedtime routine to minimize sleep disorders.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

## furosemide

Apo-Furosemide<sup>✳</sup>, Bio-Furosemide<sup>✳</sup>, Dom-Furosemide<sup>✳</sup>, Frusol<sup>⚡</sup>, Lasix, Lasix Special<sup>✳</sup>, Novosemide<sup>✳</sup>, Nu-Furosemide<sup>✳</sup>, PMS-Furosemide<sup>✳</sup>

**Pharmacologic class:** Sulfonamide loop diuretic

**Therapeutic class:** Diuretic, antihypertensive

**Pregnancy risk category** C

### Action

Unclear. Thought to inhibit sodium and chloride reabsorption from ascending loop of Henle and distal renal tubules. Increases potassium excretion and plasma volume, promoting renal excretion of water, sodium, chloride, magnesium, hydrogen, and calcium.

### Availability

*Injection:* 10 mg/ml

*Oral solution:* 10 mg/ml, 40 mg/5 ml

*Tablets:* 20 mg, 40 mg, 80 mg

### Indications and dosages

➤ Acute pulmonary edema

**Adults:** 40 mg I.V. given over 1 to 2 minutes. If adequate response doesn't occur within 1 hour, give 80 mg I.V. over 1 to 2 minutes.

➤ Edema caused by heart failure, hepatic cirrhosis, or renal disease

**Adults:** Initially, 20 to 80 mg/day P.O. as a single dose; may increase in 20- to 40-mg increments P.O. q 6 to 8 hours until desired response occurs. Thereafter, may give once or twice daily. For maintenance, dosage may be reduced in some patients or carefully titrated upward to 600 mg P.O. daily in severe edema. Usual I.M. or I.V. dosage is 20 to 40 mg as a single injection; if response inadequate, second and each succeeding dose may be increased in 20-mg increments and given no more often than q 2 hours until desired response occurs. Single dose may then be given once or twice daily.

**Infants and children:** 2 mg/kg P.O.

(oral solution) as a single dose. As necessary, increase in increments of 1 or 2 mg/kg q 6 to 8 hours to a maximum of 6 mg/kg/dose. For maintenance, give minimum effective dosage.

➤ Hypertension

**Adults:** 40 mg P.O. b.i.d. If satisfactory response doesn't occur, other antihypertensives may be added before furosemide dosage is increased. However, dosage may be titrated upward as needed and tolerated to a maximum of 240 mg P.O. daily in two or three divided doses.

### Off-label uses

- Hypercalcemia associated with cancer

## Contraindications

- Hypersensitivity to drug or other sulfonamides
- Anuria

## Precautions

Use cautiously in:

- diabetes mellitus, severe hepatic disease
- elderly patients
- pregnant or breastfeeding patients
- neonates.

## Administration

- Know that I.V. or I.M. injection is given when patient requires rapid onset of diuresis or can't receive oral doses.
- Be aware that I.V. dose may be given by direct injection over 1 to 2 minutes.
- For I.V. infusion, dilute in dextrose 5% in water, normal saline solution, or lactated Ringer's solution.
- ⚠ Don't infuse more than 4 mg/minute.
- Give oral doses in morning with food. If second dose is prescribed, give in afternoon.

Route	Onset	Peak	Duration
P.O.	30-60 min	1-2 hr	6-8 hr
I.V.	5 min	20-60 min	2 hr
I.M.	10-30 min	30 min	4-8 hr

## Adverse reactions

**CNS:** dizziness, headache, vertigo, weakness, lethargy, paresthesia, drowsiness, restlessness, light-headedness

**CV:** hypotension, orthostatic hypotension, tachycardia, volume depletion, **necrotizing angitis, thrombophlebitis, arrhythmias**

**EENT:** blurred vision, xanthopsia, hearing loss, tinnitus

**GI:** nausea, vomiting, diarrhea, constipation, dyspepsia, oral and gastric irritation, cramping, anorexia, dry mouth, **acute pancreatitis**

**GU:** excessive and frequent urination, nocturia, glycosuria, bladder spasm, **oliguria, interstitial nephritis**

**Hematologic:** anemia, purpura, **leukopenia, thrombocytopenia, hemolytic anemia**

**Hepatic:** jaundice

**Metabolic:** hyperglycemia, hyperuricemia, dehydration, hypokalemia, hypomagnesemia, hypocalcemia, **hypochloremic alkalosis**

**Musculoskeletal:** muscle pain, muscle cramps

**Skin:** photosensitivity, rash, diaphoresis, urticaria, pruritus, exfoliative dermatitis, **erythema multiforme**

**Other:** fever, transient pain at I.M. injection site

## Interactions

**Drug-drug.** *Aminoglycosides, ethacrynic acid, other ototoxic drugs:* increased risk of ototoxicity  
*Amphotericin B, corticosteroids, corticotropin, potassium-wasting diuretics, stimulant laxatives:* additive hypokalemia

*Antihypertensives, diuretics, nitrates:* additive hypotension

*Cardiac glycosides:* increased risk of glycoside toxicity and fatal arrhythmias

*Clofibrate:* exaggerated diuretic response, muscle pain and stiffness

*Hydantoins, nonsteroidal anti-inflammatory drugs, probenecid:* diuresis inhibition

*Insulin, oral hypoglycemics:* decreased hypoglycemic effect

*Lithium:* decreased lithium excretion, possible toxicity

*Norepinephrine:* decreased arterial response to norepinephrine

*Propranolol:* increased propranolol blood level

*Salicylates:* increased risk of salicylate toxicity at lower dosages than usual

*Succinylcholine:* potentiation of succinylcholine effect

*Sucralfate:* decreased naturietic and antihypertensive effects of furosemide

**Sulfonylureas:** decreased glucose tolerance, resulting in hyperglycemia

**Theophyllines:** altered, enhanced, or inhibited theophylline effects

**Tubocurarine:** antagonism of tubocurarine effects

**Drug-diagnostic tests.** *Blood urea nitrogen (BUN):* transient increase  
*Calcium, magnesium, platelets, potassium, sodium:* decreased levels  
*Cholesterol, creatinine, glucose, nitrogenous compounds:* increased levels

**Drug-herbs.** *Dandelion:* interference with drug's diuretic effect  
*Ephedra (ma huang), ginseng:* decreased furosemide efficacy  
*Licorice:* rapid potassium loss

**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension  
*Sun exposure:* increased risk of photosensitivity

ringing in ears, vertigo) and other drug toxicities.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Instruct patient to move slowly when rising, to avoid dizziness from sudden blood pressure decrease.
- Encourage patient to discuss need for potassium and magnesium supplements with prescriber.
- Caution patient to avoid alcohol and herbs while taking this drug.
- Inform patient that he'll undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

### Patient monitoring

- Watch for signs and symptoms of ototoxicity.
- 🚨 Assess for other evidence of drug toxicity (arrhythmias, renal dysfunction, abdominal pain, sore throat, fever).
- Monitor CBC, BUN, and electrolyte, uric acid, and CO<sub>2</sub> levels.
- Monitor blood pressure, pulse, fluid intake and output, and weight.
- Assess blood glucose levels in patients with diabetes mellitus.
- Monitor dietary potassium intake. Watch for signs and symptoms of hypokalemia.

### Patient teaching

- Instruct patient to take in morning with food (and second dose, if prescribed, in afternoon), to prevent nocturia.
- Tell patient that drug may cause serious interactions with many common drugs. Instruct him to tell all prescribers he's taking it.
- Instruct patient to report signs and symptoms of ototoxicity (hearing loss,

## gabapentin

Apo-Gabapentin\*, Co Gabapentin\*, Dom-Gabapentin\*, Gen-Gabapentin\*, Gralise, Neurontin, Novo-Gabapentin\*, PHL-Gabapentin\*, PMS-Gabapentin\*, Ratio-Gabapentin\*, Riva-Gabapentin\*

## gabapentin enacarbil

Horizant

**Pharmacologic class:** 1-amino-methyl cyclohexoneacetic acid

**Therapeutic class:** Anticonvulsant

**Pregnancy risk category C**

**Action**

Unknown. Possesses properties resembling those of other anticonvulsants, which appear to stabilize cell membranes by altering cation (sodium, calcium, and potassium) transport, thereby decreasing excitability and suppressing seizure discharge or focus.

**Availability**

*Capsules:* 100 mg, 300 mg, 400 mg

*Oral solution:* 250 mg/5 ml

*Tablets:* 300 mg, 600 mg, 800 mg

*Tablets (extended-release):* 300 mg, 600 mg

**Indications and dosages**

➤ Adjunctive treatment of partial seizures

**Adults and children older than age 12:**

Initially, 300 mg P.O. t.i.d. Usual range is 900 to 1,800 mg/day in three divided doses.

**Children ages 5 to 12:** Initially, 10 to 15 mg/kg/day P.O. in three divided doses, titrated upward over 3 days to 25 to 35 mg/kg/day in three divided doses

**Children ages 3 to 4:** Initially, 10 to 15 mg/kg/day P.O. in three divided doses, titrated upward over 3 days to 40 mg/kg/day in three divided doses

➤ Postherpetic neuralgia

**Adults:** Initially, 300 mg P.O. as a single dose on day 1; then 600 mg in two divided doses on day 2 and 900 mg in three divided doses on day 3. Then titrate upward as needed to 1,800 mg/day given in three divided doses. Or, titrate to a maximum of 1,800 mg (Gralise) P.O. daily as 300 mg on day 1, 600 mg on day 2, 900 mg on days 3 to 6, 1,200 mg on days 7 to 10, 1,500 mg on days 11 to 14, and 1,800 mg on day 15. Or initially, 600 mg (Horizant) P.O. in morning for 3 days; then increase to 600 mg b.i.d. beginning on day 4.

➤ Moderate to severe primary restless legs syndrome

**Adult:** 600 mg (Horizant) P.O. daily with food in evening

**Dosage adjustment**

• Renal impairment

**Off-label uses**

- Bipolar disorder
- Migraine prophylaxis
- Tremor associated with multiple sclerosis

**Contraindications**

• Hypersensitivity to drug or its components (other than Horizant)

**Precautions**

Use cautiously in:

- renal insufficiency
- creatinine clearance less than 15 ml/minute (Horizant) or less than 30 ml/minute (Gralise), patients on hemodialysis (avoid use)
- patients with suicidal thoughts or behavior
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 3 (safety not established for partial seizures)
- children (safety not established for Horizant)
- children younger than age 18 (safety not established for Gralise).

**Administration**

- Give with or without food (other than Horizant and Gralise).
- Give Gralise and Horizant whole with evening meal.
- Administer first dose at bedtime to reduce adverse effects (other than Gralise and Horizant).
- Don't give within 2 hours of antacids.
- Give daily doses no more than 12 hours apart (other than Gralise and Horizant).
- Be aware that seizures may increase in patients with seizure disorders if drug is rapidly discontinued. Withdraw drug gradually over a minimum of 1 week.

- Be aware that Gralise and Horizant aren't interchangeable with other forms of gabapentin and safety and effectiveness of Gralise in patients with seizures hasn't been established.

Route	Onset	Peak	Duration
P.O.	Rapid	2-4 hr	8 hr
P.O. (Gralise)	Unknown	8 hr	Unknown
P.O. (extended)	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** somnolence, headache, drowsiness, anxiety, dizziness, malaise, vertigo, weakness, ataxia, altered reflexes, hyperkinesia, paresthesia, tremor, amnesia, abnormal thinking, difficulty concentrating, hostility, emotional lability, **suicidal thoughts or behavior**

**CV:** hypertension, peripheral edema

**EENT:** abnormal vision, nystagmus, diplopia, amblyopia, rhinitis, pharyngitis, dry throat

**GI:** nausea, vomiting, constipation, flatulence, dyspepsia, anorexia, dry mouth

**GU:** erectile dysfunction

**Hematologic:** leukopenia

**Musculoskeletal:** joint, back, or muscle pain; fractures

**Respiratory:** cough

**Skin:** pruritus, abrasion

**Other:** dental abnormalities, gingivitis, facial edema, increased appetite, weight gain, **multiorgan hypersensitivity**

### Interactions

*Note:* Apply to all forms other than Horizant

**Drug-drug.** *Antacids:* decreased gabapentin absorption

*Antihistamines, CNS depressants,*

*sedative-hypnotics:* increased risk of CNS depression

*Hydrocodone:* decreased hydrocodone  $C_{max}$  and area under the curve (AUC), increased gabapentin AUC

*Morphine:* increased gabapentin concentration

**Drug-diagnostic tests.** *Urinary protein dipstick test:* false-positive result  
*White blood cells (WBCs):* decreased count

**Drug-behaviors.** *Alcohol use:* increased risk of CNS depression

### Patient monitoring

 Evaluate neurologic status (including observing for emergence or worsening of depression, suicidal thoughts or behavior, or unusual changes in mood or behavior) and motor function.

- Assess WBC count.

- Monitor blood pressure.

 Monitor patients for early signs and symptoms of hypersensitivity, such as fever or lymphadenopathy (although rash may not present). Discontinue drug if an alternative etiology for the signs or symptoms can't be established.

### Patient teaching

- Tell patient he may take with or without food and to take first dose at bedtime to reduce adverse effects (other than Gralise and Horizant).

- Tell patient taking Gralise or Horizant to take drug with evening meal, to swallow tablet whole, and not to crush, split, or chew tablets.

 Caution patient not to stop taking drug suddenly. Dosage must be tapered to minimize seizure risk.

- Instruct patient to avoid driving and other hazardous activities until he knows how drug affects concentration, alertness, motor function, and vision.

- Tell patient that drug may cause joint pain, muscle aches, or bone pain. Encourage him to discuss activity recommendations and pain management with prescriber.

 Advise patient or caregiver to immediately report emergence or worsening of depression, suicidal

thoughts or behavior, or unusual changes in mood or behavior.

 Instruct patient or caregiver to immediately report early signs and symptoms of hypersensitivity, such as fever or enlarged lymph nodes.

- Advise patient not to drink alcohol while taking gabapentin.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## galantamine hydrobromide

Razadyne, Razadyne ER, Reminyl , Reminyl XL 

**Pharmacologic class:** Cholinesterase inhibitor

**Therapeutic class:** Anti-Alzheimer's agent

**Pregnancy risk category B**

### Action

Unclear. May reversibly inhibit acetylcholinesterase, increasing concentration of acetylcholine (necessary for nerve impulse transmission) in brain synapses.

### Availability

*Capsules (extended-release):* 8 mg, 16 mg, 24 mg

*Oral solution:* 4 mg/ml

*Tablets:* 4 mg, 8 mg, 12 mg

### Indications and dosages

 Mild to moderate dementia of Alzheimer's disease

**Adults:** Initially, 4 mg P.O. b.i.d. If patient tolerates dosage well after at least 4 weeks of therapy, increase to 8 mg P.O. b.i.d. May increase to 12 mg P.O. b.i.d. after at least 4 weeks at

previous dosage. Recommended range is 16 to 24 mg daily in two divided doses. Or initially, 8 mg P.O. daily (Razadyne ER). If patient tolerates dosage after at least 4 weeks, increase to 16 mg P.O. daily. Further increase to 24 mg P.O. daily should be attempted after minimum of 4 weeks at 16 mg/day.

### Dosage adjustment

- Moderate hepatic or renal impairment

### Off-label uses

- Vascular dementia

### Contraindications

- Hypersensitivity to drug
- Severe hepatic or renal impairment
- Pregnancy or breastfeeding
- Children

### Precautions

Use cautiously in:

- asthma, chronic obstructive pulmonary disease, GI bleeding, moderate hepatic or renal impairment, Parkinson's disease, seizures.

### Administration

- Before giving, make sure patient is well hydrated, to minimize GI upset.
- Give with morning and evening meals.
- Give with antiemetics as needed.
- Use pipette to add oral solution to beverage; have patient drink it right away.

Route	Onset	Peak	Duration
P.O.	Unknown	1 hr	Unknown

### Adverse reactions

**CNS:** depression, dizziness, headache, tremor, insomnia, drowsiness, fatigue, syncope

**CV:** bradycardia

**EENT:** rhinitis

**GI:** nausea, vomiting, diarrhea, abdominal pain, dyspepsia, anorexia

**GU:** urinary tract infection, hematuria

**Hematologic:** anemia

**Other:** weight loss

## Interactions

**Drug-drug** *Anticholinergics:* antagonism of anticholinergic activity

*Cholinergics:* synergistic effects

*Cimetidine, erythromycin, ketoconazole,*

*paroxetine:* increased galantamine bioavailability

## Patient monitoring

- Assess fluid intake and output to ensure adequate hydration, which helps reduce GI upset.
- Monitor cognitive status.
- Evaluate patient for cardiac conduction abnormalities. Assess pulse regularly for bradycardia.
- Observe for bleeding tendencies.
- 🚨 Assess for depression and suicidal ideation.

## Patient teaching

- Instruct caregiver in proper technique for using oral pipette.
- Teach caregiver how to measure patient's pulse. Tell him to report slow pulse right away.
- Recommend frequent, small servings of healthy food and adequate fluids to minimize GI upset.
- 🚨 Tell patient or caregiver to watch for and report signs and symptoms of depression.
- Advise patient or caregiver to establish effective bedtime routine.
- Caution caregiver to prevent patient from performing hazardous activities until adverse reactions are known.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs mentioned above.

## ganciclovir (DHPG)

Cymevene<sup>®</sup>, Cytovene, Valcyte<sup>®</sup>, Vitrasert

**Pharmacologic class:** Acyclic purine nucleoside analog of 2'-deoxyguanosine

**Therapeutic class:** Antiviral

**Pregnancy risk category C**

## FDA BOXED WARNING

- Drug may lead to granulocytopenia, anemia, and thrombocytopenia. In animal studies, it was carcinogenic and teratogenic and caused aspermatogenesis.
- Drug is indicated only to treat cytomegalovirus (CMV) retinitis in immunocompromised patients and to prevent CMV disease in at-risk transplant patients.

## Action

Inhibits binding of deoxyguanosine triphosphate to DNA polymerase by terminating DNA synthesis, thereby inhibiting viral replication

## Availability

*Capsules:* 250 mg, 500 mg

*Injection:* 500 mg/vial

*Intravitreal implant:* 4.5 mg

## Indications and dosages

➤ Prevention of CMV in advanced human immunodeficiency virus (HIV) infection

**Adults:** 1,000 mg P.O. t.i.d.

➤ Prevention of CMV in transplant recipients

**Adults:** 5 mg/kg I.V. q 12 hours for 7 to 14 days; then 5 mg/kg/day 7 days per week or 6 mg/kg/day 5 days per week

➤ CMV retinitis in immunocompromised patients

**Adults and children ages 9 and older:** Intravitreal implant (4.5 mg) placed during intraocular surgery

**Adults and children older than 3 months:** Initially, 5 mg/kg I.V. q 12 hours for 14 to 21 days, followed by a maintenance dosage of 5 mg/kg/day 7 days per week or 6 mg/kg 5 days per week. For P.O. maintenance, 1,000 mg P.O. t.i.d. or 500 mg P.O. q 3 hours while patient is awake.

### Dosage adjustment

- Renal impairment
- Elderly patients

### Off-label uses

- CMV gastroenteritis, CMV pneumonia

### Contraindications

- Hypersensitivity to drug or acyclovir
- Neutropenia or thrombocytopenia
- Contraindications for intraocular surgery, such as external infections or thrombocytopenia (with intravitreal implant)
- Breastfeeding

### Precautions

Use cautiously in:

- renal impairment
- history of cytopenic reactions
- pregnant patients
- children younger than age 9 (with intravitreal implant).

### Administration

 Follow facility policy for handling and disposing of antineoplastic drugs. (Drug shares some properties with antitumor agents.)

- Be aware that safety and efficacy of I.V. use haven't been established for congenital or neonatal CMV disease, treatment of established CMV disease other than retinitis, or use in nonimmunocompromised individuals.

 Don't let powder in capsules or I.V. solution contact skin, eyes, or

mucous membranes. If contact occurs, wash skin thoroughly with soap and water, or flush eyes with water.

- Reconstitute 500-mg vial with 10 ml of sterile water; shake vial to dissolve drug. Then dilute drug again in 50 to 250 ml of compatible I.V. solution.

- If patient is on fluid restriction, dilute to a concentration of 10 mg/ml or less.

 Administer a single dose by I.V. infusion slowly (over at least 1 hour), using infusion pump or microdrip (60 gtt/ml).

- Give I.V. solution within 24 hours of dilution to reduce risk of bacterial contamination.

 Don't give by I.V. bolus or by I.M. or subcutaneous route.

- Administer oral doses with food.
- Be aware that intravitreal implant is designed to release drug over 5 to 8 months. Once drug is depleted (as shown by retinitis progression), implant may be removed and replaced.

 Handle intravitreal implant carefully by suture tab only, to avoid damage to polymer coating. (Damage could increase rate of drug release.)

Route	Onset	Peak	Duration
P.O.	Slow	2-4 hr	Unknown
I.V., intravit.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** ataxia, confusion, dizziness, headache, drowsiness, tremor, abnormal thinking, agitation, amnesia, neuropathy, paresthesia, **seizures, coma**

**CV:** hypertension, hypotension, phlebitis, **arrhythmias**

**EENT:** vision loss for 2 to 4 weeks, vitreous loss, vitreous hemorrhage, cataract, retinal detachment, uveitis, endophthalmitis (all with intravitreal implant)

**GI:** nausea, vomiting, diarrhea, abdominal pain, dyspepsia, flatulence, anorexia, dry mouth

**Hematologic:** anemia, **agranulocytosis, thrombocytopenia, leukopenia**

**Respiratory:** pneumonia

**Skin:** rash, diaphoresis, pruritus

**Other:** fever; infection; chills; inflammation, pain, and phlebitis at injection site; **sepsis**

## Interactions

**Drug-drug.** *Amphotericin B, cyclosporine, other nephrotoxic drugs:* increased risk of renal impairment and ganciclovir toxicity

*Cilastatin, imipenem:* increased seizure activity

*Cytotoxic drugs:* increased toxic effects

*Immunosuppressants:* increased immunologic and bone marrow depression

*Probenecid:* increased ganciclovir blood level

*Zidovudine:* increased risk of agranulocytosis

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, creatinine, gamma-glutamyltransferase:* increased values

*Granulocytes, hemoglobin, neutrophils, platelets, white blood cells:* decreased values

*Liver function tests:* abnormal results

## Patient monitoring

- Monitor liver function test results.
- Monitor neutrophil and platelet counts.
- Assess fluid intake and output to ensure adequate hydration.
- Make sure patient has regular ophthalmic examinations during both induction and maintenance therapy.
- 🚨 Monitor neurologic status closely; watch for seizures and coma.
- 🚨 Check for signs and symptoms of infection, particularly sepsis.

## Patient teaching

- 🚨 Advise patient to immediately report signs and symptoms of infection, including those at infusion site.
- 🚨 Instruct patient to immediately report easy bruising or bleeding.
- Instruct patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Caution female patient not to breast-feed.
- Inform patient that drug may cause birth defects. Tell females to use effective birth control during therapy; advise males to use barrier contraception during and for 90 days after therapy.
- 🚨 Caution patient not to open or crush capsule. If powder from capsule contacts skin or eyes, tell him to wash skin thoroughly with soap and water or flush eyes with water.
- Instruct patient to minimize GI upset by eating frequent, small servings of healthy food.
- Tell patient he'll undergo regular blood testing during therapy.
- Explain that drug doesn't cure CMV retinitis and that patient should have eye exams every 4 to 6 weeks during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

03

## ganirelix acetate

Orgalutran<sup>®</sup> 🌿

**Pharmacologic class:** Gonadotropin-releasing hormone (GnRH) antagonist

**Therapeutic class:** Sex hormone

**Pregnancy risk category** X

**Action**

Competitively blocks GnRH receptors on pituitary gonadotroph, suppressing secretion of gonadotropin and luteinizing hormone (LH) and thereby preventing ovulation

**Availability**

*Prefilled syringe:* 250 mcg/0.5 ml

**Indications and dosages**

➤ To inhibit premature LH surges during controlled ovarian hyperstimulation

**Adult women:** 250 mcg subcutaneously daily during early to mid-follicular phase

**Contraindications**

- Hypersensitivity to drug, its components, GnRH, or GnRH analogs
- Known or suspected pregnancy

**Precautions**

Use cautiously in:

- GnRH sensitivity
- latex sensitivity (packaging contains natural rubber latex)
- breastfeeding patients.

**Administration**

⚠ Know that pregnancy must be excluded before therapy begins.

- Inject into abdomen (around navel) or upper thigh.
- Be aware that drug is given with follicle-stimulating hormone (FSH). After starting FSH on day 2 or 3 of menstrual cycle, patient receives ganirelix on morning of day 7 or 8 and continues this drug until adequate follicular response occurs. Then human chorionic gonadotropin is given and FSH and ganirelix are discontinued.

Route	Onset	Peak	Duration
Subcut.	Unknown	Unknown	Unknown

**Adverse reactions**

**CNS:** headache

**GI:** nausea, abdominal pain of GI tract origin

**GU:** abdominal pain of gynecologic origin, vaginal bleeding, **ovarian hyperstimulation syndrome**

**Other:** injection site reaction, **fetal death**

**Interactions**

**Drug-diagnostic tests.** *Hematocrit,*

*total bilirubin:* decreased values

*Neutrophils:* altered count ( $8.3/\text{mm}^3$  or greater)

**Patient monitoring**

⚠ Monitor patient for adverse effects, especially ovarian hyperstimulation.

- Monitor total bilirubin level and CBC with white cell differential.

**Patient teaching**

- Inform patient about possible adverse reactions.

- Teach patient about duration of treatment and required monitoring procedures.

⚠ Urge patient to tell prescriber if she is pregnant before starting drug.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

**gemcitabine hydrochloride**

Gemzar

**Pharmacologic class:** Antimetabolite (pyrimidine analog)

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

**Action**

Kills malignant cells undergoing DNA synthesis; arrests progression of cells at G1/S border

**Availability**

*Powder for injection:* 200 mg in 10-ml vial, 1 g in 50-ml vial

**Indications and dosages**

➤ Pancreatic cancer

**Adults:** 1,000 mg/m<sup>2</sup> I.V. q week for 7 weeks, followed by 1 week of rest. May continue with cycles of once-weekly administration for 3 weeks, followed by 1 week of rest.

➤ Non-small-cell lung cancer (given with cisplatin)

**Adults:** 1,000 mg/m<sup>2</sup> I.V. on days 1, 8, and 15 of 28-day cycle; or 1,250 mg/m<sup>2</sup> on days 1 and 8 of 21-day cycle.

Cisplatin also given on day 1.

➤ Breast cancer (combined with paclitaxel after failure of anthracycline-containing adjuvant chemotherapy, unless anthracyclines were contraindicated)

**Adults:** 1,250 mg/m<sup>2</sup> I.V. over 30 minutes on days 1 and 8 of 21-day cycle, with paclitaxel given on day 1 before gemcitabine

➤ Advanced ovarian cancer after 6-month failure on platinum-based therapy (combined with carboplatin)

**Adults:** 1,000 mg/m<sup>2</sup> I.V. over 30 minutes on days 1 and 8 of each 21-day cycle, with carboplatin given on day 1 after gemcitabine administration.

**Dosage adjustment**

• Bone marrow depression

**Off-label uses**

• Bladder cancer

**Contraindications**

• Hypersensitivity to drug

**Precautions**

Use cautiously in:

- hepatic or renal impairment
- females of childbearing age
- pregnant or breastfeeding patients.

**Administration**

• Follow facility policy for preparing, handling, and administering carcinogenic, mutagenic, and teratogenic drugs.

• Add 5 ml of preservative-free normal saline solution to 200-mg vial, or add 25 ml of this solution to 1-g vial. Shake vial to dissolve drug.

• Reconstitute drug to a concentration of 40 mg/ml. If necessary, dilute further to a concentration of 1 mg/ml.

⚠ Infuse each dose over 30 minutes. (Infusions lasting longer than 1 hour increase toxicity risk.)

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

**Adverse reactions**

**CNS:** paresthesia

**GI:** nausea, vomiting, diarrhea, stomatitis

**GU:** hematuria, proteinuria, **hemolytic uremic syndrome, renal failure**

**Hematologic:** anemia, **leukopenia, thrombocytopenia**

**Respiratory:** dyspnea, **bronchospasm**

**Skin:** alopecia, rash, cellulitis

**Other:** flu-like symptoms, fever, edema, injection site reactions, **anaphylactoid reactions**

**Interactions**

**Drug-drug.** *Live-virus vaccines:* decreased antibody response to vaccine, increased risk of adverse reactions  
*Other antineoplastics:* additive bone marrow depression

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin:* transient increases

*Blood urea nitrogen, serum creatinine:* increased levels

**Patient monitoring**

🔊 Stop infusion and notify prescriber immediately if patient has signs or symptoms of allergic reaction.

- Monitor liver and kidney function test results.

🔊 Monitor CBC with white cell differential (particularly neutrophil and platelet counts) before each dose.

- Assess degree of bone marrow depression. Expect dosage changes based on blood counts.

🔊 Watch for signs and symptoms of infection and bleeding tendencies, even after drug therapy ends.

- Evaluate respiratory status regularly.
- Monitor temperature, especially during first 12 hours of therapy.

**Patient teaching**

🔊 Instruct patient to stop taking drug and immediately report signs or symptoms of allergic reaction.

🔊 Advise patient to immediately report signs or symptoms of infection (especially flulike symptoms).

🔊 Instruct patient to report unusual bleeding or bruising, change in urination pattern, or difficulty breathing.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- Advise patient to avoid activities that can cause injury. Tell him to use soft toothbrush and electric razor to avoid gum and skin injury.

- Tell patient to minimize GI upset by eating frequent, small servings of healthy food.

- Inform patient that he'll undergo blood testing periodically throughout therapy.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

**gemfibrozil**

Apo-Gemfibrozil<sup>✳</sup>, Dom-Gemfibrozil<sup>✳</sup>, Gen-Gemfibrozil<sup>✳</sup>, Lopid, Novo-Gemfibrozil<sup>✳</sup>, Nu-Gemfibrozil<sup>✳</sup>, PMS-Gemfibrozil<sup>✳</sup>, Riva-Gemfibrozil<sup>✳</sup>

**Pharmacologic class:** Fibric acid derivative

**Therapeutic class:** Antihyperlipidemic

**Pregnancy risk category** C

**Action**

Inhibits peripheral lipolysis, resulting in decreased triglyceride levels. Also inhibits synthesis and increases clearance of very-low-density lipoproteins.

**Availability**

*Tablets:* 600 mg

**Indications and dosages**

➤ Type IIb hyperlipidemia in patients without coronary artery disease who don't respond to other treatments; adjunctive therapy for types IV and V hyperlipidemia

**Adults:** 1,200 mg P.O. daily in two divided doses

**Contraindications**

- Hypersensitivity to drug
- Gallbladder disease
- Severe renal dysfunction
- Hepatic dysfunction

**Precautions**

Use cautiously in:

- renal impairment, cholelithiasis, diabetes, hypothyroidism
- pregnant or breastfeeding patients
- children (safety not established).

**Administration**

- Give 30 minutes before a meal.

- Know that before starting drug and throughout therapy, patient should use dietary measures and exercise, as appropriate, to control hyperlipidemia.

Route	Onset	Peak	Duration
P.O.	2-5 days	4 wk	Unknown

### Adverse reactions

**CNS:** fatigue, hypoesthesia, paresthesia, drowsiness, syncope, vertigo, dizziness, headache, **seizures**

**CV:** vasculitis

**EENT:** cataracts, blurred vision, retinal edema, hoarseness

**GI:** nausea, vomiting, diarrhea, abdominal or epigastric pain, heartburn, flatulence, gallstones, dry mouth

**GU:** dysuria, erectile dysfunction, decreased male fertility

**Hematologic:** eosinophilia, anemia, **bone marrow hypoplasia, leukopenia, thrombocytopenia**

**Hepatic:** **hepatotoxicity**

**Metabolic:** **hypoglycemia**

**Musculoskeletal:** joint, back, or muscle pain; myasthenia; myopathy; synovitis; myositis; **rhabdomyolysis**

**Respiratory:** cough

**Skin:** alopecia, rash, urticaria, eczema, pruritus, angioedema

**Other:** abnormal taste, chills, weight loss, increased risk of bacterial and viral infection, lupuslike syndrome, **anaphylaxis**

### Interactions

**Drug-drug.** *Chenodiol, ursodiol:* decreased gemfibrozil efficacy

*Cyclosporine:* decreased cyclosporine effects

*HMG-CoA reductase inhibitors:* increased risk of rhabdomyolysis

*Sulfonylureas:* increased hypoglycemic effects

*Warfarin:* increased bleeding risk

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin,*

*creatinine kinase (CK), glucose, lactate dehydrogenase:* increased values  
*Hematocrit, hemoglobin, potassium, white blood cells:* decreased values

### Patient monitoring

- Monitor kidney and liver function test results and serum lipid levels.

🚨 Watch for signs and symptoms of adverse reactions, especially bleeding tendency and hypersensitivity reaction.

- Monitor periodic blood counts during first year of therapy.
- Check CK level if myopathy occurs.

### Patient teaching

- Tell patient to take drug 30 minutes before breakfast and dinner.

🚨 Advise patient to immediately report signs or symptoms of anaphylaxis (such as difficulty breathing or rash) or other allergic reactions.

🚨 Instruct patient to immediately report unusual bleeding or bruising or muscle pain.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

• Stress importance of diet and exercise in lowering lipid levels.

• Inform patient that he'll undergo regular blood testing during therapy.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## gemifloxacin mesylate

Factive

**Pharmacologic class:** Quinolone

**Therapeutic class:** Broad-spectrum anti-infective

**Pregnancy risk category** C

**FDA BOXED WARNING**

- Fluoroquinolones for systemic use are associated with an increased risk of tendinitis and tendon rupture in all ages. This risk is further increased in patients usually over age 60, with concomitant use of corticosteroids, and in kidney, heart, and lung transplant recipients.

**Action**

Inhibits DNA synthesis by inhibiting DNA gyrase and topoisomerase IV, enzymes needed for bacterial growth

**Availability**

Tablets: 320 mg

**Indications and dosages**

> Acute exacerbation of chronic bronchitis caused by susceptible organisms

**Adults:** 320 mg P.O. daily for 5 days

> Mild to moderate community-acquired pneumonia caused by susceptible organisms

**Adults:** 320 mg P.O. daily for 5 days

**Dosage adjustment**

- Renal impairment

**Contraindications**

- Hypersensitivity to drug
- History of prolonged QTc interval

**Precautions**

Use cautiously in:

- epilepsy or history of seizures
- pregnant or breastfeeding patients
- children younger than age 18 (safety not established).

**Administration**

- Give at same time every day with plenty of fluids, with or without food.
- Make sure patient swallows tablet whole without chewing.
- Don't give iron, multivitamins, didanosine, sucralfate, or antacids

containing magnesium or aluminum within 3 hours of gemifloxacin.

Route	Onset	Peak	Duration
P.O.	Unknown	0.5-2 hr	Unknown

**Adverse reactions**

**CNS:** fatigue, headache, insomnia, drowsiness, nervousness, dizziness, tremor, vertigo, **seizures, loss of consciousness**

**CV:** hypotension, **prolonged QTc interval, cardiovascular collapse, shock**

**EENT:** vision abnormality, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, gastritis, gastroenteritis, flatulence, anorexia, dry mouth, **pseudomembranous colitis**

**GU:** genital candidiasis, vaginitis, **acute renal insufficiency or failure, interstitial nephritis**

**Hematologic:** eosinophilia, anemia, **leukopenia, granulocytopenia, thrombocytopenia**

**Hepatic:** jaundice, **hepatitis, acute hepatic necrosis, hepatic failure**

**Metabolic:** hyperglycemia

**Musculoskeletal:** joint, back, or muscle pain; leg cramps; tendinitis; rupture of shoulder, hand, or Achilles tendon

**Respiratory:** dyspnea, pneumonia

**Skin:** rash, urticaria, pruritus, eczema, flushing, photosensitivity, angioedema

**Other:** altered taste, hot flashes, fungal infection, hypersensitivity reaction

**Interactions**

**Drug-drug.** *Antacids containing aluminum or magnesium, didanosine, iron, multivitamins, sucralfate:* reduced gemifloxacin absorption

*Antiarrhythmics (class IA, such as quinidine and procainamide, and class III, such as amiodarone and sotalol), antipsychotics, erythromycin, tricyclic antidepressants:* increased risk of prolonged QTc interval

*Sucralfate*: decreased gemifloxacin bioavailability

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, bilirubin*: increased levels

**Drug-behaviors.** *Sun exposure*: increased risk of photosensitivity

### Patient monitoring

- Stay alert for signs and symptoms of hypersensitivity reaction and other serious adverse reactions.
- Monitor ECG in patients at risk for prolonged QTc interval.
- 📣 Watch for signs and symptoms of tendinitis or tendon rupture.

### Patient teaching

- Instruct patient to take drug at same time each day, with or without food.
- Teach patient how to recognize and report signs and symptoms of allergic response.
- Advise patient to take iron, vitamins, antacids, didanosine, or sucralfate 3 hours before or 2 hours after gemifloxacin.
- 📣 Instruct patient to stop taking drug and immediately report signs or symptoms of hypersensitivity reaction, severe diarrhea, change in urination pattern, easy bruising or bleeding, unusual tiredness, or yellowing of eyes or skin.
- 📣 Advise patient to stop taking drug and immediately report sudden severe pain in shoulder, hand, or Achilles tendon.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## gentamicin sulfate

Alcomicin<sup>✳</sup>, Cidomycin<sup>✳</sup>⚠️,  
Diogent<sup>✳</sup>, Garamycin<sup>✳</sup>, Gentacidin,  
Gentak, Gentacin<sup>⚠️</sup>, PMS-  
Gentamicin<sup>✳</sup>, Ratio-Gentamicin<sup>✳</sup>

**Pharmacologic class:** Aminoglycoside

**Therapeutic class:** Anti-infective

**Pregnancy risk category D** (parenteral), C (topical)

### FDA BOXED WARNING

- Observe patient closely for potential ototoxicity and nephrotoxicity. Safety isn't established in therapy exceeding 14 days.
- Neuromuscular blockade and respiratory paralysis have occurred after administration.
- Monitor renal function and eighth-nerve function closely, especially in patients with known or suspected renal impairment at onset of therapy, as well as those with initially normal renal function who develop signs of renal dysfunction during therapy.
- Avoid concurrent use with potent diuretics (such as furosemide and ethacrynic acid), because diuretics may cause ototoxicity. Also, I.V. diuretics may increase gentamicin toxicity by altering antibiotic serum and tissue levels.
- Avoid concurrent and sequential systemic, oral, or topical use of other neurotoxic or nephrotoxic products and other aminoglycosides. Advanced age and dehydration also may increase toxicity risk.
- Drug may harm fetus when given to pregnant women.

### Action

Destroys gram-negative bacteria by irreversibly binding to 30S subunit of

bacterial ribosomes and blocking protein synthesis, resulting in misreading of genetic code and separation of ribosomes from messenger RNA

### Availability

*Cream:* 0.1%

*Injection:* 10 mg/ml (pediatric), 40 mg/ml (adult)

*I.V. infusion (premixed in normal saline solution):* 40 mg, 60 mg, 70 mg, 80 mg, 90 mg, 100 mg, 120 mg

*Ointment:* 0.1%

*Ointment (ophthalmic):* 0.3% (base)

*Solution (ophthalmic):* 0.3% (base)

### Indications and dosages

➤ Serious infections caused by *Pseudomonas aeruginosa*, *Escherichia coli*, and *Proteus*, *Klebsiella*, *Serratia*, *Enterobacter*, *Citrobacter*, or *Staphylococcus* species

**Adults:** 3 mg/kg/day in three divided doses I.M. or I.V. infusion q 8 hours. For life-threatening infections, up to 5 mg/kg/day in three to four divided doses; reduce to 3 mg/kg/day as indicated.

**Children:** 2 to 2.5 mg/kg q 8 hours I.M. or I.V. infusion

**Infants older than 1 week:** 2.5 mg/kg q 8 hours I.M. or I.V. infusion

**Neonates younger than 1 week, preterm infants:** 2.5 mg/kg q 12 hours I.M. or I.V. infusion. In preterm infants of less than 32 weeks' gestational age, 2.5 mg/kg q 18 hours or 3 mg/kg q 24 hours also may produce satisfactory peak and trough blood levels.

➤ Endocarditis prophylaxis before surgery

**Adults:** 1.5 mg/kg I.M. or I.V. 30 minutes before surgery, to a maximum of 80 mg. As prescribed, give with ampicillin or vancomycin.

**Children:** 2 mg/kg I.M. or I.V. 30 minutes before surgery, to a maximum of 80 mg

➤ External ocular infections caused by susceptible organisms

**Adults and children:** One to two drops of ophthalmic solution in eye q 4 hours. For serious infections, up to two drops q hour, or ophthalmic ointment applied to lower conjunctival sac two to three times daily.

➤ Treatment and prevention of superficial burns caused by susceptible bacteria

**Adults and children older than age 1:** Gently rub small amount of drug topically on affected area three or four times daily.

### Dosage adjustment

- Renal impairment
- Cystic fibrosis

### Contraindications

- Hypersensitivity to drug or other aminoglycosides

### Precautions

Use cautiously in:

- neuromuscular disease, renal impairment, hearing impairment
- sulfite sensitivity (with parenteral use)
- obese patients
- elderly patients
- pregnant or breastfeeding patients
- infants, neonates, and premature infants.

### Administration

- Before starting therapy, obtain specimens as needed for culture and sensitivity testing.
- For I.V. infusion, dilute with 50 to 200 ml of dextrose 5% in water (D<sub>5</sub>W) or normal saline solution, and administer over 30 minutes to 2 hours.
- After infusion, flush line with normal saline solution or D<sub>5</sub>W.
- Obtain peak drug blood level 30 minutes after 30-minute infusion; obtain trough level within 30 minutes of next scheduled dose.
- Give cephalosporin or parenteral penicillin 1 hour before or after gentamicin, as prescribed.

- Know that for topical treatment of burns, gauze dressings may be applied.

Route	Onset	Peak	Duration
I.V.	Immediate	30-90 min	Unknown
I.M.	Unknown	30-90 min	Unknown
Topical, ophthalmic	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** dizziness, vertigo, tremors, numbness, depression, confusion, lethargy, headache, paresthesia, **neuromuscular blockade, seizures, neurotoxicity**

**EENT:** visual disturbances, dry eyes, nystagmus, photophobia, ototoxicity, hearing loss, tinnitus

**GI:** nausea, vomiting, stomatitis, increased salivation, splenomegaly, anorexia

**GU:** increased urinary casts, polyuria, dysuria, erectile dysfunction, azotemia, **nephrotoxicity**

**Hematologic:** eosinophilia, **leukemoid reaction, hemolytic anemia, aplastic anemia, neutropenia, agranulocytosis, leukopenia, thrombocytopenia, pancytopenia**

**Hepatic:** hepatomegaly, **hepatotoxicity, hepatic necrosis**

**Musculoskeletal:** joint pain, muscle twitching

**Respiratory:** **apnea**

**Skin:** exfoliative dermatitis, rash, pruritus, urticaria, purpura, alopecia

**Other:** weight loss, superinfection, pain and irritation at I.M. injection site

## Interactions

**Drug-drug.** *Acyclovir, amphotericin B, carboplatin, cephalosporins, cisplatin, loop diuretics, vancomycin, other ototoxic or nephrotoxic drugs:* increased risk of ototoxicity and nephrotoxicity  
*Dimenhydrinate, other antiemetics:* masking of ototoxicity symptoms  
*General anesthetics, neuromuscular blockers:* increased activity of these drugs  
*Indomethacin:* increased gentamicin peak and trough levels

*Penicillins (such as ampicillin, ticarcillin):* synergistic effect

*Tacrolimus:* nephrotoxicity

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, bilirubin, blood urea nitrogen (BUN), creatinine, lactate dehydrogenase:* increased values

*Granulocytes, hemoglobin, platelets, white blood cells:* decreased values

*Reticulocytes:* increased or decreased count

## Patient monitoring

- Watch for signs and symptoms of hypersensitivity reactions.

 Know that drug blood level monitoring is especially important in therapy lasting more than 5 days, acute or chronic renal impairment, extracellular fluid volume changes, obesity, infants younger than 3 months, concomitant use of nephrotoxic drugs, patients requiring higher doses or dosage interval adjustments (such as those with cystic fibrosis, endocarditis, or critical illness), and patients with signs or symptoms of nephrotoxicity or ototoxicity.

- Assess fluid intake and output, urine specific gravity, and urinalysis for signs of nephrotoxicity.

- Monitor CBC, BUN, creatinine level, and creatinine clearance.

- Weigh patient regularly.

- Assess for signs and symptoms of ototoxicity (hearing loss, tinnitus, ataxia, and vertigo).

## Patient teaching

 Teach patient to recognize and immediately report signs and symptoms of hypersensitivity reaction, infection, unusual tiredness, yellowing of skin or eyes, and muscle twitching.

- Advise patient to report signs and symptoms of ototoxicity (hearing loss, ringing in ears, vertigo).
- Instruct patient to drink plenty of fluids to ensure adequate urine output.

- Tell patient to monitor urine output and report significant changes.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## glatiramer acetate

Copaxone

**Pharmacologic class:** Immuno-modulator

**Therapeutic class:** Multiple sclerosis agent

**Pregnancy risk category B**

### Action

Unknown. Thought to alter immune processes believed to be responsible for pathogenesis of multiple sclerosis.

### Availability

**Injection:** 20 mg lyophilized glatiramer acetate and 40 mg mannitol in single-use 2-ml vial (1-ml vial of sterile water for injection included for reconstitution)

### Indications and dosages

➤ To reduce frequency of relapses in relapsing-remitting multiple sclerosis

**Adults:** 20 mg/day subcutaneously

### Contraindications

- Hypersensitivity to drug

### Precautions

Use cautiously in:

- pregnant or breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Give only by subcutaneous injection into arms, abdomen, hips, or thighs.
- Administer immediately after preparing. Discard unused portion.

Route	Onset	Peak	Duration
Subcut.	Slow	Unknown	Unknown

### Adverse reactions

**CNS:** abnormal dreams, agitation, anxiety, confusion, emotional lability, migraine, nervousness, speech disorder, stupor, tremor, weakness, vertigo  
**CV:** chest pain, hypertension, palpitations, tachycardia, peripheral edema  
**EENT:** eye disorder, nystagmus, ear pain, rhinitis

**GI:** nausea, vomiting, diarrhea, anorexia, gastroenteritis, other GI disorder, oral candidiasis, salivary gland enlargement, ulcerative stomatitis

**GU:** urinary urgency, hematuria, erectile dysfunction, amenorrhea, dysmenorrhea, menorrhagia, abnormal Papanicolaou smear, vaginal candidiasis, **vaginal hemorrhage**

**Hematologic:** ecchymosis, lymphadenopathy

**Musculoskeletal:** joint, back, or neck pain; foot drop; hypertonia

**Respiratory:** bronchitis, dyspnea, hyperventilation

**Skin:** eczema, erythema, diaphoresis, pruritus, rash, skin atrophy, skin nodules, urticaria, warts

**Other:** dental caries, facial edema, weight gain, herpes simplex, herpes zoster, cysts, chills, flulike symptoms, pain at injection site

### Interactions

None reported

### Patient monitoring

🚨 Assess for immediate postinjection reaction, including flushing, chest pain, anxiety, breathing problems, and hives.

- Watch for transient chest pain, but be aware that this problem doesn't seem to be clinically significant.
- Check for vaginal bleeding.
- Watch for signs and symptoms of infection.

### Patient teaching

- Teach patient how to prepare and self-administer drug. Supervise him the first time he does so.
- 🔊 Teach patient to recognize and immediately report signs and symptoms of postinjection reaction. Tell him this reaction may occur right away or up to several months after first dose.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- 🔊 Instruct patient to report signs or symptoms of infection or vaginal hemorrhage.
- Provide dietary counseling. Refer patient to dietitian if adverse GI effects significantly affect food intake.
- As appropriate, review all other significant and life-threatening adverse reactions.

## glimepiride

Amaryl, Apo-Glimepiride<sup>✳</sup>, CO Glimepiride<sup>✳</sup>, Novo-Glimepiride<sup>✳</sup>, PMS-Glimepiride<sup>✳</sup>, Ratio-Glimepiride<sup>✳</sup>, Sandoz Glimepiride<sup>✳</sup>

**Pharmacologic class:** Sulfonylurea

**Therapeutic class:** Hypoglycemic

**Pregnancy risk category** C

### Action

Lowers blood glucose level by stimulating insulin release from pancreas, increasing insulin sensitivity at receptor sites, and decreasing hepatic

glucose production. Also increases peripheral tissue sensitivity to insulin and causes mild diuresis.

### Availability

Tablets: 1 mg, 2 mg, 4 mg

### Indications and dosages

➤ Adjunct to diet and exercise to lower blood glucose level in type 2 (non-insulin-dependent) diabetes mellitus

**Adults:** Initially, 1 to 2 mg P.O. daily given with first main meal; usual maintenance dosage is 1 to 4 mg P.O. daily. When patient reaches 2 mg/day, increase no more than 2 mg q 1 to 2 weeks, depending on glycemic control. Maximum dosage is 8 mg/day.

### Dosage adjustment

- Renal or hepatic impairment
- Adrenal or pituitary insufficiency

### Contraindications

- Hypersensitivity to drug
- Diabetic coma or ketoacidosis
- Severe renal, hepatic, or endocrine disease
- Pregnancy or breastfeeding

### Precautions

Use cautiously in:

- mild to moderate hepatic or renal disease; cardiovascular disease; impaired thyroid, pituitary, or adrenal function
- elderly patients.

### Administration

- Check baseline creatinine level for normal renal function before giving first dose.
- Give with first meal of day.

Route	Onset	Peak	Duration
P.O.	1 hr	2-3 hr	>24 hr

**Adverse reactions**

**CNS:** dizziness, drowsiness, headache, weakness

**CV: increased CV mortality risk**

**EENT:** blurred vision

**GI:** nausea, vomiting, diarrhea, constipation, cramps, heartburn, epigastric distress, anorexia

**Hematologic:** aplastic anemia, leukopenia, pancytopenia, thrombocytopenia, agranulocytosis

**Hepatic:** cholestatic jaundice, hepatitis

**Metabolic:** hyponatremia, hypoglycemia

**Skin:** rash, erythema, maculopapular eruptions, urticaria, eczema, angioedema, photosensitivity

**Other:** increased appetite

**Interactions**

**Drug-drug.** *Androgens (such as testosterone), chloramphenicol, clofibrate, guanethidine, MAO inhibitors, nonsteroidal anti-inflammatory drugs (except diclofenac), salicylates, sulfonamides, tricyclic antidepressants:* increased risk of hypoglycemia

*Beta-adrenergic blockers:* altered response to glimepiride, necessitating dosage change; prolonged hypoglycemia (with nonselective agents)

*Calcium channel blockers, corticosteroids, estrogens, hydantoin, hormonal contraceptives, isoniazid, nicotinic acid, phenothiazines, phenytoin, rifampin, sympathomimetics, thiazide diuretics, thyroid preparations:* decreased hypoglycemic effect of glimepiride

*Warfarin:* initially increased, then decreased, effects of both drugs

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, cholesterol, liver function tests:* increased values

*Glucose, granulocytes, hemoglobin, platelets, white blood cells:* decreased values

**Drug-herbs.** *Agoral marshmallow, aloe (oral), bitter melon, burdock, chromium,*

*coenzyme Q10, dandelion, eucalyptus, fenugreek:* additive hypoglycemic effects

*Glucosamine:* impaired glyceemic control

**Drug-behaviors.** *Alcohol use:* disulfiram-like reaction

*Sun exposure:* increased risk of photosensitivity

**Patient monitoring**

- Monitor CBC with white cell differential, electrolyte levels, and blood chemistry results.
- Monitor blood glucose level regularly. Assess glycosylated hemoglobin level every 3 to 6 months.
- Evaluate kidney and liver function test results frequently, especially in patients with impairments.
- Assess neurologic status. Report cognitive or sensory impairment.

**Patient teaching**

- Instruct patient to self-monitor his blood glucose level as prescribed.
- Teach patient how to recognize signs and symptoms of hypoglycemia and hyperglycemia.
- Stress importance of diet and exercise to help control diabetes.
- Instruct patient to wear or carry medical identification describing his condition.
- Advise patient to keep sugar source readily available at all times in case of hypoglycemia.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Tell patient he will undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## golimumab

Simponi

**Pharmacologic class:** Tumor necrosis factor (TNF) blocker

**Therapeutic class:** Immunomodulator

**Pregnancy risk category B**

### FDA BOXED WARNING

- Serious infections leading to hospitalization or death, including tuberculosis (TB), bacterial sepsis, invasive fungal (such as histoplasmosis), and other opportunistic infections have occurred in patients receiving golimumab.
- Discontinue drug if patient develops a serious infection or sepsis.
- Perform test for latent TB and, if positive, start treatment for TB before starting golimumab.
- Monitor all patients for active TB during treatment, even if initial latent TB test is negative.
- Lymphoma and other malignancies, some fatal, have been reported in children and adolescents treated with TNF blockers, of which this drug is a member.

### Action

A human monoclonal antibody that binds to both the soluble and transmembrane bioactive forms of human TNF. This interaction prevents binding of TNF to its receptors, thereby inhibiting biological activity of TNF $\alpha$  (a cytokine protein). Elevated TNF levels in blood, synovium, and joints have been implicated in the pathophysiology of several chronic inflammatory diseases, such as rheumatoid arthritis, psoriatic arthritis, and ankylosing spondylitis. TNF is an important mediator of articular inflammation characteristic of these diseases.

### Availability

Injection: 50 mg/0.5 ml in single-dose prefilled SmartJect® Autoinjector; 50 mg/0.5 ml in single-dose prefilled syringe

### Indications and dosages

➤ Moderate to severe rheumatoid arthritis (with methotrexate); psoriatic arthritis, ankylosing spondylitis (with or without methotrexate or other nonbiological disease-modifying antirheumatics)

**Adults:** 50 mg subcutaneously monthly

### Contraindications

None

### Precautions

Use cautiously in:

- hypersensitivity reactions
- congestive heart failure (CHF)
- patients at risk for infection
- chronic hepatitis B virus (HBV) carriers
- central or peripheral nervous system demyelinating disorders
- cytopenia, including pancytopenia, leukopenia, neutropenia, aplastic anemia, and thrombocytopenia
- concurrent use of abatacept or anakinra (use not recommended)
- concurrent use of immunosuppressants, such as corticosteroids or methotrexate
- concurrent use of live vaccines (don't use)
- patients switching from other disease-modifying antirheumatics
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

### Administration

⚠ Be aware that patients with active infections shouldn't start treatment with golimumab. Also, consider risks and benefits of starting golimumab in

patients with chronic or recurrent infection, in those who have been exposed to TB, in those with a history of opportunistic infection, in those who have resided or traveled in areas of endemic TB or endemic mycoses (such as histoplasmosis, coccidioidomycosis, or blastomycosis), and in patients with underlying conditions that may predispose to infection. Be aware that when switching from one biological agent to another, overlapping biological activity may further increase risk of infection. Discontinue drug if patients develop other serious infections or sepsis.

 Test for HBV infection before initiating TNF-blocker therapy. Discontinue drug in patients who develop HBV reactivation and initiate effective antiviral therapy with appropriate supportive treatment. Know that safety of resuming TNF-blocker therapy after HBV reactivation has been controlled isn't known; therefore, exercise caution when considering resumption of therapy.

- Before starting treatment, evaluate patient for TB risk factors and test for latent infection. Consider induration of 5 mm or greater with tuberculin skin testing a positive test when assessing if treatment for latent TB is needed, even for patient who has previously received bacille Calmette-Guérin vaccine. Treatment of latent TB infection before therapy with TNF blockers has been shown to reduce risk of TB reactivation during therapy.
- Consider anti-TB therapy before starting golimumab in patients with history of latent or active TB in whom adequate course of treatment can't be confirmed and in patients with negative test for latent TB but with risk factors for TB infection.

 Consider discontinuing drug if central or peripheral nervous system demyelinating disorders develop.

 Immediately discontinue drug if severe hypersensitivity reactions occur and initiate appropriate therapy.

Route	Onset	Peak	Duration
Sub-cutaneous	Unknown	2-6 days	Unknown

### Adverse reactions

**CNS:** dizziness, paresthesia, **central or peripheral nervous system demyelinating disorders**

**CV:** hypertension, CHF

**EENT:** nasopharyngitis, pharyngitis, laryngitis, rhinitis, sinusitis

**GI:** constipation

**Hematologic:** pancytopenia, leukopenia, neutropenia, aplastic anemia, thrombocytopenia

**Hepatic:** hepatic dysfunction, **acute hepatic failure**

**Respiratory:** upper respiratory tract infection, bronchitis

**Skin:** urticaria, bruising, pruritus, irritation, induration

**Other:** injection-site reactions, viral infections, superficial fungal infections, pain, **serious infections, malignancies**, hypersensitivity reactions including **anaphylaxis**

### Interactions

**Drug-drug.** *Abatacept*, *anakinra*:

increased risk of serious infection

*Anakinra*: increased risk of neutropenia and serious infection

*CYP450 substrates*: possible altered golimumab level due to antagonized TNF $\alpha$  activity

*Live vaccines*: increased risk of infection

**Drug-diagnostic tests.** *ALT*, *AST*: increased levels

### Patient monitoring

- Monitor CBC with differential and hepatic function tests closely.
- Continue to watch for signs and symptoms of TB and test for latent TB periodically during therapy. Strongly

consider TB in patients who develop new infection during treatment, especially in those who have previously or recently traveled to countries with high prevalence of TB or who have had close contact with a person with active TB.

- Closely observe for signs and symptoms of infection during and after treatment. Know that patients who develop new infection during treatment should be closely monitored, undergo prompt and complete diagnostic workup appropriate for immunocompromised patients, and be given appropriate antimicrobial therapy.
- Observe for signs and symptoms of malignancies. Be aware that lymphomas, including Hodgkin's and non-Hodgkin's lymphoma, and leukemia have been reported.
- 🔊 Closely monitor patients with CHF during therapy. Discontinue drug if new or worsening CHF signs and symptoms develop.
- Closely monitor patients who are carriers of HBV and require treatment with golimumab for clinical and laboratory signs of active HBV infection throughout therapy and for several months after treatment ends.
- Continue to monitor patients for hypersensitivity reactions.
- 🔊 Observe for signs and symptoms (although rare) of new-onset or exacerbation of CNS demyelinating diseases, including multiple sclerosis, and of peripheral demyelinating diseases, including Guillain-Barré syndrome.

### Patient teaching

- Instruct patient who may self-inject on proper use of prefilled syringe, suitable sites for injection (including thigh and abdomen), rotation of sites, appropriate handling and disposal of syringe, and discarding unused portions of drug remaining in syringe.

- Advise latex-sensitive patient that needle cover on prefilled syringe and prefilled syringe in prefilled SmartJect Autoinjector contain dry natural rubber (a latex derivative).

🔊 Advise patient to seek immediate medical attention if signs and symptoms of severe allergic reactions occur.

🔊 Advise patient to promptly report new or worsening medical conditions (such as heart disease, neurological disease, or autoimmune disorders) and to promptly report signs and symptoms suggestive of cytopenia (such as bruising, bleeding, or persistent fever).

- Inform patient that drug may lower ability of immune system to fight infection and of importance of informing prescriber about new or previous infections, including TB and reactivation of HBV infection.
- Counsel patient about possible risk of lymphoma and other malignancies during therapy.
- Tell patient to avoid live vaccines during golimumab therapy.
- Advise breastfeeding patient that she should decide whether to discontinue breastfeeding or discontinue drug, taking into account importance of drug for her treatment.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

09

## glipizide

Glibenese<sup>®</sup>, Glucotrol, Glucotrol XL, Minodiab<sup>®</sup>

**Pharmacologic class:** Sulfonylurea

**Therapeutic class:** Hypoglycemic

**Pregnancy risk category** C

**Action**

Lowers blood glucose level by stimulating insulin release from pancreas, increasing insulin sensitivity at receptor sites, and decreasing hepatic glucose production. Also increases peripheral tissue sensitivity to insulin and causes mild diuresis.

**Availability**

Tablets: 5 mg, 10 mg

Tablets (extended-release): 5 mg, 10 mg

**Indications and dosages**

➤ To control blood glucose in type 2 (non-insulin-dependent) diabetes mellitus in patients who have some pancreatic function and don't respond to diet therapy

**Adults:** 5 mg/day P.O. initially, increased as needed after several days (range is 2.5 to 40 mg/day). Give extended-release tablet once daily; maximum dosage is 20 mg/day. Give daily dosage above 15 mg in two divided doses.

➤ Conversion from insulin therapy  
**Adults:** With insulin dosage above 20 units/day, start with usual glipizide dosage and reduce insulin dosage by 50%. With insulin dosage of 20 units/day or less, insulin may be discontinued when glipizide therapy starts.

**Dosage adjustment**

- Hepatic or renal impairment
- Elderly patients

**Contraindications**

- Hypersensitivity to drug
- Severe renal, hepatic, thyroid, or other endocrine disease
- Uncontrolled infection, serious burns, or trauma
- Diabetic ketoacidosis
- Pregnancy or breastfeeding

**Precautions**

Use cautiously in:

- mild to moderate hepatic, renal, or

cardiovascular disease; impaired thyroid, pituitary, or adrenal function

- elderly patients.

**Administration**

- Check baseline creatinine level for normal renal function before giving first dose.
- Give daily dose (extended-release) at breakfast.
- Administer immediate-release tablets 30 minutes before a meal (preferably breakfast). If patient takes two daily doses, give second dose before dinner.

Route	Onset	Peak	Duration
P.O.	15-30 min	1-2 hr	Up to 24 hr

**Adverse reactions**

**CNS:** dizziness, drowsiness, headache, weakness

**CV: increased CV mortality risk**

**EENT:** blurred vision

**GI:** nausea, vomiting, diarrhea, constipation, cramps, heartburn, epigastric distress, anorexia

**Hematologic:** aplastic anemia, agranulocytosis, leukopenia, pancytopenia, thrombocytopenia

**Hepatic:** cholestatic jaundice, hepatitis

**Metabolic:** hyponatremia, hypoglycemia

**Skin:** rash, pruritus, erythema, urticaria, eczema, angioedema, photosensitivity

**Other:** increased appetite

**Interactions**

**Drug-drug.** *Androgens (such as testosterone), chloramphenicol, clofibrate,*

*guanethidine, MAO inhibitors, non-*

*steroidal anti-inflammatory drugs*

*(except diclofenac), salicylates, sulfon-*

*amides, tricyclic antidepressants:*

increased risk of hypoglycemia

*Beta-adrenergic blockers:* altered

response to glipizide, requiring dosage

change; prolonged hypoglycemia (with

nonselective beta blockers)

*Calcium channel blockers, corticosteroids, estrogens, hydantoin, hormonal contraceptives, isoniazid, nicotinic acid, phenothiazines, phenytoin, rifampin, sympathomimetics, thiazide diuretics, thyroid preparations:* decreased hypoglycemic effect

*Warfarin:* initially increased, then decreased, effects of both drugs

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, cholesterol:* increased values

*Glucose, granulocytes, hemoglobin, platelets, white blood cells:* decreased values

**Drug-herbs.** *Aloe (oral), bitter melon, burdock, chromium, coenzyme Q10, dandelion, eucalyptus, fenugreek:* additive hypoglycemic effects

*Glucosamine:* impaired glycemic control

**Drug-behaviors.** *Alcohol use:* disulfiram-like reaction

### Patient monitoring

- Monitor blood glucose level, especially during periods of increased stress.
- Evaluate CBC and renal function tests.
- If patient is ill or has abnormal laboratory values, monitor electrolyte, ketone, glucose, pH, lactate dehydrogenase, and pyruvate levels.
- Monitor cardiovascular status.

### Patient teaching

- Advise patient to take daily dose of extended-release tablets with breakfast or immediate-release tablet 30 minutes before breakfast (and second dose, if prescribed, before dinner).
- Advise patient to monitor blood glucose level as instructed by prescriber.
- Tell patient he may need supplemental insulin during times of stress or when he can't maintain adequate oral intake.

- Teach patient how to recognize signs and symptoms of hypoglycemia and hyperglycemia.
- Stress importance of diet and exercise to help control diabetes.
- Instruct patient to wear or carry medical identification describing his condition.
- Advise patient to keep sugar source at hand at all times in case of hypoglycemia.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Tell patient he'll undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## glucagon

GlucaGen

**Pharmacologic class:** Antihypoglycemic

**Therapeutic class:** Insulin antagonist

**Pregnancy risk category B**

### Action

Increases blood glucose concentration by converting glycogen in liver to glucose. Also relaxes GI smooth muscle.

### Availability

*Powder for injection:* 1-mg vials

### Indications and dosages

➤ Severe hypoglycemia

**Adults and children weighing more than 20 kg (44 lb):** 1 mg subcutaneously, I.M., or I.V.

**Children weighing 20 kg (44 lb) or less:** 20 to 30 mcg/kg or 0.5-mg dose subcutaneously, I.M., or I.V.

➤ Diagnostic aid for radiologic examination

**Adults:** 0.25 to 2 mg I.V. or 1 to 2 mg I.M. before radiologic procedure

### Contraindications

- Hypersensitivity to drug
- Pheochromocytoma

### Precautions

Use cautiously in:

- cardiac disease, adrenal insufficiency, chronic hypoglycemia
- history suggesting insulinoma or pheochromocytoma
- elderly patients
- pregnant or breastfeeding patients.

### Administration

⚠ Use only in hypoglycemic emergencies for patients with diabetes mellitus.

- Mix drug in 1-mg vial with 1 ml of diluent supplied by manufacturer.
- For I.V. injection, give 1 mg over 1 minute.
- Use drug immediately after preparing; discard unused portion.
- ⚠ Patient should respond within 15 minutes. Because of potential serious adverse reactions linked to prolonged cerebral hypoglycemia, give I.V. glucose if patient fails to respond to glucagon.
- Give patient carbohydrate-rich foods as soon as he's alert.
- Dilute diagnostic aid doses above 2 mg with sterile water for injection.

Route	Onset	Peak	Duration
I.V.	Immediate	30 min	60-90 min
I.M., subcut.	4-10 min	Unknown	12-32 min

### Adverse reactions

**CV:** hypotension

**GI:** nausea, vomiting

**Metabolic:** hypokalemia (with overdose)

**Respiratory:** bronchospasm, respiratory distress

**Skin:** urticaria, rash

### Interactions

**Drug-drug.** *Anticoagulants:* enhanced anticoagulant effect

**Drug-diagnostic tests.** *Potassium:* decreased level

### Patient monitoring

- Monitor blood glucose level.
- Monitor patient for aspiration.
- Assess blood pressure, electrolyte levels, and respiratory status.

### Patient teaching

- Teach patient and family members the proper technique and timing for using this emergency drug.
- ⚠ Emphasize importance of contacting prescriber right away if hypoglycemic emergency occurs.
- ⚠ Tell caregiver or family member to arouse patient immediately and give additional carbohydrate by mouth as soon as patient can tolerate it.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## glyburide (glibenclamide) ⚠

Apo-Glyburide\*, Daonil⚠, DiaBeta, Dom-Glyburide\*, Euglucon\*, Gen-Glybe\*, Glynase PresTab, Micronase, Novo-Glyburide\*, Nu-Glyburide\*, PMS-Glyburide\*, Ratio-Glyburide\*, Riva-Glyburide\*, Sandoz Glyburide\*, Semi-Daonil⚠

**Pharmacologic class:** Sulfonylurea

**Therapeutic class:** Hypoglycemic

**Pregnancy risk category B**

## Action

Increases insulin binding and sensitivity at receptor sites, stimulating insulin release from beta cells in pancreas and reducing blood glucose level. Also decreases production of basal glucose in liver, enhances sensitivity of peripheral tissue to insulin, inhibits platelet aggregation, and causes mild diuresis.

## Availability

Tablets: 1.25 mg, 2.5 mg, 5 mg

Tablets (micronized): 1.5 mg, 3 mg, 6 mg

## Indications and dosages

➤ To control blood glucose in type 2 (non-insulin-dependent) diabetes mellitus in patients who have some pancreatic function and don't respond to diet therapy

**Adults:** Initially, 2.5 to 5 mg (regular tablets) P.O. daily; range is 1.25 to 20 mg/day as a single dose or in divided doses. Or initially, 1.5 to 3 mg (micronized tablets) P.O. daily, with range of 0.75 to 12 mg/day; give dosages above 6 mg in two divided doses.

➤ Conversion from insulin therapy

**Adults:** If patient takes less than 20 units of insulin daily, give 2.5 to 5 mg glyburide daily; with insulin dosage of 20 to 40 units/day, give 5 mg glyburide; with insulin dosage above 40 units/day, give 5 mg glyburide daily or 3 mg (micronized tablets) P.O. daily and reduce insulin dosage by 50%.

## Dosage adjustment

- Hepatic or renal failure
- Elderly patients

## Contraindications

- Hypersensitivity to drug
- Type 1 (insulin-dependent) diabetes
- Severe renal, hepatic, thyroid or other endocrine disease
- Pregnancy or breastfeeding

## Precautions

Use cautiously in:

- mild to moderate hepatic, renal, or cardiovascular disease; impaired thyroid, pituitary, or adrenal function
- infection, stress, or dietary changes
- elderly patients.

## Administration

🔊 Know that micronized glyburide is not bioequivalent to regular glyburide.

- Check baseline creatinine level for normal renal function before giving first dose.
- Give daily dose at breakfast; for patient receiving drug b.i.d., give second dose at dinner.
- Adjust dosage slowly if patient is taking metformin.

Route	Onset	Peak	Duration
P.O.	45-60 min	1.5-3 hr	24 hr

## Adverse reactions

**CNS:** dizziness, drowsiness, headache, weakness

**CV: increased CV mortality risk**

**EENT:** visual accommodation changes, blurred vision

**GI:** nausea, vomiting, diarrhea, constipation, cramps, heartburn, epigastric distress, anorexia

**Hematologic: aplastic anemia, leukopenia, thrombocytopenia, agranulocytosis, pancytopenia**

**Hepatic:** cholestatic jaundice, hepatitis

**Metabolic:** hyponatremia, hypoglycemia

**Skin:** rash, pruritus, urticaria, eczema, erythema, photosensitivity, angioedema

**Other:** increased appetite

## Interactions

**Drug-drug.** *Androgens (such as testosterone), chloramphenicol, clofibrate, guanethidine, MAO inhibitors, non-steroidal anti-inflammatory drugs (except diclofenac), salicylates,*

*sulfonamides, tricyclic antidepressants:* increased risk of hypoglycemia

*Beta-adrenergic blockers:* altered response to glyburide, requiring increased or decreased dosage; prolonged hypoglycemia (with nonselective agents)

*Calcium channel blockers, corticosteroids, estrogens, hydantoin, hormonal contraceptives, isoniazid, nicotinic acid, phenothiazines, phenytoin, rifampin, sympathomimetics, thiazide diuretics, thyroid preparations:* decreased hypoglycemic effect of glyburide

*Warfarin:* initially increased, then decreased, effects of both drugs

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, cholesterol:* increased values

*Glucose, granulocytes, hemoglobin, platelets, white blood cells:* decreased values

**Drug-herbs.** *Agoral marshmallow, aloe (oral), bitter melon, burdock, chromium, coenzyme Q10, dandelion, eucalyptus, fenugreek:* increased hypoglycemic effect  
*Glucosamine:* impaired glycemic control

**Drug-behaviors.** *Alcohol use:* disulfiram-like reaction

### Patient monitoring

- Monitor blood glucose level, especially during periods of increased stress.
- Monitor CBC and renal function test results.
- If patient is ill or has abnormal laboratory findings, monitor electrolyte, ketone, glucose, pH, lactate dehydrogenase, and pyruvate levels.
- Evaluate cardiovascular status.

### Patient teaching

- Advise patient to take daily dose with breakfast (and second dose, if prescribed, with dinner).

- Teach patient how to self-monitor his glucose level as prescribed; tell him to report significant changes.

- Inform patient that he may need supplemental insulin during times of stress or when he can't maintain adequate oral intake.

- Teach patient how to recognize signs and symptoms of hypoglycemia and hyperglycemia.

- Instruct patient to keep sugar source available at all times.

- Encourage patient to drink plenty of fluids.

- Stress importance of diet and exercise in helping to control diabetes.

- Advise patient to wear or carry medical identification stating he has diabetes.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- Tell patient he'll undergo regular blood testing during therapy.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## glycopyrrolate (glycopyrronium ⚠)

Robinul, Robinul Forte

**Pharmacologic class:** Anticholinergic

**Therapeutic class:** Antispasmodic, antimuscarinic, parasympatholytic

**Pregnancy risk category B**

### Action

Inhibits action of acetylcholine on muscarinic receptors that mediate effects of parasympathetic postganglionic impulses. This inhibition relaxes cardiac smooth muscle, inhibits

vagal reflexes, and decreases tracheal and bronchial secretions.

### Availability

*Injection:* 0.2 mg/ml

*Tablets:* 1 mg, 2 mg

### Indications and dosages

➤ Adjunct in peptic ulcer disorders

**Adults:** 1 mg P.O. t.i.d. or 2 mg (Forte) two to three times daily, to a maximum of 8 mg/day; or 0.1 to 0.2 mg I.M. or I.V. three or four times daily

➤ To diminish secretions and block cardiac vagal reflexes before surgery

**Adults and children ages 2 and older:** 0.0044 mg/kg I.M. 30 to 60 minutes before anesthesia

**Children ages 1 month to 2 years:** 0.0088 mg/kg I.M. 30 to 60 minutes before anesthesia

➤ To diminish secretions and block cardiac vagal reflexes during surgery

**Adults:** 0.1 mg I.V. May repeat as needed at 2- to 3-minute intervals.

**Children:** 0.004 mg/kg I.V., not to exceed 0.1 mg as a single dose. May repeat at 2- to 3-minute intervals.

➤ To diminish or block cholinergic effects caused by anticholinesterase

**Adults and children:** 0.2 mg I.V. for each 1 mg neostigmine or 5 mg pyridostigmine. May give I.V. undiluted or with dextrose injection by infusion.

### Off-label uses

- Sweating

### Contraindications

- Hypersensitivity to drug
- Arrhythmias
- Chronic obstructive pulmonary disease
- GI disease, infection, atony or ileus
- Myasthenia gravis
- Glaucoma
- Obstructive uropathy
- Severe prostatic hypertrophy

### Precautions

Use cautiously in:

- cardiovascular disease, heart failure, hypertension, renal or hepatic disease, Down syndrome, hyperthyroidism, hiatal hernia, ulcerative colitis, mild to moderate prostatic hypertrophy, autonomic neuropathy, spasticity, suspected brain damage
- pregnant or breastfeeding patients.

### Administration

• Give oral dose 30 to 60 minutes before meals.

• For I.V. injection, give either undiluted or diluted with dextrose 5% or 10% in water or saline solution. Give each 0.2 mg over 1 to 2 minutes.

⚠ Keep resuscitation equipment on hand to treat curare-like effects of overdose.

Route	Onset	Peak	Duration
P.O.	Unknown	Unknown	8-12 hr
I.V.	1 min	Unknown	3-7 hr
I.M., subcut.	15-30 min	30-45 min	3-7 hr

### Adverse reactions

**CNS:** weakness, nervousness, insomnia, drowsiness, dizziness, headache, confusion, excitement

**CV:** palpitations, tachycardia

**EENT:** blurred vision, photophobia, mydriasis, increased intraocular pressure, cycloplegia

**GI:** nausea, vomiting, constipation, abdominal distention, epigastric distress, heartburn, gastroesophageal reflux, dry mouth, **paralytic ileus**

**GU:** urinary hesitancy or retention, lactation suppression, erectile dysfunction

**Skin:** urticaria, decreased sweating or anhidrosis

**Other:** loss of taste, fever, allergic reaction, irritation at I.M. injection site, **anaphylaxis, malignant hyperthermia**

## Interactions

**Drug-drug.** *Amantadine, antihistamines, antiparkinsonian drugs, disopyramide, glutethimide, meperidine, phenothiazines, procainamide, quinidine, tricyclic antidepressants:* additive anticholinergic effects

## Patient monitoring

- ☞ Check for signs and symptoms of anaphylaxis and malignant hyperthermia.
- Monitor neurologic and cardiovascular status.
- ☞ Assess for curare-like effects (neuromuscular blockade leading to muscle weakness and possible paralysis), which indicate overdose.
- Assess fluid intake and output. Have patient void before each dose to avoid urinary retention.

## Patient teaching

- Advise patient to take oral dose 30 to 60 minutes before meals.
- ☞ Tell patient to immediately report signs and symptoms of serious adverse effects, especially anaphylaxis.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, vision, and alertness.
- Tell patient to minimize GI upset by eating frequent, small servings of food and drinking adequate fluids.
- Advise patient to report urinary hesitancy or retention.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## goserelin acetate

Zoladex, Zoladex LA<sup>☞</sup>, Zoladex 3-Month

**Pharmacologic class:** Gonadotropin-releasing hormone (GnRH) analog

**Therapeutic class:** Antineoplastic, hormone

**Pregnancy risk category D** (breast cancer), **X** (endometriosis)

## Action

Synthetic form of luteinizing hormone-releasing hormone (LHRH); inhibits gonadotropin production by acting directly on pituitary gland. Enhances release of luteinizing hormone (LH), follicle-stimulating hormone (FSH), and testosterone, lowering testosterone and estradiol levels.

## Availability

**Implant:** 3.6 mg, 10.8 mg (in preloaded syringes)

## Indications and dosages

➤ Palliative treatment of advanced prostate cancer

**Adults:** 3.6 mg subcutaneously q 4 weeks or 10.8 mg subcutaneously q 12 weeks into upper abdominal wall

➤ Adjunct to radiation therapy and flutamide in stage B2-C prostate cancer

**Adults:** 3.6 mg subcutaneously q 4 weeks starting on day 1 of radiation or during last week of radiation. Alternatively, 3.6 mg subcutaneously 8 weeks before radiation, then 10.8 mg on day 28 or 3.6 mg at 4-week intervals starting 8 weeks before radiation, for a total of four doses (two depots before and two during radiation therapy).

➤ Palliative treatment of advanced breast cancer in pre- and perimenopausal women

**Adults:** 3.6 mg subcutaneously q 4 weeks. If serum estradiol doesn't fall to postmenopausal levels, may increase to 7.2 mg q 4 weeks.

➤ Endometriosis

**Adults ages 18 and older:** 3.6 mg subcutaneously q 4 weeks, continued for 6 months

➤ Endometrial thinning before ablation for dysfunctional uterine bleeding

**Adults:** 3.6 mg subcutaneously 4 weeks before surgery. Alternatively, initial 3.6-mg dose may be followed 4 weeks later by a second 3.6-mg dose, with surgery 2 to 4 weeks after second dose.

### Contraindications

- Hypersensitivity to drug or its components or to GnRH, GnRH agonist analogs
- Pregnant patients

### Precautions

Use cautiously in:

- risk factors for osteoporosis
- chronic alcohol or tobacco use
- patients receiving drugs that affect bone density
- hyperglycemia, cardiovascular risk factors
- breastfeeding patients
- children younger than age 18 (safety not established).

### Administration

- Administer pretreatment pregnancy test to female of childbearing age.
- Know that drug should be given only by a clinician experienced in its use.
- Implant is placed subcutaneously into upper abdominal wall using aseptic technique. Give local anesthetic and stretch skin with one hand. Insert needle into subcutaneous fat, then change needle angle until it parallels abdominal wall. Push needle in until hub touches patient's skin, and withdraw about 1 ml before depressing plunger all the way.

- Don't aspirate after inserting needle. Blood will be visible in syringe if needle enters blood vessel.

⚠ Don't give by I.V. route.

- Be aware that 10.8-mg implant should not be used in women.
- Be aware that if implant must be removed, it can be located by ultrasound.

Route	Onset	Peak	Duration
Subcut.	Unknown	2-4 wk	End of therapy

### Adverse reactions

**CNS:** headache, anxiety, depression, dizziness, fatigue, insomnia, lethargy, pain, emotional lability, weakness, **cerebrovascular accident, spinal cord compression**

**CV:** vasodilation, chest pain, hypertension, palpitations, peripheral edema, **myocardial infarction, arrhythmias, sudden cardiac death**

**EENT:** blurred vision

**GI:** nausea, vomiting, diarrhea, constipation, ulcer, anorexia

**GU:** urinary obstruction, lower urinary tract symptoms, breast swelling or tenderness, vaginitis, amenorrhea, infertility, decreased libido, erectile dysfunction, other sexual dysfunction, decreased testicular size, **renal insufficiency**

**Hematologic:** anemia

**Musculoskeletal:** increased bone pain, joint pain, decreased bone density

**Metabolic:** gout, hyperglycemia, hypercalcemia

**Respiratory:** dyspnea, chronic obstructive pulmonary disease, upper respiratory tract infection

**Skin:** rash, acne, diaphoresis, seborrhea

**Other:** hirsutism, chills, fever, hot flashes, infection, weight gain, **tumor flare phenomenon, hypersensitivity, antibody formation, acute anaphylactic reactions**

## Interactions

**Drug-diagnostic tests.** *Calcium, glucose, high- and low-density lipoproteins, triglycerides:* increased levels  
*FSH, LH:* initially increased, then decreased, levels

## Patient monitoring

- Assess menstrual symptoms and watch for breakthrough bleeding.
- 🔊 Monitor neurologic status. Watch closely for signs and symptoms of cerebrovascular accident.
- 🔊 Closely monitor cardiovascular and respiratory status.
- Monitor blood glucose and glycosylated hemoglobin periodically.

## Patient teaching

- Advise female patient to avoid pregnancy and to use a nonhormonal contraceptive method.
- Instruct patient to call prescriber if menstrual bleeding persists or breakthrough bleeding occurs.
- Inform patient that menstruation may be delayed after therapy ends.
- 🔊 Instruct patient to recognize and immediately report signs and symptoms of hyperglycemia, and cardiovascular or neurological adverse reactions.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## granisetron hydrochloride

Granisol, Kytril, Sancuso

**Pharmacologic class:** 5-hydroxytryptamine<sub>3</sub> antagonist

**Therapeutic class:** Antiemetic

**Pregnancy risk category B**

## Action

Binds to serotonin receptors in chemoreceptor trigger zone and vagal nerve terminals, blocking serotonin release and controlling nausea and vomiting

## Availability

*Injection:* 1 mg/ml

*Oral solution:* 2 mg/10 ml in 30-ml bottles

*Tablets:* 1 mg

*Transdermal system (patch):* 52-cm<sup>2</sup> patch (containing 34.3 mg granisetron delivering 3.1 mg/24 hours)

## Indications and dosages

➤ To prevent nausea and vomiting caused by chemotherapy

**Adults and children ages 2 to 16:** For I.V. use, 10 mcg/kg I.V. within 30 minutes before chemotherapy. For P.O. use (adults only), 1 mg P.O. b.i.d., with first dose given at least 1 hour before chemotherapy and second dose given 12 hours later on days when chemotherapy is administered; or 2 mg P.O. daily at least 1 hour before chemotherapy. For transdermal use (adults only), apply patch for up to 7 days.

➤ To prevent nausea and vomiting caused by radiation therapy

**Adults:** 2 mg P.O. daily within 1 hour of radiation therapy

➤ Acute postoperative nausea and vomiting

**Adults:** 1 mg I.V. undiluted, administered over 30 seconds

## Contraindications

- Hypersensitivity to drug

## Precautions

Use cautiously in:

- pregnant or breastfeeding patients
- children younger than age 18 (safety of P.O. and transdermal use not established)

- children younger than age 2 (safety of I.V. use not established).

### Administration

- For I.V. infusion, dilute with 20 to 50 ml of normal saline solution or dextrose 5% in water.
- Infuse I.V. over 5 minutes, starting 30 minutes before chemotherapy.
- For direct I.V. injection, give undiluted over 30 seconds.
- Don't mix I.V. form with other drugs.
- For P.O. use, give first dose 1 hour before chemotherapy and second dose 12 hours after first.
- Apply a single transdermal patch to upper outer arm for 24 to 48 hours before chemotherapy.
- Remove patch a minimum of 24 hours after chemotherapy completion. Patch may be worn up to 7 days depending on duration of chemotherapy.

Route	Onset	Peak	Duration
P.O.	Rapid	1 hr	24 hr
I.V.	Rapid	30 min	Up to 24 hr
Transdermal	Unknown	48 hr	Unknown

### Adverse reactions

**CNS:** headache, anxiety, stimulation, weakness, drowsiness, dizziness

**CV:** hypertension

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain

**Hematologic:** anemia, **leukopenia**, **thrombocytopenia**

**Skin:** alopecia, application site reactions (patch)

**Other:** altered taste, decreased appetite, fever, chills, shivering

### Interactions

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase:* increased levels

*Electrolytes:* altered levels

*Hemoglobin, platelets, white blood cells:* decreased levels

**Drug-herbs.** *Horehound:* enhanced serotonergic effects

### Patient monitoring

- Monitor hepatic enzyme levels and CBC with white cell differential.
- Monitor temperature and blood pressure. Have patient use caution when ambulating, to avoid orthostatic hypotension.
- Know that patch may be degraded by direct exposure to natural or artificial sunlight.

### Patient teaching

- Instruct patient to apply a single transdermal patch to upper outer arm 24 to 48 hours before chemotherapy.
- Instruct patient to remove patch by gently peeling it off in a minimum of 24 hours after chemotherapy completion.
- Instruct patient to remove patch if a severe or generalized skin reaction (such as rash or itching) occurs.
- Advise patient to avoid direct exposure of application site to natural or artificial sunlight by covering site with clothing while wearing patch and for 10 days after patch removal.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Advise patient to minimize GI upset by eating frequent, small servings of healthy food.
- Tell patient he'll undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests and herbs mentioned above.

## guaifenesin (glyceryl guaiacolate)

Balminil Expectorant<sup>✳</sup>, Benilyn Childrens Chesty Coughs<sup>⚡</sup>, Benylin-E<sup>✳</sup>, Calmylin Expectorant<sup>✳</sup>, Diabetic Tussin EX, Genatuss, Koffex Expectorant<sup>✳</sup>, Mucinex, Organidin NR, Phanacin XPECT, Pneumomist, Resyl<sup>✳</sup>, Robitussin, Robitussin Chesty Cough<sup>⚡</sup>, Scot-tussin Expectorant, Siltussin SA, Tixylix Chesty Cough<sup>⚡</sup>, Venos for Kids<sup>⚡</sup>, Vicks Vaporsyrup for Chesty Coughs<sup>⚡</sup>

**Pharmacologic class:** Propanediol derivative

**Therapeutic class:** Expectorant

**Pregnancy risk category C**

### Action

Exerts vasoconstrictive action that leads to decreased edema and congestion. Also increases respiratory secretions and reduces mucus viscosity.

### Availability

*Capsules:* 200 mg

*Oral solution:* 100 mg/5 ml, 200 mg/5 ml

*Syrup:* 100 mg/5 ml

*Tablets:* 100 mg, 200 mg, 400 mg

*Tablets (extended-release):* 600 mg

### Indications and dosages

➤ Cough due to upper respiratory tract infection

**Adults:** 200 to 400 mg P.O. q 4 hours (not to exceed 2,400 mg/day), or 600 to 1,200 mg P.O. (extended-release tablets) q 12 hours (not to exceed 2,400 mg/day)

**Children ages 6 to 12:** 100 to 200 mg P.O. q 4 hours (not to exceed 1,200

mg/day), or 600 mg P.O. (extended-release) q 12 hours (not to exceed 1,200 mg/day)

**Children ages 2 to 6:** 50 to 100 mg P.O. q 4 hours (not to exceed 600 mg/day)

### Contraindications

- Hypersensitivity to drug
- Alcohol intolerance (with some products)

### Precautions

Use cautiously in:

- diabetes mellitus, cough lasting more than 1 week or accompanied by fever, rash, or headache
- patients receiving disulfiram concurrently
- pregnant patients.

### Administration

- Give with full glass of water.

Route	Onset	Peak	Duration
P.O.	30 min	Unknown	4-6 hr
P.O. (extended)	Unknown	Unknown	12 hr

### Adverse reactions

**CNS:** headache, dizziness

**GI:** nausea, vomiting, diarrhea, stomach pain

**Skin:** rash, urticaria

### Interactions

**Drug-diagnostic tests.** *Urinary 5-hydroxyindoleacetic acid, vanillylmandelic acid:* inaccurate results

### Patient monitoring

- Assess cough quality and productivity. Reevaluate treatment if cough persists and is accompanied by fever or headache.

### Patient teaching

- Tell patient to take with 8 oz of water and to drink plenty of fluids.
- Instruct patient to contact prescriber if cough lasts more than 1 week.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the tests mentioned above.

## guanfacine

Intuniv

**Pharmacologic class:** Centrally acting antiadrenergic

**Therapeutic class:** Antiadrenergic-sympatholytic, antihypertensive

**Pregnancy risk category B**

### Action

Stimulates central  $\alpha_2$ -adrenergic receptors, reducing sympathetic nerve impulses from vasomotor center to heart and blood vessels

### Availability

Tablets: 1 mg, 2 mg

Tablets (extended-release): 1 mg, 2 mg, 3 mg, 4 mg

### Indications and dosages

➤ Management of hypertension (used alone or in combination with other agents, especially thiazide diuretics)

**Adults:** 1 mg (immediate-release) P.O. at bedtime. If response unsatisfactory after 3 to 4 weeks, increase to 2 mg (immediate-release) P.O. at bedtime.

➤ Attention deficit hyperactivity disorder (ADHD) as monotherapy and as adjunctive therapy to stimulants

**Adults and children age 6 and older:**

1 mg (extended-release) P.O. daily; adjust in increments of no more than 1 mg/week. Maintain dosage within 1 to 4 mg/day, depending on clinical response and tolerability. Consider

dosing on a mg/kg basis. Improvements have been observed starting at dosages of 0.05 to 0.08 mg/kg once daily.

Dosages up to 0.12 mg/kg once daily may provide additional benefit. Dosages above 4 mg/day haven't been studied. If switching from immediate-release guanfacine, discontinue immediate-release treatment and titrate with extended-release, as directed.

### Dosage adjustment

- Hepatic or renal impairment (immediate-release form)
- Concurrent use of CYP3A4 inducers such as rifampin (immediate-release form)

### Off-label uses

- Attention deficit hyperactivity disorder (immediate-release form)
- Treatment of heroin withdrawal
- Hypertension in pregnancy

### Contraindications

- Hypersensitivity to drug, its components, or other products containing guanfacine

### Precautions

Use cautiously in:

- hepatic or renal impairment
- severe coronary insufficiency, cardiovascular or cerebrovascular disease
- history of syncope, patients at risk for hypotension, bradycardia, heart block, or syncope, such as those taking antihypertensives (immediate-release form)
- concurrent use of CNS depressants
- concurrent use of antihypertensives, other products containing guanfacine, or CYP3A4/5 inhibitors such as ketoconazole (immediate-release form)
- elderly patients
- sedated patients (especially when given with centrally acting depressants)
- pregnant or breastfeeding patients
- children younger than age 6 (extended-release form) or 12 (immediate-release form).

## Administration

- Measure heart rate and blood pressure before starting drug and after dosage increases.
- Give at bedtime to reduce daytime sleepiness (immediate-release form).
- Don't administer with high-fat meals (extended-release form).
- Know that therapy shouldn't be stopped abruptly, because this may cause rebound plasma and urinary catecholamines, anxiety, hypertension, and increase in blood pressure. When discontinuing, taper dosage in decrements of no more than 1 mg every 3 to 7 days.
- Be aware that drug may be used alone or with other agents, especially thiazide diuretics (immediate-release form).
- Be aware that for adolescents and children age 6 and older, efficacy beyond 9 weeks and safety beyond 2 years of treatment haven't been established.
- Don't substitute extended-release tablet for immediate-release tablet on a milligram-per-milligram basis, because of differing pharmacokinetic profiles.

Route	Onset	Peak	Duration
P.O.	Unknown	2.6 hr	Unknown
P.O. (extended)	Unknown	4-8 hr	Unknown

## Adverse reactions

**CNS:** somnolence, insomnia, dizziness, postural dizziness, lethargy, irritability, agitation, anxiety, nightmares, headache, fatigue, amnesia, confusion, depression, hypokinesia, asthenia, malaise, paresthesia, paresis, **seizures**  
**CV:** hypertension, hypotension, syncope, bradycardia, palpitations, substernal pain, **AV block, sinus arrhythmia**  
**EENT:** conjunctivitis, iritis, vision disturbance, tinnitus, rhinitis  
**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, dysphagia, dry mouth

**GU:** erectile dysfunction, decreased libido, increased urinary frequency, enuresis

**Musculoskeletal:** leg cramps

**Respiratory:** dyspnea, asthma

**Skin:** dermatitis, pruritus, purpura, sweating, pallor, rash

**Other:** taste perversion, decreased appetite, weight gain, chest pain, hypersensitivity

## Interactions

**Drug-drug.** *Antihypertensives:* increased risk of additive pharmacodynamic effects, such as hypotension and syncope

*CNS depressants (such as antipsychotics, barbiturates, benzodiazepines, sedative-hypnotics):* additive sedation

*CYP3A4 inducers (such as rifampin):* decreased guanfacine plasma concentration

*CYP3A4/5 inhibitors (such as ketoconazole), valproic acid:* increased guanfacine plasma concentration

*Phenobarbital, phenytoin:* decreased elimination half-life and blood level of guanfacine

*Valproic acid:* increased serum valproic acid concentration

**Drug-diagnostic tests.** *Alanine aminotransferase:* increased level

**Drug-food.** *High-fat meal:* increased guanfacine  $C_{max}$  and area under the curve

**Drug-behaviors.** *Alcohol use:* additive sedation

## Patient monitoring

- Monitor patient for evidence of drug efficacy.

- Monitor patient closely during drug withdrawal.

🔊 Continue to monitor heart rate and blood pressure periodically during therapy. Watch for hypotension, bradycardia, syncope, and heart block, especially in patients taking antihypertensives.

⚠ Be aware that rash with exfoliation has occurred in a few patients. Should rash occur, discontinue drug and monitor patient appropriately.

### Patient teaching

- Tell patient to take immediate-release tablets at bedtime to reduce daytime sleepiness.
- Tell patient to take extended-release tablets whole with water, milk, or other liquid but not to take with high-fat meals.
- Tell patient not to crush, chew, or break extended-release tablets before swallowing.
- Caution patient not to stop taking drug abruptly.
- ⚠ Instruct patient how to recognize and immediately report signs and symptoms of serious cardiovascular disorders.
- ⚠ Instruct patient to immediately report development of a rash.
- Advise patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Tell patient to avoid alcohol during therapy.
- Advise patient to avoid dehydration or overheating.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

## haloperidol

Apo-Haloperidol<sup>⚠</sup>, Dozic<sup>⚠</sup>,  
Novo-Peridol<sup>⚠</sup>, Peridol<sup>⚠</sup>, PMS  
Haloperidol<sup>⚠</sup>, Serenace<sup>⚠</sup>

## haloperidol decanoate

Haldol Decanoate 50, Haloperidol LA Omega<sup>⚠</sup>

## haloperidol lactate

Haldol

*Pharmacologic class:* Butyrophenone

*Therapeutic class:* Antipsychotic

*Pregnancy risk category* C

### FDA BOXED WARNING

- Drug increased mortality in elderly patients with dementia-related psychosis. Although causes of death were varied, most appeared to be cardiovascular or infectious. Drug isn't approved for treatment of dementia-related psychosis.

### Action

Unknown. Thought to block postsynaptic dopamine receptors in brain and increase dopamine turnover rate, inhibiting signs and symptoms of psychosis.

### Availability

*Injection (decanoate):* 50 mg/ml,  
100 mg/ml

*Injection (lactate):* 5 mg/ml

*Oral concentrate (lactate):* 2 mg/ml

*Tablets:* 0.5 mg, 1 mg, 2 mg, 5 mg,  
10 mg, 20 mg

### Indications and dosages

➤ Symptomatic treatment of psychotic disorders or Tourette syndrome  
**Adults:** For moderate symptoms, 0.5 to 2 mg P.O. two to three times daily. For severe symptoms or chronic or resistant disorder, 3 to 5 mg P.O. two to three times daily, to a maximum of 100 mg daily if needed. Adjust subsequent dosages carefully based on response and tolerance. Alternatively, 2 to 5 mg I.M. (lactate) may be given for

prompt control of acutely agitated patient with moderate to severe symptoms; based on response, subsequent doses may be given q hour.

➤ Schizophrenia in patients who need prolonged parenteral antipsychotic therapy

**Adults:** For patient previously stabilized on oral haloperidol, initial I.M. dose (decanoate) is 10 to 20 times the previous daily P.O. haloperidol equivalent, depending on patient's stability on low or high P.O. dosage. Initially, I.M. dosage shouldn't exceed 100 mg. If conversion requires dosage above 100 mg, give balance in 3 to 7 days. Maintenance dosage is 10 to 15 times the previous daily P.O. dosage, depending on response.

➤ Psychotic disorders

**Children ages 3 to 12 or weighing 15 to 40 kg (33 to 88 lb):** 0.05 to 0.15 mg/kg/day P.O. in two or three divided doses. May be increased by 0.5 mg daily given in two or three divided doses at 5- to 7-day intervals, depending on response and tolerance.

➤ Nonpsychotic behavior disorder; Tourette syndrome; hyperactivity

**Children ages 3 to 12 or weighing 15 to 40 kg (33 to 88 lb):** 0.05 to 0.075 mg/kg/day P.O. in two or three divided doses

### Dosage adjustment

- Elderly or debilitated patients

### Off-label uses

- Nausea and vomiting
- Infantile autism
- Intractable hiccups

### Contraindications

- Hypersensitivity to drug, tartrazine, sesame oil, or benzyl alcohol (with some products)
- Severe CNS depression or comatose states
- Parkinson's disease

### Precautions

Use cautiously in:

- torsades de pointes, QT interval prolongation
- patients with allergies
- hepatic disease, bone marrow depression, cardiac disease, respiratory insufficiency, CNS tumors
- history of seizures, patients receiving anticonvulsants, EEG abnormalities
- concurrent anticoagulant use
- elderly patients
- pregnant or breastfeeding patients
- children (parenteral form not recommended).

### Administration

• Be aware that torsades de pointes and QT interval prolongation have occurred in patients receiving haloperidol, especially when drug is given I.V. or in doses higher than recommended. Haloperidol isn't approved for I.V. use.

- ⚠ Don't give decanoate form I.V.
- Administer decanoate form by deep I.M. injection using 21G needle. Two injections may be necessary; maximum volume shouldn't exceed 3 ml.
- Know that recommended interval between I.M. injections is 4 weeks.
- Dilute oral concentrate in water, soda, or juice (orange, apple, tomato) immediately before administering.
- Be aware that patient should be switched from parenteral form to oral form as soon as possible.
- Know that parenteral form is not recommended in children.

Route	Onset	Peak	Duration
P.O.	Unknown	3-6 hr	Unknown
I.V. (lactate)	Unknown	Unknown	Unknown
I.M. (decanoate)	20-30 min	30-45 min	4-8 hr

### Adverse reactions

**CNS:** confusion, drowsiness, restlessness, extrapyramidal reactions,

sedation, lethargy, insomnia, vertigo, tardive dyskinesia, **seizures, neuroleptic malignant syndrome**

**CV:** hypotension, hypertension, tachycardia, ECG changes, **torsades de pointes** (with I.V. use)

**EENT:** blurred vision, dry eyes

**GI:** constipation, ileus, dry mouth, anorexia

**GU:** urinary retention, menstrual irregularities, gynecomastia, priapism

**Hematologic:** anemia, **leukocytosis, leukopenia**

**Hepatic:** jaundice, **drug-induced hepatitis**

**Metabolic:** galactorrhea

**Respiratory:** dyspnea, **respiratory depression, bronchospasm,**

**laryngospasm**

**Skin:** diaphoresis, photosensitivity, rash

**Other:** hyperpyrexia, hypersensitivity reactions

## Interactions

**Drug-drug.** *Antidepressants, antihistamines, atropine, disopyramide, phenothiazines, quinidine, other anticholinergics:* additive anticholinergic effects

*Antihypertensives, nitrates:* additive hypotension

*CNS depressants (including antihistamines, opioid analgesics, sedative-hypnotics):* additive CNS depression

*Epinephrine:* severe hypotension and tachycardia

*Levodopa, pergolide:* decreased therapeutic effects of haloperidol

*Lithium:* acute encephalopathic syndrome

*Methylodopa:* dementia

*Rifampin:* decreased haloperidol plasma level

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, thyroid function tests:* increased values  
*Arterial blood gases, bicarbonate:* altered values

*White blood cells:* increased or decreased count

**Drug-herbs.** *Angel's trumpet, jimsonweed, scopolia:* antagonism of cholinergic effects

*Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

*Nutmeg:* reduced haloperidol efficacy

**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension

## Patient monitoring

🔊 Monitor CNS status closely, especially for seizures and neuroleptic malignant syndrome (shown by extrapyramidal symptoms, hyperthermia, and autonomic disturbances).

🔊 Monitor cardiovascular status, particularly for ECG changes, blood pressure changes, torsades de pointes, and atypical rapid ventricular tachycardia, which may progress to ventricular fibrillation (with I.V. use).

- Assess respiratory status.
- Monitor liver function test results and CBC with white cell differential.
- With prolonged use, assess for tardive dyskinesia (which may occur months or even years after starting drug).

## Patient teaching

• Tell patient to dilute oral concentrate with water, cola, or juice immediately before taking.

🔊 Instruct patient to immediately report signs or symptoms of serious adverse reactions, such as unusual weakness, yellowing of skin or eyes, difficulty breathing, or symptoms of neuroleptic malignant syndrome (such as fever, muscle pain or rigidity, rapid or irregular pulse, increased sweating, change in urination pattern, or decreased mental acuity).

• Advise patient to minimize GI upset by eating frequent, small servings of food and drinking adequate fluids.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## heparin sodium

Calciparine<sup>⚡</sup>, Canusal<sup>⚡</sup>, Hepalean<sup>⚡</sup>, Heparin Leo<sup>⚡</sup>, Hep-Lock<sup>⚡</sup>, Hep-Lock U/P, Hepsal<sup>⚡</sup>, Monoparin<sup>⚡</sup>, Multiparin<sup>⚡</sup>

**Pharmacologic class:** Antithrombotic

**Therapeutic class:** Anticoagulant

**Pregnancy risk category C**

### Action

Inhibits thrombus by preventing conversion of prothrombin to thrombin and fibrinogen to fibrin, preventing clot formation. Doesn't lyse existing clot, but prevents clot enlargement and extension.

### Availability

**Solution for flushes:** 1-unit/ml, 2-units/ml, 10-units/ml, 100-units/ml syringes; 100-units/ml vials

**Solution for injection:** 1,000 units/ml, 10,000 units/ml, 20,000 units/ml, 40,000 units/ml in single-dose vials; 1,000 units/ml, 2,000 units/ml, 5,000 units/ml, 10,000 units/ml, 20,000 units/ml in multidose vials; 1,000 units/ml, 2,500 units/ml, 5,000 units/ml, 10,000 units/ml in unit-dose syringes

### Indications and dosages

➤ Therapeutic anticoagulation

**Adults:** 10,000 units I.V. by intermittent bolus, then 5,000 to 10,000 units I.V. q 4 to 6 hours. Or 5,000 units by I.V. injection, then 20,000 to 40,000 units I.V. over 24 hours (about 1,000 units/hour or 15 to 18 units/kg/hour). Or 5,000 units I.V., followed by initial deep subcutaneous dose of 10,000 to 20,000 units, then 8,000 to 10,000 units q 8 hours or 15,000 to 20,000 units q 12 hours.

**Children:** Initially, 50 units/kg by I.V. drip, then 100 units/kg by I.V. drip q 4 hours. Or 20,000 units/m<sup>2</sup>/24 hours by continuous I.V. infusion.

➤ To prevent thromboembolism  
**Adults:** 5,000 units subcutaneously q 8 to 12 hours (may begin 2 hours before surgery) given for 7 days or until patient is fully ambulatory

➤ To prevent blood clotting during cardiovascular surgery

**Adults:** At least 150 units/kg I.V. (300 units/kg if procedure less than 60 minutes; 400 units/kg if more than 60 minutes)

➤ I.V. flush

**Adults and children:** 10 to 100 units/ml I.V. heparin sodium solution to fill heparin lock set

### Off-label uses

- Prophylaxis of left ventricular thrombi
- Prophylaxis of cerebrovascular accident after myocardial infarction

### Contraindications

- Hypersensitivity to drug
- Bleeding disorders
- Severe thrombocytopenia
- Patients who can't undergo regular blood coagulation tests

### Precautions

Use cautiously in:

- severe hepatic or renal disease, bacterial endocarditis, hypertension, brain injury, retinopathy, ulcer disease
- recent CNS or ophthalmic surgery
- immediate postpartum period
- women older than age 60
- pregnant patients.

### Administration

⚡ Know that I.V. heparin sodium is a high-alert drug.

• Draw baseline blood sample for clotting studies before starting drug.

⚡ Use infusion pump to administer I.V. dose. Check regularly to ensure that infusion rate is correct.

- For I.V. use, give each 1,000-unit dose or single-dose injection over at least 1 minute. Give continuous infusion over 4 to 24 hours, depending on dose and volume of infusion solution.
- Draw blood for partial thromboplastin time (PTT) from opposite arm 4 hours after continuous I.V. infusion begins.
- Put note at patient's bedside to remind personnel to apply pressure dressings after withdrawing blood.
- With intermittent I.V. drug infusion, withdraw blood 30 minutes before dose, using arm without I.V. infusion.
- For subcutaneous dose, inject slowly between iliac crests in lower abdomen, deep into subcutaneous fat layer. Leave needle in place for 10 seconds before withdrawing. Don't massage area after injection. Alternate subcutaneous sites every 12 hours.
- Have protamine available as heparin agonist.

 Don't give I.M.

 Don't give heparin products containing benzyl alcohol to premature infants.

Route	Onset	Peak	Duration
I.V.	Immediate	5-10 min	2-6 hr
Subcut.	20-60 min	2-4 hr	8-12 hr

## Adverse reactions

**EENT:** rhinitis

**Hematologic:** anemia, **thrombocytopenia, bleeding, severely prolonged clotting time**

**Hepatic:** hepatitis

**Metabolic:** hyperkalemia

**Musculoskeletal:** osteoporosis (with long-term use)

**Skin:** irritation, rash, urticaria, hematoma, ulceration, cutaneous or subcutaneous necrosis, pruritus, alopecia (with long-term use)

**Other:** fever, pain at injection site, hypersensitivity reactions, **white clot syndrome, anaphylactoid reactions**

## Interactions

**Drug-drug.** *Antihistamines, digoxin, nicotine, tetracyclines:* decreased anticoagulant effect of heparin

*Cefamandole, cefmetazole, cefoperazone, cefotetan, plicamycin, quinidine, valproic acid, other drugs that cause hypoprothrombinemia; drugs that affect platelet function (including abciximab, aspirin, clopidogrel, dextran, dipyridamole, eptifibatid, nonsteroidal anti-inflammatory drugs, some penicillins, thrombolytics, ticlopidine, tirofiban):* increased bleeding risk

**Drug-diagnostic tests.** *Alanine aminotransferase, aspartate aminotransferase, free fatty acids, thyroxine, triiodothyronine resin:* increased levels

*Cholesterol, triglycerides:* decreased levels  
*<sup>125</sup>I fibrinogen uptake:* false-negative result

*Prothrombin time:* prolonged

**Drug-herbs.** *Anise, arnica, chamomile, clove, dong quai, feverfew, garlic, ginger, ginseng:* increased bleeding risk

**Drug-behaviors.** *Smoking:* increased bleeding risk

## Patient monitoring

• Monitor infusion rate closely, even when using infusion pump.

• Evaluate patient's vital signs.

 Watch for signs and symptoms of anaphylactoid reaction.

 Assess for white clot syndrome (new thrombus formation in association with thrombocytopenia caused by irreversible platelet aggregation).

 Stay alert for signs and symptoms of bleeding tendency.

• Check hematocrit, PTT, and platelet count frequently.

• Monitor liver function test results.

• In long-term therapy, periodically assess stool for occult blood.

• Monitor potassium level in patients with diabetes or renal disease. (Drug may cause hyperkalemia.)

**Patient teaching**

- If patient will self-administer drug, teach proper technique and emphasize need to rotate injection sites.
- 📣 Advise patient that nosebleed, blood in urine, or black stools may be first sign of overdose and should be reported immediately.
- 📣 Tell patient to immediately report other unusual bleeding or bruising.
- Urge patient to avoid activities that can cause injury. Advise him to use soft toothbrush and electric razor to avoid gum and skin injury.
- Tell patient he will undergo regular blood testing during therapy.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

**hydralazine hydrochloride**

Apo-Hydralazine\*, Apresoline, Novo-Hylazin\*, Nu-Hydral\*

**Pharmacologic class:** Peripheral vasodilator

**Therapeutic class:** Antihypertensive

**Pregnancy risk category** C

**Action**

Relaxes vascular smooth muscles of arteries and arterioles, causing peripheral vasodilation and decreasing peripheral vascular resistance. These actions decrease blood pressure and increase heart rate, stroke volume, and cardiac output.

**Availability**

**Injection:** 20 mg/ml

**Tablets:** 10 mg, 25 mg, 50 mg, 100 mg

**Indications and dosages**

- Hypertension

**Adults:** Initially, 10 mg P.O. q.i.d. After 2 to 4 days, may increase to 25 mg P.O. q.i.d. for remainder of first week; may then increase further to 50 mg P.O. q.i.d., up to 300 mg/day. Once maintenance dosage is established, may give in two daily doses.

**Children:** Initially, 0.75 mg/kg/day P.O. in four divided doses; may increase gradually over 3 to 4 weeks to 7.5 mg/kg or 200 mg/day

**Neonates:** 0.5 mg/kg P.O., I.M., or I.V. q 4 to 6 hours

**Contraindications**

- Hypersensitivity to drug or tartrazine
- Coronary artery disease
- Mitral valvular rheumatic heart disease

**Precautions**

Use cautiously in:

- suspected CV or cerebrovascular disease, severe renal or hepatic disease
- pregnant or breastfeeding patients
- children.

**Administration**

- Administer oral form with food.
- 📣 Inject I.V. form slowly over 1 minute. Monitor blood pressure response continuously.
- Draw up and use parenteral drug immediately; solution changes color after contact with metal needle.

Route	Onset	Peak	Duration
P.O.	45 min	2 hr	3-8 hr
I.V.	10-20 min	15-30 min	3-8 hr
I.M.	10-30 min	1 hr	3-8 hr

**Adverse reactions**

**CNS:** dizziness, drowsiness, headache, peripheral neuritis

**CV:** tachycardia, angina, orthostatic hypotension, **arrhythmias**

**EENT:** lacrimation, nasal congestion

**GI:** nausea, vomiting, diarrhea, constipation, anorexia

**Metabolic:** sodium retention

**Musculoskeletal:** joint pain, arthritis

**Skin:** rash, blisters, flushing, pruritus, urticaria

**Other:** chills, fever, lymphadenopathy, edema, lupuslike syndrome

## Interactions

**Drug-drug.** *Antihypertensives, nitrates:* additive hypotension

*Epinephrine:* reduced pressor response to epinephrine

*Metoprolol, propranolol:* increased blood levels of both drugs

*MAO inhibitors:* increased hypotension

**Drug-diagnostic tests.** *Coombs' test:* positive result

*Granulocytes, hemoglobin, neutrophils, platelets, red blood cells, white blood cells:* decreased levels

**Drug-behaviors.** *Alcohol use:* additive hypotensive response

## Patient monitoring

- Monitor CBC, lupus erythematosus cell studies, and antinuclear antibody titers before and periodically during therapy.

- Monitor blood pressure, pulse rate and regularity, and daily weight.

- To avoid rapid blood pressure drop, taper dosage gradually before discontinuing.

- 📣 Assess for lupuslike signs and symptoms, including joint pain, fever, myalgia, pharyngitis, and splenomegaly.

- Watch for peripheral neuritis. If it occurs, expect to give pyridoxine.

## Patient teaching

- Tell patient to take tablets with food.
- Instruct patient to move slowly when rising (especially in morning on awakening), to avoid dizziness from sudden blood pressure decrease.

- 📣 Instruct patient to immediately report fever, muscle and joint aches, or sore throat.

- Tell patient to report chest pain or numbness or tingling of hands or feet.

- To minimize GI upset, advise patient to eat small, frequent meals.

- Caution patient not to discontinue drug abruptly, because severe hypertension may result.

- As appropriate, review other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## hydrochlorothiazide

Apo-Hydro<sup>✳</sup>, Diuchlor H<sup>✳</sup>, Hydro-Par, Microzide, Neo-Codema<sup>✳</sup>, Novo-Hydraside<sup>✳</sup>, PMS-Hydrochlorothiazide<sup>✳</sup>, Urozide<sup>✳</sup>

**Pharmacologic class:** Thiazide diuretic

**Therapeutic class:** Diuretic, antihypertensive

**Pregnancy risk category B**

## Action

Increases sodium and water excretion by inhibiting sodium reabsorption in distal tubules; promotes excretion of chloride, potassium, magnesium, and bicarbonate. Also may produce arteriolar dilation, reducing blood pressure.

## Availability

*Capsules:* 12.5 mg

*Oral solution:* 10 mg/ml, 100 mg/ml

*Tablets:* 12.5 mg, 25 mg, 50 mg, 100 mg

## Indications and dosages

➤ Edema caused by heart failure, renal dysfunction, cirrhosis, corticosteroid therapy, or estrogen therapy

**Adults:** 25 to 100 mg P.O. daily as a single dose or in divided doses. Maximum dosage is 200 mg/day.

➤ Mild to moderate hypertension

**Adults:** Initially, 12.5 mg daily P.O.; then, based on blood pressure response, may give 12.5 to 50 mg/day

P.O. Higher dosages may be given in refractory cases.

**Children ages 2 to 12:** 1 to 2 mg/kg/day P.O. in single dose or two divided doses, not to exceed 100 mg/day

**Children younger than age 2:** 1 to 2 mg/kg P.O. as single dose or divided doses, not to exceed 37.5 mg/day; infants less than age 6 months may require dosage of 3 mg/kg/day in two divided doses.

### Off-label uses

- Hypercalcemia
- Ménière's disease

### Contraindications

- Hypersensitivity to drug, other thiazides, sulfonamides, or tartrazine
- Renal decompensation or anuria

### Precautions

Use cautiously in:

- renal or severe hepatic impairment, fluid or electrolyte imbalances, gout, systemic lupus erythematosus, hyperparathyroidism, glucose tolerance abnormalities, bipolar disorder
- elderly patients
- pregnant or breastfeeding patients.

### Administration

- Give with food or milk if GI upset occurs.
- Administer early in day so diuretic effect doesn't disturb sleep.

Route	Onset	Peak	Duration
P.O.	2 hr	3-6 hr	6-12 hr

### Adverse reactions

**CNS:** dizziness, drowsiness, lethargy, headache, insomnia, nervousness, vertigo, asthenia, asterixis, paresthesias, confusion, fatigue, **encephalopathy**

**CV:** chest pain, orthostatic hypotension, ECG changes, **thrombophlebitis**, **arrhythmias**

**EENT:** nystagmus

**GI:** nausea, vomiting, epigastric distress, anorexia, **pancreatitis**

**GU:** polyuria, nocturia, erectile dysfunction, loss of libido, **renal failure**

**Hematologic:** anemia, **hemolytic anemia**, **agranulocytosis**, **leukopenia**, **thrombocytopenia**

**Hepatic:** jaundice, **hepatitis**

**Metabolic:** dehydration, gout, hyperglycemia, hypokalemia, hypocalcemia, hypovolemia, hypomagnesemia, hyponatremia, hypophosphatemia, hyperuricemia, **hypochloremic alkalosis**

**Musculoskeletal:** muscle cramps

**Skin:** photosensitivity, urticaria, rash, dermatitis, purpura, alopecia, flushing

**Other:** fever, weight loss, **anaphylaxis**

### Interactions

**Drug-drug.** *Adrenocorticotrophic hormone*, *corticosteroids*: increased risk of intensified electrolyte depletion, particularly hypokalemia

*Allopurinol*: increased risk of hypersensitivity reaction

*Amphotericin B*, *corticosteroids*, *digoxin*, *mezlocillin*, *piperacillin*, *ticarcillin*:

increased risk of hypokalemia

*Antihypertensives*, *barbiturates*, *nitrates*, *opioids*: increased hypotension

*Cholestyramine*, *colestipol*: decreased hydrochlorothiazide absorption

*Digoxin*: increased risk of hypokalemia

*Insulin*, *oral hypoglycemics*: possible decreased hypoglycemic effect

*Lithium*: decreased excretion and increased blood level of lithium

*Nondepolarizing skeletal muscle relaxants (such as tubocurarine)*: increased skeletal muscle relaxant effect

*Nonsteroidal anti-inflammatory drugs*: decreased hydrochlorothiazide efficacy

*Vasopressors*: decreased pressor effect

**Drug-diagnostic tests.** *Bilirubin*, *blood and urine glucose (in diabetic patients)*, *calcium*, *creatinine*, *uric acid*: increased levels

*Cholesterol*, *low-density lipoproteins*, *magnesium*, *potassium*, *protein-bound*

*iodine, sodium, triglycerides, urinary calcium*: decreased levels

**Drug-herbs.** *Dandelion*: interference with diuretic activity

*Ginkgo*: decreased antihypertensive effect

*Licorice, stimulant laxative herbs (aloe, cascara sagrada, senna)*: increased risk of hypokalemia

**Drug-behaviors.** *Alcohol use*: increased hypotension

*Sun exposure*: increased risk of photosensitivity

### Patient monitoring

- Monitor blood pressure, fluid intake and output, and daily weight.
- Assess electrolyte levels, especially potassium. Monitor for signs and symptoms of hypokalemia.
- Monitor blood urea nitrogen and creatinine levels.
- Check blood glucose level in diabetic patients.
- Assess for signs and symptoms of gout attacks in patients with gouty arthritis.

### Patient teaching

- Advise patient to take with food or milk if GI upset occurs.
- Tell patient to take early in day to avoid nighttime urination.
- Instruct patient to track intermittent doses on calendar.
- Tell patient to weigh himself daily, at same time on same scale and wearing same clothes.

 Instruct patient to report decreased urination, swelling, unusual bleeding or bruising, dizziness, fatigue, numbness, and muscle weakness or cramping.

- Instruct patient to move slowly when sitting up or standing, to avoid dizziness from sudden blood pressure decrease.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## hydrocodone bitartrate and acetaminophen

Anexsia, Ceta-Plus, Co-Gesic, Hydrocet, Lortab, Norco, Stagesic, Vicodin, Vicodin ES, Vicodin HP, Xodol, Zydone

# h

## hydrocodone bitartrate and aspirin

## hydrocodone bitartrate and ibuprofen

Vicoprofen

## hydrocodone bitartrate and homatropine methylbromide

Hycodan

**Pharmacologic class:** Opioid agonist/nonopioid analgesic combination

**Therapeutic class:** Opioid analgesic; allergy, cold, and cough remedy (antitussive)

**Controlled substance schedule III**

**Pregnancy risk category C**

### Action

Blocks release of inhibitory neurotransmitters, altering perception of and emotional response to pain. Hydrocodone/ibuprofen combination raises pain threshold by nonselectively inhibiting cyclooxygenase; prostaglandin synthesis then decreases and anti-inflammatory and analgesic effects occur.

**Availability****hydrocodone bitartrate and acetaminophen**

*Capsules:* 5 mg hydrocodone (hyd.)/500 mg acetaminophen (acet.)

*Elixir/oral solution:* 2.5 mg hyd./167 mg acet./5 ml

*Tablets:* 2.5 mg hyd./500 mg acet.; 5 mg hyd./325 mg acet.; 5 mg hyd./400 mg acet.; 5 mg hyd./500 mg acet.; 7.5 mg hyd./325 mg acet.; 7.5 mg hyd./400 mg acet.; 7.5 mg hyd./500 mg acet.; 7.5 mg hyd./650 mg acet.; 7.5 mg hyd./750 mg acet.; 10 mg hyd./325 mg acet.; 10 mg hyd./400 mg acet.; 10 mg hyd./500 mg acet.; 10 mg hyd./650 mg acet.; 10 mg hyd./660 mg acet.; 10 mg hyd./750 mg acet.

**hydrocodone bitartrate and aspirin**

*Tablets:* 5 mg hyd./500 mg aspirin

**hydrocodone bitartrate and ibuprofen**

*Tablets:* 7.5 mg hyd./200 mg ibuprofen

**hydrocodone bitartrate and homatropine methylbromide**

*Syrup:* 1.5 mg/5 ml, 5 mg/5 ml

*Tablets:* 1.5 mg, 5 mg

**Indications and dosages**

➤ Moderate to severe pain

**Adults:** 2.5 to 10 mg P.O. q 4 to 6 hours p.r.n. When giving hydrocodone/acetaminophen, don't exceed 60 mg/day; when giving hydrocodone/ibuprofen, don't exceed 37.5 mg/day.

**Children:** 0.15 to 0.2 mg/kg P.O. q 6 hours

➤ Cough

**Adults:** One tablet or 5 ml (syrup) q 4 to 6 hours as needed; don't exceed 6 tablets or 30 ml syrup in 24 hours.

**Children ages 6 to 12:** One-half tablet or 2.5 ml (syrup) q 4 to 6 hours as needed; don't exceed 3 tablets or 15 ml syrup in 24 hours.

**Contraindications**

• Hypersensitivity to hydrocodone, acetaminophen, aspirin, ibuprofen, or homatropine methylbromide (for corresponding combination products) or

to alcohol, aspartame, saccharine, sugar, or tartrazine (with some products)

**Precautions**

Use cautiously in:

- severe renal, hepatic, or pulmonary disease; increased intracranial pressure; hypothyroidism; adrenal insufficiency; prostatic hypertrophy; thrombocytopenia; alcoholism
- elderly patients
- pregnant or breastfeeding patients.

**Administration**

⚠ In patients receiving concurrent MAO inhibitors, know that hydrocodone may produce severe, unpredictable reactions. Initial dosage may need to be 25% lower than usual dosage.

Route	Onset	Peak	Duration
P.O.	10-30 min	30-60 min	4-6 hr

**Adverse reactions**

**CNS:** confusion, drowsiness, sedation, dysphoria, euphoria, floating feeling, hallucinations, headache, anxiety, depression, fatigue, insomnia, lethargy, nervousness, slurred speech, tremor, asthenia, unusual dreams

**CV:** orthostatic hypotension, bradycardia, peripheral edema, palpitations, **arrhythmias**

**EENT:** blurred vision, vision changes, diplopia, miosis, tinnitus, pharyngitis, rhinitis, sinusitis

**GI:** nausea, vomiting, constipation, dysphagia, esophagitis, dyspepsia, flatulence, gastritis, gastroenteritis, mouth ulcers, dry mouth, anorexia

**GU:** urinary retention or frequency, erectile dysfunction

**Respiratory:** respiratory depression, bronchitis, dyspnea

**Skin:** pruritus, urticaria, diaphoresis, flushing

**Other:** physical or psychological drug dependence, drug tolerance

## Interactions

**Drug-drug.** *Angiotensin-converting enzyme inhibitors:* decreased therapeutic effects of these drugs

*Antihistamines, sedative-hypnotics:* additive CNS depression

*Buprenorphine, butorphanol, nalbuphine, pentazocine:* precipitation of opioid withdrawal in physically dependent patients  
*Buprenorphine, pentazocine:* decreased analgesia

*Lithium:* increased lithium blood level (with hydrocodone/ibuprofen only)

*MAO inhibitors:* severe, unpredictable reactions

*Methotrexate:* increased methotrexate blood level

*Naloxone:* withdrawal symptoms

*Oral anticoagulants:* increased risk of GI bleeding (with hydrocodone/ibuprofen only)

**Drug-diagnostic tests.** *Amylase, lipase:* increased levels

**Drug-herbs.** *Chamomile, hops, kava, skullcaps, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

## Patient monitoring

- In prolonged use, monitor for psychological and physical dependence.
- Watch closely for withdrawal symptoms when drug is discontinued.
- Assess elderly patients carefully for adverse reactions.

🔊 Monitor for signs and symptoms of drug overdose, including nausea, vomiting, blurred vision, cool and clammy skin, dizziness, confusion, dyspnea, respiratory depression, bradycardia, hearing loss, tinnitus, headache, and mood or behavior changes.

## Patient teaching

- Tell patient drug may cause drowsiness. Caution him to avoid driving and other hazardous activities until CNS effects are known.

- Inform patient that prolonged use may lead to physical or psychological dependence.
- Caution patient to avoid alcohol during therapy.
- Instruct patient to move slowly when sitting up or standing, to avoid dizziness from sudden blood pressure decrease.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

h

## hydrocortisone

Ala-Cort, Ala-Scalp, Cetacort, Colocort, Cortef, Cortenema, Hi-Cor, Hycort<sup>®</sup>, Hytone, Stie-Cort, Synacort, Texacort

## hydrocortisone acetate

Cortifoam, Hydrocortistab<sup>®</sup>

## hydrocortisone butyrate

Locoid

## hydrocortisone sodium succinate

A-hydroCort, Solu-Cortef

## hydrocortisone valerate

Westcort

**Pharmacologic class:** Short-acting corticosteroid

**Therapeutic class:** Anti-inflammatory (steroidal)

**Pregnancy risk category** C

## Action

Suppresses inflammatory and immune responses, mainly by inhibiting migration of leukocytes and

phagocytes and decreasing inflammatory mediators

### Availability

*Cream, gel, lotion, ointment, solution:* various strengths

*Injection:* 25 mg/ml, 50 mg/ml; 100 mg/vial, 250 mg/vial, 500 mg/vial, 1,000 mg/vial

*Intrarectal aerosol foam:* 90 mg

*Oral suspension:* 10 mg/5 ml

*Retention enema:* 100 mg/60 ml

*Spray (topical):* 1%

*Tablets:* 5 mg, 10 mg, 20 mg

### Indications and dosages

➤ Replacement therapy in adrenocortical insufficiency; hypercalcemia due to cancer; arthritis; collagen diseases; dermatologic diseases; autoimmune and hematologic disorders; trichinosis; ulcerative colitis; multiple sclerosis; proctitis; nephrotic syndrome; aspiration pneumonia

*hydrocortisone, hydrocortisone cypionate*—

**Adults and children:** 20 to 240 mg/day P.O.

*hydrocortisone acetate (suspension)*—

**Adults and children:** 5 to 75 mg by intra-articular injection (depending on joint size) q 2 to 3 weeks

*hydrocortisone acetate (intrarectal foam)*—

**Adults and children:** One applicatorful of intrarectal foam daily or b.i.d. for 2 to 3 weeks; then one applicatorful every other day

*hydrocortisone sodium phosphate*—

**Adults and children:** 15 to 240 mg/day subcutaneously, I.M., or I.V., adjusted according to response

*hydrocortisone sodium succinate*—

**Adults and children:** 100 to 500 mg I.M. or I.V.; may repeat at 2-, 4-, or 6-hour intervals, depending on response and condition

*hydrocortisone retention enema*—

**Adults and children:** 100 mg P.R. at bedtime for 21 nights or until desired

response; patient should retain enema for at least 1 hour.

➤ Itching and inflammation caused by skin conditions

**Adults and children:** Thin film of topical preparation applied to affected area one to four times daily, depending on drug form and severity of condition

### Off-label uses

- Phlebitis
- Stomatitis

### Contraindications

- Hypersensitivity to drug, alcohol, bisulfites, or tartrazine (with some products)
- Systemic fungal infections
- Concurrent use of other immunosuppressant corticosteroids
- Concurrent administration of live-virus vaccines

### Precautions

Use cautiously in:

- hypertension, osteoporosis, glaucoma, renal or GI disease, hypothyroidism, cirrhosis, thromboembolic disorders, myasthenia gravis, heart failure
- pregnant or breastfeeding patients
- children ages 6 and younger (safety not established).

### Administration

- Give oral form with food or milk to avoid GI upset.
- Give I.V. injection of sodium succinate form over 30 seconds to a few minutes.
- Know that drug may be given as intermittent or continuous I.V. infusion. Dilute in normal saline solution, dextrose 5% in water, or dextrose 5% in normal saline solution.
- Inject I.M. deep into gluteal muscle. Rotate injection sites to prevent muscle atrophy.

- Be aware that subcutaneous administration may cause muscle atrophy or sterile abscess.

 Never abruptly discontinue high-dose or long-term systemic therapy.

- Know that systemic forms typically are used for adrenal replacement rather than inflammation.

- Be aware that occlusive dressings, heat, hydration, inflammation, denuding, and thinning of skin increase topical drug absorption.

Route	Onset	Peak	Duration
P.O.	1-2 hr	1-2 hr	1-1.5 days
I.V.	Immediate	Unknown	1-1.5 days
I.M.	Rapid	4-8 hr	1-1.5 days
P.R.	Slow	3-5 days	4-6 days
Spray (topical), subcut.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** headache, nervousness, depression, euphoria, personality changes, psychoses, vertigo, paresthesia, insomnia, restlessness, conus medullaris syndrome, **meningitis, increased intracranial pressure, seizures**

**CV:** hypotension, hypertension, **thrombophlebitis, heart failure, shock, fat embolism, thromboembolism, arrhythmias**

**EENT:** cataracts, glaucoma, increased intraocular pressure, epistaxis, nasal congestion, perforated nasal septum, dysphonia, hoarseness, nasopharyngeal or oropharyngeal fungal infections

**GI:** nausea, vomiting, esophageal candidiasis or ulcer, abdominal distention, dry mouth, **rectal bleeding, peptic ulceration, pancreatitis**

**Hematologic:** purpura

**Metabolic:** sodium and fluid retention, hypokalemia, hypocalcemia, hyperglycemia, hypercholesterolemia, amenorrhea, growth retardation, diabetes mellitus, cushingoid appearance, **hypothalamic-pituitary-adrenal**

**suppression with secondary adrenal insufficiency** (with abrupt withdrawal or high-dose, prolonged use)

**Musculoskeletal:** osteoporosis, aseptic joint necrosis, muscle pain or weakness, steroid myopathy, loss of muscle mass, tendon rupture, spontaneous fractures

**Respiratory:** cough, wheezing, rebound congestion, **bronchospasm**

**Skin:** rash, pruritus, urticaria, contact dermatitis, acne, bruising, hirsutism, petechiae, striae, acneiform lesions, skin fragility and thinness, angioedema

**Other:** altered taste; anosmia; appetite changes; weight gain; facial edema; increased susceptibility to infection; masking or aggravation of infection; adhesive arachnoiditis; injection site pain, burning, or atrophy; immunosuppression; hypersensitivity reactions including **anaphylaxis**

### Interactions

**Drug-drug.** *Amphotericin B, loop and thiazide diuretics, mezlocillin, piperacillin, ticarcillin:* additive hypokalemia  
*Fluoroquinolones:* increased risk of tendon rupture

*Hormonal contraceptives:* prolonged half-life and increased effects of hydrocortisone

*Insulin, oral hypoglycemics:* increased requirements for these drugs

*Live-virus vaccines:* decreased antibody response to vaccine, increased risk of adverse reactions

*Nonsteroidal anti-inflammatory drugs:* increased risk of adverse GI reactions

*Phenobarbital, phenytoin, rifampin:* decreased hydrocortisone efficacy

*Somatrem:* inhibition of growth-promoting effect

**Drug-diagnostic tests.** *Calcium, potassium, thyroxine, triiodothyronine:* decreased levels

*Cholesterol, glucose:* increased levels

*Digoxin assays:* false elevation (with some test methods)

*Nitroblue tetrazolium test:* false-negative result

**Drug-herbs.** *Echinacea*: increased immunostimulation

*Ginseng*: potentiation of immunomodulation

**Drug-behaviors.** *Alcohol use*: increased risk of gastric irritation and GI ulcers

### Patient monitoring

 In high-dose therapy (which should not exceed 48 hours), watch closely for signs and symptoms of depression or psychotic episodes.

- Monitor blood pressure, weight, and electrolyte levels regularly.
- Assess blood glucose levels in diabetic patients. Expect to increase insulin or oral hypoglycemic dosage.

 Monitor patient's response during weaning from drug. Watch for adrenal crisis, which may occur if drug is discontinued too quickly.

### Patient teaching

- Instruct patient to take daily P.O. dose with food by 8 A.M.

 Urge patient to immediately report unusual weight gain, face or leg swelling, epigastric burning, vomiting of blood, black tarry stools, irregular menstrual cycles, fever, prolonged sore throat, cold or other infection, or worsening of symptoms.

- Tell patient using topical form not to apply occlusive dressing unless instructed by prescriber.
- Advise patient to discontinue topical drug and notify prescriber if local irritation occurs.
- Instruct patient to eat small, frequent meals and to take antacids as needed to minimize GI upset.
- Tell patient that response to drug will be monitored regularly.
-  Caution patient not to stop taking drug abruptly.
- In long-term use, instruct patient to have regular eye exams.
- Instruct patient to wear medical identification stating that he's taking this drug.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## hydromorphone hydrochloride

Dilaudid, Dilaudid-5, Dilaudid-HP, Hydromorph Contin<sup>®</sup>, Hydromorph-IR<sup>®</sup>, Palladone<sup>®</sup>, Palladone SR<sup>®</sup>, PHL-Hydromorphone<sup>®</sup>, PMS-Hydromorphone<sup>®</sup>

**Pharmacologic class:** Opioid agonist

**Therapeutic class:** Opioid analgesic, antitussive

**Controlled substance schedule II**

**Pregnancy risk category C** (with long-term use or at term with high doses: **D**)

### FDA BOXED WARNING

- Drug is a potent Schedule II opioid agonist with highest abuse potential and risk of causing respiratory depression. Alcohol, other opioids, and CNS depressants potentiate respiratory depressant effects, increasing risk of potentially fatal respiratory depression.

### Action

Binds to opiate receptors in spinal cord and CNS, altering perception of and response to painful stimuli while producing generalized CNS depression. Also subdues cough reflex and decreases GI motility.

### Availability

**Injection:** 1 mg/ml, 2 mg/ml, 4 mg/ml, 10 mg/ml

*Powder for injection (lyophilized):*

250-mg vials (high-potency)

*Oral solution:* 5 mg/5 ml

*Rectal suppositories:* 3 mg

*Tablets:* 2 mg, 3 mg, 4 mg, 8 mg

## Indications and dosages

➤ Moderate to severe pain

**Adults weighing more than 50 kg (110 lb):** 2 mg P.O. (tablets) q 4 to 6 hours p.r.n. For more severe pain, 4 mg P.O. (tablets) may be given q 4 to 6 hours. If pain increases in severity, analgesia isn't adequate, or tolerance develops, a gradual increase in dosage may be required. Or 2.5 to 10 mg P.O. (oral solution) q 4 to 6 hours p.r.n. as directed by clinical situation. Or 1 to 2 mg subcutaneously, I.M., or I.V. q 4 to 6 hours p.r.n.; or 3 mg P.R. q 6 to 8 hours p.r.n. Adjust dosage based on pain severity, underlying disease, and patient's age and size.

## Contraindications

- Hypersensitivity to narcotics or bisulfites
- Acute or severe bronchial asthma or upper respiratory tract obstruction

## Precautions

Use cautiously in:

- increased intracranial pressure; severe renal, hepatic, or pulmonary disease; hypothyroidism; adrenal insufficiency; prostatic hypertrophy; alcoholism
- concurrent use of MAO inhibitors
- elderly patients
- pregnant or breastfeeding patients.

## Administration

 Be aware that high-potency hydromorphone (Dilaudid-HP) is a highly concentrated solution and shouldn't be confused with standard parenteral formulations of hydromorphone or other opioids. Overdose and death may result.

- Know that high-potency formulation is recommended for opioid-tolerant patients who require larger than usual

doses of opioids to gain adequate pain relief.

- For maximal analgesic effect, give before pain becomes severe.
- For I.V. infusion, mix with dextrose 5% in water, normal saline solution, or lactated Ringer's solution.
- Give single-dose I.V. injection slowly, over 2 to 5 minutes for each 2-mg dose.
- Rotate I.M. and subcutaneous sites to prevent muscle atrophy.
- Give oral form with food to avoid GI upset.

Route	Onset	Peak	Duration
P.O.	30 min	90-120 min	4 hr
I.V.	10-15 min	15-30 min	2-3 hr
I.M., subcut.	15 min	30-60 min	4-5 hr
P.R.	15-30 min	30-90 min	4-5 hr

## Adverse reactions

**CNS:** confusion, sedation, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams, anxiety, dizziness, drowsiness

**CV:** hypotension, hypertension, palpitations, bradycardia, tachycardia

**EENT:** blurred vision, diplopia, miosis, nystagmus, tinnitus, laryngeal edema, **laryngospasm**

**GI:** nausea, vomiting, constipation, abdominal cramps, biliary tract spasm, anorexia

**GU:** urinary retention, dysuria

**Hepatic:** **hepatotoxicity**

**Respiratory:** dyspnea, wheezing, **bronchospasm, respiratory depression**

**Skin:** flushing, diaphoresis

**Other:** physical or psychological drug dependence; drug tolerance; injection site pain, redness, or swelling

## Interactions

**Drug-drug.** *Antidepressants, antihistamines, MAO inhibitors, sedative-hypnotics:* additive CNS depression  
*Antihypertensives, diuretics, guanadrel, guanethidine, mecamylamine:* increased risk of hypotension

*Atropine, belladonna alkaloids, difenoxin, diphenoxylate, kaolin and pectin, loperamide, pargoric:* increased risk of CNS depression, severe constipation

*Barbiturates:* increased sedation

*Buprenorphine, butorphanol, nalbuphine, pentazocine:* precipitation of opioid withdrawal in physically dependent patients

*Nalbuphine, pentazocine:* decreased analgesia

**Drug-diagnostic tests.** *Amylase, lipase:* increased levels

**Drug-herbs.** *Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

### Patient monitoring

 With I.V. use, monitor for respiratory depression. Keep resuscitation equipment and naloxone nearby.

- Assess for signs and symptoms of physical or psychological drug dependence.
- Monitor for constipation.

### Patient teaching

 Instruct patient to take drug exactly as prescribed before pain becomes severe, but caution him that drug may be habit-forming.

- Tell patient to take oral form with food to avoid GI upset.
- Advise patient to report difficulty breathing, nausea, vomiting, or dizziness.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Tell patient to avoid alcohol while taking drug.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## hydroxychloroquine sulfate

Apo-Hydroxychloroquine<sup>✳</sup>, Gen-Hydroxychloroquine<sup>✳</sup>, Plaquenil

**Pharmacologic class:** 4-amino-quinolone

**Therapeutic class:** Antimalarial, antirheumatic, anti-inflammatory (disease-modifying)

**Pregnancy risk category C**

### FDA BOXED WARNING

- Familiarize yourself completely with contents of the manufacturer's package insert before administering or prescribing this drug.

### Action

Unknown. Thought to interfere with inhibition of protein synthesis and DNA replication, leading to parasitic death.

### Availability

*Tablets:* 200 mg (155 mg base); 200 mg hydroxychloroquine sulfate is equivalent to 155 mg of hydroxychloroquine base

### Indications and dosages

➤ Malaria prophylaxis (dosages expressed as mg of base)

**Adults:** 310 mg P.O. q week, starting 1 to 2 weeks before entering endemic area and continuing for 4 weeks after leaving area

**Children:** 5 mg/kg P.O. q week, starting 1 to 2 weeks before entering endemic area and continuing for 4 weeks after leaving area

➤ Acute malarial attack (dosages expressed as mg of base)

**Adults:** Initially, 620 mg P.O., then 310 mg 6 hours, 24 hours, and 48 hours later

**Children:** Initially, 10 mg/kg P.O., then 5 mg/kg 6 hours, 24 hours, and 48 hours later

➤ Rheumatoid arthritis

**Adults:** 400 to 600 mg/day P.O. for 4 to 12 weeks, then reduced by 50%

➤ Systemic lupus erythematosus

**Adults:** 400 mg P.O. once or twice daily for several months, then reduced to 200 to 400 mg daily, depending on response

### Contraindications

- Hypersensitivity to drug or chloroquine
- Retinal or visual field changes
- Long-term therapy in children

### Precautions

Use cautiously in:

- hepatic or renal impairment, G6PD deficiency, psoriasis, bone marrow depression, alcoholism
- obese patients
- pregnant or breastfeeding patients
- children.

### Administration

- Give with food or milk.
- For malaria prophylaxis, schedule doses on same day each week.

Route	Onset	Peak	Duration
P.O.	Unknown	2-4.5 hr	Unknown

### Adverse reactions

**CNS:** anxiety, apathy, confusion, fatigue, headache, psychoses, mood swings, irritability, neuromyopathy, peripheral neuritis, **seizures**

**CV:** ECG changes, hypotension

**EENT:** visual disturbances, retinopathy, keratopathy, ototoxicity, tinnitus

**GI:** nausea, vomiting, diarrhea, abdominal cramps, anorexia

**Hematologic:** leukopenia, agranulocytosis, aplastic anemia, thrombocytopenia

**Hepatic:** jaundice, **hepatotoxicity**

**Musculoskeletal:** muscle weakness

**Skin:** dermatoses, rash, pruritus, pigmentation changes, pleomorphic skin eruption, worsened psoriasis, alopecia, bleaching of hair

**Other:** weight loss

### Interactions

**Drug-diagnostic tests.** *Granulocytes, hemoglobin, platelets:* decreased values

**Drug-behaviors.** *Sun exposure:* exacerbation of drug-induced dermatoses

### Patient monitoring

🚨 Monitor for signs and symptoms of overdose, such as nausea, vomiting, drowsiness, visual disturbances, cardiovascular collapse, and seizures.

- Watch for adverse reactions.

### Patient teaching

- Advise patient to take with food or milk.

🚨 Instruct patient to immediately report such adverse reactions as vision changes, nausea, vomiting, drowsiness, mental changes, mood swings, headache, ringing in ears, muscle weakness, rash, bleeding, bruising, and yellowing of skin and eyes.

- In long-term therapy, advise patient to have regular eye exams.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## hydroxyurea

Droxia, Hydrea

**Pharmacologic class:** Antimetabolite

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

**FDA BOXED WARNING**

- Drug may cause severe and even life-threatening adverse effects. Administer under supervision of physician experienced in using drug to treat sickle cell anemia.
- Drug damages genes, chromosomes, and DNA and may be carcinogenic. Secondary leukemias have occurred in patients receiving it as long-term therapy for myeloproliferative disorders. Prescriber and patient must carefully weigh potential benefits against undefined risk of secondary cancers.

**Action**

Unknown. May inhibit enzyme necessary for DNA synthesis without disrupting RNA or protein synthesis.

**Availability**

*Capsules:* 200 mg, 300 mg, 400 mg, 500 mg

**Indications and dosages**

➤ Head and neck cancer; ovarian cancer; malignant melanoma

**Adults:** 60 to 80 mg/kg (2 to 3 g/m<sup>2</sup>) P.O. as a single daily dose q 3 days, or 20 to 30 mg/kg/day P.O. as a single dose. Begin therapy 7 days before radiation.

➤ Resistant chronic myelogenous leukemia

**Adults:** 20 to 30 mg/kg/day P.O. in one or two divided doses

➤ Sickle cell anemia

**Adults and children:** 15 mg/kg/day P.O. as a single dose. May increase by 5 mg/kg/day P.O. q 12 weeks, up to 35 mg/kg/day.

**Off-label uses**

- Thrombocythemia
- Human immunodeficiency virus

**Contraindications**

- Hypersensitivity to drug or tartrazine

- Bone marrow depression
- Severe anemia or thrombocytopenia

**Precautions**

Use cautiously in:

- renal or hepatic impairment
- obese patients
- females of childbearing age
- elderly patients.

**Administration**

- Provide frequent mouth care.

Route	Onset	Peak	Duration
P.O.	Unknown	2 hr	24 hr

**Adverse reactions**

**CNS:** drowsiness, malaise, confusion, dizziness, headache

**GI:** nausea, vomiting, diarrhea, constipation, stomatitis, anorexia

**GU:** dysuria, hyperuricemia, infertility, renal tubular dysfunction

**Hematologic:** anemia, megaloblastosis, leukopenia, thrombocytopenia, bone marrow depression

**Hepatic:** hepatitis

**Metabolic:** hyperuricemia

**Skin:** alopecia, erythema, pruritus, rash, urticaria, exacerbation of post-radiation erythema

**Other:** chills, fever

**Interactions**

**Drug-drug.** *Live-virus vaccines:* decreased antibody response to vaccine, increased risk of adverse reactions

*Myelosuppressants:* additive bone marrow depression

**Drug-diagnostic tests.** *Blood urea nitrogen, creatinine, uric acid:* increased values

*Hemoglobin, platelets, red blood cells, white blood cells:* decreased values

*Mean corpuscular volume:* transient increase

**Patient monitoring**

- Assess CBC weekly.

- Closely monitor patient with renal or hepatic impairment. Check kidney and liver function tests often.
- Assess fluid status. Make sure patient drinks 10 to 12 glasses of water daily.

### Patient teaching

- Advise patient to mark dates for drug doses, diagnostic tests, and treatments on calendar.
- 📢 Instruct patient to immediately report easy bruising, bleeding, unusual tiredness, or yellowing of skin or eyes.
- Tell patient to report such adverse effects as appetite loss, nausea, vomiting, oral lesions, constipation, diarrhea, confusion, dizziness, headache, and rash.
- Instruct female patient to use barrier contraception.
- Tell patient he will undergo regular blood testing to monitor drug effects.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## hydroxyzine hydrochloride

Apo-Hydroxyzine<sup>✳</sup>, Atarax<sup>⊕</sup>,

Hydroxyzine<sup>✳</sup>, Riva-Hydroxyzine<sup>✳</sup>,  
Ucerax<sup>⊕</sup>

## hydroxyzine pamoate

Vistaril

**Pharmacologic class:** Piperazine derivative

**Therapeutic class:** Anxiolytic, antihistamine, sedative-hypnotic

**Pregnancy risk category** NR

### Action

Unknown. Anxiolytic and sedative effects may stem from suppression of activity in subcortical levels of CNS. Antihistamine effects may result from histamine suppression at cellular receptor sites.

### Availability

*Capsules:* 25 mg, 50 mg, 100 mg (pamoate)

*Injection:* 25 mg/ml, 50 mg/ml

*Oral suspension:* 25 mg/5 ml (pamoate)

*Syrup:* 10 mg/5 ml

*Tablets:* 10 mg, 25 mg, 50 mg

### Indications and dosages

➤ Psychiatric emergencies; acute or chronic alcoholism

**Adults:** 50 to 100 mg I.M. immediately, then q 4 to 6 hours p.r.n.

➤ Nausea and vomiting; adjunct in pre- and postoperative sedation

**Adults:** 25 to 100 mg I.M. q 4 to 6 hours

**Children:** 1.1 mg/kg I.M. q 4 to 6 hours

➤ Anxiety

**Adults and children ages 6 and older:** 50 to 100 mg P.O. q.i.d.

**Children younger than age 6:** 50 mg P.O. daily in divided doses

➤ Pruritus

**Adults:** 25 mg P.O. three or four times daily

**Children ages 6 and older:** 50 to 100 mg P.O. daily in divided doses

**Children younger than age 6:** 50 mg P.O. daily in divided doses

### Off-label uses

- Seasonal allergic rhinitis

### Contraindications

- Hypersensitivity to drug or cetirizine
- Early pregnancy

### Precautions

Use cautiously in:

- severe hepatic dysfunction
- elderly patients.

## Administration

- ☞ Don't administer I.V. or subcutaneously (may cause tissue necrosis).
- Use Z-track method for I.M. injection. Inject deep into large muscle (preferably, upper outer quadrant of buttock).

Route	Onset	Peak	Duration
P.O., I.M.	15-30 min	2-4 hr	4-6 hr

## Adverse reactions

**CNS:** drowsiness, agitation, dizziness, headache, asthenia, ataxia

**GI:** nausea, constipation, dry mouth

**GU:** urinary retention

**Respiratory:** wheezing

**Skin:** flushing

**Other:** bitter taste, hypersensitivity reaction, pain or abscess at I.M. injection site

## Interactions

**Drug-drug.** *Anticholinergics, antidepressants, antihistamines, phenothiazines, quinidine:* additive effects of these drugs

*Antidepressants, antihistamines, opioids, sedative-hypnotics, other CNS depressants:* additive CNS depression

**Drug-diagnostic tests.** *Skin tests using allergen extracts:* false-negative results

**Drug-herbs.** *Angel's trumpet, jimsonweed, scopolia:* increased anticholinergic effects  
*Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

**Drug-behaviors.** *Alcohol use:* increased CNS depression

## Patient monitoring

- Monitor closely for CNS depression and oversedation, especially if patient is receiving other CNS depressants.
- Assess for adverse effects, especially in elderly patients.
- Monitor liver function test results in patients with hepatic impairment.

## Patient teaching

- Tell patient to contact prescriber if he experiences wheezing, muscle spasms, or incoordination.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Instruct patient to avoid alcohol while taking drug.
- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## hyoscyamine

Cystospaz

## hyoscyamine sulfate

Anaspaz, Hyospaz, Levsin, Levsin/SL, Symax, Symax-SL, Symax-SR

**Pharmacologic class:** Anticholinergic

**Therapeutic class:** Antispasmodic

**Pregnancy risk category C**

## Action

Competitively inhibits acetylcholine action at autonomic nerve sites, relaxing smooth muscle and decreasing glandular secretions

## Availability

**hyoscyamine**

*Tablets:* 0.15 mg

**hyoscyamine sulfate**

*Capsules (timed-release):* 0.375 mg

*Elixir:* 0.125 mg/5 ml

*Injection:* 0.5 mg/ml

*Oral solution:* 0.125 mg/ml

*Tablets:* 0.125 mg

*Tablets (extended-release):* 0.375 mg

*Tablets (orally disintegrating):* 0.125 mg

*Tablets (sublingual):* 0.125 mg

## Indications and dosages

➤ Adjunct in GI tract disorders; pain and hypersecretion in pancreatitis; cystitis; renal colic; infant colic; acute rhinitis; rigidity, tremors, and hyperhidrosis in Parkinson's disease; partial heart block due to vagal activity

**Adults and children ages 12 and older:** 0.125 to 0.25 mg (sulfate) P.O. or S.L. two to four times daily, or 0.375 to 0.75 mg (extended-release sulfate) P.O. q 12 hours, or 0.25 to 0.5 mg (sulfate) subcutaneously, I.M., or I.V. two to four times daily p.r.n.

**Children ages 2 to 12:** In children weighing approximately 50 kg (110 lb), 0.125 mg (sulfate) P.O. q 4 hours p.r.n.; in children weighing approximately 20 kg (40 lb), 0.0625 mg P.O. (sulfate); in children weighing approximately 10 kg (22 lb), 0.031 to 0.033 mg (sulfate) P.O. Don't exceed 0.75 mg/day.

**Children ages 2 and younger:** In children weighing approximately 7 kg (15 lb), 0.025 (sulfate) P.O. q 4 hours p.r.n.; in children weighing approximately 5 kg (11 lb), 0.0208 mg (sulfate) P.O. q 4 hours p.r.n.; in children weighing approximately 3.4 kg (7.5 lb), 0.0167 mg (sulfate) P.O. q 4 hours p.r.n.; in children weighing approximately 2.3 kg (5 lb), 0.0125 mg (sulfate) P.O. q 4 hours p.r.n.

➤ Before endoscopy or hypotonic duodenography

**Adults:** 0.25 to 0.5 mg (sulfate) subcutaneously, I.M., or I.V. 5 to 10 minutes before procedure

➤ Preoperatively to inhibit salivation and excessive respiratory secretions

**Adults and children older than age 2:** 5 mcg/kg (sulfate) I.M., I.V., or subcutaneously 30 to 60 minutes before anesthesia induction

➤ Muscarinic toxicity

**Adults:** 1 to 2 mg (sulfate) I.V. Additional 1-mg doses may be given I.M. or I.V. q 3 to 10 minutes until muscarinic signs and symptoms subside; doses

may be repeated if needed. Patient may need up to 25 mg during first 24 hours. For maintenance, 0.5 to 1 mg P.O. at intervals of several hours until signs and symptoms disappear.

## Contraindications

- Hypersensitivity to anticholinergics, alcohol, sulfites, or tartrazine
- Angle-closure glaucoma, synechia
- GU or GI obstructive disease, severe ulcerative colitis
- Renal or hepatic disease
- Neonates or premature infants

## Precautions

Use cautiously in:

- cardiovascular disease, prostatic hypertrophy, reflux esophagitis, brain damage, autonomic neuropathy, hyperthyroidism, glaucoma, Down syndrome, spastic paralysis
- elderly patients
- pregnant (safety not established) or breastfeeding patients
- infants and small children.

## Administration

- Administer 30 to 60 minutes before meals and at bedtime.
- Give bedtime dose at least 2 hours after last evening meal or snack.
- Be aware that hyoscyamine is given P.O. only, whereas hyoscyamine sulfate may be given P.O., I.M., I.V., sublingually, or subcutaneously.
- Know that a cholinesterase reactivator (pralidoxime) is given concomitantly to treat muscarinic toxicity.

Route	Onset	Peak	Duration
P.O.	20-30 min	0.5-1 hr	4-12 hr
P.O. (extended)	20-30 min	40-90 min	12 hr
I.V.	2 min	15-30 min	4 hr
I.M., subcut.	Unknown	15-30 min	4-12 hr
S.L.	5-20 min	0.5-1 hr	4 hr

**Adverse reactions**

**CNS:** confusion, excitement, nervousness, dizziness, light-headedness, headache, insomnia

**CV:** palpitations, tachycardia

**EENT:** blurred vision, cycloplegia, increased intraocular pressure, mydriasis, photophobia

**GI:** nausea, vomiting, constipation, bloating, dry mouth, **paralytic ileus**

**GU:** urinary hesitancy or retention, erectile dysfunction, lactation suppression

**Skin:** flushing, decreased sweating, urticaria, local irritation (with I.M., I.V., or subcutaneous use)

**Other:** altered taste, allergic reactions (including fever), heat intolerance, **anaphylaxis**

**Interactions**

**Drug-drug.** *Amantadine, antihistamines, antiparkinsonian drugs, disopyramide, glutethimide, meperidine, procainamide, quinidine, tricyclic antidepressants:* increased anticholinergic effects

*Antacids:* decreased hyoscyamine absorption

*Atenolol:* increased atenolol effects

*Ketoconazole:* interference with absorption of both drugs

*Methotrimeprazine:* increased risk of extrapyramidal effects

*Phenothiazines:* decreased phenothiazine effects, increased anticholinergic effects

**Drug-herbs.** *Jimsonweed:* adverse cardiovascular effects

**Patient monitoring**

- Watch for adverse reactions.
- Check for mental status changes, such as confusion.
- Evaluate fluid intake and output.
- Assess patient's response to temperature changes (especially hot weather). Drug may cause heat intolerance, predisposing patient to heat stroke.

**Patient teaching**

- Tell patient to take on empty stomach 30 to 60 minutes before meals and at

least 2 hours after last evening meal or snack.

- Instruct patient with urinary hesitancy to empty bladder before taking.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and herbs mentioned above.

**ibandronate sodium**

Boniva, Boniva Injection, Bonviva<sup>Ⓢ</sup>

**ibandronic acid**<sup>Ⓢ</sup>

**Pharmacologic class:** Bisphosphonate

**Therapeutic class:** Calcium regulator

**Pregnancy risk category C**

**Action**

Inhibits osteoclast activity and reduces bone resorption and turnover; in postmenopausal women, reduces elevated bone turnover rate, leading to (on average) net gain in bone mass

**Availability**

*Solution for injection:* 3 mg/3 ml in single-use prefilled glass syringes

*Tablets (film-coated):* 2.5 mg, 150 mg

**Indications and dosages**

➤ Osteoporosis treatment and prevention in postmenopausal women

**Adults:** 2.5-mg tablet P.O. daily, or 150-mg tablet P.O. once monthly on same date each month

➤ Osteoporosis treatment in postmenopausal women

**Adults:** 3 mg I.V. injection every 3 months

### Contraindications

- Hypersensitivity to drug or its components
- Uncorrected hypocalcemia
- Inability to stand or sit upright for at least 60 minutes (after oral administration)
- Abnormalities of esophagus, such as stricture or achalasia, that delay esophageal emptying (tablets)

### Precautions

Use cautiously in:

- severe renal impairment (not recommended)
- active upper GI disease (such as Barrett's esophagus, dysphagia, other esophageal diseases, gastritis, duodenitis, or ulcers)
- patients who develop jaw osteonecrosis during therapy
- concurrent use of aspirin, nonsteroidal anti-inflammatory drugs (NSAIDs), or other bisphosphonates
- pregnant or breastfeeding patients
- children younger than age 18 (safety and efficacy not established).

### Administration

- With patient standing or sitting upright, give oral dose with 6 to 8 oz water at least 60 minutes before first food or drink (other than water) of day or before administering other oral drugs or supplements (including calcium, antacids, and vitamins).
- Give with plain water only; some mineral waters may have higher calcium concentration and shouldn't be used.
- Don't let patient chew or suck tablet because this may cause oropharyngeal ulcers.
- Keep patient upright for at least 60 minutes after oral dose to avoid serious esophageal irritation.

- Give parenteral formulation only by I.V. injection over 15 to 30 seconds.
- Don't mix parenteral formulation with calcium-containing solutions or other I.V. drugs.
- If patient misses I.V. dose, give it as soon as possible; thereafter, give dose every 3 months from date of last injection. Don't administer more often than every 3 months.

Route	Onset	Peak	Duration
P.O.	0.5-2 hr	Unknown	Unknown
I.V.	Rapid	Unknown	Unknown

### Adverse reactions

**CNS:** insomnia, asthenia, headache, fatigue, dizziness, vertigo, nerve root lesion

**CV:** hypertension

**EENT:** pharyngitis

**GI:** constipation, diarrhea, vomiting, abdominal pain, dysphagia, esophagitis, esophageal irritation (tablets), gastric ulcer, dyspepsia, gastritis, **esophageal ulcer**

**GU:** urinary tract infection

**Metabolic:** hypercholesterolemia, hypocalcemia

**Musculoskeletal:** osteonecrosis (mainly in jaw), localized osteoarthritis and muscle cramp, joint disorder, joint pain, muscle pain, back pain, extremity pain, arthritis

**Respiratory:** upper respiratory tract infection, bronchitis, pneumonia

**Skin:** rash

**Other:** tooth disorder, influenza, infection, injection site reaction, allergic reaction

### Interactions

**Drug-drug.** *Aspirin, NSAIDs:* additive GI irritation

*Drugs containing calcium and other multivalent cations (such as aluminum, iron, magnesium), including antacids, supplements, and vitamins:* interference with ibandronate absorption

**Drug-diagnostic tests.** *Alkaline phosphatase, calcium:* decreased  
*Bone-imaging agents:* interference with test results

**Drug-food.** *Milk, mineral water, other foods and beverages:* interference with ibandronate absorption, reducing drug's bioavailability and effect on bone mineral density (when patient consumes food or beverage less than 60 minutes after ibandronate dose)

### Patient monitoring

- Monitor creatinine clearance in patients with mild or moderate renal impairment.
- 🔊 Monitor for signs and symptoms of GI irritation (including ulcers) after oral administration; discontinue drug if new or worsening symptoms occur.
- Evaluate serum calcium and phosphate levels.
- Monitor for hypocalcemia and other disturbances of bone and mineral metabolism; administer effective treatment before therapy starts.
- Monitor patient for adequate intake of supplemental calcium and vitamin D during therapy, as appropriate.

### Patient teaching

- Advise patient to read patient information leaflet carefully before starting drug.
- Instruct patient to take drug first thing in morning on empty stomach with 6 to 8 oz of plain water only.
- 🔊 Caution patient not to chew or suck tablet because this may cause throat ulcers.
- Instruct patient not to eat, drink, or take other oral medications for 60 minutes after taking tablet.
- 🔊 Caution patient not to lie down for at least 60 minutes after taking drug.
- Advise patient to take once-monthly tablet (150 mg) on same date each month.
- If patient misses once-monthly dose and next scheduled dose is more than

7 days away, instruct her to take one 150-mg tablet in morning after the day she remembers it and then resume taking one 150-mg tablet every month in morning of chosen day, per original schedule. However, if next scheduled dose is only 1 to 7 days away, tell her to wait until next scheduled dose.

🔊 Instruct patient to stop drug and immediately report heartburn, serious vomiting, severe chest or abdominal pain, difficulty swallowing, severe bone, joint, or muscle pain.

- If drug is prescribed for injection, tell patient she will receive it every 3 months.
- Advise patient to take supplemental calcium and vitamin D as prescribed, if dietary intake is inadequate.
- Teach patient to take only those pain relievers recommended by prescriber. Point out that some over-the-counter pain preparations (such as aspirin and NSAIDs) may worsen adverse effects.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## ibritumomab tiuxetan

Zevalin

**Pharmacologic class:** Monoclonal antibody

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

### FDA BOXED WARNING

- Deaths have occurred within 24 hours of rituximab infusion, an essential component of Zevalin therapeutic regimen. These fatalities were associated with hypoxia, pulmonary infiltrates, acute respiratory distress syndrome,

myocardial infarction, ventricular fibrillation, or cardiogenic shock. Most fatalities (80%) occurred with first rituximab infusion. Discontinue rituximab and Y-90 Zevalin infusions in patients who develop severe infusion reactions.

- Y-90 Zevalin administration causes severe and prolonged cytopenias in most patients. Don't administer Y-90 Zevalin to patients with 25% or greater lymphoma marrow involvement or impaired bone marrow reserve.
- Severe cutaneous and mucocutaneous reactions, some fatal, can occur with the Zevalin therapeutic regimen. Discontinue rituximab and Y-90 Zevalin infusions in patients experiencing severe cutaneous or mucocutaneous reactions.
- Dosage of Y-90 Zevalin shouldn't exceed 32.0 mCi (1,184 MBq).

**Action**

Binds indium-111 (In-111) or yttrium-90 (Y-90) with free amino groups of lysines and arginines within antibody; binds specifically to CD20 antigen, found on surface of normal and malignant B lymphocytes. Radioactive component of Y-90 causes cellular damage via free radicals in target cells.

**Availability**

*Injection:* 3.2 mg/2 ml (two Zevalin kits containing four vials each)

**Indications and dosages**

➤ Relapsed or refractory, low-grade or follicular B-cell non-Hodgkin's lymphoma (NHL); previously untreated follicular NHL in patients who achieve partial or complete response to first-line chemotherapy

**Adults:** Two-step regimen that includes pre-dose of rituximab

**Step 1:** Single I.V. infusion of 250 mg/m<sup>2</sup> rituximab at 50 mg/hour; in absence of infusion reactions, increase rate in

50-mg/hour increments q 30 minutes, to a maximum of 400 mg/hour. Immediately stop rituximab infusion for serious infusion reactions and discontinue Zevalin therapeutic regimen. Temporarily slow or interrupt rituximab infusion for less severe infusion reactions. If symptoms improve, continue infusion at one-half the previous rate.

**Step 2:** On day 7, 8, or 9, rituximab 250 mg/m<sup>2</sup> I.V. at initial rate of 100 mg/hour. Increase rate by 100-mg/hour increments at 30-minute intervals, to a maximum of 400 mg/hour as tolerated. If infusion reactions occurred during rituximab infusion on day 1 of treatment, administer rituximab at initial rate of 50 mg/hour and escalate infusion rate in 50-mg/hour increments every 30 minutes to a maximum of 400 mg/hour. Administer Y-90 Zevalin injection through free-flowing I.V. line within 4 hours after completion of rituximab infusion. Use a 0.22-micron, low-protein-binding in-line filter between syringe and infusion port. After injection, flush line with at least 10 ml of normal saline.

If platelet count is 150,000/mm<sup>3</sup> or greater, administer Y-90 Zevalin over 10 minutes as an I.V. injection at a dose of Y-90 0.4 mCi/kg (14.8 MBq/kg) actual body weight. If platelet count is 100,000/mm<sup>3</sup> to 149,000/mm<sup>3</sup> in relapsed or refractory patients, administer Y-90 Zevalin over 10 minutes as an I.V. injection at a dose of Y-90 0.3 mCi/kg (11.1 MBq/kg) actual body weight. Don't administer more than 32 mCi (1,184 MBq) Y-90 Zevalin dose regardless of patient's body weight.

**Contraindications**

None

**Precautions**

Use cautiously in:

- cardiac conditions
- elderly patients
- pregnant or breastfeeding patients.

## Administration

- 🔊 Don't administer to patients with lymphoma marrow involvement at or above 25% or impaired bone marrow reserve.
- 🔊 Assess for human antimurine antibody before treatment. If result is positive, patient may experience hypersensitivity reaction.
- Premedicate patient with acetaminophen and diphenhydramine, as ordered, before each rituximab infusion.
- Know that ibritumomab should be used only as part of a regimen that combines ibritumomab and rituximab.
- 🔊 Give ibritumomab by slow I.V. infusion over 10 minutes; monitor closely.
- 🔊 Don't give by I.V. push.
- 🔊 Take steps to prevent extravasation of Y-90 Zevalin. If extravasation occurs, immediately stop infusion and restart in another vein.
- Don't give Y-90 Zevalin if platelet count is less than 100,000/mm<sup>3</sup>.
- 🔊 Immediately and permanently discontinue drug if severe infusion reaction occurs (urticaria, hypotension, angioedema, hypoxia, bronchospasm, pulmonary infiltrates, acute respiratory distress syndrome, MI, ventricular fibrillation, cardiogenic shock). Temporarily slow or interrupt rituximab infusion for less severe infusion reactions.
- 🔊 Discontinue drug if severe cutaneous or mucocutaneous reactions develop.
- Follow facility policy on radiation precautions to protect patients, visitors, and medical personnel from radiation exposure.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** dizziness, anxiety, headache, insomnia, asthenia

**CV:** hypotension, peripheral edema  
**EENT:** rhinitis, epistaxis, throat irritation  
**GI:** nausea, vomiting, diarrhea, constipation, anorexia, dyspepsia, abdominal pain or enlargement, melena  
**Hematologic:** anemia, thrombocytopenia, neutropenia, pancytopenia, hemorrhage, myelodysplastic syndrome, acute myelogenous leukemia  
**Musculoskeletal:** joint pain, myalgia, back pain  
**Respiratory:** increased cough, dyspnea, apnea, bronchospasm  
**Skin:** flushing, bruising, diaphoresis, petechiae, pruritus, rash, urticaria, angioedema, erythema multiforme, Stevens-Johnson syndrome, toxic epidermal necrolysis, bullous dermatitis, exfoliative dermatitis  
**Other:** bacterial infection, I.V. site irritation, fever, chills, generalized pain, tumor pain, hypersensitivity reactions including anaphylaxis, myeloid malignancies, dysplasias, serious infusion reactions

## Interactions

None significant

## Patient monitoring

- 🔊 Institute infection control protocols. Protect patient from potential sources of infection.
- 🔊 Assess CBC and platelet count before starting therapy. Monitor regularly during and after therapy.
- 🔊 Monitor patient for hypersensitivity reactions, which can be fatal and usually occur within 30 minutes to 2 hours of administration.
- Be alert for unusual bleeding or bruising.

## Patient teaching

- 🔊 Instruct patient to promptly report difficulty breathing, rash, fever, chills, severe GI distress, black tarry stools, illness or injury, or unusual bleeding or bruising.

- Tell patient that drug increases his risk of infection. Instruct him to avoid crowds and potential or known sources of infection.
- Advise patient to eat small, frequent meals and take antiemetic drugs to control nausea and vomiting, as needed and prescribed.
- Advise patient that he'll undergo blood testing during therapy to monitor drug effects.
- Advise patient not to receive live viral vaccines during or immediately after taking this drug.
- As appropriate, review all other significant and life-threatening adverse reactions mentioned above.

## ibuprofen

**Pharmacologic class:** Nonsteroidal anti-inflammatory drug (NSAID)

**Therapeutic class:** Analgesic, antipyretic, anti-inflammatory

**Pregnancy risk category B** (third trimester: **D**)

### FDA BOXED WARNING

- Drug may increase risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke. Risk may increase with duration of use, and may be greater in patients who have cardiovascular disease or risk factors for it.
- Drug is contraindicated for perioperative pain in setting of coronary artery bypass graft surgery.
- Drug increases risk of serious GI adverse events, including bleeding, ulcers, and stomach or intestinal perforation, which can be fatal. These events can occur at any time during therapy and without warning. Elderly patients are at greater risk.

### Action

Unknown. Thought to inhibit cyclooxygenase, an enzyme needed for prostaglandin synthesis.

### Availability

*Capsules (liquigels):* 200 mg

*Injection:* 400 mg/4-ml, 800 mg/8-ml vials

*Oral suspension:* 100 mg/5 ml

*Pediatric drops:* 50 mg/1.25 ml

*Tablets:* 100 mg, 200 mg, 400 mg, 600 mg, 800 mg

*Tablets (chewable):* 50 mg, 100 mg

### Indications and dosages

➤ Rheumatoid arthritis; osteoarthritis

**Adults:** 1.2 to 3.2 g/day P.O. in three to four divided doses

➤ Mild to moderate pain

**Adults:** 400 mg P.O. q 4 to 6 hours p.r.n. or 400 to 800 mg I.V. over 30 minutes q 6 hours, as necessary

➤ Moderate to severe pain as adjunct to opioid analgesics

**Adults:** 400 to 800 mg I.V. over 30 minutes q 6 hours, as necessary

## ➤ Fever reduction

**Adults:** 400 mg I.V. over 30 minutes, followed by 400 mg P.O. q 4 to 6 hours or 100 to 200 mg P.O. q 4 hours as necessary

## ➤ Primary dysmenorrhea

**Adults:** 400 mg P.O. q 4 hours p.r.n.

## ➤ Juvenile arthritis

**Children:** 30 to 40 mg/kg/day P.O. in three or four divided doses. Daily dosages above 50 mg/kg aren't recommended.

## ➤ Fever reduction; pain relief

**Children ages 6 to 12:** 5 mg/kg P.O. if temperature is below 102.5 °F (39.2 °C) or 10 mg/kg if temperature is above 102.5 °F. Maximum daily dosage is 40 mg/kg.

**Off-label uses**

- Migraine and tension headaches

**Contraindications**

- Hypersensitivity to drug or other NSAIDs
- Perioperative use in coronary artery bypass graft surgery

**Precautions**

Use cautiously in:

- severe cardiovascular, renal, or hepatic disease; GI disease; asthma; chronic alcohol use
- elderly patients
- pregnant (avoid use after 30 weeks' gestation) or breastfeeding patients
- children younger than age 17 (safety and efficacy not established).

**Administration**

- Ideally, give oral form 1 hour before or 2 hours after meal. If GI upset occurs, give with meals.
- Be aware that patients must be well hydrated before I.V. form is administered.
- Dilute injection form before administering.

Route	Onset	Peak	Duration
P.O. (analgesic)	30 min	1-2 hr	4-6 hr
P.O. (anti-inflam.)	7 days	1-2 wk	Unknown

**Adverse reactions**

**CNS:** headache, dizziness, drowsiness, nervousness, **aseptic meningitis**

**CV:** hypertension, **arrhythmias**

**EENT:** amblyopia, blurred vision, tinnitus

**GI:** nausea, vomiting, constipation, dyspepsia, abdominal discomfort, **GI bleeding**

**GU:** cystitis, hematuria, azotemia, **renal failure**

**Hematologic:** anemia, **prolonged bleeding time, aplastic anemia, neutropenia, pancytopenia, thrombocytopenia, leukopenia, agranulocytosis**

**Hepatic:** hepatitis

**Metabolic:** hyperglycemia, **hypoglycemia**

**Respiratory:** bronchospasm

**Skin:** rash, pruritus, urticaria, **Stevens-Johnson syndrome**

**Other:** edema, allergic reactions including **anaphylaxis**

**Interactions**

**Drug-drug.** *Antihypertensives, diuretics:* decreased efficacy of these drugs  
*Aspirin and other NSAIDs, corticosteroids:* additive adverse GI effects

*Cefamandole, cefoperazone, cefotetan, drugs affecting platelet function (including abciximab, clopidogrel, eptifibatide, ticlopidine, tirofiban), plicamycin, thrombolytics, valproic acid, warfarin:* increased risk of bleeding

*Cyclosporine:* increased risk of nephrotoxicity

*Digoxin:* slightly increased digoxin blood level

*Lithium:* increased lithium blood level, greater risk of lithium toxicity

*Methotrexate:* increased risk of methotrexate toxicity

*Probenecid*: increased risk of ibuprofen toxicity

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, blood urea nitrogen, creatinine, lactate dehydrogenase, potassium*: increased values

*Bleeding time*: prolonged

*Creatinine clearance, glucose, hematocrit, hemoglobin, platelets, white blood cells*: decreased values

**Drug-herbs.** *Anise, arnica, chamomile, clove, dong quai, fenugreek, feverfew, garlic, ginger, ginkgo, ginseng, licorice*: increased risk of bleeding

*White willow*: additive adverse GI effects

**Drug-behaviors.** *Alcohol use*: additive adverse GI effects

*Sun exposure*: phototoxicity

### Patient monitoring

- Monitor for desired effect.
- Watch for GI upset, adverse CNS effects (such as headache and drowsiness), and hypersensitivity reaction.
- Stay alert for GI bleeding and ulcers, especially in long-term therapy.
- In long-term therapy, assess renal and hepatic function regularly.
- Monitor blood pressure closely during treatment.

### Patient teaching

- Tell patient to take oral drug with full glass of water, with food, or after meals to minimize GI upset.
- To help prevent esophageal irritation, instruct patient to avoid lying down for 30 to 60 minutes after taking dose.
-  Instruct patient to immediately report irregular heartbeats, black tarry stools, vision changes, unusual tiredness, yellowing of skin or eyes, change in urination pattern, difficulty breathing, finger or ankle swelling, weight gain, itching, rash, fever, or sore throat.
- Caution patient to avoid driving and other hazardous activities until he

knows how drug affects concentration, alertness, and balance.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## ibutilide fumarate

Corvert

**Pharmacologic class:** Ibutilide derivative

**Therapeutic class:** Antiarrhythmic (class III)

**Pregnancy risk category C**

### FDA BOXED WARNING

- Drug can cause potentially fatal arrhythmias—particularly sustained polymorphic ventricular tachycardia, usually in association with QT prolongation (torsades de pointes). In studies, these arrhythmias arose within several hours of administration. They can be reversed if treated promptly. Drug must be given in setting of continuous ECG monitoring and by personnel trained in identifying and treating acute ventricular arrhythmias. Patients with atrial fibrillation of more than 2 to 3 days' duration must be adequately anticoagulated, generally for at least 2 weeks.
- Patients with chronic atrial fibrillation tend to revert after conversion to sinus rhythm, and treatments to maintain sinus rhythm carry risks. Therefore, patients to be treated with drug should be selected carefully, with expected benefits of maintaining sinus rhythm outweighing drug's immediate risks and risks of maintenance therapy, and with drug offering benefits over alternative management.

**Action**

Prolongs myocardial action potential by slowing repolarization and atrio-ventricular (AV) conduction

**Availability**

*Solution:* 0.1 mg/ml in 10-ml vials

**Indications and dosages**

➤ To convert atrial fibrillation or flutter to sinus rhythm

**Adults weighing more than 60 kg (132 lb):** 1 vial (1 mg) by I.V. infusion over 10 minutes. May repeat after 10 minutes if arrhythmia persists.

**Adults weighing less than 60 kg (132 lb):** 0.1 ml/kg (0.01 mg/kg) by I.V. infusion over 10 minutes. May repeat after 10 minutes if arrhythmia persists.

**Contraindications**

- Hypersensitivity to drug or its components

**Precautions**

Use cautiously in:

- ventricular and AV arrhythmias
- pregnant or breastfeeding patients.

**Administration**

⚠ Monitor ECG continuously during and after infusion. Stop infusion immediately if ventricular tachycardia occurs.

- As appropriate, administer diluted or undiluted. To dilute, add 10-ml vial to 50 ml of normal saline solution or dextrose 5% in water, to yield a concentration of 0.017 mg/ml.
- Infuse over 10 minutes.

⚠ Don't give with amiodarone, disopyramide, quinidine, procainamide, or sotalol, because of increased risk of dangerous arrhythmias.

Route	Onset	Peak	Duration
I.V.	Immediate	10 min	Unknown

**Adverse reactions**

**CNS:** headache, light-headedness, dizziness, numbness or tingling in arms

**CV:** hypotension, hypertension, bradycardia, **bundle-branch block, ventricular extrasystoles, ventricular arrhythmias, ventricular tachycardia, AV heart block, heart failure**

**GI:** nausea

**GU:** renal failure

**Interactions**

**Drug-drug.** *Amiodarone, disopyramide, quinidine, procainamide, sotalol:* increased risk of dangerous arrhythmias

*Antihistamines, phenothiazines, tricyclic antidepressants:* increased proarrhythmic effect (prolonged QT interval)

**Patient monitoring**

- Before giving, assess electrolyte levels and correct abnormalities (especially involving potassium and magnesium), because hypokalemia and hypomagnesemia can lead to arrhythmias.

⚠ Watch for premature ventricular contractions, sinus tachycardia, sinus bradycardia, and heart block.

- Monitor ECG during and for at least 4 hours after infusion.

⚠ Keep emergency equipment (defibrillator, emergency cart and drug box, oxygen, suction, and intubation equipment) at hand during and for at least 4 hours after infusion.

- Monitor prothrombin time, International Normalized Ratio, and activated partial thromboplastin time if patient is receiving anticoagulant therapy.

**Patient teaching**

⚠ Instruct patient to immediately report chest pain, dizziness, numbness, palpitations, headache, or difficulty breathing.

- Tell patient he'll be monitored closely for at least 4 hours after drug administration.

## idarubicin hydrochloride

Idamycin PFS, Zavedos

**Pharmacologic class:** Anthracycline antibiotic

**Therapeutic class:** Antineoplastic

**Pregnancy risk category** D

### FDA BOXED WARNING

- Administer slowly I.V.—never I.M. or subcutaneously. Extravasation may cause severe local tissue necrosis.
- Drug may cause myocardial toxicity leading to heart failure, especially in patients who have received prior anthracyclines or have preexisting cardiac disease.
- Severe bone marrow depression can occur when drug is used at effective therapeutic doses.
- Reduce dosage in hepatic or renal impairment.
- Give under supervision of physician experienced in using leukemia chemotherapeutic drugs, in facility with adequate diagnostic and treatment resources.

### Action

Inhibits nucleic acid synthesis by disrupting DNA and RNA polymerase, causing cell death

### Availability

*Injection:* 1 mg/ml

### Indications and dosages

➤ Acute myeloid leukemia

**Adults:** 12 mg/m<sup>2</sup>/day by slow I.V. injection over 10 to 15 minutes for 3 days. As prescribed, give with cytarabine by continuous I.V. infusion for 7 days, or give cytarabine as I.V. bolus followed by 5 days of cytarabine by

continuous I.V. infusion. Second course may be given, depending on response.

### Dosage adjustment

- Renal or hepatic impairment
- Severe mucositis

### Off-label uses

- Acute nonlymphocytic and chronic myelogenous leukemias
- Non-Hodgkin's lymphoma
- Breast cancer

### Contraindications

- Hypersensitivity to drug
- Pregnancy or breastfeeding

### Precautions

Use cautiously in:

- renal or hepatic impairment
- bone marrow depression
- previous treatment with anthracyclines or cardiotoxic drugs
- cardiac disease.

### Administration

When preparing, wear goggles and gloves, because exposure may cause severe skin reaction. If exposure occurs, wash affected area immediately with soap and water. For eye exposure, follow standard eye irrigation procedure.

- Reconstitute 5-, 10-, or 20-mg vial with 5, 10, or 20 ml of normal saline solution, respectively, to yield a concentration of 1 mg/ml.
- Give slowly over 10 to 15 minutes into I.V. tubing that is infusing normal saline solution or dextrose 5% in water.
- Don't administer subcutaneously or I.M. (may cause tissue necrosis).
- If severe mucositis occurs, delay second course (if prescribed) until full recovery; then reduce dosage by 25%.

Route	Onset	Peak	Duration
I.V.	Immediate	Several min	Unknown

**Adverse reactions**

**CNS:** headache, mental status changes, peripheral neuropathy, **seizures**

**CV:** chest pain, **heart failure**, **atrial fibrillation**, **myocardial infarction**, **arrhythmias**

**GI:** nausea, vomiting, diarrhea, cramps, mucositis, **GI hemorrhage**

**GU:** red urine, **renal failure**

**Hematologic:** **bone marrow depression**

**Hepatic:** hepatic function changes

**Metabolic:** hyperuricemia

**Skin:** alopecia, urticaria, bullous erythematous rash on palms and soles, erythema at previously irradiated site, tissue necrosis or urticaria at injection site

**Other:** fever, infection, hypersensitivity reaction

**Interactions**

**Drug-drug.** *Alkaline solutions, heparin:* incompatibility

**Patient monitoring**

🔊 Evaluate injection site for burning, stinging, and extravasation. If extravasation occurs, stop infusion and restart in another vein. Then rinse area with normal saline solution and apply cold compress. (Local infiltration with corticosteroids may be indicated.)

- Monitor patient's response to therapy regularly.
- Assess serum uric acid level and CBC.
- Monitor hemodynamic status and cardiac output. Assess for S<sub>3</sub> heart sound (which signals heart failure).
- Assess fluid intake and output. Make sure patient is adequately hydrated, to prevent hyperuricemia.

**Patient teaching**

🔊 Instruct patient to immediately report unusual bleeding or bruising, difficulty breathing, or sudden weight gain.

- Tell patient to eat small, frequent meals.
- Advise patient to keep follow-up appointments for assessment, regular

blood testing, and monitoring of drug effects.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

**ifosfamide**

Ifex, Mitoxana<sup>®</sup>

**Pharmacologic class:** Alkylating agent, nitrogen mustard

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

**FDA BOXED WARNING**

- Give under supervision of physician experienced in using cancer chemotherapy, in facility with adequate diagnostic and treatment resources. Adverse urotoxic effects (especially hemorrhagic cystitis) and CNS toxicities (such as confusion and coma) have occurred; these effects may warrant drug discontinuation.
- Severe myelosuppression may occur.

**Action**

Alkylates DNA, interfering with replication and synthesis of susceptible cells and ultimately causing cell death

**Availability**

**Injection:** 1 g or 3 g in single-dose vials

**Indications and dosages**

➤ Germ-cell testicular cancer

**Adults:** 1.2 g/m<sup>2</sup>/day by I.V. infusion over 30 minutes for 5 days. May repeat q 3 weeks or after recovery from hematologic toxicity.

**Off-label uses**

- Acute leukemia
- Breast, lung, ovarian, and pancreatic cancer

- Malignant lymphomas
- Sarcomas

### Contraindications

- Hypersensitivity to drug
- Severe bone marrow depression
- Pregnancy or breastfeeding

### Precautions

Use cautiously in:

- impaired renal or hepatic function, mild to moderate bone marrow depression.

### Administration

- Follow facility policy for handling antineoplastic agents.
- Know that drug is usually given with other antineoplastics and hemorrhagic cystitis agent.
- To reconstitute, add sterile water or bacteriostatic water to vial, and shake gently.
- Mix 20 ml of diluent with 1-g vial or 60 ml of diluent with 3-g vial, to yield a concentration of 50 mg/ml. For smaller concentrations, dilute solution further with normal saline solution, dextrose 5% in water, lactated Ringer's solution, or sterile water.
- Administer I.V. slowly over at least 30 minutes.

Route	Onset	Peak	Duration
I.V.	Immediate	Unknown	Unknown

### Adverse reactions

**CNS:** drowsiness, confusion, ataxia, hallucinations, depressive psychosis, dizziness, disorientation, cranial nerve dysfunction, **coma, seizures**

**CV:** phlebitis

**GI:** nausea, vomiting, diarrhea, anorexia, stomatitis

**GU:** hematuria, bladder fibrosis, gonadal suppression, **nephrotoxicity, hemorrhagic cystitis**

**Hematologic:** anemia, **leukopenia, thrombocytopenia, bone marrow depression**

**Metabolic:** metabolic acidosis

**Skin:** alopecia

**Other:** infection, **secondary neoplasms**

### Interactions

**Drug-diagnostic tests.** *Hepatic enzymes, uric acid:* increased levels  
*Platelets, white blood cells:* decreased counts

### Patient monitoring

- Monitor hematopoietic function tests (such as CBC with white cell differential) before therapy and weekly during therapy.
- Assess fluid intake and output. Ensure fluid intake of at least 2 L daily to prevent bladder toxicity.
-  Monitor urine output for hematuria and hemorrhagic cystitis. Administer mesna (protective drug), as indicated and prescribed.

### Patient teaching

-  Tell patient to immediately report jaundice, unusual bleeding or bruising, bloody urine, pain on urination, fever, chills, sore throat, cough, difficulty breathing, unusual lumps or masses, mouth sores, or pain in flank, stomach, or joints.
- Instruct patient to maintain adequate hydration and nutrition. Advise him to drink 10 to 12 glasses of fluid each day.
- Inform patient that drug may cause hair loss.
- Advise both male and female patients to use reliable contraception during and immediately after therapy, because drug may cause severe birth defects.
- Urge patient to keep regular follow-up appointments for blood tests and monitoring of drug effects.
- As appropriate, review other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## iloperidone

Fanapt

**Pharmacologic class:** Piperidinyloxybenzisoxazole derivative

**Therapeutic class:** Antipsychotic

**Pregnancy risk category** C

### FDA BOXED WARNING

- Elderly patients with dementia-related psychosis treated with antipsychotics are at increased risk for death. Analyses of 17 placebo-controlled trials (modal duration of 10 weeks), largely in patients taking atypical antipsychotics, revealed a risk of death in the drug-treated patients of between 1.6 and 1.7 times the risk of death in placebo-treated patients. Over the course of a typical 10-week controlled trial, the rate of death in drug-treated patients was about 4.5%, compared to a rate of about 2.6% in the placebo group. Although causes of death were varied, most of the deaths appeared to be either cardiovascular (for example, heart failure, sudden death) or infectious (for example, pneumonia) in nature.
- Observational studies suggest that, similar to atypical antipsychotics, treatment with conventional antipsychotics may increase mortality. The extent to which findings of increased mortality in observational studies may be attributed to the antipsychotic as opposed to some characteristic(s) of the patients isn't clear.
- Iloperidone isn't approved for treatment of patients with dementia-related psychosis.

### Action

Unknown

### Availability

**Tablets:** 1 mg, 2 mg, 4 mg, 6 mg, 8 mg, 10 mg, 12 mg

### Indications and dosages

➤ Acute treatment of schizophrenia  
**Adults:** Initially, 1 mg P.O. daily; may increase by daily adjustments to 2 mg b.i.d., 4 mg b.i.d., 6 mg b.i.d., 8 mg b.i.d., 10 mg b.i.d., and 12 mg b.i.d. on days 2, 3, 4, 5, 6, and 7, respectively, to reach target dosage range of 6 to 12 mg P.O. b.i.d.

### Dosage adjustment

- Concomitant use of strong CYP2D6 inhibitors (such as fluoxetine, paroxetine) and strong CYP3A inhibitors (such as clarithromycin, ketoconazole)

### Contraindications

- Hypersensitivity to drug or its components

### Precautions

Use cautiously in:

- hepatic impairment (use not recommended)
- congenital long QTc syndrome, history of cardiac arrhythmias (avoid use)
- known cardiovascular disease, cerebrovascular disease, or conditions that predispose patient to hypotension
- seizures or conditions that lower seizure threshold (such as Alzheimer's dementia)
- history of neuroleptic malignant syndrome
- preexisting low WBC count, history of drug-induced leukopenia or neutropenia
- possibility of conditions contributing to an elevated core body temperature (strenuous exercise, exposure to extreme heat, concomitant medication with anticholinergic activity, dehydration)
- concomitant use of drugs known to prolong QTc interval, including Class 1A antiarrhythmics (such as

procainamide quinidine), Class III antiarrhythmics (such as amiodarone, sotalol), antipsychotics (such as chlorpromazine, thioridazine), antibiotics (such as gatifloxacin, moxifloxacin), or other drug classes known to prolong QTc interval (avoid use)

- conditions that may increase risk of torsades de pointes or sudden death in association with use of drugs that prolong QTc interval, including bradycardia, hypokalemia, hypomagnesemia, recent acute myocardial infarction, uncompensated heart failure, and cardiac arrhythmia (avoid use)
- concomitant use of drugs that inhibit iloperidone metabolism, patients with reduced CYP2D6 activity
- concomitant use of other centrally acting drugs
- patients at risk for suicide or aspiration pneumonia
- pregnant or breastfeeding patients
- children and adolescents (safety and efficacy not established).

**Administration**

- Determine baseline serum potassium and magnesium levels in patients at risk for significant electrolyte imbalance before starting drug.
- Perform fasting glucose testing in patients at risk for diabetes mellitus before starting drug.
- Administer without regard to meals.
- Be aware that drug must be titrated slowly to avoid orthostatic hypotension.
- Follow initiation schedule if an interval between dosing of more than 3 days occurs.

Route	Onset	Peak	Duration
P.O.	Unknown	2-4 hr	Unknown

**Adverse reactions**

**CNS:** fatigue, tardive dyskinesia, dizziness, somnolence, tremor, lethargy, extrapyramidal disorder, **seizures**, **neuroleptic malignant syndrome**

**CV:** hypotension, orthostatic hypotension, tachycardia, **prolonged QTc interval**

**EENT:** blurred vision, nasopharyngitis, nasal congestion

**GI:** nausea, diarrhea, dry mouth, abdominal discomfort, dysphagia

**GU:** ejaculation failure

**Hematologic:** leukopenia, neutropenia, **agranulocytosis**

**Metabolic:** hyperprolactinemia, **hyperglycemia (with associated ketoacidosis, hyperosmolar coma, or death)**

**Musculoskeletal:** arthralgia, stiffness

**Respiratory:** upper respiratory tract infection, dyspnea

**Skin:** rash

**Other:** weight gain, altered body temperature regulation, hypersensitivity (including pruritus, urticaria)

**Interactions**

**Drug-drug.** *Drugs known to prolong QTc interval:* increased risk of life-threatening arrhythmia

*Strong CYP2D6 inhibitors (such as fluoxetine, paroxetine), strong CYP3A inhibitors (such as clarithromycin, ketoconazole):* inhibited iloperidone elimination resulting in increased blood levels

**Drug-diagnostic tests.** *Blood glucose:* increased level

**Prolactin:** increased level

*White blood cells (WBCs):* decreased levels

**Drug-behaviors.** *Alcohol use:* increased CNS effects

**Patient monitoring**

 Discontinue drug in patient with persistent QTc measurements above 500 ms.

 Initiate further evaluation, including cardiac monitoring, if patient develops signs and symptoms of cardiac arrhythmias (such as dizziness, palpitations, or syncope).

☞ Monitor patient for signs and symptoms of neuroleptic malignant syndrome, such as hyperpyrexia, muscle rigidity, altered mental status (including catatonic signs), and evidence of autonomic instability (irregular pulse or blood pressure, tachycardia, diaphoresis, cardiac arrhythmia, elevated creatine kinase level, myoglobinuria from rhabdomyolysis, and renal failure). If such signs and symptoms occur, immediately discontinue drug and treat appropriately.

☞ Frequently monitor CBC with differential, especially during first few months of therapy in patient with pre-existing low WBC count or history of drug-induced leukopenia or neutropenia. Discontinue drug at first sign of decline in WBC count in absence of other causative factors.

☞ Discontinue drug if patient develops severe neutropenia (absolute neutrophil count below 1,000/mm<sup>3</sup>) and continue to monitor WBC count until recovery.

- Periodically perform fasting glucose testing in patient at risk for diabetes mellitus; watch closely for worsening of glucose control in patient with diabetes mellitus.
- Periodically monitor serum potassium and magnesium levels; hypokalemia and hypomagnesemia may increase risk of QTc interval prolongation.
- Consider discontinuing drug if signs and symptoms of tardive dyskinesia occur (such as repetitive, involuntary, purposeless movements; grimacing; tongue protrusion; or lip smacking).
- Carefully evaluate patient for history of drug abuse; if history exists, observe patient for signs and symptoms of misuse or abuse (such as drug-seeking behavior and increases in dosage). Also evaluate patient for risk of suicide.

## Patient teaching

- Instruct patient to take drug with or without food.

☞ Instruct patient to immediately report signs and symptoms of cardiac arrhythmias (such as dizziness, palpitations, or syncope).

☞ Instruct patient to immediately report signs and symptoms of neurologic malignant syndrome, such as fever, muscle rigidity, altered mental status (including catatonic signs), irregular pulse or blood pressure, rapid heartbeat, and excessive sweating.

- Tell patient to promptly report fever or other signs and symptoms of infection.
- Tell patient to promptly report signs and symptoms of tardive dyskinesia (such as repetitive, involuntary, purposeless movements; grimacing; tongue protrusion; or lip smacking).
- Tell patient to report signs and symptoms of high blood glucose level (such as weakness, or excessive thirst, hunger, or urination).
- Advise patient to move slowly on rising to avoid sudden drop in blood pressure.
- Advise patient to avoid excessive exercise, exposure to extreme heat, and dehydration.
- Caution patient to avoid driving and other hazardous activities until drug's effects on concentration and alertness are known.
- Advise patient to avoid alcohol use while taking drug.
- Advise patient to consult prescriber before taking other prescription or nonprescription drugs.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and behaviors mentioned above.

## imatinib mesylate

Gleevec, Glivec

**Pharmacologic class:** Protein-tyrosine kinase inhibitor

**Therapeutic class:** Antineoplastic

**Pregnancy risk category D**

### Action

Inhibits proliferation of Bcr-Abl tyrosine kinase, an abnormal chromosome protein found in most patients with chronic myeloid leukemia (CML). This inhibition suppresses tumor growth.

### Availability

Tablets: 100 mg, 400 mg

### Indications and dosages

➤ Philadelphia chromosome–positive (Ph+) CML

**Adults:** During chronic phase, 400 mg P.O. daily as a single dose; during accelerated phase or blast crisis, 600 mg P.O. daily as a single dose. May increase to 600 mg P.O. daily during chronic phase or to 800 mg P.O. daily (400 mg b.i.d.) during accelerated phase or blast crisis in absence of severe adverse drug reaction and severe non-leukemia-related neutropenia or thrombocytopenia in following circumstances: disease progression at any time, failure to achieve satisfactory hematologic response after at least 3 months of treatment, failure to achieve cytogenetic response after 6 to 12 months of treatment, or loss of previously achieved hematologic or cytogenetic response.

➤ Newly diagnosed Ph+ CML

**Children:** 340 mg/m<sup>2</sup>/day P.O. as once-daily dose; or, daily dose may be split into two (once in morning and once in evening). Daily dose not to exceed 600 mg.

➤ Ph+ chronic-phase CML recurrent after stem cell transplant or resistant to interferon-alpha therapy

**Children:** 260 mg/m<sup>2</sup>/day P.O. as once-daily dose; or, daily dose may be split into two (once in morning and once in evening).

➤ Relapsed/refractory Ph+ acute lymphoblastic leukemia

**Adults:** 600 mg P.O. daily as single dose

➤ Myelodysplastic/myeloproliferative diseases

**Adults:** 400 mg P.O. daily as single dose

➤ Aggressive systemic mastocytosis (ASM)

**Adults:** Recommended dosage is 400 mg

P.O. daily as single dose for patients

without D816V c-Kit mutation. If

c-Kit mutational status is unknown or

unavailable, 400 mg daily may be con-

sidered for patients with ASM not

responding satisfactorily to other ther-

apies. For patients with ASM associ-

ated with eosinophilia, a starting dose

of 100 mg P.O. daily is recommended.

Dosage increase from 100 to 400 mg

for these patients may be considered in

absence of adverse drug reactions if

assessments show insufficient response

to therapy.

➤ Hypereosinophilic syndrome/

chronic eosinophilic leukemia

**Adults:** Recommended dosage is

400 mg P.O. daily as single dose

➤ Dermatofibrosarcoma protuberans

**Adults:** Recommended dosage is

800 mg P.O. daily (given as 400 mg

twice daily)

➤ Kit (CD117)-positive unresectable

or metastatic malignant GI stromal

tumors

**Adults:** 400 to 600 mg P.O. daily

### Dosage adjustment

- Hepatic or hematologic impairment

- Concurrent use of potent CYP3A4

- inducers, such as rifampin or

- phenytoin

## Contraindications

- Hypersensitivity to drug or its components

## Precautions

Use cautiously in:

- renal or hepatic impairment
- pregnant or breastfeeding patients
- children younger than age 2 (safety and efficacy not established).

## Administration

- Give with meal and large glass of water.
- Disperse tablets in glass of water or apple juice for patients unable to swallow tablets. Place required number of tablets in appropriate volume of beverage (approximately 50 ml for 100-mg tablet, and 200 ml for 400-mg tablet) and stir with spoon. Administer suspension immediately after complete disintegration of tablets.

Route	Onset	Peak	Duration
P.O.	Unknown	2-4 hr	Unknown

## Adverse reactions

**CNS:** headache, fatigue, asthenia, malaise, insomnia, headache, **cerebral hemorrhage**

**CV:** heart failure, ventricular dysfunction

**GI:** nausea, vomiting, diarrhea, constipation, anorexia, abdominal pain or cramps, dyspepsia, **GI hemorrhage**

**Hematologic:** anemia, **hemorrhage**, neutropenia, thrombocytopenia, **gastrointestinal perforation**

**Hepatic:** hepatotoxicity

**Metabolic:** hypokalemia, fluid retention

**Musculoskeletal:** myalgia, muscle cramps, musculoskeletal or joint pain

**Respiratory:** cough, dyspnea, pneumonia

**Skin:** rash, pruritus, night sweats, petechiae **bullous dermatitis**, reactions (**erythema multiforme**, **Stevens-Johnson syndrome**)

**Other:** weight gain, edema, fever

## Interactions

**Drug-drug.** *Cyclosporine, dihydropyridine calcium channel blockers, pimozide, some HMG-CoA reductase inhibitors, triazolobenzodiazepines:* increased blood levels of these drugs

*CYP450-3A4 inducers (such as carbamazepine, dexamethasone, phenobarbital, phenytoin):* increased metabolism and decreased blood level of imatinib  
*CYP450-3A4 inhibitors (such as clarithromycin, erythromycin, itraconazole, ketoconazole):* decreased metabolism and increased blood level of imatinib  
*Warfarin:* altered warfarin metabolism

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, creatinine, hepatic enzymes:* increased values

*Hemoglobin, neutrophils, platelets, potassium:* decreased values

**Drug-herbs.** *St. John's wort:* decreased imatinib effects

## Patient monitoring

- Monitor for GI distress. Provide small, frequent meals; consult dietitian if nausea and vomiting persist.

 Monitor CBC before therapy starts and regularly during therapy. Expect to adjust dosage if bone marrow depression occurs.

 Evaluate for signs and symptoms of bleeding, edema, and fluid retention.

- Measure daily weight and fluid intake and output.

- Monitor liver function tests.

## Patient teaching

- Advise patient to take with a meal and a large glass of water.

• Instruct patient to avoid potential sources of infection, such as crowds and people with known infections.

- Tell patient drug may cause sudden weight gain and fluid retention.

Instruct him to weigh himself daily.

 Advise patient to immediately report sudden weight gain, swelling,

difficulty breathing, signs or symptoms of infection, unusual bleeding or bruising, or jaundice.

- Tell patient he'll undergo frequent blood testing to monitor drug effects.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## imipenem and cilastatin sodium

Primaxin

*Pharmacologic class:* Carbapenem

*Therapeutic class:* Anti-infective

*Pregnancy risk category* C

### Action

Acts against many gram-positive and gram-negative organisms by binding to bacterial cell wall, causing cell death. Addition of cilastatin prevents renal inactivation of imipenem, resulting in increased urinary concentration. Imipenem resists actions of many enzymes that degrade most other penicillins and penicillin-like drugs.

### Availability

*Powder for I.M. injection:* 500 mg imipenem/500 mg cilastatin, 750 mg imipenem/750 mg cilastatin  
*Powder for I.V. injection:* 250 mg imipenem/250 mg cilastatin, 500 mg imipenem/500 mg cilastatin

### Indications and dosages

➤ Lower respiratory tract infections, urinary tract infections, abdominal infections, gynecologic infections, skin infections, bone and joint infections, endocarditis, and polymicrobial infections

**Adults:** For mild infections, 250 to 500 mg I.V. q 6 hours; for moderate infections, 500 mg I.V. q 6 to 8 hours or 1 g I.V. q 8 hours; for serious infections, 500 mg I.V. q 6 hours to 1 g q 6 to 8 hours or 500 to 750 mg I.M. q 12 hours

**Children:** 15 to 25 mg/kg I.V. q 6 hours or 10 to 15 mg/kg I.M. q 6 hours

**Infants ages 4 weeks to 3 months:**

25 mg/kg I.V. q 6 hours

**Infants ages 1 to 4 weeks:** 25 mg/kg I.V. q 8 hours

**Infants age 1 week and younger:**

25 mg/kg I.V. q 12 hours

### Dosage adjustment

- Renal impairment

### Contraindications

- Hypersensitivity to drug, penicillins, or cephalosporins

### Precautions

Use cautiously in:

- seizure disorders, renal impairment
- history of multiple hypersensitivity reactions
- elderly patients
- pregnant or breastfeeding patients.

### Administration

- For I.V. use, reconstitute each 250- or 500-mg vial with 10 ml of diluent; shake well.
- For piggyback infusion, add 250- or 500-mg I.V. dose to 100 ml of diluent; shake solution until clear and drug has dissolved completely.
- Infuse doses of 500 mg or less over 20 to 30 minutes; infuse doses of 750 to 1,000 mg over 40 to 60 minutes.
- Slow infusion rate if patient experiences nausea, vomiting, dizziness or sweating.
- For I.M. use, inject into large muscle.

Route	Onset	Peak	Duration
I.V.	Rapid	End of infusion	6-8 hr
I.M.	Rapid	1-2 hr	12 hr

**Adverse reactions**

**CNS:** dizziness, drowsiness, **seizures**

**CV:** hypotension

**GI:** nausea, vomiting, diarrhea, **pseudomembranous colitis**

**Hematologic:** eosinophilia

**Skin:** rash, pruritus, diaphoresis, urticaria

**Other:** phlebitis at I.V. site, fever, superinfection, allergic reactions including **anaphylaxis**

**Interactions**

**Drug-drug.** *Cyclosporine, ganciclovir:* increased risk of seizures

*Probenecid:* decreased renal excretion of imipenem

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, lactate dehydrogenase:* increased values

*Direct Coombs' test:* positive result  
*Hematocrit, hemoglobin:* decreased

**Patient monitoring**

🔊 Stay alert for seizures in patients with brain lesions, head trauma, or other CNS disorders and in those receiving more than 2 g daily.

🔊 Monitor closely for severe diarrhea and hypersensitivity reaction.

- Assess tissue or fluid culture results obtained before and during therapy.
- Monitor for signs and symptoms of infection, such as fever and elevated white blood cell count. Also evaluate for bacterial and fungal superinfection.
- Monitor electrolyte levels, especially sodium.

**Patient teaching**

- Caution patient to report discomfort at I.V. site.

🔊 Instruct patient to report rash, hives, difficulty breathing, and signs or symptoms of superinfection (such as diarrhea, mouth sores, and vaginal itching or discharge).

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

**imipramine hydrochloride**

Apo-Imipramine<sup>✳</sup>, Impril<sup>✳</sup>,  
Novopramine<sup>✳</sup>, PMS-Imipramine<sup>✳</sup>,  
Tofranil

**imipramine pamoate**

Tofranil-PM

**Pharmacologic class:** Dibenzazepine derivative

**Therapeutic class:** Tricyclic antidepressant

**Pregnancy risk category C**

**FDA BOXED WARNING**

- Drug may increase risk of suicidal thinking and behavior in children and adolescents with major depressive disorder and other psychiatric disorders, especially during first few months of therapy. Risk must be balanced with clinical need, as depression itself increases suicide risk. With patient of any age, observe closely for clinical worsening, suicidality, and unusual behavior changes when therapy begins. Advise family and caregivers to observe patient closely and communicate with prescriber as needed.
- Drug isn't approved for use in pediatric patients.

**Action**

Unknown. May block reuptake of norepinephrine and serotonin at neuronal membrane, potentiating their effects.

**Availability**

*Capsules:* 75 mg, 100 mg, 125 mg, 150 mg (pamoate)

*Tablets:* 10 mg, 25 mg, 50 mg (hydrochloride)

**Indications and dosages**

➤ Endogenous depression

**Adults:** 75 to 100 mg P.O. daily in divided doses. Don't exceed 200 mg/day for outpatients or 300 mg/day for inpatients.

**Elderly patients, adolescents:** 30 to 40 mg P.O. daily in divided doses, up to 100 mg/day

➤ Functional enuresis

**Children:** 25 mg P.O. daily 1 hour before bedtime. If necessary, increase by 25 mg/day at weekly intervals, up to 75 mg P.O. daily in children ages 12 and older or up to 50 mg P.O. daily in children younger than age 12.

➤ Attention deficit hyperactivity disorder

**Children ages 6 and older:** 2 to 5 mg/kg P.O. daily in two or three divided doses

**Off-label uses**

- Diabetic neuropathy

**Contraindications**

- Hypersensitivity to drug or bisulfites
- Untreated angle-closure glaucoma
- MAO inhibitor use within past 14 days

**Precautions**

Use cautiously in:

- cardiovascular disease, prostatic enlargement, seizures, urinary retention
- elderly patients
- pregnant or breastfeeding patients.

**Administration**

⚠ Don't give concurrently with MAO inhibitors. Interaction may lead to hypotension, tachycardia, and potentially fatal reactions.

- Give with food or milk if GI upset occurs.

Route	Onset	Peak	Duration
P.O.	Unknown	30 min-2 hr	2-6 wk

**Adverse reactions**

**CNS:** fatigue, sedation, agitation, confusion, hallucinations, drowsiness, dizziness, syncope, extrapyramidal effects, poor concentration,  **cerebrovascular accident, seizures, suicidal behavior or ideation** (especially in child or adolescent)

**CV:** hypotension, ECG changes, hypertension, vasculitis, palpitations, tachycardia, **arrhythmias, myocardial infarction, heart block**

**EENT:** blurred vision, increased intraocular pressure (IOP), lacrimation, tinnitus, nasal congestion

**GI:** diarrhea, dry mouth, **paralytic ileus**

**GU:** urinary retention, urinary tract dilation, gynecomastia, menstrual irregularities, galactorrhea, testicular swelling, libido changes, erectile dysfunction

**Hematologic:** eosinophilia, purpura, **bone marrow suppression, agranulocytosis, thrombocytopenia, leukopenia**

**Hepatic:** hepatitis

**Metabolic:** hyperthermia, hyperglycemia, **hypoglycemia**

**Skin:** flushing, diaphoresis, photosensitivity, rash, urticaria, pruritus, petechiae, alopecia

**Other:** increased appetite, weight gain or loss, edema, drug fever, chills, hypersensitivity reactions

**Interactions**

**Drug-drug.** *Adrenergics:* increased hypertensive effect

*Carbamazepine, class IC antiarrhythmics, other antidepressants, phenothiazines:* additive effects of imipramine

*CNS depressants:* additive CNS depression

*Clonidine:* decreased clonidine effects

*CYP450-2D6 inhibitors (such as amiodarone, cimetidine, quinidine, ritonavir):* increased imipramine effects

*Guanethidine:* prevention of therapeutic response to imipramine

*Levodopa:* delayed or decreased levodopa absorption, hypertension

*MAO inhibitors:* hypotension, tachycardia, potentially fatal reactions

*Selective serotonin reuptake inhibitors:* increased imipramine blood level

*Sparfloxacin:* increased risk of cardiovascular reactions

**Drug-diagnostic tests.** *Alkaline phosphatase, bilirubin:* elevated levels

*Glucose:* increased or decreased level

*Liver function tests:* altered values

**Drug-herbs.** *Angel's trumpet, jimsonweed, scopolia:* increased anticholinergic effects

*Chamomile, hops, kava, skullcap, valerian:* increased CNS depression

*Evening primrose oil:* additive or synergistic effects

*S-adenosylmethionine (SAM-e), St. John's wort:* serotonin syndrome

**Drug-behaviors.** *Alcohol use:* increased CNS depression

*Smoking:* increased metabolism and altered effects of imipramine

*Sun exposure:* increased risk of photosensitivity

### Patient monitoring

📢 Closely monitor patient's mood and assess his risk for self-harm. Limit drug access if he may be suicidal.

- Assess for urinary retention and increased IOP in patients with history of urinary retention or angle-closure glaucoma.

📢 Monitor blood pressure before and during therapy and before dosage increases.

- Watch for arrhythmias in patients with history of cardiac disease.
- During withdrawal, monitor for adverse effects, such as headache, malaise, nausea, vomiting, and sleep disturbances.

- Assess for signs and symptoms of infection. Monitor CBC with white cell differential.

### Patient teaching

📢 Teach patient or caregiver to recognize and immediately report signs of suicidal intent or expressions of suicidal ideation (especially in child or adolescent).

- Instruct patient to eat small, frequent meals to minimize GI upset.

- Inform patient that drug may cause changes in sexual function, such as erectile dysfunction and decreased libido.

📢 Tell patient to immediately report seizure, chest pain, abdominal pain or bloating, easy bruising or bleeding, unusual tiredness, or yellowing of skin or eyes.

- Advise patient to report fever, chills, sore throat, dry mouth, excessive sedation, difficulty urinating, or palpitations.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

### immune globulin for I.M. use (IGIM)

GammaSTAN S/D

### immune globulin for I.V. use, human (IGIV)

Carimune NF, Flebogamma, Gammagard S/D, Gammar-P IV, Gamunex, Octagam, Polygam S/D, Privigen, Sandoglobulin, Vivaglobulin

## immune globulin for I.V. and subcutaneous use, human

Gamunex-C

## immune globulin for subcutaneous use, human

Hizentra

**Pharmacologic class:** Immune serum

**Therapeutic class:** Antibody-production stimulator

**Pregnancy risk category C**

### FDA BOXED WARNING

• IGIV (human) products have been linked to renal dysfunction, acute renal failure (ARF), osmotic nephrosis, and death. Patients predisposed to ARF include those with preexisting renal insufficiency, diabetes mellitus, age older than 65, volume depletion, sepsis, or paraproteinemia and those receiving known nephrotoxic drugs. In these patients, give drug at minimum rate of infusion feasible. IGIV products containing sucrose accounted for disproportionate share of renal dysfunction and acute renal failure reports.

### Action

Improves immunity by binding to and neutralizing pathogens, thereby increasing antibodies against bacterial, viral, parasitic, and mycoplasmic antigens. Acts through antimicrobial and antitoxin neutralization.

### Availability

**Injection:** 2- and 10-ml vials (IGIM)

**Powder for injection:** 1-, 2.5-, 3-, 5-, 6-, 10-, and 12-g vials (IGIV)

**Solution (5%):** 10-, 50-, 100-, 200-, and 250-ml vials (IGIV)

**Solution (10%):** 10-, 25-, 50-, 100-, and 200-ml vials (IGIV)

### Indications and dosages

➤ To prevent hepatitis A

**Adults traveling to areas where hepatitis A is common:** 0.02 ml/kg I.M. if staying less than 3 months; 0.06 ml/kg repeated q 4 to 6 months if staying 3 months or longer

**Adults with household or institutional contacts:** 0.02 ml/kg I.M.

➤ To prevent or reduce severity of measles in susceptible persons

**Adults and children:** 0.2 ml/kg to 0.25 ml/kg I.M. within 6 days of exposure to measles

➤ Exposure to measles in immunocompromised children

**Children:** 0.5 ml/kg I.M. as soon as possible after exposure

➤ Varicella in immunocompromised patients

**Adults:** 0.6 to 1.2 ml/kg I.M. as soon as possible if varicella-zoster immune globulin is unavailable

➤ To reduce risk of infection and fetal damage in females exposed to rubella during early pregnancy

**Adults:** 0.55 ml/kg I.M.

➤ Immunoglobulin deficiency

**Adults:** Initially, 1.3 ml/kg I.M., followed in 3 to 4 weeks by 0.66 ml/kg, up to 100 mg/kg q 3 to 4 weeks

➤ Immunodeficiency

*Gamimune N*—

**Adults and children:** 100 to 200 mg/kg I.V. or 2 to 4 ml/kg (10%) I.V. monthly

*Gammagard S/D*—

**Adults and children:** 200 to 400 mg/kg I.V., then monthly in doses based on response

*Gammar-P IV*—

**Adults:** 200 to 400 mg/kg I.V. q 3 to 4 weeks

**Children and adolescents:** 200 mg/kg I.V. q 3 to 4 weeks

*Iveegam EN*—

**Adults and children:** 200 mg/kg I.V. monthly; may increase up to 800 mg/kg/month based on response

*Panglobulin*—

**Adults and children:** 200 mg/kg I.V. monthly, increased to 300 mg/kg/month. In some patients, infusion frequency may be increased.

*Panglobulin NF/Carimune NF*—

**Adults and children:** 0.2 g/kg I.V. monthly. If response inadequate, dosage may be increased to 0.3 g/kg or infusion frequency may be increased.

*Polygam S/D*—

**Adults and children:** 100 to 400 mg/kg I.V. monthly

*Sandoglobulin*—

**Adults and children:** 100 to 400 mg/kg I.V. monthly. In patients with previously untreated agammaglobulinemia or hypogammaglobulinemia, first infusion may be increased to 300 mg/kg or infusion frequency may be increased.

*Venoglobulin*—

**Adults and children:** 200 mg/kg I.V. monthly, increased up to 400 mg/kg/month. In some patients, infusion frequency may be increased.

➤ Idiopathic thrombocytopenic purpura

*Gamimune N*—

**Adults and children:** 400 mg/kg I.V. for 5 consecutive days, or 1,000 mg/kg/day for 1 day or for 2 consecutive days

*Gammagard S/D*—

**Adults and children:** 1,000 mg/kg I.V. Up to three doses may be given on alternating days, dependent on platelet count.

*Panglobulin*—

**Adults and children:** Initially, 0.4 g/kg I.V. for 2 to 5 consecutive days

*Polygam S/D*—

**Adults and children:** 1 g/kg I.V. Depending on response, additional doses may be given.

*Venoglobulin-S*—

**Adults and children:** 2,000 mg/kg I.V. over 5 days or less for induction

therapy; then 1,000 mg/kg p.r.n. to maintain platelet count of 30,000/mm<sup>3</sup> in children or 20,000/mm<sup>3</sup> in adults or to prevent bleeding episodes between infusions

➤ Kawasaki disease

*Gammagard S/D*—

**Adults and adolescents:** 1 g/kg I.V. as a single dose; alternatively, 400 mg/kg/day for 4 consecutive days with aspirin

*Iveegam EN*—

**Adults and children:** 400 mg/kg/day

I.V. with aspirin

*Polygam S/D*—

**Adults and children:** 1 g/kg I.V. as a single dose, or 400 mg/kg I.V. for 4 consecutive days starting within 7 days of fever onset. Give with aspirin, as prescribed.

*Sandoglobulin*—

**Adults and children:** 400 mg/kg I.V. for 2 to 5 consecutive days. If platelet count falls below 30,000/mm<sup>3</sup> or significant bleeding occurs, may give 0.4 g/kg as a single infusion, increased to 0.8 or 1 g/kg as a single infusion, depending on response.

*Venoglobulin S*—

**Adults and children:** 2 g/kg I.V. infused over 10 to 12 hours with aspirin

➤ To prevent bacterial infection in patients with hypogammaglobulinemia or recurrent bacterial infection associated with B-cell chronic lymphocytic leukemia

**Adults and adolescents:** 400 mg/kg I.V. (*Gammagard S/D* or *Polygam S/D*) q 3 to 4 weeks

➤ To reduce risk of graft-versus-host disease, interstitial pneumonia, septicemia, and other infections during first 100 days after bone marrow transplantation

**Adults ages 20 and older:** 500 mg/kg I.V. (*Gamimune N*) 7 days before and 2 days before transplantation, then weekly through 90th day after transplantation

- To prevent bacterial infection in children with human immunodeficiency virus
- Children:** 400 mg/kg I.V. (Gamimune N) q 28 days

### Off-label uses

- Chronic inflammatory demyelinating polyneuropathy
- Guillain-Barré syndrome

### Contraindications

- Hypersensitivity to drug or its components
- Selective immunoglobulin A deficiency

### Precautions

Use cautiously in:

- bleeding disorders, renal impairment
- pregnant patients.

### Administration

- Before giving, determine if patient has risk factors for acute renal failure (such as use of nephrotoxic drugs; history of diabetes mellitus, renal insufficiency, sepsis, volume depletion, or paraproteinemia; age 65 or older).
- For I.V. use, decrease infusion rate by 50% to 25% for patients at risk for renal dysfunction.
- Give IGIM by I.M. route only; give IGIV by I.V. route only.
- If sterile laminar airflow conditions aren't available for drug reconstitution, administer immediately; discard unused portion.
- Don't shake vigorously, because foaming may occur. Know that cold drug or diluent may take up to 20 minutes to dissolve.

Route	Onset	Peak	Duration
I.V.	Unknown	Unknown	21-28 days
I.M.	Unknown	2 days	Unknown

### Adverse reactions

- CNS:** headache, malaise
- CV:** chest pain, tachycardia, **thromboembolism**
- GI:** nausea, vomiting, abdominal pain
- Musculoskeletal:** joint pain, back pain, myalgia
- Respiratory:** dyspnea
- Skin:** pruritus
- Other:** chills, lymphadenopathy, pain at injection site, **anaphylaxis**

### Interactions

**Drug-drug.** *Live-virus vaccines:* decreased antibody response to vaccine

### Patient monitoring

- Watch for acute inflammatory reaction in patients receiving drug for first time (usually appears within 30 to 60 minutes after infusion begins), in those whose last treatment was more than 8 weeks earlier, and when initial infusion rate exceeds 1 ml/minute.
- Monitor vital signs continuously during I.V. infusion. Stay alert for hypotension.
- Assess fluid volume status and blood urea nitrogen and creatinine levels.
- After infusion ends, monitor patient closely for nausea, vomiting, drowsiness, and severe headache.

### Patient teaching

- Instruct patient to report symptoms occurring during or after therapy.
- Advise patient to avoid live-virus vaccines for 3 months after therapy; drug may delay or inhibit body's response to vaccine.
- As appropriate, review all significant and life-threatening adverse reactions and interactions, especially those related to the drugs mentioned above.

## indapamide

Apo-Indapamide\*, Dom-Indapamide\*, Gen-Indapamide\*, Lozide\*, Lozol, Natrilix\*, Nindaxa\*, Novo-Indapamide\*, Nu-Indapamide\*, PHL-Indapamide\*, PMS-Indapamide\*, Riva-Indapamide\*

**Pharmacologic class:** Thiazide-like diuretic

**Therapeutic class:** Diuretic, antihypertensive

**Pregnancy risk category B**

### Action

Increases sodium and water excretion by inhibiting sodium reabsorption in distal tubule; enhances excretion of sodium, chloride, potassium, and water. May cause arteriolar vasodilation.

### Availability

Tablets: 1.25 mg, 2.5 mg

### Indications and dosages

- Edema caused by heart failure  
**Adults:** 2.5 mg P.O. daily in morning. After 1 week, may increase to 5 mg/day.
- Mild to moderate hypertension  
**Adults:** 1.25 mg P.O. daily in morning. May increase q 4 weeks, up to 5 mg/day.

### Contraindications

- Hypersensitivity to drug, other thiazide-like drugs, or tartrazine
- Anuria

### Precautions

Use cautiously in:

- renal or severe hepatic impairment, ascites, fluid or electrolyte imbalances, gout, systemic lupus erythematosus,

impaired glucose tolerance, hyperparathyroidism, bipolar disorder

- pregnant or breastfeeding patients.

### Administration

- Administer with food or milk to reduce GI upset.
- Give early in day to avoid nocturia.

Route	Onset	Peak	Duration
P.O.	1-2 hr	2 hr	36 hr
(single dose)			

### Adverse reactions

**CNS:** dizziness, light-headedness, headache, restlessness, insomnia, lethargy, fatigue, drowsiness, asthenia, depression, anxiety, nervousness, paresthesia, irritability, agitation  
**CV:** orthostatic hypotension, palpitations, premature ventricular contractions, **arrhythmias**  
**EENT:** blurred vision, rhinorrhea  
**GI:** nausea, vomiting, diarrhea, constipation, bloating, epigastric distress, gastric irritation, abdominal pain or cramps, dry mouth, anorexia  
**GU:** nocturia, polyuria, glycosuria, erectile dysfunction  
**Metabolic:** dehydration, gout, hyperglycemia, hypokalemia, hypocalcemia, hypomagnesemia, hyponatremia, hypovolemia, hypophosphatemia, hyperuricemia, **hypochloremic alkalosis**  
**Musculoskeletal:** muscle cramps and spasms  
**Skin:** flushing, rash, urticaria, pruritus, photosensitivity, cutaneous vasculitis, **necrotizing vasculitis**  
**Other:** weight loss

### Interactions

**Drug-drug.** *Amphotericin B, corticosteroids:* additive hypokalemia  
*Antihypertensives, nitrates:* additive hypotension  
*Cholestyramine, colestipol:* decreased indapamide absorption

**Lithium:** decreased lithium excretion, increased risk of lithium toxicity  
**Sulfonylureas:** decreased hypoglycemic efficacy

**Drug-diagnostic tests.** *Bilirubin, blood and urine glucose (in diabetic patients), blood urea nitrogen (BUN), calcium, creatinine, uric acid:* increased values  
*Cholesterol, low-density lipoproteins, magnesium, potassium, protein-bound iodine, sodium, triglycerides, urinary calcium:* decreased values

**Drug-herbs.** *Ginkgo:* decreased antihypertensive effect

*Licorice, stimulant laxative herbs (aloe, cascara sagrada, senna):* increased risk of hypokalemia

**Drug-behaviors.** *Acute alcohol ingestion:* additive hypotension  
*Sun exposure:* increased risk of photosensitivity

### Patient monitoring

🔊 Assess for signs and symptoms of hypokalemia, including ventricular arrhythmias, muscle weakness, and cramping.

- Monitor BUN, creatinine, and electrolyte levels.
- Assess daily weight and fluid intake and output.
- Monitor blood pressure response to drug.
- Watch for signs and symptoms of orthostatic hypotension.

### Patient teaching

- Advise patient to consume potassium-rich foods, such as oranges, bananas, potatoes, and spinach.
- Instruct patient to move slowly when sitting up or standing, to avoid dizziness from sudden blood pressure decrease.
- Tell patient to weigh himself daily on same scale at same time of day while wearing similar clothing. Instruct him to report gain of more than 2 lb (0.9 kg) in 1 day or 5 lb (2.2 kg) in 1 week.
- Caution patient to avoid driving and other hazardous activities until he

knows how drug affects concentration and alertness.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## indinavir sulfate

Crixivan

**Pharmacologic class:** Protease inhibitor

**Therapeutic class:** Antiretroviral

**Pregnancy risk category C**

### Action

Inhibits replication, function, and maturation of human immunodeficiency virus (HIV) protease, an enzyme essential to formation of infectious virus. As a result, further spread of virus is prevented.

### Availability

**Capsules:** 100 mg, 200 mg, 333 mg, 400 mg

### Indications and dosages

➤ HIV infection

**Adults:** 800 mg P.O. q 8 hours

### Dosage adjustment

- Mild to moderate hepatic insufficiency secondary to cirrhosis

### Contraindications

- Hypersensitivity to drug or its components
- Concurrent use of amiodarone, ergot derivatives, cisapride, pimozide, or oral midazolam, triazolam, alprazolam, alfuzosin, sildenafil

## Precautions

Use cautiously in:

- renal or severe hepatic impairment, history of renal calculi
- pregnant or breastfeeding patients
- children.

## Administration

- Know that drug is usually given with other antiretrovirals.
  - Give with full glass of water on empty stomach 1 hour before or 2 hours after meals.
  - If GI upset occurs, give with a light meal.
- 📣 Don't give concurrently with alfu-zosin, amiodarone, sildenafil, cisapride (not available in U.S.), ergot derivatives, midazolam, pimozide, or triazolam.

Route	Onset	Peak	Duration
P.O.	Rapid	0.8 hr	8 hr

## Adverse reactions

**CNS:** depression, dizziness, headache, drowsiness, malaise, asthenia

**CV:** angina, **myocardial infarction**

**EENT:** oral paresthesia

**GI:** nausea, vomiting, diarrhea, abdominal pain or distention, dyspepsia, acid regurgitation, **pancreatitis**

**GU:** dysuria, crystalluria, nephrolithiasis or urolithiasis leading to **renal insufficiency or failure, interstitial nephritis**

**Hematologic:** anemia, **acute hemolytic anemia, increased spontaneous bleeding** (in hemophiliacs)

**Hepatic:** jaundice, **hepatic dysfunction, hepatic failure**

**Metabolic:** new onset or exacerbation of diabetes mellitus, hyperglycemia

**Musculoskeletal:** joint or back pain

**Respiratory:** cough, dyspnea

**Skin:** urticaria, rash, pruritus

**Other:** abnormal taste, increased or decreased appetite, body fat redistribution or accumulation, fever, **anaphylactoid reactions**

## Interactions

**Drug-drug.** *Azole antifungals, delavirdine, interleukins:* elevated indinavir blood level, greater risk of toxicity  
*Cisapride, ergot derivatives, midazolam, pimozide, triazolam:* CYP3A4 inhibition by indinavir, leading to increased blood levels of these drugs and dangerous reactions

*Didanosine, efavirenz, rifamycins:* decreased indinavir effects

**Drug-diagnostic tests.** *Alanine aminotransferase, amylase, aspartate aminotransferase, bilirubin, cholesterol, glucose, triglycerides:* increased values  
*Hemoglobin, neutrophils, platelets:* decreased values

**Drug-food.** *Any food:* decreased indinavir absorption

**Drug-herbs.** *St. John's wort:* decreased indinavir blood level

## Patient monitoring

- Assess fluid intake and output to ensure adequate hydration and help prevent nephrolithiasis or urolithiasis.
- Monitor for adverse GI and CNS effects.
- Evaluate liver function test results. Assess for hyperbilirubinemia.
- Monitor cholesterol, glucose, and CBC with white cell differential.

## Patient teaching

- Tell patient to take 1 hour before or 2 hours after meals with a full glass of water.
  - If GI upset occurs, advise patient to take with a light meal.
- 📣 Instruct patient to report severe nausea or diarrhea, fever, chills, flank pain, urine or stool color changes, yellowing of skin or eyes, or personality changes.
- Tell patient that drug doesn't cure HIV infection and that its long-term effects are largely unknown.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and herbs mentioned above.

## indomethacin (indometacin Ⓢ)

Apo-Indomethacin Ⓢ, Flexin, Indameth Ⓢ, Indocid-R Ⓢ, Indomax SR Ⓢ, Indocid Ⓢ, Indocid PDA Ⓢ, Indocin SR, Indolar SR Ⓢ, Indotec Ⓢ, Novo-Methacin Ⓢ, Nu-Indo Ⓢ, Pardelprin Ⓢ, Pro-Indo Ⓢ, Ratio-Indomethacin Ⓢ, Rheumacin Ⓢ, Rhodacine Ⓢ, Rimacid Ⓢ, Sandoz Indomethacin Ⓢ, Slo-Indo Ⓢ

**Pharmacologic class:** Nonsteroidal anti-inflammatory drug (NSAID)

**Therapeutic class:** Anti-inflammatory, analgesic, antipyretic

**Pregnancy risk category B** (third trimester: *D*)

### FDA BOXED WARNING

- Drug may increase risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke (which can be fatal). Risk may increase with duration of use, and may be greater in patients who have cardiovascular disease or risk factors for it.
- Drug is contraindicated for perioperative pain in setting of coronary artery bypass graft surgery.
- Drug increases risk of serious GI adverse events, including bleeding, ulcers, and stomach or intestinal perforation, which can be fatal. These events can occur at any time during therapy and without warning. Elderly patients are at greater risk.

### Action

Unknown. Thought to inhibit cyclooxygenase, an enzyme needed for prostaglandin synthesis.

### Availability

*Capsules:* 25 mg, 50 mg

*Capsules (sustained-release):* 75 mg

*Oral suspension:* 25 mg/5 ml

### Indications and dosages

➤ Rheumatoid arthritis; osteoarthritis; ankylosing spondylitis

**Adults:** 25 to 50 mg P.O. two or three times daily, not to exceed 200 mg daily; or one 75-mg sustained-release capsule P.O. once or twice daily

➤ Acute gouty arthritis

**Adults:** 50 mg P.O. t.i.d. until pain is tolerable; then reduce dosage rapidly and, finally, discontinue drug. Don't give sustained-release form.

➤ Acute bursitis or tendinitis of shoulder

**Adults:** 75 to 150 mg P.O. daily in three or four divided doses. Discontinue once inflammation is controlled.

### Off-label uses

- Bartter's syndrome
- Pericarditis

### Contraindications

- Hypersensitivity to drug, its components, or other NSAIDs
- Active GI bleeding
- Concurrent diflunisal use

### Precautions

Use cautiously in:

- severe cardiovascular, renal, or hepatic disease
- history of ulcer disease
- elderly patients
- pregnant or breastfeeding patients
- children ages 14 and younger (efficacy not established).

**Administration**

- Give with food, full glass of water, or antacids to reduce GI upset.
- Don't open or crush capsules.
- For arthritis, give up to 100 mg of daily dose at bedtime as needed to reduce nighttime pain and morning stiffness.
- Don't give sustained-release form to patients with gouty arthritis.

Route	Onset	Peak	Duration
P.O. (analgesic)	30 min	0.5-2 hr	4-6 hr
P.O. (sustained, analgesic)	30 min	Unknown	4-6 hr
P.O. (regular or sustained, anti-inflam.)	Up to 7 days	1-2 wk	Unknown

**Adverse reactions**

**CNS:** headache, dizziness, drowsiness, fatigue, vertigo, depression, **seizures**

**EENT:** tinnitus

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain or cramps, dyspepsia, ulcers, **GI bleeding**

**Other:** allergic reactions including **anaphylaxis**

**Interactions**

**Drug-drug.** *Antihypertensives, diuretics:* decreased efficacy of these drugs  
*Corticosteroids, other NSAIDs:* additive adverse GI reactions

*Cyclosporine:* increased risk of nephrotoxicity

*Diflunisal:* potentially fatal GI hemorrhage

*Lithium, methotrexate, zidovudine:* increased risk of toxicity from these drugs

*Probenecid:* increased risk of indomethacin toxicity

**Drug-diagnostic tests.** *Dexamethasone suppression test:* false-negative result

**Drug-herbs.** *Anise, arnica, chamomile, clove, dong quai, feverfew, garlic, ginger, ginkgo, ginseng:* increased bleeding risk

**Patient monitoring**

- Assess for dizziness, drowsiness, headache, fatigue, and exacerbation of depression, epilepsy, or parkinsonism.
- Monitor for drug efficacy, indicated by improved joint mobility, pain relief, and decreased inflammation.
- Monitor urine output for marked reduction.
- Watch for signs and symptoms of GI bleeding and ulcers.

**Patient teaching**

- Tell patient to take with food, full glass of water, or antacid to reduce GI upset.
- Advise patient not to open or crush capsules.
- Inform breastfeeding patient that indomethacin enters breast milk and may cause seizures in infant. Advise her to use a different infant feeding method during therapy.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, balance, and alertness.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

**infliximab**

Remicade

**Pharmacologic class:** Monoclonal antibody

**Therapeutic class:** Antirheumatic, GI anti-inflammatory

**Pregnancy risk category B**

**FDA BOXED WARNING**

- Patients treated with infliximab are at increased risk for developing serious infections, including tuberculosis (TB),

bacterial sepsis, invasive fungal infections (such as histoplasmosis, coccidioidomycosis, candidiasis, aspergillosis, blastomycosis, and pneumocystosis), and infections due to other opportunistic pathogens (including *Legionella* and *Listeria* species), that may lead to hospitalization or death. Most patients who developed these infections were taking concomitant immunosuppressants (such as methotrexate or corticosteroids).

- Carefully consider risks and benefits of treatment with infliximab before starting therapy in patients with chronic or recurrent infection.
- TB includes active TB and reactivation of latent TB. Patients with TB have frequently presented with disseminated or extrapulmonary disease. Patients should be tested for latent TB before starting infliximab and during therapy. Treatment for latent infection should be started before initiating infliximab.
- Patients with histoplasmosis or other invasive fungal infections may present with disseminated, rather than localized, disease. Antigen and antibody testing for histoplasmosis may be negative in some patients with active infection. Consider empiric antifungal therapy in patients at risk for invasive fungal infections who develop severe systemic illness.
- Closely monitor patients for signs and symptoms of infection during and after treatment with infliximab, including possible development of TB in patients who tested negative for latent TB before starting infliximab.
- Discontinue drug if patient develops a serious infection or sepsis.
- Lymphoma and other malignancies, some fatal, have been reported in children and adolescents treated with tumor necrosis factor (TNF) blockers, including infliximab. Postmarketing cases of hepatosplenic T-cell lymphoma, a rare type of T-cell

lymphoma, have been reported in patients treated with TNF blockers, including infliximab. All cases occurred in patients with Crohn's disease and ulcerative colitis, the majority of whom were adolescent or young adult males. This rare, aggressive T-cell lymphoma is fatal. All of these patients had received treatment with azathioprine or 6-mercaptopurine concomitantly with infliximab at or before diagnosis.

### Action

Neutralizes and prevents activity of tumor necrosis factor-alpha (TNF-alpha) by binding to soluble and transmembrane forms of TNF and inhibiting its receptors, resulting in anti-inflammatory and antiproliferative activity. Reduces rate of joint destruction in rheumatoid arthritis and eases symptoms of Crohn's disease.

### Availability

*Powder for injection:* 100 mg/vial

### Indications and dosages

➤ Rheumatoid arthritis (given with methotrexate)

**Adults:** Initially, 3 mg/kg I.V., followed by 3 mg/kg 2 and 6 weeks after initial dose, then q 8 weeks. In partial responders, dosage may be adjusted up to 10 mg/kg or treatment may be repeated as often as q 4 weeks.

➤ Crohn's disease

**Adults and children age 6 and older:** 5 mg/kg I.V. as a single infusion, starting as induction regimen at 0, 2, and 6 weeks, then a maintenance regimen of 5 mg/kg q 8 weeks. For some adults patients who respond initially but then stop responding, dosage of 10 mg/kg may be warranted.

➤ Ulcerative colitis

**Adults and children age 6 and older:** 5 mg/kg I.V. infusion given as induction therapy at 0, 2, and 6 weeks,

followed by maintenance regimen of 5 mg/kg I.V. q 8 weeks thereafter

➤ Ankylosing spondylitis

**Adults:** 5 mg/kg I.V. infusion at 0, 2, and 6 weeks, followed by maintenance regimen of 5 mg/kg q 6 weeks thereafter

➤ Psoriatic arthritis

**Adults:** 5 mg/kg I.V. infusion (with or without methotrexate) given as induction therapy at 0, 2, and 6 weeks, followed by maintenance regimen of 5 mg/kg q 8 weeks thereafter

➤ Plaque psoriasis

**Adults:** 5 mg/kg I.V. infusion given as induction therapy at 0, 2, and 6 weeks, followed by maintenance regimen of 5 mg/kg q 8 weeks thereafter

### Off-label uses

- Sarcoidosis

### Contraindications

- Hypersensitivity to drug, murine proteins, or other drug components
- Dosages above 5 mg/kg for patients with moderate to severe heart failure

### Precautions

Use cautiously in:

- history of tuberculosis (TB), active infection, or exposure to TB; patients who have resided or traveled in areas of endemic TB or endemic mycoses, such as histoplasmosis, coccidioidomycosis, or blastomycosis
- chronic or recurrent infection or underlying conditions that may predispose to infection; history of opportunistic infection; hepatitis B virus (HBV) carriers
- jaundice or marked liver enzyme elevations, cytopenias
- neurologic disorders (including CNS manifestation of systemic vasculitis, seizures), new-onset or exacerbation of demyelinating disorders (including multiple sclerosis and optic neuritis) and peripheral demyelinating

disorders (including Guillain-Barré syndrome)

- male patients with Crohn's disease or ulcerative colitis who are receiving azathioprine or 6-mercaptopurine treatment
- concurrent use of live vaccines, tocilizumab (avoid use)
- concurrent use of anakinra or abatacept (use not recommended)
- when switching between biological disease-modifying antirheumatics (overlapping biological activity may further increase risk of infection)
- elderly patients
- pregnant or breastfeeding patients
- children younger than age 6 (safety not established).

### Administration

- Know that latent TB should be treated before infliximab therapy begins.
- To reconstitute, use 21G or smaller needle to add 10 ml of sterile water to each vial. To mix, swirl (don't shake). Solution may foam and appear clear or light yellow.
- Withdraw volume equal to amount of reconstituted drug from 250-ml polypropylene or polyolefin infusion bag or glass bottle of normal saline solution. Slowly add reconstituted drug to infusion bag or bottle, and gently mix. Use within 3 hours.
- Know that concentration of infusion should be 0.4 mg/ml to 4 mg/ml.
- Give I.V. infusion over at least 2 hours. Use polyethylene-lined infusion set equipped with in-line filter, with pore size of 1.2 microns or less.
- Premedicate with antihistamines, acetaminophen, and corticosteroids, as prescribed.
- ⚠ Watch for infusion reactions, especially after first infusion. Be aware that mild to moderate infusion reactions may improve after slowing or suspension of infusion. Upon resolution of reaction, restart infusion at lower

infusion rate or administer antihistamines, acetaminophen, or corticosteroids. Discontinue drug in patients who don't tolerate infusion following these interventions; permanently discontinue drug in patients who have severe infusion-related hypersensitivity reactions.

- Discard unused portions of infusion solution.
- Don't give to patient with active infection.
- Be aware that patient who doesn't respond by week 14 isn't likely to respond, and therapy should cease.

Route	Onset	Peak	Duration
I.V.	1-2 wk	Unknown	12-48 wk

**Adverse reactions**

**CNS:** fatigue, headache, anxiety, depression, dizziness, insomnia, CNS manifestation of systemic vasculitis, seizures, new-onset or exacerbation of demyelinating disorders (including multiple sclerosis, optic neuritis, Guillain-Barré syndrome)

**CV:** chest pain, hypertension, hypotension, tachycardia, peripheral edema, **worsening of heart failure**

**EENT:** conjunctivitis, rhinitis, sinusitis, laryngitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, flatulence, ulcerative stomatitis, **intestinal obstruction**

**GU:** dysuria, urinary frequency, urinary tract infection

**Hematologic:** hematoma, anemia, **hemolytic anemia, pancytopenia**

**Hepatic:** HBV reactivation, **hepatotoxicity**

**Musculoskeletal:** arthritis, joint pain, back pain, myalgia, involuntary muscle contractions

**Respiratory:** upper respiratory tract infection, bronchitis, cough, dyspnea

**Skin:** acne, diaphoresis, dry skin, bruising, eczema, erythema, flushing, pruritus, urticaria, rash, alopecia

**Other:** oral pain, tooth pain, moniliasis, chills, hot flashes, flulike symptoms, herpes simplex, herpes zoster, **autoimmunity**, lupuslike syndrome, serious infections, **malignancies, infusion reactions**, hypersensitivity reaction including **anaphylaxis or serum sickness-like reactions**

**Interactions**

**Drug-drug.** *Abatacept, anakinra:* increased risk of infections

*Tocilizumab:* increased immunosuppression and increased risk of infection

*Vaccines:* decreased antibody response to vaccine

**Drug-diagnostic tests.** *Antinuclear antibodies:* positive titer

*Hepatic enzymes:* increased values

*Hemoglobin:* decreased value

**Patient monitoring**

☞ Stay alert for signs and symptoms of hypersensitivity and infusion reactions, including fever, chills, itching, rash, chest pain, dyspnea, facial flushing, and headache.

☞ Watch for evidence of infection, especially in patients who have chronic infections or are receiving immunosuppressants. Drug increases risk of life-threatening opportunistic infections and TB.

• Monitor platelets and CBC with white cell differential.

☞ Assess for heart failure in patients with history of cardiac disease.

☞ Be aware that CNS disorders (such as seizures, new-onset or exacerbation of demyelinating disorders), malignancies including lymphoma, HBV reactivation, hepatotoxicity, and cytopenias may occur.

**Patient teaching**

☞ Instruct patient to report signs or symptoms of hypersensitivity reaction, such as fever, chills, itching, rash, chest pain, dyspnea, and facial flushing (may occur up to 12 days after therapy).

 Tell patient to report infection symptoms, such as fever, burning on urination, cough, or sore throat.

- Advise patient to avoid potential infection sources, such as crowds and people with known infections.
- Advise patient not to receive live vaccines while receiving infliximab.

 Instruct patient how to recognize and immediately report signs and symptoms of blood dyscrasias, hepatotoxicity, or other new or worsening symptoms.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

### insulin, regular (insulin injection)

Humulin R, Humulin-R Regular U-500 (concentrate), Insulin-Toronto\*

### insulin (lispro)

Humalog, Humalog Pen

### insulin glulisine, recombinant

Apidra, Apidra SoloSTAR

### insulin lispro protamine, human

Humalog Mix 50/50, Humalog Mix 75/25

### isophane insulin suspension (NPH insulin)

Humulin N, Novolin N

### isophane insulin suspension (NPH) and insulin injection (regular)

Humulin 70/30 (70% isophane insulin and 30% insulin injection), Humulin 70/30 PenFill, Novolin 70/30, Novolin 70/30 PenFill

**Pharmacologic class:** Pancreatic hormone

**Therapeutic class:** Hypoglycemic

**Pregnancy risk category B**

### Action

Promotes glucose transport, which stimulates carbohydrate metabolism in skeletal and cardiac muscle and adipose tissue. Also promotes phosphorylation of glucose in liver, where it is converted to glycogen. Directly affects fat and protein metabolism, stimulates protein synthesis, inhibits release of free fatty acids, and indirectly decreases phosphate and potassium.

### Availability

*Glulisine, recombinant:* 100 units/ml in 10-ml vials, 100 units/ml in 3-ml cartridge system, 100 units/ml in 3-ml prefilled pen

*Isophane suspension, injection (regular):* 70 units NPH and 30 units regular insulin/ml (100 units/ml total), 50 units NPH and 50 units regular insulin/ml (100 units/ml total)

*Isophane suspension (NPH insulin):* 100 units/ml

*Lispro:* 100 units/ml in 10-ml vials and 1.5-ml cartridges

*Regular insulin injection:* 100 units/ml  
*Regular U-500 (concentrated), insulin human injection:* 500 units/ml

*Zinc suspension, extended (ultralente):* 100 units/ml

*Zinc suspension (lente insulin):* 100 units/ml

## Indications and dosages

➤ Type 1 (insulin-dependent) diabetes mellitus; type 2 (non-insulin-dependent) diabetes mellitus unresponsive to diet and oral hypoglycemics

**Adults and children:** In newly diagnosed diabetes, total of 0.5 to 1 unit/kg/day subcutaneously as part of multidose regimen of short- and long-acting insulin. Dosage individualized based on patient's glucose level, adjusted to premeal and bedtime glucose levels. Reserve concentrated insulin (500 units/ml) for patients requiring more than 200 units/day.

➤ Diabetic ketoacidosis

**Adults and children:** Loading dose of 0.15 units/kg (nonconcentrated regular insulin) I.V. bolus, followed by continuous infusion of 0.1 unit/kg/hour until glucose level drops. Then administer subcutaneously, adjusting dosage according to glucose level.

## Contraindications

- Hypersensitivity to drug or its components
- Hypoglycemia

## Precautions

Use cautiously in:

- hepatic or renal impairment, hypothyroidism, hyperthyroidism
- elderly patients
- pregnant or breastfeeding patients
- children.

## Administration

⚠ Be aware that insulin is a high-alert drug whether given subcutaneously or I.V.

⚠ Don't give insulin I.V. (except nonconcentrated regular insulin), because anaphylactic reaction may occur.

- When mixing two types of insulin, draw up regular insulin into syringe first.

- For I.V. infusion, mix regular insulin only with normal or half-normal saline solution, as prescribed, to yield a concentration of 1 unit/ml. Give every 50 units I.V. over at least 1 minute.
- Rotate subcutaneous injection sites to prevent lipodystrophy.
- Administer mixtures of regular and NPH or regular and lente insulins within 5 to 15 minutes of mixing.

Route	Onset	Peak	Duration
I.V. (regular)	10-30 min	15-30 min	Unknown
Subcut. (glulisine)	Rapid	Unknown	Short
Subcut. (lente)	1-2.5 hr	7-15 hr	24 hr
Subcut. (lispro)	15 min	30-90 min	6-8 hr
Subcut. (lispro/ protamine mix; regular U-500 conc.)	Unknown	Unknown	Unknown
Subcut. (NPH)	1-1.5 hr	4-12 hr	24 hr
Subcut. (regular)	30-60 min	2-4 hr	Unknown
Subcut. (ultralente)	8 hr	10-30 hr	>36 hr

## Adverse reactions

**Metabolic:** hypokalemia, sodium retention, **hypoglycemia, rebound hyperglycemia (Somogyi effect)**

**Skin:** urticaria, rash, pruritus

**Other:** edema; lipodystrophy; lipohypertrophy; erythema, stinging, or warmth at injection site; allergic reactions including **anaphylaxis**

## Interactions

**Drug-drug.** *Acetazolamide, albuterol, antiretrovirals, asparaginase, calcitonin, corticosteroids, cyclophosphamide, danazol, dextrothyroxine, diazoxide, diltiazem, diuretics, dobutamine, epinephrine, estrogens, hormonal contraceptives, isoniazid, morphine, niacin,*

*phenothiazines, phenytoin, somatropin, terbutaline, thyroid hormones:*

decreased hypoglycemic effect

*Anabolic steroids, angiotensin-converting enzyme inhibitors, calcium, chloroquine, clofibrate, clonidine, disopyramide, fluoxetine, guanethidine, mebendazole, MAO inhibitors, octreotide, oral hypoglycemics, phenylbutazone, propoxyphene, pyridoxine, salicylates, sulfipyrazone, sulfonamides, tetracyclines:*

increased hypoglycemic effect  
*Beta-adrenergic blockers (nonselective):* masking of some hypoglycemia symptoms, delayed recovery from hypoglycemia

*Lithium carbonate:* decreased or increased hypoglycemic effect

*Pentamidine:* increased hypoglycemic effect, possibly followed by hyperglycemia

**Drug-diagnostic tests.** *Glucose, inorganic phosphate, magnesium, potassium:* decreased levels

*Liver and thyroid function tests:* interference with test results

*Urine vanillylmandelic acid:* increased level

**Drug-herbs.** *Basil, burdock, glucosamine, sage:* altered glycemetic control

*Chromium, coenzyme Q10, dandelion, eucalyptus, fenugreek, marshmallow:* increased hypoglycemic effect

*Garlic, ginseng:* decreased blood glucose level

**Drug-behaviors.** *Alcohol use:* increased hypoglycemic effect

*Marijuana use:* increased blood glucose level

*Smoking:* increased blood glucose level, decreased response to insulin

### Patient monitoring

- Monitor glucose level frequently to assess drug efficacy and appropriateness of dosage.
- Watch blood glucose level closely if patient is converting from one insulin type to another or is under unusual stress (as from surgery or trauma).

📣 Monitor for signs and symptoms of hypoglycemia. Keep glucose source at hand in case hypoglycemia occurs.

📣 Assess for signs and symptoms of hyperglycemia, such as polydipsia, polyphagia, polyuria, and diabetic ketoacidosis (as shown by blood and urinary ketones, metabolic acidosis, extremely elevated blood glucose level).

- Monitor for glycosuria.
- Closely evaluate kidney and liver function test results in patients with renal or hepatic impairment.

### Patient teaching

• Teach patient how to administer insulin subcutaneously as appropriate.

• Advise patient to draw up regular insulin into syringe first when mixing two types of insulin. Caution him not to change order of mixing insulins.

• Instruct patient to rotate subcutaneous injection sites and keep a record of sites used, to prevent fatty tissue breakdown.

📣 Teach patient how to recognize and report signs and symptoms of hypoglycemia and hyperglycemia. Advise him to carry a glucose source at all times.

• Instruct patient to store insulin in refrigerator (not freezer).

• Teach patient how to monitor and record blood glucose level and, if indicated, urine glucose and ketone levels.

• Tell patient that dietary changes, activity, and stress can alter blood glucose level and insulin requirements.

• Instruct patient to wear medical identification stating that he is diabetic and takes insulin.

• Advise patient to have regular medical, vision, and dental exams.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## insulin aspart (rDNA origin)

NovoLog

## insulin aspart and insulin aspart protamine

NovoLog Mix 70/30

**Pharmacologic class:** Pancreatic hormone

**Therapeutic class:** Hypoglycemic

**Pregnancy risk category C**

### Action

Short-acting insulin form. Promotes glucose transport, which stimulates carbohydrate metabolism in skeletal and cardiac muscle and adipose tissue. Also promotes phosphorylation of glucose in liver, where it's converted to glycogen. Directly affects fat and protein metabolism, stimulates protein synthesis, inhibits release of free fatty acids, and indirectly decreases phosphate and potassium.

### Availability

**Injection (NovoLog):** 100 units/ml in 10-ml vials and 3-ml PenFill cartridges

**Injection (NovoLog Mix 70/30):** 100 units/ml in 10-ml vials, 3-ml PenFill cartridges, and 3-ml FlexPen prefilled syringes

### Indications and dosages

➤ Type 1 (insulin-dependent) diabetes mellitus; type 2 (non-insulin-dependent) diabetes mellitus

#### Adults and children ages 6 and older:

**Insulin aspart**—Dosage tailored to patient's needs, given subcutaneously in divided doses 5 to 10 minutes before meals. Insulin aspart provides 50% to 70% of dose; intermediate or long-acting insulin provides remainder.

Dosage range is 0.5 to 1 unit/kg/day in divided doses based on meals. **Insulin aspart and insulin aspart protamine**—Give subcutaneously b.i.d., 15 minutes before morning and evening meals. For monotherapy, initial dosage is 0.4 to 0.6 unit/kg/day in two divided doses. Titrate in increments of 2 to 4 units q 3 to 4 days to achieve target fasting plasma glucose level. When given with oral hypoglycemics, initial dosage is 0.2 to 0.3 unit/kg/day.

### Contraindications

- Hypersensitivity to drug or its components
- Hypoglycemia

### Precautions

Use cautiously in:

- hepatic or renal impairment, hypothyroidism, hyperthyroidism
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

 Be aware that insulin is a high-alert drug.

- Know that drug is bioavailable as regular human insulin but has a faster onset and shorter duration.
- Give by subcutaneous route only, 5 to 10 minutes (15 minutes for NovoLog Mix 70/30) before a meal.
- When mixing insulin aspart with intermediate or long-acting insulin, draw up insulin aspart into syringe first.
-  Don't mix insulin aspart protamine with any other insulin.
- When giving insulin aspart by pump, don't mix with other insulins.
- Rotate injection sites to prevent lipodystrophy.

Route	Onset	Peak	Duration
Subcut.	15 min	1-3 hr	3-5 hr

## Adverse reactions

**Metabolic:** hypokalemia, sodium retention, **hypoglycemia, rebound hyperglycemia (Somogyi effect)**

**Musculoskeletal:** myalgia

**Skin:** urticaria, rash, pruritus

**Other:** edema; lipodystrophy; lipohypertrophy; redness, warmth, or stinging at injection site; allergic reactions including **anaphylaxis**

## Interactions

**Drug-drug.** *Acetazolamide, albuterol, antiretrovirals, asparaginase, calcitonin, corticosteroids, cyclophosphamide, dandelion, dextrothyroxine, diazoxide, diltiazem, diuretics, dobutamine, epinephrine, estrogens, hormonal contraceptives, isoniazid, morphine, niacin, phenothiazines, phenytoin, somatropin, terbutaline, thyroid hormones:* decreased hypoglycemic effect

*Anabolic steroids, angiotensin-converting enzyme inhibitors, calcium, chloroquine, clofibrate, clonidine, disopyramide, fluoxetine, guanethidine, mebenzazole, MAO inhibitors, octreotide, oral hypoglycemics, phenylbutazone, propoxyphene, pyridoxine, salicylates, sulfapyrazole, sulfonamides, tetracyclines:* increased hypoglycemic effect

*Beta-adrenergic blockers (nonselective):* masking of some hypoglycemia signs and symptoms, delayed recovery from hypoglycemia

*Lithium carbonate:* decreased or increased hypoglycemic effect

*Pentamidine:* increased hypoglycemic effect, possibly followed by hyperglycemia

**Drug-diagnostic tests.** *Glucose, inorganic phosphate, magnesium, potassium:* decreased levels

*Liver and thyroid function studies:* test interference

*Urine vanillylmandelic acid:* increased level

**Drug-herbs.** *Basil, bee pollen, burdock, glucosamine, sage:* altered glycemic control

*Chromium, coenzyme Q10, dandelion, eucalyptus, fenugreek, marshmallow:* increased hypoglycemic effect

*Garlic, ginseng:* decreased blood glucose level

**Drug-behaviors.** *Alcohol use:* increased hypoglycemic effect

*Marijuana use:* increased blood glucose level

*Smoking:* increased blood glucose level, decreased response to insulin

## Patient monitoring

- Monitor blood glucose level frequently to gauge drug efficacy and appropriateness of dosage.

- Watch blood glucose level closely if patient is converting from one insulin type to another or is under unusual stress (as from surgery or trauma).

- ☚ Stay alert for signs and symptoms of hypoglycemia. Keep glucose source at hand.

- ☚ Assess for evidence of hyperglycemia, such as polydipsia, polyphagia, polyuria, and diabetic ketoacidosis (as shown by urine and blood ketones, metabolic acidosis, extremely elevated blood glucose level, and hypovolemia).

- Monitor for glycosuria.

- Closely monitor kidney and liver function test results in patients with renal or hepatic impairment.

## Patient teaching

- Teach patient how to administer insulin subcutaneously or by injection pen.

- If patient must mix insulin aspart with intermediate or long-acting insulin, instruct him to draw up insulin aspart into syringe first.

- ☚ Tell patient not to mix any other insulin with mixture of insulin aspart and insulin aspart protamine.

- Advise patient to rotate subcutaneous injection sites and keep a record of sites used, to help prevent fatty tissue breakdown.

 Teach patient how to recognize and report signs and symptoms of hypoglycemia and hyperglycemia. Advise him to always carry a glucose source.

- Inform patient that changes in diet, activity, and stress level affect blood glucose levels and insulin requirements.
- Teach patient how to monitor and record blood glucose level and, if indicated, urine glucose and ketone levels.
- Tell patient to wear medical identification stating that he is diabetic and takes insulin.
- Instruct patient to have regular medical, vision, and dental exams.
- Tell female patient to contact prescriber if she is pregnant or plans to become pregnant.
- Advise patient to store insulin in refrigerator, not freezer.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## insulin glargine (rDNA origin)

Lantus

**Pharmacologic class:** Pancreatic hormone

**Therapeutic class:** Hypoglycemic

**Pregnancy risk category** C

### Action

Long-acting insulin form. Promotes glucose transport, which stimulates carbohydrate metabolism in skeletal and cardiac muscle and adipose tissue. Also promotes phosphorylation of glucose in liver, where it's converted to glycogen. Directly affects fat and protein metabolism, stimulates protein

synthesis, inhibits release of free fatty acids, and indirectly decreases phosphate and potassium.

### Availability

*Injection:* 100 units/ml in 10-ml vials and 3-ml cartridges

### Indications and dosages

➤ Type 1 (insulin-dependent) diabetes mellitus and type 2 (non-insulin-dependent) diabetes mellitus in patients who need long-acting insulin  
**Adults and children ages 6 and older:** Subcutaneous injection daily at same time each day, with dosage based on blood glucose level

➤ Conversion from another insulin type in patients with type 1 diabetes mellitus who need long-acting insulin  
**Adults and children ages 6 and older:** For patients switching from once-daily NPH or ultralente human insulin, start glargine at same dosage as current insulin dosage. For patients taking twice-daily NPH or ultralente human insulin, reduce initial glargine dosage by approximately 20% of current insulin dosage during week 1; then adjust based on blood glucose level.

➤ Type 2 diabetes mellitus in patients receiving oral hypoglycemics  
**Adults:** Dosage highly individualized based on glucose levels and response

### Contraindications

- Hypersensitivity to drug or its components
- Hypoglycemia

### Precautions

Use cautiously in:

- pregnant or breastfeeding patients
- children.

### Administration

 Be aware that insulin is a high-alert drug.

- Give by subcutaneous route only, at same time each day.

 Don't mix in solution with other drugs, including other insulins.

- Before drawing up insulin into syringe, roll vial between hands to ensure uniform dispersion; don't shake.
- Rotate injection sites to prevent lipodystrophy.

Route	Onset	Peak	Duration
Subcut.	1.1 hr	5 hr	24 hr

## Adverse reactions

**Metabolic: rebound hyperglycemia (Somogyi effect), hypoglycemia**

**Skin:** urticaria, rash, pruritus, redness, stinging, or warmth at injection site

**Other:** edema, lipodystrophy, lipohypertrophy, allergic reactions including **anaphylaxis**

## Interactions

**Drug-drug.** *Acetazolamide, albuterol, antiretrovirals, asparaginase, calcitonin, corticosteroids, cyclophosphamide, danazol, dextrothyroxine, diazoxide, diltiazem, diuretics, dobutamine, epinephrine, estrogens, hormonal contraceptives, isoniazid, morphine, niacin, phenothiazines, phenytoin, somatropin, terbutaline, thyroid hormones:* decreased hypoglycemic effect

*Anabolic steroids, angiotensin-converting enzyme inhibitors, calcium, chloroquine, clofibrate, clonidine, disopyramide, fluoxetine, guanethidine, mebendazole, MAO inhibitors, octreotide, oral hypoglycemics, phenylbutazone, propoxyphene, pyridoxine, salicylates, sulfapyrazone, sulfonamides, tetracyclines:* increased hypoglycemic effect  
*Beta-adrenergic blockers (nonselective):* masking of some hypoglycemia signs and symptoms, delayed recovery from hypoglycemia

*Lithium carbonate:* altered hypoglycemic effect

*Pentamidine:* increased hypoglycemic effect, possibly followed by hyperglycemia

**Drug-diagnostic tests.** *Glucose, inorganic phosphate, magnesium, potassium:* decreased levels

*Liver and thyroid function studies:* test interference

*Urine vanillylmandelic acid:* increased level

**Drug-herbs.** *Basil, bee pollen, burdock, glucosamine, sage:* altered glycemic control

*Chromium, coenzyme Q10, dandelion, eucalyptus, fenugreek, marshmallow:* increased hypoglycemic effect

*Garlic, ginseng:* decreased blood glucose level

**Drug-behaviors.** *Alcohol use:* increased hypoglycemic effect

*Marijuana use:* increased blood glucose level

*Smoking:* increased blood glucose level, decreased response to insulin

## Patient monitoring

- Monitor blood glucose level frequently to assess drug efficacy and appropriateness of dosage.

- Watch blood glucose level closely if patient is converting from one insulin type to another or is under unusual stress (as from surgery or trauma).

 Check for signs and symptoms of hypoglycemia (such as CNS changes). Keep glucose source at hand.

 Monitor for signs and symptoms of hyperglycemia, such as polydipsia, polyphagia, polyuria, and diabetic ketoacidosis (blood and urine ketones, metabolic acidosis, extremely elevated glucose level, hypovolemia).

- Monitor for glycosuria.

- Closely monitor kidney and liver function test results in patients with renal or hepatic impairment.

## Patient teaching

- Instruct patient how to administer insulin subcutaneously.

📢 Teach patient how to recognize and report signs and symptoms of hypoglycemia and hyperglycemia. Advise him to always carry glucose source.

- Advise patient to rotate subcutaneous injection sites and keep a record of sites used.
- Teach patient how to monitor and record blood glucose level and, if indicated, urine glucose and ketone levels.
- Inform patient that changes in diet, activity, and stress level can affect blood glucose level and insulin requirements.
- Advise patient to wear medical identification stating that he is diabetic and takes insulin.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, herbs, and behaviors mentioned above.

## interferon alfa-2b, recombinant

Intron A, Viraferon 

**Pharmacologic class:** Biological response modifier

**Therapeutic class:** Antineoplastic, antiviral

**Pregnancy risk category** C

### FDA BOXED WARNING

• Drug may cause or worsen fatal or life-threatening neuropsychiatric, autoimmune, ischemic, and infectious disorders. Monitor patient closely with periodic clinical and laboratory evaluations. Discontinue drug in patients with persistently severe or worsening signs or symptoms of these conditions. In many cases, these disorders resolve after withdrawal.

### Action

Unknown. Antitumor and antiviral activity may stem from direct antiproliferative action against tumor or viral cells, inhibition of viral replication, and modulation of host immune response.

### Availability

**Injection:** 3 million international units/0.5-ml vial, 5 million international units/0.5-ml vial, 10 million international units/1-ml vial; 18 million international units/3.2-ml vial, 25 million international units/ 3.2-ml vial  
**Powder for injection (vial with diluent):** 3 million, 5 million, 10 million, 18 million, 25 million, and 50 million international units

### Indications and dosages

➤ Chronic hepatitis C

**Adults:** 3 million international units subcutaneously or I.M. three times weekly. If patient tolerates therapy and alanine aminotransferase (ALT) level is normal after 16 weeks, continue for 18 to 24 weeks. If ALT doesn't normalize, drug may be withdrawn.

➤ Chronic hepatitis B

**Adults:** 30 to 35 million international units subcutaneously or I.M. weekly for 16 weeks, given as 5 million international units daily or 10 million international units three times weekly

➤ Hairy cell leukemia

**Adults:** 2 million international units/m<sup>2</sup> I.M. or subcutaneously three times weekly for 6 months or longer

➤ AIDS-related Kaposi's sarcoma

**Adults:** 30 million international units/m<sup>2</sup> subcutaneously or I.M. three times weekly. Continue dosage unless intolerance occurs or disease advances rapidly.

➤ Malignant melanoma (as adjunct to surgery)

**Adults:** 20 million international units/m<sup>2</sup> I.V. for 5 consecutive days per

week for 4 weeks; then a maintenance dosage of 10 million international units/m<sup>2</sup> subcutaneously three times weekly for 48 weeks. Withhold drug if adverse reactions occur; when reactions ease, resume at half of previous dosage. Withdraw if reactions persist.

➤ *Condyloma acuminatum* (genital or venereal warts)

**Adults:** 1 million international units/lesion given intralesionally three times weekly for 3 weeks

➤ Aggressive follicular non-Hodgkin's lymphoma

**Adults:** 5 million international units subcutaneously three times weekly for up to 18 months (given with chemotherapy regimen containing anthracycline)

### Off-label uses

- Adjuvant treatment of malignant melanoma
- Hepatitis D

### Contraindications

- Hypersensitivity to drug or its components
- Autoimmune disorders
- Female partners of males receiving drug

### Precautions

Use cautiously in:

- cardiac or pulmonary disease; bone marrow, autoimmune, seizure, or psychiatric disorders
- diabetic patients prone to ketoacidosis
- pregnant or breastfeeding patients
- children.

### Administration

• Administer by subcutaneous, I.M., I.V., or intralesional route. For I.V. use, reconstitute with diluent provided by manufacturer (bacteriostatic water for injection), according to chart provided. Mix gently, draw drug up into sterile syringe, and inject into 100 ml of

normal saline solution. Infuse slowly over 20 minutes.

- Give antiemetics, as needed and prescribed, for nausea and vomiting.

Route	Onset	Peak	Duration
I.V.	Unknown	15-60 min	4 hr
I.M.	Unknown	2-12 hr	Unknown
Subcut.	Unknown	3-12 hr	Unknown
Intrales.	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** dizziness, confusion, paresthesia, rigors, lethargy, depression, difficulty thinking or concentrating, insomnia, anxiety, fatigue, asthenia, amnesia, malaise, nervousness, drowsiness,

#### suicidal ideation

**CV:** chest pain, hypertension, palpitations, **arrhythmias**

**EENT:** visual disturbances, stye, hearing disorders, nasal congestion, sinusitis, rhinitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, flatulence, eructation, stomatitis, dry mouth, **intestinal obstruction**

**GU:** gynecomastia, impaired fertility in women, transient erectile dysfunction

**Hematologic:** anemia, **leukopenia, thrombocytopenia, neutropenia**

**Metabolic:** hyperglycemia, hypocalcemia

**Musculoskeletal:** joint pain, back pain, myalgia

**Respiratory:** cough, dyspnea

**Skin:** flushing, rash, dry skin, pruritus, alopecia, dermatitis, diaphoresis

**Other:** gingivitis, flulike symptoms, candidiasis, edema, weight loss

### Interactions

**Drug-drug.** *Aminophylline, theophylline:* reduced clearance of these drugs

**CNS depressants:** additive CNS effects

**Live-virus vaccines:** decreased antibody response to vaccine, increased risk of adverse reactions

**Zidovudine:** synergistic effects

**Drug-diagnostic tests.** *Alkaline phosphatase, ALT, aspartate aminotransferase, bilirubin, blood urea nitrogen, calcium, creatinine, fasting glucose, lactate dehydrogenase, neutralizing antibodies, phosphate, uric acid:*

increased levels

*Hemoglobin, platelets, white blood cells:*  
decreased values

*International Normalized Ratio, partial thromboplastin time, prothrombin time:*  
increased values

### Patient monitoring

🔊 Before therapy and monthly during therapy, assess CBC with white cell differential, bone marrow hairy cells, glucose and electrolyte levels, and liver and kidney function tests.

- Discontinue therapy if neutrophil count drops below 500 cells/mm<sup>2</sup>.
- Monitor fluid intake and output. Keep patient well hydrated.
- Assess for GI upset. Provide small, frequent meals and antiemetics to ease severe nausea and vomiting.

🔊 Monitor for mental status changes, depression, and suicidal ideation.

- Assess for bleeding and bruising.
- Institute infection-control measures.

Monitor for signs and symptoms of infection.

### Patient teaching

- Teach patient or caregiver how to prepare and give drug subcutaneously or I.M., rotate injection sites, and track dosing schedule and injection sites on calendar.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, alertness, and vision.
- Inform female patient that drug is linked to fetal abnormalities. Advise her not to get pregnant during therapy, and to use barrier contraception.
- Tell female patient not to breastfeed.

- Advise patient to avoid potential infection sources, such as crowds and people with known infections.
- Tell patient to eat small, frequent meals to combat nausea, vomiting, and loss of appetite.
- Inform male patient that drug may cause transient erectile dysfunction.
- 🔊 Instruct patient to immediately report depression, suicidal thoughts, mental status changes, signs or symptoms of infection (such as fever, chills, sore throat), unusual bleeding or bruising, dizziness, palpitations, or chest pain.
- Tell patient he'll need regular follow-up examinations and blood tests to gauge drug effects.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## interferon alfacon-1

Infergen

**Pharmacologic class:** Biological response modifier

**Therapeutic class:** Antiviral

**Pregnancy risk category C**  
(*monotherapy*), **X** (*with ribavirin*)

### FDA BOXED WARNING

- Drug may cause or worsen fatal or life-threatening neuropsychiatric, autoimmune, ischemic, and infectious disorders. Monitor patient closely with periodic clinical and laboratory evaluations. Discontinue drug in patients with persistently severe or worsening signs or symptoms of these conditions. In many cases, these disorders resolve after withdrawal.

- If drug is used with ribavirin, birth defects or death of the fetus may occur. Female patients and female partners of male patients must take extreme care to avoid pregnancy. Ribavirin also causes hemolytic anemia, which may result in a worsening of cardiac disease. Ribavirin is genotoxic and mutagenic and should be considered a potential carcinogen.

### Action

Binds to membrane receptors on viral cells, inducing protein synthesis, inhibiting viral replication, and suppressing cell proliferation. Increases phagocytosis, enhances expression of human leukocyte antigen, and augments lymphocyte cytotoxicity.

### Availability

*Injection:* 9-mcg/0.3-ml vials, 15-mcg/0.5-ml vials

### Indications and dosages

➤ Chronic hepatitis C

**Adults:** Initially as monotherapy, 9 mcg subcutaneously as a single dose three times weekly for 24 weeks; for patients who tolerated previous interferon therapy and didn't respond or relapsed following its discontinuation, 15 mcg subcutaneously as a single injection three times weekly for up to 48 weeks. For combination therapy, 15 mcg subcutaneously daily as a single injection with weight-based ribavirin at 1,000 to 1,200 mg (less than 75 kg to 75 kg or more, respectively) P.O. daily in two divided doses for up to 48 weeks.

### Dosage adjustment

- Hematologic toxicities
- Patients with depression
- Serious adverse reactions

### Off-label uses

- Hairy cell leukemia

### Contraindications

- Hypersensitivity to drug, its components, or ribavirin
- Hepatic decompensation (Child-Pugh score above 6), autoimmune hepatitis
- Patients with creatinine clearance below 50 ml/minute (combination therapy with ribavirin)
- Hemoglobinopathies, such as thalassemia major and sickle cell anemia (combination therapy with ribavirin)
- Pregnant patients and men whose female partners are pregnant (combination therapy with ribavirin)

### Precautions

Use cautiously in:

- cardiac disease, severe psychiatric disorders, ischemic and hemorrhagic cerebrovascular events, pulmonary disorders, chronic hepatitis C infection with cirrhosis, renal insufficiency, colitis, pancreatitis, ophthalmologic disorders, endocrine disorders, any abnormal test values
- history of significant or unstable cardiac disease (avoid use)
- other autoimmune disorders
- abnormally low peripheral blood cell counts or concurrent use of agents known to cause myelosuppression
- combination therapy with ribavirin in patients with low baseline neutrophil count (less than 1,500/mm<sup>3</sup>)
- transplant patients or other chronically immunosuppressed patients
- combination of interferon alfacon-1 and ribavirin in treatment-naïve patients or in patients co-infected with hepatitis B virus or HIV-1 (safety and efficacy not established)
- breastfeeding patients
- children age 18 and younger.

### Administration

- Give by subcutaneous route only.
- Give antiemetics for nausea and vomiting, as needed and prescribed.

Route	Onset	Peak	Duration
Subcut.	Unknown	24-36 hr	Unknown

- Be aware that female patients must have a negative pregnancy test before starting combination therapy with ribavirin.
- Be aware that patients who have pre-existing cardiac abnormalities should have an ECG before starting treatment with interferon alfacon-1 and ribavirin combination.
- Be aware that laboratory tests are recommended for all patients before starting therapy. Entrance criteria that may be considered as a guideline to acceptable baseline values for initiation of treatment are shown below:

Test	Baseline value
Absolute neutrophil count	$\geq 1,500 \times 10^6/L$
Bilirubin	$\leq 1.4$ mg/dl (except patients with Gilbert's syndrome)
Hemoglobin concentration	$\geq 10$ g/dl
Platelet count	$\geq 75 \times 10^9/L$
Serum albumin concentration	$\geq 25$ g/L
Serum creatinine concentration	$< 180$ $\mu$ mol/L ( $< 2$ mg/dl) or creatinine clearance $> 0.83$ ml/second ( $> 50$ ml/minute)
Thyroid-stimulating hormone, $T_4$	Within normal limits

### Adverse reactions

**CNS:** dizziness, confusion, rigors, headache, emotional lability, hypoaesthesia, paresthesia, lethargy, depression, difficulty thinking or concentrating, insomnia, anxiety, fatigue, amnesia, nervousness, drowsiness, asthenia, malaise, **suicidal ideation, stroke**

**CV:** chest pain, hypertension, palpitations, hypotension, tachycardia, angina

pectoris, **cardiomyopathy, myocardial infarction, arrhythmias**

**EENT:** visual disturbances, stye, retinopathy including macular edema, retinal artery or vein thrombosis, retinal hemorrhages and cotton wool spots, optic neuritis, papilledema, retinal detachment, hearing disorders, nasal congestion, rhinitis, sinusitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, flatulence, eructation, stomatitis, dry mouth, anorexia, **intestinal obstruction, hemorrhagic and ischemic colitis, pancreatitis**

**GU:** impaired fertility in women, gynecomastia, erectile dysfunction, **renal failure**

**Hematologic:** anemia, **leukopenia, thrombocytopenia, neutropenia, severe cytopenias, hemolytic anemia**

**Hepatic: hepatic decompensation**

**Metabolic:** hyperglycemia, diabetes mellitus, hypothyroidism, hyperthyroidism

**Musculoskeletal:** joint pain, back pain, limb pain, neck pain, myalgia

**Respiratory:** cough, dyspnea, **pulmonary infiltrates, pneumonia, bronchiolitis obliterans, interstitial pneumonitis, pulmonary hypertension, sarcoidosis**

**Skin:** rash, dryness, pruritus, flushing, alopecia, candidiasis, dermatitis, diaphoresis

**Other:** gingivitis, flulike symptoms, edema, weight loss, fever, body pain, injection-site erythema, infections, hypersensitivity including urticaria, **autoimmune disorders, angioedema, bronchoconstriction, anaphylaxis**

### Interactions

**Drug-diagnostic tests.** *Alkaline phosphatase, aspartate aminotransferase, bilirubin, creatinine, lactate dehydrogenase, neutralizing antibodies,*

*serum creatinine, thyroid-stimulating hormone, triglycerides, uric acid:*

increased values

*Granulocytes, hematocrit, hemoglobin, platelets, serum albumin, thyroxine white blood cells:* decreased values

### Patient monitoring

☞ Before and regularly during therapy, assess CBC with white cell differential and hepatitis C virus antibodies.

- Assess fluid intake and output. Keep patient well hydrated.

☞ Stay alert for depression, mental status changes, psychosis, and suicidal ideation (especially in patients with history of mental illness).

- Assess for bleeding and bruising.
- Institute infection-control measures. Monitor for signs and symptoms of infection.

- Watch for flulike symptoms.

☞ Monitor patient for hypersensitivity reactions; discontinue drug immediately and institute appropriate treatment if severe signs and symptoms (such as urticaria, angioedema, bronchoconstriction, or anaphylaxis) occur.

☞ Monitor patient for signs and symptoms of pancreatitis. Suspend treatment if signs and symptoms occur; discontinue treatment in patients diagnosed with pancreatitis.

☞ Closely watch for and discontinue treatment if patient develops persistent or unexplained pulmonary infiltrates or pulmonary function impairment. Be aware that respiratory failure has been observed with interferon rechallenge.

☞ Be aware that patients with chronic hepatitis C with cirrhosis may be at risk for hepatic decompensation when treated with this drug. Closely monitor hepatic function during treatment. Treatment should be immediately discontinued if signs and symptoms of hepatic decompensation, such as jaundice, ascites, coagulopathy, or

decreased serum albumin, are observed.

- Monitor renal function (particularly increases in serum creatinine level) during therapy.

☞ Be aware that hemorrhagic and ischemic colitis, sometimes fatal, has been observed within 12 weeks of initiation of therapy. Discontinue drug immediately in patients who develop signs and symptoms of colitis.

☞ Be aware that development or exacerbation of autoimmune disorders (such as autoimmune thrombocytopenia, idiopathic thrombocytopenic purpura, psoriasis, rheumatoid arthritis, thyroiditis, interstitial nephritis, and systemic lupus erythematosus) have occurred in patients receiving interferon alpha therapies.

- Monitor patients for vision impairment; be aware that patient who develop ocular signs and symptoms should receive a prompt and complete eye examination. Discontinue therapy in patients who develop new or worsening ophthalmologic disorders.

- For patients receiving combination therapy, discontinue ribavirin in patients who temporarily or permanently discontinue interferon alfacon-1.

### Patient teaching

- Teach patient or caregiver how to administer drug subcutaneously, rotate injection sites, and track dosing schedule and injection sites on calendar.

- Advise patient to avoid sources of potential infection, such as crowds and people with known infections.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, alertness, and vision.

- Tell female patient that drug is linked to fetal abnormalities. Advise her not to get pregnant during therapy, and to use barrier contraception.

 Instruct patient to immediately report signs and symptoms of infection, unusual bleeding or bruising, mental status changes, dizziness, palpitations, vision impairment, diarrhea, abdominal pain, respiratory signs and symptoms, rash, hives, or new or worsening symptoms.

- Tell patient he'll need regular follow-up examinations and blood tests to gauge drug effects.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## interferon beta-1a

Avonex, Rebif

## interferon beta-1b

Betaferon , Betaseron, Extavia

**Pharmacologic class:** Biological response modifier

**Therapeutic class:** Antiviral, immunoregulator

**Pregnancy risk category** C

### Action

Binds and competes with specific receptors on cell surface, inducing various interferon-induced gene products. Also inhibits proliferation of T cells.

### Availability

*Lyophilized powder for injection (beta-1a):* 22 mcg (6 million international units; Rebif), 33 mcg (6.6 million international units; Avonex), 44 mcg (12 million international units; Rebif)  
*Lyophilized powder for injection (beta-1b):* 0.3 mg in glass, single-use, 3-ml vial

*Powder for injection (beta-1b):* 0.3 mg (9.6 million international units; Betaseron)

*Prefilled syringes (beta-1a):* 30 mcg/0.5 ml (Avonex)

### Indications and dosages

 To reduce frequency of exacerbations in relapsing-remitting multiple sclerosis  
**Adults ages 18 and older:** 8.8 mcg Rebif subcutaneously three times weekly, increased over a 4-week period to 44 mcg three times weekly. Or 30 mcg Avonex I.M. once a week. Or 8 million international units (0.25 mg) Betaseron subcutaneously every other day. Or initially, 0.0625 mg (0.25 ml) (Extavia) subcutaneously every other day, increased over 6 weeks to 0.25 mg (1 ml) every other day.

### Contraindications

- Hypersensitivity to drug, its components, or albumin

### Precautions

Use cautiously in:

- cardiac disease, seizure disorders, mental disorders, depression, suicidal tendencies
- women of childbearing age
- pregnant or breastfeeding patients
- children ages 18 and younger.

### Administration

- Reconstitute Avonex (I.M. injection) and Rebif (subcutaneous injection) using diluent provided, according to instructions provided.
- Reconstitute Betaseron (subcutaneous injection) using 1.2 ml of diluent supplied by manufacturer, to yield a concentration of 0.25 mg/ml. Swirl gently to mix; don't shake. Use reconstituted drug within 3 hours; discard unused portion.
- Reconstitute Extavia (subcutaneous injection) by attaching prefilled, single-use syringe containing 1.2 ml of diluent supplied by manufacturer to vial

using vial adapter. Slowly inject 1.2 ml of diluent into vial to yield a concentration of 0.25 mg/ml. Swirl gently to mix; don't shake. Use reconstituted drug within 3 hours; discard unused portion.

Route	Onset	Peak	Duration
I.M.	Unknown	Unknown	Unknown
Subcut.	Unknown	1-8 hr	Unknown

### Adverse reactions

**CNS:** dizziness, confusion, rigors, paresthesia, lethargy, depression, difficulty thinking or concentrating, insomnia, anxiety, fatigue, amnesia, nervousness, drowsiness, asthenia, malaise, **suicidal ideation**

**CV:** chest pain, hypertension, palpitations, **arrhythmias**

**EENT:** visual disturbances, stye, hearing disorders, nasal congestion, sinusitis, rhinitis, pharyngitis

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, dyspepsia, flatulence, eructation, stomatitis, dry mouth, **intestinal obstruction**

**GU:** gynecomastia, breast pain, early or delayed menses, menstrual bleeding or spotting, shortened duration of menstrual flow, menorrhagia

**Hematologic:** anemia, **neutropenia, leukopenia, thrombocytopenia**

**Metabolic:** hypocalcemia

**Musculoskeletal:** joint pain, back pain, myalgia, myasthenia

**Respiratory:** cough, dyspnea

**Skin:** rash, dry skin, pruritus, flushing, alopecia, dermatitis, diaphoresis

**Other:** gingivitis, flulike symptoms, weight loss, edema, candidiasis, lymphadenopathy, inflammation, pain

### Interactions

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, bilirubin, blood urea nitrogen, creatinine, glucose, lactate*

*dehydrogenase, neutralizing antibodies, phosphorus, uric acid:* increased values  
*Hemoglobin, neutrophils, white blood cells:* decreased values

### Patient monitoring

 Before therapy and monthly during therapy, assess CBC with white cell differential, glucose and electrolyte levels, and liver and kidney function tests.

- Assess fluid intake and output. Keep patient well hydrated.

- Watch for GI upset. Provide small, frequent meals to minimize nausea and vomiting.

 Monitor for mental status changes, depression, and suicidal ideation.

- Evaluate for bleeding and bruising.
- Institute infection-control measures. Monitor for infection symptoms.

### Patient teaching

- Teach patient or caregiver how to administer drug subcutaneously or I.M., rotate injection sites, and track dosing schedule and injection sites on calendar.

- Advise patient to avoid sources of potential infection, such as crowds and people with known infections.

- Tell patient to eat small, frequent meals to combat nausea, vomiting, and appetite loss.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration, alertness, and vision.

 Tell patient to contact prescriber immediately if depression or suicidal ideation occurs.

- Inform female patient that drug is linked to fetal abnormalities. Advise her not to get pregnant during therapy, and to use barrier contraception. Tell her to consult prescriber before breastfeeding.

 Instruct patient to immediately report signs or symptoms of infection (such as fever, chills, sore throat, achiness), unusual bleeding or bruising,

mental status changes, dizziness, palpitations, or chest pain.

- Tell patient he'll need regular follow-up examinations and blood tests to monitor drug effects.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the tests mentioned above.

## interferon gamma-1b

Actimmune, Immukin 

**Pharmacologic class:** Biological response modifier

**Therapeutic class:** Antineoplastic

**Pregnancy risk category C**

### Action

Enhances cellular toxicity and killer cell activity and promotes generation of oxygen metabolites in phagocytes, resulting in destruction of microorganisms.

### Availability

**Injection:** 100 mcg (2 million international units)/0.5-ml vial

### Indications and dosages

➤ Chronic granulomatous disease; severe malignant osteoporosis

**Adults with body surface area (BSA) above 0.5 m<sup>2</sup>:** 50 mcg/m<sup>2</sup> (1 million international units/m<sup>2</sup>) subcutaneously three times weekly

**Adults with BSA of 0.5 m<sup>2</sup> or less:** 1.5 mcg/kg subcutaneously three times weekly in deltoid or anterior thigh

### Contraindications

- Hypersensitivity to drug, its components, or *Escherichia coli*-derived products

### Precautions

Use cautiously in:

- thyroid disorders, bone marrow depression, hepatic or cardiac disease, seizure disorders, compromised CNS function
- pregnant or breastfeeding patients
- children ages 18 and younger.

### Administration

- Administer into deltoid muscle by subcutaneous route only.
- Give at bedtime if flulike symptoms occur.
- Provide antiemetics to ease nausea and vomiting, as prescribed.

Route	Onset	Peak	Duration
Subcut.	Unknown	7 hr	Unknown

### Adverse reactions

**CNS:** dizziness, confusion, paresthesia, lethargy, depression, difficulty thinking or concentrating, insomnia, anxiety, fatigue, amnesia, nervousness, drowsiness, asthenia, malaise

**CV:** chest pain, hypertension, palpitations, **arrhythmias**

**GI:** nausea, vomiting, diarrhea, constipation, abdominal pain, **pancreatitis**

**GU:** proteinuria

**Hematologic:** anemia, **leukopenia**, **thrombocytopenia**, **neutropenia**

**Musculoskeletal:** joint pain, back pain, myalgia

**Skin:** flushing, rash, dry skin, erythema

**Other:** flulike symptoms, weight loss, edema, hypersensitivity reaction

### Interactions

**Drug-drug.** *Bone marrow depressants:* increased bone marrow depression  
*Zidovudine:* increased zidovudine blood level

**Drug-diagnostic tests.** *Hepatic enzymes:* increased levels

*Neutrophils, platelets:* decreased counts

**Patient monitoring**

📢 Before and monthly during therapy, assess CBC with white cell differential, glucose and electrolyte levels, and liver and kidney function tests.

- Assess fluid intake and output. Keep patient well hydrated.
- Monitor for GI upset. Provide small, frequent meals or antiemetics to ease severe nausea and vomiting.

📢 Monitor patient for mental status changes and depression.

- Assess for flulike symptoms. If these occur, give drug at bedtime and provide supportive care, such as rest and acetaminophen for headache and fever.

**Patient teaching**

- Teach patient or caregiver how to administer drug subcutaneously, rotate injection sites, and track dosing schedule and injection sites on calendar.
- 📢 Tell patient to contact prescriber immediately if depression occurs.
- Advise patient to eat small, frequent meals to combat nausea, vomiting, and appetite loss.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Inform female patient that drug is linked to fetal abnormalities. Advise her not to get pregnant during therapy, and to use barrier contraception.
- Tell female patient to consult prescriber before breastfeeding.
- Tell patient he'll need regular follow-up examinations and blood tests to monitor drug effects.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

**irbesartan**

Aprovel , Avapro

**Pharmacologic class:** Angiotensin II receptor antagonist

**Therapeutic class:** Antihypertensive

**Pregnancy risk category D**

**FDA BOXED WARNING**

- When used during second or third trimester of pregnancy, drug may cause fetal injury and even death. Discontinue as soon as pregnancy is detected.

**Action**

Blocks aldosterone-secreting and potent vasoconstrictive effects of angiotensin II at tissue receptor sites, which reduces vasoconstriction and lowers blood pressure

**Availability**

Tablets: 75 mg, 150 mg, 300 mg

**Indications and dosages**

➤ Hypertension

**Adults:** 150 mg/day P.O.; may increase to 300 mg/day

➤ Nephropathy in patients with type 2 diabetes and hypertension

**Adults:** 300 mg P.O. once daily

**Dosage adjustment**

- Volume-depleted or hemodialysis patients receiving diuretics

**Contraindications**

- Hypersensitivity to drug or its components

**Precautions**

Use cautiously in:

- heart failure, volume or sodium depletion, renal disease, hepatic impairment

- black patients
- females of childbearing age
- pregnant or breastfeeding patients
- children ages 18 and younger (safety not established).

### Administration

- Administer with or without food.
- Know that drug may be given with other antihypertensive drugs.

Route	Onset	Peak	Duration
P.O.	Unknown	Within 2 hr	24 hr

### Adverse reactions

**CNS:** dizziness, fatigue, headache, syncope

**CV:** orthostatic hypotension, chest pain, peripheral edema

**EENT:** conjunctivitis, vision disturbance, ear pain, sinus disorders

**GI:** nausea, diarrhea, constipation, abdominal pain, dry mouth

**GU:** albuminuria, **renal failure**

**Metabolic:** gout, **hyperkalemia**

**Musculoskeletal:** joint pain, back pain, muscle weakness

**Respiratory:** upper respiratory tract infection, cough, bronchitis

**Other:** dental pain

### Interactions

**Drug-drug.** *Diuretics, other antihypertensives:* increased risk of hypotension

*Lithium:* increased lithium blood level

*Nonsteroidal anti-inflammatory drugs:* decreased antihypertensive effects

*Potassium-sparing diuretics, potassium supplements:* increased risk of hyperkalemia

**Drug-diagnostic tests.** *Albumin:* increased level

**Drug-food.** *Salt substitutes containing potassium:* increased risk of hyperkalemia

### Patient monitoring

- Monitor vital signs, especially blood pressure.
- Watch for signs and symptoms of orthostatic hypotension.

- Watch blood pressure closely when volume depletion may cause hypotension (as in diaphoresis, nausea, vomiting, diarrhea, and postoperative period).

- Assess fluid intake and output. Keep patient well hydrated, especially if he's receiving diuretics concurrently.

- Monitor blood urea nitrogen and creatinine levels.

### Patient teaching

- Tell patient he may take with or without food.

- Instruct patient to change position slowly and to stay well hydrated, to minimize blood pressure decrease when rising.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- Tell female patient that drug has been linked to fetal injury and deaths. Caution her not to get pregnant during therapy. Advise her to use barrier contraception.

- Instruct female patient to report pregnancy.

- Instruct patient to report fever, chills, dizziness, severe vomiting, diarrhea, and dehydration.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and foods mentioned above.

## irinotecan hydrochloride

Campto<sup>®</sup>, Camptosar

**Pharmacologic class:** Topoisomerase inhibitor

**Therapeutic class:** Hormonal anti-neoplastic

**Pregnancy risk category D**

**FDA BOXED WARNING**

- Give under supervision of physician experienced in using cancer chemotherapy, in facility with adequate diagnostic and treatment resources.
- Drug can cause both early and late forms of diarrhea that may be severe. Early diarrhea (arising during or shortly after drug infusion) may be accompanied by cholinergic symptoms of rhinitis, increased salivation, miosis, lacrimation, diaphoresis, flushing, and intestinal hyperperistalsis that can cause abdominal cramping. Atropine may prevent or relieve such symptoms. Late diarrhea (generally arising more than 24 hours after administration) can be life-threatening and prolonged, and may lead to dehydration, electrolyte imbalance, or sepsis. For late diarrhea, give loperamide promptly. Carefully monitor patients with diarrhea and provide fluid and electrolyte replacement if they become dehydrated or antibiotic therapy if they develop ileus, fever, or severe neutropenia. Interrupt administration of irinotecan and reduce subsequent doses if severe diarrhea occurs.
- Drug may cause severe myelosuppression.

**Action**

Inhibits topoisomerase 1 (an enzyme that allows DNA replication) by binding to it. This action prevents religation of DNA strand, which results in breakage of double-stranded DNA and cell death.

**Availability**

*Injection:* 20 mg/ml in 2-ml and 5-ml vials

**Indications and dosages**

➤ Metastatic colorectal cancer or recurrence or progression of metastatic colorectal cancer after fluorouracil (5-FU) therapy

**Adults:** 125 mg/m<sup>2</sup> I.V. infused over 90 minutes on days 1, 8, 15, and 22, followed by a 2-week rest; given with leucovorin and 5-FU. Or, 180 mg/m<sup>2</sup> I.V. infused over 90 minutes on days 1, 15, and 29 with leucovorin, 5-FU bolus, and 5-FU infusion followed by a 2-week rest. Or as monotherapy, 125 mg/m<sup>2</sup> I.V. infused over 90 minutes weekly for 4 weeks, followed by a 2-week rest period; or, 350 mg/m<sup>2</sup> I.V. infused over 90 minutes q 3 weeks as long as tolerable. Adjust dosage in increments based on tolerance and age.

**Off-label uses**

- Most cancers

**Contraindications**

- Hypersensitivity to drug
- Concurrent atazanavir use
- Pregnancy or breastfeeding

**Precautions**

Use cautiously in:

- bone marrow depression, severe diarrhea
- patients undergoing radiation therapy
- elderly patients
- children.

**Administration**

⚠ Follow facility policy for handling antineoplastics. If skin contact occurs, wash with soap and water immediately and thoroughly. If mucous membrane contact occurs, flush with water.

- Dilute in dextrose 5% in water or normal saline solution, to a concentration of 0.12 to 1.1 mg/ml.
- Infuse within 6 hours if drug is stored at room temperature or within 24 hours if refrigerated.
- Give single dose by I.V. infusion over 90 minutes.
- Administer antiemetic to ease nausea and vomiting, as needed and prescribed.

Route	Onset	Peak	Duration
I.V.	Immediate	1-2 hr	Unknown

## Adverse reactions

**CNS:** insomnia, dizziness, asthenia, headache, akathisia

**CV:** vasodilation, orthostatic hypotension

**EENT:** rhinitis

**GI:** nausea, vomiting, constipation, diarrhea, flatulence, dyspepsia, abdominal pain or enlargement, stomatitis, anorexia

**Hematologic:** anemia, **neutropenia, leukopenia, thrombocytopenia**

**Hepatic:** **hepatotoxicity**

**Metabolic:** dehydration

**Musculoskeletal:** back pain

**Respiratory:** dyspnea, increased cough

**Skin:** alopecia, diaphoresis, rash

**Other:** weight loss, edema, fever, pain, chills, minor infections

## Interactions

**Drug-drug.** *Dexamethasone:* increased risk of lymphocytopenia

*Diuretics:* increased risk of dehydration

*Laxatives:* increased risk of diarrhea

*Other antineoplastics:* additive adverse effects

**Drug-diagnostic tests.** *Alkaline phosphatase:* increased level

*Hemoglobin, neutrophils, white blood cells:* decreased values

## Patient monitoring

🔊 Assess CBC before each infusion. Withhold dose if neutrophil count is below 1,500 cells/mm<sup>3</sup>.

- Monitor infusion site for extravasation; if it occurs, flush with sterile water and apply ice.
- Assess fluid intake and output. Keep patient well hydrated.
- Monitor oral intake. Evaluate for nausea and vomiting.
- Assess for diarrhea. In severe diarrhea, expect to decrease dosage or withhold dose.
- Institute infection-control protocols to help prevent infection.
- Monitor liver function test results.

## Patient teaching

• Inform patient that blood tests will be done before each dose.

• Instruct patient to report pain at infusion site; severe nausea or vomiting; severe, increased, or bloody diarrhea; infection; or injury.

🔊 Instruct patient to immediately report unusual tiredness or yellowing of skin or eyes.

• Tell patient that drug increases his risk of infection. Advise him to avoid crowds and other potential infection sources.

• Caution female patient not to breastfeed or become pregnant during therapy. Recommend barrier contraception.

• As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## iron dextran

Cosmofer<sup>®</sup>, DexFerrum, InFeD

**Pharmacologic class:** Trace element

**Therapeutic class:** Iron supplement

**Pregnancy risk category** C

## FDA BOXED WARNING

- Parenteral use has caused anaphylactic-type reactions, some resulting in death. Use only in patients with clearly established indications when laboratory tests confirm iron deficiency not amenable to oral iron therapy. Give drug only where resuscitation techniques and treatment of anaphylactic and anaphylactoid shock are readily available.

**Action**

Replenishes depleted stores of iron (a component of hemoglobin) in bone marrow

**Availability**

*Injection:* 50 mg/ml

**Indications and dosages**

➤ Iron-deficiency anemia in patients who can't tolerate oral iron

**Adults and children weighing**

**more than 15 kg (33 lb):** Dosage individualized based on patient's weight and hemoglobin (Hgb) value, using the following formula: Dosage (ml) = 0.0442 (desired Hgb minus patient's Hgb) times lean body weight (LBW) plus the product of 0.26 times LBW

Give test dose before starting I.V. or I.M. therapy: For I.V. use, administer test dose of 0.5 ml (25 mg) I.V. over 30 seconds to 5 minutes; if no reactions occur within 1 hour, give remainder of therapeutic dose I.V.; repeat this dose daily. For I.M. use, give test dose of 0.5 ml (25 mg) by Z-track method; if no reactions occur, give daily doses not exceeding 100 mg I.M. in adults, 50 mg I.M. in children weighing more than 10 kg (22 lb), or 25 mg in infants weighing less than 5 kg (11 lb).

➤ Iron replacement caused by blood loss

**Adults:** Dosage individualized based on the following formula: Replacement iron (in mg) = blood loss (in ml) times hematocrit

**Contraindications**

- Hypersensitivity to drug, alcohol, tartrazine, or sulfites
- Acute phase of infectious renal disease or hemolytic anemia

**Precautions**

Use cautiously in:

- autoimmune disorders, arthritis, severe hepatic impairment

- elderly patients
- breastfeeding patients
- children.

**Administration**

- For I.M. administration, inject by Z-track method into upper outer quadrant of gluteal muscle.
- For intermittent I.V. infusion, administer undiluted at a rate no faster than 1 ml/minute.
- Don't give with oral iron preparations.

Route	Onset	Peak	Duration
I.V., I.M.	4 days	1-2 wk	Wks-mos

**Adverse reactions**

**CNS:** dizziness, headache, syncope, seizures

**CV:** chest pain, tachycardia, hypotension

**GI:** nausea, vomiting

**Hematologic:** hemochromatosis, hemolysis, **hemosiderosis**

**Musculoskeletal:** joint pain, myalgia

**Respiratory:** dyspnea

**Other:** abnormal or metallic taste, tooth discoloration, fever, lymphadenopathy, hypersensitivity reactions including **anaphylaxis**

**Interactions**

None significant

**Patient monitoring**

⚠ Monitor for hypersensitivity reaction. Keep epinephrine and other emergency supplies on hand in case reaction occurs.

- Assess serum ferritin levels regularly, because these levels correlate with iron stores.
- In patients with rheumatoid arthritis, monitor for acute exacerbation of joint pain and swelling. Provide appropriate comfort measures.
- Watch for signs and symptoms of iron overload, including decreased activity, sedation, and GI or respiratory tract bleeding.

## Patient teaching

- Caution patient not to take oral iron preparations or vitamins containing iron during therapy.
- Instruct patient to report difficulty breathing, itching, or rash.
- Tell patient he'll undergo periodic blood testing to monitor his response to therapy.
- As appropriate, review all other significant and life-threatening adverse reactions mentioned above.

## iron sucrose

Venofer

**Pharmacologic class:** Trace element

**Therapeutic class:** Iron supplement

**Pregnancy risk category B**

## Action

Replenishes depleted stores of iron (a component of hemoglobin) in bone marrow

## Availability

*Aqueous complex for injection:* 20 mg elemental iron/ml in 5-ml single-use vials (100 mg of elemental iron)

## Indications and dosages

➤ Iron-deficiency anemia in hemodialysis patients concurrently receiving erythropoietin

**Adults:** 100 mg of elemental iron (5 ml) I.V. directly into dialysis line or by slow injection or infusion during dialysis session (up to three times weekly) for 10 doses (total of 1,000 mg)

## Off-label uses

- Autologous blood donation
- Bloodless surgery

## Contraindications

- Hypersensitivity to drug, alcohol, tartrazine, or sulfites
- Hemolytic anemias and other anemias not caused by iron deficiency
- Primary hemochromatosis

## Precautions

Use cautiously in:

- autoimmune disorders, arthritis, severe hepatic impairment
- elderly patients
- breastfeeding patients
- children.

## Administration

- Give test dose only if ordered: 50 mg (2.5 ml) I.V. over 3 to 10 minutes.
- Dilute 100 mg of elemental iron in no more than 100 ml of normal saline solution; infuse slowly I.V. over at least 15 minutes.
- Administer I.V. directly into dialysis line or by infusion at 20 mg/minute, not to exceed 100 mg/injection.
- Don't give with oral iron preparations.

Route	Onset	Peak	Duration
I.V.	4 days	1-2 wk	Wks-mos

## Adverse reactions

**CNS:** dizziness, headache, syncope, seizures

**CV:** chest pain, tachycardia, hypotension

**GI:** nausea, vomiting

**Hematologic:** hemochromatosis, hemolysis, **hemosiderosis**

**Musculoskeletal:** muscle cramps, aches, or weakness; joint pain

**Respiratory:** dyspnea

**Other:** abnormal or metallic taste, tooth discoloration, fever, lymphadenopathy, allergic reactions including **anaphylaxis**

## Interactions

None significant

### Patient monitoring

Monitor for hypersensitivity reaction. Keep epinephrine and other emergency supplies available in case reaction occurs.

- Assess hemoglobin, hematocrit, serum ferritin, and transferrin saturation levels before, during, and after therapy.

Monitor blood pressure. Stay alert for hypotension.

- Watch for signs and symptoms of iron overload, such as decreased activity, sedation, and GI or respiratory tract bleeding.

### Patient teaching

- Caution patient not to take oral iron preparations or vitamin supplements containing iron during therapy.

- Instruct patient to report dyspnea, itching, or rash.

- Tell patient he'll undergo periodic blood testing to monitor his response to therapy.

- As appropriate, review all other significant and life-threatening adverse reactions mentioned above.

Risk also rises with daily alcohol consumption. Monitor patients carefully and interview them monthly. For persons aged 35 and older, also measure liver enzymes before therapy starts and periodically throughout. Isoniazid-associated hepatitis usually arises during first 3 months of therapy. Hepatitis risk also increases with daily alcohol use, chronic hepatic disease, and injection drug use. Recent report suggests increased risk of fatal hepatitis among women; risk also may increase during postpartum period. If adverse effects or signs and symptoms of hepatic damage occur, discontinue drug promptly.

- Tuberculosis patients with isoniazid-associated hepatitis should receive appropriate treatment with alternative drugs. If isoniazid must be restarted, do so only after symptoms and laboratory abnormalities resolve. Restart in small and gradually increasing doses, and withdraw drug immediately at any indication of recurrent liver involvement. Defer preventive treatment in patients with acute hepatic disease.

## isoniazid (INH)

Dom-Isoniazid<sup>⚠</sup>, Isotamine<sup>⚠</sup>, PMS Isoniazid<sup>⚠</sup>, Rifater<sup>⚠</sup>, Rifinah<sup>⚠</sup>, Rimactazid<sup>⚠</sup>

**Pharmacologic class:** Isonicotinic acid hydrazide

**Therapeutic class:** Antitubercular

**Pregnancy risk category C**

### FDA BOXED WARNING

- Severe and sometimes fatal hepatitis has occurred, even after many months of treatment. Risk increases with age until 64, then decreases after age 65.

### Action

Inhibits cell-wall biosynthesis by interfering with lipid and nucleic acid DNA synthesis in tubercle bacilli cells

### Availability

*Injection:* 100 mg/ml

*Syrup:* 50 mg/5 ml

*Tablets:* 100 mg, 300 mg

### Indications and dosages

➤ Active tuberculosis (TB)

**Adults:** 5 mg/kg P.O. or I.M. (maximum of 300 mg/day) daily as a single dose, or 15 mg/kg (maximum of 900 mg/day) two to three times weekly; given with other agents

**Children:** 10 to 15 mg/kg P.O. or I.M. (maximum of 300 mg/day) daily as a

single dose, or 20 to 40 mg/kg (maximum of 900 mg/day) two to three times weekly

➤ To prevent TB in patients exposed to active disease

**Adults:** 300 mg P.O. daily as a single dose for 6 to 12 months

**Children and infants:** 10 mg/kg P.O. daily as a single dose for up to 12 months

### Off-label uses

- *Mycobacterium kansasii* infection

### Contraindications

- Hypersensitivity to drug
- Acute hepatic disease or previous hepatitis caused by isoniazid therapy

### Precautions

Use cautiously in:

- severe renal impairment, diabetes, diabetic retinopathy, ocular defects, chronic alcoholism, hepatic damage
- Black or Hispanic women
- pregnant or breastfeeding patients
- children ages 13 and younger.

### Administration

- Give on empty stomach 1 hour before or 2 hours after meals. If GI upset occurs, administer with food.
- Administer parenterally only if patient can't receive oral form.
- Use cautiously in diabetic or alcoholic patients and those at risk for neuropathy.

Route	Onset	Peak	Duration
P.O., I.M.	Rapid	1-2 hr	Up to 24 hr

### Adverse reactions

**CNS:** peripheral neuropathy, dizziness, memory impairment, slurred speech, psychosis, **toxic encephalopathy, seizures**

**EENT:** visual disturbances

**GI:** nausea, vomiting

**GU:** gynecomastia

**Hematologic:** eosinophilia, **methemoglobinemia, hemolytic anemia,**

**aplastic anemia, agranulocytosis, thrombocytopenia**

**Hepatic:** hepatitis

**Metabolic:** pyridoxine deficiency, hyperglycemia, **metabolic acidosis**

**Respiratory:** dyspnea

**Other:** fever, pellagra, lupuslike syndrome, injection site irritation, hypersensitivity reaction

### Interactions

**Drug-drug.** *Aluminum-containing antacids:* decreased isoniazid absorption  
*Bacille Calmette-Guérin vaccine:* ineffective vaccination

*Carbamazepine:* increased carbamazepine blood level

*Disulfiram:* psychotic reactions, incoordination

*Hepatotoxic drugs:* increased risk of hepatotoxicity

*Ketoconazole:* decreased ketoconazole blood level and efficacy

*Other antituberculars:* additive CNS toxicity

*Phenytoin:* inhibition of phenytoin metabolism

**Drug-diagnostic tests.** *Albumin:* increased level

**Drug-food.** *Foods containing tyramine:* hypertensive crisis, other severe reactions

**Drug-behaviors.** *Alcohol use:* increased risk of hepatitis

### Patient monitoring

- Assess hepatic enzyme levels.
- Watch for adverse reactions, such as peripheral neuropathy.

### Patient teaching

- Advise patient to take once daily on empty stomach, 1 hour before or 2 hours after meals. If GI upset occurs, tell him to take with small amount of food.
- Caution patient to avoid foods containing tyramine (such as cheese, fish, salami, red wine, and yeast extracts), because drug-food interaction may cause chills, diaphoresis, and palpitations.

- Teach patient with peripheral neuropathy to take care to prevent burns and other injuries.
- Instruct patient to report anorexia, nausea, vomiting, jaundice, dark urine, and numbness or tingling of hands or feet.
- Tell patient he'll need periodic medical and eye examinations and blood tests to gauge drug effects.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, and behaviors mentioned above.

## isoproterenol hydrochloride

Isuprel

**Pharmacologic class:** Sympathomimetic, beta<sub>1</sub>-adrenergic and beta<sub>2</sub>-adrenergic agonist

**Therapeutic class:** Vasopressor, bronchodilator, antiasthmatic

**Pregnancy risk category C**

### Action

Acts on beta<sub>2</sub>-adrenergic receptors, causing relaxation of bronchial smooth muscle; acts on beta<sub>1</sub>-adrenergic receptors in heart, causing positive inotropic and chronotropic effects and increasing cardiac output. Also lowers peripheral vascular resistance in skeletal muscle and inhibits antigen-induced histamine release.

### Availability

**Injection:** 20 mcg/ml, 200 mcg/ml

### Indications and dosages

➤ Shock

**Adults and children:** 0.5 to 5 mcg/minute by continuous I.V. infusion

➤ Heart block; ventricular arrhythmias

**Adults:** Initially, 0.02 to 0.06 mg I.V., then 0.01 to 0.2 mg I.V. or 5 mcg/minute I.V. Or initially, 0.2 mg I.M., then 0.02 to 1 mg I.M., depending on response. Or initially, 0.2 mg subcutaneously, then 0.15 to 0.2 mg subcutaneously, depending on response.

➤ Bronchospasm during anesthesia  
**Adults:** 0.01 to 0.02 mg I.V., repeated when necessary

### Contraindications

- Angina pectoris
- Angle-closure glaucoma
- Tachyarrhythmias
- Tachycardia or heart block caused by digitalis intoxication
- Ventricular arrhythmias that warrant inotropic therapy
- Labor, delivery, breastfeeding

### Precautions

Use cautiously in:

- renal impairment, unstable vasomotor disorders, hypertension, coronary insufficiency, chronic obstructive pulmonary disease, diabetes mellitus, hyperthyroidism
- history of cerebrovascular accident or seizures
- elderly patients.

### Administration

- Give each 0.02-mg I.V. dose by direct injection over 1 minute, or by I.V. infusion, as ordered. Always use continuous infusion pump to deliver infusion.

Route	Onset	Peak	Duration
I.V.	Immediate	Unknown	<1 hr
I.M.	Unknown	Unknown	Unknown
Subcut.	Immediate	Unknown	2 hr

### Adverse reactions

**CNS:** tremors, anxiety, insomnia, headache, dizziness, asthenia, nervousness

**CV:** palpitations, tachycardia, angina, rapid blood pressure changes, **arrhythmias, cardiac arrest, Stokes-Adams attacks**

**EENT:** pharyngitis, visual blurring

**GI:** nausea, vomiting, heartburn

**Metabolic:** hyperglycemia

**Respiratory:** bronchitis, dyspnea, increased sputum, **pulmonary edema, bronchospasm**

**Skin:** diaphoresis

**Other:** parotid gland swelling (with prolonged use), pallor

### Interactions

**Drug-drug.** *Cyclopropane, epinephrine, halogenated general anesthetics:*

increased risk of arrhythmias

*Propranolol, other beta-adrenergic blockers:* antagonism of bronchodilating effects

**Drug-diagnostic tests.** *Glucose:* increased level

### Patient monitoring

- During I.V. administration, monitor ECG and vital signs carefully.
- Assess patient's response to drug and adjust I.V. infusion rate accordingly.
- Closely monitor arterial blood gas values, urine output, and central venous pressure.
- 📢 Stay alert for rebound bronchospasm.

### Patient teaching

- Assure patient that he'll be monitored closely.

## isosorbide dinitrate

Angitak<sup>⚡</sup>, Apo-ISDN<sup>⚡</sup>, Cedocard<sup>⚡</sup>, Cedocard-SR<sup>⚡</sup>, Dilatrate-SR, Isochron, Isoket<sup>⚡</sup>, Isordil Titradose, Novo-Sorbide<sup>⚡</sup>, PMS-Isosorbide<sup>⚡</sup>, Soni-Slo SR, Sorbid

## isosorbide mononitrate

Angeze<sup>⚡</sup>, Chemydur<sup>⚡</sup>, Cibral<sup>⚡</sup>, Cibral XL<sup>⚡</sup>, Dynamin<sup>⚡</sup>, Dynamin XL<sup>⚡</sup>, Elantan<sup>⚡</sup>, Elantan LA<sup>⚡</sup>, Imazin XL<sup>⚡</sup>, Imdur<sup>⚡</sup>, Imo LA<sup>⚡</sup>, Isib<sup>⚡</sup>, ISMO, Isodur<sup>⚡</sup>, Ketanodur<sup>⚡</sup>, Modisal<sup>⚡</sup>, Monigen<sup>⚡</sup>, Monigen XL<sup>⚡</sup>, Monit<sup>⚡</sup>, Monit LS<sup>⚡</sup>, Monoket, Monomax<sup>⚡</sup>, Monomax SR<sup>⚡</sup>, Monomax XL<sup>⚡</sup>, Monomil<sup>⚡</sup>, Monosorb<sup>⚡</sup>, Trangina<sup>⚡</sup>, Trangina XL<sup>⚡</sup>, Xismox<sup>⚡</sup>, Zemon<sup>⚡</sup>, Zemon XL<sup>⚡</sup>

**Pharmacologic class:** Nitrate

**Therapeutic class:** Antianginal

**Pregnancy risk category** C

### Action

Promotes peripheral vasodilation and reduces preload and afterload, decreasing myocardial oxygen consumption and increasing cardiac output. Also dilates coronary arteries, increasing blood flow and improving collateral circulation.

### Availability

#### isosorbide dinitrate

*Capsules:* 40 mg

*Capsules (extended-release):* 40 mg

*Tablets:* 2.5 mg, 5 mg, 10 mg, 20 mg, 30 mg, 40 mg

*Tablets (chewable):* 5 mg, 10 mg

*Tablets (extended-release):* 20 mg, 40 mg

*Tablets (sublingual):* 2.5 mg, 5 mg, 10 mg

#### isosorbide mononitrate

*Tablets:* 10 mg, 20 mg

*Tablets (extended-release):* 30 mg, 60 mg, 120 mg

### Indications and dosages

➤ Treatment and prophylaxis in situations likely to provoke acute angina pectoris

**Adults:** 2.5 to 5 mg S.L. May repeat dose q 5 to 10 minutes for a total of three doses in 15 to 30 minutes.

➤ Prophylaxis of angina pectoris

**Adults:** 5 to 40 mg P.O. (dinitrate conventional tablets) two to three times daily. Or 5 to 20 mg (mononitrate conventional tablets) b.i.d. Or 30 to 60 mg (mononitrate extended-release tablets) once daily. After several days, dosage may be increased to 120 mg (given as single 120-mg tablet or two 60-mg tablets) once daily. Rarely, 240 mg/day (mononitrate extended-release tablets) may be needed.

### Off-label uses

- Heart failure

### Contraindications

- Hypersensitivity to drug
- Severe anemia
- Acute myocardial infarction
- Angle-closure glaucoma
- Concurrent sildenafil therapy

### Precautions

Use cautiously in:

- head trauma, volume depletion
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

- Give oral form 30 minutes before or 1 to 2 hours after a meal. Make sure patient swallows tablets or capsules whole.
- Have patient wet S.L. tablet with saliva before placing it under tongue. To avoid tingling sensation, have him place tablet in buccal pouch.

Route	Onset	Peak	Duration
P.O. (dinitrate)	15-40 min	Unknown	4 hr
P.O. (dinitrate, extended)	30 min	Unknown	≤12 hr
P.O. (mono- nitrate)	30-60 min	Unknown	7 hr
P.O. (mono- nitrate, extended)	Unknown	Unknown	12 hr
S.L. (dinitrate)	2-5 min	Unknown	1-2 hr

### Adverse reactions

**CNS:** dizziness, headache, apprehension, asthenia, syncope  
**CV:** orthostatic hypotension, tachycardia, paradoxical bradycardia, rebound hypertension  
**EENT:** sublingual burning (with S.L. route)  
**GI:** nausea, vomiting, dry mouth, abdominal pain  
**Skin:** flushing

### Interactions

**Drug-drug.** *Aspirin:* increased isosorbide blood level and effects  
*Beta-adrenergic blockers, calcium channel blockers, phenothiazines:* additive hypotension  
*Dihydroergotamine:* antagonism of dihydroergotamine effects  
*Sildenafil:* severe and potentially fatal hypotension  
**Drug-diagnostic tests.** *Cholesterol:* decreased level  
*Methemoglobin, urine vanillylmandelic acid:* increased levels

### Patient monitoring

- Monitor ECG and vital signs closely, especially blood pressure.
- 🔊 In suspected overdose, assess for signs and symptoms of increased intracranial pressure.
- Monitor arterial blood gas values and methemoglobin levels.

### Patient teaching

- Teach patient to take oral drug 30 minutes before or 1 to 2 hours after a meal.
- Inform patient that drug may cause headache. Advise him to treat headache as usual and not to alter drug schedule. If headache persists, tell him to contact prescriber.
- Instruct patient to move slowly when sitting up or standing, to avoid dizziness or light-headedness from sudden blood pressure decrease.

- As appropriate, review all other significant adverse reactions and interactions, especially those related to the drugs and tests mentioned above.

## isradipine

DynaCirc CR, Prescal 

**Pharmacologic class:** Calcium channel blocker

**Therapeutic class:** Antihypertensive

**Pregnancy risk category** C

### Action

Inhibits calcium ion movement across cell membranes of cardiac and arterial muscles, relaxing coronary and peripheral vascular smooth muscle. This action reduces diastolic blood pressure, enhances left ventricular function, and improves ejection rates; it also reduces mean vascular and systemic vascular resistance, increasing cardiac output and improving stroke volume.

### Availability

**Capsules:** 2.5 mg, 5 mg

**Tablets (controlled-release):** 5 mg, 10 mg

### Indications and dosages

➤ Hypertension

**Adults:** Initially, 2.5 mg P.O. b.i.d. as monotherapy or combined with a thiazide diuretic (regular-release capsules); may increase in increments of 5 mg/day at 2- to 4-week intervals, to a maximum of 20 mg/day. Or, 5 to 10 mg P.O. (controlled-release) daily as monotherapy or combined with a thiazide diuretic.

### Contraindications

- Hypersensitivity to drug or other calcium channel blockers

### Precautions

Use cautiously in:

- heart disease, hypotension, hepatic or renal disease, GI hypermotility or obstruction (controlled-release form)
- concurrent use of beta-adrenergic blockers
- elderly patients
- pregnant or breastfeeding patients
- children.

### Administration

- Give with or without food.
- Don't give with grapefruit juice.
- Don't crush or break controlled-release tablets. Make sure patient swallows them whole.

Route	Onset	Peak	Duration
P.O.	2 hr	Unknown	Unknown
P.O. (controlled)	Unknown	Unknown	Unknown

### Adverse reactions

**CNS:** dizziness, headache, fatigue, syncope, sleep disturbances

**CV:** peripheral edema, tachycardia, hypotension, chest pain, **arrhythmias**

**GI:** nausea, vomiting, constipation, abdominal pain or distention, dry mouth

**GU:** nocturia, urinary frequency

**Hematologic:** leukopenia

**Hepatic:** hepatitis

**Skin:** rash, pruritus, urticaria

**Other:** flushing

### Interactions

**Drug-drug.** *Atracurium, gallamine, pancuronium, tubocurarine, vecuronium:* increased respiratory depression

*Beta-adrenergic blockers:* increased cardiac depression

*Carbamazepine, digoxin, prazosin, quinidine:* increased blood levels of these drugs

**Drug-food.** *Grapefruit juice:* increased drug absorption

**Patient monitoring**

- Monitor vital signs closely, especially blood pressure.
- Assess liver function test results.
- Monitor for arrhythmias and peripheral edema.

**Patient teaching**

- Tell patient he may take with or without food, but not with grapefruit juice.
- Instruct patient to move slowly when sitting up or standing, to avoid dizziness or light-headedness from sudden blood pressure decrease.
- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.
- Teach patient with heart, kidney, or liver disease to watch for and promptly report adverse reactions.
- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs and foods mentioned above.

**itraconazole**

Sporanox

**Pharmacologic class:** Synthetic triazole**Therapeutic class:** Antifungal**Pregnancy risk category** C**FDA BOXED WARNING**

- Don't administer capsules to treat onychomycosis in patients with evidence of ventricular dysfunction, such as current or previous heart failure. If heart failure signs or symptoms occur during therapy, discontinue drug.
- Concurrent use of cisapride, dofetilide, levacetylmethadol (levome-thadyl), pimozide, or quinidine with

itraconazole capsules or oral solution is contraindicated. Itraconazole is a potent CYP3A4 inhibitor and may raise blood levels of drugs metabolized by this pathway. Serious cardiovascular events (including QT prolongation, torsades de pointes, ventricular tachycardia, cardiac arrest, and sudden death) have occurred in patients taking these drugs concurrently with itraconazole.

**Action**

Prevents ergosterol synthesis in fungal cell membranes, altering membrane permeability

**Availability***Capsules:* 100 mg*Oral solution:* 10 mg/ml**Indications and dosages**

➤ Aspergillosis; blastomycosis; histoplasmosis

**Adults:** 200 to 400 mg P.O. daily for at least 3 months until patient is cured. In life-threatening infections, loading dose of 200 mg P.O. t.i.d. for 3 days, then 200 to 400 mg P.O. daily until cured.

➤ Esophageal candidiasis

**Adults:** 100 to 200 mg of oral solution daily, swished in mouth for several seconds and swallowed, for at least 3 weeks; continue for 2 weeks after symptoms resolve.

➤ Oropharyngeal candidiasis

**Adults:** 200 mg of oral solution daily, swished in mouth for several seconds and swallowed, for 1 to 2 weeks

➤ Onychomycosis; tinea unguium

**Adults:** For toenails, 200 mg P.O. daily for 12 weeks. For fingernails, 200 mg b.i.d. for 1 week; wait 3 weeks, then repeat dosage for 1 week.

**Contraindications**

- Hypersensitivity to drug or its components
- Ventricular dysfunction, congestive heart failure (CHF) or history of CHF (in onychomycosis use)

- Concomitant use of astemizole, cisapride, dofetilide, ergot alkaloids (such as dihydroergotamine, ergonovine, ergotamine, and methylergonovine), lovastatin, midazolam, pimozide, quinidine, simvastatin, or triazolam
- Pregnancy or anticipated pregnancy (in onychomycosis use)

### Precautions

Use cautiously in:

- hypersensitivity to other azole derivatives
- renal impairment (with I.V. use), hepatic disorders, achlorhydria, hypochlorhydria
- breastfeeding patients
- children (safety and efficacy not established).

### Administration

- Obtain specimens for fungal cultures, as needed, before starting therapy.
- Administer capsule with a full meal.
- Give oral solution without food when possible.
- Be aware that liquid and tablets aren't interchangeable.

Route	Onset	Peak	Duration
P.O.	Slow	4-6 hr	4-6 days

### Adverse reactions

**CNS:** dizziness, headache, fatigue, malaise

**CV:** peripheral edema, tachycardia,

**heart failure**

**EENT:** rhinitis, transient or permanent hearing loss

**GI:** nausea, vomiting, constipation, abdominal pain, flatulence, anorexia, dyspepsia, **GI bleeding, pancreatitis**

**GU:** albuminuria, erectile dysfunction

**Hepatic:** jaundice, **hepatotoxicity** (including **hepatic failure and death**)

**Metabolic:** hypokalemia

**Musculoskeletal:** myalgia, bursitis, **rhabdomyolysis**

**Respiratory:** **pulmonary edema**

**Skin:** flushing, rash, pruritus, urticaria, increased sweating, herpes zoster infection

**Other:** fever, pain

### Interactions

**Drug-drug.** *Alfentanil, antihistamines (minimally sedating agents, such as fexofenadine, loratadine), antineoplastics (busulfan, docetaxel, vinca alkaloids), anxiolytics, benzodiazepines, cyclosporine, delavirdine, digoxin, immunosuppressants, methylprednisolone, protease inhibitors, tacrolimus, tolterodine, tretinoin:* increased blood levels of these drugs

*Amiodarone, anabolic steroids, androgens, antithyroid drugs, carmustine, chloroquine, dantrolene, daunorubicin, disulfiram, estrogens, gold salts, hormonal contraceptives, hydroxychloroquine, mercaptopurine, methotrexate, methyl dopa, naltrexone (with long-term use), valproic acid:* increased risk of hepatic damage

*Amphotericin B:* reduced or inhibited amphotericin B effects

*Antacids, anticonvulsants, antimycobacterials, cyclobenzaprine, histamine<sub>2</sub>-receptor blockers, isoniazid, proton pump inhibitors (such as lansoprazole, omeprazole), reverse transcriptase inhibitors, sucralfate:* reduced itraconazole blood level

*Antipsychotics, antiarrhythmics (such as quinidine, dofetilide), anxiolytics, astemizole, cisapride:* increased risk of serious cardiovascular effects

*Calcium channel blockers:* increased risk of edema, possible increase in itraconazole's effect

*Carbamazepine, carbidopa, levodopa:* altered blood levels of these drugs

*Didanosine, vinblastine, vincristine, xanthine bronchodilators:* decreased efficacy of these drugs

*Digoxin:* increased digoxin blood level, possible digoxin toxicity

*HMG-CoA reductase inhibitors, miconazole*: inhibited metabolism of these drugs, increased risk of skeletal muscle toxicity (including rhabdomyolysis)

*Macrolide antibiotics*: increased itraconazole blood level

*Oral hypoglycemics*: severe blood glucose decrease

*Quetiapine, sildenafil*: increased efficacy of these drugs

*Warfarin*: enhanced anticoagulant effect

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase, blood urea nitrogen, gamma-glutamyltransferase, serum creatinine*: increased levels

*Potassium, magnesium*: decreased levels

**Drug-food.** *Any food, cola*: increased itraconazole blood level

*Grapefruit juice*: decreased blood level and reduced therapeutic effects of itraconazole

**Drug-herbs.** *Chaparral, comfrey, germander, jin bu huan, kava*: increased risk of hepatic damage

**Drug-behaviors.** *Alcohol consumption*: toxic reaction, hepatic damage

### Patient monitoring

- In patient with hepatic dysfunction, monitor hepatic enzyme levels.

- 🔊 Monitor for signs and symptoms of hearing loss, pancreatitis, hepatic dysfunction (jaundice, fatigue, nausea, vomiting, dark urine, pale stools), heart failure, muscle disorder, and pulmonary or peripheral edema.

- Monitor potassium level. Stay alert for hypokalemia.

### Patient teaching

- Tell patient he may take capsule with a full meal. If he's using oral solution, advise him to take it without food.

- Inform patient that drug interacts with many other drugs. Advise him to tell all prescribers he's taking it.

- 🔊 Teach patient to recognize and immediately report signs and symptoms of hearing loss, pancreatitis,

hepatic dysfunction, persistent muscle pain, and heart failure.

- Caution patient to avoid driving and other hazardous activities until he knows how drug affects concentration and alertness.

- Advise female patient of childbearing potential to use effective contraception during and for 1 month after therapy. Caution her not to breastfeed.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, foods, herbs, and behaviors mentioned above.

## ketoconazole

Apo-Ketoconazole<sup>✳</sup>, Dactarin Gold<sup>⚡</sup>, Dandrazol<sup>⚡</sup>, Extina, Kryoxolr, Nizoral, Nizoral A-D, Novo-Ketoconazole<sup>✳</sup>, Nu-Ketocon<sup>✳</sup>, Nu-Ketoconazole<sup>✳</sup>, Ratio-Ketoconazole<sup>✳</sup>, Xolegel

**Pharmacologic class:** Imidazole

**Therapeutic class:** Antifungal

**Pregnancy risk category** C

### FDA BOXED WARNING

- Oral form has been linked to hepatic toxicity, including some deaths. Inform patient of this risk, and monitor closely.

- Concurrent use of astemizole, cispapride, or terfenadine with ketoconazole tablets is contraindicated, because serious cardiovascular adverse events (including death, ventricular tachycardia, and torsades de pointes) have occurred.

## Action

Alters fungal cell membranes, resulting in increased permeability, growth inhibition, and ultimately, cell death

## Availability

*Cream:* 2%

*Shampoo:* 1%, 2%

*Tablets:* 200 mg

## Indications and dosages

➤ Blastomycosis; chronic mucocutaneous candidiasis; oral thrush; candiduria; coccidioidomycosis; histoplasmosis; chromomycosis; paracoccidioidomycosis; mucocutaneous or vaginal candidiasis

**Adults:** 200 to 400 mg P.O. daily

**Children ages 2 and older:** 3.3 to 6.6 mg/kg P.O. as a single daily dose. Duration depends on infection: for candidiasis, 1 to 2 weeks; other systemic mycoses, 6 months; recalcitrant dermatophyte infections involving glabrous skin, 4 weeks. Chronic mucocutaneous candidiasis requires maintenance therapy.

➤ Scaling caused by dandruff or seborrheic dermatitis

**Adults:** 2% shampoo applied topically twice weekly for 4 weeks, then as needed to control symptoms, with at least 3 days between applications; or 1% shampoo applied topically q 3 to 4 days for up to 8 weeks, then as needed to control dandruff

➤ Tinea corporis; tinea cruris; tinea versicolor; tinea pedis, cutaneous candidiasis

**Adults:** 2% cream applied topically to affected areas daily for 2 weeks (except for tinea pedis, which may require 6 weeks of therapy)

## Contraindications

- Hypersensitivity to drug or its components
- Concurrent oral astemizole, cisapride, triazolam, or terfenadine therapy

## Precautions

Use cautiously in:

- renal or hepatic disease, achlorhydria
- pregnant or breastfeeding patients
- children younger than age 2.

## Administration

• Apply cream to damp skin of affected area and wide surrounding area.

• To use shampoo, wet hair, then apply shampoo and massage into scalp for 1 minute. Leave on for 5 minutes before rinsing. Rinse and repeat, this time leaving shampoo on scalp for 3 minutes before rinsing.

• Don't apply shampoo to broken or inflamed skin.

• In achlorhydria, dissolve 200-mg tablet in 4 ml of 0.2N hydrochloric acid solution.

• Withhold antacids for at least 2 hours after giving oral ketoconazole.

⚠ Don't give concurrently with cisapride, available in U.S. for compassionate use only. (Astemizole and terfenadine are not available in U.S.)

Route	Onset	Peak	Duration
P.O.	Unknown	1-2 hr	Unknown
Topical	Unknown	Unknown	Unknown

## Adverse reactions

**CNS:** headache, nervousness, dizziness, drowsiness, severe depression, **suicidal ideation**

**EENT:** photophobia

**GI:** nausea, vomiting, diarrhea, abdominal pain, anorexia

**GU:** erectile dysfunction, gynecomastia

**Hematologic:** purpura, **hemolytic anemia, thrombocytopenia, leukopenia**

**Hepatic:** **hepatotoxicity**

**Metabolic:** hyperlipidemia

**Skin:** pruritus, rash, dermatitis, urticaria, severe irritation, stinging,

alopecia, abnormal hair texture, scalp pustules, oily skin, dry hair and scalp

**Other:** fever, chills, allergic reaction

### Interactions

**Drug-drug.** *Antacids, anticholinergics, histamine<sub>2</sub>-receptor antagonists:*

decreased ketoconazole absorption

*Cyclosporine:* increased cyclosporine blood level

*Isoniazid, rifampin:* increased ketoconazole metabolism

*Theophylline:* decreased theophylline blood level

*Topical corticosteroids:* increased corticosteroid absorption

*Triazolam (oral):* increased triazolam effects

**Drug-diagnostic tests.** *Alanine aminotransferase, alkaline phosphatase, aspartate aminotransferase:* increased levels

*Hemoglobin, platelets, white blood cells:* decreased levels

**Drug-herbs.** *Yew:* inhibited ketoconazole metabolism

### Patient monitoring

🔊 Assess for suicidal ideation and signs and symptoms of depression.

🔊 Monitor for evidence of hepatotoxicity, such as nausea, fatigue, jaundice, dark urine, and pale stools.

- With long-term therapy, stay alert for adrenal crisis.

### Patient teaching

🔊 Advise patient to watch for signs and symptoms of depression and to immediately report suicidal thoughts.

🔊 Teach patient to recognize and immediately report signs and symptoms of hepatotoxicity, such as unusual tiredness or yellowing of skin or eyes.

- Advise patient not to take antacids for at least 2 hours after oral ketoconazole.

- Instruct patient to apply cream to damp skin of affected area and wide surrounding area.

- Tell patient to wet hair before applying shampoo and to massage into scalp for 1 minute; then leave on for 5 minutes before rinsing off. Tell him to shampoo again, leaving it on for 3 minutes this time before rinsing.

- Caution patient not to apply shampoo to broken or inflamed skin.

- As appropriate, review all other significant and life-threatening adverse reactions and interactions, especially those related to the drugs, tests, and herbs mentioned above.

## ketorolac tromethamine

Acular, Acular LS, Apo-Ketorolac\*

**Pharmacologic class:** Nonsteroidal anti-inflammatory drug (NSAID)

**Therapeutic class:** Analgesic, antipyretic, anti-inflammatory

**Pregnancy risk category** C (first and second trimesters), D (third trimester)

### FDA BOXED WARNING

- Drug is indicated for short-term management (up to 5 days in adults) of moderately severe acute pain that requires opioid-level analgesia. It's not indicated for minor or chronic painful conditions. Drug carries many risks; NSAID-related adverse events can be serious in certain patients, especially when used inappropriately. Raising dosage beyond recommendations increases risk of serious adverse events and won't provide better efficacy.

- Drug can cause peptic ulcers, GI bleeding, and perforation and is

contraindicated in patients with active peptic ulcer disease, recent GI bleeding or perforation, or history of peptic ulcer disease or GI bleeding.

- Drug is contraindicated in advanced renal impairment and patients at risk for renal failure.
- Drug inhibits platelet function and is contraindicated in patients with suspected or confirmed cerebrovascular bleeding, hemorrhagic diathesis, incomplete hemostasis, or high risk of bleeding.
- Drug is contraindicated as prophylactic analgesic before major surgery, and intraoperatively when hemostasis is critical.
- Hypersensitivity reactions ranging from bronchospasm to anaphylactic shock have occurred. Ensure that appropriate counteractive measures are available when giving first dose of injection form. Drug is contraindicated in known hypersensitivity to ketorolac or allergic reaction to aspirin or other NSAID.
- Drug is contraindicated for intrathecal or epidural administration (due to alcohol content), during labor and delivery (may impede fetal circulation and inhibit uterine contractions), in breastfeeding women (due to potential adverse effects of prostaglandin-inhibiting drugs on neonates), and in patients currently receiving aspirin or NSAIDs (due to cumulative risk of serious NSAID-related adverse effects).
- Tablet form is indicated only as continuation therapy to injection form, and combined duration of use of both forms mustn't exceed 5 days.
- For tablets, recommended total daily dose (maximum 40 mg) is significantly lower than for injection (maximum 120 mg).
- Adjust dosage in patients age 65 and older, those weighing less than 50 kg (110 lb), and those with moderately elevated serum creatinine level. With injection form, don't exceed 60 mg (total daily dose) in these patients.

Injection form is indicated as single-dose therapy in pediatric patients, not to exceed 30 mg for I.M. use or 15 mg for I.V. use.

### Action

Interferes with prostaglandin biosynthesis by inhibiting cyclooxygenase pathway of arachidonic acid metabolism; also acts as potent inhibitor of platelet aggregation

### Availability

*Injection:* 15 mg/ml in 1-ml preloaded syringes, 30 mg/ml in 1- and 2-ml preloaded syringes

*Ophthalmic solution:* 0.4%, 0.5%

*Tablets:* 10 mg

### Indications and dosages

➤ Moderately severe acute pain

**Adults younger than age 65:** Initially, 30 mg I.V. or 60 mg I.M. as a single dose, or 30 mg I.M. or I.V. q 6 hours, not to exceed 120 mg/day. To switch to P.O. therapy, give 20 mg P.O. initially for patients who received single 30-mg I.V. or 60-mg I.M. dose, followed by 10 mg P.O. q 4 to 6 hours as needed (not to exceed 40 mg/day or 5 days).

**Children ages 2 to 16:** 1 mg/kg I.M. as a single dose, to a maximum of 30 mg; or one dose of 0.5 mg/kg I.V., to a maximum of 15 mg

➤ Ocular itching caused by seasonal allergic conjunctivitis

**Adults and children ages 3 and older:**

One drop of 0.5% ophthalmic solution (Acular) instilled into affected eye q.i.d.

➤ Postoperative ocular inflammation related to cataract extraction

**Adults and children ages 3 and older:**

One drop of 0.5% ophthalmic solution (Acular) instilled into operative eye q.i.d., starting 24 hours after surgery and continuing for 2 weeks

➤ To reduce ocular pain, burning, or stinging after corneal refractive surgery

**Adults and children ages 3 and older:**

One drop of 0.4% ophthalmic solution (Acular LS) instilled into operative eye q.i.d. for up to 4 days

**Dosage adjustment**

- Mild to moderate renal impairment
- Elderly patients
- Patients weighing less than 50 kg

**Contraindications**

- Hypersensitivity to drug, its components, aspirin, or other NSAIDs
- Concurrent use of aspirin, other NSAIDs, or probenecid
- Peptic ulcer disease
- GI bleeding or perforation
- Advanced renal impairment, risk of renal failure
- Increased risk of bleeding, suspected or confirmed cerebrovascular bleeding, hemorrhagic diathesis, incomplete hemostasis
- Prophylactic use before major surgery, intraoperative use when hemostasis is critical
- Labor and delivery
- Breastfeeding

**Precautions**

Use cautiously if:

- mild to moderate renal impairment, cardiovascular disease
- elderly patients
- pregnant patients
- children.

**Administration**

- Be aware that oral therapy is indicated only as continuation of parenteral therapy.
-  Know that parenteral therapy shouldn't exceed 20 doses in 5 days.
- For I.V. use, dilute with normal saline solution, dextrose 5% in water, dextrose 5% and normal saline solution, Ringer's solution, or lactated Ringer's solution.
- Administer single I.V. bolus over 1 to 2 minutes.
- Inject I.M. dose slowly and deeply.

- Don't give by epidural or intrathecal injection.

Route	Onset	Peak	Duration
P.O.	Unknown	2-3 hr	≥4-6 hr
I.V., I.M.	10 min	1-2 hr	≥6 hr
Ophthalmic	Unknown	Unknown	Unknown

**Adverse reactions**

**CNS:** drowsiness, headache, dizziness

**CV:** hypertension

**EENT:** tinnitus
