The first stage of his activity—which he summarized in a paper on the law's value standards (Somló 1909–1910)—is characterized by a reassertion of Herbert Spencer's doctrines, concomitantly with an espousal of Gyula [Julius] Pikler's (1864–1937) sociological approach, naturalistic and utilitarian at the same time (see, e.g., Pikler 1897), which was based on a strictly scientific, psychologically coloured outlook within the framework of a materialist philosophy of history. He could thus complete Ágost (Augustus) Pulszky's (1846–1901) endeavour to lay the philosophical foundations of legal positivism in the country (see in particular Pulszky 1888). It is only later, in the second stage of development, that his work took a definite neo-Kantian turn. Initially, he had still seen legal philosophy and legal sociology as equal in standing, but neo-Kantian conceptualization also made it necessary to separate them—regardless of whether they are interconnected fields.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_19

He first criticized contemporary authors from a natural-science perspective inspired by positivism and evolutionism. He then reconsidered the increased role the state had to play when capitalism, having changed into a monopolistic scheme, demanded a reformulation of all the relevant functions and institutions of law (Somló 1903).

When he set out to systematize these ideas and concerns in his masterly *Juristische Grundlehre* (Basic theory of law: Somló 1917)—differentiating the pure sciences from the applied ones (the latter of which were to include the normative sciences as well)—he proceeded on two fronts, on the one hand (1) proposing a definition of law's preconditions (considering what the concept of law could be in a basic doctrine), while at the same time also (2) searching for rightful law (*richtiges Recht*) by developing a full legal axiology. It is this very search that necessitated the neo-Kantian turn, on the model defined by Rudolf Stammler[1]. Reasoning in line with John Austin's *Jurisprudence*,[2] and to a lesser extent with Fritz Berolzheimer's *Rechtsphilosophie*, Somló offered an analysis of the concept and conceptual components of law, without regard to content.[3] Concluding from the Kantian approach, he first distinguishes *a priori* "basic concepts of law" (*juristische Grundbegriffe*) from "valid notions" of jurisprudence (ibid., par. 4; my translation). Then, he will identify law as norms that embody *Sollen*, norms which are empirical and heteronomous, that is, drawn from the "highest power" (*höchste Macht*). For sure, this *Sollen* "is the notion of a must-to-be [*Geschehen-Sollens*], and not of the regularity of anything being [*Regelmäßigkeit des Geschehens*]" (ibid., 107; my translation). On the final analysis, "law will thus mean the norms of a customarily followed, comprehensive and stable highest power [*einer gewöhnlich befolgten, umfassenden und bestandigen höchsten Macht*]" (Somló 1917, 105; my translation). As to the law's sources, ones coming from the "legal power" (*Rechtsmacht*) itself can either be (1) primary and expressed (*primare ausdrücklich*) and (2) primary and non-expressed (*primare nichtausdrücklich*); and ones coming from the organs of the "legal power," (3) secondary and expressed (*sekundare nichtausdrücklich*) and (4) secondary and non-expressed (*sekundare nichtausdrücklich*). The first two sources are exemplified by written constitutions and constitutional customs, which he placed on equal standing (ibid., chap. 11).

[1] On Stammler, see Section 1.3 in this tome and Section 2.2 in Tome 2 of this volume.

[2] As to the roots of Anglophilia in Hungary, the proximity of the Magna Carta (1215) and the Bulla Aurea (1222), the admiration of English parliamentarism as well as the non-codified quasi-precedential development of Hungarian private law are to be mentioned. As to all its echo in jurisprudence, educated within a political émigré's family in England, Pulszky made already an early translation of Henry Maine's *Ancient Law* in 1875, "copiously annotated" with a series of references to Austin. As the common-law orientation continued until the Communist takeover in 1948, "the connection with English jurisprudence and political science was for many years somewhat closer in Hungary than in Germany" (A. B. Schwarz 1934, 198; cf. Szabadfalvi 2001).

[3] On Berolzheimer, see Section 5.2 in this tome.

In the contemporary continental debate on whether law was considered a system open or closed, Somló strongly argued for the law's logical closure. The only exception he admitted was the chance of a "gap without agent of decision [*Lücke ohne Entscheidungsinstanz*]" (ibid., 414; my translation). This, as he continued at once, could exclusively be the case of a gap in constitutional law, fillable in no other way if not through illegitimate law making (*illegitime Rechtssetzung*).

The enthusiasm he raised in German-speaking countries urged him to lay the philosophical foundations for an axiology of his own. He did not live long enough to complete this endeavour, but his students did manage to edit and publish the book-length preparatory fragments he left behind (Somló 1926).[4]

His *Juristische Grundlehre*—with its grounding of a general theory of law describing a conceptual structure that is continuously evolving in modern formal law—is now considered a classic, a masterpiece in the company of other pioneering works (Funke 2004).

19.3. The Interwar Period

19.3.1. Gyula (Julius) Moór (1888–1950)

Moór's oeuvre is best characterized as having a "comprehensive nature" with some features of eclecticism (Szabadfalvi 1999).

Early on, after making Stammler's acquaintance at the University of Berlin, he began challenging Hans Kelsen with corrective remarks investing every part of his theory.[5] Seeking to develop a framework for a complex approach (Moór 1923), he acknowledged as independent, albeit interrelated, research topics (1) the concept of law (its definition within a foundational doctrine), (2) the kind of social causality the law may generate (an investigation in legal sociology), and (3) rightful law, or law according to justice (as the main concern of legal axiology), a trichotomy he would later expand by the addition of (4) the methodology for the study of statutory law.

Striving to elaborate a system of legal philosophy of his own inspired by the Baden School, and in particular by Wilhelm Windelband and Heinrich

[4] Throughout his life, Somló played the fermentative role of a leftist progressist. An idealist who espoused the republicanism that was gaining momentum at war's end, he committed suicide when, owing in part to the idealism of his cohorts blindly trusting in the Wilsonian principle of peoples' self-determination up to the dead end with its implementation denied, his "beloved Kolozsvár" [now re-named as Cluj-Napoca] was lost to Romania. Somló's personal archives have been processsed and, as to his diary and correspondence, partly published in German in Funke and Sólyom 2013.

[5] In fact, the close relationship of trust between Moór and Kelsen may help explain how Moór's offer to translate Kelsen encouraged Kelsen to commit himself, in 1927, to the first of his two intellectual *Selbstbiographien* (see Varga 1995c, 15–23, and Jestaedt 2006, 8–10, 21–29).

Rickert,[6] Moór rebuilt a theoretical connection—rather than a merely declared antagonistic separation—between reality (*Sein*) and value (*Sollen*). He accordingly classified law as belonging to a "reality valued [*értékes valóság*]" (Moór 1945, 61; my translation). At the same time, in order to rejuvenate legal philosophy as a new cultural tendency based on a synthesis between neo-Kantianism and neo-Hegelianism, he had to turn to Nicolai Hartmann. In this final vision, even law builds as a kind of *Sein*: An aggregate of enacted abstract norms owing their content to human activity in its daily affairs, law builds through a process in the course of which intellectual representation will turn into some specific (legal) reality (Moór 2006).

For it was during the war years that in his neo-Kantianism the mature Moór progressed from the Marburg school to the Baden school on the one hand, while on the other turning especially to Nicolai Hartmann in order to "find the path leading from the philosophy of Hegel to the one of Kant" (Moór 1943, 93; my translation). He realised that social and historical phenomena are made up of human actions which are, in addition to given meaning and purpose, i.e., intellectual contents, to embody corporal-spiritual (or psycho-physical) reality themselves. From this double-layer-existence—breaking down Hegel's "objective spirit" (*objektiver Geist*) (Moór 1942, 245)—he concluded that one has to count with three kinds of fields of existence: (1) nature, (2) culture as reality valued, and (3) pure value (Moór 1945, 61). As a synthesis of Kantian dualism with Hegelian monism (Moór 1943, 94), he eventually established that

> The spiritual (*szellemi*) component of law lies in those ideas and regulations that provide for the contents of the law's provisions. At the same time, it has corporal-spiritual (*testi-lelki*) component as well, partly in those psychical processes through which men take notice of legal regulations and let their own will influenced by the latter and partly in those bodily motions that manifest themselves as the external, bodily realisation of the will aimed at implementing legal rules. Such corporal-spiritual processes do belong to the law's historical and social reality so much as the intellectual message of the content of legal provisions does. Without them law would remain mere paper-law with no role played in the life of human societies. (Moór 1942, 247; my translation)

The same consideration seem to lurk behind the key notion underlying the concept of law itself. Accordingly,

> all social powers as much as all social phenomena have spiritual contents in addition to their corporal-spiritual reality, for human forces transformed into power are cemented together by common goals, ideas and evaluations. (Ibid., 250; my translation)

The years of upheaval following World War II, combined with his personal persecution at the hands of the Communists about to seize power in the country, effectively prevented him from erecting something like a grand theory (see Varga 2005, 82–6). Despite all that, by comparing different theories relating to

[6] On the neo-Kantianism of the Baden School see Section 1.1 in this tome.

power and force, Moór was successful in transferring the idea of social reality into the realm of law, thereby opening new perspectives on the kind of sociality that lurks behind the law.

19.3.2. Barna Horváth (1896–1973)

Horváth started out as Moór's assistant and went on to gain a professorship at Szeged, only to become Moór's rival, with a "synoptic theory of law based upon a synoptic method" (*synoptische Methode, synoptische Rechtstheorie*; *szinoptikus módszer, szinoptikus jogelmélet*) he advanced step by step.

Inspired by Kelsen, Horváth took up as a precondition the separation between facts (*Sein*) and values (*Sollen*), a separation that neo-Kantian philosophy had deduced from Kant's epistemological distinction between transcendental, *a priori* knowledge (based on the form of all possible experience) and empirical, *a posteriori* knowledge (based on the content of experience). But in Horváth's formulation, the separation deduced on this basis shows itself to be a logical contradiction. Accordingly, he concludes,

> every judgment that can be directly or indirectly reduced to statements asserting that (1) a sheer fact is valid, (2) a sheer value is fact, or (3) an object of cognition is sheer fact and value at the same time is logically contradictory. (Horváth 1937, 94; my translation)

Horváth was in a unique position, having at first studied in Vienna—where he attended Kelsen's lectures and became acquainted with Alfred Verdross—and having then moved on to London, where he met Harold Laski (who would channel his political views) and Leonard T. Hobhouse (whose understanding of social development made quite an impression on him): With this background, he could be expected to counterpoise Germany's dominant cultural influence in Hungary. And indeed the synoptic view he developed is an attempt at transcending the dualism between *Sein* and *Sollen* by effecting a synthesis that would dissolve the traditional antagonism between the Anglo-Saxon and German traditions. Kelsen's reductionism, which had launched the logic of norms as the sole method of legal cognition, was found by him to be too sterile; he thus looked for a compromise solution:

> For a theory seeking to meet the proper requirement of methodological purity, while espousing the theoretical approach that views law as a conglomerate of norms and facts, there is but one conclusion to be drawn. That is, law is not an object of cognition but is rather the way in which, in accordance with a given scheme, norms and facts as exclusive objects of cognition can be seen in their endless mutual reference; and, accordingly, law is that which will be socially objectified out of such a perspective. This is the basic idea of the synoptic method:[7] the parallel view of these two sides taken together in mutual projection of one upon another. (Ibid., 8; my translation)

[7] Horváth contrasts here synopsis with synthesis which, according to Kelsen, could already amount to methodological syncretism.

And if law is not an object of cognition, the same goes for synopsis conceived as a method to describe law: It, too, cannot be an object-constitutive method of cognition. Rather, synopsis may be taken to be

> merely a particular technique for combining natural- and norm-scientific methods; or the technique for combining these two methods by actually observing how they mutually refer to one another; or, again, the technique for functionally experiencing *Sein* and *Sollen*. Synopsis, in short, is the method of methods. (Horváth 1934, 63; my translation)

The foregoing considerations, if applied to the judges, mean that their mode of thinking has a synoptic structure. Judges, in substantiating the claims made in their own judgments, proceed in two opposite directions, on the one hand filtering their knowledge of norms in light of the facts they select, and on the other filtering their knowledge of facts in light of the norms they select. This latter statement can be extended to all social and cultural domains shaped by human behaviour, because here, too, there is a mediator necessarily wedged between nature and values. Moreover, "norms" is just a sign standing for law here. For "proposition of law" not yet "positivated" in a "case of law" is still a "half-finished" product. And the interpretation its finishing needs amalgamates reproduction and creation through combining elements specific of the classical understanding of both applying and making the law (Horváth 1937, par. 236).

For Horváth, what is synoptic in methodology will be qualified as a procedural approach in theory. This is based upon the same duality:

> The essence of the procedural approach to law lies in the idea that law is neither mere proposition (or norm) nor mere fact but their combination, that is, an abstract standard of behaviour and a corresponding actual behaviour. And these two linked together intellectually is already a procedure [...]. This is why according to a procedural legal theory law will be defined as the most developed social procedure. (Ibid., 7; my translation)

As Horváth concluded at a time when he still had a voice in Hungary, the social reality of law can be traced to the regularity and order that can be observed in human conduct—a regularity that can also empirically be observed in society and measured as a mathematical average. And on a societal level, social order is reached as a complex of interlocked levels of institutions and processual schemes. Of all these levels, law is the most developed procedural structure (Horváth 2006).[8]

[8] It was clear by this time, in 1949, that what had been a promising outlook for post-war Hungary had turned gloomy. Or at least this is how it must have appeared to Horváth: As the most senior applicant for the chair in legal philosophy left vacant in Budapest as a result of Moór's expulsion, Horváth expected to be appointed to that post but was instead rejected in favour of Imre Szabó (discussed below in Section 19.4.1), at that time an unnoticed Communist academic. Horváth thus left the country and emigrated to the United States, where he became af-

19.3.3. The Szeged School

19.3.3.1. József Szabó (1909–1992)

As Moór's student at Szeged, Szabó later became acquainted with Horváth. But the latter's renewed admiration for common-law and English legal theory drew the enthusiasm of his more advanced disciples, so much so that they would eventually found their own Szeged School. Szabó was also awarded a grant to enrol in Alfred Verdross's course in Vienna, and the two thus wound up forging a lifelong friendship, fruitful in theoretical sensitivity as well.

In a number of papers (e.g., J. Szabó 1948), Szabó criticised the neo-Kantian approach by drawing for the most part on David Hume and American legal realism. In a "neorealistic" doctrine he formulated looking to common-law casualism, he drew a parallel between the British case-law approach and "traditional" models of judicial reasoning in Hungary, a country then known as a civil-law empire without a civil code.[9] Supported by Jerome Frank, Edward Robinson, and Thurman Arnold, he ascribed the belief in the certainty of law to the faulty logic erected by legal philosophers. His "fact-scepticism" and "rule-scepticism" was in this way sublimated into a theory based on the eventuality of the judicial event, whose contexture is dependent on "psychological circumstances" as well (cf. Varga 2006, 81–133).

In his unfinished oeuvre (J. Szabó 1999), he offered pragmatic explanations of classic neo-Kantian paradigms, sometimes with a streak of eclecticism.[10]

19.3.3.2. István Bibó (1911–1979)

Bibó studied under Horváth at Szeged. After making visits to Vienna for lectures delivered by Verdross, Adolf Merkl, and Felix Kaufmann—and travelling to Geneva to listen to Kelsen (in the company of Paul Guggenheim, Maurice

filiated with the New School for Social Research in New York, but it was a rough start and a bitter end for him at this school, which at just about this time was placing less and less emphasis on its members' formal academic credentials. He had a family to support, and was thus persuaded to seek employment as an analyst at *Voice of America*, where he remained until his retirement in 1964. His repeated lecture tours in Europe did, however, result in a collection of selected writings, and these were later republished (Horváth 1971).

[9] The Hungarian Civil Code was not promulgated until 1959, as Act IV of the National Assembly of Hungary.

[10] Szabó and his wife attempted to seek refuge by crossing the border, after his teacher succeeded in doing so after the Communist putsch in 1949, but they were caught and imprisoned for years. Then, his health failing, and struggling for his life, he managed to survive only thanks to commissions received for academic translations. The couple was then imprisoned a second time—for "counterrevolutionary acts" allegedly committed in 1956—and they continued in intellectual exile, and extreme poverty. A government interdiction meant that Szabó could only publish abroad, aided by Verdross, but this too was illegal at the time.

Bourquin, and Guglielmo Ferrero) teach at the *Institut des Hautes Études Internationales*—he made a translation of Kelsen's *Reine Rechtslehre*, thus becoming the first scholar to translate the work in extenso (and with the author's approval for its posthumous edition: Kelsen 1988).

In a neo-Kantian perspective, he contrasted the functional links among liberty, constraint, and law with Henry Bergson's idea of spontaneity and Nicolai Hartmann's ontology and ethics. Superseding his teacher's synoptic view, he introduced the law of spontaneity (*spontaneitás törvénye*) as playing an important role in law. According to him, a certain balance necessarily obtains between constraint and freedom in the practical workings of the law. By a seeming paradox, it is law that provides at once the most objective constraint and the most objective freedom, considering that any area freed from constraint is ipso facto the realm where freedom finds its most objective (i.e., the least subjective) manifestation (Bibó 1935). Therefore, law must perforce be Janus-faced. It is in this tension between these two forces that law's genuine power lies, and this is the specificity that distinguishes it from any other arrangement of social rules (cf. Varga 2006, 11–77).[11]

19.3.3.3. Tibor Vas (1911–1983)

Vas—his eyesight gradually deteriorating in his youth, so practically blind when entering the profession—was a classmate of Bibó.

His award-winning paper on the significance of transcendental logic for legal philosophy—published in both German and Japanese (Vas 1935)—defended Horváth's synoptic method and Georges Gurvitch's ideal-realistic one for recognizing the duality inherent in law, thus having the intellectual potential to move beyond the logic that had been developed by classic transcendentalism. Then, in a short paper (Vas 1936), he presented Horváth's *Rechtssoziologie* (or sociology of law) as the conclusion to be drawn from the concession that Kelsen makes in his *Pure Theory* by conceiving law as a "twofold object," in which facts are reflected in values and vice versa. The upshot of this reasoning was that the logical approach cannot have a significant role in law without taking sociological and evaluative aspects into account and working them into a single overall perspective (cf. Varga 2006, 137–241).[12]

[11] During and after World War II, Bibó became involved in political debates as an author and in reforming government administration as a specialist and high-ranking official. His academic career was cut short by the Communist seizure of power in 1949, and he had to survive both intellectual exile and long imprisonment (as minister of state in Imre Nagy's revolutionary government of 1956). For the rest of his life, he mostly concerned himself with issues in the philosophy of history and with world-power dependencies in Central and Eastern Europe.

[12] Vas would probably not have survived the persecution years if Moór, a member of the Upper House, had not interceded in his behalf with the governor, Admiral Miklós Horthy, who officially exempted Vas from the race laws. With the Soviet occupation of the country, however,

19.3.4. István Losonczy (1908–1980)

A recipient of the governor's golden ring award as *doctor iuris sub auspiciis gubernatoris* at the University of Pécs, István Losonczy attended Verdross's class in Vienna and subsequently met Giorgio del Vecchio in Rome.[13]

In line with his ambition to supersede legal positivism through a solid scientific realism, Losonczy sought to lay the study of law on new foundations by borrowing from the sciences (Losonczy 1937) and adapting the methods and principles of science to law (Losonczy 1941). In an innovative manner, he based his "realistic" account on a two-pronged approach, differentiating the ontic layers of existence, on the one hand,[14] from the neurophysiological aspect, on the other, and developing in this latter respect an explanation he would later complement and detail by exemplifying the way neurophysiological stimuli are networked in humans. In legal philosophising proper, he treated in detail those logical *a priori* presuppositions (e.g., 'law', 'punishment', 'possession', 'privity') which, mostly without being logified and made conscious, are floating in mind as the sine qua non logical components for that whatever legal order can be thought. Borrowing the term from Otto Weininger, he qualified them as of a "henid" state of consciousness (Losonczy 2002, 34). In this effort he relied on his own medical studies and worked in cooperation with leading local physiologists. To be sure, this promising start would soon be quashed,[15] but he did firmly believe in the project, persuaded that in this way the question of determinism and indeterminism in law, the enigma of causation in law (especially criminal law) as well as the variety of complicity in crime could be set on a scientific foundation (for a general overview of the period, see Szabadfalvi 2003).

19.4. The Post-war Period (Communism)

The Marxist dictatorship began with the Communist takeover in 1948. What it meant, among other consequences, was an ideological totalization with a view to transplanting Stalinism in Hungary. Which in turn meant that Stalinism had to be translated into a legal conception, a task entrusted to Andrey

Vas abruptly converted to Stalinist orthodoxy and held key positions, never again committing to paper anything of lasting value.

[13] On Del Vecchio see Section 11.2.1 in this tome.

[14] The physical, chemical, biological, psychical, social, cultural, as well as supernatural are the "modes of subsistance" (*Subsistanzweise*) recognised by him. His developments in this first area were summarized in a paper commissioned by Verdross in late 1948 for *Österreichische Zeitschrift für öffentliches Recht*. The manuscript was sent without ever reaching its addressee, however, as the Iron Curtain had in the meantime come down (see the posthumous Losonczy 2002).

[15] When the Communist takeover froze the air around him, he changed course and in 1950 took the chair of criminal law. Despite all his work, he was forced to retire at sixty-six (cf. Varga 2005, 86–94).

Vyshinsky, and which eventuated in a doctrine called socialist normativism.[16] What came out of this was a narrow-minded, almost exegetic legal positivism (reminiscent of that which had developed especially in France, pushed by the enthusiasm of the new Civil Code, in the first half of the 19th century), combined with a materialist and determinist view of social history as developed by Marx and Engels and "congenially redeveloped" by Lenin and Stalin. This end product did "primitivize" research and the pursuit of knowledge across the board, to be sure, raising also the issue (perceiving as troubling) of whether or nor past achievements in theoretical development in a critical reassessment of the Vienna school, on the one hand, and pioneering in sociological approach to law, on the other—both having the potential of erecting a future Budapest school—could be continued under the Communist regime. In other words, was classical legal positivism destined to perish, or could it develop into early postpositivism (giving way to the free-law movement, among other developments)? And did the sociological approach have any chances of surviving, or even thriving, despite the fact that it had been blamed from the outset as counterrevolutionary? Tacit questions they were, but implied by works of restart, rendering a moral, political and deeply theoretical account of past and present as well (cf., among others, Moór 1947).

19.4.1. Imre Szabó (1912–1991)

Imre Szabó grew up in East Hungary, a successor state to Hungary, from which it was detached in 1920 to become part of Czechoslovakia, and then of Ukraine in 1945. His personal development was twice pushed into a position of minority. It was in this context that Szabó, having graduated in 1937 from Charles University in Prague, would go on to write in his youth as a leftist Zionist, publishing in a comparatively open way, mostly in a Magyar journal based in the city of Kolozsvár (ceded to Romania, which at that point was already known as Cluj). In the post-war period, however, the Communist Szabó identified with the mission of consolidating as perfectly as he could Vyshinsky's doctrine of socialist legality. He brought jurisprudential thought into conformity with Soviet "socialist normativism," insisting in this way that no provision of the law can say anything other than what had already been textually embodied in the law itself (I. Szabó 1960; see also I. Szabó 1963, translated into Russian as I. Szabó 1964).

Later on, taking up the challenge of returning to the young Marx—a challenge that came to form part of the mainstream in Eastern and Western Europe alike at the time—he undertook an implicitly ontological reconstruction of Marx's early thought (I. Szabó 1981). Before that, based upon partly the

[16] On Vyshinsky see Section 17.3 in this tome.

Marxian pattern and partly Pashukanis's quasi-ontological approach[17], he had set out to reconstruct legal relations as a reflection of social relationships (I. Szabó 1971, translated into French as I. Szabó 1973 and into Russian as I. Szabó 1974), without, however, being able to make a genuine breakthrough, either at home or abroad.[18]

19.4.2. Vilmos Peschka (1929–2006)

Peschka studied under Imre Szabó at the Eötvös Loránd University in Budapest and then continued at the Institute for Legal Studies of the Hungarian Academy of Sciences (*Magyar Tudományos Akadémia Állam- és Jogtudományi Intézete*). He later joined the editorial board of the *Archiv für Rechts- und Sozialphilosophie* (a member since 1978) and cofounded the Hungarian National Section of the International Association for Philosophy of Law and Social Philosophy (IVR), serving as well as the section's first president.

Peschka devoted his entire scholarly life to a thorough study of the foundational issues—mostly philosophical and methodological—with which philosophising *in* and *on* law is concerned. Had he not been a Marxist, he would have been a conceptual analyst, for he took law to be a serious notional game standing for some abstraction in his epistemological realism. Theory was mere conceptual analysis for him, with no interest extended to either practical workings of law or its historical development or comparative variety. His sole interest lay in Marx, Engels, Hegel, Lukács, Weber, and Kelsen, within a conceptual world which he brought to near perfection, but this also meant that the categorial realm he designed was bound to remain a dry world, not inspirited by the greenness of life his beloved Goethe spoke of.

A conclusion which Peschka first reached with his doctoral dissertation (Peschka 1960), and which he would go on to develop, was that legal relationships actualized in practice are prior to any formal enactment of law that may have preceded them: He thereby implicitly rejected Vyshinsky's stance based upon a rigid statutory positivism with the state as an exclusive centre, enacting law and sanctioning whatever disobedience. Five years into his development of these ideas, Peschka (1965) expounded his policy desideratum as concerns the question whether the supreme court's rulings for legal uniformity should at

[17] On Pashukanis, see Section 17.3 in this tome.

[18] Even with all of his shortcomings, Szabó must be reckoned among the brightest legal minds of the orthodoxy of socialist Marxism. At one time the only jurist in the Soviet Academy of Sciences in Moscow, he was also internationally renowned as a legal comparatist. Relatively conservative as a thinker and open-minded in his institutional role in the academy—where he also served as director—Szabó made possible the diversification which got underway with Kulcsár and Peschka and which continued with the next (or third) generation of legal philosophers and other scholars at the academy. On the legal-philosophical achievements of his directorship, see, e.g., Péteri 1968 and 1984 and Tumanov 1969.

the same time be deemed lawmaking acts, by virtue of their role in guiding the process of making the case law uniform: In breaking with the view upheld by political voluntarism— according to which with no limitations party dictates as law posited via competent state organs should prevail over reality without the chance of being interfered by the judiciary—Peschka asserted and substantiated that such rulings should be so considered.

His critical overview of contemporary Western legal philosophy (Peschka 1972, translated into German as Peschka 1974 and into Japanese as Peschka 1981) became a classic of Socialist literature in Hungary. This was followed by an assessment of Weber's sociology of law (Peschka 1975), after which point he concerned himself with various topics and then eventually steered toward ethics, with a study in which he reconsidered Aristotle and Kant (Peschka 1980).

Once George Lukács (1971–1973) had expounded his social ontology, the stage had been set for turning "Marxist (and Leninist) theory of law" into a legal ontology.[19] Peschka took up the challenge by setting out a conception of legal norms in terms of causality and teleology, taking law as a particular reflection of objective reality (Peschka 1979). Proceeding from a rereading of Hartmann and Karl Larenz, he went back to the idea of ontologizing *in* law and *on* law by way of a synthetic reassessment of all teachings and ideas he had ever developed on law (Peschka 1988, translated into German as Peschka 1989).[20] This line of thought was brought to a conclusion in Peschka 1992, where he reconsidered Friedrich Hayek's position and Kelsen's posthumous theory of legal norms in comparison with legal hermeneutics as developed by Wolfgang Fikentscher, Hans-Georg Gadamer, and Arthur Kaufmann.[21]

Peschka never managed to supersede Lenin's perspective in treating law as a reflection of reality. His only concession was that such reflection would eventuate in some transformation of various kinds, grades and developmental phases, from legal norms via legal acts up to legal relationships. Unlike what Lukács did, he could not symbolically return from Lenin to Marx. He did shift the emphasis from the lawgiver's individual will to the legal-technical mechanics of the transformation. But in the final analysis he could only see law emerging from social reality by "specific reflection" (*visszatükrözés*/*visszatükröződés*), in a process thought to yield a "correspondence" between law and reality. To be sure, he conceived of this specific reflection transforming reality into law to be gradual: The discretionary margins of the law's objectivation (phase of law making) will get actualised as valid in and for the given case by the recipient consciousness (phase of decision making).

[19] On Lukács see Section 7.3.1 in this tome.

[20] On Larenz see Sections 5.4 and 9.4 in this tome.

[21] On Gadamer, A. Kaufmann, and legal hermeneutics see Section 10.3.5 in this tome and Section 23.4 in Tome 2 of this volume.

Despite his shortcomings, he eventually shed his self-inflicted scholarly rigidity by also integrating case law and hermeneutic moments into his system, constructing them as part of the process of law itself, which by their predominance might become the final moment of the law's development. As the Cold War wound down and the split emerged between Western Marxism and so-called Soviet Marxism, Marxism became both corrupt and politicized, and Peschka had fought both of such trends all along. He was the kind of Marxist you could easily approach in person: open-minded and always ready to engage professionally in discussion.

19.4.3. Kálmán Kulcsár (1928–2010)

A legal sociologist sensitive to theory from the outset, Kulcsár addressed the law's internal system of fulfilment (or the formal rules under which it is to be applied and through which it develops), while at the same time also taking into account its factual actuality (its actual use). He thus found the law to be a two-pronged phenomenon, one that could be viewed in parallel from the point of view of virtual homogeneity (its coherence and uniformity as a system of norms) and that of sociological role-playing. He argued that this is not a contradiction waiting to be resolved but is rather an ontic difference set against a background where we find, on the one hand, a normative idea (or ideal) of order, and on the other hand, some factual situation (Kulcsár 1960, translated into Russian as Kulcsár 1981; see also the revised edition Kulcsár 1976). He empirically also showed that the law's genuine effect is due for the most part, not to the mere fact of its having been enacted, but to its interaction within the overall social totality of which it is a part (Kulcsár 1980).

Having concluded the pioneering sociological incursion by which he broke through Stalinist dogmas, he undertook a comparative investigation into the factors at play in the attempts made across the world to achieve social modernization through the law. He warned that no reform can be successful without fully setting the whole of society on a new and solid foundation. Stated otherwise, once law develops into a complex phenomenon, there is only so much that can be achieved by the mere means of formal enactment (Kulcsár 1989, translated into English as Kulcsár 1992).[22]

[22] A role in removing the politically imposed ideological restrictions was played as well, from the 1960s on, by Mihály Samu (1929–) and Zoltán Péteri (1930–), among others. Samu came out with several monographs discussing the call for a socialist legal policy, a policy to be shaped by relying on both statutory enactment and legal scholarship (so as to mediate between the making and the application of law), the aim being to enable law's autonomy to strengthen social autonomy through further mediations wedged in social complexity for that the edge of political domination, characteristic of totalitarianisms, would somewhat be lost. Péteri, on the other hand, called for a socialist legal axiology (while also engaging in exercises in the methodology of comparative law) with the same aim, working tacitly in the background.

19.5. Contemporary Trends and Perspectives

19.5.1. Csaba Varga (1941–)

In the contemporary period, the parallelism has continued between the philosophical investigation of law and its sociological investigation. But the next generation was also faced with the problem of accounting for the law's complexity, while also having to explain what exactly it is that changes, and in what way, when the law is observed to change or when such change is otherwise provoked.

Csaba Varga (1991) started out with a historical comparative analysis investigating the objectification the law undergoes as it is codified to make it more rational, and he went on to develop an ontology of law on the model of Lukács's posthumous ontology of the social being (Varga 1985). These investigations became for him the basis on which to proceed in subjecting any epistemologizing of the law—i.e., any attempt to identify the law's power to reflect reality—to an overall ontological assessment of the law's structural makeup and operation. The lawyer's ideology (usually treated as a false ideology, along the lines of Friedrich Engels's *juristische Weltanschauung*) thus came to be one of the law's ontic components. For of ontic presence is what has effect in reality. And the way, dictated by the deontology of the profession, decision maker processes information of alleged facts and norms in his/her mind taken as a judicial black-box will have its imprint on the decision as an output. At the same time, he used his ontological reconstruction to respond to the "modernisation and law" enigma as well. Namely, if we accept that the law's complexity is owed in part to its ontology, then any built-in (ontological) element (impetus or stimulus) will inevitably march on as irreversible part of the law's overall process. This means that all-embracing reforms can be pursued, after all.

From the mid-1980s onward, he devoted himself to treating law as a language game in legal discourse, a game and discourse generating new conventionalizations in an endless sequence. Consequently, the law's identity is defined by the process that produces it rather than by the source of its validity. Or, stated otherwise, cognition and law alike—the former verifiable only by humans, the latter canonizable only by professionals—are autopoietic processes (Varga 1995a). Instead of viewing law in the developmental trichotomy of objectification, reification, and alienation alone—as Marxism has done not without justification (Varga 2013), but without the moment of human involvement—Varga now sets out to reveal law's genuine roots and the unavoidable responsibility we all share as to its future shape (Varga 1999, with an expanded edition in Varga 2012).

His conclusion was anticipated by two thinkers under whom he studied and with whom he thereafter maintained a friendship: Michel Villey (with his concept of *dikaion*) and Chaïm Perelman (with the praxis component of his

notion of *auditoire universel*).[23] It is a conclusion that Varga has complemented with the Thomistic conception of the fullness of the human being, active in every situation. The basic claim that legal positivism makes as to what is law thus turns out to be no more than a desideratum; for there is a never-ending rivalry—between (1) the officials entrusted with *making* law, on the one hand, and (2) those entrusted with *applying* it, on the other—as to who will control the way the law is to be defined, and the process is further complicated in society by the (3) spontaneous emergence of popular practices bearing on the same issue (Varga 1994).

In this connection there also emerges the problem of the historicity of law, with the opposition between universalism and particularism. Which is to say that such familiar constructs as "rule of law," far from belonging to the realm of the universal, are particular historical formations developed and applied in response to specific challenges under specific cultural conditions. Which in turn means that any final ideal of law cannot resolve itself into anything more certain or universal than the outcome of a responsible and responsive mediation, where law can actually balance conflicting rules, principles, interests, and values—a process that for this reason carries weight and must be taken seriously (Varga 1995b, 2008a; cf. also Cserne 2007 and Melkevik 2012).

As to European law, regarded as the model with adaptations for the future of continental domestic laws, he sees its actual working as exerting from the beginning a destructive impact upon the bounds once erected by the national laws' anchorage in the traditions of legal positivism. For and by its operation, the European law—whose efficacious operation is achieved by transposing the control on its central enactments to autonomous implementation and jurisdiction by member nations—dynamizes large structures, through which it transforms into order that what is chaos itself. Its whole construct as a kind of artificial reality construction is frameworked by an artificially animated dynamism (Varga 2011). To be sure, this idea of reaching order out of chaos is the one properly fitting in with the underlying philosophy of modern social theorising, multifactored and counting with statistical probabilities, producing result mostly as a final mass effect—contrasted to the individual paths of causal or quasi-causal chains, accostumed in the earlier phases of social sciences as well, as the traditional, Newtonian, legacy.

19.5.2. András Sajó (1949–)

Essentially a sociologist, Sajó has conducted methodical studies revealing that the apparently descriptive function of legal scholarship is frequently outweighed by the normative and formative impact which the conceptualization

[23] On Villey see Section 12.6 in this tome and Sections 1.3.3.4 and 3.3 in Tome 2 of this volume. On Perelman see Section 23.2 in Tome 2 of this volume.

and classification of law (along with all the other efforts to reconstruct and restate the law) may exert on the practical making and application of law. For this reason theoretical reconstruction can frequently intersect with the construction of factual reality (Sajó 1983).

In a series of books from 1978 to 1988 he then summarized his inquiries by drawing attention to the priority of social interaction in assessing the law's implementation or change. Otherwise stated, he puts forward the view that the sociological complexity of law is such that there is only so much the law's stimuli can account for: Their impact is at best subordinate and for the most part indirect. Or, after considering that neither the law's (or the law-giver's) authority and legitimacy, nor the interest or morality involved, nor the habitual practice of following rules, the lack of genuine alternatives or any negative sanction or consequence can guarantee the effective observance of law, his balance drawn will be reduced to stating that "It is impossible to effectuate a norm system by punishment only, without society approving it. Albeit no operation of a norm system is possible without calling those responsible to personal account" (Sajó 2008, 704; my translation).

19.5.3. Béla Pokol (1950–)

A disciple of Niklas Luhmann at Bielefeld, Pokol started out doing macrosociological theory, with an abiding interest in the layering of law that takes place in consequence of its differentiation (the *Ausdifferenzierung des Rechts*), a differentiation that continues to operate at the lower levels of the law as well (Pokol 1990, translated into English as Pokol 1991). According to his descriptive picture of law as the enacted law officially put into practice, what gives any working legal system its coherence and identity is the classificatory web of concepts making up its particular *Rechtsdogmatik*, or legal dogmatics: This is the stablest element of law, underlying its coherence and identity alike, and it also serves as a suitable framework in channelling its future shape (Pokol 2001).

In a series of inquiries into the origins and development of the doctrines expounding and reconstructing the various branches of law in Europe, he has come to the conclusion that *Rechtsdogmatik* exerts on the law a framework effect (Pokol 2008) as one of the quasi ontological components, in addition to the aspects and respective languages of the law as enacted, as officially enforced, as well as of law cultivated in *scientia iuris* (Varga 2008).

19.5.4. Hungarian Understanding of the Law Today

There is much additional work that can be found in legal philosophy in Hungary today.[24] If anything unifies this work—and the broader spectrum of cur-

[24] I should at least mention in this regard András Tamás (1941–), who in 1977 investigated

rent legal philosophy in Hungary[25]—it is the appreciation that law is a historical construct, shaped by anthropological conditions owed to an interplay of factors both social and cultural. What emerges in the outcome is a social totality and prevailing intellectuality within which to understand any given social actuality at any time. The dominant characteristic is the all-pervasive and mutual influence that can be observed among the various factors in question, without any fixed point or condition that can be pointed out as more foundational or as an absolute starting point. It is for this reason that if we are to arrive at a methodological scheme by which to survey and map out anew the vast territory across which the legal phenomenon extends, so as to gain a deeper understanding of it, we will have to enter into a historico-comparative investigation of legal cultures and of the manifold legal mind they shape (Varga 1992).

the role of legal consciousness in the law's implementation, and who has recently also contributed to what is known as *legistica*, the study concerned with the proper methods of legal drafting; Antal Visegrády (1950–), who in 1988 looked at the role that judicial practice has in the law's development, and who then focused on the question of the law's efficacy; Miklós Szabó (1951–), who has devoted himself to juridical methodology and with the trivium of law's grammar, logic, and rhetoric; and József Szabadfalvi (1961–), who has traced out a history of ideas having legal relevance, his focus being for the most part on Hungary. There are also the theoretical investigations undertaken by Péter Szigeti (1951–), Péter Takács (1955–), and Lajos Cs. Kiss (1955–). Then, too, Péter Paczolay (1956–) has concerned himself with constitutional philosophy, István H. Szilágyi (1963–) has worked from an anthropological perspective, and the newer generations have dealt in analytical jurisprudence, natural law, classic rhetoric, and history of ideas.

[25] The two main book series are *Jogfilozófiák/Philosophiae Iuris*, edited by Csaba Varga in Budapest and started in 1988 (collecting twenty-one titles in foreign languages and thirty-three in Hungarian), and *Prudentia Iuris*, edited by Miklós Szabó in Miskolc (with twenty-nine titles since 1995). See also Paksy and Varga 2010.

Chapter 20

20TH-CENTURY LEGAL PHILOSOPHY IN OTHER COUNTRIES OF EASTERN EUROPE

by Jasminka Hasanbegović, Ivan Padjen, Marijan Pavčnik, Vihren Bouzov, Adrian-Paul Iliescu, and Simina Tănăsescu

20.1. 20th-Century Philosophy of Law and General Theory of Law in Serbia (*by Jasminka Hasanbegović*)

It is an abiding characteristic of Serbian philosophy and theory of law that they reflect the leading and predominant ideas from abroad in an effort to transplant them into their own culture, and sometimes the effort is to critically shape their further development.

As for modern Serbia (i.e., the country as configured by its current territory), the philosophy of law started to develop in the final decades of the 18th century and the early ones of the 19th. Sava Popović Tekelija, or simply Sava Tekelija (also known by his Hungarian name, Sabba Tököl, 1761–1842), was among the first Serbs to have defended a doctoral thesis in jurisprudence, and in particular in legal theory and philosophy: This was in 1786 at the University of Pest, now Budapest (Tekelija 1786; 2009). However, the philosophy of law proper—as a clearly defined philosophical discipline in its own right, distinguished from, and independent of, related philosophical disciplines, such as political philosophy—did not emerge until the late 1830s (Basta 1991, 1).[1] Throughout the 19th century, the central preoccupation of Serbian legal philosophers was with natural law, which came to be understood in various ways, drawing on sources and ideas that ranged from the doctrine of the divine origin of natural law to rationalistic doctrines, including those arguing for the natural rights of man. The first century of Serbian legal philosophy was shaped by a series of authors who influenced the discipline both through their writings and, in some cases, their lectures: These authors are Pavle Julinac (or Đulinac, 1731 or 1732–1785), Petar Stojšić (born in 1790, died after 1846), Efrem Lazarović (born before 1770, died after 1815), Dositej Obradović (1739?–1811), Lazar Vojinović (1783–1812), Teodor Filipović (also known by his pseudonym, Božidar Grujović, 1778–1807), Jovan Stejić (1803–1853), Dimitrije Davidović (1789–1838), Jovan Filipović (1819–1876), Mihailo Hristifor Ristić (1839–1897), Jovan Sterija Popović (1806–1856), Dimitrije Matić (1821–1884), and Nastas Petrović (1867–1933). Other authors published in

[1] I would like to acknowledge my debt to Prof. Danilo Basta for helping me prepare this contribution, which is mainly based on his research on the history of legal philosophy in Serbia.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_20

legal journals such as *Pravda* (Justice), *Porota* (The Jury), *Pravo* (Law), *Branič* (The Defender), *Pravnik* (The Lawyer), and *Srpski pravnik* (The Serbian Lawyer), as well as in official or literary periodicals, such as *Srpske novine* (The Serbian Gazette), *Javor* (The Maple), and *Delo* (The Act): The bulk of these contributions consisted of translations or adaptations of the work of authors from abroad, though to a lesser extent it also included original research by Serbian authors.

Serbian legal philosophy and theory in the 20th century starts out with the lectures and writings of Gligorije Giga Geršić (1842–1918): These are collected in his *Enciklopedija prava* (Encyclopedia of Law: Geršić 1908–1909) in the form of lithographed notes taken of his lectures. To be sure, the philosophy and theory of law were not central parts of Geršić's scholarly work. But that was neither the only nor the decisive reason why the late 19th century and early 20th century saw legal philosophy and natural law losing ground to the project for the so-called encyclopedia of law, by which it wound up being almost completely replaced. Indeed, the encyclopedia tended to be scientific, so it took only "positive law, [...] and not some ideal law," as its object (ibid., 55–6; my translation). Geršić rejected natural law as unscientific, but he did recognize its political and social impact and significance, and he accordingly took a hostile attitude to "the abstract legal philosophy" of Fichte, Hegel, and Schelling, which he assessed as built on "ingenious misconceptions" (ibid., 59, 85; my translation). Geršić turned instead to the German historical school of law led by Gustav Hugo, and especially by Friedrich Carl von Savigny, but as much as he appreciated this school for its effort to move away from the abstract, he criticized it for attempting to replace legal philosophy with history (ibid., 73–102). Contrary to what was until then perceived to be the task of legal philosophy, Geršić believed that this discipline had to (*i*) investigate and logically define the elements common to various branches and fields of law, while setting out the general laws of their development; (*ii*) examine and demonstrate the ultimate foundations of all law, the necessity for the idea of law to emerge in the human spirit, and the relation of law to other factors of social life; (*iii*) define the place of law (as an intellective phenomenon) in the "noetic universe," as well as the essence of law and its necessary and permanent relation to the complete moral, intellectual, and social development of a nation and epoch; (*iv*) identify the highest principles of law, to this end relying on comparative and historical legal materials, understood in light of their broad ethnological and social background; and (*v*) be able to serve as "a criterion making possible a deep evaluation and critique of positive law" (ibid., 86–7, 95, 97; my translation). In brief, it is fair to say that the philosophy of law, in Geršić's treatment of it, turns into an anthropologically, sociologically, and historically grounded general theory of (positive) law that, by explaining the origin and essence of positive law, offers a standard by which to evaluate and critique concrete that law. By taking a *holistic* approach to law, Geršić strove to

explain positive law from the cosmic perspective of the empirical law of attraction and repulsion, a law understood to govern the whole universe, inclusive of both the stellar systems and social life, as well as the life of every individual, by maintaining an equilibrium in these systems between pairs of elements: (*a*) freedom and necessity, which are primary, followed by (*b*) instinct and reason, (*c*) the condition being in authority and that of being obliged, (*d*) rights and duties, and (*e*) legal sense or feeling and legal consciousness (ibid., 33, 37ff.). In taking this approach, he was among the first thinkers, if not *the* first one, to bring Serbian theory and philosophy of law into contact with the positivistic scientific spirit of the time, while also introducing a cultivated sociological and anthropological method. Before the *Encyclopedia of Law*, Geršić wrote another work relevant to the philosophy and theory of law: It was titled *Teorija o povratnoj sili zakona* (Theory of the retroactive force of law: Geršić 1883), and in it he emphatically argued that a retroactive law "is *not* a law—it is an absolute injustice, the abolition of the concept of law in general" (ibid., 29; my translation, italics added).

Whereas the questions that engaged the interest of Serbian theory and philosophy of law in the 19th century and the second half of the 20th century were of broad scope, the *first* half of the 20th century produced writings and lectures mainly concerned with *particular* branches or fields of law (private, criminal, public, and international law), and so Geršić seems to be not only a pioneer but also a standard-setter. The same applies to Živojin Perić (1868–1953), in whose work, remarkably diverse and copious,[2] a prominent role is reserved for the idea of statutes as the sole source of law and for the companion idea of legality—the two acting in combination as the most important guarantees of legal certainty (Ž. Perić 1899; 1915, 17–8). This legal and statutory rigorism is higher and more comprehensive than ethical rigorism—the view that "inobservance of a law amounts not just to illegality but to immorality" (ibid.; my translation)—and even though it is based on the idea of state authority and on the dogmatic-exegetic method, it avoids resolving in an étatist jurisprudence, due to the important role played in it by the ideas of individual rights, rationalism, and pacifism, as well as by his Christian-socialist ethics (ibid.; cf. Ž. Perić 1908). As much as the companion ideas of the statute and of legality figure centrally in Perić's approach, it is worth noting that he also addressed some other issues in his shorter articles, especially the question of nuances in law, the temporal dimension of law, and unsolvable legal problems, and he also discussed various legal schools (see Ž. Perić 1907, 1921, 1927, 1934, 1939).

In the first half of the 20th century, Serbian theory and philosophy of law were dominated by the French influence. Živojin Perić graduated in law in

[2] A good bibliography of Živojin Perić's works, with some 660 entries, can be found in the *Bibliografija Živojina Perića* (Živojin Perić bibliography), in *Arhiv za pravne i društvene nauke* 1–2: 245–70.

Paris, where three other scholars also successfully defended their doctoral theses before World War I: Milan Gavrilović (1882–1976), with a dissertation published under the title *L'État et le droit* (The state and the law: Gavrilović 1911); Ilija Šumenković (1882–1962), *Les droits subjectifs publics de particuliers* (The public rights of individuals: Šumenković 1912); and Živan Spasojević (1876–1938), *L'Analogie et l'interprétation: Contribution à l'étude des méthodes en droit privé* (Analogy and interpretation: a contribution to the study of methods in private law, Spasojević 1911). The starting point for Živan Spasojević was the approach developed by François Gény (1861–1959), which he radicalized by sociologizing the concept of a statute: This he did by emphasizing the teleological element that comes into play in reasoning by analogy from social needs, interests, and goals.[3] A direct influence on the theory of law can also be attributed to his essay *O jurisprudenciji* (On jurisprudence: Spasojević 1912), as well as to his *Nacrt jedne opšte teorije prava* (Draft of a general theory of law: Spasojević 1989), posthumously edited and published from his rich manuscript collection by his student Božidar S. Marković.

In contrast to Živojin Perić and Živan Spasojević, who were specialists in private law, Toma Živanović (1884–1971) specialized in criminal law. He, too, earned a graduate degree in Paris, where in 1908 he defended a doctoral thesis published under the title *Du principe de causalité efficiente en Droit pénal* (On the principle of the efficient causation in criminal law: Živanović 1908), and throughout his career he kept his focus on criminal law and on the philosophy of law, investigating as well their interrelations and attaining the highest accomplishments in both fields. In the theory of criminal law he rejected the bipartition between the two basic concepts of crime and punishment. In its place he introduced the tripartition crime, *criminal* (a criminal offender), and punishment, thereby subjectifying the science of criminal law by singling out a subjective element (the criminal) that had traditionally been incorporated in the concept of crime (Živanović 1909, 1910, 1916, 1929). In this way he not only revised the very foundations for the systematization of criminal law but also opened criminal law to nonlegal sciences and enabled its broader humanization. In his treatise *Osnovni problemi etike (Filozofije moralne)* (Basic problems in ethics [moral philosophy]: Živanović 1935, French edition 1937) he redefined ethics on the basis of the tripartite model. His *Sistem sintetičke pravne filozofije* (System of synthetic legal philosophy: Živanović 1921, 1927, 1951, 1959, French edition 1970) is a monumental, three-volume work offering the most comprehensive, exceedingly accomplished systematization of law and legal knowledge, both scientific and philosophical. That system has been divergently evaluated because it is grounded in contradictory foundations: Modeled on conceptual jurisprudence, it represents a system of dogmatic positivism, which, created by synthesis, and driven by the ideal of so-called scien-

[3] On Gény see Section 12.5 in this tome.

tific philosophy, would conceptually, synthetically, and systemically crystallize all knowledge of law and the legal sciences and the corresponding philosophies! We can see, then, that Živanović's constructions can sometimes appear stretched and anachronistic. However, working on his own, and independently of the logical positivists, Živanović did anticipate the difference between theory and metatheory, and with his tripartition he made an enduring contribution to the theory of criminal law.

A special place in Serbian theory of law belongs to Slobodan Jovanović (1869–1958), a professor of constitutional law and a versatile personality with a comprehensive and diversified *oeuvre*, whose main sphere of interest comprised political and constitutional theory, history, comparative studies, and political philosophy. His key work, *Država: Osnovi pravne teorije o državi* (The state: foundations of the legal theory of the state, Jovanović 1906), went through four editions over the course of three decades (1906, 1914, 1922, 1936), each bringing substantive revisions, and in Serbia it stands as the most advanced work in the legal theory of the state. But it is also a social and political theory of the modern state, while also addressing some fundamental issues in legal theory and philosophy (such as the validity of law, its legitimacy, and the social contract). Jovanović was also the first Serbian scholar to have written on totalitarianism, and was among the first to have done so even outside Serbia.

Many are the Russian immigrants in Serbia who have charted new paths in Serbian culture, and among them are two who have significantly contributed to the development of legal philosophy: Teodor (or Feodor) Taranovski (1875–1936) and Evgenije Spektorski (1875–1951). Taranovski, an expert in legal history with an exceptionally wide range of interests and a profound philosophical knowledge, is the author of the voluminous *Enciklopedija prava* (Encyclopedia of law: Taranovski 1923), presenting not only a richly informative theory of law corroborated by a wide range of sources, including literary ones, but also a distinctive philosophy of law. Spektorski, for his part, was professor of constitutional law, philosophy of law, and sociology: His range of interests and the scope of his scientific and philosophical knowledge and erudition were also impressive, and he enriched the Serbian (Yugoslav) intellectual landscape with a book about the state, as well as with a two-volume history of social philosophy and a series of valuable articles on the history of legal philosophy (see Spektorski 1932–1933, 1997). He was primarily a historian of legal philosophy, theory, and thought in general, and even though he did not explicitly set out a conception of his own or a distinctive theory of law, such a view could be reconstructed on the basis of his diverse and profound critical works (two paradigmatic examples in this regard are Spektorski 1930, 1931).

Among those who pursued doctoral law degrees in Paris after World War I was Božidar S. Marković (1903–2002), who graduated in 1930 defending a dissertation titled *Essai sur les Rapports entre la Notion de Justice et l'Élaboration*

du droit privé positif (An essay on the relation between the notion of justice and the development of private law: Marković 1930, 1995). This work is mentioned by Wilhelm Sauer (1936, 118), and after World War II, Ilmar Tammelo described it as "addressing the problem of justice on the basis of a dynamic conception of law", and "substantially under the French influence" (Tammelo, 1977, 142; my translation)—though the latter assessment may not be hermeneutically accurate. Being primarily a specialist in private law, Marković went into legal philosophy mostly by discussing the problem of *fairness*, understood as the justice involved in concrete cases. He investigated fairness as an idea, as a practice, and as a source of law, drawing a distinction among what he took to be the four basic functions of fairness: technico-legal, moral, economic, and evolutional (Marković 1993, 15–80). Although his conception of fairness is scattered across various articles, and so cannot be described as a *theory* of fairness proper, it is nonetheless comprehensive, versatile, complete, and consistent. It is interesting to note that this Serbian legal philosopher par excellence has challenged the very need for legal philosophy as a freestanding discipline with its own raison d'être.

The work of Đorđe Tasić (1892–1943) is considered to be the culmination of legal-philosophical thought in the period preceding World War II.[4] Tasić was the first Serbian lecturer and writer on the theory, philosophy, and sociology of law whose main concern was not with any *particular* area of (positive) law. This subsequently became the standard practice, and to this day it has remained a characteristic feature of Serbian (and Yugoslav) theory (philosophy, sociology, and history) of law in academia, which certainly does not mean that nonlawyers and legal experts in particular areas of law did not make significant contributions to Serbian (or Yugoslav) theory of law. What makes Tasić's work the culmination of Serbian legal philosophy is above all the open-ended nature and diversity of his academic and philosophical interests, coupled with his multi-methodological approach to law (Tasić 1920, 1921, 1924, 1925, 1931, 1938, 1941, 1984). Furthermore, he possessed a deep, multifaceted understanding of the major ideas of contemporary theory, philosophy, and sociology of law: He was especially knowledgeable about the theories of Léon Duguit and Hans Kelsen, so he could engage on an equal footing with the leading lawyers and legal philosophers of the day (including Duguit and Kelsen) in discussions on the most complex issues in legal theory and philosophy, recognizing the significance and greatness of their theories, while also being able to critique their extreme positions in a convincing and lucid manner.[5] And, finally, he could fruitfully combine intrinsically worthy elements, not simply by a com-

[4] For a good bibliography of Đorđe Tasić's works, including secondary literature on his *oeuvre* as well as on his individual writings, see M. D. Simić 1990.

[5] On Duguit see Section 12.3 in this tome. On Kelsen's theory see Section 2.3 in this tome and Section 8.4 in Tome 2 of this volume.

pilatory method, eclectic for its own sake, but rather in an original and nuanced way achieving a new synthesis of the material. With Tasić, Serbian (Yugoslav) legal philosophy thus found its way to Europe, not by mere acknowledgment of its existence but as a significant body of work in its own right. And what was particularly noticed were Tasić's complex methodological approach to law, his intellectual independence, and his refined critical and analytical attitude (see, e.g., Sauer 1936, 118; Del Vecchio 1937, 217–8).

Also worthy of mention is Novica Kraljević (1906–1942). He was a physician and graduated in Prague, but before going to medical school he had obtained a master's degree in philosophy in Vienna (1932). After graduating in medicine he studied law and was awarded a doctoral degree in law in Paris (1939). Because of his right-wing political views he was assassinated in 1942: For the same reason he was blackballed, passing into obscurity, and only recently, in 2004, did his work find a new lease on life (Kraljević 2004). In his thesis, *La portée théorique du glissement du Droit vers la Sociologie: La doctrine juridique au point de vue de la Connaissance et de la Sociologie* (The theoretical scope of the epistemological sliding of law toward sociology: legal science from the standpoint of knowledge and sociology, Kraljević 1939), as well as in his book *Predmet i smisao prava* (The object and purpose of law: Kraljević 1940), Kraljević claims that any attempt to create a legal science is methodologically and epistemologically futile and that law can be understood only within the sociology of law.

Just as the mid-20th century is in almost every respect (political, cultural, spiritual, etc.) shaped by World War II, so Radomir D. Lukić (1914–1999), a pupil of Tasić, is one of the last authors of the first half of the century to have had a shaping influence on Serbian (Yugoslav) theory and philosophy of law in the second half of the century. He was an outstanding jurisprudential figure from the very outset, with his Parisian thesis of 1939, titled *La force obligatoire de la norme juridique et le problème d'un droit objectif* (The bindingness of the legal norm and the problem of an objective law: Lukić 1939). Here, the term *droit objectif* ("objective law") denotes law as an ideal or value and is to be understood in distinction to *positive* law rather than in distinction to *droit subjectif* (or "subjective law", i.e., the rights a subject enjoys under the law). As for the second half of the century, Lukić was the most prominent and most influential legal theorist in Serbia (and Yugoslavia), especially in academic circles, and his work will surely remain unrivalled for some time to come.[6] Although he defines positive law as a set of norms enacted by the state, his approach to law is very complex, as can be clearly appreciated, for example, from his *Metodologija prava* (Methodology of law: Lukić 1977). For one thing, law is explained by Lukić as a social phenomenon interacting with all other social phenomena, such as the state, politics, the economy, social groups, the social

[6] For a good bibliography of Radomir D. Lukić's works, see Kostić 1995.

structure, the nation, social welfare, social struggles, social cooperation, organizations, churches, ideologies, cultures and subcultures, religion, and social pathologies (Lukić 1953–1954; 1960; cf. Lukić 1974b). For another thing, law as a normative phenomenon is not reduced to normativity: It is only one component in the legal order, which is made up not only of legal norms but also of legal acts (legislative acts, court decisions, treaties, contracts, etc.), legal relations (encompassing the whole range of rights, including human rights, powers, and correlative duties), legal objects, legal subjects, human behaviour (both commissive and omissive, lawful and unlawful), and events and occurrences (natural and social ones alike, such as the passing of time, births, deaths, and storms, as well as wars, hyperinflation, riots, epidemics, and demonstrations). This unreduced conception of normativity expounded by Lukić is reflected in his theory of legal interpretation and in his conceptions of constitutionality and legality, as well as in his notions of the validity, positivity, and efficiency of legal norms and in the relative criteria (Lukić 1956, 1961, 1966). And finally, law is conceived by Lukić as value-and-content-dependent: This, too, is a theme that can be observed from the beginning, in his doctoral dissertation (Lukić 1939), and later on it is developed by him both in scientific terms—as in his *Sociologija morala* (The sociology of morality: Lukić 1974a)—and in philosophical terms, particularly in his *Sistem filozofije prava* (System of legal philosophy: Lukić 1992), where his philosophy of law forms part of his elaborate general philosophy. Lukić's conception of law has been criticized as normativist (espousing an étatist approach to positive law) and Marxist, that is, as taking a class-based approach in explaining law as a social phenomenon. The criticism of Lukić's normativist-étatist approach to law is unlikely to stand, especially considering that his system of legal philosophy paradoxically has no place for norms, much less for a (philosophical) theory of norms, while in his (scientific) theory of law, his conception of the validity and positivity of legal norms ultimately rests on the efficiency of the legal order as a whole. Lukić's Marxist explanation of law as a social phenomenon, however, can be reinterpreted in the broader terms of social conflict without undermining the whole system of his theory of law, which to date is unsurpassed and is still waiting for an appropriately mature philosophical and theoretical critique showing the way it could be improved.

To be sure, there have been no systemic theory and philosophy of law since Lukić, but there has been some significant work on certain issues in legal theory and philosophy. This body of work can roughly be divided into two groups, one part of it being devoted to the *history* of legal philosophy and the other to *contemporary schools* of legal philosophy. Mihailo Đurić (1925–2011) investigated the Greek Sophists' idea of natural law and the history of political philosophy. Ljubomir Tadić (1925–2013) has explored the philosophical foundations of Hans Kelsen's legal theory, and written a pregnant review of the history of legal philosophy. Stevan Vračar (1926–2007) addressed the social func-

tions of the state and the legal order, and also discussed issues in legal methodology, as well as the theories of certain schools and authors in legal theory and philosophy, both within Serbia and without. Milijan Popović (1938–2008) set out to define the concept of rights, investigated the *Rechtsstaat* in relation to the totalitarian state, and also took up issues of post-socialism. Budimir Košutić (1941–) has written books on precedent (judicial decision as a source of law), on the great legal systems of the contemporary world, and on legal theory and jurisprudence. Kosta Čavoški (1941–) has written on the conception of the state in Marx's early writings, on constitutionality and federalism, on the philosophy of an open society, on the constitution as a guarantee of freedom, on constitutionality and the rule of law, and on absolute and tempered justice in Aeschylus' *Oresteia*. Todor Podgorac (1934–) has focused on Leon Petrażycki's theory of law. Danilo Basta (1945–) has explored the origin and purpose of the state in Kant's political philosophy, Ernst Bloch's philosophy, the natural law tradition, modern natural law in Fichte's early political philosophy, the complex personality and work of Slobodan Jovanović, and the idea of freedom in foreign and domestic legal philosophy. Tatjana Glintić (1946–1997) devoted herself to justice, freedom, and equality in the theories of John Rawls and Michael Walzer. Miroljub Simić (1947–2008) concerned himself with the domestic heritage in the theory of law. Gordana Vukadinović (1949–) has written monographs on the idea of natural law in Rousseau's work, on the law regulating worker self-management, and on the Serbian theorists' conceptions of *Rechtsstaat* in the first half of the 20th century. Radmila Vasić (1950–) has written books on Đorđe Tasić's conception of law, on the legal bindingness of customary law, and on the rule of law and the transition to democracy in the post-Yugoslav countries. Dušan Vranjanac (1952–) has explored Austin's legal positivism and Bentham's idea of legal norms. Dragan Mitrović (1953–) has written monographs on the relationship between the state and worker self-management law, on the content and forms of legality, and on chaos theory applied to law and legal theory. Jasminka Hasanbegović (1956–) has critically investigated the philosophical foundations and practical scope of the conception of legal logic that Chaïm Perelman developed in his theory of the new rhetoric; she has also researched the history of the theory of topics and its renewal, its relevance to law, and its role in shaping legal reasoning; she has also pointed out and logically demonstrated the main misconceptions about the logical structure of legal norms and clarified misconceptions about the scope of the imperative conception of legal norms. Miodrag Jovanović (1971–) has written monographs on the anthropological roots of law, on collective rights in multicultural communities, on the constitutionalization of secession in federal states, and on federalism and decentralization in Eastern Europe.[7]

[7] An overview of most of the works from this period can be found in Stepanov and Vukadinović 2002.

20.2. Croatian Legal Philosophy and General Jurisprudence in the 20th Century (*by Ivan Padjen*)

Legal education in Croatia can be traced back to the 13th century, but only in 1776, with the founding of the Law faculty (*Facultas juridica)* of the Royal Academy of Sciences in Zagreb (*Regia Scientiarum Academia Zagrabiensis*), did law become an academic discipline proper, systematic and continuous. In 1874, the faculty was reconstituted as the University Faculty for the Sciences of Law and the State (*Pravoslovni i državoslovni fakultet*: Čepulo 2007), and it was renamed Faculty of Law in 1926.[8] In the first half of the 20th century, the faculty taught political economy, finance, and, with the first chair in Austria-Hungary (endowed in 1905), sociology and criminology and even practical philosophy, the last of these a required course lasting three terms taught by a philosopher. Still, because Austrian legal education was grounded in Roman law and German legal history (see Simon 2007), the philosophy of law and the theory of law were offered solely as elective courses until 1933, when the *Enciklopedija prava* (Encyclopaedia of law), renamed Introduction to legal sciences, became compulsory (see Metelko 1996, 95, 97; Čepulo 2007, 136–7; Pokrovac 2006; Pavić 1997a, 773–80; Pavić 1998, 1023–30).

20.2.1. History qua Philosophy

Legal philosophy was initially institutionalized in Croatia with a course titled *Opća pravna povijest* (General legal history). The course was introduced into the curriculum on the theory that Slavic laws could be a vehicle for the development of law, in that the latter was thought to be inherent in the former. However, the theory was discredited before the course got underway (Kostrenčić 1970, 264). Hence, the course and its offshoots served several interrelated functions. The first one, taken from Hungarian legal education, was that of studying European legal developments with a view to preparing a "return" to the European legal-cultural framework. The second function was to provide not merely a positivistic overview but also a grounding in the philosophy of legal history, and a Hegelian one in particular. The third function was to ground the Encyclopaedia of law as a program of study and body of knowledge concerned with the concept of law, with legal systems, with the

[8] Croatia came into being as a political entity in 812 and became an independent kingdom in 925 (see Čepulo 2012, 48–9). It entered into a union with Hungary in 1102 (ibid., 52) and also with Austria in 1527 (ibid., 59), while parts of Croatia were under Venetian and Ottoman rule. Croatia became a part of the first Yugoslavia in 1918 (ibid., 257–8), and during World War II it became a republic having internal sovereignty within the second Yugoslavia, which was governed under a communist regime but has been independent of the Soviet Union since 1948 (ibid., 293–308). The Republic of Croatia adopted a liberal democratic constitution in 1990, declared independence in 1991 (ibid., 351–5), and gained full control over its entire territory in the war of 1990–1995.

systematization and sources of law, and broadly with legal history (Mikulčić 1869). Finally the course, retaining a vestige of its original intent, was meant to explore distinctly Croatian legal institutions as social laws, while investigating their relation to modern laws, largely transplanted. These functions remained central to Croatian legal scholarship throughout the 20th century. Whereas legal theory and legal dogmatics in Croatia were professedly positivistic—exclusively concerned with positive law, while keeping philosophy at arm's length—legal history relied heavily on philosophical assumptions that made it a genuine sociological jurisprudence, and it remained a cornerstone of Croatian legal scholarship and legal education.

The hypertrophy of Western history had a far-reaching impact. Until 1945, the continuity of law was taken to be self-evident. Croatian law was considered Western; what mattered was the thought of major Western authors; hence there was no pressing need for legal philosophy *qua* legal theory concerned with legal systems and with trans-systemic relations; erudition was valued above originality; the theory of public law, especially in the realm of international law, served the functions of the theory of the state and, together with private international law, the functions of the theory of law itself. However, legal history generated the idea of social law (*socijalno pravo*, *društveno pravo*), an idea which was reinforced by the experience of the conflict between Western law and the Croatian tradition, and according to which law is a unity in which "grassroots" norms and actions (created by local communities, economies, and the like) are coupled with the reason and logic inherent in law, however imperfect and culturally inflected such reason and logic may be. Mainstream Croatian legal theory has been resolving this conflict through a concern with law in action, while disregarding law in books and the theory of law.

That idea is central to Eugen Ehrlich's sociology of law, where the development of law is explained as a function not of the state but of society—the main engine of that development (Ehrlich 1913)—and where law is defined as "an intellectual thing" (Ehrlich 1916, 848; my translation).[9] Ehrlich recognized Baltazar Bogišić's concern with living law (Bogišić 1874, Čepulo 2006, 2010) as one of his precursors (Ehrlich 1911; 1913, 299), and in turn he probably inspired Ivan Strohal (1871–1917) (see esp. Strohal 1915). Baltazar Bogišić (1833–1908), who was a member of the Yugoslav Academy of Sciences and Arts in Zagreb and sought a teaching position at the Zagreb Faculty of Law (Čepulo 2011), was the foremost Croatian (as well as Montenegrin and Serbian) student of social law (see Bogišić 1967, 1999), who belonged intellectually to the 19th century (Đivanović 1985, Zimmermann 1962, Čepulo 1992). Some remarks on Strohal's work are given later (Section 20.2.2).

[9] The German original: "ein gedankliches Ding." On Ehrlich see Section 3.3 in this tome and Sections 1.1.4.1 and 22.3.1 in Tome 2 of this volume.

A source for the idea of social law is the so-called "peasant home," a communal family that in the Constitution of the Neutral Peasant Republic of Croatia figures as the basic constituent of what is referred to as the peasant state. That constitution was drafted by Stjepan Radić (1871–1929) (Radić 1995, sec. B.5.5; Cipek 2001, 163): A law student in Zagreb and Prague, he went on to gain a graduate degree in political science in Paris, and later founded and headed the Croatian Peasant Party, which would regularly sweep up ninety percent of Croatian votes in the First Yugoslavia between the two world wars. The peasant home provided the unintended functional missing link between peasant customs and the "basic organizations of associated labour," described in the Croatian and the Yugoslav constitutions as the basic units of socialist self-management, and hence as constituents of the socialist economic and political system.[10]

The idea of social law can also be derived in part from Hegel's *Philosophy of Right*, where the thesis is put forward that a class and its corporation link a person to a universal (Hegel 1821, pars. 200–208, esp. 207), and where the idea of logos in history is investigated (ibid., *Vorrede*, XVIII-XX; Gans 2005; 1995, 102). Hegel's ideas had formed the core of the course titled General legal history taught at the Zagreb Faculty of Law, and they reemerge when Berislav Perić (1921–2009), teaching Theory of law and the state from 1949 to 1992, built a Marxist philosophy of law on the basis of Hegelian dialectics (B. Perić 1962; c.f. B. Perić 1996). Perić expanded his philosophy by bringing into it the idea of social law that Georges Gurvitch (1932) developed on the basis of the experience of Soviet and workers' factory councils in the first stage of the Russian Revolution of 1917 (Hunt 2009, 164ff). Perić used the idea to both explain and justify Yugoslav socialist workers' self-management (B. Perić 1964, chap. III F).

According to Eugen Pusić (1916–2010)—of the Zagreb Faculty of Law, where he taught administrative science from 1955 to 2010—workers' self-management had a chance of developing in working groups of specialists regulated primarily by technical rules: Examples included research, surgical, and project teams (Pusić 1968, 56–95, esp. 92). Ivan Šimonović explored Pusić's framework for self-management after its demise (1992). Pusić applied his theory to the university (Pusić 1970), thus coupling inherited academic self-government with student participation in university governance and socialist workers' self-management. This gave a new twist to the idea of social law.

[10] See članak 14 Ustava Socijalističke Republike Hrvatske. *Narodne novine* 8/74 (Article 14 of the Constitution of the Socialist Republic of Croatia, *Official Gazzette of the SR Croatia*, 8/74); članak 14 Ustava Socijalističke Federativne Republike Jugoslavije. *Službeni list SFRJ* 30/74 (Article 14 of the Constitution of the Socialist Federal Republic of Yugoslavia, *Official Gazzette of the SFRY* 30/74).

Relying on a wide variety of sources, including Marxism, Nikola Visković (1938–) recognized legal pluralism as both a reality and an idea (Visković 1981, 237–44), while adding his own account of Yugoslav law on self-management (ibid., 325–46). His study of legal argumentation bespeaks his concern with reason in law (Visković 1997).

Aleksandar Goldštajn (1912–2010) studied the sources of autonomous international commercial law against the background of the idea of social law, but he approached this idea without the idealization typical of high theory (Goldštajn 1986).

That understanding of the idea of social law was also backed by Peter Winch in his *Idea of a Social Science*, arguing that "a principle of conduct and the notion of meaningful action are interwoven" with the criteria of logic which arise out of ways of living or modes of social life, and which are intelligible only in that context (Winch 1990, 63, 100). Ivan Padjen (1947–) has drawn on Winch's *Idea*, among others, to explain the distinctiveness of hermeneutic disciplines, including legal scholarship (Padjen 1984, 1988a), and so to pave the way for the Croatian Constitutional Court's recognition in 2000 of the autonomy of every academic discipline taught at the universities (Padjen 2000, sec. A.2.1.2.2.ac).[11]

Social law and legal pluralism were infused with new meaning at the end of communist rule when scholars in Croatia as well as in other parts of Central Europe explored the idea of civil society with a view of setting the stage for political pluralism. Among these scholars was Zoran Pokrovac (1955–), who has used that idea to separate civil society from the state, and thus accommodate the exercise of the freedom of association, first by nongovernmental organizations and then by political parties (Pokrovac 1988a, 1988b, 1990a, 1990b, 1991).

After the Republic of Croatia adopted a multiparty political system in 1990, and gained international recognition in 1991–1992, it entered into four international agreements with the Holy See in 1997–1998. The criticism was raised that these agreements violated the equality of all religious communities before the law (Padjen 1999b, 200–4):[12] This meant that the Catholic Church in Croatia abandoned its role as a unit within a transnational legal system having the status of social law, and thus morphed into a cosovereign. When the Republic of Croatia entered into similar public, albeit not international, agreements with a dozen other religious communities in 2002, the agreements, together with

[11] Ustavni sud Republike Hrvatske. Odluka i rješenje U-I-902/1999. od 26. siječnja 2000, Obrazloženje II.6, *Narodne novine* 14/00 (Constitutional Court of the Republic of Croatia. Decision and Ruling U-I-902/1999 of January 26, 2000, Reasons II. 6, *Official Gazzette of the Republic of Croatia* 14/00).

[12] See članak 41. stavak 1. Ustava Republike Hrvatske. *Narodne novine* 56/90 (See Article 41 Section 1 of the Constitution of the Republic of Croatia, *Official Gazzette of the Republic of Croatia*, 56/90).

a similar development in Hungary (Schanda 2003, 125), were interpreted as a significant building block toward a revival of legal pluralism, or at least as a sign of such a revival (Padjen 2004, 106), despite what Berman and Witte (1987, 495) had previously argued.

When all is said and done, it may well be the legal status of religions that explains the proclivity of Croatian lawyers for the idea of social law. Just as a religion is defined by law (Padjen 2010), so is Croatia. While that may be true of any nation *by definition*, what distinguishes Croatia is that the law defining Croatia in the past millennium was more often than not merely an autonomous law, that is, a social law, and at times merely a memory of such a law (see Čepulo 2012). Viewed against the backdrop of Croatian participation in networks of legal orders (especially those of the Austro-Hungarian Empire and Yugoslavia), the concern with social law may be recognized as a central problem of legal theory, in that law is not merely a legal system (see Raz 1970, 2; Kelsen 1961, 3) but also a web of trans-systemic normative relations (Padjen and Matulović 1996, 28–9).

20.2.2. Methods and Concepts

In light of the foregoing remarks, a brief characterization can be provided of other salient features of Croatian legal philosophy in the 20th century, focusing primarily on the legal methods that come out of that tradition and on the ways in which it has interpreted the concept of law.

In light of Bogišić's and Kantorowicz's views, Ivan Strohal analyzed the discrepancies between the transplanted Austrian civil law and the relations within extended families in Croatia. Strohal criticized not only naturalist but also positivist doctrines, including Savigny's and Bogišić's, for failing to recognize that law is created on a foundation of rights, rather than the other way around (Strohal 1908, 1910, 1915, Maurović 1918, Pavić 1997b, 651–8).

Natko Katičić (1901–1983) conceived the state as a unity of norms and facts, criticizing the one-sidedness of historicist and normative conceptions alike (Katičić 1928).

Stanko Frank (1883–1953) conceptualized law and the state as a normative structure created by social life, and hence as needing coercion only when law is wanting, especially when it is a transplant (Stanko Frank 1925a, 1925b, Pavić 1997a, 117–46; 1997b, 369–79).

Mihajlo Lanović (1882–1968) wrote an introduction to legal sciences (*Uvod u pravne nauke*: Introduction to legal disciplines, Lanović 1942) where he distinguished three disciplines in the study of law, namely, dogmatic jurisprudence, legal history, and legal philosophy, the last of these concerned with the ground or values of law, and he defined law as "a set of norms issued under a continuous power that by force of custom, and with greater success than any other power, comprehensively and deeply regulates the life and living relations

of its subordinates." Since "continuous power" was equated by him with sovereignty, international law could not be law (ibid., 26–8, 86, 318, my translation; Pavić 1997a, 265–72; 1997b, 461–74).

Ivo Krbek (1890–1966) wrote a treatise on administrative discretion (Krbek 1937, Pavić 1998, 563–97; 1999, 341–54) that is still relevant today in both theory and practice, and under the communist regime he developed a Marxist-Leninist conception of law (Krbek 1952), and he also put out a study investigating various theories of sovereignty (Krbek 1964).

A draft for a new civil code—annotated with a full panoply of doctrinal and comparative considerations—appropriately marked the end of the era (Eisner and Pliverić 1937).

Due to Soviet communism, theory and philosophy of law became a cornerstone of Croatian legal education. Russian (originally German) legal theory was transplanted into Yugoslavia, including Croatia, already by Teodor Taranovski (1923), an émigré from Bolshevik Russia. Theory of law and state (*Teorija države i prava*) as well as General history of law and state (*Opća povijest države i prava*), both marxized, became compulsory first-year courses in 1946, after the communist victory in World War II in Yugoslavia (Metelko 1996, 101). The courses remained a pivot of the law curriculum after the Soviet-Yugoslav rift of 1948. Elective courses in the philosophy and methodology of law were offered. The theory of law and the state was progressively departing from Marxism, in Croatia as well as in other Yugoslav republics (Padjen 2013), but the theory's concern with the social context of law, which upgrades the idea of social law, has outlived socialism. In taking that direction, Croatian legal theorists made little use of the voluntaristic Marxism characteristic of Stalinism—on which law simply expressed the will of a ruling class as implemented by a state, thus leaving no social space for anything like social law (see esp. Vyshinsky 1949)—nor did they rely much on the economistic Marxism of Evgenii Pashukanis (1926), on which law reflects the exchange of commodities on the open market, and in this sense is an expression of social law (the one and only such law, since there is no social law other than that based on the exchange of commodities). As noted, Croatian theorists built their ideas on the self-management of workers' councils, which was of dubious Marxist provenance, and most definitely non-Bolshevik. The departure from Marxism was prompted by institutional as well as political and intellectual developments. By the end of the 20th century, there were four university law faculties in Croatia (Zagreb, established in 1776; Split, in 1961; Osijek, in 1973; and Rijeka, in 1973), employing about two hundred faculty members, including about one hundred teachers of legal disciplines (Padjen and Matulović 1996, 16 n. 30). The theory of law and state became one of a dozen disciplines/habilitations in legal science (alongside Roman law, civil law, international law, etc.) taught by seven teachers at the four law faculties just mentioned and at the Zagreb University Faculty of Political Science. Two periodicals were devoted in part to legal theory (*Pravo i društvo* [Law and Society],

1982–1992, and the *Croatian Critical Law Review*, 1996–1999), while several other journals would occasionally publish contributions to the discipline: Worthy of mention in this regard are *Zbornik Pravnog fakulteta u Zagrebu* (Collected papers of Zagreb Law Faculty), *Zbornik radova Pravnog fakulteta u Splitu* (Collected papers of Split Law Faculty), *Pravni vjesnik* (The journal of law), *Zbornik Pravnog fakulteta Sveučilišta u Rijeci* (Collected papers of the Law Faculty of the University of Rijeka), *Dometi* (Achievments), *Naše teme* (Our themes), *Filozofska istraživanja* (Philosophical investigations), *Synthesis Philosophica* (English edition of *Filosofska istraživanja*), *Pogledi* (Views), and *Pitanja* (Questions).

Berislav Perić broke new ground with a doctoral dissertation on autonomy and heteronomy in law in Immanuel Kant's and Rudolf Laun's philosophies (B. Perić 1955), at a time when his colleagues were writing on Marx and Plekhanov. In his habilitation, however, Perić attempted a Marxist philosophy based on Hegel's dialectics (B. Perić 1962; cf. B. Perić 1996, Miličić 1992). His attempt ran contrary to the Praxis school (at the time a very influential group of Croatian and Yugoslav philosophers), since these intellectuals, following in the footsteps of the young Marx, engaged in philosophy as a radical critique of all things existent (see Greuenwald 1983), and thus claimed that there could be no such thing as a Marxist philosophy of law. Perić's textbook (B. Perić 1964)[13] is more conventional. It defines law as a unity of legal norms and social relations, and discusses themes that cannot be made to fall within the range of Marxist legalism: The continuity of legal systems on Yugoslav soil; the structure and role of customary law, especially in commerce; and the role of equity and "the nature of things" in judicial reasoning; the formative impact of both legal scholarship and the legal profession on modern legal systems. Perić's analysis of Hans Kelsen's pure theory of law may well express the later *communis opinio* of Croatian jurisprudents, but it does not necessarily express their reasons. Perić considered Kelsen's theory essentially unacceptable as a theory offering "a very narrow and one-sided truth about law" (B. Perić 1974, 302, 305). However, some tenets of the pure theory, especially as developed in the theory of international law—namely, the unity of law and the state, of general and individual norms, and of law and rights—were considered by him acceptable to "the contemporary dialectical philosophy of law" (ibid., 299–300, 304–5).[14] In *Pojam prava* (The concept of law: Visković 1981), Nikola Visković constructed an integral theory of law (*integralna teorija prava*) on which law is defined by taking the professional experience of lawyers into account, but with a view to enabling lawyers to be critical of ideology (ibid., 49–52). The definition (ibid., 41–5) identifies three elements of law—namely, positive le-

[13] Cf. B. Perić 1981, superseding Mandić 1960–1961, in turn superseded by Metelko 1992, Visković 1995, Vrban 1995 and Miličić 1999.

[14] On these aspects of Kelsen's theory see Section 2.3.2 in this tome and Sections 8.3. through 8.5 in Tome 2 of this volume.

gal norms, extra-positive values, and social relations (all supported by inherited conceptions)—that together make up the content of law (ibid., 46–7). This three-dimensional content correlates with three criteria of validity (ibid., 47–50) derived by analyzing the relationship between the is and the ought on three levels, an ontological one, a socio-psychological and epistemological one, and a linguistic one (ibid., 64–70), the last one in turn dividing into semantics, syntax, and pragmatics (ibid., 168–75). Hence a norm is legal if (*a*) authorized by another norm; (*b*) consonant with extra-positive values (like peace, security, and justice, as well as determinacy, completeness, and coherence of legal norms); and (*c*) adequate to the facts, meaning that the norm (*i*) is intended to regulate highly conflictual social relations amenable to public control and (*ii*) is part of a normative system that on the whole is efficacious (ibid., 254–7, 273–87). Such integration of the content and criteria of law commits one to methodical pluralism (ibid., 50–2). As much as Visković may be professedly committed to Marxist dialectics (ibid., 53), his own sympathies are attested by his reliance on Carlos Cossio's egology (Visković 1990), and by his studies on law and language (Visković 1989) and on argumentation in law (Visković 1995).[15] Visković's impact in Croatia is evidenced by the fact that all Croatian specialists in the discipline (e.g., Miličić 1999, Vrban 1995) accept the integral legal theory in one variant or another (in this way Croatian legal theory added axiology to deontology), as well as by a wide use of his textbook (Visković 1995; 2006) and by an international symposium in his honour after his retirement.[16]

In the 1980s, the *Radna grupa 'Pravo i društvo-temeljna istraživanja'* ("The working group 'Law and society—fundamental problems'") of the Yugoslav Academy of Sciences and Arts, led by Natko Katičić and Eugen Pusić, engaged in a Croatian-styled *Methodenstreit*, or dispute on method.[17]

In Pusić's view, "the fundamental sciences of the classical epoch—law, medicine, pedagogy, politics, rhetoric, astronomy—basically amount to a systematization of experience, coupled with the skills developed through that experience" (Pusić 1989, 18; my translation). They are applicable as long as their

[15] On Cossio's egology see Section 26.2.1.2 in this tome.

[16] The symposium (*Pojam prava: Viskovićevo integralno poimanje prava*, The concept of law: Visković's integral conception of law), took place at the *Pravni fakultet Sveučilišta u Rijeci i Hrvatska udruga za pravnu i socijalnu filozofiju* on November 27, 2010.

[17] See *Pravo i društvo*: *godišnjak Radne grupe 'Pravo i društvo—temeljna istraživanja,'* Vol. 1 (1982), Vol. (1983), Vol. 3 (1984); Vol. 4 (1985); Vol. 5 (1989); Vol. 6 (1992). Zagreb: Jugoslavenska a akademija znanosti i umjetnosti. The original "battle on method," which took place among German scholars in the late 19th century, involved three points of disagreement. "First, it involved questions of subject matter in relation to whether values would be dominant over facts; second, it involved a choice in the type of investigative methods to be pursued in the social sciences; and third, it involved decisions about what the main purpose and aim of the social sciences would be" (Morrison 2006, 340). The Croatian dispute over method was closer to a related German controversy over the study of law, especially as concerns the relation of law to other aspects of society such as the state, politics, and the economy (see Koch 1977).

boundary conditions obtain. Consequently, if a change is made to a constitution or to a basic legal institution, such as private ownership of the means of production, "entire libraries become wastepaper" (ibid.; my translation; cf. Kirchmann 1848). Pusić argued that a paradigmatic (*in nuce* naturalistic) social science could replace juristic and other commonsense identifications of social phenomena (ibid., 21–2). While recognizing that "the development of the area of social sciences as a whole has perhaps not matured for a synthesis," he claimed that it was possible to make an inventory of problems—and he proceeded to do so (ibid., 93ff.; my translation). His understanding of the relation of theory (rationality, science) to practice (law, morality) is encapsulated in the view that the dependence of a community on normative regulation ("counterfactual expectations") is inversely proportional to the sum total of reliable knowledge ("realistic expectation": ibid., 159; my translation; cf. Luhmann 1972, 40–53).

Ivan Padjen advanced a diametrically opposed argument, derived from an inquiry into international law and morality in light of the early Kelsen's insight that not only legal science and ethics but also grammar is a normative science (Kelsen 1916, 38), an argument that draws as well on the later Kelsen's criticism of Weber's sociological concept of law (Kelsen 1928), and on Peter Winch's use of the later Wittgenstein (Winch 1990). The argument runs as follows: Normative explanation, i.e., the identification of an object by reference to the norms (rules, reasons) constitutive of the object, is the basic method for scientific as well as commonsense inquiries into social phenomena; modern social formations and systems (firms, nation states, etc.) are primarily constituted by legal norms; for this reason, the empirical sciences of modern societies (sociology, political science, etc.) presuppose that their subject matter be identified jurisprudentially; when legal norms designed to constitute a social system are secret or ineffective, this does not only make for sterile legal scholarship but also makes fruitless the empirical sciences of the system (Padjen 1984; cf. Cotterrel 2001).

The argument is echoed in Zoran Pokrovac's reminder that the dependence of legal sociology on legal dogmatics was first recognized by Hermann U. Kantorowicz, and that it might even have been recognized by Semen V. Pachman (1986). Relying on Hans Jauss's theory of aesthetic reception (Jauss 1970),[18] Pokrovac pointed out some failings in the literature on Kantorowicz: He thus set out to reconstruct the latter's views on law, free law, the sources of law, and gaps in the law, outlining in detail the flaws he detected in the idealized self-image of lawyers, and especially of judges, as automata of legal application, while also criticizing the accompanying tenet that all judgments must be grounded in a statutory foundation. The advocacy of free law, analysed in the

[18] Cf. Jauss 1982, 15: "Literature and art only obtain a history that has the character of a process when the succession of works is mediated not only through the producing subject but also through the consuming subject—through the interaction of author and public."

context of contemporary theories of judicial activity, turned out to be a social movement rather than a mere doctrine (Pokrovac 1995, 1992).

Miomir Matulović (1957–) has edited *Ljudska prava. Zbornik tekstova iz suvremenih teorija ljudskih prava* (Human rights: A collection of texts in contemporary theories of human rights, Matulović 1989), a work through which the focus of Croatian legal philosophy, in what was still a country under communist rule, moved closer to contemporary liberal, chiefly American, philosophy of law and politics. In *Ljudska prava: Uvod u teoriju ljudskih prava* (Human rights: Introduction to the theory of human rights, Matulović 1996), he argues that a complete theory of human rights needs to solve the problem of justifying human rights and their content, while working out the conflicts among different human rights as well as between human rights and other values (ibid., 12–4). To this end Matulović probes into classical theories of natural rights (those of Thomas Hobbes, John Locke, and Thomas Paine, especially in light of the objections raised by Edmund Burke, Jeremy Bentham, and Karl Marx), while also drawing on contemporary theories of human rights (those of John Rawls, Robert Nozick, Alan Gewirth, and John Finnis) (ibid., 35–205). Matulović puts forward a modified contractarian theory as a solution to the problem of justifying the human rights to freedom, welfare, and culture (ibid., 241–77; Matulović 1988b). His solution to the problem of content relies on the work that Hella Kanger carried out applying Stig Kanger's normative and logical analysis of rights to the rights listed in the United Nations Declaration of Human Rights (H. Kanger 1984; Matulović 1996, 311–22). Building on the theories of Rex Martin (1985, chap. 7) and John Rawls (1982, 57), Matulović works out a procedure for solving the conflict among human rights, and he illustrates that procedure by looking at the conflicts involving freedom of the press (Matulović 1996, 323–37).

Branimir Lukšić (1935–)—of the Split Faculty of Economics, where he taught commercial and maritime law from 1986 to 2005—attempted to bridge the gap between the "contextual" component of value judgments, which is subject to change, and their "essential" or "textual" component, which by contrast is nonsubjective (Lukšić 1995, 215; 1981, 1983, 1986, 1988, 1991, 1994). His arguments that positive law is linked to substantive natural law run parallel to arguments put forward by other thinkers linking positive law to (*a*) procedural natural law and its presuppositions (Padjen 1976, 1988a), (*b*) natural human rights (Matulović 1988b, 1996), and (*c*) morality (Babić 1987, Metelko 1999).

Some Croatian jurisprudents regularly participated in the Group for Legal Theory headed in the 1970s and 1980s by Radomir Lukić at the Serbian Academy of Sciences and Arts in Belgrade. Nikola Visković was the most active participant from Croatia. He introduced his colleagues from other Yugoslav republics to the integral conception of law and to research on law and language. Another influential participant was Vjekoslav Miličić (1943–), whose primary

concern lay with issues in the methodology of law. Pokrovac introduced their Yugoslav colleagues to the German *Freirechtsschule* (Free law movement), while Matulović advanced Angloamerican theories of human rights.

Several legal philosophers and theorists left Croatia for good. René Marčić (1919–1971) was at the University of Salzburg from 1963 until his death in 1971, where he taught philosophy of law and state, constitutional law and political science. He developed an ontological philosophy of law that from the being and lifeworld (or *Lebenswelt*) of humans deduces dignity as the basis of justice and human rights, which in turn form the basis of legal orders (Marčić 1971, Marcic and Tammelo 1989, Mayer-Mally and Simons 1983). Ivo Lapenna (1909–1987) taught comparative law at the London School of Economics from 1955 to 1980. He analysed Soviet theories of international law at the height of the Cold War (Lapenna 1954) and compared Soviet and Yugoslav theories of law and the state that moved increasingly apart after the Soviet-Yugoslav rift of 1948 (Lapenna 1964; Pavić 1999, 375–8). Mirjan Damaška (1931–) moved from the University of Zagreb to the University of Pennsylvania Law School in 1971, and to Yale Law School in 1976, where he became Sterling Professor in 1996. His *Faces of Justice and State Authority: A Comparative Approach to the Legal Process* (Damaška 1986)—a work that gained him both fame (see, e.g., Jackson, Langer and Tillers 1998) and influence (see, e.g., Ackermann 2009)—may be recognized by Croatian readers to have been built on the comparative history of criminal procedure traced out by his teacher at Zagreb, Vladimir Bayer (1943). Following a well-trodden path, Bayer set up a contrast between two types of procedures in adjudication: The adversarial procedure characteristic of Anglo-American law, and the inquisitorial one characteristic of the law of continental Europe. Damaška replaced the two types with two oppositional pairs that link court procedures to the policy aims and political institutions of modern states: He called these (*a*) the reactive state versus the activist state and (*b*) hierarchical versus coordinate officialdom, illustrating the heuristic use these pairs can be put to in investigating several Western legal systems (Damaška 1986). Vladimir Vodinelić (1948–) moved from the Split Law Faculty to the Belgrade Law Faculty in 1975, and then to Union University Belgrade in 2002. While still at Split, he began his dissertation on the relationship between public and private law (Vodinelić 1986). His numerous works on civil law include theoretical introductions to the subject (see, e.g., Vodinelić 1991). Igor Primorac (1947–) has published widely on the philosophy of punishment (see, e.g., Primorac 1980, 1990), though he has also analyzed patriotism and secessions (Primorac and Pavković 2006); he moved to Hebrew University in Jerusalem in 1983, where he became professor emeritus of philosophy. Some jurisprudents moved in the opposite direction. Among them is Anton Perenič (1941–), who investigated the concept of law in a book (Perenič 1981) that moves parallel to Visković's book on the same topic (Visković 1981). Duško Vrban (1938–) returned from his doctoral stud-

ies in France and Germany to teach theory of law and state at the Osijek Law School (see Vrban 1995).

At the end of the 20th century came a turning point, and what paved the way for it was the criticism of Marxist theories (Padjen 1975, 1977; Miščević 1978a), in concert with an interest in contemporary theories ranging from cybernetics (Anzulović 1971) to the economic analysis of law (Kregar and Šimonović 1996), as well as in the theories of major 20th century legal philosophers, among whom Rudolf von Jhering and Leon Duguit (B. Perić 1964, chap. 4.3), Hans Kelsen (B. Perić 1962, 225–65; B. Perić 1974, Padjen 1984, 1988b), Rudolf Laun (Perić 1955), Mario G. Losano (Anzulović 1971, Losano 1990), Carlos Cossio (Visković 1990), Lon L. Fuller (Padjen 1977), Norberto Bobbio (translated in Croatian by N. Visković and Ž. Anzulović: see Bobbio 1988), H. L. A. Hart (Matulović 1983, 1985a, 1986), Ronald Dworkin (Matulović 1985b), and John Rawls (Matulović 1996, 2000). Two lawyers contributed to the historiography of earlier legal philosophy: Matija Berljak (1978) and Pavo Barišić (1988, 1996). Matulović edited special issues of periodicals on legal philosophy (Matulović 1985a, 1986–1987, 1988a), a collection of essays on theories of human rights (Matulović 1992), and a collection of papers by John Rawls (Rawls 1993). Matulović also had many excellent translations to his name. Two milestones in this whole development have been (*a*) the recognition that Marxism as a philosophy had ceased to be a viable solution (Puhovski 1984) and no longer made sense (Pokrovac 1987), and (*b*) the reception of analytical philosophy of language and action (Mišćević 1978b, Mišćević, Smokrović and Mrakovčić 1983, Padjen 1984, Matulović 1986, Puhovski 1987).

Several theorists have worked on themes and problems of interest to specialists: the nature of socialist legal systems, especially the secrecy of laws (Padjen 1977); the prospects for the rule of law (Padjen 1989); the *Rechtstaat* (Pokrovac 1989); the legal system in comparison with other systems (Padjen 1991); the incoherence of Marxist theory of property (Padjen 1983), and the post-communist Croatian Constitutional Court's use of that theory to justify the nationalization of social property as an extra-legal fact (Padjen 1992, Petričić 2000);[19] the irrelevance of property to socialism, since socialism is geared towards the production of surplus-power rather than surplus-value (Puhovski 1988); the justification of punishment, with a focus on theories of retribution (Primorac 1980, 1990); a framework for empirical inquiries into the self-images of Croatian judges (Pokrovac 1993); a reconstruction of how the Croatian Constitutional Court operates without a theory of human rights (Padjen and Matulović 1996, 37–53); the revival of Fascism and the Western legal tradition

[19] See Ustavni sud Republike Hrvatske, Rješenje U-I-137/1992. od 24. lipnja 1992. *Narodne novine* 43/92 (See Constitutional Court of the Republic of Croatia, Ruling U-I-137/1992 of June 24, 1992, *Official Gazzette of the Republic of Croatia* 43/92).

(Padjen 1997b); Catholicism and nationalism among Croats from the perspective of the integral theory of law (Padjen 1999a); multiculturalism (Matulović 1998); Catholicism and liberalism (Matulović 1999); the creation of states in international law (Padjen 1997a; Padjen and Matulović 1996, 53–74) and relative and unequal sovereignty in international law (Šimonović 2000a, 2000b). A case apart are the contributions made to cultural zoology, addressing issues such as the legal protection of animals (Visković 1996) and medical ethics (Miličić 1996, 2000).

International lawyers have made contributions to the general theory of law. Juraj Andrassy (1896–1977) argued that state sovereignty is limited by law (Andrassy 1927) and so that it could be attributed even to the League of Nations (Andrassy 1938). While defining the international community as the community bound by international law, he linked the validity of such law to its effectiveness (Andrassy 1976). His students wrote on the sources and interpretation of law (Degan 1963, 1970, 1997, Vukas 1975, Metelko 1982, 1992, Padjen 1988a, 65–89), as well as on the new subjects of international law (Lapaš 1999). Bakotić argued that decreases in substantive sovereignty correlate with increases in the breadth of sovereignty (Bakotić 1972), and he also taught that all legal problems worthy of study are trans-systemic (Padjen and Bakotić 1972). Katičić (1977) explored the trans-systemic functions of private international law.

Some other specialists have also made contributions to the general theory of law, especially with investigations on the general part of that theory, on the sources and interpretation of civil law (Vuković 1953, 1959, 1961), on the general part of criminal law (Bačić 1978), on adjudication as a source of constitutional law (Stefanović 1965, 63–5); on tort theory (Klarić 1991), and on truth in judicial procedure (Uzelac 1997).

However, despite all these investigations, Croatian jurists in the 20th century by and large ignored the theory and philosophy of law and were scarcely acquainted with it (Padjen and Matulović 1996, 9–22).

20.3. 20th-Century Philosophy of Law in Slovenia (*by Marijan Pavčnik*)

20.3.1. The State and the Legal Framework

At the beginning of the 20th century, the territory of the Republic of Slovenia was a part of the Austro-Hungarian Empire, which dissolved in 1918 (see Štih, Simoniti, and Vodopivec 2008). On October 29, 1918, Slovenia became a constituent part of the State of Slovenes, Croats, and Serbs, which on December 1 of the same year changed into the Kingdom of Serbs, Croats, and Slovenes. At the time, Yugoslavia comprised six separate jurisdictions that maintained their legal peculiarities until new legislation was passed. Slovenia and Dalmatia formed the area of Austrian Law, where the amended Austrian Civil Code was in force.

No new civil code was passed in the Kingdom of Yugoslavia. The law in other areas was made significantly uniform, most intensively in 1929 and 1930, when general statutes on substantive criminal law, criminal procedure, and civil procedure were passed. In spite of these efforts to achieve cohesive legislation, the differences from one jurisdiction to the next were such that in order for the supreme court of cassation to perform its functions, it had to establish branches in each of the six jurisdictions. The Supreme Court in Ljubljana was established in 1939.

After the transition from the Kingdom of Yugoslavia to the Democratic Federative Yugoslavia, and then to the Federative People's Republic of Yugoslavia in 1945 and 1946, the principle of legal discontinuity was implemented. What followed was the emergence of extensive legal gaps, but the repealing statute made it possible to fill those gaps by enabling the courts to bring back legal rules from the prewar period, so long as those rules were not in conflict with the new constitutional order, and the case at hand concerned an unregulated matter or involved unregulated legal relations. Under these premises the courts in Slovenia also subsequently followed the rules of the Austrian Civil Code. This applied to the general part of civil law, as well as to property law and the law of obligations, which were mainly regulated by statute in 1978 and 1980.

When the independent state of Slovenia came into existence in 1991, the Constitution laid down the principle of legal continuity. Under this principle, those federal rules that were in force in the Republic of Slovenia at the time the Constitution came into force would apply *mutatis mutandis* as rules of the Republic of Slovenia, on condition of not being contrary to the republic's legal order, and unless otherwise provided by the Constitution itself. Practically all basic laws of the Slovenian legal system have been introduced in this way so far, and by now the system has been rounded out.

20.3.2. The Question of Legal Positivism

Historical experience teaches that legal dogmatics (legisprudence), methodologically specific to the individual sciences of positive law, can never be self-sufficient. Or at least the science must continuously check to see whether positive legal regulation expresses the "normative power of the factual" (*die normative Kraft des Faktischen*). Positive legal regulation is always informed by certain values and sociological backgrounds: The social and value contexts codetermine our understanding of the statutes and act as the social reality in which legal behaviour, legal violations, and legal decision-making unfold. These reasons, along with numerous others, bear out the intuition that the science of positive law must not live in an ivory tower of normativity. If it does, it can easily turn into a dead letter or into an ideological ornament at the service of political authority.

The situation regarding positive legal science is anything but easy, because legal scholars have to study the valid law of the day. The attitude of positive legal science turns unscientific whenever it uncritically defends the positive legal system of the day (apologetic legal positivism), whereas it is scientific when based on the generally accepted tradition of the science in question (e.g., civil law or criminal law). Scientific legal positivism is not in the business of judging the value of (i.e., evaluating) the content of the positive law of the day. The task of scientific legal positivism is rather to study, analyze, and interconnect this content by established scientific methods (see Pavčnik 2005, 17ff.).

Between the two World Wars, Slovenian legal science came under the strong influence of Austrian-German legal positivism, based on the normative-dogmatic method, and legal-comparative, sociological, and axiological methods gradually became important as well. After World War II, the development was not uniform. In some critical periods and certain areas of the law, it was an apologetic legal positivism that to some extent gained prominence. This brand of legal positivism was especially strong in areas of the law that sought to radically break with the traditional Roman-Germanic legal family, a family coextensive with non-socialist law in continental Europe. Those areas were especially worker self-management law, collective labour law, and constitutional law.

It should not be overlooked, however, that legal positivism also served as a *defensive barrier* against the invasion of legal science by political irrationality and despotism. The establishment of several new institutes and departments at the Ljubljana University Faculty of Law fostered the development of a growing number of sciences (such as criminology, sociology of law, political economics, and public administration), which noticeably broadened the knowledge of law. Also important was the development of several new research areas (all comparative, such as comparative commercial law, industrial property law, and market law), and among the classical legal sciences, some (like criminal law) have gained by the addition of new methods (such as the sociological, axiological, and comparative methods). The legal-comparative method in particular has been gaining wide acceptance in all areas of civil law, and in constitutional law.

A specific question is the attitude toward the positive law that was previously valid in the socialist era. It would not be correct to maintain that no critical legal thinkers existed at the time. Responsible theorists were concerned to ensure the quality of their original science even when dealing with the so-called "new" legal areas, and some of these theorists were also very critical. A case in point is the work on social property done by Alojzij Finžgar (1902–1994): While not rejecting the concept of social property per se, this astute expert on civil law constantly clarified and analyzed that concept by drawing on the instruments of civil law, and especially of property law. The final result is well-known in Slovenia: Although social-property law is no longer valid law

in the country, Finžgar's theory stands, and it can also explain how social property can be transformed into other forms of property (Finžgar 1992, 5ff.).

20.3.3. Perspectives on the Philosophy and Theory of Law

The development of the philosophy and theory of law in Slovenia is closely bound up with the Law Faculty of the University of Ljubljana, which was founded in 1919. The first dean of the faculty was Leonid Pitamic (1885–1971), who gained international fame as a follower and critic of Kelsen's pure theory of law. Pitamic's fundamental contribution to the pure theory was his treatise *Denkökonomische Voraussetzungen der Rechtswissenschaft* (Economy of thought as a precondition of legal science: Pitamic 1917). In the foreword to the second edition of the *Hauptprobleme der Staatsrechtslehre* (Kelsen 1923c), Kelsen explicitly emphasized that Pitamic had importantly contributed to the question of how to define the basic norm as a presupposition of legal cognition.

From the very start, Pitamic doubted that the theory of law could take purity as its object. He instead based law on the facts of being (on the is, the German *Sein*), in which law is realized as a norm, and which through the mediation of the language influence our understanding of the law. He also maintained that the inductive-empirical method is compatible with the deductive-normative method, but that we must be careful not to "conflate" the two. If we allow these two methods to "support each other," we can, as Pitamic put it, "move closer to what we must strive for by all—with the best intentions *all*—means: *cognition*" (ibid., 367; my translation).

The final result is that Pitamic's understanding of the basic norm differs fundamentally from that of Kelsen, who draws a clear distinction between the concepts of morality and law. Pitamic takes another path, and as concerns the question of what it is to have an understanding of law, he appropriately connects the positive law and the natural law conceptions of the nature of law. The essential elements of law are identified by him as consisting in an order coupled with human behaviour. These elements are interdependent, in that an order is dependent on legal norms regulating external human behaviour. So it is an essential point that law ceases to be law when its norms cease to be at least *grosso modo* effective (Pitamic 1956, 192–3). Moreover, not just *any* order can function as an element of law: The condition is that it be an order prescribing "only external humane behaviour, while not prescribing or allowing its contrary, namely, 'inhumane behaviour,' for it would otherwise lose its legal standing" (ibid., 194; my translation).

However, a legal norm "ceases to qualify as law when its content seriously threatens the existence and social interaction of the people subject to it" (ibid., 199; my translation). But in order for this state of affairs to come about, it will take more than just any kind of egregiousness in the content of the legal norm

(e.g., unreasonably high taxes): There needs to be "a conspicuous, obvious, or severe case of inhumanity" (Pitamic 1960, 214; my translation), such as the mass slaughter of helpless people. There has to be a "crude disruption" (such as the extermination of the members of another race), something interfering so forcefully with law as to negate its nature as law (Pitamic 1956, 199; my translation).

His most important treatises written in German were translated into Slovenian and published in both languages as *Na robovih čiste teorije prava / An den Grenzen der Reinen Rechtslehre* (On the fringes of the pure theory of law: Pitamic 2005).

Pitamic also contributed to the theory of the state. In his book *Država* (The state: Pitamic 1927) he developed a normative theory of the state. This work was slightly revised and expanded for its English edition (Pitamic 1933). Pitamic defined the permanent core of the state as "a juridical organization of men" (ibid., 27). At the core of the state we find, once again, legal norms that tell us which territory, people, and organs are to be considered as belonging to the state, and which organizations fall outside that domain: The state is thus "a juridical organization of men which is (1) established on a certain territory, which is (2) subject directly to international law, but which has (3) authority over all juridical organizations on its territory save those which depend directly upon international law" (ibid.).

Between the two world wars, the philosophers of law active in Ljubljana were Djordje Tasić (1892–1943), Evgenij Spektorskij (1875–1951), and Boris Furlan (1894–1957). Tasić—a Serbian professor who taught in Ljubljana from 1922 to 1930—is best known for his encyclopedic *Uvod u pravne nauke* (Introduction to the legal sciences: Tasić 1941). Spektorskij—a Russian professor who taught in Ljubljana from 1930 to 1945—wrote a two-volume work called *Zgodovina socijalne filozofije* (History of social philosophy: Spektorskij 1932–1933), which was translated into Slovenian. Furlan was professor in Ljubljana from 1930 to 1941 (cf. Kušej 1958); after World War II he resumed teaching until May 30, 1947, when he was removed from his post for political reasons. Furlan's most important papers are collected in the book *Problem realnosti prava* (The problem of law's reality: Furlan 2002). Like Arthur Kaufmann (cf. A. Kaufmann 1982), Furlan accepted the view that analogy was an essential element of law: "It is not the principle of absolute identity that applies to law but rather that of similarity, stated in the gloss under the formula *per similibus ad similia*" (Furlan 1933–1934, 46; my translation). Here Furlan proceeds from the premise that no two things can be absolutely identical in reality, and that the same therefore applies to law as well. It follows that to some extent we always have a similarity between the reality of life, and what is normatively provided (by law), that is, between the relevant *factual* elements, and the *normative* constituent elements applicable to the former. That means that the contents of a legal decision can only be justified by setting out persuasive arguments demonstrating how factual and normative states of affairs have been

construed as to their meaning within the legal framework, and how legal consequences are made to flow from the normative state brought to bear on the factual, and so how those consequences have been concretized. An optimum legal decision is achieved when the closest fit is achieved between the two states, that is, when the factual state is subsumed under the normative state to which legally relevant facts (the factual state) correspond most closely (see ibid., 46; A. Kaufmann 1982, 18).

An important link between the era before World War II and the first decades after can be found in the work of Gorazd Kušej (1907–1985). He was among the best professors of legal theory in Slovenia, and a lecturer and supervisor for forty-three years. He participated in shaping Slovenian legal culture, developed a normative understanding of law, and examined its social background. In the period between the two world wars he was already drawing attention to the sociological background of law. He defined law as a permanent, supreme, and inviolable socially binding will determining the permissible aims of the individual subordinate wills and aspirations and the permissible adequate means to achieve those aims (Kušej 1931–1932, 265ff.). His most important work of legal philosophy is *Uvod v pravoznanstvo* (Introduction to jurisprudence: Kušej 1960), which was published in five revised editions (the last one in 1976).

After World War II, especially in the first decades, several discussions were held concerning the nature and importance of Marxist philosophy of law and the state. The orthodox school of thought favoured a self-sufficient Marxist theory of law and the state without any room for any special philosophy of law. Anton Žun (1917–1978) argued that the evaluative element of law (especially the theory of justice) belongs to the philosophy of law, the factual element and/or relation to the sociology of law, and the normative element to the legal science (Žun 1968, 225ff.). The most important criticism of law in the socialist era was contributed by Anton Perenič (1941–).The law's distinctively legal (normative) structure is not something that intrudes upon facts; rather, the need for legal regulation is shaped by human thought as a part of human practice: When human thought takes the form of a specific social norm, it returns to facts and gives them legal meaning (Perenič 1981, 66ff.).

Over the last two decades several monographs have been published dealing with specific groups of problems relevant to legal theory and legal philosophy. Marijan Pavčnik has written monographs about interpretation and argumentation in law. In his view, the judge's decision is a value synthesis assessing the normative starting point with regard to the factual starting point, and vice versa. Pavčnik has analyzed the elements of the normative concretization of the statute, i.e., the elements and arguments making sure that legal decisions are sound and substantiated (Pavčnik 1991, 1993). Furthermore, the legal practitioner (e.g., the judge) is always beyond legal positivism. Legal rightness is a necessary and initial element of law (Pavčnik 1997, 17ff.). Legal rightness, at least in our day and age, is measured by looking at whether the law protects

basic human rights and whether the state operates under the rule of law and the principles of democracy (ibid., 461).

Two books by Boštjan M. Zupančič (Zupančič 1990, 1995) deal with the questions of the rule of law and of legal culture. Zupančič is especially interested in the discourse on justice as a way of life: "*We each have our own way of being just and truthful, yet none of us can achieve adulthood and maturity* without having experienced *truth and justice directly*" (Zupančič 1990, 6; my translation).

Also deserving mention are Cerar's book on the multidimensionality of human rights and duties (Cerar 1996) and the collective work on fundamental human rights titled *Temeljne pravice* (Fundamental human rights: Pavčnik, Polajnar-Pavčnik and Wedam-Lukić 1997).

In the 1990s came the first comprehensive treatment of legal theory in the Slovenian language (Pavčnik 1997). The work addresses the fundamental concepts and problems dealt with by the theory of law: The legal norm, the legal relation and its elements (rights, duties, the legal subject, the object of a legal relation), legal acts (i.e., acts *in* the law and *of* the law), the sources of law, gaps in the law, the application and interpretation of the law, the systematization of law, and main theories about the nature of law. The ambition of the monograph is to contribute to our understanding of law. The factual starting point for a legal decision can be of any kind; its normative starting point can be of any kind. But the point *connecting* the two, and the legal decision itself, always lies in human acts for which one is responsible—and it is in that connecting point that law in the fullest sense of the word is created. Commentators have described the work as "a new Slovenian synthesis of the theory of law" (V. Simič 2000, 234; my translation) and as an original contribution to discussions on the philosophy of law (see Holländer 1999, 139ff.).

Important contributions to the philosophy of law have also been made through a number of doctoral theses. Worthy of mention in this regard are those by Miro Cerar, *(I)racionalnost modernega prava* (The [ir]rationality of modern law: Cerar 2000); Marko Novak, *Delitev oblasti: Medigra prava in politike* (The separation of powers: An interplay of law and politics, M. Novak 2001); and Aleš Novak, *Narava in meje zavezujoče moči prava* (The nature and limits of the binding force of law: A. Novak 2003).

20.3.4. Closing Remarks

It would be impossible, within the allotted space, to enter into individual works in any greater detail than has been done (see also Vilfan 1968 and Pavčnik 1989). Scope of Slovenian philosophy and theory of law is commensurate with the size of Slovenia as a central-European country. The works in question analyze the fundamentals of the issues mentioned and presented. I should also like to add that Slovenian philosophy and theory of law are well

informed about what is happening in the world (especially in continental Europe and in the Anglo-American debate). It is important as well that some foreign works that shaped the 20th century were translated into Slovenian. Among these are Gustav Radbruch's *Rechtsphilosophie*, Hans Kelsen's *Reine Rechtslehre*, H. L. A. Hart's *The Concept of Law*, and various works by Ronald Dworkin—including *Taking Rights Seriously*, *A Matter of Principle*, and *Law's Empire*—edited by Aleš Novak.

20.4. 20th-Century Bulgarian Philosophy of Law: From Critical Acceptance of Kant's Ideas to the Logic of Legal Reasoning (*by Vihren Bouzov*)

20.4.1. Bulgarian Philosophy of Law before 1944

In Bulgaria, there exist no more than a handful of studies on the development of the country's own philosophy of law and its accomplishments. These studies are far from comprehensive, even as a group: Only brief outlines of that development have been published, dwelling on specific ideas put forward by representative thinkers active at various times (cf. Popov 1970, Nenovski 1998). My analysis here is an attempt to bring out the main through-line in the development of Bulgarian philosophy of law today.

A proper account of Bulgarian philosophy of law in the 20th century requires an attempt to find, on the one hand, a solution to epistemological and methodological problems in law and, on the other, a clear-cut influence of the Kantian critical tradition. Bulgarian philosophy of law follows a complicated path, ranging from acceptance and revision of Kantian philosophy to the development of interesting theories on the logic of legal reasoning.

The development of philosophy in Germany exerted a major influence on the nature of philosophical discussions in Bulgaria before World War II: That was an important aspect of the broader cultural and political influence that Germany had on Bulgarian social life, as well as on its political development and legal system.

During that period, philosophical life in Bulgaria was overwhelmingly dominated by German idealist philosophy (Hegelianism and Kantianism), and in particular by the dualist philosophy of Johannes Rehmke (1848–1930), as interpreted in an original way by Dimiter Mihalchev (1880–1967), a renowned Bulgarian philosopher (Rehmke 1923, Mihalchev 1933). After 1951, these philosophical interests were shelved at the country's universities and at the Bulgarian Academy of Sciences—all of them crushed under the ideological steamroller.[20] In the first half of the 20th century, the analytic orientation, and

[20] From 1944 to 1949, Bulgaria became a communist country, once it destroyed the multiparty system and established a planned state economy. Marxism was imposed as the official ideology in philosophy and politics.

especially logical positivism, had no following in Bulgaria: It only drew criticism (Bouzov 2003a, 558–9).

Indeed, it is possible to speak of the existence of original ideas and genuine achievements in Bulgarian philosophy of law from the first half of the 20th century. The development of significant studies in Europe and beyond was dominated by realist and natural-law theories.

Historically, the first Bulgarian legal scholars after the country was liberated from Ottoman rule in 1878 graduated from German universities. Philosophical and methodological discussions on law in the country were initially dominated at that time by legal positivism, not in original interpretations. Its main opponent in Bulgaria was Tseko Torbov (1889–1987). As a philosopher, a jurist, and a university professor of law, he was the most prominent follower of Kantian philosophy in the country and was the first translator of Kant's works, developing as well his philosophical theory of law. Torbov studied law and philosophy at the University of Göttingen, Germany, where he graduated in 1929. While studying there he became close to Leonard Nelson, and their longstanding friendship is described in his memoirs (cf. Torbov 2005). In Germany Torbov defended his doctoral thesis in philosophy in 1929. His translations of Kant's basic works became universally known across Bulgaria and Germany in the 1970s. In 1973, he became an honorary member of the Kantian Philosophical Society in Mainz, Germany. A honorary gold doctoral degree in law was conferred on him by the University of Göttingen in 1974 (see Torbov 1991, 5–6).

Torbov's interpretation of the essence of natural-law theories and legal positivism is indeed fairly original. He contends that natural-law theories proceed from "rational or philosophical knowledge" in their seeking to formulate law, whereas legal positivism proceeds from empirical knowledge, looking to account for the de facto force of a given social system in action (Torbov 1992a, 13). So, in interpreting the nature of the principal discussion in contemporary legal philosophy, he starts from an epistemological point of view, understanding that discussion as predicated on an initial choice between rational and empirical knowledge. He draws the conclusion that legal positivism cannot arrive at a theory or philosophical conception of law, because it cannot reveal the properties of its development (ibid., 15–6).

Torbov further developed Kant's theory of law in a systematic way. He criticized Kant for his formalistic interpretation of the main principle of law, a principle that Kant borrowed from the classical school of natural law (Torbov 1991, 47): Kant, he argued, failed to extract the main principle of juridical law from the meaning of *moral* law.

Torbov drew a line of demarcation between the formal theory of law and its material theory. He thought that it is the task of a philosophical theory of law to set out and call for certain requirements adequate to the legal circumstances of a given society. In his view a system of law should be based on the practi-

cal necessity of mutual restrictions in the sphere of freedom among persons bound by mutual relations. The formal theory of law incorporates an analysis of the *form* of law, a form given by its correspondence to requirements or principles formulated on the basis of analytic and synthetic principles determining the nature of law. The latter principles are those of equality before the law and of the legal distinctness and autonomy of subjects of law (juristic persons): These principles make up the framework of relations among such subjects, in turn understood as rational beings with corresponding interests and obligations. The formal theory of law also formulates the principle of legal objectivity, offering as well an account of the possibility of imposing that objectivity on life. According to the principle of legal rigorism, the need for legal obligation is not determined by any goal. And according to the principle of legal indeterminism, the application of law covers a sphere of values outside of the realm of law (ibid., 80–4).

The synthetic principle, forming the basis of Torbov's formal theory of law, postulates the existence of juridical law, a view set out in Kant's *Critique of Pure Reason*. According to Torbov the minor premises of the formal theory of law are given by some subsumptions in which there are no elements of the essence of legal law, nor are there any empirical elements. These premises are based on the idea that legal law only pertains to relations among rational beings. The first subsumption deriving from those premises is the one defining the need to express thoughts by means of language; the second subsumption posits the need to provide for a definite distribution of possessions. The possibility of making mistakes in the process by which law is known is itself a subsumption, and in that possibility lies the difference between juridical law—which belongs to the practical realm—and the laws of nature. The possibility of making mistakes for lack of good will is also a subsumption stating a thesis of the same type (ibid., 84–8).

In action, the main principle of law and the subsumptions set out above lead Torbov to the formulation of the four postulates of his formal theory of law. These postulates are as follows: (1) Rational beings must recognize a single compulsory language for use in their mutual relations; (2) possessions must have a distribution based on a definite scheme; (3) rational beings must accept the resolution of legal disputes on the basis of public law as applied by courts of law, where decisions are made under the provisions of that law; (4) legal security must be guaranteed, meaning that society must enforce the law so as to thwart the intentional violation of laws (ibid., 90–3).

Torbov's material theory of law, as distinguished from the formal one, is concerned with determining the *content* of legal law. The theory is characterized in the first place by the idea that justice is a right, and that as such it defines a genuine rule of law. Justice defines a rule under which individual liberties are delimited in their interrelationships; this means that everyone is equal and that no one can claim any special privilege. The dictate of justice is

an expression of the operation of juridical law; it is of an *a priori* nature as the foundation of law (Torbov 1992b, 217–41). The postulates of the material theory of law define an obligation of people to govern the form of their relations by means of contracts; it also flows from these postulates that people have to comply with those provisions of law under which possessions are distributed. According to these postulates, people have to accept the distribution of possessions and the principle of equality, as well as the principle of redress as the foundation of penal law (Torbov 1991, 97–102).

The philosophical conception put forward by TsekoTorbov is a brilliant reaction to the spirit of the legal positivism that was holding sway in legal science and legal practice in Bulgaria before World War II. It marked a turning point, when an authentic critical tradition began to take hold in legal and philosophical debate in the country.

Mention should be made here of the ideas developed by Venelin Ganev (1880–1966), a leading legal theorist before World War II, since he exerted a remarkable influence on the mainstream of Bulgarian legal philosophy, irrespective of his affinity for legal positivism and normativism. Having graduated in philosophy, law, and music from the universities of Leipzig and Geneva, he returned to Bulgaria and taught philosophy of law at St. Kliment Ohridski University of Sofia over a ten-year period. He was a cabinet member, then Bulgarian ambassador to Paris, and then a member of the Council of Regents until the dissolution of the Bulgarian monarchy in 1946. His two-volume *Uchebnik po obshta teoria na pravoto* (Textbook on the general theory of law: Ganev 1990), published in 1932, contains a relatively comprehensive definition of the philosophy of law and an original conception of the nature of law as a whole.

In contrast to many legal theorists, Ganev drew a distinction between the philosophy of law and the general theory of law, a distinction based on their object and scope. According to him, a philosophical analysis needs to be aimed at investigating "the place of law in the whole of the existent, the first cause of its genesis and its givenness, and its ultimate nature" (ibid., 9; my translation), and it must also seek to explain its meaning in the context of human life, truth, justice, and the good. The general theory of law, by contrast, does *not* take on this task: It only seeks to achieve a synthetic unification of the special and the general knowledge of law; this amounts to saying that the general theory of law is concerned with studying the legal phenomenon in its most general aspects (ibid., 9–10).

Ganev developed an original conception of the nature of the legal phenomenon as a unity of (*i*) legal facts, (*ii*) legal consequences, (*iii*) the subject and object of law (i.e., the persons and things that law applies to), and (*iv*) the legal norm. He does not equate law and the object of the general theory of law with legal norms, as legal positivism does; rather, he equates them with the relations among legal subjects (the juristic person), defined in sociological and naturalistic terms, or with certain psychological or value elements. He holds that these

elements are all "normatively processed" in the legal phenomenon. He therefore espoused a "definite eclecticism" (Nenovski 1998, 37; my translation), drawing on the different traditions in legal philosophy to identify the basic elements of the legal phenomenon and bring out their interrelations. Following the Kantian tradition, he held that one can define the object content of legal reality by methodological study; he did not see much value in metaphysical or speculative projects. In light of this integrative context we ought to understand his definition of legal reality as "mentally sociological," by which he meant to refer to a "normative sociological reality" (Ganev, 1990, 13; my translation).

Vitali Tadjer, a prominent legal theorist from the communist period in Bulgaria, rightly remarked that Ganev's works set "a very high, perhaps *the* highest, standard" in Bulgarian legal theory (see Tadjer's introduction to Ganev 1990; my translation). Ganev's ideas importantly influenced the concepts of law espoused by an entire generation of Bulgarian legal theorists who held academic positions in the age of totalitarian communism: Prominent among these theorists were Neno Nenovski, Vitali Tadjer, and Zhivko Stalev (see Nenovski 1983, Tadjer 1998, Stalev 1997). All too regrettably, however, the general theory of law was soon to be removed from university curricula, beginning in 1949, when it was replaced by Marxist theory of state and law.

20.4.2. Bulgarian Legal Philosophy and General Jurisprudence from the Communist Period and after 1989

The idea of bringing up for discussion the conception of the multidimensionality of law as a complex ontological phenomenon was put forward for the first time by Zhivko Stalev (1912–2005), an outstanding Bulgarian legal theorist and practitioner and head of the Constitutional Court in his lifetime. According to him, law exists in four different types of being (four ontological dimensions): He thus identified normative, social, material, and psychical law, ascribing priority and a decisive role to the psychical dimension. The ontological existence of a legal norm is only existent in the human mind and has a physiological correlate, too (Stalev 1997, 18-9). His development of a modernized version of legal realism backed by a psychological interpretation can be described as his most important contribution to the theory of law.

The idea of the multidimensional nature of law is well known in the Polish psychological school as well: It can especially be appreciated in the works of Jerzy Lande, a proponent of the conceptions put forward by Leon Petrażycki (Wolenski 1999, 4–5; Lande 1959), as well as in works by other Polish theorists of law.[21] Lande espouses the "cherished" positivist thesis that legal norms cannot be formulated on the basis of factual statements: He, just like some of his followers, views the law as a normative system and a socio-psychological

[21] On Lande see Chapter 19 in Tome 2 of this volume.

phenomenon. Stalev tries to develop a more general conception than that of traditional psychologism. Much like the German legal philosopher Georg Jellinek, Stalev gives a quite broad interpretation to what he calls "the normative force of facts" (Stalev 1997, 36; my translation), for he understands that force to mean that the normativity of law is dependent on the external facts of objective reality. But he also goes on to *list* those facts, classifying them as natural (geographical, climatic, ecological), biological (genetic heritage, instincts), psychical (different types of belief), and social. Other dimensions of law (the psychical and the social) can also influence its being normative: These dimensions are no doubt available in the world of existence. The normative force of facts results from a totality of different causal relations that hold between the facts of objective reality and the normativity of law, namely, its being normative (ibid., 36–7).

In Bulgaria, there exists a definite tradition that attempts to fashion the conception of causality in legal and philosophical thought into a comprehensive interpretation of law. In the 1960s, Venetsi Buzov (1906–1983), a professor at the Institute of Legal Sciences of the Bulgarian Academy of Sciences, sought to develop a theory of criminal law premised on Marxist postulates. According to him, a legal conception of causality must include not only physical causation but also psychological dependencies, such as the intentionality behind action. In criminal law this causal link also covers (*i*) an act, (*ii*) its consequences in a situation of social danger, and (*iii*) the conditions of causation, discoverable in the characteristics of the *corpus delicti*. The functioning of this link can be understood taking into account the influence of psychological factors (cf. Buzov 1964, chap. 2).

Mention should be made here of the work of Neno Nenovski (1934–2004) for his attempt to develop an axiological theory of law (cf. Nenovski 1983). Nenovski was a founding member of the Bulgarian section of the International Association for Philosophy of Law and Social Philosophy (IVR); in 1985, he became its head and would carry on in that role for many years to come. It was his ambition to define the essence of law as a mental phenomenon and its values as criteria of law itself. According to him, values are the "ideals" of law and are defined by specific social needs and interests. He championed the subjectivist thesis that values are always rationalized: No value exists outside consciousness. Value, he thought, is a form in which reality is reflected, and he defined values as the point of view of different interests.

The years of democratic transition in Bulgaria after 1989 saw a significant positive development in Bulgarian philosophical and legal thought, since it did away with the ideological tutelage of Marxism, abandoning its dogmas and postulates. As a result, departments of law and philosophy at various national universities now offer courses on the philosophy of law and the logic of legal reasoning, and the basic grounding in Marxist theory of law and the state has been replaced with training in the general theory of law. And with the growing

influence of English across the world there has developed a growing interest in familiarizing with the analytic tradition and with analytical methods in philosophy.

Joint work and cooperation among philosophers and legal theorists in discussing on problems in the philosophy and theory of law is a new phenomenon of the past few years. If this process develops, the works of legal theorists will no longer be dominant in legal philosophy. I would think it reasonable if, in the interest of advancing knowledge at large, the textbooks used at secondary schools and universities discussed the achievements of Bulgarian philosophers; and in the same spirit an effort could be made to bring their work to a wider international audience, though I should not underrate the role these textbooks played in the 1990s in the teaching of legal philosophy at secondary schools: Some interesting ones came out during that time, along with some interesting programs (see Stojanov 1993, Yotov 1994, Bouzov 2001). At secondary schools, legal philosophy has now been replaced by courses on ethics and on the fundamentals of law.

In 2004, the Union of Jurists and the Institute for Philosophical Research of the Bulgarian Academy of Science held a joint conference titled *Truth and Justice in the Criminal Trial*. It was its aim to bring into focus and do away with the existing tension between these two concepts—truth and justice—and to define and accept a procedural theory for the legal process during Bulgaria's democratic transition (cf. Velchev 2006).

Two trends can tentatively be identified in the development of Bulgarian philosophy of law and general jurisprudence:an analytic trend and a hermeneutic one. The first of them can be related to the analytic tradition in current philosophy of law: In it one can trace out the influence of legal positivism and institutionalism, with the focus of theoretical attention being on problems involving normative systems and legal epistemology. The hermeneutic trend is instead focused on legal discourse and legal interpretation.

Included in the first research field are the theory of norms, the logical study of normative systems, and some epistemological problems in law. In contrast to hermeneutics, these investigations are largely based on linguistic and logical methods. Daniel Vulchev (1962–), a lecturer in the theory of law at St. Kliment Ohridski University in Sofia—as well as a good interpreter of European philosophy of law (cf. Vulchev 1999) and a former minister of education and science from 2005 to 2009—tried to define the place of the legal norm as a basic interpretive schema through which to gain legal knowledge. He argues that the legal norm is not a sufficient criterion of law: The law can be considered a spontaneously developing and relatively centralized legal order understood as a complex social organization. In support of his conception, he points to the withering away of the national state and the erosion of the international legal order in the globalized world. As concerns legal positivism, he puts forward the thesis that the idea of justice as an ideal of law, rich in content and value,

needs to be replaced with peace as a formal ideal effected by consensual resolution of social conflicts (cf. Vulchev 2003).

Studies on the concept of the normative system can be considered and assessed in light of various theoretical attempts to develop a comprehensive theory of legal norms. Vihr Kiskinov (1953–), a professor of legal informatics at the University of Sofia, holds that normative systems exist in an individual's consciousness. As bearers of information, such systems have definite structural qualities. Legal knowledge is imparted through a knowledge of normative structures (cf. Kiskinov 2007). Rossen Tashev (1953–), a leading specialist in the theory and philosophy of law at the Department of Law of the University of Sofia, upholds a dogmatic theory of legal interpretation: In two books (Tashev 2006, 2007) he lays out a systematic theory of law within the conceptual framework of legal positivism. He thinks that legal interpretation had specific characteristics of its own, and that a doctrinal legal theory specific to it should accordingly be brought to bear on it. Tashev puts forward an original procedural understanding of legal interpretation starting out from the relevant Bulgarian tradition (cf. Apostolov 1946, Stalev 1997). The interpretation and application of law involve both art and method. He draws a dividing line between linguistic methods of interpretation and logico-systematic ones, each governed by its own set of rules (cf. Tashev 2007). Reasoning along similar lines is Tencho Kolev (1949–), professor at the Sofia University, Department of Law, who maintains that in order for a legal decision to be fair, it must be justified, and this shows the importance of truth in judicial investigation (Kolev 2011).

Svetut na normite (The world of norms: Bouzov 2006), one of the books published by Vihren Bouzov (1966–), could well be indebted to the same tradition. It presents a grounded analysis of the achievements of the contemporary deontic logic and the theory of norms with an emphasis laid on legal norms. In it Bouzov sets out conclusions about the non linguistic theory of norms of Jan Wolenski (1982, chap. 3), and about a possible way in which this theory can be applied to axiological discourse.[22] In Bouzov's view, the problems of the deontic logic relative to attempts to build up an adequate theory of norms can be resolved by means of their consideration in a wider context of decision logic. Norms are decisions by a normative authority (Bouzov 2004). In *Scientific Rationality, Decision and Choice* (Bouzov 2003b), Bouzov argues that this conception can be a methodological means by which to explain the nature of the norms of scientific rationality. Scientists make decisions to accept or reject rational norms when such decisions fall within their own understanding of the aims and problems of science, as well as within the understanding accepted by their own scientific community (ibid.). The specific characteristics of legal discourse are an argument in favour of detaching the logic of legal

[22] On Wolenski see Section 16.3.3 in this tome.

reasoning from applied logic. The logic of legal reasoning calls for systematic development of its formal, methodological, and epistemological aspects (cf. Bouzov 1999, 2008).

In Bulgaria there exists a strong tradition in the informal analysis of legal discourse from a hermeneutical and a phenomenological standpoint. As mentioned, this is the second line of inquiry in the philosophy and general theory of law. The nondogmatic study of law in Bulgaria is in fact rooted in a book by Mihailina Mihailova (1937–) titled *Pravoto: Smisl, senki, protivopolojnosti* (Law: sense, shadow, contradictions: Mihailova 2001). In it she says that law " has senses following in succession" (ibid., 78; my translation). Zhana Sharankova's (1960–) book *Juridicheskoto mislene: Proekt za interpretativna teoria* (Judicial thought: A project for a theory of interpretation: Sharankova 2001), published in 2001, has been described by Neno Nenovski as the first comprehensive study of the development of judicial thought in Bulgarian legal literature. Sharankova is a jurist and a teacher, and this book carries forward and expands on her philosophical dissertation of 2000. She does not accept the dogmatic understanding of legal interpretation as a set of procedural rules; rather, she views legal hermeneutics as a method of legal thought whose function is to help us further our understanding the law. A similar view has been advanced by Luchezar Dachev (1952–), a professor at the University of Sofia, who depicts legal dialogue as a meeting and mutual relationship of positions occupied by subjects of law with respect to the objects of law. Law develops dialogues by means of accepted rules; these rules are a multitude of models of discourse. Dachev considers Kelsen's positivist ideas anachronistic. In his view, the law is not the totality of norms, but the totality of discourses (Dachev 2004).

The ideas presented above reflect a great change in the development of contemporary discussions on the philosophy of law: They reflect the shift to the so-called dialogical view of law. On this view, law is considered a dialogue, a tool with which to resolve social conflicts consensually (cf. Morawski 1999, chap. 4). These conceptions can be instrumental to understanding law in the present day, when great social change is underway and the world is becoming increasingly globalized.

In conclusion, it is fair to say that the topical problems in the philosophy of law and general jurisprudence have now found an important place in the theoretical discussions of Bulgarian jurists and philosophers. But one would hope that these intellectuals could make themselves and their achievements and original ideas known to a wider public by means of publications in foreign languages and by an effort to expand cooperation among researchers on an international basis.

20.5. Legal Philosophy and Theories of the State in 20th-Century Romania (*by Adrian-Paul Iliescu and Simina Tănăsescu*)

20.5.1. Philosophy of Law

The philosophy of normative fields (legal philosophy, political philosophy, moral philosophy) was in general visibly underdeveloped in Romania during both the 19th and 20th centuries. As late as 1936, one of the few Romanian legal philosophers acknowledged that his field had "until recently" been "almost completely neglected" (Speranţia 1936, 250; my translation). Entire tracts of legal-philosophical reflection, such as the British and American philosophy of law, remained essentially unknown to Romanian theorists: Major figures like John Austin or Oliver Wendell Holmes, and classic books like John Chipman Gray's *The Nature and Sources of the Law*, were almost completely unknown in this part of Eastern Europe. Traditionally, the dominant influences on legal thought were German and French, and Kant undeniably was the best-known classic. After World War I, an Italian influence was added to the older ones, namely, Giorgio Del Vecchio, perhaps the most widely known foreign legal philosopher in Romania before 1945.[23] Of course, after World War II, ignorance in the philosophy of law deepened, as Marx, Engels, and Lenin were officially proclaimed to be the main sources of legal wisdom.

One striking feature of Romanian discourse in the philosophy of law is its heterogeneity. Even the most important authors—Mircea Djuvara (1886–1945), Eugeniu Speranţia (1888–1971), and Vespasian Pella (1897–1952)—frequently admix legal considerations with epistemological, anthropological, historical, or sociological ones. They often speak as if there was an unproblematic and unquestionable continuum between anthropology, the social order, and the legal order, assuming that epistemological ideas and sociological facts can directly establish the truth in matters of legal philosophy. Kant's principles in the philosophy of knowledge and Henri Bergson's theses (in Djuvara's case) and Émile Durkheim's or Gabriel Tarde's ideas (in Speranţia's case) are taken to be in themselves capable of justifying conclusions in the philosophy of law. Differences between legal concepts and various epistemological or sociological concepts, and between factual and normative matters, do not seem to have much relevance in this kind of discourse; sometimes it is explicitly claimed that "normativity derives from the laws of Life," i.e., from the empirical laws of human life (Speranţia 1936, 10–1; my translation). Superficial analogies—like "physics deals with relationships between bodies, law with relationships between persons" (Djuvara 1939a, 23; my translation)—lead to superficial analyses simply meant to support the prestige of law (no less scientific than "natural science").

[23] On Del Vecchio see Section 11.2.1 in this tome.

The disappointing result is that even the most prominent works abound with general and vague formulations, like "justice is as objective as nature" (Djuvara 2005, 167; my translation) or "life creates norms" (Speranţia 1936, 12; my translation), which are supposed to derive from undeniable descriptive accounts of "human experience," "historical evolution," or "social order." The most problematic topics are often settled by decree: "Good and Evil exist as principles in themselves, like day and night" (Dissescu 1915, 183; my translation). In most cases, conceptual controversies are not understood to spring from real theoretical difficulties or dilemmas, but are rather understood as results of mistakes made by this or that author; the feeling one gets is that in the end there is nothing deeply problematic in the field. Conceptual argumentation is either missing or else very superficial, and conclusions are very often eclectic if not incoherent. Thus, Mircea Djuvara sees nothing problematic about claiming, on the one hand, that legal truth is as unique and objective as truth in natural science (Djuvara 2005, 317) and, on the other, that "there are no universal legal norms for a people, but only norms and institutions" (Djuvara 1941, 57; my translation). Djuvara seems to agree both with Kant's universalism and with von Savigny's historicism, without having any concern about the possible incompatibility between these two paradigms. The distinction between "rational law" and "positive law" is mentioned, but it tends to be forgotten when conclusions are drawn. Extensive and uncritical recourse is made to speculative notions like "the spirit," "human reason," and "the natural law of evolution." In many cases, efforts are dedicated to defending a certain cause, rather than to analyzing or constructing arguments; for instance, Speranţia insists on defending the position that the true legal order must be founded on the Christian creed: "The Christian creed [...] includes and presupposes some great imperatives inevitably acknowledged and adopted by all reasonable beings," and consequently "true 'valid Law' cannot be conceived in the absence of sincere religious belief" (Speranţia 1942, 14–6; my translation). In general, the authors' ideological stance is quite visible; in most cases (at least until 1945), they aimed at defending natural law against legal positivism (the former being the dominant tradition in the area: see Varga 2000, 17), conservatism against liberalism, and authority against what they considered to be certain regrettable anarchical tendencies. Finally, one shortcoming of almost all Romanian works in this field is that trivialities abound: Witness "outside society there can be no law" (Djuvara 1941, 55; my translation); "life cannot be sustained regardless of conditions" (Speranţia 1936, 10; my translation); or "war is not a fatality" (Pella 1928, 84; my translation).

Surprisingly enough, the best-known contributions of Romanian legal philosophy are to be found in the field of international law. Nicolae Titulescu (1882–1941), former president of the League of Nations, is well known for his contributions to the definition of the concepts of aggression and aggressor and to international activities in support of collective security, the international le-

gal order, and pacifism. Unfortunately, all these contributions, no matter how remarkable from a diplomatic point of view, are not very significant from a theoretical or conceptual one. For instance, the definition of the concept aggressor, though perhaps useful for some practical purposes, provides little more than an enumeration of undesirable international acts, and in itself it is of little philosophical interest.

More interesting as a thinker, though not necessarily much more profound, was Vespasian V. Pella (1897–1952), who is hailed in Romania as the founder of international penal law. In 1919, Pella published an unusual work, titled *Delicte îngăduite* (Tolerated delicts: Pella 1919), that makes very obvious the characteristic weakness of the legal-philosophical arguments usually advanced in Romania. For instance, Pella argues that suicide should be deemed an offence, simply because "the right to life is natural" and "violating it is the gravest offence against the natural order" (ibid., 70; my translation). He simply finds "revolting" the fact that attempts to commit suicide normally go unpunished, and does not feel the need for more-sophisticated inferences. In his argumentation, vague formulas like "man is slave to Life" (ibid.; my translation) are used in all seriousness. Pella is best known for his campaign in favor of outlawing war, a campaign based on the premise that aggressive wars are simply crimes that should be imputed to states. But, no matter how good his intentions were, the arguments used were very poor. Thus, Pella thinks that states can and should be charged for starting wars simply because (*a*) states are real beings, having continuity over time; (*b*) they are "palpable"; and (*c*) they have "souls" (*Volksseele*), as Tarde and other scientists have "demonstrated" (Pella 1925, 181–2; my translation). Hans Kelsen has described Pella's argument as "a hopeless attempt to demonstrate that the state as a juristic person is not a legal fiction, but a real being, a super-individual organism" (Kelsen 2000c, 73). Even if one rejected the radical idea that the state is a legal fiction, one could not be satisfied by the speculative and superficial character of Pella's arguments, which are founded on little more than a simplistic analogy between states and persons.

20.5.2. Theories of the State

All through the 20th century, Romanian scholarship on the theory of the state merely adapted and reformulated concepts and ideas that were circulating abroad. However, due to historical circumstances, this meant a switching back and forth between democratic and totalitarian theories of the state.

In the early 20th century, Romanian jurisprudence was taking up and incorporating legal concepts used in Western Europe, particularly in France, but also in Germany and Great Britain. As early as 1884, the debate in legal theory was framed by Constantin G. Dissescu (1854–1932) as a methodological debate on the nature of legal science on the basis of the opposition between "the

deductive method and the natural sciences," on one hand, and the "inductive method and the social sciences," on the other (Dissescu 1884, 90–2). This line of inquiry, focused more on method than on substance, continued with the majority of authors all through the first half of the 20th century (Negulescu 1900, 3; Dissescu and Dumitrescu 1903, 29).

The theory of the state was focused on the opposition between the state as a goal and the state as a means (ibid., 172–3; Dissescu 1915, 24–6; Negulescu 1927, 170–2), and at the same time it depicted the historical evolution of the state from its "embryo, namely, the family" (Dissescu 1915, 9; my translation), to the modern concept of the *Rechtsstaat*. In a nutshell, the debate was conceived as an opposition between the French and the Anglo-Saxon jurisprudence. In the French tradition, the state was considered an end in itself, and the human individual merely a "means" to that end. From this flowed the importance of public life for the citizens of ancient Greece and Rome (*Salus reipublicae suprema lex*), and Dissescu thought that this idea also guided the French revolutionaries who in 1793 organized the *Comité du Salut Public* (Committee for Public Salvation), while Paul Negulescu (1874–1946) argued that in Germany "the concept of the state is dominant and the individual is more like a tool for the development of state" (Negulescu 1927, 171; my translation). In the Anglo-Saxon tradition, the state was an instrument at the service of individuals: It was created "to guarantee individual security and property, to ensure the freedom of each"; the state is "constituted for the greater *private* happiness of all" (Dissescu and Dumitrescu 1903, 172; my translation). However, by the turn of the 20th century, both approaches were already considered obsolete by the majority of Romanian authors, who embraced Johann Caspar Bluntschli's integrative theory, according to which the state was at once a goal and a means.

This presentation of main ideas and concepts continued during the unstable period from 1938 (when a Fascist constitution was adopted which lasted only two years) to December 30, 1947, with the establishment of the Popular Republic of Romania (*Republica Populară Română*). However, due to the quite conservative attitude of lawyers in general, and of scholars of public law in particular, most authors simply carried forward theories established before Fascism and National Socialism penetrated the political institutions of the Romanian state. Highly regarded authors, such as Negulescu, merely included a chapter on the racial policy of the state (Negulescu and Alexianu 1942–1943, 309–60), while in the two volumes of his important treatise on public law, he expounded a theory of the state conceived in terms almost identical to what he had previously done. Little attention, if any, was paid, on the theoretical level, to concepts specific to National Socialism (Drăganu 1941, 5–33).

This approach completely changed with the advent of communism, when a different source of inspiration was found in the writings of Soviet authors, in turn inspired by Lenin. Starting in the 1950s, the general theory of the state

and of law (*teoria generală a statului şi a dreptului*) became a discipline distinct from constitutional law (*drept constituţional*), to be taught in all law departments of Romanian universities. A main objective of the communist theory of the state lay in the analysis of "the essence and typology of the state," meant to explain the deterministic relation between the economic and social system of society as a "base" or "structure" and the state as a "superstructure" (Ceterchi et al. 1967, 5–6; my translation). The communist theory of the state traced the origins and historic evolution of the socialist state and explored its possible future, while presenting it as an instrument of (social) class domination and coercion. Voluntaristic and contractarian theories of the origin of the state were resolutely rejected. The state was analysed as a manifestation of force, as an instrument based on coercion, aimed at facilitating a "popular and centralised democracy." A detailed presentation of the so-called bourgeois theories of the state in virtually every textbook on the theory of law and the state served only as basis for strong criticism of those theories. Starting in the 1980s, an osmosis between the state and the Communist Party was strongly advocated in Romania under the label "theory of the state and party organs" or "double-natured organs," but this concept did not originate in Romanian jurisprudence (Ceterchi and Luburici 1983, 261–2).

A wave of democratization swept across Romania at the end of 1989, leaving a vacuum in the theory of state. During the decade to the turn of the millennium, Romanian scholars barely managed to analyze the transformation of the state's institutions, elaborating no theories or concepts to that end.

Chapter 21

SWEDEN: LEGAL PHILOSOPHY IN THE 20TH CENTURY

by Uta Bindreiter[*]

21.1. Introduction

The evolution of legal philosophy in Sweden in the first half of the 20th century basically coincides with the history of the so-called Uppsala School, which will be treated extensively in Tome 2 of this volume, in the part devoted to legal realism. Here I will be dealing with Swedish legal philosophy after that period, from the early 1940s onward, when the hitherto dominant influence of the philosophy advanced by the Uppsala school was definitely on the decline.[1] Apart from the generational shift marked by the death of the philosopher Axel Hägerström in 1939, there were other factors that accounted for this decline—most prominently, perhaps, the ramifications of World War II and the consequent shift in interest, among Swedish legal philosophers, from Germany to the United Kingdom and the United States. Furthermore, there was the fact that in the 1940s, quite a few of Hägerström's followers (such as Ingemar Hedenius and Anders Wedberg) were inclined to take a more independent stance toward his teachings.

Thus, with the diminishing influence of the Uppsala school of philosophy,[2] Swedish legal scholars became interested in current international trends in philosophy and were often eager to embrace those trends.

This is where the present contribution comes in. Its purpose is twofold, for in the first place it is intended to show that Swedish jurisprudence, after the heyday of the influence exerted by the Uppsala school and throughout the 20th century, is characterized by a reflection on major trends in the international philosophical debate; and consequently, in the second place, it highlights the intellectual background against which jurisprudence (*allmän rattslära* in Swedish)[3] has developed as an academic discipline at Swedish law faculties.

[*] I would like to express my warm thanks to Professor Åke Frändberg, of Uppsala University, for his valuable advice on the structure and content of this contribution. I am further indebted to Assistant Professor Christoffer Wong, of Lund University, for many clarifying and stimulating discussions.

[1] On the Uppsala School see Chapters 13 through 17 in Tome 2 of this volume.

[2] After Vilhelm Lundstedt's death in 1955, the Uppsala school can be said to have had any further influence only on Manfred Moritz and Tore Strömberg.

[3] The expression translates literally to "general doctrine of law," but that is misleading. The accepted translation of *allmän rättslära* is "general jurisprudence" or simply "jurisprudence."

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_21

There are three problems, however, that come up in working to achieve this twofold purpose.

First, Swedish legal thought received impulses from theories that proved to be both strong, that is, widely discussed and applied,[4] as well as stable over time. Examples that stand out are analytical philosophy, formal logic, and modern Anglo-Saxon philosophy of language. Influences of this type I will call *strong and abiding influences*.

Second, there were theories which certainly drew interest when they were introduced in Sweden, but which nonetheless proved to be unstable in the long run and either fell into oblivion (as in the case of logical positivism and neo-Marxist legal theory) or, at best, resurfaced at different times. Influences of this type I will call *transitory influences*.

And third, there were influential theories which date back to the early 20th century, but which Swedish legal scholars did not consider seriously until much later, a case in point being Hohfeld's theory of rights.[5]

In view of these circumstances, and intent on preserving a chronological order in tracing out the influences on Swedish jurisprudence, I have decided to organize the discussion as follows.

There will be two main parts (Sections 21.2 and 21.4) covering the period from 1940 to 1960 and from 1960 to 2000, respectively.

Within each of these two main parts, there will be a discussion of the influences on Swedish jurisprudence in accordance with the two main classes previously distinguished: I will thus be considering, on the one hand, what I am calling strong and abiding influences, and on the other what I am calling transitory influences.

Between these two major parts, there will be a middle section (Section 21.3) where I will sketch out the origin of the development of jurisprudence in Sweden as an academic discipline (circa 1960).

I will not be characterizing the various influences themselves, that is, the influential movements,[6] but will rather be discussing the significance of the major works by the more outstanding Swedish representatives of the influence in question.[7] For the big picture, I will take as my point of departure the com-

[4] I say this judging by the number of doctoral dissertations, textbooks and course readings, and monographs and articles devoted to the theory or approach in question.

[5] As described in Section 21.4.1.1.1, Hohfeld's theory of rights would be taken up by Manfred Moritz, Stig Kanger, and Lars Lindahl.

[6] Two further criteria for inclusion will be as follows: (*i*) The movement in question must have left an impact on Swedish jurisprudence by the beginning of the 20th century (though it proved necessary to make a few exceptions), and (*ii*) the issue of jurisprudence as an academic discipline will be considered only in connection with the three major law faculties, namely, those in Lund, Stockholm, and Uppsala.

[7] Exceptions will be the philosophers whose work has already been covered elsewhere in this *Treatise*. This applies to Ingemar Hedenius, Per Olof Ekelöf, and Tore Strömberg, respectively discussed in Sections 17.3, 17.2, and 17.1 in Tome 2 of this volume.

prehensive survey of 20th-century Swedish legal theory and legal philosophy offered in Åke Frändberg 2005.

So here, in summary, is how we will proceed in this discussion. We start out in Section 21.2 considering the two most important influences on Swedish legal thought from 1940 to 1960, namely, analytical philosophy and logical empiricism, a period book-ended on the one hand (1940) by a shift in generations as well as in orientation among Swedish legal scholars, and on the other (1960) by the birth of jurisprudence as an academic discipline in its own right at the law faculties in Lund, Stockholm, and Uppsala through the creation of three chairs in jurisprudence. This event will accordingly become the focus of Section 21.3, where the views of three professors on the nature of the new discipline and its tasks are briefly described as a way to introduce some of the perplexities this discipline was bound to encounter. That will pave the way for Section 21.4, where I consider the influences on Swedish legal thought from 1960 to 2000. As far as strong and abiding influences are concerned, I take up modern Anglo-Saxon philosophy of language, formal logic, and the continuing influence of analytical jurisprudence. Finally, in Section 21.5, I take stock of the developments discussed by offering some final observations.

21.2. Influences from 1940 to 1960

21.2.1. Strong and Abiding: The Influence of Analytical Philosophy[8]

The "Swedish golden age of analytical philosophy" (Nordin 1984, 171; my translation) was to last from the mid-1940s to the mid-1960s. There are four philosophers who deserve mention in this context: Ingemar Hedenius, Anders Wedberg, Konrad Marc-Wogau, and Manfred Moritz. Ingemar Hedenius is covered elsewhere in this *Treatise*,[9] so I will turn immediately to Anders Wedberg, entering more closely into his main contribution to Swedish jurisprudence under the influence of analytical philosophy.

21.2.1.1. Anders Wedberg (1913–1978)

The Swedish philosopher Anders Wedberg has become famous for his contribution in philosophy and *legal* philosophy alike.[10]

Wedberg studied at Uppsala under Axel Hägerström, among others, and was impressed by the program of conceptual analysis that had been set out by the Uppsala school of philosophy. He was nonetheless open to other current

[8] On the entry of analytical philosophy into Sweden, see Nordin 1984, 146ff.

[9] On Hedenius see Section 17.3 in Tome 2 of this volume; see also Frändberg 2009a.

[10] Wedberg taught theoretical philosophy at *Stockholm Högskola* (Stockholm Academy, later Stockholm University) from 1949 to 1976. For biographical data, see Dahl 1955.

philosophical trends as well: According to Wedberg's (1966) own account, he was most influenced by the analytical philosophy coming from Cambridge, by logical positivism, and by the Oslo school,[11] in that order.

Wedberg's sojourn in the United States, from 1939 to 1943,[12] proved to be highly fruitful for his further career, for he came into closer contact with various schools of analytical philosophy as well as with modern logic.[13]

In philosophy, Wedberg's two most important works are *Plato's Philosophy of Mathematics* (Wedberg 1955) and *Filosofins historia* (The history of philosophy), the latter in three volumes published from 1958 to 1966 (Wedberg 1958–1966).[14]

Wedberg's *History of Philosophy*—his magnum opus and an enterprise that has been described as unique in Sweden—is an impressive attempt to outline the whole of Western philosophy through the methods of modern analytical philosophy: It was Wedberg's intention, as he put it, to present the "ideas of the past in a more precise way than they were described by their originators" (Wedberg 1980, 187).

This was a novel approach, and it gave rise to much criticism from the more traditional quarters (such as the departments of history of ideas). Wedberg thus felt compelled to explain as well as defend his method, and this he did in his *Introduction* to the second edition of *The History of Philosophy* (1968):[15] His method, he asserted, amounted to seeing the classical philosophers as contemporaries and to establishing whether or not their philosophical results were "correct" and their arguments "valid." The arguments put forward by the classical philosophers had to be validated by subjecting their theses to a strict schematization, that is, by formulating those theses as sentences made "more precise" with the help of the method developed by the Oslo school (cf. Nordin 1984, 184).

In legal philosophy, Wedberg made a contribution whose significance has been acknowledged ever since. Two major aspects can be pointed out.

The first lies in his distinction between "external" and "internal" sentences. The initial inspiration for this distinction came in 1941, in that Wedberg developed it by drawing on Ingemar Hedenius's distinction between *äkta* and *oäkta*

[11] The Oslo school was a philosophical movement in Norway whose fountain-head was the philosopher Arne Naess. This school investigated the function of ordinary language ("empirical semantics"), and it interestingly crops up in a textbook by Jan Evers (1993) that was highly appreciated by students of jurisprudence in the 1970s and 1980s.

[12] Wedberg had received a grant from the Sweden-America Foundation and subsequently gave lectures in philosophy at Cornell University in New York.

[13] It bears mentioning here that Wedberg, at an early age, was impressed by Hans Kelsen's theory as well: It was Wedberg who translated Kelsen's 1945 *General Theory of Law and State* into English.

[14] This history (Wedberg 1966) was translated into English and published by Oxford University Press in 1982–1984. In Sweden, the work was reprinted by Thales in 2003–2004.

[15] Mentioned in Nordin 1984, 184ff.

(genuine and spurious) legal sentences (Hedenius 1963).[16] Wedberg's distinction had important implications and would subsequently make its way into the legal theories of both Hans Kelsen and H. L. A. Hart. It will be considered more closely below.

And the second aspect, which attracted considerable attention, lies in Wedberg's treatment of the concept of rights. According to Wedberg, the term *right* designates a so-called intermediate concept and as such is without independent meaning. The concept serves an important function, though, which is to match a set of legal consequences to a set of legal grounds.

In 1944, Wedberg presented this view in a lecture he gave at the Uppsala Law Club.[17] The lecture was titled "Om juridikens grundbegrepp" (On the fundamental notions of jurisprudence).[18] In the time that followed, Wedberg's views on the concept of a right were further developed by Per Olof Ekelöf,[19] whose 1945 article would set off the curiously long-lived debate that came to be called the Scandinavian debate on rights.[20]

The idea of a right as an intermediate concept gained international recognition. However, it was not Wedberg who was credited with the idea,[21] but the Danish legal philosopher Alf Ross, who made use of Wedberg's views in his famous essay *Tû-Tû*. (Ross 1951).[22]

Let us return to what, in Sweden, is considered to be Wedberg's outstanding achievement under the influence of analytical philosophy: his distinction between "external" and "internal" sentences.

In 1951, the renowned Swedish journal of philosophy *Theoria* published what would become Wedberg's most famous article, i.e., *Some Problems in the Logical Analysis of Legal Science* (Wedberg 1951). In this article, Wedberg deals with the problem of a rational reconstruction of legal science:[23]

[16] On genuine vs. spurious legal sentences, see Hedenius 1963, 56–8.

[17] It should be pointed out, however, that this view of rights can already be found in embryo in Östen Undén (1928), as well as in Ivar Strahl (1941). It is interesting to observe that while Undén conceived of the right of ownership as shorthand for a set of legal *consequences*, Strahl (ibid., 317ff.) conceived of it as shorthand for a set of legal *facts*. On this question, see also Frändberg 2005, 380ff.

[18] Wedberg himself mentioned that the lecture was based on a mimeographed typescript having the same title (Wedberg 1951, 275). I am indebted to Professor Åke Frändberg, of Uppsala University, for kindly providing me with a copy of this mimeograph. The article based on it is included in Wedberg 1968, 1–30.

[19] On Per Olof Ekelöf see Section 17.1 in Tome 2 of this volume.

[20] On the Scandinavian debate on rights, see the comprehensive study by Nils Kr. Sundby (1968).

[21] As has been pointed out by Lindahl and Odelstad (2000, 272–3), there may have been a disadvantage in using intermediate terms in law and ethics by virtue of their indeterminate status, in that they do not lend themselves to any easy classification as being either descriptive or normative.

[22] On Ross see Chapter 16 in Tome 2 of this volume.

[23] "An outside observer may study legal science from many different angles. To psychology

Rationally to reconstruct the doctrine *Dn* is to replace it by another formulation *Dr* which is more exact than *Dn* but still somehow expresses the same set of ideas as *Dn*. (ibid., 250)

Wedberg confines himself to two problems, namely, the distinction between "external" and "internal" sentences and the concept of property (or ownership). In the following, only the first of those two problems will be taken up.

According to Wedberg, we must distinguish between two types of juristic sentences: (*i*) sentences stating the rules themselves and (*ii*) sentences stating that those rules either are or are not in force in a given society at a given time.

To state a rule is to make a statement *internal* to that system, whereas to state that a rule belongs or does not belong to that system is to make a statement *external* to that system. From the perspective of legal science, Wedberg asserts, the statement of a rule *P* "is always, somehow, incomplete unless it is accompanied by an external element to the effect that *P* is (or is not) in force in a society *S* at a time *t*" (ibid., 253).

According to Wedberg (ibid., 254–5), it is a central task for the logical analysis of legal science to clarify the role of external statements and, furthermore, to establish their scientific status. He proceeds by asking two questions: (*i*) What exactly do we mean by saying "*P* is in force in Sweden now?" and (*ii*) How can we arrive at an adequate definition of that sentence, that is, a definition that can be useful *scientifically*?

In answering these two questions, Wedberg takes as his point of departure the jurists' *use* of the sentence "*P* is in force in Sweden now." This is no coincidence. For although he denies that the question can be settled in light of what jurists may think about the sentence (which can be true or false, and may even have a different nature), he notices that the manner in which the sentence is actually *used* seems to be quite stable.[24] Accordingly—and starting from the *use* of the sentence—Wedberg accepts a definition of the sentence as adequate

if and only if the definiens is a "necessary and sufficient condition" for the definiendum: i.e., if the definiens can be truthfully stated of any rule *P* of which the definiendum can be truthfully stated, and conversely; or if definiens and definiendum delimit exactly the same set of rules. (Wedberg 1951, 255)

In studying contemporary Swedish law, Wedberg finds that "its factual basis consists of a set of facts *F* and that the legal interpretation of *F* consists in a certain method of reasoning *M*" (ibid.). This enables him to arrive at the following definition of the sentence in question:

and sociology the legal phenomena offer a rich and varied field of investigation. However, there is also another, perhaps more artificial but still legitimate and important point of view [...] which perhaps may be called that of *logical analysis* or *rational reconstruction*" (Wedberg 1951, 250).

[24] "Concerning a very large body of rules *P* most contemporary Swedish jurists agree when it comes to deciding whether [the sentence "*P* is in force in Sweden now"] can be *truthfully* stated or not" (Wedberg 1951, 255; italics added).

P is in force in Sweden now $=_{\text{def}}$ *P* is obtainable by applying *M* to *F*. (ibid.)

As far as the roles of *internal* and *external* sentences are concerned, Wedberg points out that there is a characteristic difference between the practical jurist (the judge or lawyer) and the legal scholar (the law professor) as regards their respective attitude to these sentences. While the interests of the former are mainly directed at finding the legal rule that applies to the case at hand (and are consequently focusing on the contents of the rule, not on whether the rule is part of the law), the interests of the latter are directed at ascertaining what rules actually belong to the law. Accordingly, the practical jurist is mainly interested in the *internal* sentences (i.e., those that state the legal rules themselves), whereas the legal scholar's (theoretical) interest is focused on *external* sentences (ibid., 258–9).

But what about the *scientific* status of external and internal sentences? As Wedberg had previously shown, the *external* sentence "*P* is in force in Sweden now" can adequately be defined, among other ways, by proceeding from the factual basis of legal science and the method of legal interpretation. "If such a definition is adopted, the external sentences become sociological, in a wide sense of the term" (ibid., 260). By combining logical and empirical methods, then, we can decide "whether a given rule is in force in *S* at *t*. In this sense, the external sentences of legal science undoubtedly possess a scientific quality" (ibid.).

It is a different situation that we are looking at, however, when the legal scholar asserts *internal* sentences as well, that is, sentences stating legal rules: The assertion of internal sentences cannot be claimed to be part of any scientific activity.[25] Therefore, the assertions of a rationally reconstructed legal science "should mainly be assertions of external sentences" (ibid., 261).

In conclusion, in Wedberg's view, the assertions of a rationally reconstructed legal science should mainly be assertions of *external* sentences; *internal* sentences (those that express legal rules) should, by contrast, be asserted only when they are factual and when their truth can be ascertained empirically.

And this view, as Wedberg (1951, 261 n. 13) hastens to add in a footnote, is not invalidated by the observations that Ingemar Hedenius had made ten years earlier, namely, that a legal scholar uttering a sentence expressing a legal rule *P* is frequently using an "elliptical" mode of speech: Although the scholar's sen-

[25] The assertion of internal sentences is, as Wedberg puts it, "no more a genuine science than is an intellectual activity which proceeds on the assumption of the Axiom of Naive Biblical Theology" (Wedberg 1951, 261). Wedberg's meaning here is far from clear. What he *seems* to have had in mind is the propensity of "naive" jurists to jump from the (descriptive) statement (*i*) "*P* is valid law" to the (normative) conclusion (*ii*) "*P* shall be obeyed"—a propensity similar to that of a "naive" theologian to jump from (*i*) "*P* is a biblical assertion" to (*ii*) "*P* shall be a moral standard."

tence literally expresses rule *P*, the point of the sentence is often not to state *P* as such but merely to state that *P* is in force, here and now, or, in other words, that *P* is valid.

Apart from Wedberg, two other philosophers ought to be mentioned who were also initially drawn to some of the main tenets of the philosophy done at Uppsala, but who subsequently became strongly influenced by Cambridge philosophy. These two philosophers, who also concerned themselves with *legal* philosophy, are Konrad Marc-Wogau and Manfred Moritz.

21.2.1.2. Konrad Marc-Wogau (1902–1991)

In Sweden, Konrad Marc-Wogau is known as the nestor of Swedish analytical philosophy.[26] Unlike Hedenius and Wedberg, he belonged to the "old" school of philosophers who preferred to write in German (his main work, for example, is *Die Theorie der Sinnesdaten*, Theory of the objects of perception, of 1945).

Marc-Wogau was professor of theoretical philosophy at Uppsala University. A disciple of Adolf Phalén (1884–1931), he was influenced by logical empiricism (see Section 21.2.2; cf. Nordin 1984, 157) as well as by the analytical philosophy coming from Cambridge (Moore, Russell, and C. D. Broad).[27] Marc-Wogau's tendency to stress the similarities between the national philosophy done at Uppsala and international philosophical trends comes through even in the title of his 1947 inaugural lecture: "Uppsalafilosofin och den logiska empirismen" (Uppsala Philosophy and Logical Empiricism: cf. Nordin 1984, 157).

Apart from investigating the work of Kant and Hägerström (see Marc-Wogau 1968), Marc-Wogau published books on modern logic. Also, he edited a well-known four-volume anthology titled *Filosofin genom tiderna* (Philosophy over time: Marc-Wogau 1976). In his *Preface* to Volume 1, he emphasizes that the main purpose of this monumental work is to outline the evolution of "scientific" philosophy.

Furthermore, there is Marc-Wogau's (1961) popular textbook on how to study philosophy as an academic discipline. Having criticized or dismissed a whole series of philosophical schools, Marc-Wogau presents what he understands to be the correct—i.e., scientific—philosophy, namely, analytical philosophy. Taking as his point of departure the term *explication* (coined by Rudolf Carnap), he describes the analytical method as consisting in the analysis of a sentence by "translating" it into a formal (constructed) language. This is not so much about offering an equivalent translation as it is about *improving* a sentence and making its content more precise (cf. Nordin 1984, 175).

[26] On Konrad Marc-Wogau, see Nordin 1984, 173–7; see also Halldén 1992.

[27] It is noteworthy that Marc-Wogau disliked Oxford Philosophy (i.e., the later Wittgenstein), finding its method of analyzing everyday language "inexact" (see Nordin 1984, 176).

In the philosophy of law, Marc-Wogau made two important contributions in the form of two early articles published in the journal *Theoria*:[28] *Über die Begriffe "bindende Kraft des Rechts," "Rechtspflicht" und "subjektives Recht"* (On the concepts of the binding force of law, legal obligation, and rights: Marc-Wogau 1940) and *Zum Begriff des subjektiven Rechts* (On the concept of rights: Marc-Wogau 1941).

21.2.1.3. Manfred Moritz (1909–1990)

Moritz was a German philosopher who came to Sweden in 1934.[29] In due course (in 1959), he would become professor of practical philosophy at Lund University, where he taught until 1975.

Moritz's research covers Kant's moral philosophy, 18th-century British moral philosophy (which he investigated applying the tools of analytical philosophy), meta-ethics, and the problem of freedom of the will. He also made important philosophical contributions outside practical philosophy, especially in the general theory of norms and, in later years, the philosophy of law.[30]

Moritz had a considerable role in helping to keep the Uppsala school to some extent alive at a time when its influence had been rapidly dwindling, after the death of Hägerström and his immediate followers (see Frändberg 2005, 392). He embraced Hägerström's value nihilism in ethics and in legal philosophy and would therefore come to repudiate deontic logic. The possibility of a logic of norms had already been dismissed by Hedenius, and Moritz emphasized this point even more. According to Hägerström himself, his emotive theory implied the impossibility of a logic of value statements and normative statements. Moritz was vigorous in arguing for this impossibility, and his criticism was directed specifically at modern versions of deontic logic.[31]

Apart from an article on the practical syllogism and on juristic thinking (Moritz 1954), Moritz's two most important contributions in legal philosophy are his monograph on the concept of a juristic person (Moritz 1971) and his work *Über Hohfelds System der juridischen Grundbegriffe* (On Hohfeld's system of fundamental legal concepts: Moritz 1960). In the latter work, he takes up the issue of how best to understand the set of four fundamental legal con-

[28] In 1936, Marc-Wogau became editor-in-chief of *Theoria.* This journal had been founded the year before, in 1935, with Åke Petzäll as editor-in-chief and Marc-Wogau and Gunnar Aspelin as co-editors (see Nordin 1984, 21).

[29] Additional biographical details can be found in the obituary for Moritz written by Göran Hermerén (1992).

[30] See Hermerén 1992, 1. In the 1960s, Moritz published a series of articles in and on the philosophy of law. In 1973, he was awarded the title of *doctor honoris causa* by the law faculty of Lund University (ibid., 2).

[31] But Moritz is in the minority here: Kanger and Åqvist were by contrast very interested in deontic logic.

ceptions of a right expounded by the American jurist W. N. Hohfeld. This question would subsequently also be addressed by Stig Kanger and Lars Lindahl (see Section 21.4.1.1.1 below).

21.2.2. Transitory Influences: Logical Empiricism

Logical empiricism, also referred to as logical positivism, or neopositivism,[32] originated in Vienna in the late 1920s and reached its heyday in the mid-1930s. The "embryo" of this movement was the so-called Vienna Circle, which formed around Moritz Schlick, professor of philosophy.[33] Although the movement developed out of Vienna, its centre, it also had epicentres in Cambridge, with its analytical school, and Oxford. At an early stage, the impulses from Vienna reached Scandinavia as well: The "messengers" were Jörgen Jörgensen (1894–1969) in Denmark, Eino Kaila (1890–1958) in Finland, Arne Naess (1912–2009) in Norway, and Åke Petzäll (1901–1957) in Sweden (cf. von Wright 1972, 6ff.; 1978, 188).

The term *logical empiricism* indicates the two sources from which the movement initially drew its inspiration, namely, mathematical logic (as developed by Russell) and the empirical theory of knowledge (cf. Wedberg 1966, 211).

The members of the Vienna Circle enthusiastically embraced many of the ideas the early Wittgenstein expressed in the *Tractatus*, such as the idea that metaphysics is meaningless; that any meaningful philosophy must be some sort of language criticism; and that analytical propositions are *a priori* but empty, while synthetic ones must be empirically verified.

At an early stage, logical empiricism put forward a series of theses—among which the thesis of the emptiness of metaphysics, coupled with the verification principle—that, not unlike slogans, expressed a vague view about the "conditions for thinking" and served as a unifying theme for the various members of the movement, all of whom rejected "metaphysics" and "traditional philosophy" (ibid., 212; my translation).

Among the Swedish philosophers who embraced logical empiricism (even if they did not devote their entire careers to it) are the previously considered Anders Wedberg and Konrad Marc-Wogau. But also worthy of mention is Björn Ahlander, and since he has not yet come up, the discussion that follows will be entirely devoted to his work.

[32] On this current, see Wedberg 1966, 210ff.

[33] Other members were Rudolf Carnap, Otto Neurath, and Felix Kaufmann. The publication announcing the formation of the Vienna Circle in 1929 was the manifesto *Wissenschaftliche Weltauffassung* (The scientific conception of the world).

21.2.2.1. Björn Ahlander (1920–1982)

Björn Ahlander is credited with having introduced logical empiricism to Swedish legal philosophy.[34] This was in 1950. Strictly speaking, however, and considering philosophy in general, it was Åke Petzäll (1901–1957) who, as early as 1931, had introduced the salient features of this school in Sweden, with his publication *Logistischer Positivismus* (Logical positivism: Petzäll 1931).[35]

Although Ahlander's scholarly production is not extensive, it is highly original. Two years before submitting his doctoral dissertation, he published the work he would become famous for: a monograph intriguingly titled *Är juridiken en vetenskap?* (Is law a genuine science?: Ahlander 1950).[36] Ahlander's point was that legal rules can be understood, as both theoretical and practical sentences, on the basis of the function they serve in actual juristic argumentation. It is not Ahlander's intention to confer any new meaning on the term *legal rule*: His theory is concerned with the *use* of such terms, addressing their claim to correctness. A theory, he argues,

> can be accepted as correct if legal rules in theoretical juristic argumentation are employed in the same way that laws, theories, and assumptions are employed in natural science in general. Otherwise, the theory is incorrect. (Ahlander 1950, 131; my translation)

Legal rules (*rättsregler*) are general assumptions about the *meaning* of the terms and expressions contained in legal statements (*rättssatser*) (ibid., 160). Ahlander now sets out to scientifically verify what are called legal rules. It is at this point that logical empiricism comes into play.

According to Ahlander, from every theoretical legal sentence consequences can be deduced "that can be tested by means of empirical study of the legal statements [*rättssatser*] that exist in a given society" (ibid., 79; my translation). Thus, Ahlander is seen to embrace the logical empiricist view that sentences "from which no such consequences can be deduced are [...] without scientific interest" (ibid., 34; my translation): If a sentence is to have any theoretical meaning, it must accurately state "the conditions under which the sentence can be verified or falsified" (ibid., my translation; cf. Frändberg 2005, 384).

As a theoretical discipline, legal philosophy is tasked only with analyzing and defining the *meaning* of fundamental legal concepts, and this must be done on the basis of the way in which these concepts are used by legal participants (Ahlander 1950, 44). Or, in other words:

[34] Ahlander was awarded a doctor of laws degree from Uppsala in 1952 and was a journalist. He worked as a press attaché in Washington, D.C., from 1955 to 1959, and then as a correspondent for Sveriges Radio, first in Washington (1959–1968) and then in Moscow (1969–1971). In 1971 and 1972, he served as editor-in-chief of *Göteborgs Handels- och Sjöfarts-Tidning*, and after 1972 he worked for *Svenska Dagbladet.* He wrote several books on the United States.

[35] Nordin (1984, 146) suggests that it may have been Petzäll who arranged the visits Carnap made in the 1930s to the philosophical societies in Lund, Gothenburg, Stockholm, and Uppsala.

[36] See the review by Wedberg 1952.

> If research in legal philosophy is intent on addressing its problems in a fruitful way, it must be careful not to endow its concepts—and consequently also the concept "legal rule"—with *more* meaning than is necessary for the use the law [*juridiken*] makes of them. (Ibid., 74; my translation)

And with a "swipe" at strictly behaviouristic legal theories, Ahlander proceeds to comment thus:

> Anyone claiming that the term *legal rule* denotes factual regularities has neglected the study of how legal rules are actually used in the law [*juridiken*]. For such a study will show, and in a way not to be doubted, that the concept has been loaded with much more than is warranted in the actual technique of legal argumentation. (Ibid.; my translation)

Ahlander's terminology is unusual and—it must be admitted—not easy to render in English. Alongside his inquiries into the nature of what are commonly called "legal rules," he distinguishes between *rättssatser* and *juridiska satser*.

Rättssatser are linguistic expressions, normally found in statutes, regulations, and judicial decisions. They are characterized by an important quality, their "being official"; that is, *rättssatser* are uttered or written by officials in their capacity as officials (Ahlander 1950, 78).

Juridiska satser, on the other hand, are of a different nature. Their distinguishing feature is that they are *about* the former: They are either about *rättssatser* or can be transformed into sentences about them.

> Some of them [i.e., some *juridiska satser*] express assumptions or assertions, while others express evaluations. The former can be called theoretical juristic sentences, or juridico-scientific sentences; the latter can be called juristic value judgments, or juristic value sentences. (ibid.; my translation)

Thus, *juridiska satser* can be conceived as both theoretical sentences and practical (evaluative) sentences: "This is the case even with those [*juridiska satser*] that express legal rules [*rättsregler*]" (ibid., 130; my translation). In Ahlander's view, then, we can speak of a specific "juristic argumentation technique" (an expression he coined): It is a technique that is part scientific, part grounded in evaluation.[37]

21.3. Setting the Stage: Jurisprudence as an Independent Academic Discipline at Swedish Law Faculties

In the late 1950s in Sweden, legal education was overhauled, and in the process there were established three special chairs in jurisprudence (*Allmän rättslära* in Swedish). The discipline was introduced in the 1961–1962 academic

[37] Ahlander distinguishes between "valid legal rules" (*gällande rättsregler*) and "plausible legal rules" (*plausibla rättsregler*). If the conclusion of an argument is scientifically tenable, it counts as a "valid" legal rule; on the other hand, a sentence *not* supported by any scientifically tenable argument, but only by arguments permitted within the juristic argumentation technique, is a "plausible" legal rule (Ahlander 1950, 130).

year at the law faculties of three major Swedish universities: At Lund, the chair was assigned to Tore Strömberg, who thus became Sweden's first professor in the discipline; the one at Stockholm was assigned to Ivar Agge; and the one at Uppsala to Lars Hjerner.

Although the *chairs* in jurisprudence were new, the subject was not. In the mid-19th century, before jurisprudence was introduced into the curriculum of Swedish law faculties, the subject was preceded by the *Juridisk encyklopedi* (juristic encyclopaedia).[38] This subject, which did not have specially designated professors of its own, was concerned with the fundamental features of the philosophy of law and the historic development of legal theories, as well as with the formation of juristic concepts and with general legal doctrines.[39]

In the decades preceding the 1958 reform, legal theory and methodology had received a significant impetus as subjects of academic study: This, it may be supposed, was due to an increased interest in theoretical and methodological issues in law, an interest that had been encouraged by the philosophers of the Uppsala school and the representatives of Scandinavian legal realism (Strömholm 1976, 190). At the same time, it was claimed that the future generation of Swedish lawyers ought to show a greater awareness of legal method. In short, the older *juristic encyclopaedia* was judged inadequate for a proper law curriculum: It was being taught as a first-year foundational course, but now it came time to give it a broader scope and a role of greater prominence within that curriculum.[40]

The inaugural lectures held by the three new professors are revealing with respect to the question of how to define jurisprudence itself (*Allmän rättslära*), that is, how to characterize its nature and tasks in distinction to those of legal science (i.e., the doctrinal study of law) and the philosophy of law. In other words: What exactly are the contents and tasks specific to *Allmän rättslära*, justifying its having graduated to the status of an independent academic discipline?

In the following, I will sketch out the three inaugural lectures just mentioned, using them as a yardstick by which to judge the extent to which jurisprudence has been following the outline that was drawn for it around 1960.

[38] On the history behind the *juristic encyclopaedia* and its roots in Germany, see Sundberg 2005, 434–5.

[39] As Strömholm (1976, 190) points out, this was true of the 1935 curriculum (*1935 års studieordning*).

[40] It may be interesting to note that in 2010, Lund University made jurisprudence once again an introductory course, moving it back to term 1 in the curriculum after many years of teaching it in terms 6 and 7. It also deserves mention that the new discipline was initially taught in connection with comparative law, which subsequently was replaced at different intervals with the history of law, with legal informatics, and with Law and Economics. At the law faculties of Uppsala University and Stockholm University, by contrast, the course in jurisprudence has always been placed toward the end of the law curriculum.

21.3.1. Tore Strömberg (1912–1993)

In his inaugural lecture,[41] Tore Strömberg (1962a, 273) conceived of the new discipline as being "the result of a division of labour" within the doctrinal study of law. He expressed the view that, as much as jurisprudence (*Allmän rättslära*) may not be identical with the philosophy of law, it is nevertheless largely inspired by it. Therefore, one of the foremost functions of the new discipline must consist in bringing legal philosophy to bear on the study of law (ibid., 276). There were two things that jurisprudence had to do to this end: First, it had to proceed from unequivocally legal-philosophical premises; and, second, it had to concern itself exclusively with concrete legal material. By adhering to these two principles, jurisprudence would earn its status as a free-standing discipline—formally separate from the philosophy of law—and in the main it would also be able to claim a scientific status (ibid.).

Strömberg also had a view about the Swedish name for the new discipline, *Allmän rättslära*, which he thought was not enlightening: Speaking for himself, he preferred the term *Rättsteori* (that is, legal theory) which, while not identical to *Allmän rättslära*, seemed to him to be the stricter of the two (ibid., 273).

According to Strömberg (ibid.), there are only three tasks for jurisprudence to fulfil: The first is to work out an approach to the fundamental problems common to all fields of law (*hela juridiken*); the second is to explain, further develop, and possibly revise legal systematics (legisprudence); and the third is to provide a comprehensive survey of the legal order, similarly to what had previously been envisioned for the former *juristic encyclopaedia*.

If we rigorously assign these three tasks to jurisprudence—and Strömberg was specific about there being no other tasks—then jurisprudence will be seen to emerge as a genuine, autonomous academic discipline, coordinated with the special branches of law and, together with them, forming a self-sustaining whole.

Strömberg taught jurisprudence at Lund for many years, from 1961 to 1977. Naturally, his jurisprudential thought would have considerable impact on the discipline. Interestingly, the course material he produced would be retained long after his retirement.[42]

Strömberg belonged to the school of Scandinavian legal realism and was rooted in the tradition of the Uppsala school.[43] However, he did much more than merely follow in Karl Olivecrona's footsteps: In his analysis of the mean-

[41] Tore Strömberg's inaugural lecture, held on March 17, 1962, was published under the title *Uppgifter för den allmänna rättsläran* (Tasks for jurisprudence: Strömberg 1962a).

[42] According to a record dated December 9, 1997, the course readings in jurisprudence at the law faculty of Lund University consisted of Peczenik 1995b, Simmonds 1988, and the most recent editions of Evers 1970 and Strömberg 1962b.

[43] Strömberg has been described as "the last orthodox representative of the Uppsala school" (Frändberg 2005, 383).

ing of the term *legal validity*, Strömberg arrived at valuable psychological insights.

Strömberg's well-known textbook *Inledning till den allmänna rättsläran* (An introduction to jurisprudence: Strömberg 1962b) came out in 1962 in the form of a course compendium. Published in book form in 1964, this work was used as a textbook from 1970 to 1992: It went through eight editions, the last one dating to 1981.

Next to that work, Strömberg also included a slim but weighty booklet as a mandatory reading for his course on jurisprudence. It was titled *Rättsfilosofins historia i huvuddrag* (Main features of the history of legal philosophy: Strömberg 1989), and it, too, first appeared in the form of a course compendium. In book form, it was used as a textbook from 1970 to 1998 (in 1989, the book had gone through four editions).[44]

21.3.2. Ivar Agge (1903–1978)

Views similar to Strömberg's were expressed by Ivar Agge, professor of jurisprudence at Stockholm.[45] Even so, Agge did not hesitate to equate jurisprudence with the philosophy of law, since it is well-nigh impossible, in his view, to draw a clear dividing between them.

Agge (1967, 560–1) emphasized that even though jurisprudence and legal philosophy use different methods, they are concerned with the same types of questions. Indeed, the two disciplines have a common task, namely, to inquire into (*i*) the theoretical problems concerning the nature and functions of the legal order, (*ii*) the ideas and ideologies characteristic of legal science, and (*iii*) the methods employed in adjudication.

In Agge's view, the most important task for jurisprudence is methodological (where he included the doctrine of the sources of law). Another important task consists in co-ordinating the study of law (*juridiken*) with other branches of science (Agge 1955, 3 n. 1). Here too, Agge thought, the matter comes down to a "conventional division of labour" (ibid., 3ff.): Issues concerning legislative technique, the practical application of law, and the interaction between rules pertain to jurisprudence, whereas legal philosophy is concerned with the strictly theoretical discussion about the "nature" of the legal order and with the logical analysis of the conceptual apparatus in the doctrinal study of law (ibid., 4).

In contrast to Strömberg, Agge did not object to the Swedish term *Allmän rättslära.* He used it for

[44] On Strömberg see also Section 17.1 in Tome 2 of this volume.

[45] Ivar Agge's inaugural lecture has unfortunately gone lost, and the following account therefore relies on Agge 1955 and Agge 1967.

that part of legal dogmatics that deals with general juridico-technical and juridico-systematic issues, with the functional connection between different legal rules and legal concepts, with the relation between social ideologies and the legal order in force, and, finally, with the method for the practical application of law. (Agge 1955, 3 n. 1; my translation)

In principle, Agge welcomed the tendency of Swedish legal science to break out of the isolation it had gone into under the all-pervasive influence of the Uppsala school of philosophy. Indeed, he cautioned against an exaggerated "scientific realism" (ibid., 5) which in the long run would lead to the "sterilization" (ibid., 4) of legal science. But at the same time he cautioned against expanding jurisprudence too eagerly into the sociology of law as a strictly empirical discipline.[46] In his view, jurisprudence ought to serve as an "observation post" (ibid., 16), seeing to it that the boundary between the law (*juridiken*) and the (empirical) social sciences remained intact.

When the chair in jurisprudence was established at Stockholm in 1961–1962, its new holder, Professor Ivar Agge, did not have to look far for adequate course literature. He assigned to his students a textbook—*Huvudpunkter av den allmänna rättsläran* (The main features of general jurisprudence)—that had previously been in use for the new discipline's "forebear," the *juristic encyclopaedia.* In book form, the work appeared in 1972 (Agge 1972) and would go through three editions, the last one dating to 1980. It is not an exaggeration to say that for several generations of Swedish jurists, Agge's book was *the* textbook of jurisprudence. As such, it shows the extent to which the Uppsala school was influential, but it should also be noted that Agge did not embrace this movement wholeheartedly, always keeping some distance from it (Frändberg 2005, 379).

Ivar Agge taught jurisprudence at Stockholm University for nearly a decade, from 1961 to 1970. He was succeeded by Professor Jacob W. F. Sundberg, who held this chair for an even longer period, from 1970 to 1993.

During his tenure, Jacob W. F. Sundberg (1927–)[47] contributed importantly to the history of ideas in jurisprudence with his monograph *From the Edda Poem to Ekelöf* (Sundberg 1978).[48] In a broad sweep from ancient times to the present, Sundberg lays out a meticulous investigation into the relative significance of the sources of law in the Scandinavian countries. Emphasizing the close relationship that various sources of law bear to certain classes of per-

[46] Interestingly, Agge would later offer a sociological definition of the sources of law as consisting of factors, or "forces," that lead to changes in the content of legal rules (Agge 1972, 44; cf. Frändberg 2005, 379).

[47] Jacob W. F. Sundberg is director of studies at the Stockholm Institute of Public and International Law (IOIR), founded in 1943.

[48] This was Sundberg's major work, which from 1979 on was an optional reading in the syllabus at both Uppsala and Stockholm. Sundberg published a "continuation" of it in the form of the book *Från Ekelöf till Europa* (From Ekelöf to Europe: Sundberg 2004), where he discusses the significance of the European Convention on Human Rights for Swedish law.

sons (such as lawmakers, judges, and legal scholars), he argues that of all the sources, it is *customary* law—understood as close to "ordinary people"—that must be seen as fundamental relative to the others.[49]

21.3.3. Lars Hjerner (1922–2006)

Lars Hjerner,[50] professor of jurisprudence at Uppsala, also had resolute views on the new discipline, *Allmän rättslära*.[51] In fact, in 1963, in his inaugural lecture, he seized the opportunity to lay out in no uncertain terms what he saw as the current state of Swedish jurisprudence.[52]

Hjerner mentioned the intimate connection between jurisprudence, the philosophy of law, and the sociology of law. To be sure, he did see the need to discuss the "nature" of law, the concepts of valid law and of legal rights, and the function and effect of legal rules. But he did not see those as the only issues that jurisprudence should focus on, nor—in reply to Strömberg (1962a, 276)—should it be the main task of jurisprudence to bring the philosophy of law to bear on positive law: Such a task, Hjerner thought, would be "both too narrow and too exclusive" (Hjerner 1966, 578).

In his lecture, Hjerner opines that the three new chairs in jurisprudence had been created not specifically to address the scientific study of law but as "ordinary" chairs in law: Jurisprudence was meant to offer "deeper insight into legal method as well as into the similarities and differences between the various parts of the legal order" (ibid.; my translation).

The focus of the new discipline ought to be on questions of method common to *all* areas of legal activity, such as legal drafting and statutory interpretation.

As concerns legal education, jurisprudence ought to be concerned above all with legal method. Here, Hjerner was mainly referring not to the various

[49] On Jacob W. F. Sundberg's work, see generally Frändberg 2005, 386–7.

[50] Lars Hjerner was professor of civil law and international law at Stockholm University from 1958 to 1962. He then taught jurisprudence at Uppsala University from 1963 onward. He was succeeded by Professor Stig Strömholm in 1969.

[51] Lars Hjerner's inaugural lecture, held on October 12, 1963, was published under the title *Den allmänna rättsläran—ett nytt ämne och något om dess uppgifter* (Jurisprudence: A new discipline; A few words about its tasks, Hjerner 1966).

[52] Specifically, Hjerner called into doubt P. O. Ekelöf's teleological method of interpretation and A. V. Lundstedt's theory of social welfare (Hjerner 1966, 579–80). In Hjerner's view, the teleological method, "an outgrowth of social welfare and value nihilism," would result in a tendency to thrust into the background, and devaluate, the letter of the law in favour of what is conceived as the legislator's intention or as social welfare (Hjerner 1966, 580; my translation). Hjerner was also critical of American legal realism: Reducing the question of valid law to a prediction about the way the courts will act is, in his view, "not particularly realistic" (ibid., 581; my translation). In brief, Hjerner took the view that things had gone too far and that it was time to react: Legislation should be left to the legislator, while the courts should content themselves with applying the law. The letter of the law should be given a more prominent place, for, after all, "one cannot with impunity endow words with any meaning whatsoever" (ibid.; my translation).

methods of interpretation but to those skills one can expect from "a good lawyer" (ibid.). In the second place, jurisprudence ought to investigate the doctrine of the sources of law. A third task, finally, is to inquire into the rules for dealing with conflict of laws (ibid., 584).

In what concerns jurisprudence as a research discipline, Hjerner mentioned tasks of *immediate* practical significance for modern business life (such as the task of analyzing the current concept of contract) as well as tasks of *future* relevance: Here, he was thinking of "supranationalism" (ibid., 589) and the implications of the 1957 Treaty of Rome, establishing the European Economic Community.

Interestingly, there is an early "coherentist touch" to Hjerner's jurisprudential thinking. He hinted that it was time to recall the values embedded in natural-law theory, examples being the value of coherence in the legal order, the importance of understanding legal rules in relation to the system of rules as a whole, and the need to pay attention to historical development. In brief, Hjerner's "message" was, again, that we ought to recognize *continuity* within the legal order as a value in itself (ibid., 581).[53]

Not surprisingly, Hjerner's most important contribution to jurisprudence was on the question of method. As early as 1961, he published the course lectures titled *Om rättsfallstolkning* (Case interpretation: Hjerner 1961). The book came out in several editions (the last time in 1982) and was a mandatory reading in jurisprudence at both Uppsala University and Stockholm.

Lars Hjerner's successor to the chair in jurisprudence at Uppsala was Professor Stig Strömholm (1931–). During his tenure, from 1969 to 1982,[54] Strömholm wrote both extensively and manifoldly in jurisprudence. His major work in jurisprudence—titled *Om rätt, rättskällor och rättstillämpning* (On law, the sources of law, and the application of law: Strömholm 1981)—is an exhaustive and masterly treatment of the subject: It thus served as a mandatory reading at Uppsala from the autumn term of 1981 until the end of the century, and it went through five editions, the last one dating to 1996.

Strömholm's most significant work, even from an international perspective, is probably his famous contribution to the history of ideas in jurisprudence, namely, *A Short History of Legal Thinking in the West* (Strömholm 1985). As the author points out in the preface, the expression *legal thinking*—in distinction to both the philosophy of law and legal scholarship in general—ought to be understood as attempting to cover two elements, namely,

[53] These evaluative criteria, akin to the values that might be embedded in natural law, form part of the legal method propounded by Hjerner.

[54] In 1982, Strömholm left the chair of jurisprudence to become professor in civil law and international private law, at the same university, from 1982 to 1997. From 1989 to 1997, he was *Rector Magnificus* (vice chancellor) of Uppsala University.

not only theory-building about what the law is, as a body of rules [...] and an element of social organization and social realities, but also thinking about the principal problems raised by the exercise of the lawyer's craft, in particular those related to interpretation of statutes or precedents (Strömholm 1985, 5).

Spanning across Western jurisprudential thought from antiquity to the year 1900, this study in the history of jurisprudence focuses on fundamental ideas and outstanding writers (and consequently ought to be read together with a selection of original texts).[55]

21.4. Influences from 1960 to 2000

21.4.1. Strong and Abiding Influences

21.4.1.1. Anglo-Saxon Philosophy of Language

Modern Anglo-Saxon philosophy of language came to Sweden in two waves: The first one was American—it started in the 1920s, originating from the theory of fundamental legal conceptions developed by the American jurist Wesley Newcomb Hohfeld; the second one was English and started in the 1950s, originating from the ordinary language philosophy done at Oxford, which was then the locus of that sort of investigation.[56]

In what follows, I will first describe the early reception of Hohfeld's theory in Sweden through Manfred Moritz and the theory's further development by Stig Kanger and Lars Lindahl (Section 21.4.1.1.1), and then, having mentioned J. L. Austin's influence on Mats Furberg and Karl Olivecrona, I will look more closely at the way the philosophy of language "broke through" in Sweden with the work of Nils Jareborg (Section 21.4.1.1.2).

21.4.1.1.1. W. N. Hohfeld and His Theory of Basic Types of Rights

The American jurist W. N. Hohfeld (1879–1918) investigated legal language as used by the courts.[57] He became famous for introducing a conceptual framework within which to discuss what he called "changes in legal relations" (cf. L. Lindahl 1977, 193). His analyses were first published as articles from 1913 to 1917 and then, after his death in 1918, in book form under the title *Fundamental Legal Conceptions* (Hohfeld 1919). His aim was to arrive at "the lowest common denominators" of jural relations.

[55] Strömholm's many-sidedness is evidenced as well by his collection of essays (Strömholm 1979). Strömholm is also an accomplished belletristic writer, with over twenty novels to his name.

[56] In contrast to logical empiricism, whose inspiration was the early Wittgenstein's *Tractatus*, the Oxford school was inspired by his later philosophy, and in particular by his posthumous *Philosophical Investigations*, of 1953.

[57] In this section, I will be relying on the account of Hohfeld's theory in Eng 2007, 145–9.

Hohfeld wanted to arrive at a list of all possible relations between two legal persons. His basic thesis was that anything of legal relevance—including rights (*rättigheter* in Swedish)—can be expressed as aspects of this relation. In particular, it can be expressed through four relations he identified (Eng 2007, 145ff.).

His investigation accordingly starts out with a division of jural relations, analyzing on the one hand aspects of duty and on the other aspects of power.

In connection with the aspects of duty,[58] Hohfeld identified the following two main relations:

claim ("right")—duty
non-claim (no-right)—privilege

In connection with the aspects of power, he instead identified the following two main relations:

"power"—liability
disability—immunity

In sum, Hohfeld showed, first, that what we call rights can always be analyzed as claims, privileges, powers, or immunities (or as combinations of these) and, second, that a legal system correlates each of these elements with a certain normative modality in relation to another person: Always correlating with a claim is somebody else's duty; always correlating with a privilege is somebody else's no-claim; always correlating with a power is somebody else's liability; and always correlating with an immunity is somebody else's disability (see Eng 2007, 146; cf. L. Lindahl 1977, 25).

Hohfeld's analyses were greatly influential on legal theorists and lawyers alike. His project as stated—to identify the lowest common denominators in legal language, and specifically in the language of rights—was intriguing. Prominent among the Swedish legal philosophers who built on Hohfeld's theory were Manfred Moritz, Stig Kanger, and Lars Lindahl. Let us briefly consider them in turn.

Manfred Moritz (1909–1990) is responsible for introducing Hohfeld's theory to a Swedish audience: He did so with his book *Über Hohfelds System der juridischen Grundbegriffe* (On Hohfeld's system of fundamental legal concepts: Moritz 1960), where he analyzes Hohfeld's distinctions among different types of rights and explains his account of the relation between a claim and a duty.

Hohfeld's analysis of rights was further developed and refined by one of Sweden's most renowned logicians, Stig Kanger (1924–1988), who in a 1966

[58] The four concepts in this group are closely related to the concepts a right (to a service), obligation, and liberty in Bentham and Austin (cf. L. Lindahl 1977, 25).

article, *Rights and Parliamentarism* (Kanger and Kanger 1966, 86ff.), distinguished and defined eight "simple types of rights" and proceeded to set out the logical relations between them (ibid.). By combining these types of rights and their negations, and by eliminating all redundant or inconsistent combinations, Kanger arrived at twenty-six "atomic" types of rights, representing existing and more-complex legal positions (such as the position we find ourselves in as owners of an estate) (Kanger and Kanger 1966, 93ff.; cf. Frändberg 2005, 384).[59]

As for Lars Lindahl (1936–),[60] he has written in both jurisprudence and theoretical philosophy and is also the author of what has turned out to be one of the most impressive works in Swedish legal theory, namely, his doctoral dissertation, *Position and Change: A Study in Law and Logic* (L. Lindahl 1977).

As stated in the preface (ibid., VII), this work investigates an area of the general theory of law the author calls the "theory of *legal positions*." Lindahl—a disciple of Kanger—further develops here the logical tools made available by Kanger and applies them to *legal* acts (or acts in the law, such as forming a contract or making a will).

The book divides into two main parts. In Part 1 ("Basic Types of Legal Position"), Lindahl offers a survey of the theories of Bentham, Austin, Hohfeld, and Kanger with a view to situating his own theory of legal positions in its proper historical context.[61] With that done, he proceeds to set out his theory of basic types of legal positions (chapters 3–5). He constructs three basic systems of legal positions, namely, (*i*) the system for one-agent types, (*ii*) the system for individual two-agent types, and (*iii*) the system for collective two-agent types.

Lindahl's main interest, however, lies in analyzing not so much legal positions in themselves as their *changes*: A change in an individual's legal position may be brought about by some other agent, and the change is thus an act which in turn can be permitted, forbidden, and so on.

In Part 2 of the book ("Change of Position and Ranges of Legal Action"), Lindahl applies the systematization provided in Part 1 to the problems surrounding Hohfeld's theory of changes in existing legal relations (ibid., chaps. 6–5). The legal situation of one or more individuals can change in a number of ways, by virtue of a contract or a promise, for example. Situations of this sort raise the problem of the "dynamics" of legal positions (ibid., 65). This in turn clearly raises the problem of how to go about analyzing the concept of compe-

[59] On Kanger's theory of rights, see L. Lindahl 1994.

[60] At present, Lars Lindahl is emeritus professor of jurisprudence as well as associate professor of theoretical philosophy. He taught for many years at the law faculty of Lund University. In his active period, the course literature was modified with the addition of Simmonds 1988.

[61] "The theory for basic types of legal positions can be seen as a further development of Kanger's theory for atomic types of right" (L. Lindahl 1977, 85).

tence (or power), an issue that would later be investigated by Torben Spaak.[62] This final part of the theory of legal positions is developed by Lindahl (ibid., chap. 9) in the form of a theory of what he calls "ranges of legal action."[63]

21.4.1.1.2. "How to Do Things with Words"

In the view of the British philosopher of language J. L. Austin (1911–1960), much of what had traditionally been cultivated under the heading of philosophy was destined to be transformed into something he called linguistic phenomenology. As von Wright (1978, 193) has explained, what he had in mind was an empirical investigation into the conceptual—and hence logical—characteristics of our use of language.

Austin's most influential work is *How to Do Things with Words* (Austin 1962). Having introduced several types of sentences that, as he points out, can neither be true nor false, he closes in on one of these types—which he calls *performative utterances*, or simply *performatives*—and proceeds to analyze it.

Performatives have two characteristics: (*i*) although they may have the form of an indicative sentence, they are not used to *describe* things and are therefore neither true nor false, and (*ii*) when, in appropriate circumstances, we utter a performative, we are not just *saying* something but are *performing* a kind of action, one that Austin classifies as a speech act.[64]

One of Austin's most famous examples, which incidentally would make its way into the work of Karl Olivecrona (1971), is the following sentence (occurring in a will): "I give and bequeath my watch to my brother." This sentence is not meant to *describe* what the testator is doing but is rather being used to actually *do* it, that is, to bring something about, and in particular to make it so that the testator's brother will, at some future time, become the rightful owner of the watch.

J. L. Austin's philosophy drew the interest of Karl Olivecrona (1897–1980), who devoted intense study to it in the later stages of his career.[65] This can be appreciated, for example, in his well-known article *Legal Language and Reality* (Olivecrona 1962), where several pages are given over to Austin's (1961) performative utterances. And Austin's philosophy of language is given a promi-

[62] See Section 21.4.1.3.1; cf. Frändberg 2005, 389.

[63] Lindahl subsequently abandoned the assumption of a necessary correlation between one party's rights and a counterparty's duties, proposing a formal theory of rights that could explicate "sentences that cannot be well interpreted [...] in terms of the reconstructed notions of rights against a counterparty" (L. Lindahl 1994, 908). For a critique of the extension of the language of rights to a new domain, see Peczenik 1997, 319.

[64] A performative is an action that Austin would subsequently call an *illocutionary act*.

[65] Olivecrona held the chair in procedural law at Lund University until 1964. He continues to exert much influence in Sweden and abroad. On his life and work, see Chapter 14 in Tome 2 of this volume. In his study of speech act theory, he relied on Austin 1961.

nent place as well in the second edition of Olivecrona's major work, *Law as Fact* (Olivecrona 1971).

In Olivecrona's view, the sense of all performative statements is magical, their purpose being to create something immaterial:

> That which is held to be performed is the creation of a non-physical relationship or property through the pronouncing of some words. Such doings fall under the category of magic [...]. [Hägerström] spoke of magic where others now speak of performative utterances. (Olivecrona 1962, 174)

Also an early close investigator of Austin's philosophy of language in Sweden was Mats Furberg (1933–), who began teaching theoretical philosophy at Gothenburg in 1980. But it was much earlier that he turned to Austin, in his 1963 doctoral dissertation, titled (in translation) "Locutionary and Illocutionary Acts," a study he subsequently augmented and brought out in book form under the title *Saying and Meaning* (Furberg 1971).

In addition to Olivecrona and Furberg, there have been other Swedish thinkers who have closely studied the philosophy done at Oxford.[66] But in a strict sense, it was in 1969—through the work of Nils Jareborg (1938–)—that the philosophy of language first broke through in Swedish legal theory. This was the effect of his doctoral dissertation, which is titled *Handling och uppsåt* (Action and criminal intent: Jareborg 1969), and which incidentally also explains why the philosophy of language was influential in Swedish *criminal* law as well.[67] The overarching aim of his doctoral dissertation was to arrive at a way to form concepts that would be tenable in the sense of being practically applicable. In this work, Jareborg defines the *legal* concept of intent (*uppsåt* in Swedish) through a series of *non-legal* (or pre-legal) concepts—that is, concepts used in everyday language—such as the concepts of act, omission, purpose, insight, knowledge, possibility, and probability. Having done that, he sets out to analyze these (nonlegal) concepts in an investigation that takes up the bulk of the dissertation.

But Jareborg's dissertation was only a beginning. Already in 1974, he published another, perhaps still more important work inspired by the semantics of the Oxford school, namely, *Begrepp och brottsbeskrivning* (Concept and description of crime: Jareborg 1974).[68] Part 1 of this work offers a comprehensive overview of the basic ideas in modern semantics; Part 2 applies these ideas to the concept of crime, and in particular to the controversial principle in Swedish law that where the concept is not statutorily defined, the legislator leaves it

[66] Two examples are P. O. Ekelöf (1966) and Nils Herlitz (1963, 94ff.).

[67] In 1984 and 1985, before teaching criminal law, Jareborg was professor of jurisprudence at Uppsala University.

[68] As Madeleine Löfmarck observes in her review, in this book "there is very little of what traditionally falls under criminal law; the main part of the treatise is of a purely philosophical nature" (Löfmarck 1975, 748; my translation).

to the judge to decide what is to count as a crime in the statute in question, in an evaluation that is necessarily going to be subjective.

Finally, in his book *Värderingar* (Evaluations: Jareborg 1975), Jareborg undertakes an analysis of the "nature" of evaluative sentences (*värdeutsagor*). Clearly distancing himself from non-cognitivist and emotivist theories, he argues for the view that evaluative sentences have truth value.[69]

21.4.1.2. Formal Logic

A special school of analytical philosophy promotes the use of formal logic as an analytical tool (as logical empiricism had previously done). The first work in formal logic in Sweden was a 1950 dissertation by Sören Halldén titled *Några resultat i modal logik* (Some results in modal logic: Halldén 1950). Other prominent Swedish adherents of this school are Stig Kanger (1957), Dag Prawitz, Lars Lindahl, and Lennart Åqvist.

Stig Kanger (previously discussed in Section 21.4.1.1.1) used formal logic as an analytical tool and a model of representation. In a 1972 article titled *Law and Logic* (S. Kanger 1972), he addresses the question of how legal systems can be expressed in a way that is "logically well-written."

Together with Kanger and Åqvist, the philosopher and logician Dag Prawitz (1936–)[70] also belongs to the third generation in Swedish philosophy of law, a generation with a strong interest in formal logic. Prawitz's scholarly work essentially falls under the heading of formal logic, with a focus on the proof theory. Worthy of mention among Prawitz's works is the essay titled *Några filosofiska synpunkter på rationell argumentation i juridiken* (Some philosophical views on rational argumentation in the law: Prawitz 1985), where Prawitz argues that the meaning of what he calls spurious legal sentences (*oäkta rättssatser*) lies in what constitutes a correct argument for them; in doing so, he is drawing an analogy to what in mathematics are known as external statements (cf. Frändberg 2005, 384).

Since Lars Lindahl and his important work *Position and Change* (L. Lindahl 1977) have both been considered already, in connection with Hohfeld's theory (Section 21.4.1.1), we will now turn to Lennart Åqvist.

Lennart Åqvist (1932–)[71] is one of Sweden's most outstanding philosophers and logicians of the present time. His interests are directed not only to-

[69] "If one says that S is good, one is in fact saying that there are adequate reasons for the order 'Choose S!' And if one says that S is better than T, one is in fact saying that there are adequate reasons for the order 'Choose S over T!'" (Jareborg 1978, 132; my translation). In other words, one is describing a *state of affairs* (that there are adequate reasons) in a sentence that accordingly can be true or false.

[70] Prawitz was appointed professor of theoretical philosophy at Stockholm University in 1976.

[71] Åqvist received his Ph.D. in 1960 from Uppsala University, where he subsequently was associate professor of practical philosophy.

ward research in logics and semantics but also toward problems in the philosophy of language (as in Åqvist 1972) and in the philosophy of law.

Åqvist is unique in that much of his scholarly work is given over to the basic problems within specific branches of law, such as torts or the law of evidence. His foremost works include one on the law of torts, namely, *Kausalitet och culpaansvar inom en logiskt rekonstruerad skadeståndsrätt* (Causality and negligence in logically reconstructed tort law: An inquiry into analytic jurisprudence, Åqvist 1973), and another one he co-wrote with Philip Mullock titled *Causing Harm: A Logico-Legal Study* (Åqvist and Mullock 1989). Deserving mention among Åqvist's more recent works is a 2008 article titled *Some Logico-Semantical Themes in Karl Olivecrona's Philosophy of Law: A Non-Exegetical Approach* (Åqvist 2008).

21.4.1.3. Analytical Jurisprudence

By about 1960, logical empiricism had practically disappeared from the philosophical scene in Europe.[72] What remained, were the erstwhile "epicentres" (Cambridge and Oxford) and analytical jurisprudence.

One of Sweden's most prominent representatives of analytical jurisprudence is Åke Frändberg, who describes the main tasks of this school as follows: Analytical jurisprudence is concerned in the first place with the r*econstruction* of fundamental legal concepts, and in the second place with the study of judicial decision-making and legal reasoning (Frändberg 1973, 167). Reconstruction in general jurisprudence is conceived by him as an activity involving two steps: The first step consists in analyzing basic legal concepts, i.e., determining their meaning in actual legal discourse; only in the second step do we turn to the properly constructive part of the endeavour, where the attempt is "to work these concepts into a well-defined, consistent and smooth-running system built by analysis, and in such a way as to answer the needs of the special branches of legal science (civil law, criminal law, etc.)" (ibid.; my translation).

At both Uppsala and Lund, the tradition of analytical jurisprudence has been energetically kept alive by a younger generation, in the past as well as now.

At Uppsala, Torben Spaak made an impression with his doctoral dissertation, devoted to the concept of legal competence; and at Lund, Christian Dahlman and David Reidhav have made a name for themselves by excellent scholarly work, proving that the analytical tradition is alive and well even at Lund, for a long time the last outpost of the Uppsala school of philosophy.

[72] For political reasons, the most important members of the Vienna Circle had dispersed, many of them settling in the United States.

21.4.1.3.1. At Uppsala University: Åke Frändberg and Torben Spaak

Åke Frändberg (1937–) has been professor of jurisprudence at Uppsala since 1994,[73] and with his impressive scholarly output he is often considered the "grand old man" of Swedish jurisprudence.

Frändberg represents the analytical tradition in legal theory and places much emphasis on its (re)constructive endeavour. His scholarly interests have accordingly been directed in the first place at the formal (structural) properties of law, an aspect for which he has coined the term "morphology of law" (*rättsmorfologi*) (Frändberg 2005, 387ff.).

Frändberg wrote his doctoral dissertation in 1973 under the title *Om analog användning av rättsnormer* (On the analogical use of legal norms: Frändberg 1973). This treatise is a study in general analytical jurisprudence, where the author—using the apparatus of modern logic—analyzes some of the "ordinary" relations between legal norms (such as the relations of analogy and *a contrario*). It is the author's purpose to answer the question (essential in discussing the analogical use of legal norms) "What is the meaning of 'analogy' in legal discourse, and what use of the word is the most suitable?" (ibid., 169; my translation).[74]

A decade later, Frändberg published one of his most important works, titled *Rättsregel och rättsval* (The concept of a legal rule and choice of law: Frändberg 1984).

The purpose of this book is twofold: (*i*) to inquire into the concept of a legal rule as such (as concerns its meaning, use, and merits in legal discourse),[75] and (*ii*) to inquire into different kinds of conflicts between legal rules and between systems of legal rules.

Conflicts between legal rules *within* a legal system, are grouped by Frändberg (1984, chap. 3) into two classes, which he calls normative collision (*regelkollision*) and competition (*regelkonkurrens*). In Chapter 5 he deals with "intertemporal" legal problems, that is, problems arising when statutory provisions are changed by the legislator. Special attention is paid to problems concerning retrospective legislation.

According to Frändberg, legal rules are judgments, and so are

> a sort of abstract entity, the products of human thinking and, at the same time, tools for this thinking—not unlike figures in mathematics and cubes, circles, and triangles in geometry. (ibid., 44; my translation)

[73] He was also professor of jurisprudence at Stockholm in 1993 and 1994, when he moved to Uppsala University, also teaching the same subject.

[74] In constructing a general methodology capable of expressing his theory of analogies, Frändberg occasionally makes use of elementary set theory.

[75] Frändberg also analyzed a number of concepts appurtenant to that of legal rule. Examples are the concepts of observance, expedience, effectiveness, and validity of legal rules, the last one designating their being in force, where Frändberg (1984, 202) argues for a realistic concept of validity.

With respect to the complex issue of the validity of legal rules, Frändberg ventures to suggest the following distinction (which has been criticized by some):[76] Only in reference to rules actually applied should jurists use the expression "juridically valid legal rules"; when merely referring to rules supported by the doctrine of the sources of law, they ought to use instead the expression "juridically possible (conceivable, acceptable) legal rules," for on this doctrine "certain rules may, of course, be 'more possible' than others" (Frändberg 1984, 64).[77]

Worthy of mention, next to the aforementioned works by Frändberg, is a series of articles expressing his broad interest not only in concept formation (see, e.g., Frändberg 2009b) but also in the relation between law and the state, the *Rechtsstaat*, and legal certainty (see, e.g., Frändberg 1982, 1986a, 1986b, 1993, 2001). These are themes explored in Frändberg and Strömholm's anthology *Rättsteoretiska klassiker* (Classic works in legal theory: Frändberg and Strömholm's 1988).

Let us turn now to Torben Spaak (1960–). In his doctoral dissertation he sets out to explicate (i.e., reconstruct) the concept of legal competence (the work is accordingly titled *The Concept of Legal Competence*: Spaak 1994). Legal concepts are different from most other concepts, for they are intimately connected with norms and, in certain cases, with values as well (ibid., 46).

Taking as his point of departure what leading jurists and philosophers of law have said about competence, Spaak constructs a concept of competence that identifies "a lowest common denominator for said writers' conceptions" (ibid., 22). This concept of competence is defined in D.1, which also defines a legal consequence.

According to D.1, a person *p* "has the competence to change a legal position, LP, if and only if there is a C-act, *a*, such that *p* has the possibility, by performing *a*, of changing LP" (ibid.).

A person with competence has the possibility of changing legal positions and is himself in a legal position "by the very fact that he has competence" (ibid., 99). Spaak discusses three ways of understanding a competent person's possibility of changing legal positions: This may be construed as (*i*) a permission, (*ii*) a *practical* possibility, or (*iii*) a *hypothetical* possibility (ibid.). But it is only (*iii*) that applies: A competent person has a hypothetical possibility of changing legal positions. This idea can be expressed as follows: "*p* has the competence to change LP if and only if there is an *a* and an S such that *if p* in S performs *a*, and thus goes about it in the right way, *p will*, through *a*, change LP" (ibid., 100).

[76] One example is Aleksander Peczenik (Peczenik 1985) in his review of Frändberg 1984.

[77] Frändberg (2005, 388) explained that he conceived of himself as a normativist with respect to concepts such as legal rule and legal order, but that he nonetheless embraced a "realist" view of the concept of validity. This is a position that invariably recalls Ivar Strahl's (1941, 312) famous comment that even though he embraced normativism, he wished to "remain on realistic ground" (*Det oaktat vill jag stå på realistisk grund*).

In plain language, a person is competent to change another person's legal position if, and only if, there are an act and a situation to which the following applies: If the first person performs this act in this situation, and does so correctly, then he or she will thereby change the other person's legal position. As Spaak points out, this construction has the advantage "that the agent's competence is no longer dependent upon the situation" (ibid.).

But what is it, one might ask, that characterizes a C-act? This essential question is discussed by Spaak in Chapter 5 of the work, where he embraces MacCormick's idea that a C-act "is an act which for its legal effect is dependent on its being performed with a certain (actual or imputed) intention"(ibid., 126). As Spaak observes, one might actually understand this as a description of the old concept of "act in the law."

Spaak's investigations lead him to the conclusion that it is logically possible to reduce competence norms to fragments of duty-imposing norms addressed to legal officials within the legal order, but that we are not warranted in considering competence norms independent norms (ibid., 181).

Worthy of mention among Torben Spaak's other publications is *Guidance and Constraint* (Spaak 2007). He is also the author of several articles on legal positivism (Spaak 2004) and, last but not least, on Karl Olivecrona's philosophy of law.[78]

21.4.1.3.2. At Lund University: Christian Dahlman and David Reidhav

Also at the law faculty of Lund University, a younger generation of legal theorists succeeded in establishing themselves as the preservers of the tradition of analytical jurisprudence.

In 2008, Christian Dahlman (1970–) was appointed to the chair in jurisprudence. His doctoral dissertation (Dahlman 2000), on the issue of competing criteria of negligence,[79] is a treatise not so much in general jurisprudence as in the law of torts. But more significant—tackling an "old" problem with a new method—is a 2002 monograph titled *Objektiv moral—tro det den som vill* (Objective morality—believe it or not: Dahlman 2002), where Dahlman deals with the received (and in Sweden longstanding) opinion that objective morality is decisive for moral and legal philosophy, and in particular for the notion of the validity of law—whether or not there is actually such a thing as objective morality.

[78] See, for example, Spaak's recent article *Karl Olivecrona's Legal Philosophy: A Critical Appraisal* (Spaak 2011).

[79] Three criteria of negligence can be found in Swedish tort law. They are defined in terms of normality, efficiency, and safety and are used side by side despite their apparent incoherence, in that their definitions rest on incompatible moral and political theories. Dahlman shows that the way in which conflicts among the three criteria are solved can be observed to follow a clear pattern.

On the one hand, many embrace Hägerström's value nihilism, claiming that objective morality is an impossibility. On this view, the sentence "Abortion is immoral" lacks truth value and does nothing but express the speaker's feelings. On the other hand, there are those, like Ronald Dworkin, who have tried to show that it is untenable to claim that morality is subjective only.

Dahlman (2002, chap. 4) analyzes the relation between legal validity and the objectivity of morality. Specifically, he first identifies those issues that have to do with the validity of law—i.e., its normativity, legality, and legitimacy—and then proceeds to scrutinize these issues one by one so as to find out whether they are affected by the existence or non-existence of an objective morality and by peoples' belief or disbelief in such a morality. Dahlman's analysis shows that the objectivity of morality is completely irrelevant to the normativity and legality of law; as concerns its legitimacy, a certain connection does exist with objective morality, but it is of no practical importance.

In a concise and lucid way, Dahlman (ibid., 8) scrutinizes the arguments advanced by both parties,[80] arriving at the somewhat surprising conclusion that none of them are actually tenable: Neither the value nihilists nor their opponents have succeeded in proving the tenability of their respective "creed." Dahlman shows that the whole discussion on the objectivity of morality is based on a misunderstanding: Both sides assume that objective morality is essential to the "validity" of law, whether or not such a morality exists. But as Dahlman (ibid., 114ff.) shows, that assumption is mistaken: The existence or non-existence of an objective morality has no practical consequence whatsoever, either for the issue of law's validity nor for any kind of legal statement (ibid., 137).

Worthy of mention among Dahlman's published articles is his 2004 *Adjudicative and Epistemic Recognition* (Dahlman 2004), since it has significantly advanced our understanding of H. L. A. Hart's theory of the rule of recognition.

The article takes on the dilemma that cases like *Riggs v. Palmer* (1889) have raised for Hart (and other legal positivists), a dilemma that has led to the division between "inclusive" and "exclusive" legal positivists. Inclusive positivists deal with the dilemma in the same way as Hart did, that is, by rejecting the "strong" social facts thesis in favour of a "weak" one, while "exclusive" positivists insist that the rule of recognition is merely supervenient on social facts (ibid., 230).[81]

Dahlman wants to show that this purported dilemma is in fact no dilemma at all, since there is no conflict between the strong social facts thesis and the observation that the law "sometimes instructs the judge to recognize a norm as a part of the law because of its moral content" (ibid., 230).

[80] "It is not fashionable at the moment to embrace value nihilism. However, for all that has been levelled against value nihilism, there is nothing that says that a rational human being must absolutely abstain from it" (Dahlman 2002, 8; my translation).

[81] The latter position is exemplified in Himma 2002.

Dahlman's point is that we need to emphasize the crucial difference between *participating* in and *observing* the law, and to show that a norm can accordingly be "recognized" in two different senses: an adjudicative sense and an epistemic one. In the adjudicative sense, a norm is recognized by virtue of a court deciding "that the norm in question is valid according to the norms of adjudication that the court applies" (ibid., 231). Here "recognition" follows from certain norms of adjudication. In the epistemic sense, a norm is recognized by virtue of "the social fact that the norm is being practiced in the legal order can be observed" (ibid.). Here "recognition" is a matter of knowledge, that is, of ascertaining whether a norm is being practised as a matter of fact.

As Dahlman (ibid., 231ff.) argues, although Hart was perfectly aware of the distinction between participating in and observing the law, he failed to apply it when it came to the question of recognition. His theory of the rule of recognition was aimed at providing a *general* account of legal recognition, and so it overlooked the fundamental distinction between adjudicative and epistemic recognition: "The twofold nature of legal recognition cannot be captured in a one-sided theory" (ibid., 232).

Thus, there is no conflict between the strong social fact thesis and the weak one, since the former concerns epistemic recognition and the latter adjudicative recognition, and neither is any "weaker" or "stronger" than the other.

Even before being appointed to the chair in jurisprudence in 2008, Dahlman had published a textbook still in use in legal education at Lund (Dahlman 2010). Also, in co-operation with Marcus Glader and David Reidhav, Dahlman has written a textbook in Law and Economics (Dahlman, Glader, and Reidhav 2005).[82]

This takes us to David Reidhav (1970–). Although his doctoral dissertation was submitted in 2007, which means that he falls outside the period considered in this investigation,[83] he deserves to be mentioned in connection with the tradition of analytical jurisprudence and the present state of Swedish jurisprudential thought.

Reidhav's dissertation, titled *Reasoning by Analogy: A Study on Analogy-Based Arguments in Law* (Reidhav 2007)—a contribution to legal argumentation, or legal methodology—is an outstanding example of the path Swedish jurisprudence has been revisiting over the last few decades.

As stated in the introduction to this dissertation, its overarching purpose is to clarify, or explicate, reasoning by analogy in law, that is, to provide an account of it that is "as precise as possible, and adequate for decision-making in the context of legal systems" (ibid., 15). But reasoning by analogy is not

[82] For some time in the 1980s and 1990s, Law and Economics was taught together with jurisprudence and the history of law at Lund. A written examination could comprise all three subjects.

[83] The same applies even more to Lena Wahlberg, whose doctoral dissertation was submitted in 2010 (Wahlberg 2010).

unique to any particular legal system or area of law. What is more, although Reidhav concentrates on reasoning by analogy in the *law*, much of his work can be used in reasoning *outside* the law, too.

Reidhav's focus is on arguments, and in particular on "how arguments from analogy can be given as justification for judges' decisions" (ibid., 15). Having set out a framework for argument by analogy in law, Reidhav distinguishes several such ways of arguing, identifying a *form* for each of these ways. He thus examines what *reasons* can be given for preferring one way of arguing by analogy to another.

Finally, he proposes a *model* for analyzing and assessing these arguments. On this model (ibid., 176), arguments by analogy "are given a form so that they come out as *deductively valid* under a logical assessment" (ibid., 16). The model also makes it explicit what *principle* it is that underlies each argument and makes the reasoning plausible.

21.4.2. Transitory Influences

Although the programme in Swedish jurisprudence was not "shaken up" in any significant way in the period following the creation of the three chairs in that new discipline—that is, in the 1960s and for part of the 1970s—a few transitory influences did act on Swedish legal thought.

Intent on preserving the chronological order, I will first mention two influences that, while rather forceful in their day, cannot be said to have made any greater impact on Swedish jurisprudence—namely, rule scepticism (Section 21.4.2.1) and neo-Marxist legal theory (Section 21.4.2.2)—and then I will, going into greater detail, take up the transitory but important influence of coherentism (Section 21.4.2.3).

21.4.2.1. Rule Scepticism

The influence of rule scepticism on Swedish jurisprudence was intense but comparatively short-lived. This movement came to Sweden in the late 1960s, and one of its foremost representatives was Per Olof Bolding (1918–1997).[84] His book *Juridik och samhällsdebatt* (The law and open debate: Bolding 1968) appeared in the politically charged year 1968. Although it addressed fundamental issues in connection with the sources of law, it is primarily devoted to the jurist's role in society.

In Bolding's opinion, all jurists—judges, solicitors, law professors—should conceive of themselves as participating in an open societal debate; thus, for example, jurists should co-operate much more with sociologists. But the co-operation he envisions is severely undermined by the juristic way of thinking

[84] Per Olof Bolding was professor in procedural law at Lund University from 1964 to 1983.

as well as by the specifically juristic technique of argumentation, and so he embarks on an endeavour to refashion the legal method radically. Specifically, he urges us to do away with the concept of a legal rule in legal reasoning and replace traditional teleological interpretation with what he describes as "an extremely cautious" mode of interpretation. This is a strictly linguistic interpretation, and it is completed as soon as the judge has established which meanings of the rule in question are consistent with its language.

Obviously, this type of interpretation cannot answer the question, *which* solution ought to be chosen? After all, there may be more than one interpretation that can be defended linguistically. Before making that decision, the judge must consider *other* sources of law (such as legal practice) *and* must take socio-political considerations into account. It is this last point in particular that Bolding is especially sensitive to: *General societal considerations* ought to stand by themselves—they should *not* be encased into statutory interpretation or in the doctrine of precedent.

Bolding takes one more step, however. In his view, an open discussion of societal considerations ought to be the *first* phase in legal reasoning: "Traditional" sources of law can wait—Bolding seems to think—until the judge has settled on a "preliminary" view of how the case in question ought to be decided. This way of proceeding goes under the label of "Bolding's open model" (see Bolding 1968, 85ff.): The judge initially ought to disregard traditional sources of law, instead engaging in an open and unbiased debate in which sociologists, for example, can easily participate. What actually takes place, therefore, is a "weighing" between two types of claims: those that spring from social concerns and those grounded in the traditional sources of law. But as Strömholm (1969, 657) aptly points out in his review of Bolding's book,[85] Bolding appears to disregard that there is a relevant distinction between evaluations *de lege lata* and *de lege ferenda*.

In summary, Bolding seeks to craft a jurisprudence alert to the concerns of his time, a jurisprudence sensitive to a changing society. He thus foregrounds sociology and gives it precedence over the law (*juridiken*), which in his view is at bottom a kind of "applied sociology" (Bolding 1968, 87; cf. Frändberg 2005, 383).

21.4.2.2. Coherentism

Although many legal thinkers in Sweden have taken an interest in the concept of coherence, it was only Aleksander Peczenik (1937–2005) who consistently made use of this concept in working out a theory of the ultimate justification of legal argumentation.[86]

[85] Interestingly, Bolding's book and Strömholm's review figured as optional readings in the syllabus at Uppsala throughout the 1970s.

[86] On Peczenik see also Section 25.6 in Tome 2 of this volume.

The coherentist theory of law developed by Peczenik (1998, 13) is a theory about normative and valuative statements (i.e., statements expressing norms and values, respectively). These are distinguished into (*i*) prima facie and (*ii*) all-things-considered normative and valuative statements, in a theory at once cognitivist, as regards the former, and noncognitivist, as regards the latter: The former are *true* if they correspond to a society's cultural heritage; the latter are *not true* in an ontological sense, but they may be more or less *reasonable* in light of an individual's acceptance and preference system.

Thus, whereas prima facie values can be an object of *knowledge*, a well-argued belief about all-things-considered values merely expresses "something essentially similar to knowledge, not knowledge in the literal sense" (ibid.).[87]

In 1978, Peczenik succeeded to the chair in jurisprudence at Lund University, a position he would hold until his retirement in 2004. During the twenty-six years of his professorship, his views on law found expression in a host of monographs and articles.[88]

From the very beginning of his career in Sweden, his efforts were mainly directed at a coherent reconstruction of legal reasoning and a justification of legal argumentation, appealing to deeper, more speculative philosophy only as a tool by which to better understand how lawyers think.[89]

According to Peczenik, legal argumentation is a special case of moral argumentation. What is special is that an individual engaged in legal argumentation

> enters a particular social role, the role of a lawyer and—within it—a particular role of a judge, attorney, constructive legal researcher (a "dogmatician"), critic of the law, etc. Each role has moral consequences. Within each role, the lawyer must create a pocket of coherence. (Peczenik 1998, 14)[90]

Peczenik devoted many years of his career to investigating how knowledge of a morally justified interpretation of law might be possible, and he arrived at the conclusion that both norm- and value-encapsulating statements in legal argumentation can indeed be well grounded and are consequently not mere expressions of feelings (as the Scandinavian realists had maintained). "Well grounded"—how? What *is* the basis of legal justification?[91]

[87] Peczenik (1998, 13–4) comments that, even though he cannot be sure about the soundness of this theory, it still appears to him to be "more reasonable" than its competitors, namely, foundationalism and scepticism.

[88] For biographical data and the milestones in Peczenik's career, see Alexy 2006b; for a bibliography, see Bindreiter 2006.

[89] As Peczenik comments, "almost all legal thinking is defeasible, outweighable and justifiable by recourse to coherence. Legal doctrine is the most elaborated form of legal thinking" (Peczenik 2005b, 4).

[90] The expression "pockets of coherence" was coined by Joseph Raz in 1994.

[91] This was the title of Peczenik's doctoral dissertation in philosophy (Peczenik 1983).

In developing his coherentist theory of law,[92] Peczenik drew much inspiration from the work of Keith Lehrer (1990, 1997), who argues that whatever is justifiable is justifiable on the basis of one's background system of beliefs, or what Lehrer calls acceptances and preferences (Peczenik 1998, 11; Lehrer 1997, 3). But Peczenik had occupied himself with the concept of coherence long before Lehrer came onto the scene:[93] In one of his last manuscripts, Peczenik (2005b, 4) commented that his theory had been influenced by Jerzy Wróblewski, Aulis Aarnio, Robert Alexy, and Jaap Hage in that order.[94]

With Robert Alexy, Peczenik published an important article in 1990 (Alexy and Peczenik 1990), in which the analytical connections between justification, coherence, rationality, and correctness are identified.[95] In this context, the authors develop a series of coherence criteria, stating the *concept* of coherence as follows: "The more the statements belonging to a given theory approximate a perfect supportive structure, the more coherent the theory" (ibid., 131). Logical consistency is a necessary but not a sufficient condition of coherence. There are some additional interrelated criteria of coherence that Alexy and Peczenik identify by arguing that a theory's degree of coherence depends on such factors as

(*a*) how many supported statements belong to the theory;
(*b*) how complex the webs of supportive reasons are that belong to it;
(*c*) how many universal statements belong to it;
(*d*) how many general concepts belong to it, and how high a degree of generality they exhibit; and
(*e*) how many cases and fields of life the theory covers (Alexy and Peczenik 1990, 132–41; cf. Peczenik 2005a, 146).

Coherence is a matter of degree, and the *degree* of coherence is determined by weighing and balancing these criteria. As Peczenik points out, his use of the idea of weighing is not formal or logical but rather "holistic" (ibid.), and in his weighing and balancing he relies on John Rawls's idea of reflective equilibrium.

[92] Although it would be a stretch to say that Peczenik's coherentist theory comes in different "varieties," there is no doubt that over the course of about two decades, he did modify his views, at least insofar as his focus shifted to different philosophical issues.

[93] The concept of coherence, and the accompanying one of support, had previously been addressed in Peczenik 1983.

[94] On Wroblewski see Section 16.3.3 in this tome. On Aarnio see Section 25.5 in Tome 2 of this volume. On Alexy, see Sections 10.3.2.2 and 10.4.3.1 in this tome, and Sections 1.5.4.1, 10.3, and 25.4 in Tome 2 of this volume.

[95] This relation is expressed by the authors in the following way: "If the norm- or value-system in question is more coherent than any competing system, then it is *prima facie* better justified and more rational than any competing system. If the norm- or value-system in question is more coherent than any competing system, then there exists a *prima facie* reason that it is correct" (Alexy and Peczenik 1990, 144).

Reflective equilibrium in morality is achieved by revising general principles in light of individual moral convictions and vice versa. Principles and individual convictions both wind up being modified to the extent that they support each other: Sometimes a principle will come out in front of an individual conviction; other times it will be the other way around (see Peczenik 1997, 313). According to Peczenik, this procedure is reasonable and increases the coherence of argumentation (ibid., 314): It is reasonable to state that

> the ultimate step of moral reasoning is determined by an individual's personal preferences and feelings, within the flexible and ever changing framework of the cultural heritage [referring to Peczenik 1995a, 439ff., 652ff.]. [...] In other words, the cultural heritage decides what *prima-facie* moral and legal reasons are. (Peczenik 1997, 318)

In *legal* justification, reflective equilibrium takes a specific form: It is at once wide, constrained,[96] and segmented, and it coalesces, not around precise ideas, but around commonly accepted "platitudes," as Peczenik calls them (Peczenik 2005b, 5–6),[97] such as that the law should be just (Peczenik 2005a, 150).[98] All the constraints on reflective equilibrium in the law "are ultimately justifiable by recourse to a total system of acceptances and preferences" (Peczenik 2005b, 6, with reference to Hage 2004).

In Peczenik's view, although the theory of reflective equilibrium in law is complex, its aim is simple, insofar as it recognizes that the reasoning of lawyers must keep within the limits outlined by the political system. On the other hand, the theory also recognizes that lawyers in general, and writers on law in particular, "may and should re-work the law in the most rational manner. Only by following the requirements of rationality, legal reasoning can achieve both harmony and justice" (Peczenik 2005b, 6).

The criticisms that over time have been levelled at Peczenik's coherentist theory can for the most part be grouped into two broad classes: They point out the theory's part descriptive, part normative status (see Frändberg 2000, a review of Peczenik 1995a and 1995b), or they take issue with its circularity. In this latter regard, Peczenik certainly admits the circularity of a coherentist justification (see Peczenik 1997, 316). In his view, the only way out consists in admitting that coherentism

[96] This means that legal scholars are not free to adjust principles and judgments to one another at will: This must be done within the framework of the law (Peczenik 2005b, 6).

[97] The reason for this role accorded to platitudes is that the criteria of coherence need to be *general*, that is, applicable to all coherent theories, and that is possible "only because these criteria are not precise. They are platitudes of a kind similar to that found in moral theory" (Peczenik 2005a, 147).

[98] Platitudes do not just come into play in connection with the law: They also shape our ideas about the objectivity of moral judgments, the relation between the moral and the natural, and substance of morality (in this last respect, they are about the concern and respect we should show for other persons). See Peczenik 2005b, 6, referring to Smith 1994, 39ff.

is based on general, philosophical, and in a sense foundationalist, assumptions [...] at least the following weak assumption is (not proved but) reasonable: If a theory can be made highly coherent, then there exists something in the world, some "truth-makers" which decide about this possibility. A stronger, and thus more controversial assumption may be considered, too: *Ceteris paribus,* the more coherent a theory, the closer it corresponds to what is the case. Needless to say *that such assumptions are* (*and perhaps even must be*) *controversial.* (ibid., 317)

And as concerns the status of the theory, Peczenik points out that, on the one hand, the theory is *descriptive*—not normative—when it states what *is* the case, but at the same time, "it is also normatively recommended by the author as legally correct. In other words, my theory not only describes legal doctrine but, being partly descriptive, partly normative, itself belongs to general legal doctrine" (Peczenik 2005b, 5).

In 2004, after twenty-six years of professorship, Aleksander Peczenik could look back on the following achievements.

In developing a coherentist theory of law, Peczenik moved away from the philosophical heritage of Karl Olivecrona and Tore Strömberg and sought to chart a middle course between natural-law theory and legal positivism, an effort that, in his own words, took him back to the "spirit" of natural-law theory (see Peczenik 1998, 9).

Along the way he wrote a range of monographs, among which four textbooks in jurisprudence, two of which have reached a second edition. The more recent of these textbooks was titled *Juridikens teori och metod: En introduktion till allmän rättslära* (On the theory and method of law: An introduction to jurisprudence, Peczenik 1995b) and was a concise version of his magnum opus of the same year, namely, his comprehensive monograph *Vad är rätt? Om demokrati, rättssäkerhet, etik och juridisk argumentation* (What is law? On democracy, legal certainty, ethics, and legal argumentation: Peczenik 1995a).

Finally, one must not forget that Aleksander Peczenik, as incumbent of the chair in jurisprudence at Lund University, never lost sight of two commitments: The first was to maintain the tradition of sustaining an open intellectual exchange with the Institute of Philosophy at Lund; the second was to stimulate doctoral students in jurisprudence by organizing yearly seminars at the three major law faculties.[99]

21.4.3. Other Influences

Rule scepticism and coherentism were of course not the only influences on Swedish jurisprudence in the period from 1960 to 2000: A more or less transitory influence was exerted as well by other international philosophical trends,

[99] Fortunately, both traditions are being kept up by the present incumbent of the chair in jurisprudence at Lund, the previously discussed Christian Dahlman (Section 21.4.1.3.2).

especially Critical Legal Studies, Law and Economics, various forms of deconstructivist and discourse theory. But most of these movements do not meet the two criteria previously stated at footnote 6 for inclusion in this survey of Swedish jurisprudence.

So, in what follows, I will restrict myself to two international movements that have had or continue to have some influence on Swedish jurisprudence, each in its own way, namely, feminist and neo-Marxist legal theory, both of them part of the broader current of Critical Legal Theory.

Critical Legal Theory encompasses not only Marxism and feminist legal theory but also Critical Legal Studies, since these movements share at least three common denominators: First, they all take as their point of departure the view that in society there obtain some basic incongruities created by society itself through its own organization; second, they all assume that the existing societal order is maintained through societal structures, that is, through invisible principles that define boundaries for social practices;[100] and, third, they are all more or less radical in outlook.

21.4.3.1. Feminist Legal Theory

From the 1980s onward, the writings of Carol Gilligan, Catharine MacKinnon, Judith Butler, and Carol Smart, among others, have been of immense importance to the feminist movement in general. In Sweden, their work gave impetus to what in the 1990s would establish itself as Swedish feminist jurisprudence, spawning a flurry of promising new research projects.

The only work so far done in this line of inquiry in jurisprudence as such in Sweden is Eva-Maria Svensson's[101] doctoral dissertation, *Genus och rätt: En problematisering av föreställningen om rätten* (Gender and law: A problematizing of the concept of law, Svensson 1997), which develops a theory that attempts to combine traditional gender theory with a dynamic conception of gender.

However, there are several doctoral dissertations that apply a feminist perspective within special areas of the law. I will mention five outstanding ones in chronological order: In tax law, there is Åsa Gunnarsson's *Skatterättvisa* (Tax equity: Gunnarsson 1995).[102] Investigating gender equality in EU law is Karin Lundström 1999. In labour law there is Susanne Fransson's (2000) *Lönediskriminering* (Wage discrimination: Fransson 2000). In criminal law, Ulrika Andersson (2004) carried out a gender-theoretical analysis of legal protection

[100] Structures come into view in the way that different societal functions unfold (cf. Hydén 1978, 388).

[101] Eva-Maria Svensson is Professor in Law at the School of Business, Economics and Law, University of Gothenburg.

[102] Åsa Gunnarsson is professor at the *Juridiskt Forum* of the University of Umeå.

against sexual abuse. And, also in criminal law, there is Monica Burman, *Straffrätt och mäns våld mot kvinnor* (Criminal law and men's violence against women: Burman 2007).

21.4.3.2. Neo-Marxist Legal Theory

In retrospect, it is not easy to pin down exactly how or when, or even *whether*, neo-Marxist legal theory has influenced Swedish jurisprudence. According to Frändberg (2005, 390), among others, the influence was minimal.

Even so, neo-Marxism—which flourished in Europe (and Sweden) in the 1960s and 1970s—did exert some influence on a well-known doctoral dissertation in jurisprudence whose merits have been acknowledged in several works (such as Strömberg 1978). Its author is Dag Victor and its title *Rättssystem och vetenskap: Studier kring en analysmodell för ideologiska system* (Legal systems and science: Studies on an analytic model for ideological systems, D. Victor 1977).

The work divides into two main parts. Part 1 deals with the issue of what can be required of an activity if it is to count as "scientific." According to Victor, the most important requirement is that the activity have an object existing in reality. Part 2, on the other hand, deals with the issue of the extent to which legal dogmatics can be said to have such an object, and the claim is that it does have such a real object, which is said to lie in social ideology.

The definition of this object forms the basis of Victor's construction of what he calls "a model for analyzing legal systems." Two essential elements of this model are the concepts of structural agreement and disagreement (*enighet och oenighet*), which go back to Jean Piaget, the originator of structuralism, who is a source of inspiration to Victor, as are many other thinkers, including Aristotle, Karl Popper, and Karl Marx.

In constructing his model for analyzing legal systems, Victor puts forward the thesis of "structural disagreement," in this way anticipating Niklas Luhmann's theory of autopoietic law and the idea of binary codes.[103]

21.5. Closing Remarks

As has emerged from the foregoing discussion in Sections 21.2, 21.3, and 21.4, of all the major philosophical movements at an international level that in various ways have shaped Swedish jurisprudence, those whose influence has been more or less continuous are analytical philosophy, Anglo-Saxon philosophy of language, formal logics, and analytical jurisprudence, resulting in well-known

[103] Another outstanding doctoral dissertation inspired by Marxist thought is (aside from Dag Victor's) Håkan Hydén 1978. The reason why I am not discussing it is that, although it was completed at Lund University, it was submitted not at the law faculty but at the faculty of social sciences at Lund University.

monographs, articles, and doctoral dissertations, some of which are still regarded as milestones in Swedish jurisprudence (this holds in particular for Wedberg 1951, Jareborg 1974, L. Lindahl 1977, Frändberg 1984, and Spaak 1994). Other influences, as we saw, turned out to have less staying power: This is true especially of logical empiricism and rule scepticism, and to some extent of coherentism as well, though this last approach was taught and disseminated for some time.

The comments that follow take their cue from the earlier discussion in Section 21.3, which suggests that the scholars who initially held the three newly created chairs in jurisprudence—professors Strömberg, Agge and Hjerner—were all of one mind. This is true as concerns their view of the "nature" of the new discipline, which they all understood as having been carved out, as it were, from the main body of what in Sweden is called legal science, thus leading to a division of labour. But as far as the functions of the newborn discipline are concerned, there was no unanimity among the three professors.

At Lund University, Tore Strömberg (1962a, 276) did not think this carving out in any way undermined the "scientificity" of the new discipline. In his view, what had been effected was merely a *formal* separation from the philosophy of law: The primary function of jurisprudence must still consist in bringing the philosophy of law to bear on the study of law (*juridiken*). How? Through a scholarly approach to the fundamental problems of law—scholarly in Hägerström's sense—by explaining, further developing, and revising the systematicity of the law, as well as by providing a comprehensive survey of the legal order.

In short, the legal scientist, following Strömberg's guidelines, would be restricted to describing, analyzing, and systematizing the law. Which is exactly what happened.[104]

According to Ivar Agge at Stockholm, the two most important tasks for jurisprudence were legal methodology and the co-ordination of the study of law and other branches of science. With respect to the latter, Agge was outspoken and open-minded. While he cautioned against the dangers of too close a contact with the strictly empirical sociology of law and assigned to jurisprudence the role of an observation post, he was sympathetic to the idea that Swedish jurisprudence should leave her fettered existence behind—fettered, that is, by what Agge called the scientific realism prescribed by the Uppsala school—so as to open up to more-modern and promising philosophical trends.

However, Agge did not anticipate the lingering stubbornness of a once dominant and all-pervasive force in Swedish legal life—the philosophy of the Uppsala school. His fears of a "sterile" Swedish legal science (cf. Agge 1955, 4) were only too justified.

[104] In the 1960s and 1970s, a number of frustrated Swedish law professors began to question the "scientific" nature of their own work and decided to forsake jurisprudence for legal sociology, among other research areas.

A slightly different note was finally struck at Uppsala in the inaugural lecture delivered by Lars Hjerner, who emphasized the *practical* role of jurisprudence: As an academic discipline, he thought, jurisprudence should focus on the teaching of a legal method, while as a research discipline, it should take on issues of more or less immediate practical significance.

In retrospect, Hjerner's vision can be said to have been realized, at least in part. For on the one hand there is no denying that each of the three major law faculties left it to the professors holding the chair in jurisprudence to define the specific contents of the broad (and rather vague) guidelines set out in the course syllabus, but on the other hand the discipline at all three faculties wound up giving great weight to the study of legal method.

What is more, Hjerner was also correct in predicting that jurisprudence would come to play an important role in European integration, and in particular in Sweden's accession to the European Union.

Let us now briefly go back to the philosophical influences that have emerged as strong and abiding, producing a series of well-known publications. A closer look at these influences suggests two questions:

(*i*) Why did these influences, strong as they were, not have a *more direct and immediate* impact?[105] and
(*ii*) Why did analytical philosophy, despite its temporary intermissions, manage to hold sway over Swedish legal thinking throughout the greater part of the 20th century?

At first glance, these two questions do not seem to have much in common. In my view, however, there is a single answer that explains both.

The first question can be answered by pointing out that, as much as Swedish jurisprudence did change course, beginning in the 1940s, by moving away from the Uppsala school and from Scandinavian realism in its initial form, the latter approach has never entirely been defeated. In short, it cannot be denied that at least some of Hägerström's achievements, though not his ontology, have survived to this day (and, one might add, that they continue to attract consid-

[105] This also applies to jurisprudence as an academic discipline. At the law faculty of Lund University, for example, it was at a comparatively late stage that students in jurisprudence were introduced to theories like Hart's and Dworkin's. In 1988, Simmonds 1988 was added to the syllabus at the urging of the then associate professor Lars Lindahl (who had done the Swedish translation). Considering that H. L. A. Hart's major work—*The Concept of Law*—appeared much earlier (in 1961), and that several prominent Swedish authors had found it well worthy of attention, it is astonishing that law students at Lund University were not encouraged to study it more or less immediately. In this respect, the law faculty of Uppsala University was decidedly more up to date, where the work was introduced as a suggested reading in the syllabus from the autumn term of 1970. Also a suggested reading at Uppsala was Ronald Dworkin's article *Is Law a System of Rules?* (Dworkin 1968). As concerns the required literature, students could choose among excerpts from Olivecrona 1966, Ross 1953, Strömberg 1962b (4th ed. 1970), and Hedenius 1963.

erable attention).[106] And in light of this state of affairs, the philosophy done at Uppsala cannot be said to have at any time been entirely "displaced" by any other school of thought, no matter how strong the intervening influence.

But something to the same effect can be said in answer to the *second* question, too: The reason why Swedish analytical philosophy managed to retain its position (in the long run becoming an integral part of this movement on an international level) is *precisely* that there was no radical "breaking away" from the Uppsala school, but only a smooth transitioning based on a common denominator, namely, *conceptual analysis*.

When the nestor of Swedish analytic philosophy, Konrad Marc-Wogau, looked back on his career in 1951, he admitted that he was still holding on to three tenets of the Uppsala school: its anti-metaphysical stance, its critique of idealism, and especially the view that the province of philosophy lay in conceptual analysis.[107] Unwittingly, Marc-Wogau thereby gave expression to the leitmotif that runs through the spiritual development of 20th-century Swedish jurisprudence, namely, tradition and innovation amicably proceeding hand in hand.

[106] A good example is Dahlman 2002.
[107] Marc-Wogau, in Ahlberg 1951, 121ff. (mentioned in Nordin 1984, 156ff.).

Chapter 22

20TH-CENTURY LEGAL PHILOSOPHY IN DENMARK

by Henrik Palmer Olsen

22.1. Introduction: Danish Jurisprudence before the 20th Century

No adequate understanding of Danish legal philosophy in the 20th century can be arrived at, particularly as concerns the first part of that century, without some background knowledge of Danish legal philosophy in the 19th century. This is especially so with the important and influential work of Anders Sandøe Ørsted (1768–1860)[1] and with the two-volume dissertation on legal philosophy by Carl Goos (1835–1917), published at the turn of the century.

As the first truly important legal scientist in Denmark, Ørsted is still very much revered among Danish legal scholars,[2] and since his death in 1860 his work has continued to draw much admiration. His influence is primarily owed to his ability to address legal issues as practical regulatory problems. To contemporary eyes, this may not look like a particularly significant or remarkable feat, but in the context of early 19th-century law and politics it was an innovatively engaged approach to analysis. Indeed, legal scholarship at the time was by and large philosophically oriented and mostly speculative. Inspired mostly by German philosophy and influenced politically by the existing absolutist monarchy,[3] most legal "science" was conducted in the form of abstract considerations on how the law could best be seen as a product of monarchical wisdom and the laws of reason. It was controversial to take an interest in the

[1] Anders Sandøe Ørsted was the brother of the famous Danish physician H. C. Ørsted.

[2] It should be noted, however, that Anders Sandøe Ørsted never held a formal position in any university. As was not unusual at the time, Ørsted held a number of public and private offices, but he did not occupy a position as a law professor. Ørsted's publications was therefore not written from the position of chair at the law faculty, but was a result of his own private undertakings. In spite of that, his contributions to legal science are widely acknowledged as unique and many see Ørsted as the founder of legal science proper in Denmark. Attesting to that fact is a three-volume tribute to Ørsted published only twenty-five years after his death (Goos et al. 1885–1906). In this tribute, he is unanimously characterised as the founder of legal science in Denmark. His influence also extended beyond Denmark, primarily in Norway (Blandhol 2005, 211ff.; Larsen 2006, 247–9). Ørsted's work remains unknown outside Scandinavia, as he only ever published in Danish.

[3] Denmark was ruled as an absolute monarchy until 1849, when the king introduced a constitution, which gave some participation in legislative competence to a democratically elected parliament. The king however retained full control over the government until 1901, and since legislation could not be enacted without the consent of the king, he retained signifcant political power all through the 19th century.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_22

way legal issues were actually decided in the courts or by other branches of government. Not only was it unorthodox from the point of view of traditional natural law, but it was also contentious from a political point of view, since it challenged the existing one-way communication between the king and his courts.[4] Nevertheless, for Ørsted—who had had a career in the courts and in civil service before turning to academic legal research[5]—an intimate connection existed between legal science and legal practice. Ørsted was concerned to emphasize the role of legal science in providing a firm methodological framework for legal inquiry, thereby providing a bulwark against abstract legal opinions that did not sufficiently take into consideration the actual social practices in which the legal rules and principles is supposed to operate (see further details in Larsen 2006, 23). Legal science, Ørsted maintained, should provide the law with a foundation of certainty, without which there would be no law at all, and he emphasized that such certainty could not be provided by an *a priori* natural law. He explicitly rejected "abstract philosophy" in favour of an approach to legal inquiry that sought a thorough knowledge of statutory instruments and their historical origins, as well as an intimate acquaintance with the practical problems these instruments were meant to solve (ibid.).

In a recent doctoral dissertation, Sverre Blandhol characterizes this approach to legal science as an early forerunner of legal realism and philosophical pragmatism (Blandhol 2005). As Blandhol argues, Ørsted's legal thinking can distinctively be described as resting on three basic elements, namely, (*i*) his anti-formalism (the view that practical legal problems evolve with and are coloured by the social and economic development of the time and cannot be fixed in any set of legal forms), (*ii*) his anti-foundationalism and pluralism (the view that the law cannot be understood as a single, unified, coherent system with a common ground but emerges from a society's actual socioeconomic conditions), and (*iii*) a focus on real, experienced legal problems, with a view to understanding the practical underpinnings of these problems as well as their possible solution. Whether, as Blandhol suggests, Ørsted should properly be considered a forerunner of American realism and pragmatism is debatable.[6] Consistent with that thesis is Ørsted's refusal to adopt or develop a unified

[4] At the time, court decisions were not being published in Denmark. Ørsted has to be credited for having initiated a systematic publication of Danish court decisions, but it was only after his death, in 1867, that publication of court decisions became more institutionalised, with the publication of the law journal *Ugeskrift for Retsvæsen* (Weekly journal of legal affairs).

[5] Ørsted began his legal career as a judge, and in 1810 he made it all the way to the Supreme Court. In 1825, he was appointed chief legal adviser to the royal government (*Generalprokurør*), and in that capacity he was responsible for drafting new legislation. He served as prime minister to the royal government in the early years after the 1849 constitution, which abolished the absolute monarchy in Denmark.

[6] Blandhol traces the pragmatic approach to legal reason all the way back to Cicero (Blandhol 2005).

system, choosing to instead address practical legal problems as they emerge in real-life legal practice—but as mentioned above he published only in Danish, and it is unlikely therefore that his thought travelled beyond Scandinavia (see footnote 2). It is fair to say, however, that within Scandinavia, and particularly in Denmark, his work has been influential and a source of inspiration for later legal science. Ørsted's themes can clearly be detected at the turn of the 19th century in the work of Viggo Bentzon.

22.2. Viggo Bentzon: From Normative Systems to Judicial Discretion

Viggo Bentzon (1861–1937) was a professor of maritime law at the University of Copenhagen, but he taught a wide range of subjects, including the law of persons, family law, the law of succession, and jurisprudence. He took particular interest in how law was taught at the university and was centrally involved in reforming the study of law by steering it in a more practical and problem-oriented direction. As part of this effort he developed a theory of law which placed judicial decision-making at the centre of didactical attention.

When Bentzon was appointed professor of maritime law in 1892, he was at the same time assigned the task of teaching jurisprudence to law students. As was customary at the time, in the first years of his tenure he followed his predecessor's course outline and textbook material. In Bentzon's case, that was the two-volume work *Forelæsninger over den Almindelige Retslære* (Lectures in general jurisprudence: Goos et al. 1885, 1894).[7]

Goos was much admired in his own time both as a lawyer and as a conservative politician. His two-volume work on general jurisprudence is long (almost 1,200 pages) and meticulous. In this work he did not just portray law as a general phenomenon and describe its relation to morality and justice and to problems in the theory of sources of law: He also set out his own view of natural law in a detailed and comprehensive fashion. In the introduction to this work (Goos et al. 1885, 2ff.), Goos commented that one might well choose to develop an account of law mainly concerned with describing the basic elements of the existing positive law as well as its history, but that such an approach would yield merely a "theoretical" understanding of the subject matter. Here Goos took up Kant's distinction between theoretical and practical reason (between knowing what *is* the case and what *ought to* be the case), and no doubt his point was that an approach of the kind he identified would not afford a full and proper understanding of law. He then observed that one could instead pursue a theory of ethical jurisprudence (in effect a theory of natural law); a theory which would set out the practical requirements for something to rank as "Good Law," and which would be aimed at setting standards for

[7] In 1891, Goos was appointed minister for education and the church (*Kultusminister*), and at that point he gave up his position at the faculty.

existing and future positive law (i.e., the law created by an act of will). This latter endeavour, says Goos, would lead to a better both practical and theoretical understanding of law. In this work, Goos mostly follows the latter route and argues that the study of natural law has practical import for positive law when it comes to determining in closer detail the *content* of the law. This impact can be appreciated when the effort is either to systematize existing positive law as it is often done in legal doctrine or when judges have to determine what the law *is* in cases where that question can only be settled by judicial discretion and therefore implies some appeal to "natural justice."[8]

Goos's work can perhaps best be described as a liberal conservative theory of ethics with a focus on how ethics should bear on law.[9] Goos's own view in this regard was that ethics should operate both as a form of what in contemporary jurisprudence has been called *legisprudence* and as a framework for legal interpretation. His intention undoubtedly was that existing positive law should be interpreted in such a way as to bring it as far as possible in line with the theory of ethics he outlined.

Goos stands out as the last major theorist in the old tradition of natural law, a tradition that in the 20th century would die out. Despite the acclaim he received in his own time, his work would soon come to be regarded as exemplifying a mode of thought of merely historical significance.

Goos's successor, it was mentioned earlier, was Viggo Bentzon, and it was also remarked that when he was appointed, in Copenhagen in 1892, he saw himself as having little choice but to rely on Goos's heavy two-volume work as the set text book for law. It could be that he felt here the intimidating popularity of his predecessor, but it was certainly not his enthusiasm about Goos's voluminous work and speculative approach to law that led to this outcome, since Bentzon could not see much practical use in that approach. In his own first work on jurisprudence (Bentzon 1904), a lean 176 pages by comparison with Goos's magnum opus, he criticized Goos for not paying sufficient attention to "the real grounds of law," by which Bentzon meant "that which has generated and which sustains every single rule of law, which in sum lies behind all [positive] law, [and] which forms its purpose" (Bentzon 1904, 15; my translation). In his assessment, the reason for this neglect of "the real grounds of law" was an inadequate concern with the issue of how the aims and purposes of legal

[8] The Danish expression here would be *forholdets natur*—similar to the German *natur der sache*—and *natural justice* is something I have chosen for lack on any more-suitable English rendering of that idea. It should be pointed out that the term "natural justice" in this context is not identical with the same term, used as a technical expression in English administrative law, where it signifies a more specific legal rule against bias in public decision making.

[9] The idea of a "liberal conservative" may seem contradictory, but it means that Goos was a liberal reformist within the conservative party and in the prevailing conservative culture in Denmark at the time. Other commentators have described his political outlook in similar terms (e.g., Tamm 1992, 221ff.).

regulation interact with the way in which specific legal disputes are resolved in concrete cases. Inquiring into these very concrete and detailed dimensions of how the legal system operates in practice, was not an approach favoured by Goos, and Bentzon lamented that Danish legal science had been dominated by a Hegelian approach at the expense of Ørsted's more tangible research methods (regarded by Bentzon as superior). Bentzon attributed this speculative turn to F. C. Bornemann[10] and his intellectual descendants (among whom he included Carl Goos)[11] and argued that the failure to embrace Ørsted's more pragmatic approach to law and legal science was to be ascribed to an overblown belief in what can be achieved through "word and logic" (ibid., my translation).

Bentzon's interest in, and focus on, the interaction between the aims and purposes of regulation and the actual decisions of the courts and administrative agencies undoubtedly stems from his admiration for the German legal philosopher Rudolf von Jhering (1818–1892), whose *Der Zweck im Recht* (Jhering 1877–1883, translated into English under the title *Law as a Means to an End*, Jhering 1913) fathered the so-called *Interessenjurisprudenz* (jurisprudence of interests) prevalent across much of German legal theory at the beginning of the 20th century.

Jhering essentially maintained that purposes in law are the products of underlying interests. In law, then, the purpose of some legal rule reflects the underlying interests promoted or protected by the law. Jhering identified both individual and collective (societal) interests, and he promoted an understanding of law and adjudication as an organized institutional approach whose function it is to negotiate between the various conflicting interests reflected in the law. Bentzon uses this as a springboard for promoting a jurisprudence committed to looking for the sources of law in the contemporary social conditions that people live under and respond to either happily (in that their interests are satisfied) or uneasily, by criticising those conditions. Here Bentzon cautions us that, however careful, precise, and insightful we might be in constructing a general conceptual account of the unifying formal grounds on which legal rules rest, if we *only* rely on these formal grounds, we will inevitably fail to appreciate the life that lies behind what formally present themselves as the impersonal commands of law. The only way we can gain insight into this richness of the life that lies behind the formal letter of the law, says Bentzon, is by constantly tracking the way life itself keeps creating and recreating the rule over the course of its development, and by reflecting on how this rule reflects back on life itself (see Bentzon 1904, 17–8).

[10] F. C. Bornemann (1810–1861) was professor of law and jurisprudence from 1840 to 1861. As the discussion suggests, he was strongly influenced by Hegel.

[11] It should be noted that neither Goos nor others whom Bentzon counted as Hegelian traditionalists were oblivious to the role that aims or purposes play in legal interpretation. But whereas these earlier theories conceived the aims and purposes of law as *a priori* and rooted in ethics, what Bentzon meant by *purpose* was the value beliefs and intentions held by those who had an actual interest in the law by being directly affected by it.

This approach also has a political dimension. Writing in 1904, Bentzon listed a number of legal institutions accepted as legitimate in times past whose fate was to be rejected or severely criticized: slavery, the duty to hold the Christian faith, the subordinate position of women, and so on. Bentzon emphasizes that it is of the utmost importance that criticism or acceptance of legal institutions be based on real insight into forms of individual and social life actually unfolding in contemporary society. His point was that the law will only be effective if it is attuned to the lived life of a society, and that the law must therefore evolve with the interests that shape this life.

Bentzon pursued this approach in what is perhaps his best work, *Skøn og Regel* (Discretion and rules: Bentzon 1914), inconspicuously published in 1914 as an offprint that, as we are told in an introductory footnote on the first page of the book, originated from the notes the author had written (a 102-page manuscript) in preparation for a lecture in the spring of 1904 on "Den positive rets ideale berettigelse" (The ideal justification of the positive law). This work focuses on what Bentzon saw as the deepest and most problematic distinction in law—that between regularity and individualisation, i.e., the problem that arises because legal regulation must be general yet applicable to unique individual situations.

Here Bentzon essentially develops a theory of judgment. He focuses on how behaviour in the most general sense must first be learned through instruction and on how these instructions over time recede into the background, when the behaviour in question is fully ingrained. He uses bicycle riding as an example. When we first learn to ride a bike, we have to listen to and follow instructions about how to get the bike moving, all the while keeping our balance, and then how to make turns and stop. Once we "know" how to ride, we simply follow a mode of behaviour. Over time, the practical art of cycling will become an unconscious skill, and the movements necessary to hold our balance, get up to speed, and control our direction will come naturally, without our having to deliberately repeat to ourselves the rules that govern the activity. This, Bentzon argues, is true of all forms of practical activity. The more familiar we become with the forms of life we participate in, the more we will be able to make immediate and finely tuned judgments about the proper way to behave in any given situation (Bentzon 1914, 24).

Bentzon's theory does not really concern itself with the question of what constitutes the right or correct decision in any of these situations. This, too, is probably because Bentzon drew inspiration from Jhering, while also attempting to mark an intellectual distance from his own predecessor in the chair, Carl Goos and the Hegelian tradition of structural conceptualism. Both in his work in general legal theory and in more specialised legal studies on various legal topics Bentzon emphasised the duality in legal concepts, a duality owed to the two basic yet opposite interests that must be reconciled in the practice of law: On the one hand the need for uniformity and regularity in the applica-

tion of law; on the other, the need to adapt the rules and principles of law to individual cases in a reasonable way. This duality found expression in the relationship between individual discretion and fixed rules. Legal practitioners and theorists alike accordingly have to frame or apply legal rules by taking these opposite interests duly into account, which in turn entails a need to balance individual interests against societal interests: freedom against coercion, individualisation against regularity, and so on. And since Bentzon took the view that the correct way to balance these interests in the decision-making process cannot be determined by recourse to *a priori* principles, he assigned a central role to judicial discretion and the individual circumstances of the case in his legal theory.

So, by reason of the focus Bentzon kept on actual judicial processes, he can be said to have anticipated legal realism in Scandinavia. But Bentzon was not alone in breaking away from the structural conceptualism characteristic of Hegelian approaches to jurisprudence. In Germany, both *Interessenjurisprudenz* (the previously mentioned jurisprudence of interests associated with Jhering) and the *Freirechtsbewegung* (or free law movement)[12] took an increased interest in the role and function of courts in the legal system. These two intellectual currents in German legal theory pursued what now appears to be an apposite acceptance of the insight that courts do not only engage in syllogistic reasoning but also carry out crucial tasks by "gap-filling" and developing the normative structure of law. Situating Bentzon in relation to the German developments in jurisprudence at the time, it would probably be fair to say that he was closer to the approaches developed under the heading of *Interessenjurisprudenz*. While the *Freirechtsschule* seemed to have more in common with the rule scepticism developed in American legal realism—both reacting to what was perceived as an excessive legal formalism, and both emphasising the wide scope of indeterminacy left open by most legal norms and the ensuing normative freedom for courts to use this indeterminacy as a vehicle for political activism—*Interessenjurisprudenz* was more moderate in this regard, in that it circumscribed judicial competence by tying discretion to the real interests that could be identified as reflected in the norms of positive law, primarily in legislation. In keeping with a Danish legal tradition tracing back to Ørsted and originally tied to absolute monarchy, but now to new forms of democratic government, Bentzon undoubtedly found it more correct to see the judge's role as being subordinate to the legislator. Bentzon's new theoretical stance should therefore be understood not as a radical break with the past, but as a

[12] The free law movement is most often associated with Hermann Kantorowicz (see Section 3.1 in this tome), and in particular, perhaps, with his essay, published in 1906 under the pseudonym Gnaeus Flavius, *Der Kampf um die Rechtswissenschaft* (The battle for legal science). This essay has recently drawn renewed attention with its first English translation: see Flavius [Hermann Kantorowicz] 2011.

turn toward a more pragmatic approach to the analysis of conflicting values and interests inevitably woven into the legal system. Bentzon retired in 1930.

22.3. Frederik Vinding Kruse: An Elitist Interplay in Danish Jurisprudence

Bentzon was much admired in his own time, and he was later praised by Alf Ross for his effort to connect general jurisprudence to practical legal thinking. In the foreword to the Danish edition of *On Law and Justice*, Ross wrote:

> It is perhaps only in recent years it has really occurred to me how healthy Bentzon's thoughts on legal philosophy is, how realistic his juridical method, and how many lines that connects my own thinking to Bentzon's. If logical rigour was not his strength, and if he was only little learned in philosophy, he had in return a higher degree of contact with the practical science of law than any of my two other tutors [Hans Kelsen and Axel Hägerström]. (Ross 1953, 4; my translation)

But Bentzon was not Ross' immediate predecessor. The background to Ross' *On Law and Justice* and also to his earlier publications on the general theory of law was the severe criticism from Frederik Vinding Kruse (1880–1963), who strongly opposed to the analytical turn that Ross advocated in jurisprudence.[13]

Vinding Kruse was appointed professor of law at the University of Copenhagen in 1914. After a doctoral dissertation on the legal aspects of the organization of capital and labour (Kruse 1913), he invested his time and energy in a major research effort in property law. This resulted in a 1923 book on the registration and organization of land ownership and other rights over land (Kruse 1923). The Ministry of Justice took notice and commissioned him to write a draft bill with a view to reforming the Danish law on land registration: The draft was accepted by the ministry and passed by Parliament in 1926. To appreciate just how thorough his work on this topic was, one need only consider that the Parliamentary Act on land registration (*Tinglysningsloven*) has been modified only slightly since its enactment more than eighty years ago.

From 1929 to 1933, Vinding Kruse published the massive five-volume *Ejendomsretten* (Property law: Kruse 1929), in which he introduced not only new legal distinctions and new ways of systematising the law, but also the basic jurisprudential ideas he would go on to develop in his later work. On the first page of the first volume he introduced his guiding idea: "As far as I can see, the social sciences must in the future rest on an amalgamation of law, social economics, physiology, psychology, and other academic disciplines that investigate the human condition" (Kruse 1929, 1, vol. 1; my translation). His claim, in other words, was that law in general, and property law in particular, had to be understood by investigating all the functions performed by the law in question and by analysing the impact of such law on all other spheres of life: the economy, ethics, psychology, aesthetics, and so on.

[13] On Ross see Chapter 16 in Tome 2 of this volume.

In this and in some of his earlier works, this holistic approach can be taken to signify an interdisciplinary openness to exploring the social causes of law and its effects on other social and societal phenomena. There are even suggestions that Vinding Kruse espoused a strict empirical approach to legal science. On the same page of *Property Law*, he writes that "if legal science is to become a realistic legal science, it must embrace the experimental evaluative approach to experience familiar to the other sciences" (ibid.; my translation). The key to this passage lies, of course, in the word *evaluative*. As was clear from his early criticism of Alf Ross, and as would become even clearer with the 1943 publication of his two-volume work on general jurisprudence (Kruse 1943), Vinding Kruse did not subscribe to what was then the radical new current in philosophy, logical empiricism. Indeed, as much as he was sympathetic to using empirical inquiry as part of the task of carrying out proper legal research he always held that empirical information was valuable only if coupled with an evaluation of its use and impact. Description for description's sake he considered futile, and in much of Alf Ross's early work he saw a concern with analysis and value neutrality so obsessive that it could not be reconciled with his own ideal of science. In Vinding Kruse's view legal science could be analogized to medical science: Just as medical science looks for ways to maintain *bodily* health, so legal science looks for forms of social organisation and legal regulation that can sustain a healthy *society*. So just like medical research is not simply concerned with observation, but with observation for the purposes of being able to actively interact with the body in order to preserve good health, so too legal research should not simply record information about legal events, but should theorize how the law can be adapted to bring about a good society.

Vinding Kruse was in this respect much more a man of the 19th than of the 20th century, and his sympathies lay much more with Goos's systematic and normative jurisprudence than with the down-to-earth pragmatism advocated by Bentzon, whom he succeeded in 1930, when he was entrusted with organising the jurisprudence curriculum at Copenhagen and teaching the subject to law students there.

In 1930, Vinding Kruse (1930, 135–62) reviewed Alf Ross's *Theorie der Rechtsquellen* (The theory of the sources of law: Ross 1929), strongly criticising the descriptive (pure) approach to law that Ross, much inspired by Kelsen's pure theory, adopts in that work. Since the main objective for Ross, as for Kelsen, was to bring into being a new legal science freed from natural law, politics, ethics, and economics—a science that would meet the standards of objectivity and exactness found in the natural sciences—the sociology of law was separated by Ross from legal politics and from the science of law. Ross also separated the science of law from legal history and ethics. In this early publication, Ross saw the single purpose of a theory of law as that of answering the question of how something can be conceptualized as law. In his quest to answer this question, he fought against the prevailing view, that the objec-

tive of legal science was both to systematically set out what the *existing* law is and to complete this system by identifying basic principles by which to interpret and apply the law. On the traditional approach law was conceived as the basic normative framework for state and society, and legal science therefore inevitably had to have a normative dimension to it. This normative dimension of legal science had historically been addressed by invoking natural law, and even though the language of natural law had been replaced with a more technical and "scientistic" language (as in Vinding Kruse's writings), it was widely accepted in legal science that those who are "learned in the law" are possessed of insights legitimizing them to "complete" the positive law by fleshing out the normative framework that the positive law is embedded in (natural law). Now, this idea that the descriptive and normative dimensions of law had to be merged in legal science was precisely the target of Ross's critique. Legal science had to be cleansed from the political and ethical dimensions that so often befouled the pure descriptions of what the law is. Vinding Kruse did not take kindly to this suggestion. In his review (Kruse 1930), he wrote that Ross in this way dispensed with the entire Danish and Norwegian tradition of legal science since Ørsted (see Section 22.1 above). This, according to Vinding Kruse, was not only unprecedented but also outright foolish, for a purely descriptive science of law will be of no value whatsoever: It will merely replicate the positive law such as it is, reiterating those facts that are already familiar to the judge and the other legal officials. Simply lining up trivial facts about the content of law does not amount to a science of law.[14] Only by offering a normative perspective on the positive law can legal science contribute with original knowledge to the legal community, and to this end legal scholars must engage in some kind of normative completion and guidance about how the positive law can best be made out to be a rational and ethically optimal normative system.

While Vinding Kruse was joined by other leading Danish law professors in his criticism of Ross, his own contribution to jurisprudence in turn drew significant criticism, when it appeared in 1943. This contribution, published under the title *Retslæren* (The general theory of law[15]: Kruse 1943), was a hefty two-volume work, but in fact a compilation of Vinding Kruse's previous writings[16] bundled together and presented as a work in its own right. The main

[14] Ross seems to have later come around to Vinding Kruse's view, publishing in 1936, in the same journal, an article (Ross 1936) that under the pretence of celebrating the pure theory of law actually winds up criticizing Kelsen along those same lines. For an English translation and commentary of this article see Ross 2011, Olsen 2011.

[15] As much as this may be a one-word title, it is actually difficult to translate. While *Retslære* (without the final n) corresponds to the indefinite (or zero article) form of the term jurisprudence, *Retslæren* (with the final n) corresponds to the definite form of the same term—"the jurisprudence"—but such usage would not be idiomatic in English.

[16] These are discussed in Evald 2005. For a sense of just how productive Vinding Kruse had been before publishing his *Retslæren*, and so how much material he could draw on, see ibid., 459ff.

theme running through the book consists in a kind of social Darwinism. In the first pages Vinding Kruse sets out the idea that law emerges naturally as higher forms of life evolve. With the development of the human species—and the ensuing possibility of large-scale social organization, division of labour, and long-term planning—science, philosophy, and the arts commence to flourish as part of an effort to make sense of this higher order of life. Science, philosophy and the arts then express in different ways the logic and rationale by which this higher order of life is held together. In this scenario, Vinding Kruse sees law as an instrument which serves to protect this higher-order form of life against the corrupting beast (evil) that is assumed to naturally live within us all. Law, then, serves to promote and protect the highest and finest forms of life.

In this book Vinding Kruse was also thinking about the way a future government ought to be set up,[17] and on the basis of this same sweeping conception he argued that the best solution would be neither monarchy nor democracy.[18] Both of these forms of government suffered from the same problem, namely, that the right to govern was based simply on the fact of birth. Neither the king in a monarchy nor the common man in a democracy had to demonstrate any special skills or competences to participate in the political process. Vinding Kruse saw this as a weakness in both forms of government, and in their place he advocated a meritocracy, in which government would be put in the hands of the nation's most intelligent and skilled men.

Vinding Kruse's critical attitude to democracy would soon mark the end of his success as a lawyer and an academic. Shortly after the end of the German occupation, Alf Ross wrote a scorching article in the leading Danish newspaper, *Politiken* (see also Evald 2010, 167ff.). Under the heading *Vinding Kruse and Nazism*, Ross pointed out how Vinding Kruse's legal theory supported a dictatorial form of government, not unlike that in place in Germany during the Nazi period. Vinding Kruse replied two days later in the same newspaper, accusing Ross of dishonesty for having mischaracterized his position, but there was abundant evidence in *Retslæren* to support the thesis that Vinding Kruse was in fact highly critical of democratic forms of government, and this, was

[17] At the time when *Retslæren* was published, 1943, Denmark was occupied by German forces and the Danish government had been exiled to London. Since no one knew what the outcome of the war was going to be, there was ample room for speculation about how best to organize Danish politics after the war. It is against this backdrop that Vinding Kruse's reflections on the best form of government ought to be read.

[18] Denmark had had parliamentary democracy since 1901, but the legal basis for this form of government lay in constitutional practice. Under the formal written constitution, dating back to 1849, the Danish king was free to appoint his own cabinet, and only in 1901 did he begin to appoint his cabinet in accordance with the political wishes of the lower chamber (or *Folketinget*). Several attempts to reverse this practice ensued, and as late as 1940, shortly after the commencement of the German occupation, a group of leading industrialists and businessmen approached the king with a proposal for a new constitution. *Folketinget*'s control over the Danish government was codified by a constitutional change in 1953.

enough for Ross's argument to win the day and to isolate Vinding Kruse as an anti-democrat under suspicion of having sympathy for Nazism. Ross henceforth positioned himself as the undisputed leading law professor in Denmark, with expertise not only in jurisprudence but also in constitutional law, while simultaneously running a private business writing legal briefs both for the government and for a number of private associations and businesses in Denmark.

22.4. Danish Legal Philosophy after Alf Ross

Alf Ross, and in particular his book *On Law and Justice* (Ross 1953), dominated Danish jurisprudence for two decades after its publication in 1953.[19] Indeed, the intellectual climate that developed in the post-war period was much more congenial to Ross's descriptive approach to law and legal science, and with the developing welfare state and a growing legislation and administrative apparatus, the legal system in Denmark gradually expanded to such a degree that no single person could possibly aspire to master its full breadth and complexity. Increased specialisation proved necessary, and in this light the idea of a general normative jurisprudence (be it Kantian, Hegelian, or Darwinian) seemed more and more distant and irrelevant. At the same time—with the increasing emphasis in the 1960s on new and more critical approaches to the social sciences (mainly that of the Frankfurt School, and of Habermas in particular, and that of contemporary hermeneutics, e.g. as developed by Gadamer)—it became apparent that legal science needed to revise its epistemological foundations, in order to address these new currents in social science.[20] As someone with a positivist background—and mainly inspired by Hans Kelsen, Axel Hägerström, and the philosophical movement of logical positivism—Alf Ross became an obvious target of criticism for those who were propounding these emergent new approaches to social science.[21] In the late 1960s and in the 1970s, criticism of Alf Ross's dominant approach to legal science emerged. Some of these first stabs at Ross' realism were single articles published in Nordic journals, but the emerging critique soon gelled into more comprehensive criticism. Looking back on this development, two strands of criticism can be singled out: They were articulated separately by two different authors who, through their criticism of Ross, and subsequently by attempting to theorize alternative foundations for legal science, have both contributed substantially to Danish jurisprudence, albeit in quite different ways. The first of these authors

[19] Ross's legal philosophy is treated in details in Chapter 16, Tome 2 of this volume.

[20] On Habermas see Sections 10.3.5 and 10.4.3.2 in this tome, and Sections 10.4 and 25.3 in Tome 2 of this volume. On Gadamer and legal hermeneutics see Section 10.3.5 in this tome and Section 23.4 in Tome 2 of this volume.

[21] On Kelsen see Section 2.3 in this tome and Section 8.3 and 8.4 in Tome 2 of this volume. On Hägerström see Chapter 13 in Tome 2 of this volume.

was Stig Jørgensen, one of the first professors in what was then new Danish law school situated in Aarhus, and the second was Alf Ross's predecessor as professor of jurisprudence in Copenhagen, Preben Stuer Lauridsen.

22.4.1. Stig Jørgensen: The Critique from Hermeneutics—the Rationality of Legal Judgment

Stig Jørgensen (1927–) started his career at the University of Aarhus by writing a doctoral dissertation on damages for personal injury in tort law (Jørgensen 1957), and in 1958, at just thirty-one years of age, he was appointed professor of tort law at the Aarhus University Institute of Legal Science.[22] In the 1960s, Jørgensen's growing interest in more general problems in legal science resulted in two minor publications (Jørgensen 1966, 1967), and then in a collection of articles published in German under the title *Vertrag und Recht* (Contracts and law: Jørgensen 1968). From 1972 and onwards, Jørgensen taught jurisprudence, and from 1974, his title was professor of jurisprudence and sociology of law. He retired in 1997.

Unlike Alf Ross and Frederik Vinding Kruse, Stig Jørgensen was a prolific writer, and yet he never published an opus magnum. Nor can any of his works in jurisprudence be said to offer something like a comprehensive theory of law. Instead, he published many articles and small books, often setting out good reasons for supporting certain already existing theories. One of Jørgensen's colleagues has explained this circumstance by pointing out a preference for what he called an "organic authorship" over that of a systematic and analytical authorship, which continuously builds on the same stringent system (Larsen 2006, 134). Applying Isaiah Berlin's famous paradigms for approaches to inquiry, that of the "hedgehog and the fox" (Berlin 1998, 436–98), Jørgensen would have to be categorized as a fox (who knows many small things, as opposed to the hedgehog, who knows one big thing).

Among Stig Jørgensen's many publications we find an article entitled *Argumentation and Decision*, published in 1969 in a *Festschrift* marking seventy years since Alf Ross's birthday (Jørgensen 1969a, 261–84). In this article, Jørgensen criticises Ross for not paying enough attention to the way legal argumentation and legal decision-making is structured. Jørgensen suggests that Ross's inadequate attention to the structure of legal argumentation and decision-making can be explained by reason of his scepticism about everything metaphysical, and by his espousal of logical positivism. Jørgensen sees this as

[22] The Juridisk Institut at Aarhus Universitet was inaugurated in 1936, but it was not until 1950 that the institute could offer a full master's degree in law. Its main purpose was originally to serve as a platform for educating legal practitioners for legal work, mainly in Jylland. Only in 1974 was a chair in jurisprudence endowed at the institute in Aarhus: It was called the chair in Jurisprudence and Sociology of Law.

a flaw in Ross's work, and in his article he underscores this point precisely by arguing that argumentation and decision-making can be construed as a rational activity, and hence that it is possible to have a science of argumentation and decision-making. In making the case that the study of argumentation can be set on a scientific foundation, Jørgensen looks to Theodor Viewehg's *Topik und Jurisprudenz* (Viehweg 1953, translated into English as *Topics and Law*: Viewehg 1993)—on the relation between general topicality and juristic argumentation—as well as to two works by Chaïm Perelman, namely, *Traité de l'argumentation: la nouvelle rhétorique*, cowritten with Lucie Olbrechts-Tyteca (Perelman and Olbrechts-Tyteca 1958, translated into English as *The New Rhetoric: A Treatise on Argumentation*, Perelman and Olbrechts-Tyteca 1969), and *Justice et Raison* (Perelman 1963a, translated into English as *The Idea of Justice and the Problem of Argument*: Perelman 1963b).[23] The point, as concerns Alf Ross, is that while neither Viehweg nor Perelman accept the premises from which logical positivism proceeds in laying out what counts as scientific inquiry and whether our knowledge of some object can be attained, they both have a method by which to understand how legal reasoning works. In other words, they both seek to show how legal argumentation can be understood as a rational activity even though it is neither deterministic nor amenable to empirical investigation. In the same year, Jørgensen (1969b) published an article in another *Festschrift*, this time in honour of the Norwegian professor of legal science Carl Jacob Arnholm. In this latter article Jørgensen further elaborates on Viehweg's work and attempts to show that topical concepts are central to legal reasoning. Jørgensen argues that topical concepts are closely linked to evaluative reasoning and that intensity plays a significant role in this form of reasoning, in that the various elements of a topic can be present with greater or lesser intensity. Intensity in the various elements of a topic is much more important to an understanding of legal reasoning than are the analytic distinctions among various legal concepts. As is also pointed out in *Argumentation and Decision,* it follows from this conception that syllogism does not play as important a role in decision-making as is often assumed in analytical jurisprudence (Jørgensen 1969a). Of course, Jørgensen does acknowledge that syllogism is a legitimate and important means of ascertaining whether the conclusion of a legal judgment follows from the premises set out in the case (that is, syllogism may be used as a rationality check on the final decision), but he adds that it may be "dangerous" to use syllogism as a model for describing the decision-making process itself, since this may lead to what Jørgensen sees as an erroneous view of what characterizes a legal judgment. More to the point, Jørgensen (1969a, 270) argues that a legal judgment should not be regarded *solely* as a logical conclusion derived

[23] On Viehweg and Perelman see respectively Sections 23.3.1 and 23.2 in Tome 2 of this volume.

from given premises: It should instead be understood as a decision based on an underlying value system that (*a*) is framed by basic legal principles inherent in the legal system, and (*b*) supports the rationality of the decision itself (ibid., 279ff.).[24]

Stig Jørgensen was among the first Danish lawyers to pay attention to the intellectual revival of hermeneutics. In 1973, he published *Hermeneutik og fortolkning* (Hermeneutics and interpretation: Jørgensen 1973), an article in which he attempts to apply hermeneutics to some basic patterns in juristic thought. With this article, Jørgensen comes somewhat close to identifying his own position within a hermeneutic approach to legal science. He makes it clear that a purely analytic definition of law narrows our perspective and leads to an impoverished understanding of the phenomenon. He argues that law should instead be understood as a societal and cultural phenomenon that has developed over time. Law is never only contemporary, here and now, but is always located in a historical context that shapes its content. Also in line with hermeneutics, Jørgensen rejects the way Ross construes the study of law, as an empirical science where propositions can be verified or falsified. Legal science is predominantly interpretive and mainly concerned with ascertaining the validity and import of evaluative statements (statements about the weight of different values and principles in legal argumentation). Legal science is better understood and carried out as a science preoccupied with understanding the nature and rationality of such evaluative statements.

Like Ross, but unlike Frederik Vinding Kruse, Viggo Bentzon, and Preben Stuer Lauridsen (see immediately below), Stig Jørgensen published widely in both English and German, and his work might therefore not be wholly unknown outside the Nordic countries. However, since his oeuvre cannot be clearly associated with any single current in jurisprudence, he is unlikely to have been counted as a leading theorist in any of the main "schools" of jurisprudence. And one can speculate that this outcome was precisely what he wanted, as is attested by one of his last publications, *Faces of Truth* (Jørgensen 2000): The cover illustration is a Janus-faced head, and the title only reinforces that metaphor (probably deliberately), signifying either a commitment to pluralism or an inability of the author to commit to any single coherent theory (here, too, the fox analogy suggests itself in an attempt to characterize Jørgensen's approach to jurisprudence). The content of the book's 114 pages is diverse and covers jurisprudence from ancient Greece to postmodernity. It

[24] Jørgensen likewise points out that "a choice is not irrational simply because it is a choice or cannot be the conclusion of a logical inference"; and, he continues, "the choice is guided by the legal ideas which control the legal system, and may 'etre justifies d'une facon raisonable grace à une argumentation don't on reconnait la force et la pertinence [justified in a reasonable way by virtue of an argument whose force and pertinence is recognized]'" (Jørgensen 1969a, 279). The French quote within the quote is referenced by Jørgensen as Perelman 1964 (see Engel 1964, 226ff.).

shows the breadth of Jørgensen's interest and his extensive knowledge not only of Nordic, English, and American but also of German and French legal philosophy. Perhaps it is precisely because he was so widely read, and because he could appreciate the ubiquitousness of ideas, that he remained reluctant, or otherwise found it imprudent, to embrace any mono-theoretical approach to legal science.

22.4.2. Preben Stuer Lauridsen: Iconoclasm or a New Paradigm?

The second substantial criticism of *On Law and Justice* had an even more epistemological twist to it and was mostly directed at Ross's so-called prognosis (or prediction) theory of law—the theory that if doctrinal propositions about law are to be viewed as having scientific content, they must be understood as predictions about the normative ideology judges will feel bound to apply in cases where that doctrinal content is relevant. This theory was frontally attacked by Preben Stuer Lauridsen (1940–2013) in a manuscript that was published as part of a doctoral dissertation on legal-political argumentation (Stuer Lauridsen 1974).

Ross's prognosis (or prediction) theory, as Stuer Lauridsen understood it, seems to entail a view of legal science as an empirical forensic science—and that, Stuer Lauridsen argued, is not the proper way to go about construing legal science. More to the point, Stuer Lauridsen identifies the problem as a misguided attempt to apply Russell's and Moore's correspondence theory of truth to the legal sciences. For the same reason, he considers it absurd to interpret legal doctrinal statements as predictions of future judicial behaviour (Stuer Lauridsen 1992, 66). What makes a particular statement about valid law true is not that it corresponds to some legal ideology that (in principle) can be shown to be shared by some group (say the group of Danish judges), but rather that the statement can be seen to be coherent with the overall assumptions made about the world in the linguistic community of lawyers.

A basic assumption of Ross's prognosis theory of law is that legal statements can be compared against legal reality. This assumption is closely tied to the correspondence theory of truth, under which statements are true if their meaning somehow contains a linguistic representation of empirical reality and can thus be said to correspond to that reality. On Ross's theory, the statement "X is valid law" is true only if it corresponds to a judicial ideology, where X is actually applied and perceived as a binding norm. Doctrinal statements can therefore be verified or falsified by holding them up to the existing judicial ideology and seeing how the two compare. Now, Stuer Lauridsen's argument is that no such comparison can make sense. The so-called legal reality (judicial ideology) can only be accessed through a similarly structured legal language, and that means that the distinction between reality and description collapses: There simply is no language-independent reality against which to measure

doctrinal statements. Any such reality is necessarily going to be itself captured through a description expressed through doctrinal propositions, and there is therefore no way to distinguish description from reality.[25]

Stuer Lauridsen uses a concrete example to illustrate the problem of applying the correspondence theory of truth to the legal sciences. On the correspondence theory of truth, a statement, e.g. "Theft is illegal," is true only if theft is in fact illegal. On Ross's theory of law, whether that is actually the case is something to be determined by empirically investigating the judges' behaviour and convictions, that is, by investigating the prevailing judicial ideology. But such an inquiry into empirical reality would itself yield a *description* of that reality, a description whose truth would in turn have to be determined by looking at how closely it matches the reality it claims to explain, and so on ad infinitum. Hence, there is no ultimate way to verify or falsify the statement "Theft is illegal." Ultimately, all one can do is check to see whether the statement is coherent with other statements about the legal system.

This criticism of the correspondence theory of truth is not unique. Nor was it new when Stuer Lauridsen used it as a basis for criticising Ross. Although Stuer Lauridsen makes no clear reference to the leading international works in epistemology, it seems likely that he was inspired by W. V. O Quine (1953, 20–43), and in particular by the criticism of logical empiricism he first set out in his famous article *Two Dogmas of Empiricism* (Quine 1951) and later, more comprehensively, in *Word and Object* (Quine 1960).[26] According to Quine, all knowledge is generated out of an interaction between language and experience. Human cognition should be analogized to a spider web (a web of beliefs): At its centre lie the most basic components of our language and forms of reasoning, that is, the basic *logical* components; from here there is a gradual transition towards the web's outer rim, where language that points to concrete physical objects meets sensory experience (our experience of the perceived world). Quine's point is that even the most exact sciences (like physics and chemistry) cannot create any certain knowledge on the basis of empirical verification

[25] As one might expect, Ross came out with a trenchant response to this criticism: In a Danish weekly law journal, he reviewed Stuer Lauridsen's dissertation under the title *En Traditionstro Billedsstormer* (A traditionalist iconoclast: Ross 1975), in what might be qualified as an empirical rebuttal of Stuer Lauridsen's argument. In a bid to defend the scientific validity his own prognosis theory, Ross wrote: "This is how scientists proceed all over the world—they test their hypothetical assumptions about some universal law by deducing predictions about specific observations that one should be able to make under certain conditions" (Ross 1975, 231; my translation). But he does not seem to really address Stuer Lauridsen's point, which is that the "specific observations" by which those "hypothetical assumptions" would be verified or falsified are themselves descriptions (of what has been observed), and as Quine has pointed out, there may be more than one way to describe any observed phenomenon, nor is it always clear which description best captures the observation.

[26] Stuer Lauridsen refers mainly to the Danish philosopher Arne Thing Mortensen, whose *Perception og sprog* (Perception and language: Mortensen 1972) does include references to Quine.

alone, because any empirical inquiry will always have an interface with nonempirical factors, such as the structure of language, logic, and various theoretical assumptions. The overall web of belief, in other words, is underpinned not only by experience but also by our theoretical, logical, and linguistic conventions: This existing web is something we must always reckon with, and with it we must accordingly align whatever results an experiment might yield. This is done by making sure that the descriptions of the experiment and its results can be made to cohere with the web. The decisive criterion of truth, then, is not correspondence but consistency: Whether a thesis or theory is true depends not on whether its language corresponds with reality but on whether the new web of beliefs (inclusive of that theory or thesis) turns out to be more or less consistent.

In keeping with Quine's theory, Stuer Lauridsen claims that there can be no legal reality independent of language, and that the truth of a legal statement therefore cannot be determined just by subjecting that statement to an empirical examination. He therefore rejects the correspondence theory of truth in favour of a theory according to which legal propositions are true if they cohere with the overall legal system as set out in other propositions about the law generally accepted as true. The truth of a legal proposition, then, is something primarily to be investigated by considering that proposition together with all the other relevant propositions to see if they make a coherent whole. So for Stuer Lauridsen, judging the legal validity of a proposition is ultimately a matter of taking in the overall network (or web) of propositions at issue and working out the consequences of these propositions—and a statement is valid insofar as the resulting web and consequences can be accepted altogether. Stuer Lauridsen asserts therefore that legal validity depends on the extent to which the language user can vouch for all the linguistic and legal consequences arising from his once made choices of description (Stuer Lauridsen 1974, 201). In a more recent publication that was issued shortly before Stuer Lauridsen's retirement as a professor of jurisprudence at the University of Copenhagen, he restated this as follows: "Decisive of whether a description is correct, therefore, first and foremost depends on whether the choices of description are properly made. The linguistic consequences of the choices of description represent the meaning of the chosen description. If the language user can vouch for these consequences, he has chosen correctly" (Stuer Lauridsen 1992, 70; my translation).

On this view, the decisive criterion in determining legal validity (i.e., in determining whether or not doctrinal statements are correct) becomes whether or not the language user can "vouch for," that is, endorse, his or her own description. This seems inadequate for two reasons. Firstly it seems intuitively odd that the criterion by which to determine the validity, or correctness,[27] of a legal proposition should be whether or not the speaker is willing to accept the

[27] In replacing the correspondence theory of truth with a coherence theory, Stuer Lauridsen also chose to replace the notion of truth with that of correctness.

linguistic consequences deriving from the proposition in question: Why should the person who is formulating the proposition also be the one entrusted with assessing its correctness? You would be a quirky lawyer indeed if, having described the law applicable to some area, you were to claim that the description you just offered is incorrect, since you cannot bring yourself to accept the linguistic consequences which follow from that description. Secondly it seems an implicit background assumption that when we engage in making claims about the law (indeed making any kind of claims), we will be ready to vouch for them and will believe them to be correct. But that does not make those claims correct, for it would surely be absurd if we could make claims about the law and reject the possibility of their being false. Why shouldn't someone's description of what the law is be amenable to falsification by some standard other than the describing person's own rejection of that description? If correctness depends only on what the describing person is willing to accept, any discussion about what the law really is will prove meaningless.

Stuer Lauridsen (1974, 22) is well aware of this problem, and he therefore attempts to further qualify the correctness requirement. He does so by acknowledging that statements about valid law cannot be made completely independent of any constraints other than our intrapersonal acceptance of the consequences those statements will have on our larger web of legal beliefs. More to the point, statements about valid law must be made in accordance with the generally accepted legal method, that is, by looking at the sources of law and observing the general principles of legal interpretation. Correctness is in this way grounded in an interpersonal acceptance of a shared basic web of legal beliefs. In this way Stuer Lauridsen holds to his criticism of the correspondence theory of truth, thereby also continuing to support the view that there is no ultimate truth to be reached outside the legal language itself. But, as was just hinted at, he introduces a correction by which to keep in check the extreme subjectivism suggested in the foregoing account of his theory: He posits the requirement that statements about valid law can be accepted as true only if grounded in the generally shared principles for generating such statements; these are the generally accepted principles for generating correct statements about valid law, or, for short, the method of legal inquiry (ibid., 185). On this view legal inquiry—or law finding at large—is best described as the product of a self-sustaining epistemological community.

On this revised view, statements about the law—whether they are made by law professors at universities or by lawyers arguing a case or by a judge deciding a case—are correct only if they cohere with the broadly accepted sources of law and the principles of legal interpretation, that is, with the generally accepted method for producing statements about valid law. Statements about the law, then, will stand or fall depending on whether or not they comply with the rules for describing the law. Stuer Lauridsen emphasizes that this is what gives the finding and description of law its methodological basis:

> Legal method is scientific; its correctness depends not on our emotional response to it but on its ability to function as an analytically satisfactory and harmonious foundation for describing the law and its theory. This is likely to ultimately depend on its intersubjective acceptance among competent legal professionals [that is, among good lawyers]. (Stuer Lauridsen 1992, 111–2; my translation)

This position is entirely in line with the move from the correspondence theory of truth to the coherence theory. According to Stuer Lauridsen, the question of which principles of method and which principles for identifying sources of law can lead to the greatest harmony is a question for competent lawyers to decide. The epistemological buck stops here! Consensus among legal professionals (or, as Stuer Lauridsen says elsewhere, among competent peers) stands out as the irrevocably final criterion of correctness and hence of legal validity.

22.5. Conclusion: Connecting Danish Legal Philosophy after Alf Ross to Broader Jurisprudential Movements

Danish legal philosophy is most widely known for the contribution of Alf Ross. There is still an interest in his legal philosophy in international jurisprudential circles, even if his work is somewhat removed from contemporary trends in general jurisprudence. The criticism H. L. A. Hart devoted to Ross's *On Law and Justice* (Hart 1959) was undoubtedly the single most important influence on the reception of Ross's work in the English-speaking world, but there recently seems to be greater recognition that Hart proceeded on a somewhat superficial reading of that book. It has also been credibly suggested that the book suffers from a poor translation, and that this makes it difficult to appreciate the real depth of Ross's theory.[28]

It is, however, Preben Stuer Lauridsen's epistemological move from the correspondence theory of truth to the coherence theory, and the ensuing focus on the autonomous status of the epistemic community of lawyers that steers a path closer to some of the more dominant trends in contemporary general jurisprudence. Perhaps the best-known theory in this area is Robert Alexy's, in which coherence plays a central role in ultimately determining legal validity (Alexy 1978).[29] Similarly, the Polish-born legal philosopher Aleksander Peczenik, who taught as professor of jurisprudence in Lund, Sweden, until his death in 2005, has theorised a view of legal argumentation as an exercise in constructing coherence in practical reason (a view he developed in part with Robert Alexy).[30]

[28] In order to mend that, a new translation of *On Law and Justice* is currently underway. This new edition, to be published by Oxford University Press, will be translated by Uta Bindtreiter (Lund University) and edited by Jacob v. H. Holtermann and Henrik Palmer Olsen (both University of Copenhagen).

[29] On Alexy see Sections 10.3.2.2 and 10.4.3.1 in this tome, and Sections 1.5.4.1, 10.3, and 25.4 in Tome 2 of this volume.

[30] Aleksander Peczenik has published extensively in Swedish. Among the writings he pub-

Also relevant in this respect is the turn to contemporary hermeneutics and the focus on the rational reconstruction of legal argumentation: This can be appreciated in the work of Neil MacCormick, which in the spirit of Stig Jørgensen's attempt to "undo" Ross's anti-metaphysical deconstruction, as it were, by constructing legal argumentation and decision-making as an enterprise that proceeds from the legal system's inherent values (MacCormick 1990).[31]

In Norway, the late David Doublet[32] argued that legal argumentation is situated in a specialised epistemic community, and that the validity of legal arguments stand and fall with their acceptance in this community (Doublet 1995). Albeit relying on an epistemological foundation different from that of Stuer Lauridsen (Doublet seem to have been predominantly inspired by Niklas Luhmann) and without an explicit commitment to coherence theory in the style of Robert Alexy and/or Aleksander Peczenik, this is quite close to—if not identical with—Stuer Lauridsen assertion in the quote above, that validity "ultimately depend on its intersubjective acceptance among competent legal professionals" (Stuer Lauridsen 1992, 112; my translation). In Finnish legal theory, Kaarlo Tuori (2002a) has developed a theory he has termed critical legal positivism, arguing that the legal system is a coherent normative structure and that at the core of this system we find non-positivized principles of law capable of functioning as critical hermeneutics aimed at determining and assessing the content of positive law.[33] Like Stig Jørgensen, Tuori envisages law as consisting of layers, with positivised law at the upper level (or surface) and the more general values situated at deeper levels within the law. For Tuori, this layered structure makes for a gravitational force in legal reasoning, a force that serves as a kind of common reference point enabling us to stabilize law's normativity and ground the legitimacy of public policy as expressed through positive legislation. Coherence ensures a connection with the basic principles of law (the values that underlie positive law), which play an important role in rationalizing legal decision-making, as they do for Jørgensen, too.

Coherence and hermeneutics also seem to play an essential role in Ronald Dworkin's theory of adjudication (Dworkin 1986), even though Dworkin prefers the term *integrity*. Although some aspects of Dworkin's theory go well beyond what can be found in Danish legal theory after Ross (witness his one-right-answer thesis and his rights-as-trumps thesis: Dworkin 1977), many similarities can be found at the level of theoretical orientation, especially in connection with conceptual strategies such as interpretivism (hermeneutics), coherence (integrity), and context-based argumentation (Dworkin 1986).

lished in English with Alexy see Alexy and Peczenik 1990, Aarnio et al. 1998. On Peczenik see Sections 21.4.2.2 in this tome and Section 25.6 in Tome 2 of this volume.

[31] On MacCormick's theory of legal reasoning see Section 25.2 in Tome 2 of this volume.

[32] On Doublet see Section 23.4.2 in this tome.

[33] On Tuori see Section 24.4 in Tome 2 of this volume.

But if one should wish to identify in Danish jurisprudence an undercurrent running all through the 20th century, it would have to be its unwillingness to subscribe to any grand theory. Danish jurisprudence and legal theory is, if anything, pragmatic—not in the sense of adapting to pragmatist theory but in the sense of rejecting the idea that a theory can somehow define what law is. It would, of course, be a contradiction in terms to characterize Danish jurisprudence as anti-theoretical, but there is at least a sense in which neither sophistication nor conciseness for its own sake can be said to be highly valued in Danish legal theory. There is instead a prevailing sense that theory must yield to practice and that a theory of law should be measured by its ability to produce insights that are of use to practicing lawyers.

Chapter 23

LEGAL PHILOSOPHY IN NORWAY IN THE 20TH CENTURY

by Svein Eng[*]

23.1. Introduction

Legal philosophy is inescapably interwoven into the issue of the relationship between law, morals, and the possibility of practical knowledge. In this respect, legal philosophy in Norway in the 20th century took a path different from the corresponding fields in the neighbouring Scandinavian countries, Denmark and Sweden. In the first three quarters of the century, the discussions were more fragmentary and low-key, and in the period of Hägerström, Olivecrona, Lundstedt, Hedenius, and Ross, one would seek in vain corresponding research and discussion among Norwegian academics.[1]

A presentation of the developments in Norway is therefore at times dependent upon extrapolation from texts not intended as contributions to legal philosophy proper or written by authors who dedicated their main research efforts to other fields. In what follows, we have systematised our presentation around two main sets of issues, selected partly with an eye to the history of legal philosophy in general and its recurrent core issues, partly with an eye to the actual developments in Norway in the period under consideration.

First, there is what we may term the "ontology of normativity": What is the basis of normativity in reality? Included here is the question of the possibility of natural law based on reason: Are we invested with practical reason, that is, is there such a thing as practical knowledge related to law?

Secondly, there is a cluster of discussions centered on which concepts have the strongest claim on our attention and interest if we choose to give an account of the idea of a positive legal system.

Placing the developments in Norway in perspective requires that both sets of issues be a part of our map. The fact that an area was left unexplored for some time is significant in itself.

23.2. The Origins: Experience and Interests

In 1834–1835 the Norwegian jurist Anton Martin Schweigaard (1808–1870) published a critique of German philosophy in general and of its legal and politi-

[*] The author should like to thank Stanley L. Paulson for help and advice on matters of English style.

DOI 10.1007/978-94-007-1479-3_23

cal relevance in particular (Schweigaard 1834, 1835). He passed harsh judgments on what he took to be empty metaphysics—"empty," that is, given his own framework of what exists, what we can cognize, and what we can rationally discuss.

On these philosophical points, Schweigaard's own reasoning was rudimentary or nonexistent. His conclusions, however, epitomized and strengthened prevailing views. Schweigaard soon established himself as a leading figure on the public scene of the recently established constitutional democracy in Norway. As a professor of law from 1840, and as the leading member of the Norwegian parliament, first elected in 1842 and serving until his retirement in 1869, he incrementally built what was to become the ruling view of the relations between economic life, civil society, and state power. From a political point of view the key concept is pragmatic coexistence. From a philosophical point of view the key concepts are experience and interests: The only possible basis of cognition is experience, and practical argument acquires its justificatory force from interests and utility, be it the interests of individuals, groups of individuals, or of society at large.[2]

From a broader point of view, the upshot was a *sui generis* blend of economic liberalism, utilitarianism, and state intervention. In the perspective of legal philosophy, those parts of the framework referring to experience and interests contributed significantly to constituting the form of legal positivism that was to become a permanent part of legal philosophy in Norway, and, as we shall see, at times also the dominant part. The key idea was that the bounds of practical reason coincided with the bounds of arguments from interests and utility.[3]

23.3. From 1900 to 1945

23.3.1. The Ontology of Normativity

Francis Hagerup (1853–1921) argued for a species of what we may term the psychological concept of norm.[4] In a brief paper entitled *Det psykologiske*

[2] See Seip 1959 and 1968, 22–71, for analyses of species of Schweigaard's arguments in public debates; see further Seip 1974, 98–115, and 1988, 67–125. For a collection of essays on various aspects of Schweigaard's work, with further references, see Mestad 2009. Contested issues of interpretation relating to Schweigaard and his heritage are discussed in Sørensen 1988 and Slagstad 2001, especially 62–98, 223–7, 232–6.

[3] In stating that "the basis and source of all law" cannot but be the criterion of "least imperfection," Schweigaard indicates a version of negative utilitarianism (Schweigaard 1834, 307; my translation). This particular aspect of his position does not seem to have found much resonance in later theory, however.

[4] Francis Hagerup was a professor of law at the University of Christiania from 1887 (in 1925 the city was renamed Oslo). Representing the conservative party in national politics, he served as minister of justice, 1893–1895, and as prime minister, 1895–1898 and 1903–1905. He wrote in a wide range of fields: the law of obligations and property, procedural law, criminal law, legal method, and public international law.

grunnlag for retten (The psychological basis of the law: Hagerup 1907), he formulated his view thus:

> [That a norm, including a legal norm] "is valid" means in general that it can motivate human beings in their acts and omissions. If a legal norm has lost this capacity, it is no longer valid, regardless of the extent to which it happens to be part of our consciousness in other respects. (Ibid., 2–3; my translation)

> Altogether we will not speak of "law" where the only motivating element is the physical force sanctioning the directives in question. True, there is force behind the laws, too, and, true, directives that were initially *solely* orders backed by threats [...] may become legal norms. A genuine legal norm, however, is present only if it evokes the idea of a *duty* to obey the directive [...]. (Ibid., 3; my translation)

In Hagerup we see the idea of a psychological concept of norm in embryonic form. The idea has been developed and refined by many authors; in Norway, this is especially true of Torstein Eckhoff and Nils Kristian Sundby. We shall return to a more detailed discussion in the context of these two authors' work (Section 23.4.1.1 below).

In the first three-quarters of the 20th century, Frede Castberg (1893–1977) was one of the very few among professional legal academics in Norway who argued for a natural law position (Castberg 1939, 1957, 1965).[5] He rejected seeing the nature of normativity and norms as exhausted through analyses in terms of internalisation or other psychological factors.

The positive content of Castberg's position, and what he took to be the grounds justifying it, was, on the other hand, less clear. From several passages we may gather a certain influence from Kantian and Kelsenian ways of thinking, but also, in contrast to these two authors, a marked hesitation to enter into more detailed argument.

On the issue of the nature of the binding force of norms, Castberg's final justificatory step seems to be an appeal to the fact that most people do not accept that their idea of the binding force of norms is illusionary (see, e.g., Castberg 1939, 153, 155; 1957, 111, 112; 1965, 37; 1971, 204). On the issue of the content of natural law, he points to justice, logical coherence, and the effectiveness of the laws as means to the ideal and ultimate goals—while refraining from attempting to specify what these goals are (see, e.g., Castberg 1939, 154; 1957, 111; 1965, 128–33, cf. 106–15). While, with respect to the issue of the binding force of norms, he is content to refer to what people do or do not accept, he is precluded from invoking this kind of argument at the level of the more specific norms, since a basic tenet of his is that the difference between

[5] Frede Castberg was a professor of law at the University of Oslo from 1927. His main fields were international public law, constitutional law, and administrative law. Serving as an expert for the Ministry of Foreign Affairs, he acquired firsthand knowledge of the relations between law and force. Throughout his life he was dedicated to the issue of what makes good law.

right and wrong does not coincide with the difference between majority and minority opinion (Castberg 1965, 118; 1971, 318–20).

In his earlier writings he kept natural law at a certain distance, and although he would later term himself a natural law theorist (Castberg 1965, 131), he hedged his position in several important respects. Thus, according to Castberg (ibid., 128–9), there is no set of laws that are valid independently of time and place, and there is no set of correct solutions to each and every human conflict. Instead, the substance of natural law consists in imposing certain limits to what can justifiably be argued for in light of the ultimate ideals, and the most that is corroborated by this is a natural law with a changing content (Castberg 1939, 155; 1957, 111; 1965, 138, cf. 121–35). He denied (Castberg 1965, 133–5), however, that his position could be adequately characterised as exclusively formal.

In some places, Castberg (ibid., 125–6, 133) relies on beliefs and emotions, in contrast to cognition, in such a way that the distinction between his own position and the emotivist stance of the Scandinavian legal realists becomes a very fine one.

Castberg's main research fields were international law, constitutional law, and administrative law. His acquaintance with the issues and arguments of legal philosophy not infrequently seems to be second-hand only, and his arguments are often rudimentary. He deploys a psychologically tinged nomenclature, quite often referring to our mental acts and their feature of being "more or less conscious" (see, e.g., Castberg 1939, 131; 1957, 94), and he takes little part in the substantive issues of philosophical justification. In brief, he was more of a presenter of standpoints than a participant in the ongoing debates of legal philosophy. His important contribution was his keen sense of the inescapability of normativity in human existence, and, consequently, his consistent questioning of the arguments of the Scandinavian legal realists to the effect that this aspect of human existence is illusionary through and through.[6]

23.3.2. The Foundations of Legal Method

Doing justice to the Norwegian discussion on legal method at the end of the 19th and beginning of the 20th century requires both that we see the links to

[6] An aspect of Castberg's contribution was his ability to see, already in his first writings, the importance of what must be a critical issue in any argument for intersubjectively valid normativity, namely, the mediation between the normative structure taken to be valid and the changing empirical circumstances in which, and to which, this normative structure is to be applied: see Castberg 1920, 539; 1922a, 150. Since most authors in the Norwegian literature rejected, or kept at a safe distance from, the premise of the problem—the existence of an intersubjectively valid normative structure—the problem of mediation was not given the attention it deserves. In the recent literature, the issue has been reformulated and discussed in detail by Svein Eng: see Eng 2007, 247–487, esp. 377, 394–436, 453–9.

the corresponding German discussion and that we see how the German concepts of conceptual jurisprudence (*Begriffsjurisprudenz*) and constructive method (*konstruktive Methode, juristische Konstruktion*) were transformed into heuristic tools.

We may characterise the heuristic turn by pointing to the way in which the constructive method was justified by reference to the goals of making certain information easier to comprehend, recall, and apply; such considerations we shall call "heuristic considerations" (Eng 2003, 397, 412).

To pinpoint the pertinent contrasts, we shall quote from Hagerup and Castberg.

> Through such subsumption of the legal material under a system of relatively few and simple concepts [i.e., via such legal construction], the *acquisition of it and the mastery of it* is greatly facilitated. […] Through the constructive tracing of general legal norms back to simple concepts, and through the cognition of these concepts' systematic connection with one another, the understanding is gained, first, that here it is in reality a matter of relatively few elements, and, second, that it is important to penetrate these in order thereby to be able to master a wide range of individual precepts and *with relative ease and speed to be able* to find one's bearings when confronted with new or unfamiliar legal rules. [...] With respect to the simplification of the legal material and the facilitation of the acquisition thereof, which the formation of legal concepts brings about, an apt comparison has been made between the formation of legal concepts and the *formation of the alphabet*. (Hagerup 1931, 29–30; my translation, italics added)[7]

> The constructive method is what one calls that method in legal science according to which one seeks to *summarise* the norms of positive law in more general propositions, with the intention of *cognising the logical coherence* of the legal order, *sparing memory* the labour of retaining an infinity of detailed norms, and—in the view of many people—acquiring, in the generalisations set up, *the means for the resolution of newly arising questions* of law. (Castberg 1922b, 294; my translation italics added, italics in the original omitted)[8]

These quotations illustrate the emphasis that was placed upon heuristic considerations in justifications of the constructive method. In addition, however, we see a tension between a version of constructivism that is *only* so based and a version that accepts the use of generalisations as a "means for the resolution of newly arising questions" (see the end of the quotation from Castberg). We may speak of a "law-producing" as opposed to a "heuristic" view of concepts and principles generated by the constructive method (Eng 1998, 409–10, 474–6; in part also in Eng 2003, 412–3).

The constructive method generated opposition on two fronts.

First, it understood itself to have superseded the sceptical attitude towards abstract concept formation that was instantiated in Schweigaard's "analytical-

[7] The reference to the comparison with the alphabet is almost certainly made with Jhering in mind (see Jhering 1858, esp. pp. 339ff., 363, 372ff.).

[8] See also Castberg 1922b, 304 ("facilitates the intellectual mastery of the legal material") and 316 ("urge for logical cognition").

descriptive method" as well as in the casuistic approach he deployed in his writings on the law.[9]

Schweigaard's may seem to be a moderate version of scepticism towards our ability to form and apply concepts. This impression owes more, however, to the fact that his investigations were brief than to any clearly delineated doctrine on his part. The 20th-century version by Gunnar Astrup Hoel (1896–1968) was, by contrast, more systematic and clearly intended to be radical. In his book *Den moderne retsmetode* (The modern legal method: Hoel 1925), Astrup Hoel argued that in any determination of what the law is, the crucial element is a *decision* on the part of the law applier (ibid., 62–6, and further, e.g., 124–5, 147, 179).[10] The key term *decision* is here to be understood "in the widest sense possible, as a general term for the actively personal element in legal reasoning" (ibid., 62 in note; my translation). Such decisions are based on an immediate and intuitive act of grasping the singularity of each case, with its infinite particularities. They are not, we may infer, in any way mediated by intersubjectively shared conceptual criteria.

While having the form of a critique of what he took to be the prevailing view of the role of concepts in legal reasoning, namely, the law-producing view (ibid., 101–5, 203), Astrup Hoel's argument has wider implications. Indeed, his decisionism represents a radically sceptic view of our ability to share in *any* practice of forming and applying concepts, and as such the argument has to be defended at the level of basic philosophical positions. Astrup Hoel's discussion, however, moves within the limits set by the discussions of legal methodology, and he does not seem to recognise the general philosophical implications of his own statements (ibid., e.g., 19–20 and 104 n. 2; cf. 203–5).[11]

While the first front—against scepticism vis-à-vis our ability to form and apply concepts—was part of the genesis of constructivism as a position in Norwegian legal theory (Hagerup 1888), the second front came later. Although not a necessary implication of the position as it was presented in the works of Hagerup, its leading proponent and practitioner in the Scandinavian literature,

[9] In the paper by Hagerup in which he argued that constructivism was the superior method, he says: "In order to fulfill its task, legal science must take the path against which Schweigaard warned, and view the legal norms in their conceptual and systemic interconnections" (Hagerup 1888, 19; my translation). Schweigaard did not offer any explicit definition of what he termed the "analytical-descriptive" method, but left it to the reader to gather its meaning from the context, i.e., from its implied contrast with the constructivist methods he criticised: see Schweigaard 1834, 307, 332–3.

[10] For reasons of internal consistency, this thesis must be claimed to hold good whether the determination be formulated in general or singular terms, whether it be a determination found in legal textbooks, in the premises or conclusion of a judgment, or in other contexts. In his actual argument, however, Astrup Hoel focuses primarily on the perspective of the decision-maker in an individual case.

[11] Surprisingly, Astrup Hoel has very little to say about the Uppsala school: see Hoel 1925, 66 n. 1.

constructivism tended to go together with conservative political views, promoted by way of considerations of certainty and foreseeability with regard to the legal consequences of actions (Hagerup 1888, 42–3; 1915, 24–5).[12] In this respect, opposition to constructivism was raised by those claiming the methodological relevance of considerations referring to social policy and general political ideals.

The sociopolitical view found telling expression in the works of Ragnar Knoph (1894–1938). In line with newer trends at the time, he argued that Section 97 in the Norwegian Constitution, stating that the legislative assembly lacks competence to enact statutes with retroactive effect, was to be read as a legal standard (Knoph 1939). By *legal standards* he meant norms instructing the law-applier to weigh and balance arguments and to let this weighing-and-balancing act be informed by the normative attitudes that in fact exist in society.

Knoph's arguments are of interest to us in that they touch upon two themes that were to be elaborated in more systematic and precise ways later in the century. First, his concept of legal standards and that of their rationalisation anticipated later theories of weighing and balancing and their companion guidelines and type instances. Secondly, his reflections in the area where constitutional law intersects partly with the doctrine of the sources of law, partly with politics, serve aptly to illustrate the later discussion of the basis of the doctrine of the sources of law. For both themes, see Section 23.4 below.

These, then, are three important lines of thought in jurisprudential debates on method in Norway: varieties of a *sceptical* attitude, quite often combined with an analytical-descriptive view; the *constructive* view; and the *sociopolitical* view. This tripartite division seems true to the way in which the interlocutors themselves looked upon their methodological debates, and it seems representative of the main currents in the methodological debates of the century.[13]

[12] Although Hagerup built upon the seminal German discussions, and although he was a leading figure in the Norwegian conservative political party, he did not emulate the link between the doctrine of legal method and conservative political views that was seen in Germany (Wilhelm 1958, 125–7). On Hagerup's constructivism in its historical context, see Björne 2002, 216–28, with further references to lines of discussion and interpretation.

[13] Considerations of space do not allow us to refine the meanings of the three key terms or to investigate whether, and, if so, to what extent, the three lines of thought are incompatible in argumentative terms; the latter obviously depends on how we choose to define the key terms in various directions in which we may be interested in arriving at clarity.

23.4. After 1945[14]

23.4.1. The Ontology of Normativity

23.4.1.1. Torstein Eckhoff and Nils Kristian Sundby

On the model put forward by Torstein Eckhoff (1916–1993)[15] and Nils Kristian Sundby's (1942–1978),[16] a norm is a normative proposition that has been internalised.[17]

Eckhoff and Sundby distinguish between direct and indirect internalisation.[18] An individual stands in a relationship of *direct* internalisation to a normative proposition when the individual has a positive attitude towards it. An individual stands in a relationship of *indirect* internalisation to a normative proposition when it may be justified through other normative propositions that the individual has internalised directly. These other norms, then, may be termed *meta-norms*.

In legal systems there are two sets of such meta-norms that are particularly important.

First, there are *the norms in the constitution that empower the legislative assembly to enact statutes*. Few people stand in a relationship of direct internalisation to more than a fraction of the statutes applicable to them. Most people, however, have directly internalised the norms in the constitution em-

[14] World War II meant an end to the predominance of German authors and discussions as parameters in Norwegian law and legal philosophy, making it a basic criterion of periodisation in any general presentation.

[15] Torstein Eckhoff was a professor of law at the University of Oslo from 1957. His first writings were in procedural law, but over the years he moved into public law, the doctrine of the sources of law, and analyses of types of norm and their interaction in law and legal science. Eckhoff acted as a catalyst between law and other academic disciplines, especially social science, in which he kept a lifelong interest.

[16] After having studied philosophy and law, Nils Kristian Sundby was an associate professor of law at the University of Oslo from 1972. His main research field was legal philosophy. He also wrote papers in criminal law, tort law, and on psychiatry, and he took an active part in critical legal studies and in the politics of his day.

[17] We use the term *proposition* in a neutral sense in relation to the distinction between the normative modality and the descriptive modality. More precisely, a proposition may be normative or descriptive, or it may have a fused descriptive and normative modality: on the third alternative, see Section 23.4.6 below.

[18] The term *internalisation* may designate a wide variety of mental states or processes: In one dimension there is a range that runs all the way from accepting the content of a norm to simply not rejecting it; in another dimension there is a range that runs from deliberately performing these mental acts to simply growing into traditions and habits; in a still further dimension there is a range that runs from deeply held convictions to ephemeral opinions; and so on. Here, we shall use the term as shorthand, denoting these dimensions and degrees collectively. This is true to the subject matter, since Eckhoff and Sundby do say quite a lot about internalisation, but do not offer a systematic theory of the psychological aspect of norms.

powering the national assembly *qua* legislative body. As a consequence (by definition according to Eckhoff and Sundby's model), they have indirectly internalised the statutes passed by that body, the regulations issued in pursuance of those statutes, and so on. This is so for non-lawyers and lawyers alike.

Secondly, legal systems contain a set of meta-norms addressed to lawyers in particular, namely, *the norms making up the subject of the doctrine of the sources of law, including the norms on interpretation and application*. No lawyer can stand in a relationship of direct internalisation to more than a small part of existent law. Most lawyers, however, have directly internalised the norms examined in the doctrine of the sources of law concerning how one is to proceed in order to identify the norms of the system. As a consequence (by definition according to Eckhoff and Sundby's model), they have indirectly internalised the norms that are justifiable according to the doctrine of the sources of law.[19]

In light of this, Eckhoff and Sundby argue, the internalisation perspective is suited to capturing those aspects of reality that are of interest where the topic is the way in which norms actually work, be it norms in general or legal norms. It is internalisation, direct or indirect, that turns a normative proposition into a norm. Internalisation is thus among the truth conditions for propositions about the existence of norms.

After Sundby's death, Eckhoff published a second and revised edition of their cooperative work, *Rettssystemer* (Legal systems: Eckhoff and Sundby 1991). One of Eckhoff's revisions was to supplement internalisation, as one way in which normative propositions can acquire a basis in reality, with what he termed *systembasis* (system basis), as another way in which normative propositions can acquire a basis in reality. Still, in Eckhoff's revised version, too, internalisation is the central way in which normative propositions change their existence mode from that of being solely abstract objects to that of being treated as reasons for action as well.

From a philosophical point of view, then, a pressing question is: What is the *relationship* between Eckhoff and Sundby's position and the position of the Scandinavian legal realists (Hägerström, Olivecrona, Lundstedt, Hedenius, and Ross)?[20]

By way of introduction, we indicated that legal philosophy in Norway in the first part of the 20th century differed from the corresponding fields in Sweden and Denmark in being less philosophically inclined. Here we see an example of this. To answer the question just posed, we shall have to draw a

[19] We should note that, while pointing out the role of meta-norms, Eckhoff and Sundby reject the general applicability of theories that represent the legal system as a hierarchical structure with a single ultimate basic norm at its apex. See Section 23.4.2 below.

[20] On Scandinavian legal realism, see Chapters 13 through 17 in Tome 2 of this volume.

distinction between *two senses of the term* "Scandinavian legal realism": a philosophical one, which is the one usually intended, and a wider and philosophically agnostic one, which, we submit, is an analytical tool necessary if we are to reach sufficient clarity in discussions involving the term (Eng 2007, 290–3).[21]

Psychological concepts of norm are not of philosophical interest in themselves, and so they ought not to be philosophically contested. They acquire philosophical substance, and, thus, interest, only if they are *sharpened* by the addition of internalisation as the *only* possible form of reality for normative propositions, not just *one* possible form of reality. Then—and only then—do we see the contrast with non-psychological concepts of norm.

Such a sharpening is characteristic of Scandinavian legal realism in the philosophical sense. A common feature is the analysis of our idea of normative bindingness, or normativity, as an illusion. This idea, in other words, does not correspond to anything real. The only possible reality-basis of norms and normativity are phenomena in space and time, including the psychological facts of internalisation. That psychological concepts of norm cannot account for our idea of the binding force of norms is no objection to psychological concepts of norm. Instead, it is our idea of the binding force of norms that creates the problem. It is not possible to identify any aspect of reality that may serve as the basis for our idea of norms as *also* binding on those who have not internalised the norms. This idea is metaphysical in a bad sense; it may be causally explained, within the framework of psychoanalysis, for example, but it cannot be justified in argumentative terms.[22]

Scandinavian legal realism in this philosophical sense contrasts with Scandinavian legal realism in the wider and philosophically agnostic sense of being interested in the psychological aspects of norms as *one* basis in reality for norms, but not necessarily the only basis in reality. Whether there are *other* bases in reality, indeed other *forms* of reality, where norms have a mode of existence different from the psychological one, remains an open question on this approach. It is thus left open whether we have at our disposal the argumentative means necessary to establish that certain normative propositions are inescapably binding on us in our capacity as beings invested with reason. The empirical, or spatiotemporal, basis in reality is not rendered absolute as the only possible basis in reality, as is done in Scandinavian legal realism in the philosophical sense.

How Sundby would have dealt with the distinction between Scandinavian legal realism in the philosophical sense and the wider sense is left as an open question. Neither in *Om normer* nor in the first edition of *Rettssystemer*, which

[21] On the meaning of "legal realism," see also Chapter 12 in Tome 2 of this volume.

[22] For a paradigmatic version of the argument, see Olivecrona 1939, 9–27, esp. 9–17, and for a reconstruction of Olivecrona's text, see Eng 2007, 277–90.

he wrote together with Eckhoff, did he address the issue of the ontology of normativity in a direct and clear manner.[23]

Eckhoff, on the other hand, did address the issue and took a clear stand. In the 1960s, in a paper on one of the Nuremberg Trials, he rejected the possibility of natural law, be it based on religion or on reason, and declared his adherence to an emotivist position (Eckhoff 1962, 118). Thirty years later, he confirmed his position in the second edition of *Rettssystemer* (Eckhoff and Sundby 1991, 59).

Two things should be noted here. First, Eckhoff's express adherence to a Scandinavian realist position in the philosophical sense, found in the second edition of *Rettssystemer*, was new. This edition was published after Sundby's death, and responsibility for it rested entirely with Eckhoff.

The second thing to be noted is that Eckhoff's express adherence to a Scandinavian realist position in the philosophical sense is *not necessary* in relation to the issues addressed in *Rettssystemer*. Eckhoff's declaration of his view appears as an aside, a piece of information not specifically aimed at supporting the points made in the book. *Rettssystemer* is a book on the fundamental concept of norm and on the various types of norm, particularly with a view to mapping those argumentative structures that we find in the language and argumentation of lawyers. The book is subtitled "system-theoretical introduction to the philosophy of law," but it does not address philosophical (ontological and epistemological) issues concerning normativity and practical reason. The book does not ask: Do norms partake of a specific level of reality beyond the physical and psychological levels, and, if so, what level of reality is this, and how can we cognise (decide upon) the existence or nonexistence of such a level of reality? This family of issues is touched upon in a few places, but only in passing and only as issues against which they demarcate their discussions (Eckhoff and Sundby 1976, 68, 243; 1988, 62, 181; 1991, 69, 206).

The same demarcation is made in Eckhoff's book entitled *Rettferdighet* (or *Justice*, in English: Eckhoff 1971, 1974). This work does not discuss justice as a normative concept or ideal; it investigates the ways in which arguments from justice are in fact employed in various local contexts. The subtitle to the English edition is indicative: "Justice—its determinants in social interaction." What is here a subtitle points to two facts of general import: Eckhoff leaned towards the perspective of the social sciences, and he did not see legal philosophy as altogether separate from these sciences.[24]

[23] He did voice impatience with the perspective of natural law on a couple of occasions: see, e.g., Eckhoff and Sundby 1975, 150. However, to an even greater extent than in Eckhoff's case (see the main text), this attitude is not an integral part of his main contributions.

[24] The contrast between the richness of his treatise on American law and jurisprudence (Eckhoff 1953) and his reserve in engaging with the problems of philosophy is telling.

In sum, the work of Sundby and Eckhoff bears witness to the importance of making the distinction that served as our starting point: Sundby's *Om normer* and Eckhoff and Sundby's *Rettssystemer* claim that there are *also* in existence certain psychological facts that are of importance for our understanding of normativity and norms, namely, the forms and degrees of internalisation; Scandinavian legal realism in a philosophical sense, and Eckhoff in the few express remarks he makes on the issue, claims that these psychological realities are the *only* realities there are, in the sense that they exhaust the possible bases of norms in reality.

This distinction—between Scandinavian legal realism in a philosophical sense and in a wider, philosophically agnostic sense—seems to be overlooked by Alf Ross when he states in a letter to Nils Kristian Sundby:

> It is indeed clear, and a point which you make with exemplary emphasis, that, for you as well, the concept of norm is not a purely semantic affair, but requires that the meaning content be linked to an individual (or a group) in a particular way (internalisation). The norm is always a norm *for* someone: It *is valid* [orig: *gælder*] for someone. This element, the internalisation, is a psychological-sociological fact. [...] There is, then, an essential similarity between our views. (Ross 1977, 2; my translation)

The last two sentences in the quotation are unclear. On one reading that is tempting, they express a fallacious inference. Thus, contrary to what the quotation may suggest, deeming Sundby's use of internalisation in his modelling of norms to be a fruitful move does *not* imply adherence to Ross's philosophical view of normativity, i.e., to Ross's absolutisation of the empirical world of science as the only possible basis for normativity in reality and to his corresponding rejection of a specifically practical reason.

Given this clarification, we are in a position not only to appreciate the true content of the quotation from Ross, but also to characterise Ross's influence. His analyses of norms, rights, legal method, and the legal system represented the single most influential strand of work in legal philosophy—as well as in theoretical reflections on law more generally—in Norway after 1945. The perceived possibility of deploying Ross's analyses in abstraction from his arguments for noncognitivism and for the unity of science made Norwegian lawyers value those analyses as important additions to their analytical toolbox, regardless of any philosophical criticism directed at them. Further, Ross's works encouraged scholars in various fields of the law, as well as philosophers, to engage in the problems of legal philosophy (see, for instance, Ofstad 1949, 1952 and Aubert 1954).[25]

[25] Harald Ofstad (1920–1994) studied philosophy and began his career with critical studies of Kelsen and Ross; in addition to the works mentioned in the main text, see Ofstad 1950. He went on to practical philosophy in general and held a chair at Stockholm university in that field, 1955–1987. Vilhelm Aubert (1922–1988) studied law and philosophy, and already as a student he

While Eckhoff and Sundby's model of law is similar to H. L. A. Hart's model in some respects, there are also important differences (see Section 23.4.2 below). To end with a bird's-eye view in closing our main discussion of their joint work, we submit that the main directions of influence were from Ross to Eckhoff and Sundby and from Ross to Hart (cf. Eng 2011); the similarities between Eckhoff and Sundby's work, on the one hand, and Hart's work, on the other, are more coincidental.

23.4.1.2. Svein Eng[26]

The Norwegian discussion of natural law was sparse, written from the non-committed stance of the history of ideas (Foss 1934), or limited in terms of argumentative rigour, as in Castberg's mixture of argument and appeals to our moral emotions (see Section 23.3.1 above).

Svein Eng argues that the philosophy of law qua engagement of reason has to see itself as similar to the professional fields and the sciences in one respect, namely, in the obligation laid down by reason itself to establish and follow modes of justification that can themselves be justified. Only in that way can it be decided whether our propositions, and consequently our agreements and disagreements, are tenable. What the relevant modes of reasoning are can only be determined by reflection upon the logic of reasoning in the fields under consideration, here the fields of law and legal philosophy.

Eng discusses his philosophy in two books that complement each other. Roughly speaking, the first lays down the analytical framework (Eng 1998, 2003); the second partly expands on this and partly extends the discussion to the ontology and epistemology of normativity (Eng 2007).

With respect to the nature of normativity, Eng argues for the ontological and methodological primacy of a first-person perspective, and from here for a reason-based normative requirement of inviolability and generalisability with respect to beings invested with our perspective on the world, most basically, with our capacity for acting under the idea of freedom.

Eng takes as his point of departure what he terms "a critically reflexive mode of questioning." The mode is reflexive in that thought turns back on it-

wrote a noteworthy paper in which he attempted to apply recent theories of science to legal dogmatics (Aubert 1943). He went on to the sociology of law and, finally, general sociology. He kept, however, a lifelong interest in the basic issues of law, and his wide-ranging work often straddled traditional borders between the disciplines in an innovative way (Aubert 1965).

[26] After having studied philosophy and law, Svein Eng (1955–) held positions as a legal advisor in the Norwegian Ministry of Justice and as a deputy judge before returning to the University of Oslo in 1985. Eng was appointed professor of philosophy of law in 1997, marking the first appointment of an individual to a professorship in this field in the history of the University of Oslo. In addition to his work in legal philosophy, his writings include comparative studies in legal method and studies of basic concepts in contract law and public law.

self, and it is critical in that thought asks for the criteria and facts (in the widest possible sense of this term) that are relevant in assessing the tenability of its own propositions. First, we cannot but distinguish between, on the one hand, propositions that contribute to determining the meanings of words (or concepts), and, on the other, propositions that presuppose this topic and thematise other topics: "definitions" and "characterisations," respectively, in Eng's nomenclature. Different *facts* are relevant in assessing the tenability of these two kinds of propositions. Secondly, we cannot but distinguish between descriptive propositions and normative propositions. Here, different *criteria* are relevant in an assessment of tenability.

This critically reflexive form, Eng contends, leads a shadow existence in theoretical terms: The literature has not captured the wealth of nuances, the internal coherence (the systemic character and dynamics), the independence, and the factual significance that all characterise the fundamental proposition types. He goes on to analyse the fundamental proposition types in detail and to argue for their significance in *all* fields formulated in everyday language, in particular philosophy and law, where the latter term designates both the field (*Rechtsdogmatik*) and its object (*Recht*).[27] Three analyses will be mentioned below: definitions, reconstructions and redefinitions, and fused modality.

The critically reflexive form outlined here can only be cognised from within a basic first-person perspective, that is, it exists in and through interaction between language users, and its existence and content cannot be grasped unless the reader qua reader at least to a certain extent exercises the critically reflexive form herself, i.e., does not only think *about* the critically reflexive form, but also *through* it (Eng 1998, 10–1, 579–80; 2003, 10–1, 551–2).[28]

Having thus argued for the methodological and ontological primacy of the first-person perspective within the analytical framework of the fundamental types of proposition (Eng 1998, 2003), Eng (2007) turns to the realm of normativity in particular—the analytical forms of normativity as well as the possibility of grounding normativity in a specifically practical reason. Specifying the first-person perspective into what he calls "the perspective of justification" (ibid., 7; my translation), his discussion proceeds by way of a progres-

[27] Eng uses the term *everyday language* in contrast to *artificial languages* (like logic and mathematics) but not in contrast to *academic*, *scientific*, or *philosophical* forms of language and argumentation. Many academic subjects, many sciences, and much philosophy are wholly or mainly formulated in forms of language and argumentation which by degrees, and sometimes only to a small degree, differ from those we use in everyday life. This applies, for example, to law and to large areas of legal philosophy.

[28] Eng emphasises that if one leaves language users and their decisions out of the analysis, i.e., if one relates to language as an *abstractum*, then the identity criteria for the fundamental proposition types are necessarily lost, i.e., one will not be able to capture the acts that are mapped in his work. This abstraction, Eng proceeds, is at the root of Quine's criticism of the ontology of meaning entities and his mistaken disavowal of definitions as a separate and important type of proposition (Eng 1998, 353–65; 2003, 354–66).

sion through various positions that have been held on normativity: scepticism, represented by Scandinavian legal realism; utilitarianism, represented by Bentham, Mill, and certain strands in economics; and the idea of a normativity integral to our capacity for reasoning itself, represented by an argument built on Kant's practical philosophy. These positions, Eng (ibid., 443–87) argues, are representative in both historical and argumentative terms, in that our thinking is constantly drawn towards and between them. Proceeding from these analyses, he goes on to explicate the positions of Hart, Rawls, and Habermas within the perspective of justification.

The argument is transcendental in the Kantian sense: It proceeds by demonstrating the performative inconsistency in any refusal to accept that we act under the idea of the freedom of the will. On this basis, Eng argues for a reason-based principle of right (a *rettsprinsipp* in Norwegian, or *Rechtsprinzip* in German) that enjoins the political powers to promote and safeguard a legal space in which each and every person is independent of the will of others under laws that are general and that respect the inviolability of the person.

Taking the perspective of justification to its logical conclusion, Eng emphasises that the choice of a method of justification must itself be justified. On this basis, he proceeds to a critique of various modes of justification, such as Rawls's method of reflective equilibrium, as well as pragmatism and deconstruction. He submits that a transcendental form of argument, like the one evaluated in his discussion of freedom of the will, is the only available alternative when it comes to satisfying the reflexive requirements of the perspective of justification (ibid., 7–71, 443–87; Eng 2014a, 2014b, 2014c).

23.4.2. Basic Norms and the Foundations of Legal Method

Eckhoff and Sundby (1975) criticise the view that it is necessary to assume that legal systems have one or more basic norms. They argue that there is no need for this idea in order to understand the features of law under discussion in the literature. A case in point is legal justification and the idea of legal validity, as discussed, for example, by Kelsen and Hart.[29] The derivation of a norm from another norm that is one level higher in the norm hierarchy is just one form of normative reasoning. Another form is justification from a norm at a lower level, as in the practical case of justifying a competence norm at the constitutional level by pointing to the fact that the norms issued on the basis of the asserted competence have been accepted and followed, by courts, other legal officials, or citizens. In this case, a vicious circle is avoided, for the factors justifying the higher-level norm—acceptance and rule-following with respect to the issued norms—come into existence subsequent to the higher-level norm. Eckhoff and

[29] On Kelsen's conception of legal validity, see Section 2.3.2 in this tome and Section 8.5 in Tome 2 of this volume.

Sundby (1975, 140–1, cf. 145–6; 1976, 225–6, cf. 220; 1988, 150–1, cf. 138; 1991, 178–9, cf. 165–6) argue that a vicious circle can also be avoided when the justification refers to factors present at the same point in time, since the mutual justificatory force of the competence norm and the issued norm may refer to different aspects of their relationship; it is a matter of *partial* justification, not a matter of total justification, as in the derivation model. Having analysed some arguments assumed to justify the introduction of the idea of basic norms, they reject Kelsen's and Hart's models in particular.

Eng (1997, 2000b) has approached basic-norm issues from several perspectives, including specific issues within the perspective of the basis of the doctrine of the sources of law. Lawyers are regularly confronted with questions concerning the limits of permissible legal argumentation. While recognising that such questions may turn out to be resolvable within the doctrine of the sources of law, Eng takes as his point of departure the fact that the logic of irresolvable conflicts points beyond this field to the issue of the basis of the doctrine of the sources of law itself. Within this issue he takes up one topic that has been little discussed, if at all: Does the doctrine of precedent apply to judicial arguments concerning the doctrine of the sources of law?

Eng's conclusion is negative. The doctrine of precedent attained its content and justification through practices addressing the level of ordinary legal rules. Applying the doctrine of precedent at the level of the doctrine of the sources of law would represent a category mistake, removing the doctrine of precedent from its context and transferring it to a level whose problems it does not address. Any binding force given to judicial arguments concerning the doctrine of the sources of law must seek its justification in quarters other than the doctrine of precedent.

Criticism of descriptive methodologies has been a recurrent theme in theoretical debates after Eckhoff and Sundby. It lies beyond the scope of the present work to discuss the tenability of the various interpretations of Eckhoff's and Sundby's theories put forward in the literature. As an introduction to the following, we shall point to an important crossroad in the discussions. Sundby characterises legal dogmatics as "moral reasoning with a bounded mandate," and he proceeds to argue that prediction analyses, including the seminal version in Ross (1953, 1958), invert the relationship between the philosophically interesting relata: The basic element in theoretical terms is not prediction and its subject matter but rather the necessarily presupposed and normatively regulated form of argumentation that makes predictions possible (Sundby 1974, 265). This "inversion view" of the relationship between predictions and norms has been taken up and developed by several other authors, albeit with different claims regarding the lessons to be learned, as we shall see in what follows.

Like Eckhoff and Sundby, David Doublet (1954–2000) built upon theoretical elements from systems theory. However, in what he takes to be a sig-

nificant departure from their work, he seeks to go beyond a purely descriptive model of law (Doublet 1989, 1995). In his attempt to explicate the normativity of legal methodology, Doublet (1995, 31–62) blends system-theoretic elements with ideas from hermeneutics, viewing what he terms "the legal communicative community" (*det juridiske kommunikasjonsfellesskap*) as the embodiment of the criteria of legal rationality. He rejects natural law, legal positivism, and legal realism and turns instead to the idea of a system in its self-evolving totality as the final arbiter: In the last instance, it is only the legal system itself that can decide upon issues of correctness, be it issues that relate to ways of arguing, to particular decisions, or to other parts of what we take to be the particular legal rationality.

Doublet cooperated closely with Jan Fridthjof Bernt (1943–), and together they wrote several works criticising theories that represent legal dogmatics as a purely descriptive enterprise (Doublet and Bernt 1993, 1998).

Seeking inspiration in Derrida's genealogical approaches, the work of Knut Bergo (1967–) diagnoses a decline in the literature on legal method—a decline he links to a lack of reflection as regards the basis of the doctrine of the sources of law, with a correspondingly increasing lack of relevance of one's theoretical apparatus (Bergo 2002). Bergo rejects many of the empirical assumptions about norms in the literature, particularly assumptions related to the concept of internalisation in the works of Sundby and Eckhoff. On Bergo's reading, this concept, innocent as it may seem on the surface, implies determinism and solipsism. Further, Bergo is critical of widespread ideas about the nature of weighing and balancing in law, including ideas about so-called *reelle hensyn*, i.e., arguments from considerations of policy, of the reasonable, and the like. Today, the steps in legal decision-making where such considerations are said to enter are not on the other side of the spectrum from formal factors. Instead, Bergo argues, they have come to function as placeholders for a new formalism, namely, state-sanctioned views of what is to count as the best policies, as reasonable, and so on. On the basis of a comprehensive study of the role of arguments from preparatory works (*travaux préparatoires*) in the judgments of the Norwegian Supreme Court, he submits that the weighing-and-balancing model is not the most adequate one; he instead suggests a model giving prominence to several more specific and formal argument patterns, like arguments from the intention of the legislator, from systemic coherence, and from similarity (Bergo 2000, 288ff., 945ff.).

Morten Kinander (1972–) criticises theories that understand the law as the effective decisions of legal officials, theories he collectively refers to as "legal realism" (Kinander 2004). Common to these theories, Kinander argues, is that they leave little or no room for abstraction and broader principles; only viewpoints already established, functioning and seen as rewarding in one respect or another are taken into consideration. While theories of law should indeed thus refer to the self-understanding of the participants, it

is crucial that they proceed beyond this level and establish a critical perspective.

Arguing for and from these premises, Kinander criticises various aspects of what he takes to be the dominant approach in Norwegian doctrinal law and its methodological doctrines.[30] Particularly unfortunate, he argues (ibid., 13, 240ff., 287ff.), has been the lack of a clear distinction between the methods applied in legal practice, especially the practice of the courts, and the methods adequate to doctrinal law. Seeking inspiration in Dworkin's analyses, he argues that a normative hermeneutics—one that includes but is not exhausted by Hagerup's constructivism (see Section 23.3 above)—is a more adequate point of departure for doctrinal law than are descriptive methodologies (ibid., 161, cf. 288). The sphere of normative theory and discussion excluded by the latter is necessary to law's claim to legitimacy and should be made part of doctrinal law (ibid., 287–8, 319ff.).

23.4.3. Guidelines

Sundby (1974, chaps. 7–12) singled out norms that govern weighing-and-balancing processes for particular treatment, and this topic was also to remain central in his work together with Eckhoff (Eckhoff and Sundby 1976, chap. 7; 1988, chap. 6; 1991, chap. 7; see also Eckhoff 1976, 1980). Sundby designated these norms *retningslinjer*, a term translated by him and Eckhoff as *guidelines* in English and *Richtlinien* in German (Eckhoff and Sundby 1975, 128 in note).

In his final discussion of the concept, Eckhoff laid down the concept in this way:

> [T]he feature common to guidelines that we [i.e., Sundby and Eckhoff] use as a conceptual feature is [...] that they specify (or presuppose) what are to be reckoned as relevant (or irrelevant) factors in a weighing and balancing. [...] Some guidelines also say something about the direction in which a factor pulls, what weight it has, and whether it is necessary to take it into account or whether one has a free hand in this respect. (Eckhoff and Sundby 1991, 109; my translation)[31]

Sundby distinguished between norms in the form of guidelines and norms indicating that a weighing and balancing must take place. Guidelines accompany the latter, putting argumentative strictures on the discretion of the decision-maker. Having structured the field in this way, Sundby maps a wide variety of weighing-and-balancing norms, their accompanying guidelines, and forms of reciprocal relations. As a part of this mapping, he introduces a distinction between those guidelines that are specific to a particular weighing-and-balancing

[30] Kinander opts for the term *doctrinal law* as his translation of the Norwegian term *rettsdogmatikk* (cf. the German *Rechtsdogmatik*) (ibid., 24).

[31] We have reversed the order of the two sentences in the quotation.

norm and those that are not, arguing that the norms relating to the sources of law and their intepretation may be seen as guidelines of the latter kind. In this way, he highlights how law is structured at several levels around weighing and balancing (Sundby 1974, 254–68).

Sundby's and Eckhoff's analyses were rich in material and stimulated much discussion. However, as Sundby (1978) experienced, and as Eckhoff (1980, 154) acknowledged, it was no easy matter to reach a satisfactory determination of the conceptual distinction between guidelines and other norms. The definition by Eckhoff quoted above is essentially co-extensional with Svein Eng's conclusion. Eng's conceptual construction of the distinction is different, however, in that he does not see it as a matter of the content of the norms, but as a matter of which normative consequence is in question. Norms stating what arguments are relevant to a weighing and balancing, and, possibly, what weight they are to be given—in shorthand, "relevance-and-weight norms"—are just as determinative as other norms *if* our normative question is precisely one of relevance or weight. Their non-determinative character is seen only when the context is expanded to include the question of whether or not the normative consequence of the weighing-and-balancing norm, i.e., the norm to which the relevance-and-weight norms attach, ought to obtain. In relation to *this* question, relevance-and-weight norms are never determinative. Thus, the distinction sought for is not contentual, but contextual (Eng 1990b; 2007, 163–77).[32]

The concept of relevance-and-weight norms thus conceived is Janus-faced. It speaks in part against deductive views, in part against the view that the language and argumentation of lawyers is window-dressing for outcomes reached from other arguments or motives; it claims to illuminate how guidelines lend to the language and argumentation of lawyers a rationality of a peculiarly bounded kind.

23.4.4. Competence Norms

Competence norms were part of the analytical inventory of Norwegian lawyers from an early point. In the works of Alf Ross (1953, 45–6, 74, 94–7; 1958, 32–3, 59, 79), the nature and role of this type of norm were analysed further. Sundby and Eckhoff both contributed to this discussion (Sundby 1974, part 3; Eckhoff and Sundby 1976, 93–107; 1988, chap. 5; 1991, chap. 5).[33]

[32] It falls outside the scope of this contribution to explore the relations between the conceptualisation outlined and the idea of norms that can be realised to varying degrees (principles, standards, etc.), an idea common to the works of Ronald Dworkin (1987, 14–45) and Robert Alexy (1986, 71–157). The discussions referred to in the main text relate to this idea as well, but the topic awaits fuller exploration. On Alexy, see Sections 10.3.2.2 and 10.4.3.1 in this tome and Sections 1.5.4.1, 10.3, and 25.4 in Tome 2 of this volume.

[33] Sundby, as well as Eckhoff and Sundby in their joint work, viewed competence norms as a species of qualification norms (see Section 23.4.5 below on the latter type of norm). In the revised

Building on these contributions, Eng (1990a; 2007, 79–127) has presented a general model for the logic of lawyers' discussions of the binding force of issued norms.[34] Contrary to earlier theory, he argues that competence should be seen as neither necessary nor sufficient for an issued norm to be deemed valid, i.e., deemed to have effect according to its content. He emphasises that competence is a capacity, constituted and circumscribed by norms relating to what he calls personal, situational, and contentual criteria (the who, when, and what of norm issuance). Arguing for the theoretical and practical importance of treating capacity as such as a separate step in legal reasoning, Eng restricts the concept of competence to the union of these three types of criteria, and, correspondingly, he restricts the concept of competence norms to norms laying down these criteria. In addition to these three sets of criteria referring to competence qua capacity, the categorisation of an issued norm as valid or invalid is the result of an argument where various features of the exercise of the capacity and of developments subsequent to this exercise are taken into consideration.

Eng (1990a, 649–69; 2007, 101–3, 110–27) argues that legal logic marks a separation between, on the one hand, norms relating to competence, its exercise, and subsequent developments and, on the other, norms qualifying issued norms as valid or invalid, in that there is a variety of relationships between the satisfaction or non-satisfaction of norms in the first three groups and the assessment of the issued norm as valid or invalid.

23.4.5. Definitions, Reconstructions and Redefinitions, and Law as a Definitional Activity

Eckhoff and Sundby divided the field of norms into two main groups: norms of obligation and norms of qualification (Sundby 1974, chaps. 3–4; Eckhoff and Sundby 1976, chaps. 4–5; see also footnote 33 above). Qualification norms provide criteria for what belongs to a category; in that respect they are a species of definitions.

In a comprehensive theory of definitions, Eng (1998, 55–266, cf. 28–41; 2003, 56–269, cf. 28–41) presents a model for representing the modalities, functions, and means of definitions formulated in nonformal language and argumentation. Being a paradigm example of a discipline working from and through everyday language, law figures prominently at the level of evidence for the adequacy of the model. Indeed, as an outcome of the analysis, law is

editions of their joint work, published after Sundby's death, Eckhoff moved the discussion of competence norms to a separate chapter, thereby placing this type of norm on the same footing as norms of obligation and norms of qualification (see Eckhoff and Sundby 1988, 46–7, 88; 1991, 50, 106).

[34] *General* here refers to the fact that the model applies to norm issuance in all realms of the law (international law and municipal law, public law and private law, etc.) and regardless of whether the issued norm is general or referring to named parties, and, in the latter case, whether it is bilateral or unilateral.

shown to be a definitional activity; in the argumentative practice of lawyers, the various forms of definition set forth in the general analysis are put to work as means of expounding the general meaning of, and particular subsumption under, terms in norm formulations.

Building upon his analyses of the fundamental proposition types—i.e., definitions and characterisations, be they normative, descriptive, or fused—Eng (1998, 519–76; 2003, 489–547) further presents a model for a widespread way of combining them, a combination he terms "reconstructions and redefinitions." Here, a set of phenomena is kept *more or less* constant across a range of competing analyses (representing a point of agreement), and the differences that exist between and among the analyses refer to the issue of what criteria to use to generate this set (representing the point of disagreement). Eng compares and contrasts this model with related conceptualisations in Carnap, Goodman, and Rawls, and demonstrates that many controversies in philosophy, legal philosophy, and law have the logical structure the model represents. Law provides a *paradigm case* of the model in the doctrine of precedent: The pairwise constellations of facts and outcomes in previous court cases have to be taken as given, and any disagreement there is regarding the precedential value of previous cases must relate to the issue of what criteria to use in generating the given set of pairwise facts and outcomes (Eng 1998, 532–8; 2003, 502–9; 2007, 537–40).

23.4.6. The Fused Modality of Lawyers' Propositions de Lege Lata

Eng (1998, 310–50; 2003, 312–51; see also 2000a) argues that lawyers' propositions *de lege lata* have a fused descriptive and normative modality, thus calling for a representation of descriptive and normative propositions as extreme points on a graduated scale, not as members of a dichotomous pair.

He presents the concept of fusion by taking as his point of departure the reaction criterion of the distinction between descriptive and normative propositions: If the language user corrects *the proposition*, this is a criterion of his intending to advance a descriptive proposition. If the language user tries to correct *reality*, this is a criterion of his intending to advance a normative proposition.

In lawyers' argumentation *de lege lata*, the source of the descriptive component is the relevance, in many situations, of thematising what norms motivate those who enforce the law. This tangible source Eng sees as a special case of a *general* feature of lawyers' argumentation *de lege lata*, namely, that it is always considered relevant to ask "What will the other lawyers say about my proposition *de lege lata*?"; that is, it is always relevant to make tentative predictions in this respect.[35]

[35] Two features of Eng's analysis regarding the descriptive component may be noted. First,

The normative component in lawyers' propositions *de lege lata* stems from the fact that lawyers more or less directly solve conflicts; the parties and the public expect, and the lawyers themselves wish to achieve, what one considers to be reasonable and just results, both in the case of general interpretation (i.e., on the level of rules) and in the case of subsumption (i.e., in the individual case).

Eng proceeds to argue that lawyers' propositions *de lege lata* are often neither purely descriptive nor purely normative. At the time of giving expression to his or her proposition *de lege lata*, the lawyer takes the standpoint that he or she will not take any standpoint on what is to be adjusted in the event of any subsequent discrepancy between the proposition and the practice of the authorities that enforce the law; and this "third standpoint" is institutionalised through the legal community's customarily practised norms for good legal argumentation. The phenomenon of fusion is *not* constituted through lack of insight or lack of decision on the part of the individual lawyer, but through the fact that the individual lawyer's choice does not fall at either of the extreme points on the graduated scale between the descriptive and the normative.

The general descriptive component in lawyers' propositions *de lege lata* corresponds to a fundamental consciousness perspective on the part of the individual lawyer, the perspective of "the generalised lawyer." It seems necessary to assume the existence of such a consciousness perspective according to Eng's argument. For if this perspective is hypothetically eliminated, the possibility of the general descriptive component in lawyers' propositions *de lege lata* also seems to disappear, and with it the possibility of the fusion modality in these propositions; according to Eng's argument, however, the fusion modality is a fact.

23.5. Some Final Remarks

There is no conventional agreement on sharp boundaries for the field called *rettsfilosofi* in Norwegian—cf. the German *Rechtsphilosophie*—and the same goes for the field called "legal philosophy," or the "philosophy of law." We have given priority to discussions of the ontology and epistemology of normativity and to discussions of some basic concepts. While we have included discussions of the basis of legal method, we have excluded discussions of the

his analysis of this component does not exhaust his analysis of lawyers' propositions *de lege lata*; this is in contrast to the analyses by Holmes and Ross, for example, in which lawyers' propositions *de lege lata* are subordinated to prediction (Eng 1998, 317; 2000a, 242; 2003, 319). Second, Eng claims that the predictive element is part of the propositions *de lege lata* coming from all lawyers (Eng 1998, 317–18; 2000a, 242–3; 2003, 319–20)—not just those coming from legal writers (which is the starting point in Ross 1953, 1958), and also those coming from judges and other lawyers enforcing the law (something which is claimed to be logically impossible by many authors, e.g., Hart 1961, 1994).

method itself. In the 20th century, the Norwegian discussion for long periods did not go beyond the bounds of the doctrine of the sources of law (*rettskildelære* in Norwegian; cf. the German *Rechtsquellenlehre*). From this perspective, the work of Nils Kristian Sundby was a significant event: He was the first academic in Norway to make legal philosophy his main research field, and during the relatively brief time allotted to him for creative work, he produced a corpus setting new standards in its combination of law and philosophy at a highly sophisticated level (Section 23.4.1.1 above).

While legal philosophy may make use of bits and pieces of knowledge from empirical disciplines like psychology, sociology, economy, linguistics, rhetoric, history, and so on, legal philosophy itself is usually not considered an empirical discipline. In Norway, the sociology of law has been an especially strong field. A prominent example of a border case is the wide-ranging work of Vilhelm Aubert (see footnote 25 above, Section 23.4.1.1).

At various times, some parts of the law more than others engender problems that call for theoretical reflection; in Norway, at present, many discussions in fields like constitutional law, human rights law, and international law lead us to legal philosophy. In 1946 the Norwegian Supreme Court, in plenary session, meted out a death sentence to an employee of the Gestapo for acts against members of the Norwegian resistance (Norwegian Law Reports 1946, p. 198). Some of these acts may be hard to distinguish from the "enhanced interrogation techniques" of today. This may serve to illustrate and represent the issues that divide our present society. They confront us not only with the problem of what the current law is, but also with the issue of how we ought to approach situations in which the purported bindingness of the law strikes us as problematic. The most important change that took place in legal philosophy in Norway in the 20th century was the development of a richer assortment of theoretical tools with which to approach this seemingly eternal riddle of legal philosophy: How to represent intentionality with respect to the normativity of law?

Chapter 24

LEGAL THEORY AND PHILOSOPHY OF LAW IN FINLAND IN THE 20TH CENTURY

by Susanna Lindroos-Hovinheimo

24.1. The Beginning of the Century

At the beginning of the 20th century, Finnish legal philosophy was influenced by conceptualist legal dogmatics (*Begriffsjurisprudenz*). This is generally considered to be the dominant theory of law in Finland up to the 1940s or 1950s (see Aarnio 1983, 11–2; cf. Pihlajamäki 2000). There were, of course, some theorists whose work belonged to other schools as well, such as the jurisprudence of interests (*Interessenjurisprudenz*) developed by Rudolph von Jhering. It is noteworthy that Scandinavian legal realism (the Uppsala School) never became a very important school of thought in Finland, even though there were some encounters between that school and Finnish legal scholars.[1] At the beginning of the century, neo-Kantian legal philosophy was represented by Bror Clas Carlson (1890–1966), who wrote a number of theoretical essays and a book proceeding from that approach. He was active from the 1920s to the 1950s (see Minkkinen 2003). But the first modern legal theorist in Finland is generally thought to be Elieser Kaila (1885–1938). His inspiration came mostly from German legal thought. His dissertation, of 1924, is strictly speaking the first in legal theory and contains an analysis and classification of the logical forms of legal sentences, with a focus on their normativity (Kaila 1924; see also Tolonen 2008, 167–210; Björne 2007, 232).

The most important legal theorist in Finland at the beginning of the century was no doubt Otto Brusiin (1906–1973), whose career began in the 1930s. His influence on the development of the discipline is significant, as he played a very prominent role in the legal-philosophical debate after the war. He also participated in international theoretical debates in forums such as the IVR.[2] The intellectuals in his circle would go on to lay the groundwork for legal philosophy in Finland, even though he cannot really be said to have wanted to be the fountainhead of a school of thought. He influenced Finnish legal philosophy because, in addition to conducting his own research, he supported the ac-

[1] According to Helin (1988), the influence of Scandinavian legal realism can be appreciated in research on civil law. That was facilitated by Swedish-speaking Finnish researchers who introduced Scandinavian ideas to Finland. On Scandinavian legal realism see Chapters 13 through 17 in Tome 2 of this volume.

[2] This is the *Internationale Vereinigung für Rechts- und Sozialphilosophie* (International Association for Philosophy of Law and Social Philosophy), founded in 1909, of which Brusiin served as vice president from 1957 to 1963.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_24

tivity of others and created conditions conducive to discussion in legal theory. He was a critic of Hegelian thought and neo-Kantianism, both of which were topics of discussion in legal philosophy at the time (see Aarnio 1983, 17–22; Tolonen 2008, 167–210). Brusiin was a realist and sought to refute all kinds of metaphysical explanations. His work was to some extent influenced by logical positivism and the Uppsala School. Brusiin paid much attention in his research to sociological and anthropological studies. His thinking clearly issues from the conviction that law is a social construct and is manmade (Kangas 1976, 37–42; 1990). He underlined the importance of legal science in approaching the law from the perspective of society and its members. Law is always the expression of a certain historically determined social reality, and it reflects the values that are shared in society. It follows that legal science has to look at law as a social phenomenon. The most important task of legal science is to study the relationships between legal norms and the behaviour of people, both citizens and authorities, such as judges (Brusiin 1990, 1977).

In his dissertation Brusiin (1938) discusses the (judicial) deliberation of judges. His idea is that any legal order includes a set of presupposed goals, and that these are influenced by the underlying social goals. Legal norms cannot be understood in a genuine sense if the goals behind the norms and the legal system as a whole are not known. Especially when deliberating on matters where the law has gaps, the judge has to take the entire legal order into account, an order always connected to a certain historical society. Indeed, there is no way to understand law without a grasp of society: The way to gain knowledge of this complex phenomenon is by studying social reality, social structures, and their historical development. Brusiin argues that judges should have a living knowledge of the society in which they act, and it is not enough for him to rely exclusively on sociological, historical, or economic research (see also Lindroos-Hovinheimo 2011, 289–93). In addition, Brusiin (1938, 1990) draws a distinction between the interpretation and systematization done in legal science, on the one hand, and the concrete decision-making of judges, on the other. In his theory on legal deliberation his focus is on the actual situations in which judges find themselves, and it is from this perspective that he develops his theory of legal argumentation (see Tolonen 2008, 167–210; Aarnio 1983, 18–9).

24.2. Analytical Legal Theory

Analytical philosophy became the dominant tradition in philosophical research in Finland in the second half of the 20th century. Continental philosophical thought was much less familiar, as the prominent Finnish philosophers of the time, most importantly Georg Henrik von Wright (1916–2003) and Jaakko Hintikka (1929–), focused on analytical philosophy. Especially visible in Finland in the latter half of the 20th century was the influence of Ludwig Wittgenstein's work. This naturally had an impact on legal philosophy as well, since

this discipline was in many ways influenced by trends in general philosophy. Continental philosophy was for some time almost absent from work in legal theory. Also affecting the development of legal thought were the developments of society. Finnish society underwent substantial changes after World War II, both structurally and economically: The legal order had to respond to the new types of problems brought on by industrialization and urbanization (see Aarnio and Tolonen 1998, 172). These factors in turn contributed to the development of analytical legal theory, which came to hold a dominant position in legal philosophy for some time, emerging as a critique of the legal dogmatics of the day.

Two objectives of analytical legal theory can be described. First, the analytical theorists thought that the language of legal dogmatics must be improved by eliminating superfluous elements that obstruct legal thinking. Second, legal theory must be developed so that it can provide legal dogmatics with concepts exact enough to solve practical legal problems (Aarnio 1983, 25). It is therefore understandable that analytical legal theorists should have focused on the analysis of legal concepts. The most important difference from the earlier conceptualist legal dogmatics is that analytical legal theorists did not see conceptual deduction as capable of solving practical legal problems: The definition of legal concepts was not a normative argument on which a legal decision could be based. Analytical theorists saw that the function of concepts was primarily heuristic. Normative arguments on which basis to justify legal decisions should be sought in the sources of law, especially in statutes, not in the definition of concepts (see Tuori 2002b, 903).

One of the pioneers of analytical legal theory was Osvi Lahtinen (1912–1967), who also sat as a judge on the Finnish Supreme Court. His theoretical work shows a clear connection to logical positivism, and he concentrated on the semantic analysis of legal language (see, e.g., Lahtinen 1951, 1958). Perhaps the most important scholar of early analytical legal theory was Simo Zitting (1915–2012), whose research was mostly concerned civil law, and especially with property rights. His understanding of legal theory included the idea that law, and especially the definition of legal concepts, should be purified or kept free of foreign elements, such as social facts or moral propositions. Zitting's work laid the groundwork for a general theory of the law of property (see Aarnio and Tolonen 1998, 173). In his dissertation, of 1951, he discussed change in ownership in a new, ground-breaking way, arguing that ownership should be understood as a dynamic concept, a concept that takes in different aspects in different legal situations (see, e.g., Paasto 2004; Karhu 2003, 149; Zitting 1977).

24.3. Later Developments in Analytical Legal Theory

In the 1970s, analytical legal theory in Finland began to develop toward a version that has been called analytical hermeneutics. This happened in part in response to the criticism faced by the analytical school, especially from those

scholars who underlined the connections of law to social reality (Aarnio 1983, 35–6; Backman 1977). Kaarle Makkonen (1923–2000) played an important role in developing analytical legal theory and distancing it from strict logical positivism. He is doubtless a scholar who had a significant influence on legal philosophy from the early 1960s onward. In a way, he continued the work begun by Brusiin.[3] His research is concerned above all with the judicial decision-making situation, and he discusses theoretical problems connected to legal interpretation and argumentation. The novelty of his thinking, drawing inspiration from the later philosophy of Wittgenstein, lies in his focus not on the logical structure of language but on its functional role and on its manifold connection to reality and practices. Makkonen presents a detailed analysis of three different types of legal decision-making situations: the isomorphic situation (*isomorfia*), the interpretation situation (*tulkintatilanne*), and the gap situation (*säätelemätön tilanne*). He concludes that a judge's decision is relatively free, dismissing as an illusion the idea of a decision bound by logic, and criticizing the one right answer thesis on the ground that there are no universally applicable criteria for correct legal decisions (Makkonen 1977, 1981; see also Tuori 2003, Lindroos-Hovinheimo 2011, 294–97).

The most prominent legal theorist in the analytical hermeneutic school has undoubtedly been Aulis Aarnio (1937–), whose work has exerted great influence on legal philosophy in Finland, especially in the last decades of the 20th century.[4] Another theorist, whose work can be situated within analytical hermeneutics, is Hannu Tapani Klami (1945–2002), who developed what he calls a "finalistic" theory of law. According to him, the interpretation of law is essentially a goal-oriented activity in which teleological arguments are important and where legal rules will at times have no more than an ancillary role (Klami 1983; 1986, 154–243, 503–7; Aarnio 1983, 37–8). Klami was a very productive scholar whose research interests range from general legal philosophy to Roman law and different branches of law.

The panorama of Finnish legal philosophy started to change from the 1960s onward, as more and more researchers contributed to the discussion and as the theoretical approaches began to branch out. Much discussed in Finnish legal philosophy beginning in the 1970s was hermeneutics, especially in the form developed by Hans-Georg Gadamer. Kauko Wikström (1943–), whose dissertation concerned the interpretation of legal practice, combines the idea of the hermeneutic circle with practical reasoning as developed by von Wright, and he presents some counterarguments to Aarnio's theory (Wikström 1979). By the 1980s, at the latest, Finnish legal philosophy had gradually begun to take on an international dimension, as an increasing number of schol-

[3] Brusiin acted as discussant when Makkonen defended dissertation in 1965, and is said to have held Makkonen's work in high regard. See Brusiin 1965, Tolonen 2008, 171–72.

[4] Aarnio's work is discussed in details in Section 25.5, Tome 2 of this volume.

ars took part in international discussions and increasingly published in international journals. The language of research also started to change toward the end of the century, a shift that can be appreciated in the growing number of doctoral theses written in English.

The dominant theoretical school almost to the end of the century was, in different forms, analytical legal theory. Eerik Lagerspetz (1956–) is a Finnish philosopher who has done research in political and social philosophy, focusing on legal institutions, among other issues, and investigating the ways in which their existence is dependent on conventions (Lagerspetz 1995). In 1996, Matti Ilmari Niemi (1958–) defended his doctoral thesis, in which he studies the preconditions of knowledge as well as the foundations of legal orders. What he puts forward is a conventionalist theory of knowledge in legal dogmatics, following in the footsteps of Hintikka and von Wright in his analysis of legal language as a normative language, and taking his cue from Wittgenstein's ideas of language shared in a community. He also discusses the social contract in the Rawlsian sense as a precondition for a legal order (Niemi 1996).

In his doctoral thesis, of 1998, Raimo Siltala (1960–) developed analytical legal theory into what he calls a post-analytical philosophy of law, studying legal precedents and developing a theory based on analytical jurisprudence as expounded by Jerzy Wróblewski, Alf Ross, and H. L. A. Hart, but which also draws inspiration from Jacques Derrida and Michel Foucault (Siltala 2000).[5] Siltala has subsequently written extensively on theoretical questions of legal interpretation and on theoretical issues in jurisprudence (Siltala 2003, 2004). He sees law as a deliberative practice, practice that even extends to the concept of law itself as an object of debate. He rejects the idea of a definite truth about law, an idea contradicted by the fact that different schools of legal thought define the concept of law in their own ways. His own theory of law is perhaps most clearly connected to institutional legal positivism, and he sees valid law as an institutional and social fact, the content of which enjoys institutional support and societal approval. The institutional and societal principles on which basis law is justified form a meta-context of legal interpretation and provide various models of legal reasoning. Legal science comprises several ways of doing research, and it can be divided into five areas depending on the kind of knowledge pursued and on the method for attaining that knowledge: We thus have an interpretive science, a human science, a cultural science, a social science, and legal philosophy.

24.4. Law and Society

In the 1960s and 1970s analytical legal theory began to be criticized from different directions. According to Aarnio (1983, 32–3), what lay behind the criti-

[5] On Wróblewski and Ross see respectively Section 16.3.3 in this tome and Chapter 16 in Tome 2 of this volume.

cism was a general dissatisfaction with legal positivist research. Some scholars underscored the need for legal research to focus on ways of *changing* society rather than only on explaining the prevailing systems. Analytical legal theory was faulted for having detached law from society and its problems (see also Aarnio and Tolonen 1998, 174). These critical voices took their inspiration especially from Marxist thought.

Marxist legal theory emerged in Finland in the 1960s. The most important theorist in this school is Lars D. Eriksson (1938–), who started his work in legal philosophy on the topic of legal argumentation. He gradually became interested in the Frankfurt school of critical theory and in Marxist theory. He did not, however, lock his research into any dogmatic viewpoints, but gave wide scope to his research interests and managed to keep it that way (see Aarnio 1983, 40). Eriksson argues that legal philosophy should take social reality into account instead of concentrating on isolated and technical problems pertaining to legal dogmatics. Many of his texts deal with issues broader than those traditionally treated in legal theory, since his interests range from political questions to the classics of political theory (see Eriksson 1992). He criticizes hermeneutic theory, among other things, for its inability to see and take account of structural conditions, especially those connected with power relations. Eriksson (1978) also underlines that hermeneutic research is unsuitable for any critique other than the kind strictly immanent in the object of study. Eriksson's work has been influential in the development of later theoretical expositions. His ideas on an alternative legal dogmatics have been further developed by many theorists, a case in point being Thomas Wilhelmsson (1949–). Alternative legal dogmatics sees law as a system that includes inconsistencies and tries to uncover and criticize tensions between the law and social reality (see, e.g., Tuori 1990).

Although Wilhelmsson's research is mostly focused on issues in private law, he has also written on general problems in legal theory. Later in his career he has also worked on European law. Wilhelmsson (1987, 1997, 2001, 2002) seeks to develop the general doctrine of private law in connection with certain values. He introduces the idea of social civil law, which connects law to morality and social responsibility. He underlines values such as solidarity and altruism over against freedom and individualism. These ideas coincide with the reassessment of the welfare state in Finland from the 1980s onward. Wilhelmsson's understanding of law is in many ways postmodern,[6] as he believes in the importance of "small narratives" instead of grand, all-encompassing theories of law. He rejects the idea that society and law could, or even should, be deliberately reshaped in accordance with a general ideology. Indeed, a characteristic of contemporary law, in his view, is fragmentation, a phenomenon bound up with the nature of late modern society. Thus legal philosophy should give up

[6] Wilhelmsson mostly uses the term *late modern*.

ideas of law as a coherent system and pay more attention to particular legal situations. System-oriented thinking can even have harmful effects if it prevents a sensible analysis of law. Fragmentation is a tendency especially visible in European law. Discrepancies are internal to the European legal system, and there are many points of collision between EU law and national law. Wilhelmsson explains the nature of EU law using the Jack-in-the-box analogy: EU law can pop up anywhere in national legal systems and can contradict traditional ways of understanding the law.

Another theorist whose work has been especially influential on the theory of civil law is Juha Karhu (1953– ; born Juha Pöyhönen), who defended his doctoral thesis in 1988. His research is on contract law, and he addresses the antinomy of form and substance, viewed by him as one of the central questions in Western systems of contract law. Form and substance are two dichotomous concepts that cannot be made to cohere. Karhu (1988) argues this antinomy to be an example of an unsolvable tension in law. He draws on the distinction between rules and principles as discussed by Ronald Dworkin and Robert Alexy.[7] In his later work, Karhu has broadened his scope to general issues in civil law and jurisprudence. His ideas are similar to Wilhelmsson's, since he develops a more dynamic way of understanding the law of property and underlines the need for law to be flexible, in the sense that there is room for a situation-centred analysis not constrained by any imperative to follow rigid and unyielding practices. His proposal for a new law of property connects the basic principles of property law with basic constitutional rights (Karhu 1999, 2003).

Among the most influential Finnish legal philosophers at the turn of the century is Kaarlo Tuori (1948–), whose work has ranged from administrative law to social law and legal philosophy. He has developed his own way of seeing the interconnectedness of law and society, in a theory he calls critical legal positivism, where he engages in a dialogue with the theories expounded by Jürgen Habermas, Max Weber, and Michel Foucault, among others, with the aim of describing modern law. Law is seen by Tuori (1983, 2002a) as a multi-layered system, and he distinguishes three layers: the surface level (*pintataso*: i.e., statutory and case law), the level of legal culture (*oikeuskulttuuri*: i.e., general legal theory and basic legal concepts), and the deep structure of law (*syvärakenne*: i.e., fundamental principles, such as civil rights, and the prevailing rationality of the particular legal system in question). The different levels change and affect one another in different ways and at different paces: The pace is rapid at the surface level, slower at the deeper ones. There is an important place for critical legal reflection in this picture, and that explains why his theory is called critical legal positivism. The layered system makes immanent critique possible, as the yardstick can be derived from the object itself. For instance, a court de-

[7] On Alexy, see Sections 10.3.2.2 and 10.4.3.1 in this tome, and Sections 1.5.4.1, 10.3, and 25.4 in Tome 2 of this volume.

cision can be criticized for being contradictory with some elements in the legal culture. The theory's positivism derives from a firm belief in manmade law, always tied to a particular society and historical situation. Law is both a legal system and a social phenomenon.

Later in his work, Tuori (1999, 2007) has developed a pair of notions—the *ratio* and the *voluntas* of law—whose tension is another way of conceptualizing modern law. Law is an instrument both for exercising power (*voluntas*) and for restraining it (*ratio*). *Ratio* controls and holds back the *voluntas* of law and provides systematization, whereas *voluntas* is the legislator's political will. The legal landscape has been transformed with the reduced importance of the nation-state as the only sovereign legislator, and with the variety of legal sources and concepts that derive from international and EU law. This has led to pluralism and even fragmentation, but in Tuori's view there is still a possibility of local coherence in different legal fields. The growing importance of human rights can be seen as an element that also increases coherence on the international level. The *ratio* of law, which in Tuori's system belongs to the level of legal culture, can still provide systematization and uniformity in the current situation, in which the nation-state has lost some of its importance.

In the 1990s, the discourse on rights broke through in Finnish legal philosophy, and it has since remained a much-discussed theme. One of the first scholars to focus on this topic was Martin Scheinin (1954–), whose dissertation concerns international human rights and their applicability in Finland. He studies the role of the judiciary as a safeguard for constitutional and human rights, as well as the general questions relating to the division of power (Scheinin 1991). He later worked with different issues relating to human rights and comparative constitutional law.

24.5. Theoretical Approaches at the End of the 20th Century

Legal philosophy became increasingly diverse in Finland in the 1990s. Perhaps the greatest change in comparison with earlier developments was that the continental philosophical tradition became an important and widespread theoretical framework for Finnish legal philosophers. Hannu Tolonen (1945–2005) is among the first legal theorists to have studied law from what could broadly be described as a postmodern perspective. He, too, was influenced by hermeneutics, but his main interest was in the ontology of law.[8] Tolonen (1997) was a theorist who continuously sought for new ways in which to understand the legal system and its features. His conception of law does not postulate a single principle by which to explain the legal system but develops a pluralistic view of law. Law is a kaleidoscope and can be understood in countless different

[8] In his dissertation, defended in 1984, Tolonen discusses natural law theory and especially Thomas Aquinas's thought: See Tolonen 1984.

ways. In addition, law is not a coherent system but always contains conflicts and contradictions (Tuori 2008).

The research tradition in which law and society are seen as interconnected, and in which legal theorists develop critical perspectives for the study of law, continued and developed new forms at the end of the 19th century. The late modern perspective on law has been developed by many legal philosophers. Their work is closely connected to international debates in legal philosophy, both European and American, and especially to critical schools of thought. One of the internationally best-known Finnish legal theorists is Martti Koskenniemi (1953–), whose field of speciality is public international law. His research includes elements of social and political theory, underlining the political nature of international law, a feature that can be observed in its practices, institutions, and conceptual frameworks. International law is not independent of international politics, nor can it be seen as objective in distinction to the subjectivity of politics (Koskenniemi 2005; see also Koskenniemi 2002). In the 1990s there also emerged in Finnish legal philosophy an interest in gender studies and the development of feminist perspectives. In 1993, Kevät Nousiainen (1950–) defended a dissertation that addresses the special characteristics of modern trials and the power relations at work in legal proceedings (Nousiainen 1993). She has since been focusing especially on gender and equality issues.

The legal philosophers who have been active around the turn of the century have made legal philosophy interdisciplinary by establishing very close connections with general philosophy and the social sciences. Panu Minkkinen (1957–) defended his doctoral thesis in 1998. His philosophical frame of reference is continental philosophy, and he discusses classic theories such as those of Plato, Aristotle, and Kant, as well as postmodern ones. His thesis attempts a deconstruction of legal philosophy, and he focuses on metaphysics and the nature of law. Minkkinen argues that justice can be understood as a striving for metaphysical correctness, something which can never be realized, but which nonetheless plays an important role in steering the law toward correctness itself (Minkkinen 1998). Minkkinen has actively participated in international discussions in legal philosophy, and in his later work he has investigated issues in areas of study ranging from law and literature to social and political philosophy. In 2009, he published a book on sovereignty in which he investigates the topic from three different angles: as a legal question in relation to the state, as a political question in relation to power, and as a metaphysical question in relation to self-knowledge (Minkkinen 2009).

Similarly, the research conducted by Ari Hirvonen (1960–) has focused on a variety of issues, such as the polycentricity of law and questions connected with law and evil (see Hirvonen 1998, 2010). He has also done research in fields beyond legal theory, mostly in general philosophy and psychoanalytic theory. Hirvonen's thesis, of 2000, offers a reading of Sophocles' *Anti-*

gone through which to look at the connections between law and justice and the ontology of law. His approach can be described as phenomenological and poststructuralist, and he discusses theories such as those of Martin Heidegger, Jacques Derrida, and Jacques Lacan. His effort is to find ways to understand law in Greek tragedies so as to avoid the shortcomings of rigid positivism, which excludes questions about justice and the legitimacy of law. He also emphasizes the undecidability inherent in law and the problems associated with the determination of legal meaning (Hirvonen 2000). In both Hirvonen's and Minkkinen's work one can appreciate the influence of Tuori's thinking, as well as of Eriksson's, in that both have developed critical accounts of law, of its purpose, and of it justification. Hirvonen's and Minkkinen's research profile is fairly similar, in that they have both drawn on phenomenology, deconstruction, and psychoanalytical theory, and both started their careers by studying criminal law and abolitionism.

Another legal philosopher whose work is very clearly influenced by continental philosophy is Jarkko Tontti (1971–). In his dissertation (of 2002) he discusses legal decision-making from the point of view of hermeneutical philosophy and deconstruction. According to him, hermeneutical philosophy has two sides: It is a transcendental philosophy—concerned with investigating the conditions for the possibility of understanding its object, namely, law—and it is also a methodological approach, one through which we can clarify what happens in practical interpretive work such as legal decision-making. Tontti studies law from both perspectives. He is interested in the ontology of law, as well as in describing the process of legal decision-making. According to him, law is one example that paradigmatically shows what it means to engage in hermeneutic activity: It is an exercise through which other interpretive activities can be understood. Tontti (2004) develops a theory that emphasizes the need for a critical perspective on law, a perspective provided by hermeneutics, through which hidden structures of pre-understanding can be revealed. The work done by Minkkinen, Hirvonen, and Tontti shows that at the turn of the century there was a strong tendency in legal philosophy to move away from analytical theory. At the same time, Finnish legal thought has become diversified, as more and more scholars have taken part in international theoretical discussions.

Chapter 25

LEGAL PHILOSOPHY IN THE LOW COUNTRIES

by Mark Van Hoecke and Arend Soeteman[*]

25.1. Introduction

In legal philosophy as in other fields, the Low Countries have always been a place where the streams flowing from different neighbouring countries intersect. Until recently, most Dutch and Flemish scholars spoke all the languages of the neighbouring countries: They could read and understand publications in German, French, and English. As a result we find in the Low Countries the influence of German idealism, French structuralism, and English analytical philosophy. Also, one should not neglect the influence of the United States: American pragmatism and American idealism have counterparts in the Low Countries.

This characteristic of Dutch and Belgian legal philosophy—its being a crossroads of different traditions—seems to be at once its main weakness and its main strength: a weakness to the extent that it was difficult to develop an authentic Dutch/Belgian philosophy in the shadow of so many impressive neighbours; a strength in the sense that legal philosophers in the Low Countries, being conversant with a range of traditions, can compare them and enrich their thinking through that knowledge.

It is clear that legal philosophy in the Low Countries has become much more international over the course of the 20th century. Better possibilities for travel and, more importantly, modern communications have prevented a provincial approach to legal philosophy. Although Dutch and Flemish authors knew what was going on in the countries around them, their discussions at the beginning of the century were still mainly internal. That is impossible today, even if many papers and books are still published in Dutch—and it will continue to be that way for as long as Dutch is the language of the law in the Netherlands and in the Flemish part of Belgium.[1]

At the beginning of the 20th century the Association for the Philosophy of Law was founded. Originally it was a strictly Dutch association, but soon its membership came to include Dutch-speaking Belgian legal philosophers. It was only from the 1970s onward that they have also been participating in meetings on a regular basis. The association now meets twice a year to discuss

[*] This contribution is partly based on two earlier papers, namely, Soeteman 1993 and Ost and Van Hoecke 1995.

[1] In this contribution we will be focusing on the Flemish part of Belgium because the French-speaking authors are discussed in Chapter 12 in this tome, while Perelman's theory of legal reasoning is treated in Section 23.2 in Tome 2 of this volume.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_25

papers written by members or by invited guests from other countries, to give young scholars an opportunity to present their ideas to a broad audience of legal philosophers, and to discuss current social problems from the perspective of legal philosophy. The association has grown into the most important forum for discussion on legal philosophy in the Low Countries (apart from all the many informal meetings that take place every day). The papers presented at the meetings, as well as the contributions of different participants in the discussion, were originally published in the *Handelingen van de Vereeniging voor Wijsbegeerte des Rechts* (Proceedings of the Association for the Philosophy of Law). Since 1972, the association's journal has been the *Nederlands Tijdschrift voor Rechtsfilosofie & Rechtstheorie* (Netherlandish journal for legal philosophy and jurisprudence, since 2012 titled *Netherlands Journal of Legal Philosophy*),[2] which publishes not only papers presented at the association's meetings but also papers by Dutch, Belgian, and occasionally other authors.

In this short contribution we can only provide a partial picture of the work on legal philosophy that has been done in the Low Countries in the 20th century. We will first introduce some of the themes elaborated in Dutch-language legal philosophy today and then provide a short survey of the most important work done before World War II. Second, we will mention some of the work done in the first decades after the war. Thereafter we will continue along some more-thematic lines, discussing, third, natural law and the relation between law and morals; fourth, the question of what justification, if any, there can be for morality—assuming it is important—in the pluralist world of modernity; fifth, some legal moral ideas (justice, democracy, fundamental rights, and euthanasia); and sixth, the Dutch and Belgian contribution to the question of judicial decision-making. In the more thematic parts we will occasionally also refer to work done before 1950. The last section mentions some further areas and topics.

Dutch and Flemish legal philosophers often make a distinction, as others do, between legal philosophy and legal theory. The demarcation between these two fields is, however, rather vague.[3] There seems to be agreement that substantive questions—such as justice and human rights—belong to legal philosophy. The study of legal reasoning and the analysis of legal concepts (such as the concept of law, of a legal person, of rights, of duty, of an act, and of liability), on the other hand, belong to legal theory. Paradigmatic conceptions in legal theory in the Netherlands have been developed by Marc A. Loth (1956) and Popke W. Brouwer (1952–2006). In 1988, Loth, now a member of the Dutch

[2] In the interests of full disclosure, it should be noted that the authors of this contribution both have sat for many years on the journal's editorial board: Soeteman was a member from the very first issue (November 1972) and van Hoecke from the second one (March 1973), in which he was erroneously identified as a doctor of law ("Dr."), a title he would obtain only six years later.

[3] A discussion can be found in Gijssels and Van Hoecke 1982 and Van Hoecke 1985.

High Court, wrote a most penetrating analysis of acts, causality, and liability making use of analytical philosophical tools (Loth 1988). Two years later, Brouwer, professor at the University of Amsterdam from 1991 until his untimely death in 2006, published what is perhaps the most theoretical book ever written in Dutch about coherence in the law (Brouwer 1990). A particularly interesting aspect of his conception is that Brouwer regarded legal principles as only marginally relevant in creating coherence, considering that different principles point in different directions, thereby undermining (rather than sustaining) coherence.

In the 1970s and 1980s, a good deal of work was done in (analytical) legal theory, but today legal theory and legal philosophy are more in balance. Political and demographic developments in our countries (today about 10 percent of the population is Islamic) require that we reevaluate some fundamental principles of our legal system and our democratic order. In the courtroom, we are confronted with cases involving ritual slaughter, honour killing, and, less dramatically, the custom of wearing headscarves. A strictly majoritarian understanding of democracy proves quite undemocratic in a multicultural society. Freedom of speech is endangered when tolerance diminishes. On the other hand, freedom of religion is endangered when used by religious leaders (and imams in particular, even if only a small minority of them) to argue for the inferiority of other communities (Jewish and Christian, and non-Muslim generally) and claim that husbands are allowed to beat their wives. And can we afford to maintain the traditional principles of our criminal procedure when confronted with modern criminal outfits and large-scale terrorist threats? Questions of this sort—lying at the heart of the contemporary debate across the world—also figure centrally in the Low Countries. Legal philosophy may contribute to finding some answers.

25.2. Before World War II

In the first half of the century, a dominant influence in the Netherlands was exerted by Germany. We will mention four authors, all of whom mark points of high achievement in legal philosophy in the Low Countries. They all illustrate that Dutch legal philosophy looked to the East.

The first work in legal theory of any importance in the 20th century is the doctoral thesis written in 1903 by a civil lawyer, Eduard M. Meijers (1880–1954), later professor of civil law in Leiden and the first author of the new Dutch Civil Code. The discussion is limited to Dutch and German authors (Meijers 1903) and addresses a range of topics usually understood to fall within the scope of legal theory: legal concepts, legal interpretation, induction, and deduction. More than forty years later, the same author wrote a book (Meijers 1947) that can be considered a supplement to the earlier work, and in which he develops a method of "definition by normal types," essentially proceeding

along the same lines that Ludwig Wittgenstein (1953) suggests in his *Philosophical Investigations* when he speaks about family resemblances between the different uses of some word.

A second author worthy of mention is the constitutional lawyer Hugo Krabbe (1857–1936). Law, Krabbe (1906, 1915) argued, is determined by the people's sense of justice. In a parliamentary democracy, legislation is authoritative as the voice of the people. It fills something like the role Rousseau envisioned for the *volonté générale*, entailing the same dangers for the protection of minorities.[4]

A third important author was a criminal lawyer, Leo Polak (1880–1941). Polak (L. Polak 1921) wrote a thesis of more than 650 pages on punishment. Punishment, he argues, cannot be justified by its putative effect (specific or general deterrence), but only by reestablishing in society the ethical balance that was upset by the criminal act itself. Here we can clearly see a Kantian influence.

The last person to be mentioned—he wrote important work before World War II and was still active in the 1950s—is Herman Dooyeweerd (1894–1977). According to G. E. Langemeijer, then president of the Royal Dutch Academy of Arts and Sciences, Dooyeweerd is the most original Dutch philosopher in history, even more so than Spinoza. Dooyeweerd was an orthodox Calvinist thinker who developed a Christian philosophy he called philosophy of the Cosmonomic Idea, where *nomic* refers to the cosmic world order created by God.[5] He offers a transcendental criticism (the reference is to Kant) arguing that every science necessarily presupposes a religious commitment. The cosmic order is held together by time. If you abstract from time, the cosmic order breaks up into fourteen or fifteen different aspects, or modes of being: One of these is the legal aspect, next to which are the physical, the historical, and the moral, among the others, and they all form part of a coherent structure, but it is beyond the scope of this discussion to enter into this conception or explain the other parts of Dooyeweerd's philosophy, which also includes a philosophical analysis of the state and other social communities, such as the family and the church, considered to be "sovereign in their own sphere." Although Dooyeweerd was a lawyer by training, he did not publish much on the legal consequences of his philosophy. But he did write about them in unpublished materials for students. His disciple and successor as professor at the Free University at Amsterdam, H. J. van Eikema Hommes (1930–1984), worked this out in a number of books (van Eikema Hommes 1972, 1976, 1986). What seems to be the obvious Kantian influence on Dooyeweerd's work has always been denied by him.

[4] On Krabbe see also Section 2.2 in this tome.

[5] The fullest statement of his philosophy is contained in Dooyeweerd 1935–1936, a work in three volumes of more than 500 pages each. There is also an English version (Dooyeweerd 1953–1957), which in translating the Dutch original also offers a further development of his views (it contains an additional fourth volume, but this is essentially a very elaborate index).

In Flanders, the situation was quite different. After Belgium separated from the Netherlands in 1830, French took hold as the dominant language in education and most notably in higher education. It was only starting from 1930 that it became possible to attend university lectures in Dutch in Belgium, notably at Ghent University. At the University of Leuven this process started later and more slowly. Until the 1960s, these were the only two Flemish universities. This explains why hardly anything was published in Dutch in jurisprudence (and in fact in most disciplines) before World War II. Three legal philosophers of note active in the first half of the 20th century who only published in French are Jean Dabin (1889–1971), who taught at Leuven (his classes, too, were in French only) and is to be counted as a legal philosopher and natural lawyer; Georges Cornil (1863–1944), who took a sociological approach to private law; and Henri De Page (1894–1969), who taught legal interpretation in Brussels and figures among doctrinal legal writers who have also written at least one book in legal theory.

In the same period, in Flanders, only two professors at Ghent University published in jurisprudence, namely, René Victor (1897–1984) and Jean Haesaert (1892–1976).

René Victor was a part-time lecturer in legal theory at the Free University of Brussels (1931–1941) and later at Ghent University (1955–1967). He was very good at describing other people's work,[6] but his own scholarly production was limited.[7] He was mainly a legal practitioner who did a lot to promote a Flemish legal science, including by founding, in 1931, the weekly law journal *Rechtskundig Weekblad*, for which he served as editor-in-chief for more than fifty years.

Jean Haesaert was a professor at Ghent University from 1925 to 1962. He worked mainly in sociology and legal theory. His approach to legal theory was rather sociological. In 1935, he published a general introduction to legal theory (Haesaert 1935)[8] in which most of the attention goes to German authors, while also discussing some English and Dutch authors and, with somewhat more emphasis, French ones, too. Haesaert did not develop a full theory of his own but was quite productive, mostly with articles and books published in French, and he had original ideas on many points. He was markedly antimetaphysical and considered natural law (and its revival) to be no more than a "temporary disease" (Haesaert 1933, 20).

[6] For instance, he wrote a very complete overview of the work of J. P. Haesaert (R. Victor 1963) and an essay, published as a monograph, on the importance of Dutch scholarship in legal theory (R. Victor 1933).

[7] R. Victor (1935) mainly explained Adolf Reinach's "Platonic" theory of law. This was also the first contribution by a Flemish scholar at a meeting of the (Dutch) Association of Legal Philosophers. On Reinach see Section 4.2 in this tome.

[8] Later, in 1948, he came out with a more developed general book on legal theory in French (Haesaert 1948).

25.3. The Early Post-war Period

The German influence did not wane after World War II, to be sure. But in the Netherlands a French influence began to take hold, mainly in the work of a number of Roman Catholic authors influenced by French existentialism (and German existentialism, too, with Werner Maihofer) and sometimes also by the work of Emmanuel Levinas. Perhaps no work is more representative of these scholars' investigations than a short book that J. J. M van der Ven (1907–1988) published in 1966 (Van der Ven 1966). As Langemeijer (1978) summarized it: "The primal conviction underlying his theory is the proposition that man's 'being with others' is a datum from which it follows as a matter of course that he can only reach authentic existence if he accepts the consequences of this datum." Also in this group of scholars was W. Luijpen (1922–1980), who argued that in a perfect society, where love reigns, there is no place for law and justice. According to Luijpen (1966, 261–2), law is for an imperfect society, where it is needed to secure the realization of at least a minimum degree of love. With that caveat in the background, Luijpen (1969 and 1975) defends a natural law responsive to changing circumstances, and hence a natural law that can itself change over time: The requirements of the minimum content of love cannot be determined once and for all. Love also figures centrally in the work of Jan Jozef Loeff (1903–1979).

Another approach to legal philosophy can be found in the work of R. A. V. Van Haersolte (1919–2002), who was professor at Rotterdam and Leiden. In Van Haersolte 1946, he offers a conception of the state modelled on Hegel's philosophy of the state, though not as authoritarian as the kind more common among authors who look to Hegel. In his later work, he freed himself from Hegel and embraced a conception of legal philosophy as a branch of philosophical anthropology (Van Haersolte 1984, 147). We are the one animal that speaks with itself, an evolutionary development of our speaking with others. In moral and legal conversation there is a certain tension between my own interests and those of the generalized other, between ego and alter ego. The alter ego represents the individual conscience. In law, however, conscience is the *legal* conscience, by which is meant an institutionalized positive morality, such as it actually exists in society. Law is founded in the existing expectations of existing others. This anthropological construct is extended by van Haersolte (1971) to the state, on the reasoning that the state can itself be considered a kind of person.

Another post-war author was J. F. Glastra van Loon (1920–2001), who rejected metaphysical ideas or ideal standards as important for an understanding of law, thereby clearly moving away from van der Ven, Luijpen, and Loeff. Although the conception developed by Glastra van Loon (1957) is perhaps best described as one of general philosophy than of legal philosophy, it laid the groundwork for many legal philosophers in the generation (at least in the

Netherlands). It presents an independent elaboration of both phenomenology (Helmuth Plessner) and Anglo-Saxon analytical philosophy, using both to challenge a traditional Cartesian dualism.

Glastra van Loon was one of the two intellectual fathers of *functionele rechtsleer*, or functional legal theory. The other intellectual father was J. ter Heide (1923–1988), especially in Ter Heide 1965 and 1970. Both authors reject an essentialist analysis of law: Law is not founded on any transcendental, moral, or instrumental value singled out as the putative essence of law. As Glastra van Loon puts it in one of his later works (Glastra van Loon 1989, 7), law derives its binding force only from itself. The law is constituted by a legal community. Legal rules are not imperatives: They originate in social interaction among human beings. The concept of law does not point to the existence of any special entity out there in the world, but rather singles out an aspect of social life (in its ongoing development), identifying in particular an institutionalized method for preventing people from taking the law into their own hands if their legitimate expectations are frustrated.

Also worthy of mention is G. E. Langemeijer (1903–1990), whose work can be argued to bear a stronger relation to either van Haersolte or van der Ven, but which (regardless of that question) offers an independent conception. This conception builds on the idea that anyone who invokes a rule of positive law as being just, insofar as it is prevalent, is doing so proceeding from a basic presupposition, namely, that we all want to coexist on the basis of mutual convictions, at least with respect to the issue or matter at hand. It follows from this premise that all interests should be recognized as having equal weight. This does not result in any incontestable proof that we are asserting a legitimate claim on the basis of those interests, but it does give us an opportunity to be apprised of what is surely unjust. No more than that level of proof or conviction is needed for the practical working of law (Langemeijer 1973).[9]

In Flanders, Carlos Gits worked out a phenomenological approach to law based on the work of Georges Gurvitch. However, upon earning a Ph.D. from Leuven University in 1949 (Gits 1949), he went into law without further pursuing his scholarly activity.[10] At Ghent University, Willy Callewaert was appointed to the chair in legal philosophy after Haesaert's retirement. In the 1960s, he regularly attended the meetings of the Association for the Philosophy of Law, even though he mainly devoted himself to his activity as a criminal lawyer, a trial lawyer and a politician (a member of parliament and a minister). So, in this case, too, there was no real follow-up at Ghent University in the area of jurisprudence. In the 1970s, jurisprudence went through a revival at Ghent Univer-

[9] This summary is based on Langemeijer's own summary in Fokkema et al. 1978, 591.

[10] The only exception is a book on natural law he wrote with Jan Delva, president of the Constitutional Court of Belgium (Gits and Delva 2000). This book was still largely influenced by theories developed in the first half of the 20th century.

sity under the leadership of Marcel Storme (1930–), a procedural lawyer with a wide range of interests: This he did, most notably, by paying attention to the changing role of the judge, in collaboration with Dutch colleagues such as ter Heide and Langemeijer (Storme 1973 and 1976). The same happened in Leuven, and indeed throughout the whole of Flanders, following the publication of a very influential book on judicial decision-making, *Het beleid van de rechter* (The policy of the judge: van Gerven 1973), marking the start of a period when jurisprudence became institutionalized in Flanders, through research centres, journals,[11] congresses, seminars, and inter-university cooperation.[12] None of these centres or initiatives has lasted to this day, to be sure, but there has been an overall continuity even so.

25.4. Law and Morals

By the end of the 20th century, natural law was no longer very popular. D. H. M. Meuwissen (1939–), now a retired professor at the University of Groningen, was still making a case for natural law, but he reduced its content to Radbruch's formula: A law or set of laws can be so egregiously unjust and harmful that its validity, and even its nature as law, must be denied (Radbruch 1963, 336).[13] His legal philosophy is inspired by Hegel (see Meuwissen 1982). Another scholar who worked in the natural-law tradition from its ethical side is Fernand Van Neste (1931–), who taught legal philosophy at the University of Antwerp from 1965 to 1995 and developed the idea of a minimal content of natural law based on a foundation of human liberty, self-fulfilment, mutual recognition among individuals, and a degree of organization through law (see Van Neste 1975, 12; 1991).

Frank Van Dun (1947–)—he taught at Ghent University after many years of teaching at Maastricht University—worked out a comprehensive libertarian system of natural law. This system is based on two complementary principles: the absolute freedom of all individuals, coupled with an unconditional prohibition for any other person or any social body from interfering in the individual's life or

[11] Chief among these was the previously mentioned *Netherland Journal for Legal Philosophy and Jurisprudence*, but in time other journals emerged, such as the Dutch-Flemish *Recht en Kritiek* (1975–1997)*, Tegenspraak* (1982–1984, now a series), and the *Marxistisch Juridisch Tijdschrift* (1976–1978). These journals are mainly aimed at providing critical commentary on the law and on legal developments from an external perspective (be it ideological, political, philosophical, or otherwise).

[12] Apart from ad hoc cooperation for research, there has been the *Interuniversitaire Kontaktgroep Rechtstheorie* founded in 1982 with representatives from all Flemish law faculties, and which has been active until the mid-nineties. Also, many Flemish scholars have been involved in the activities of the European Academy of Legal Theory, most notably in the period during which the Master Course in Legal Theory was organized in Brussels (1992–2009).

[13] On Radbruch's Formula see Section 10.2.2 in this tome, and Sections 1.1.3.2, 9.1, and Chapter 2 in Tome 2 of this volume.

property, unless the individual has previously willingly become a member of the social body and thus has accepted its power over him or her. Law so conceived is, in Van Dun's view, logically incompatible with the state (Van Dun 1983).

Meuwissen's successor in Groningen is Pauline Westerman (1957–), who in her dissertation—*The Disintegration of Natural Law Theory* (P. Westerman 1997)—lays out three main reasons why natural law is not attractive as a research programme: It is difficult to find an acceptable foundation for it today; it is perhaps even more difficult to justify its obligatoriness; and, third, what is left of natural law today is so general that it loses its critical potential. Maybe not everyone will find her uncompromising analysis convincing, but no one who is still intent on defending natural law can ignore her arguments.

This general rejection of traditional natural law does not mean that most Dutch legal philosophers are legal positivists. Legal positivism, moreover, is considered a container concept. In the final chapter of her thesis on moral ideals in legal theory—a chapter characteristically subtitled "Beyond Legal Positivism and Natural Law Theory"—Sanne Taekema (1970–), professor of legal theory at the University of Rotterdam since 2009, offers interpretations of a number of legal positivist tenets, including the so-called separation thesis (the thesis that law is separate from morality). An important distinction is between exclusive legal positivism—under which law can be identified exclusively by reference to social facts, without resorting to moral argument—and inclusive legal positivism, which holds that morality plays an important role when it comes to identifying law, but that this is nonetheless a contingent role (Taekema 2000, 176ff.).[14] Legal positivism and natural law are similarly not considered to be an oppositional pair in the conception put forward by Luc Wintgens (1959–), who in Wintgens 1991 draws a distinction between legal and "juridical" positivism: The latter is described by him as "moderate legal positivism," a theory that seeks to explain the validity of law in positivist terms but in a way that is compatible with moral criticism.

The role of morality in the identification of law is often discussed along with the role of legal principles. A central question in this latter regard is the difference between rules and principles, a topic that Dutch and Flemish legal philosophers have discussed,[15] and there is general agreement among them that legal principles do exist. But do they or do they not invalidate legal positivism? P. W. Brouwer believes they do not, while A. Soeteman (1944–) believes they do.[16] The answer to this question partly depends on the type of pos-

[14] A slightly revised version of this thesis came out a year later, in 2001, with Kluwer Academic Publishers.

[15] See, for example, the October 1991 special issue of the law journal *Ars Aequi*, an issue titled *Rechtsbeginselen* (Legal principles) and, in the same year, Van Hoecke 1991.

[16] See Soeteman's contributions to the special issue of *Ars Aequi* mentioned in the previous footnote.

itivism one refers to. Brouwer and Soeteman both refer to what Taekema has called inclusive positivism. The question, then, is whether inclusive positivism is a consistent position.[17]

Principles are related to ideals. There is wide acceptance in the Netherlands of Robert Alexy's (1985a, 19) definition of principles as *Optimierungsgebote* (optimization commands), that is, norms requiring that something (such as an ideal) be realized to the highest degree possible.[18] But this raises questions about the concept of ideals and their role in law, morality, and politics. Wibren Van der Burg (1959–), currently a professor at the University of Rotterdam, has written an important paper on the importance of ideals (Van der Burg 1997).

Principles and ideals are used to construct a third way between natural law and legal positivism. This third way goes by the name of culture law or interactionist law or functional legal theory, but the overarching idea is that, on the one hand, law and morality cannot be separated—or at least that this separation is not as strict as staunch positivists are inclined to think—while, on the other hand, the morality relevant to the law cannot be based in some eternal natural law. This approach can be found in many modern Dutch introductions to law.[19] Some authors, such as Witteveen and Van der Burg (1999), make this argument relying on the work of Lon Fuller.

Another author concerned with the relation between law and morals is Thomas Mertens (1955–), who holds the chair of legal philosophy at Nijmegen. His approach is based on Kant and neo-Kantian legal philosophy, especially Gustav Radbruch, but also Hans Kelsen. He is thinking not so much about morals *in* the law as about the consequences of possible discrepancies between the two normative systems: What should we do with the officials of the German Democratic Republic who shot citizens who tried to escape to Western Germany?[20] But he is also concerned to set positive law on a Kantian or neo-Kantian foundation. In his inaugural address he discusses two debates that took place in interbellum Germany. The question in both debates was the legacy of Kant and the liberal democratic order: The first was a debate between the neo-Kantian Ernst Cassirer and Martin Heidegger and the second between Hans Kelsen and Carl Schmitt.[21] It is clear that Mertens (2000) is sympathetic to the neo-Kantians.

[17] Taekema (2000, 188–9) argues (convincingly in our view) that it is not.

[18] On Alexy, see Sections 10.3.2.2 and 10.4.3.1 in this tome, and Sections 1.5.4.1, 10.3, and 25.4 in Tome 2 of this volume.

[19] Examples are Soeteman 1990, Witteveen 1996, Franken et al. 2001, and Loth and Gaakeer 2002.

[20] On this question, see Mertens 1998 and Mertens and Lensing 1998. See also Soeteman 1990, 54ff.; Brouwer 2000, 92ff.

[21] On the debate between Kelsen and Schmitt see Section 2.6 in Tome 2 of this volume.

25.5. A Justification of Morality?

If the morality of law cannot be grounded in natural law, and if neo-Kantianism develops into value relativism—which, contra Kelsen, cannot provide the foundation of liberal democracy—what, then, can that morality be made to rest on? It may be argued that this basis is positive law itself, in that the entire body of concrete legal prescriptions will provide the material from which to extract or infer the principles and ideals absent which law itself (even on a positivist conception) cannot function. Arend Soeteman (1991) has argued that a principle can be a *legal* principle only if it fits with positive law. But there is also another condition: The principle should be attractive from a *moral* standpoint, too. So legal philosophy winds up drawing on moral philosophy: Can it be argued that the moral foundations of our law are morally sound?

The question of the foundation of our political morality is made all the more pressing by the multicultural makeup of our modern society. C. W. Maris (1947–), until 2012 professor of legal philosophy at the University of Amsterdam, argues that in the end we modern Western liberals cannot prove the superiority of our political philosophy: When engaging with persons with cultural and religious backgrounds far removed from our own, we lack the common ground with which to start our argument. Liberals may follow Ronald Dworkin, saying that what is unproven may nonetheless still be true. But Maris (1992), using an example by Alasdair MacIntyre, points out the same could be said of unicorns and witches.

Scepticism, however, is not a feasible position. Soeteman (2000) has argued that it is a necessary condition for a liberal society to be able to uphold the truth of its basic assumptions (such as equal dignity for every human individual, the recognition of fundamental human rights, and material democracy). It may be conceded that truth in general, and moral truth in particular, is essentially open to question. One scholar who hase developed this theme is Serge Gutwirth (1960–), professor of legal theory in Brussels (Vrije Universiteit), who in his Ph.D. thesis (Gutwirth 1993) made a case for a "pluralism of truth," arguing that since facts are not entirely objective data, but are partly constructed by norms, they cannot be described in a neutral way. What holds for claims to the truth in law and science basically also holds for claims to the truth in philosophy and so in the philosophy of law. Still, even with these relativistic conclusions, there are serious arguments to be made for the liberal position. There is no better way to arrive at conclusions than by careful argumentation and with an open mind. Even when other persons do not agree—regardless of whether they are outliers, and even if they have arguments not to agree—that fact is not in itself relevant to determining the truth of our own views. As soon as compelling arguments for the existence of unicorns and witches are put forward, we might rationally believe in their existence. But to the best of our knowledge, no such serious arguments exist. As soon as com-

pelling arguments for the existence of liberal rights are put forward, we will have a rational basis for believing in these rights. And in this latter case serious arguments *are* available (Soeteman 2000).

Wibren Van der Burg offered a broad pluralist framework for the law-and-morality debate and put forward a theory he called legal interactionism, rooted in pragmatism and conceived as a synthesis between natural law theory and legal positivism (Van der Burg 2014).

What about the economic analysis of law? Could the economic approach provide a foundation for our political morality? According to Dutch and Flemish scholars who have investigated law from an economic-analysis standpoint, the answer to this question is no.[22] Economic analysis may be able to explain some parts of positive law, but efficiency or even wealth cannot be values in themselves, so they cannot be a basis to *justify* law. Most economic analysis, moreover, is concerned with contract law, torts, competition law, environmental law, and other areas where cost efficiency plays an important role, but it cannot say anything about fundamental rights or about the principles of a liberal democracy: It seems difficult to form views about euthanasia, for example, on the basis of economic analysis alone.

25.6. Law and Ideology

A line of investigation pursued in the 1960s, quite apart from the interest taken in the moral aspects or foundations of law, was that in which the effort is to uncover the hidden underlying ideological assumptions behind law or the hidden analyses informing different accounts of law. Scholars such as Fernand Tanghe (1948–), professor at University of Antwerp, and Koen Raes (1954–2011), professor of legal philosophy at Ghent University, started out from a Marxist approach but then embraced a broader critical approach. In his doctoral thesis, Tanghe (1982) tried to reconstruct a Marxist theory of law, but by his own admission (in the introduction) he did not succeed in this endeavour. He had to conclude that a credible socialism needs positive liberalism, legal certainty, and freedom. Raes also started out from a Marxist approach, but having written his doctoral thesis on John Rawls's theory of justice, the stronger influences on his work are Rawls himself and Habermas.[23] He criticizes Marxism and other communitarian theories for laying too much emphasis on the community, while neglecting that a community is essentially made up of individuals. Raes can be considered a representative of the Critical Legal Stud-

[22] See Hol 1993, Holzhauer and Teijl 1989, and de Geest (1993), pointing out the advantages but also the limits of law and economics, and Raes (1988, 20), who is more critical of the approach, taking issue with what he views as the "economization" of law.

[23] On Habermas see Sections 10.3.5 and 10.4.3.2 in this tome, and Sections 10.4 and 25.3 in Tome 2 of this volume.

ies movement, though not in a narrow sense, as he has always criticized the nihilist approach taken by European critical scholars influenced by postmodern French philosophy (Raes and de Lange 1991).

Jan Broekman—born in 1933, and until 1998 professor of legal philosophy at the University of Leuven—proceeded from structuralism and the philosophy of language to "deconstruct" the language of law by exposing the unexpressed and thus hidden views it carries in regard to man and society, thereby shaping the way lawyers and legal scholars talk about and work with the law, and ultimately endowing lawyers with power over society (Broekman 1979a, 1993). At the University of Leuven, Broekman supervised a Ph.D. thesis defended by Frank Fleerackers (1964–), now professor of law in Brussels. His work follows the research lines pursued by his supervisor (Fleerackers 2000, 2002), but neither one nor the other makes for an easy read.

25.7. Justice

Justice is studied by moral, legal, and political philosophers, among others. Many of them—such as Raes (1983)—work within the Rawlsian paradigm. The concept of reflective equilibrium has been analysed in a *Festschrift* (Van der Burg and van Willigenburg 1998) marking the 60th birthday of Robert Heeger (1938–). A liberal political philosophy has been worked out by Frans Jacobs (1943– ; retired from the University of Amsterdam),[24] who in his doctoral dissertation (Jacobs 1985) studied the universalizability of ethics. Also a professor who has in 2008 retired from the University of Amsterdam is Govert den Hartogh (1943–): He has developed a conventionalist theory of law based on mutual expectations (den Hartogh 1998, 2001a), and in a later article (den Hartogh 2001b) he made a case for humanitarian intervention against large-scale violations of fundamental human rights.

Democracy is an important aspect of any theory of justice. Willem Witteveen (1952–2014) was professor of law at Tilburg University, and in his inaugural address he discussed the *trias politica*, arguing that the important point is not a *separation* of powers but a *balance* among them (Witteveen 1991). In the second part of his introduction to law, Witteveen (1996) also discusses some other aspects of the *Rechtsstaat*, including the principle of legality, representative democracy, majority rule, and fundamental rights.[25] Also working on issues such as representation, authority, and sovereignty in legal philosophy is a colleague of his at Tilburg, Bert van Roermund (1948–), who finds inspiration in Rousseau and Hans Kelsen. Together with Stanley Paulson he edited a special issue of *Law and Philosophy* on Kelsen, titled *Authority and Competence*

[24] See, e.g., his contributions to Musschenga and Jacobs 1992.

[25] In the other parts of his introduction he addresses the language of law and law as practiced in in activities such as lawmaking, judicial decision-making, and legal argumentation.

(van Roermund and Paulson, 2000, van Roermund 2000). A discussion of formal and material democracy can be found in the work of G. A. van der Wal (1934–), emeritus professor in Rotterdam, who in van der Wal 1992 explained that every plausible justification of a formal democracy also justifies material democracy, as every plausible justification entails respect for individuals and minorities. It is not obvious, he says, that all new minorities endorse this ideal of material democracy: No one who rejects the principle of respect for individuals or fails to appreciate their important role can really be said to have absorbed the democratic ideal.

An interesting thesis about freedom of expression has been advanced by Theo E. Rosier (1956–). In Rosier 1997, he investigates the limits of freedom of expression in the United States and the Netherlands. Discriminatory statements are morally wrong, to be sure—the more so the more they are outrageous—but should they be forbidden by criminal law? His answer is *sometimes*—more than the Americans are willing to accept, but much less than the Dutch are inclined to think. He argues that it is essential for the Netherlands to have an open conversation on these matters in the face of increasing immigration: This is a discussion that should not be hindered by criminal law. In view of recent political developments in the Netherlands, this turned out to be a prescient insight. But there are good reasons for prohibiting language that is abusive and racist.

Another important but specific point is euthanasia. The Netherlands is the first country in the world to have enacted a law allowing euthanasia under certain conditions. But the issue is not yet completely settled, as the law allows for some interpretation even under the conditions it sets forth. In the *Brongersma* case, judges had to decide about an old man who found himself alone and thought that "death had forgotten him": He was assisted by his doctor in ending his life even though he was not ill. On December 24, 2002, the Supreme Court of the Netherlands decided that in this case the doctor acted in violation of the law in assisting his patient.[26]

25.8. Judicial Decision-Making

Judicial decision-making has always drawn much attention in the Netherlands and in Belgium. We know that judges apply the law, but in doing so they are *interpreting* the law as well.

In Belgium, two important works bear mention, both written in French in the first half of the 20th century, namely, *Méthode positive de l'interprétation juridique* (The positive method of legal interpretation: Van der Eycken 1907), by Van der Eycken, and *De l'interprétation des lois* (On the interpretation of laws: De Page 1925), by Henri De Page (1894–1969). Both authors carried forward the French reaction that François Gény (1899) launched in 1899 against

[26] *Nederlandse Jurisprudentie* 2003, 167.

the strict textual approach to statutory interpretation that had been dominant in the 19th century, and it was especially Van der Eycken who in doing so argued in favour of a more flexible approach.[27] After that, it took almost half a century before this discussion would be taken up again, with the critical and protest movements that swept through society in the 1960s and beyond (reaching a peak in the "Mai 68" events in France). Almost all jurisprudential writings returned to some form of plea for greater flexibility in statutory interpretation.[28] In recent decades, there has been a shift in focus on (unwritten) legal principles (see above) and on human-rights law and its impact on legal interpretation in all areas of law, most notably through the case law of the European Court of Human Rights (ECHR). With the increasing role of international courts, such as the ECHR and the European Court of Justice, and of the Constitutional Court of Belgium, established in 1983, the national legislatures gradually lost some of their authoritative hold on the law, and it became more acceptable for judges to have law-creating powers. So the focus is now more on the content and scope of principles and of human rights than on the separation of powers between judges and legislators.

In Dutch jurisprudence, the authoritative classic on judicial decision-making is by an author who was active the first half of the 20th century, Paul Scholten (1875–1946). His view can be said to anticipate Dworkin's law-as-integrity thesis, put out half a century later, despite some considerable terminological differences between the two authors. Scholten (1934) believes that in every judicial decision there is at work a view about the principles behind the law. At its most basic, this is a view about the justice of law, which every judicial decision must try to realize, and to this end judges must make their decisions in keeping with what their conscience dictates. Every Dutch work on judicial decision-making has since had to define its position in relation to that of Scholten.

As much as this view would seem to suggest that judges can exercise a good deal of discretion in their adjudication, Scholten actually denies that they should have any such discretionary power (something that can be gleaned from Scholten's work even though he does not use that term).[29] The question whether judges have discretionary power is important for a number of reasons (it carries implications for the authority of the judge's decision and for the possibility of legal criticism, among other things), but on the more pragmatic approach that seems dominant in the Netherlands, it is clear that no matter how

[27] On Gény see Section 12.5 in this tome.

[28] See Van Gerven 1973, Storme et al. 1979, Van Hoecke 1979, and Bouckaert 1981, and there are in addition many articles by a variety of authors.

[29] Dworkin, for his part, defines the term as follows: Judges have discretionary power to the extent that they can choose between alternatives without being bound by any higher human authority.

the theoretical issue is settled, judges have to make decisions which are open to challenge (other judges could render different decisions) and which lie beyond the letter of the law or fall outside the scope of the legislator's intent. Popke (Bob) W. Brouwer (2001) argued that there is a limit to legal rationality. When we are faced with quantitative problems (e.g., to what extent is a loss or injury the victim's own fault) or with incommensurable principles applicable to the case at hand, then some of the decisions rendered can be clearly wrong, but many times there will also be more than one sound decision. We can choose between them through a method of weighing and balancing, but in the end it is impossible to conclusively argue that one of those sound decisions is the right one.

Sometimes judges clearly make "new law" (which for a Dworkinian "noble dreamer" might be hidden in existing law, but in that case it will be very deeply hidden). There are many examples in Dutch law. Rules about the legality of strikes and the liberalization of euthanasia were formulated by the courts before the legislature (more or less) codified this judge-made law.

One of the questions that come up in connection with these facts is that of legitimacy: The legislator is elected; the judge is not. It would seem to follow that the judge's decisions lack the democratic legitimacy of the legislator's statutes. This question is dealt with by Peter Rijpkema (1962–), who in Rijpkema 2001 analyzes the division of tasks between legislator and judge, investigating the legitimacy of different types of legal rules in statutory and judge-made law. Sometimes, for one reason or another, a legislature cannot make new law, or it will choose to rely on the insight afforded by prior judicial decisions. The judge, Rijpkema (ibid.) argues, plays a modest but important role in making new law. Possible undesired consequences of judge-made law can be mitigated by "the art of tempering." The judge may, for example, give a strong case-dependent description of applicable law. Another tempering technique is prospective overruling. The question of legitimacy is addressed as well by Mark Van Hoecke (2002) in a theory he calls law as communication, and in which he seeks to transcend the apparent opposition between the (elected) lawmaker and the (unelected) judge, on the reasoning that the two do not act independently of each other but make their decisions by constantly interacting (communicating) with each other, with the community, and with society at large. The typical 19th-century one-directional, hierarchical model is no longer suited to current society and needs to be replaced by concepts such as network and communication if it is to offer a realistic theoretical framework of current reality, in which a considerably increased role is played by constitutional courts (at the national level) and supranational courts (at different levels of European jurisdiction).

Other questions concern the defeasibility of legal rules: There always is an open class of exceptions, at least in principle. Moreover, legal rules may contradict one another in concrete cases, but this does not mean, as traditional logic seems to imply, that the legal system collapses. These types of consid-

erations have stimulated the study of non-monotonic logic for the law. Some extraordinarily important work in this field has been done by Henry Prakken (1960– ; see Prakken 1997) and Jaap Hage (1956– ; see Hage 1997, 2005). Prakken (1997), for example, has formalized principles for dealing with conflict of rules, such as the principle *Lex specialis derogat legi generali*. Attention has been paid as well to legal reasoning and informatics, most notably by using legal expert systems. Generally, a critical attitude to the possible use of informatics is taken (see Raes 1993, 87–122, and Gutwirth 1993, 123–48).

A Dworkinian approach to legal reasoning is taken by Klaas Rozemond (1960–), who in *Strafvorderlijke rechtsvinding* (Interpretation in criminal procedural law: Rozemond 1998) develops a constructivist interpretation and applies it to criminal procedure. The code of criminal procedure in the Netherlands was enacted in 1926, but it subsequently went through deep changes, not only by way of new legislation but also through judgments rendered by criminal judges. Moreover, the Constitution of the Netherlands has changed and the European Convention on Human Rights came into force. Constructive interpretation tries to construct a normative unity in this diversity of rules and decisions. As Rozemond argues, the purpose of criminal procedural law is to provide a framework for fighting crime while protecting citizens against any arbitrary exercise of power by the authorities. He investigates the applicability of constructivism to almost all the problems of criminal procedural law (such as the admissibility of anonymous witnesses and of investigative methods like police surveillance of suspects).

Legal positivists, such as Brouwer (2000), disagree. They argue that judges who rule according to what they believe to be the right answer, reasoning from the morality of the law as encapsulated in legal principles or in natural law, are making new law when traditional sources of law are silent or ambiguous, and also when ruling retroactively. If these judges claim that they are only enforcing existing law, then they are hiding that fact and avoiding responsibility for the new law they have made.

The debate between constructivists and positivists is as unsettled in the Dutch-speaking area as it is in the rest of the world. This again illustrates that Dutch and Flemish legal philosophy is an offshoot of world legal philosophy, however much a minor one. It also illustrates that legal philosophy has not come to an end just yet.

25.9. Other Areas and Topics

In the late 20th and early 21st centuries, a variety of problems relating to the state and democracy have received a lot of attention. In these investigations, the boundaries between legal philosophy, legal theory, and positive law have partly been fading, as changes in positive law and its context have placed traditional theories in a difficult spot.

In the theory of the state, strong liberal ideologies have argued for a minimal state, if not for its abolition (Van Dun 1979, 9). Conspiring with that influence are the developments in Europe that came with the creation of parliaments and courts at a regional and a supranational level: This has reinforced the need to investigate law from more-pluralist approaches where national state law is but one element and no longer the starting point for all law. Moreover, it has been argued by Jan Gijssels (1929–2010, professor of public law at the University of Antwerp from 1974 to 1993) that legal relations mainly have a contractual basis and are prior to state law (Gijssels 1991). Jef Van Bellingen (1948– ; now a retired professor of legal philosophy at the Vrije Universiteit Brussel) has discussed the philosophical aspects of federalism (Van Bellingen 1991, 20). One of the changes in legal practice that scholars have increasingly been faced with is the blurring of the strong 19th-century division between public and private law, at least in continental Europe. Interesting writings on this topic have been published by René Foqué (1946– ; professor of legal philosophy at Leuven University from 1998 to 2011; see Foqué and Weyembergh 1997) and Josse Mertens de Wilmars (1912–2002), former president of the European Court of Justice and professor at the University of Leuven (see Mertens de Wilmars 1983). The tension between the public and private spheres also lies at the core of theoretical and philosophical reflections on democracy. Here, Maurice Adams (1964–), professor of law at the Universities of Antwerp and Tilburg, has contributed to the discussion with several writings, mainly addressing the question how we can construct a framework of rules enabling us to live together in a pluralist society (Adams 2006; see also Gutwirth 1998, 137–93). Theories of democracy are closely linked to human-rights theories. Scholars who have contributed to this discussion include Serge Gutwirth (Vrije Universiteit Brussel), who has written, with others, on the measures taken against antidemocratic political parties (Backs et al. 2001), and Paul De Hert (Vrije Universiteit Brussel and Tilburg University), who has regularly been working with Gutwirth. In his doctoral dissertation, De Hert framed human rights from the larger perspective of rights and investigated the process toward the constitutionalization of rights and values, focusing on its consequences for nonconstitutionalized freedoms, including in the context of the new information and communication technologies (De Hert 2002). One who has also worked in the area of human rights is Stephan Parmentier (1994), professor of legal sociology at the University of Leuven. The theory of legislation has been a new focus in research since the last decade of the 20th century (see, e.g., Wintgens et al. 2001 and Thion 2010).

Also a recent topic that has attracted some attention in legal philosophy is globalization. Hans Lindahl, successor to Bert van Roermund in the legal philosophy chair at Tilburg University, published an important book titled *Fault Lines of Globalisation: Legal Order and a Politics of A-Legality* (H. Lindahl 2013), arguing that a host of novel legal orders can no longer be accom-

modated in a concept of law that takes the spatially bounded state to be the paradigm for the legal order. Lindahl criticizes a variety of theories that have sought to articulate a general concept of the legal order without having to rely on the inside/outside distinction as an essential feature. With concrete examples, he shows that this inside/outside distinction has to be maintained. There is no universal conception or language of law.

Furthermore, some research has been carried out in the theory of criminal law, covering topics such as the boundary between criminal law and civil law (Gutwirth and De Hert 2002), the relationship between punishment and morality (Claes et al. 2005), and legality and interpretation in criminal law (Claes 2003).

A branch of law that in the Netherlands has developed in the last decades of the 20th century, challenging traditional legal thinking, is environmental law. Work in this area has been done by Serge Gutwirth, Gerrit van Maanen (see Gutwirth and van Maanen 1995), Jean-Marc Piret, Koen Raes, and Mark Van Hoecke (1995, 2002).

Finally, and mainly in this last decade, much attention has been paid to the epistemology and methodology of legal scholarship—a discussion in which roughly all possible positions have been taken by a wide variety of scholars.[30] Obviously, legal scholarship is looking for a new identity, different from traditional, mainly descriptive "legal dogmatics," by pursuing a more contextual and empirical approach.

[30] Eg: Van Klink and Taekema 2011. Most of the discussion is in Dutch-language publications, including a long list of articles published in the journal *Nederlands Juristenblad.* Some of these authors have contributed to Van Hoecke 2011. See also Jan Smits 2009.

Latin America

Chapter 26

20TH-CENTURY PHILOSOPHY OF LAW IN ARGENTINA

by Manuel Atienza

26.1. Introduction. Some Remarks on Argentinian Legal Philosophy in the First Half of the 20th Century

The marked development of philosophy of law in Argentina, particularly since the end of the World War II, can at first sight seem surprising.[1] There is no doubt that during the 20th century, Latin America occupied a peripheral position on the world stage, from both an economic and a cultural perspective. Thus, it is difficult to talk about a genuinely "Latin American" philosophy (or philosophy of law). What can be presented under this label is, except for some rare exceptions, more a copy or a reflection of the "authentic" philosophical culture elaborated in the advanced Western countries. And what distinguishes Argentinian philosophy of law—something that can with qualifications be applied to other spheres of this country's culture—lies in having achieved an important place in philosophy of law (even while retaining a degree of cultural dependence) as a result of a series of rather exceptional circumstances that to a great extent are related to the country's peculiarities within the Latin American context.

Indeed, although the recent history of Argentina has in many ways been a failure, there are various features that make Argentina a relatively advanced country, closer to Europe than to Latin America, at least from a cultural point of view. For many decades Argentina has been a secular country, with a high literacy rate, a "European" demographic growth (its population is also largely of European origin), and a large urban and middle-class population (about a third of Argentina's population lives in the capital city, *el gran Buenos Aires*). Throughout the 20th century, the country's *per capita* income was well over the Latin American average. In the history of the country there has been a significant tradition of liberal (but not democratic) regimes, which gave it considerable political stability from 1852 to 1930. It was in this latter year that the "coups" began which from then on, until democracy was restored in 1983, characterized Argentinian political life. Moreover, the existence should be

[1] Sections 26.1, 26.2, and 26.2.1 of this contribution essentially constitute a condensed version of my book *La filosofía del derecho argentina actual* (Current legal philosophy in Argentina: Atienza 1984), where the reader can find a complete bibliography of the period. For an overview of legal philosophy in Latin America until the 1950s and 1960s, see also J. L. Kunz 1951 and Recaséns Siches 1963.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_26

pointed out of a working class, which from a very early point (about 1883) was organized into free trade unions, and of an autonomous and progressive university since the radical reform of 1918.[2] However, a constant factor has been the situation of economic dependence (first on Great Britain and then on the United States), even in the country's greatest moments. It should not be forgotten that around 1930 Argentina was one of the richest countries in the world, thanks in part to the exploitation of its great wealth in agriculture and livestock.

From the mid-19th century until World War I, the prevailing philosophy in Argentina (as in other Latin American countries) was positivism. This is not surprising, given that the positivist ideas of progress and development seemed well suited for a country which was at that point growing dramatically. What is more, this philosophy, with representatives of great stature such as José Ingenieros (1877–1925), contributed markedly to the education and modernization of Argentina. The most important author of that time in philosophy of law was Carlos Octavio Bunge (1875–1918), who represented an extreme type of sociological positivism and who was greatly influenced by Comte, Spencer, and Darwin.

The anti-positivist reaction came mainly from the philosophy of Alejandro Korn (1860–1936), who introduced German idealism and based on Kant a criticism of positivism rooted in liberalism. Until World War II, all or nearly all the philosophies then prevailing in Europe were represented in Argentina. Francisco Romero (1891–1962), one of the most original and important Latin American philosophers, was responsible for introducing phenomenological philosophy. Carlos Astrada (1894–1970) disseminated existentialism and later evolved towards Marxism. Traditional metaphysics had a great number of representatives, such as Coriolano Alberini (1886–1960) and Alberto Rougés (1880–1945).

In philosophy of law, the distancing from positivism was introduced through neo-Kantianism. In this sense, the influence of Rudolf Stammler (a neo-Kantian from Marburg) was decisive in the work of Enrique Martínez Paz (1882–1952) and in that of Alberto J. Rodríguez, and it is also present in the work of Enrique R. Aftalión (in his pre-egological stage), in that of Segundo V. Linares Quintana (1909–2013), and in that of Mario Sáenz. Aníbal Sánchez Reulet (1910–1998), Ramón Alsina, and Martín T. Ruiz Moreno were also neo-Kantians.[3] In fact, although the neo-Kantian influence went into a slow decline, it lasted until the 1940s, when Carlos Cossio introduced his egological theory (shortly to be discussed, in Section 26.2.1.2).

Whereas neo-Kantian philosophy is associated with ideologies of a liberal or liberal-conservative nature, neoscholastic natural law theory, which was

[2] The *Unión Cívica Radical* was founded in 1891 by Leandro N. Alem and is roughly equivalent to the European liberal parties of the time.

[3] On Stammler see Section 1.3 in this tome and Section 2.2 in Tome 2 of this volume.

widespread, was instead associated with positions of a markedly conservative, rarely liberal nature. Neoscholastic writers who published works of this type between the two world wars were Tomás Casares, Ismael Quiles, Adolfo Korn Villafañe, Eduardo Lustosa, Faustino Legón, Alfredo Fragueiro, and Manuel del Río.

26.2. Argentinian Legal Philosophy in the Second Half of the 20th Century

In Argentina, the end of World War II coincided with Perón's first government. Peronism (a populist interclass movement, which was politically authoritarian and ideologically vague) is a key factor in understanding the recent history of Argentina and is not at all easy to explain. Perón's first government lasted until the so-called *Revolución libertadora* (Liberating revolution) in 1955, but Peronism returned to power in 1973, until the 1976 coup d'état, which, until democracy was restored in 1983, established "a repressive system never before seen in Argentina" (Luna 2009, 242; my translation). The experience of the dictatorship has undoubtedly been a determining factor in recent Argentinian history, and so in what follows I will use this date to divide in two parts my presentation of Argentinian philosophy of law.

26.2.1. Main Trends until 1976

From the end of the World War II until the military coup in 1976, the following four currents can be distinguished in Argentinian philosophy of law: a more traditional one, coinciding with natural law theory; a phenomenological and/or existential one; analytical legal philosophy; and a strand of legal philosophy which finds its inspiration in Marxism. The diversity of these orientations and their unequal development cannot be ascribed to intra-cultural reasons alone: It was also due to socioeconomic and political circumstances, to be sure, but these will only be briefly dealt with here.

26.2.1.1. Natural Law

Natural law was comparatively less influential in post-war Argentina than it was, for example, in Spain. This can be explained not only by reference to cultural and political factors but also by the appearance, from the 1940s on, of what is known as the egological theory of law (see Section 26.2.1.2 below), which decidedly clashed with natural law theory. In any event, natural law attracted a considerable number of philosophers of law who taught not only at national universities but, above all, at private Catholic universities. Such was the case with Tomas Casares, Juan Casaubón, Manuel Seoaje, Bernardino Montejano, Edgardo Fernández Sabaté, Manuel M. del Río, Federico Torres Lacroze, José M. Díaz Cosuelo, and Oscar Viola. None of these scholars produced work of

great theoretical interest, but a highly conservative political orientation can be observed in nearly all of them (Manuel del Río being an exception).

Werner Goldschmidt's trialist theory of the legal world (W. Goldschmidt 1973), which could also be qualified in a way as a theory of natural law, may be considered more original. This theory, which had a certain resonance among Argentinian philosophers of law and jurists of the time, was based on the distinction among three levels, namely, that of norms, that of facts, and that of values. Taking this as a starting point, Goldschmidt defended a "realist" formula *integrating* the three levels, a move that distinguished his theory from other tridimensionalisms, especially from the one put forward by the Brazilian-born Miguel Reale, who was considered by Goldschmidt to be an idealist and a relativist.[4] Indeed, in Goldschmidt's opinion, it is Christianity, as a doctrine incorporating monotheist genetic realism, which provides a firm basis for tridimensionalism.

26.2.1.2. Phenomenology and Existentialism

Goldschmidt's theory notwithstanding, the prevailing trend in philosophy of law in Argentina in the 1940s and 1950s was, as was earlier pointed out, Carlos Cossio's egological theory of law, which as he himself indicates was inspired by Kant, Husserl, and Kelsen, among other authors.[5] Cossio started out teaching at the University of La Plata but during the first Peronist government (1945–1955) he went on to occupy the position of professor of philosophy of law at the University of Buenos Aires. It is with Cossio, one could say, that a period of marked development of Argentinian philosophy of law began, a period that has continued to this day.

The main thesis of egology lies in the claim that law is a mode of conduct lying within the sphere of intersubjective interference, while norms are judgments (not imperatives) through which such conduct is known. With this, Cossio seeks to make legal science a science of experience (a science specifically, and most importantly, concerned with *judicial* experience, since the judicial decision is for him the legal phenomenon par excellence), in such a way as to surpass normativist conceptions (such as Kelsen's), which he regards as going along with formalism and legal liberalism. Cossio distinguishes the following themes in philosophy of law: legal ontology, formal legal logic, transcendental legal logic, pure legal axiology, and the gnosiology of error.

Egology seeks, above all, to be an ontological approach to law. He takes Husserl's "regional ontologies" as a starting point and classifies objects as ide-

[4] On Reale see Section 27.5 in this tome.

[5] On Kelsen see Section 2.3 in this tome and Section 8.3 and 8.4 in Tome 2 of this volume. On Husserl's phenomenology as applied to law see Chapter 4, and in particular Section 4.1, in this tome.

al, natural, cultural, or metaphysical. Cultural objects can in their own turn be subclassified either as things of the world, where the substratum is objectified human life, or as egological, whose substratum is living human life, namely, conduct. Cossio further distinguishes three themes in his legal ontology: the ontic being, the ontological being, and legal time. Formal legal logic can be seen as representing the pole opposite to legal ontology: While "in legal ontology what is given are acts, or conduct, in logic in general what is given are concepts, or logos, but the concept as such can be studied from two angles: as thought or as knowledge. [...] Formal logic deals with the first, and transcendental logic with the second" (Cossio 1964, 329; my translation). Formal legal logic is not a logic of *is* but of *ought*; as has been pointed out, however, the legal norm is not an imperative but a judgment, specifically a disjunctive judgment having two parts as follows: "Given A, B ought to be the case [stating what Cossio calls an endonorm]; or, given no-B, S ought be the case," stating what he calls the perinorm (Cossio 1964, 453; my translation). In any case, since formal legal logic is the study of legal norms (this is why the pure theory is limited to formal logic), Cossio introduces into his theory a transcendental legal logic that basically addresses what he takes to be the object of law, namely, conduct. Here, in turn, he distinguishes three themes, these being the three antinomies raised by dogmatic science: the antinomy of personality, that of freedom, and that of validity. Yet there is more to transcendental logic than this, since on the ontological level (the antinomies refer to the ontic level) this logic implies values. As Cossio repeats over and again, law is conduct, and conduct without value is not ontologically possible. He thus finds that legal science is none other than an *axiological* dogmatics. Values are immanent in law (law is a valuable object), which in turn does not prevent the possibility of evaluating them, whether positively or negatively. On this point, Cossio differs clearly from Kelsen (and from Gioja), that is, from those who consider the norm a neutral element, thus (in their opinion) making the relationship between law (the norm) and values purely extrinsic. Cossio introduces in his legal axiology the metaphor of the sphere of values, capturing the idea that there is no rigid hierarchical relationship between values: In the "sphere," values place themselves in such a way that at any given moment their weight rests on one of them, which then becomes the supreme value. It should also be pointed out that conduct (i.e., law) is for Cossio "phenomenalized metaphysical freedom," leading him to argue for what he calls the "ontological axiom of freedom," which he expresses in the formula "Everything which is not prohibited is permitted" (Cossio 1964, 405; my translation). This formula implies considering law as a seamless, gapless system wherein all conducts are determined "*a priori*." In any case, the question of the "gnosiology of error" is no doubt what enabled Cossio to evolve towards theses close to Marxism (perhaps not in a completely coherent way, as he did so without modifying the basic elements of his theory). In Cossio's opinion, a theory in decline—in the social sciences, and

so also in law—is not only an error but an obstacle that must be overcome. In other words, ideology is not just tantamount to error but also includes a positive aspect that cannot be ignored. This is why he calls for investigating the social function of error: "When the critical history of legal conceptions looks at these as errors, it finds in them a functional truth that Karl Marx typified as ideology. Accordingly, we are led to consider scientific ideologies through a gnosiology of error" (Cossio 1964, 649; my translation).

It is not easy to do an overall assessment of Cossio's work. For on the one hand, it contains elements of unquestionable originality, and one clearly has to give Cossio credit for promoting an extraordinary interest in philosophy of law in Argentina, and interest that, as I have already mentioned, still exists today. But on the other hand, the egological theory is in many ways obscure and arbitrary, combining an amalgam of elements which are difficult, if not impossible, to reconcile, and which in certain respects brought it close to the Peronist ideology. Thus, personalism, rhetoric, and ideological confusion led to a situation where both egology and Peronism gained acceptance up to a certain point among sectors of the antiliberal right and the Marxist left, while both met stiff resistance from reformists and liberals; another element (in addition to personalism and rhetoric) was nationalism, considering that the egological theory sought to be the Argentinian synthesis of English, German, and French jurisprudence; there was, too, the pretence that Peronism would supersede liberal democracy, and that egology would do the same with respect to the pure theory; or, again, there was the antagonism to the Catholic Church, a stance which was typical of the first Peronist period, and which in Cossio's work took the form of an opposition to natural law theory.

It was Ambrosio Gioja (1912–1971) who substituted Cossio as professor of philosophy of law at the University of Buenos Aires after *la Revolución libertadora* and held this post until his untimely death, in 1971. The period of democratic rule—lasting from 1955 to 1966, though I am referring here to a "limited" democracy, since Peronism was proscribed—had a positive effect on the university, which at that point regained its autonomy and, in a climate of freedom and tolerance, brought about significant cultural development. This period, however, came to an abrupt end with General Onganía's 1966 coup d'état and the military's violent crackdown at the University of Buenos Aires. This sparked a protest movement which took the form of mass resignations among university professors. Gioja and his colleagues, however, did not take part (nor, in general, did the law school's faculty), choosing to instead stay at the university in an attitude of "passive resistance" to the established power. Cossio identified with Peronism, and the same could be said of Gioja with respect to radicalism.

Gioja's written work is less important than his teaching, for Gioja was essentially a Socratic teacher. Carrió described him in the following way: "There was little work that Gioja set to paper and bequeathed to us, this by contrast to his incessant theorizing. For him, philosophy was mainly an oral activity. We

could hear him philosophising almost until the end of his days, and it was from him that we learnt to do so, according to our vocations and individual abilities" (quoted in Nino 1990, 345; my translation).

Gioja's philosophy of law can be seen as a synthesis of Husserl's phenomenology and Kelsen's pure theory. Gioja's early training was under Cossio, and like Cossio he considered philosophy to be essentially ontology or metaphysics. There are, however, notable differences between the two. According to Gioja, Kelsen's pure theory is an ontological one, since it is based on the separation between the normative and the natural world (through imputation) and that between law and morality (through coercion). Whereas for Cossio law (which he equated with conduct) is evaluation, for Gioja (and Kelsen) law is based on imputation, that is, on what ought to be, understood as an axiologically abstract and neutral category. In addition, an important role is played in Gioja's work by the separation between prescientific and scientific law, a separation corresponding to that drawn by Kelsen between legal norms and legal rules. His conception of values, then, is relativist, as in Kelsen's case: The objectivity of values can have no other ground than intersubjectivity, and while, on the one hand, this leads Gioja to support democracy, it also leads him to reject the view that the enemies of this form of government should be recognized as having political rights.

Cossio and Gioja were the great masters of Argentinian philosophy of law in the second half of the 20th century, but of course they were not the only philosophers of law of phenomenological and/or existentialist inspiration. In addition to them, one should mention a series of authors, like Enrique Aftalión, Esteban Ymaz, and Julio Cueto Rúa (1920–2006), representing the egological theory of law; Juan Carlos Smith, who advocated a phenomenology influenced by Kant; Abel Arístegui, who supported a typically Heideggerian existentialism; Sebastían Soler, author of an important work in the field of criminal law and the general theory of law, in which the influence of Nicolai Hartmann is evident; and José Manuel Vilanova (1924–1999), who always considered himself to be an egological author, despite some rather significant differences setting his work apart from that of Cossio (1903–1987).

26.2.1.3. Analytical Legal Philosophy

Gioja's greatest significance was probably that of opening the path to an analytical philosophy of law. Although he was not, strictly speaking, an analytical philosopher, most of his disciples and colleagues adopted this kind of philosophy, which since the 1960s has been the predominant trend in Argentina. It is important to point out that even before that time, in the 1950s, analytical philosophy had already been taken up, as a general philosophical trend, by authors as notable as Mario Bunge (1919–), Gregorio Klimowski (1922–2009), Rolando García (1919–2012), and Tomás Moro Simpson (1929–), who had

founded the *Association of Río de la Plata for Logic and Philosophy of Science*, which preceded the *Argentinean Society of Philosophic Analysis* (SADAF). This association played a very important role after the 1960s, since it somehow filled the vacuum brought about by the dismantling of the universities. A more or less traditional classification should be made within the group of analytically inspired philosophers of law, distinguishing those in favour of using formal-logical techniques from those who advocated a kind of natural language analysis.

As far as the logical analysis of law is concerned, the most important work of the period, an emblematic work of Argentinian legal philosophy and one of the landmarks of philosophy of law in the second half of the 20th century, is Carlos Alchourrón and Eugenio Bulygin's *Normative Systems*, originally published in English (Alchourrón and Bulygin 1971) and later translated into Spanish (Alchourrón and Bulygin 1974). As von Wright remarked writing twenty years on, "this work is still today the most complete monographic study on basic questions in theory of law carried out using the instruments of modern logic and conceptual analysis" (quoted in Alchourrón and Bulygin 1991, XI; my translation).

Carlos Alchourrón (1931–1996) and Eugenio Bulygin (1931–) take as a starting point Tarski's notion of deductive system, understood as a set of statements containing all their consequences. A normative set, then, is a set of statements that contains norms (but also definitions, among other things). By *normative system* they mean a normative set containing norms that set forth a sanction. By *legal system* they mean a normative system containing norms that set forth a sanction in such a way that the sanction does not characterize *every* component of the law but the legal system as a whole. In a slightly later work, Alchourrón and Bulygin (1976) complement the notion of system with that of order, understood as a succession of systems over time. Thus, proceeding from the notion of system, they define norms as those statements that correlate cases with solutions.[6] Solutions are elements consisting of an act (normative content) preceded by a normative marker, namely, a deontic operator, whereas cases are defined through a series of determinable properties starting from a Universe of Properties. Among the requirements a system must meet are those of completeness, coherence, and independence. A system failing to exhibit these properties is said to be gappy, contradictory, or redundant, respectively. Alchourrón and Bulygin pay special attention to the concept of a gap, drawing clearly defined distinctions between normative gaps, on the one hand, and axiological ones, on the other (the former arising when the system does not provide a solution to a case, and the latter when a solution does exist but proves

[6] Norms are so defined on the *syntactic* level. In an important later work, Alchourrón and Bulygin (in *La concepción expresiva de las normas*, The expressive conception of norms, 1976; now in Alchourrón and Bulygin 1991) described this as a "hiletic" or abstract conception of norms, setting it in contrast to what they called the "expressive" conception.

unsatisfactory). Apart from that, systems can be either closed or complete (if they contain a closure principle), but this is not necessarily so in all systems. In contrast to what has been stated from different angles by authors like Cossio and Kelsen, Alchourrón and Bulygin believe that law can contain gaps, and not only axiological gaps but also normative ones. In *Normative Systems*, emphasis is also laid on the importance of systematization in legal science. In this operation we should distinguish among three phases, in the first of which we determine the system's base (consisting in the Universe of Cases and the Universe of Solutions), in the second we use the rules of inference to derive consequences from the base, and in the third we substitute the primitive base with a new one (thus reformulating the system). Alchourrón and Bulygin underline that even though legal science is a deductive activity, at least in part, this does not make it to that extent uncreative, as is often held by jurists who object to the application of logical analysis in law.

As I noted before, *Normative Systems* constituted a landmark in Argentinian law. Carlos Alchourrón (whose training was essentially that of a logician) and Eugenio Bulygin (whose knowledge of logic is combined with a command of the theory of contemporary law) offered an impressive model of intellectual symbiosis and rigorous analysis of the problems inherent in the theory of law, whose influence has been of great relevance in Argentina and in many countries of the Latin world, including such European countries as France, Italy, Spain, and Portugal. Not only did the work introduce a new research method but it also set the agenda to be followed, the problems which philosophers of law had to deal with.

It was Genaro Carrió (1922–1997) who took on the role of intellectual leadership in this respect, studying law from the perspective of natural or ordinary language analysis. He did this from positions akin to that of the "second" Wittgenstein, of the philosophers in the Oxford group, and, in law, of H. L. A. Hart. Carrió translated a number of Hart's works and introduced in Argentina a vision of philosophy of law very much like Hart's. However, Carrió did not write any general work on philosophy of law. He focused more on analyzing a series of basic problems in philosophy of law (that with extraordinary rigour, originality, stylistic purity, and wit). To use Bobbio's terminology, his is a clear example of a *jurist*'s philosophy of law (which the Italian thinker set in contrast to the *philosophers*' philosophy of law), and in fact, Carrió was from a professional point of view essentially a lawyer (who would one day sit on Argentina's Supreme Court, when democracy would be restored after the military juntas). He started out as a follower of Cossio's egology, but in 1946 abandoned his teaching post in protest against the totalitarian politics of Peronism. He returned to the university in 1958 but then resigned once more, in 1966, after General Onganía's coup d'état.

In 1965, Carrió published a book, *Notas sobre derecho y lenguaje* (Remarks on law and language: Carrió 1965), in which he very clearly pointed out the

need to distinguish the various uses and functions of language (descriptive, prescriptive, performative, etc.) and the various "congenital defects" that can affect natural language: ambiguity, vagueness, open texture or potential vagueness, and emotional charge. Taking these basic notions as his starting point, he argues that an attempt can be made to solve some of the problems which have traditionally engaged legal science, and which in some cases are simply pseudo-problems arising from the jurists' lack of sensibility to the language in which law is expressed. Many of these mistakes, it is argued, stem from an essentialist conception of language, that is, from the belief that language directly reflects some type of natural, essential, or substantial reality. This has led jurists to seek "essences" or "legal natures" in expressions that denote nothing at all, since they are only used for economy of language. In a series of works, always brief but impeccably written, Carrió relied on these and other linguistic tools to contribute decisively to clarifying such fundamental notions as that of judicial lawmaking, the interpretation of law (in a famous debate with Soler), arbitrary ruling, legal obligation, original constituting power, legal principles, and legal positivism.

In 1970, Carrió devoted to these two concepts a brief work (Carrió 1970), in which he defended Hart's positivist model against Dworkin's attacks. To this end, Carrió distinguished various notions of the term *legal principle*, reaching the conclusion that Hart's model (which, in his view, is misleadingly characterized by Dworkin as "a model of rules") makes it possible to include both rules of conduct and principles (including principles as characterized by Dworkin), so long as this is authorized under the system's rule of recognition. So, Carrió was at that point already prefiguring what many years later would be called "inclusive legal positivism."

Other important authors who were engaged in Argentinian analytical philosophy of law in the years before the military juntas and who belong to the same generation as Carrió are Roberto Vernengo (1926–), Ernesto Garzón Valdés (1927–), and Eduardo Rabossi (1930–2005).

Roberto Vernengo is probably the philosopher of law with the widest intellectual range. He evolved from egology and phenomenological philosophy to analytical philosophy, but he also took an interest in Marxism and Chomsky's linguistic theory (which he applied to legal interpretation), as well as in game theory, cybernetics, and programmed instruction.

Although Vernengo's work reveals Gioja's influence during this period, it was especially as a direct disciple of Kelsen that Vernengo worked. One of his main concerns appears to have been that of removing all traces of metaphysics from pure theory; in this, he showed an attitude contrary to any kind of ontological approach in law, and above all contrary to egological ontology. Vernengo shows a full awareness of the effect that axiological, political, and ideological factors, among others, have on the conceptualization of legal science. This explains his determination, following in Kelsen's footsteps, to remove all ideo-

logical elements from legal knowledge (this in an attempt to make such knowledge rational) by categorically separating the world of is from that of ought. All told, Vernengo must be classified among the analysts of ordinary language, since he takes natural language to be at once the means of expression in law and the central object of theoretico-legal analysis. At the same time, though, he draws widely on formal logic in formulating the general theory of law, using formalization to approach legal concepts in a rigorous manner.

Ernesto Garzón Valdés wrote in 1970 what is considered to be his most important work from this period (Garzón Valdés 1970), criticizing the German authors with regard to the nature of things. Garzón Valdés sees in this new "renaissance of natural law" a vain attempt to overcome the traditional opposition between natural law doctrines and legal positivism. He shows that this process was facilitated by the "emotive" content of language, that is, by the merely persuasive use of terms like *law* and *nature*. In criticizing these authors, he gives evidence of an axiological relativism that he would later categorically move away from, at a second intellectual stage to which I will refer in Section 26.2.2.1.

The work of Eduardo Rabossi belongs more to moral philosophy than to philosophy of law strictly so called. However, a number of his works greatly influenced the Argentinian analytical philosophers of law from that period. Relevant in this respect are his characterization of analytical philosophy (he was essentially an analytical philosopher of an "Oxonian" type), his classification of ethical theories, and his study on the moral justification of punishment.

The most representative legal analytic authors of the subsequent generation are Antonio Martino, to whom we owe an interesting study on legislative definitions (Martino et al. 1975); Luis Warat, who was interested in legal semiotics and the way legal science conceals its prescriptive character, by turning to (ideological) techniques such as redefining terms and using semantically anaemic expressions and axiological variables (like the abuse of law and legal gaps); Carlos Santiago Nino (1943–1993), who wrote significant works in the *first* half of the 1970s—especially his "Notes" of introduction to law (Nino 1973–1975) and his criticism of traditional legal dogmatics (Nino 1974)—but whose most significant work was developed later; Ricardo Guibourg, who in the early 1970s began to show an interest in legal logic and legal informatics; and Martín Farrell, who in the 1970s advocated a rather extreme legal realism and went on to be essentially a moral philosopher, putting forward his own version of utilitarianism. Some other authors that should be noted are Jorge Bacqué (1945–2011), Norberto Griffa, Eduardo Russo, and Maria Isabel Azaretto.

26.2.1.4. Materialist Philosophy

The appearance of materialist philosophy of law in Argentina dates back to the years after the 1966 coup d'état. This current's theoretical development in this

period was markedly inferior to that of analytical philosophy of law, a circumstance that to at least some extent may be due to the political and institutional difficulties the representatives of this conception were faced with. For only a very brief period (coinciding with Héctor J. Campora's accession to the presidency of the republic in 1973, before Perón's second government), the Argentinian university (particularly the National University of Buenos Aires) was in the hands of the left (Peronist and non-Peronist alike), and it was this brief period that contributed to the development of these studies.

Here a distinction should be drawn between the members of what could be called the Buenos Aires group—with authors like Jorge Rébori, Enrique Marí, Eduardo Barcesat, Carlos Cárcova, Ricardo Entelman, and Alicia Ruiz—and other authors inspired by Marxism, such as Juan Carlos Gardella and Alberto Kohen. The most important among those in the former group is Enrique Marí (1928–2001), author of an influential book on neopositivism and ideology (Marí 1974). Under the rubric of neopositivism Marí includes logical empiricism, philosophy of language, and the Popperian school. The authors in these schools are criticized by him for either avoiding the question of ideology or boxing the question into an intra-propositional matter. This latter approach is deemed insufficient in any case, since what prove to be deformed are not only the propositions of science but also its very object. The distinction drawn by the neopositivists between scientific judgments and value judgments was in Marí's opinion superseded by materialist epistemology (that of Bachelard and Althusser), which showed how what is scientific can only be determined by taking ideology as a starting point.

In reality, what the materialist philosophers of law do is not in a strict sense to develop their own philosophy of law but to criticize the analytical legal philosophers, whom they accuse of both neglecting to study ideology and not taking into account the socioeconomic circumstances that condition law. Althusser's influence on the authors in the Buenos Aires group is very marked (Gardella combined Marxism with a nonpositivist empiricist philosophy inspired by Aristotle; Cohen approached the question of law and the state from an orthodox Marxist-Leninist position), and so they all accepted the thesis of the relative independence of the superstructure in relation to the socioeconomic base, the existence of an "epistemological rupture" between ideology and science, and the twofold (positive and negative) character of ideology.

26.2.2. Argentinian Legal Philosophy after 1976

The period of the military juntas lasted from March 1976 until the end of 1983. It was a time of terrible repression (the famous *Nunca Más* report set the number of *desaparecidos* in this period at approximately 9,000), which led to the exile of many intellectuals and professors. However, in addition to this, the restoration of democracy was not fully satisfactory, which is why the period

has been termed "an incomplete democracy" (Luna 2009, 245). There were some significant achievements, such as the trial and sentencing of the members of the three juntas for their human rights violations, when Alfonsín was in power. However, this was followed by the *Ley de Obediencia Debida* (Law of due obedience), under which lower-ranking members of the military were relieved of responsibility; and shortly afterwards (during Menem's first term as president) came a series of pardons for the convicted members of the military, who were thus set free and cleared of all charges. Moreover, the economic and social situation has not helped the country at all in recent times. The juntas had piled up an enormous foreign debt, and various measures taken during the democracy in an attempt to improve the situation were either unsuccessful or even deleterious, actually *worsening* the situation. In this way, the country went through moments when inflation was so high that prices needed to be revised up various times during the day; "neoliberal" experiments wound up deindustrializing Argentina and led to deep inequalities, which meant poverty for many of its inhabitants; or, again, there was the so-called *corralito*, the economic measures freezing the bank accounts of Argentinian citizens. This situation of extreme instability on both a political and a socioeconomic level, a situation that characterized the last decades of the 20th century in Argentina, is reflected in a rather absurd way in two events that took place in 2001: the succession of no fewer than five presidents of the republic in a single month and the protest of wide sectors of the population under the slogan "They must all go!"

Logically, all of this affected philosophy of law and even explains why, to a certain extent, it is not exactly clear what one means when speaking of "Argentinian philosophy of law," for the expression could refer to that which is produced *in* Argentina or to that produced *by* Argentinians. Consider, for example, Ernesto Garzón Valdés, who has lived in Germany since the 1970s, and most of his work has been produced there. The same goes, in later generations, for many other philosophers of law who are from Argentina (or were born there) but have permanent posts as professors at universities outside Argentina: Witness Jorge Malem, Rodolfo Vázquez, Óscar Correas, Cristina Redondo, Pablo Bonorino, Carlos Herrera, Gustavo Fondevila, Maria Inés Pazos, and Silvina Alvarez. The number of philosophers of law whose academic life in large part takes place (or has taken place) outside Argentina is impressive. In other respects, the legal philosophical landscape has become more complex, for at least these two further reasons. The first is that in addition to the authors of the previous period, many of whom continued to publish prolifically after 1976, many others should be counted who have been active since that date. (According to Ortega y Gasset's criterion, these of philosophers of law make up two new generations.) The second reason is that the lines of demarcation between various conceptions of philosophy of law are less clear today than in the previous period. Certainly, the most relevant classification is that

which distinguishes philosophers of law according as they follow natural law or an analytical orientation or, again, a critical one (phenomenology and existentialism no longer being in fashion).[7] However, natural law has been renovated, and today's neo-natural law theorists are considered in many ways close to other authors from other traditions, authors like Nino and Alexy. Not all analytical philosophers of law are still positivist and sceptical in ethics. There are authors, like Russo, who have moved from analytical philosophy to postmodernism. As for "analytical Marxism," it ceased to be an oxymoron some decades ago.

For these reasons, my presentation of the most recent stage of Argentinian philosophy of law will be divided into two sections. In the first of these, I will deal with the work of those philosophers of law who were active before 1976, showing how they have since evolved. In the second, I will outline a general characterization of this period and will also include the work of the newer generations.

26.2.2.1. New Developments of Previous Trends

It is a considerable amount of work that Carlos Alchourrón and Eugenio Bulygin produced (both together and separately) after *Normative Systems* (Alchourrón and Bulygin 1971). A good part of this subsequent production can be found collected (along with some earlier works) in an extensive volume published in 1991 under the title *Análisis lógico y derecho* (Logical analysis and law: Alchourrón and Bulygin 1991), with a foreword by Georg H. von Wright, which is divided into three parts, under the headings "Logic and norms," "Issues in the general theory of law," and "Some philosophical problems." Many of these works have been very influential, and in the Spanish-speaking community they have caused a great deal of controversy about conceptions of norms, about permission and permissive norms, about definitions, and about derogation. Alchourrón (he died in 1996) was not only a jurist but also, and perhaps above all, a philosopher and a logician, and his work on change in theories and beliefs is of great importance. Also of great importance was his research on the logic appropriate for law, a subject that, as Vernengo (1996) pointed out, he chose to concentrate on in his later years. Eugenio Bulygin advocated in various works a legal positivism that could be qualified as "radical": The legal positivism we are dealing with here is exclusive (though quite different from that of authors like Raz), based on the thesis of the separation between law and morality and on scepticism in normative ethics, a framework that has greatly influenced the younger generations.

Genaro Carrió, by contrast, did not write any work of relevance after the 1970s. Notable, however, during the military period, was the stand he took in

[7] On this classification, see Botero Bernal 2008.

a number of court cases where he came out in defence of victims of human rights abuses. He later became the first president of the Argentinian Supreme Court during the restoration of democracy. He died in 1997.

The case of Roberto Vernengo is quite different. He took exile in Mexico during the years of the military juntas, returned to Argentina when democracy was reinstated, and in this second period he also wrote copiously on a range of subjects. His most relevant research is on the problems involved in applying and interpreting the law, as well as on the relation between law and morality and on logic. In this last field, Vernengo cowrote with the Brazilian logician Newton da Costa (see Vernengo and Da Costa 1996) various articles devoted to exploring the ability of divergent logics to explain legal reasoning. As he himself explains (see Guibourg 1996, 446), his central concern as a philosopher of law, and as philosopher tout court, has been the question of rationality and its traditional nucleus, namely, reason, which he interprets in quite a strict sense. Reason is bounded by the formal and the empirical sciences, in such a way that he is also a convinced noncognitivist in matters of morality and an enemy of theories like Dworkin's and Nino's, which he considers to be forms of natural law "qui n'ose pas dire son nom" (ibid., 455).

Ernesto Garzón Valdés changed direction in his work in the mid-1970s or thereabouts. At the outset, he was essentially concerned with moral philosophy, producing in this field extensive work characterized by his steadfast support of moral objectivism. Garzón Valdés was a diplomat in Germany when the 1976 coup d'état took place. He was removed from service and stayed in Germany. He has played a fundamental role in recent decades in the development of philosophy of law in Latin America as well as in Europe and the United States. His moral philosophy can be found in numerous works (many of them collected under the title *Derecho, ética y política* [Law, ethics, and politics: Garzón Valdés 1993]), where he deals with questions such as the relation between law and morality, as well as tolerance, civil disobedience, positive duties, and paternalism. One of his most influential ideas is encapsulated in what he calls the off-limits area principle, reinforcing the nucleus of fundamental rights and setting a limit on the reach of majority rule; it is formulated thus: "Questions concerning the full validity of primary or basic goods cannot be left to procedures of discussion in which a role is played by the community members' will or desires" (quoted in Garzón Valdés 1993, 26; my translation).

Enrique Marí also produced most of his work in the 1980s and 1990s (he died in 2001). Although he was a lawyer by profession, his intellectual interests went beyond law and included many fields in philosophy and the social sciences. The work he has done in a more legal-philosophical vein is accordingly concerned with the question of the boundaries of law. He thus investigated the relation between law and power, between law and ideology, between knowledge and power (it was he who introduced Foucault's work on legal culture into the Spanish-speaking world), between law and literature, and between law

and psychoanalysis (see Courtis 2001). Marí was doubtless the main reference point for critical legal theory in Argentina at the turn of the 20th century.

As for the authors of the following generation, their careers have also ranged widely in different directions. Antonio Martino moved to Italy at the end of the 1970s, and it was there that he pursued a career as a teacher interested especially in questions of logic and legal informatics. He and Carlos Alchourrón wrote an influential article about logic without truth. Luis Alberto Warat also left Argentina in the same period to settle in Brazil, where he has been a charismatic professor, criticizing "scientific reason" and advocating a "hedonist justice." He is the kind of iconoclastic jurist determined to bring law closer to artistic expression. Of those who stayed in Argentina, Martín Diego Farrell did significant work in moral theory and is the main representative of utilitarianism in the community of Spanish-speaking philosophers. He has written on practical questions (such as abortion, euthanasia, and education) as well as on the grounds of ethics. His support of utilitarianism goes along with his support of the liberalism of neutrality, which in contrast to the liberalism of autonomy does not postulate the existence of any objective value. In Farrell's opinion, no plan of life is objectively better than any other, for which reason the state should always be neutral with respect to all plans, so long as they satisfy John Stuart Mill's harm principle (see Farrell 2000). Ricardo Guibourg has followed a path similar to that of Alchourrón and Bulygin; has written on methodology, logic, and legal informatics; and has defended a "classic" version of methodological legal positivism. He presents under two headings—system and method—what he considers to be his most important contributions (he has written extensively and with an impeccable style):

> Where questions of system are concerned, my contribution lies in an imperfect, albeit probably useful, proposal for formalizing competence rules; in the area of method, my contribution lies in a proposal for reconstructing the concept of truth, this being an aspect of general philosophy that, when applied to law, can help us dispel certain structures of the traditional debate (so much with us even today) and, more simply, it can also help us organize our ideas and preferences about what still stands true. (Quoted in Atienza 2003, 914; my translation)

The main representative of critical legal theory Argentina after Marí was Carlos Cárcova. It was precisely while carrying forward Marí's work, as well as Cossio's, that Cárcova became interested in the nontransparent aspect of ideology and law (their opacity), pointing out the existence of a "paradoxical function of law," in that law "reproduces the conditions for the existence of a social system and, at the same time, helps it towards its positive transformation" (Cárcova 1998, 162; my translation). Apart from that, he holds quite sceptical conceptions in epistemology—like Rorty, he thinks that "in a democratic and tolerant society, truth is not discovered but is rather made within language games" (quoted in Botero Bernal 2008, 71; my translation)—and these are conceptions that could be extended to the realm of morality.

The most important philosopher of law in this period—and indeed in the history of Latin America—is rightly considered to be Carlos Santiago Nino (on which see also Section 26.2.1.3 above), who was born in 1943 but died rather young (in 1993, before turning fifty) and so belonged to this same generation.[8] Nino started out as an analytical philosopher very much in the same line of thought as Carrió, but later (still using the analytical method) he constructed a complete and original philosophy of law aimed at articulating law with morality and politics under the concept of the unity of practical reason. Nino also actively participated in the restoration and consolidation of democracy in Argentina and played an important role in many a young researcher's scholarly training.

He defended a theory of ethics close to that of authors such as Rawls and Habermas, and called it "epistemological constructivism."[9] *Constructivism* describes the role he ascribes to rational discourse in determining correctness and moral truth. *Epistemological* specifies that the result of this discourse is not *constitutive* of truth or moral correctness but simply the most reliable path to achieving it. Discourse makes it possible to justify three basic principles from which human rights derive, and which Nino qualifies as "one of the greatest inventions in our civilization" (Nino 1984, 1; my translation). These three principles are (*a*) the inviolability of the person, under which no individual can be asked to bear burdens and sacrifices for the greater good of others or of the majority (*b*) the principle of autonomy, prescribing that the state should remain neutral with respect to individual plans of life and the ideals of human excellence, and should simply facilitate the carrying out of these plans and prevent mutual interference in this process; and (*c*) the principle of dignity, according to which we should judge and treat people on the basis of their voluntary acts rather than on the basis of other properties or circumstances, such as their race, sex, and beliefs.

In political philosophy, Nino developed a theory of democracy in which this type of government is justified as a regulated substitute for moral discourse. Which is to say that democracy (understood as *deliberative* democracy) is a procedure of collective decision that preserves as far as possible the characteristics of moral discourse, all the while managing to overcome the operative limitations of such discourse, this by extending the scope of moral discourse beyond what morality would allow. Nino consequently supports a moralization of democracy, but only if this is counterbalanced with a politicization of morality, given that morality is for him a deliberative intersubjective praxis and not an activity or the result of any individual's activity (see Roca 2005, 23).

[8] On Nino see also Sections 1.4.5.2 and 10.2 in Tome 2 of this volume.

[9] On Habermas see Sections 10.3.5 and 10.4.3.2 in this tome and Sections 10.4 and 25.3 in Tome 2 of this volume.

And with reference to philosophy of law, Nino made essential contributions to each of the three fields into which by convention this discipline is broken down, namely, the theory of law, the theory of legal science, and the theory of justice. As he saw it, law should be understood as a broad social practice that takes place over time and cannot be separated from either politics or morality. As he stated on many occasions, law is not an insular phenomenon but is inherently connected in several respects with political practice and morality. What he considered to be the central problem of philosophy of law was that of explaining that legal reasons are not autonomous reasons for justifying decisions; which is to say that practical reasoning is unitary in nature (this prevents its breakup) and it is structured in such a way that legal or political reasons are subject to moral ones.

All things considered, Nino is one of the half-dozen most notable philosophers of law in the second half of the 20th century. Together with Dworkin and Alexy, he is the most prominent representative of what has come to be called legal constitutionalism.[10]

26.2.2.2. Salient Features of Argentinian Philosophy of Law in Recent Decades (Post-1976)

I now discuss what I consider to be the most salient features of Argentinian philosophy of law in recent decades. In what follows I present nine such features, which in combination give us a kind of x-ray of the current situation.

(1) The *most* relevant of these features is without a doubt the extraordinary wealth that Argentinian philosophy of law presents today. Many are the philosophers who dedicate themselves to the discipline. And their output is extensive (published both in Argentina and abroad, in Spanish and in other languages, such as English). A considerable amount of what is published is of a high or extremely high level, and the thematic variety could not be greater, ranging from specialized work in deontic logic to law and literature and covering, among other areas, the theory of human rights, the theory of norms and normative systems, legal informatics, legal ethics, the philosophy of criminal law, and international law. However, not everything has received equal attention, and two areas I would point out as needing greater development (though they have not been completely neglected) are the sociology of law and the history of legal thought.

(2) Moral and political philosophy have played a significantly more important role in shaping Argentinian philosophy of law. Until 1976, the only work in moral philosophy that played such a role was that of Rabossi, but now one would have to also recognize the influence of some additional moral philosophers. Apart from Garzón Valdés, there are Martín Farrell, Osvaldo Guari-

[10] On neoconstitutionalism see also Chapter 10 in Tome 2 of this volume.

glia, and Eduardo Rivera López. And to this list one would have to add those scholars who have explored in particular the way moral and political philosophy intersect with other legal disciplines. That is the case with Horacio Spector, whose most significant work is perhaps *Autonomy and rights: The moral foundations of liberalism* (Spector 1992); other examples are Guido Pincione, Fernando Tesón, and other younger professors at the University of Torcuato di Tella (such as Marcelo Ferrante, Martín Hevia, and Ezequiel Spector), as well as Roberto Gargarella, who has especially concerned himself with political philosophy and constitutional law. Important in this respect—I would say even essential—has been the influence of Nino, this for his role in leading many Argentinian philosophers of law to arrive at a "noninsular" conception of law today, or otherwise to believe that legal theorists may form a view about problems of normative ethics.

(3) Although Argentinian philosophy of law is to this day mostly concentrated in Buenos Aires, it has also been developed to a certain extent (more now than at earlier times) at influential centres in Córdoba, Rosario, Santa Fe, and Mar del Plata, among other places. And even in Buenos Aires, philosophy of law has developed at centres other than the University of Buenos Aires itself: At least two other universities—Torcuato di Tella and Palermo—have formed significant groups of philosophers of law. All these centres maintain close institutional as well as personal connections with universities in the United States, Latin America, and Europe, with the result that many Argentinian philosophers of law have taught or now teach at foreign universities, and as I previously mentioned they have also *published* abroad. It would be fair to say, then, that philosophy of law in present-day Argentina has become a highly internationalized discipline.

(4) There are two orientations in Argentinian analytical philosophy of law, its two reference points—indeed its two points of attraction—being Bulygin's and Nino's conceptions of philosophy of law. Bulygin takes a strictly positivist stance in the theory of law and a sceptical one in moral philosophy. Nino lays emphasis on the unity of practical reason and advocates moral objectivism. Adherence to one camp or the other is not a matter of steadfast and uncompromising loyalty, and neither group's attitude is even remotely dogmatic. In the first group we can include Hugo Zuleta, even if this has not prevented him from criticizing the deductivist thesis and Alchourrón and Bulygin's "bridge conception" of the norm. Jorge Rodríguez proposed a distinction with respect to one of the central concepts expounded in *Normative Systems* (Alchourrón and Bulygin 1971): His distinction may appear subtle, to be sure, but it can lead to changes of some substance (J. Rodríguez 2002). As concerns the second group, we have to consider that Carlos Nino's influence is to a greater or lesser extent present in all Argentinian philosophers of law, although this is especially true of Carlos Rosenkratz, Roberto Gargarella, Martín Böhmer, Marcelo Alegre, and Roberto Saba, who have all basically proceeded along the same line.

(5) Human rights, virtually an unknown question until 1976, has in recent years become very important. Clearly, the experience of the military juntas has had a role in shaping this phenomenon, but it was Nino's work that provided the initial impetus among Argentinian philosophers, and one would be hard put to it to find even a single philosopher of law in Argentina who has not in one way or another dealt with this question. This widespread interest has given rise to various interesting discussions—between Nino and Rabossi, for example, in which Guariglia also took part—about how to understand human rights (or how to frame the theoretical paradigm from which to approach them), as well as about the question of social rights, in which regard one should point out the important book by Abramovich and Courtis (2002), which revisits the traditional idea of human rights as programmatic rather than as claimable rights.

(6) In any event, the most striking feature of contemporary Argentinian philosophy of law is probably the enduring strength of legal positivism, especially that brand of it which bears the imprint of Kelsen's work, and especially as concerns his thesis of the strict separation between law and morality, as well as his moral scepticism. It is fair to say that these two features—the separation thesis and the moral scepticism—are what most characteristically distinguishes the mainstream of Argentinian philosophy of law. As we have seen, they are present in the work of Bulygin and Vernengo, and also in the work of Guibourg, who can be said to have gone through a stage where he brought systems theory to bear on legal positivism (Ernesto Grün has likewise supported a systemic and cybernetic vision of law not far from that of Guibourg). Guibourg is extremely critical of the "openly antipositivist" conception that he sees as something of a current vogue in legal culture. The same two features are also present in the work of Ricardo Guarinoni and in that of Hugo Zuleta, and with some clarifications in that of Farrell, too, who combines moral utilitarianism with the liberalism of neutrality, the former being a *nonsceptical* conception of morality and the latter instead a sceptical one, at least in his understanding of it. Strict positivist theses have been supported as well by others from the Buenos Aires school, like Eduardo Barbarosch and Juan Pablo Alonso.

(7) The same could be said of a considerable number of those who belong to what may be called *la escuela cordobesa* (the Córdoba school), in which at least two generations can be distinguished. In the first of these we find various disciples of Garzón Valdés, such as Jorge Malem (who has worked in particular on questions of legal ethics, such as civil disobedience and judicial corruption), Carlos Ernst (the author of an interesting book on implicit rights), Ernesto Abril, and Ricardo Caracciolo. Caracciolo can be described as the guiding light of the later generations and wrote very rigorous works, the most important of which is on normative systems. In the next generation, important work has been produced by Pablo Navarro and Cristina Redondo, who can

definitely be considered as belonging to what I have elsewhere called "the central line." Apart from what they have written together, the former is the author of works that have had much influence in shaping the legal concepts of efficacy and applicability (the law's applicability is the subject of works that Navarro has written together with Jorge Rodríguez, Germán Súcar, and Claudina Orunesu). Cristina Redondo, for her part, has worked on the theory of the reasons for action, among other subjects she has investigated. Other members in this school are Hugo Seleme (whose specific interest is Rawls), Guillermo Lariguet (who has worked on ethical dilemmas), and Alberto Bovino.

(8) There is also a natural law strain that runs through Argentinian legal philosophy after 1976. I will not count legal trialism as part of this current, however, for even though its founder, Goldschmidt, cast it as a theory of natural law, that is no longer the case with Ciuro Caldani. The most influential natural law theorists in Argentina appear to be Carlos Massini and Rodolfo Vigo. Both belong to a classical realist line of natural law theory closely linked to the work of John Finnis. Massini and Vigo thus support very similar conceptions, but the latter is more open than the former to dialogue with other trends in legal philosophy. In fact, Vigo has shown a great deal of interest in the work of Nino and other authors (like Dworkin and Alexy) who work in what is usually called the constitutionalist (or neoconstitutionalist) paradigm.

Both Massini and Vigo criticize the attempt to construct a purely descriptive theory of law, to reduce law to the normative level, and to draw a conceptual separation between law and morality, and they also criticize moral scepticism and relativism. What they instead advocate is the centrality of the notion of praxis; the analogical nature of the concept of law, which leads them to consider the normative dimension as deriving from what they take to be the authentic meaning of law, namely, law as human conduct that is objectively required; the unity of practical reason, in such a way as to find a continuity between law and morality; and the existence of some principles of justice that are valid in an objective sense, independently of whether they have been established by political authority or whether a consensus exists in the community. It should be pointed out that the two belong to *classical* natural law, the kind inspired by St. Thomas Aquinas, and are critical of Enlightenment natural law theory.

(9) Finally, a considerable amount of work in Argentina has been devoted to critical legal theory, with authors who have carried forward Marí's legacy in what concerns epistemology and its application to law. Prominent among these authors are Carlos Cárcova, Ricardo Entelman, Alicia Ruiz, Claudio Martyniuk, and Christian Courtis. We should also include Óscar Correas in Argentinian critical legal theory (even though he is based in Mexico), as well as Enrique Zuleta Puceiro, who has written an influential book (Zuleta Puceiro 1981) applying Kuhnian ideas about science to legal dogmatics. The main representative of critical legal theory in Argentina is Cárcova, and it is significant

that he sees it "as an unfinished project in progress" and further believes that "it would not be desirable for critical legal theory to take the form of a theory" (quoted in Botero Bernal 2008, 71; my translation).

26.3. Closing Remarks

The foregoing discussion is not in any way meant to offer a complete panorama of Argentinian philosophy of law in the 20th century, for that would no doubt take up books of considerable length. What has been attempted here is simply a rough outline intended to help readers do further study on any of the authors and ideas discussed here. If I were asked to for general opinion, I would say that Argentina, and Buenos Aires in particular, stands as one of the most important centres of philosophy of law in the second half of the 20th century and will probably continue to do so in future decades. It is unfortunate, in my opinion, that this extraordinary technical development has not been guided—and continues not to be guided, apart from some significant exceptions—by a more pragmatic brand of legal philosophy more concerned with improving law and social institutions.

Chapter 27

PHILOSOPHY OF LAW IN BRAZIL IN THE 20TH CENTURY

by Ronaldo Porto Macedo junior and Carla Henriete Bevilacqua Piccolo

27.1. Introduction

It is commonly noted that the problem of philosophy begins with its own definition. Brazilian philosophical thought in the 20th century is confronted with the same preliminary question, namely, what is to count as philosophy in Brazil, and in particular what is to count as *legal* philosophy? Moreover, the philosophy of law investigates philosophical problems arising in connection with the *practice* of law and is somehow parasitic on the philosophy of ethics, mind, and action.

As in other Western countries, law schools in Brazil have played a key role in disseminating and expanding what can be broadly referred to as humanistic culture, thus transcending the limits of law itself as a discipline. For this reason, the developments covered in this exposition are divided into four phases. The first one starts with the establishment of higher education in Brazil and runs through the end of the 19th century. This first development will be introduced very briefly just to make the rest of the discussion on the 20th century more intelligible. The second phase sees the emergence and development of a type of legal philosophy that lasts almost through the entire 20th century. This second phase can be characterized by the presence of humanism and rhetoric in legal thinking, often without clear boundaries between sociology, history, general philosophy, and legal philosophy. The third phase is marked by the emergence of professional, technical, academic philosophy in Brazil at the universities (especially as an outcome of the establishment of the first schools of philosophy) and its coexistence with the philosophy of law produced in the law schools. This third phase began with the establishment of the University of São Paulo in 1934 and follows a "parallel history" of philosophy in Brazil that is still with us. Its distinguishing features are an obsession with method and conceptual accuracy and an emphasis on the history of philosophy, especially among classical authors, as there is little concern with the philosophy of law in a strict sense. In the fourth stage, which begins in the first decade of the 21st century, the discussion closes in around a reduced number of topics that became the subject of theoretical work done for the most part by professional philosophers and in cases by the law schools.

27.2. Law Courses in Brazil and the Building of a National Elite: The Legal Legacy before the 20th Century

27.2.1. Overview

The history of legal philosophy in Brazil traces back to colonial times, which makes it unconceivable to separate that history from the history of legal philosophy in Portugal. The first law graduates in Brazil were educated in Europe, especially in Portugal, where they absorbed the culture and tradition of Lusitanian legal studies and where they came from in playing various roles among the cultural, political, and economic elites in Brazil (see Lima Lopes 2000, Venâncio Filho 1977, and Adorno 1988). A similar situation is found in most Latin American countries of that time.

One of the earliest philosophical manifestations of this influence in Brazil was seen during Brazilian independence in 1822, before the first two law schools were founded in 1827. Influenced by the French Enlightenment, Father Diogo Antônio Feijó (1784–1843) and Martim Francisco (1775–1844) taught the first courses on some of the main philosophers of the French Revolution. Martim Francisco even taught a course on Kant in Brazil from 1805 to 1810, which certainly was remarkable, given that Kantianism would take longer to get to European countries such as France. It is worth noting, however, that Kant and the Enlightenment were "received" more as expressions of liberalism than as an outcome of the philosophical revolution they would bring about, especially in epistemology (see Ferraz Jr. 2000, 12–30).

Not until 1827 did the newly independent Brazil, through a decree of its emperor, institute the first law courses, one in Olinda (in northeastern Brazil), though it was later moved to Recife, and the other in São Paulo, in the southeast. That was the foundational moment not only for legal studies in Brazil, but also for higher education in the humanities. However, although it was only several decades later that Brazilian intellectual life would begin to move away from the Portuguese, the creation of law courses stems directly from a new political institutional design for the country and brought new intellectual influences like Romanticism in literature and liberal ideas in politics.

Hence, the rise of the national state and of liberalism emerge as two central issues in the first Brazilian reflection on the philosophy of law (see Lima Lopes 2000). Interestingly, however, a liberal legal-philosophical consciousness coexisted ambivalently with the maintenance of slavery, abolished in Brazil as late as 1888. As José Reinaldo Lima Lopes has pointed out,

> a liberal and enlightened revolutionary perspective capable of large demonstrations in defence of individual freedom coexisted uneasily—from a theoretical point of view—with slavery. But it invoked a number of arguments to rationalize this restricted universalization of civil rights. Even the American and French Revolutions had to live with this kind of contradiction [...]. And the revolutionary and civilizing France, having abolished slavery in its territory and colonies by or-

der of the Convention of February 4, 1794, had second thoughts in 1802, when it allowed both slavery and the slave trade in the colonies, thus putting an end to equal rights. (Lima Lopes 2000, 351; my translation)

Such nonrepublican thought, however, remained alive during this period. One of its representatives was José Maria Corrêa de Sá e Benevides (1833–1901), of the Faculdade de São Paulo, who stood apart as a follower of theological natural law, relying especially on the doctrine of the Catholic Church. He rejected Auguste Comte's positivism on two grounds: in the first place because it is not based on a belief in God and the immortality of the soul, and in the second place because it asserts that morality should be subordinate to sociology (see Nader 2000, 255).

The law schools, however, were not only venues for the teaching of law. Generalist education tended to have a strong humanistic component. More often than not, students would engage in discussions on the arts, politics, literary criticism, and science, as well as on the law. Some examples of this dominant type of education can be found in some classic writers of Brazilian literature, including Álvares de Azevedo, Castro Alves, and José de Alencar. The impact of the law schools was also strongly felt in the development of the social sciences in Brazil. Virtually all classical social thinkers in Brazil were trained in the law schools.

This generalist and interdisciplinary scenario fostered the first efforts aimed at a philosophical investigation of law. This philosophy of law was born as a *philosophy of jurists* trained in a rhetorical tradition commonly known as *bacharelismo* (lawyership), characterized by classical and general humanism, generalism, and erudition; influenced by the belle époque; and lacking academic and methodological accuracy in treating authors and ideas. The national elite echoed the European debate in legal philosophy—especially in Paris and Lisbon—without necessarily digesting it with the rigor with which it was conceived and developed. The legal philosophical production of that time can be said to have been much more interested in disseminating mainstream *European* thought than Brazilian philosophical thought (cf. Reale 1976, 9). Brazilian social thought evolved differently, as it focused on Brazilian facts and realities, thus forging an identity of its own long before general philosophy, and legal philosophy in particular. Such an eclectic academic environment, a lawyerly one (see Venâncio Filho 1977), is still alive and well in most Brazilian law schools of the 21st century. Even so, these legal philosophers did produce some works of intellectual value.

In the end, it is still in an original way that European ideas travelled across Brazil, even if for the most part these ideas were imported and reworked not so much for their inherent philosophical merit as for the political and ideological function they could play Brazil's political and legal landscape (cf. Reale 1976, 137).

27.2.2. The Main Point of Reference in the Colonial Period

Even during the colonial period there was some effervescence, a case in point being Tomás Antônio Gonzaga (1744–1809), author of the *Tratado de Direito Natural* (Treatise on natural law). Gonzaga developed some libertarian political ideas and was sent to exile for having allegedly participated in the affair known as the Minas conspiracy (*Inconfidência Mineira*), a famous chapter in Brazilian history in which the Portuguese authority was challenged by the settlers. Although his natural law tempered with theological nuances did not bring major innovations, he did set out a systematic and clear outline of the thinking of some authors, including Johann Gottlieb Heineccius, Samuel Pufendorf, and Hugo Grotius, the last of these criticized for designing a natural law independent of God's existence.

In the 19th century, several names were associated with the philosophy of law, usually professors in São Paulo. One of these was José Maria de Avelar Brotero (1798–1878), who at the newly established São Paulo School of Law was the first professor of natural law (a course that would subsequently be replaced by the philosophy and general theory of law). In 1829, he published for his course a handbook offering an introduction to natural law. His teaching was informed by the work of authors like Gabriel Bonnot de Mably, Baron d'Holbach, Claude Adrien Helvétius, Bruno Perreau, and Pierre Jean Georges Cabanis and introduced avant-garde opinions clearly at odds with the prevailing doctrine in Portugal. So, for example, he argued that marriage was an agreement based on mutual consent, that divorce was the only possible moral solution in the absence of such a mutual agreement, and that spouses should have equal rights.

The establishment of the São Paulo School of Law in 1827 came at a time when European philosophical influences were somehow already present (especially as concerns Grotius, Pufendorf, Heineccius, Filangieri, Beccaria, Bentham and Smith). However, it is only with the institution of the law course that this influence was consolidated (cf. Lima Lopes 2000, 338).

As we saw earlier, Kant was already familiar. However, late in the 1830s, Kantianism began to wield a more powerful influence, particularly through the work of a lesser Kantian named Karl Christian Krause (1791–1832), brought to Brazil by a German immigrant, Julius Frank (1808–1841), who taught at preparatory schools for admission to law school. This Kantian presence, though somewhat ambiguous, is felt on the thought of Tobias Barreto (1839–1889), one of the jurist philosophers who stands out in this period. Barreto, who taught in Recife, was significant for his effort to disengage Brazilian legal thought from traditional Portuguese legal thought, still deeply rooted in ordinary legal praxis and in Scholasticism. It was precisely against praxis-oriented thinking and the Scholastic style that he charged, looking instead to natural science as a methodological model to be followed in legal science, too. Distancing himself from the French exegetical school and the German Pan-

dectists, whose influence peaked in the first half of the 19th century, Barreto was one of the authors who did most to bring sociological and anthropological inquiry to jurists. In a syncretic and quite inconsistent fashion, Barreto combined Krause's Kantianism with the evolutionism of Ernst Haeckel—an author who drew a cult following in Brazil—and with the work of Rudolf von Jhering and Herman Post. He forged a kind of sociology of natural law. Another professor of natural law in São Paulo was João Theodoro Xavier (1828–1878), also responsible for disseminating Karl Krause's and Heinrich Ahrens's ideas. These theoretical reference points were remarkable in the education of another important 19th century Brazilian jurist and thinker who projected his influence on the 20th century, Clovis Bevilacqua (1859–1944).[1]

It is important to remember that, as was previously highlighted, this generation of jurists also bears the strong influence of the "practical approach" espoused by Portuguese philosophy, completely averse to pure metaphysics (cf. Costa 1956, 438). Perhaps this can explain why Brazil had not had a philosopher of law per se, but did, for example, have great theorists of private law who built their works relying on their eclectic knowledge of philosophy. According to Clovis Bevilacqua, responsible for drafting the Civil Code of 1916, "if some day we will produce further works of philosophy, they will not emerge from the heights of metaphysics" (see Costa 1956, 442; my translation). In fact, the "practical approach" that dominated in the law schools foreclosed any other avenue, at least in the near future. The practical approach, however, was not tantamount to a lack of theories or reflection on law. Bevilacqua was influenced by the evolutionism of Tobias Barreto, whose conception he combined with the idea that the law would evolve by way of struggles (the obvious reference here was to Jhering).

Also noteworthy is that around 1854, João Chrispiniano Soares (1809–1876), professor of Roman law at the São Paulo School of Law, was influenced by Pandectism and the ideas propounded by Friedrich Carl von Savigny. This influence would be remarkable in shaping the exegetical and systematizing model followed by several prominent jurists and codifiers, such as Bevilacqua, Teixeira de Freitas, and Conselheiro Ribas. In the latter's civil law course, we can also see noteworthy German influences and many quotations by German writers, including Ludwig Arndts von Arnesberg, Johann Burchard Freystein, Johann Ulrich von Cramer, Christian Friedrich von Gluck, and Georg Friedrich Puchta (cf. Ribas 1915).

Teixeira de Freitas (1816–1883) drafted a general code intended to stand above all other civil, criminal, and procedural laws, containing standards for the application, interpretation, validity, and duration of laws, as well as criteria for resolving conflicts of laws across time and space. Although his work and ef-

[1] His most important works are *Teoria general do direito civil* (General theory of private law: Bevilacqua 1908) and *Código Civil dos Estados Unidos do Brasil Comentado* (The Civil Code of the United States of Brazil: Bevilacqua 1916).

forts were not accepted in Brazil, its logical structure served as a model for the civil code enacted in 1898 in the Empire of Japan, the 1929 Vatican laws and general rules and sources of law, the Italian Civil Code of 1942, and the revision of the French Civil Code in the 1930s. In Latin America, his works served as a basis for the civil codes of Argentina, Paraguay, and Uruguay. Teixeira de Freitas is a further example of an intellectual man of legal science, versed in philosophy, but whose intellectual potential brought him fame for his role in practical matters such as the creation of a code of laws. His work is marked by the traits of the Brazilian legal thought of this time, with little concern for purely metaphysical questions and much emphasis on practical questions. Even so, he did also put his great skill to work in brilliantly tackling the philosophical dimensions of private law, an interest rarely seen among his peers.[2]

Another prominent author in this turn of the century was Silvio Romero (1851–1914), responsible for disseminating in Brazil an eclectic concept of Spencerian evolutionism and a positivist scientific approach to law under the strong influence of the English evolutionist Thomas Huxley.[3] Also advancing a "positivist" philosophy of law, in São Paulo, was Pedro Lessa (1859–1921), who adopted the principles and methods of Auguste Comte, Herbert Spencer, and John Stuart Mill, among others (see Lessa 1909 and 1912). Despite strong resistance from those who propounded Scholasticism in Brazil—especially Soriano Sousa (1833–1895) in the north and João Mendes Junior (1856–1923) in the south—this positivist scientific approach to law, also espoused by Clovis Bevilacqua and Pontes de Miranda, prevailed until the late 1930s. Since then, new doctrinal currents have been embraced by Brazilian legal thought: Prominent examples are Edmund Husserl's phenomenology, existential philosophy, and Marxism.

In short, the inception of Brazilian legal thought bears the mark of two parallel forces: the emphasis on legal practice, coupled with the influence of positivism and its scientistic ambition, evolutionism, and classical Scholasticism as theoretical frameworks. In the words of Lima Lopes,

> the theoretical discussion in the second half of the century (the generation born in 1870, the so-called Brazilian Enlightenment) shows the need to overcome the traditionalist natural law that prevailed. The alternative that emerges is *science*: Here, as almost everywhere, what is pursued in various forms is *naturalism.* (Lima Lopes 2000, 341; my translation)

As we discuss below, these features go beyond the 19th century, crossing over into the 20th. This new approach in legal thought dealt with an often mentioned "dilemma between the real country and the country of laws," the "living law and the doctrinally constructed law," and the solution offered was

[2] His most important works are *Consolidação das Leis Civis* (The consolidation of civil laws: Teixeira de Freitas 1857) and *Código Civil: Esboço* (The civil code: A draft, Teixeira de Freitas 1864).

[3] On the philosophy of law, Romero wrote Romero 1878 and 1885.

clear: The science of law should focus on the real law and abandon the metaphysics of idealistic legal philosophy.

27.3. Legal Philosophical Thought in the Early 20th Century

The late 19th century marks the beginning of republican decentralization in Brazil, a process that ultimately consolidated the state of São Paulo as the new crucible of the Brazilian economy, with its strong reliance on the production of coffee. This fact would have an impact from both a cultural and a philosophical standpoint. These changes underpin the emergence, early in the 20th century, of a new emphasis on reflection wedded to dogmatic practice, away from the previous concern with the dilemma between the living law and doctrinally constructed law. Some influential works set the new methodological requirements that would resonate in legal philosophy. João Mendes Junior, for example, outlined a role for the philosophy of law as a kind of basic doctrine of legal science. Francisco Campos assigned to the doctrinal study of law the task of devising general principles of law and determining how to explain the legal phenomenon. Pedro Lessa and João Arruda focused on the methodological issues involved in a scientific investigation of law. A scientific approach to law was taken as well by Pontes de Miranda, but in his view it was sociology that offered the model for such an investigation (see Ferraz 2000).

From a cultural standpoint, the last decades of the 19th century generated what Barros (R. Barros 1927) termed the Brazilian Enlightenment, which stemmed from a direct contact with European culture and particularly with France. From this development sprang a focus on the ideas of evolution, biological and social Darwinism, positivism, and materialism. These ideas were embraced by the Brazilian local elites, who developed themes and aspects closer to them. Although positivism had great influence in the military and scientific arena, it did not hold much sway with the law schools, the main site of philosophical conjecture at the time. As João Cruz Costa has pointed out, "positivism was incorporated into Portuguese and Brazilian culture for its inherent philosophical worth, but because it served the interests of a politico-historical movement" (Reale 1976, 137; my translation).

The 1920s and 1930s brought changes that profoundly influenced legal thought throughout the European legal tradition. In Brazil, the situation was not different. Political changes were profound and extreme. Huge ideological conflicts between socialism, liberalism, fascism, and corporativism would leave their footprint in both public and private law. In the private arena, reforms to the Code of Obligations and Family were planned. Although such reforms were not carried out, they set liberal ideas against fascist corporativism (particularly influential in Brazilian labour-relations law and social-security policies: cf. Lima Lopes 2000, 382). A case in point—in the Vargas era, the period when Brazil was governed by President Getulio Vargas (1930–1945)—was the

theoretical debate between two competing views about the role of jurists and the role of private law. The main characters in this debate were Waldemar Ferreira (1865–1964), professor at the São Paulo School of Law, and Oliveira Vianna (1883–1951), a legal adviser at the Ministry of Labour and also a sociologist and jurist who taught in Rio de Janeiro. The former made a classic defence of liberal thought (see Ferreira 1938), arguing that liberalism is inconsistent with Brazilian labour courts, fashioned after the corporatist model, and hence completely at odds with the standards of private law. Oliveira Vianna (1938) defended the need for strong state intervention to implement a national development project. Vianna's corporative model, successful in the Vargas era, has considerably influenced the political and legal debate that continued in the following decades.

In public law, a comprehensive administrative reform was undertaken under the powerful influence of some social thinkers, such as the same Oliveira Vianna, and legal philosophers proper, such as Francisco Campos (1891–1968), who wrote the Authoritarian Constitutional Charter of 1937 and the reform that created the curriculum that went by the name of "introduction to the science of law" (mostly focused on the main concepts of legal dogmatics). One of the high points of this reform was the creation of a system of appointment to public office by examination, gradually replacing the system of appointment by simple designation and enabling the establishment of a professional bureaucratic corps recruited from the urban middle class independently of traditional patrimonial relations or family ties (cf. Lima Lopes 2000, 383). However, even late in the 1930s, influential Catholic sectors coalesced around Alceu Amoroso Lima (1893–1983) and Father Leonel Franca (1893–1948) to come up with an alternative to the system of vocational schools modelled after the medieval university corporations: These reformers put science and technique under the umbrella of philosophy and theology, and in this way they laid the foundations for a movement that eventually resulted in the *Pontifícia Universidade Católica do Rio de Janeiro* (Catholic University of Rio de Janeiro). This environment was shaped under the continuing influence of Saint Thomas Aquinas's religious thought, which remained present in the natural-law thinking at the law schools (see Schwartzman 1979, 189).[4]

This strongly eclectic positivist, evolutionist, and naturalist frame of mind—coexisting with a strong presence of Catholic thought and an inflow of the nonliberal ideas that informed authoritarian fascist and communist thinking (see Lamounier 1989)—defined the dominant intellectual landscape in Brazil from 1930 to 1940. In 1940, Miguel Reale (1910–2006), published *Fundamentos do Direito* (Fundamentals of law: Reale 1940), bringing about a shift in the legal and philosophical scenario of the post-war period. Before we ana-

[4] Social thought inspired by Catholicism has influenced the São Paulo Catholic University (PUC), especially through the teaching practices adopted by Montoro (2009).

lyze this work and its influence, we should describe a new philosophical intellectual force that came into being in Brazil with the creation of the University of São Paulo. To this subject we thus devote the next section.

27.4. The Creation of the School of Philosophy: Professional Philosophers

27.4.1. The Foundation of the University of São Paulo (USP) and the "French Mission"

It is worth noting that in the early 20th century, social theory and philosophy was generally done by Brazilian jurists specialized in other branches of legal dogmatics. This is still a salient feature of the theoretical and philosophical work of contemporary "legal philosophers," whose writing is chiefly concerned with the production of handbooks, précis, and disseminative works designed for the legal publishing market, but these materials are scarcely used in academic circles outside the law schools. They thus constitute a theoretical production intended "for consumption by law students and jurists," not engaging in intellectual debates with other university departments. This phenomenon is evidently linked in part to the framework of Brazilian theory of law, still predominantly carried out by lawyers or legal professionals who hold a professorship on the side, usually showing little concern for academic research proper.

A turning point in this timeline was the founding of the University of São Paulo (USP) and its School of Philosophy in 1934. This event provided a bold model that would deeply shape the university in Brazil. The USP has since been the most influential and reputable institution of higher education in Brazil. Although it was not the first Brazilian university, it was born out of the reform designed by Francisco Campos (Minister of Education and Public Health under Getulio Vargas). This reform was concerned with creating "an administrative and educational unit aimed at technically equipping the Brazilian professional elites and making for an environment conducive to speculative and disinterested vocations—an environment essential to the formation of a national culture and devoted to research and pure science" (Schwartzman 1979, 172; my translation). The USP preceded most other universities in embracing this new phase of modernization.

For the foundation of the USP, and in particular for the formation of the School of Philosophy, Sciences, and Literature, many foreign professors were hired representing almost all areas of knowledge. In the humanities, the first full professors included the sociologist Roger Bastide (1898–1974), the political scientist Paul Arbousse-Bastide (1899–1985), the anthropologist Claude Lévi-Strauss (1908–2009), the geographer Pierre Monbeig (1908–1987), the philosopher and psychologist Jean Maugüé (1904–1985), and the historian Fernand Braudel (1902–1985), all of whom came from France at a young age

as recent graduates invited by the mathematician Theodoro Ramos (1895–1936), sent to Europe to seek out a teaching and research cadre. This group of intellectuals thus began to teach at the new university: For them we have chosen the term *Missão Francesa* (French mission), for on the one hand they all came from France, and on the other the word *mission* can designate a group of people entrusted with advancing some vision, usually in another place or country. And at the same time the term also carried the connotation that, as Novais (1994, 161), has observed, "we were seen as a land of indigenous people to be indoctrinated" (my translation).

Brazilian philosophical production had just begun and so was not much developed, and in this context the French mission represented a foundational moment, introducing Brazil to a unique way of philosophizing—more scholarly, methodologically strict, and distant from the *lawyerly* style of the past. The concern with a close and structural reading of classical texts was such that the curriculum was gradually veering toward the *history* of philosophy and away from philosophy itself. This became glaringly conspicuous with the arrival of the first professors of history of philosophy, such as Gilles Gaston Granger (1920–), and with the strong influence of the structuralism of Martial Guéroult (1891–1976) and Victor Goldschmidt (1914–1981). From 1960 to 1990, the French professors Gérard Lebrun (1930–1999), Michel Debrun (1921–1997), and Francis Wolff (1950–) would also be very influential (cf. Arantes 1994). A few years earlier, in 1936, Émile Bréhier (1876–1952) had also been hired to teach philosophy at the University of the Federal District of Rio de Janeiro, and he too left a lasting mark on future generations.

The French mission brought a new academic style and a rigorous method to the study of philosophy. This new intellectual moment in philosophy in Brazil immediately gave rise to a sort of rivalry (especially in São Paulo) with the philosophy done by jurists, hitherto prevalent in major Brazilian cities like São Paulo itself, as well as Rio de Janeiro and Recife. The differences in method, approach, and aims was such that the two models of philosophical investigation in Brazil would each go their separate ways, with hardly any contact. This insularity of legal philosophy at the law schools would not dissipate until the end of the 20th century. And only recently have academic philosophers become interested in contemporary philosophy of law and jurisprudence.

27.4.2. The Main Reference Points

The professor of philosophy assigned to initiate the philosophical civilizing mission was Jean Maugüé, who taught from 1935 to 1944. He was later succeeded by his first assistant, João Cruz Costa (1904–1978), who along with Lívio Teixeira (1902–1975) would ensure that the previously instituted radical reform project would continue (Arantes 1994, 1988). The French mission also included the aesthetics professor Gilda de Mello e Souza (1919–2005)

and the second generation of university graduates, a group of Brazilian philosophers who deeply influenced future generations: In this group were José Arthur Giannotti (1930–), Bento Prado, Jr. (1937–2007), Oswaldo Porchat (1933–), and Ruy Fausto (1935–). Contemporary with this first wave of technical philosophers were the French professors Michel Debrun (1921–1997) and Gérard Lebrun (1930–1999). This generation was succeeded by other major figures in Brazilian philosophy—such as Marilena Chauí (1941–), Rubens Rodrigues Torres (1942–), and Luis Roberto Salinas Fortes (1937–1987)—as well as in the philosophy of law, such as Tércio Sampaio Ferraz Jr. (1941–), who opened a small chapter of methodological dialogue between the jurists' philosophy and the technical philosophy taught in the USP School of Philosophy. This first generation did its methodological homework by incorporating the strict academic spirit handed down by the founders and by other missionaries who had been part of the department of philosophy, such as Gilles Gastón Granger (1920–) and Victor Goldschmidt (1914–1981).[5] These were responsible for encouraging the push to internationalize philosophical education, which essentially required an internship abroad, preferably in France.

The first results of this technical-philosophical education lay in a number of structuralist studies devoted to reading several thinkers who made up this generation's intellectual universe (this line of inquiry was taken up in a more or less orthodox manner and was always part of the curriculum, at least as a preliminary step in a study of the history of philosophy). The thinkers the new Brazilian philosophers studied on this close-reading philosophical method included Descartes (L. Teixeira 1990), Marx (Giannotti 2000 and Fausto 1997), Spinoza (Chauí 1999), Schopenhauer (Cacciola 2004), Rousseau (Prado Jr. 1976, Fortes 1976), Fichte (Torres Filho 1975), Aristotle (Pereira 2001), Mill (Giannotti 1953), Hume (Monteiro 2009), and Hegel (Arantes 2000), and later Husserl (Moura 2007), Frege (L. H. L. Santos 2008), and Kant (Terra 2003). Subsequent generations would continue in the same tradition, undertaking a structuralist study of a thinker according to Gueroult's "order of reasons" (i.e., according to the internal logic of the argument: see Guéroult 1953), at least as a starting point for philosophical interpretation. Noteworthy in this body of work was the lack of interest in the philosophy of law. An exception to this rule was Tércio Sampaio Ferraz, Jr., who earned his Ph.D. in Mainz, Germany, with a dissertation devoted to a structural reading of Emil Lask's thought (see his interview in Nobre and Rego 2000, 277).[6]

The model created at the USP shaped the development of philosophy in Brazil. So, as much as other states were home to highly accomplished philosophers and historians of philosophy—such as Henrique de Lima Vaz (1921–

[5] On this development, see Macedo Jr. 2008; V. Goldschmidt 1982, 130; and Moura 2001, 13.
[6] On Lask see Section 1.4 in this tome and Section 1.1.3.2 in Tome 2 of this volume.

2002), Raul Landim (1939–), and Guido Antônio de Almeida (1939–) in the state of Rio de Janeiro, and Gerd Bornheim (1929–2002), Ernildo Stein (1934–), and Balthazar Barbosa Filho (1947–2007) in the state of Rio Grande do Sul[7]—they were often looking at the USP School of Philosophy as a model. In that way the school's influence spread to other parts of Brazil. The dissemination of the new technical standard of philosophical or historico-philosophical production gained momentum with the creation of the Centre for Logic and Epistemology (CLE), based at the department of philosophy of the University of Campinas (UNICAMP).[8] The CLE was conceived and organized in 1976 and was officially introduced at UNICAMP in 1977 by Prof. Oswaldo Porchat Pereira (1933–). By organizing seminars on epistemology and several philosophical topics—including political philosophy, moral philosophy, metaphysics, the philosophy of language, and logic—this centre brought together philosophers from several Brazilian cities who had hitherto been scattered and without much interaction. In lieu of a classic congress, with keynote speakers and few participants, these seminars introduced an interactive and philosophical debate that has since become fairly established in Brazil (see Balthazar Barbosa's interview in Nobre and Rego 2000, 406). This experience consisted of an important moment of self-criticism addressing the exaggerations of the structuralist method, which in a way constrained the USP's initiatives in producing an independent philosophy (see Oswaldo Porchat Pereira's and Paulo Arantes's interviews in Nobre and Rego 2000, 119–44, 337–72). Even today, the centre plays an important and key role in Brazilian philosophy, although it has not produced relevant works in the philosophy of law.

Later on, in 1983, the Brazilian Association of Graduate Programmes in Philosophy (ANPOF) was founded, bringing together all master's and doctoral degrees in philosophy in Brazil: This new association—accredited by CAPES, an agency of the Ministry of Education responsible for higher education—has made it possible to organize national meetings, in such a way as to unify and standardize a philosophical style brought forward by the USP's School of Philosophy.

27.5. The Tradition of Legal Philosophers and the Brazilian Institute of Philosophy (IBF)—Miguel Reale: A New Chapter in the Philosophy of Jurists

As we turn now to legal philosophy specifically, we should first note that the tradition of the "jurists' philosophical thought" did not come to an end with the beginning of the 20th century. In fact, it remained alive and hegemonic un-

[7] The works of the authors just mentioned include Lima Vaz 1986, Landim 1998, Bornheim 2001, and Stein 2005.

[8] The CLE publishes three major philosophy journals: *Cadernos de História da Filosofia da Ciência*, *Revista Manuscrito*, and *Coleção CLE*.

til the 1930s, when it was essentially replaced by the philosophy taught at the universities. The key figure in this new tradition, the most influential philosopher of law in Brazil in the second half of the 20th century, is surely Miguel Reale (1910–2006). In this period, Reale became the most renowned Brazilian philosopher worldwide, and his works were translated into Italian and Spanish. A typical example of a cross-disciplinary man of letters, he synthesized various characteristics of the mode of thought he represents. He was a philosopher, a jurist, an educator, a lawyer, a journalist, a poet, a member of the Brazilian Academy of Letters, a politician, an ideologue, and a legislator (he drafted the Brazilian Civil Code of 2002).

In 1932, Miguel Reale started an early intellectual movement: With Plínio Salgado (1895–1975) he became one of the main ideologues and founders of *Ação Integralista Brasileira* (Brazilian *Integralismo*), a Brazilian version of fascist thought that reached its heyday in the 1930s. *Integralismo* also attracted other important intellectual philosophers, among whom Goffredo da Silva Telles Júnior (1915–2009), a jurist philosopher at the USP Law School (cf. Telles Jr. 2003, 2008); Roland Corbisier (1914–2005), a jurist and a philosopher (see Corbisier 1978); and Álvaro Vieira Pinto (1909–1987), a physician, physicist, and mathematician (see Pinto 1960). It is at this time that Reale produced some of his earliest works, permeated by an authoritarian and critical attitude to liberalism. Over the years, his political engagement moved away from fascist thought, but it did remain authoritarian and conservative in outlook. In 1969, President Artur da Costa e Silva appointed him to the so-called High Level Commission, entrusted with revising the 1967 Constitution. This work led to the wording of the First Amendment to the Constitution: The amendment was enacted on October 17, 1969, and the revised constitution of which it was part consolidated the military regime in Brazil by restricting many civil and political rights. It was de facto a new constitution written by the military regime.

There is a whole collection of educational and disseminative works that gave Reale fame (and are still in circulation),[9] but apart from that he can be seen as a "freethinker" in the philosophy of law by comparison with authors who valued the rigor of a more "technical," more academic philosophy, and his more open approach has had an undeniable influence on Brazilian legal and philosophical thinking and style. According to Reale's culturalist approach (often called *Culturalismo*), law is not a natural fact, but a *cultural product* essentially marked by its connection to social values. Accordingly, the science of law should not follow the method of the natural sciences but that of the social sciences. His "three-dimensional" theory of law, combining the influences of Radbruch's neo-Kantianism with Husserl notions of *Lebenswelt* and

[9] For example, Reale 1953, 1968a, 1973, some of them translated into Spanish, French and Italian.

intentionality, attempts to overcome the unilateral character of legal positivism (broadly construed) that prevails in the Brazilian academies of law, treating law as a phenomenon that has three dimensions: a factual one, an evaluative one, and a normative one. For him, sociologism (such as Leon Duguit's), normativism (such as Kelsen's), and natural-law theory (such as Jean Maritain's) offer a one-sided view of law.[10] Reale's three-dimensional theory is based on an eclectic merging of these three main sources of modern jurisprudence and sought to overcome them by arguing that facts, values, and norms should be viewed in a dialectical and dynamic way, according to what he called the "dialectics of complementarity" (see Reale 1977, 120; my translation). For Reale (ibid.) values are historical products. However, once created and culturally accepted, they become "axiological invariables" and affect the law of a community. Positive law is for him a fact that should be analyzed from the standpoint of its three dimensions. Thus values become historically concrete in facts, and intersubjective relationships become normatively regulated. Key to that effort is the not-always-clear concept of dialectics, which Reale explains as follows:

> The term *three-dimensional* can be rigorously understood only if taken as though it were translating a dialectical process in which the normative element becomes whole in itself and supersedes the factual-axiological correlation; the norm thus gains an ability to convert into fact at a subsequent moment in the process, but it can do so only with reference to, and as a function of, a new normative integration determined by new axiological demands and new factual circumstances. (Reale 1968b, 77; my translation)

For many years in Brazil, this conception of law informed the courses introducing students to the study of law. Only very recently has it lost its central role in the academic study of legal philosophy. His philosophical syncretism often makes it hard for interpreters to understand his ideas clearly. As Tércio Sampaio Ferraz, Jr., diplomatically argues, the production and courses offered by Reale were profoundly different from those prevailing at the USP School of Philosophy.

> One time I said to Celso [Lafer] that the seminars organized by Professor Miguel Reale had nothing to do with the study of philosophy, and he replied that I was being biased. In fact, the study I was used to at the School of Philosophy was the kind shaped from the point of view of the French structuralists: It was about studying the history of philosophy, studying philosophical systems as strictly as possible, while Miguel Reale's style was completely open-ended. The course he was offering at that time, for example, was on Vico, but there was no concern with rigor in the interpretation of his philosophical system: What really mattered was thinking about the issues raised by Vico. At first, I found it eccentric, but little by little, I realized that he was simply doing something different—and why not? (Nobre and Rego 2000, 274; my translation)

[10] On Duguit see Section 12.3 in this tome. On Maritain see Section 3.2 in Tome 2 of this volume.

Reale's undeniable intellectual brilliance made him the ideal example of a rhetorical philosopher, heir of the old lawyerly style, a high representative of the spirit that at the USP School of Philosophy was pejoratively described as "philosophizing" (*filosofante*). The political, ideological, and methodological contrast marked a distance between different "styles" of doing philosophy, and prompted Reale himself to offer a critical reply, which he so expressed after introducing one of the philosophy congresses he promoted:

> Certain people who adhered to a different line of thought pursued elsewhere were against this initiative, this to the extent that, in their express view, the history of philosophy in Brazil has been nothing other than a sequence of influences received, and its mentors arrogantly denied us the title of philosophers, calling us "philosophizers." (Reale 2002, 02; my translation)

In 1949, Reale founded the *Instituto Brasileiro de Filosofia*, or IBF (Brazilian Institute of Philosophy), which was very influential among Brazilian intellectuals and served as an institutional alternative to the USP School of Philosophy. As Reale put it:

> In 1949, with the support of some thinkers affiliated with the government or with private universities, I found it critically important to create an entity that would enable our promoters of philosophy to interact in a broad national dialogue. This was the origin of the Brazilian Institute of Philosophy, with the creation of the *Brazilian Journal of Philosophy* (*Revista Brasileira de Filosofia*, or RBF), its essential organ of communication, without preference for any doctrine, and open to collaboration with all stakeholders, whether or not they belonged to the university. Last year [2001], that quarterly journal celebrated half a century of existence, with the publication of 206 issues to date, each of about 120 pages. (Reale 2002, 02; my translation)

The IBF organized some national congresses of philosophy,[11] and it brought together intellectuals from various philosophical and ideological backgrounds, especially those working in different "philosophical styles." In a historical account, Reale notes that the

> IBF gathered thinkers of all doctrinal stripes, from Djacir Menezes (1907–1996), with his Hegelian dialectic; to Blondel, with his "intuitionism of action"; to João de Scantimburgo (1915–). As founder of the IBF, I could work with the wonderful team comprising Luis Washington Vita (1921–1968), Vicente Ferreira da Silva (1916–1963), Renato Cirell Czerna (1922–2005), Heraldo Barbuy (1913–1979), Vilém Flusser (1920–1991), Milton Vargas (1914–2011), Teófilo Siqueira Cavalcanti, Roque Spencer Maciel de Barros (1927–1999), Adolpho Crippa (1929–2000), and Lourival Vilanova (1915–). The team was later strengthened by Antonio Paim (1927–2011).[12] Vicente is indisputably the greatest existential metaphysician in the Portuguese language. Luis Washington was the great architect behind the effort to unify Brazilian and Portuguese thinkers, an effort that later culminated in the foundation of the Institute of Portuguese-Brazilian philosophy. (Reale 2005, 01; my translation)

[11] Reale had a direct role in organizing seven Brazilian philosophy congresses (from 1950 to 2002) and the Eighth Inter-American Congress of Philosophy (held on Brasília in 1972).

[12] The main works the scholars in this group wrote on the philosophy of law are Menezes 1980, Vita 1950, and Czerna 1999.

The IBF and the *Brazilian Journal of Philosophy* (RBF) thrived, especially through the 1980s, by bringing together thinkers from diverse backgrounds, especially those disconnected from the tradition inaugurated with the foundation of the USP School of Philosophy. Along with the IBF, the *Instituto Superior de Estudos Brasileiros*, or ISEB (Higher Institute of Brazilian Studies) also played a unifying role in Brazilian social thought. The ISEB was created in 1955 by an eclectic group of nationalist intellectuals affiliated with the Ministry of Education and Culture: It was given administrative autonomy and freedom of research and opinion, and it had its own chair, and its activity revolved around the study, teaching, and dissemination of the social sciences. It worked as a centre of ideas and its main purpose was to discuss theories of development, in principle with the function of validating the action of the state under the administration of Juscelino Kubitschek, president of Brazil from 1956 to 1961.[13] Although many of the thinkers associated with the ISEB came from the USP, some tension remained on the question of methodology, with accusations from the USP that the work done at the ISEB lacked a strict philosophical theoretical framework. The philosophers in the ISEB group were Miguel Reale, Álvaro Vieira Pinto (1909–1987), and Roland Corbisier (1914–2005), a graduate of the São Paulo University School of Law and of the São Bento School of Philosophy. These philosophers distanced themselves from the USP's philosophy and even scorned it, thus working in a direction similar to that of IBF: one of detachment.

Indeed, the dialogue among intellectuals at the IBF and the USP School of Philosophy, Sciences, and Literature has always been scant. On the relationship between these two institutions, Jose Arthur Giannotti (1930–), one of the main voices at school of philosophy, would later comment as follows:

> Although the opposition between the right wing and the left was very polarized, there was much conviviality (perhaps because the participants were all members of the ruling class) among younger groups; grievances had not yet solidified. Owing to our French roots, we developed the tactic of not directly engaging in discussions involving Brazilian matters: We would be different, would do another kind of philosophy, and this other kind would spread like wildfire. Therefore, we simply began to publicly ignore what they did—not so much out of contempt but because of this difference in style, precisely to test and consolidate our way of being. On occasion we would "take a swipe at each other," but that did not produce major consequences on either side. (Nobre and Rego 2000, 99–100; my translation)

Hence, educated or professional philosophers had no interest in the philosophical work of their "philosophizing" colleagues, as the legal philosophers who gathered around the Brazilian Institute of Philosophy (IBF) were contemptuously called. From the point of view of those philosophers graduating

[13] Kubitschek is usually viewed as the father of modern Brazil because he favored long-term planning and set high goals for Brazil's development. He started the construction of a new modernist capital, Brasília.

at the USP School of Philosophy, legal philosophers seemed to be the outcome of the intellectual underdevelopment of a culturally unemancipated country, a victim of pedantic superficiality and of an ideological and methodological syncretism capable of merging elements from conflicting schools of thought without feeling compelled to provide readers with explanations. Legal philosophers linked to the ISEB and the IBF, on the other hand, criticized the philosophers at the USP School of Philosophy for their "alienation" from national problems as well as for their scarce interest in law and its specific problems, often seen as having no philosophical interest or as a mere expression of legal "ideology." They were accused of being excessively driven by a very specific philosophical interpretation of history of philosophy. Some of them later did admit to this excessively technical approach, that is, to a deep concern with accuracy and the methods of philosophical interpretation. Thus, for example, Paulo Arantes (1942–) even stated that "we were technicians, rather than 'philosophers,'" ironically emphasizing the intellectual obsessions of those in his own camp (Arantes 1994, 141; my translation).

This mutual ignorance and indifference, this purposeful lack of dialogue, was further strengthened from the 1960s on. This development was precipitated by a decisive historical event that would call on intellectuals to ideologically position themselves, thus magnifying the differences that were already separating them: the seizure of power by the militaries in 1964.

27.6. The 1960s: Increasingly Divergent Paths

The military regime in Brazil began with a coup d'état carried out by the armed forces on March 31, 1964, and lasted until 1985. In October of 1964, the government passed the so-called Suplicy Act, extinguishing the Brazilian Student Union (UNE) and banning any state-level student associations. The idea that dictatorship sought to convey was the need to defend democracy against its worst enemies, the communists. Some leftist groups responded by armed struggle, and that led to a hardening and expansion of political repression, leaving deep scars in academia and Brazilian intellectuals. Persecution, imprisonment, exile, and compulsory retirement affected the lives of many who engaged in philosophy, and it put the question of democracy at the core of the militancy of many intellectuals who were against the dictatorship.

In São Paulo, leftist thought penetrated the USP School of Philosophy, Sciences, and Literature, while the more conservative line, allied with the military regime, made its home the School of Law of the Mackenzie Presbyterian University. Ideological and political tensions grew more bitter. The Mackenzie, USP, and PUC (*Pontifícia Universidade Católica*) Schools of Law, the three most important in São Paulo at the time, supplied a number of intellectuals who supported and championed the military dictatorship, including some professors of philosophy of law, such as Miguel Reale and Alfredo Buzaid.

In other Brazilian states, an association was also forged between law and the right wing and between the left wing and academic philosophy. In these states the law schools were the privileged locus for the production of conservative thought.

The new political moment aggravated the rift the French mission engendered between "jurist philosophers" and "academic philosophers." The political (and philosophical) thought of the right wing and the left found their natural loci in the schools of law and philosophy, respectively. In São Paulo, this antagonism was exemplary, considering how the most prominent representative of the "jurist philosophers," Miguel Reale, openly supported the military regime. Similar alliances were formed in the other Brazilian states, too, though the bias in these cases was not as strong.

As can be surmised, the divergence between the schools of philosophy and of law was ideological, not based on philosophical arguments, and the military regime only exacerbated that situation. The obvious tension between institutional and ideological positions further nurtured the existing methodological disconnect. But this disconnect was not confined to method, considering how the schools of philosophy felt the strong influence of philosophical currents—like Marxism and phenomenology in the French versions developed by Sartre and Merleau Ponty—that did not have as much sway in the schools of law, which instead were dominated by an eclectic culturalism that drew inspiration from various sources such as Husserl, Stammler, and Emil Lask and the Baden school.[14]

In this landscape, rendered in broad strokes, there emerged some works strongly influenced by a reading of the main works of pre-Hartian legal positivism, especially the conceptions put forward by Hans Kelsen and Norberto Bobbio, and to a lesser degree the Scandinavian realism of Alf Ross, but also the conceptions advanced in dealing with the issues in legal logic.[15] Two scholars who had a role in this development were Tarcisio Burity (1938–2003; see Burity 1988) and Lourival Vilanova (1915–2001; see Vilanova 1997). Especially worthy of comment in this context is the latter's work, since it represents the first systematic effort to build an analytically inspired theory of norms in the Kelsenian fashion. Although these readings of Kelsen may be open to question, they left a deep mark on the theoretical work done in specific areas like administrative law and tax law. In recent years, the latter has surprisingly flourished as a focus of publication in legal theory.[16]

[14] On Stammler, see Section 1.3 in this tome and Section 2.2 in Tome 2 of this volume. On Lask see Section 1.4 in this tome and Section 1.1.3.2 in Tome 2 of this volume.

[15] On Kelsen see Section 2.3 in this tome and Section 8.3 and 8.4 in Tome 2 of this volume. On Bobbio, see also Section 11.4 in this tome and Section 9.3.1 in Tome 2 of this volume. On Ross see Chapter 16 in Tome 2 of this volume.

[16] Examples can be found in the work of Paulo de Barros Carvalho (1938–), Celso Antonio Bandeira de Mello (1934–), and Geraldo Ataliba (1936–1995). See also Sundfeld 2005.

The new political environment has not helped schools of philosophy and of law to produce work based on any mutual engagement. Indeed, if anything, the situation is one of mutual *disinterest*: The philosophers have not been concerned with the investigations carried out at the law school—or with law itself, except in its classic treatment, as in the works of Hegel and Kant—and the jurists likewise ignored what was being produced at the schools of philosophy.

Despite significant differences, both movements were adversely affected by the lack of their own national production, that is, by the absence of a Brazilian philosophy, whether general or legal.[17] Throughout the 20th century, national philosophical production was popularizing and disseminative in nature.[18] The same goes for the philosophy of law, whose fate was no different.

27.7. The Beginning of a Difficult Dialogue and a Venture: Some Overview of the Present Moment

There is a certain point in our outline of 20th-century philosophy of law in Brazil when an interesting fact took place that brought about a change of direction: A large number of European and North American philosophers revived the interest in law. Significant in this regard is Jürgen Habermas's account of the reevaluation of law:

> In Germany the philosophy of law has long ceased to be a matter just for philosophers [...]. Indeed, it is no accident that legal philosophy, in search of contact with social reality, has immigrated into law schools. [...] What could once be coherently embraced in the concepts of Hegelian philosophy now demands a pluralistic approach that combines the perspectives of moral theory, social theory, legal theory, and the sociology and history of law. (Habermas 1996a, X)[19]

The expansion of the importance of modern constitutionalism, and in particular the moral readings of law, has prompted philosophers and jurists to find a renewed interest in common themes. In a sense, the new constitutionalism and the emergent question of the role of principles in the interpretation of constitutional law has been a gateway to a discussion of philosophical issues in the law schools.

On the other hand, the reevaluation of the agenda for discussion in political philosophy (theories of justice) and moral philosophy steered the interest of academic philosophy toward legal issues, opening new horizons for a more

[17] This seems to be a general diagnosis made by a considerable portion of the Brazilian philosophical community. See Nobre and Rego 2000, and especially the reports by Paulo Arantes and Bento Prado.

[18] Bento Prado, Jr., accordingly commented thus: "Here, we also do Marxism, phenomenology, existentialism, positivism, and so on. But what we usually do is dissemination. These works neither coherently follow a tradition nor do they develop their own system: Their cohesion always comes from the outside" (Prado Jr. 1985, 176; my translation).

[19] On Habermas see Sections 10.3.5 and 10.4.3.2 in this tome, and Sections 10.4 and 25.3 in Tome 2 of this volume.

fruitful dialogue between legal and academic philosophers. The remarkable influence of John Rawls's work on the agenda of contemporary political philosophy has also made an impact in Brazil, where the texts of major international philosophers, such as Amartya Sen, Ronald Dworkin, Jürgen Habermas, and Charles Taylor, have already been translated into Portuguese. Moreover, more than ever, certain problems and legal issues under discussion in our courts require both technical and philosophical expertise coupled with an awareness of technical legal problems.

On the other hand, the central themes in the philosophy of language have definitely been incorporated into the themes of moral philosophy and law, especially after the publication of H. L. A Hart's *Concept of Law* and the dominant debate in the philosophy of law in English-speaking countries and continental Europe. This development updated the legal philosophy done "before the linguistic turn," bringing new issues and challenges that now prevail in the schools of philosophy. As a case in point is the extent to which the conceptions expounded by Hart, Neil MacCormick, and Robert Alexy are linked to the core of the contemporary philosophical debate that revolves around the philosophy of language and around the work of authors such as Habermas, Wittgenstein, Heidegger, Gadamer, Searle, Williams, and Rawls. This fact—coupled with the undeniable process toward globalization in legal and philosophical production, and with expanded technological access to discussion on the issues at stake in the countries that lead the way in the production of philosophical knowledge—has made it possible for the national debate to update its agenda so as to stay abreast of the international debate. Note, too, that because Brazil came relatively late to the process of translating works written in English (a process begun many years before in Latin American Spanish-speaking countries, especially Argentina, Colombia, and Mexico), the national debate could put into perspective the theoretical reference points it had traditionally looked to: the Italian production (especially Del Vecchio, Bobbio, and Romano), the French production (Duguit and Hauriou), and to a lesser extent, to the German production, save for the strong influence of criminal and civil law.[20]

What survives—especially when we consider the mass education that currently prevails in almost 1,200 law schools in Brazil—is a lawyerly and outdated form of disseminative philosophical vogues from Europe and the United States, a trend that differs little from the general and superficial practices of the past. However, aside from this large market for educational dissemination

[20] This influence can be traced to the 1960s, which brought a wave of German immigration that made for linguistic familiarity with the prevailing German culture of the time (Welzel and Wieacker). Today, Brazilian criminal law pays much attention to authors like Claus Roxin, Günther Jakobs, and Bernd Schünemman, whereas American criminological schools attract next to no attention. Even so, it is fair so say that English-language legal and philosophical thought is now generally becoming increasingly influential in Brazil.

and simplification, a common agenda is gradually emerging among those jurists who are more concerned with the standards of academic rigor set by the university. This has opened some new avenues for debate, with the promotion of publications, congresses, and authentic discussion in an effort to bridge the historical divide that has traditionally been wedged between the jurists' philosophy and the philosophy practiced at the universities.

Some signs of this change can be noticed in the vivid market for the translation of works of legal philosophy, as well as in the vast production of dissertations on legal philosophy at the schools of law, political science, and philosophy, with an incipient process of institutional dialogue. Little by little, law libraries are replacing books on legal philosophy based on a "philosophical production of jurists for jurists," bringing in works written by philosophers as well as by jurists. Several works have directly been translated into Portuguese, introducing modern classics hitherto unknown, or which have made their way in through translations into Spanish. These changes have popularized books of legal philosophy exhibiting better technical and academic quality and have played a role in renewing the current model of legal education, still clinging to the lawyerly traditions dating back to the beginning of the 20th century.

It should be noted that the Brazilian Association for Graduate Programmes in Philosophy (ANPOF) has recently created thematic groups on theories of justice, philosophy, law, ethics, and political philosophy, bringing together researchers in law and philosophy. This convergence is also beginning to be reflected in some publications. Also from an institutional point of view, it should be noted that the philosophy of law in Brazil is gradually coming out of a state of complete seclusion by comparison to other Latin American countries. With rare exceptions, the most evident one being Miguel Reale, few Latin American authors are read in Brazil, and few Brazilians exert influence in other countries. The academic exchange between Brazil and Latin America is still embryonic and lacks prestige.

The perspective afforded by the present always limits our ability to identify and properly evaluate changes in Brazilian legal philosophy. In the short term, it is not easy to pinpoint the effects that flow from the interweaving of agendas, with the philosophers' philosophy crossing over into the jurists' philosophy, and vice versa. As much as the interchange between Brazilian jurists and European and North American universities has grown stronger, renewing the methodological paradigms of theoretical research on law, there have been few institutionalized channels for dialogue and collaboration between schools of law and philosophy departments in Brazil. The syllabuses are usually isolated from one another, the methodological division is still very strong, and there is even professional dispersion, since very few professors of legal philosophy are entirely devoted to academic work.

This is a circumstance that has weighed heavily in bringing about the superficial kind of educational literature that can be found on bookshelves in

Brazil. This large amount of "textbook-like" or introductory works on the philosophy of law has grown at a startling rate thanks to an important sociological factor, namely, a booming number of law schools in Brazil in recent years: Brazil has gone from 165 schools in 1991 to over 1,200 in 2012. Every year, around 120,000 new law graduates graduate from colleges and universities. The opportunities offered by the publishing market and the small academic community guided by a stricter philosophical style has promoted the survival of the old lawyerly style and its more contemporary forms, both marked by doxographic compilations, linear summaries of ideas, and a "superficial" reading of essential authors. Clearly, the new vogues are different from those of the past, but the mode of appropriation remains at bottom the same.

Among the philosophical trends in this syncretically divided philosophical and sociological-legal world, there is room for a methodologically eclectic production bearing the influence of the French structuralism of Foucault, Derrida, Deleuze; the Frankfurt School (Adorno, Horkheimer, Marcuse); Habermas; systems theory (Luhmann and Teubner); and Marxism. Moreover, even though Critical Legal Studies has had only a limited influence in Brazil, it is worth commenting the conception developed by Roberto Mangabeira Unger (1947–), who was a Brazilian citizen with a degree from the Federal University of Rio de Janeiro, but who pursued an academic career at the Harvard Law School, where he has been teaching for four decades. There, along with Duncan Kennedy, Mark Tushnet, and Morton Horwitz, he has been among the main proponents of Critical Legal Studies, a movement that characterized North American legal thought, mainly in the 1970s and 1980s. Unger has written many books on social theory, legal thought, economic thought, political alternatives, and philosophy, developing the ideals of a radical democratic society open to constant institutional experimentalism.[21] One of his main theoretical concerns is how to plan a transformative politics consistent with new alternative arrangements for economic development. His work in legal theory has focused on criticizing the hegemonic methodological consensus in contemporary thought. Interestingly enough, Mangabeira Unger is a legal thinker who falls outside the Brazilian academic circles. Although he may be the most quoted Brazilian legal theorist (in part because he writes in English), his theoretical influence is greater abroad than in Brazil.

In the context of the 1970s, we should draw attention to the presence and influence of Luis Alberto Warat (1941–2010), an Argentinean jurist based in Brazil and one of the founders of the program in postgraduate studies in law at the Law School of the Federal University of Santa Catarina, where he also teaches. His presence (and in particular his work on law and language, legal education, and legal epistemology), along with a new generation of jurists dedicated to legal theory, turned this program into a new national reference point,

[21] His works include Unger 1976, 1986, 1996, and 1998.

especially for Critical Legal Studies and the *Uso Alternativo do Direito* (Alternative Use of Law). The latter has been more closely linked to legal practice than to formal legal education.

Although we may fall outside the scope of this discussion if we go into legal sociology in Brazil in the 20th century, it is interesting to note that a phenomenon probably similar to the one described with regard to philosophy has made it possible for sociologists, jurists, and sociologists of law to conduct research that crosses disciplinary boundaries. Several protagonists of this movement in Brazil, including José Eduardo Faria (1949–), Joaquim Arruda Falcão (1943–), José Reinaldo de Lima Lopes (1952–), Celso Campilongo (1957–), and Cláudio Souto (1931–), are also intellectuals responsible for teaching and publishing works in the philosophy of law.[22] The study groups include the Law and Society Working Group, affiliated with the *Associação Nacional de Pós-graduação em Ciências Sociais*, or ANPOCS (Brazilian Association for Graduate Studies and Research on the Social Sciences), which up to 1989 held annual meetings with other study groups, professors, and researchers concerned with the critical study of the relationship between law, sociology, politics, and philosophy; the *Instituto de Direito Alternativo* (Alternative Law Institute), which has organized several lectures and conferences, disseminating alternative practices in law; the *Grupo de Magistrados Gaúchos* (Group of Justices from the State of Rio Grande do Sul), a centre set up to discuss alternative law; and the Association of Judges for Democracy, which seeks to increase the judges' awareness of the role they can play in protecting human rights and helping to empower the less affluent social groups.

It is also worth noting that the political struggle against the dictatorship has sparked a heated debate and stimulated the production of Brazilian social and theoretical thought on the topic of legitimacy and democracy. The efforts of intellectuals in the social sciences, history, philosophy, and law thus produced important theoretical works on the Brazilian reality and had repercussions on the national jurisprudential agenda.[23] This is also one of the reasons why the works of Norberto Bobbio, as well as of Antonio Gramsci, would become very popular in Brazil. The other reason lies in the strong influence exerted by Kelsenian positivism, which Bobbio helped disseminate.

Also as part of research in law schools, new institutions emerged reflecting the increasing complexity and diversity of Brazilian legal and philosophical thinking. Examples are the *Associação Brasileira de Filosofia e Sociologia do Direito* or ABRAFI (Brazilian Association for the Philosophy and Sociology of Law), founded in 2001; the Jacques Maritain Institute of Rio Grande do Sul, dedicated to the dissemination of Catholic concepts, and inspired by

[22] Their works include Faria 2010, Faria and Campilongo 1991, Falcão and Souto 1980, Campilongo 2001, and Souto 1997.

[23] Among these works are Cardoso 1975, Weffort 1984, and Coutinho 1984.

the works of the thinker for whom it is named (Jacques Maritain), as well as those of John Finnis; and the reborn Brazilian Institute of Philosophy, headed by Tércio Sampaio Ferraz, Jr., and Celso Lafer. Likewise, the *Instituto Brasileiro de História do Direito*, or IBHD (Brazilian Institute for the History of Law), founded in 2002, has been organizing and promoting courses, conferences, seminars, publications, and research projects to foster discussion on the history of law and related fields. The Research Group on Law and Democracy—created by the *Centro Brasileiro de Análise e Planejamento*, or CEBRAP (Brazilian Centre for Analysis and Planning), a very prestigious research centre founded in 1969 by Fernando Henrique Cardoso (a sociologist and a former Brazilian president) and other influential Brazilian social theorists—has been bringing together scholars from the schools of law and philosophy who are interested in the theory of law, enabling them to converge on a line of research inspired by Habermas's theory of democracy and law.

Finally, it should be noted that alongside these institutional efforts, some works and individual teaching initiatives in the philosophy of law have contributed to expanding Brazilian legal philosophical production and giving it greater sophistication. Some works of applied theory of law also represent the result of advancing discussions of legal philosophy in Brazil, especially in constitutional theory and in particular in the interpretation of law.[24] Many of these authors are influenced by the work of Robert Alexy, Ronald Dworkin, and Joseph Raz, among others.[25] Several authors are engaged in these efforts, and although it may be too early for an assessment, the trend can be observed in several Brazilian states, marking a change from the past, when a select group of developed states virtually monopolized the production and dissemination of legal philosophy. Even so, production is still very uneven in terms of quality and methodological commitment.

It is reasonable, as well as desirable, that these individual efforts should usher in a new stage in the production of legal philosophy in Brazil, institutionalizing it, professionalizing it, making it more technical and less amateurish or dilettantish, directing its discussions toward Brazilian legal themes. As of this writing, however, this scenario is more an optimistic prospect than a consolidated reality. Globalization has posed challenges to the old ambitions of producing a genuinely home-grown philosophy. Perhaps for this reason, the old ambition of some Brazilian legal experts—that a distinctly Brazilian *philosophy of law* may flourish—should be replaced by an ambition to establish a philosophical and legal theory directly engaged and interested in the Brazilian *legal reality*.

[24] These works include L. da Silva 2005, Ávila 2003, Vieira 1999, Dimoulis 2006, Bonavides 1998, and Macedo Jr. and Barbieri 2011.

[25] On Alexy, see Sections 10.3.2.2 and 10.4.3.1 in this tome, and Sections 1.5.4.1, 10.3, and 25.4 in Tome 2 of this volume.

Chapter 28

20TH-CENTURY LEGAL PHILOSOPHY IN OTHER COUNTRIES OF LATIN AMERICA

by Rodolfo Vázquez[*]

The historical and cultural and political Latin American context in which we can speak of a "standardization" of philosophy in general and philosophy of law in particular—borrowing an expression used by the philosopher Francisco Romero—has been none other than that of modernity. What modernity are we talking about? In an effort to summarize this situation, Octavio Paz once said:

> [Latin America] was born as a projection of the universal vision of the Hispanic monarchy; it harboured a plurality of nations that rested on one philosophy: Neo-Thomism. That political construction and the philosophy that justified it have dissipated over the course of history, but the foundation, the basis—the language, culture, and basic beliefs—resisted the changes. After that, we conceived another, no less universal project: a republican and democratic modernity. The realization of this project demanded a radical critique of our past and of our culture. After many vicissitudes we have entered the modern world. We are living a transitional period, and I ignore what the outcome of this great process of change will be. In any case, I can say that our fate will be that of modernity [...] and modernity is in crisis. (Paz 2010, 209–10; my translation)

Paz wrote these words in 1991. During this decade—especially after the terrible military dictatorships and the so-called "lost decade" of the 1980s—great expectations regarding Latin America were prevalent concerning what could be an effective instrumentation for an international system of justice and the long-awaited consolidation of a democratic political system. In a way, it was a decade of transition, full of uncertainties, towards modernity. After all, the weight of the past was not something that could simply be obviated through good intentions. It is because of this that it is now a commonplace to say that Latin America has been laggard compared to the three modern technological-scientific revolutions, for (1) it taught within the counter-reform dogmatism without having known the reform itself; (2) it imported a liberal and illustrated conception of the state without a bourgeoisie that could implement it; and (3) it incorporated the discourse on globalization ignoring the profound ancestral inequalities of its classes. The "Caesarism," the clientelism, and the generalized anomie would continue to be the distinctive characteristics of our collective Latin American mentality. As Marcos Kaplan comments:

[*] I would like to thank René González de la Vega and Mariana Cortina for the English version of this paper.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_28

> Norms are perceived as invalid or inefficient, the legal as illegitimate, the illegal as reasonable and necessary. The politics of sacrifice, of effort, of work give way to a form of ethics that is based on speculation, the hope of a quick gain, the short-term replenishment of capital, a fictitious consumerism with regard to the actual state of the national economy. Delinquency is thus generated not only by socioeconomic structures but also by certain features of the collective mentality and of the predominant culture, historically created and developed, as well as by the interdependence of all these factors. (Kaplan 2002, 364; my translation)

The last democratization wave led many to believe that the time had come for Latin America to transition from a legislative state to a constitutional state, as had already happened in Europe many years before. Since the decade of the 1990, Latin America witnessed, and Mexico was no exception, a repositioning of the constitutional democracy. As the Chilean constitutionalist Javier Couso (2010, 38) explained, the consensus surrounding democratic constitutionalism was built as much from the right wing as from the left wing. Among the left, the dictatorial wave of the preceding years—translated in terms of torture, disappearances, extrajudicial executions, and other human-rights violations—led to a reappreciation of constitutional institutions such as habeas corpus and due process. Likewise, the fall of socialism confronted the left wing with the need to promote fundamental human rights, and accept their entrenchment within the constitutions, this as a necessary element of any reasonable political regime. Among the right, the economic pragmatism led to the conviction that "without a solid rule of law to establish clear property rights, an independent judicial system, and a well-organized public force, the weaker countries will not achieve economic development." The more conservative sectors began to evaluate the contentions included in the constitutional designs. In this way, whether in a dogmatic fashion or an organic one, constitutional democracy appeared to be the only possible alternative for reaching the necessary governance consensus.

This constitutional wave, typical of representative democracies, began to take shape on the basis of several axes of analysis and social demands: (1) the construction of a rule-of-law model based on the recognition and effectiveness of the most ample spectrum of human rights, including civil and political rights as well as economic, social, cultural, and so-called third-generation rights; (2) the entrenchment of these rights within the supreme constitutional norm, reinforced by the instruments of an international system of human rights; (3) the organization and preparation of a progressive, independent, and impartial judiciary that can guarantee the legal adjudication of those rights, especially social ones, with deference, but not with subordination, to the organs of popular representation; (4) the construction of an inclusive democracy that could open the channels necessary to enable ethnic minorities, vulnerable groups, and the historically excluded majority to gain proper recognition; (5) the empowerment of those groups through the use of legally and judicially recognized procedural mechanisms, such as habeas corpus, tutelage, shelter

and collective actions; and (6) the goal towards which all of the foregoing demands and requisites are geared, namely, the building of a more homogenous and plural society, through the implementation of public policies upholding the principle of equality in order to protect differences and reduce economic and material disparities.

There are reasons to believe that the Latin American project of a constitutional democracy has scarcely fulfilled the promises it made. What has been witnessed from the late 1990s until now is what throughout the region has been called an "epidemic of specific powers." As Eugenio Zaffaroni (2004, 120) has rightly observed, everything indicates that instead of moving from a legalist rule of law towards a constitutional one, we are once again receding towards a "rule by decree" based solely on the state. Far from consolidating a culture of robust legality within the framework of a democratic and social rule of law, we are moving towards a culture of illegality, or, in Guillermo O'Donnell's terms, an *un(rule) of law*, where what prevails is a "low-intensity citizenship":

> What I mean by this is that everyone has, at least in principle, the political rights corresponding to a democratic regime, but that many are denied basic social rights, as is suggested by the extent of poverty and inequality [...]. These people are also denied basic civil rights: They are protected from neither local violence nor different forms of private violence; they are denied an easy and respectful access to government institutions or to the courts; their homes may be arbitrarily searched; and, in general, they are forced to lead a life not only of poverty but also of systematic humiliation and fear of violence [...]. These people, whom I will call the popular sector, are not merely materially dispossessed: They are also legally dispossessed. (O'Donnell 2003, 91; my translation)

The Chilean sociologist Jorge Larraín has expressed this situation through a powerful statement: We are living in a "syndrome of learned despair" (Larraín 2001, 90, my translation). This no longer only applies to the displaced but to an increasing number of people who have lost the illusion of a future and who find it impossible to carry on in a climate of uncontrollable insecurity. It would seem that a considerable portion of our population is living in a dynamic that the Brazilian legal philosopher Óscar Vilhena (2007) has depicted as an "extreme invisibility of the poor," a "demonizing of those who question the system," and an "immunity of the privileged" or of the powers that be. A trilogy that corresponds to another, no less dramatic one: the corruption, ineffectuality, and impunity of our leaders. It is for this reason that I think Ernesto Garzón Valdés is right to criticize a considerable number of Latin American scholars for living under a "veil of illusion" and for attempting to conceal our failures behind euphemisms—such as the one encapsulated by the expression "transitioning democracy"—that only justify the "delay" or the "departure from the proclaimed goal." Or rather, Garzón Valdés criticizes these scholars for living under the illusion of a "rule of law" when what is present is an abysmal distance between the formal rules and the rules that are actually being applied:

> To speak of the validity of the rule of law is, in most Latin American countries, to disfigure the judicial reality and mislead anyone who attempts to take an interest in the norms that regulate the behaviour of the governing and the governed within the broad areas of social life. For those who have a penchant for literary quotations, allow me to remind you of a phrase by one of Alejo Carpentier's characters: "As we say down there, 'Practice always screws up theory' and 'A leader with balls does not need papers to show leadership.'" (Garzón Valdés 2009, 205; my translation)

These signs, which are currently being manifested in a considerable number of countries in the region, certainly do not invite us to be more optimistic: The Fujimori precedent and the acts of corruption and nepotism perpetrated by the subsequent Peruvian governments; the authoritarian populism that can be observed in the governments of Nicaragua, Venezuela, Ecuador, Paraguay, and Bolivia; the abusive use of *decretos de necesidad y urgencia* (emergency decrees); the inefficiency and impunity of the Argentine governments from Menem until now; the widespread violence committed by organized crime and the repressive—yet not preventive—policies that have been enacted in Colombia and Mexico; the endemic poverty experienced in a good part of Central American and Caribbean countries; the humiliating socioeconomic inequality present throughout the region, and even more acute in emerging countries such as Chile and Brazil.[1]

It might be time, as Roberto Gargarella says, to thoroughly consider redesigning the institutional machinery, since the current one is now perceived as having been "exhausted." It is worth quoting *in extenso* a recent text he wrote in honour of the bicentennial of independence that is being celebrated in some Latin American countries:

> After more than two hundred years of modern constitutionalism, as understood by its most basic features—the adoption of a declaration of rights and of a system of "checks and balances"—it cannot be said that its endeavour has been successful, particularly in a vast majority of Latin American countries. This majority of countries continues to be affected by politically unstable and highly unequal economic systems; here, violations of human rights are a recurrent occurrence; the government's decision- and law making bodies tend to function independently of any sort of claim made by the citizens, while showing a propensity to mould norms in accordance with private interests; the courts appear to be organs without easy access, closed off from the public and with a tendency to decide in favour of the powerful, criminalizing those who protest; and public debate (both during election campaigns and, even more so, in the interim periods between elections) is made conspicuous by the poverty of its content. [...] It is my understanding that the severity of the institutional deficiencies at play is forcing us to abandon the idea that

[1] The *first Regional inform about human development for Latin America and the Caribbean* (2010), put out by the United Nations Development Programme (UNDP), has some troubling figures: 10 of out of the 15 countries in the world where inequality is greatest are found in Latin America and the Caribbean. According to the Gini regional coefficient of income distribution—the most widely used indicator—inequality is 65% higher than in high-income countries, 36% higher than in Far Eastern countries, and 18% higher than the average for sub-Saharan Africa. A special mention is reserved for Costa Rica and Uruguay, because they stand as islands amongst a sea of generalized indecency.

we just need to "perfect" and "polish" certain aspects of said scheme. [...] There is an urgency to rethink the causes of what most definitely is an institutional failure with already tragic consequences. (Gargarella 2010, 7–8; my translation)

It is remarkable that even within this bleak picture, some of the countries in the region have managed to develop since mid-century a philosophy of law. Above all, these philosophical developments in Latin America have had the merit of translating the great themes and debates of the most advanced countries; and even more remarkable is that the region has managed to incorporate these ideas into its specific demands and requirements. This has helped us to build an agenda of Latin American problems that have occupied the attention of our main legal philosophers. Included in this range of output is an adequate theory of norms and of legal systems based on classic models, the effort to fortify constitutionalism by forging what is known as neoconstitutionalism, the development of a modern theory of legal argumentation and its application in the courts, and a solid theory of justice in constant dialogue with other practical disciplines, such as politics and economics. As concerns the theory of justice, let us recall, for example, the debate on human rights and, especially, on social rights and their necessary legal adjudication; the reflections on the problems affecting a region characterized by its multiculturalism, and on the place of the indigenous populations within a globalizing environment; and the proposals for building a democratic and social rule of law in societies that are deeply polarized by poverty and inequality; as well as the research done in response to the increasing demand to forge good leaders, officials, and heads of state—with a focus on transparency, accountability, efficiency, and the eradication of impunity—while also addressing the urgent need to build a social and cohesive network of critical and active citizens. Also, these and many other problems have forced us to reconsider the way we teach our discipline in the classroom, highlighting the need to renew the current crop of scholars, researchers and academics. This is an insurmountable task that has been met with innumerable resistances; however, especially in light of the traditional conservatism that characterizes our law schools, it is undoubtedly something that needs to be done.

Attempting, as I have done here, to organize and summarize the developments of legal philosophy in Latin America—from the Rio Bravo all the way down to Patagonia, and in such a way as to accurately depict the variety and complexity of the authors and schools of thought, as well as each country's unique peculiarities—has not been an easy task. A self-imposed restriction for this account has been to leave out two countries: Argentina and Brazil.[2] The rationale for this exclusion lies in the unquestionable relevance of the Argentinean production of legal philosophy and the particular characteristics of Lu-

[2] On legal philosophy in Argentina and Brazil see respectively Chapters 26 and 27 in this tome.

so-American history and culture—which is more than reason enough to warrant a separate and special treatment.

A further restriction has to do with historical temporality. Although the two abidingly recurrent theories in modern legal philosophy, namely, natural law and legal positivism, can be traced back to the independence movements of the 19th century, it is not until the 1940s that we can possibly speak of a "standardization" of legal philosophy. To be sure, this is a notion that Romero applies to the "founders" of Latin American philosophy in general: Antonio Caso, José Vasconcelos, Carlos Vaz Ferreira, José Ingenieros, Alejandro Korn, Enrique Molina, Alejandro Deustúa, and Raimundo de Farías Brito. But the notion can be extended to our own discipline, the philosophy of *law*, for it, too, acquired a presence and a standardization it previously did not have, moving from "facile improvisation" to "methodical and rigorous" research conducted on the basis of direct information regarding the philosophical production of the European countries. Deserving mention among the most prominent legal philosophers of this period are Carlos Cossio, Luis Recaséns Siches, Juan Llambías de Acevedo, Eduardo García Máynez, Rafael Pizani, Miguel Reale, Ambrosio Gioja, Luis Eduardo Nieto Arteta, Jorge Millas, and Francisco Miró Quesada.

Not all the countries in the region have received an equal treatment in this discussion; this, in good measure, is due to two reasons: Either their contribution to our discipline has been limited, or they have devoted themselves to problems and debates which have been sufficiently developed in other latitudes, and by simple transfer at that, reiterating such other debates without the backing of an adequate critical apparatus. Ultimately, what is being offered is a representative collection that allows us to present a fairly objective account of the Latin American school of thought and scholarly production. The order in which each country is presented is strictly alphabetical.[3]

28.1. Colombia

The founding of the *Instituto de Filosofía y Letras de la Facultad de Derecho de la Universidad Nacional de Colombia*, in 1946, is considered the moment when the "standardization" of philosophy was set up in Colombia. Two works have decisively marked the beginning of modern legal-philosophical thinking: *Lógica, fenomenología y formalismo jurídico* (Logic, phenomenology, and legal formalism: Nieto Arteta 1942), by Luis Eduardo Nieto Arteta, considered the first philosopher to disseminate Kelsen's *Pure Theory of Law* in Colombia, and

[3] This contribution concisely incorporates and adapts to the discussion of the ideas and comments I have received in writing from Pablo Ruiz Tagle (Chile), Minor Salas (Costa Rica), Leonardo García Jaramillo (Colombia), David Sobrevilla (Peru), Óscar Sarlo (Uruguay), and Julia Barragán (Venezuela). I wish to thank them all for their invaluable insights.

El ambiente axiológico de la teoría pura del derecho (The axiological context of the pure theory of law: Carrillo 1947), by Rafael Carrillo. Both works have decisively contributed to breaking with the neo-Thomist philosophical line that had prevailed since the ideological project was presented in Núñez and Caro's regenerationist constitution. Other important figures who played a role in the Colombian standardization of legal philosophy were Cayetano Betancur—the founder, in 1951, of what is now considered to be the most important Colombian philosophical journal, *Ideas y Valores* (Ideas and Values)—as well as the jurist Jaime Vélez Sáenz, whose importance in the analytic branch is highly appreciated, and Abel Naranjo Villegas, who studied philosophy with Manuel García Morente and Francisco Romero.

The discussion between natural lawyers and legal positivists, as in the majority of Spanish-speaking countries, occupied a central place in the debates on the nature of law. Legal positivism, particularly in its Kelsenian version, exercised an influence that is still showing its consequences in the design of academic programs throughout the country. In the same way, natural law exercised a determining influence on the subjects and contents of legal-philosophical reflection. Because natural-law theory affirms at its core that certain principles of natural law—immutable and eternal—exist beyond human laws, the theory won favour when it came to articulating a conception of law based on the notion that those principles were the same ones as were defended by the Catholic faith. In Colombia, they had to wait until the promulgation of the secular liberal constitution in 1991, and in particular until the introduction of a court system that would guarantee the rights set forth in the constitution itself, before a decision-making process could get underway on previously censured topics such as abortion, euthanasia, the rights of same-sex couples, and the implementation of affirmative action policies.

With the exception of Alf Ross, North American legal realism has been studied far more than Scandinavian legal realism.[4] Other tendencies include Habermas's political-democratic proposal and his theory of practical discourse, which has become known throughout the country thanks to the work of Guillermo Hoyos Vázquez and his disciple Oscar Mejía Quintana.[5] This last author wrote the first book in Colombia to address the German thinker's legal philosophy. Since then, Mejía Quintana has done extensive research in political philosophy and on the criticism of constitutional jurisprudence, as can be appreciated in his books *Derecho, legitimidad y democracia deliberativa* (Law, legitimacy, and deliberative democracy: Mejía Quintana 1998) and *Teoría política, democracia radical y filosofía del derecho* (Political theory, radical democracy, and legal philosophy: Mejía Quintana 2005). Hoyos, for his part,

[4] On Scandinavian legal realism see Chapters 13 through 17 in Tome 2 of this volume.

[5] On Habermas see Sections 10.3.5 and 10.4.3.2 in this tome, and Sections 10.4 and 25.3 in Tome 2 of this volume.

published with Ángela Uribe the anthology *Convergencia entre ética y política* (The convergence between ethics and politics: Hoyos and Uribe 1998).

The change introduced with Dworkin's legal-interpretation paradigm, his egalitarian critiques of political liberalism, and his thesis about the general principles of law have been highly relevant in Colombian philosophical developments, especially since the enactment of the 1991 constitution. It is the decisive influence of Rodolfo Arango (1999) that explains how Dworkin's theories and their dogmatic developments came to be a part of university curricula. Arango's legal theses on the interpretation of law, as well as his politico-philosophical theses on the nonaggregative conceptions of democracy and on the idea of rights as trump cards, can respectively be appreciated in his books *¿Hay respuestas correctas en el derecho?* (Can there be right answers in law?: Arango 1999) and *Derechos humanos como límites a la democracia* (Human rights as a limit to democracy: Arango 2007).

The feminist theory of law has found fertile ground at the University of the Andes through publications such as *La mirada de los jueces: Género en la jurisprudencia latinoamericana* (The judicial perspective: Gender in Latin America's jurisprudence, Motta and Sáez 2008), a collective work edited by Cristina Motta and Macarena Sáez, and also, to a large extent, through the work of nonprofit organizations advocating equal rights for women. Critical Legal Studies (especially the work of Duncan Kennedy) have been developed by Diego López Medina (2006), who is now among the most influential CLS theorists in Latin America. He started out publishing works on the philosophy of law in the strictest sense, linked to Plato's philosophy; and recently, in his books *El derecho de los jueces* (The law of the judges: López Medina 2006) and *La letra y el espíritu de la ley* (The literal meaning and the spirit of the law: López Medina 2008), he has been working on the theory of judicial precedents, as well as on the issues involved in legal transplants, and has pointed out several directions regarding the discussion that surrounds legal interpretation and its methods.

Legal interpretation, and constitutional interpretation in particular, is one of the cardinal themes in the legal theorist's agenda. The local production, centred on Alexy's theory of legal argumentation, is ample. Alexy's theory has become well known thanks to Rodolfo Arango's teachings and intellectual production—mainly with his book *El concepto de derechos sociales fundamentales* (The concept of social fundamental rights: Arango 2005), which carries a foreword by Alexy himself. This work also contains contributions by Carlos Bernal Pulido (2005) and Gloria Lopera (2005), and the well-known translations of Luis Villar Borda. Neoconstitutionalism has not only been influential; it has also added to the transnational Colombian canon. The works of Bernal Pulido—initially conceived in Alexy's tradition of constitutional law, with *El principio de proporcionalidad y los derechos fundamentals* (The principle of proportionality and fundamental rights: Bernal Pulido 2007), and most recently dealing with the philosophy of language, with *El neoconstitucionalismo y la*

normatividad del derecho (Neoconstitutionalism and the normativity of law: Bernal Pulido 2009), have contributed in the broadest sense to the configuration of the emerging research agenda in constitutional theory and the philosophy of law.[6]

The works of Toulmin, Perelman, MacCormick, Aarnio, Peczenik, and Atienza have also been studied; and since the mid-Nineteenth century hermeneutics has, too, specifically in the technical sense of modernity, and the work of Gadamer in particular, and Theodor Viehweg's legal topics.[7] Rodrigo Uprimny Yepes and Andrés Abel Rodríguez published *Interpretación judicial* (Judicial interpretation: Uprimny Yepes and Abel 2006), in which they tackle the classic problem of the scope of legal interpretation, its practice, and its limits, as well as the main theories of legal interpretation.

Bourdieu's theory of social fields has made it possible to construct some very interesting articulations between judicial and sociological discourse, with studies taking up the question of normative law and social needs from different perpsectives, such as those of legal power, weak democracy, representation deficits and constitutional theory. These topics have received close attention for some years now, particularly from Uprimy, César Rodríguez, and Mauricio García Villegas (2001). The collective work *El caleidoscopio de las justicias en Colombia* (The kaleidoscope of Colombian justice: García Villegas and de Sousa 2001), which García Villegas edited with Boaventura de Sousa, along with *Jueces sin Estado* (Stateless judges: García Villegas 2008) and most recently his *Sociología y crítica del derecho* (Sociology and the criticism of law: García Villegas 2010), constitutes without a doubt one of the most significant and advanced contributions in the field.

The inclination towards moral and political philosophy in Colombia is an early reflection of the developments this branch has shown in other Latin American countries, which developments in turn correspond to the resurgence of global political thought fostered by the work of Rawls. One indication of the importance of Rawls's theory among local scholars lies in the activities that took place when he died, among which is worth noting the monographic work edited by Leonardo García Jaramillo under the title *John B. Rawls: El hombre y su legado intelectual* (John B. Rawls: The man and his intellectual legacy, García Jaramillo 2004). This book gathers the contributions of Rawls's disciple and assistant professor, Thomas Pogge, and his colleague Martha Nussbaum, as well as those of some of the main Colombian experts, such as Oscar Mejía Quintana, Francisco Cortés Rodas, and Delfín Ignacio Grueso. Among the

[6] On Alexy, see Sections 10.3.2.2 and 10.4.3.1 in this tome, and Sections 1.5.4.1, 10.3, and 25.4 in Tome 2 of this volume. On neoconstitutionalism in general see Chapter 10 in Tome 2 of this volume.

[7] On the contemporary theories of legal argumentation see Chapters 23 through 25 in Tome 2 of this volume.

normative conceptions of democracy, we must highlight the analyses on its deliberative conceptions and the importance of civic virtues. We can find several texts on the subject in the collective work edited by Andrés Hernández under the title *Republicanismo contemporáneo: Igualdad, democracia deliberativa y ciudadanía* (Contemporary republicanism: Equality, deliberative democracy, and citizenship: Hernández 2002).

We should notice that the particular reality of the Colombian state has encouraged a wide range of investigations, such as those on the multiethnic and multicultural society, but especially on the constitutional enshrinement of the rights of indigenous people, along with the constitutional court's guaranteeing of such rights. Two works that stand out among those that address the subject of culturally differentiated rights are *La constitución multicultural* (The multicultural constitution: Bonilla 2006) by Daniel Bonilla, and *Petróleo economía y cultura: El caso U'wa* (Oil, the economy and culture: The U'wa case, Uribe 2005) by Ángela Uribe.

28.2. Costa Rica

In a categorically critical tone that is not without realism, Minor Salas maintains that

> in Costa Rica—and I fear in a large part of Central America—philosophy of law does not actually exist [...]. We have reached such an extreme that in many universities the subject itself has already been expunged from curricula; that is to say, it is now either part of the historical bookshelves and the failed curricular projects, or it has completely ceased to exist. (Salas 2007; my translation)

The disenchantment expressed in this statement—a disenchantment made more significant by the fact that it comes from one of the area's most emblematic countries, known for its social and democratic stability—must not dissuade us from highlighting the personal work and academic contributions of figures such as Enrique Pedro Haba and, in the younger generation, the contribution made by Minor Salas himself (Salas 2007) and Gustavo González Solano.

Originally from Uruguay, Haba begins his brilliant career in Europe. Then, in 1978, he becomes a professor of philosophy of law at the University of Costa Rica, where he remains until his retirement in 2006. His thinking is part of what he qualifies as a critical-realistic or negative-heuristic conception of law and of social theory in general. More than by a set of theoretical premises and attitudes (epistemological scepticism, an analytic orientation, and empirical individualism, for example), this conception is characterized by an intellectual stance in the face of the problems of knowledge. A careful reading of his works—among which it bears highlighting *La idea del totalitarismo y la libertad individual* (The concept of totalitarianism and of individual freedom: Haba 1976), *Tratado de derechos humanos* (A treatise on human rights: Haba 1987), *El espejismo de la interpretación literal* (The illusion of literal in-

terpretation: Haba 2003), and *Metodología jurídica irreverente* (Irreverent legal methodology: Haba 2006)—reveals his special inclination towards what he qualifies as "matters of degree." Essentially, his leitmotif emerges from a need to bring into evidence and dismantle the vices of reasoning that one usually incurs when examining all sorts of social, legal, political, and sociological issues. Among the most criticized and discussed vices we find in his book are what Haba calls the "lawyer's normative syndrome," false generalizations (or "fallacy of the whole"), the "missionary conception of the social sciences," and the "false-opposition fallacy."

Minor Salas is a professor at the University of Costa Rica. His body of research ranges across three different fields, all of them interrelated: the philosophy of law, criminal law, and the epistemology of social science. His works grapple, on the one hand, with the idea that some social and legal phenomena can (or must) be subjected to criteria of rationality and argumentation (critical rationalism) and, on the other hand, with the grim realization that those very criteria, however much they might have been properly elaborated by the metatheory of law or by social theory, have little or no chance of being implemented in the vital praxis of social and legal relationships in general (a view called people scepticism). According to Salas, legal institutions, and particularly the legal discourse in which these institutions are versed—regardless of whether their field is legal or judicial or whether it consists of strict academic theory, that is, whether it falls within the legal dogmatism now being nurtured in the faculties of law—basically only play the role of providing symbolic legitimizations for human action.

Gustavo González Solano, also a professor at the University of Costa Rica, describes himself as a cognitive scientist, with a strong influence from what could generically be called analytical philosophy. His philosophical research is currently oriented towards the study of the semiotics and logic (both formal and informal) of legal discourse, a study through which he attempts to describe the interpretive, deductive, adductive, and heuristic processes carried out by lawyers and judges. González Solano estimates that his research situates him within what he calls the post-Morris stage; accordingly, he does not believe in the idea of an inherent nature or essence of law, nor does he believe in paleo-symbolisms or conceptualisms. His main purpose is to make explicit those processes in law whose origin is dubious, all the while clarifying their value, this to implement the ethical and scientific bases for optimizing them, yet without holding out any hope whatsoever that any of them should be either adopted or followed as a matter of practice.

28.3. Chile

In the 1930s, and in line with trends that prevailed beyond the Chilean borders, we saw how legal positivism—in a climate of deep commitment to natu-

ral law—reached the classrooms and other areas of discussion, thus extending its influence amongst Chilean intellectuals, philosophers, and jurists. For example, we can highlight the valuable contribution made by the philosopher Jorge Millas (1917–1982), who in legal philosophy can be made to fall within the tendency of axiological formalism and a school of thought that was closer to democratic socialism. Although he does to some extent show a Kelsenian influence, he claims that the ultimate foundation of law lies in the social power by which it is established. Concerned with the study of norms, and especially with legal values and the nature of law, he comes to identify the certainty of law as the sole value. Perhaps a product of the country's historical context, and of its zeal for ideology and for the politicization of the academy, Millas identifies this value with what is known as the rule of law. In 1960 came the publication of his book *Filosofía del derecho* (The philosophy of law: Millas 1960), which reflects his incessant study of the discipline. Aside from philosophical production, his contributions are also devoted to defending the Chilean university. This is clearly and incisively expressed in a 1981 speech he gave at the conference *Análisis de la universidad actual* (Analysis of the contemporary university: Millas 1981), where he dramatically claimed that the "university [is] under surveillance," referring to the military intervention of which he was a victim under the Pinochet dictatorship (1973–1990).

Well into the mid-20th century we can attest to the arrival of the new and absolutely reforming currents of thought that were part of the prevailing tendencies. It is worth highlighting in this respect the immense legacy left behind in the 1960s and early 1970s by Professor Eduardo Novoa Monreal (1916–2007), who acted as a political advisor to the government of Salvador Allende, and who in parallel to this legacy also produced a body of legal thought in criminal law and legal philosophy. In *Obras escogidas: Una crítica al derecho tradicional* (Selected works: A critique of traditional law, Novoa Monreal 1993), we can recognize the main features of his doctrine, which are closely linked to the influence of Marxism in its relationship with Christianity, and which also stem from the need to justify the deep political changes underway at that particular time in Chile. In effect, Novoa's legal analysis is based on an acknowledgment of the Chilean reality, with respect to which he marks "the subsistence of enormous differences in the distribution of wealth and the existence of an enormous mass of people [...], placed in a position of great disadvantage" (ibid.; my translation). This is how he sets up the relation between social organization and the legal framework: Rather than *determining* the social organization, the law is *determined* by it, or by political and economic factors. The law, understood as a complex of positive norms, is defined—as to both its concept and its ends—as an instrumental relationship with its underlying reality. So then, according to Novoa, law can be harmless or it can be fair: In the former case, we are looking at a law that enables just this type of society to subsist; in the latter case, law will have as its main objective that of modify-

ing and eliminating differences in the distribution of wealth and the people's quality of life.

Subsequently, legal positivism in its Kelsenian version reached its moment of greatest influence through the professorships of Antonio Bascuñán and Agustín Squella, both of whom have extended the influence of this form of thought through an active participation in Chile's academic, intellectual, and professional life. Agustín Squella (2001) has published several books that reflect his work as a teacher and his important contribution to the study of the philosophy of law in Chile. Among his works we can highlight his thesis, published under the title *Derecho y moral: ¿Tenemos obligación moral de obedecer el derecho?* (Law and morality: Are we under a moral obligation to obey the law?, Squella 1989) and his books *Introducción al Derecho* (Introduction to law: Squella 2000), *Estudios sobre derechos humanos* (Studies on human rights: Squella 1991), *Positivismo Jurídico, democracia y derechos humanos* (Legal positivism, democracy, and human rights: Squella 1995), and *Filosofía del Derecho* (Philosophy of law: Squella 2001). In this last book, Squella expounds his methodological legal positivism, which he formulates hand in hand with Norberto Bobbio, and which (on a monistic theory) assumes the unity of law, establishing a distinction—albeit not a separation—between morality and law, considering them both as "different normative orders" (see Squella 2001). It is to Squella that we owe the reception of Norberto Bobbio's thought in Chile, and it is to Bobbio that Squella devoted an entire book, *Norberto Bobbio: Un hombre fiero y justo* (Norberto Bobbio: A feisty and fair-minded man, Squella 2005).[8]

Moving further along in the 20th century we come upon Enrique Barros, who has been influenced by the work of Dworkin, and who in *Reglas y principios en el derecho* (Rules and principles in the law: E. Barros 1984), as well as in his doctoral work, advances a critique of positivism where he points out that "a strictly logical focus carries with it serious limitations that are not always grasped by analytical theoreticians, who are too closely bound to the objective of either formulating a general theory or comprehensively capturing the concept of law" (ibid., 279; my translation).

With the arrival of the 1990s, a period that saw a return to democracy in Chile, innovative currents in the analysis of law appeared. These currents are known for bringing different sciences, disciplines and foreign perspectives into the traditional analysis carried out in legal science. I am referring to the economic analysis of law, the feminist analysis of law, and the literary analysis of law, among others. In the beginning, these new currents were slow to find acceptance in Chilean doctrine, this owing in part to a natural mistrust attendant on the process of integrating into the analysis of law extraneous disciplines that do not share the basic principles of legal science. In time, however, the Chilean academy did bring these currents to bear on its own analysis, as can be

[8] On Bobbio, see also Section 11.4 in this tome and Section 9.3.1 in Tome 2 of this volume.

observed in the increasing number of publications that address these subjects. Their presence within university classrooms has also increased. The most popular of these philosophical currents in Chile has undeniably been the economic analysis of law, which has not only made its way into the philosophy of law but has also permeated the study of the civil law of contracts. In turn, a rigorous critique of legal positivism has been advanced by Fernando Atria (2001), in works such as *Creación y aplicación del derecho* (Creation and application of law: Atria 2001b) and *La ironía del positivismo jurídico* (The irony of legal positivism: Atria 2004). His book *On Law and Legal Reasoning* (Atria 2001a) undoubtedly ranks among the most lucid contributions made to the contemporary theory of law.

In recent years, the works of Joaquín García Huidobro (1993) and Cristóbal Orrego (1997) have attempted to bring natural-law theory up to date and incorporate it into current philosophical discourse. Standing out in this respect is the book *Razón Práctica y Derecho Natural* (Practical reason and natural law: García Huidobro 1993). In it, García Huidobro analyzed the main features of Thomas Aquinas's natural-law philosophy, in the same way that the Oxford professor John Finnis has recently done. Likewise in *H. L. A. Hart: Abogado del positivismo jurídico* (H. L. A. Hart: the advocate of legal positivism, Orrego 1997) Orrego, in continuity with his doctoral thesis, critiques the main tenets of Hart's theory, taken up as the paradigm of legal positivism in the second half of the 20th century. He lays special emphasis on the analysis of what might turn out to be the conceptual separation between law and morality, concluding that reference to ends and values is indispensable for an understanding of positive law, a constitutive element of which is the idea of the common good.

As far as Hart's legacy is concerned, it is important to point out the work done by Carlos Peña (2008), who in his diverse publications has encouraged and revitalized the space occupied by this paradigmatic author of legal positivism in the Chilean legal-philosophical discussion of recent decades. The same goes for his analysis of Ronald Dworkin's and John Rawls's work. His study of the latter has also had a great influence in Chile, and many are those who have dedicated themselves to the study and dissemination of Rawls's work, among whom Pablo Ruiz Tagle (1989), with *La prioridad del derecho sobre el bien en la Teoría de la justicia de John Rawls* (Priority of law over welfare/goodness in John Rawls´s theory of justice: Ruiz Tagle 1989), and Carlos Peña himself in his most recent work, *Rawls: El problema de la realidad y la justificación de la filosofía política* (Rawls: The problem of the reality and justification of political philosophy: Peña 2008). In like manner, political philosophy, particularly its republican version, has also had a decisive impact on Chilean philosophy of law: Among the most recent books is the one written by Renato Cristi and Pablo Ruiz Tagle, *La República en Chile: Teoría y práctica del constitucionalismo en Chile* (Republic in Chile: The theory and practice of constitutionalism in Chile, Cristi and Ruiz Tagle 2008).

28.4. Mexico

Since the mid 1940s, contemporary philosophy of law in Mexico began to revolve around four personalities, two of them internationally recognized, Luis Recaséns Siches (1903–1977) and Eduardo García Máynez (1908–1993), while the other two equally brilliant but only locally recognized: Guillermo Héctor Rodríguez (1910–1988) and Rafael Preciado Hernández (1908–1991). With considerable intellectual force, the influence of this first group lasted all the way into the early 1970s. Nonetheless, it must be acknowledged that this was also the moment when their proposals began to be eclipsed by other philosophical ideas. Analytical philosophy, for example, was bursting onto the scene in Mexico with great vitality.

Recaséns Siches, in exile since 1937, developed his prolific academic activity at the *Universidad Nacional Autónoma de México*. In works such as *Vida humana, sociedad y derecho* (Human life, society and law: Recaséns Siches 1945) *and Tratado general de Filosofía del Derecho* (General treatise of legal philosophy: Recaséns Siches 1965)—and on the basis of the *ratio*-vitalism of his teacher, Ortega y Gasset—Recaséns structures a conception of law understood as a cultural product, as an objectified form of human life, that is to say, as a group of signifiers which constitute the rules of human behaviour. Within this prism, law must be understood as a set of norms that have been worked out to achieve values (legal axiology) existentially integrated into, and revolving around, the principle of human dignity. In a late stage in his philosophical thought, Recaséns took vitalism all the way to the theory of rational discourse, and with a certain amount of originality distinguished between the logic of vital reason (the logic of action) from a formal logic. This can be found in his book *Experiencia jurídica, naturaleza de la cosa y lógica "razonable"* (Juridical experience, the nature of "the thing," and "reasonable" logic: Recaséns Siches 1971). Thus we could rightfully locate his conception among the modern theories of legal argumentation.

Eduardo García Máynez defended, alongside his German teacher Nicolai Hartmann, an objectivist axiology that served as a basis on which to justify the obligatory nature or validity of legal norms. But his objectivism did not bind him to the natural-law thesis. For Máynez, natural law is not, strictly speaking, law. In *La definición del derecho: Ensayo de perspectivismo jurídico* (The definition of law: An essay in legal perspectivism, García Máynez 1948), a book written under the guidance of Ortega y Gasset, he developed his theory of the three circles, claiming that the law can have three different definitions, corresponding to three different perspectives as concerns the notion of validity: a formal perspective, an intrinsic one, and a positive one. The bearing of this division is only theoretical. When these three perspectives are joined in each and every one of the precepts that form part of a legal system, we then have the limit or ideal case for the realization of justice. In a former stage of his thought,

which spans across fifteen years, he devoted himself to elaborating a legal logic from a traditional point of view, an effort that resulted in *Lógica del concepto jurídico* (The logic of the legal concept: García Máynez 1959), *Lógica del juicio jurídico* (The logic of legal judgment: García Máynez 1955), and *Lógica del raciocinio jurídico* (The logic of legal reasoning: García Máynez 1966), a body of work that would eventually be superseded by the parallel research conducted by authors such as Georg Henrik von Wright. His most systematic account, and in a sense a compendium of his legal-philosophical thought, can be found in his book *Filosofía del derecho* (Philosophy of law: García Máynez 1974), in which he takes enough distance from his initial objectivism—values exist not in and of themselves but rather *for* someone—and elaborates a self-referencing theory of legal systems.

The importance of Recaséns Siches's and García Máynez's intellectual production cannot be ignored, however, and it must be said that they did not bother to bring up a group of disciples, nor were they interested in giving any sort of continuity to a school of thought. The same goes for Preciado Hernández. His *Lecciones de Filosofía del Derecho* (Lectures on the philosophy of law: Preciado Hernández 1947), which pioneered the development of natural-law theory in Mexico, continues to be one of the most widely read works in law schools in Mexico, and there are undoubtedly many philosophers who owe Preciado Hernández the best part of their legal-philosophical training, although he, too, did not concern himself with disciples. All in all, the development of natural-law theory can be found in Miguel Villoro, Antonio Gómez Robledo, Héctor González Uribe, and Efraín González Morfín, to mention but a few of its most distinguished representatives.

The situation is quite different for Guillermo Héctor Rodríguez, a neo-Kantian from the Marburg lineage, as well as a student and follower of Stammler and Kelsen.[9] His work has not yet received the necessary transcendence for it to be valued, but the disciples or "travel companions" he left behind are a clear measure of his importance. In the mid-1970s the "neo-Kantian" group included Leandro Azuara, Fausto Vallado Berrón, Ulises Schmill (1971), Agustín Pérez Carrillo, and Rolando Tamayo y Salmorán (1989), among others. One of their distinguishing trademarks is their profound knowledge and understanding of Hans Kelsen's work.

In the late 1970s, and especially with *Kelsen y Ross: formalismo y realismo en la teoría del derecho* (Kelsen and Ross: Formalism and realism in legal theory, Esquivel 1980)—a work by Javier Esquivel (1941–1992) gathering a good part of his intellectual production—we come closer to the analytical philosophy that was being vigorously developed at the *Instituto de Investigaciones Filosóficas de la Universidad Nacional Autónoma de México* (National Autono-

[9] On Stammler see Section 1.3 in this tome and Section 2.2 in Tome 2 of this volume. On Kelsen see Section 2.3 in this tome and Section 8.4 in Tome 2 of this volume.

mous University of Mexico´s Philosophical Investigations Institute) by scholars such as Luis Villoro, Fernando Salmerón, and Alejandro Rossi. It is through their work, as well as through the institute, that we became aware of the Argentinean analytical philosophy of law that was being advanced by people such as Roberto Vernengo, Eugenio Bulygin, Carlos Alchourrón, Ernesto Garzón Valdés, and Carlos Santiago Nino, who in turn introduced Mexico to thinkers such as Alf Ross, H. L. A. Hart, Karl Olivecrona, and Georg Henrik von Wright, among other notable legal philosophers.[10]

The entire decade of the 1970s was characterized by an intense legal-philosophical productivity that regretfully waned from the early 1980s onward. It is not easy to determine the cause of this situation, even though many attribute it to the 1982 economic crisis, which forced the new generation to abandon teaching and research in favour of better financial opportunities in both the public and the private sector. It can be said without exaggeration that Mexico lost an entire generation of legal philosophers, and the consequence of that loss was felt throughout the 1980s and into the early 1990s. Yet, in spite of it all, it is worth highlighting the perseverance of some legal philosophers who expended much effort in charting new courses, even though they unfortunately lacked the necessary critical guidance of a legal-philosophical community. We can see this in Ulises Schmill (1971)—with *El sistema de la Constitución Mexicana* (System of the Mexican Constitution: Schmill 1971), *Lógica y derecho* (Logic and law: Schmill 1993), and *Recostrucción pragmática de la teoría del derecho* (A pragmatic reconstruction of the theory of law: Schmill 1997)—and Rolando Tamayo y Salmorán, with *El derecho y la ciencia del derecho* (Law and the science of law: Tamayo y Salmorán 1986), *Introducción al estudio de la Constitución* (An introduction to the study of the Constitution: Tamayo y Salmorán 1989), and *Elementos para una teoría general del derecho* (Elements for a general theory of law: Tamayo y Salmorán 1992), both of whom I previously mentioned as forming the neo-Kantian group of the mid-1970s, as well as in the work of Óscar Correas (1998) and the journal *Crítica Jurídica*, founded in 1983, both devoted to legal Marxism and critical theory with a revision of Kelsen's thought.

Since the early 1990s, legal philosophy in Mexico has become revitalized in an attempt to make up for the lost time, catching up with the contemporary debate and creating opportunities for teaching, research, and publication at several universities throughout the country. This change also came about in response to certain legal-political conditions that developed in the country, especially with regard to the exercise of judicial power and its perception. One of these conditions is the democratization process and the subsequent reforms of the judicial system. The year 1988 turned out to be a watershed year for Mexico, because there was suspicion of electoral fraud, and at the same time

[10] On Argentinean analytical philosophy see Section 26.2.1.3 in this tome.

the legal conditions were generated for political competency, and also because the reforms of judicial power introduced in 1987 and implemented in 1988 changed its relation to political power by converting the Mexico's Supreme Court into a constitutional tribunal. Another objective condition that developed in Mexico was the downscaling of power itself and the political pluralism consequent upon a deep questioning of the principle of the separation of powers. Mexico went from a hegemonic party system—with the *Partido Revolucionario Institucional* (PRI), which governed uninterruptedly in Mexico from 1929 to 2000—to a government that is now divided into upper and lower chambers. This situation has favoured a greater balance between the powers. And yet, despite these changes, and this is something that must be insisted upon, the greater opening of the political system proved insufficient to cope with the enormous social deficiencies. As José Woldenberg has commented:

> There was a democratic transition that enabled us to move from a system based on a hegemonic party to a balanced system, from noncompetitive to competitive elections, from a world of one-color representation to a plural one, from an exceeded presidency to a limited one, from a subordinated congress to a living and plural one. It was a very important political change. But what seems to remain the same, ever since Humboldt, is that this is an absolutely deformed country, beset by an inequality that, as is sometimes stated by the United Nations Economic Commission for Latin America and the Caribbean (ECLAC) itself, prevents us from thinking of building an inclusive "us," because Mexico is so many Mexicos, marked by such an inequality that the sense of belonging to a national community becomes hindered. (Interview with José Woldenberg. *Milenio*, July 19, 2010; my translation)

The impulse of legal-philosophical studies in Mexico, within the context of the process towards greater democratization, was reflected in each of the different legal-philosophical schools. The influence that analytical-normative legal philosophy came under from what has been called the "rehabilitation of practical reasoning" was driven—with the decisive support of Ernesto Garzón Valdés and Manuel Atienza—by the creation and development of the 1991 seminar *Eduardo García Máynez*, dedicated to the theory and philosophy of law, and some time later, in 1994, by the founding of the journal *Isonomía*. Both initiatives, as well as considerable collections of books, have contributed to the creation of a favourable climate for research and teaching that has had very positive results in the advancement of the discipline, with an output ranging from an analytical and argumentative legal epistemology—with contributions such as the ones by Carla Huerta, Bernardo Bolaños, and Roberto Lara—to a theory of justice and human rights in the context of a constitutional, democratic, and social rule of law, as can be appreciated in the works of Rodolfo Vázquez (2006, 2009), Adrián Rentería, Jaime Cárdenas, Juan Antonio Cruz Parcero (2007), Miguel Carbonell, and Pedro Salazar Ugarte (2006). And the list also includes Pablo Larrañaga (2009), with a pragmatic-constitutional focus and a foundation in market theory, and Imer Flores, with a special interest in Latin American legal philosophy and North American constitutionalism.

Under the guidance of Javier Esquivel (1996), with his rigorous Anglo-Saxon analytic training, legal positivism decisively influenced a generation whose signature work came in the 1980s, without any further development or any critical revision, however well deserved it may be. In this group we find Álvaro Rodríguez Tirado, Juan García Rebolledo, and Alfonso Oñate, among others. The continuity of this current of thought can be appreciated in the works of Javier Ortiz, María Inés Pazos, Juan Vega, and Jorge Cerdio.

As concerns legal realism and the critical theory of law, in constant dialogue with anthropology and the social sciences, we must highlight the works of Antonio Azuela, Arturo Berumen, Martín Díaz y Díaz (2001), Sergio López Ayllón, Héctor Fix Fierro, and Karina Ansolabehere. The economic analysis of law, despite its inability to make its way into the curricula of the law schools, has been developed in the work of Andrés Roemer.

Finally, in the traditional line of Scholastic natural law, with contributions to the field of international law, we find the works of Jaime Ruiz de Santiago. The research done by Mauricio Beuchot and Javier Saldaña stands out for the renewed vision they developed working from an analogical and pragmatic hermeneutics. And from a historicist point of view, with contributions in the philosophy of liberation, we find the works of Jesús de la Torre Rangel.

28.5. Peru

During the first half of the 20th century, the philosophy of law in Peru gave continuity to a traditional legal-philosophical thought gravitating toward natural-law theory, be it in its Scholastic or rationalist version. At the same time there began to develop the broad outlines of legal positivism as conceived from a formal and sociological point of view. For example, at the dawn of the 20th century, Manuel Vicente Villarán (1873–1958) initially worked from the standpoint of natural-law theory, but then he veered towards legal positivism, as can be observed in his 1907 article *Objeto y división de la Jurisprudencia* (The object and division of jurisprudence: Villarán 1907) where he maintains that we must abandon traditional legal philosophy and replace it with a sociological approach to law. This appeal by Manuel Vicente Villarán must have received a warm reception, because the 1911 book by Juan Bautista de Lavalle (1887–1970)—*La crisis contemporánea de la filosofía del derecho* (Contemporary crisis of legal philosophy: Lavalle 1911), a book deeply influenced by the ideas of the Italian legal philosopher Icilio Vanni, whom Lavalle has translated—sparked an immediate reaction against natural law.[11] Lavalle described the contemporary crises in legal philosophy as owed to an uncertainty about its object of study, an uncertainty generated by the pretence, advanced by the sociology of law, that it would displace and replace traditional philosophy of law.

[11] On Vanni see Section 11.1.1 in Tome 2 of this volume.

The author maintained that legal philosophy was still necessary as a synthetic discipline, and that, in keeping with Vanni's ideas, it is shaped by a three-pronged purpose: (*a*) to know the law, (*b*) to know its history and how it is generated, and (*c*) to inquire into the problem of justice.

The great Peruvian civilist José León Barandiarán (1899–1987) began his intellectual production with the 1929 course *Lecciones de filosofía del derecho* (Lectures in legal philosophy: Barandiarán 1929), where he rejected three conceptions of the philosophy of law: one that conceives it as the science of law, one that looks at it from a purely genetic point of view, and one that addresses it from a sociological perspective. For Barandiarán, legal philosophy studies the law for what it *is* (gnosiological point of view) and for what it *should be* (deontological point of view). The law is the norm that regulates human activity. Its constitutive elements are four: the subject, the object, the relationship, and the pretence. Its final cause is justice, whose most ontological and dynamic quality is equity. In later works, the author made a presentation of the law as consisting of such three dimensions: sociological, deontological and ontological.

Mariano Iberico Rodríguez (1892–1974) was an eminent philosopher and a member of the Peruvian judiciary. For him, law—conceived as a discipline concerned with human social conduct—is essentially a mode of existence which to some extent is independent from those who adhere to it, but which still constrains them by making them serve certain intentions or finalities of life. The law is as much a form of legal thought as it is the object of a specific theory that lends itself to a logical study. That is how, in 1944, Rodríguez proceeded in writing his *Principios de lógica jurídica* (Principles of legal logic: M. I. Rodríguez 1944), exploring the ways of organizing legal thought. According to the author, the theory of legal thought does not coincide with the philosophy of law, which is much broader and takes law into account not only as an object of thought but also as a social objectification in its ontological fundament.

But the greatest Peruvian philosopher of law is without a doubt Francisco Miró Quesada Cantuarias. In 1953 he wrote his thesis, "Bases y lineamientos de la lógica jurídica" (Basis and linings of legal logic), which was then published in 1956 under the title *Problemas fundamentales de lógica juridica* (Fundamental problems in legal logic: Miró Quesada 2008a). For him, legal logic is a specific logic that "must determine which structures are applicable to the field of legal knowledge" (ibid., 43; my translation). He believed that legal norms are not descriptive propositions, which is why we cannot at a glance apply any sort of deductive structure to them. However, this difficulty can be overcome by resorting to what Miró Quesada calls the principle of normative-propositional parallelism, under which every norm corresponds to a true (descriptive) proposition, even though not every true descriptive proposition corresponds to a norm. Once this principle is assumed, the derivation can be accomplished through an encirclement: One looks at the norm applicable to

the case at hand, determines on this basis the corresponding legal-descriptive proposition, deductively derives therefrom another legal-descriptive proposition, and finally returns from the latter to the corresponding norm. In later years he abandoned this conception in light of the development of deontic logic. In *Lógica Jurídica Idiomática* (Idiomatic juridical logic: Miró Quesada 2008b), he maintained that norms have an even more complex structure than what is ordinarily assumed, for they are neither descriptive nor prescriptive but rather descriptive-prescriptive, which is why a new hybrid logic must be elaborated so that we can account for typical legal deductions.

Another of Miró Quesada's objects of interest has been the concept of just law which he discusses in an article so titled published in his book *Ensayos de filosofía del derecho* (Essays in legal philosophy: Miró Quesada 2011a); he then takes up the subject again in the later article *Ensayo de una fundamentación racional de la ética* (An essay on the rational foundations of ethics: Miró Quesada 2003), and it is to this last source that we are referring. According to Miró Quesada the principle of symmetry unifies the theoretical and practical worlds. In the case of the practical world, and more concretely the world of law, in order for a norm to be regarded as having a proper basis, it must be symmetrical. Thus, for example, if we hold A obligated to B, then we must also hold B obligated to A. However, this is only one of the necessary conditions for a norm's basis, for we still have to add the condition that the norm must not be arbitrary.

Finally, a third area in the philosophy of law to which Miró Quesada has devoted his interest is legal interpretation, the subject of his book Ratio interpretandi*: Ensayo de hermenéutica jurídica* (*Ratio interpretandi*: An essay in legal hermeneutics, Miró Quesada 2011b). According to the author, there are three main types of interpretation: deductive, which pertains to the problem of the contradictions that come up between norms; analogical and extensive, which is used to deal with the problem that experience always supersedes any conceptual system; and the type he calls *epiphysis*, which is for the syntactic, semantic, and contextual interpretations used to resolve the difficulties generated by conceptual empiricalness and polysemy. For Miró Quesada, all the types of interpretation proposed by legal tradition can be reduced to these three basic types.

Other representative figures of Peruvian philosophy of law are Mario Alzamora Valdez (1909–1993) and Carlos Fernández Sessarego (1990). The former is the author of *Introducción a la ciencia del derecho* (Introduction to legal science: Alzamora Valdez 1987), *La filosofía del derecho en el Perú* (Legal philosophy in Peru: Alzamora Valdez 1968), and *Filosofía del Derecho* (Legal philosophy: Alzamora Valdez 1976). Alzamora makes a distinction between the scientific study of law, which answers the Kantian question *quid juris*—that which has been established as law by a certain legal system—and the philosophical study of the law, which is concerned with the question *quid jus*, or

that which is generally understood by *law*. According to the author the law is based neither on a system of norms, nor on a group of values, nor on human conduct but rather on the essential direction of human beings towards the goals that correspond to them so that they may realize their rational end. As for justice, this rational end is the common good. Fernández Sessarego (2006), a recognized Peruvian civil lawyer, has in his own turn formulated a three-dimensional approach, this in his dissertation thesis, *Bosquejo para una determinación ontológica del derecho* (Tracing for an ontologic determination of law: Fernández Sessarego 1950), where law is conceived as human conduct that is bound by norms and carries out values. In a later work, *Derecho y persona* (Law and the person: Fernández Sessarego 1990) he criticizes the Kelsenian formalism, realistic vision and Marxist law as the same kind of one-dimensional conceptions.

Deserving mention in the current landscape of Peruvian philosophy of law are the works of Fernando de Trazegnies (1993), David Sobrevilla (2008), Domingo García Belaunde (1982), and Luis Manuel Sánchez (2011). Trazegnies has published the books *Posmodernidad y Derecho* (Postmodernity and law: Trazegnies 1993) and *Pensando insolentemente: Tres perspectivas académicas sobre el Derecho, seguidas de otras insolencias jurídicas* (Thinking insolently: Three academic perspectives of law, followed by other legal insolences, Trazegnies 2001). Trazegnies (1993) advocates a postmodernism that can free postmodernity from its narrowness; that recognizes an order within the cultural diversity, as well as it recognizes cultural diversity within the order; and that furthermore conceives the law as a struggle among values, proposals, and interests which can be productively developed only if we establish rules designed to prevent this struggle from turning into a collective suicide. Sobrevilla embraces an inclusive positivism and has done noteworthy work in the historico-critical analysis of contemporary legal ideas, as can be appreciated in his book *La filosofía alemana del derecho actual de orientación racionalista* (The rationalist approach in current German philosophy of law: Sobrevilla 2008), with studies on Alexy, Habermas, and Höffe. García Belaúnde has written the book *Conocimiento y Derecho: Apuntes para una filosofía del derecho* (Knowledge and law: Considerations for a philosophy of law, García Belaúnde 1982), in which he defends a three-dimensional vision of the law akin to the one presented by Miguel Reale.[12] Luis Manuel Sánchez, in his book *Después del positivismo* (After Positivism: Sánchez 2011), offers a radical critique of legal positivism such as we find it in the theories of Alexy, Atienza, and Garzón Valdés, among other authors, and proceeds on that basis to lay out what he calls a "re-substantiation of law." Finally, it is imperative to highlight the academic and professional work of Alfredo Bullard, who introduced the economic analysis of law in Peru.

[12] On Reale see Section 26.2.1.3 in this tome.

28.6. Uruguay

Up until the end of the 19th century, the chair in legal philosophy had settled on two major orientations: a spiritualist but secular natural law, on the one hand, and the Spencerian version of evolutionist positivism, on the other. During this period, the chair assumed a highly polemic stance and took it upon itself to play a leading role in the formation of the national consciousness. Since the consolidation of the democratic state, at the beginning of the 20th century, the philosophy of law has adhered to a series of efforts intended to support the professional training of lawyers and notaries by adopting a series of eclectic, syncretic positions calling on those in the legal profession to commit themselves to this or that ideal.

Carlos Vaz Ferreira (1872–1958) and Antonio M. Grompone (1893–1965)—two eclectic thinkers who combined positivist, natural-law, Marxist, and solidarist influences—devoted themselves to the standardization of philosophy in general and of legal philosophy in particular. When they left their post, the chair in Legal Philosophy and General Theory of Law was awarded to Professors Julio Luis Moreno (1925–1981) and Esther Aguinsky (1925–1999). In his general theory of law courses Moreno was basically guided by Kelsen's pure theory, in its typically Latin American version, that is, through the interpretation of García Máynez and Recaséns Siches, who at that time were the most widely read legal philosophers in Latin America. Likewise, Moreno did as he preached by reiterating an existentialist basis of law that was yet another attempt at a "commitment" wavering between the formal perspective and the realistic perspective. Meanwhile, although Aguinsky's interests appeared to be closer to phenomenology, her teachings were framed within the traditional syncretism of legal philosophy. She also introduced more modern authors, such as Norberto Bobbio, Giovanni Reale, and Fernández Galiano. Thanks to this innocuous spirit, the chair in legal philosophy was not affected during the dictatorship (1973–1985), despite the fact that the post was filled by democrats who had no commitment to the totalitarian thinking of the period.

However, it must be pointed out that the most important Uruguayan philosopher, the only one with international recognition, was Juan Llambías de Azevedo (1907–1972). His main works were published in Buenos Aires and later translated into English, German, and Italian. He was the first to undertake serious and original research on the subject. And his philosophical thought gravitated around phenomenology, with influences from Edmund Husserl, Nicolai Hartmann, and Max Scheler, but without veiling his Catholic inspiration.[13]

It fell to Hugo Malherbe (1927–1999), a disciple of Juan Llambías de Azevedo, to initiate a profound renewal within the chair in legal philosophy, which

[13] On the phenomenology of law see Chapter 4 in this tome.

he took in 1993. His main objective was to criticize the legal dogma that was still predominant in the study of law. To this end he resorted to contemporary hermeneutics, dialectics, and semiotics: It was the first time that Aristotle, Kant, Heidegger, Gadamer, Eckart Viehweg, Perelman, Foucault, and Charles Morris, among others, were presented within a single sweep. This unusual conjunction of thinkers can be explained by a rare rigor that Uruguayan philosophy exhibits, but also by the direct connection that the thinkers so grouped bear to legal problems. Malherbe's teachings strongly influenced the subsequent generation of teachers and scholars, among whom were Alicia Castro, Luis Meliante, Américo Abad, and Óscar Sarlo, in addition to whom came, in the last stage of Malherbe's docent activity, Marcela Vigna, Gianella Bardazano, Gonzalo Calviño, and Marcia Collazo.

In 2001, after Malherbe's death, his chair went to Óscar Sarlo (Caetano and Sarlo 2010), who had been trained in the Kelsenian tradition. Sarlo couples his interests to Gadamer's hermeneutics, the analysis of language, and other collaborative work done in the contemporary theory of critical positivism. His main interests lie in the epistemology of legal science, the methodology of law, the theory of argumentation, and legislative technique.

Some of the most significant contributions in the period in question—from the mid-20th century onward—come from thinkers who are not affiliated with any chair in legal philosophy. Perhaps the main promoter of studies in legal philosophy pursued outside the ambit of the chair was the trial lawyer Eduardo J. Couture, whose writings on legal language and legal logic were the first of their kind in Uruguay and introduced the subject to the country. Other trial lawyers who followed his example were Adolfo Gelsi Bidart, inspired by Max Scheler and Ortega y Gasset; Luis Alberto Viera Ruiz, influenced by Kelsen, Ross, and Marxism; and Dante Barrios de Angelis, with a solid background in German philosophy. And an unusual contribution to the philosophy of law came from the doctoral thesis of the priest José Gabriel Buzzo Sarlo, influenced by Javier Hervada, where he addresses the issue of canonical law and our knowledge of it.

Also worthy of mention are some contributions made by Uruguayans living abroad, mostly political exiles. In the 1940s, Lorenzo Carnelli (1887–1960) gained a certain notoriety for joining, after his political exile (of 1933), the egological school led in Argentina by Carlos Cossio.[14] Other Uruguayan professors who earned a strong academic standing were Eduardo Piacenza Otaegui, Enrique Pedro Haba (see Haba 1987), Javier Sasso, Carlos Pereda, and Daniel Schwartz.

[14] On Cossio see Section 26.2.1.2 in this tome.

28.7. Venezuela

The philosophy of law in Venezuela—currently embracing a politico-philosophical and economic approach—has seen an overall evolution stimulated by initiatives undertaken for the most part at different academic centres, among which are the *Universidad Central de Venezuela*, the *Universidad del Zulia*, the *Universidad de Carabobo*, and the *Universidad Católica Andrés Bello de Caracas*. It is a clear influence that these activities have exerted over the years, making it possible for us to identify and describe an interesting process toward conceptual and methodological maturity.

In 1935, Rafael Pizani (1909–1997) came out with a book—*La Filosofía del Derecho en Venezuela: Exploración crítica para una vocación* (Philosophy of law in Venezuela: Critical exploration for a vocation, Pizani 1935)—that in both its title and content evidences the then-growing interest in the philosophy of law, all the while shaping a conception of that cultural literary form which is the essay, a form at the time was gaining ground. This work was most influential among the intellectuals of his time, a time when Venezuela abandoned the dictatorship of Juan Vicente Gómez, which had spanned across the entire 2oth century: Accordingly, this was also a time of enthusiasm about the prospect of cultural advancement by exploring new subjects and writings that had until then been kept in the dark. Years later, in 1954, Pizani would leave us with another important mark, this time charting a new course, with his *Reparos a la teoría egológica del Derecho* (Faults in the egological theory of Law: Pizani 1954), where he takes up his ongoing polemic with the Argentinean philosopher of law Carlos Cossio. Venezuelan philosophers of law would feel the influence of this book for quite some time, as can be appreciated from the clear legal-positivist orientation they wound up taking.

In parallel, the *Universidad Católica Andrés Bello de Caracas* took in the academic Luis M. Olaso (of the *Societas Jesu*), who in time would place at the centre of the philosophical debate the discussion on human rights, later aggregating a large group of researchers with a strong inclination towards social critique.

Another noteworthy influence is the one that begins to gestate at the Institute of Political Science of the *Universidad Central de Venezuela*, initially with the work of Manuel García Pelayo (1909–1991) and subsequently with that of Juan Carlos Rey. They incorporated political categories into their reasoning, thus enriching their philosophical readings with concepts borrowed from the analysis of power, legitimacy, and the efficiency of norms. An analogous line would be taken up and developed at the University of Zulia's Institute of Philosophy under the direction of José M. Delgado Ocando. For the whole of five decades Delgado Ocando has steered his research activities towards an attempt to deconstruct the institutional framework that constitutes the law, looking at the philosophy of law from a topical perspective. Some of the prob-

lematic issues that have been discussed are the ones that deal with axiological relativity (there are no absolute values), the political character of justice, the negative and formal reach of democracy, and the study of legal semiotics with its social references. These studies have led him to propose a revision of the fundamental concepts of judicial and legal production and of the judges' theory of argumentation.

In turn, the University of Carabobo's important influence on the evolution of legal philosophy in Latin America has become effective in the work of Roque Carrión: Working out of the *Centro Latinoamericano de Investigaciones Jurídicas y Sociales* (Centre for juridical and social investigation of Latin America: CELIJS), he not only stimulated the use of analytical tools but also took it upon himself to carry out the inestimable task of academic-editorial management, thus introducing local philosophers to the work of some of the most outstanding scholars in Latin American philosophy. In informatics and in the semiotics of legal discourse, Carrión has oriented his research towards the semiosis of discursive legislative and discursive judicial signs. And in a secular way, he has managed to incorporate this perspective within the postulates of the logical and analytical semiotics of legal language, with an emphasis on analyzing the way the meaning of discursive legislative and discursive judicial signs is produced within the core of social life, thus highlighting the essential role of pragmatics in constructing the meaning of these two types of discourse.

Jesús Esparza has developed his research at the University of Zulia and the Rafael Urdaneta University, both located in Maracaibo. His line of research has attempted to chart a methodological path (metatheory) based on the formal analysis of normative sentences and their deductive possibilities. His work was originally centred around the logic of action based on deontic modalities, where permission, prohibition, and indifference are defined by way of derivation, assuming the Leibnizian modal tradition developed by Georg von Wright. His research is largely devoted to the attempt to trace clear paths by recourse to legal hermeneutics, but recently he has been trying to trace the bases for a comprehensive deductive system as a model of practical reasoning in the law. In another line of work, he has also brought forth politico-philosophical and existential reflections on the state, society, liberty, and culture.

The prolonged and rigorous academic activity of Rogelio Pérez Perdomo (1990) in several national and international institutions is most certainly worthy of attention. At the *Universidad Central de Venezuela* and the *Universidad Metropolitana* he concentrated on the developments of argumentative theory as well as on analyzing the role of values in legal education and the legal profession and studying the functioning of the administrative justice system. Then, at the *Instituto de Estudios Superiores de Administración* (Superior Administration Studies Institute: IESA), his focus turned to the shared values of the Venezuelan society and to the analysis of corruption. In his capacity as the academic director of the Standford's program in international law, he has worked

on the subject of Latin American legal culture and comparative law. He has also served as academic director for the *Instituto Internacional de Sociología Jurídica* (International Juridical Sociology Institute) in Oñati. In all of these studies he has given the philosophy of law a sociological and socio-historical focus.

Lastly, we must once again point out the *Universidad Central de Venezuela*, this time by reason of its Postdoctoral Program in Normative Studies under the direction of Julia Barragán: Just as the philosophy of law has grown richer with concepts drawn from political science, so this postdoctoral program has incorporated categories of analysis conceived in the theory of rational decision, the theory of games, and economic theory, with the intent of taking into greater account the complexity that characterizes this field of knowledge (cf. Aguiar et al. 2007, Barragán 2009). The program has done very important work in education—with researchers among whom one cannot fail to mention Elega Carolina Jiménez Sandoval and Miguel Ángel Latouche—as well as in its management of academics and publishing in collaboration with the likes of John Harsanyi and James Griffin, among other researchers. The program has served as a reference point in the legal-philosophical debate and has also contributed to broadening relations among academic institutions internationally. In concrete terms, Barragán's driving interest has been in matters of public decision, both in law and the economy as well as in public policy. In this latter field she has analyzed risk and uncertainty using tools drawn from the theory of legislation, institutional economics, the theory of rational decision, and especially the theory of games. Working on this basis, she has taken up social ethics by inquiring into the inherent problems affecting the design and functioning of institutions.

For ease of reference in the indexes that follow, letters belonging to alphabetic systems having a different arrangement than English have been slotted into the place they would occupy in the English alphabet. To this end we have adopted a criterion of similarity (for example, å = a). If an original work has been translated into English and the contributor has deemed it necessary, the title of that translation will appear next to the original title even if the former is not a literal translation of the latter.

TABLE OF CONTENTS

Part Three - Legal Realism

Part Four - Legal Reasoning

A NOTE ON THE AUTHORS AND THE CONTRIBUTORS - TOME 2

MAURO BARBERIS is professor of philosophy of law and jurisprudence at the University of Trieste (Italy) and at the Master's Programme on Global Rule of Law and Costitutional Rights (University of Genoa) and has written extensively on these topics. His books include *Libertad* (Nueva Vision, 2002), *La eterogeneidad del bien* (Fontamara, 2006), *Etica para juristas* (Trotta, 2008), *Juristas y filósofos* (Communitas, forthcoming), and *Introducción al estudio del derecho* (Palestra, forthcoming).

GUILLAUME BERNARD is senior lecturer supervising research at the Catholic University of the Vendée, where he teaches the history of law and political philosophy. Among the books he has published or coedited are *Introduction à l'histoire du droit et des institutions*, 2nd ed. (Studyrama, 2011) and *Dictionnaire de la politique et de l'administration* (Presses universitaires de France, 2011).

UTA BINDREITER is associate professor of jurisprudence at the Faculty of Law, University of Lund, Sweden. She is the author of *Why Grundnorm? A Treatise on the Implications of Kelsen's Doctrine* (Kluwer Law International, 2002) and is also the Swedish translator of the second (1960) edition of Hans Kelsen's *Reine Rechtslehre* (Thales, 2008). In June 2012, she was appointed by the Hans Kelsen Institute in Vienna to serve as the organization's international correspondent for the Nordic countries.

GIORGIO BONGIOVANNI is professor of philosophy of law and theory of law and justice at the University of Bologna and is assistant editor of *Ratio Juris*. His publications include a study on Kelsen's theory titled *Reine Rechtslehre e dottrina giuridica dello Stato* (Giuffrè, 1998); an analysis of neoconstitutionalism, *Costituzionalismo e teoria del diritto* (Laterza, 2005); an anthology on legal reasoning, *Reasonableness and Law*, edited with G. Sartor and C. Valentini (Springer, 2009); and "Neocostituzionalismo," in *Enciclopedia del diritto* (Giuffrè, 2011).

PIERLUIGI CHIASSONI is professor of jurisprudence and theory of legal interpretation at the University of Genoa, Italy. He serves on the editorial board of the journals *Ragion Pratica*, *Analisi e Diritto*, and *Nordicum-Mediterraneum* and is coeditor of *Materiali per una storia della cultura giuridica*. He also serves as president of the master-program Global Rule of Law and Constitutional Democracy,

and member of the Executive Committee of the IVR. Among his recent books are *L'indirizzo analitico nella filosofia del diritto*, vol. I, *Da Bentham a Kelsen* (Giappichelli, 2009); *Técnicas de interpretación juridica: Breviario para juristas* (Marcial Pons, 2011); *Desencantos para abogados realistas* (Externado, 2012); and *El análisis económico del derecho en los Estados Unidos* (Palestra, 2013).

EVELINE T. FETERIS is associate professor in the Department of Speech Communication, Argumentation Theory, and Rhetoric and a member of the Argumentation and Discourse research programme and of the research school of the International Learned Institute of Argumentation Studies (ILIAS). She is director of the master's programme Text and Communication. She is a member of the editorial board of the journals *Argumentation in Context*, *Legal Discourse and Communication*, and *Language, Law, and Interdisciplinary Practice*. She is a member of the editorial board of the series *Argumentation in Context* (John Benjamins). She has been a visiting professor at the University of Lethbridge and at Lund University.
Eveline Feteris's research concentrates on legal argumentation. She has written several books and academic volumes and many publications in international journals. Among her key publications are *Fundamentals of Legal Argumentation: A Survey of Theories on the Justification of Judicial Decisions* (Springer, 1999), also translated into Chinese, Spanish, and Turkish, and *Argumentation and the Application of Legal Rules*, cowritten with H. Kloosterhuis and H. J. Plug (Sic Sat, 2009). With C. Dahlman she has edited *Legal Argumentation Theory: Cross-Disciplinary Perspectives* (Springer, 2012).

EDOARDO FITTIPALDI is associate professor of sociology of law at the State University of Milan. He has been a visiting scholar at the University of Mannheim (Germany), where he prepared his book *Science of Law and Critical Rationalism* (Giuffré, 2003, in Italian) under the supervision of Hans Albert. He has written several books and essays on critical rationalism and Polish-Russian legal realism. In English he has published *Everyday Legal Ontology. A Psychological and Linguistic Investigation within the Framework of Leon Petrażycki's Theory of Law* (LED, 2012). In 2012, the University of Warsaw's Institute of Applied Social Sciences awarded him the distinction *Pro sapientia cum virtutis praescriptis adaequata* in recognition for his contribution to developing and disseminating Leon Petrażycki's ideas.

DAVIDE GROSSI is a lecturer at the Department of Computer Science of the University of Liverpool (UK). He graduated *cum laude* in Philosophy at the Scuola Normale Superiore of Pisa (Italy) and earned a Ph.D. in computer science at Utrecht University (the Netherlands). His research focuses on the foundations of artificial intelligence, and in particular on reasoning and decision-making. He is the author of over forty peer-reviewed articles in interna-

tional journals and conferences and has been awarded research grants from national research agencies in Luxembourg (Ministry of Culture, Higher Education, and Research), the Netherlands (NWO), and the UK (EPSRC).

STEPHAN KIRSTE is professor of legal and social philosophy in the Department of Economic and Social Sciences at the Law Faculty of the Paris Lodron University of Salzburg, Austria. He is president of the German section of the International Association for Legal and Social Philosophy (IVR). His main publications include *Die Zeitlichkeit des positiven Rechts und die Geschichtlichkeit des Rechtsbewußtseins* (Duncker & Humblot, 1998) and *Einführung in die Rechtsphilosophie* (Wissenschaftliche Buchgesellschaft, 2010), translated into Portuguese in 2013. He has also edited (among others) *Globalisierung als Problem von Gerechtigkeit und Steuerungsfähigkeit des Rechts*, with M. Anderheiden and S. Huster (ARSP-Beiheft 79, 2001); *Paternalismus und Recht*, with M. Anderheiden, P. Bürkli, H. M. Heinig, and K. Seelmann (Mohr, 2006); *Rechtsphilosophie im 21. Jahrhundert*, with W. Brugger and U. Neumann (Suhrkamp, 2009); and *Human Dignity and the Foundation of the Rule of Law*, with W. Brugger (ARSP-Beiheft 137, 2013).

HARM KLOOSTERHUIS holds an M.A. and a Ph.D. in argumentation theory and an LL.M. from the University of Amsterdam. He is a lecturer and researcher at the Erasmus School of Law in Rotterdam and a fellow at the Erasmus University College. His main research areas are legal argumentation theory, legal theory, and speech act theory. His publications include *Reconstructing Interpretative Argumentation in Legal Decisions* (Rozenberg Publishers, 2006) and *Argumentation and the Application of Legal Rules,* coedited with E. T. Feteris and H. J. Plug (Sic Sat, 2009). His articles on legal theory and argumentation theory have been published in *Argumentation*, *Ratio Juris*, and *Artificial Intelligence and Law*.

HANNA MARIA KREUZBAUER is assistant professor of legal philosophy at the University of Salzburg (Austria). She has co-founded the "Rector's Office – Rhetoric" and is author of *Die Norm im Völkerrecht* (LIT, 2006) and of articles that include "Topics in Contemporary Legal Argumentation: Some Remarks on the Topical Nature of Legal Argumentation in the Continental Law Tradition," *Informal Logic* (2008) and "So lange nicht alle Brot haben, soll niemand Kuchen essen: Überlegungen zur Modellierung präferenzethischer Gerechtigkeit" (2014). Her research interests include legal argumentation and rhetoric, ethics, and the metaphysics of law.

GIUSEPPE LORINI is associate professor of legal philosophy in the Department of Law at the University of Cagliari. He is the author of *Dimensioni giuridiche dell'istituzionale* (CEDAM, 2000); *Oggetto e atto: Contributo alla Filosofia del*

diritto (Giappichelli, 2008); and *Il valore logico delle norme* (Adriatica D.A., 2d ed., 2012). With A. G. Conte, P. Di Lucia, A. Incampo, and W. Żełaniec he has co-written *Ricerche di Filosofia del diritto* (Giappichelli, 2007). He is editor of *Atto giuridico* (Adriatica, 2002). He has co-edited *Filosofie della norma*, with L. Passerini Glazel (Giappichelli, 2012), and *Antropologia della vendetta*, with M. Masia (Edizioni Scientifiche Italiane, 2015).

CARLOS I. MASSINI-CORREAS holds a Ph.D. in legal and social sciences and one in philosophy. He holds the chair in legal philosophy and bioethics at the University of Mendoza in Argentina, where he also directs the Institute of Practical Philosophy. He has served as principal investigator at Argentina's National Council of Scientific Investigations (CONICET) and as academic secretary at the University of Mendoza. He has published twenty-eight books and over 170 articles in Europe and the United States on issues in legal and political philosophy, as well as in ethics and bioethics. His most recent books include *Filosofía del Derecho* (Lexis-Nexis, Abeledo Perrot, 2005–2008); *La ley natural y su interpretación contemporánea* (Universidad de Navarra, 2006); and *Derecho natural, derechos humanos y gobierno del derecho* (2014). He has been a visiting scholar at the Universities of Münster, Paris, Navarra, La Coruña, and Notre Dame, as well as the Universidad Panamericana de México and the Universidad de los Andes de Santiago de Chile.

MÁTÉ PAKSY is currently a lecturer in the Department of Legal Philosophy at the Law School of the Pázmány Péter Catholic University in Budapest, where he teaches legal and political philosophy. He submitted his doctoral dissertation in 2011, on H. L. A. Hart and the French tradition in legal philosophy. He has published extensively in English, French, and Hungarian on Dworkin, Hart, Kelsen, Leibniz, Maritain, and Sieyès among others. His publications include *Ius Unum, Lex Multiplex*, edited with I. H. Szilágyi (2005); *Theory of State*, edited with I. H. Szilágyi (2005, in Hungarian); *Theatrum Legale Mundi*, edited with P. Cserne et al. (2007); *European Law and Legal Philosophy*, edited (2008); *Recta Ratio*, edited with Sz. Tattay (2014, series in Hungarian); *Archaeology of Constitutionalism* (2014, in Hungarian); and the *Attraction of Dialogue* (2014, in Hungarian). With Szilárd Tattay he founded the book series *Recta Ratio*. He has conducted his postdoctoral research as a visiting academic at the University of Toronto School of Law, the Max Planck Institutes in Frankfurt and Heidelberg, and the Centre de Théorie et Analyse du Droit (Université Paris Ouest, Nanterre La Défense), and recently at the University of Glasgow School of Law.

ENRICO PATTARO was born in Rome on April 8, 1941. He has taught philosophy of law and legal informatics at the Bologna University Faculty of Law,

serving as dean from 1977 to 1979. He is now professor emeritus at the University of Bologna. His fields of research are legal philosophy, the history of ideas, and legal informatics. He has published fifteen books and more than two hundred articles. Of these he likes to recall "Validità o verificabilità del diritto?," *Rivista trimestrale di diritto e procedura civile* (1966) and *The Law and the Right: A Reappraisal of the Reality That Ought to Be* (Springer, 2005). His achievements include founding CIRFID (Centre for Research in Legal Philosophy and Legal Computer Science) in 1986, and *Ratio Juris: An International Journal of Jurisprudence and Philosophy of Law* (Oxford, UK) in 1987, as well as conceiving and designing the present multi-author *Treatise of Legal Philosophy and General Jurisprudence* in the late 1990s, realizing it in twelve volumes published by Springer from 2005 to 2016. He has served as president (1995-1999), and is now honorary president, of the International Association for the Philosophy of Law and for Social Philosophy (IVR).

ANTONIO ENRIQUE PÉREZ LUÑO is professor emeritus of legal philosophy and former dean of the Seville University School of law. He holds a Ph.D. from the University of Bologna, and he further pursued his education in Coimbra, Trieste, Freiburg, and Strasbourg, where he was awarded a certificate by the Faculty of International Comparative Law. He has also received research grants from various institutions, such as the Max Planck Institut in Heidelberg, the Juan March Foundation, and the Coal and Steel Research Fund.
He has written widely on the history of legal thought, law and technology, and human rights and the rule of law. His most significant works include *Lecciones de Filosofía del Derecho* (Minerva, 2008); *La Filosofía del Derecho en perspectiva histórica* (Publicaciones de la Universidad de Sevilla, 2009); *Derechos humanos, Estado de Derecho y Constitución* (Tecnos, 2010); *Nuevos retos del Estado constitucional: Valores, derechos, garantías* (Universidad de Alcalá, 2010), which also came out in a Portuguese edition titled *Perspectivas e tendências atuais do Estado Constitucional* (Livraria Do Advogado, 2012); *Los derechos fundamentals* (Tecnos, 2011); *El desbordamiento de las fuentes del Derecho* (La Ley & Wolters Kluwer, 2011); *Los derechos humanos en la sociedad tecnológica* (Universitas, 2012); and *Teoría del Derecho* (Tecnos, 2014).

ANTONINO ROTOLO is professor of philosophy of law at the Bologna University School of Law. He is currently deputy head of the Department of Legal Studies and a board member of CIRSFID (an interdepartmental research centre based at the Bologna University School of Law), where he carries out international research on knowledge representation in the legal domain, normative systems and game theory, and logics for normative multi-agent systems. He has written extensively on legal logic, artificial intelligence and law, formal methods of practical reasoning, and deontic logic. Antonino Rotolo has

been an invited speaker at several international seminars and workshops, and has served as program chair or on the program committee for more than seventy international conferences. He is a reviewer for many academic journals, a member of the editorial board of the journal *Artificial Intelligence and Law* (Springer), and assistant editor of *Ratio Juris: An International Journal of Jurisprudence and Philosophy of Law* (Wiley) and of *A Treatise of Legal Philosophy and General Jurisprudence* (Springer).

CORRADO ROVERSI is currently a lecturer at the Bologna University School of Law, where he teaches legal philosophy. He has given talks and presented papers at several international workshops and conferences. Among his publications are *Pragmatica delle regole costitutive* (GEDIT, 2007); "On Constitutive Normativity," in *New Essays on the Normativity of Law*, ed. G. Pavlakos and S. Bertea (Hart Publishing, 2011); *Costituire: Uno studio di ontologia giuridica* (Giappichelli, 2012); "Acceptance Is Not Enough, but Texts Alone Achieve Nothing: A Critique of Two Conceptions of Institutional Ontology," *Rechtstheorie* (2012); and "Conceptualizing Institutions," *Phenomenology and the Cognitive Sciences* (2013).

TORBEN SPAAK is professor of jurisprudence in the Department of Law at Stockholm University. He is the author of *The Concept of Legal Competence: An Essay in Conceptual Analysis* (Dartmouth Publishers, 1994); *Guidance and Constraint: The Action-Guiding Capacities of Theories of Law* (Iustus, 2007); and *A Critical Appraisal of Karl Olivecrona's Legal Philosophy* (Springer, 2014); as well as of number of articles and review articles in journals like *Analisi e Diritto*, *Archiv für Rechts- und Sozialphilosophie*, *Ethics*, *Jurisprudence*, *Law and Philosophy*, *Ratio Juris*, *Theoria*, and *The Theory and Practice of Legislation*. He is also series coeditor of the Springer *Law and Philosophy Library* book series and has twice been a visiting professor at the University of Minnesota Law School.

ELENA V. TIMOSHINA holds a doctoral habilitation in legal sciences and is professor in the Department of Theory and History of State and Law at the Saint Petersburg State University. She is the author of *How Is the Theory of Law Possible? The Epistemological Foundations of the Theory of Law in Leon Petrażycki's Interpretation* (Moscow, 2012, in Russian). She has edited Leon Petrażycki's *Theory and Policy of Law* (Saint Petersburg, 2010, also in Russian), a comprehensive compilation of Petrażycki's German, Russian, and Polish works.

STAMATIOS TZITZIS is director at the French National Centre for Scientific Research and associate professor at the Laurentian University in Sudbury,

Ontario, Canada. He is deputy director of the Paris Institute of Criminology and Penal Law. He is also lecturer at Pantheon-Assas University, at the Institut Coeur Effort Santé, and at the Catholic Institut of Paris. Several of his works have been translated into Greek, English, Spanish, Italian, and Portuguese. Among them are *La Philosophie Pénale* (PUF, 1996); *Esthétique de la Violence* (PUF, 1997); *Qu'est-ce que la Personne*? (Armand Colin, 1999); *La Personne, L'Humanisme, Le Droit* (Les Presses de l'Université Laval, 2001); *La vittima e il carnefice: Lezioni romane di filosofia del diritto*, ed. F. d'Agostino and F. Macioce (Guiffrè, 2004); and *La Personne. Criminel et Victime* (Les Presses de l'Université de Laval, 2004).

CSABA VARGA is professor emeritus at the Pázmány Péter Catholic University, founder of its Institute for Legal Philosophy, and research professor emeritus at the Institute for Legal Studies of the Hungarian Academy of Sciences. He is the author of *The Place of Law in Lukács's World Concept* (1985); *Codification as a Socio-Historical Phenomenon* (1991); *Theory of the Judicial Process* (1995); *Transition to Rule of Law* (1995); *The Paradigms of Legal Thinking* (1999); *Transition? To the Rule of Law?* (2012). His papers, including some in English, are collected in *Law and Philosophy* (1994); *Comparative Legal Cultures* (2012); *Theory of Law* (2012); and *Contemporary Legal Philosophising* (2013). He has been awarded the Széchenyi Prize, the highest recognition available for scholarly achievement in Hungary.

FRANCESCO VIOLA is professor emeritus of legal philosophy. Since 1986, he has been teaching legal philosophy, the general theory of law, human rights, and legal ethics at the University of Palermo (Italy). He is coeditor of a series on legal philosophy; coeditor-in-chief of *Ragion Pratica*, a journal on practical philosophy; and coeditor-in-chief of *Ars Interpretandi*, a journal on legal hermeneutics. Since 2001, he has been director of the Law and Politics section of the new edition of an encyclopedia of philosophy published by Bompiani. From 2010 to 2014, he served as president of the Italian Association for Legal Philosophy and as editor-in-chief of its journal of legal philosophy. His twenty-five books and 229 essays are devoted to issues in legal science and legal interpretation and to the concept of a legal rule, Hobbes's legal thought, the concept of legal and political authority, the legal order and the legal system, human rights and natural law, legal hermeneutics, law and morality, nature and rights, and multiculturalism. Lastly, with I. Trujillo, he published *What Human Rights Are Not (or Not Only): A Negative Path to Human Rights Practice* (Nova Science Publishers, 2014).

JAN WOLEŃSKI is professor emeritus of philosophy at the Jagiellonian University in Kraków and professor at the University of Information Technology

in Rzeszów. He is also a member of the Polish Academy of Sciences, the Polish Academy of Arts and Sciences, the International Institute of Philosophy, and the Academia Europea. His research areas include philosophical logic, epistemology, the history of logic, and legal philosophy. He has published thirty books in Polish, English, French, Russian, Romanian, and Spanish, as well as more than one thousand papers in all fields of philosophy.

WOJCIECH ŻEŁANIEC is a philosopher with a background in mathematics and linguistics, and a generalist who draws on Aristotelianism, phenomenology, and analytic philosophy. He is currently director of the Chair of Ethics and Social Philosophy at the University of Gdańsk (Poland). His recent publications include *Laws of Essence or Constitutive Rules? Reinach vs. Searle on the Ontology of Social Entities,* with B. Smith, in *Eidetica del diritto e ontologia sociale: Il realismo di Adolf Reinach / Eidetics of Law and Social Ontology: Adolf Reinach, the Realist*, ed. F. De Vecchi (Mimesis, 2012); "A Solution to the Problem of a 'Principle of Individuation'," *Filo-Sofija* (2013); *Create to Rule: Studies on Constitutive Rules* (LED, 2013); "An Example of the 'Synthetic a Priori': On How It Helps Us to Widen Our Philosophical Horizons," *Semiotica* (2013); "On the Value of Eccentricity," *Rivista di Estetica* (2014).

MAURO ZAMBONI is professor of legal theory at Stockholm University (Sweden) and visiting professor at the University of Groningen (The Netherlands). His fields of interest are jurisprudence, transnational corporate law, and the relationship between law and politics (mostly from a legal-theoretical perspective). His main publications in recent years include "From 'Evolutionary Theory and Law' to a 'Legal Evolutionary Theory'," *German Law Journal* (2008); *Law and Policy: A Long (and Bright) Way to Go*, in *Law of the Future and the Future of law*, ed. S. Muller, S. Zouridis, M. Frishman, and L. Kistemaker (Torkel Opsahl Academic EPublisher, 2012); and *'Makers' vs. 'Markers': Are Constitutional Courts Political or Legal Actors?*, in *On Judicial and Quasi-judicial Independence*, ed. S. Comtois and K. de Graaf (Eleven International Publishing, 2013).

Part One

Natural Law Theory

Chapter 1

INTRODUCTION: NATURAL LAW THEORIES IN THE 20TH CENTURY

by Francesco Viola

If Karl Magnus Bergbohm (1849–1927) had lived later in the 20th century, he would have had an opportunity to use his bloodhound's sense of smell with much greater satisfaction in sniffing out the hidden presence of natural law in the legal doctrines of the time (see Bergbohm 1973). I will try to carry on his work, certainly without his acumen, but also without his preconceived hostility.

We need to preliminarily distinguish natural law from the *doctrines* of natural law. The latter are manifold and often very different from one another, but they are linked by the persistence of an identical problem, that of the existence of a law not produced by man or, more modestly, of the presence in positive law of some strictly legal elements not posited by man. That is natural law as a problem, while a natural law doctrine is any of the possible answers to that problem. The problem is one, the answers many. The problem persists throughout the history of legal thought; the answers appear and fade away and return, at times in a renewed form, but they always depend on the historical evolution of positive law.

Natural law theory can present itself as a deontological conception of law, that is, it can say the way positive law *ought* to be. From this point of view it is distinguished from other deontological conceptions of law by the way it identifies the criteria of the legal ought.

Natural law theory can also present itself as a theory of law, that is, it can describe law as it is. From this point of view it is distinguished from other theories by the way it defines the *concept* of law. It is only in this second sense that natural law theory can properly be situated in the sphere of the knowledge of law and so can be compared with, and can compete with, other theories of law, and in particular with legal positivism.

In the first sense natural law theory belongs to the sphere of ethics or politics or, more precisely, to the sphere of the moral or political criticism of positive law, and in principle it is compatible with legal positivism. Nevertheless, in the history of legal thought it is not at all easy to distinguish the two meanings of natural law theory, in part because a deontological conception of law often presupposes a concept of law already fraught with elements of natural law.

Since the most typical and controversial meaning of natural law theory is the one linked to its claim to be a theory of law, attention will be paid here to this meaning.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_29

Natural law theory as a theory of law is generally speaking interested in addressing some of the following contentions: (1) that law must be described in light of its practical sense, that is, it must be described as a reason for action; (2) that the contents of law cannot be determined regardless of an attentive look at human nature; (3) that legal theory implies value judgments with a cognitive content; (4) that law and morality are necessarily connected; and (5) that natural law has a legal character.

Obviously, it is very unlikely that a doctrine of natural law should endorse *all* of these contentions, and so there will be stronger and weaker conceptions of natural law. Which of these contentions are strictly indispensable in characterizing a theory of law as a natural law theory? Which of these characteristics is the strictly indispensable one, without which one can no longer speak of a natural law theory? It is impossible to answer this question without moving into the internal point of view of a doctrine of natural law. For this reason, in this historical investigation we will adopt the broadest possible meaning of natural law theory.

For natural law theory to maintain its salience, it cannot just recognize that positive law in its origin and in its practical application is not self-sufficient, having to resort to external elements (of a moral, social, or economic nature). Nor even can it just observe that legal systems, as cultural expressions, are steeped in positive morality. Rather, the stronger claim to be made is that factors not ascribable to human will play a normative role and are already marked by their own legality, even if they still need to be taken through a process of positivization. This also explains why among the distinctive characteristics of natural law theory I have not included the distinction between what is natural and what is artificial. The fact is that not everything that is artificial stands in opposition to nature, and indeed nature, if it is to have any value, always needs to be expressed by human work.

After a century marked by legal positivism, on different occasions the 20th century witnessed a return to natural law. This is not so much due to antipositivism, which grouped a range of philosophical tendencies (see Fassò 2001, 214). Indeed, the reciprocal independence of philosophical and legal positivism has been abundantly demonstrated (see, for instance, Pattaro 1974a). The reason is instead to be sought in the conjunction between social transformation and the triumph of legal-philosophical speculation, which became autonomous both from the philosophers' philosophy of law and from the jurists' philosophy of law.

Three revivals of natural law can be identified: one at the beginning of the 20th century, one provoked by World War II, and one proper to contemporary constitutionalism beginning in the last two decades of the 20th century. All three belong to the so-called short century, but we need to realize that the same label encompasses a broad spectrum of different cultural phenomena and philosophical trends. If there are three rebirths, it means that there have been as many deaths or crises (see Bobbio 1965a, 180) and consequent returns of legal positivism (cf. Lang-Hinrichsen 1954).

(1) The revival of natural law in the early 20th century was in reality brought about by a dissatisfaction with 19th-century legal positivism, which in general had pursued the objective of rigorously separating out the legal sphere, unduly neglecting moral ideals and the social bases of law.
(2) The revival of natural law after World War II was obviously prompted by the fact that evident and serious violations of human dignity had been permitted or at least not prevented by positive law, so it was felt necessary to avoid that from happening again.
(3) The revival of natural law at the end of the 20th century was provoked by the greater role the question of human rights assumed within constitutional regimes, with the consequent transformation of the very way of conceiving positive law. Here the rebirth of natural law is confused, often indistinguishably, with the crisis within legal positivism.

1.1. The First Revival

1.1.1. Natural Law and Legal Science

In 1854, Bernhard Windscheid proclaimed that "the dream of Natural Law is over," but in 1884 he reluctantly admitted that the dream of "a universal, fixed and unchanging law grounded in reason" was still alive (Windscheid 1904, 9, 105; translated in Bjarup 2005a, 292).

In the early 20th century, when post-Kantian natural law theory had long since died out (see, for instance, Ahrens 1838–1840), the revival of natural law was possible because of the wearing out of legal positivism and the renewal of Catholic natural law theory, though the two cultural phenomena developed separately and remained separate.

Within legal positivism there emerged nonpositivist tendencies that confusedly manifested a restlessness and increasing dissatisfaction in legal science. This, however, often did not mean an explicit recourse to natural law, which in the most benevolent cases was seen as a morality external and extraneous to positive law. At the same time, Catholic natural law was developing its own moral theory, freeing itself of eclecticism. In this way it was able to intervene in the theoretical debate about law and legal science, but with results limited to the sphere of jurists of Christian persuasion. This new cultural climate helped to accredit the plausibility of natural law orientations. This is precisely the connotation of the first revival of natural law, meaning that its presence was accepted where it had hitherto been radically denied.[1]

The slow and systematic construction of 19th-century legal science had been possible because it did not presuppose a law at the mercy of a fluctuating

[1] A reconstruction of this reappraisal of the concepts of natural law in Europe and in the United States can be found in Haines 1930.

sovereign will: Rather, on Savigny's conception, law harked back to an objective order existing in society, an order from which it drew all its stability (see Fioravanti 2011). Once the fundamental legal categories had been worked out, positive law had lost contact with its social bases on the assumption that lived a life of its own. In the place of society and the people there now was the state, that is to say, an artificial order. Therefore, the formula of the *Rechtsstaat* is representative of this self-foundation of law in the 19th century.

This state of affairs went through a crisis when the issue of the correctness of judges' decisions could not be fully resolved by an appeal to strict conformity with the legal norms (see Schmitt 1912). Legal claims may be grounded in sources other than the statutory law. The possibility of *contra legem* law is accepted. These other sources can be those of legal praxis or of legal science itself, but also, deeper down, those of social life.

Although in the first decade of the 20th century many works were published on natural law, the first scholar expressly to speak of a rebirth of natural law was Joseph Charmont (1910).[2] He saw it as a form of "legal idealism" that accorded legitimacy to those moral claims which would have been disqualified had law been merely seen as a set of technicalities. More than to natural law, however, Charmont, following in the footsteps of Raymond Saleilles (1902), made reference to natural rights as having their origin in the 17th- and 18th-century classical school of natural law (see Solari 1904) and their full development in the French Declaration of the Rights of Man and of the Citizen and the American Declaration of Independence, as well as in Kant's thought. What Charmont defended was above all the role of the subject of law, sterilized mostly at the hands of utilitarianism and philosophical positivism. He very clearly saw the problem of the conflict between law and individual conscience and reevaluated the thought of Rudolf von Jhering, who unlike Savigny stressed the active role of the struggle for subjective rights and the importance of aims in law.[3] However, Charmont did not appear very consistent with his Christian subjectivism when he traced the causes of the revival of natural law to the organicistic solidarism of Émile Durkheim, to Gény's theory of free scientific research, and even, albeit with some reservations, to the theory of objective law advanced by Léon Duguit, regarded as a crypto–natural lawyer (see also Haines 1930, chap. 10). These references would have required greater consideration of natural law as an objective morality.

Indeed, the renewed attention to natural law in legal science was hindered by the circumstance that natural law was confined to the field of morality and clearly distinguished from positive law. Even if, as Jean Dabin (1928, 431) remarked, the natural law of moralists could be accepted by jurists as a rational

[2] For what can be considered a corresponding text in American culture, see the article by Morris Raphael Cohen (1916).

[3] As we shall see, this reference to Jhering's thought would assist the first rebirth of natural law.

ideal law, it remained external to positive law (see Ripert 1918), while as a subjective right it could give rise to legal claims.

However, a true rebirth of natural law cannot be described solely by reference to Enlightenment natural rights. It is necessary above all that objective moral values be perceived as meaningful for the concept of positive law. We will start by examining the evolution of the relation between natural law and morality, and then we will consider the cultural phenomenon involving legal science taking up ethico-social concerns.

1.1.2. Catholic Natural Law Theory

In the early 20th century, natural law became a candidate for serving a dual function, to use a distinction drawn by Lask (1950, 6–7). From a formal point of view (formal natural law) it presented itself as a criterion for the validity of positive law and as a foundation of its normativity (a metaphysical doctrine of the sources of law); from a material point of view (material natural law) it sought to dictate the necessary contents of positive law. To be sure, recourse to metaphysics was not seen favourably by the dominant philosophy; for its part legal science did not appreciate the lack of any distinction between morality and law, for it was concerned to defend the principle that formal legality should be equidistant from ethical ideals and from mere facticity. Set in opposition to "the idealistic doctrine of natural law," then, was "the realistic doctrine of positive law" (Bergbohm 1973, 144; my translation).

As is well known, the main defence of natural law came from the long tradition of the Catholic Church, which had long been going through a period of internal cultural travail. From the standpoint of natural law, this change of heart did not concern the traditional contents but rather affected the theoretical bases. These were primarily of a theological nature and so not very meaningful to nonbelievers.

There are two ways of considering natural law: as a universal morality founded on a general idea of human nature and on the use of natural reason, and as a specific moral tradition that formed within the Christian faith and in the shadow of the Scriptures (see Porter 2003, MacIntyre 1988). For the medieval Schoolmen, who sought to carry forward the Greek and Roman tradition, both Scripture and reason are expressions of the same divine wisdom and so are isomorphic. Not only was natural law inspired by Scripture, but the latter was also interpreted in light of natural law. In modernity, the two sources of Christian revelation, reason and Scripture, have become independent of one another, even though they are compatible. For Grotius, Hobbes, and Locke, Scripture validates what reason discovers on its own. But when the possibility of a scientific knowledge of morality is affirmed, natural law is conceived as a set of rational rules deduced from first principles and there is no further need for Scripture. Accordingly, the survival of Catholic natural law theory was made to depend on

the possibility of showing that its specific contents were grounded in a rational ethics set in contrast to Enlightenment ethics. But in the early 19th century, Catholic doctrine did not yet have a philosophical compactness of its own and became eclectic, with strong influences coming from Locke's natural law theory and Condillac's sensationalism. Still, in mid-19th century, the signs of a revival of the Catholic philosophical tradition of law became clearly manifest above all in the thought of Antonio Rosmini (1841–1843) and in that of Luigi Taparelli d'Azeglio (1840–1843). At the end of the 19th century, a return to the thought of Thomas Aquinas provided a more rational foundation for the Catholic doctrine of natural law, which was completely reworked. Even today Thomist thought can be said to remain the only organic doctrine of natural law, both inside and outside the Catholic Church. In Protestantism, natural law began to draw philosophical attention only after the tragic experience of the Holocaust.

Throughout the 20th century, the Aquinas's thought showed its remarkable ability to survive its transient interpretations. Consequently, Catholic natural law theory contains a variegated range of approaches to his thought on law and justice. After pointing out what the principal approaches are, I will try to outline the elements they have in common so as to provide a general identification of this current of thought.

The rebirth of Thomism in Catholic thought was supported by Leo XIII's the encyclical letter *Aeterni Patris* (1879), and it started in pontifical universities, and so in an ecclesiastical milieu, owing to the cultural training of the clergy. (For this reason its first organic expression was markedly Scholastic, though it was very different from its medieval expression.) But with the rise of the social question and the exhortations contained in the 1891 *Rerum Novarum*, the social part of Catholic doctrine began to gain wider currency.

The philosophical and theological movement of neo-Scholasticism was promoted above all by the Jesuits at the end of the 19th century, and it quickly spread not only in Italy but also in Belgium, France, and Germany, aspiring to take on the role of the philosophy proper to the Catholic Church. Especially with regard to natural law and morality, the German-speaking countries were the most fertile for this school of thought,[4] both because of the strength of a rationalistic tradition that overstressed the connection between Thomas Aquinas and Christian Wolff and because of the need to give cultural substance to the political presence of the Catholics in Bismarck's Germany. So imposing was this movement that it led some to speak of a "restauratio christiana juris naturalis" (Hollerbach 1974, 114).

In general the attitude of neo-Scholasticism was that of frontal opposition to the philosophical currents dominant at different times: first to positivism,

[4] Here we can point to the works of Theodor Meyer (1885), Georg von Hertling (1893), Johann Haring (1899), Constantin Gutberlet (1901), Joseph Mausbach (1918), and Martin Grabmann (1922).

neo-Kantianism, and neoidealism, and then to Marxism, phenomenology, existentialism, and analytical philosophy—all immanentist philosophies. For this reason, too, neo-Scholasticism took on a rationalistic form very distant from the ancient Christian moral tradition. Not satisfied with so many external enemies, it also provoked lively and at times very heated debates. Neo-Scholasticism persisted until after World War II, though it gradually abandoned its original expository style.

Neo-Scholasticism was a method for studying and expounding Aquinas's thought, a method that inevitably became a way of interpreting it. With this rigorously and rigidly syllogistic method, neo-Scholasticism was dry, confutative, and peremptory. The tendency was to establish philosophical and theological theses distinctive to Catholic thought. Among them there were, obviously, those regarding natural law and the relation between law and morality. For a paradigmatic example of this style of thought, one need look no further than the work of the Jesuit Victor Cathrein (1845–1931). His writings, among which there are some on law (see Cathrein 1891, 1901), spread widely and have been reprinted in numerous editions down to our own day.

The study of Aquinas refused to be imprisoned in Scholastic methods, and after a few decades the need was felt for a direct contact with his writings, that is to say, a contact no longer mediated by traditional commentators and no longer couched in stereotyped formulas. In some measure, this made it possible to recover the old Scholastic tradition founded more on the universality of human capabilities and virtues than on that of moral norms (see Sertillanges 1916). This new tendency, which spread above all in the French-speaking countries, favoured a historical approach over a systematic one, something that had already been prefigured by Martin Grabmann and his school. One of the first works in this direction was concerned precisely with natural law, and it is that of Odon Lottin (1931).

Among the advantages of historiographical research were that it brought out the rich complexity of Aquinas's practical philosophy, and they reignited the issue of his relation to metaphysics. The fact is that the rigorously deductive method by which moral problems were dealt with in neo-Scholasticism were not well-suited for practical reason. The disadvantages, by contrast, were those of any historiographical research, meaning that it cannot present itself as a militant philosophy. Still, the direct approach to Aquinas's texts and its intellectual attitude helped to free Catholic thought from the *hortus clausus* of ecclesiastical universities and sparked the interest of lay intellectuals. This fostered greater freedom compared to other ecclesiastical traditions of thought, as well as greater creativeness in its applications.

The fruits of this second phase would be seen much later, when Thomism became disconnected from political conservatism, with which it had been once identified, even though that connection was not at all obvious (see Maritain 1984, 1988b). Another later consequence was that non-Scholastic theories of

natural law were modelled, as those of Heinrich Rommen and Jacques Maritain, to whom we will return.

The last phase in the interpretation of Aquinas in the 20th century sees a departure from a holistic reconstruction of his thought and the development of largely independent currents, including one that focuses on practical reason, the sphere in which natural law belongs (see Viola 1998). This allows us to bracket off, without wholly forgetting, both the theological drive and the metaphysical foundation of natural law, while at the same time abandoning neo-Scholastic rationalism once and for all. This new orientation tends to equate the problems of natural law with that of ethical cognitivism understood in terms of practical reasonableness, and it is also nurtured by important contributions from Anglo-Saxon culture, both English and American.

We will now try to identify the elements common to the treatises on natural law in the first phase of Thomism by taking Cathrein's conception as paradigmatic, for it is much more clear-cut and rigorous than the others. The other two phases will instead be mentioned in connection with their respective historical periods.

As is well known, natural law theory also serves a political function, one that cannot be fully understood without keeping social context in mind. At the beginning of the 19th century, during the Restoration, the main problem of Catholic political thought was that of the justification of authority. At the end of the 19th century, it instead became more urgent to justify obedience to the commands of this authority, since the throne was moving further and further away from the altar. For this reason the question of law took on an absolutely central role as an intersection of theology, metaphysics, and morality.

According to Catholic doctrine, the obligation to obey positive law is a moral obligation. This means that this obligation is ultimately founded on God, from whom there originates both the order of nature and that of morality. Only God can create obligations for beings who are created free, and God does that through the law. Human law is the last link in a chain that begins with eternal law, and its fulcrum lies in natural law. This scheme is common to Catholic natural law theory throughout time. But within the scheme, variants are possible that may even differ widely from one another.

According to Cathrein (1893, 146, n. 199), moral obligation derives from a theoretical truth that indicates what actions are intrinsically good or bad. This truth concerns human nature as shaped by a rule of reason drawn from natural inclinations. Here we should note the strict derivation of the practical norm of human action from creationist metaphysics.

As regards the relation between natural law and positive law, certainly Cathrein reprises Aquinas's theses on the two modalities of derivation (*ad modum conclusionis* and *ad modum determinationis*), though without emphasizing the distinction between them. But in any case the moral bindingness of positive law depends entirely on its conformity to natural law, which in itself can

constitute a true legal order needing the positive order especially for a more effective protection of the natural laws themselves. Hence Locke is not entirely forgotten, while the polemic target is Kant and his distinction between morality and law, the moral order and the legal order.

According to Cathrein (1893, 216–7, n. 297), without a natural legal order, positive law could never be deemed unjust, there would be no intrinsically unjust actions, and international law would be impossible. This is considered that part of positive law which is most directly dependent on natural law, and hence superior to the law of the state itself.

Despite this strong natural law theory, Cathrein endorses the positivist idea of the importance of constituted authority. When faced with the issue of whether the judge can directly resort to natural law, Cathrein agrees that the duty attached to that office is to apply the positive law even though it may be unjust law, unless the injustice is so serious as to force the judge in conscience to resign. This means that safeguarding the constituted order is regarded as a dictate superior to considerations about the justice of any single law.

Cathrein's doctrine, though much admired for its stringent rigour, appeared too rigid and compact to be able to influence legal science, including the kind of legal science that was open to natural law. The immutability of natural law was affirmed in an absolute way (ibid., 175, n. 236–8). Yet Aquinas himself, following Aristotle, had spoken of the *mutability* of human nature, and so of natural law. This implied that the positive legal order had a much more significant role than it was recognized to have by Cathrein, and as a result it proved more acceptable to jurists (see Dabin 1928, 432). Even so, Cathrein's thought has stood as the most consistent model of natural law theory in the legal imagination, especially for the purpose of *refuting* that theory.

In conclusion, the general characteristics of Catholic natural law theory can be listed as follows: theism, a metaphysical foundation based on a correspondence of the order of the good with the order of being, objective ethics and ethical cognitivism, a teleological derivation of the precepts of natural law from human nature, the universality and immutability of natural law, and the axiological conformity of positive law with natural law.

Each of these tenets has been bitterly challenged by adversaries. The most common accusation has been an undue derivation of normativity from human nature (see Kelsen 1949b, 484), that is to say, from empirical natural inclinations, which in fact Locke had rightly rejected as a criterion of morality. But according to Aquinas, the forms of the good, which natural law is aimed at, are learned by reason as "those things to which man has a natural inclination" (*Summa Theologiae*, I–II, 94, 2). So it is reason that distinguishes good desires from bad ones, both present in human nature (see Zuckert 2007). According to Scholastic philosophy, reason is not sufficient for there to be normativity, and the transcendence of being and the good is necessary, and only theism suc-

ceeds in founding normativity. For this reason Catholic natural law theory is opposed to the immanentism and mechanicalism typical of modernity.

In answering these criticisms, Catholic natural law theory has shown a certain capacity for flexibility and evolution, but never to the point of losing sight of the pedigree traced out above. The very understandable general tendency has been to increasingly underline the role of human reason in knowing good and evil, the just and the unjust, thus making such knowledge independent of any given conception of divinity, but never going so far as to embrace immanentism. If the theses advanced by Cathrein, for whom natural law consists in unchangeable precepts drawn from human nature as willed by God,[5] are compared with the more recent ones of John Finnis, for whom natural law consists in evident principles of practical reasonableness, it will become possible to appreciate the way and the extent to which a doctrine claiming to be immutable can change.

Strictly speaking, neo-Scholastic natural law theory is not a theory of law but a theory of morality, a reduction of natural law to moral philosophy (see Brieskorn 2009). This is the main reason why Catholic natural law theory did not succeed in making its way into the debates in philosophy and legal science, remaining a body extraneous to them throughout the first half of the 20th century. However, some claims of natural law not infrequently presented themselves within the theories of positive law. And it is that story that I intend to reconstruct here.

1.1.3. Formalism and Natural Law

In the second half of the 19th century, legal philosophy took its first steps as a discipline independent of both general philosophy and legal science. But the path was not easy, for on one hand, in order for legal philosophy to be recognized as a true philosophical discipline, it had to establish a close connection with the dominant currents of the time, which were positivism, neo-Kantianism, and neoidealism, but on the other hand, these philosophical orientations did not pay adequate attention to the legal phenomenon. Philosophical positivism considered law an antiquated technique of social control; neo-Kantianism tended only to think of it in the framework of outward precepts and their coerciveness; neoidealism either reduced it to economics or drowned it in ethics. Accordingly, philosophers of law almost always appeared heterodox in a tradition of thought they themselves worked in, and so they were looked on with suspicion by philosophers at large. While philosophers demoted them to the rank of jurists, the latter did not regard them as belonging to their club (see Cammarata 1922, for example, as concerns Italy).

Indirect help came from attempts to free legal science from "metaphysics" and from identification with the *iuris naturalis scientia* of modernity, bringing

[5] "Ergo reicienda est *moralis* quae vocatur *independens* seu *laica*" (Cathrein 1893, 161 n. 219).

an empirical scientific approach to bear on legal science in hopes of finding common concepts and rules within the legal system and between different legal systems. In 1890, the German jurist Adolf Merkel (1836–1896) published *Elemente der allgemeinen Rechtslehre* (Elements of the general theory of law: Merkel 1890), which ushered in a "positive science of law," decidedly opposed to natural law. But mere generalization of the contents of positive law could not rescue the latter from contingency and historicity. As Radbruch (1914, 16) remarked, the ambition of the general theory of law to take over philosophical research on the concept of law led to a "euthanasia of legal philosophy." The most vigorous reaction was that of neo-Kantian legal philosophy, which can be considered the promoter of a way of seeing legal philosophy that would condition the entire first half of the 20th century. This current gained much ground, especially in Germany, Spain, and Italy, to such an extent that it can be considered the first, and perhaps so far the only, great European legal philosophy (see Alexy et al. 2002).[6]

Generalization of normative contents is blind if it is not guided by logical transcendental forms capable of giving a scientific solidity and status to epistemological legal knowledge. It was necessary to pass from the technical legal sciences to theoretical legal science. These objectives were pursued with full awareness by neo-Kantian legal philosophy, because a doctrine of the universal forms of law promised to confer a scientificness on legal empiricism. But the legal forms the neo-Kantians were thinking of were not the same thing as those of the general theorists of law, who were concerned with the problem of the legal qualification of actions or facts and not with that of the transcendental conditions of legal experience.

In these transcendental legal forms of neo-Kantianism one can still perceive a vestige of natural law, or at least of its claim to the universality of legal experience and its internal consistency. This fact should not be underplayed, because this is a standard that is very difficult to satisfy on a strictly formal plane. That this presupposition can by itself be interpreted as a sign of natural law theorizing is recognized by Kelsen himself:[7]

> With the postulate of a meaningful, that is, non-contradictory order, juridical science oversteps the boundary of pure positivism. To abandon this postulate would at the same time entail the self-abandonment of juridical science. The basic norm has here been described as the essential presupposition of any positivistic legal condition. If one wishes to regard it as an element of a natural-law doctrine despite its renunciation of any element of material justice, very little objection can be raised; just as little, in fact, as against calling the categories of Kant's transcendental

[6] On neo-Kantian legal philosophy see also Section 8.2 in this tome and Chapter 1 in Tome 1 of this volume.

[7] It is well known that according to some commentators Kelsen's thought is a form of natural law theory without natural law. René Marcic (1919–1971) sought to apply Thomist natural law theory to the pure theory of law (see Marcic 1969; see also the debate with Kelsen in Voegelin 2004, 126ff.).

philosophy metaphysics because they are not data of experience, but conditions of experience. What is involved is simply the minimum, there of metaphysics, here of natural law, without which neither a cognition of nature nor of law is possible. (Kelsen 1949a, 437)

The problems brought into focus by neo-Kantian legal philosophy can only be understood in relation to the problem of the distinction between the natural sciences and the human sciences. In 1883, Wilhelm Dilthey published his *Einleitung in die Geisteswissenschaften* (Introduction to the spiritual sciences: Dilthey 1883). The peculiarity of the cultural and symbolic expressions of the human world moves away from the empirical methods of the natural sciences and invites questions about the way we come to know the values and judgments of relevance with which the world produced by human works is interwoven.

The disputes that arose on the proper place of legal science largely depended on the very way of understanding its object, that is to say, the concept of law. From the start, jurisprudence appeared to be a borderline science as to both its object and its method. The classificatory spirit of the time could not accommodate this eccentric position of law and explored all possible ways to avoid it, but without yielding any convincing and definitive results.

The *moral sciences*, which the neo-Kantians preferred to refer to as *cultural sciences*, created for them two difficulties of opposite kinds: On the one hand, in these sciences the possibility was lost of clearly separating science from philosophy, description from evaluation, and explanation from understanding, while on the other hand contents of a historicist and relativistic nature were introduced into philosophical speculation. This led to the need to face the problem of the relationship between historical reality and values. In the cultural sciences, values played a role similar to that of neo-Kantian forms. But they were much too like the objects of abhorred metaphysics and so had to be treated adequately.

1.1.3.1. The Nature of Law

The Kantian transcendental project is at once subjective and universal. The effort to identify the conditions for the possibility of every experience in the law had to be accompanied by a conviction that this experience could not purely and simply be reduced to a shapeless set of facts or to an essentialist structure relating to positive law as such.

If we want to seek traces of natural law theory in neo-Kantian legal philosophy, however weak these traces may be, we will have to start from the firm belief in the objective value of science and, above all, in the possibility of conferring scientific dignity on legal experience. This conviction was founded more on the method of legal science than on its object. According to Rudolf Stammler (1856–1938), who will be taken here to be the most representative exponent of neo-Kantian legal philosophy, one of the errors of natural law theory is to believe that scientific validity lies in the results of the method used and not

in the method itself (Stammler 2000, 91).[8] And yet the method of neo-Kantian legal philosophy itself has some characteristics that are proper to natural law.

In two respects Stammler's thought is less distant from natural law theory than he would like. From the point of view of legal theory, the distinction between pure or a priori legal concepts and empirical or a posteriori legal concepts is based on the universality of the former, which the latter lack. Consequently, the distinction between a pure theory and an empirical theory of law is clearly an epistemological substitute for the traditional ontological distinction between natural law and positive law. From the point of view of the purpose of law, natural law is taken into account again but in an original way rich in potentialities for development. Stammler rejects the ontological or anthropological sense of nature and rather sees nature as a search for a "uniform and universal essence" or, even more precisely, as the "permanent unity and systematic uniformity" of an area of experience (Stammler 2000, 73). And it is precisely here that lies the greater proximity of Stammler's thought to natural law theory, despite the influence of the Marburg school (see C. Müller 1994).

The fact is that this concept of nature is applied to law itself, understood as an idea of social cooperation, which presents itself as a specific object needing special investigation. We thus move from a natural law based on human nature to an investigation of the "nature of law," which has a teleological character. In this sense, although the distinction between natural law and positive law cannot be understood as a genetic one (as a distinction based on origins), the systematic distinction according to which the nature of law is found in the idea of a legally ordered life in general preserves its value (Stammler 2000, 76, 166). Stammler expressly recognizes that "all positive law is an attempt to be just law" (ibid., 24) and that the purpose of natural law is to become positive law. Above all, however, he claims that it is necessary to preserve the general justice of the legal order by respecting what we would recognize today as the principles of the rule of law. These principles make it possible to respect the nature of law and the social purpose of the legal order. Law is in fact an indispensable means of social unity.

According to Stammler, law is a form of social life, for no society is possible unless the pursuit of common purposes is constrained through an external rule. This constraint is the logical condition of social activity and therefore constitutes its form, while the material is the world of needs that informs social activity itself. For Stammler (1928, pars. 35, 56), the concept of law lies wholly in the formal element. In this way he argues that normative content is irrelevant to the purpose of the concept of law, a thesis typical of the stance against natural law. Nevertheless, it is for the sake of common purposes that freedom and autonomy have to be somehow limited.[9]

[8] On Stammler see also Section 1.3 in Tome 1 of this volume.

[9] This teleological conception of social science came under sharp criticism from Max Weber (1907).

For these reasons the formal or logical concept of law, which in itself is inert on a practical level, has to be integrated by the *idea of law*, that is, by the value of justice. In this way law becomes a principle of social behaviour on the basis of the ideal of a "community of freely willing men" (*eine Gemeinschaft frei wollender Menschen*), or men who voluntarily submit to the rule of law for a social or cooperative ideal (ibid., 204; my translation).

Stammler thus subscribes to a view that would persist in legal philosophy in the first half of the 20th century: The search for just law is admissible only as a practical ideal of law (from a deontological perspective), not as a theory of law, since the latter concerns the *is* of law and not its ought. The concept of law is constitutive, while the idea of law is only regulative. Even so, investigations on right law (*richtiges Recht*) were considered a proper part of legal philosophy—and not, as Kelsen would later claim, part of the ethical or political sphere or at any rate of a sphere external to the law—and in this way the ideal of justice took on an importance internal to positive law itself.

As is well known, Stammler translated the idea of natural law into that of "a natural law with changing content" (*ein Naturrecht mit wechselndem Inhalte*) (Stammler 1924, 174; my translation). This expression has given rise to two broad interpretations, for they can be taken to mean that right law is *formal law* or that is it *cultural law* (Radbruch 1950, 60). Certainly Stammler (2000, 89) does not share the natural law thesis on the invalidity of unjust law and maintains that such law is not logically contradictory and does not in the least authorize its arbitrary violation. Stammler's recourse to natural law means that in stating what right law is we have to follow a principle of reason held up as a social ideal, an ideal of mutual respect among people united under law (see ibid., 159). So this, too, is a formal ideal, echoing the principle of natural justice under which equal cases must be treated equally. Since in applying this ideal we have to take changing empirical circumstances into account, the content of right law is by nature changeable. In any case, the problem of justice pertains to the philosophy of positive law and has to remain wholly internal to it.

The separation between law and morality could thus be captured by following two different paths: one that excludes every moral element from the nature of law and one that searches for a morality internal and proper to law, and clearly distinguished from general morality. Stammler opts for the second way. Since the presence of moral aspects in the nature of law could not be denied, law's internal control on morality can preserve the autonomy of the legal sphere. "The land must not be governed by a foreign power" (ibid., 39). Here we are looking at what today we would call "ethical positivism."

If we now compare Stammler's thought with Cathrein's, the central point appears to be the separability of the is of the law from its ought. Cathrein had claimed that unjust law is not true law, just as a fake friend it is not a true friend. Stammler replied that the most appropriate comparison is not with friendship, which is a concept already enveloped in value, but with a sermon:

An unjust law is a real law just as a bad sermon is still a real sermon (see Stammler 2000, 88). Stammler added that the concept of law is not contradicted by a content that might command polygamy, the burning of widows, slavery, or the exposure of weakly children. Yet he could not deny that this contradicts the nature of law as informed by the principle of mutual respect among people united under law.

The distinction between the *concept* of law (deriving from Kant) and the *idea* of law (deriving from Hegel) was aimed at separately satisfying two demands of legal knowledge that were difficult to reconcile. On the one hand, the theoretical investigation required an understanding of law independent of its particular and factual historical realizations and free of evaluative content. In this respect, epistemological constraints went hand in hand with those of legal certainty. On the other hand, the practical investigation entailed that positive law should be subject to value judgments and to possible criticism by the moral conscience where this law aspires to become an obligatory rule of human behaviour. Between the concept and the idea there was the slender common element of the importance of otherness or intersubjectiveness.

Neo-Kantianism thus takes on the task of holding together, though in a sort of artificial cohabitation, the two fundamental problems of legal philosophy, that is, the theoretical-cognitive one and the practical-normative one (Banfi 1926, 195).

In the subsequent development of neo-Kantian legal philosophy it proved very difficult to maintain a separation between the concept and the idea of law in the manner dictated by Stammler. In Italy, a criticism of legal positivism had already been advanced precisely by neo-Kantian thinkers (see Petrone 1895, Bartolomei 1901). However, it was only with Giorgio Del Vecchio (1878–1970), the greatest Italian neo-Kantian legal philosopher, that this became evident.[10] Del Vecchio gradually moved toward natural law theory. This was possible thanks to a major change in the way to go about dealing with the problems regarding the concept of law.

In the first place, while Stammler derived the concept of law from a reflection on legal science and on its transcendental bases (theoretical legal science), Del Vecchio, working from the Kantian distinction between *quid ius* and *quid iuris*, assigned this task to legal philosophy, which he understood as capable of an autonomous cognitive approach to its object.

In turn, philosophical investigation does not confine itself to *logical* research but also includes both *phenomenological* research on the universal or common character of legal experience and *deontological* research relating to the ought of positive law (the triadic theory of law).[11] This implies that a philo-

[10] On Del Vecchio see also Section 11.2.1 in Tome 1 of this volume.

[11] This tripartite division of the tasks of legal philosophy has been widespread, especially in Latin America and in other countries in Europe that speak Romance languages, in part because

sophical knowledge of law by the same token includes both its logical concept and its own ideal, that is, its ought. The relation between the two consequently becomes much closer than that prefigured by Stammler, both belong to the same global cognitive enterprise.

In characterizing the experience of law on the basis of a principle of practical evaluation, in keeping with the line of thought embraced by the Baden school, we are already taking that experience to be part of ethical life and a modality internal to it. This means that the concept of law is not entirely normatively inert: It is "a value-laden claim like any other." Morality and law are not separate but distinct (this is the doctrine of the differential features of law), since there are two ways of evaluating human action, the one internal to the subject (the person) and the other intersubjective and external, where possible actions between multiple subjects are coordinated on the basis of an objective ethical principle (see Del Vecchio 1962, 226). It is even conceded that law and morality belong to the same ethical system and so that there cannot be any contradiction between them (cf. ibid., 227), a thesis that natural lawyers also maintained, though in a non-formal way. Here one can notice an attempt to translate the pre-Kantian or Leibnizian natural law theory in a formalistic fashion. This means that the concept of law already has a "practical" character, and so that it is not in the least neutral or normatively inert, as Del Vecchio kept repeating. At this point it becomes clear that the relation between neo-Kantianism and natural law theory turns entirely on the way the concept of law is understood, since the scientific dimension and the practical one did not seem compatible with the philosophy of the time.

According to Del Vecchio, positivity does not belong in any essential way to the concept of law, which strictly consists in the intersubjective form of legality, something that a law as a juridical proposition possesses even before being enacted and even after it is repealed (see Del Vecchio 1911). Accordingly, one would also need to admit that even a proposition of natural law, which for Del Vecchio can only be a proposition deducible from reason alone, has a juridical form on a par with positive laws. As a result, the only difference between positive law and natural law will rest on imperativeness and coerciveness, which are the characteristics typical of the positivity of law. However, one can no longer see what purpose this concept of law serves.

For instance, the legal form of slavery is curiously defended by Del Vecchio not on the basis of the positive laws that allow slavery but on the ground that the concept of slavery possesses the formal characteristics of law, being a form of property. Thus slavery realizes the *concept* of law but not its *idea*: "It is legal

of the numerous translations of Del Vecchio's works. The influence of this theory also extends beyond neo-Kantianism. One need only note that Bobbio's distinction among the approach to law, the theory of law, and the ideology of law can in some respects be considered a reworking of the three-dimensional theory of law (Bobbio 1965a, 112–4).

but not just" (Del Vecchio 1962, 368; 1922, 89). However, if legality is independent of positive legality, then we cannot see why the prohibition against slavery cannot be considered legal in addition to also being "just." In short, it is impossible to maintain the validity of unjust law without giving weight to positivity in the concept of law.

Moreover, since the form of legality is independent of positivization, it would seem that any coordination of social actions is in itself "legal." It follows, however, that the role of the ethical principle is lost, as it is lost the distinction between law and other social rules, which are likewise bilateral and external.

But in reality, if we are to fully appreciate Del Vecchio's thought, we will need to consider his well-known investigation on justice, where legality itself is linked to a formal concept of justice, which in turn is more easily connected with justice in an ideal sense, conferring a more unitary dimension on legal-philosophical reflection (see Del Vecchio 1924).

In the last phase of his thought, Del Vecchio moved increasingly closer to a form of rationalist or metaphysical natural law theory, a fact attesting the demise of neo-Kantian legal philosophy.

Back in 1921, a keen, though much discussed, critic of neo-Kantian legal philosophy, understood to encompass both Stammler's and Kelsen's version, highlighted the aporias and weakness of this conception, identifying them in the rigid separation between transcendental forms and empirical reality; in the rejection of the Kantian "thing in itself," in such a way as to prevent the ideas of reason from having a regulative and normative role; and in the very decline of the object of legal science (see E. Kaufmann 1921). The same author later noticed the tendency of the time to pass from a neo-Kantian epistemology to the ontology of Aristotle, Aquinas, and above all a reinterpreted Hegel (cf. E. Kaufmann 1931). In short, the division between the nature of man and the nature of law was challenged.

In effect the neo-Kantian conception contains insurmountable aporias. The main difficulties derive from the "positive" character of law, which the neo-Kantians certainly did not intend to challenge. And yet, subjecting legal positivity to logical-formal conditions of a Kantian type doubtless meant recognizing its inadequacy for the purpose of defining the nature of law. For this reason the neo-Kantian conception of law has been considered as collateral or complementary to legal positivism. In this very view, however, lay a trap, in that the increasing importance of the formal legal relations was destined to obscure the defining role of legal positivity.

It has also been shown to be impossible to formulate a logical concept of law wholly indifferent to values. What does the neo-Kantian concept of law refer to? The attempt to answer this question made it necessary to either return to facts, forsaking the universality of law, or to take the path of values, conferring greater cognitive importance on the idea of law (see Treves 1934).

1.1.3.2. Law and Values

Taking the *cultural sciences* seriously meant searching for a connection between facts and values, something that Kantian orthodoxy did not allow. Thus a heterodox strand of thought developed that also proved attentive to Hegel's teaching. Attention to method was not pursued to the point of losing sight of the meaning of the object of study.

To better illustrate these problems I will turn to a thinker whose writings on law are sparse but who nonetheless exerted an underground influence on legal-philosophical speculation in the first half of the 20th century (see Hobe 1973, Carrino 1983). Emil Lask (1875–1915) clearly rejected metaphysical natural law theory, arguing that it Platonically duplicates legal reality.[12] Only empirical reality exists, but as Rickert had observed, this reality is "irrational." From a philosophical point of view, this same reality is "the scene or the substratum of transempirical values or meanings of general validity" (Lask 1950, 4). Legal philosophy looks at reality from the standpoint of absolute values: It reflects on the meta-empirical meaning of empirical law, and in this way it rejects both metaphysical natural law and relativist historicism.

> Natural law wants to conjure the empirical substratum out of the absoluteness of value; historicism wants to conjure the absoluteness of value out of the empirical substratum. (Lask 1950, 12).

Here I would only like to stress the nonpositivist aspects of this theory of law. Lask thought that the only possible form of natural law theory was the metaphysical one. But he was wrong.

In the first place, for Lask, law is characterized by typical values, which can certainly be viewed in light of the idea of justice, but the latter in turn is worked out on the basis of different conceptions of the world. These legal values can be perceived only in their operativeness in historical life, and yet they preserve their absoluteness, that is to say, they remain outside the world. In this concretizing of values into norms, a finalistic conception of law is revealed on which the production of legal norms, institutes, and concepts is linked to an idea of purpose that governs the correctness of law. In general, the process through which law is formed is teleological.

The idea of purpose, as we have seen, was also present in Stammler, but it was still generic and in substance individualistic. Things change when Lask maintains, following Hegel and Gierke, that empirical law can take on a universal meaning only if connected with a specific social value, the transpersonal one of community life, displacing Stammler's atomistic ideal (see Lask 1950, 17ff.). What comes into relief, then, in an outlook that can be considered Aristotelian, are goods and purposes not proper to individuals singly

[12] On Lask see also Section 1.4 in Tome 1 of this volume.

considered but to individuals bound to the life of a human community, even though Lask insists on the distinction, previously underlined by Wilhelm Schuppe (1884), between an empirical use and a transcendental use of the teleological principle.

> The destination (*télos*) immanent in particular relationships of life, such as property, family, rank, class, or state, is to provide the "objective and real principle of legal philosophy." (Lask 1950, 15)

So there are goods or values that can only be attained *through* law and *in* law, and this is a typically natural law perspective. The real object of legal science is law with its world of values and not only the laws or statutes (cf. Lask 1950, 38).

Another idea that gains ground is that the phenomenal substratum requires reference to values and that these differ from one another owing to the difference in the substrata by virtue of which they are valid (*hingelten*). And in this way, doubt is implicitly cast on the asserted irrationality of the substratum.

If there are values specific to law, even if tied to a given conception of the world among others, then it can be said that there is a "nature" of legality in the Hegelian sense of the objective spirit and that there are tasks that must be performed by the human community. And this is a natural law principle set in the world of history and culture. Lask takes up Jellinek's doctrine of the "ethical minimum," a minimum core of common ethical ideas seen as the internal structure of socio-typical value.

The doctrine of the value typical of law also has the effect of no longer interpreting law itself as a social technique in the service of extrinsic ends (something that Lask wrongly accused Kantian individualism of). Law can instead be viewed as much more than a simple means: It can be understood as a fundamental element in the articulated structure of the objective spirit (see Lask 1950, 13). Here, too, we can recognize a nonpositivist attitude.

It can therefore be claimed that a necessary condition for a conception to be considered nonpositivist and as open to natural law theory lies in its consideration of law not only as a fact and an instrumental value but also as a value in itself, that is, not only as a means but also as an end in itself. At this point the central problem of legal philosophy becomes that of the relation between law and value.

As far as value is concerned, there are only three possibilities: a form of knowledge can be *blind* to value, it can be *connected* to values, or it can *itself* be valuative. In the two latter cases the discussion is about the objectivity of value. As is well known, in the first decade of the 20th century the controversy over values (*Werturteilstreit*) was decisive in defending the scientificity of the social sciences and their independence from politics. The value-free principle, deriving from the impossibility of any rational and objective knowledge of values, did not in the least imply that values are arbitrary, contingent, or purely emotional, or even that the social sciences can do without them. The relation-

ship to value is endowed with some intelligibility based on our understanding and recognition (*Bekenntnis*); otherwise, it would be a baseless act of faith.

In any case, as we have seen, one cannot avoid considering law as geared toward values and aiming at typical values as distinguished from the canonical values of truth, goodness, and beauty. Gustav Radbruch (1878–1949), carrying forward the legacy of Lask, sums up the latter's legal philosophy as follows: "Law is the reality whose meaning [*Sinn*] is to serve justice" (Lask 1950, 75).[13]

To understand in what sense Radbruch's conception represents a further small step toward natural law theory, we need to pay attention to some evolutionary elements.

In the first place, necessary consequences are drawn from a consideration of law from the viewpoint of the world of culture, in which Is and Ought in some way meet, thus resolving the incommunicability that Kantianism typically sees between them. Legal normativity can be understood only insofar as it is linked to cultural facts that identify and concretize it. This makes it possible to put to good effect Lask's idea of the interrelatedness of methods in the study of law, a necessary outcome of the interconnectedness of Is and Ought.

Radbruch fully consciously sought to bring to fruition the conception put forward by Stammler, who had developed the role of the idea of law in legal philosophy but did so only in a "methodic" sense. It was now necessary to give it a "systematic" dimension, since the core meaning of law lies wholly in its idea, that is, in its being oriented toward the value of justice. The result is an overturning of Stammler's conception: The concept of law is considered a mere substratum that must be illuminated with meaning, indeed a meaning that cannot even be formulated without reference to the idea of law: "The concept of law can be defined only as the reality tending toward the idea of law" (Radbruch 1950, 69). The idea of law is obviously inspired by Stammler's right law, again taking a neo-Kantian outlook (Wiegand 2004).

Driven by this relation to justice as a value, legal-philosophical reflection takes on greater internal compactness. It is not divisible into separate research sectors, as in the triadic theory of law, and becomes a global and unitary enterprise. Its task is to understand law through its ideal type, that is, through all its most elevated paradigmatic aspects, with no exceptions. Hence Radbruch is against a reductionist conception of law, whether it is the kind that disregards the merit of law or the kind that disregards its effectiveness. Law is now fully considered as a distinctive cultural object not to be confused with power or morality. None of the particular cultural instantiations exhaust the potentiality of the ideal type, and they all manifest the great mutability of cultural products, but always within the same ideal frame. However, it would be improper to set this scheme of thought next to the model of the relation between

[13] On Radbruch's Formula see Chapter 2 and Section 9.1 in this tome, and Section 10.2.2 in Tome 1 of this volume.

the principles of natural law and their historical concretizations, since the idea of law captures not the ideality but the global sense of legality and its typical praxis.

Law is not justice but a complex and specific way of *relating* to justice. Indeed, if we examine all the aspects that according to Radbruch are present in the idea of law, we realize that the latter is internally and radically conflictual, both because of the conflict of values that constitutes it and because of the opposition between value and contingent reality. For Radbruch, the values present in the idea of law consist in justice, purposiveness (*Zweckmässigkeit*), and legal certainty. Justice is seen as "an empty category that may be filled with the most varied contents (cf. Radbruch 1950, 131). It is a formal value, linked to equality and equity, but is not formalistic, because it controls the way we can formulate and interpret the content of law. Purposiveness concerns the content of law, and so the suitability of the means to the end pursued. This process of realization has a political and particularizing character, and precisely for this reason it is potentially opposed to the general equality of justice. Precisely at this point we meet Radbruch's so-called relativism (see Spaak 2009). The choice between political values cannot be scientifically grounded but is rather entrusted to our judgment according to conscience, which must not be confused with mere arbitrariness. In any case the sphere of choice is not infinite but can be referred to three constellations of political values: individualistic, trans-individualistic, and trans-personalistic. This means that general political aims are also subject to the general condition of significance. Lastly, there is the question of legal validity, which is linked to positivity, and yet it is also subject to value judgments, which makes certainty functional to peace and order: "Justice is the second great task of the law, while the most immediate one is legal certainty, peace, and order" (Radbruch 1950, 118).

The framework of this conception is undoubtedly positivistic, both because of the formal character of justice and because of the priority given to certainty, but it is supported by the conviction that a certain degree of justice will in any event be achieved by the very *form* of legality. As we know, this conviction would subsequently be proven wrong, and then Radbruch would show he was not prepared to renounce justice for certainty, or substantive justice for merely formal justice.

> Where there arises a conflict between legal certainty and justice, between an objectionable but duly enacted statute and a just law that has not been cast in statutory form, there is in truth a conflict of justice with itself, a conflict between apparent and real justice. (Radbruch 2006b, 6–7)

In order to emphasise the positivistic orientation of the first phase of Radbruch's thought, an assertion is often invoked that is entirely contrary to the famous Radbruch's formula: "It is the professional duty of the judge to validate the law's claim to validity, to sacrifice his own sense of the law to the au-

Gustav Radbruch (1878–1949)

thoritative command of the law, to ask only what is legal and not if it is also just" (Radbruch 1950, 119). But if it depended only on that, then even Cathrein ought to be considered a legal positivist philosopher. In reality, as Stanley Paulson (2006) has rightly pointed out, the positivist orientation of Radbruch's first phase is certainly not founded on a separation between morality and law and carries with it a theory of justice or of the way in which law is related to justice.

In effect, law proceeds by successful and unsuccessful attempts alike, which nonetheless remain formally valid in view of the good of peace and order. However, the fact remains that they are "failures," that is, they do not fully bring out the nature of law, which is to be just. In any case, human works of justice are never endowed with absoluteness, so they cannot claim to prevail over individual conscience (see Radbruch 1950, 118).

Against true natural law philosophy, Radbruch makes two accusations that are in fact not new: that this philosophy defends the scientific intelligibility of values and their enactment, and that it volatilizes the material substance of law, thus undervaluing its resistance to values, or losing sight of the historicity of law (see Radbruch 1950, 121). Even so, he does not make the nature of law wholly dependent on its historical sources, and specifically on those of the state, which undoubtedly controls its contents (purposiveness) but not its form. Just as science preserves its autonomy even when its results are used by the state, so law—a tool of the state—withstands every improper use and imposes its conditions on the political will (cf. ibid., 199). At least this is the conviction that drives Radbruch in his first period.

Neo-Kantianism and the philosophy of culture did away with the couplet of 19th-century legal positivism based on the conjunction between the facticity thesis and the separability thesis. But they also rejected the couplet of natural law doctrine based on the conjunction of the normativity thesis and the morality thesis. They thus inaugurated that search for the third way that is still underway today. Is this an enterprise that can hope for success? Radbruch started to move in this direction, but on the horizon there already loomed problematic issues regarding legal normativity, or the type of constraint created for users of law, first among whom the judges. But this issue cannot adequately be addressed without first specifying the ambit or scope of legal normativity and the object of legal science. Can law be reduced to statutory law?

1.1.4. Anti-Formalism and Natural Law

Legal formalism dealt with methods of investigation and the construction of concepts, taking as its empirical object the normative datum of the state's positive law. But now we may want to ask whether positive law itself can fully be identified in this way, and whether it is necessary to go beyond normative statutes. This new attitude can be captured in the dictum "Law does not

dominate but rather *expresses* society" (Cruet 1908, 336; my translation, italics added).[14]

The antiformalist reaction, already very much present in the last decade of the 19th century, was given a new lease on life by the reaction against the exegetical school in France and by the debates on the application of the German Civil Code (BGB) in Germany, and it lasted until the eve of World War II.

Legal antiformalism is a label that generally encompasses a heterogeneous cluster of theories of law, prominent among which are the sociological ones. Distinctions and differentiations can also be made by looking at the particular aspects of law and the legal practices from which this current proceeds.

These aspects can in principle be said to lie in the general problem of the origin and purpose of law and in the more specific one of the sources of law and the way positive law ought to be interpreted and applied.

This radical change in the approach to positive law affords new opportunities for natural law to make its voice heard, though antiformalism often distances itself from it. But we must not allow ourselves to be conditioned by similar statements, because natural law as a problem can hide in other guises. The historical school of law, too, had been a fierce adversary of natural law, and yet the method used by German Pandectism—a method the historical school eventually endorsed, not only because of its Scholastic conceptualism but also because of its universalistic pretensions—had aspects that undoubtedly savoured of crypto–natural law (see Wieacker 1952, 228ff.). The presence of a natural law vein in sociological theories of law has been stressed, among others, by Kelsen (1911, 16; cf. also Menzel 1912) as well as by Bobbio, who regarded them as "a form of updated natural law theory" (Bobbio 1965a, 141; my translation).

1.1.4.1. The Living Law

In general, antiformalism rejects the formalist thesis that positive law exists only when legal propositions are formulated and made official. If it is true that law has a practical character and is constructed in view of a purpose, as Rudolf von Jhering (1877–1883) showed, then the existence of law can be said to already start with its initial formation in social life. The science of law has to be able to describe this process by which positive law is formed. So, for example, in the 1913 work *Grundlegung der Soziologie des Rechts* (Foundations of legal sociology), Eugen Ehrlich (1862–1922) sums up the idea as follows:

> At the present as well as at any other time, the center of gravity of legal development lies not in legislation, nor in juristic science, nor in judicial decision, but in society itself. (Ehrlich 2002, LIX)

[14] The French original: "Le droit ne domine pas la société, il l'exprime."

Social relationships are thought capable of generating legality on their own (they are jurisgenerative), preceding the possible official formalization of law. From this standpoint, natural law can no longer be accused of not being true law by reason of its not having been positivized or formalized, though the accusation that it is ideal or unreal law stands. In this connection, Ehrlich links the theme of natural law to legal philosophy, which in his opinion only deals with the legal ought, while the sociology of law as a theoretical science of law (*Rechtswissenschaft*) deals with the facts of law, those that Jellinek called "normative facts," according to the outlook of a positivism that in truth is too elementary and naive. But Ehrlich, one of the founders of the sociology of law, was not a philosopher (see Villey 1968, 353): He was a historian of law looking to recover what had been lost in the teaching of the historical school, that is to say, the view that law is rooted in the social order.[15] We should now take up the question whether and in what sense natural law theory is present in this theoretical science of law.

The sociological conception of law undoubtedly has the same enemy as natural law: the thesis of the legal monopoly of the state and the negation of legal pluralism. With natural law it shares the thesis that laws as social rules guide the action of the members of society at large (rules of conduct) and are not only those primarily aimed at officials (particularly judges) for the purpose of resolving controversies in a certain way (rules of adjudication). The sociological conception thus also shares with natural law the thesis that coercion is a secondary trait in the definition of law (see Ehrlich 2002, 61), in that law is such to the extent that it is accepted by the members of a community (*Anerkennungtheorie*). Furthermore, likewise similarly to natural law theory, the sociological conception rejects the separation of law and morality and so the idea that judges may not decide cases on the basis of rules that do not issue from the state (cf. ibid., 39–40).

The strong suit of this conception consists in its showing that "the practical concept of law" is in fact very different from that prefigured by the legal science of the time, which therefore stands accused of being prescriptive and even ideological. Indeed, both judicial decision-making (see Ehrlich 1903) and legal reasoning in general (see Ehrlich 1918) are informed by psychological and social factors and are very far from confining themselves to logical deduction from norms. Hence the attention to the ethics of the legal profession and to legal science seen as an exercise of practical reason (*praktische Jurisprudenz*).

Lastly, we have to remember, and stress, the conception of "living law," that is to say, the "law which dominates life itself even though it has not been posited in legal propositions" (Ehrlich 2002, 493). Much more than statutory law, the living law captures the idea that law isn't so much a specialized social technique as it is what guides human behaviour. Once again this idea is close to

[15] On Ehrlich see also Section 22.3.1 in this tome and Section 3.3 in Tome 1 of this volume.

natural law theory, or at least it could be defended from that perspective (see van Klink 2009).

Despite all these possible similarities, Ehrlich's conception is actually naturalistic rather than like natural law. Like Otto Gierke, Ehrlich is interested in the origin of positive law and finds it in "the inner order of associations" and the order of human groups, which spontaneously organize in response to increasingly complex needs and interests. When Ehrlich turns to the problem of distinguishing legal norms from other social norms, he resorts to the feelings of the members of social groups, reducing the problem to a question of social psychology. One may well wonder by what criteria a feeling can be identified as "legal," distinguishing it from others without having first cleared up the difference between law and nonlaw. If the sociology of law as a theoretical science of law needs to resort to social psychology to define the concept of law, this means that it cannot on its own achieve its explanatory objectives. Moreover, Ehrlich's social psychology is vague and approximate and is exposed to the charge of irrationalism. Undoubtedly, among the driving forces of the legal development of social institutions there are also emotional factors. Ehrlich himself dangerously invokes the need for an intervention by charismatic and exceptional personalities in resolving the most arduous problems of justice and the common good (see Ehrlich 2002, 207). In the end, claiming that law is what people believe it to be does not solve the problem, especially when there are conflicting beliefs. But in this respect, too, Ehrlich's work is pioneering.

There is thus configured a third path next to the idea of law as will, as legal positivism claims, and that of law as reason, as natural law theory claims: It is the idea of law as feeling or empathy. This is a strand of thought also pursued by a contemporary of Ehrlich's, the Russian thinker Leon Petrażycki (1867–1931), who later distinguished official law from an unofficial or "intuitive law" independent of external authority, and in this he would be followed by other sociologists and philosophers of law down to our own day (see, e.g., Podgórecki 1974; Treviño 2007, part III).[16] Petrażycki considers natural law a form of unofficial law that is still primitive and naive: He thus sets out to replace it by disclosing its mechanisms of psychological projection (see Petrażycki 1955, chap. 6, sec. 33), and then anticipating someway Scandinavian legal realism (cf. Pattaro 2005, chap. 15).

In the natural law tradition, by contrast, there is the constant idea that law is a normative and not merely a psychological concept. Even the doctrine of the natural inclinations, which might make one think of Ehrlich's legal feeling, is worked out with reference to a concept of human nature based on a creationist theology and metaphysics, such that having an obligation is not confused with feeling obliged.

[16] On Petrażycki see Chapter 18 in this tome and Section 16.2 in Tome 2 of this volume.

The importance of Ehrlich's conception lies more in its *pars destruens* than in its *pars construens*, and more in its descriptions than in its explanations. His confutation of the paradigm of legal formalism is based on facts rather than on theory. He very effectively shows that the practice of law actually unfolds in a different way than is prefigured by official legal science, and on this very premise he challenges that science, though in his own turn he fails to offer a clear solution. He thus recovers some aspects of the natural law tradition (not always wittingly), but grafts them onto a positivist framework, seen as a refuge from neo-Kantian formalism. His appeal to the doctrine of the "nature of the thing" (*Natur der Sache*)—which unlike Gény he applies to the field of public law—could have opened philosophical reflection to the reasons why social life organizes itself in similar or analogous forms, but Ehrlich (2002, chap. 15) never abandons his empiricism, which is wary of generalizations. It goes to his credit, however, that he did not emphasize the collective will of the social group to the detriment of the individual, as other sociological currents would instead do (see, for instance, Levy-Bruhl 1951).

In conclusion, sociological antiformalism claims not only that law has social origins but also that it is often produced by society unintentionally, and above all that it already exists as effective positive law even before its possible conceptual or legislative transcription. And this is a step in the right direction compared to the historical school of law.

1.1.4.2. Positivist Neo-Thomism

While Ehrlich and the sociology of law emphasized the presence of nonstate law alongside that of the state, French institutionalism turned to the problem of the social origin of the state. The state is a macro-institution that has the same nature as all other social institutions. It is a construction built starting from the institution, the market, and the contract (see Maspétiol 1968). It is therefore necessary to work out a general theory of institutions, of which the law is an essential component; in other words, a theory of institutions is needed that is at once properly social and properly legal.

This theory is marked from the start by the cultural background of its founder, Maurice Hauriou (1856–1929), a scholar of administrative law who at the same time professed himself a liberal, a Catholic, and a follower of Aquinas's philosophy (see Millard 1995, 386–87).[17] As a liberal he was linked to the 1789 Declaration of the Rights of Man and of the Citizen; as a Catholic he took an active part in the cultural renewal of the pontificate of Leo XIII and is thought to have been close to the political-religious movement known as Le Sillon and to the milieus of liberal Catholicism; as a Thomist philosopher he did not look back to neo-Scholasticism but pursued a personal synthesis of his

[17] On Hauriou see also Section 12.2 in Tome 1 of this volume.

own in which major influences of Bergson's and Durkheim's thought can also be noticed. In any case his stated objective was to show that Christianity is a driving force of civilization capable of building on the advances of modernity (see Jones 1993, chap. 7).

He was hostile to idealist subjectivism and behavioural social science, mistakenly suspecting that his colleague Léon Duguit was a proponent of that discipline. The dominant idea was the continuity between nature and spirit, and so between the natural and the cultural sciences, seeing analogies and correspondences between biological processes and social ones—a typically Bergsonian idea that, as we know, would reach its theological conclusion in the thought of Teilhard de Chardin. In French institutionalism we see the application of social vitalism to the theory of law in the form of objective idealism.

Hauriou was avowedly an advocate of natural law. But in his strictly legal writings he spoke very little about it, and in his theoretical work, the 1925 *La théorie de l'institution and de la foundation: Essai de vitalisme social* (Theory of institutions and of foundation: An essay on social vitalism, Hauriou 1970), he says nothing at all about it. Accordingly, it would seem logical to turn to the occasional writing in which he speaks more at length of natural law. And here it can be ascertained that, in his view, natural law is not about guiding institutions and is not even to be identified with justice but rather consists in a set of rules relating to the defence of individual rights. Starting from the general principle that "law is a sort of conduct geared toward order and justice" (ibid., 795; my translation),[18] he conceives natural law as that amount of justice that is guaranteed in every true legal order, which is tasked with reconciling the need for stability and continuity with the need to respect people's rights. So natural law is not ideal law, for that would amount to confusing it with justice, but rather law already present on its own in human history. The precepts of natural law rest on the data of the natural history of humankind and on the process of civilization but are manifested as a historical belief in egalitarian and democratic principles. This is a naturalistic vision, and it has aptly been defined "a positivist neo-Thomism" (*un néotomisme positiviste*: Brimo 1969, 65). Without any justification, Hauriou upholds both the absoluteness of natural law and its cultural and historical character. He defends it strenuously, so much so that he accuses Savigny of having deprived legal science of the contribution of natural law (see Hauriou 1918),[19] but at the same time, like a true positivist, he does not assign it any place in legal science.

[18] The French original: "Le droit est une sorte de conduite qui vise à réaliser l'ordre et la justice."

[19] In France, World War I provoked a reaction against German legal science, deemed responsible for the conflict, and so also a rebirth of natural law doctrines, seen as typical of Latin peoples (see Battaglia 1929, 79).

Hauriou's real contribution to the doctrine of natural law lies not only in the view of public liberties as part of constitutional legitimacy on account of their supra-legality, superior to the written constitution itself (and here he is referring to the 1875 constitution, which did not include a bill of rights; cf. Hauriou 1923, 298), and not only in the conviction that the general principles of law are not enacted but on the contrary are "discovered" by the judge, but also and especially in his concept of institution.

In this connection, Hauriou's approach to positive law cannot adequately be understood without bearing his Christian and Thomist inspiration in mind. The idea of the work to be realized in a social group or for the benefit of this group is certainly not Hegel's idea but is an even more refined way to prefigure the concept of practical reason, that is, of reason that guides action and makes it alive from within. Hence positive law presents itself as a social practice governed by reason and not by will. Hauriou insists that "the guiding idea of the enterprise" (what Hauriou calls an *oeuvre*) is not to be confused either with the notion of end or with that of function, because it remains immanent in the process of its realization and is not even exhausted by it. This means that positive law is in an ongoing state of becoming, even as it imparts stability to the institution that has produced it, and it contains its own yardstick. Positive law is pervaded by the dialectic between determinacy vs. indeterminacy, so its historical concretization is never completed once and for all.

> There is the domain of function: the administration, and a determined group of public services. Then there is the domain of the directing idea: the political government, which works in the undetermined area. And the fact is that the political government is of much more vital interest to citizens than the administration, which shows that what is undetermined in the directing idea has more influence over men than what is determined under the form of function. (Hauriou 1970, 102)

The proper relation between positive law and institutions is not the relation between a tool and its function or between a technique and its purpose, but is rather a means-end relation in which the means are inherent in the end itself, since that confers stability over time, without which institutional enterprises cannot be such. This relation of means to end is precisely that of Aristotle and Aquinas.

Lastly, Hauriou appears to be very attentive to the process by which the guiding idea is interiorized by those who take part in the institutional enterprise: He thus rejects an extrinsicist vision of law, though some have accused him of collectivism (see Platon 1911) and even of being a precursor of Nazism (on the manifold interpretations, see Gray 2010, 33ff.).

The task of the theoretical jurist is not to deal in natural law, but to work out a scientific conception of positive law. Still, it is a task inevitably influenced by cultural and philosophical presuppositions. Hauriou's conception is undoubtedly marked by an unspecified and implicit natural law theory.

Despite the philosophical uncertainties, Hauriou brought to legal science a principle that belongs to the history of natural law: Cooperative activities are possible only if there is also a common direction despite the variety of intents and interests. On this view, the theory of institution is equipped to embrace the concepts of authority and the common good, which as is well known belong to the Thomist natural law tradition, a tradition that other exponents of French legal institutionalism indeed also look to.

The first of these is Georges Renard (1876–1943),[20] a disciple of Hauriou's who, after a first work of a more legal character (see Renard 1930), tried his hand at the arduous enterprise of setting out a general philosophy of institutions (see Renard 1939), a philosophy he develops applying the concepts distinctive to Thomist metaphysics and, above all, that of the analogy of being (in the footsteps of Lachance 1933). We have now entered that second phase of Thomism marked, as noted, by a certain independence from traditional Scholasticism.

According to Renard, the notion of institution is analogical, and so is that of law. In this way he seeks to overcome all dualisms and also to pursue a social pluralism positing a unity across differences. Here we will not be concerned with the philosophical importance of this conception of law or with its fidelity to Aquinas's thought, both of which have been authoritatively and emphatically called into question (see Bobbio 1936). What is important to stress is rather the way in which natural law is regarded.

Renard does not proceed from precepts of natural law from which to derive positive law, as was instead usual in neo-Scholasticism. Natural law must not be seen as an ideal model or even as a source from which to derive positive laws but as "the analogical reason of law, the *ratio juris*" (Renard 1970, 293), or what links up the different positive legal systems and is not exhausted by any of them: "The analogical reason is only a potency with limitless possibilities of actualization" (ibid., 300). As Renard says, quoting Lachance, natural law is "sheer law." In fact natural law is not understood to exist outside positive law, just as man does not exist in general, since only concrete men exist. Even so, while the concept of man is univocal and not analogical—and according to classical metaphysics it points to a specific essence—Renard's concept of law does not have any substantive content of its own and dissolves within the social group into a set of formal relations among order, authority, and the common good. The result is that of more or less justifying *any* legal order, thus seriously undermining the possibility of using higher criteria by which to judge the justice of positive law. And this leads to social conservatism, or at least it deprives natural law of its function of criticizing social injustice, something for which there was a great need at that time in particular.

[20] Aside from Renard, others who claim to be followers of Aquinas are Joseph T. Delos, who applied the theory of institutions to international law (see Delos 1931), and Georges Gurvitch, who upheld a transpersonal conception of law (see Gurvitch 1932).

Lastly, to Renard we owe the formula "natural law with a progressive content" (Renard 1927, chap. 4; my translation). The formula is set in opposition to the previously mentioned one by Stammler, "natural law with a changing content," but it has the defect of not setting conceptual limits on the legal sphere. Jacques Leclercq would try to recover this line of thought in the formula "natural law with changing and progressive applications" (Leclercq 1927, 45; my translation), but that, too, remains vague.

French institutionalism is very significant in the history of natural law theory, in that it develops some perspectives on society and law that encourage us to reflect on the problems natural law is concerned with: the plurality of the sources of law; antistatism, in opposition to Raymond Carré de Malberg; social pluralism; and the search for shared ends and values (see Gurvitch 1935). The influence of these convictions has been much greater than has institutionalism as such. Still, the increasing emphasis on the social objectivism of legal rules by comparison with the conception defended by Hauriou himself, who also defended natural rights, helped to highlight two lines of thought within natural law theory: the traditional one of neo-Scholasticism, based on the tenets of natural law, with the risk of turning them into a legal order superior to the positive order; and the one that emptied natural law of specific contents to make it the principle of the objectivity of the positive legal order, with the risk of depriving it of its critical function. In either case, the subjective rights of the person were underdetermined.

1.1.4.3. Filling the Gaps and Finding the Law

The orientations so far examined are antiformalist by virtue of their approach to the study of law. Law has to be regarded as a phenomenon which derives its original structure from society and which is aimed at making social life possible. The legal formulation is considered a product of the social origins of law. But there is also another antiformalist orientation, one that proceeds from the problems connected with the application of the written law and reaches the conclusion that a written text alone is insufficient in identifying what the law is. What is contested is the principle of the completeness of a legal system as such, a principle that follows as a corollary of the dogma of the legislator's omnipotence. What is claimed is that there needs to be an appeal to legal resources not governed by the legislator's will. This can be considered a "jurisprudential" antiformalism understood in both senses of that term as referring to legal practice and legal science.

This orientation, too, even more than the previous one, paves the way for a rebirth of natural law. Corresponding to the different ways of addressing the problem of filling legislative gaps and finding the law are different attitudes to natural law.

1.1.4.3.1. Irreducible Natural Law

The French jurist François Gény (1861–1959) was the first to challenge the positivistic vision of the sources of law in its totality within the frame of a theory of legal science.[21]

Gény starts out from the interpretation of the written law with a view to establishing the legislator's will, which he recognizes as having a central role, though not in the formalist and literal sense of the exegetical school or the formalist and conceptual one of the Pandectist method. Since there are often lacunae in the written law in relation to the demands of the concrete case, the problem arises of how to fill those gaps. To this problem Gény devotes most of his theory of legal science. This means that in his opinion the shortcomings of the written law are much greater than is commonly thought, and also that there are other sources of law to which to have recourse in working out what the law says. The task of filling the gaps belongs to the jurist, not the judge, because the nonformal sources of law demand two sorts of work, on the one hand finding or recovering the law and on the other giving it a technical elaboration. If, instead, the main task were the judge's, we would have to either acknowledge the existence of an already formed natural law or entrust the judge with a role as a *maker* of law. Gény rejects both solutions. The search for the law has to be both *free*, that is, not constrained by positive authority, and *scientific*, that is, founded on objective elements, or *données* (see Gény 1954, vol. 2, 78).

These nonformal sources present themselves as facts, and in this way a positivist conception of science is maintained, but among these facts there are also the demands of reason and appeals to values, and this takes us away from mere factualist empiricism. Gény is a follower of Bergsonian philosophy and subscribes to its attempt to harmonize philosophical positivism with metaphysics and to its recourse to intuition as a form of knowledge (see Oppetit 1991). There is thus prefigured both a broader conception of natural or nonpositive law—expressed in the concept, deriving from Montesquieu, of the nature of things ("la nature des choses": Gény 1954, vol. 2, 75–9; cf. Villey 1965), formed on the basis of a combination of elements that are real, historical, rational, and ideal—and a narrower and more specific conception that identifies natural law with the rational datum. As a testament to the major influence of Gény's thought, it has also been noticed that the real or natural datum finds greater emphasis in Duguit, the historical one in Saleilles and Hauriou, and the ideal one in Ripert and Josserand.

In Gény's work the presence of natural law is at one and the same time pervasive and elusive. Volume 2 of his main work is expressly devoted to *L'irréductible droit naturel* (the irreducible natural law), and Volume 4 turns to the problems of the conflict between natural and positive law (Gény 1914–

[21] On Gény see also Section 12.5 in Tome 1 of this volume.

1924). Gény distinguishes not only ideal law from natural law (ibid., vol. 1, 52–3) but also and especially, in an open controversy with Cathrein, moral from legal natural law (ibid., vol. 4, 217; see also the criticisms in Dabin 1928, 456–7). Natural law has an integrative and subsidiary function in comparison with its function in the classical and neo-Scholastic approach, for it is reduced to the necessary minimum and consists of universal principles that are infinitely mutable in their application. Gény distances himself from Stammler's natural law with variable content, because he defends a fixed and stable centre of evident principles with ethical and legal but highly indefinite content. This "irreducible natural law" is seen as a framework law or, as Rommen says, "a skeleton law" (Rommen 1998, 151).

One must not seek an authentically philosophical perspective in Gény's thought. From this point of view he is an eclectic, as is appropriate for a jurist to be and as is usually the case with all those who accord primacy to the concrete experience of law and do not intend to sacrifice that experience to an abstract conception. The central idea is that natural law, like positive law, belongs to the practice of law and to its historical execution.

As much as Gény broke the positivist streak of the 19th century, his thought also gave dissatisfaction to many moderate legal positivist theorists (see Ripert 1918) and to natural law theorists themselves (cf. Villey 1963). That said, Gény's natural law theory is innovative in several respects: (1) His way of conceiving natural law is rigorously secular, or at least it is so in its intentions (see Gény 1933);[22] (2) in seizing on natural law to defend the autonomy of law as such, Gény, polemicizing with Salleilles, does not resort to external props (like the spirit of the people, the social bases of law, public opinion, or popular consent) but rather appeals to custom and the nature of things; (3) his use of analogy, clearly distinguished from interpretation, as the logical structure proper to legal science makes possible the connection between written law and natural law; (4) natural law tends to be identified with the problem of the nature of law; and (5) Gény refrains from equating natural law in a narrow sense with the idea of justice, an idea that belongs to the ideal datum and has emotional characteristics linked to beliefs and intuitions and yet is also part of the object of legal science.

Unlike Stammler, Gény tends to treat all aspects of law—including ideal ones—in terms of scientific truth, because he has a conception of the experience of law as a unitary body that can be fully realized only if aimed at realizing justice at a given time and in a given space in accordance with appropriate rules (see Gény 1914–1924, vol. 1, 47–55). He is well aware, however, of the tension between law and justice, as can be appreciated from the attention he devotes to the right to resistance.

[22] In 1923, Gény established a chair of natural law calling it "Introduction philosophique a l'étude du droit" (Philosophical introduction to the study of law).

Unlike Gény, other French jurists also influenced by Bergson's thought have undervalued the rational character of natural law in favour of intuitive law, thus embracing a legal science grounded in feeling, or *Gefühlsjurisprudenz* (see, for instance, Le Fur 1937, and the commentary in Collina 2007).

1.1.4.3.2. A Transient and Frail Natural Law

Between the coming into force of the German Civil Code and the Weimar Republic there came the German free law movement.[23] It originated from the Society for Legal Science, founded in 1903 by Hermann Kantorowicz (1877–1940) and Gustav Radbruch, though the latter would subsequently to dissociate himself from the movement, as he was not happy with the term *freies Recht*, preferring instead *außerstaatliches Recht* (see Kantorowicz Carter 2006, 666). In 1906, under the pseudonym Gnaeus Flavius, Kantorowicz published the manifesto of this movement and titled it *Der Kampf um die Rechtswissenschaft* (The battle for legal science: Kantorowicz 2011) echoing Jhering's *Der Kampf um's Recht* (The struggle for law).

This movement, too, emerged in reaction to legal positivism: It sprang from the combined influence of the historical and the positivist schools in elaborating the German Civil Code. The central issue now was no longer only that of the gaps in statutory law but also that of its utter inability to account for the whole of positive law from manifold points of view. The first problem lies in the uncertainty involved in the recognition of the appropriate positive norm, both because theories of legal validity are not unequivocal and because concrete cases cannot be made to fall within univocal categories. The methods for interpreting norms are manifold and do not all lead to the same result. Logical methods of argumentation are in competition with one another: reasoning by analogy, argumentation *a contrario*, recourse to general principles, presumptions and legal fictions, the construction of legal concepts. In this situation jurisprudence, in the twofold sense as the science of law and as case law, is free to settle on the solution it prefers. And then the jurist and the judge are faced with the alternative between deciding according to their motivated subjective preferences, as the French judge Magnaud maintained, and looking for the best possible interpretation of the law (see Lombardi Vallauri 1990a).

As can be appreciated, the free law movement was interested in the tasks of the judge and not only in those of the jurist. Some proponents of the movement, such as Ernst Fuchs, worked in the legal professions. Legal science itself was seen as operative and creative, while Gény was still committed to his descriptive model. The free law movement deliberately abandoned the positivist

[23] On the free law movement see also Section 3.1 in Tome 1 of this volume.

model of legal science once and for all and opened up to the perspective of practical reason, though it did so in a confused way.

All these conditions certainly predisposed people favourably toward natural law, but it won't suffice to reject positivist legal theory by branding it as a form of natural law theory. In reality, the common way of thinking in natural law was very similar to that of positive law: In both cases the concern was ultimately to have a set of norms. Ronald Dworkin will consider this a semantic conception of law, against which he set an interpretive or practical conception. The free lawyers moved precisely in this direction. Their ambition was to modify the approach to positive law. The point was not so much to reveal the inadequacy of the state's law and the presence of other sources of law as to modify the concept of positive law itself.

Free law is all positive law, to be sure. However, the latter is regarded not as fully realized and defined from the outset but as a process always moving toward completion by working from normative materials of various kinds, including those originating from the state. Positive law is human work and constantly under construction. Among these normative materials there are undoubtedly some that are not positive, like the general principles of law, values, fairness, *rationes decidendi*, and principles of reasonableness, but none of that warrants our setting the free law movement next to a doctrine of natural law, because the decisive element lies in their foundation. The term *free* in *free law*, I would argue, has a very different meaning than it does for Gény, who understood it to describe scientific research as independent of political authority, whereas here *free* describes positive law itself, which does not in principle depend on any predetermined parameters, of either a voluntaristic or a rational character. *Free* means "incomplete." In this sense, the free law movement is against both positivist legal theory and the doctrine of natural law. Nevertheless, from the former there derives the conviction that law is founded on power, will, and choice, while from the latter there derives the demand that the choices made by the jurist and the judge should not be arbitrary but rationally justified.

In the 1906 manifesto, Kantorowicz mentions natural law on several occasions: "*The new conception of law presents itself as a resurrection of natural law in renewed form*" (Kantorowicz 2011, 2008). But he immediately clarifies that this novelty of "natural law of the twentieth century" consists in freeing itself from its universal and unchangeable character so as to take on a particularistic and historical one, so it has the merit of being the first and original form of free law as nonstate law. Obviously, this natural law has very little to do with Catholic metaphysics, still very much present in Gény's thought, and it rejects every form of Scholasticism. It is a natural law as "transient and frail as the stars themselves." Kantorowicz exemplifies that remark by making reference to Stammler's *Richtiges Recht* (Right law), Ehrlich's *Frei Rechtsfindung* (The free finding of law), Mayer's *Kulturnormen* (Cultural norms), Wurzel's *Projek-*

tion (Projection), Stampe's *Interessenwägung* (The weighing of interests), and Rümelin's *Werturteile* (Value judgments) (ibid., 2008–9).

The new ideals are sought in the social function of legal prescriptions and in the social effects of judicial decisions. Jurists and judges have to be inspired by the new postulations of appropriateness to the values of the people, of professionalism, of impartiality, and of fairness. If these are respected, "the movement strives with all its might towards a goal that contains all the others stated, the highest goal of all legal action: justice" (ibid., 2028).

The reference made to the values espoused by the people is clearly a reference to Savigny's thought, with the important difference that by that time the idea of an objective legal order specific to the people had been lost. Social relationships are understood through the people's consciousness about norms—a consciousness they develop as they interact in concrete situations—and are not universal but transitory and contingent, always changing as society changes. They are not based on human nature but require an act of recognition and of will by the people and an act of normative understanding by the jurist and the judge. It is worth mentioning in this regard that the Swiss Civil Code, enacted in 1907, contains the famous Article 1, authorizing judges to act as if they were legislators when no law is applicable. The attention paid to the judge's role, the interpreter's personality, and his or her emotions also explains the influence the free law movement had on American legal realism, sensitive to the distinction between explicit and implicit law (see Kantorowicz and Patterson 1928, 692; cf. also Herget and Wallace 1987).

The stress laid on the social perception of justice has led some scholars to claim that the free law theory indirectly paved the way for Nazi legal theory and practice, but this claim has been persuasively rejected (cf. Grosswald Curran 2002, 162). In any case, free law is not an invention of legal interpreters but is already present in social life in an implicit way and *in statu nascenti*.

In conclusion, one has to wonder whether the appeal to values as historically perceived—and ultimately the appeal to social consensus and common opinion in general—deprives legal theory of its critical strength, and so whether legal theory is compatible with natural law. As was noticed by one of the founders of the *Institut International de Philosophie du Droit et de Sociologie Juridique*, natural law at the start of the century found itself in this impasse: If it is unchangeable, it is contrary to life; if it is variable, it winds up being confused with the vague and dangerous concept of public opinion (see Le Fur 1937, 181).

1.1.4.3.3. The Aims of Law

The excessive weight given to the interpreter's individual evaluation of the law led the jurisprudence of interests (*Interessenjurisprudenz*) to seek a more objective basis on which to address the problem of normative gaps. For this reason,

recourse was made to an investigation of those interests that have been at the root of legislative norms, this for the purpose of evaluating norms anew.

The central idea is that law is a way to deal with the conflict among the interests present in every human society. Official law consists in the resolution of this conflict by political authority, but legislative gaps require a new evaluation by interpreters.

This definition of law clearly has a finalistic character (the teleological school). Once more, we can see here the influence of Jhering (1877–1883), according to whom law is created by its aims, while according to the proponents of the Pandectistic school and the jurisprudence of concepts (*Begriffsjurisprudenz*) the aims of law do not belong in its definition. So the effort was to better specify Jhering's orientation, identifying the aims of law in its underlying interests. But this, too, is a highly indefinite notion, which as Binder observed tends to have an empirical-descriptive character, thus losing its original teleological dimension.

Philipp Heck (1858–1943) specified that this was not just a matter of material interests but also of cultural tendencies (*Begehrungsdispositionen*), thus including as well the highest interests of humanity, such as religious or ethical ones (see Heck 1948, 33). But this should lead to diversification in the criteria for evaluating interests. In reality, this school paid attention to economic interests above all others, thus in some respects anticipating the economic analysis of law.

In the first place the judge will have to respect the legislator's solutions for solving conflicts among interests. If a norm presents lacunae, it will be necessary to integrate it, protecting those interests that according to the legislator are worthy of protection. But if cases come before the court that have not been taken into account by the legislator, then the judge has to behave as if he or she were a legislator. The preference accorded to analogy over the *argumentum a contrario*, a form of argument obviously favoured by formalism, makes it possible to see a continuity between the work of the judge and that of the historical legislator.

The fundamental novelty of the jurisprudence of interests consists in having introduced a new method for interpreting the state's norms, a method that rejects the idea, still present in the free law movement, of interpretation confined to the text of law. Not the text but the aim of law (or *ratio legis*) can show what its lacunae really are. So as we ponder over the relation between the jurisprudence of interests and natural law, it is to this novelty that we specifically have to look.

The official attitude of the jurisprudence of interests is one of opposition to natural law, since natural law is conceived on the model of the conceptualism of the Pandectistic school and all a priori conceptions of law (see Rümelin 1948, 7ff.). Legal science must instead start from the social facts tied to interests, and must follow their transformation into legal prescriptions, in which the extralegal dimension is still very much present. Accordingly, legal norms can

ultimately be found to derive from legal and extralegal concepts that are interconnected. In any case, concepts are an epiphenomenon and do not have any legal causality: "Law is not created by concepts but by interests, by the end pursued" (Heck 1948, 35).

In spite of the stated intents of the jurisprudence of interests, traces of natural law theory can be espied in that movement, and they can be summed up as follows.

To begin with, the choice between the formalistic or conceptual method and the teleological one is undoubtedly guided by a value judgment about the aims of law, a judgment that confers a specific meaning on law.

Secondly, resorting to interests and the conflict among interests is tantamount to seeking the genesis of law in social relations that are "natural," or at any rate certainly not created by the sovereign's will. There are also the interests of the legislators, who want their commands to be practicable (an interest in practicability, an interest of presentation). For this reason, according to Heck, it is not enough to refer only to the aim of law, for that causes one to lose sight of the conflict among real interests at its basis. The science of law looks well beyond the legislators' work, which is submitted to the jurists' judgment: It looks to real life or, as Heck puts it, it "wishes to serve everyday life."

Lastly, the web of interests goes far beyond the confines of a national legal system, and so legal systems should be conceived as open-textured. A merit of the jurisprudence of interests is to have appreciated the practical importance of comparative law. In the background one can glimpse the conviction that interests potentially have a certain intrinsic order and that law can go back to the original composition of interests.

Legal antiformalism, in all of the versions considered, is representative of two fundamental concerns: On the one hand is a concern with the connection between law and real life; on the other, a concern with the connection between legal science and the social sciences. The former is a practical concern; the latter, a theoretical one. They can coexist, on condition of subscribing to the view that inherent in the social relations of real life is an objective order which science can demonstrate and which constitutes a criterion for measuring, judging, and interpreting legal prescriptions. In this sense the aspirations of natural law can be considered in a way present, in different degrees of intensity, in legal antiformalism. After all, expressed in real life are not only facts but also values, and the two are inextricably interwoven. Consequently, legal science cannot avoid making value judgments, and the spurious idea of natural law as an objective social order has to accept the mutability and contingency of social life.

1.1.5. Beyond Formalism and Antiformalism

The conflict between formalism and antiformalism, which marked the first half of the 20th century, substantially developed around the question of how to

conceive legal science and its relation to other sciences. But it is also necessary to mention another direction of thought, driven by the intention to overcome the divide between formalism and antiformalism by challenging the primacy of legal epistemology over legal ontology.

The phenomenological orientation had limited resonance in legal philosophy, to be sure.[24] But, over and above any reference to Edmund Husserl's philosophy, it did wind up bridging legal reflection between the first and the second half of the 20th century. The motto adopted by this orientation was that of a "return to things themselves," that is to say, an effort to perceive the essence of law, without the filter of legal science and cutting through the law's historical manifestations, which are purely empirical and transient. From this perspective, law is a modality of intentional conscience concerned with social actions in which bonds are formed between the I and you in the form of rights and duties marked by reciprocity.

For the phenomenological orientation, the examination of social acts, which affect law (especially the act of promising, in private law, and that of commanding, in public law), has neither a factual nor a normative character but a purely theoretical and structural one. This vision of law is not based on concepts, which are built for abstraction, or on consent, which is not by itself a basis of truth, but on eidetic intuitions, which precede all experience and confer a meaning on it.

Law is considered to belong to a third sphere of being, clearly distinguished from that of facts and from that of values. Consequently, phenomenological description strips law of its practical character, both in the instrumental sense as a means of social utility and in the valuative sense as an embodiment of justice. The study of positive law loses all scientific importance and is demoted to the status of a mere technique, but the study of natural law is equally delegitimized, both on the theoretical plane, as belonging to an outdated form of metaphysics, and on the practical plane, since it, too, is a cultural phenomenon devoid of absoluteness and so of any capacity to found positive law. In short, true law is wholly separated from valid law and from just law.

Phenomenology paves the way for a new philosophical approach to law, distancing itself both from the social metaphysics of natural law theory and from the social science of positivism (see Bobbio 1934, 137).

Reinach (1883–1917) explicitly takes on the problem of the relation between his conception of pure law and natural law, which he rejects because of its ideal character and its unfounded universalism (see Reinach 1983, 133–9). He admits that in certain cases the propositions of pure law can help fill legislative gaps. He also admits that there is a problem of connection between essential laws and the particular communities of life in which they are realized. But for him these are wholly secondary aspects that do not concern the cen-

[24] On phenomenology of law see also Chapter 4 in Tome 1 of this volume.

tral objective of the phenomenological conception of law. In truth, however, if the practical character of the idea of law is denied, then we are talking about something different from what jurists, judges, and legislators deal with.

Despite this originality of phenomenological speculation, there is no doubt that its function is to highlight the meaning of historical social acts, connecting them with their eidetic structure, which certainly does not derive from human will. The world of social acts in their essential purity is not an artificial world. In this, phenomenology is very distant from a positivist theory of law. The reason for moving away from natural law theory, regarded as a purely deontological doctrine, is that according to Reinach these social acts apply not only to the human world but also to every imaginable world, that is to say, they are not founded on philosophical anthropology. Phenomenology aspires to rid itself not only of the psychological dimension but also of all anthropomorphism if it is to be pure theoretical thought. But this heady separation between pure ultramundane law and mundane empirical law is very difficult to maintain. It has been noticed in this connection that in fact, in spite of Reinach's intentions, not every content of positive law is compatible with his a priori law (see Seifert 1983, 227–30). Edith Stein (1891–1942) is aware of this. She traces the phenomenological roots of law to the person, understood as an intersubjective and empathetic being. Hence the possibility of critically judging the laws of the state (see Stein 1925).

Indeed, Gerhardt Husserl (1893–1973), the son of Edmund Husserl, deals with the relation between the essence of law and its positive force, taking the central problem of legal philosophy to lie in legal validity. This validity has a temporal and spatial character and, at the same time, a normative one (*normatives Sein*). The anthropological dimension thus reappears in the Heideggerian form of human existence as being-in-the-world (*in-der-Welt-sein*), and the world of positive law and that of pure law are connected (see Husserl 1955).

Every legal system has a temporal character and belongs to a determined life-world (*Lebenswelt*). But the circulation of legal ideas and the very continuity of positive law can only be achieved through a process of detemporalization (*Entzeitung*), making it possible to move from one vital sphere to another. This process brings out the fundamental legal structures, seen as nuclei of meaning stripped of their historico-temporal form and furnished with a claim to universality. This is not true natural law, because we are talking about truth propositions deprived of normativity and of ought. Nevertheless, without these normatively inert legal apriorisms, human orders and legal norms would not have an ultimate foundation, since pure and simple human volition is not a satisfactory justification for the nature of the thing called law.

So the phenomenology of law has shown up an aspect that undoubtedly belongs to the problems of natural law, which is to say that present in positive legal systems are persistent objective legal categories, common archetypes, and legal invariants that take on the particular form of life-worlds. This makes

it possible to speak of an identity of the legal sphere despite the differences among historical arrangements. However, natural law needs not only the universality of its categories but also the normativity of its principles. The *punctum dolens* of legal phenomenology lies in the relation between Is and Ought: On the one hand legal phenomenology belongs with those philosophies that separate the two worlds, while on the other it aspires to *overcome* this separation.

The phenomenological orientation would survive the very conception that brought it into being. Evident traces of these problems can be found throughout German legal thought in the wake of Pufendorf's *entia moralia*, reinterpreted in light of the concept of the "nature of the thing" as a *Sollenstruktur.* But we are now very distant from Reinach's original intentions.

The first rebirth of natural law thus happened simultaneously in different philosophical and cultural orientations and in different conceptual sectors. Catholic natural law theory worked out a complete conception that was made increasingly flexible and complex by the legal science influenced by it. Formalism progressively opened up to legal values, so much so as to include them in the concept of law. Antiformalism denounced the loss of the social bases of positive law and fought against statism. In this way, it came up against non-positive law, both because of the sources of that law and because of the indeterminacy of the state's law and the incompleteness of the legal system, with the consequent problem of the gaps and aims of law, and in reference to legal universals that are variously concretized in positive legal orders. By that time the problems of natural law had crept into the very theory of positive law. Dissatisfaction with 19th-century positive law theory was too widespread to be underestimated, and it was owed to both the concept of law and to the processes by which law is interpreted and applied, but the philosophical landscape was too fragmented and confused. Navigating between Is and Ought meant finding one's way between the rock of sociologism, which reduced values to facts, and that of neoidealism, which sublimated facts in the absolute spirit.

1.2. Natural Law and Totalitarianism

These intellectual vicissitudes of the concept of law were put to the test by an epochal event that deeply marked European history and split the 20th century in two. The advent of totalitarian regimes highlighted the inadequacy of legal formalism, the very easy drifting of antiformalism, and the political inertia of the metaphysical vision. Although the legal culture of the *Rechtsstaat* drew strength from a glorious tradition, it appeared incapable of fending off the economic and political forces at work in human history. We will limit ourselves to Nazi totalitarianism, because it drew on the legal culture at that time regarded as the most advanced in Europe.

1.2.1. Nazi Law

The heavy economic toll of World War I—coupled with the crisis of liberal individualism and the humiliating peace conditions imposed on the German people—contributed to the isolation of Germany from the strand of European culture that developed out of the Enlightenment. This also had immediate effects on legal culture, which had been deeply marked by German legal thought since the 19th century. That precisely German legal thought proved not just incapable of keeping the totalitarian state in check but was even willing to support it in many cases is a lesson in history that must not be forgotten. The Nazi regime was supported by great jurists like Julius Binder, Carl Schmitt, Ernst Forsthoff, and Karl Larenz (see A. Kaufmann 1983).[25]

As far back as 1922, Ernst Troeltsch clearly identified the antagonism present in Europe:

> Those who believe in an eternal and divine Law of Nature, the common nature of human beings and the unity of destiny pervading mankind, and find the essence of humanity in these things, cannot but regard the German doctrine as a strange mixture of mysticism and brutality. Those who take an opposite view—who see in history an ever-moving stream of unique forms, each of which is shaped on the basis of a law which is always new—are bound to consider the West-European world of ideas of cold rationalism and equalitarian atomism, a world of shallowness and Pharisaism. (Troeltsch 1934, 201–2)

In reality, neither legal positivism nor natural law theory can be listed among the main causes of totalitarianism, but neither did they pose a true obstacle to it, the former because of its exsanguine formalism, the latter because of its theoretical and practical weakness. The accusations the proponents of the two groups subsequently exchanged were clearly ideological, each seeking to turn history to its own advantage. Historical facts can disprove a doctrine only when deliberately and directly applied to it.

Whereas the neoidealist philosophy of Italian Fascism rejected both Catholic metaphysics and modern natural law theory, Nazi propaganda made abundant use of the expression *natural law*. Even so, we are clearly situated outside and against the natural law tradition, as can be appreciated by the overwhelming revival of natural law theory in postwar Germany.

Here we will confine ourselves to listing the reasons why Nazi culture was not compatible with natural law, as they are significant for the history of natural law theory in the second half of the 20th century.

Nazi law has an avowedly particularistic character. The intention was to restore Germanic law to its original purity. At the 1933 Leipzig Congress, jurists argued for the need to expunge from the law of the Third Reich all Latin influences, all universalistic abstraction, and the germs of liberal individualism.

[25] On Nazi legal philosophy see also Chapter 9 in Tome 1 of this volume.

A new history of law was to start! But we must not confuse the Third Reich's imperialist ambitions with the universalistic appeal rooted in the idea of natural law. It is true that there was a revival of Gierke's conception of natural law (*gierkische Renaissance*), but only with the most moderate wing of Nazi legal science (e.g., Koellreutter 1932).

Nazi law has a naturalistic character, for it is rooted in the ethno-biological bases of the German people (*Blut und Boden*, or Blood and Soil) and in a specific race (*Rassenseele*). The *Volksgemeinschaft* (or people's community) is conceived as a natural and organic unit to which single individuals are functional. The natural law tradition, by contrast, very clearly draws a sharp distinction between natural laws and the laws of nature: the former are normative, being formulated by practical reason, while the latter are factual. The law of the strongest is not strictly a natural law but, if anything, a law of nature.

Nazi legal culture affirms the principle of the primacy of the political. Accordingly, the distinction between friend and enemy prevailed over the legal and humanitarian principle of equality (see Schmitt 1932a). Without this principle, natural law is nonsense.

Consequently, Nazi law rejects normativism and embraces the principle of effectiveness. The normative ought is replaced with the strength of the concrete order (ibid.). Law is merely a tool in the hands of power. The state is a machinery (*Apparat*) that answers directly to the Führer (*Führerprinzip*). *Führung* (leadership, rulership, command) does not mean *Regierung* (government), since the commands issued by authority of the *Führer* do not guide the action of free and equal persons, who need reasons for action, but strictly determine their conduct as an efficient cause, and that is contrary to the spirit of the rule of law.

In 1934, after the Night of the Long Knives, came the ex post facto enactment of the "Law Regarding Measures of the State Self-Defence," which retroactively legalized the killings committed during the purge (Evans 2005, 72). The importance of this statute goes beyond the circumstances of its enactment, because it introduced a dispensation from the principle of nonretroactivity in the Nazi legal system. This, too, is contrary to the spirit of the rule of law.

Nazi law rejects the concept of subjective rights (see Larenz 1935), which it considers to be at the origin of liberal individualism (cf. Höhn 1934). The individual has no rights as such but is only recognized as having a personality in the community (*Gemeinschaftspersönlichkeit*). This, too, is contrary to the natural law tradition, in which we find the origins of subjective rights as antecedent to the will of the state. Aversion to subjective rights would become very important to understanding the characteristics of natural law theory in the postwar period.

If the state is an expression of the concrete order of the life of a given people, then it is identified with justice. No longer is it possible to draw a distinction between formal and substantive justice: "Law is what benefits the people"

("Recht ist, was dem Volke nutzt": Radbruch 2006a, 13). This means that arbitrary power and violence are law if deemed useful to the people, and that what any authority commands for the benefit of the people is for this very reason just.

Lastly, moving the party outside the legal control of the state is in marked contrast with the conception of the *Rechtsstaat*, as Nazi law stands above the law. Schmitt's doctrine of the "state of exception" (*Ausnahmezustand*) is incompatible with the rule of law and is founded on moral relativism of a Hobbesian type. As far back as 1937, Ernst Fraenkel qualified the Nazi state as "discretionary" (*Massnahmenstaat*), in that government by decree outbalanced government by general norms.

Since the judge has to interpret the law in the light of the Nazi *Weltanschauung*, one can no longer speak of the neutrality of the judiciary. The principle *Nulla poena sine lege* is no longer valid, since there can be behaviours contrary to the community yet not directly written into law. It is replaced with the principle *Nullum crimen sine poena*, an overt violation of habeas corpus. It may even be too charitable to speak of the creation of a "dual state," because governmental institutions themselves frequently operated in contempt of the law (see Fraenkel 1941).

Nazi law thus violated two necessary conditions of natural law theory: the substantive condition regarding the moral content of legal norms, and the formal one regarding the legal system as a whole, a condition requiring respect for the principles of the rule of law. It is very difficult to imagine a legal system as contrary to the natural law tradition as the Nazi regime was. So one would at least expect the proponents of natural law to have been among the staunchest opponents of the Nazi regime. But, surprisingly, with some remarkable exceptions, such as Rommen (1998), that was not to be, and we now need to identify the reasons for it.

In criticising Nazism, Catholic theology found itself in a more favourable position than Reformed theology, which from Luther to Barth had consolidated and reinforced an attitude contrary to natural law. Yet the intellectual reaction that German Catholicism had to Nazism was inadequate and, to an even greater extent, unsatisfactory.

There are historical and cultural reasons that explain this weakness of Catholic natural law theory. The first of these was the legacy of the *Kulturkampf*, which compelled Catholics to show their ability to integrate and cooperate in social and political life. Conspiring with that influence was an initial affinity with some of the themes that drove Nazism—two in particular, namely, communitarianism, in contraposition to liberal individualism, and a tendency toward anti-Semitism (actually much less marked than in Protestantism)—but without foreseeing or desiring its violent outcomes. But after 1933, following the *Gleichschaltung*, a policy designed to absorb all non-Nazi organizations and keep them in check, it became clear that the compromise the Catholic Church came to with Nazism was no longer viable. Even so, a very cautious at-

titude prevailed that favoured indirect to frontal criticism (see Dietrich 1987). The Church became overly concerned with defending the possibility of carrying on its religious mission in German society, and too little concerned with the common good of this society as a whole (see Dietrich 1988). Along with racism, however, there was a point that Catholicism absolutely could not accept, and that is Rosenberg's 1937 statement that "National Socialism always claimed the whole of man and his entire personality." This claim clearly bespoke an antireligious attitude.

Aside from the moral and political responsibilities, which will not be an object of investigation here, an important theoretical lacuna in Catholic natural law theory was highlighted. In principle, starting from *Rerum Novarum*, Catholic natural law sought to respond to all the central problems of social and political life. But in fact, it paid too little attention to the strictly political aspect. A realist attitude to all political regimes, including dictatorships, had taken hold in the conviction that it was enough to require that they meet certain conditions, especially as concerns the *bona particularia* of the family and educational freedom (see Böckenförde 1961–1962). In the Catholic natural law of that time there was no adequate reflection on the rule of law, limited government, or democracy, all questions that were already present in some form in Aquinas's thought.

In these circumstances the concept of the common good—one of the fundamental pillars of Catholic natural law theory—failed to yield evaluation criteria (when truly needed) capable of critical and operational force. Accordingly, natural law fell into a void and became an inert or merely abstract doctrine, incapable of holding concrete political institutions to critical scrutiny. It appeared evident that a doctrine of natural law is not complete if it cannot also express a political theory.

Moreover, the metaphysical bases of Catholic natural law theory, developed by neo-Scholasticism, favoured the elaboration of abstract principles valid for every time and place, even though, for this very reason, such principles turned out to be decontextualized and inert on the sociopolitical plane. On the other hand, nonmetaphysical natural law—variable, irreducible, or progressive—was vague and for that reason could not furnish stable and reliable criteria of judgment.

1.2.2. The Nuremberg Trials

The Nuremberg trials undoubtedly compelled people to reconsider the possibility that natural law could be effective in cases of clear contempt for human dignity. There was a widespread conviction that Nazi war criminals had to be brought to justice under the law, but there was also broad disagreement about the *justification* for such punishment. Particularly indicative in that regard is the following statement by Kelsen:

> Justice required the punishment of these men, in spite of the fact that under positive law they were not punishable at the time they performed the acts made punishable with retroactive force. In case two postulates of justice are in conflict with each other, the higher one prevails; and to punish those who were morally responsible for the international crimes of the Second World War may certainly be considered as more important than to comply with the rather relative rule against ex post facto laws, open to so many exceptions. (Kelsen 1947, 165)

That noncognitivist and cognitivist theorists agreed on this point is evidence of at least some objectivity in the criteria for identifying injustice, or "at least a rudimentary non-relativist ethic" (Alexy 1999a, 33). And that brings natural law back into play. Still, on the legal plane, the way punishment of those found guilty is justified is by no means irrelevant, and in this respect the divide remains between legal positivism and natural law theory.

For a better grasp of the issue, we ought to remember that it fundamentally concerns international law, which was considered less rigorous and developed than domestic law, that is, less purified of natural law elements. Cathrein had previously argued that it is impossible to justify international law if there is no natural law.

A rigorous application of the principles of the *Rechtsstaat*—especially the principles *Nullum crimen sine lege* and *Nulla poena sine lege* in connection with the prohibition on retroactivity in criminal law—would have made the punishment of Nazi war criminals illegal (though not unjust). Since, as was just observed, it was thought necessary for punishment to have the seal of legality, different justification strategies were adopted within the two groups.

Legal positivism would obviously have been fully satisfied if at the time the acts were committed the positive laws (national or international) had contained provisions making those acts crimes. But nothing of the sort existed in the international law in force at the time. Accordingly, the advocates of legal positivism fell back on a search for principles already contained in the law, however much not fully developed, and went looking for them in the interstices of the Kellogg-Briand Pact of 1928 or the 1899 Hague Convention. These were certainly very defective legal rules if judged against the positivist ideal by which the punishment distinguishes the law from morality. But these attempts proved unsatisfactory, since the model of law held up by traditional legal positivism, centred on the commands of the sovereign state, was incapable of adequately accounting for international law (in general, see Paulson 1975). So, in a last-ditch attempt, some exponents of legal positivism abandoned the thesis of the stringency of the principle of nonretroactivity (see Kelsen 1945c), but this meant sawing the branch on which people were sitting, for if such a principle can be defeated by a superior value, then this means that, at least in some cases, moral principles prevail over legal ones. Hitler also thought the same thing, though espousing a very different concept of morality.

Hart's conception goes in the same direction as Kelsen's, though in relation to the issue of obedience to the sovereign's commands, in stating that "laws

may be law but too evil to be obeyed" (Hart 1957–1958, 620, and also Hadelmann 2005). But if a valid norm must not to be obeyed, then it is normatively inert, that is to say, it is not a real norm.

Even within natural law theories, a range of positions can be observed. Traditional metaphysical natural law theory makes a strong case for the invalidity of unjust laws and accordingly holds those who obey such laws legally responsible. Consequently, a positive law that simply recognizes natural law principles, which by definition everyone already recognizes from the start, cannot strictly be considered retroactive. This thesis as a general proposition appeared overblown to many theorists of law, and apt to seriously undermine the certainty of law. As is well known, Gustav Radbruch formulated a more downsized version of it, independent of metaphysical natural law theory:

> The positive law, secured by legislation and power, takes precedence even when its content is unjust and fails to benefit the people, unless the conflict between statute and justice reaches such an intolerable degree that the statute, as "flawed law" [*unrichtiges Recht*], must yield to justice. (Radbruch 2006b, 7)

Radbruch's formula essentially says that extreme injustice cannot count as law. There is therefore a certain connection between law and morality, though it is limited to extreme cases. Moreover, Radbruch introduces another thesis:

> Where there is not even an attempt at justice, where equality, the core of justice, is deliberately betrayed in the issuance of positive law, then the statute is not merely "flawed law," it lacks completely the very nature of law. (Ibid.)

Hence in addition to unjust laws there are nonlaws. Radbruch would reaffirm his natural law theses in *Vorschule der Rechtsphilosophie* (Primer on the philosophy of law: Radbruch 1948a), where legal philosophy is conceived as a doctrine of right law (*richtiges Recht*).

This opens up a third way of natural law theory, in which the formal principles of the rule of law are part of the concept of law. Nazi laws should not have been complied with because they violate these principles. But this strand of thought, developed, as is well known, in the United States by Lon Fuller, has no echo in the European cultural landscape, and one can understand the reasons why. For one thing, not all Nazi laws were thus vitiated and, for another, the rules followed at Nuremberg were themselves applied retroactively, at least as regards the *nulla poena* principle, and so in violation of a fundamental principle of the rule of law. It must be recognized that there was no way to circumvent this problem: It was necessary to frontally address the question of the substantive justice of law.

In fact neither legal positivism nor natural law theory in their pure form were invoked by the judges of the Nuremberg Court. A pragmatic path halfway between the two prevailed: On the one hand an effort was made to demonstrate the prior existence of international rules of law (for this reason, for

instance, the application of rules on crimes against humanity was limited to the war context), and on the other there was invoked the particular nature of international law, marked by an appeal to the common conscience and to the principles of basic humanity widespread "among civilized people."

The Charter of the International Military Tribunal contained an affirmation of the principle of individual criminal liability for the most serious violations of international humanitarian law, even when people acted out of obedience to higher orders. This is an important point in the history of natural law in the second half of the 20th century, as it put an end to the state's absolute sovereignty and provided legal recognition of the values of morality and conscience.

The time had now come to consider not which legal philosophical conception had favoured Nazism, but what conception of the law could help to avoid it being repeated.

1.3. The Second Revival

1.3.1. The Enforcement of Natural Law

As we have seen, the first revival of natural law was characterized on the one hand by a consolidation of Catholic doctrine and, on the other, by the dissemination of ideas linked in some way to natural law but essentially rooted in a dissatisfaction with formalistic positive law theory. Between the first and the second revival there is the watershed of World War II, which radically changed the framing of the problem much more than World War I had (see Kühl 1990, A. Kaufmann 1991). It appears evident that the first issue to be addressed, before turning to the role of natural law in the *theory* of law, is that of its role in the actual *practice* of positive law.

The Nuremberg trials did not remain an isolated case, especially in the *Bundesrepublik*. Specifically, the German courts and the Federal Constitutional Court of Germany itself in some cases expressly used the Radbruch's formula to ground the conviction of Nazi war criminals, and in more recent times it also used the formula in its decisions on the so-called Berlin wall shootings by the *Volkspolizei*, or *VoPo* (see Alexy 1999a, 19–22). Natural law in the form of a minimum objective morality had a concrete influence in judicial practice, and not only in West Germany.

Natural law would soon crop up in the legislation of the Federal Republic of Germany as well, particularly in criminal and family law. But that is even more evident in the *Grundgesetz* and, more in general, in all the constitutions enacted after World War II, which were presented as a supra-statutory law superior to the state's powers (see Rosenbaum 1972, 106–30).

This presence of natural law elements in the rules and practice of positive law may be overt or hidden, but regardless, in it lies the new and distinctive trait of the second natural law revival.

It is certainly not a new thing for the positive law to be applied and interpreted by also taking extralegal elements into account, especially after the theses advanced by the free law movement. The new development instead lies in the active presence of natural law in the lawmaking processes, that is, in the positivization of law at large.

In Italy the Association of Catholic Jurists—inspired by the 1942 radio message in which Pius XII reaffirmed the eternal validity of natural law, this time with the inclusion of human rights (cf. Gonella 1942)—coined the significant formula "natural law in force" (Angeloni et al. 1951). In Germany, too, people spoke of "positivized natural law" (G. Müller 1967, 10–2; see also Foljanty 2013). This was also an appeal to the jurist's and the judge's conscience and to legal ethics in relation to unjust law, in such a way that the problem of the justice of positive law would not be deemed extraneous to the judges' professional role, as legal positivism by contrast maintained. If the whole legal enterprise takes justice as its aim, then the theory and philosophy of law should take justice into account, with a consequent deep transformation of the paradigms at work in the tradition of legal science since the 19th century. In fact, however, it was not so or at least it did not happen in a significant way. The theory appeared more resistant to natural law than practice has been. The appeal to natural law often did not correspond to a different way of seeing the theory of legal science.

1.3.2. Common Values and Natural Law

The presence of natural law in postwar legal philosophy came about through a progressive and significant transformation of moral culture in general.

The reaction against the crimes perpetrated by the totalitarian regimes helped to consolidate a broadly shared substantive ethic, regardless of the foundations on which such an ethic is made to rest. Instead, as we have seen, in the first half of the 20th century the only full-fledged conception of natural law was the Catholic one, which finds a specific justification on theological, metaphysical, and anthropological bases. This made it possible to hold up common or shared moral values without having to endorse foundations that many were not prepared to accept. So, for example, there were those who maintained that natural law and individualistic modern ethics were incompatible (see Piovani 1961). Consequently, the traditional relation between positive and natural law was replaced with that between law and morality. This also avoided the need to invoke "nature," which in ethics divides much more than it unites. But setting aside both the legal character of natural law and its natural character meant a profound transformation of the traditional issue, whose real effects would not show themselves until a few decades later. For the time being we should only note that, unlike what is the case in natural law, the existence of shared values is a factual matter which is predicated on consent, but which at the same time also presents itself as endowed with normativity.

The passage from natural law to an ethics of shared values was also perceived in the Catholic culture as an opportunity for dialogue (see Delhaye 1960). Neo-Scholasticism had by now abandoned its typical syllogistic method and presented itself in a more discursive form, more attentive to a deeper distinction between law and morality (cf. Graneris 1949) and moderately open to the historicity of law (cf. Olgiati 1944). But it was essentially aimed at supporting the traditional theses of neo-Thomism, with few serious attempts at bringing the theory up to date, especially in the areas of human rights, international law, and social ethics (see Messner 1950, Auer 1956, Verdross 1958, and Ütz 1958–1963).

Within Catholic natural law theory the most significant innovations originated from the epigones of the second phase of Thomism, which as previously remarked was based on a direct reading of Aquinas's works in light of the philosophical problems of the time. Here we will simply emphasise the contribution of two thinkers that in some respects influenced the Second Vatican Council: the Frenchman Jacques Maritain (1882–1973) and the Pole Georges Kalinowski (1916–2000).[26]

Maritain believed firmly in the ductile capacity of Thomism to seamlessly bring the emergent cultural values into its fold: These were values he himself identified and at times harbingered, as by making the case for world governance. Rejecting the state's sovereign omnipotence in the name of the priority of the human person (see Maritain 1951), he understood the importance of democracy (cf. Maritain 1988b). A supporter of the Universal Declaration of Human Rights, he was committed to showing the connection between human rights and the traditional problems of natural law (see Maritain 1988a). In particular, giving further impetus to the spread of the ethics of shared values, he defended the possibility of practical accord and cooperation among very different ideal and cultural families on the theoretical plane, prefiguring Rawls's overlapping consensus (see Maritain 1990). His exile to the United States, during World War II and for some years after the war ended, allowed him to appreciate American political culture, from which he drew inspiration (see, for instance, Pound 1942). Maritain's social and political writings, in both Europe and the United States, can be said to have been more influential than his general philosophical thought.

As regards natural law more directly, Maritain regarded its principles not as general precepts but as universal "dynamic schemes" operating in all cultures in an unconscious way and amenable to a wide variety of concretizations (see Maritain 1951, 93–4). The idea is taken, once more, from Bergson, but is elaborated on the basis of a cultural concept of human nature. Positive law—the primary meaning of law—obviously belongs to the cultural dimension and is the fruit of practical reason, which imparts order to human actions by means

[26] On Maritain see also Section 3.2 in this tome.

of "knowledge through inclination." This means that the derivation of positive law from natural law *ad modum conclusionis* must also be conceived not in a deductive sense but as a historical concretization among many possible ones. Maritain did not succeed in further specifying this strand of thought, which he intended to back up with the support of cultural anthropology (see Maritain 1986, Viola 1984). Even so, it stands as a variant on the other previously discussed interpretations of the relation between natural law and positive law in the framework of Aquinas's thought.

From this perspective, Maritain's thought on natural law unwittingly crosses into a tradition of thought that spans from Vico to Gadamer, the latter also having invoked ideal schemes of action (Gadamer 1960, 302ff.). Natural law constitutes a necessary condition for the practicability of positive law, an internal source of guidance for the latter that cannot be disregarded. This "just by nature" never exists in a pure form but is manifested through its cultural concretizations, which require the exercise of the judicial form of *phronesis*, or practical reasonableness.

Georges Kalinowski, for his part, addressed natural law not directly but looking at its cognitive presuppositions. If value judgments and norms themselves do not have any truth value, then natural law and the moral law, however interpreted, do not have any rational justification. Kalinowski, coming from the famous Polish school of logic, contributed to the development of deontic logic at the same time as the Dane Alf Ross, the Finn Georges Henrik von Wright, and the German Oskar Becker were conducting their investigations, but independently of them. Careful to defend the peculiarity of practical knowledge, which had aroused the interest of other researchers inspired by Thomist thought (see Y. Simon 1934), he maintained that science cannot properly set the truth conditions for practical knowledge, which instead require philosophical perspectives, that is, strictly dialectical ones. According to Kalinowski, first value judgments are based on evidence and support one another with the aid of the virtues, while second value judgments are verifiable on a logical plane (cf. Kalinowski 1967). In his opinion it is necessary to abandon a static concept of human nature, typical of modern natural law theory, and to clearly distinguish normality from normativity, which is compatible with the mutability of human nature (see Kalinowski 1983, Kalinowski and Villey 1984).

Christian culture was not limited to the Thomist school but also developed in a secular version. Recourse to an ethic of shared values also made for greater freedom from a Christian perspective. Here begins what was previously indicated as the third phase of Thomist natural law theory, in which what is at stake is no longer fidelity to a school but the intersection of different philosophical models, from Aquinas to Kant.

The Italian philosopher Alessandro Passerin d'Entrèves published a study that was emblematic of this new cultural atmosphere (Passerin d'Entrèves

1951). Although this was clearly an introductory text and was modest in its tone, it is representative of this secular turn in natural law theory of Christian persuasion. The goal was to reconstruct a tradition of thought that preserves its critical role in Western social and political history. The effort, proceeding from the natural light of reason, capable of distinguishing good from evil, the just from the unjust, was to find norms that are not only a measure of human action but also a judgment on its value. According to Passerin d'Entrèves, who followed Aquinas in a non-Scholastic way, it is possible to have a rational foundation of ethics. Law is recognized as having a moral character and is thus brought back into the fold of morality, yet there is a specificity to it that is not based on the stifling distinguishing traits of tradition but on the possibility of translating moral norms into legal principles. Precisely in that effort, according to Passerin d'Entrèves, lies the task proper to natural law, the task of serving as an interface between morality and positive law. It is interesting to note that in this way a traditional aspect of natural law was vindicated that had been entirely forgotten, namely, the important role natural law plays not only in the formation of legal language and the construction of legal categories, but also in the way in which law is produced and put into practice (cf. also Y. Simon 1992). It is thus shown that the validity of law stands on more than mere legality.

In the same strand of thought, though with greater attention to the teaching of historicism and the transcendence of faith (see Fassò 1956), we find the Italian legal philosopher Guido Fassò (1915–1974), who in 1964 published a study on the historical role of natural law theory to reaffirm its validity in Western political history. Fassò notes that it is impossible to understand the meaning of constitutionalism and the liberal state without considering natural law. But it needs to be observed that, like Passerin d'Entrèves and unlike the other previously mentioned Thomist authors, Fassò places a premium on natural law theory, and above all defends the role of reason in law, which in keeping with the English tradition is viewed by him as *artificial reason*, a reason at once not absolute and clearly distinguished from the sovereign's imperious will (see Fassò 1999, 217–52).

The experience of totalitarianism also led Protestant theology, traditionally very distrustful of natural law, to reexamine its views on the relation between nature and grace. A systematic attempt was made to examine the manifold natural law models (see Wolf 1955, 1947). By comparison with the strand of thought contrary to natural law—positing the existence of two kingdoms and spanning from Luther to Barth—the Calvinist treatment of moral conscience left open the possibility of natural revelation (*revelatio generalis*) beyond specifically evangelical revelation, and this made possible a dialogue with Catholic theology (see Böckle 1965 and also Reber 1962). The central problem therefore becomes what Brunner calls the point of connection (*Anknüpfungspunkt*) between the action of God and man's response. The admission of the existence of various arrangements or orders of creation and justice (cf. Brunner 1943),

thus making room for natural law, leaves unprejudiced the question of subjective human action burdened by sin, and makes it necessary to set power on a theological foundation. That is precisely the outlook on which Protestant theology approaches law and politics (see Künneth 1954). Brunner rejected the equation between law and power and on that basis took exception to legal positivism. Even so, every formalization of natural law is extraneous to the Protestant vision, and there is a preference for turning to conscience. What is good cannot be preestablished once and for all: The good lies in obedience to God's command at any given moment (see Brunner 1939, 33). This paved the way for a situational ethics, which had already been prefigured by Bonhoeffer (1949, 215), and which intersects with the existentialist trends of the time. On this path, Protestant thought is somewhat cautious toward natural law as an objective secular ethics, as is evidenced by the writings of Ellul, who passionately stressed the subversive strength of Christianity against established institutions, first among which the ecclesiastical ones (see Ellul 1946, 1988). But even in Catholic theology the traditional way of seeing natural law was challenged (see, for instance, Böckle and Kaufmann 1966).

1.3.3. The Nature of the Thing

The shock of the war led many legal philosophers to reexamine their own thought, and there were many "conversions" to natural law, some in truth certainly dictated by opportunism but others sincere. On the opposite side there was a return to philosophical positivism in the guise of logical neopositivism and analytic philosophy, which presented themselves as methods of scientific investigation to be applied to legal science as well. But in general the urgency of providing a theoretical answer by which to account for the facts of history—not a preconstituted answer or one or deriving from an implied general vision—prevailed over the need to stay true to any given current of thought. This helped legal philosophy gain greater autonomy from general philosophy, setting in motion a distancing process that was destined increase over time.

As legal philosophy began to take on a history of its own not ancillary to general philosophy, a conflict emerged between those who as a priority saw legal philosophy as an epistemology of legal science and those who defended its speculative character. This brought back the perennial contrast between legal positivism and natural law theory. But now it was clear that the effort was to give an answer to the same problem, that of defining positive law. On the one hand the general theory of law, following in Kelsen's footsteps, took an epistemological course, thus freeing itself of the particularism of legal dogmatics; but on the other, the legitimacy of a philosophical conception of positive law was vindicated. The conflict was set precisely on the plane of the general approach to positive law, and so no longer was there a distinction between the philosophers' philosophy of law and that of the jurists.

Among the philosophical currents of the first half of the 20th century that appeared to be most involved in the drift toward totalitarianism was undoubtedly neoidealism. This current was responsible for dismantling the cognitive credentials of legal science, reducing the essence of law to an act of subjectivity that posits norms and continually overcomes them, and absorbing individuality within the subjectivity of the absolute spirit. The legal philosophy of neoidealism, in both its historicist version and its absolutist one, took the strongest conceivable stance against natural law, even outdoing philosophical positivism in this regard, despite some attempts at recovery (see, for instance, Antoni 1959).

If normativity comes from the immanent acts of the spirit in its internal dynamism, then in principle there is no limit to the subjectivity by virtue of which norms are set. It was thus necessary to reconsider the foundation of legal normativity so as to set limits to be respected. This is the general thrust of the second revival of natural law. Indeed, nature, understood as a simulacrum of objectivity, became the constraint the spirit tends ceaselessly to overcome. And yet the reduction of nature to pure facticity was the main theoretical obstacle that made it impossible to recognize a source of normativity in nature itself. It was the challenge of overcoming this obstacle—through orientations grounded in a creationist metaphysics, though not always—that engaged natural law theorists after World War II.

Although the strategies employed in addressing this challenge were manifold and quite varied, they often overlapped in important respects, and the effect was to produce a certain eclecticism.

A common element can be identified in what has been called the "doctrine of the nature of the thing," but only if we give that doctrine a much broader sense than that used by those who expressly looked to it. In this way we can understand all those conceptions that seem to embrace the idea of an objective structure which the positive legal creation of norms is called on to somehow respect.

The doctrine of the nature of the thing had been put forward by Radbruch in a form that was still subsidiary to positive law, where it was seen as the objective meaning to be extracted from the conditions of life and as the force driving the transformation of legal institutions in response to social change (see Radbruch 1948b, 147). But it was reprised in a broader way in the postwar period (see Baratta 1959).

The modest version of the doctrine of the nature of the thing is the one that recognizes the importance of that nature when it comes to interpreting and integrating the law itself but not as regards the *sources* of law. This was the version espoused by Bobbio (1958), who thus lent support to Radbruch's theses, giving them an even more restricted form. But in this form the doctrine has very little importance for natural law, except to the extent that fairness is a concern of natural law.

Bobbio notes that the doctrine of the nature of things is hostile to voluntarism, statism, and legislative fetishism—the same enemies as those of natural law. But as much as Bobbio may avoid a metaphysical concept of nature, he cannot avoid the naturalistic fallacy. In the manner of the antiformalist sociological conception, he recognizes the pluralism of legal sources but confuses the sources from which law is derived with those on which basis norms are qualified. In reality, the doctrine of the nature of the thing must be linked to teleological and sociological methods that guide the judge and the jurist in interpreting legal norms and the nature of legal institutes. That is all.

In reality, even for natural lawyers the doctrine of the nature of the thing was not meant to add a new source of law competing with the positive law or superordinate to it. It was instead meant to challenge the positivist doctrine of the sources of law itself or, more precisely, to challenge the way statutory law was conceived as a source of law. It was not a matter of introducing a new source—that of the nature of the thing—alongside the others, but rather of rejecting the idea of law as an issuance of the legislator's will. On the contrary, law was subjected to constraints both at the moment of its production and at that of its interpretation. These constraints had the same function as the traditional ones of natural law (that is to say, they were among the elements required to define the validity of law or to establish its normativity), but they differed from the latter in some significant respects. The fundamental difference lies in the *realism* of the nature of the thing. The facts invoked by the nature of the thing are not bare or "naked" but are instead enveloped in values. And here the difference among the various renderings of the doctrine of the nature of the thing depends on how they see the kinds of facts to be taken into account and the kind of relation these facts bear to values. That doctrine rejects the metaphysical abstractionism of traditional natural law theory, precisely because the latter does not succeed in making natural law effective. For all these reasons, the doctrine as a whole can be regarded as an attempt at a profound revision of natural law theory (see Poulantzas 1965).

What emerged as the central legal-philosophical problem was that of the relation between facts and values, between real law and ideal law, since their separation, that is, dualistic thought, was considered responsible for the inertia of theory toward history.

The different versions of the doctrine of the nature of the thing often depend on the nature of the facts considered. These can be any of the following: the very mode in which law is experienced, the human condition, the ontological structure of legal culture, and the concrete legal situation. Let us take them up in turn.

1.3.3.1. Law as Experience

The philosophy of law as experience, which did not intend to break entirely with idealism and historicism, found its greatest expression in Italy. The

principal proponent of this orientation was Giuseppe Capograssi (1889–1956), who did not abandon the central importance of conscience proper to idealism but did reject its absoluteness (see Capograssi 1959b).[27] Law is not a set of rules but an activity that expresses itself in different forms reflecting the different ways in which individuals relate to one another and to goods (see Capograssi 1959c). These relations are always present in legal systems, and the problem is to protect their meaning in the application of law. Capograssi defends the individual against the voracity of the state's power and works out a form of Christian existentialism inspired by Augustine and Rosmini. Like Vico, he seeks natural law in the historical development of positive law, by looking at the way law comes into being rather than at its normative or prescriptive form. Law as such, unqualified, is a unitary practical experience whose aim is to strive for the infinite, all the while preventing individuals from escaping such a striving.

Capograssi's influence on Italian legal culture was a major one and favoured the development of the natural law orientation, though he himself was not strictly an advocate of natural law in the traditional sense.

In its further development, the philosophy of law as experience saw the need to better delimit what is distinctively legal in human experience, distinguishing that element (the law) from other forms of practical life. In this sense it is the nature of legal experience that presents itself as the "thing" to be defined. Thus, for example, Enrico Opocher (1914–2004) looked to the trial and to litigation in identifying this specificity involved in putting into practice the value inherent in law. This strand of thought is meant to avoid both transcendental formalism and historicism, as well as legal positivism and traditional natural law theory, so as to affirm law as a value (see Opocher 1983, 267–315). Without a doubt, the centrality of the value of justice, the primacy of reason over will, and the recognition of truth in legal judgment are all natural law aspects, but in the thought of Opocher the temporal process by which the value of law is objectivised is not governed by any well-defined criteria other than the formal Kantian criterion of the coexistence of freedoms.

1.3.3.2. The Human Condition

Another orientation looks above all at human existence and its relational conditions of development. This strand of thought ought to be further distinguished into two orientations.

There is first of all an attempt to apply the philosophy of existentialism to reflection on law and society, though the results have not, in truth, been remarkable, this owing to the original vocation of a conception born of the uprooting of humans from their place in the world (see Battaglia 1949). It is very

[27] On Capograssi see also Section 11.3.1 in Tome 1 of this volume.

difficult to find natural law in a philosophy that defends the primacy of existence over essence. Nevertheless, in various respects existentialism undoubtedly contributed to this second rebirth of natural law.

Personalism, which owes a lot to the effort made by Emmanuel Mounier (1905–1950) to give it wide currency and a revolutionary edge, in turn played a central role in renewing social anthropology, placing it at the centre of philosophical reflection (see Mounier 1936). Personhood, in which being and the good are identified, takes on the role of a supreme value. The dignity of the human person is considered a sacred value, and the person himself or herself is seen as a plexus of social relationships reflected in the political form of participatory democracy. Personalist thought is certainly not analytical, so it would be vain to seek in it any systematic working out of moral principles. Even so, the primacy of the human person, taking the place of creationist metaphysics, becomes the valuative basis for a new expression of ethical and legal principles.

Also very much present in atheistic or secular existentialism is the theme of social justice, both in the form of a hopeless denunciation and in that of a commitment to the construction of emancipatory social relational structures, as can be appreciated in the thought of Maurice Merleau-Ponty (1908–1961). In the place of a natural law there is undoubtedly the demand for responsible choice as the fundamental basis of human existence (see Scarpelli 1949). Further, existentialism was also behind the effort to explore the basic forms of social life, from mere coexistence to political society down to communion (see, for instance, Berdjaev 1936). Today a certain return to existentialist perspectives can be observed in studies in Law and Literature.

The attempt to bring the existentialist perspective to bear on the categories of legal science remained isolated (see Cohn 1955). It was trenchantly criticized by Kelsen (1957, 161), who compared it to a vogue that made its way to the suburbs after it lost its lustre in the metropolis, though it was defended by Arthur Kaufmann (1958, 23).

More significant, in that it came into being within legal-philosophical reflection, was the other strand of thought, for which "the thing" to be thematized as having an essential nature was the cultural world created by humans, and so also the strictly legal world.

We take as emblematic in this regard the thought of Werner Maihofer (1918–2009).[28] The facts of culture cannot be treated like natural facts, because value is immanent in them from the start. Value therefore does not remain a pure subjective element of the conscience, as Radbruch maintained, but rather enters the world of being. However, this being is not that of nature but that of history—the order of human coexistence created by humans themselves (see Maihofer 1958). Therefore, the nature of the fact is the process

[28] On Maihofer see also Sections 10.2.1.2 and 10.2.3 in Tome 1 of this volume.

by which we realize we have to be in the world of being. Dualistic thought is superseded by a monistic vision aiming to overcome the dichotomy between Ought and Is, between subject and object.

Konkrete Naturrecht (or concrete natural law), as Maihofer called it, has a typological character, in that it is founded on the roles that humans play in concrete social life, understood as formed by plexuses of rights and duties, expectations and obligations. These roles represent relationships of coexistence, and they change over time, but at every moment in history they are normative, meaning that rules are drawn from them according to the method of the Kantian categorical imperative and that of the principle of reciprocity. Maihofer does not mean to put forward an ideal of justice or even to defend a new source of law, but is only interested in ascertaining that the layperson and the jurist alike follow positive law in light of rules proper to the meta-positive law on which positive law is founded.

This strand of thought was the same as that of the others, but with some variants, sometimes more attentive to the prelegal limits on the contents of legal validity (see Welzel 1951), and sometimes proceeding on the basis of Scheler's material ethics, more concerned with the relation between historical conscience and the universal values of the person to which the law is linked (see Coing 1950). But all agree in rejecting a metaphysical foundation of natural law as incompatible with the historicity of human existence.

So why still call it "natural law"? Perhaps because, though created by humans, it presents itself as an objective constraint, albeit a historical one, on individual conscience? This still seemed to be too extrinsic in the eyes of a more consequent natural law theory. Although Sergio Cotta (1920–2007) also adopted a phenomenological and existentialist perspective, he criticized Maihofer's theses, arguing that they lead to a dissolution of human authenticity behind the mask of social roles. In this way law would not be an expression of the mode of being distinctive to humans (see Cotta 1991). For this reason it is necessary to connect natural law to the fundamental modes of human coexistence, understood as the set of conditions and principles required for an authentic existence of the relationships that form the basis of legal phenomena. The focal problem of natural law is not to identify precepts dictated by human nature but to justify the obligatoriness of positive law, which cannot in turn be explained on factual or voluntaristic bases (cf. Cotta 1981). This conception, too, as I see it, is inscribed in the general horizon of the doctrine of the nature of the thing, but since the "thing" is now our being human that binds the structure and content of the legal phenomenon, the basis of the law turns out in the final analysis to have a metaphysical character.

1.3.3.3. The Ontological Structure of Law

The third version of the doctrine of the nature of the thing turns directly to the structure of positive law considered in itself. In it a marriage is forged between Is and Ought, between the social fact and normativity.

If we take Arthur Kaufmann (1923–2001) to be representative of this strand of thought, we again see an effort to bring Thomas Aquinas's philosophy of being to bear on the concept of law as regards the distinction between essence and existence.[29] This leads one to exclude the both essentialist path of idealistic natural law and the empiricist one of legal positivism, thus looking for a third path.

> Positivism regards the validity of the norm to be the result of its effectiveness; idealistic natural law regards validity as the criterion of the effectiveness. The problems concerning "law and power," "justice and certainty," are finally insoluble for both views. (A. Kaufmann 1963, 81–2)

The third way consists in considering positive law to be internally never fully realized once and for all but always in search of the realization of its own essence. The universal is met only in the particular. The nature of the thing lies in its manifesting itself in the particular concretization of something universal. The law-thing always has a historical character, so as Gerhart Husserl previously noticed, law has the "time-structure of historicity." This means that natural law itself, which is equated with justice, has a historical character (see A. Kaufmann 1957, 11ff.), though it is not on that account relativistic. Natural law must not be confused, as Aquinas's followers have often done, with the fundamental principles of law and morality, which have an abstract and decontextualized character. Lying somewhere between these principles and mere positivity is precisely natural law, in that it confers a normative ought on the latter. Legal positivism is accused of defining positive law in such a way as to assert as true the thesis already implicit in that very definition, namely, the thesis of the separation between law and morality.

If we instead look at the effective reality of law, we cannot exclude the presence of evaluations and moral values in law.

From this perspective, law can no longer be equated with positive law, as legal positivism would have it. After all, this distinction had been enacted in Article 20 of the *Grundgesetz*, establishing a bond between the judge and the *Gesetz und Recht* (statutes and the law). The statutes are only one element of law, which also includes what the concrete case contributes in an institutional way to the formulation of the rule, bringing in legal principles, general clauses, maxims based on experience, and so forth (cf. Esser 1956). The statutes and law are to one another as power is to action, and possibility to reality. The stat-

[29] A conception of the nature of the thing even more closely derived from Aquinas's thought was developed by Herbert Schambeck (1964).

utes are not yet the reality of law: They are only a stage—a necessary one, to be sure—in the path toward the realization of law (see A. Kaufmann 1977, 157).

At this point legal philosophy finds itself having to take the path of hermeneutics, which can no longer simply be seen as the art of interpreting texts, since it reflects the very nature of law, which lies in its being structurally indefinite and open-ended (see A. Kaufmann 1965). Also developed in those same years were the philosophical hermeneutics of Gadamer (1900–2002), likewise sensitive to the question of the "nature of the thing" (see Gadamer 1993).[30]

In Italy Emilio Betti (1890–1968) had actually already worked out a hermeneutic conception of legal interpretation that from a philosophical point of view was based on the philosophy of values advanced by Nicolai Hartmann (1882–1950). But Heideggerian hermeneutics had come into being in direct opposition to the purported objectivity of the philosophy of values, in which it perceived a hidden desire for power and a failure to recognize the subject in his or her capacity for moral choice. Nevertheless, replacing the distinction between essence and existence with the ontological one between being and entity did not seem to make it possible to specifically recognize regional ontologies, among which is that of law. Indeed, Kaufmann, criticizing Maihofer, notes that law as a regional ontology can be developed only as a philosophy of essence in Edmund Husserl's sense (see A. Kaufmann 1963, 84–5). Still, it is true that what law is depends on the question of why there is law, which in turn takes us back to the social nature of the human being. So there arose the issue of the configuration of a philosophical hermeneutics suited to working out the concept of law.

Gadamer's conception, though dependent on that of Heidegger, sought to reconcile the permanence of values with their status of dependence on a given ethos, so as to avoid cultural relativism. The basic effort was to pursue a nonmetaphysical objectivity of values. To this day there is an ongoing discussion about whether this goal has been achieved in an acceptable way. It needs to be recognized that the relation between philosophical hermeneutics and natural law theory remains problematic. But the connection between philosophical hermeneutics and the call to rehabilitate practical philosophy (see Riedel 1972–1974) makes it possible to address present-day problems involving the concept of law, the identification of law with social practices rather than with norms, and the role of the virtue of *phronesis* (see Kriele 1979).

So between legal positivism and rationalistic natural law theory there opens up the third way of "hermeneutic natural law theory," which rejects (*i*) the dualism between Is and Ought, (*ii*) the identification of law (*ius*) with statutory law (*lex*), and (*iii*) the view of law as already set, embracing instead a view of law as a process in action.

[30] On Gadamer and legal hermeneutics see Section 23.4 in this tome and Section 10.3.5 in Tome 1 of this volume.

1.3.3.4. *Ipsa Res Iusta*

We can finally turn to a version of the nature of the law-thing that invokes not the general structure of positive law but the concrete legal situation, in whose regulation ultimately lies the aim of the legal enterprise.

Michel Villey (1914–1988), polemicizing with rationalism and the abstractionism of modern legal science, and making use of the experience of Roman law and Aristotle's philosophy, argued for the primacy of the concrete case, requiring the judge to look to social relations in working out the correct balance between rights and duties (*res iusta*).[31] Law already exists in things (*id quod iustum est*) and must be recognized by observing social reality on the basis of a dialectical method. The rule drawn from the concrete situation is valid only for the situation itself, and so is not strictly speaking law. Villey reserved the concept of norm for a general provision deriving from human or divine authority. Hence what is designated as "natural law" is not a set of norms or principles but is rather a set of relationships between humans and things and among humans themselves: These relationships are inevitably changeful but always reasonable (Villey 1976a).

In a keen historical reconstruction, Villey (1975) shows that our way of seeing law and putting it into practice has changed so much over time as to lose its original reason for being. Christian theology has given us the primacy of law, and modern thought has set into motion a process of subjectivization of law that exists to this day with human rights (see Villey 1983). The conjunction of these two cultural factors has pushed law into the arms of morality and into the science for which both modern natural law theory and legal positivism are responsible. Hence Villey's real contribution to the problems relating to natural law lies in his conception of law in general, since the primacy of law and of subjective rights, which are two sides of the same coin, frustrates the *ordo rerum* and turns law into a purely artificial construct for administering conflicting claims.

It has to be recognized that by observing the impossibility of returning to the past, Villey identified two essential themes for the fate of natural law: that of the epistemological status of jurisprudence and that of the role of the legal subject.

The view of jurisprudence as a science, and not as an art, put natural law in a blind alley, because the natural sciences rejected any teleological conception of nature, and the human sciences, though open to values, could not set values on a philosophical foundation. Moreover, the practical character of law and its being geared toward the concrete case were in any event lost.

The second issue was even more important. The premodern legal tradition had stressed the objective character of natural law. There is to this day a

[31] On Villey see also Section 3.3 in this tome and Section 12.6 in Tome 1 of this volume.

discussion about whether Roman law and medieval thought adequately recognized natural rights, which certainly develop fully in modernity. Hence natural law theory is called on not only to account for natural rights but also to work out the question of whether the objective dimension or the subjective one takes priority. While natural law in an objective sense met with the obstacle of the rejection of teleological conceptions of nature, natural law in a subjective sense now turned to the concept of the human person, which is a development of the legal subject in modernity. Consequently, the theory of natural law faces the thorny problem of the relation between the human person and human nature.

The second revival of natural law is marked by the need to fight the spectre of totalitarianism. This seems to be possible only on condition that natural law be seen as immanent in positive law itself, such that neither can be known without the other. With a play on words, natural law can be said to belong to the nature of positive law. This is an epochal turn by comparison with preceding natural law theory, which was intent on deriving positive law from natural laws, a turn that had earlier been timidly preluded by antiformalist positive law theory. Its immediate result was an opening of legal science itself to the questions with which natural law is concerned. Yet jurists rarely went beyond a more or less rhetorical appeal to moral values, since the whole apparatus of European legal dogmatics had been constructed in such a way as to be impermeable to natural law. But in philosophy and theory of law, conceptions developed that were often not metaphysical but avowedly open to recognizing objective constraints within positive law. Underlining the historical strength of these constraints is the fact that they are reduced to problems pertaining to the "nature of the thing," which is a nonmetaphysical way of defending the conjunction between facts and values.

1.4. The Third Revival

We have seen that in the two decades after World War II there was more discussion about the relation between positive law and natural law than about the content of the latter. In fact, the strengthening of a shared morality also inclusive of public life made less dramatic the issue of the relation between law and morality and more crucial that of the definition of positive law (see Viola 1989). No significant reflection was devoted to what moral values were connected with positive law, while the main interest was on whether these values were external or internal to the concept. It is on this issue that the debate between natural law theory and legal positivism was focused.

The dominant philosophical theme in this frame of thought was that of the normativity of positive law and its basis. According to the most rigorous natural law theory, positive law is in a proper sense obligatory to the extent that its norms are binding on the substantive moral plane. Full legal validity

implies axiological validity. Accordingly, one is not legally obligated to obey immoral laws. It follows, however, that legal obligation is entirely absorbed within, and identified with, moral obligation. The most moderate version of natural law theory admits that the formal validity of legal norms in itself makes these norms obligatory, though only *prima facie*. This is a presumptive normativity that must be validated all things considered. On this basis, which to some extent takes into account the principle of legal certainty, a dialogue with legal positivism became possible. Legal positivism in turn gradually departed from its traditional insistence on the primacy of the sovereign's will and on legal sanctions—both entirely inadequate in explaining normativity in a strict sense—while also rejecting Kelsen's hypothetical normativity: In so doing, legal positivism moved toward a conventionalist approach to legal obligation. This also explains the increasing success and spread of Hart's theory of law. In general, the influence of Anglo-Saxon analytical jurisprudence grew in non-English-speaking countries, chipping away at the traditional primacy of German philosophy and legal theory.

The transformation the basic legal positivist model underwent as a result of the ideas advanced by H. L. A Hart (1907–1992) was mainly targeted at Austin's conception of the legal norm as the sovereign's command. However, it also obliquely took aim at Kelsen's concept, which from a descriptive point of view had maintained the same vision of the law as Austin's (*keine Imperativ ohne Imperator*). The basis of legal legitimacy shifted from the sovereign's perspective to the behaviour of officials and other participants in putting law into practice, a conception on which the acceptance of legal rules rests solely on the way they are used. That shift paved the way for the importance of practical reason in legal theory and yielded effects that could hardly be contained within any strictly legal positivist conception (see Hart 1994b). Indeed, with foresight Kelsen had kept practical reason away from the pure theory of law, considering it a Trojan horse of natural law theory (see Kelsen 1979, 52–7). Although Hart supported a clear-cut separation between law and morality, he himself saw that separation in the weak sense ("there is no necessary connection") and not in the strong sense ("necessarily, there is no connection") (Postema 2011, 325, n. 50).

If we take the standpoint of practical reason, we cannot take a strictly causal or psychological approach to power relations—the raw material of legal obligation. On the contrary, we will have to pay special attention to the reasons for complying with or accepting normative precepts, even if these reasons are not necessarily moral ones. What is important is the change that took place in way law was considered, no longer as a piece of machinery (as a social technique) serving to elicit acquiescence in view of the aims of peace and social order, but as a social practice in which all users of law participate in a responsible way. Hence the stronger emphasis on the effectiveness of law and the theory of legal interpretation.

This evolution of legal philosophy was part of a more general trend in philosophical thought in the last decades of the 20th century, a trend that led to a rehabilitation of practical philosophy (see Riedel 1972–1974) and acknowledged the peculiar role of *prudentia* over *scientia*. Contributions from very different streams of thought were made to the reappraisal of practical knowledge, ranging from the philosophy of language (Stephen Toulmin, Richard Hare, Kurt Baier) to rhetoric (Chaïm Perelman), scientific constructivism (Wilhelm Kamlah, Paul Lorenzen, Oswald Schwemmer, Friedrich Kambartel), the revival of the categorical imperative as a principle of universalizability, neo-Aristotelianism, discourse ethics (Jürgen Habermas, Karl Otto Apel), and Gadamerian hermeneutics. This unexpected convergence was supported by a common search for a rational justification of practical judgments without which ethical, political, and legal debates are meaningless.

In this effort, continental philosophy converged with analytical thought, though taking different approaches and methods. We need to be fully aware of this attention to practical reason and to the different ways of seeing it if we are to properly capture the modalities of the third rebirth of natural law. But before legal theory could take full advantage of these new philosophical trends, it had to wait for a profound transformation in the general framework of positive law.

1.4.1. Interpretation and Legal Reasoning

At the end of the 1960s, the climate was no longer favourable to postwar natural law theories, and legal positivism clearly prevailed. Moreover, and as a general rule, when the structures and institutions of positive law become firm and stable, and when interpretive practice is consistent and not very controversial, a reliance on the procedures to be followed and a widespread agreement on the way in which to proceed will favour and strengthen the plausibility of legal positivism. Only when controversy heats up—and there is no longer a solid consensus on the proper way to assess the validity of legal norms or to interpret them—new spaces and opportunities for natural law theory can open up. It is a different matter when natural law has to be applied, for it can be used not only to challenge but also to legitimize constituted power, as happened in Franco's Spain or in Argentina under the generals.[32] However, this conclusion stands only so long as broad social consent is maintained regarding the main contents of normative ethics. Natural law theory can be characterized as potentially revolutionary in principle (see Kelsen 1934b, par. 8), even though in practice it has often been conservative.

[32] On the question of whether an emerging democracy has an obligation to take action against the leaders of a past dictatorial regime for crimes against humanity on the basis of the precedent of the Nuremberg trials, see Nino 1998.

In those years the task pursued by legal positivism was to construct a theory of law on neopositivist and analytical bases. The legal system, as the proper focus of legal positivism, has been described with specific reference to its formal and procedural structure, while special attention has been paid to legal science and its epistemological bases. And yet, the theory of law was internally divided by the debate between formal conceptions of law deriving from Kelsen and realist ones of Scandinavian origin.

A bird's eye view of such a positivist theory of law will reveal the following components: (*i*) a rigorously value-neutral theory of legal validity (law as fact); (*ii*) the state's law as the paradigmatic and focal form of positive law; (*iii*) a vision of the legal system as an orderly set of coercive norms; and, in general, (*iv*) a theory of legal science as a logical organization of the contents of norms (see Bobbio 1979). Moreover, in the manner of the language analysis, greater importance is ascribed to issues relating to the interpretation of legal texts and terms.

In general, the linguistic turn—which characterized the philosophy done proceeding from both Wittgenstein's and Heidegger's thought—made the concepts of meaning and understanding central to philosophical investigation and led to the discovery of a close link between language and action, as well as between language and the interpretive community. This cultural context was favourable to legal thought, which had always been engaged in issues of interpretation (see Jori 1994).

There is no necessary connection between a formalistic theory of law and formalism in the application of law and in legal reasoning. For example, Kelsen's theory of interpretation is certainly not formalistic, and Hart's recognizes the possibility of interpretive discretion. But if interpretation and argumentation take on a major role in legal theory itself, as the view from practical reason implies, the theory's formalism is also seriously threatened. And that is precisely what happened. Which explains why a description of the developments of the theory of interpretation and of the theory of legal reasoning is necessary, since it was primarily through these theories that a climate favourable to the third revival of natural law could develop.

The disconnect between law as described in legal theory and law as a practical enterprise was growing beyond the physiological threshold dictated by the evolution of society. More in particular, while on the one hand legal positivism defined law as a set of norms flowing from a stable hierarchy of sources (certainty) amenable to logical ordering through the work of the jurist (consistency) and capable of satisfying the demands of justice without any integration (completeness), on the other hand law as a practical undertaking instead brought to light the inevitable uncertainties of legal decisions, the role of general clauses, and the inadequacy of a rigorously neutral logic and of purportedly infallible interpretive methods (cf. Engisch 1956).

At first this interference of legal practice in the theory of law was avoided: Problems pertaining to the interpretation of law were carefully kept sepa-

rate from problems concerning its application. Accordingly, the theory of law dealt with the interpretation specific to the jurist, and legal science was seen as a theoretical activity aimed at faithfully reproducing the legal system. The activity of judges and officials in the application of law, by contrast, was left to investigations of a descriptive or sociological kind. Consequently, whereas the theory of doctrinal interpretation had a normative character—for it prescribed how a jurist should behave in dealing with legislative language—investigations of judicial interpretation showed how law was *in fact* applied, that is, by recourse to value judgments and subjective choices by the interpreter. These analyses showed that the ideology of interpretation is necessarily present in practice (see Wróblewski 1972).

In the background of this theoretical framework it is still possible to detect the influence of Savigny, whose theory of interpretation was framed in large part as a response to the demands of legal doctrine and legal science. Furthermore, it can be easily acknowledged that while in common law countries the theory of legal interpretation develops toward a judge-centred approach, in non-English- speaking countries, based on civil law systems, it takes a jurist-centred approach. In the latter there is a stronger tendency to apply deontic logic to the interpretive processes of legal science, conceived as a meta-language aimed at describing a prescriptive language which is precisely that of norms (see, among others, Alchourrón and Bulygin 1971). However, it becomes clear that even the interpretations and doctrines of jurists have an ideological character, in that they manipulate the legal system in its contents, too, even as they claim to make it rigorous on a formal plane (cf. Tarello 1971).

This is one of the fundamental points of dissent between formalist and realist theories of law. The former are still bound to a conception of meaning as preconstituted by the legislator and passively reproduced by the interpreter, while the latter maintain a sceptic conception on which meaning is "ascribed" by the interpreter at the interpretive stage.

Although theories of natural law do not have a theory of legal interpretation of their own, they are rooted in an ancient tradition linked to the plurality of the sources of law, to the rejection of the idea that rules are rigidly hierarchical, to the importance of jurisprudential and judge-made law, to the centrality of reasoning by analogy, and to the role of *auctoritas doctorum* in the very production of law. This tradition goes from Roman law to the *ius commune* (see Lombardi Vallauri 1967). However, despite appearances to the contrary, the same tradition is also still at work in the interpretive practice of civil law systems, at least if we look carefully at actual interpretive processes (the common law of civil law systems).

One can thus easily understand why formal theories of law are accused of "logicism," that is, of reducing law to formal logic of a deductive type. In the attempt to defend legal certainty, the real processes by which law is formed

and applied are neglected. Logicism is substantially a form of "legalism" (see Lombardi Vallauri 1981).[33]

By contrast, in relation to realist legal theories, the disagreement of natural law theories concerns not the description of interpretive processes but the ethical noncognitivism and the psychological reductionism from which realists proceed as background assumptions. As much as value judgments and value choices play an inevitable role in the interpretive activity aimed at finding the solutions that can be deemed the fairest or most correct among all possible alternatives, this does not mean that the interpreter's discretion is wholly arbitrary and escapes the control of reasonableness and the need for an adequate justification. If value judgments are irrational and purely ideological, then it is impossible to manage or control the interpreter's unavoidable discretion. But if we can recognize that between the two extremes of scientific rationality and irrationality there is the wide landscape containing the reasonable, the probable, the fitting, and the equitable, then the natural law tradition still has something to say in defending the value of the certainty of law.

In turn, if legal reason is one of the possible aspects of practical reason, then the role of the interpreter, jurist, or judge is also to check and develop the *ratio legis*. So we have here a reversal of the perspective of classical legal positivism, from the idea of interpretive discretion as a threat to the legislator's will to its being a necessary instrument for perfecting the law (*Rechtsfortbildung*). Only in context can law be perfected and its compliance with practical reasonableness tested and fostered through the resources of case law and of judicial activity, and among these resources one should not underestimate the role of precedent, or *ratio decidendi* (cf. Kriele 1979). Nobody holds a monopoly on the use of reason.

As was to be expected, the development of the theory of interpretation gives greater importance to the theory of legal reasoning. Indeed, between interpretation and argumentation there is continuous circularity (see Ricoeur 1995): In order to interpret legal texts it is necessary to reason, and in order to reason in law it is necessary to interpret legal texts (see Viola and Zaccaria 2011, 98ff.). Legal argumentation has a pragmatic character in that its goal is practical, being concerned with justifying judicial decisions. As a result, interpretation itself becomes a decision when a solution is chosen among the admissible ones. Practical reason is aimed precisely at justifying decisions, supporting them with arguments in principle acceptable to everybody. The fact is that something can be valid as a "reason" only if endowed with universality, however much on certain conditions and in certain spheres.

[33] The line of thought that refuses to separate the interpretation of law from its application and rejects the logicism of legal dogmatics is well rooted in Italian jurisprudence, aside from specific natural law orientations. See Carnelutti 1951a, 1951b, Caiani 1954, Ascarelli 1955, and Betti 1971.

In addition to marking the difference between ascribing a meaning to a legal text (the activity proper to interpretation) and justifying a decision (the activity proper to reasoning), we should also note that in argumentation an intersubjective relationship is present that is usually absent in interpretation, or at least is usually believed to be absent. Argumentation takes place among a subject who proffers an argument; a discursive situation, which is a pragmatic context or, more broadly, a form of life (see Aarnio 1987, 211ff.); and another subject or an audience to be convinced by appealing to reasons for action.

The logic of law can be divided into two main branches: the new rhetoric, whose main focus is persuasion rather than demonstration (see Perelman and Olbrechts-Tyteca 1958)—and which, in a broader form, includes the theory of topics (cf. Viehweg 1953) and dialectics (cf. Giuliani 1974), and even the more recent fuzzy logic (see Zadeh 1975, Haack 1996)—and argumentation theory in a strict sense, which follows a demonstrative method, albeit renouncing absolute claims (see Aarnio et al. 1981). Argumentation theories of legal reasoning, which developed in those years in Europe (especially in Germany, Poland, and the Scandinavian countries) are manifold (cf. Feteris 1999), but the most important of them agree in considering legal reasoning a special case of practical reasoning, in that legal and practical reasoning alike are governed by the same general rules, even though the former is also subject to the constraints dictated by positive law.[34] Hence, no sharp separation can be maintained in legal reasoning between law and morality, just as—in line with what has already been noted—it is also very difficult to maintain such a separation in legal interpretation.

The presence of elements external to positive law—elements originating in an area in which legal practice borders with and blends into ethical claims and social factors—is particularly evident in the distinction between *internal* justification, which presupposes the premises from which to deduce or infer a decision, and *external* justification, aimed at resting these premises on a rational foundation (see Wróblewsky 1974). The latter kind of justification—the privileged field of legal reasoning—has to resort to resources that are external to legislation and belong in a broad sense to law as a practical enterprise, an activity that extends to doctrine, precedent, and legal maxims and is sensitive to normative and value claims.

From this point of view, positive law cannot be claimed to be a self-enclosed and self-justifying world (see Hruschka 1972), nor can the natural law model be considered obsolete or ruled out. All these theories are certainly united by their rejection of metaphysics and by the conviction that it is impossible to found ultimate values. But then the practical universality that reason claims for itself once again leads one to call its philosophical bases into ques-

[34] On 20th-century theories of legal reasoning see Part 4 of this tome, and particularly Chapters 23 through 25.

tion. Not only is there at work a belief that a common element can be found among the plurality of ideas on justice, but also, and especially, the appeal to a universal audience made up of all normal and competent humans in effect presupposes an anthropological commonalty that is typical of natural law doctrines (see Perelman 1945).

The development of studies on interpretation and legal reasoning has shown the inadequacy of both the positivist and the natural law paradigms separately taken. Law cannot be reduced to a fact without losing something important to its concept, but it cannot be reduced to a value, either, without losing its effectiveness, which distinguishes it from morality. For this reason one can easily understand that theories of legal reasoning themselves tend to turn into true and complete theories of law, or at least they tend to generate such theories from within, distancing themselves both from legal positivism and natural law theory, thus helping to confer on legal thought in the closing decades of the 20th century a characteristic that has lasted down to the present.

Since a theory of law is aimed at working out a concept of law, it is legitimate to expect from it a full-blown conception of positive law rather than a mere description of particular aspects of it, however important such aspects may be. But in the practical domain every description makes it necessary to first determine what aspects of the experience are truly relevant and meaningful in the eyes of the theorist. Every judgment on relevance is inevitably a value judgment. Accordingly, from the standpoint of practical reason the concept of law is at once descriptive and normative. The claim that practical reason is based on a purely descriptive method can lead either to incomplete conceptions or, worse, to ones that are irrelevant to law as a practical enterprise.

For these and many other reasons, in the 1970s the need was felt for a profound renewal of the theory of law, with major effects on the eternal conflict between legal positivism and natural law theory, precisely the conflict we are here interested in.

1.4.2. Christian Natural Law Philosophies

We should now go back to Catholic natural law theory in the last phase of its evolution in the 20th century. Let us recall that by "Catholic natural law theory" is meant what can be considered an expression of the official tradition of the Catholic Church. As noted, this strand of thought was influenced above all by Aquinas's thought as subsequently strengthened. There are doubtless other forms of natural law theory inspired by Christian values, often in a dialectical position vis-à-vis ecclesiastical natural law.

From a philosophical point of view, as much as the orientations of the past abandoned arid Scholastic formulas, they substantially remained unchanged and were expressed in abundant often boilerplate literature serving to spread a

conception (see, for example, Pizzorni 1978), with only rare examples of speculative originality (e.g., Pieper 1953, 1963). The central idea is that of natural law as an objective order of ethico-legal values corresponding to the demands of human nature "conceived aright," that is, on the basis of Catholic Church tradition as supported by Thomist metaphysics (though with few references to Holy Scripture, it should be stressed). The argument was that Christian ethics is fully capable of a rational foundation and so is also valid for nonbelievers. But this rationality is not to be understood in the sense of modern natural law theory, of which Enlightenment natural law theory is seen as the highest expression on account of its subjectivist and immanentist outcomes. There was no interest whatsoever in the evolution of legal and political philosophy, but even more significantly, no account was taken of the nascent claims of practical reason. At the same time, however, this did not account for the whole of Catholic natural law theory.

With the pioneering work of Josef Fuchs (1955), the question of natural law came very much into prominence in the Catholic moral theology of the time, which not infrequently freed itself of the shackles of neo-Scholasticism (see Häring 1954), and which, under the thrust of ecumenicalism, conversed with Protestant theology (see, in general, Gustafson 1978). At first, the renewal of moral theology took an existential orientation more attentive to the concrete exercise of moral action in the conditions that shape the life of faith and charity and with the help of grace, avoiding philosophical discussions on the foundation of natural law, which Fuchs instead addressed frontally. These theological debates had an influence on the Second Vatican Council (1962–1965), and with French Catholic philosophy they indirectly contributed to an evolution of the Catholic Church's official doctrine of natural law. But we need to be clear about where these innovations of the Council really lay.

Natural law as divine law and as an objective order of moral values was reemphasized in full continuity with tradition, but now greater attention was being paid to the question of subjectivity in moral choice. Natural law is present in the moral conscience, whose intangible dignity was stressed (*Gaudium et spes,* par. 16). Consequently, the role of freedom was thrown into greater relief, though with an eye to the objective moral good (ibid., par. 17). The result was a full reconciliation with the problem of human rights, seen as natural rights founded on natural law (see the encyclical letter *Pacem in terris*, 1963). These rights were seen in an anti-individualistic light and were blended into the principle of solidarity. There was a reaffirmation of the primacy of the human person as "the subject and goal of all social institutions" (*Gaudium et spes*, par. 25), and the principle of laicity came into view in the recognition of the autonomy of temporal realities (ibid., par. 36). At the height of the Cold War there was an insistence on the question of peace and the ability of the international legal order to make it possible (ibid., chap. 5). Lastly, in a special declaration of the Council dedicated to the right to religious freedom (*Digni-*

tatis Humanae), this right was presented as the central locus of conscience and of personal life plans in relation to public powers.

The focus of the Second Vatican Council in regard to natural law can thus be said to have lain precisely in the relation between law and conscience, a question that was already being energetically discussed in moral theology at the time (e.g., Böckle 1965). This question, which would be taken up *ex professo* in the 1993 encyclical *Veritatis Splendor*, falls within the sphere of the problems of practical reason, or at least that was a step in this direction.

The encyclical *Humanae Vitae* (1968) reopened a discussion that until a short time earlier had subsided: It was devoted to the philosophical bases of natural law and its contents. The importance of this encyclical lies not so much in the specific question that provided the occasion for it, namely, contraception, but in its way of addressing that question, by appealing more to natural reason than to religious principles. So the problem arose as to whether this encyclical was binding on those believers who were not convinced by the reasons given. Catholic natural law theory once more found itself facing the arduous task of reconciling the rational foundation of moral norms with the principle of authority. At the same time it was evident that the common morality to which the contents of natural law were tied had begun a process of erosion and destabilization.

One of the unintended consequences of the encyclical was to focus natural law on questions of *private* morality, while for the Catholic tradition natural law was primarily concerned with *social* morality.[35] Accordingly, natural law was identified *tout court* with the moral law. When in the last two decades of the 20th century a renewed interest was taken in the social doctrine of the Church, the contribution of an updated natural law theory proved to have only a limited capacity for innovation.

The debate sparked by *Humanae Vitae* was concerned more with moral theology than with philosophy. Indeed, precisely in theology, among other fields of study, we find a claim being made for the autonomy of reason in a sense very close to Kant's. Moral normativity springs from human reason, which is set outside the order of being and makes it an ought (see Auer 1971). We are no longer only talking about the personal autonomy at issue in the debate between law and conscience but about the moral autonomy or "self-legislation" (*Selbstgesetzlichkeit*) of reason. Needless to say, this was a context in which natural law in the Thomist tradition disappeared,[36] or else it was pro-

[35] On the mistrust of natural law as a tool susceptible of ideological use, see Ratzinger 1964.

[36] It is interesting to note that in political theology in general, and in liberation theology in particular, there is no appeal to natural law, and sometimes there is even some hostility toward it (see Gutiérrez 1973). Liberation theology, animated by wholly legitimate demands for justice, draws on primary evangelical sources (the option for the poor) and on socioeconomic analyses influenced in some respects by Marxism. It is inspired by Bartolomé de Las Casas rather than by Francisco de Vitoria (cf. Gutiérrez 1989). In this way, there is brought back to life the anar-

foundly refashioned (see Auer 1977), and its place was taken by the ethos of the world (*Weltethos*). This seminal idea would find its ultimate development in the *Declaration toward a Global Ethic*, written by Hans Küng and approved in Chicago on September 4, 1993, by the Parliament of the World's Religions (see Küng and Kuschel 1993, cf. Küng 1998).

Natural law theory—which at this point should more accurately be described as "Christian," in that it challenged the traditional tenets of Catholic natural law theory—now went off in two directions depending on whether or not it accorded importance to nature as the order of being in providing a foundation for moral norms. A new discussion emerged on the correct way to interpret Aquinas's thought in light of the alternative between the Aristotelian and Kantian conceptions of practical reason (cf. Höffe 1971).

What has been presented as the second phase in the interpretation of Aquinas (see Section 1.1.2 above) set the stage for a critical use of his thought open to comparison and evolution. This is the third phase of 20th-century Thomist hermeneutics. What I mean is aptly summed up as follows:

> To be a Thomist today in a judicious and effective way is undoubtedly to have a sense of tradition, as St. Thomas himself had, but also a sense of historicity, progress, and philosophical criticism. (Van Steenberghen 1987, 196; my translation)[37]

This view of Aquinas's thought as no longer a complete system but a critical method ushered in a fragmentation into specific or sectoral studies in which greater attention was paid to theology than to philosophy and to ethics than to metaphysics (cf. Bonino 1994). This made possible interpretations of Thomist natural law that did not a priori exclude the influence of modern philosophy, particularly of Kant's thought, which since Cathrein's time had been regarded as the main adversary. Obviously, conflicts of interpretation did arise—at times acutely, all internal to the Catholic world—but this helped to breathe new life into problems that had grown stale.

One of the best fruits of this turn is found in Martin Rhonheimer's interpretation of the Thomist doctrine of natural law (cf. Rhonheimer 1987). Through ample documentation the thesis was maintained that the appeal to "nature" in natural law has to be seen as an appeal to reason, which (unlike what Auer thought) was conceived as an integral part of human nature and as having a personalistic structure. This reason is in turn the "practical" reason linked to the Aristotelian ethic of virtues (see Rhonheimer 1994). As we shall see, this vibrant abandonment of a "naturalistic" conception of natural law was very similar to the one previously pursued by John Finnis in 1980.

chic vein of Christianity and its controversial tendency to go beyond the boundaries of the legal framework (cf. Sohm 1909).

[37] The French original: "Être thomiste aujourd'hui d'une manière judicieuse et efficace, c'est avoir sans doute, comme St. Thomas lui-même, le sens de la tradition; mais aussi le sens de l'historicité, du progrès et de la critique philosophique."

Also belonging to the sphere of Christian natural law theory is the thought of Otfried Höffe (1943–), who draws on the legacy of modern natural law theory and its constructivist method of political society for a meta-positive criticism of law and the state (see Höffe et al. 1987 and also Ilting 1978).[38] To modern natural law we owe not only the theory of natural rights, the precursors of human rights, but also that set of principles and guarantees that form the basis of the rule of law and of democracy. Höffe rejects legal positivism in all forms: Austin's imperativist one, Kelsen's normativist one, Hart's empiricist one, and Luhmann's procedural one. But Höffe also abandons the very term *natural law*, because of its naturalistic connotations, and prefers to speak of *political justice*, understood by him to consist in a transcendental structure proper to a free community based on the principle of advantageous coexistence of freedoms in a distributive sense (see Höffe 1987). As is evident, this conception fits into the present-day debate on theories of justice, whose roots in natural law are unquestionable, with particular reference to Locke and Kant (see Höffe 2006).

An opportunity for the development of natural law theory, though in a different sense from the conceptions just referred to, is afforded by the ecological emergency, which suggests that we shouldn't separate human nature from nature in general (cf. Viola 1997, 45–60 and chap. 4) or at least to reconsider the relation between them (see Zacher 1973, Hösle 1991).

In conclusion, in the 1970s, neo-Scholastic natural law theory was radically challenged by Christian thought, and new paths were tried out that moved away from a "naturalistic" conception of natural law—and at times from a "metaphysical" conception of natural law as well—and closer and closer to conceptions of law framed from the perspective of practical reason. There emerged the central role of the dignity of the human person receiving consent, at least formal consent, over and above cultural and ideological differences.[39] Still, it bears noting that these investigations pay scarce attention to the legal sphere, favouring instead the moral and political spheres. At the same time, the declining interest in the legal issues addressed in natural law in Europe is made up for in the United States by a growing and continuing interest in Aquinas's ethical and legal thought.

[38] On Höffe see also Section 10.4.2 in Tome 1 of this volume.

[39] An influential voice in favor of natural law sprang out of the different sphere of Marxist theory. Ernst Bloch, well aware of the distinction between natural law as a critical ideal and its contingent historical incarnations, considers natural law a watchdog necessary for the dignity of the human person in connection with the values of equality, fraternity, and solidarity, though there remains the utopian vein expressing the need to go beyond positive law once social and economic exploitation is eliminated (see Bloch 1961). On Bloch see also Section 10.2.1.2 in Tome 1 of this volume.

1.4.3. Evolution of Positive Law

As noted, when natural law becomes an object of moral philosophy or theology, its strictly legal aspect is undervalued. But in the 1980s the revived interest that legal and political philosophy took in natural law was favoured by a profound transformation of the general configuration of positive law founded on the primacy of the state's law. This evolution hasn't yet attained a stable order. In this context, natural law reemerged in changed forms both as a constraint on normative contents and in a deontological role in criticizing institutions and shaping the law.

Legal positivism in turn found itself facing a serious theoretical difficulty largely owed to the increasing expansion of human rights in domestic and international law. Indeed, it is very difficult to continue to maintain that law is a fact, since law is clearly shaped by evaluations and value judgments. For legal positivism, the imperative to rely on an empiricist philosophy is an obstacle to formulating an adequate descriptive theory of positive law as it actually is. To insist on this philosophical background is to fall into a philosophers' philosophy of law, though this time not involving any *idealist* philosophers. So there emerged a normative version of legal positivism (ethical positivism) proper to a jurists' philosophy of law concerned to defend the value of liberty and self-determination, both threatened by the confusion between law and morality (see, in Italy, Scarpelli 1965). However, if legal positivism is understood as an ideological or political option, then it is not clear why the opposite option, namely, natural law theory, is to be seen a priori as devoid of meaning.

The transformation of positive law is marked by three closely connected processes that are still underway: legal decodification, constitutionalization, and internationalization. It is interesting to note that, especially in civil law countries, these three evolutionary aspects have in common the crisis of the state's law. Note that state-law has been the reference point for logicist legal positivism. We will now have a look at these three phenomena in the legal history of our day, only so as to identify the spaces which opened up for the third revival of natural law, but which at the same time conditioned its forms of manifestation.

When the postwar constitutions began to reveal their potentialities, the first effect was that the code regime gradually lost centrality (legal decodification). This is quite understandable, since there is now a law (supra-statutory law) that stands above statutory law. But we are not only talking about a formal change in the legal system, since this superior law dictates the values and aims that ordinary legislation has to pursue. The innovation relative to the past is that these values and aims, which by their nature have an ethico-political character, are now also "legal," in that they are enshrined in that eminently legal document which is the constitution. Every form of legislation has always been governed by values and aims, but these were considered external to the strictly

legal sphere. This made it possible to construct a concept of law and of legal science with a view to securing the autonomy and separation of law from other spheres of practical life. But now this is no longer possible, in part because the plurality of these values and aims would be wiped out by the standardizing uniformity of the categories of legal dogmatics. In this connection, there is an increase in special laws and sectoral regulations owing to greater sensitivity to social pluralism. Accordingly, the code takes on the role of a residual law to which to have recourse only if special laws do not exist or contain lacunae. This fragmentation of legislative material into legal micro-systems is undoubtedly a sign of the disappearance of that unitary will that once characterized the state's internal sovereignty (see Irti 1979).

The idea that there are values and aims that in themselves are strictly "legal" is typical of natural law theory throughout the ages. The present-day legal situation can be read as confirmation of this thesis, but one can likewise maintain that such values and aims are "legal" only insofar as they are "positivized" in constitutional charters, in such a way that legal positivism is not ruled out. A characteristic of the third revival of natural law is its not automatically implying a decline of legal positivism. But the question remains: Can constitutions legitimately take any value or aim as fundamental?

If we now turn to these values and aims, we can easily appreciate that the constitutions enacted after World War II share a certain commonalty of value in form and substance, at least as a matter of fact (see G. Dietze 1956). All contain affirmations of justice regarding the rights of individuals and the organization of socioeconomic relations. As a whole they delineate the general characteristics of the common good that society is bound to pursue. Accordingly, the legal ought is no longer an issue solely concerned with constructing a picture of ideal law, as was typical of the traditional deontological task of legal philosophy. The legal ought is now in the first place an issue about the *validity* of law, and so is an object for legal science and theory. This is a fact that has major consequences for the very concept of law. The teleological structure of practical reason is now clearly seen to be a constitutive part of legal knowledge.

The affirmation of the primacy of the constitution is supported by its being written, long, and rigid, as well as by judicial review. There is thus prefigured a process of progressive constitutionalization of positive law that profoundly changes its identificatory structure.

Contemporary constitutionalism is a much more complex legal phenomenon than the provision of fundamental laws, since it implies a transformation of the very concept of juridical law. It would be misleading to consider constitutional law only as the addition of one more step, the highest, to the hierarchy of norms. The superior character of constitutional law distinguishes it from the statutory law not only as a matter of a lexical ordering but also in a strictly qualitative sense. The relationship between them is not one of univocality but one of analogy. Even though the world of positive legal rules has

always been peopled by manifold forms that cannot be slotted into any single category, legal science has always searched for a main overarching category. Legal principles are now consolidated into normative form, a form that legal positivism tends to make into, or somehow connect with, the form of statutory law, always considered central, while natural law theory defends the normative autonomy and priority of those principles.

Obviously, constitutional law is not natural law, because it too is artificial and produced by human will. However, like natural law, it is a founding law and it governs civil coexistence. Its role is to urbanize values, making it possible to transform them into legal norms through rational processes of progressive determination, balancing, and weighting. It is *jurisgenerative*. In this way the principle of authority, or the primacy of the will, is limited, checked, and completed by the principle of reasonableness, which is substantiated by attitudes of openness toward the reasons proffered by others.

If we look at the jurisprudential practice of constitutional courts around the world, we can easily observe the presence of arguments drawn from moral and political philosophy. The arguments for decisions often resemble discourses on natural law, especially ones relating to personal statuses, the problems of life, and birth and death. Unwillingness to recognize all this as evidence of a return to natural law largely derives from an identification of natural law theory with the antipluralist contents that have traditionally accompanied it. But if natural law is founded on ethical objectivism, then all claims supported by reasons, rather than by mere preferences, are in a sense forms of natural law, or at least they can legitimately claim to be so. Nevertheless, it should be specified that the relation between positive law and natural law has been converted into that between law and morality.

The teleological tendency of legal reasoning is further supported by the spread of human rights in the practice of domestic and international law. The central importance taken on by human dignity sets in motion a process of constitutionalization of the person, a process that not only implies a recognition of the presence of objective values but also confers legal weight on the conscience of individuals and their autonomy (see Spaemann 1996).

The objectivism of values and the subjectivism of choices often coexist in a sharply conflicting way. The sharing of a common morality, which seems to have been strengthened by consent about human rights, actually dissolves with the passage from general declarations of rights to the practice of respecting those rights. And law now has to deal with moral pluralism that law itself has favoured. Human rights have no boundaries and develop a transversal language or *lingua franca*, establishing communication between legal systems previously conceived as self-enclosed. Positive law opens up to communicative perspectives with universalistic tendencies.

International law—which has always been regarded as defective law in legal science, even by Hart—becomes a reference point in the world dialogue on

law, and in addition to developing as interstate law, it develops into the new forms of transnational and supranational law, as well as into the law of international organizations. International law is undergoing processes of constitutionalization, manifested in part in the recognition of peremptory principles, which after all were already present in the traditional *ius gentium.* Indeed, just to give one example, 1969 the Vienna Convention on the Law of Treaties states that there are norms existing as *ius cogens*, such that no exception to the can be carved out by an *inter partes* agreement.[40] In this way, supra-statutory norms are now recognized even in international law, with the consequence that, at least in theory, the will of states no longer counts as the last word. In general, despite the fragmentation of legal systems, there are standardization processes that make it possible to prefigure a global law, however much in a way that is still vague.

In this context, here only sketched out in broad strokes, there are doubtless new opportunities for the theory of natural law, but only if that theory can express itself in a new way and offer a better interpretation of contemporary law than that of rival theories.

1.4.4. The Third Theory of Law

The epoch-making work that ushered in a new phase in contemporary legal-philosophical culture is Ronald Dworkin's *Taking Rights Seriously* (Dworkin 1977). This work, ostensibly a revision within analytical jurisprudence, is in reality an attack on Hart's legal positivism. It follows a third way (see Mackie 1977a) that does not just distance itself from both legal positivism and natural law theory but goes deeper, seeking to revolutionize the epistemological approach of the theory of law. In this respect Dworkin's conception, setting aside its particular and questionable aspects, preserves to this day a meaning paradigmatic of the new trend in the legal philosophy of the last two decades of the 20th century.

Dworkin (1986, chaps. 2–3) distinguishes between semantic theories of law (which he intends to challenge) and interpretive theories, which he instead endorses. The former, which include most legal positivist theories from Austin and Kelsen to Hart, attempt to define the grounds of law through its identificatory criteria, as if the law were a preexisting object to be explained and as if there were a "nature of positive law." The latter instead believe that if we are to describe a social practice like law, we have to take a practical approach, justifying both the principles followed by those who use law (especially lawyers and judges) and the coercive force of such principles. In this second case, practical knowledge is seen not only in an applicative function but also

[40] The notion of *ius cogens* was anticipated before World War II, and promoted afterward, by Alfred Verdross (1937, 1966).

as a distinct form of human knowledge based on interpretive concepts whose content is determined in relation to paradigmatic cases.[41] Thus Dworkin goes back, though in an independent way, to a hermeneutical perspective influenced by pragmatism.

In this context the traditional problem of the separation between law, on one side, and morality and politics, on the other, loses the centrality it has in semantic theories. Once law is conceived as a social practice, it is easy to understand why legal reasoning often resorts to moral or political arguments. These arguments are elements of law as much as the arguments that are usually understood as typically legal. The following question therefore needs to be addressed: How have natural law theories responded to the demands of the interpretive theory of law? In fact, the natural law theories so far discussed have a clear semantic and classificatory character.

Once more we have to distinguish a broad and all-encompassing view of natural law theory from a narrower and more specific one. The former has an exclusively metaethical character in that it looks to the investigative method of practical reason, while the latter also has an ethical character in that it looks to moral contents.

In a broad sense, all conceptions that reject the separation, descriptive or normative, between law and morals can be considered natural law theories. This can be said to apply also to all nonpositivist theories of law, that is, to all those conceptions that significantly make reference to an objective morality in legal theory. However, we would be misunderstanding the natural law tradition if we equated natural law theory with the connection between law and morality, as is often done today.

In a narrower and more appropriate sense, natural law theory is not only a theory of morality but also an ethic connected in some way with "human nature" and "natural reason," and it is also a theory of law because it argues as well for the legal character of natural law (cf. Y. Simon 1992, chap. 5). If it is true that the appeal to nature can be seen in a broad sense—in such a way that respect for human dignity or the fundamental values can also be seen as a consideration of the "moral nature" of the human being—the legal character of natural law is precisely what ultimately specifies natural law theory. From this point of view, nonpositivist conceptions are not, strictly speaking, natural law conceptions.

The history of the relation between law and morality has shown that there is no necessary connection between natural law *qua* moral theory and natural law *qua* legal theory. One can without contradiction accept the moral theory of natural law and at the same time maintain the separability thesis (see Soper 2007). But in the authentic tradition, ancient and modern alike, natural law *is* law in a strict sense.

[41] On the distinction between critical concepts, natural-kind concepts, and interpretive concepts, see Dworkin 2011, 158–70.

In virtue of all these possible combinations, the interstitial area between legal positivism and natural law theory today is increasingly widening, owing in part to the recurrent criticism of the value-free principle, and in part to the refusal to acknowledge the normative character of human nature in keeping with the thesis of the naturalistic fallacy. The rich debate within nonpositivism seems to render marginal the traditional opposition between the two extremes, an opposition that appears to have been overcome with the charting of a third way. Nevertheless, every so often in this middle ground, the atavistic conflict between the two hostile siblings flares up in new clothes, with visions closer to the two extremes.

So in a sense the third revival of natural law also concerns nonpositivist conceptions, leading to the rise of a debate within natural law theory broadly construed. The same thing happens in the house of legal positivism between the exclusivist orientation and the inclusivist one. Both legal positivism and natural law theory face an identity crisis. Neither can entirely reject the other's good arguments, and they labour to integrate them into their own conception in the most diverse ways, with results sometimes enlightening and sometimes confused.

It is worth noting, in general, that the reasons behind the third revival of natural law are much more complex than those of the two preceding revivals. It is not only a matter of revisiting the concept of law but also of dealing with ethical pluralism. The inevitable involvement of legal theory in moral conflict pushes all contenders willy-nilly into the arms of moral argumentation (once identified with natural law) as they find themselves advancing competing interpretations of the fundamental constitutional values.

In the cultural area we are considering in the last decades of the 20th century there are no major legal-theoretical innovations in natural law theory in a strict sense. Those who carry forward the tradition of Catholic natural law theory—like Francesco D'Agostino (2006) in Italy; Francisco Carpintero Benítez (1999), Jesus Ballesteros (2001), and Andrés Ollero Tassara (1996) in Spain; and Carlos I. Massini-Correas (2006) in Argentina—are mainly and perspicaciously committed to criticizing legal positivism above all from an anthropological and moral point of view, vindicating the need for a philosophical foundation of legal theory. In this way the debate primarily develops around the question of aims and values and not as a matter of legal theory in a narrow sense.

From the English-speaking area, which maintains its cultural leadership, comes the most interesting attempt to combine the natural law tradition from Plato onward with contemporary legal theory. In 1980, the fundamental *Natural Law and Natural Rights* came out, written by John Finnis (2011), testifying to the seminal character of Hart's thought, considering that like Dworkin, Finnis is a disciple of Hart.

The remarkable novelty in the thought of Finnis, who sets out to wed the Thomist tradition with the analytical method, consists in its being the first true

theory of positive law framed from the perspective of natural law theory. More precisely, he gave us a natural law theory of positive law: "There is no proper place for a positivism outside natural law theory" (Finnis 2012, 71).

As we have seen, the prevailing tendency in Catholic natural law theory in the 20th century was to regard positive law as a tool for realizing natural law on metaphysical and theological bases, that is, on bases extrinsic to legal science. And even when there was an insistence on the rational laicity of the principles of natural law, as happened in the second half of the century, the effort did not yield a conception of positive law of its own competing with the legal-positivist conception. Finnis, by contrast, maintained that analytical descriptive jurisprudence needs the theory of natural law to establish its own internal principles and to support the practical attitudes of those who use law, as well as it needs a justification of authority and of its exercise in keeping with natural rights and the common good, and generally also in keeping with the rule of law. From a methodological point of view, the decisive move was that of rejecting in legal science the method of the distinction *per genus et differentiam specificam* and adopting the Aristotelian and Weberian method of the ideal or exemplary type and secondary cases. Only a full definition of law can stress law's close connection with morality in the unique flow of practical reasoning. But this does not mean that formal validity is in itself insufficient in giving rise to legal obligation, but the latter does need a deeper justification.

In this way Finnis defuses the disquieting Augustinian dictum *Lex injusta non est lex*, which made a dialogue with legal positivism impossible. But at the same time he rejects the clear-cut distinction between law and nonlaw embraced by legal positivism and traditional natural law theory alike, and he brings in the idea of the gradualness of obligation in realizing positive law in its fullness, an idea also already present in what was earlier termed "hermeneutical natural law theory." So here we have all the conditions needed for the civil law countries to embrace Finnis's thought, which for the moment is more influential in South America. In Europe the dominant problem continues to be that of the debate between positivism and nonpositivism, a debate centred on the relation between law and morality, and so on the separability thesis, and it is to this matter that we now turn.

1.4.5. Non-Positivism and Natural Law

The emblematic historical event of this period is no doubt the fall of the Berlin wall in 1989. This episode in history can be interpreted symbolically as expressing a desire to put an end not only to a political and cultural separation but perhaps also to *any* separation. Boundaries do not vanish, to be sure, but they are no longer seen as walls of division and exclusion: They rather become the locus or lingua franca enabling an exchange with the other in which to listen to their reasons. The borders become a common ground.

Finding one's bearings in this common ground, which is no longer rigorously positivist and certainly not avowedly that of natural law, is not easy. Labels are no longer helpful. The neoconstitutionalist label is ambiguous and inappropriate, because it can have different and opposite meanings, signalling the difficulties of contemporary legal positivism. It is necessary to look at the real problems brought into focus by the new object of observation, that is to say, law in the constitutional state and in the global legal order. Positivist legal theory is forced to make some major adjustments. How far can it go without morphing into natural law theory?

This is a story that in a strict sense belongs to the evolution of legal positivism.[42] Here we need only identify the moments of greatest proximity to natural law positions in the broadest sense.

The relation between law and morality can be observed from three points of view: that of the contents of legal rules, that of the normativity of law, and that of the formal structure of legal rules (see Viola 2009). To what extent does the revision of legal positivism in each of these three spheres take legal positivism dangerously close to natural law theory in a narrow sense?

To answer this question we have to bear in mind both the underlying theory of morality—which in natural law theory, as is well known, is objectivistic—and the way the role of legal theory is understood, a role that in natural law theory is to work out the criteria on which basis to justify our obedience to law. It is *in conjunction*, rather than separately, that these two theses properly configure a conception as being closer to natural law theory in a narrow sense.

In the nonpositivist camp, which is growing bigger and bigger, we will only look at some paradigm examples of each of the three points of view just indicated.

1.4.5.1. The Claim to Correctness

Robert Alexy (1945–) rejects both the descriptive thesis of the separability of law from morality and the normative thesis of separation, arguing that between law and morality there are actually necessary connections on both a conceptual and a normative level.[43] Nonpositivism is distinguished from legal positivism in that it believes that essential to the concept of law is not only the element of legality, understood as conformity to the legal system and the social effectiveness of legal norms, but also the moral element, essentially centred on fundamental human rights, which have become positive principles of law in the form of "optimization commands" (cf. Alexy 1986). Nonpositivism is also distinguished from pure natural law theory, according to which only the moral

[42] On legal positivism and the challenges of neoconstitutionalism see Chapter 10 in this tome.

[43] On Alexy see also Sections 10.3 and 25.4 in this tome and Sections 10.3.2.2 and 10.4.3.1 in Tome 1 of this volume.

element is essential. But we should note that this certainly is not the tradition of natural law, which has always been attentive to the positivity of law. And that brings Alexy's nonpositivism close to natural law theory in a narrow sense.

If immoral normative contents are unjust in the extreme, they can make legal norms invalid (and here Alexy accepts Radbruch's formula), but in most cases the outcome is a defect the legal system can remedy with its own internal resources. This is possible because positive law has an open texture, meaning that it is necessarily indeterminate. The judge, the prototypical participant involved in putting law into practice, is required by the claim to correctness to state the law by recourse to principles both moral and legal. Judges do this through a balancing procedure, revealing the presence of moral principles internal to the legal system. Through the use of these principles, the claim to correctness becomes a claim of a moral kind, in that it invokes a morality that can be founded at the level of rational justification and is not just a claim of empirical consent proper to positive morality. In this respect the theory of law becomes part of the more general theory of moral argumentation, which looks to just morality as its regulatory ideal. In this connection, correctness (*Richtigkeit*) substantially amounts to rational acceptability based on good reasons (see in general Alexy 1992).

Alexy, as noted, has developed a well-known theory of legal argumentation (Alexy 1978) within a general theory of practical rational discourse. His thesis is that legal discourse is a particular case of practical discourse at large, in which the demand for justice is asserted within the constraints and conditions of the legal system (this is the special-case thesis, or *Sonderfallthese*). This means that in law, freedom of discussion is constrained by procedures set up to confer greater certainty on the expectations of citizens, but the fact remains that legal argumentation to all intents and purposes is part of practical rationality and its actualization in social reality.

The *Sonderfallthese* has been criticized, among others, by Habermas (1992), who in agreement with Neumann (1986, 90) has argued that legal and moral justice are heterogeneous, accusing Alexy of subordinating law to a morality conceived in the manner of natural law. But in order to properly speak of subordination in the sense just explained, one would have to show that in Alexy's theory the constitutive moral element of law takes priority over the other two—which it does not. On the contrary, while in most cases a moral defect cannot by itself make a legal norm invalid, a defect involving the formal characteristics of legal validity does in a strict sense deprive a norm of its legal quality. From this point of view Alexy's theory is less close to natural law theory in a narrow sense. However, if we compare his theory with Finnis's, there is one difference we will notice, among many others, in that it envisions a very different relationship between general practical reasoning and specifically *legal* practical reasoning. For Finnis, the latter is a phase internal to the general flow of practical reasoning, and even though it can be isolated, it does not yet lead

to a concept of law in the full sense. For Alexy, the *Sonderfallthese* is instead conceived as an *Integrationsthese*, that is, as a way to strengthen the weakness of general practical discourse. This means that the need to realize justice in the *concrete* overrides the demand for its *full* realization. The legal system looks to practical reason as its deontological ideal (see Alexy 1987, 407). We can still hear the echo here of the neo-Kantian distinction between the concept and the idea of law. Even so, the effective presence of fundamental rights, coupled with the law's open texture and the role of principles, is such that the *Sonderfallthese* comes very close to the fullness of the moral claim.

1.4.5.2. Law's Normativity

The Argentinian philosopher Carlos Santiago Nino (1943–1993) starts out from a rejection of conceptual essentialism, arguing that conventionalism has made possible a plurality of concepts of law, all legitimate on the basis of the point of view adopted.[44] The choice depends on the aims assigned to the theory of law. This makes it possible to achieve compatibility between the descriptive concept of law proper to legal positivism—a concept useful in carrying out historical, sociological, or comparative investigations—and the normative concept proper to natural law theory, useful as a basis for legal decisions and claims. Accordingly, the atavistic dispute turns out to be essentially "trivial" (see Nino 1980a, 543; cf. also Carrió 1983).

The normative concept of law is appropriate if our purpose is to *justify* obedience to the law, and not simply to *explain* such obedience, and if we take up the point of view of participants in legal practice, who in turn can participate on the basis of internal reasons or acting on extrinsic motives, but who are ultimately sensitive to the social practice of moral discourse (see Nino 1984).

On these bases it can be stated that the answer to the question Why obey the law? is moral and that moral discourse, which legal discourse has to take into account, is the only discourse with an autonomous and fully justificatory character.

Nino, inspired at one and the same time by Hobbes and Kant, is a supporter of ethical constructivism, which is certainly not the metaethics of traditional natural law theory (see Nino 1991, 64–72). Although moral facts are *constructed*, and so involve human work, the resulting construction is not thereby arbitrary, in that it is subject to limits and conditions dictated by its presuppositions and by its functions, which are to resolve conflicts and promote social cooperation. Moral discourse therefore has an ideal structure from which one can also derive a way of conceiving moral agents. The latter must be thought of as endowed with autonomy, that is, as capable of freely accepting the princi-

[44] On Nino see also Section 10.2 in this tome.

ples that guide their behaviour, and also as capable of rational communication; otherwise, moral discourse would be impossible. So this moral agent is ultimately the same as that of Kantian natural law theory. Moral discourse looks for intersubjective values or moral truths, whose role is ultimately to justify the legality of a legal system.

The justification of obedience to law cannot rest on law itself; otherwise, we would have an infinite regress. Nor can the chain of competence norms be infinite. It leads to norms that are not legal in the same sense as other norms. In general, it must be recognized that the constitution is not the most fundamental practice of a society, for in its own turn it rests on a more fundamental practice that also explains why we observe the constitition even when it is modified in a regular way. This is essentially Kelsen's intuition about the basic norm (*Grundnorm*), though Kelsen erroneously configures it in a hypothetical sense. In reality, the basic norm, which imparts validity to the ensuing constitutions, is not a legal norm according to the descriptive and institutionalized concept of positive law but an extra-legal principle of a moral character.

Hence the concept of validity, used from the internal point of view, is a normative concept that implies extra-legal or moral norms. Obviously, this is in the first instance a positive morality, but it is nonetheless subject to the practice of moral deliberation, in turn subject to revision by intersubjective critical morality. The most favourable political arena for the latter is that of deliberative democracy (cf. Nino 1996), which is enacted above all in processes interpreting and applying the law.

If we want to credit law with authentic normativity belonging to the sphere of morality and not merely with the exercise of force and coercion, then we will have to abandon any insular conception of law as a freestanding enterprise. Every legal system possesses an internal normative reserve that is not strictly legal-formal and makes the obligatory force of its norms possible (see Nino 1994).

In conclusion, Nino maintains that if the theory of law is to have an active role, that of justifying obedience to law, it has to abandon conceptual positivism, which, being based on the separability thesis, cannot say if and when we have to follow legal norms. If law belongs to the sphere of practical reason, then once we appreciate that fact we can appreciate that law is a moral reason for action.

Very close to this conception is that of Manuel Atienza (1951–). He, too, maintains that acceptance of the rule of recognition requires a moral judgment (see Atienza 2001, 112), a line of thought he has recently summed up as follows:

> […] the two main reasons for rejecting ethical noncognitivism (and relativism, though obviously not understood as a position of descriptive ethics) are the following: (1) it does not allow the reconstruction of important aspects of legal practice (particularly the justification of legal decisions); (2) it is self-frustrating. The alternative should be a (minimal) moral objectivism which, in contrast to relativism, defends the thesis that moral judgments incorporate a claim to correction

and, in contrast to absolutism, defends the thesis that moral judgments (such as those made by courts of last instance) should incorporate final reasons (in practical reasoning), but these should be open to criticism and, as a result, be fallible. (Atienza 2007, 244)

1.4.5.3. A Natural Law of Positive Law

The third perspective to be considered concerns the connection between law and morality as an element on which depends the way we conceive the very structure of positive law. This is a line of thought pioneered by the American jurist Lon Fuller, who in the formal principles of the rule of law identified a real morality internal to law (see Fuller 1969), to the point of speaking of "a natural law of institutions and procedures" (Fuller 1981, 32). But this perspective is now further broadened because of the variety of the forms of contemporary law, which is growing increasingly diversified both within each political community and without, in the international, transnational, and supranational sphere. Legal rules themselves do not all have the same obligatory force, and more and more frequently there are cases of soft law.

In this context we clearly see the inadequacy of the criterion of formal validity for identifying the positive law. This criterion is based on the origin of norms, an origin that today, more than ever, is not unitary, just as there are no stable hierarchies of sources of law. Consequently, the focal point shifts from the origin to the use of norms. The legal character of the rule is instead sought in the way the rule has to be put into practice, that is, how it is to be interpreted and applied. The formula of the rule of law can thus be understood as a meta-rule on the use of legal rules (see Viola 2011, 5). It is a normative conception of legal practice that concerns both the conditions that make rules practicable and the presence of special institutions of a political and jurisdictional character. It appears more and more evident that positive law is made up not only of norms but also of doctrines, principles, concepts, and institutions. All this concerns not only the contents of law but also its formal structure.

The upshot of the foregoing considerations is that there is no way to put law into practice without first making reference to the traditional principles of the rule of law, as is shown by the frequent recourse to this formula in international legal documents and in European treaties. But there is controversy today about what these principles are and how they relate to the concept of law.

On the one hand, the evolution of contemporary law seems to require reformulating these principles in an effort to forge a rule of constitutional law and a rule of international law (cf. Viola 2007), while, on the other, considering such principles as a constitutive part of the concept of law means seeing them in a normative sense and prefiguring, in the manner of Fuller, an ethic proper to positive law and sensitive to the ontological or historical characteristics of human nature. This, after all, is also the meaning of Hart's appeal to "the minimum content of natural law," since this "natural necessity" which law has to

take into account is to be seen not in a causal sense but in a rational one (see Postema 2011, 330). This is the way in which practical reason has to take human nature into account.

So if we believe, in the manner of Dworkin, that the principles of the rule of law are not only formal but also substantive—in that they now incorporate human rights and the guarantees of contemporary constitutionalism—then the ethic of positive law grows even thicker, well beyond Fuller's intentions.

According to Luigi Ferrajoli (1940–), the legal validity of norms rests on a judgment that is objective and axiological yet internal to the legal system (see Ferrajoli 1989, 353) and is a "positivization of the law of reason" (Ferrajoli 2010, 2782); indeed, it is a substantivist version of the rule of law.

At this point nonpositivism finds itself facing a dramatic alternative,[45] for it must choose between embracing ideological legal positivism and opening the door to the claims of natural law.

Those who believe that the ethical substance of law is entirely contained in constitutional principles and is only waiting to be made explicit by deductive logic have to show they can avoid the ideological thesis that a law is just by virtue of its being constitutionally valid. But in effect nothing that is positive can escape the criticism of reason, and that also applies to constitutional principles, which are the positivization of fundamental values. Besides, if we recognize cognitivism *within* the legal system, then it will be difficult reject it *outside* the system. Hence natural law theory, seen as a rational search for a better way to protect human dignity, is a defence against ideological legal positivism. There are undoubtedly objective judgments on the violation or the protection of human dignity, and indeed positive law itself assumes as much.

By contrast, those who believe that the positivization of fundamental values does not imprison the meaning of those values or eliminate their prominence over the positive datum—thus asserting a role for ethical discourse in general—find it hard to continue on a path of support for legal positivism. Witness, for instance, the words of the Italian constitutionalist Gustavo Zagrebelsky: "In the presence of principles, social reality expresses values, and law is valid *as if* natural law were in force. Again, and this time for a reason connected to the law's very mode of operation and not as regards contents, law grounded in principles meets natural law" (Zagrebelsky 1992, 162; my translation), even though, incomprehensibly, he does not deem this a sufficient reason for abandoning legal positivism.

The only way to lay the ghost of natural law to rest is to deny that the problem of legal normativity truly belongs to legal theory, confining it to the outside, that is, to politics or morality (cf., e.g., Guastini 1996, 515), but in this way positivist theory remains incomplete as an explanation of law, as well as inert on the normative plane (see Gardner 2001).

[45] Ferrajoli prefers to speak of a "new legal positivism." Cf Section 10.5 in this tome.

1.4.6. The Open Texture of Practical Reason

In conclusion, nonpositivism has shown up some critical aspects of legal positivism, legitimizing the third revival of natural law as a search for just law internal to the framing of positive law and as a constitutive element of its positivity. We will now try to sum up these themes developed on the natural law approach.

(1) A characteristic of constitutionalism is the positive existence of a *lex superior* standing above ordinary legislation. The problem is to define the normative status of this supra-statutory law, which places a constraint on the content of ordinary norms. Dworkin and Alexy regard these principles as structurally and qualitatively different from positive norm, but since the same principles bear on the interpretation and application of law, that recognition according to the positivist conception amounts to opening the door to morality in law (see Prieto Sanchís 1997). Hence legal positivism is forced to choose between working out a different theory of constitutional principles and openly declaring itself incompatible with constitutionalism (cf. Troper 1992, 37), the latter option being something frankly paradoxical, as a theory based on facts cannot then turn around and reject them.

(2) The second characteristic, closely connected to the first one, consists in placing legal argumentation within moral argumentation. As noted, constitutional decisions often become a locus of moral evaluation when it is necessary to judge whether ordinary law is consistent with constitutional values, and these processes of reasoning are very similar to those typical of modern natural law theory. According to Atienza, "the approach to law as argumentation is committed to a minimum objectivism in ethics" (Atienza 2006, 53; my translation).[46]

(3) The positivization of human rights not only does not do away with the need to search for nonpositive law but, on the contrary, makes that an even stronger need. Rights are not something original but are an ethico-legal reflection of values. Today the language of values has taken the place of that of natural law. Values are translated into reasons that ground the ascription or recognition of rights.

This does not entail a return to the philosophy of values. To be sure, this current had a major influence on legal philosophy at the time of Dilthey, the neo-Kantianism of the Baden school, and Scheler. But, as previously noticed (see Section 1.3.3.3), it became unyielding in the hands of Hartmann, for whom value is an absolute that exists in itself (*Ansichsein*), regardless of whether anyone recognizes it (cf. Hartmann 1949, 154). Consequently, no dialogue was possible between values and the facts of history—which was precise-

[46] The Spanish original: "[…] el enfoque del Derecho como argumentación está comprometido con un objetivismo mínimo en materia de ética."

ly the problem to be addressed. The urbanization of values, for the purpose of toning down their violent and conflicting character (cf. Schmitt 2011), was the objective of the movement to rehabilitate practical philosophy (cf. also Mengoni 1985).

(4) Another opportunity for natural law theory lies in the principle of reasonableness, which has become the reference point for the processes through which rights are balanced and for the argumentation typical of constitutional courts. If conflicts between fundamental rights are to find a solution that can be considered reasonable, judgments of suitability, necessity, and proportionality in the narrower sense, through which the principle of reasonableness finds expression, have to satisfy their claim to objectivity. Since these are evaluative judgments, a cognitivist perspective is required. Nor can it be objected that we are only talking about instrumental judgments about the means adopted, because at least the judgment of proportionality in a narrow sense also requires evaluating the goals pursued by the legislator, their importance, and the degree to which it is useful to achieve them. Balancing is not a mechanical or merely procedural operation but requires judgments of relevance and comparative weight.

The very principle of equality, which lies at the root of that of reasonableness, entails value judgments about the objective difference between the situations to be compared, and that in itself justifies the differential treatment of those situations. If practical evaluations cannot be regarded as objective, the whole enterprise of the constitutional state would have no rational basis.

That these moral evaluations are also subject to restrictions and constraints dictated by positive law does not make them incompatible with natural law theory understood in a narrow sense, which defends the presence of natural law within legal positivity itself.

(5) Contemporary pluralism rejects the principle of authority and and asks that disagreements be settled on the basis of reason. The Hobbesian formula *Auctoritas non veritas facit legem* is incompatible with the constitutional state. The main task authority takes on is to make sure that the rules governing the practical discourse on which basis to choose among competing conceptions of life are practicable and complied with, and in this sense it turns out that authority can no longer stand on its imperative role alone. The exercise of natural reason is brought into prominence, but it has to reckon with the limits and constraints of positive law.

(6) Finally, the current debate on the universality of human rights sees a reconsideration of the natural law tradition. If human rights are universal, it is reasonable to search for a basis or justification of them in the traits common to all of humanity. This does not necessarily entail an appeal to human nature understood in a biological or teleological sense, but it certainly commits us to searching for and identifying values common to all humans. However, it remains an open question whether recognizing freedom also means recogniz-

ing human nature, since freedom is possible only among natural beings (see Spaemann 1994a, 79). On the other hand, denying the universality of human rights in every possible expression and maintaining their relativistic particularism does not help to explain their origin or their present currency, but only their possible ideological use. It is no accident that studies in international legal philosophy are multiplying and cosmopolitan theories of law have been developing.

In conclusion, nonpositivism, as we have seen, offers three ways of seeing the connection between law and morality: that of integration, where law is distinguished from morality by the need to make practical discourse effective; that of the incorporation of law into social morality, which provides the basis for law's obligatoriness; and that of a full or partial absorption of morality into law, which thus takes on an internal moral value.

These three orientations come close to natural law theory in varying degrees but are not full-fledged natural law theories. This is so above all because of the widespread refusal to recognize "human nature" as having some role in legal theory. In place of natural law there is moral law, but in legal theory the latter is perceived as a foreign body. Legal theory seeks to defend itself with the separability thesis, but in so doing loses its full capacity to explain the legal phenomenon. The only option left is to forgo the full autonomy of legal theory, recognizing its dependence on political philosophy and moral philosophy.

Law has to have a dialogue with morality if it is to avoid collapsing into morality itself, just as politics has to have a dialogue with religion if is to avoid becoming a religion itself. Practical reason cannot be worked out in sectors entirely separate from one another (see Spaemann 1994b). In this way, however, the legacy the 20th century inherited from 19th-century legal science theory is seriously jeopardized, and new scenarios open up that are still very uncertain.

The third rebirth of natural law, as we have seen, is widespread, though it is quite incomplete relative to the ancient and modern tradition. But as theories change, so do traditions. As long as there is meaning to the distinction between just and unjust actions, and as long as something is recognized that is unchangeable in positive law, which by definition is changeable, then what enlivens natural law theories will always allow a new resurrection of them.

Chapter 2

NATURAL LAW IN GERMANY IN THE 20TH CENTURY

by Stephan Kirste

Despite at least three revivals during the 20th century, natural law seems to have lost its importance at the end of the past millennium. Natural law theory as well as its subject of investigation has shifted from the philosophy of law to ethics. Natural law is no longer regarded as law in the strict sense of the concept. It does not consist of norms promulgated on the basis of authoritative competence and procedural norms and executed under certain constraints. The theory of these law-related moral norms now belongs to philosophical ethics—not to jurisprudence—even though it is still discussed and taught at law faculties.

However, natural law's loss of importance is not the result of the vehement critique of its ideological basis but of its success. The formal and material criteria the German natural law theorists have elaborated in an exchange with other central European and North American scholars have largely been adopted in German constitutions and other statutes. The formal criteria any law should fulfil according to natural law theory, criteria such as legal certainty and equality of application, have been accepted in legal theory as well as in legal practice in the 19th century, i.e., in the age of historicism and positivism in Germany. Criteria of material justice, such as human dignity, basic liberties, and legal equality, found a more difficult path into positive law. The process of their incorporation into positive law can be seen as the history of natural law in 20th-century Germany. Accordingly, the core tenets of natural law are no longer a spirit floating above the water; despite severe setbacks during the Third Reich—where we find the approaches of a National Socialist *Naturrecht*—they have become positive law and are now treated in the same way as other legal principles.

This development in Germany is a good illustration of how natural law emerges only when positive law degenerates in times of crisis or in times of transition from one legal regime to another, or simply when it ignores basic moral demands. The three "renaissances" of natural law—around World War I, in the aftermath of the Third Reich, and after the fall of the Berlin Wall—with the following reunification of Germany were such moments of crisis, when the old legal regime had come to an end and did not provide guidance for the future.

DOI 10.1007/978-94-007-1479-3_30

2.1. The Starting Point

In the beginning of the 20th century, historicism and legal positivism dominated jurisprudence. Only norms which had developed as expressions of the spirit of the people (*Volksgeist*), as Friedrich Carl von Savigny put it, or which were formulated by the supreme will of a sovereign were considered law. If the idea of natural law was not bluntly rejected, these higher, nonpositive norms were considered changeable though not arbitrarily alterable. Especially the positivism in public law (*staatsrechtlicher Positivismus*) of Paul Laband (1838–1918), Karl Friedrich Wilhelm Gerber (1823–1891), and to a certain extent Georg Jellinek (1851–1911) found no justification for any legal norms prior to the implementation of positive norms.

Perhaps the most outspoken critic, but certainly not the only one, was Karl Magnus Bergbohm (1849–1927), proclaiming what follows: "In my view the pest plants of natural law, in whatever form and disguise they may ever appear, open or concealed, have to be destroyed root and branch" (Bergbohm 1892, 118; my translation). More moderate voices, too, would prefer "to go back to normal" instead of bothering with natural law (see Anschütz 1914, 26). Others spoke of "wishful thinking" with respect to natural law and emphasized the realistic and critical approach of legal positivism (cf. Somló 1927, 308ff.).[1] Even Gustav Radbruch (1878–1949), who played an important role in the post World War II natural law discussion, held that value judgments, which are the basis of natural law, could not be expressions of knowledge but only of confessions.

2.2. Natural Law Theory in the First Third of the 20th Century

Despite the predominant positivism in German jurisprudence and legal philosophy at the end of the *Kaiserreich* and the Weimar Republic, the natural law tradition had not been forgotten at all. On the contrary, the first renaissance of natural law was prepared under the seemingly all-embracing cover of positivism. Two developments were responsible for this renewed interest in the extrapositive foundations of law. The first impulse came from the scientific point of view: Can a strictly empirical jurisprudence be called a science at all, or is it "like the wooden head in the fable of Phaedrus, fine enough in appearance, but unfortunately it wants brain," as Immanuel Kant (1887, 44) had put it in his *Metaphysics of Morals*. Natural law as the unity of the empirical diversity of the positive laws—this was the idea pursued by neo-Kantian scholars. Taking a path different from this formal approach, other thinkers looked for answers to the pending "social question." They were more interested in the substantive answers provided by the old natural law tradition.

[1] Hans Kelsen (1881–1973) called it "ideology" (Kelsen 1927–1928b, 78ff).

The experiences of World War I were of great importance. As Erich Kaufmann (1880–1972) put it, "these experiences have forced us to subject our thoughts about law and the state to new scrutiny" (E. Kaufmann 1921, 3; my translation). Phenomenological scholars like Erich Kaufmann, as well as neo-Hegelian thinkers like Julius Binder (1870–1939), had to reexamine their convictions.[2] They thought of the Great War as an "eye-opener" alerting them to the shortfalls of legal positivism and naturalism. Accordingly, Rudolf Smend (1882–1975) wrote: "The natural lawyers knew more about the state than Laband and Max Weber, much more than their adepts and dispraisers and critics, and much more than what the common accounts of their history say about them" (Smend 1994, 182; my translation). In most cases, however, the revival of natural law in the first third of the 20th century in Germany was not an original approach to the topic: It was a renewal. It is in this sense that many of these approaches were "neo-" theories: neo-Kantianism, neo-Hegelianism, and neo-Thomism.

More than referring to the *Metaphysics of Morals*, neo-Kantianism reminded the scholarly community of the transcendental approach of critical philosophy. Natural law did not mean a set of norms as a basis for the deduction of just provisions in positive law, but rather consisted of the conditions for the possibility for secure knowledge in law. Empirical knowledge cannot be systematically gained and explored if there is no unifying idea as a focal point. The idea of law (*Rechtsidee*)—that is, the idea of justice—was regarded as the focal point of law. Rudolf Stammler (1856–1938) considered a fixed set of substantive norms as the content of natural law to be an unproven assumption (see Stammler 1896, 171). They are the expressions of the ongoing process of producing paradigms for the legislator to look to. They also served as tools for the recognition of positive norms. Accordingly, Stammler spoke of "natural law with changing content" (Stammler 1988, 185; my translation):[3] The form remained the same, while the content was constantly changing. What he positively developed was a set of abstract guidelines for positive law, which in his "doctrine of right law" (*Lehre vom richtigen Recht*) were decidedly not considered norms (see Stammler 1902).[4]

Leonard Nelson (1882–1927)—a neo-Kantian thinker, though he drew much inspiration from Jakob Friedrich Fries and in this sense was more neo-

[2] "This turn from a material philosophy to a worldview [*Weltanschauung*] and metaphysics has been aided by the dreadful experiences that have befallen mankind, and Germany in particular, in the last couple of years. Whoever had not been woken up from his slumber by the impending auspices woke up with this catastrophe […]. The World War awakened mankind from its daydreams, and with watchful eyes it observes the ruins of the world of positivism and naturalism" (Binder 1925, XLVI; my translation).

[3] The German original: "Naturrecht mit wechselndem Inhalt."

[4] On Stammler see also Section 1.1.3.1. in this tome and Section 1.3 in Tome 1 of this volume. On neo-Kantianism in general see Chapter 1 in Tome 1 of this volume.

Friesian than neo-Kantian—proved that empirical knowledge of law can never achieve necessity. He rather adopted the transcendental method. That is why a conception that could confer necessity and certainty on the experiences of law would have to be constructed a priori (see Nelson 1964, 21).[5] Without such necessity, norms would not be capable of any obligation.

Whereas this argument was close to the Marburg school of neo-Kantianism, the ongoing discussion in the Heidelberg school (i.e., the southwestern school of neo-Kantianism) was absorbed with the question of how a knowledge of values was possible at all (Paulson 2002a, 11ff.). Emil Lask (1875–1915), who had a major influence on Gustav Radbruch, tried to avoid the assumptions of both legal positivism and natural law (see Lask 1982, 198).[6] Whereas legal positivism was considered merely historical, natural law theories claimed to be ahistorical (see ibid., 191ff.). This dualism could be avoided if law was conceptualized as a reality related to a certain legal value.

The neo-Hegelian scholar Julius Binder (1870–1939) placed greater value on historical and social aspects than neo-Kantian philosophers did. He, too, understood all law as oriented toward the idea of law. This idea of law contained the concept of community, which he thought would form the individual's personality (see Binder 1925, 283). As long as positive law was guided by this idea of law, different historically concrete and correct laws would be possible. Thinking along Hegelian lines, Binder's disciple Karl Larenz (1903–1993) rejected the idea of a higher law but attempted to uncover the "immanent idea of law" in positive law. He considered this an expression of the objective spirit.[7]

The neo-Thomist approach to natural law looked to certain material principles that should guarantee justice in positive law. The respective scholars tried to recall the timeless moral foundations of all laws, thus rejecting any voluntarism in jurisprudence. According to Victor Cathrein (1845–1931) human reason is only a *receptive* norm-inventing capacity, not a creative one (see Cathrein 1901, 126). During this first phase, natural law did not play an important role in Protestant legal theory or in Protestant theology. Only the individual consciousness was important for building moral reasons for action, but legal norms seemed to belong to the *civitas terrena*. This two-kingdoms doctrine was later made responsible for justifying legal positivism. But it did leave the individual consciousness as a source of resistance and even, for some, of a right to resistance.

Apart from these approaches reviving traditional concepts and methods of philosophy and further developing them, only a few natural law schools in the first third of the 20th century related to contemporary philosophical theories. One of these comprised natural law theories based on the concept of the sciences of spirit (*Geisteswissenschaften*) as developed by Wilhelm Dil-

[5] He raised that line of criticism against positivism as early as 1917; cf. Nelson 1917, 2.

[6] On Lask see also Section 1.1.3.2 in this tome and Section 1.4 in Tome 1 of this volume.

[7] On Binder and Larenz see also Chapter 5 in Tome 1 of this volume.

they (1833–1911) and elaborated by Theodor Litt (1880–1962). Although they considered all law to be cultural phenomena made by humans on the basis of their legal consciousness, Dilthey accepted the idea of natural law understood a complex of norms not made but discovered through a knowledge of values (see Dilthey 1990, 78). The central category of the humanist approach to natural law was that of life. Dilthey (1957, 4) considered his theory an attempt to understand life not from any abstract point of view but through the expressions of life itself. On this basis, Erich Kaufmann (1880–1972) criticized neo-Kantian theories of natural law for their abstract formalism, and instead accentuated their historicity: "Only living forms are capable of enabling life; and only these forms share the fate of life, to be amenable to death" (E. Kaufmann 1921, 101; my translation). The source of this natural law that would enable social life lies not in reason but in the "heart of the human being," as Rudolf Laun (1927, 29; my translation) put it. This philosophy of life in jurisprudence generally accorded a higher value to legal emotions than to the rational construction of law. By acknowledging the impact of legal consciousness and the legal emotions (*Rechtsgefühl*), it would be possible to prevent the uncontrolled subjectivism in law to which a strict formalism would lead (see Isay 1929, 225). These thinkers urged an awareness of the emotions and their embeddedness in the "trans-subjective stream of history" as a means by which to counteract the subjective arbitrariness of legal judgments to which positivistic or neo-Kantian theories would lead (see Holstein 1926, 1ff.).

Another new theory of natural law—which was first elaborated at the beginning of the century, even though it became most influential only after World War II—was the originally phenomenological "Material Value Ethics" (*Materiale Wertethik*) of Max Scheler (1874–1928) and Nicolai Hartmann (1882–1950). They, too, rejected neo-Kantian formalism. They were aware, however, of the epistemological problem of natural law. By applying Edmund Husserl's phenomenological methods to ethical knowledge, Scheler tried to enable an experience of values, which were not mere constructions but pre-existing material ideas. The content of the norms of natural law is based in these values, its form as embodied in norms stems from the "empirical striving of men." Accordingly, such a natural law is changeable due to this form (see Scheler 1966, 224; cf. ibid., 532ff.).

In the first half of the 20th century, natural law theory did not influence the courts. The German Imperial Court of Justice (*Reichsgericht*) had at best a legitimizing understanding of it: "Natural law," it stated, "is to be understood as a sum of legal norms that are binding on all mankind by virtue of nature itself, not by positive enactment […] to these norms belongs every citizen's duty of allegiance to his fatherland and its people." And the court considered the "welfare of the state the supreme law."[8]

[8] Rulings of the *Reichsgericht* in Criminal Law (RGSt) 62, 65ff. (67); my translation.

Thus, when Ernst Beling (1866–1932), at the end of the Weimar Republic, wrote "The dream of positive law is over" (Beling 1931, 1; my translation), this was an accurate account of legal philosophy in Germany but not of legal practice across the country's jurisdiction.

2.3. Natural Law During the Third Reich

2.3.1. Is there a National Socialist Natural Law?

In the early 1930s, National Socialist legal philosophy was quite heterogeneous (Pauer-Studer 2014, 15ff., 118ff).[9] A common denominator, however, was the rejection of legal positivism as a liberal theory. This conviction did not, however, amount to a return to classical natural law. The traditional content of natural law was in fact also abandoned. It was replaced by the National Socialist legal ideology, which again had nothing in common with the neo-Kantian idea of law (*Rechtsidee*).

National Socialist supra-positive law was supposed to be less abstract in its form than traditional natural law. For some authors in a misunderstood Hegelian tradition this higher law was meant to overcome the former dualism of natural law and positive law. It was therefore conceptualized as a unity—natural and immediate, as well as an ideal and normative. Some authors spoke of natural law as the "characteristic order of the species of a people, a pre-legal, 'natural,' or 'divine,' genuine reality" (Best 1939, 1203; my translation). The idea was expressed as follows by Hans Frank (1900–1946), founder of the National Socialist *Akademie für Deutsches Recht* and "Commissioner of the total control (*Gleichschaltung*) of the judicial branch and the renewal of the legal order": History "gave us a consciousness that the concept of what law is depends upon the blood-inspired conviction of man, accordingly determined by race. If National Socialism creates a law founded not on so-called universal abstractions but on a people's sense for its race, the accord with the sense of ethics, too, will be secured" (H. Frank 1934, 8; my translation). The "new natural law" was considered to have only one aspect in common with the natural law of the Enlightenment, namely, "the firm belief that there is an absolute, eternal law, a law that flows from the essence [*Wesen*] of a naturally given subject" (Fehr 1938, 31; my translation). This encouraged others like Hans-Helmut Dietze to declare, "[o]ur present turning to natural law becomes more and more obvious" (H. Dietze 1936b, 818; my translation; cf. H. Dietze 1936a, 108, 204ff.).

The historical and naturalist aspirations of National Socialist legal philosophy also shaped the content of norms transcending positive law. Many authors explicitly or implicitly looked to the ideological foundations of National So-

[9] On Nazi philosophy of law see also Section 1.2.1 in this tome and Chapter 9 in Tome 1 of this volume.

cialism in Hitler's *Mein Kampf* and Alfred Ernst Rosenberg's *Der Mythos des zwanzigsten Jahrhunderts* (The myth of the 20th century: Rosenberg 1930). The fundamental categories in this anti-individualistic worldview were the people (*Volk*), the race (*Rasse*), and the unity of blood (*Blut*). The individual's status was only that of a member of the mass of the people (*Volksgenosse*). Mixed with components of Nordic mythology,[10] a naturalist ideology of the unity of the homeland, the common German language, and heroic history served as the foundation of this "blood-filled natural right to live as a natural law of the race" (H. Dietze 1936b, 819; my translation). This "natural law" was a decidedly unequal, anti-individualistic,[11] racial-elitist, and anti-universalist law.[12] It was meant to contain values that bind the legislator, but only in the form interpreted and specified by the Führer, Adolf Hitler.

The quest for a National Socialist "natural law" united many legal scholars of formerly different schools of thought—some of them remained influential in the early years of the Federal Republic of Germany and even in the renaissance of natural law after World War II. Hans Julius Wolff (1898–1976), for example, held it to be true in 1933 that "we are moving into a new natural law epoch."[13] Ernst-Rudolf Huber (1903–1990) tried to find a middle ground between a temptation to "backslide into Scholastic natural law theory" and lib-

[10] "It has always been the case that for the Nordic man the inner approximation to the nature of the laws of life is valued as being higher than the absolute arbitrariness of the state legislator" (H. Dietze 1936b, 819; my translation). The German original: "Höher als die absolute Willkür des staatlichen Gesetzgebers gilt dem nordischen Menschen von jeher die innere Wesensgemäßheit einer lebensgesetzlichen Ordnung."

[11] "The ethnic-organic worldview locates the original (primary) reality of mankind not in the individual human being (or in the individual soul) but in the people" (Best 1939, 1201ff., 1202; my translation). The German original: "Die völkisch-organische Weltanschauung sieht nicht im Einzelmenschen (oder in der Einzelseele), sondern im Volk die ursprüngliche (primäre) Wirklichkeit des Menschentums." This collectivist imprinting of law is expressed in principles like *Gemeinnutz vor Eigennutz* (the common interest prevails over the individual interest) or *Das Ganze vor dem Teil* (the whole is more important than the part).

[12] "However, contrary to the old natural law, the new natural law is no longer a law of mankind. The new natural law no longer encompass all peoples, all men, wherever they may live. It captures only a particular people, community, and national unity" (Fehr 1938, 25; my translation). The German original: "Aber entgegen dem alten Naturrecht ist dieses neue Naturrecht kein Menschenrecht mehr. Das neue Naturrecht umspannt nicht mehr alle Völker, alle Menschen, wo immer sie wohnen. Es ergreift jeweils nur ein Volk, nur eine Gemeinschaft, nur eine kulturelle und nationale Einheit."

[13] "The new German state knows […] a material idea of law, a highest legal value capable of sanctioning all delegated legislations. Even though this idea of law may not yet be clarified, one can recognize its shape already. We are moving into a new natural law epoch!" (Wolff 1933, 8; my translation). The German original: "Der neue deutsche Staat kennt […] eine materielle Rechtsidee, einen obersten rechtlichen Wert, der alle delegierten Rechtssetzungen zu sanktionieren geeignet ist. Wenn diese Rechtsidee auch—wie das Gefüge des neuen Reiches überhaupt—theoretisch noch nicht geklärt ist, so kann man sie doch schon in ihren Umrissen erkennen. Wir treten in eine neue naturrechtliche Epoche!"

eral normativism, legal positivism, and conceptual jurisprudence (see Huber 1939, 276). Other proponents of natural law in National Socialism certainly wanted to establish at least some limitations to the dictatorial power of the regime but their efforts were frustrated. This is true of Herbert Kraus (1884–1965). Illustrating his conception with many quotations from the speeches of Adolf Hitler and his *Mein Kampf*, Kraus intended to prove that "natural legal thinking belongs to the foundations of the National Socialist legal world view. The National Socialist is an adept of natural law" (Kraus 1933, 2419; my translation). From this normative ground he tried to impose limitations on imperialistic conceptions of world politics by elaborating a concept of international law. In 1937, he was removed from his position and worked at Columbia University; he was then reintegrated into German academia in 1945.

This National Socialist higher law gained practical importance in the interpretation of the overused general legal principles such as public morals (*Sittlichkeit*, *gute Sitten*). The *Völkisches Gesetzbuch*, which was to substitute the German Civil Code (BGB), though it was never enacted, contained several "basic rules" that were to be applied if the code provided no provision on the issue at hand. These "rules" contained the essentials of National Socialist higher law. The first basic rule stated, "The supreme law is the wellbeing of the German People"; the second, "German blood, German honour, and the health of our heritage [*Erbgesundheit*] are to be kept clean and to be preserved. They are elementary forces of the law of the German people [*deutsches Volksrecht*]." Following these "basic rules" was a catalogue of rights and duties. These rights were to be enforced "in good faith" (*Treu und Glauben*), however, and in accord with the acknowledged principles of the racial community's life (*völkisches Gemeinschaftsleben*). The community's wellbeing is to be preferred to individual utility.

In sum, the anti-positivist National Socialist legal theory and practice assumed a higher law. This higher law had formal similarities with natural law and served the same function as a legitimating foundation of positive law. However, by virtue of its anti-universalist and anti-individualistic content, it departed substantially from the natural law tradition. This higher law was a strictly immanent law without universal claims. All the transcendent values of the classical natural law tradition (the individual human being, the common good, liberty, equality, and the like) mutated into naturalistic "values." The hope of salvation was pinned not to the incarnated God but to the person of the Führer Adolf Hitler (see Schild 1983, 450ff.). Mankind became the biological unity of the people as a race, and the free individual degenerated into the people's dependent accomplice; only among the people was there some equality—making exception for the leaders of each societal level—but there was no equality between peoples. As far as scholars explicitly spoke of natural law, they instrumentalized the pathos of the natural law tradition for the elaboration of the National Socialist ideological myth of law (see Cassirer 1946, 298).

With respect to the outline just provided of the structure of a National Socialist higher law and its impact on positive law, Gustav Radbruch's dictum that "Positivism has made German lawyers defenceless" (Radbruch 1947, 9; my translation)[14] cannot be followed (Walther 1988, 263ff.). National Socialist legal theory and practice did not follow the ideas of legal positivism; neither did it carry forward the natural law tradition with respect to the content of its fundamental principles; it did work out, however, a conglomerate of higher principles of law which performed the same function natural law did in the history of legal thought (Neumann 1994, 147). These norms were not merely a subconsciously working ideology that a strict positivist, unaware of the ideas at work in him, would have become a victim of: They served as the explicit normative foundation of positive law in the Third Reich.

2.3.2. Natural Law at the Foundation of the Resistance to Hitler

Traditional natural law was not forgotten during these twelve years. This tradition was kept alive by a variety of groups, including by different circles in the opposition against Hitler. Importantly, the natural right to resistance was discussed in Catholic as well as in Protestant circles. Apart from elitist conceptions of a future Germany, elements of the Catholic social doctrine of the late 19th and early the 20th centuries gained some importance in the *Kreisauer Kreis*. In the 1934 Barmer Declaration, the Confessing Church (*Bekennende Kirche*), which formed around Martin Niemöller and Dietrich Bonhoeffer, rejected the totalitarian claim to power and insisted on the right of the individual consciousness and the transcendent designation of the church. They later openly criticized the concentration camps and the oppression of individuals and of society by the National Socialist regime. This Protestant opposition based on the rights of the individual is of special importance for the post–World War II development of the natural law theory in Germany, because,

[14] "The traditional conception of law, namely, the doctrine that 'law is law,' which is undisputedly the prevalent opinion among German lawyers, was defenceless and powerless against such an injustice in the form of law; the adepts at this doctrine were compelled to acknowledge any law as law, no matter how unjust. Jurisprudence must go back to the centuries-old common wisdom of antiquity, the Christian Middle Ages, and the Age of the Enlightenment, recognizing that there is a law higher than positive law—a natural law, a divine law, a law of reason, in short a supra-legal law in comparison with which unjust law remains unjust even if cast in the mould of positive laws" (Radbruch 1947, 9; my translation). The German original: "Die überkommene Auffassung des Rechts, der seit Jahrzehnten unter den deutschen Juristen unbestritten herrschende Positivismus und seine Lehre 'Gesetz ist Gesetz,' war gegenüber einem solchen Unrecht in der Form des Gesetzes wehrlos und machtlos; die Anhänger dieser Lehre waren genötigt, jedes noch so ungerechte Gesetz als Recht anzuerkennen. Die Rechtswissenschaft muß sich wieder auf die jahrtausendalte gemeinsame Weisheit der Antike, des christlichen Mittelalters und des Zeitalters der Aufklärung besinnen, daß es ein höheres Recht gebe als das Gesetz, ein Naturrecht, ein Gottesrecht, ein Vernunftrecht, kurz ein übergesetzliches Recht, an dem gemessen das Unrecht Unrecht bleibt, auch wenn es in die Form des Gesetzes gegossen ist […]." See also Radbruch 1946, 105ff.

in contrast to the first three decades of the century, Protestants then actively joined the natural law debate.

In the different groups of resistance against the regime, and Adolf Hitler in particular, the classical theories of the right to resistance was as much discussed as the question of a right to murder a tyrant. As the Protestant Adolf Arndt (1904–1974) later asked, "was it murder […] to lay one's hands on Hitler, or was it murder not to stop Hitler?" (Arndt 1948, 430; my translation).

2.4. Natural Law after World War II

The second renaissance of natural law in Germany began with the end of the National Socialist regime. The revival of the classical ideas of the natural law tradition was so fervent that some authors criticized natural law a "fashionable term."[15] Unlike the first renaissance of natural law, the second one was supported not only by legal philosophy but also by legislation and adjudication. Characteristic of this epoch was a tendency towards a concrete, historical, and realistic natural law and a stronger emphasis on emotional capacities for the cognition thereof (see Hubmann 1954, 319ff.).

2.4.1. Natural Law in the Philosophy of Law

The reactions of legal philosophy to the experiences of the National Socialist regime were quite heterogeneous. United in their attempt to find legal norms that would limit the legislator's arbitrariness, these thinkers adopted very different basic philosophical assumptions. We find elements of Aristotle, Cicero, the Stoics, Christian Scholasticism, Max Scheler's and Nicolai Hartmann's ethic of material values; fewer receptions of Kant and Enlightenment natural law philosophy;[16] and even of Ernst Bloch's socialist natural law, drawing on the early Marx and the idea of human dignity (see Bloch 1961).[17] If there was any single uniting attitude, it would have to be a scepticism of bold theories. On the one hand, we find a reflection on the timeless principles of tradition. On the other hand, this did not yield a mere return to the classical forms of natural law. Almost no one relied on the formalistic approach of neo-Kantianism.

[15] Heydte 1948–1949, 185ff. Other authors, however, question the idea of a renaissance. Wilhelm R. Beyer (1947) put his finger on the arbitrariness of the contents of natural law, which exclude the possibility of any return to a similar conception. Ulfrid Neuman held that the practical problem of doing justice to redress the National Socialist atrocities was so dominant, and the lines of theoretical continuity so thin, that it would not be appropriate to speak of any "renaissance" of natural law, even assuming a single understanding of natural law par excellence (see Neumann 1994, 154).

[16] For an overview, see Hollerbach 2004, 278ff.

[17] On these developments of German legal philosophy see also Section 10.2 in Tome 1 of this volume.

Even Kantian philosophers like Julius Ebbinghaus (1885–1981) criticized the natural law theory of the Marburg school for its formalism. Instead of looking to Kant's *Critique of Pure Reason*, the *Critique of Practical Reason* or the *Groundwork of the Metaphysics of Morals*, he drew heavily on the idealist's legal theory as set out in the *Metaphysics of Morals* (Ebbinghaus 1952, 229). Within the confines of Kant's concept of law, he stated: "Only these laws limiting the external freedom of human beings belong to the laws of nature, without which this liberty cannot, under any condition, be united with the freedom of all under laws" (Ebbinghaus 1960, 322ff.; my translation). In a dualistic view, he held that natural law does not contain any enforceable individual rights, but only objective duties of the legislator.

Just like in the first renaissance of natural law in the 20th century, in the postwar period an important role was played by neo-Scholastic natural law. In 1947 came the "manifesto of neo-Scholastic natural law conceptions" (Hollerbach 2004, 280; my translation), Heinrich Rommen's *Die ewige Wiederkehr des Naturrechts* (The eternal return of natural law: Rommen 1947). It contained the characteristics of the neo-Scholastic natural law: the ontological quality of its principles, the congruence between divine and human reason, the unchangeability and universal validity of those principles, and the primacy of the Church's authentic interpretation (cf. Hollerbach 2004, 280).[18] Johannes Messner (1891–1984) wrote a monumental work of 1372 pages, *Das Naturrecht* (Natural law: Messner 1950), dealing with institutions based on the neo-Scholastic foundations of natural law, the basic needs of human existence, and the individual consciousness. Messner drew a distinction between "elementary natural law"—with basic principles like the golden rule, which he felt are obvious to everybody—and "applied natural law," the concrete natural law for specific areas of activity in society.

Some of the new philosophical approaches to natural law in the Weimar Republic found a deeper reception in academic legal philosophy. In a much-discussed essay, *Die obersten Grundsätze des Rechts* (The highest principles of law: Coing 1947), Helmut Coing (1912–2000) built his theory on the humanities approach of Max Scheler's and Nicolai Hartmann's ethic of material values. Here he was looking to set out the most fundamental principles that would guide and limit legal orders in their attempt to provide a powerful guarantee of peace. Agreement with these principles secures the validity of the legal order. The source of recognition for these self-contained principles is the human consciousness of values. At the core of these principles we find freedom and the dignity of the person. Hans Welzel (1904–1977) strongly opposed this idea. He held that the only aspect which survives "from the world of natural law thought […] is not a system of eternal, material legal principles, but the ongo-

[18] Ellul (1948, 101) believed that the individual could err, but the Church could never have a lapse of reason.

ing task of positive law, to take care that the struggle for the right configuration of social relations remains a *spiritual* debate and is not stopped by predation or even by man's extinction by man" (Welzel 1980, 253; my translation).

The need for guidance for all legislation and legal practice was so deeply felt after World War II that even worldviews hitherto reluctant to join the concert of natural law conceptions overcame their doubts. Among these were the Protestant approaches. In the Calvinist tradition, Emil Brunner (1889–1986) emphasized the religious foundation of natural law through the revelation of the Bible (Brunner 1947, 269). In his view, natural law should be primarily concerned not with individual rights but with the state's objective justice (see Brunner 1947, 388).[19] Hermann Weinkauff (1894–1981) wanted to deduce principles of natural law from man's status in creation, especially his being an image of God (see Weinkauff 1951, 95ff.). Unlike those thinkers, who were optimistic about the recognition of natural law, Karl Barth (1948) radically rejected the idea based on the Lutheran interpretation of humankind's fall from grace.[20]

From the late 1940s to the early 1960s, in a public mood comparable to the one that prevailed after World War I, when Martin Heidegger had written his *Sein und Zeit* (Being and Time), several authors tried to make use of existentialism for the foundation of natural law. Friedrich August Freiherr von der Heydte (1907–1994) put it as follows:

> Forever lonely, forever deserted, alone with his fear of the meaninglessness of the present and the nothing of tomorrow, the single human being is thrown into a world of ruins. In this world, all historical, political, economic, and social order, indeed all order, is shaken to the core, and nothing seems to be certain and nothing original, nothing true, nothing real. In these ruins, the arms of the octopus of a nameless, amorphous, dispossessed mass, the machine that suppresses man, and of inevitable, catastrophic events snatch at the individual man to steal his last property, his I, namely, his already experienced and potentially experienceable being. Such times need a philosophy that leads man from meaningless and valueless availability [*Vorhandensein*] to his "existence," meaning the conscious unique "being" and "self-being" that is based on free decision—that lets him rediscover, understand, and experience his I and plan the possibilities enshrined in the I. Our times need an existential philosophy. (Heydte 1948–1949, 187ff.; my translation)

In a similar vein, other authors tried to develop existentialist conceptions not only of law in general but also of natural law. The later attempt is surprising insofar as existentialism emphasizes the momentary, situative character of hu-

[19] On other Protestant approaches, see Würtenberger 1952–1953, 584ff.

[20] "Any attempt to come at a concept of nature as a starting point and object of reasonable systematization on the basis of the Protestant understanding of Scripture would ultimately lead to a harmonization that would be in direct contradiction with Luther's fundamental conceptions. This would be the case even if we acknowledged that Luther allotted a much too narrow role to the use of reason" (Forsthoff 1947–1948, 686; my translation). The German original: "Jeder Versuch, auf dem Boden des evangelischen Schriftverständnisses zu einem Naturbegriff als Ausgang und Gegenstand vemunftmäßiger Systematisierung zu gelangen, würde zu einer Harmonisierung führen, die mit den Grundanschauungen Luthers notwendig in Widerspruch treten müßte, und das selbst dann, wenn man der Ansicht beitreten wollte, daß Luther dem Vernunftgebrauch ein zu enges Feld eingeräumt habe."

man existence. August von der Heydte, Erich Fechner, and especially Werner Maihofer (1918–2009) acknowledged the impact of the individual and of unbound conscience;[21] however, they tried to show that law belonged as well to being (*Dasein* or *Alssein; being-there* and *being-as*). This *Dasein* is based not on the individual alone but on the individual's dialogue with others. This basic relation is the foundation of all societies in its need for protection. According to von der Heydte and Fechner, the norms produced by this existential dialogue and meant to secure it are the "emerging natural law."[22] Werner Maihofer considered this structure of the *Dasein* as the ideal-typical fact (*Natur der Sache*; the nature of things/matter) from which other norms can be developed.[23] Natural law is part of the meaning of human existence, as it is the product of existential decisions. This is to say that natural law does not preexist these decisions but is the product of its innermost exegesis of their being. Natural law is therefore thoroughly historical.

The idea of an ideal nature of things as the foundation of a natural law that would avoid the abstractions of enlightened or idealist concepts of *Vernunftrecht* without falling prey to legal positivism was picked up in many postwar conceptions of natural law. The question of an adequate definition of the "nature of things" was never solved, however (Stratenwerth 1957). Still, it is paradigmatic for the new natural law in Germany—not a natural law rooted in strong ideological assumptions or abstractions but the ideal law of the here and now, a "historically elastic natural law" (Spranger 1948, 409; my translation). These tendencies are summed up by the title of Arthur Kaufmann's book *Naturrecht und Geschichtlichkeit* (Natural law and historicity: A. Kaufmann 1957). Natural law with its evolutionary, historical aspect was of great concern: "The historicity of law is the decisive dimension which makes it a human law […]. Only historical law that is open to man in his concrete being is truthfully human law" (A. Kaufmann 1994, 222; my translation). In accordance with the Scholastic tradition, other thinkers, like Alfred Verdross (1890–1980), distinguished an eternal and a historical layer of natural law (see Verdross 1971).

[21] Just like Heydte (1948–1949, 197), Günther Küchenhoff (1948, 46) considered natural law to be *Gewissensrecht*, that is, law stemming from consciousness.

[22] "Only after a deed does this emerging and daring natural law prove to be correct. This natural law has to be ventured in order to come to be. Accordingly, it is subjective in its origin, but objective in its purpose. This objectivity is the genuine criterion of natural law. This criterion is the reason that natural law remains what it essentially is, even if it cannot be proven or be attributed the certainty of an absolute and timeless validity" (Fechner 1954–1955, 325; my translation). The German original: "Dieses werdende und gewagte Naturrecht erweist sich dabei erst nach der Tat als richtig. Es muß gewagt werden, um überhaupt zu sein. So ist es in seinem Ursprung subjektiv, in seinem Ziel aber objektiv. Diese Objektivität ist das eigentliche Merkmal des Naturrechts. Mit ihm bleibt Naturrecht, was es wesentlich ist, auch, wenn ihm die Sicherheit absoluter zeitloser Geltung nicht mehr nachweisbar zuerkannt werden kann."

[23] For an overview, see Sprenger 1976 and the essays in Kirste and Sprenger 2010, esp. Hochhuth 2010, 82ff.

Whereas these conceptions of natural law sought a solid moral foundation of positive law, a more urgent practical problem was how to cope with the atrocities of the National Socialist regime. At the Nuremberg Trials, the regime's most important officials were charged with crimes against humanity (see Carl Haensel 1950, 253–94, defence lawyer at the Nuremberg Trials). But what to do with the judges and officers who acted in compliance with National Socialist laws or with other norms adopted by the regime. Were these legal norms at all? Were they legal even if they did not even aim at justice? Under the prohibition against retroactive criminal law, one could not impose present democratic and liberal standards on these past crimes. If the validity of positive norms were dependent on their coherence with natural law, many of the National Socialist norms would lose their validity and could not serve as justifications for these cruel actions. The discussion about these problems began right after the war, and one of the most debated and so far most relevant voices was that of Gustav Radbruch (1878–1949).[24] He rejected the idea that law and morals form a strong unity whereby any deviation of positive law from natural law would render the former invalid. However, from the still neo-Kantian perspective of the Heidelberg school, Radbruch looked at the law from the perspective of values (Paulson 2012b, 141). In his *Rechtsphilosophie* of 1914 and 1932, he considered law to be the reality that aims at the idea of law (see Radbruch 2003). In his view, this idea of law effects a unity of three legal values: those of the justice, utility, and certainty of law (ibid., 73ff.). In his famous and still much-debated article *Gesetzliches Unrecht und übergesetzliches Recht* (Statutory Lawlessness and Supra-Statutory Law: Radbruch 1946, 105ff.), he developed this well-known formula: If a statute gives rise to a conflict among these values, none of them can be altogether neglected without changing that law into something different. The utility of law, however, is the least important of those values. In a conflict between the two remaining values, the certainty of law ranks as more important until the injustice of law passes a threshold that Radbruch (ibid., 107ff.) defines by the criterion of its being unbearable (*unerträglich*). If a law violates elementary demands of justice under this criterion, it becomes a "flawed law" and may even altogether lose its character as law, at which point it must give way to justice.[25] Radbruch recognized the vague-

[24] On Radbruch see also Sections 1.1.3.2 and 9.1 in this tome, and Section 10.2.2 in Tome 1 of this volume.

[25] "The conflict between justice and legal certainty may well be resolved in this way: The positive law, secured by legislation and power, takes precedence even when its content is unjust and fails to benefit the people, unless the conflict between statute and justice reaches such an intolerable degree that the statute, as 'flawed law,' must yield to justice. It is impossible to draw a sharper line between cases of statutory lawlessness and statutes that are valid despite their flaws. One line of distinction, however, can be drawn with utmost clarity: Where there is not even an attempt at justice, where equality, the core of justice, is deliberately betrayed in the issuance of positive law, then the statute is not merely 'flawed law,' it lacks completely the very nature of law. For law, including positive law, cannot be otherwise defined than as a system and an institution whose very meaning is to serve justice" (Radbruch 2006b, 7; English translation of Radbruch

ness of this criterion but found no way to sharpen it. In his view, examples of laws violating justice in such a strong way would be arbitrary laws and laws that deny human beings their human rights and treat them as *Untermenschen*. Accordingly, a contradiction with the basic assumptions of natural law would invalidate positive law. As disputable as this inference from the value of law to its character as law may be, this "Radbruch's formula" was broadly accepted not only in German jurisprudence (see Alexy 1992) but also in the German judicial practice. As vague as the criterion is, it helped to not only bring the Nazi criminals to justice but also to redress the cruelties of the German Democratic Republic, especially the crimes committed at the Berlin Wall. The formula still serves in contemporary debates as a well-recognized argument for balancing law and morals.

2.4.2. Natural Law in the German Constitutions after World War II

The framers of postwar federal and state constitutions did not rely on the vague and varied form of natural law principles; they adopted basic principles of natural law, and through more or less transparent democratic processes transformed them into positive law. The German Basic Law of May 23, 1949, begins with the protection of human dignity (Art. 1 I). It continues in Art. 1 II with a statement of human rights. Germany's Basic Law thus transforms some central principles of the natural law tradition into positive law and contains further guarantees in the form of basic rights.

The constitutions of the German states followed very much the same course—some of them even preceding the Basic Law. Remarkable in this respect is Art. 1 III, IV, of the Constitution of Rhineland-Palatinate, which was drafted under the influence of Adolf Süsterhenn (1905–1974):[26] "The rights and duties of public power are founded on and limited by the requirements of the common good as determined by natural law. The institutions [*Organe*] of legislation, adjudication, and administration are bound to ensure these principles" (my translation). This was not a singular phenomenon. Many of the early German postwar state constitutions invoked "Christian social morals and social justice" (Preamble to the Baden Constitution of May 18, 1947) or stated

1946, 107–8). The German Original: "Der Konflikt zwischen der Gerechtigkeit und der Rechtssicherheit dürfte dahin zu lösen sein, daß das positive, durch Satzung und Macht gesicherte Recht auch dann den Vorrang hat, wenn es inhaltlich ungerecht und unzweckmäßig ist, es sei denn, daß der Widerspruch des positiven Gesetzes zur Gerechtigkeit ein so unerträgliches Maß erreicht, daß das Gesetz als, unrichtiges Recht der Gerechtigkeit zu weichen hat. Es ist unmöglich, eine schärfere Linie zu ziehen zwischen den Fällen des gesetzlichen Unrechts und den trotz unrichtigen Inhalts dennoch geltenden Gesetzen; eine andere Grenzziehung aber kann mit aller Schärfe vorgenommen werden: wo Gerechtigkeit nicht einmal erstrebt wird, wo die Gleichheit die den Kern der Gerechtigkeit ausmacht, bei der Setzung positiven Rechts bewußt verleugnet wurde, da ist das Gesetz nicht etwa nur 'unrichtiges Recht,' vielmehr entbehrt es überhaupt der Rechtsnatur."

[26] Süsterhenn drew a distinction between specifically Christian levels of natural law and universal principles (see Süsterhenn and Rüfner 1948).

that the state had learned from its own violations of human dignity and thus enacted a new constitution in order to prevent future injustices (Constitution of Bavaria of December 2, 1947). Heinrich Mitteis (1889–1952) also saw natural law as playing an important role in securing a future: "Germany will become a full-fledged member of the society of nations only when it recovers its faith in the law, in the unbreakable principles of law enshrined in the convictions of natural law" (Mitteis 1948, 43; my translation).

The Austrian scholar René Marcic (1919–1971) thought that "together with Art. 79 III Basic Law," these provisions revealed "the supra-positive validity of law in general (natural law)" (Marcic 1952, 52; my translation). He considered the West German Constitutional Court (*Bundesverfassungsgericht*) "a guardian not only of the constitution but of natural law" (ibid.). His Austrian colleague Felix Ermacora (1923–1995) was right to reject this idea, and at the same time he pointed to the very significance of these principles: "The provisions contained in the Basic Law that have been attributed the nimbus of timeless law are on the contrary powerfully acknowledged law aimed at ordering society within time" (Ermacora 1955, 527; my translation).

2.4.3. Natural Law in the Postwar Courts

These constitutional principles seemed to permit an open reception of natural law by the courts. In the decade after World War II, courts on all hierarchical levels applied natural law at least in hard cases. They emphasized the foundation of the fundamental principles of the state (democracy, the rule of law, the *Rechtsstaat*), the basic rights, and certain institutions (marriage, family, local autonomy) in natural law. The Federal Constitutional Court "acknowledges the existence of higher law that binds even constitutional power" and found itself "competent to measure the positive law against that standard."[27]

In the long run, however, this did not in general mean a dense connection of natural law and positive law. The court explicitly referred the Radbruch's formula and applied it to National Socialist norms,[28] as well as to the cases involving border guards shooting escapees at the Berlin Wall.[29]

[27] Rulings of the Federal Constitutional Court (BVerfGE) 1, 14ff. (14 u. 61)—Südweststaat; my translation.

[28] "Legal validity can be denied to National Socialist 'legal' provisions if they so evidently contradict the basic principles of justice that a judge who applied or acknowledged its legal consequences would administer injustice instead of justice" (BVerfGE 23, 98ff. [98 u. 106]—Ausbürgerung I; my translation). The German original: "Nationalsozialistischen ‚Rechts'-vorschriften kann die Geltung als Recht abgesprochen werden, wenn sie fundamentalen Prinzipien der Gerechtigkeit so evident widersprechen, daß der Richter, der sie anwenden oder ihre Rechtsfolgen anerkennen wollte, Unrecht statt Recht sprechen würde."

[29] "So far the Federal Constitutional Court has dealt with the problem of 'unjust law in the form of statutes' only in noncriminal cases. It has taken into consideration that in cases of an intolerable contradiction between statutory law and justice, the principle of legal certainty can

Arguments grounded in natural law have been used not only by the Federal Constitutional Court of Germany but also the constitutional courts of the states and the Federal Court of Justice (FCJ). Under the presidency of Hermann Weinkauff, the FCJ ruled on the deportation of Jews: "Decrees that do not even aim at justice—decidedly denying the idea of justice and disregarding the legal convictions inherent in all civilized peoples who uphold the dignity of the human person—do not produce law, and any action taken under such decrees remains unjust."[30] The natural law orientation of the FCJ was relevant not only in criminal law but also in civil law matters, as in its decisions on marriage.

The influence of natural law vanished with the differentiation among positive law, legal dogmatics, and jurisdiction based on jurisprudence. Beginning with the 1960s, natural law lost its significance, and only the Radbruch's formula survived as a source for the courts' decisions (see Faller 1995, 12ff.). In 1974, Peter Häberle (1934–) could not only postulate a "Theory of the Constitution without Natural Law" but also diagnose it.[31] The transparent democratic process set up under constitutional law would give constitutional theory an advantage over natural law theory, which tends to dogmatize its findings. Apart from constitutional theory, the second heir of natural law was human rights theory. In a major project, for example, Johannes Schwartländer (1922–2011) investigated the history and systematic importance of human rights.[32]

From then on, natural law became an object of criticism. Its social function and the class structure of its principles were analyzed from a sociological point of view (see F. Kaufmann 1973, 126ff.; Rosenbaum 1972, Breuer 1983a, Breuer 1983b, 127ff.). Following in the footsteps of Hans Kelsen, on the one hand,

be judged less important than material justice. To that end the court has invoked the arguments offered by Gustav Radbruch […]. In these cases the court has repeatedly emphasized that the invalidity of statutory law has to remain an exception […]. As the time of the National Socialist regime has shown, however, the legislator can enact severe 'injustice' […], and so a statutory norm can be denied obedience if its contradiction to justice is intolerable" (BVerfGE 95, 96ff. [134ff.]—Mauerschützen; my translation). The German original: "Das Bundesverfassungsgericht war bisher mit dem Problem des 'gesetzlichen Unrechts' nur im außerstrafrechtlichen Bereich befaßt. Es hat in Betracht gezogen, daß in Fällen eines unerträglichen Widerspruchs des positiven Rechts zur Gerechtigkeit der Grundsatz der Rechtssicherheit geringer zu bewerten sein kann als der der materiellen Gerechtigkeit. Es hat dazu auf die Ausführungen von Gustav Radbruch […] Bezug genommen […] Dabei hat es mehrfach betont, daß eine Unwirksamkeit des positiven Rechts auf extreme Ausnahmefälle beschränkt bleiben muß […] Indessen habe gerade die Zeit nationalsozialistischer Herrschaft gezeigt, daß der Gesetzgeber schweres 'Unrecht' setzen könne […] und deshalb einer Norm wegen unerträglichen Widerspruchs zur Gerechtigkeit von Anfang an der Gehorsam zu versagen sei."

[30] Rulings of the Federal Court in Criminal Matters (BGHSt) 2, 234ff. (238ff.); my translation.

[31] "After all, a single democratic constitutional theory today can accomplish more than any conglomerate comprising many natural law conceptions" (Häberle 1974, 439ff., 444; my translation).

[32] See, for example, Schwartländer 1978.

and Karl Popper, on the other, Ernst Topitsch (1909–2003) uncovered natural law's ideological character. In 1971, Jürgen Habermas (1974, 89ff., 93ff.) argued it to be an ideology by which to legitimize the power structures of governments. On epistemological grounds, Topitsch and Hans Albert (1921–) criticized natural law theories as "systems of circular arguments and empty formulas that can be used for the justification or rejection of any possible legal or social order, whether existing or dreamt up. It is to this unlimited susceptibility to manipulation that they owe their success" (Topitsch 1971, 36ff.; my translation).

Despite this strong criticism based on the analytical arguments put forward in the 1980s (Hoerster 1979, 78ff.; 1986, 2480ff.), Ralf Dreier (1987, 372) spoke of a new renaissance of natural law. Its core would lie in a theory of justice, distinguished from older forms of natural law by its refined theoretical instruments. Scholars inspired by John Rawls, such as Otfried Höffe, developed concepts of justice that combine the findings of legal positivism with the natural law tradition (see Höffe 1983, 305). Whereas Höffe took Kant as his starting point, Vittorio Hösle (1997, 776ff.) relied more on Hegel's idealism, making some remarks on natural law as well. This third and smaller renaissance came just in time to inspire the courts, after the fall of the Berlin Wall, to again use natural law—and particularly the Radbruch's formula—in dealing with the injustices of the German Democratic Republic.

2.5. Natural Law at the End of the Century

The history of natural law is usually told as the story of its decline. Especially in the second renaissance, many authors spoke of a loss of awareness of the foundations of law in faith and in morals. It was argued from an external sociological point of view that natural law lost the conditions for its emergence and sustenance. Others have held that natural law would have faded owing to its internal contradictions.

In the third renaissance, too, natural law reappeared not as law but rather as a reflection on the moral preconditions of law. Natural law has indeed come to an end. Because it does not consist of norms based on competence and procedural norms and accordingly enforced, it cannot be considered law. But this is not a *failure* of natural law: It is rather a success. In undifferentiated legal systems of times past, natural law contained principles of good law. The 19th century has realized its formal principles and has given law a predictable and stable form. The theory with which to reflect this form was legal positivism. It was a reductionist theory insofar as it excluded as unscientific any and all further substantive questions concerning the justice of law. And yet human beings want just laws. Moreover, democratically legitimized framers and legislators will try to give flesh to that claim to justice. They did so in postwar Germany in the framing of constitutions and in other laws. This is the success of natural

law: It does not float freely above positive law, demanding its own realization. Instead, it has been embodied in the law—in constitutions and declarations of rights. Only now can positivism be an appropriate method for understanding the law, once natural law has become positive. To that extent, natural law is no longer reductionist. Natural law theory and legal positivism share the view that law is a given entity. At the same time, they both neglect to a certain extent that it is also a product of interpretation. Thus, not only natural law but also positivism shifts from the concept of a given law to a hermeneutics of law. The determination of the weight of hermeneutics is a different topic, however.[33] The law-related aspects of morality can now be discussed more freely in disciplines other than law, such as ethics and moral philosophy.[34]

[33] One approach can be found in A. Kaufmann 1975, 337ff. For a linguistic approach, see Christensen and Sokolowski 1999, 15ff.

[34] The Catholic philosopher Spaemann holds that "natural law today cannot be understood as a catalogue of norms, a kind of meta-constitution. It is rather a mode of thought, one that critically revises all legitimation of action" (Spaemann 1973, 276; my translation).

Chapter 3

20TH-CENTURY PHILOSOPHY OF NATURAL LAW IN FRANCE

by Stamatios Tzitzis and Guillaume Bernard

3.1. Introduction

Twentieth-century natural law theory in France can be described as having two faces: On the one hand there have been few authors of consequence (though they did commit a few words to paper), but on the other hand they counted among their number some jurists who have made significant contributions to that subject matter. On the whole, the 20th century was marked by the prevalence of legal positivism, this for two reasons: there was an initial hostility between lawyers of domestic law and legal philosophy (the latter discipline is regarded as subordinate at law schools in France and is even frowned upon by legal historians); and, in addition, there has been much ignorance surrounding natural law, which is generally confused with the general principles of law (based on reason) as well as with a theologically oriented metaphysical law (comparable to the moral law).

However, the contemporary French legal system does not exclude the idea of natural law. By reason of the ideology of human rights, natural law is itself by and large locked into submission, especially after the *Liberté d'association* opinion the French Constitutional Council rendered on July 16, 1971. Indeed, under this decision the 1789 *Déclaration des droits de l'homme et du citoyen* and the Preamble to the 1946 Constitution were recognized as authoritative sources of law, giving rise to what has come to be called the "constitutional core". At bottom, French positive law is a combination of legal positivism and modern natural law, the latter serving as a basis on which to legitimize the former or criticize its provisions.

So it is an ambivalent place that natural law occupies in the French legal system. And that may explain why the doctrines originating from the notion of natural law and its role in the system are reduced to the notion of the rights attributed to humans (the inalienable rights enshrined in the *Déclaration des droits de l'homme*). Nature is reduced to human nature and, under the influence of neo-Kantianism, the latter is returned to what is thought to be its noblest expression: reason. "Official" natural law thus comes down to a rationalist law.

So there exists a twofold phenomenon: on the one hand there is the underlying existence of natural law (making it possible to find certain legislative provisions unconstitutional and, as a general rule, contrary to the natural rights of man), but at the same time natural law is excluded from playing any role in

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_31

positive legal production. Consequently, once we move outside the sphere of human rights, natural law vanishes from the positive legal order, surviving only thanks to the theoretical work of lawyers or philosophers. However, through a series of perfunctory readings of Plato, Aristotle, Cicero, and other authors who in antiquity wrote on the philosophy of law, natural law has come to be misunderstood in a variety of ways, holding back the effort to arrive at a rigorous conception of it. Many authors in France have taken old philosophical doctrines as their starting point but tried to explain them using modern concepts. That led many to confuse law and morals, and in particular natural law (*jus naturale*) and the moral law (*lex naturalis*).

3.2. Eclectic Natural Law: An Outcome of Sociology

Natural law reached its heyday in the 18th century within a contractarian framework and reached its apex with the 1789 *Déclaration des droits de l'homme*, recognizing rights as attributes of human nature. These rights were identified by reason: They were in this sense rationalist rights, even though they were not called by that name. Rights in the 19th century, after the French Revolution, were grounded in statutory law, in principle an expression of the general will, but more plausibly of the parliament, which is supposed to embody national sovereignty. The stature of the judge was reduced to that of "a mouth pronouncing the words of the law" (*une bouche prononçant les paroles de la loi*), as Montesquieu famously said—whence the rule under Article 5 of the French Code Civil, barring judges from deciding cases by way of general or regulatory provisions.[1] Likewise, jurists were generally bound to confine themselves to analysing the law in a strict literal sense.

Also, there emerged a theory of natural law in reaction to the exegetic method (see Bonnecase 1924, 1933), which dominated in the 19th century, then waned, and then made a comeback as the 19th century rolled over into the 20th. However, there is not much to be said for this reaction: Its proponents simply defended a view of natural law with variable contents. This natural law was thus eclectic, in the sense that multiple sources were combined in fleshing it out, even though it remained rooted in the modern legal conception, which grounded natural law in human nature and its reason. Still, this natural law was no longer the completely unchanging, unrealistic scheme envisaged by the supposedly universal natural law of the 18th century: It was dynamic and sought to be realistic, expressing above all the historical order of societies (and their progress). Sometimes influenced by the German historical school, this natural law carried sociological overtones. These principles formed

[1] Art. 5: "Judges may not issue general and regulatory provisions in deciding the cases brought before them" (my translation). The French original: "Il est défendu aux juges de prononcer par voie de disposition générale et réglementaire sur les causes qui leurs ont soumises."

the basis on which all the authors who defended natural law proceeded to lay out their conceptions, but when it came to filling that natural law with content, they each took their own direction.

The exegetical method was criticized by Raymond Saleilles (1855–1912) for the interpretive ossification it entailed. Saleilles (who was also critical of Savigny and the historical school) viewed law and history as two elements of sociology, which in turn he conceived in the manner of Gabriel Tarde (1843–1904). Saleilles considered the natural lawyers' abstract individualism a thing of the past, and in its place he defended realist conceptions of moral personality on the basis of rights informed by social considerations (see Saleilles 1910). Following in Saleilles's footsteps, but more radical in outlook, was François Gény (1861–1959), who was influenced by German thought and defended a naturalist eclecticism, a "reasoned syncretism" combining Kant and Bergson.[2] Gény in turn influenced Julien Bonnecase (1878–1950), whose natural law (see Villey 1963) consisted in the immutable precepts of reason (on a secular understanding of that concept). Natural law was *given*, very much the opposite of the Aristotelian-Thomist conception of natural law as a quest for justice: For Bonnecase, natural law was a code of norms replicating those of positive law (see Gény 1919, 1914–1924).

Another natural lawyer was Maurice Hauriou (1856–1929), influenced at the same time by sociology and by a scientistic approach to law.[3] Hauriou viewed natural law against a Christian Thomist background, and his political views were close to those that drove the French political and religious movement known as Le Sillon.[4] He can be described as a neo-Thomist positivist: His natural law was not set in contrast to positive law but was an ideal that could progressively be realized through the work of the jurists. Law existed as a composite of social order and justice (see Hauriou 1896, 1919, 1923). Hauriou in turn influenced Georges Renard (1876–1943), who was a member of Le Sillon but then left the movement, and after the death of his wife (François Gény's sister) he became a Dominican.[5] He refused to reduce law to the norms enacted by the state. So he embraced natural law, which he conceived as an eternal principle, but amenable to change in its historical applications. Whence his understanding of positive law as the adaptation of natural law to particular cases. So, in his view, positive law was defined by natural law, the latter embodying order, the former justice (see Renard 1928, 1939).

[2] On Gény see Section 12.5 in Tome 1 of this volume.

[3] On Hauriou see also Section 1.1.4.2. in this tome and Section 12.2 in Tome 1 of this volume.

[4] This movement, founded by Marc Sangnier (1873–1950), lasted from 1894 to 1910 and sought to provide an alternative to the anticlerical left by forging a closer alliance between Catholicism and republican ideal.

[5] On Renard see Section 1.1.4.2. in this tome.

3.3. A Moralizing Natural Law: An Outcome of Transcendence

Once a breach into positivism was opened, certain authors quickly noted that there existed *moral* obligations beyond the legal ones of social life. And so it came to be that natural law was assimilated to the moral law. The philosophy behind this moralizing natural law was illustrated by jurists and philosophers alike, the most prominent among whom was Jacques Maritain (1882–1973).[6] In this framework (see Thieulloy 2005, 2006, Villey 1974a), Maritain assimilated natural law to the moral law, itself understood as an expression of the divine law. Wittingly or not, these authors went back to the conception of natural law expounded in Cicero's *De re publica*, in such a way as to fashion a kind of Christian Stoicism. This current helped to lend credence to the idea that a Catholic ethic could not be separated from a natural law conception of the world. But in assimilating natural law to the moral law, these authors wound up rallying in defence of individual rights. Maritain thus went to the point of seeing in the character of Antigone a precursor of the human rights champion!

Even here different thinkers filled their natural law with disparate contents. Joseph Charmont (1859–1922) was a staunch defender of human rights. Influenced by the sociological method, he viewed natural law as a means with which to counteract the lawmaker's immorality (see Charmont 1910). Proceeding from opposite political ideas, and in reaction to positivist scientism, Louis Le Fur (1870–1943) defended the teaching of legal philosophy: In 1931, he was among the founders of the *Archives de philosophie du droit et de sociologie juridique* (Archives of legal philosophy and legal sociology). Moreover, he took part in the movement to revive natural law: Influenced by the second Spanish Scholastics, he developed a conception of *jus gentium* (international law) based on the moral rules (see Le Fur 1937).

Tancrède Rothe (1851–1935) defended a highly theological natural law: Any positive legal rule was subordinated to natural law, in turn conceived as the work of God and the source of all authority. For this author, just as positive law was to be understood as the complex of all positive laws, so natural law was the sum total of all moral laws (see Rothe 1885–1912).

Another of these thinkers was the Protestant Jacques Ellul (1912–1994): Initially influenced by the personalism advocated by Emmanuel Mounier (1905–1950), he would later move away from that conception to espouse a theological approach to law (see Ellul 1946). More recently, the Dominican friar Philippe-Ignace André-Vincent (1911–1986) defended a doctrine of natural law influenced by Stoicism and the second Spanish Scholastics, giving it a marked theological inflection (see André-Vincent 1971, 1974, 1976).

[6] On Maritain see also Section 1.3.2 in this tome.

Definitely less individualistic was the work done in the two decades from 1950 to 1970 by the members of the *Cité Catholique* (Catholic city), at that time a branch of the *Office international des œuvres de formations civiques et d'action doctrinale selon le droit naturel et chrétien* (International office for civic training and doctrinal action according to natural and Christian law), who put forward a doctrine of natural law in which the sacred and the clerical come together to form a sacerdotal movement whose fountainhead was Jean Ousset (1914–1994) (see Ousset 1959).

Even more recently, a group of jurists have attempted to rest law on a moral foundation by invoking a transcendent natural law. This is the route taken, for example, by Yvonne Bongert (1921–2012), who imparts a strong Augustinian flavour to his project (see Bongert 1982, 2003). A similar approach is the one the two criminal jurists Jean Pradel and Jacques-Henri Robert have taken in addressing questions of sexual ethics, for they have not hesitated to see in "natural morals" (*la morale naturelle*) the foundation of all law (see Pradel 2006 and Robert 2007). On this conception, the jurist may not render any judgment or express any view contrary to the physical integrity and morals of the human person. Natural law gives humans a *metaphysical* status underlying their legal status, and that gives them a right to life. This conflation between law and morals is pervasive in the French debate on bioethical issues. Thus part of Catholic thought (especially after the Second Vatican Council, 1962–1965) set out to defend individual rights to support the unprotected (unborn children, the dying), not by reason of their innocence but in virtue of their intrinsic dignity. This has given rise to a phenomenon analyzed by Anne-Claire Aune (2007), arguing that in this way these thinkers have facilitated a haphazard multiplication of individual rights, and not necessarily in a way consistent with Christian morals.

All told, this theological natural law was at once markedly voluntarist (conceived as an expression of divine will) and rationalist: On the model of Ciceronian Stoicism, natural law was conceived as a reason immanent in nature and discoverable by human reason. In the end, all these authors, progressive and conservative alike, found themselves trapped in the very conception they sought to defeat, namely, legal positivism, in that the natural law they proffered for humans resolved itself into God's *posited* law. Altogether different was the classical conception of natural law, on which positive law was just an instrument with which natural law could enact justice. As is stated in the Justininian Digest: *Non ex regula jus sumatur, sed ex jure quod est, regula fiat* (The law is not derived from rules, but rules are from the law: *D.*, 50, 17, 1).

3.4. Objective Natural Law: An Outcome of Dialectics

The philosophy of traditional natural law consisted in a return to an Aristotelian-Thomist conception of law as an objective thing attributed to a person

(*persona*).[7] This sort of investigation has been reprised by two professors at the Sorbonne, Claude Polin and Claude Rousseau, who do so by defending an idea of natural sociability (see Polin and Rousseau 1981). But even before that time it was Michel Villey (1914–1988) who revived the same current of thought with the help of his two closest collaborators: Guy Augé (1938–1994) and François Vallançon (1943–) (see Augé 2000, Vallançon 1998, 2012).[8]

Initially, Michel Villey (1962, 1969, 1987) sought to clarify the history of law by drawing on philosophical sources: Aristotle for an account of praetorian law in ancient Rome, while medieval law and the justice of kingly rule he analyzed in light of Thomas Aquinas. Later on, Villey laid out the various conceptions of natural law (see Villey 1961a, 1961b, Augé 1998, 2005), arguing for the superiority of the traditional method of particular justice (see Villey 2001). He thus proceeded from an Aristotelian-Thomist account of natural law, showing it to be topical and drawing a distinction between general justice (moral virtue) and particular justice (concerning individual rights). Here, too, the Digest also becomes a relevant source: *Justitia est constans et perpetua voluntas jus suum cuique tribuendi* (Justice lies in the constant and perpetual commitment to give everyone their due: *D.*, 1, 1, 10). Justice depends on the will and is embodied in behaviour: It is a matter to be worked out within morals. Law, for its part, is what ascribes to each that which they deserve (*dignitas*).

Aristotelian political justice—*dikaion politikon*, or what is right under the law—cannot be constrained within the formalities of a statutory provision. It is linked neither to nature nor to human reason, and so it must be discovered in the nature of things. It requires judicial prudence, or the judge's ability to make use of reason and the laws. It is in this sense that traditional natural law can be described as objective. It is not based on any Platonic metaphysics that locates justice (*dikaion physicon*) in an eternal idea beyond the world of experience: The art of the wise lawmaker consists in copying this model by applying it to human affairs. Villey showed that traditional natural law is to be sought in interpersonal relationships. The jurist's task is to find the right of apportionment things, this starting from things themselves and within their framework. Law is a reality existing apart from humans: It extends beyond human interiority; it is a "thing," a good proportion; it is discovered through the art of dialectics. The truth of law lies in justice and not in the statutes, which are only a tool in the service of justice. The relation between law and the statutes in traditional thought on law can be summarized as follows: The statutes (posited law) are imposed, while law (that which is just) is discovered; the statutes command, while law points us in the right direction (see Villey 1974b). So Villey

[7] See, in particular, Aristotle (*Nicomachean Ethics*, V, 5, 1130 b; V, 6, 1131 a; V, 7, 1131 b, 1132 a) and Thomas Aquinas (*Summa Theologiae*, II-II, 61, 1–2).

[8] On Villey see also Section 1.3.3.4 in this tome and Section 12.6 in Tome 1 of this volume.

did not set natural law against positive law as a product of culture: He embraced the ancient Greek conception of culture as part of the natural order. Positive law accordingly does not fall under the oversight of natural law, as it would on a moralizing conception of natural law, but is rather part and parcel of the latter.

Traditional philosophy of law draws a distinction between the moral law (or moral command) and natural law (concerned with allotting resources on the basis of merit). It emphasizes that morals and religion are closely bound up (the moral law is subjective, an outcome of an act of will): Morals and law must be distinguished—*Non omne quod licet honestum est* (Not all that is allowed is honest: *D.*, 50, 17, 144)—since the former is about *being*, the latter about *having*; the former makes certain behaviours *mandatory*, while the latter passes *judgment* on those behaviours. But the use of the moral law in the legal domain ushers in individual rights (see Bastit 1990). But Villey (1976b and 2003) also criticized modern thought on law and the dominance of individual rights (see Villey 2008, Augé 1993).

A variety of authors working at different faculties and in different ideological currents continue to take an interest Villey's work. This is particularly true of Garcin (1985), but others include Niort and Vannier (2000), Bauzon (2003), Campagna (2004), and Bauzon and Delsol (2007). Likewise, in 1991, the journal *Persona y Derecho* (based at the University of Navarre in Pamplona, Spain) devoted a special issue to Villey (vol. 25, issue 2) under the title *Escritos en memoria de Michel Villey* (Writings in memory of Michel Villey), and in 1999, the journal *Droits* (vol. 29) published a selection of the speeches delivered at a conference on Michel Villey held on February 13, 1998, at the University of Paris II. Finally, two eminent members of the *Institut de France*, François Terré and Chantal Delsol, head the *Association des Amis de Michel Villey*.

3.5. Conclusion: The Ineffectualness of Natural Law?

Natural law has always interested thinkers of Catholic persuasion more so than others (See Arabeyre et al. 2007, Audren 2008), and there is little doubt that no one today apart from Christian authors is still committed to showing its significance and topicality (See Tzitzis 1999, 2004, P. Simon 2006). For this reason we can only point out the publications put out by the *Confédération des Juristes Catholiques de France* (Confederation of the Catholic lawyers of France) at the initiative of Professors Joël-Benoît d'Onorio and Jean-Michel Lemoyne de Forges (See D'Onorio 1986, 1989, 1994, 1997, Eid and Rassat 1988, and Morange 2002). Noteworthy in this series of publications are the works by Professor Alain Sériaux (1988, 1993, 1999).

Villey no longer has much of a following today. However, the current that does authentically carry on his work stands as an exception in 20th-century France, for in all other cases natural law theory has itself unwittingly recog-

nized the principles of modern natural law it is a prisoner of. Its criticism of modernity thus appears ineffective. Indeed, research in this area is quite poor, so much so that the philosophy of law is regarded as a subject matter of lesser significance, and when it is taught, it is more often than not pejoratively reduced to a "theory" of law (see Brimo 1967, Morvan 2012).

Chapter 4

20TH-CENTURY NATURAL LAW THEORY IN SPAIN AND PORTUGAL

by Antonio-Enrique Pérez Luño

4.1. Method, Scope, and Philosophical Criteria

Designing an overarching approach to the current landscape of natural law theory in Spain and Portugal is no easy task. Traditionally, theologians, philosophers, sociologists, and lawyers have shown an interest in this area over the centuries and have thus put out abundant literature that makes any attempt to capture that complexity a tall order. On the other hand, the undeniable plurality of approaches to natural law in Spain and Portugal makes it appropriate to adopt the open and flexible rationale that Enrico Pattaro suggests in presenting his *Legal Philosophical Library* (Faralli and Pattaro 1980, 17).

In view of the breadth and heterogeneity of natural law theories in Spain and Portugal, drawing sharp and aprioristic distinctions may be useful for partial research projects, but it would be inadequate to the overall aim and scope of in this discussion, which calls for an essentially descriptive approach, though not without offering personal viewpoints when that seems unavoidable. Then, too, these boundaries mean that the thinkers, issues, and theories concerned cannot be discussed exhaustively.

A further comment is in order in regard to some basic methodological foundations for this discussion. Bearing in mind that it is the *current* philosophical and legal panorama that this contribution attempts to describe, it seems advisable to consider theories as something alive, in-the-making, so to speak, thus refraining from drawing any wall of separation among well-established and unalterable doctrinal conceptions. Scholars attempting a historical study of their present time must inevitably engage in some form of *ursprüngliche Geschichte* (original history), in its Hegelian meaning: On the one hand, scholars reconstructing their own time must rely on direct experience, looking at it closely as both actors and chroniclers of the reality they are describing, but at the same time they lack the perspective that only distance can afford.

One final caveat. Although the subject matter covered in this contribution is marked by some shared historical and cultural features that make it possible to bring Spanish and Portuguese natural law theories under a single umbrella, it would certainly be a mistake to take an undifferentiated approach to these two traditions, which have their own histories and peculiarities. Consequently, the formative era of these two traditions, when the interchange of ideas and approaches was more intense, will be treated jointly, while the 20th century, where the differences are more significant, warrants separate treatments.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_32

4.2. Natural Law in the Spanish and Portuguese Traditions

The institutional study of natural law in Spain can be said to coincide with the 1228 founding of the oldest Spanish university, in Salamanca, where the *ius commune*, civil law, and canon law became a focus of study prompted by deep theological, philosophical, and political concerns. At the same time, a whole range of moral, political, and legal questions that now fall within the scope of *legal* philosophy were addressed on an Aristotelian approach in courses on *philosophia practica*. For a long period, there was instead little interest in positive law. This fact did not escape Perelman's (1975, 5) notice, who remarked that the famous library at the University of Salamanca devotes little space to classical works on Spanish law, while works of theology, moral philosophy, and natural law abound.

From the beginning of the 15th century, and especially during the 16th and 17th centuries, scholars in the so-called *Escuela de Salamanca* (Salamanca school), also more broadly known as *Clásicos españoles del derecho natural* (classical natural lawyers of Spain), produced a copious body of literature collected under the titles *De Justitia et iure* and *De legibus*, which can offer an understanding of the configuration of modern natural law.

A similar role in the spread of philosophical and legal thought in Portugal was played by the University of Coimbra, which gained prominence much like the University of Salamanca in Spain. In the Renaissance era, cultural relations between these two countries were intense, and the theses advanced by the classical natural lawyers of Spain found an eager reception in Portugal.

With the 18th century came an era of decline in the study of natural law—a reflection of the profound economic, social, and political crisis that Spain was going through at that time. The Portuguese universities were not affected as hard by the crisis, thanks to the policies that Marqués de Pombal enacted looking to the European Enlightenment model. By the end of the century, Spain likewise had initiated an Enlightenment movement under King Carlos III. In this period, Portugal and Spain saw the uptake of rationalist versions of natural law, which became especially widespread in the so-called *Escuela Iluminista Salmantina* (Salamanca Enlightenment school). The Enlightenment spirit breathed fresh air into the Salamanca academic establishment, which had become corrupt and was indulging in fruitless exercises. In the study of law, this intellectual rejuvenation was facilitated by the emergence of a deep interest in the study of *Ius Naturae et gentium* (natural and international law) which started to be taught at the *Reales Estudios de Madrid* and later at the Universities of Valencia, Granada, and Zaragoza. No special chair or professorship was established in Salamanca, but the discipline was cultivated as a part of other subjects.

In the 19th century, the institutional introduction of natural law as an academic discipline became a main point of contention within the ideological

controversy between liberals and traditionalists at the university. At the beginning of that century, liberal ideology promoted the establishment of chairs of natural law at the law schools, with syllabuses inspired by rationalism and contractarianism, thus opposing the philosophy schools' conservative and traditionalist tendency to defend a merely Scholastic study of natural law. The influence and spread of German idealism contributed to reviving natural law theories. Some local peculiarity needs to be noted, since the idealist scholar who drew the most interest was Krause (1781–1823), not the great masters of idealism, like Kant, Hegel, and Fichte. The spread of legal historicism and philosophical positivism led to a gradual decline of natural law theory, which by the end of the 19th century had definitely fallen out of favour (see Pérez Luño 2007, Truyol y Serra 2004).

4.3. Natural Law Scholars and Tendencies in the 20th Century

The 20th century saw the birth and development of the main trends and philosophical movements that still prevail. We cannot here enter into a thorough analysis of 20th-century works and doctrines. Instead, we will attempt a summary, describing the cultural horizon enveloping the reflection on natural law that flourished in Spain in the 20th century. The different theoretical positions and research topics will be grouped under three trends: legal naturalism, resting on Neokantian and axiological bases; neo-Scholastic natural law theory; and, finally, those versions of natural law that take an innovative, vitalist, and experiential approach. Several doctrines developed in legal theory and philosophy in the 20th century that built on the different varieties of natural law. That the majority of philosophers can be ascribed to natural law should not be taken to mean that they all espoused the same *concept* of natural law or that this concept should be understood and defined in a uniform way. In fact, natural lawyers in the 20th century make up a highly heterogeneous conceptual landscape. The frequently denounced multivocality and equivocalness of natural law is solidly borne out by this variety of natural law theories, no matter how widespread or preponderant any single version may have been. Hence the need to set out some theoretical distinctions in approaching this broad philosophical current.

4.3.1. Axiological and Neo-Kantian Approaches

In addressing the situation of natural law in Spain before the Spanish Civil War, which broke out in 1936, reference needs to be made to a group of scholars who studied some of the most influential movements in legal philosophy in the first half of the 20th century, looking to give them widespread circulation across Spain. These scholars tried to rest their natural law conceptions on bases other than those on which were built the 19th-century neo-Scholastic

and Krausist doctrines that then prevailed in legal philosophy outside Spain. In most cases, this new foundation for natural law was developed taking axiological and neo-Kantian approaches.[1]

Among the most significant advocates of neo-Kantianism was Adolfo Bonilla San Martín (1875–1926), according to whom there are two basic elements to any legal rule, namely, its content and its form, the former being established by experience, the latter instead being *a priori*. So-called natural law can only be a study of the *a priori* forms of legal experience, a sort of legal logic, a specific formal normative structure with no concrete subject or content of any kind (see Bonilla San Martín 1897).

A higher degree of fidelity to neo-Kantianism can be found in the works of Francisco Rivera Pastor and Wenceslao Roces, both of whom were especially influenced by Stammler but found his formalism excessive, so they liberally drew on other philosophical theories in order to mitigate that formalism. Wenceslao Roces (1897–1992) played a decisive role in spreading neo-Kantian legal philosophy in Spain through his exemplary translations of the main works of Radbruch and in particular of Stammler. Francisco Rivera Pastor (1878–1936) wrote some important studies on the legal application of Kantian thought: These include his essays *Algunas notas sobre la idea kantiana del derecho natural* (Some notes on the Kantian idea of natural law) and *La razón pura en sí misma y como fundamento del derecho* (Pure reason by itself and as a foundation for law). His most ambitious attempt to bring Kantian, or rather neo-Kantian, ideas to bear on the legal realm was his monograph *Lógica de la libertad* (The logic of freedom: Rivera Pastor 1913), a work whose main purpose lies precisely in reframing the basic concepts and categories of legal theory from a neo-Kantian natural law perspective. The influence of Radbruch and Stammler can be appreciated in Rivera Pastor's effort to move beyond Kantian formalism.[2]

4.3.2. Neo-Scholastic Natural Law Doctrines

Most neo-Scholastic natural law doctrines were developed after the end of the Civil War, a period in which they reached a position of almost absolute predominance among the legal philosophers of the time. These theories referred to or drew on classical sources, particularly those of the Spanish school. There were nonetheless attempts at assimilating the main contemporary Catholic natural law trends, the effort in most cases being to make the new theories more or less flexibly compatible with traditional thought.

[1] On neo-Kantianism in general see Chapter 1 in Tome 1 of this volume.

[2] On Stammler see Section 1.1.3.1 in this tome and Section 1.3 in Tome 1 of this volume. On Radbruch see Section 1.1.3.2, Chapter 2, and Section 9.1 in this tome, and Section 10.2.2 in Tome 1 of this volume.

One of the most significant centres for the study of natural law theory was created in the early decades of the 20th century at the University of Zaragoza around the figure of Luis Mendizábal Martín. Among his disciples was his own son, Alfredo Mendizábal Villalba, as well as Miguel Sancho Izquierdo, Enrique Luño Peña, and (at the beginning of his academic career) Luis Legaz Lacambra.

This is a group of scholars that in the 1970s I suggested we refer to as the Aragonese school of natural law, and even though they were committed to neo-Thomism, were also influenced by the neo-Kantian legal philosophy of Stammler and Radbruch, and most importantly by that of Giorgio Del Vecchio.[3]

Luis Mendizábal Martín (1859–1931) acted as a liaison between the 19th-century treatises and the natural law pursued in the early 20th century. His works—from the 1890 *Elementos de derecho natural* (Elements of natural law: 1905) to the *Tratado de derecho natural* (Treatise of natural law: Mendizábal Martín 1928), which went through seven editions, the last one reelaborated by his son, Alfredo Mendizábal Villalba (1897–1981)—represent at the same time the hindmost example of the ways and concerns of 19th-century natural law and an opening to the new horizons and problems the discipline was turning to at the beginning of the following century. Mendizábal Martín defined natural law as law enacted by proper reasoning on the basis of facts and of divine law. His conception of natural law does not rigidify into an inflexible system, nor is it incapable of taking historical circumstances into account; rather, taking an approach to natural law then widely accepted among Hispanic scholars, Mendizábal conceived natural law as a reality in tension with the requirements of daily life.

Mendizábal Martín's disciples, Miguel Sancho Izquierdo (1890–1988) and Enrique Luño Peña (1900–1985), followed the philosophical guidelines established by their teacher in structuring their treatises on natural law. They both proceeded from the idea of order, and on this basis they set out the relations between the moral and the legal order. The latter is determined by an aim that acts as its regulating principle and consists in the notion of the common good in its strictest Thomist sense. Following the doctrine of the Salamanca school, Luño Peña argued for the need to concretize the primary principles of natural law, that is, to deduce consequences from natural law and project those consequences onto the sphere of practical and historical situations. This deductive method was implemented by way of necessary conclusions and approximate determinations. In addressing the relationship between law and morals, he summarized the Salamanca school theses by putting forward the idea that these two normative realms of human conduct ought to be conceived as related by a union without unity and a distinction without separation (see Luño Peña 1968, Mendizábal Martín 1928, Mendizábal Villalba 1925, Sancho Izquierdo 1955).

[3] On Del Vecchio see Section 1.1.3.1. in this tome and Section 11.2.1 in Tome 1 of this volume.

As concerns the first half of the 20th century, mention should be made of the works of Fernando Pérez Bueno (1877–1934), who taught at the University of Madrid and earned his Ph.D. from the Collegio di Spagna in Bologna in 1902, defending a dissertation titled *Breve esposizione delle dottrine etico-giuridiche di Antonio Rosmini* (A brief exposition of Antonio Rosmini's ethico-legal doctrines). He was the main advocate of Rosminian thought in Spain, especially with his book *Rosmini: Doctrinas* ético-jurídicas (Rosmini's ethico-legal doctrines: Pérez Bueno 1919). He professed a natural law inspired by Thomism, but he was also open to other currents, as is evidenced by his interest in sociology and the foundation of human rights. The end of the Civil War marked the beginning of a new phase in the evolution of natural law in Spain. The variety of theoretical directions prior to the 1936–1939 Civil War, reflecting an ideological pluralism, was displaced by the overwhelming supremacy of so-called Catholic natural law, which reigned under Franco's authoritarian regime. The literature on natural law in postwar Spain was highly uniform: Neo-Scholasticism had already enlisted many proponents, and from 1939 onward it became the de facto standard adhered to by virtually every legal philosopher, as well as by most theorists of public or private law. Even scholars with no Thomist background, such as Luis Legaz, Enrique Gómez Arboleya, and Salvador de Lissarrague, produced research in which they showed an interest in natural law and particularly in the Salamanca school. It would clearly be an overstatement to say that the political regime established in Spain by Franco after the Civil War pretended to support a "revival" of Spain's classical natural lawyers. Clearly, the so-called *Movimiento Nacional* (National movement) had some issues of greater urgency to address, culture not being among their primary concerns. But then the context was such that it made sense to use the Salamanca school to political advantage, thus manipulating its teaching in a way that had never been done before. Several reasons can explain this situation, but the primary and most evident one had to do with the international isolation in which Franco's regime found itself after the defeat of both Nazi and Fascist totalitarian regimes. Lacking an *external* political legitimacy in the eyes of contemporary democracies, the dictatorship had no choice but to look for an *internal* legitimation rooted in the past. This phenomenon led to an exacerbated ideological nationalism, fuelled by a distrust and hostility toward anything that could undercut the cultural policies of monolithic unity imposed by the regime. The Salamanca school was therefore chosen as an autochthonous thinking model through which the glories of the lost Empire could be restored.

Among the most representative natural lawyers of the Franco era was Francisco Elías de Tejada (1917–1978), who put forward a Catholic existentialist conception based on the idea that God plays a decisive role in the practical realm, arguing that in this way human agency can be grounded in objective values. One of Elías de Tejada's pupils was Francisco Puy (1936). He edited

and wrote *El Derecho natural Hispánico* (Hispanic natural law: Puy 1973), whose title may be equivocal, since not all the thinkers discussed are Hispanic, nor can they in any strict sense be considered followers of the Salamanca school. But, on the other hand, some of the most significant contemporary trends in Spanish neo-Scholastic natural law are represented in that work. In strict neo-Scholastic terms, Puy summarizes the task of legal philosophy as twofold, serving to guide both law and politics according to a transcendental and hence transcending goal, namely, to strive toward the absolute goodness inherent in God—an idea of natural law that can encapsulate the entire conception espoused by this school (see Puy 1973). Another thinker who embraced a strictly neo-Scholastic natural law was Eustaquio Galán (1910–1999), in whose *Ius naturae* (Natural law: Galán 1954) natural law is contended to entail a *iustum* (or just state of affairs) ordained by God or by Nature. Natural law therefore exists as a prepositive law more valuable than positive law, the latter thus having to conform to the former, which accordingly serves as a paradigm or canon.

Another significant figure in contemporary Spanish neo-Scholastic natural law was José Corts Grau (1905–1995), who for a long time served as vice chancellor of the University of Valencia. He made the case for a radical denial of one the core tenets of legal positivism, that of the separation of law and morals. In his *Curso de derecho natural* (A course on natural law: Corts Grau 1970) he defended the view that legal and moral orders cannot be separated, either metaphysically or psychologically. Such a divorce would mean a failure to acknowledge the universal order, or a breakdown in both divine unity and human unity, a denial of our very nature. Moral and legal subjects are the same, and their ends, far from being mutually exclusive, complement and support each other. For this reason morality is regarded by many neo-Scholastic scholars of that time as an end and law as a means by which to fulfil that end. According to Corts Grau (ibid.), to defend a divorce between the moral and the legal order is to attack the dignity of law, since law is rooted in a moral act and not only originates from morality but also inevitably returns to it. José Corts Grau (ibid.) took on the intellectual challenge of introducing new contemporary trends at the core of neo-Scholastic natural law, to this end studying legal institutionalism or existentialism, paying attention in particular to Martin Heidegger.

Natural law in the *classical* tradition, either in its neo-Scholastic version or in some other conceptions linked to Christian philosophy, still holds importance for a considerable group of lecturers and scholars in contemporary Spain. The direct references to neo-Scholastic natural law made in some encyclicals by John XXIII, particularly *Mater et Magistra* and *Pacem in Terris*, as well as the social and political implications of some Vatican II constitutions, which carry unquestionably humanist and democratic overtones, paved the way for a rehabilitation of Christian natural law, making it compatible and

conversant with contemporary culture. Later pontifical and pastoral activities have acquired an ambivalent meaning: Some actions and documents have carried forward the humanist trend just mentioned, while others have been openly involutional, bespeaking an unfortunate misunderstanding of modern values. These two tendencies have influenced the most recent Spanish Catholic natural law, aimed in some cases at bringing natural law up to date, while adopting clearly pre-conciliar approaches in other cases. A wide group of lecturers in legal philosophy from different Spanish universities have resorted to traditional Catholic natural law to argue that positive law must necessarily rest on a moral foundation, placing moral objectivism ahead of moral relativism and deploying these theses to address a range of contemporary moral and political concerns. Issues involving marriage, divorce, abortion, euthanasia, reverse gender discrimination, secularization, and laicism have been treated in a dense literature by scholars like Jesús Ballesteros, Francisco Carpintero, Francisco Contreras Peláez, Francisco José Lorca Navarrete, Alberto Montoro Ballesteros, Andrés Ollero, and Ernesto Vidal, among others.

4.3.3. Innovative Trends in Natural Law

In the final decades of the 20th century some theoretical attitudes offering innovative points of view came on the scene, sometimes even criticizing the hitherto dominant neo-Scholastic natural law. It is true that the main exponents of what I have called the Aragonese school of natural law, as well as some other neo-Scholastic natural lawyers like José Corts Grau, took an open and receptive attitude to some 20th-century philosophical, legal, and sociological trends, such as existentialism, institutionalism, or solidarism, but for subsequent scholars the innovative or critical attitude was central to their understanding of natural law. It is nonetheless important to notice that these innovative and critical formulations were not set *against* natural law: They were rather conceived *within* natural law itself in an attempt to clarify their meaning and adapt their theses to new contexts and concerns.

No diligent scholar trying to understand contemporary Spanish legal philosophy should overlook the fact that two of our most internationally recognized legal philosophers, Luis Legaz Lacambra and Luis Recaséns Siches, shared two basic features: Both were influenced by Ortega y Gasset's *ratio* vitalism in their formative years, and both showed an interest in the experience of law in some of their last and most influential works. While Ruiz Giménez sought to bring institutionalism and *ratio* vitalism closer together, Legaz and Recaséns can be credited with having noticed the similarities between some *ratio* vitalist premises and the philosophy of legal experience.

Luis Legaz Lacambra (1906–1980) elaborated in his early years a concept of law that shows the imprint of two opposing influences: Kelsenean formalism and Ortega's *ratio* vitalism. In the preface to the second edition of his

1961 *Filosofía del derecho* (Philosophy of law: Legaz Lacambra 1961), Legaz explains that he is trying to characterize his conception using a clearer notion of natural law than the usual one, thus giving natural law a central role in his legal theory. Natural law would thus be responsible for concretizing a "point of view on justice," which accounts for the law's valuative dimension. This dimension was understood by Legaz as merely formal in his early years. Not so in the second phase of his thought: Law, he would later claim, is always a "point of view on justice," and natural law must accordingly be the *best* possible point of view on justice—justice in its purest programmatic form (ibid.).

For Luis Recaséns Siches (1903–1977), the object of natural law lies in its axiological dimension (natural law he referred to for some time as *estimativa jurídica*, a study in legal estimation, but he later returned to the traditional label, so as to avoid the logomachy that can arise when two names are used for the same object). Natural law, as he conceived it, is built on ideal objective values from which necessarily valid guidelines are derived. These values belong with human existence, and in particular with specific situations experienced in life. Natural law therefore must not be understood as an expression of facts, since in the realm of being there are good and bad phenomena, fairness and unfairness, convenient and inconvenient facts, virtues and vices, health and illness. Natural law must be understood as a set of normative principles, not as a description of ontological realities: It expresses not an is but an ought, providing what Recaséns Siches calls estimative criteria (see Recaséns Siches 1959, 1983).

Some of the most solid, stimulating, and innovative work in contemporary Spanish natural law is that of Antonio Truyol y Serra (1913–2003), who in the 1950s elaborated a systematic and historical summary of natural law theory. He saw law and morals as two different but interrelated normative realms. This conceptual distinction does not entail the sort of separation alleged by legal positivism. The intertwining of the two orders reaches its most important expression, according to Truyol, in social morality, that is, the part of morality that sets out the duties one has as a member of society (see Truyol y Serra 1950).

An innovative thrust can also be appreciated in the thought and work of Joaquín Ruiz Giménez (1913–2003), who held the chair in legal philosophy at the Complutense University of Madrid. His doctoral dissertation, subsequently published in book form (1944), became a pioneering study in Spanish legal institutionalism. An effort to revivify natural law can also be appreciated in the theses advanced by Mariano Hurtado and José M. Rodríguez Paniagua. The latter offered a suggestive natural law conception based on legal axiology. It is widely recognized among contemporary Spanish scholars that Jose Delgado has played a leading role in critically revising natural law. There are three basic aspects to his innovative attitude. The first lies in his prospective reading of the Salamanca school; the second in his interest in facing one the biggest challenges that contemporary culture poses to classical natural law, that of the historicity of legal concepts; and the third in his effort to resolve the centuries-old

tension between natural law and legal positivism. That is why some of the most solid legal-philosophical constructions of our time (Hart, Rawls, Dworkin, Alexy) are interpreted by him as theoretical attempts at solving the crisis of legal positivism, but without explicitly taking sides with traditional natural law. Also undeniably innovative is the conception of natural law proposed by José Luis López Aranguren, who accepted natural law as making a claim to legality and keeping law open to historical, cultural, political, and social forces. Much influenced by Aranguren's theses, as well as by the teachings of Ruiz Giménez and Peces-Barba, is Eusebio Fernández, who argues for a critical and deontological natural law understood as a set of principles expressing the concerns of public morality and held up as a standard that must inspire and limit positive law (see Pérez Luño 2007).

Jesús Ballesteros (1943–) is considered José Corts Grau's main disciple. He wrote a very meticulous Ph.D. dissertation later published in book form in 1973 under the title *La filosofía jurídica de Giuseppe Capograssi* (The legal philosophy of Giuseppe Capograssi: Ballesteros 1973). In Spain, this work did much to spark an interest in the most important proponent of the Italian conception of the experience of law, Giuseppe Capograssi.[4] Ballesteros offers a natural law interpretation of legal experience according to which legal knowledge is not understood as a sheer external projection of certain logical methods, because knowledge cannot be separated from human action: Law is considered a product of life experience, life itself being regarded as an ethical experience (see Ballesteros 1973, 1984).

The Spanish natural law tradition has drawn on many scholars especially committed to providing a historical approach to natural law. This tradition has weakened of late, but it still brings out some significant contributions. Among those who have developed historiographical reflections within an experience-of-law framework is Francisco Contreras Peláez, who stands out for his valuable work in analyzing Kant and Savigny from the perspective of a natural law and legal philosophy (see Contreras Peláez 2005a, 2005b). In a similar fashion, Fernando Llano Alonso has done significant work on Immanuel Kant's cosmopolitan humanism (see Llano Alonso 1997, 2002). Carlos López Bravo pursues a firm historiographical vocation aimed at studying the sources of natural law, drawing in particular on a thought-provoking critical review of Paul of Tarsus and Isidore of Seville. But his main contribution to natural law historiography lies in his monograph on the philosophy of history and on philosophy and natural law in the work of Giambatista Vico (López Bravo 2003).

I should point out as well my own intellectual experience, which has involved a long-term engagement with these innovations in natural law. Having studied the scholars of the Salamanca school through the teachings of my uncle, Professor Enrique Luño Peña, I never abandoned my interest in their

[4] On Capograssi see Section 1.3.3.1 in this tome and Section 11.3.1 in Tome 1 of this volume.

doctrinal legacy. I have consequently had the chance to write different papers as well as a comprehensive book in which, celebrating the fifth centenary of the discovery of the New World, I tried to renew the *Spanische Naturrechtslehre Forschung* in a threefold fashion: addressing those thinkers or topics that had been neglected or insufficiently investigated; subjecting those doctrines to critical scrutiny by putting them through a "meta-theoretical sieve"; and proposing prospective analyses to explore the contemporary projections of this theoretical legacy (see Pérez Luño 1994). The teachings and stimuli received from other legal philosophers were similarly influential in my attempts to renew natural law. My Ph.D. dissertation, written at the University of Bologna under the direction of Guido Fassò, was defended in 1969. It analyzed the tensions between natural law theory and legal positivism in contemporary Italy. Its Spanish version was published two years later, with a foreword by professor Fassò himself (see Pérez Luño 1971). I then transferred to the University of Freiburg, where I had an opportunity to study under Eric Wolf. In the following years, my contact and scholarly relations with different Spanish and foreign colleagues enabled me to hone my ideas and innovative intentions regarding natural law. With that aim in mind, I have always found it appropriate to distinguish an *ontological*, *dogmatic*, or *radical* natural law—invoking a metaphysically objective order from which absolute and atemporal values can be deduced—from a *deontological, critical*, or *moderate* natural law, which does not deny that unjust positive law counts as law proper but establishes criteria by which to assess that law, thus laying the groundwork for critiquing it and replacing it with a just system. The first sort of natural law I consider incompatible with some important values and exigencies informing our contemporary humanist culture, and for this reason I endorse a rationalist, deontological, and critical natural law. Some have argued that we can grant the existence of values prior to positive law and not aligned with natural law in any way, so long as they are kept in a moral or social realm but not a legal one. I cannot share this position, because it seems quite paradoxical that legal scholars past and present should maintain that the criteria for identifying proper or correct law are not legal. This attitude finds no equivalent in epistemology, where no one would argue that the criteria on which basis to tell truth from falsity should be *logical* criteria; or in aesthetics, where one would doubt that the criteria on which basis to tell beauty from ugliness are aesthetic criteria; or in ethics, where no one would characterize as nonmoral the criteria on which basis to tell good from evil (see Pérez Luño 2006).

4.4. Natural Law in Private Law

The spread of natural law under Franco's regime was not confined to the legal-philosophical sphere: It also reached some other relevant areas in the life of the law, affecting in particular the methodological attitudes of scholars specialising

in private law.[5] The methodological incidence of natural law expressed itself as an attempt to overcome formalism, thus grounding the interpretation and application of law in valuative premises, which at that time would have rested on neo-Scholastic ethical postulates. For Spanish private law scholars of the time, the methodological approach to law would usually have been based on Christian natural law. This fact responded to the belief, set out by the civil law scholar Antonio Hernández Gil (1915–1994), that the highest and most genuine Spanish legal theory could only be grounded in natural law. This tendency was predominant among those legal scholars who studied the basic concepts and concerns of legal theory and method in that historico-cultural context.

According to Hernández Gil, this theoretical option makes it possible to avoid the risky overtly anti-philosophical tendencies embraced by legal scholars in other countries, thus making it possible to move beyond the antagonism that from a natural law perspective has been argued to exist between the philosophical method and the legal one (Hernández Gil 1945).

This approach also inspired the private law scholar Felipe-Clemente de Diego (1886–1945), who thought that method meant order provided that it could serve different human ends, it was rooted in human nature itself, and it found a fundamental explanation in the science of ultimate causes and reasons, that is, in philosophy. That is why this task cannot be merely mechanical, as legal positivism pretends, but requires a valuative stance that maintains an open tension with the needs of legal praxis, an attitude that only a natural law method can foster. For Federico de Castro (1903–1983), positive law always requires justification. This justification is expressed in a scheme of immutable values legitimizing legal claims that respect them while reducing to sheer non-legal arbitrariness any piece of lawmaking that should contradict them. Natural law offers criteria by which to judge positive law, but since human weakness and the morally neutral character of certain acts are such that a positive law fully coinciding with natural law cannot be applied in the world or in the state, the relationship between those criteria and the law needs to be assessed. In keeping with Thomas Aquinas, De Castro argues that human law can be derived from natural law, either *per modum conclusionis*, establishing consequences and specific applications of a general principle of natural law, or *per modum determinationis*, concretizing what has to be done within the scope offered by natural law. Positive law thus operates against the background of the generality or indeterminacy of natural law. The civil law professor and chief justice of the Supreme Court of Spain José Castán Tobeñas (1889–1969) considered it urgent, in our post–Civil War scenario, to follow both Spanish natural law and universal, classical, and modern natural law. In his works he argued that the dictates of natural law derive from the practical need to elaborate and

[5] On legal philosophy in Spain during the Francoist period see also Section 13.4 in Tome 1 of this volume.

interpret our positive law, always created from an ethical perspective, and that these dictates also benefit from the theoretical advantages that classical natural law provides as a fundamentally homogenous doctrine in the history of Western thought, accessible by all and doctrinally and popularly grounded at the same time. This characterization contrasts with those kinds of modern philosophical theories that keep sprouting up and dying without effectively penetrating the soul of society or being fully understood by legal scholars themselves (see Legaz Lacambra 1975, Pérez Luño 2007).

The influence of neo-Scholastic natural law in Spain under Franco was not confined to the scholarly sphere but also had an impact on case law. Most of the court's solemn invocations of natural law, however, were no more than declarations of principle. A cursory glance at our Supreme Court's opinions under Franco in cases involving values and principles of justice and morality may give the impression that judges were making a conscious effort to stay away from the political pressures of the day. But there is actually a trend in the courts' argumentation that insists on the *supra-historical* and *meta-temporal* status of their moral assessments (cf. Pérez Luño 1990, Pérez Ruiz 1987).

4.5. Natural Law and Human Rights

Legal thought cannot exist or be intelligible if considered apart from the political, cultural, and social circumstances that delimit its spatiotemporal context. Theories and works belonging to one historical phase in thinking about natural law cannot be understood independently of a given system of collective experiences. The peculiarities of the topics and perspectives that have characterized Spanish natural law in recent years cannot be understood without an account of the new circumstances that contextualize its development. The political changes that had taken place in our country by the end of the 1970s resulted in the ouster of an authoritarian regime and its replacement with a democratic state fully respectful of the rule of law. This fact has directly and decisively influenced the research and activities done by current legal philosophers. The most important event to have had a decisive impact on Spanish natural law has been, in my opinion, the enactment of the 1978 Constitution. The social and intellectual mobilization the Spanish Constitution brought about also entailed a commitment, a challenge, and a renewed enterprise in research. To many legal philosophers and theorists of my generation, the Constitution has represented a true milestone that has shaken both our status as citizens and our intellectual development. For Spanish legal culture, the enactment of the Constitution marked the beginning of a research venture still in process.

The central role given to fundamental rights in the 1978 Constitution has made them a crucial aspect of our legal culture. In fact, fundamental rights are assigned the task of framing the exercise of public powers and articulating the implementation of the active subjective status of citizens, namely, their facul-

ties and entitlements in relation to the government and public offices. There is a view, espoused on a critical approach to natural law close to the Frankfurt school, that the rights and liberties granted by our current Constitution can be regarded as institutional conduits through which to answer the great aspirations and needs of Spanish society, and in fact it cannot be denied that this has actually been the case. From other perspectives, linked to the liberal natural law tradition, these rights and liberties are instead more aptly explained as implementing the higher values that ground our *Rechtsstaat* (Article 1.1 of Spanish Constitution). There is no doubt that fundamental rights contain an undeniable axiological core and that they evoke this condition by their very name, as can clearly be appreciated in the language of the Spanish Constitution, where it says that "fundamental rights […] are the foundation of political order and social peace" (Article 10.1 of the Spanish Constitution; my translation).[6] Other theses, inspired by natural law conceptions more sensitive to history, have stressed that liberties are "protean" and necessarily responsive to the cultural, social, and economic changes that have recently been witnessed in recent Spanish politics.

Some legal philosophers, like Javier Antuátegui, Rafael de Asís, Gregorio Peces-Barba, Luis Prieto Sanchís, and Gregorio Robles, have attempted to set on a positivist foundation what the French revolutionaries called *droits de l'homme*. But, as I would argue, a foundation conceived in natural law offers a better account of what makes these rights specifically legal. This can be illustrated by looking at the Romance languages, where the same root accounts for both the word *law* (*derecho*, *diritto*, *direito*, *droit*) and the word *rights* (*derechos*, *diritti*, *direitos*, *droits*), offering evidence of a reality at once normative (legal) and moral (right). This suggests that if we are to explain the term *derechos* (rights) in the expression *derechos humanos* (human rights), we will have a much harder time proceeding from positivist premises than from a natural law approach, and the outcome will be much less convincing, too. This is because positivism is a *monist* theory, so it only recognizes *positive* law as legal. From this perspective, talking about natural, human, moral, or prenormative rights as something different from positive law amounts to a *contradictio in terminis*. As a dualist theory of law, natural law theory distinguishes two normative systems: a system of natural law conforming to a complex of values prior to positive law and tasked with grounding, guiding, and critically limiting all legal regulation, and a system of positive law established and enforced through the binding force of those who hold power in society. Human or natural rights have a deontic status different from that of positive rights but are not independent of them, because every natural right tends to be positivized, and every positive right must adhere to natural law if it is to make a claim to fairness.

[6] The Spanish original: "los derechos fundamentales […] son fundamento del orden político y la paz social."

Natural law has served the persistent historical function of limiting power. On the premise that the civic consciousness is pervaded with the idea that inherent in the human being are values that no political authority can breach, modern natural lawyers have given human rights a rationale that cannot be discarded without at the same time undermining their foundation. The attempts made over the course of history to offer a positivist alternative to the natural law conception of human rights have inevitably led to compromising their political effectiveness. One need only think here of the 19th-century conceit of "subjective public rights" and how important a role they came to play at the time: They were devised by the German public law school as a replacement for the idea of natural rights as liberties enjoyed by citizens vis-à-vis their government, but the premise was that this would happen through the introduction of a subjective status dependent on the government's self-limitation. We should recall, with Antonio Truyol y Serra, that this way of understanding rights emerged in response to the problem of the legal status of international law, meaning that this law could not be recognized as law proper if conceived as merely built on the "will of the states," more as a set of moral or courtesy rules followed by nations (the *comitas gentium*, or comity of nations) than as an actual system of law (see Truyol y Serra 1968, Ballesteros 1992, De Castro Cid 1982, Fernández García 1984, Pérez Luño 2005, and Vidal Gil 2002).

The natural law foundation of human rights has also come up in connection with important concerns of the present day, such as the impact the new technologies have on law, or the quality of life in relation to the environment, or the risks that biotechnology poses to citizen's rights.

The study of the legal ramifications of the new technologies has sparked a growing interest among legal philosophers and theorists in Spain. Ortega calls this "the issue of our time," which could not but draw the attention of natural lawyers, just as it has involved the main areas of legal research in developed countries. In recent decades, the conceptual and textual universe of legal scholars has seen a profound and radical change with the transformation of the cultural, political, and economic premises experienced in contemporary technological societies. English-speaking countries might want to devote greater attention to the phenomenon that in Spain has been termed *contaminación de las libertades* (polluting the freedoms), referring to the new forms of breach that rights and liberties are subject to with the indiscriminate use of communications technology, and in particular the Internet (see Garriga Domínguez 1999, Pérez Luño 1976, 2004).

Human rights in the present day demand an adequate sensitivity to the "ecological paradigm" on the part of jurists and legal philosophers and theorists working in the natural law tradition. This requires a critical reflective attitude, assuming the responsibilities deriving from the new challenges and issues that environmental threats pose in the economic, social, political, and legal spheres. It stands as an unavoidable task for legal practitioners and theorists

alike to strive to improve the quality of life and guarantee a balanced and sustainable development and biodiversity (see Ballesteros 1995 and Bellver 1994).

Natural law has also shown itself to be a topical approach by taking an interest in what biomedicine, bioethics, and biotechnology entail for human rights. This is a research area closely bound up with the social and legal repercussions of the new technologies, an area in which the question of the quality of life emerges with its own significance. Hence the interdisciplinarity of this field. Human dignity, identity, and privacy are values and rights that from a natural law perspective must be protected before certain biotechnological investigations can proceed. The notion of human nature—a core aspect in the natural law tradition—takes on a new topicality and urgency in light of current bioethical issues (cf. Ballesteros and Fernández 2007, Marcos del Cano 2004).

4.6. 20th-Century Natural Law Theories in Portugal

It was previously mentioned that positivism gained a foothold in Portuguese legal culture in the last part of the 19th century, and in the beginning of the 20th century this trend continued and grew stronger. The spread of a positivist and scientist mentality contributed to a decline of natural law, so much so that the study of this discipline became relegated to seminaries and theology faculties. Several circumstances can explain this situation, three of which are as follows.

The first is the creation of a law school in Lisbon in 1913. This academic centre was founded from the outset as a lay and republican alternative to the conservative and traditional old Coimbra School of Law. The new Lisbon School of Law had no place for the natural law tradition, which was considered a carryover from a past incompatible with the open and progressive mentality that jurists-in-training were encouraged to develop. The innovation fostered at this new law school soon also spurred a drive for renewal at the old Coimbra School of Law, whose lecturers were unwilling to ignore the call for modernization.

The second circumstance lies in the spread of a legal method based on commenting and elaborating on legal rules, a method begun at the Lisbon School of Law and shortly thereafter taken up at Coimbra as well. The main feature of this method consists in its drawing on the French exegetical school. Much less influential were other approaches to legal positivism, like German legal dogmatics and general legal theory or British analytical jurisprudence. Some scholars showed an interest in utilitarianism, as well as in some evolutionist approaches to positivism. All this activity led to a progressive abandonment of methods linked to the neo-Scholastic or idealist-Krausist natural law theories that had peaked at the beginning of the 19th century.

The third circumstance is that some lecturers, researchers, and students from the Coimbra and Lisbon Schools of Law began to embrace progressive,

reformist, or even revolutionary political ideologies. In the early 20th century some lecturers at these two Portuguese law schools drew inspiration from different forms of the so-called *socialismo de cátedra* (i.e., socialism defended and developed from the position of an academic chair), as well as from Marxism and anarchism, in addressing the concept, meaning, and social function of law (see Moncada 1960, Lacasta Zabalza 1988, and Merêa 1955).

A clear theoretical example of the attitudes of legal scholars opposed to natural law can be found in the early works of Domingos Fézàs Vital (1888–1953), a professor of public law. Much influenced by the legal sociologism of the French legal theorist Leon Duguit, Fézàs Vital rejected the notion of a subjective right.[7] He considered this concept to be a continuation of the sort of metaphysical ideas defended in natural law, since it assumes the existence of legal powers that people have even before they are recognized as having those powers under the positive rules issued by the state. His later positions are representative of the turning point that brought about the crisis of positivism and ushered in what has been called *Die ewige Wiederkehr des Naturrechts* (The eternal return of natural law: Rommen 1947). Certainly, in the mid 1920s, Vital forsook positivism and legal sociologism for legal institutionalism under the influence of Maurice Hauriou and Georges Renard, whose doctrines he helped to spread in Portugal.[8] From that point on, he attempted to elaborate a neo-Thomist institutional theory that would lay the groundwork for legal institutions in Christian natural law. This attitude would make him one of the ideologues of the Estado Novo personified by Antonio Oliveira Salazar's political authoritarianism, and he would even become one of the inspirers of the 1933 Portuguese Constitution, a key legal text in that legal-political system (see Fézàs Vital 1929).

The renewed Portuguese interest in natural law found its most representative figure in Luis Cabral de Moncada (1888–1974), professor and dean of the Coimbra School of Law, who can be described as the most respected 20th-century legal philosopher in Portugal.[9] From the late 1920s he set out to criticize positivism and its consequences on legal education, and he accordingly promoted the inclusion of philosophy of law as a compulsory subject in the curriculum as law schools. This intellectual attitude, always favouring natural law, evolved from neo-Scholastic premises to approaches closer to phenomenology, neo-Kantianism, and existentialism. Being deeply knowledgeable in German legal doctrine, Moncada was influenced by Radbruch's and Stammler's theses, and he critically studied Kelsen's thought. He gained international recognition with an *honoris causa* doctorate conferred by the University of Heidelberg (see

[7] On Duguit see Section 12.3 in Tome 1 of this volume.

[8] On Hauriou see Sections 1.1.4.2. and 3.2 in this tome and Section 12.2 in Tome 1 of this volume. On Renard see Section 1.1.4.2 in this tome.

[9] On Moncada see also Section 14.3 in Tome 1 of this volume.

Jayme 1993). His natural law conception, receptive to existentialism, comes through in the way he distils what he takes to be the three main beliefs espoused in midcentury Europe: (*i*) the idea that social and political life must be built from the inside out as a projection of a deeper dimension than individual life itself and as a type of existence revolving around the religious idea of salvation; (*ii*) the conviction that law and the state are neither ends in themselves nor merely instruments by which to achieve economic goals but are rather human "tasks" entrusted to culture and hence means to spiritual ends; (*iii*) the belief that in order to fulfil those ends, it is necessary to appeal to higher, objective, ahistorical values making it possible to rise to a superior axiological cosmos insulated from the whims and fantasies of the day. According to Cabral de Moncada (1945), the problem of natural law is no longer a metaphysical but an ontological and axiological issue. This is so because, in the phenomenology of conscience and historicity, the autonomous sphere of the spiritual being has taken shape as a new logos, a logos dependent on, intertwined with, and conditioned by other vital circumstances but still counting on its own laws, sense, and aims. It is the current task of natural lawyers to figure out the structure of the values we call spiritual and to identify the laws we ought to observe in keeping with those values. The highest place in this scheme is reserved for social justice and the common good. This natural law only requires a belief in the reality of the spirit but does not have to take on board any metaphysical or religious conception. Even so, there is no denying that these conceptions have an *in limine* legitimacy, and in fact only by embracing such conceptions is it possible to fully achieve the aims of natural law, which poses not only a theoretical intellectual problem but also a practical problem concerned with action. Intelligence alone will not suffice: There also needs to be the support of the human will. We will never be truly human unless by deep searching we can find a conviction and belief that will open us to the perspective of the absolute, understood as the ultimate sphere in which to assert our reason and give meaning to all our needs and deeds as spiritual beings in this world (see Moncada 1945, 1966).

The teachings and works of Cabral de Moncada significantly influenced the most remarkable Portuguese legal philosophers of the second half of the 20th century: Machado, Castanheira Neves, and Brito.[10] Joâo Baptista Machado (1917–1991) lectured on international law and legal philosophy at the new Oporto School of Law. In his early academic years, he devoted a good deal of study to Hans Kelsen, some of whose works he translated into Portuguese, thus contributing to spreading Kelsen's thought in Portuguese legal culture. In his mature years he sought to move beyond two basic premises of Kelsen's theory: normativist positivism in legal theory and axiological relativism as a ba-

[10] On Machado, Castanheira Neves, and Brito see also Sections 14.8, 14.9, and 14.11 in Tome 1 of this volume, respectively.

sis of legal legitimacy. Machado thus worked out a natural law theory seeking to revise its traditional neo-Scholastic underpinnings in an ambitious project to bring it up to date, to which end he drew on a variety of theoretical sources, including existentialism (where we can see influence of Cabral de Moncada), hermeneutics, and theories of justice, demonstrating a knowledge of contemporary thinkers like Habermas, Luhmann, and Rawls (see Ferreira da Cunha 2006). Antonio Castanheira Neves (1929–) lectured on legal philosophy at the University of Coimbra and has been quite critical of both legal positivism and natural law theory. His criticism of legal positivism stems from his rejection of that brand of legal reasoning which proceeds by subsumption and syllogism. He also rejects the idealism and abstractness that pervades many natural law conceptions. Against these notions and approaches he sets a real, concrete, and historical law whose content takes shape in the ongoing process of solving empirical legal cases. He thus takes the view that court rulings are essentially the determination of what must be considered legally correct in any legal system (see Neves 1993). Some commentators have noticed some analogies that the works of Castanheira Neves bear to hermeneutical theory or even to Dworkin's law-as-integrity theory. The matter is taken up directly in one of Castanheira Neves's more recent works (Neves 2003), where he clarifies that his own position is quite different, since it places greater emphasis on the experiential dimension of law and in the end entails a necessary connection between theoretical reflection and actual praxis in the legal sphere.

The 1974 Carnation Revolution, whose main legal and political result was the 1976 Constitution, resulted in the replacement of an authoritarian regime with a democratic state in Portugal. This important political transformation had cultural ramifications that also affected the attitudes taken to natural law. So, in legal historiography, Antonio Hespanha, of the University of Lisbon, replaced traditional natural law, which had served as theoretical foundation for the conception of legal history developed by Paulo Merêa (1889–1976), with the philosophical premises of postmodern culture (Hespanha 1978). Likewise, José Gomes Canotilho, of the University of Coimbra, replaced the conservative natural law that prevailed under the political rule of Antonio Oliveira Salazar and Marcelo Caetano with critical legal conceptions clearly aligned with a progressive approach (see Gomes Canotilho 1986). José Manuel Pureza, also of the University of Coimbra, has worked to revise cosmopolitan natural law as a foundation for international law with a view to addressing the problem of pluralism and multiculturalism. The effort is to steer clear of any ideal and abstract universalism that might be encouraged by the standardization of international legal principles and values (see Pureza 1996). Mention should be made as well of the sociologist and legal theorist Boaventura de Sousa Santos (of the University of Coimbra) for the research he conducted in Latin America.[11] De

[11] On Santos see also Section 14.12 in Tome 1 of this volume.

Sousa Santos rejects the paradigm of modernity, which in the legal realm found expression in the natural law pursued in the Enlightenment era, and sets that paradigm against a postmodern one understood as a new critical conception of experience and a reframing of legal and political common sense in light of an emancipatory aim. Against rationalist natural law, grounded in what he calls "indolent reason," he sets a utopic rationality committed to liberation and emancipation. In the Enlightenment era, natural law turned law into a myth that now needs to be demystified, considering how the legal system has proved unable to adequately solve some of the most pressing social issues. A response to this progressive criticism of law requires a series of institutional mechanisms, procedures, and reforms designed to make law accessible and useful to the greatest possible number of citizens (see Santos 1995, 1998, 2003).

4.7. Conclusion: Premises for an Assessment

By way of a summary, it can be observed that natural law theory currently finds itself at a crossroads in Spain and Portugal alike, in a landscape marked by new influences, profound changes, and unsettling uncertainties. In recent years, the paradigms that have traditionally been articulated in natural law and legal positivism seem to have run their course. Just like Pirandello's famous characters, many of the youngest Spanish and Portuguese legal philosophers and theorists are "in search of an author." An attempt in recent years to move beyond the doctrinal baggage inherited from the recent past has served as an incentive to swiftly import theoretical models deemed more appropriate to the changed circumstances. Under the amorphous label of post-positivism, legal positivism has sought to take up a motley range of programmes and theories, including those carried forward in analytical philosophy and neoconstitutionalism, as well as the work done addressing feminist, ecological, and multicultural concerns and the criticism of the global society. This reinvigorating attitude seems fully legitimate to me in view of the concerns it addresses and the anti-conformism it fosters, and only time will make it possible adequately assess the results, since no definitive conclusions can be drawn by observing a panorama still *in fieri*, to use a legal phrase.

As a final consideration, I should point out what I understand to be the biggest danger the most innovative movements in Iberian legal theory and philosophy are exposed to, namely, the danger that they should too eagerly make a clean sweep of the natural law era of the past, thus undiscriminatingly doing away with currents whose centuries-old history and plural meanings have engendered a variety of implications and nuances that cannot be packaged into any simplifying criticism. By bringing moral values to the law at different times and across different legal cultures, natural law has made possible an engaged attitude, giving evidence of a historical function that urgently needs to be clarified and taken into account, failing which Spain and Portugal would

paradoxically see the rise of attitudes that reject natural law while invoking rationally grounded objective values (however much in a historico-sociological sense) and defending the need to recognize basic human rights and values as legitimizing ends or guidelines for every legal system, thereby claiming a connection between law and morals. These positions therefore implicitly recognize well-known natural law premises. Indeed, we are witnessing an opening to human values and rights and to the historical conscience typical of the natural law theses developed with an eye to innovation; we are seeing the effort of parts of critical legal theory to salvage the most vivid aspects of a humanist natural law conceived in defence of the notion of human dignity (see Bloch 1961); and, finally, we can also observe attempts to revive practical reason and to address the problems of our contemporary globalized and technological society by working from a renewed theory of justice—all these trends show that the big questions linked to the historical development of natural law doctrines are alive and well. For, in any event, as Karl Jaspers (1949) once observed, our overall image of history and our consciousness of the present situation are interdependent: The deeper our consciousness of the past, the more authentic our participation in the present moment.

Chapter 5

20TH-CENTURY NATURAL LAW THEORY IN ITALY

by Francesco Viola

To explore the history of natural law theory in 20th-century Italy (see Fassò 1964a, 109–28; Pérez Luño 1971, Marini 1987, Lorenzi 1990) there is no need to make reference to political unification of the country in the second half of the 19th century: We can refer to a much older tradition of thought that rather marks the persistence of a cultural approach, despite chequered political and social vicissitudes. The fact is that the cultural unification of Italy came long before its political unification. Since every culture can be considered as an interpretation of human nature, it is legitimate to wonder whether there is a propensity of Italian culture towards a specific doctrine of natural law.

I will limit this exploration especially to the period that goes from the years after World War II, down to our own day, and I will entirely neglect studies on the history of natural law, even though they have had major importance in Italy. Does a natural law doctrine exist that is dominant in Italy in the second half of the 20th century?

I will say straightaway that the answer to this question will be a negative one. Rather than of a unitary doctrine it will be necessary to talk of some typical approaches to the problems of natural law that are persistent in Italian culture and derive from its tradition of thought.

5.1. The Italian Tradition

In this tradition the common fabric of society is represented by Catholic ethics, whose principles and values, until a few decades after World War II, were amply shared, though not always adequately practiced. For the Italian people, the Catholic ethic was identified for a long time with ethics *tout court* and it had no rival alternatives of any importance.

On this common basis there developed two orientations of thought that can emblematically be seen as going back respectively to St. Thomas Aquinas (1225–1274) and Giambattista Vico (1668–1744), both Neapolitan philosophers. The former represented both the theological origin of this normative ethic and its possible rational foundation, natural law being at once divine law and law of reason. Vico—to whom we owe a philosophy of history attentive to the way in which natural inclinations and the principles of reason are developing in the minds of men and in the work of civilization—represented the demand for a bond with praxis and with the concrete experience of social life

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_33

and politics. Hence reason and history, divine will and human culture are the elements always present in the background to this tradition of thought.

One of the unquestionable characteristics of Italian reflection on natural law is given by the fact that these two orientations of thought, not incompatible per se, rarely fertilized one another but developed along parallel and often antagonistic lines.

The Italian interpreters of Aquinas have given life to varying interpretations oscillating between voluntarism and rationalism, but often rejecting attention to the historicity of human experience.

The followers of the Viconian line of thought, which actually did not produce a true legal-philosophical school and for long periods fell into oblivion, were concerned above all with the interpretation of political and civil history, abandoning Vico's undoubted religious inspiration and his attention to law.

If now, leaping forward a few centuries, we look, even superficially, at the 19th century, we have to recognize that the philosophical bases were not adequately developed in the sphere of Catholic thought, which had the monopoly on natural law theory.[1] Everyone recognizes a large dose of eclecticism in Christian thought itself and, more broadly, in all Italian philosophical culture down to our own day.[2] In the first half of the 19th century the only detailed discussions of natural law had an avowedly rationalistic imprint.

The glorious tradition of Christian thought had been seriously damaged by the impact with the Enlightenment, but it was not entirely dead. In the second half of the 19th century some scholars interested in legal and political problems quite consciously returned to the conception of natural law of St. Thomas Aquinas. Among them for depth of thought there stands out Luigi Taparelli d'Azeglio (1793–1862), who worked out a complete and detailed doctrine of natural law that still today is of some importance (see Taparelli d'Azeglio 1849). Among these scholars there was certainly a conservative orientation aiming to oppose the spread of liberal individualism. Nevertheless, there is, especially on the part of Taparelli d'Azeglio, an endeavour not to impose the principles of natural law from above, but to see them as in some measure immanent in the history of customs and social praxis.

Following Pope Leo XIII's encyclical *Aeterni Patris* (1879), Catholic thought again found its identity and reprised the tradition of natural law as

[1] One of the few exceptions is the philosophical system of Antonio Rosmini (1797–1855), a Catholic priest that succeeded in creating a dialogue between the Christian philosophical tradition and modern thought. For this purpose he valorised Kant's thought against sensism and empiricism. However, he was isolated and looked on with suspicion within the Catholic Church itself.

[2] A typical example of eclecticism in the legal-philosophical field is the thought of Gian Domenico Romagnosi (1761–1835), who blends naturalism and ethical finalism. It is not clear whether he is to be considered a supporter of natural law theory or of legal positivism. Nevertheless, he is a major scholar on theory of society and constitutional law.

a basis for a moderate and prudent recognition of human rights (see Menozzi 2012).

In Italy the neo-Thomist movement developed until after World War II and to it we obviously also owe a determined conception of natural law. The orientations of this School were to have a lot of weight, for good and for bad, on the image of natural law that spread in Italian culture before and after the World War II.

In Italy neo-Thomism was a movement of thought linked to the Catholic Church much more than in other European countries. We have to remember that in Italy there were no state theology faculties, and still there are none. Catholic culture, even more after the political vicissitudes linked to the unification of Italy, was steeped in an ecclesiastical and clerical dimension. Consequently the neo-Thomist conceptions of natural law experienced a double separation: from lay culture, and from legal culture. They were set apart as theological-philosophical and ethical problems, while the prevailing orientation of jurists continued to be linked to legal positivism in legal science,[3] though anchored to Catholicism in private morality. Accordingly the Thomist doctrine of natural law remained in a defensive position towards lay culture and was not able to develop a capacity for dialogue and valorisation of the universality of reason.

If we then look at the way of thinking of natural law, it mainly centred on the affirmation of absolute and unchangeable norms independent of historical variations and founded on the rational will of God or on human nature steeped in finalism in virtue of the principle of creation. A certain ramification was possible on the basis of the Thomist distinction of the derivation from natural law *ad modum conclusionis* or *ad modum determinationis.* Nevertheless, recourse to historical experience was not seen as necessary for knowing the principles of natural law, but rather for being aware of the variety of their applications (see Olgiati 1944).

The very concept of law was identified with justice seen as a supreme synthesis between internal action, linked to virtues, and intersubjective and social rules (see Olgiati 1932). The reduction to ethics leads to a loss of the autonomy of the concept of law. The neo-Thomists had to defend themselves from this accusation, and some, in order to face it, tried to separate more deeply external action from internal ones (see Graneris 1949).

From the accusation of lack of historicity, neo-Thomist thought was defended by invoking the distinction between ancient and Christian natural law, on the one side, and modern natural law on the other. The latter was held to be responsible for an abstract and unhistorical conception of natural law, while

[3] Dominant in the world of Italian jurists in the first half of the century is the institutionalism of Santi Romano, which is a rigorous legal positivist. On Romano see Section 11.4 in Tome 1 of this volume.

the former, in the wake of Aristotle, was held never to lose sight of the concreteness of moral experience. However, the true reason for the rejection of modern natural law theory lies in its links with rationalism and deism.

On the lay side,[4] historicism and idealism, which were the dominant philosophy of the time and denied the normative character of human nature, had in turn appropriated the thought of Vico to themselves, the other great interpreter of the Italian spirit, bending him to the needs of an immanentist philosophy of history. Benedetto Croce in 1910 and Giovanni Gentile in 1915, with their interpretation of Vico's thought, profoundly conditioned the approach to the Neapolitan philosopher but not so much to link him to Hegelian philosophy, rather because of the excessive importance given to the themes of aesthetics and poetics in comparison to legal ones, considered to have a low theoretical profile.[5] Accordingly, historicism was no less abstract in its intellectual positions and the clash between Catholic and lay thought was played out on the plane of the greatest theoretical systems. In these cases the fierce battle on principles was almost always accompanied by pragmatism not very attentive to values on the practical plane.

One also has to consider the situation of particular difficulty in which legal philosophy found itself. On one side, in order to be recognized as true philosophical speculation, it had to be closely connected to the dominant currents of thought, that is to say, at that time, to positivism, neo-Kantianism, and neo-idealism; on the other side, however, no adequate valorisation of the legal phenomenon came from these philosophical orientations. Philosophical positivism considered law as an antiquated instrument of social control; neo-Kantianism tended to think of it in an outlook of mere appearance and coerciveness; neo-idealism now reduced it to economy (see B. Croce 1909) and now drowned it in ethics (see G. Gentile 1916). Accordingly legal philosophers almost always appeared to be heterodox in relation to the tradition of thought to which they too made reference and were therefore looked on with suspicion by pure philosophers. If the philosophers reduced them to mere jurists, the latter did not consider them as belonging to their guild.

The neo-Thomist orientation, or Catholic spiritualism in general, in actual fact represented the only doctrine of natural law in Italy before World War II. Certainly some demands of the problems of natural law were also accepted by the adversaries of natural law, and particularly those regarding the formation of more just positive law. Philosophical positivism spoke of "social idealities." One can also identify non-Catholic natural law orientations linked to a line of thought that starts from Filomusi Guelfi (1846–1903) and Igino Petrone (1870–1913)

[4] Among the few exponents of secular Catholic culture we can mention Eugenio Di Carlo (1882–1969) of the University of Palermo for his willingness to take into consideration the historical dimension of natural law (see Di Carlo 1966).

[5] On the neo-Hegelianism of Croce and Gentile see Section 11.2.2 in Tome 1 of this volume.

and is linked to the Neapolitan neo-Hegelian School (Augusto Vera and Bertrando Spaventa). But these were positions that were very close to historicism.

The only real doctrine of natural law originally different from the neo-Thomist one can be found in the neo-Kantianism of the Bolognese Giorgio Del Vecchio (1878–1970), the founder in 1921 of the *Rivista Internazionale di Filosofia del Diritto* (*International Journal of Legal Philosophy*), which circulated widely abroad too. The difference does not consist in the contents of natural law, which are still those of Christian ethics, but in the distinction between legality and justice. Del Vecchio maintains that the logical concept of law is independent of that of justice. Legality is a logical form that makes it possible to give legal meaning to social phenomena of intersubjectivity and is neutral from the evaluative point of view. But law moves towards the ideal of justice, which is its principle in terms of contents. The originality and importance of the thought of Del Vecchio, to whom we also owe later valuable writings on natural law (see, e.g., Del Vecchio 1954), is mainly in the working out of a definition of law that overrides the controversy between legal positivism and natural law theory, in that it is only on this basis that it is possible for this controversy not to be a dialogue of the deaf.[6]

On the plane of ethical-political commitment, none of the forms of natural law present in Italy before the war was fully aware of the incompatibility between fascist ideology and natural law, developing an organic and combative critical opposition. This is proof of the abstract character of Catholic natural law in that period and its incapacity to tackle history.

5.2. The Natural Law of Jurists

One of the most important cultural effects of World War II on legal-philosophical problems—as is well known—was renewed attention, not infrequently opportunistic, to natural law. This happened in general in the culture of the defeated countries, that is to say Italy and Germany.[7] There has been much discussion of the responsibilities of legal positivism regarding Nazi and fascist totalitarianism.[8] It is understandable that the whole configuration of pre-war

[6] On Del Vecchio see also Section 1.1.3.1 in this tome and Section 11.2.1 in Tome 1 of this volume.

[7] It is curious to observe the rapid conversion of idealist philosophers to natural law theory. From the school of Croce himself there was to come a defender of natural law (see Antoni 1959). On the revival of natural law theory in Germany see Sections 1.3 and 2.4 in this tome and Section 10.2 in Tome 2 of this volume.

[8] Uberto Scarpelli and Norberto Bobbio vigorously defended legal positivism against this accusation: the former on the basis of the connection between legal positivism and the constitutional and democratic state, the latter on the basis of the distinction between legal positivism as a theory and as an ideology. On Bobbio and Scarpelli see Section 9.3 in this tome and 11.4 in Tome 1 of this volume.

culture was challenged without any distinction being made. Actually the true responsibility should have been sought not so much in legal positivism, but in the separation between ethical and legal culture. The upholders of legal positivism and natural law theory were equally responsible for this.

One of the first results of the rebirth of natural law was renewed attention to it on the part of jurists. Once more the initiative and the impulse came from the Catholic Church. Pope Pius XII had great sensitivity to law and advocated a new international legal order. His appeals were fully accepted by the Union of Italian Catholic Jurists (1951). The central problem was the legal ethics of the jurist and his virtues. The work of the jurist was undoubtedly linked to positive law and the value of legal certainty, but now it could no longer be affirmed that the drama of unfair law should or could remain only a private matter of conscience, especially when it took on very large proportions.

The variety of opinions present in this debate was the unmistakable sign of a development in the problems of the validity of natural law. First of all people once again proposed the neo-Scholastic position whereby natural law had at once a transcendent and a systematic character. Accordingly, where the jurist ascertained the contradiction between the positive norm and the natural one, he or she would have to recognize that the former is not true law (see Barbero 1953, 40). But this *strong version*[9] of natural law theory received very little support and its own upholders did everything possible to reduce its negative impact on the value of certainty and on the duties of the role of the jurist. The *weak versions* insisted either on the difference between the single positive norm and the system of norms as a whole, or on the particular character of the norms of natural law. These were two moderate approaches that allowed a dialogue between positive law and natural law without implying a duplication of legal normative systems.

According to the first perspective there was a substantial difference between the legal system as a whole and the single norm. The former could never clash with natural law, since it was the objective order of social coexistence, an arrangement consolidated through the tests of history and therefore endowed with immanent rationality of its own. In this sense natural law is the sum of the constitutive requirements of positive law itself, whether derived from the structure of action or expressed in the internal values constituting a legal order. This was substantially the position of Giuseppe Capograssi (1889–1956), a legal philosopher who had a great influence on the training of Italian jurists in the post-war period.[10] Capograssi, the upholder of a philosophy of legal expe-

[9] A version is strong if it contains the following assumptions: Non-positive law exists; this law is valid by itself, that is to say without any need of human recognition; this law, being axiologically superior to positive law, prevails over it as regards compulsoriness (see D'Agostino 1993, 71).

[10] On Capograssi see also Section 1.3.3.1 in this tome and Section 11.3.1 in Tome 1 of this volume.

rience, expressly harked back to Vico and spoke of the "natural law of the wise men," that is to say of the result of the work of reason displayed in history, underlining the deep needs of humanity (see Capograssi 1959a). In this framework unjust law has to be somehow taken back, through interpretation, to the interior values of the positive order and thus purified of its contradictions.

We can consider this trend as being a fully natural law theory, although its upholders did not always accept this definition, which in the cultural imagination seemed to be an exclusive monopoly of the *strong version.* In its turn the philosophy of legal experience was engaged in opposing the historicist drift, which threatened it from inside. This task was faced differently by the disciples of Enrico Opocher of the University of Padua (1914–2004): through recourse to classical dialectics and ancient rhetoric (see Cavalla 2005; see also Opocher 1983), in the study of the potentialities inside the legal order (cf. F. Gentile 2000), in investigations of the history of natural law theory (see Todescan 1973), and in legal theory inspired by German hermeneutics (see Zaccaria 1984a, 1984b).

The second trend rejected identification of natural law with a system of precepts. It consisted, instead, in a few fundamental or core precepts and in a set of orientations guiding the production of positive law. Today we would say that natural law is manifested above all through principles, that is to say general orientations for action. Consequently the irresolvable conflict between natural and positive law would come down to a few extreme cases concerning precepts, while it would only have a moral and not strictly legal value in the case of principles.

The innovations thus consisted in a differentiation of the ways of seeing the validity of natural law and in jurists' involvement in these problems, reserved in the past for legal philosophers and moralists. The latter aspect is strengthened by the presence of a legislative text steeped in ethical-political values like the Italian Constitution that came into force in 1948. Since the constitutional text incorporated some principles that belonged to the natural law tradition, the fidelity to law typical of the jurist could be merged in some way with natural law theory. In any case it is significant that people began to speak of the "philosophy of jurists" (see Caiani 1955), which before the war would have seemed like nonsense. This philosophy does not abandon the unhistorical formalism typical of the Italian jurist (see Merryman 1966), but recognizes that values are incorporated in legal and institutional formulas, are "law in force" and therefore must be kept in mind in the procedures of legal interpretation and legal science.

The result of this evolution was a strengthening of the convergence on the constitutional contents of law, which for upholders of natural law theory were founded on the natural law in force, while for upholders of legal positivism they were positive law to all intents and purposes. But agreement always has the effect of paralysing research. At that time in Italy there was no debate on

the contents of fundamental legal values, but only on their classification as natural or positive law ones. A natural law doctrine should instead present itself as a programme of research on the precepts and principles of law, that is to say it should exert practical reasoning to trace and justify legal rules. Moreover, this is by no means extraneous to the tradition of Italian legal science, which harks back to Roman law, to medieval jurisprudence and to *ius commune*, and which—as was well highlighted by Giuliani (1997)—could now use the resources of the new rhetoric and the theory of reasoning. But jurists in the age of codification had abandoned this tradition, unlike Anglo-Saxon jurisprudence. In conclusion, it can be affirmed that the two weak versions of natural law still need to be further extended and developed.

5.3. Natural Law Theory as a Theory of Morality

Hence one should not be surprised if the most vital focus of the debate moved onto the epistemological plane. As it was no longer the contents of precepts that classified a doctrine as natural law, then the stress was to fall on a determined foundation or on a determined justification. Norberto Bobbio perceived this problem with his usual lucidity when he long ago considered natural law theory not as a determined morality, but as a determined theory of ethics (see Bobbio 1965a, 180). This was an objectivistic theory of ethics that presumed to base value contents on the cognitive plane. The conflict between natural law theory and legal positivism thus became a conflict between cognitivism and non-cognitivism of value judgments (c.f. Viola 1993). This epistemological controversy drew the main attention to itself, causing issues of normative ethics to fall into oblivion.

The division now concerned meta-ethics, the conception of science and legal interpretation, and the concept of law, that is to say whether it is fact or value. There developed a strong current of legal positivism with an analytical inspiration, which was inspired by the works of Hans Kelsen, Alf Ross, and H. L. A. Hart and became the main adversary of the natural law theory of ethics, using the *Is-Ought question* as its favourite weapon (see Bobbio 1965a, 172; see also Carcaterra 1969).

Meanwhile, in more general Catholic philosophical culture neo-Thomism faded away and almost disappeared, without being replaced by a different and more adequate interpretation of the thought of Aquinas. It is true that Catholic culture in Italy in the post-war period was greatly influenced by the thought of Jacques Maritain, but especially with reference to political and social philosophy rather than to legal philosophy.[11] In actual fact natural law theory had

[11] Maritain's most interesting work for legal philosophers was published posthumously in Italian even before being published in the original language, but unfortunately did not arouse sufficient attention (see Maritain 1985). On Maritain see also Sections 1.3.2 and 3.2 in this tome.

run off into a thousand rivulets, no longer having a strong and unitary speculative basis. Obviously its eternal and invincible argument was kept alive, that is to say that it is necessary to admit a criterion of moral measurement of positive law if one wants to avoid the triumph of factuality. But the uncertainty remained about the way of founding this *recta ratio* on the cognitive plane and on its strictly "legal" character.

The essential connection between Christianity and natural law theory was sharply challenged by Guido Fassò (1915–1974), a legal philosopher of law at the University of Bologna and—as already stated—the author of the only complete history of legal thought still existing today. Fassò, in whom we again hear the voice of Viconian philosophy, clearly separates the plane of the absolute transcendence of moral and religious values from the institutional and social plane, which is necessary to cohabitation and coexistence and therefore has to accept a certain relativism and historicism of values, with their consequent inevitable secularisation (see Fassò 1969; see also Ambrosetti 1985). The law is set on the latter plane, just as all social or rational moralities are in reality legal forms of coexistence in some contrast with the essential ultramundane spirit of Christianity. In this there is a good dose of mistrust in human reason, which to some extent is reminiscent of non-cognitivism (see Pattaro 1982) and the mysticism of Wittgenstein, but Fassò clearly rejects voluntarism. In this religious background for the construction of legal and political institutions he recognizes the educational importance of natural law seen as *law of reason* (see Fassò 1964b). This is empirical and historical Viconian reason that is not at all eternal and unchangeable, but essential for the guaranteeing of rights and freedom, that is to say for founding the values of constitutionalism. On this plane it is also possible to intercept the natural law theory of Thomas Aquinas, seen by Fassò as an upholder of critical and non-dogmatic reasonableness able to adapt to the historicity of human relations.

Despite the non-absolute value of natural law, this recognition of the importance of practical reasonableness and the use of Thomism along these lines is interesting. Fassò himself makes reference to the English legal tradition, which has developed law from the concrete demands of society interpreted by reason, a law that is not voluntaristic, as continental law is; it is *positive natural law*, to use Roscoe Pound's expression.

It must be remembered that some years before, an Italian with a Thomist background and a deep knowledge of English legal and political thought, Alessandro Passerin d'Entrèves (1902–1985), had maintained that the importance of natural law consisted more in its *historical function* than in its doctrine (see Passerin d'Entrèves 1954). And this historical function was precisely what was emphasised by Fassò, that is to say limiting the power of the state and protecting the individual against the sovereign's will. Crediting natural law with this "historical" merit, Bobbio noticed that for this reason an objectivistic theory of ethics was not necessary, in that the same merit must be attributed to other

doctrines or philosophies that had nothing to do with it (see Bobbio 1965a, 190). But natural law theory is not the only possible cognitive meta-ethic and it is doubtful whether constitutionalism and human rights are defended better on the theoretical plane by cognitivism or ethical relativism. In conclusion, for the fate of natural law theory the crucial point is not the content of natural law but its foundation, that is to say the concept of human nature. It would be senseless to go on speaking of "natural" law if this did not somehow mean an appeal to nature, and nevertheless the naturalistic fallacy would seem to prevent it.

To get over this difficulty it is necessary to offer a non-naturalistic interpretation of human nature and this required a new speculative effort. It was to this theoretical undertaking that Sergio Cotta (1920–2007) devoted his studies; he brought together an original Augustinian inspiration and an ontological revisiting of Husserl's phenomenology (see Cotta 1991). Cotta does not dwell on defending determined contents of natural law, in which he admits a good deal of historicity. The philosophical concept of "nature" cannot be reduced to mere factuality, but indicates the constitutive structure of an existential entity. The entity to which law refers is man. Philosophical investigation shows the structural characteristics of this entity and reveals its coexistential relationality. From this anthropological truth there derive objective duties, that is to say ones valid for every human being. Hence natural law is positive law that is justified by its corresponding to the structure of the entity to which refers. It is not ideal law, or naturalistic law, but *law which is valid* for being an expression of the human being. The principal task of natural law theory becomes justifying the compulsoriness of positive law, which substantially means answering the radical question "why law?" (see Cotta 1981). In this way Cotta manages to trace in positive legal systems some inalienable principles of a structural character, violation of which would make the coexistential relationship impossible (like the duty to respect the innocent and not to subjugate other's will). Such principles are not merely formal, because they express a sort of ontological a priori requisite, and not merely logical, and at the same time they need to be worked out in historical praxis. Limiting natural law exclusively to the first principle of practical reason, that is "good is to be done and pursued, and evil is to be avoided," would mean abandoning the contents of natural law to the becoming of history and to relativistic historicism. Hence it is necessary—according to Cotta—to translate the old metaphysical ontology of Thomism into phenomenological and anthropological ontology.

Cotta's thought to some extent harks back to the theme of the concept of law dear to Del Vecchio, whom he succeeded at the University of Rome. However, Cotta does not reduce the concept of law to mere logical formalism but rather shows that the form of legality implies some anthropological and ontological conditions.

This debate on natural law is set on the plane already specified by Bobbio, that is to say on the epistemological one. Cotta, indeed, agrees that the criteri-

on of historical contents and that of social function are not adequate to define natural law theory. It is not the unity of a school or a doctrine, but the unity of a *research model* characterized by the question on the foundation of the law when it is sought in the nature of man (see Cotta 1989).

Sergio Cotta's teaching gave rise to a flourishing school of disciples, who, starting from a common original inspiration, moved in various directions, at times conflicting ones: the phenomenological orientation in a Heideggerian sense was chosen by Romano (1984), that of philosophical anthropology by D'Agostino (1984), and that of criticism of social functionalism by Montanari (1989).

Lastly, it must be mentioned that a possible resource for natural law conceptions came from logical studies on the ontology of the norm that were developed in Italy in a very sophisticated way by Conte (1989–1995).

This return of natural law problems to the philosophical dimension, in both an ontological and an epistemological sense, though of great speculative value, did not always satisfy the demands of jurists more interested in the contents of law that in its foundation. Besides, jurists favourable to natural law had been satisfied with constitutional values and therefore went back to entrenching themselves in legislative formalism in defence of the certainty of law. By contrast, it was to be jurists animated by left-wing ideologies that attempted alternative interpretations of positive law in the name of a search for more just law (see Barcellona 1973). In any case legal philosophy of law once again estranged itself from the attention of jurists (c.f. Viola 1994).

5.4. The Return of Normative Ethics within Positive Law

From the 1970's a cultural phenomenon of great importance for the search for natural law began to be apparent. We have said that the only undisputed firm point was agreement about the contents of Christian ethics. But in Italian society at that time this convergence gradually vanished. The introduction of divorce (1970) and the legalization of abortion (1978) did away with common ethics and led to pluralistic fragmentation of moral convictions. Since public deliberation requires reasonable accord at least on some central themes, attention began once again to be paid to issues of normative ethics that meta-ethical researches had caused to be neglected.

Debates on just law imply the existence of and therefore the search for objective criteria, and this confers plausibility on the natural law outlook. But the principles and precepts of natural law need to be defended on the argumentative plane from within legal experience. On the other hand—as already mentioned—purely philosophical reflection on law does not capture the attention of jurists oscillating between formalism and ideologism. Nevertheless, the crisis in common ethics shifted to positive law the task of guaranteeing the shared values necessary for all civil cohabitation (see Viola 1989). Paradoxically this is

a situation favourable to natural law, which has always had to respond to two contradictory accusations, i.e., being ethics and not law, and being based on nature as a fact. But now the general concept of "nature" had become the crucial issue of law and morality (see Lombardi Vallauri 1990b).

Today in Italy—as in the rest of the world—the legislation is forced to deal with issues that are ethically important not only on the public plane but also in the private sphere. Accordingly, themes like bioethics, ecology, the future generations, feminism, and gender become significant chapters of legal philosophy. In relation to the answers provided by normative ethics, two conflicting groups are configured, which in a sense reflect the traditional division between laymen and Catholics. Nevertheless, it would be wrong to identify this opposition with that between legal positivism and natural law theory, both because "lay people" too often defend an objective ethic, and because the "Catholics" do not always base their ideas on the normative concept of human nature. Among the numerous contributions to this ongoing debate we can consider the writings of Francesco D'Agostino, who, on the basis of rational justification, rigorously defends the contents of the Christian tradition of natural law (see, for example, D'Agostino 1998). In any case history itself takes on itself the task of refuting the ferocious aggression by Piovani against natural law theory considered as anti-modern (see Piovani 1961, 11).

Natural law theory today does not present itself as a theory of morality, but as an ethic deriving either from the normative character of nature or from a specific use of practical reasonableness. For this purpose it is necessary to regain not only normativity, but also all the breadth of the concept of "nature." Natural law theory—as Luigi Lombardi Vallauri observed—is not concerned only with the nature of man, but also with the nature of things and with the very nature of law. Natural law does not only concern norms of conduct, but also norms of organization (see Lombardi Vallauri 1987). The same procedures, to which today attempts are made to reduce all positive law, are not merely arbitrary, but have to respect certain constraints of value and practicability. Constitutionalism, democracy and human rights have binding internal rules; they have—as Fuller would say—their own internal morality. The "naturalness" of positive law lies in everything that is taken away from the full disposition of human will. In this sense there is a sort of minimal natural law theory that is at the basis of our present-day legal culture. It is based on refusal to reduce values to facts, on rejection of absolute subjectivism (see Lombardi Vallauri 1981) and on the defence of the individual against public power (see Cattaneo 1994).

On the contents of structural or procedural natural law today in Italy there is a high degree of consensus, only recently impaired by the debate on the revision of the Italian constitution. The most difficult problem concerns natural law of conduct, because it remains linked to the controversial concept of the nature of man, around which the division remains between Catholic and secu-

lar thought. For this problem to be solved it is necessary to overcome two obstacles still present in Italian natural law.

The first obstacle is conciliation between the universal form of the precept of natural law and its content, which to some extent is historical (see Sala 1971). It is once again a question of succeeding in fruitfully harmonizing Thomas Aquinas and Giambattista Vico, that is to say reason and culture, principles and history.

The second obstacle lies in the difficulty of developing practical reasoning without being conditioned by ideological presuppositions. Only greater trust in reason and in its practical use (see Viola 1990) can favour communication and dialogue between conflicting orientations. Philosophers have to achieve better knowledge of the argumentative processes of jurists and the latter have to be able to perceive the non-positivistic presuppositions of their arguments and interpretations.

Some signs that look to the future are favourable to a renewed approach to the problems of natural law seen as a search for the first principles of legal reasoning.

Neo-Thomist thought and the influence of Jacques Maritain having been worn out, the line of thought inspired by Thomas Aquinas is struggling to find new lifeblood in Italy (cf. also Azzoni 2008). The Italian translation of the main work of John Finnis (i.e., Finnis 1996) does not seem to have made a major contribution to renewing Italian natural law theory, which is not very sensitive to analytical philosophy. Greater hopes lie in the internal evolution of contemporary positive law and the theory deriving from it.

In this connection the most significant turn consists—in my opinion—in the slow but gradual abandonment of the identification of law with rules. We tend to think of natural law in the same way as we think of positive law. But in positive law today the importance of other normative elements is recognized, over and above the rules established by the authority.

Dworkin's distinction between rules and principles has been widely discussed in Italy. Positive law today appears more like a set of interpretative processes than a pre-established system of norms and the problem of the sources of law is revived. The primacy of interpretation shifts the focus from above to below, from normative validity to the use of legal rules. And then we wonder whether this praxis has some *internal primary goods* or guiding principles, what, if any, they are, and what type of normativity they exhibit. Further, the study of human rights (see Viola 2000) favours reconsideration of the theory of natural law, and forces jurists themselves to abandon all rigorous formalism and challenge the rigid separation between validity and justice, law and morality (see Union of Italian Catholic Jurists 1993).

Nevertheless, although it is now clear that the concept of nature cannot be reduced to mere factualness but has to refer to the unity of meaning of the fundamental ontological spheres of human experience, it is still too far from

and external to social praxis and historical processes, which constitute the real life of law. A pathway still not much explored is that which seeks in historical experience the constants of legal rules, having recourse to the acquisitions of cultural anthropology (see Scillitani 1996), or to trans-cultural laws (see Carcaterra 1992, Cosi 1993), or to the suggestions of Maritain and Gadamer on the "dynamic schemes" of action, or, finally, to the "reflective judgment" of Kant (see Mathieu 1989). One can endeavour to arrive at natural law along a plurality of research pathways.

Chapter 6

20TH-CENTURY NATURAL LAW THEORY IN HUNGARY

by Máté Paksy and Csaba Varga

6.1. Scholasticism and Neo-Kantianism in the Interwar Period

Neo-Scholastic natural law enjoyed a spectacular renaissance in Hungary starting from the end of the 19th century.

Several monographs and articles on Thomas Aquinas and his natural law doctrine came out, written by authors like the internationally renowned Dominican theologian Alexander (Sandor) Horváth (1884–1956), whose work on this topic is summarized in A. Horváth 1941. His theory on social justice led him to criticize capitalism as an economic and social order, arguing that no society can be just when mere parts of an organic unit can promote their separate interests independently of the common good of society, and undermining that good as well. This realization provided a basis for his argument against the right to property as a natural right. Interpreting Aquinas in a unique way, he argued that individual property is not necessarily and absolutely justified by natural law. According to him, economic collectivism can very well be in harmony with the requirements of natural law and justice. This is so because, from the standpoint of the whole, human labour has primacy over the right to property. As a human activity, labour is defined by its specific aim, which is to advance the common good itself. Consequently, on this conception, it is morally obligatory, as well as necessary, that the fruits of that labour be redistributed. This is why he ends by declaring that no Christian social order could be built on capitalism but only on its ruins (see A. Horváth 1928–1929a, 1928–1929b, 1928–1929c, 1928–1929d, 1928–1929e, 1928–1929f, 1929, 1929–1930a, 1929–1930b, 1929–1930c, 1929–1930d).

Since the early decades of the 20th century, the leading school of legal philosophy in Hungary was neo-Kantianism in its various inflections. This dominance was in line with the trends in German-speaking central Europe (see Szabadfalvi 2003a, 2003b). One of the key problems addressed within the neo-Kantian methodological framework was that of natural law, reconceptualized either as an axiology or as the enigma of "ideal law."

This kind of investigation can be seen in the work of Felix Somló (1873–1920), our own "Continental Austin," as he came to be called, since he propounded a legal positivism in the English manner.[1] It is just such a conception that he developed in his *Juristische Grundlehre* (Somló 1917), working within

[1] On Somló see also Section 19.2 in Tome 1 of this volume.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_34

a neo-Kantian framework and standing firmly against the idea of natural law, which he analyzed as simply an attempt to elevate an eternal and objective legal order above the realm of positive law. In his view, natural law presupposes an absolute and self-evident system of principles, while the rules of positive law can only be contingent. The distinctive feature of positive law, for him, lies precisely in its being enacted by the will of a supreme legislative authority, whose issuances cannot be substantiated on the basis of any values but can only rest, instead, on social recognition, that is, on the fact that its will elicits habitual obedience (see Somló 1917, 1999; see also Szabadfalvi 2001).

In contrast to Somló's pre-Kelsenian analytical positivism, the "synthetic" legal philosophy constructed by Julius Moór (1888–1950) accentuated the role of natural law in defining the very "idea" of law that stands behind all legal developments.[2] He, too, rejected natural law as an eternal, unalterably valid set of norms, since he saw history as testifying to the contrary. Indeed, his conception is an effort to reconcile Kant with Hegel. He was convinced that no one can derive legal norms either from human nature or reason or from "the nature of things." Quite the contrary, he argued that natural law served a negative function as a force constraining the positive law (see Moór 2006; see also Szabadfalvi 1999).

The next step in the definitive deconstruction of the antinomy between natural law and legal positivism came with the new dialectics implied by the "synoptic conspectus" provided by Barna Horváth (1896–1973). For Horváth, natural law is no more than a specific form of, or corollary to, positive law: "Instead of being contradictory or opposite to natural law, legal positivism, in its most coherent form, is only a species of positive natural law" (B. Horváth 1928, 211ff.; my translation). Natural law doctrines that legitimize the positive law or revolutionary change ultimately contribute to strengthening legal positivism. Horváth extended his relativization of antinomic duality to positivism itself. He started criticizing Kelsen, too, realizing how much Hungarian legal philosophy had begun to work in his shadow. Formalistic legal positivism had to accept from the outset that the laws of logic are valid; therefore, on the reasoning that the logical laws and the natural laws alike are held to be eternal and objective, the pure theory of law was bound to also accept a kind of natural law as having a foundational role. What is more, as a kind of "positivist" natural law, Kelsen's doctrine winds up expressly seeking an idea of pure natural law (B. Horváth 1934).

One of Horváth's disciples was István Bibó (1911–1979), who agreed with his teacher in rejecting the antinomy between legal positivism and natural law.[3] Although Bibó devoted his later research to political philosophy, he never ceased to concern himself with issues in the philosophy of law. In international

[2] On Moór see also Section 19.3.1 in Tome 1 of this volume.

[3] On Bibó see also Section 19.3.3.2 in Tome 1 of this volume.

law and under the influence of Verdross, Bibó attempted a theory of the international order excluding any form of violence and founded on humanist moral principles. He was deeply committed to the idea that natural law could be revived in some way, and that this would help to eventually overcome the paralysis of formalistic legal positivism (see Bibó 1976; see also Karácsony 2002).

6.2. Natural Law in the Marxist Conception of Socialism

Under the socialist regime in Hungary (1949–1989), the *prima philosophia iuris* was known as socialist normativism. This was neither a conception of natural law nor a legal positivist one but was rather a legalistic ideology that reduced law to the legislator's political will, not in the least meaning to subject that will to any axiological constraint.

When this normativism started to lose its "official" status and doctrinal relevance, in the late 1970s, Hungarian legal scholars suddenly found themselves facing an abyss. Which is to say that, while legal positivism seemed unacceptable—as a conception far too removed from social reality—the idea of natural law was equally objectionable as "unscientific." In search of a solution in a political climate not tolerant of any alternative to Marxism, some scholars looked to Lukács's later ontology of the social being, an ontology they took up as their philosophical framework.[4] Values could find their place within this ontology as specific ontological parts of the total social reality, being components of the prevailing ideology at work in actual practice. This kind of theoretical construction opened the prospect of a minimalist materialist axiology, a view that, among other things, could make it possible to set pragmatic limits to legislation. The argument went on to show that if the legislator took such minimalist values into account, the law itself as a technique of social governance could become more effective. As a synthetic theory, this was certainly closer to the natural law tradition than to Anglo-Saxon command theories (see Peschka 1974, Péteri 1989). In parallel, Lukács's conception was also used to develop a complex legal ontology in which the workings of the judicial mind could be seen as an equal—albeit complementary—part of what is ontologically meant by law. Accordingly, the natural limitations on the workings of the law spring both from the overall social totality and from the participants' value-consciousness (see Varga 1985). In this scheme, it was even possible to give flesh to a theoretical proposition stipulating an "ideal law": This could be done by reinventing "legal policy," that is, by advancing normative arguments that instead of prescribing political goals could suggest effective legal means for achieving those goals without detriment to Marxism's primitively inherent humanistic tendencies (see Koller, Varga and Weinberger 1992).

[4] On Lukács see Section 7.3.1 in Tome 1 of this volume.

6.3. Between Social and Analytic Theories: Natural Law Today

As the "transition to the rule of law" took place in Hungary without the slightest reference to the idea of natural law, the emergence of new natural law doctrines was neither politically nor historically inevitable after the fall of the *ancien régime*.

The legal-ideological problem of what *transition* meant was pointed out by the first president of the Hungarian Constitutional Court, when, late in his term, he summarized the court's official view by saying that "legal certainty—within the boundaries of what this Constitutional Court refers to as legal continuity—gains its significance against a background of political and ideological discontinuity" (Sólyom 2001, 65; my translation). His argument for an "invisible constitution"—an argument invoked only once, in an early opinion on the unconstitutionality of the death penalty—immediately drew sharp criticism from many who saw it as too close to the idea of natural law, despite the fact that the founding president himself came out and said he had only intended to "protect" the Constitution from the prospect of recurrent politically motivated modifications. Indeed, he may have had a coherence theory of interpretation in mind, an ever-evolving conceptual dogmatics positioned above—and thereby both substantiating and framing—the text of the Constitution itself, in terms of which the Court's established interpretive practice can prevail even if the underlying text is changed. Certainly, to make one example, when the entire Court recused itself from judging past crimes committed under the socialist regime, claiming the priority of legal certainty—meaning that formal continuity acknowledged by the successor regime was prior to any "subjective" preference for justice—no consideration based on natural law was invoked. Even when the Court adjudicated so-called hard cases (on abortion or euthanasia, for example), some of their arguments genuinely grounded in natural law were in fact positivist arguments in disguise pretending to be only engaging in textual interpretation.

After 1990, the new crop of Hungarian analytic theorists took up Oxford philosophy of law as a model, believing that its methodological approach could prove better suited to formally analyzing rule-of-law concepts. So for many (e.g., Bódig 2004, chaps. 2–4, and Györfi 2006), Dworkin could become the "new link in the chain" with which to connect the 1980s radical theories of natural rights with contemporary normative legal philosophy. On the other hand, the so-called social science theorists of law could take satisfaction in having already deconstructed official socialist ideology, so they were in a position to continue along their own paths, begun as early as the 1980s (see, e.g., Varga 1994).

In the 1990s, both the political context and local traditions suggested to emerging Hungarian natural lawyers that they should not reject the historical and sociological bases of law as foundations. Since then, the line of demarca-

tion within the community of legal theorists seems to have been between macro-sociological "grand theories" (like those of Varga and Béla Pokol) and analytical legal theories set against a practical-philosophical backdrop (like those of Bódig and Györfi; cf. Paksy and Takács 2007, 657ff.). With much internal variation, the former group criticized the latter by arguing that if we push sociology out of the way, we won't be able to see law in its full complexity as a socio-historical phenomenon, and will thus wind up with only a limited appreciation of law. The latter group claimed theoretical superiority over the former, arguing that social theorizing cannot explain the *normativity* of law.

On the one hand, from a natural law perspective, the advantage that sociological theories of law have over analytical positivism is that they do not aim at any strict separation of law from morality, so they retain their compatibility with the idea that certain widely shared values may form a necessary part of any legal system. On some of these theories (see Varga 2008), it is tradition that mediates between such values and the legal subsystem. The counterargument made by natural lawyers is that the sociological perspective entails a moral relativism. For once the working legal system is conceived as conditioned by social contexts and historical tradition, then values cannot be claimed to be objective: At best, they can be treated as components of the overall effectivity of the prevailing law and order. This stands in contrast to normative conceptions based on natural law, which as the leading canon lawyer in Hungary argues, makes justice an essential criterion for evaluating law (see Erdö 1999). On the other hand, by endorsing the separation thesis, analytical positivists claim they can bring objective values into harmony. In their view, the kind of a natural law theory propounded by thinkers like John Finnis is indeed closer to legal positivism than, say, to the theoretical perspective adopted by Bergbohm.

A way out of this divide has been proposed by Ferenc Hörcher, with his theory of "pragmatic" natural law. Instead of proceeding from any Scholastic kind of hierarchy between normative orders—natural law above positive law—he discusses multiple dimensions of human nature as the factor that drives individual action. This view is based on a philosophical anthropology according to which humans are fallible by nature, and on this premise it is argued that the only guide we have to go by in life is practical moral knowledge, or what the ancient sages called *phronesis*. From this perspective, adjudication is more than an applied syllogism. Instead, it needs to be recognized that aesthetic, moral, and legal judgments have something in common, and they are moreover interconnected in any particular decision-making situation. In Hörcher's view, if it is possible to speak of legal science at all, it should be called *prudentia juris*, using this term referring to the ultimate moral criteria of knowledge and action in the legal sphere (see Hörcher 2000a, 2000b).

As concerns the very central question of human nature, Hörcher tries to combine a rather pessimistic (anti-Cartesian) anthropology with the effort to revivify the virtue ethics of Aristotle and Aquinas. In Varga 1999, an almost

parallel approach is expounded on a social-science platform based on Villey's interpretation of the early understanding of *dikaion* (justice).[5] This is a flexible measure adapted to the specificity of given cases when used as a criterion of judgment. Slowly but surely, over the course of history, the very idea of having a measure at all has morphed into a linguistically composed technical mediator serving to guarantee both stability and flexibility in modern formal law, where both the social context of the law and the tradition of the given political community are taken into account. Historically speaking, contexts and traditions are bound to change continuously, but in a given situation at a given time its established functioning may serve as an adequately predictable measure. Describing law in practical operation, Varga (1996) takes in earnest the proposition that modern law is a complex social subsystem, one that in Luhmann's terms can be described as being at once cognitively open and normatively closed. The system's openness makes it possible to introduce not only new information and interests but also social values, balanced against one another under the personal responsibility unavoidably borne by the decision-maker. In conclusion, legal argumentation cannot become fully autonomous and still less mechanistic, for the actual workings of the law necessarily reflect the state of the underlying social structure in a changing situation constantly in flux (see Varga 1999).

The autonomy of legal argumentation has been defended by Miklós Szabó in his value-oriented theory, a theory that (*pace* Varga) he calls legal dogmatics. A variant of *prudentia iuris*, its point of departure is the logic of law (*pace* Hörcher). As to method, instead of sketching out an anthropology or working from an idea of law as a set of flexible measures, he focuses on the lawyer's "craft." When confronted with "hard cases," the legal craftsperson's supposed secret lies in a technically channelled practical moral knowledge (see Szabó 2005).

According to János Frivaldszky, a natural lawyer in a more classical vein, society is a network of intersubjective relationships among persons endowed with human dignity. These relationships, prior to the law as no more than the sovereign's command, are based on mutual respect, recognizing each person's dignity. Therefore, the legislator's goal is to sanction these intersubjective relations as legal tenets prevailing in their "political friendship," while the validity of law is closely bound up with those fundamental intersubjective relations and principles of justice which are balanced by the so-called golden rule. Indeed, the law's ultimate end is almost attained once everyone can get their due. On this basis, all of the foregoing considerations serve to define what is just [*iustum*], on the one hand, and to define the nature of things as the measure of whatever judgment is produced in the administration of justice, on the other (see Frivaldszky 1998, 2001).

[5] On Villey see Sections 1.3.3.4 and 3.4 in this tome and Section 12.6 in Tome 1 of this volume.

In conclusion, as much as Hungarian legal philosophers may have pursued a variety of paths in dealing with the challenges they have been facing—witness Tattay (2005a, 2005b) and Takács (2002)—the prevalence of natural law doctrines in their work shows that they share the emphasis on values found in modern European legal thought, while maintaining a link to classical traditions as well.[6]

[6] At the Catholic University of Hungary, natural law theory has been a compulsory course since 2006 (see Frivaldszky 2007).

Chapter 7

20TH-CENTURY NATURAL LAW THEORY IN LATIN AMERICA

by Carlos I. Massini Correas

7.1. Introduction

Natural law theory was the dominant trend in Latin America throughout the colonial period. In fact, at the universities founded by the Spanish crown—especially in those in New Spain (Mexico), Peru, and Cordoba (Argentina)—scholars lectured on *theologia moralis*, or *ius naturae*, expounding the contents of what today is known as natural law theory. They followed the general doctrine of Thomas Aquinas, though framing it within the modern school of natural law. With the independence movements, however, came a secular push, and gradually the positivism of the 19th century began to gain ground in the teaching of legal philosophy, especially at the new universities that emerged under the independent governments.

However, in the beginning of the 20th century, and mainly as a consequence of the spread of the neo-Thomistic movement in Latin America, various authors put forward a conception of legal philosophy cast in the mould of natural law. This phenomenon took place in almost all Latin American countries, but it was particularly strong in Mexico, Brazil, Chile, and Argentina, where natural law schools were founded and books and journals that espoused this vision were published.

7.2. 20th-Century Natural Law Theory in Argentina

In Argentina, the rejuvenation of natural law can undoubtedly be said to have been the work of Tomás Darío Casares (1895–1977), who received his Ph.D. in 1918 with a dissertation on the relation between religion and the state. Casares devoted his life to forging a career in the judiciary, reaching the pinnacle of that career when he was appointed to the Supreme Court of Argentina. From this position, he was able to wield significant influence in the sense of moving beyond the 19th-century legalism and introducing the natural law doctrine in Argentinian jurisprudence. In 1922, Casares founded a series of courses on Catholic culture that later developed into the Catholic University of Argentina (or UCA, short for *Universidad Católica Argentina*) and helped to spread neo-Thomism in Argentina. Moreover, he was professor of medieval philosophy at the University of Buenos Aires and professor of legal philosophy at the UCA, but it was at the latter university that he had numerous disciples and where he founded a school of natural law. In 1934, Casares also

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_35

wrote the foundational book for this school, *La justicia y el derecho* (Justice and the law: Casares 1974). The book went through several editions and is especially remarkable for having been written before all other works in this current of thought. He wrote many articles and several other books, including *La religión y el estado* (Religion and the state: Casares 1919), *Jerarquías espirituales* (Spiritual hierarchies: Casares 1928), *Naturaleza y responsabilidad económico social de la empresa* (The economic and social nature and responsibility of enterprises: Casares 1967), *Acerca de la justicia* (On justice: Casares 1971), and *Conocimiento, política y moral* (Knowledge, politics, and morality: Casares 1981). In his books, Casares defended the central theses of Thomistic natural law theory, claiming in particular that justice plays a constitutive role in the definition of law; that normative practical orders, from ethics to law, are continuous; and that a complete legal order can only be accomplished by transcending the rational-temporal level and opening the order to metaphysical transcendence.

Octavio N. Derisi (1907–2002), bishop, Ph.D. holder, and cofounder of the UCA, also made a major contribution to the development of natural law theory, especially through his outstanding work *Los fundamentos metafisicos del orden moral* (The metaphysical foundations of the moral order: Derisi 1969) and through numerous other books, articles, and contributions. Moreover, as university president (a position he held for many years), Derisi encouraged the spread of natural law theory through a range of initiatives, endowing chairs in that discipline; bringing out publications; organizing lectures, conferences, and congresses; and the like.

Various significant thinkers emerged from the UCA, all of them disciples of Casares. Noteworthy among them was Juan Alfredo Casaubon (1918–2011), a researcher at the Argentinian National Scientific and Technical Research Council (or CONICET, short for *Consejo Nacional de Investigaciones Científicas y Técnicas*) and professor of legal philosophy at the UCA and the University of Buenos Aires. Casaubon also taught logic and wrote numerous books and articles. Among them are *Palabras, ideas, cosas* (Words, ideas, things: Casaubon 1984a); *Introducción al derecho* (Introduction to law: Casaubon 1979–1985); and *El conocimiento jurídico* (Legal knowledge: Casaubon 1984b). Casaubon's contribution mainly lies in his having offered a strictly logical presentation of legal philosophy and having brought analytic philosophy to bear on Thomistic legal philosophy. A contemporary of Casaubon was Abelardo Rossi (1920–2009), a member of the Supreme Court of Argentina who in this role promoted a justice grounded in principles of equity, sometimes resulting in rulings invoking a transcendent reality. He cofounded the Thomistic Society of Argentina and was also professor at the UCA. He also wrote many articles and *Aproximación a la justicia y a la equidad* (Approaching justice and equity: Rossi 2000). Many of his writings on this theme are collected in *Precisiones sobre la justicia* (Clarifications regarding justice: Rossi 1980).

At the UCA there is a generation of natural lawyers (current faculty members or former ones) who have been carrying that current forward. Among them are Bernardino Montejano, author of *Curso de Derecho natural* (Course on natural law: Montejano 1967a), *Los fines del derecho* (The aims of law: Montejano 1967b), *Estática jurídica* (Static theory of law: Montejano 1969), *Ideología, racionalismo y realidad* (Ideology, rationalism, and reality: Montejano 1981), and other books on issues concerning the universities. Another author is Carlos Raúl Sanz, who translated several books by his teacher, Michel Villey, and wrote introductions to them. Sanz also wrote many original articles. Also in this group are Eduardo M. Quintana and Jorge G. Portella, who wrote many good articles and books. Many young authors have emerged from this school: Juan Cianciardo, Pilar Zambrano, Juan Bautista Etcheverry, and Fernando Toller—all professors at the Austral University of Buenos Aires—as well as Santiago Legarre and Daniel Herrera, professors at the UCA. All these young authors have published important books and are now developing their teaching and investigative capacities to the fullest.

Also a prominent thinker is Rodolfo L. Vigo, educated outside the UCA but now a professor there. Vigo was formerly a professor at the University of Litoral in Santa Fe and now teaches at Austral University in Buenos Aires. He has been president of the Argentinian Association for Legal Philosophy, and his books include *Las causas del derecho* (The causes of law: Vigo 1983), *Sobre los principios jurídicos* (On legal principles: Vigo and Delgado Barrio 1997), *Interpretación jurídica* (Legal interpretation: Vigo 1999), *De la ley al derecho* (From statutes to law: Vigo 2003a), *El iusnaturalismo actual, de M. Villey a J. Finnis* (Present-day natural law from M. Villey to J. Finnis: Vigo 2003b), and *Perspectivas iusfilosóficas contemporáneas* (Contemporary perspectives in legal philosophy: Vigo 2006). Vigo's best work is on legal interpretation and legal ethics, where he has made substantial and original contributions. One of his disciples was María de los Angeles Manassero, who recently died at a very young age. She taught at the University of Litoral and at the Catholic University of Santa Fe and wrote an impressive book titled *De la argumentación al derecho razonable: Un estudio sobre Chaim Perelman* (From argumentation to reasonable law: A study on Chaim Perelman, Manassero 2001). I should also include myself in this group, noting only that I have studied in large part under Georges Kalinowski and am a professor of law and ethics at the University of Mendoza; I have also taught ethics at the UCA and have written numerous books, among which *La prudencia jurídica* (Legal prudence: Massini Correas 1983), *Filosofía del derecho* (Philosophy of law: Massini Correas 1994a), *Los derechos humanos en el pensamiento actual* (Human rights in contemporary thought: Massini Correas 1994b), *Constructivismo ético y justicia procedimental en John Rawls* (Moral constructivism and procedural justice in John Rawls: Massini Correas 2004), *La ley natural y su interpretación contemporánea* (Natural law and its contemporary interpretation: Massini Correas 2006), and

Objetividad jurídica e interpretación del derecho (Legal objectivity and the interpretation of law: Massini Correas 2008). Finally I should mention Renato Rabbi-Baldi, professor at the University of Buenos Aires and the author of a praiseworthy book titled *La filosofía jurídica de Michel Villey* (Michel Villey's legal philosophy: Rabbi-Baldi 1990) and of many articles connect different philosophical currents with Argentinian jurisprudence. Villey was the subject of Rabbi-Baldi's earliest investigations, which subsequently turned to the effort to show how the concepts of philosophical hermeneutics can help advance our understanding of judicial practice.

Another current in natural law theory originated in Cordoba. Its initiator was Alfredo Fragueiro (1899–1975), author of *De las causas del derecho* (On the causes of law: Fragueiro 1949), *La analogía del derecho* (Analogy in law: Fragueiro 1952), and numerous articles. Quite evident in his work is the influence of Francisco Suárez. A disciple of Fragueiro was Olsen Ghirardi, who became president of the University of Cordoba and wrote important books, such as *Hermenéutica del saber* (Hermeneutics of knowledge: Ghirardi 1979), *Lecciones de lógica del derecho* (Lectures on the logic of law: Ghirardi 1982), and *Introducción al razonamiento forense* (Introduction to legal reasoning: Ghirardi 2003). Most of his work is focused on epistemology, logic, and legal argumentation. Schooled in the approach set out by Ghiradi was Armando Andruet, a member of the supreme court in his province, a professor at the Catholic University of Cordoba, and an author of various articles on bioethics and legal rhetoric. Teaching in the province of Santiago del Estero is Julio César Castiglione, a follower of Michel Villey, as well as a professor and the author of various books and articles.

Also from Cordoba is Guido Soaje Ramos (1918–2004), though most of his intellectual work was done in Buenos Aires and abroad. He was a member of Argentina's National Research Council and founded, and for many years directed, the prestigious Argentinian Institute for Practical Philosophy and its official publication, the journal *Ethos*. He taught ethics at the UCA and philosophy of law at the same university as well as at the University of Buenos Aires. It was at these institutions that his teaching had the greatest impact, and it was here that he trained many disciples. Soaje did not write any book but did write many articles, some of which were quite extensive and important. He distinguished himself by the accuracy of his investigations and the extent of his philosophical knowledge. Soaje professed a very strict Thomism after the fashion of Cornelio Fabro. He did, however, have a profound knowledge of contemporary philosophy, and German philosophy in particular. Two direct pupils of Soaje are Hector Hernandez and Felix Lamas, who stand out for the systematicity and depth of their inquiries. Hernandez is a professor at FASTA University in Mar del Plata, director of the legal philosophy supplement of the journal *El Derecho*, and the author of *La justicia en la "Teoría Egológica del Derecho"* (Justice in the "egological theory of law": Hernandez 1980) and *Valor*

y derecho: *introducción axiológica a la filosofía jurídica* (Value and law: An axiological introduction to the philosophy of law: Hernandez 1998), among other articles and reviews. Lamas, for his part, is a professor at the UCA, director of the *Revista Internacional de Filosofía Práctica*, and the author of *Los principios internacionales* (International principles: Lamas 1974), *La concordia política* (Political concord: Lamas 1975), and *La experiencia jurídica* (The experience of law: Lamas 1991), among other books.

As distinguished natural lawyer from Tucumán, in northern Argentina, was Edgardo Fernández Sabaté (1918–1982), who followed Maritain and taught at the University of Tucumán until his death in 1982. He also wrote important books whose approach is distinctly personalistic. Among them are *Los grados del saber jurídico* (The degrees of legal knowledge: Fernández Sabaté 1968), *Lecciones de filosofía* (Lectures on philosophy: Fernández Sabaté 1974), and *Filosofía del derecho* (The philosophy of law: Fernández Sabaté 1984). Among his disciples are Adalberto Villeco and René Goane, both professors in Tucumán and authors of articles published in university journals. Villeco, too, wrote many books, among them *En torno a la perfección* (On perfection: Villeco 1976) and *Ateísmo, lógica e historia* (Atheism, logic, and history: Villeco 1969). In a neighboring city, Salta, is Julio Raul Mendez, the author of an important book on metaphysics titled *El amor, fundamento de la participación metafísica* (Love as the foundation of metaphysical participation: Mendez 1985). Mendez is a committed Thomist in the mould of Cornelio Fabro. He also teaches medieval philosophy at the University of Salta.

7.3. 20th-Century Natural Law Theory in Brazil

Brazil initially inherited its philosophical culture from Portugal, and an important role in this process was played by the Jesuits—with their quasi-monopoly on education in the colonial period—who introduced the practical philosophy of the Scholastic school. An exceptional work from this period was Tomas Antonio Gonzaga's *Tratado de direito natural* (Treaty of natural law: Gonzaga 1957), which became the starting point for the natural law tradition in Brazil. Gondaga's *Tratado* was reprinted in 1957. It bears mentioning in this regard that the Brazilian independence movement did not bring about the widespread introduction of secularism and positivism that was seen in most of the countries colonized by the Spanish (Brazil was still a colonial empire). This change instead came with the founding of the republic at the end of the 19th century. It also bears mentioning that positivism bore a strong Comtian imprint in Brazil, and that this was one of the few countries where Comte's positivist religion had a significant following. (There is even to this day a church dedicated to this religion in Porto Alegre.) The late coming of secularism meant that the natural law tradition in Brazil could continue solidly without the interruptions that intervened in the other Latin American countries.

Among the natural law thinkers of the 19th century was José Soriano de Sousa, who in 1880 wrote a remarkable book titled *Elementos de philosophia do direito* (Elements of legal philosophy: Sousa J. Soriano 1884).

By the 20th century, the central theories of the neo-Thomistic school had become widespread in Brazil. Especially consequential in this school were the personalistic ideas propounded by Jacques Maritain and Emmanuel Mounier, for they would later influence philosophers such as Alexandre Correia, the Belgian priest Leonardo van Acker, Edgard Mata Machado, and Alceu Amoroso Lima. Among the personalistic philosophers was André Franco Montoro (1916–1999), who devoted much of his work to the philosophy of law. He was a politician—serving as governor of São Paulo and as a senator—and a professor of legal philosophy at São Paulo's Pontifical University. Moreover, Montoro wrote *Introducao à ciência do direito* (Introduction to the science of law: Montoro 1968), in which he defended Thomistic natural law ideas, backing them up with strong arguments, as did other philosophers of law, like Miguel Reale.[1] Montoro, who was strongly influenced by the Belgian jurist Jean Dabin, maintained that law in its every phase is underpinned by three core axiological elements—the common good, justice, and the dignity of the human person—serving as a guide and a model in the making of law itself. As much as concrete law in each age does not clearly align with these axiological elements, it can nonetheless be described as an effort to achieve such an alignment. In this way, according to Montoro, the principles of natural law are general but not devoid of content: They have a concrete historical sense, and the axiological elements of law play a role throughout the adjudication process, especially when interpreting the law.

In São Paulo in the second half of the 20th century, natural law theory had two noted representatives outside the sphere of personalism. The first one was the Estonian Jesuit priest Stanilavs Ladusans (1912–1993). He was a strict Thomist and for may years directed the Inter-American Catholic Association for Philosophy and the Brazilian Association of Catholic Philosophers. Moreover, Ladusans led a philosophical research group, first in São Paulo and later in Rio de Janeiro, and he organized annual meetings devoted to issues in natural law theory. The minutes of these meetings would later be published in books such as *A análise social filosófico-cristà* (Christian-philosophical social analysis: Ladusans 1988) and *Questoes atuais de Bioética* (Current issues in bioethics: Ladusans 1990). Ladusans also wrote books like *Gnosiologia pluridimensional* (Pluridimensional gnoseology: Ladusans 1982) and numerous articles. To be sure, he was more a promoter and organizer of meetings and publications than an original philosopher. But through this commitment to promote these ideas and give them currency, he exerted considerable influence on the Brazilian philosophical community. Closely connected with Ladusans was the

[1] On Reale see Section 27.5 in Tome 1 of this volume.

Paulist jurist José Pedro Galvao de Sousa (1912–1992). He taught theory of the state at the Catholic University of São Paulo, the Public University of São Paulo, and the University of Campinas, and he wrote highly regarded books like *Iniciacao a teoria do estado* (Introduction to the theory of the state: Sousa J. P. Galvao 1967), *A historicidade do direito e a elaboracao legislativa* (The historicity of law and lawmaking: Sousa J. P. Galvao 1970), *O estado tecnocrático* (The technocratic state: Sousa J. P. Galvao 1973), and *Direito natural, direito positivo e estado de direito* (Natural law, positive law, and the rule of law: Sousa J. P. Galvao 1977). But his most important work was undoubtedly *O totalitarismo nos origens da moderna teoría do estado: Um estudo sobre o "Defensor Pacis" de Marsilio de Padua* (Totalitarianism at the origins of the modern theory of the state: A study of Marsilius of Padua's *Defensor pacis*, Sousa J. P. Galvao 1972), a work of exceptional scholarship on the origins of modern political thought. Galvao was a traditionalist in the mould of Francisco Elías de Tejada, as well as a monarchic activist, and it is for this reason that his Thomist natural law theory picked up the traditionalism of authors like Joseph de Maistre, Donoso Cortés, and Juan Vázquez de Mella.

Finally, there are two active groups currently working in the natural law tradition in Brazil. The first group—based in Porto Alegre, in the state of Rio Grande do Sul, and more specifically at the pontifical university of that state—was formed under the influence of personalism. The main vehicle for its ideas was the journal *Realism*, and in Porto Alegre its members organized annual conferences on natural law, with the participation of John Finnis in 2007. The main representatives of this group are Luis Fernando Barzotto and Wambert Gomes Di Lorenzo. Barzotto wrote a valuable book titled *O Positivismo jurídico contemporâneo* (Contemporary legal positivism: Barzotto 2001); in *A democracia na constituicao* (Democracy in the constitution: Barzotto 2003), he addressed the problem of democracy; he also wrote *Filosofía do direito: Os conceitos fundamentais e a tradicao jusnaturalista* (The philosophy of law: Fundamental concepts and the natural law tradition, Barzotto 2010) and numerous articles on the philosophy of law. Gomes di Lorenzo, for his part, edits the previously mentioned journal *Realism* and is an active promoter of academic and research activities. The second group works in the traditionalist current. It is based in São Paulo and is led by Judge Ricardo Marques Dip, who has published various articles on legal philosophy and criminal law.

7.4. 20th-Century Natural Law Theory in Mexico

It is well known that in Mexico, Spanish Scholasticism achieved great prominence during the Viceroyalty of New Spain until the wars for independence, maintaining a strong footing even as it struggled with masonic and positivist forces, which were very influential in Mexico during the second half the 19th century. However, after the Mexican Revolution (1913–1920), governments

adopted a policy of eradicating all currents of thought linked to the Catholic Church, and among these currents was natural law theory. Of course, this aim was not achieved and natural law theory began to recover in the 1940s, returning to a prestigious position. An important role in this recovery was played by Rafael Preciado Hernández (1908–1988) and Efraín González Morfín (1929–2012). Preciado Hernández taught at the National Autonomous University of Mexico (UNAM, short for *Universidad Nacional Autónoma de México*) for more than thirty years and wrote various works on legal philosophy from a Thomist angle. Among these works is *Lecciones de filosofía del derecho* (Lectures in the philosophy of law: Preciado Hernández 1965), holding that natural law is only a set of rational criteria—criteria of practical rationality—underpinning the legal organization of society and corresponding to the human ontological structure. Other works include *Contra la servidumbre del espíritu* (Against the servitude of the spirit: Preciado Hernández 1940) and *Ensayos filosófico-jurídicos y políticos* (Legal-philosophical and political essays: Preciado Hernández 1977).

González Morfin, for his part, was not just an academic but also went into politics, joining the National Action Party, for which he served as a congressman and also ran for president. He studied law and political science in Innsbruck and Paris and taught philosophy of law and political theory at the Ibero-American University of Mexico. González Morfin was professor emeritus at the Pan American University—the Guadalajara branch—and wrote numerous books and articles, including *Formar personas: Sugerencias y caminos de un pensador* (Forming people: A thinker's suggestions and paths, González Morfín 2002) and *Temas de filosofía del derecho* (Themes in the philosophy of law: González Morfín 2003), to name just a few. He had many disciples, and they have come together to write a book in his honor: *El magisterio de Efraín González Luna Morfín* (The teaching of Efraín González Luna Morfín: González Morfín et al. 2005). His Thomist thought bears a strong personalist and Christian-social imprint. A contemporary of González Morfín was Hector González Uribe (1918–1988), who taught philosophy of law at the National Autonomous University of Mexico and wrote *Teoría política* (Political theory: González Uribe 1972), *Hombre y sociedad* (Man and society: González Uribe 1979), and *Hombre y estado* (Man and the state: González Uribe 1988). His vision of natural law appears to be framed for the most part within the theory of human rights, which in his thinking is the contemporary way of talking about natural law.

Another significant author was Antonio Gómez Robledo (1903–1994), who taught international law at the UNAM School of Law and Greek philosophy at the same university's school of philosophy. He also served as Mexican ambassador to many countries, including Greece. Gómez Robledo was a prominent Platonist and Aristotelian and a well-known translator of classic texts, and he also wrote numerous books, all of them widely praised, which include *Ensayo*

sobre las virtudes intelectuales (Essay on the intellectual virtues: Gómez Robledo 1957), *Meditación sobre la justicia* (Meditation on justice: Gómez Robledo 1963), *Sócrates y el socratismo* (Socrates and Socraticism: Gómez Robledo 1966), *Platón: Los seis grandes temas de su filosofía* (Plato: The six great themes in his philosophy: Gómez Robledo 1974), *Dante Alighieri* (Gómez Robledo 1975), *El ius cogens internacional: Estudio histórico-crítico* (International *ius cogens*: A historico-critical study: Gómez Robledo 1982a), *Fundadores del derecho internacional: Vitoria, Gentili, Suárez, Grocio* (Founders of international law: Vitoria, Gentili, Suárez, Grotius: Gómez Robledo 1986), and *Doctoralis Oratio:* Últimos escritos (*Doctoralis Oratio*: Last writings: Gómez Robledo 1994). His theory is conceived in a classical mould and is mainly Aristotelian, though it also draws on Platonic themes and on the philosophy of values. Eduardo García Máynez (1908–1993) and Luis Recaséns Siches (1903–1977) also played a part in the middle of the 20th century.[2] And even though they cannot be considered natural law thinkers in any strict sense, they did defend positions very close to those of natural law. García Máynez moved away from a Kelsenian position to traditional ideas of natural law, mainly in his books *Doctrina aristotélica de la justicia* (The Aristotelian doctrine of justice: García Máynez 1973) and *Filosofía del derecho* (Philosophy of law: García Máynez 1977). Recaséns Siches, a Honduran Spaniard living in Mexico, distinguished himself for his defence of human rights and for his criticism of legal formalism and positivism. He wrote many other books, including *Direcciones contemporáneas del pensamiento jurídico* (Contemporary orientations in legal thought: Recaséns Siches 1929), *Nueva filosofía de la interpretación del derecho* (New philosophy for the interpretation of law: Recaséns Siches 1956), *Tratado general de filosofia del derecho* (General treatise of philosophy of law: Recaséns Siches 1959), and *Introducción al estudio del derecho* (Introduction to the study of law: Recaséns Siches 1970). Also worthy of mention is Agustín Basave (1923–2006), a professor in Monterrey and a philosopher with an impressively broad range of interests. He wrote various books from a natural law perspective. These include *Filosofía del hombre* (Philosophy of man: Basave 1957), *Filosofía del derecho internacional* (Philosophy of international law: Basave 1985), and *Meditación sobre la pena de muerte* (Meditation on the death penalty: Basave 1997).

At present, the most authoritative representatives of natural law theory in Mexico are Mauricio Beuchot (1950–) and Javier Saldaña (1966–). Beuchot studied philosophy and philology in Mexico and Fribourg (Switzerland) and is a researcher at the UNAM's Institute for Philological Research. Here he directs the Center for Classical Studies, where he conducts research in the philosophy of language, hermeneutics, analytic philosophy, logic, and the philosophy of law: The work is distinguished by its attention to detail and its excellent scholarship. Beuchot has published seventy books and more than two hun-

[2] On García Máynez and Recaséns Siches see also Section 28.4 in Tome 1 of this volume.

dred articles. In the philosophy of law alone, the list includes *Los principios de la filosofía social de Santo Tomás* (The principles of Thomas Aquinas's social philosophy: Beuchot 1989), *Filosofía y derechos humanos* (Philosophy and human rights: Beuchot 1993), *Los fundamentos de los derechos humanos en Bartolomé de las Casas* (The foundations of human rights in Bartolomé de las Casas: Beuchot 1994), *Derechos humanos, iuspositivismo y iusnaturalismo* (Human rights, legal positivism, and natural law theory: Beuchot 1995), *Ética y derecho en Tomás de Aquino* (Ethics and law in Thomas Aquinas: Beuchot 1997), and *Derechos humanos y naturaleza humana* (Human rights and human nature: Beuchot 2000). Although Beuchot undoubtedly works in the classical natural law tradition, he is deeply knowledgeable in analytic philosophy and philosophical hermeneutics, which can clearly be seen to influence his views on natural law and human rights.

Saldaña, for his part, is a professor at the UNAM School of Law and a researcher at the National Research System, part of the UNAM's Institute for Legal Research. He holds a Ph.D. from the University of Navarra with a dissertation titled "Libertad religiosa y derecho natural" (Freedom of religion and natural law) and has published *Poder estatal y libertad religiosa* (The state's power and religious freedom: Saldaña and Orrego 2001), *Derechos del enfermo mental* (Rights of the mentally ill: Saldaña 2000), *Ética judicial: Virtudes del juzgador* (Judicial ethics: Virtues of the judge: Saldaña 2007), and *Derecho natural: Tradición, falacia naturalista y derechos humanos* (Natural law: Tradition, the naturalistic fallacy, and human rights: Saldaña 2012), as well as various articles and book chapters. A faithful disciple of Javier Hervada, he has developed natural law doctrines that (as can be gathered from the titles just listed) he has applied to a range of concrete problems, such as human rights, the rights of the mentally ill, and religious freedom.

Also worthy of mention in Mexico are Virgilio Ruiz Rodríguez, María del Carmen Platas Pacheco (*Filosofía del derecho: Lógica jurídica* [Philosophy of law: Legal logic]: Platas Pacheco 2004), Juan Abelardo Hernández Franco (*Dialéctica y racionalidad jurídica* [Dialectics and legal rationality]: Hernández Franco 2006), Hugo Ramírez (*Derechos humanos* [Human rights]: Ramírez and Pallares Yabur 2011), and Jorge Adame Goddard (*Naturaleza, persona y derechos humanos* [Nature, persons, and human rights]: Goddard 1996). With Beuchot and Saldaña, they all offer different perspectives on natural law theory, contributing to the development of this rich new current in Mexican legal thought.

7.5. 20th-Century Natural Law Theory in Colombia

Similarly to what happened in the other Latin American countries, Scholastic natural law in Colombia—influenced by the Spanish Scholasticism of Vitoria and Suárez—established itself as the predominant practical philosophy in the colonial period, which under the independent republic faced the challenge

posed by Bentham's utilitarianism and Destutt de Tracy's ideology. In this debate, Scholastic natural law theory was tasked with supporting conservative positions against liberal ones. One who stood out in defending conservatism and attacking utilitarianism was the politician Miguel Antonio Caro (1843–1909), who wrote the Colombian Constitution of 1886 and served as president of the republic.

Also in synchrony with what happened in the other Latin American countries, the 20th century in Colombia began with the introduction of neo-Thomism. In legal philosophy, this line of thought was normative (centered on norms), differing from Thomas Aquinas's thought in several respects. Worthy of mention within this current was José Vicente Castro Silva (1885–1968), who held the chair in legal philosophy from the second half of the 20th century until his death. Another leading figure was Pedro María Carreño (1874–1946), a notable jurist, politician, and educator, as well as dean of the National University's law school, where he taught philosophy of law. He wrote *Filosofía del derecho* (Philosophy of law: Carreño 1909), where he defends the central positions of traditional Thomistic natural law theory. In the second half of the century, Abel Naranjo Villegas (1908–1992) developed Thomist thought under the clearly appreciable influence of Jacques Maritain and Etienne Gilson. Naranjo Villegas taught philosophy of law at the Bolivarian University of Medellín and at the National University of Colombia and wrote the book *Filosofía del derecho* (Philosophy of law: Naranjo Villegas 1947). Contemporary with him was Rodrigo Noguera Laborde (1920–2004), who was founder and rector of Sergio Arboleda University and the author of *Derecho natural: Apuntes de clase* (Natural law: Lecture notes, Noguera Laborde 1992), a mainly historical book.

Beginning in the 1980s in Bogotá, at La Sabana University and the Catholic University of Colombia, natural law gained a new impetus with the formation of an outstanding group whose members were for the most part disciples of Javier Hervada at the University of Navarra and felt his influence. Here I should mention Ilva Miriam Hoyos Castañeda (*El concepto jurídico de persona* [The legal concept of a person]: Hoyos Castañeda 1989), Francisco José Herrera, who died at a young age in 1996, Edwin de Jesús Hortta, Gabriel Mora Restrepo, and Claudia Helena Forero—all members of the group at La Sabana. Mora Restrepo and Forero have contributed to neoconstitutionalism and constitutional methodology. Carlos Alberto Cárdenas and Edgar Antonio Marín, both at Saint Thomas Aquinas University, have written a very interesting book titled *Filosofia y teoria del derecho: Tomás de Aquino en diálogo con Kelsen, Hart, Dworkin y Kaufmann* (Philosophy and theory of law: Thomas Aquinas in dialogue with Kelsen, Hart, Dworkin, and Kaufmann, Cárdenas and Guarín Ramírez 2006). The La Sabana group has published several of Hervada's books, and through its work his thought has spread rapidly across Colombia, so much so that one can rightly speak of a Hervadian school in Colombia that keeps growing steadily.

7.6. 20th-Century Natural Law Theory in Uruguay

In the first half of the 20th century in Uruguay, the philosophy of law came under the influence of Kelsen's doctrine, which was not developed to any great extent but did gain widespread acceptance among jurists, so much so as to become entrenched as dogma. The tide began to turn in the 1930s, however, when this secular dogma became a target of criticism in the teachings and publications of Juan Llambías de Acevedo (1907–1972), who taught at the University of the Republic and wrote *Eidética y aporética del derecho* (Eidetics and aporetics of law: Llambías de Azevedo 1940). Llambías de Acevedo propounded an axiological theory of natural law in the mould of Max Scheler, about whom he wrote an important book titled *Max Scheler: Exposición sistemática y evolutiva de su filosofía* (Max Scheler: A systematic and evolutional exposition of his philosophy: Llambías de Azevedo 1966). He conceived natural law as a set of deontological principles and criteria based on an idea of human essence and serving to guide positive law. Also worthy of mention is Antonio M. Grompone (1893–1965), professor of legal philosophy, dean of the law school at the University of the Republic, and the author of *Filosofía de las revoluciones sociales* (Philosophy of social revolutions: Grompone 1932), a book that takes a strong stance against legal positivism.

Among Llambías de Acevedo's pupils was Esther Aguinsky de Iribarne (1925–1999), who became an important figure in her own turn. She followed an axiologist approach and taught philosophy of law at the University of the Republic. Her various book include *Justicia y derecho* (Justice and law: Aguinsky de Iribarne 1965), *Fenomenología y ontología jurídica* (Legal phenomenology and ontology: Aguinsky de Iribarne 1971), and *El pensamiento de Ihering y Hegel* (Jhering's and Hegel's thought: Aguinsky de Iribarne 1975). Classic natural law studies have seen a rebirth at the University of Montevideo through the work of Nicolás Etcheverry Estrázulas (1949–). Etcheverry is professor and dean at that university's law school; he is the first professor in Uruguay to have adopted an overtly Thomistic approach.

7.7. 20th-Century Natural Law Theory in Chile

In a pattern that can be observed in many other countries, contemporary natural law theory in Chile was mainly defined by its opposition to legal positivism, which was predominant in the 19th century and the first decades of the 20th century. Its main precursor in Chile was Rafael Fernández Concha (1833–1912), but the current was also shaped by the influence of the neo-Thomism that emerged in Europe under the influence of the encyclical *Aeterni Patris*. Numerous Chilean intellectuals thus studied Cathrein, Mausbach, Vermeersch, Taparelli, and Mercier, among others—a body of work that in this way played a decisive role in shaping Chilean natural law theory the 20th cen-

tury. Among the intellectuals who worked in this tradition were Roberto Peragallo (1872–1954), who taught philosophy of law at the Catholic University of Chile for more than forty years and wrote *Iglesia y estado* (Church and state: Peragallo 1923), strongly criticizing legal positivism. Another prominent figure was Francisco Vives (1900–1969), who taught philosophy of law at the Catholic University and wrote an introduction to the study of law, later republished as *Filosofía del Derecho* (Philosophy of law: Vives 1941). Carlos Hamilton Depassier (1908–1988) taught at the University of Chile and wrote *Introducción a la filosofía social* (Introduction to social philosophy: Depassier 1949), a book written in a Thomistic vein, and *Introducción al estudio del derecho* (Introduction to the study of law: Depassier 1948). There was also Máximo Pacheco Gómez (1924–2012), who taught an introductory law course at the University of Chile and wrote numerous books and articles, including *Introducción al studio de las ciencias jurídicas y sociales* (Introduction to legal and social science: Pacheco Gómez 1952) and *Las tendencias actuales de la filosofía jurídica* (Current trends in legal philosophy: Pacheco Gómez 1959). Although his conception is Thomistic, he also draws on other thinkers, such as Giorgio Del Vecchio.[3]

A special mention should go to Jorge Iván Hübner Gallo (1923–2006), who taught an introductory law course at the University of Chile for many years and put forward a system of legal philosophy mainly grounded in Thomistic natural law theory but enriched with insights gleaned from the philosophy of values, the theory of institutions (Hauriou, Renard, Delos), and again Del Vecchio.[4] He also wrote numerous books, many of which went through several editions. Among them are *Introducción a la teoría de la norma jurídica y la teoría de la institución* (Introduction to the theory of legal norms and the theory of institutions: Hübner Gallo 1951), with a foreword by Giorgio Del Vecchio, *Manual de filosofía del derecho* (Textbook of legal philosophy: Hübner Gallo 1954), *Introducción al derecho* (Introduction to law: Hübner Gallo 1966), and *Panorama de los derechos humanos* (Overview of human rights: Hübner Gallo 1973). According to Hübner Gallo, the intellect does not properly *create* norms or arbitrarily and artificially build them, but rather *discovers* them as objectively necessary in light of the human ends discovered by ontological investigation. He thus espoused a normativist and ontological conception of natural law, as did many of his contemporaries trained in the rationalist Scholasticism of the 18th and 19th centuries.

A central role in Chilean natural law theory was played as well by Jaime Williams Benavente (1940–), who taught introductory courses on law and legal philosophy at the University of Chile, the University for Development, and

[3] On Del Vecchio see Section 1.1.3.1. in this tome and Section 11.2.1 in Tome 1 of this volume.

[4] On Renard see Section 1.1.4.2 in this tome. On Hauriou see the same Section 1.1.4.2 in this tome as well as Section 12.2 in Tome 1 of this volume.

Gabriela Mistral University. He also took part in the philosophy of law programme taught at the University of Rome and held a Ph.D. from the University of Navarra. He is a prolific writer who has published various articles in European journals—mainly in Spain—as well as numerous books, among which *Panorama de la filosofía jurídica en Chile* (Overview of legal philosophy in Chile: Williams Benavente 1969) and *Lecciones de introducción al derecho* (Introductory lectures on law: Williams Benavente 1994). Although Williams Benavente defends Thomistic natural law theory, he is also conversant with all the other lines of thought in the philosophy of law and has enriched his Thomism with ideas from the philosophy of values and the work of Sergio Cotta.[5]

The youngest generation of Chilean natural law thinkers can be divided into two main groups: One is traditionalist and looks to Osvaldo Lira (1904–1996), the author of *Nostalgia de Vázquez de Mella* (Nostalgia for Vázquez de Mella: Lira 1942) and *Derechos humanos: Mito y realidad* (Human rights: Myth and reality, Lira 1993); the other, by contrast, is more receptive to contemporary thought and looks in particular to John Finnis. A prominent member in the first group is Gonzalo Ibánez Santamaría (1944–). He received his Ph.D. from the University of Paris under the direction of Michel Villey and wrote an important book titled *Persona y derecho en el pensamiento de Berdiaeff, Mounier y Maritain* (Person and law in the thought of Berdiaeff, Mounier, and Maritain: Ibánez Santamaría 1984). He also taught at the Catholic University of Chile and at Adolfo Ibáñez University for many years, also serving as president of the latter university, though he is now engaged in political activity. Also worth a mention is Eduardo Soto Kloss (1942–), though his area of expertise is administrative law. Soto Kloss taught at the University of Chile and is now teaching at Saint Thomas University. He edits the journal *Ius Publicum* and has also edited a very important book titled *El derecho natural en la realidad social y jurídica* (Natural law in social and legal reality: Soto Kloss and Castaño 2005). Next I would mention José J. Ugarte Godoy (1945–), professor at the Catholic University of Chile, and Raúl Madrid (1965–), who holds a Ph.D. from the University of Navarra, has served as general secretary of that university for many years, and has written numerous articles on topics relating to natural law and postmodern thought, especially that of Jacques Derrida. Another author is Alejandro Guzmán Brito (1945–), an important student of Roman law, as well as a legal historian who has written several deep and learned articles and books on the history of legal thought.

In the second group we find Joaquín García Huidobro (1959–), who received his Ph.D. from the University of Navarra. García Huidobro has done some work on natural law theory and ethics and currently teaches at the University of the Andes. His books include *Filosofía y retórica del iusnaturalismo* (Philosophy and rhetoric of natural law theory: García Huidobro 2002) and

[5] On Cotta see Sections 1.3.3.2 and 5.3 in this tome, and Section 11.6 in Tome 1 of this volume.

El anillo de Giges: Una introducción a la tradición central en la ética (The Ring of Gyges: An introduction to the main tradition in ethics, García Huidobro 2005). Another important member of this group is Cristóbal Orrego (1965–), who also holds a Ph.D. from the University of Navarra and teaches at the Catholic University of Chile. He has written *H. L. A. Hart, abogado del positivismo jurídico* (H. L. A. Hart: The advocate of legal positivism, Orrego 1997), an essential book for an understanding analytic philosophy of law, and is also the author of *Analítica del derecho justo* (Analytics of just law: Orrego 2005). Orrego has written the Spanish translation of John Finnis's *Natural Law and Natural Rights*, the central book of natural law theory in the 1980s.[6] I should also mention Alfonso Gómez Lobo (1940–), who teaches moral philosophy at Georgetown University and has sat on the President's Council on Bioethics in the United States. Among his many books is *Los bienes humanos: Ética de la ley natural* (Human goods: Ethics and natural law, Gómez Lobo 2006), a short but fundamental work setting out his personal views on the ethics of natural law. Among the youngest in the group is Max Silva Abbot, who teaches at the Catholic University of Concepción and has written a voluminous and critical book on the philosophy of Norberto Bobbio (Silva Abbot 2008).

7.8. Conclusion

As can be gathered from the foregoing overview, natural law theory in Latin America is an especially strong current of thought that keeps growing and expanding across the continent. The most salient features of this current can be summarized as follows: (*i*) Its current members have been especially influenced by foreign authors like Michel Villey, Sergio Cotta, Javier Hervada, Georges Kalinowski, and John Finnis; (*ii*) despite this foreign influence, significant work has been done by local authors; (*iii*) most of these authors are versed not only in the philosophy of law but also in general philosophy and the history of philosophy; (*iv*) this current promotes vigorous debate and a close dialogue with the other orientations in contemporary thought and has incorporated the ideas of contemporary natural law thinkers; and (*v*) a great many books, articles, and translations of contemporary authors have been produced in this current, resulting in a full revision of the relevant bibliography.

Part Two

Legal Positivism

Introduction

LEGAL POSITIVISM IN THE 20TH CENTURY

by Mauro Barberis

The expression *legal positivism*, more than one century after its first appearance, is widespread in Western legal culture. Various definitions have been offered of it, and they will all be considered in what follows; in fact, most of the civil law theorists mentioned in this chapter have either been labelled legal positivists or have problematized the label, or both. The label itself designates less a theory than a research tradition: a complex of practices, beliefs, and attitudes cultivated by Western jurists and then articulated in clusters of theories. This tradition traces back to the epoch-making turning point of codification—affecting only civil-law countries in a direct way—and it developed by differentiation out of a little older tradition, modern natural law.

The millenary natural-law tradition, which in Continental Europe continues in the various forms of *Rechtsphilosophie*, can be described in turn as a broadly philosophical and normative cluster of theories—where *philosophical* is opposed to *legal*, and *normative* to *cognitive*. On this conception, the *positive* law is only a means by which to achieve the proper end of law: justice. Legal positivism broke away from the latest offshoot of natural law, *rational* law, in order to pursue a broadly legal and cognitive study of positive law. The legal positivist research tradition would thenceforth see a line of development having at least three phases.

The *first* phase began with the great codifications of continental Europe, in Prussia (1794), France (begun in 1804), and Austria (1811). The expression *legal positivism*—which established itself only in the late 1800s on the model of *philosophical positivism*—applies here above all to the Continental jurists' legal dogmatics in the new legal framework moulded by codification, and today often referred to as the legislative state (*Gesetzsstaat*). What distinguishes the legislative state from previous particularistic or *ius commune* systems lies in its formal doctrine of the legal sources; what distinguishes it from what followed, namely, the constitutional state (*Verfassungsstaat*), which main legal source is not legislation but constitution.[1]

Revolving around this formal doctrine of legal sources—which always excludes natural law, and occasionally also legal dogmatics and judicial decisions—is a complex of practices, beliefs, and attitudes, set forth in the codes themselves or taught at the universities, and sometimes referred to as *technical*

[1] The two expressions alike originate in the 20th century, the former as part of a tripartition with *governmental state* and *jurisdictional state* (cf. Schmitt 1932b), and the latter as part of a bipartition with *legislative state* (cf. Häberle 1998; Zagrebelsky 2009, 117–46).

legal positivism. Technical legal positivists use positive law exclusively, identifying it in different ways from country to country depending on the domestic doctrine of the sources. In France, it was established that the only source should be general legislation, namely, Napoleonic codification itself. In Germany, the Roman *ius commune* survived, reinterpreted as national customary law; in England, the common law survived, too, but the Benthamite proposal to codify it wound up rigidifying the system of precedents.

Technical legal positivism—paradigmatically the study of private law by the exegetical school in France and by the historical school in Germany—would branch out into a *theoretical* legal positivism in England, with general jurisprudence, and in Germany itself, with the *allgemeine Rechtslehre*. These are general theories of law distinct from the different domestic legal dogmatics, and which would typically uphold theses such as the following: There is no law outside positive law (no natural law); positive law serves to guide conduct by way of commands or norms backed by sanctions; legal norms are created by the state, and are deductively applicable by the judges; law is an ordered set of norms, i.e., a legal system or order, marked by unity, coherence, and completeness; legal dogmatics could be considered a genuine science of law, at least in the sense of an objective and teachable doctrine.

Theoretical legal positivism—this whole set of theories—would soon be pejoratively labelled legal *formalism*, if nothing else for its abstracting from the different contents of law, thus becoming the polemic target of various neo-natural-law schools, and even more so of those movements referred to as antiformalist: the jurisprudence of interests, the free law movement, the sociology of law, and especially the Scandinavian and the American legal realisms. The main criticism made by the antiformalist movements was that theoretical legal positivism, such as it existed in the 1800s, did not recognize judge-made law—a criticism that does not yet apply, however, to the legal positivist theories of the 20th century, i.e., Adolf Merkl's and Hans Kelsen's *reine Rechtslehre* and Maurice Hauriou's and Santi Romano's institutionalism.

It was in the *second* phase of development, however, once World War II was over and the Nazi extermination camps came to light, that Continental legal positivism fell into its worst crisis. What drew criticism this time were not any specific cognitive theses about law—as had been the case with the antiformalist movements, and as would again be the case with the theorists of the constitutional state—but a broadly normative attitude, that which came to be known as *ideological* legal positivism. This consists in the assumption—in truth already present in the prosopopoeia of the laws in Plato's *Crito*, and common to the whole of Western legal thought thereafter, including natural-law theory—that the law is morally binding, and so that it must be obeyed (by the citizens) and applied (by the judges).

Legal positivism was blamed in particular for having numbed the minds of German jurists and citizens, desensitizing them to the laws enacted under the

Third Reich—an unwarranted charge for many reasons. Indeed, Nazism regarded the formalism of legal positivists as an enemy to be vanquished, preferring to resort to judicial interpretation and to the Führer's orders rather than to the constitution or to the ordinary laws enacted under it. And even more damaging to the charge laid against legal positivism is that Nazism had been presented by its makers as itself being a sort of natural law of earth and blood (see in this regard Chapter 2 in this tome and Chapter 9 in Tome 2 of this volume). Yet the charge resonated widely, considering, among other reasons, that it found a receptive audience among thinkers as far apart from one another as Alf Ross and Gustav Radbruch, the former a rabid legal realist and the latter a legal positivist who embraced a moderate form of natural law. In any event, the charge drove legal positivism into a crisis out of which it would emerge as a deeply changed conception.

This change is owed above all to H. L. A. Hart, the most influential legal positivist theorist of the common-law world—though we are only interested here in the way his famous Separability thesis developed in civil-law legal positivism. The legal positivist tradition, which at that time was already a century old, was characterized by Hart (1973, 1961) in terms of the Austinian dictum: "The existence of law is one thing; its merit or demerit is another." Stated otherwise, what joins all legal positivists would be the Separability thesis, the apparently "simple" (Hart 1973, 55) and undemanding assumption that the term *law* can be defined independently of the terms *morals* and *justice*. Or again, stated in a different way still, the phenomena denoted by *law* and *morals* present *empirical* or *contingent* connections, not any necessary ones.[2]

The definitional thesis wound up assuming an essentially methodological sense: The law can be identified, and hence known, without resorting to moral evaluations. In fact, legal positivism is characterized by Hart 1994b as *methodological* positivism (on which see Section 9.3.1 in this tome), using for the theory a qualifier that Norberto Bobbio (1996) had used more than thirty years before.[3] Such methodological positivism provided the canvas against which to view the natural-law tradition, accordingly reconfigured starting from the Connection thesis of law and morals. To be sure, the Hartian reconstruction is debatable from a historical standpoint, presenting natural law and

[2] As has been noted by Nino 1994 (cf. Section 10.2 in this tome), the concepts of law and of morals can be connected or separated *ad libitum*, at least on a conventionalist conception of language, depending on the definition one chooses for these terms. Angloamerican theorists speak today not of a *definitional* but of an *identificatory* Separability thesis, aimed not at *quid ius* but at *quid iuris*, in terms of a Kantian distinction normally ignored by them (cf. Marmor 2001, chap. 4; Raz 2007).

[3] See Hart 1994b, Perry 2001. Hart, unlike many of his English-speaking epigones, read Continental literature and the same Bobbio. And even though Hart 1973 could not have been influenced by Bobbio 1996—Hart 1973, 77, rather shows the influence of Berlin 1958—that work by Bobbio can conceivably have been an influence on Hart 1994b.

legal positivism as different answers to the same universal and eternal question (Murphy 2003)—but it identified a common ground for debate among different legal and ethical traditions, especially as concerns the civil-law theory of law.

In fact, the most important contributions on law and morals would come from German, Italian, Spanish, and Argentinean thinkers, that is, from countries that had known the military dictatorships and the totalitarianisms of the 20th century. But maybe it was only with Hart that this question—hitherto ignored by general jurisprudence and the *allgemeine Rechtslehre*—became common ground for debate among philosophers and lawyers who had until then ignored one another, the former having mostly concerned themselves with normative philosophy of justice and the latter with cognitive theory of law.

But the theoretical space opened by Hart also made possible the debate between legal positivism and that "third theory of law," sometimes referred to by Continental authors as *nonpositivism* and here termed *neoconstitutionalism*, whose defining feature consists in its identifying in the constitutional principles the true connection between law and morals (see Section 1.4.5 and Chapter 10 in this tome). The evolution of this debate, it should be noted, depended not so much on its being framed in Hartian terms, nor on the shift in focus from the theory of norms and the legal system to themes such as legal reasoning and interpretation. It depended mostly on the changed cultural and institutional context in which the legal positivist tradition was developing, and especially on the shift from the legislative to the constitutional state, the latter seeming to embody morals into law by way of the constitution.

In the *third*, and current, phase in the development of legal positivism, legal theorists, especially the Continental theorists, are attempting to account for the changes that positive law undergo, the major Continental countries drewing up rigid constitutions buttressed by different forms of judicial review. Through such a framework, with rigid constitutions whose interpretation is entrusted to constitutional courts, positive law itself becomes *constitutionalized*, i.e., provided with constitutions formulated in terms of rights or principles which tend to permeate the whole of legal interpretation. The discussion is only on such principles, considered by legal positivists as a mere positivization of moral values, and by neoconstitutionalists, instead, as a new confirmation of the old connection between law and morals.

Just as the evolution of civil-law legal positivism has felt the influence of Hart, so is the evolution of neoconstitutionalism deeply influenced by Ronald Dworkin's criticism of Hart, a criticism initially framed in terms of legal-moral principles, and then in terms of legal-moral integrity or interpretation. Of course, this should not be taken to suggest that the Continental and Latin American discussion is simply an appendix to the debate in the English-speaking world: It is rather the case that the debate's internationalization and the

wide use of English reduce the distinction between the common-law and the civil-law discussion to a merely expository one.[4]

On the other hand, nonpositivism, or neoconstitutionalism, is a distinctly European theory of law, developed above all by German, Italian, and Spanish theorists with reference to Continental institutions of the constitutional state, such as rigid constitutions and constitutional courts. To be sure, the Continental legal positivists and neoconstitutionalists do take up some theoretical schemes of the common-law debate, but the issues and phenomena they concern themselves with are those typically distinguishing the evolution of Continental and Latin American law. Not only do they debate the contentious incorporation of morals into law via the constitution, but they have also developed a theory of norms infinitely more complex than the originary imperativism, a theory of legal systems now confronted with the problem of European integration, and a theory of legal interpretation increasingly tempted by a moral reading of the constitution.

These developments will all be taken into account in this Part 2, which will be organized as follows. We begin in Chapter 8 by discussing the legal positivist theory that developed in the civil-law tradition in the first half of the 20th century. Chapter 9 will be devoted to the postwar debate on law and morals and to the increasing importance that legal reasoning and interpretation have come to play, partly on account of that very debate. Chapter 10 will be devoted to nonpositivism, or neoconstitutionalism, conceived as a third way between legal positivism and natural law, or even as a "postpositivist" account seeking to overcome or update legal positivism. In Chapter 11 we will consider the legal positivist replies to this neoconstitutionalist challenge. And then, finally, in Section 11.5, we will go back and attempt an overall assessment.

[4] We also need to point out a somewhat increasing inability of Anglo-American and Continental theory of law to communicate, at least judging by a recent dispute in which Raz (2007) criticizes Alexy (2007) for not referring to any post-Hartian sources in the English-speaking world, only to be reminded that he himself cites no Continental literature other than an English translation of Alexy. In reality, it is a one-directional incommunicability that we are looking at, with the Anglo-American writers often ignoring the Continental ones, but rarely the other way around.

Chapter 8

LEGAL POSITIVISM IN THE FIRST HALF OF THE 20TH CENTURY

by Giorgio Bongiovanni

8.1. Philosophical Positivism and Neo-Kantian Philosophy of Law

Legal positivism did not establish its dominant position in the 1800s without giving rise to a range of highly critical counter-currents, especially in the late 1800s. These were analyses that, starting from the disavowal of the positivist approach on the part of Rudolph von Jhering (1913, 1884), called into question the positivist method and the criteria by which to identify the law. This phase of the debate in legal theory was distinguished by its close connection with the broader philosophical debate: The effort to underscore the shortcomings of the legal positivist account of the defining traits of law—in answer to the question, what is law?—brought into focus a need to identify the criteria that make jurisprudence a scientific enterprise. Two main approaches to legal and philosophical inquiry were developed in the late 19th and early 20th centuries in response to this need: an empirical one—which could be cast in naturalistic, psychological, or sociological terms, and which took philosophical positivism as its reference point[1]—and a Kantian critical one. On the empirical approach, legal positivism was the critical target of an analysis aimed at offering a new concept of law and a new method for legal science, especially a sociological method; on the Kantian critical approach, the objective lay in a renewed effort to bring positivism conceptually and methodologically up to date. The debate in the early 20th century was in this sense marked by a contraposition between authors in two camps: Arrayed on one side were those who, in the framework of the "revolt against formalism" (Treves 1996, 103, who borrows that expression from White 1949), put forward an empirical approach set broadly in contrast to the basic assumptions of 19th-century legal positivism; arrayed on the other were those who sought to carry legal positivism forward by renewing its method for analyzing law and its substantive beliefs about law. It is this latter endeavour that gave legal positivism the distinctive shape it took in the 20th century, proceeding on the basis of a philosophical sensibility and a view of law and legal science different from the outlook that had shaped legal positivism in the 19th century. Legal positivism in the 20th century had to convincingly address the charge of methodological formal-

[1] According to Norberto Bobbio (1996, 133ff.), there is a single point of contact between legal and philosophical positivism, in that they both seek to distinguish description from evaluation (and it was in part out of the effort to solve this problem that both currents originated in the first place).

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_36

ism and substantive detachment from reality that had been laid against 19th century legal positivism. In different contexts, the anti-formalist currents underscored that 19th century legal positivism entailed a commitment to a specific set of views about the sources of law (positing the absolute centrality of the statutes), about the proper role of judges as interpreters of the statutes (a role reduced to that of simply applying the statutes), and about the way in which legal concepts are constructed (on the basis of Jhering's method),[2] and the charge was that this resulted in a picture of law entirely disconnected from its reality.[3] As was mentioned a moment ago, these criticisms were answered by looking to neo-Kantian philosophy, and in particular to the two main streams of neo-Kantianism developed from the 1870s onward: that of the Marburg school (with Hermann Cohen, Paul Natorp, and Ernst Cassirer) and that of the Baden school, at the Universities of Heidelberg and Freiburg (with Wilhelm Windelband and Heinrich Rickert).[4] In this connection, idealist philosophy played no more than a marginal role in the first two decades of the 20th century (when it was not criticized outright),[5] and only in the 1920s was it revived, especially in Germany.

Legal positivism in the 20th century thus owes its shape primarily to the effort to answer the criticisms previously made to legal positivism in the 19th century. A special place in the context of the criticisms of positivism was occupied by Scandinavian legal realism, which over the course of the 20th century would develop into one of the main currents in the analysis of law. Indeed, the line of inquiry that Axel Hägerström developed starting from his 1908 *Das Prinzip der Wissenschaft* (The principle of science: Hägerström 1908), relying on the reality principle as the basis for scientific activity, was bound to emerge as a major approach to the philosophical analysis of law next to legal positivism and natural law theory.[6] Although the criticism of formalism and the responses to those criticisms was a phenomenon that ranged across the whole of Europe (Fassò 2001, 188ff.), it is particularly in the German-speaking countries that the debate took place, making it possible for legal positivism to develop along new lines. Indeed, it was in this setting that the legal debate engaged directly with the philosophical debate: The neo-Kantian reaction to scientistic positivism formed the basis on which legal positivism would develop in the 20th century. German neo-Kantian criticism took aim at two metaphysics: the "metaphysics of matter," encapsulated in "the positivist assertion of the absolute or metaphysical quality of scientific truth," and the "metaphysics of the spirit," that is,

[2] On Jhering's method, see Wilhelm 1958, 88ff.; Bobbio 1996, 121ff.; Chiassoni 2009, 285ff.

[3] Treves (1996, 103–4) argues that the three tenets just mentioned form the basis on which three brands of formalism can be distinguished in legal positivism: legal, scientific, and interpretive.

[4] On neo-Kantianism see also Chapter 1 in Tome 1 of this volume.

[5] On the marginal role of idealism in this context, see Korb 2010, 24ff., Stolleis 2004, 68, 167.

[6] See Chapter 13 in this tome for a discussion of Hägerström and legal realism and its development in the 20th century.

the "metaphysico-religious integration of scientific knowledge propounded on a spiritualist and idealist approach" (Abbagnano 1999, 543; my translation). On a neo-Kantian approach, the view of scientific method and objectivity as a matter of factual accuracy alone needs to be superseded by also taking into account the way facts are organized within a theoretical framework. The approach in this sense calls for a "critical reflection on science," and on the basis of the distinction between "the validity of science" and "matters of fact" (ibid.; my translation), it criticizes the effort to reduce knowledge to "empiricism" and accordingly underscores the need to investigate the "conditions under which" knowledge can be said to have been gained by a valid process (M. Ferrari 1997, 4):[7] The task of philosophical reflection is to identify "the conditions for the possibility of scientific cognition," experience and objectivity (Hammer 1998, 179). Transcendental philosophy becomes a method for determining the validity of scientific knowledge and is thus aimed at discovering the synthetic a priori principles underlying such knowledge and the foundations on which it rests. The a priori is reconstructed proceeding from "the fact of science and of the objective realizations of culture": The transcendental method is thus brought into connection with scientific experience rather than with everyday experience (M. Ferrari 1997, 60–1; my translation, commenting on H. Cohen 1883).

This mode of thought both presupposes and entails a "recasting of the transcendental" that makes it necessary to reject any psychologistic reading of Kant and to revise other important aspects of the Kantian approach (ibid., 60; my translation). This rejection of psychologism, and the effort to accordingly rework the Kantian categories, is what makes it possible to describe transcendental philosophy as a "theory of scientific knowledge." So the idea that scientific and cultural experience needs to be analyzed by bringing the a priori into play, by stating the "transcendental conditions for the possibility and validity of knowledge and culture across different areas" (ibid., 5ff.; my translation), rests on the fact that the transcendental cannot adequately be interpreted on a psychologistic basis, and even more so by moving beyond the role of the aesthetic in the transcendental system. The problem with psychologism is that, on this approach, our "knowing" winds up being reduced to "a complex of impressions and representations, that is, to an empirical subject's complex of states and modifications of consciousness" (Lamanna 1967, 4; my translation). From here we get the "phenomenalism" of knowledge and the need to "resort to an unknowable 'thing in itself' as the foundation of phenomena" (ibid., 5; my translation). To "collapse the transcendental into the psychological" (M. Ferrari 1997, 30; my translation), a move implying a distinction between *phenom-*

[7] As has been noted by Friedman, the idea that true judgments stand for or depict "objects or entities that exist independently of our judgements" not only informs the "naked, unconceptualized sense-experience" of empiricism but also underlies metaphysical realism, positing "'transcendent' objects […] existing somehow 'behind' our sense-experience" (Friedman 2000, 26).

enon and *noumenon*, is to deny the Kantian perspective by giving the transcendental a subjective cast.[8] Furthermore, aesthetics and sensibility are seen as aspects of the transcendental analytic: "The transcendental is constitutive of the object; it is resolved into the conceptual process, into the movement of concepts through which the object of knowledge comes into being" (Lamanna 1967, 7; my translation). In this way, experience is understood as "an a priori construction" and does not come about without "the synthetic principles of the intellect." These principles are therefore forms of thought that constitute experience and act as conditions for the possibility of experience: The "a priori is […] the formal condition of experience" (M. Ferrari 1997, 31–2; my translation). This reduction of the a priori elements to the analytic and to logic alone shows the need to construct the theory of experience as a theory of *scientific* experience, and it posits the transcendental as "the complex of methods for the construction of science." By "encasing the transcendental aesthetic within the analytic" (ibid., 63; my translation), we recognize the categorial forms and the synthetic principles as central and have a tool for denying that knowledge can be derived from an object prior to it. The neo-Kantian approach thus sheds the distinction between phenomenon and noumenon as well as that between "intuition and thought" (Abbagnano 1999, 564; my translation).[9]

The revisions just outlined account for the main features of the neo-Kantian approach. These features flow from the idea of constructive character of thought and from that of reality as the "legal determination of phenomena" (M. Ferrari 1997, 35; my translation). On this approach, knowledge is defined not by its object but by "its own structure," that is, by the functions and laws of thought. This means that knowledge is dependent on the transcendental conditions and autonomous "from the object in itself" (Ollig 1997, 35, 37; my translation). To know reality is to move within the "transcendental logic" of the categories and the principles. This logic

> reduces phenomena to the unity of the law: Inquiry does not start from any concrete datum, for any determination [of reality] is possible only by proceeding from the standpoint of the universal, only by determining the quantity, the quality, and the relations by which any single element is distinguished from any other. (M. Ferrari 1997, 69; my translation)

An equivalence is thus established between the law of thought and objective reality: To know is to reduce phenomena to the unity of the law and principles of thought. Thinking thus takes on a formal nature (in that it is structured by forms, that is, by the conditions for the possibility of experience): The critical method lies in "the procedure by which form is separated from the content of

[8] This critical stance entails a need to clearly separate the empirical subject from the transcendental subject (Ollig 1997, 36).

[9] For Kant, as is known, between the a priori logical structures and the nonconceptualized multiplicity of impressions coming in from the senses lie the pure forms of sensible intuition (space and time).

knowledge so as to identify the logical and formal elements presiding over the organization of experience" (ibid., 39; my translation).

Philosophical inquiry is thus made to consist in the endeavour to critically analyze the validity of scientific and cultural knowledge: It is a *critical* endeavour, in that it cannot consist in simply recording the contents of such knowledge but must investigate the (transcendental) conditions under which it is obtained. The task of a transcendental investigation is to set out a foundation for truth and objectivity, that is, for the validity of science and culture. On these premises, German neocriticism underscores the "methodological" or "valuational" component of transcendentalism, a feature that, as was not the case with Kant's original conception, makes it possible to apply transcendentalism in the theory of knowledge and in the ethico-political sphere (Artosi 2006, 19; Holzhey 1997, 486–9; Hammer 1998, 179–80).[10] What has just been laid out is a general programme was specified in several ways through the work of the Marburg and Baden schools.[11]

As discussed, the neo-Kantian paradigm became the paradigm for the new mode of legal-philosophical speculation. Its way of grounding the validity of the sciences made it possible to analyze the legal phenomenon in an innovative way. This is a development owed to the work of important authors who in the late 19th and early 20th centuries adopted Kantian or neo-Kantian epistemologies. Two examples are Rudolf Stammler (1906, 1911) and Gustav Radbruch (1914), who define the concept of law in light of the "aim" or value singled out as needing to be realized.[12] These attempts were important, to be sure, but their role in shaping legal positivism in the 20th century would not be a decisive one, at least not in the first half of that century.

8.2. The New Legal Positivism: Hans Kelsen's *Reine Rechtslehre* vs *Naturalismus* in Legal Science and Natural Law Theory

Undoubtedly, no thinker was more influential in the development of 20th century legal positivism than Hans Kelsen.[13] As he points out in his first work, the 1911 *Hauptprobleme der Staatsrechtslehre* (Main problems in the theory of

[10] It is something of a cliché to present neo-Kantianism as an effort to extend the Kantian method to the human sciences (see Paulson 2005a, 202; Korb 2010, 13).

[11] Oesterreich (1923, 416ff.) identifies seven strands of neocriticism, calling them physiological (Helmholtz and Lange), metaphysical (Liebmann and Volkelt); realist (Riehl), logicist (the Marburg school), the theory of values (the Baden school), relativist (Georg Simmel), and psychologico-neo-Friesian (Cornelius and Nelson).

[12] On Stammler see Section 1.1.3.1 in this tome and Section 1.3 in Tome 1 of this volume. On Radbruch see Section 1.1.3.2 in this tome and Section 1.8 in Tome 1 of this volume.

[13] Kelsen is described by Roscoe Pound as "unquestionably the leading jurist of the time" (Pound 1933–1934, 532, quoted in Paulson 2002a, 11, n. 3). H. Dreier (1986, 16) observes that Kelsen is widely regarded as the jurist of the century ("Jurist des Jahrhunderts"). On Kelsen see also Section 2.3 in Tome 1 of this volume.

public law: Kelsen 1960a), what prompted him to develop his conception was a need to "revisit" the method of jurisprudence and the basis on which it can be deemed a science,[14] not only in relation to the traditional theory of public law but also in relation to the more recent theories (and he is thinking in particular of Stammler). In redefining the method by which to construct the concept of law, and legal dogmatics (*Rechtsdogmatik*) in general, Kelsen proceeded on a new way of conceiving legal science on the basis of the neo-Kantian analysis. Kelsen's effort, in other words, was to set legal positivism on a new foundation by relying on the neo-Kantian epistemology that had recently been developed. The neo-Kantian influence on Kelsen's work is apparent, and Kelsen himself points it out on several occasions.[15] Less apparent is which of the two main neo-Kantian schools played the greater role. Even if there is no agreement on the foundation of Kelsen's theory (see Paulson 2007a, 91),[16] this is an important question, since it is a question that makes it possible to work through some interpretive problems and understand the different phases in the evolution of Kelsen's thought.[17] By way of a preliminary remark, Kelsen's early works (those written in the first half of the 1910s)[18] can be said to bear a closer connection to the neo-Kantianism of the Baden school (although this influence is neither exhaustive nor exclusive): It is in light of this approach that we can best make sense of Kelsen's distinction between *Sein* and *Sollen* (is and ought) and the role he ascribes to these two categories as a basis on which to proceed in the analysis of law, and through this lens we can also have a better grasp of the way he conceives their mutual relation. In later works (at least until the 1934 *Reine Rechtslehre*), Kelsen drew as well on ideas developed by the Marburg school, and these prove useful both in characterizing his theory and in tracing out its evolution. One could thus distinguish an initial phase in which the neo-Kantian influence is more closely tied to the Baden school's philosophy of values and a later phase in which Hermann Cohen's and Ernst Cassirer's logicism moves into the foreground.[19]

[14] Kelsen speaks of "Revision der methodologischen Grundlagen der Staatsrechtslehre" (revision of the methodological foundations of public law), underscoring that "the problem of method […] is […] of the utmost importance" (Kelsen 2008, 51, 53).

[15] Kelsen mentions a variety of thinkers in this regard, among whom Windelband (Kelsen 1922a, 1960a), Simmel, Helmoltz (Kelsen 1960a), Rickert (Kelsen 2010), Lask (Kelsen 1922a, 2010), Cohen (Kelsen 1998), Cassirer (Kelsen 1922b, 1968a).

[16] Gustafsson (2007, 87) quotes this comment by Edel (1998, 195): "Anyone who is trying to come to grips with the neo-Kantianism of Kelsen will be confronted […] with a 'great maze of problems.'"

[17] Two different periodizations of Kelsen's thought in relation to the role of neo-Kantianism are offered by Paulson (1998, 1999) and Heidemann (1997). Nogueira Dias (2005) puts forward a periodization more closely tied to Kelsen's legal theory itself. On this topic, see Jestaedt 2009.

[18] These include, in addition to the *Hauptprobleme*, Kelsen 1911b and 2010.

[19] According to Hammer 1998, 182–3, however, "Kelsen does not adapt any of the theories of his neo-Kantian precedessors, whom he regards as having for the most part failed in their effort to

The formation of Kelsen's thought must also be considered in connection with the legal theory that came before it.[20] As we will see, beyond the general need to systematize legal material, there prevail moments of discontinuity. Although Kelsen worked within a methodological framework different from the one grounding the main theories of 19th century legal positivism, he did proceed from the same need to arrange legal material into a systematic construction:

> It is only and precisely in jurisprudence that the value and rightness of a special construction depend exclusively on whether the underlying principle of construction can fruitfully be used in other ways, too—or on whether this principle, once placed on higher ground as a general maxim of construction, can ensure the simplest and most unitary structure for the global system. (Kelsen 2008, 51; my translation)[21]

However, in recognizing this need in common with previous legal dogmatics, Kelsen was also resolute in looking at that tradition *critically*: The categories of the dominant theory needed to be subjected to deep criticism in working toward a new theory of legal positivism, and this led Kelsen to rethink the relations by which public law is structured, in an effort not only to resolve the antinomies which beset the preceding doctrine but also, and especially, to construct a new general theory of the state. So the need to revise our understanding of law and the basic categories of legal science led to a need to also revise the theory of the state, so as to expose the ideological function served by dominant dogmatics and by the "fictions" at work in the *Staatsrechtslehre* (such as the *Willenstheorie*, or will theory). Kelsen's theory thus has two faces, a theoretico-methodological one and a critico-dogmatic one. This latter aspect needs to be understood in connection with the progressive entrenchment of democracy and constitutional systems (Bongiovanni 2007).

Proceeding from the neo-Kantian approach and from this need for critical reassessment, Kelsen's theory shaped the new face of legal positivism in the 20th century. This path is marked by a few steppingstones. The starting point was to elaborate both a new method for constructing a science of law based on the postulate of "purity" and a new concept of law. Central to this endeavour was the distinction between *Sein* and *Sollen*, a distinction that becomes a

apply Kantian transcendental philosophy to cultural and normative sciences, and to legal science in particular […] Kelsen's own 'original' neo-Kantianism consists in his independent effort to carry out a programme that he shares with the others neo-Kantians, namely, to apply the Kantian transcendental theory of knowledge as a theory of science to fields outside the natural science."

[20] This question comes up in the debate on the formalism of Kelsen's theory. Until the 1980s, the broad consensus was that Kelsen should properly be understood as carrying forward 19th-century German theory and its formalism. This interpretation, however, is rejected in Fioravanti 1987 and Sordi 1987. See also Paulson 2005b. And Kelsen (1929) himself answers this charge of formalism by arguing that his theory is formal in a "conceptual" sense only.

[21] As as pointed out by Paulson (1998, XXIV), "construction […] means in traditional German legal science concept formation."

tool with which to define the methodological outlines of purity and to identify the province of law. The distinction between *Sein* and *Sollen*, together with the neo-Kantian approach, provided the foundation on which Kelsen moved forward in pursuit of both of those aims, on the one hand, as concerns the question of method, developing a "metatheory" of science and legal dogmatics (Heidemann 1997, 49)[22] aimed at bringing to light the indispensable criteria for securing their theoretical validity, and on the other, as concerns the concept of law, laying out a general definition of law revolving around the theory of norms (a definition that, as part of a general theory of law, was also bound to redefine some basic concepts and distinctions). And, as was just pointed out, this entails a need to deeply revise the categories of public law especially with reference to the relation between law and the state.[23] These themes were developed in different ways over the course of Kelsen's thought, to be sure, but it is nonetheless fair to say that the basic building blocks of the *reine Rechtslehre* (or pure theory of law) were put in place from the outset, in the 1911 *Hauptprobleme*,[24] and that what followed was essentially an effort to solve a series of problems and shortcomings that subsequently came to light in the original foundation. This is not to say that this evolution was inconsequential, for it refashioned certain features of the theory in important ways by going deeper into the related questions: This holds in particular for the conception of norms developed within the new theory of law as a system, for on that basis Kelsen reframed the elements of normative validity.

His entire science and analysis of law is grounded in the postulate of methodological purity. This is a principle set in contrast to those modes of analysis where law is reduced to its naturalistic components (as in the example of "psychologism," on which see Paulson 2012a, 93–102) or is otherwise investigated through a pastiche of methods: It follows from this that methodological purity needs to proceed from a distinction between human and natural sciences (taking up the terminology introduced in Dilthey 1989). In laying out his critique, Kelsen embraced a wide range of positions that in different ways found the analysis of law on models developed in the natural sciences.[25] This

[22] This is a point that Kelsen clarified in his polemic with Fritz Sander on the object of philosophical speculation about law: In rejecting Sander's view that legal science should have no role in any philosophical analysis of law, Kelsen argued that "a transcendental logic can only take as its object an area of knowledge and of science" (Kelsen 1922a, 132). On the debate between Kelsen and Sander, see Paulson 1988; Heidemann, 2002, 213–5; Lijoi 2008. See also, in this regard, Section 2.5.2 in Tome 1 of this volume.

[23] Of course, Kelsen's reflection extends beyond the realm of public law to also include international law: See Rub 1995, Walter, Jabloner, and Zeleny 2004, Bongiovanni 2006, and Von Bernstoff 2010.

[24] See Heidemann (1997, 221), for whom Kelsen's main theses can already be found in his early works, and in particular in the *Hauptprobleme*.

[25] The method of the natural sciences figures in the work of Adolf Merkel and in Georg Jellinek's *Zwei-Seiten Theorie* (two-sides theory), and it also informs the conceptions of the anti-for-

contrast comes into relief in the *Hauptprobleme* and in the writings that immediately followed (such as Kelsen 1911), especially where Kelsen discusses the role that on the sociological approach and in the construction of public law is ascribed to the concept of the will.[26] The use of that concept evinces an understanding of law as an essentially causal phenomenon. According to Jellinek's sociology, or social theory of law, law is to be explained (either wholly or in part) as a causal phenomenon. Kelsen objects to that view, arguing that if we reduce the analysis of law by resorting exclusively (or even partly) to causal phenomena and to the paradigms of natural science, we wind up having an inadequate understanding of the legal phenomenon, or at least such reduction is possible only on condition of positing fictive entities and hypostatizations (an example being the idea of the state as a person possessed of a will).[27] Law cannot be conceived on the basis of the empirical necessity that underlies all causal relations but needs to be explained in light of a different sort of relation among phenomena. Kelsen, in other words, is saying that if we are to have an adequate understanding of law, we will have to investigate law using a method other than that of the natural sciences, and in such a way as to identify the specificities that make legal relations unique. Both of these aspects find a unitary solution in the distinction between *Sein* and *Sollen*, making it possible to identify what Kelsen (2010) calls the *normative* sciences—where he locates jurisprudence, and in which are grounded its method and scientificity—and to define the concept of law.

Kelsen (2008, 53) argues this point directly by underscoring that when dealing with "disciplines" that "come into contact by reason of their object"—and among these disciplines he counts those that take the law as an object of investigation—we have to separate "the ones from the others on the basis of their different ways of considering" reality: This makes it possible to avoid the "syncretism of methods" (which cannot "lead to scientifically sound results") and to "free the legal formation of concepts from certain sociological or psychological elements" (for otherwise we would wind up with "an improper way of framing the problems" we propose to solve). These results can be achieved by proceeding from a fundamental contrast, "that which separates the is from the ought."[28] Kelsen's approach is thus premised on the possibility of singling

malists and of those who looked to sociology as a new paradigm for legal science. On naturalism in law (*Rechtsnaturalismus*), see Haferkamp 2007. On the thinkers listed by Kelsen as proponents of this approach (including Bierling, Binding, Ehrlich, Gerber, Gierke, Hold v. Ferneck, Jhering, Kantorowicz, Preuss, Radbruch, Somló, Stammler, Thon, Weber, Windscheid, and Zitelmann), see Paulson 2002a, 230; 1990, 159ff.

[26] According to Kelsen (1960a, 162), "all theorists who accept the idea of the state qua person" posit the "state's will" (*Staatswillen*) as a "substrate" for the state so conceived.

[27] On fictions in science and in law, see Kelsen 1919, offering an analysis of Vaihinger 1914.

[28] Next to this contrast, as we will see, Kelsen (2008, 54) places the equally basic one that "separates form and content."

out two different ways of considering events: one concerned with being (the is) and the other with duty (the ought). This distinction between two modes of analysis (and two corresponding types of sciences and methods) finds its origin in the neo-Kantianism developed by the Baden school, for it runs parallel to that school's distinction between being and values.[29] Kelsen's distinction between is and ought needs to be viewed as a rendering of the one between facts and values: It expresses both the separation between the two domains and the two different ways to go about considering events. The direct source for the distinction lies in the analyses that Wilhelm Windelband and Heinrich Rickert carried out in organizing the general presuppositions of neo-Kantian philosophy in relation to "values," and we have seen that these presuppositions are understood as bases on which to identify the criteria for the validity of knowledge.[30] Values provide the criterion (or normative prescription) on which basis to establish that validity: It is "value which grounds experience" (M. Ferrari 1997, 79; my translation), and in value therefore lies the basic element of judgment. In this sense, an essential role is played by the distinction between

> the plane of that which *is*, or which is otherwise qualified as belonging to the sphere of the factual, the empirical, the contingent, and the historical, and that which, by contrast, normatively *ought to* be, or which otherwise counts as a worthwhile aim or value. (Ibid., 75; my translation)

Knowledge—or that which we come at by searching for and respecting the "conditions ensuring the validity and universality of synthetic a priori judgments in relation to different contents" (ibid., 77; my translation)—arises out of the distinction between the is (the factual, the empirical) and the ought (value). Kelsen's is and ought replicate this distinction and thus reflect the difference between fact/s and value/s, accordingly expressing the different ways in which events may be considered.[31] In directly engaging with Rickert's theory, Kelsen underscores the existence of two different "directions in which we can turn our gaze": On the one hand we have "the is of that which happens as a matter of fact, namely, reality"; on the other "we have the ought—which may be ethical, legal, aesthetic, or otherwise conceived—and by this is meant ideality" (Kelsen 2010, 552ff.; my translation). From this perspective, "the world—

[29] For this analysis, see Paulson 2002b, 226ff. Kelsen develops the distinction in his own way and gives it a variety of inflections, on which see Paulson 2002a, 13.

[30] In this sense, on Windelband's approach, "the object of philosophy lies not in the particular objects which make up the empirical material of thought and of willing and feeling, but only in the norms with which our thought, willing, and feeling must comport in order to be valid and to embody the value they aspire to" (Abbagnano 1999, 557; my translation). In this framework, philosophy is understood to concern itself not with judgments of fact but with value judgments and their universal validity. As is known (see M. Ferrari 1997, 74–5), Windelband's account of validity and value develops themes found in the work of Hermann Lotze and Kuno Fischer.

[31] As is known, this is the point of departure from which the Baden school proceeds in setting out the distinction between nomothetic and ideographic sciences, arguing that "empirical reality can […] be construed in two different ways" (M. Ferrari 1997, 151–9, 154; my translation).

understood as the outcome of our knowledge—splits into two realms between which there can be no communication," in such a way that "the contrast between is and ought winds up corresponding to an opposition between reality and value, nature and purpose" (ibid.; my translation). Kelsen can in this sense be said to endorse a *Zwei-Welten-Lehre*, or two-worlds doctrine (Paulson 2002b, 226ff.; 2005b, 279ff.), a conception analogous to that of the Baden school. In Rickert's view, what it means "to know is to judge"—an activity concretized into our "recognizing a value"[32] (an ideal necessity, an ought)—and this view translated into a clear distinction between the world of reality and that of value: "Values are not reality, but they are valid, and their realm lies beyond the subject and the object alike" (Abbagnano 1999, 560; my translation, commenting Rickert 1910). This distinction between different worlds can also be found in Georg Simmel, another thinker explicitly mentioned by Kelsen (1960a, 4, 12): "Addressing the concerns of the Baden school," Simmel conceived the ought as an "original category of thought," recognizing it as having a "status independent of historical situations" and locating it in a specific "realm" of its own (Abbagnano 1999, 589–90; my translation, commenting Simmel 1910).[33]

This construction, giving rise to the problem of the relation between the world of the is and that of the ought, has a twofold dimension to it. Indeed, the *Sollen* is at the same time an element in the world of ideality and the transcendental category that operates in judgment and determines its objectivity. As has been observed, "the 'ought' belongs to the normative region of morals (or practical reason)," but "it also functions as an a priori category for the legal comprehension" (Gustafsson 2007, 87). The distinction between *Sein* and *Sollen*, in other words, is at once ontological and transcendental, and these two dimensions suggest different ways to understand its meaning.[34] This ambivalence can be appreciated, for example, in the question of what Kelsen's theory takes to be its object: On the ontological understanding legal science is a human science aimed at comprehending law as a posited ideal object, whereas

[32] In this sense, judgment always presupposes some value, whose "function […] it is to make evaluation possible," and on which rests the truth or validity of judgment itself (M. Ferrari 1997, 85; my translation).

[33] The realm in question (the fourth one in Simmel's system) is the one containing ideal needs and the ought. Kelsen refers explicitly to the distinction found in Simmel 1892, and he also mentions Kitz 1864. According to Losano (1981, 70), Kelsen borrows from Simmel the idea of the indefinability of the *Sollen*, and from A. Kitz the idea of its indivisibility. Kelsen (1960a, 24–5) also draws on Kant in making the case for the separation between *Sein* and *Sollen* and for the autonomy of the latter from the former (the argument is that of the validity of the moral law regardless of whether it is being actually observed).

[34] On the different shapes the ontological dimension of the relation between *Sein* and *Sollen* assumes in Kelsen, see Heidemann 1997, 57–61. This involves not only the distinction between facts and values (nature and spirit) but also those between nature and society (the latter understood as a normative system and as an expression of freedom) and between reality and ideology.

on the transcendental understanding the object (law) is not given, or posited, but is constituted proceeding from the categories (Heidemann 1997, 43ff.).[35] This double layer also characterizes the Baden school (especially with Rickert), where the transcendental investigation is centred on the complex relationship among "reality, validity, and value" and so implies a distinction between the realm of "knowledge in an objective sense," i.e., validity, and "a plane prior even to knowing and its truth value," i.e., values (Centi 1997, 410, 417; my translation). Kelsen's framing of the distinction between *Sein* and *Sollen* can be understood in both of those senses, and he doesn't do much to specifically distinguish between the two (perhaps seeing them as complementary).[36]

The main problem with such a doctrine, envisaging two separate worlds, and with the dual function this doctrine can have, lies in the tension "between fact and value" (Friedman 2000, 33, 35)[37] and the relation that can hold between facts and values. As has been observed, this tension is distinctive to the so-called "Southwest school," which "affirms an explicitly dualistic conception according to which the realm of pure thought stands over and against a not yet synthesized manifold of sensation (a not yet formed 'matter')," leading to "particularly vexing problems […] in attempting to explain the application of the categories to objects of experience" (ibid., 29, 31, 33). This is a foundation for which "the gulf between pure logic and 'reality'"—and between the other distinctions, such as those "between the 'ideal' forms of judgement and the 'preconceptual' manifold of sensation, between thought and 'reality', between 'validity' and 'being'"—"becomes, in the end, the gulf between value and fact" (ibid., 33, 34–5). The most immediate problem is that of their relation: Even if we take it that the separation between *Sein* and *Sollen* entails a commitment to the view that the latter cannot be reduced to the former—both in the sense of Hume's law (that no *Sollen* can be derived from any *Sein*) and in the idealistic sense that what is real is rational—we will still have to figure out how these two realms can find any points of contact.[38] Kelsen solves this problem tak-

[35] On the ontological understanding, the investigation will be aimed at describing the necessary structure of law such as it exists, whereas on the transcendental understanding, the object law is constituted by concepts on the basis of the distinction between alogical material and transcendental logic. For Heidemann (1997, 43ff.), this second way of conceiving the object of knowledge (on the basis of an identity between judgment and norm) is what distinguishes neo-Kantian philosophy from Kantianism at large. For a critique of this approach, see Paulson 1999, 355ff.

[36] This amenability to a twofold reading can suggest an ambiguity in Kelsen's thought, or even an antinomy. The ambiguities/antinomies in the pure theory often take centre stage in the critical literature. For an overview, see Papaefthymiou 2004, discussing the antinomies deriving from (*a*) the co-presence of "Kantian and positivistic ingredients," (*b*) "the Is-Ought separation and the fact-value connection," and (*c*) "the coexistence of a dynamic and a static system."

[37] For Friedman (2000, 28), this separation flows directly from a rejection of the "idea of an independent faculty of pure intuition" while claiming that there exists "an 'ideal' realm of timeless, formal-logical structures."

[38] One way in which the complexity of the problem of the relation between *Sein* and *Sollen*

ing his cue from Rickert: The nexus lies in the *meaning* ascribed to acts and events, and so in an intermediate "realm" between facts and values. "In the act of judging something we express the sense of value": This act "is located in a *third* realm, between that of reality and that of values, and that is the realm of *meaning*" (Abbagnano 1999, 560; my translation). This idea is fleshed out in neo-Kantianism and by Kelsen on the basis of two distinctions: that between the psychological sphere and logical sense, and that between subjective and objective meaning.[39] Objective meaning, located in the sphere of normativity and the ought, is explained on the basis of Cohen's and Cassirer's logicism (and in particular by separating psychology from the logic of the origin of relations). In Kelsen's view, the objective ought is predicated on the "specific existence of the norm" (Kelsen 2001, 12), an existence in turn dependent on the norm's validity. This complex web of mutually referring concepts (meaning, objective ought, specific existence, validity) and the framing of the problem of the relation between fact and value are to be viewed in light of Kelsen's neo-Kantian approach, where the existence of positive law and the legal system figure as background assumptions and are conceived as givens (somewhat in parallel to the "fact of science": Paulson 2002a, 19). The ought as a category is in this sense a device by which to guarantee the "objectivity" of our scientific knowledge of existing law (Paulson 2005b, 282; 2012a, 109–11).[40]

The decisive moment in Kelsen's theoretical development lies in his singling out the characteristics distinctive to two modes of knowledge and in the consequent distinction between sciences of the is and sciences of the ought. This singling out and these characteristics issue from a set of general assumptions (those that, as has been indicated, are distinctive to neo-Kantianism), which are then specified into the fundamental distinctions pertaining to the relations and modalities by which the world of the is and that of the ought are marked. In

can be appreciated is by considering the role of lawmaking. Kelsen sees the lawmaking process as a social function (and so as belonging to the world of the is), but at the same time he highlights how this process acts as the "pipeline through which customs, morality, economic interests, and religious concerns turn into legal propositions," and he comments that in this passage lies "the great mystery of law and the state" (Kelsen 1960a, 410–1).

[39] In Kelsen 1960a, the subjective dimension is that which depends on someone's will, while the objective dimension is given by the norm underpinning a judgment. On these distinctions, see Heidemann 1997, 29–30.

[40] The relation between *Sein* and *Sollen* and the role of the neo-Kantian categories (Paulson 2005a, 193ff; 2007b, 149ff.; 2012a, 109ff.) can be read in light of Rickert's (1904) distinction between categories of reality (which are transcendental) and methodological forms (which are specific to each type of science). This thesis (Paulson 2012a, 109) is based in part on the fact that Kelsen's transcendental argumentation appears inconclusive (whether read in a regressive-analytical sense or in a synthetic-constructive sense). On top of this analysis we can add Kelsen's (2001, 24) view of the *Sollen* as a "relative a priori category," that is, a category the law necessarily depends on if it is to be viewed as a system of objective propositions (see Paulson 2002a, 18; Alexy 2002b; Heidemann 1997, 56–7).

distinguishing the two approaches (and the two worlds of the *Sein* and the *Sollen*), Kelsen proceeds in three stages. His starting point is judgment as a model of knowledge,[41] where primacy is accorded to hypothetical judgments as a basis on which to identify the object of investigation (having superseded intuition as an aspect of the transcendental foundation of law). From the centrality of hypothetical judgment flows the theory's formal nature as a theory framed by the *relations* it sets up among events/phenomena (then, too, as we have seen, it is a fundamental role that Kelsen ascribes to the distinction between form and content).[42] And, in the third place, these two directions of knowledge are built on the basis of the relation between universal and particular, in that judgment forges a unity out of the multiplicity of phenomena (a principle understood to hold in scientific and normative law alike). As we will see, this is something that Kelsen underscores by arguing that the legal proposition is grounded in juridical law, and hence in the principle of unity posited by that law. Kelsen thus distinguishes two modes of knowledge depending on the different kinds of relations among phenomena we are dealing with: In the sciences of being we are concerned with causal relations; in the normative sciences, with imputative relations.[43] The distinction between causality and imputation lies in the different modality of hypothetical judgment: Where causality is concerned, judgment establishes a necessary relation between phenomena (a relation of cause and effect); where imputation is concerned, the relation established by judgment is only contingent and possible (and hence not necessary). The distinction between these two modes of knowledge is thus predicated on the different kinds of relations taken as an object of knowledge (causal relations on the one hand, imputative ones on the other), as well as on the different modality by which those relations are characterized.[44] This distinction enables Kelsen to do away with teleological criteria as a basis on which to identify normative disciplines, in that purposes are a function of the will and so belong to the sphere of the *Sein* (Kelsen 1960a, 57ff.; on these questions, see Heidemann 1997, 26). The distinction between causality and imputation makes it possible to distinguish explanatory and normative sciences and to specify their distinctive traits: The normative sciences are necessarily tied to the ought.[45]

[41] On the central role of judgment in Rickert's and Kelsen's thought, see Heidemann 2002, 215.

[42] The relational approach is one on which, from Rickert's perspective, "scientific concepts are […] concepts set in relation to one another" (M. Ferrari 1997, 153; my translation).

[43] In Kelsen's 1911 *Hauptprobleme* (Kelsen 1960a) we do not yet find the distinction between central and peripheral imputation, the former ascribing something to someone (a subject), the latter setting out a connection among phenomena. Only in the 1920s does Kelsen (1920; 1925a, 65) distinguish these two types of imputation, all the while recognizing a central role for peripheral imputation in the process of knowledge. On these questions, see Paulson 2012a, 103ff.

[44] For Kelsen (1960a, 4) are normative: juridical laws, moral and customary laws (those arising in custom, or *Sitten*), the rules of logic, grammar, and aesthetic.

[45] Kelsen (2010, 552ff., 562) proceeds on this basis to criticize Rickert's distinction, where the explanatory sciences are set in opposition not to normative ones but to cultural ones. Kelsen's

These distinctions are geared toward achieving methodological purity, a standard centred on the need to eliminate all manner of syncretism. Kelsen's analysis can in this sense be characterized as metatheoretical, inasmuch as it applies across the board to all sciences. When we turn to law as an object of analysis, the point (as we just saw) is to keep the causal mode of consideration out of the way and not confuse it with the normative mode.[46] This principle reflects as well the rule (classically formulated in the effort to avoid the naturalistic fallacy) under which assertions about facts must be separated from assertions about duty: This is a fundamental through line in Kelsen's methodological construction.[47] On this purist approach, scientificity is thus identified with unitarity (and oneness), that is, with the need to identify a unifying relational nexus structuring the phenomena being investigated. And of course, as we saw, this rules out any recourse to postulates extraneous to the construction, and in particular it keeps out all ethico-political postulates. Methodological purity is thus to be understood as a criterion on which basis to say what it is for scientific knowledge to be valid. Here scientific knowledge is primarily concerned with dogmatic legal science,[48] which in turn is exclusively concerned with positive law (without bringing in any moral considerations grounded in natural law).

In several important respects, Kelsen's conception breaks new ground on the question of the concept of law. In the first place, law is identified in light of the distinctive relation found to hold among phenomena, a relation based on the ought (*Sollen*). As was previously discussed, it is only by belonging to the ought that a legal sentence can have any meaning, where meaning is the proposition expressed by that sentence: A legal proposition (*Rechtssatz*) expresses the basic structure of a legal sentence. Legal sentences (the norms of positive law) are hypothetical judgments based on an imputative relation. Kelsen's positivism thus frames the concept of law around that of a norm, describing its basic form as an element of the *Sollen*. This basic form lies in the idea of a norm as a "hypothetical judgment," which accordingly becomes the core element of legal science, and whose distinctive trait lies in its excluding all aspects involv-

distinction is meant to point up the incoherencies in Rickert's concepts of culture and value. Value, in particular, is seen as a twofold notion, for on the one hand it picks out the "human evaluations such as they appear in history," while on the other hand it figures as a fundamental aspect of the transcendental dimension. This ambiguity is liable to cast in an objectively valid light that which is no more than the outcome of actual, and hence subjective, evaluations. Kelsen regards all historical values as relative, and so as falling outside the realm of scientific inquiry, which only concerns itself with formal nexuses.

[46] In this framework, as we will see, Kelsen (1960a; 1922b) resolutely rejects Jellinek's theory of the "normative force" of facts.

[47] These methodological distinctions, as mentioned, entail a commitment to the view that no ought can be derived from any is.

[48] The role of legal dogmatics, as we saw at footnote 22, lies at the centre of the polemic between Kelsen and Sander.

ing causal relations (as well as all fictitious entities). Having located law in the ought—and in particular in the concept of a norm as an ought judgment—Kelsen proceeds to identify the specificities of this legal ought. This he does principally in two ways: by distinguishing the legal ought from morality and by setting out the role that sanctions play in defining the legal ought. In the *Hauptprobleme*, the relation between moral and legal norms (*Sittengesetz und Rechtsnorm*) is analyzed by Kelsen by denying that there can be any analogy between law and morality and by setting out the criteria by which to distinguish the two: Whereas morality presupposes "the principle of individual autonomy, or moral self-determination," law is conceived in heteronomy (Kelsen 1960a, 34). In fact, the legal ought is not just heteronomous: It is also marked by its coerciveness or enforceability (the fact that compliance with it can be exacted by force). Law can thus be identified by looking at whether a sanction (or punishment) is provided as a consequence of noncompliance and whether it is coercive. As we will see, these are the two bases on which the law can be characterized as a legal hypothetical judgment. This formal framework entails the thesis that a norm's existence (as well as its validity) is independent of its content: Kelsen thinks that law cannot be defined by any specific content, and in particular by any moral content. The reality and validity of norms are therefore not contingent on their embodying any substantive ideas.

From this account of the concept of law flows a decisive consequence as concerns the problem of the obligatoriness of law. As has been noted (Paulson 1998, XXX–XXXV), Kelsen's conception moves away from both the natural law tradition and the 19th century positivist tradition: Neither any content of natural law nor any social fact or mode of behaviour needs to be reflected in a legal norm in order for it to qualify as binding. Kelsen's solution to this problem charts a middle course relative to previous approaches, by identifying a norm's bindingness with its existence and validity. Kelsen, in other words, is looking for a specifically *legal* foundation by avoiding recourse to any foundations outside law itself (Alexy 2002a, 95ff.). His reliance on the neo-Kantian approach is also a way for him to show the inadequacy of those two legal traditions (legal positivism and natural law theory), all the while supporting the twofold thesis that positive law is (*a*) separate from morality and (*b*) endowed with a distinctive normativity of its own.

8.3. Kelsen's Theory of Norms: Between Nature and Morality

The most direct embodiment of this analysis of law lies in Kelsen's theory of legal norms. In firming up the view of legal norms as analogous to the law-like statements of science, in that both share the form of the hypothetical judgment,[49]

[49] As is known, the idea of a legal norm as a conditional statement was first put forward by Zitelman (1879).

Kelsen specified the exact nature of legal norms by arguing, as we saw, that the hypothetical judgment in question is an imputative one providing a sanction as an essential element of the ought relation. Kelsen proceeded along two parallel paths in this endeavour to explain the features of the legal norm, on the one hand identifying the features distinctive to the legal ought relation—where the point is made that legal norms are neither natural phenomena (set in the world of the is) nor moral ones—while at the same time setting out a typology of norms and their validity. His analysis of the basic elements of the ought judgment in the legal sphere has an important application when it comes to laying out the structure of norms. The typology of norms (and the problem of their validity) is worked out on the basis of the dynamic conception of norms: It is within the framework of the relationship among norms that he describes the relations of authorization and delegation involved in the passage from a higher norm to a lower one (in the lawmaking process).[50]

In specifying the features of the legal ought, Kelsen starts out by rejecting the role traditionally ascribed to the processes by which norms are formed and to the will as an element on which basis to understand the normative phenomenon itself. These processes belong to the world of the is, and it would be a mistake to conflate them with legal norms: For Kelsen, the empirical formation of law should play no part in defining the concept of law. All those approaches that look to empirical processes to arrive at an understanding of law mistake the is for the ought. The need to distinguish the *Sein* from the *Sollen* is highlighted by Kelsen in his criticism of those theories that equate norms with the processes by which they are formed, and that more generally fail to distinguish norms from facts and the will (both being empirical). The targets of Kelsen's criticism are Jellinek's (1905, 329–36) theory of the *normativen Kraft des Faktischen* (the normative force of the factual), the historical school of law and the role it ascribes to customary law, and the theories that identify legislation with normativity. Kelsen shows that the idea that normativity arises out of empirical processes stems from a failure to distinguish normativity from psychological processes, a failure that leads one to misunderstand the essential features of normativity. As far as Jellinek's theory is concerned, Kelsen (1960a, 9; 1922b, 114–20) argues that the so-called normative force of facts can only explain the way duty comes about or is extinguished on a psychological level, but it can neither account for the origin of normativity (a *Sollen* can only derive from another *Sollen*) nor describe its structure. Similar considerations are made in regard to customary law: In rejecting the historical school's view of customary law as a sort of self-legislation embodying a set of ethico-political values, Kelsen (ibid., 33ff.) notes that to make this argument is to disregard the heteronomous nature of law (among other problems the view suffers from). And

[50] According to Paulson (2012a, 83–5) the specificity of Kelsen's theory lies precisely in his conception of the norm as a form of "empowerment."

the same also holds for legislation: As much as legislation may be a condition for there to be law, it cannot be taken to be the same thing as normativity itself. Kelsen (ibid., 405–12) targets the German tradition in the theory of public law for its view of law as the will of the state,[51] and he criticizes this view by showing both that the production of law is a *social* process and that normativity lies in the binding force sealed into a rule and cannot be located in the creation of law (that is, in a causal relation). Kelsen argues that the *Sollen* and law are autonomous from the phenomena that call for a causal explanation: In this sense, norms are to be understood as "rules that bring imputative relations into being" (Heidemann 1997, 36ff.).

In making this argument, Kelsen draws an essential distinction between norms and the will, arguing that if the will is to have any role in an understanding of the law, it must be conceived in an exclusively normative sense. The legal will—set in contrast to psychological will, which is causal—is identified by Kelsen (1960a, 182–8) with the normative relation: The legal will is none other than the relation of imputability, whereby the normative consequence flowing from an illicit behaviour is imputed to the state. So when Kelsen, in the *Hauptprobleme*, defines law as the will of the state, he is referring not to a psychological will (in the world of the is)[52] but to the (juridical) will constituted by norms. The relation between norms and the will is turned on its head: Rather than *instituting* norms, the will—understood as the imputation through which the reaction to an offence is ascribed to the state—is *instituted by* them (Heidemann 1997, 35).[53]

Norms must therefore be understood in light of the distinction between acts and the meaning ascribed to them (a distinction parallel to that between *Sein* and *Sollen*): As an ought, a norm consists of content, or meaning; as the meaning ascribable to an act, a norm (in parallel to nonlegal norms) sets up an ought relation between a premise and a consequence (the imputation); as an aspect of the *Sollen*, a norm therefore consists of an ideal content, or meaning.[54]

This assumption is made explicit by Kelsen in his characterization of law in the realm of the ought, that is, in specifying the features that distinguish

[51] Kelsen points out Jellinek 1905 and Anschütz 1891, among other works in which this view is espoused.

[52] Nor, consequently, should the state be understood to have any unitary will (Kelsen 1960a, 162ff.)

[53] In the *Hauptprobleme*, Kelsen (1960a, 71–2) distinguishes two elements of a norm: the subject (the person who owes a duty) and the object (that which is owed), both constituted by the normative relation. In later writings (Kelsen 2001, 48) this terminology changes (see Heidemann 1997, 71), and the subject (or person) is reframed as the "personification of a subsystem" of rights and obligations. But even in the first formulation the subject recognized by law is distinguished from humans understood as natural persons.

[54] A norm can in this sense also be understood as a *Deutungsschema*, that is, a scheme on which basis to interpret facts.

legal norms from other kinds of norms, and moral ones in particular.[55] Kelsen, as we have seen, resorts to the idea of the coerciveness of law (an idea he arrives at by working from the distinction between autonomy and heteronomy). In line with the "tradition of nineteenth-century positivist legal theory," Kelsen characterizes a legal norm as a "coercive norm," such that "the consequence attached in the reconstructed legal norm to a certain condition is the coercive act of the state—comprising punishment and the civil or administrative use of coercion" (Kelsen 2001, 26). The legal norm consists in the relation between "the conditioning material fact […] qualified as an unlawful act and […] the conditioned material fact […] qualified as the consequence of the unlawful act" (ibid.).[56] Reasoning from the premise that "the law is never individual or autonomous," Kelsen (1960a, 35; my translation) shows that what makes legal norms unique lies in their making certain actions sanctionable (subject to penalty) and in the possibility of applying the same norms coercively: "This possibility of [coercive] application forms part of the essence of law. There is no law without the courts!" (ibid.). The law is in this sense heteronomous, a distinguishing feature of it that goes hand in hand with the institutional possibility of setting forth sanctions: That is where we must locate the difference between the legal ought and the moral ought.[57]

The structure of norms is defined by Kelsen through a critical contrast with the mainstream view of norms in 19th century jurisprudence: the idea of norms as imperatives.[58] The imperativist view is criticized for ascribing an inconclusive role to coercion and for presupposing a psychological relation of super- and subordination. Kelsen (1960a, 222ff.) exemplifies imperativism by reference to Jellinek's (1905, 325ff.) theory of norms as *garantierte Normen* (guaranteed standards). The problem is that of coercion (*Zwangsmittel*) in framing the concept of a norm: A contrast is set up by Kelsen between "theorists of imperativism who exclude the so-called coercive moment in framing the idea of a legal norm" and theorists who, by contrast, understand this to be an essential trait (Kelsen 1960a, 221–4; my translation). Jellinek thought that coercion is too restrictive as an element on which basis to define norms, and that it must therefore be replaced with the broader concept of a "guarantee."

[55] Kelsen holds that "the formal category of norm—the category designated by 'ought'—yields only the genus, not the *differentia specifica*, of the law." (Kelsen 2001, 26).

[56] Kelsen specifies that "what makes certain human behaviour illegal—a delict (in the broadest sense of the word)—is neither some sort of immanent quality nor some sort of connection to a metalegal norm, to a moral value, a value transcending the positive law" (Kelsen 2001, 26).

[57] According to Heidemann (1997, 37–8) the separation between law and morality (between the legal and the moral) is defended by Kelsen on other grounds, too. More to the point, Kelsen argues that a connection would (*a*) make it impossible to have an autonomous legal science, (*b*) present moral norms as objective, (*c*) make difficult the idea of certainty in the law, and (*d*) run contrary to legal practice.

[58] The structure of norms is a problem that Kelsen (1960a, 237) frames in terms of their "ideal linguistic form." See Paulson 2012a, 78.

On this theory, norms owe their existence to a "recognized external authority": A norm, in other words, is said to exist insofar as it "can act as a motive for action," and hence insofar as "its psychological effectiveness is guaranteed" (Jellinek 1905, 325–6; my translation). A norm, on the imperativist view, is an "imperative requiring compliant behaviour by those subject to it": Its essential trait lies in its "motivational force." This motivational force, stemming from an "authority […] that in the representations of individuals acts as a motive of behaviour" (Kelsen 1960a, 222-223; my translation), presupposes a power relation, that is, a relation of super- and subordination. A norm is in this sense the command issued by an authority that on the basis of a power relation can prompt others to action. On the German imperativist view, this authority is the state. This means that a command qualifies as such by virtue of its "coming from the state," on the principle "that one must do that which is willed [*verlangt*] by the state" (ibid., 224; my translation). As Kelsen underscores, this means that "the relation between the state and its subjects" is understood as "a relation of super- and subordination based on the state's de facto power: On its physical and psychological force" (ibid., 225; my translation).[59]

Kelsen's point is that this conception does not reflect a normative stance, and that it grows out of a confusion between is and ought. For Kelsen, "every relation of super- or subordination—of dominion, power, or command—is by nature exclusively factual" (ibid., 226; my translation) and bears no relevance to any juridical consideration. Law cannot be viewed naturalistically as a "duty of obedience or disobedience" in response to a command issued by a higher power, for that is tantamount to reducing the bindingness of law to the factual relations it sets up. On the normative approach, the idea of law as a hypothetical judgment entails, by contrast, that the relations among those subject to the law depend neither on the de facto power relations (*faktischen Machtverhältnisse*) nor on the psychological motivations that make for compliance. Legal norms must instead be viewed in light of the bindingness arising out of the imputative relation:[60] A legal norm is thus a hypothetical judgment (*hypothetische Urteil*). In the law, as discussed, this judgment is captured in a scheme as follows: If certain illegal behaviours take place, the state will react with certain other behaviours understood as consequences of those offences, that is, the state will punish the offender or enforce a judgment (Heidemann 1997, 66–7).[61]

[59] From this perspective, the "guarantee" built into a norm (its guaranteed compliance) may also be rooted in "moral or religious motives" (Kelsen 1960a, 222; my translation).

[60] As was noted earlier at footnote 43, Kelsen draws no distinction in the *Hauptprobleme* between peripheral and central imputation, the former attaching a consequence to a premise, the latter setting up a relation between a possible fact and a subject (or person).

[61] This relation is described by Kelsen (1925a, 49) through the formula "Wenn M^h + E (oder M^u + E), so Z → M," which can be written out as follows: When certain acts or omissions to act give rise to certain facts (*Ereignisse*), there will follow a coercive reaction by the competent authorities targeting the authors of those same acts or omissions.

The legal hypothetical judgment (setting up the imputative relation) is thus made up of an antecedent (protasis) and a legal consequence (apodosis) that consists of a sanction (a punishment or the enforcement of a judgment). As has been pointed out (Celano 1999, 216–7; Paulson 2012a, 78–85), this structure of the norm reveals that the ought refers not so much to the behaviour of those bound by the law as to that of the state carrying out a sanction, since "what all legal norms state is that under certain conditions there 'must' follow just one behaviour, namely, the exercise of coercive power (the enforcement of coercive measures)" (Celano 1999, 214; my translation). If what must be is the sanction, it follows that "a legal norm, in setting forth a sanction, *authorizes* a given individual or group of individuals to carry out that sanction; in other words, a legal norm *empowers* them to apply the norm itself" (ibid., 216–7). This is to say that "the 'ought' whose object is the sanction […] entails the notion of authorization, signifying a conferral of normative power" (ibid., 217).[62]

In keeping with this analysis, Kelsen worked out a typology of norms upending the relation that jurisprudence had previously found to hold between primary and secondary norms, all the while proceeding on a distinction between general and individual norms. In Kelsen, primary norms (norms proper) are no longer those that set out rules of conduct but those that impute (or attach) a sanction to certain behaviours.[63] This inversion needs to be read in light of Kelsen's investigation of the structure of norms, for on the one hand law is no longer seen as a model of conduct (as an obligation) but as an imputative relation attaching a sanction to a given behaviour (a desubstantializing conception of law), and on the other hand law presents itself as a set of prescriptions mainly addressed to the enforcers (prescriptions authorizing those who are to apply the given sanction).[64]

[62] According to Bobbio, this means that the law is understood by Kelsen as "a set of norms regulating the use of force," or as a technique for governing the use of force (Bobbio 2012, 102; my translation; English translation Bobbio 1965b). On this view, norms can thus be described as prescriptions mainly addressed at the judges (Barberis 2008a, 126).

[63] In previous jurisprudential thought, primary norms were those that set forth rules of conduct (like those that prohibit theft), whereas secondary norms were those that provide a sanction for the prohibited conduct (in the example, the norms that punish theft). On these distinctions, see Gavazzi 1967.

[64] This conception corresponds to the notion of a norm in a strict sense found in the 1911 *Hauptprobleme* (Kelsen 1960a, 189ff.), where the basic breakdown is between these norms and norms in a broad sense: In this latter sense, norms establish that which the state *wills* as concerns its own behaviour (the state may will its own enforcement of a sanction or its own provision of a service, so that we have a negative duty in the first case and a positive one in the second); in a strict sense, norms establish the way the state will *react* to the behaviour of citizens (by enforcing the appropriate sanctions). Norms in a strict sense thus describe a specifically qualified and conditioned behaviour of the state, where the condition is given by a citizen's behaviour and the consequence by the corresponding sanction. This means that, given certain circumstances, the state will behave in a certain way: If citizens do *x*, then the state will do *y* (Heidemann 1997, 38–40; Paulson 2012a, 82). The idea of a norm in a broad sense would later be abandoned by Kelsen.

The distinction between general and individual norms is present throughout the Kelsenian oeuvre, but it takes on a new meaning with Kelsen's adoption of the dynamic conception, where it is reworked within the framework of the hierarchical view of the legal system: The relationship between a general norm (higher and abstract) and an individual norm (lower and concrete) is now seen as a relationship of authorization or delegation. The lower norm is made possible by an "authorization" provided by the higher norm. The passage from a general norm to an individual one therefore requires a delegation mechanism (through which powers are conferred on competent authorities on the basis of specific procedures), which in turn presupposes a multilayered legal system (Celano 1999, 304–12).

As we will see, the adoption of a dynamic perspective will lead Kelsen to rethink as well the way he understands both the validity and the interpretation of norms. Indeed, in the 1911 *Hauptprobleme* Kelsen takes the view that once you have specified the features of a legal norm, you have somehow already accounted for their validity and interpretation. For this reason, he does not frontally address the validity of norms in that work, except to underscore its distinction from the efficacy of norms (on the basis of the distinction between *Sein* and *Sollen*), while denying that efficacy plays any role as a pertinent legal question (Kelsen 1960a, 352–3). Similar considerations are made with regard to the problem of how norms are interpreted and applied: A norm is concretized simply by virtue of applying the higher general norm, in which the contours of the lower norm are already contained; in this sense, all secondary legislation can be said to be contained in the relative primary legislation (a regulation, for example, or even an executive order, is contained in the act conferring the powers to issue it). Interpretation is not for legal science to be concerned with but is something metalegal that finds its place only where a norm cannot be clear. It is in any event a problem that does not affect the life of the law in any significant way.

8.4. The Vienna School's Theory of the Legal System: The Law as a *Stufenbau* and the *Grundnorm*

Kelsen's theory took an important turn in the 1920s, when, as noted, he embraced the dynamic perspective in the analysis of law and consequently also took up the *Stufenbaulehre* (or doctrine of hierarchical structure in the law) and the *Grundnorm* (or basic norm), the former describing the structure of the legal system and the latter providing its unifying principle. These new elements, introduced by drawing on the work of Adolf J. Merkl (1968a, 1968b, 1968c), innovate the *reine Rechtslehre* (or pure theory of law) in important ways. In the preface to the second edition of the *Hauptprobleme*, Kelsen underscores that the passage from the static to the dynamic conception of law marks "a significant change in the system of the pure theory of law as against the original conception of the system in *Main Problems*" (Kelsen 1998, 11).

In introducing these innovations, systematically laid out in the 1925 *Allgemeine Staatslehre* (General theory of the state: Kelsen 1925a) and the 1934 *Reine Rechtslehre* (translated in English as Kelsen 2001), Kelsen points out that the reason for them is to make up for some important shortcomings in his earlier conception. This holds in particular for the relation between general norms and the (individual) norms that apply them, as well as for the ensuing problem of the unity of legal norms, which are produced by different subjects and can take different contents. It is in working to solve these problems that Kelsen introduces the dynamic conception of law, which sits next to the static one. The law is now defined not only by the ought relation captured in each legal norm but also by the relation among norms (the law as a system). This shift makes it necessary to broaden the scope of the analysis: The law is no longer considered only in its "idle state," by "abstracting from the process by which it is brought into being […] and from the processes through which the law changes over time" but is investigated by also taking into account this very "process of formation and transformation" (Celano 1999, 107–8; my translation, referring to Kelsen 2006). This means that a whole series of problems hitherto regarded by Kelsen (1960a, 353) as "legally" irrelevant now become central. This concerns in particular the problem of the validity of norms (the fact that norms "must be observed and applied") and that of the foundation of their validity, that is, the "complex of reasons […] justifying the conclusion that we ought to behave as prescribed by the norm" (Celano 1999, 278; my translation).[65]

Indeed, as Kelsen points out, that is the main shortcoming of his own previous work: Even though, as he says,

> I am thoroughly aware in *Main Problems* that the abstract legal norm is significantly different in content from the concrete state act enforcing it, that the latter contains not only the elements established in the abstract norm, but also many others (Kelsen 1998, 11–2)

he does not draw from this premise the consequence that the "the concrete acts of so-called enforcement […] must be understood […] as acts of law, as legal acts" (ibid.). For this reason,

> if the general legal norm, like the individual state act, must be comprehended in terms of unity within the legal system, then this postulated unity […] cannot be established in such a way that one thinks […] that the individual norm is essentially contained […] in the general norm, [since] the content of the individual norm goes far beyond the content of the general norm. (Ibid.)

[65] In the 1911 *Hauptprobleme*, Kelsen argues that "inherent in the concept of a legal norm from the outset […] is the idea that it must be observed and applied. This qualification—that each norm must be observed and applied—is contained *ab initio* in the description of a legal proposition as a legal norm" (Kelsen 1960a, 352–3; my translation). It is not for the jurist to inquire into the foundation of validity: The jurist is tasked with "ascertaining the how, not the why," and can only investigate the "logical form" of legal propositions. On these aspects, see Paulson 2013, 45–9.

The problem, then, is to account for the validity of lower norms, whose content cannot be derived from the higher norms, "as if the validated norm were 'already contained' in the validating norm" (Celano 1999, 300; my translation).

In working to solve this problem, Kelsen takes as given the distinction between *Sein* and *Sollen*: From this premise he draws the necessary conclusion that "the foundation of a norm's validity lies in a norm,"[66] and from here he arrives at the solution that, more to the point, validity depends on "the processes by which the law is produced" (Celano 1999, 285, 291; my translation). If "the only way a norm can be validated (the only way a judgment about its validity can be grounded) is to assume the validity of another norm," this relation cannot be analogized to that between a "particular concept" and a "general" one (ibid., 297, 301; my translation) but must rather be conceived as involving the act of a competent authority (an act from which alone can come the validity of any lower norm). Kelsen takes up Merkl's work on the general theory of law (see Merkl 1968b, 1091ff., 1903), drawing in particular on his thesis that it is necessary to find "an element of normative mediation" (Abignente 1984, 15; my translation) acting as a liaison between a norm (general and abstract) and the act through which it is applied.[67] This "intermediate element," through which "the abstract hypothesis expressed in a norm is translated into a concrete command or is reduced to such a command" (ibid.), is achieved by "combining a subjective factor with an objective one" (Merkl 1968b, 1096). It is to this element that the law owes its dynamic nature, by which is meant its regulating its own production by authorizing other organs to issue norms that both produce and apply higher norms:[68] This is achieved by "delegating power" (Celano 1999, 311; my translation), in which consists Merkl's mediating element, namely, the act by which a lower source is authorized by a higher, validating source (which in this way grounds the validity of the lower source). So by way of delegation and authorization, a norm confers on lower organs the "competence" to create new legal rules.[69] Which means that the higher norm, as we have seen, is an "authorizing norm, that is, a norm that sets up an authority" (ibid., 304–5; my translation). In this sense, the "power conferred by the authorizing norm is

[66] This foundation, as we have seen, cannot be reduced to any acts of will or to a norm's efficacy (Celano 1999, 284–5).

[67] On Merkl see also Section 2.4.1 in Tome 1 of this volume.

[68] According to Merkl, if "the production or application of law takes place […] by virtue of an organ concretizing or individualizing the given legal matter to a greater or lesser extent" (Merkl 1968b, 1096) the law acquires a twofold structure where a norm represents two acts: one by which law is *produced* and another by which it is *applied*.

[69] For Kelsen, the norms through which power is delegated to an organ (which is thus authorized to use the same power) do not constitute a class of their own: Power-conferring norms (like those found in a constitution) are "not independent complete norms. They are intrinsic parts of all the legal norms which the courts and other organs have to apply" (Kelsen 2006, 143–4). As is known, the distinction between rules of conduct and power-conferring rules was later developed by Hart (1961). On these questions, see Barberis 2008a, 126–9.

[…] a normative power, in the twofold sense of being […] a power conferred by norms and a power to produce norms" (ibid., 305; my translation).

Law is seen as a system at once dynamic and formal, in which "a norm is valid qua legal norm […] because it was […] created according to a certain rule, issued or set according to a specific method" (Kelsen 2001, 56). The system is hierarchically structured (ibid., 63ff.): "A conditioned norm (*bedingte Norm*) owes its validity to its conditioning norm (*bedingende Norm*)" (Abignente 1984, 18). The law presents itself as a dynamic order, as a process of progressive concretization, a process imparting to it a hierarchical stepwise structure termed *Stufenbau*, in that the lower norm is created by delegation of powers conferred by a higher norm, however much the modes of creation may vary across different areas and levels of the law. But three basic levels may be distinguished in the hierarchical structure, corresponding to three successive stages in the law-creating process: We have the constitutional level, the legislative one, and the applicative one, this last one comprising adjudication, administration, and "private" normative production (all equally ranked in the hierarchy). The legal order is thus depicted as a hierarchy of planes: a system for the production and application of norms, general and individual alike, that find their place within the same normative pyramid.

The *Stufenbaulehre*—marking the shift from the solely normative conception of law to its conception as a dynamic order—brings a series of innovations to the architecture of the pure theory, while firming up its basic features.

In the first place, to qualify the law as a dynamic order is to identify a criterion by which to tell what makes for a valid norm and what the distinction is between law and morality, in that both questions are answered by looking at whether a norm belongs to the order and the way it fits into that order. So the validity of a norm is specified in relation to the structure of the legal order and the relationships that obtain within that order, and the distinction between law and morality is drawn on the basis of the different characteristics peculiar to the two orders (the legal one and the moral one). As discussed, the validity of a norm is determined on the basis of its belonging to the legal system: An individual norm is valid if its production is delegated by a higher norm (this is what Kelsen describes as an "objective ought"). It is on the basis of these norm-producing criteria that the validity of norms is determined: A norm is said to be valid if its production can be traced to a higher (validating) norm. And on this basis Kelsen comes to equate the existence of a norm with its validity: From the dynamic perspective, a legal norm exists insofar as it is valid (and is thus binding), that is, if it has been issued in accordance with the appropriate delegation and authorization criteria. This characteristic of the legal system marks its distinction from morality: The latter consists of a set of norms linked up only on the basis of their content. Morality is understood by Kelsen as a static set of norms where the derivation of lower norms from higher ones can only be based on content, that is, it must be deductive. The distinction

between static and dynamic orders maps onto that between morality and law: Moral systems are content-dependent, whereas "any content whatever can be law" (Kelsen 2001, 56). Although this should not be understood as an absolute statement,[70] it does provide one of the bases of Kelsen's legal relativism: If law is a system that governs its own creation, then it can have any range of contents. Unlike systems of natural law, for example, which identify law with morality and thus posit universal principles as their foundation, Kelsen's legal positivism does not set any content-specific criteria in order for something to count as law. The distinction between law and morality thus turns on their different techniques: The law fixes criteria by which to produce norms (with the exception that this must be in keeping with the substantive constraints set forth in the constitution), whereas morality is concerned with questions of substance (i.e., content) and nothing else besides.[71]

In the second place, Kelsen expands the notion of normative production (*Rechtssetzung*), which is no longer limited to statutory enactment (as was the case in the *Hauptprobleme*)[72] but also includes the constitution and so-called individual norms (court rulings, administrative actions, and legal transactions between private parties). From the dynamic perspective, the legal order includes both supra-legislative law and the legal activity of state organs and private entities. With the introduction of the hierarchical-structure of law, the constitution is recognized as a higher source of law having a direct normative bearing as a norm setting out the different functions of the state. The lawmaking process is conceived as the process of applying higher norms, and that entails the need to bring that activity under judicial review to determine whether the norms so produced are compliant with those higher norms as to both form and content (Kelsen 1928a). From this perspective, even the series of acts by which law is applied takes on a different meaning. In the *Hauptprobleme*, as we saw, these acts represent only one moment in the "implementation" (*Ausführung*) of the obligation contained in the norm: No legal norms are directly brought into being in that moment, and in this sense the processes in question are confined to enforcing the *consequence* deriving from a breach or offence or to pursuing the social aims entrusted to the state. The dynamic conception revisits this notion of enforcement by claiming that even administrative regulations, court rulings, and legal transactions between private parties contain legal norms, and these norms cannot be found simply by looking them up (*Rechtsfindung*).[73]

[70] One need only consider here what Kelsen (1944, 87–8) said about individual liability for the violation of international law.

[71] On Kelsen's view of natural law theory, see in particular Kelsen 1927–1928a, 1968b.

[72] On the approach taken in the *Hauptprobleme*, the features of normativity are such that they only apply to statutory law.

[73] In laying out the import of the *Stufenbaulehre*, Kelsen and Merkl underscore how this construction entails (among other things) a need to revise the traditional account of the functions of the state, or the theory of the three powers of government. As Merkl points out, "the

In the third place, the *Stufenbaulehre* changes the criterion on which basis to theorize the unity of law. In a hierarchical system the legal order can be understood as unitary if there can be presumed to exist at its apex a higher law-creating norm (the *Grundnorm*), which is to be identified with the constitution in a logico-juridical sense (Kelsen 1922b, 94), and which is stipulated as a meta-alegal hypothesis by which to close the system.[74] For Kelsen, "the sought-after unity can only be the unity of a rule of creation; law creation itself, as a legally relevant material fact, must be understood as the content of a reconstructed legal norm" (Kelsen 1998, 12). Unlike Kelsen's previous thought—where the problem of unity is solved by looking to the law of noncontradiction among the norms (or statutes) present in the system, a law deriving from the application of the principle *Lex posterior derogat legi priori* (More recent law trumps an earlier law)[75]—in the hierarchical construction unity is made to depend on a norm by which to make the system self-enclosed, a norm that in the first place fixes the criteria for delegating the authority to make norms.[76] A hierarchical

hierarchical-structure affects the entire theory of the functions of law and the state, because from the standpoint of that construction, these functions are entirely determined by other functions" (Merkl 1968d, 135; my translation). As a "new way of understanding of the functions of the state," the hierarchical-structure frames the "uses of each state power […] as a hierarchical series of acts" (ibid.; my translation) carried out by authority of a higher law contained in the constitution. In this framework, lawmaking and public administration are both understood as functions by which law is produced and applied, in a process of incremental legal concretization that takes the constitution as its point of departure. This construction supersedes the view of the legislative process as an activity not subject to judicial validation, and in so doing it also introduces the possibility of judicial review for constitutional compliance. Indeed, as the highest norm, the constitution makes it possible to view lawmaking as an entirely juridical function, and hence as subject to judicial review. As is known, judicial review for constitutionality was written into the Austrian constitution of 1920 through the efforts of Kelsen himself. On constitutional judicial review in Kelsen, see Bongiovanni 2007.

[74] The idea of the "basic norm" as a criterion on which basis to find the unity of the system is attributed by Kelsen (1998, 13) to Verdross (1968). On Verdross see Section 2.4.2 in Tome 1 of this volume.

[75] In the *Hauptprobleme*, the problem of the unity of law is solved by identifying a single source for all norms. The unity of law, in other words, is predicated on the notion that there can be no law outside statutory law and is accordingly understood to entail the need for general norms not to contradict one another. Where norms or their sources lie on the same level, this noncontradiction is secured by the chronological *lex posterior* principle, but when we are dealing with the relationship between laws and their administrative implementations, noncontradiction is secured by the principle whereby a specific norm is included in a general one that covers the same subject matter: While the chronological principle serves as a criterion by which to repeal earlier norms that stand in a relation of antinomy with later ones, on the inclusion principle, the act of implementing a general norm is understood to be contained in that norm from the start. The conception of the activity of the state in terms of implementation—that is, as a simple carrying out of duties—leads to a view of the state's administrative activity as a "concretization" of the norms contained in its abstract contours, namely, in the laws.

[76] According to Paulson (2012a, 85ff.), this is the main role of the *Grundnorm*. See also Celano 1999, 322ff.

system can be understood to be unitary to the extent that, on a neo-Kantian approach, it can be said to rest on a principle capable of generating the entire series.[77] In law, this function is served by the *Grundnorm*, which makes it possible to conceptualize the system's dynamic unity. This norm is not enacted but is presupposed, in the sense that it must be understood to exist if we are to explain in what sense the system is legal, binding, and unitary and what makes its individual norms valid. The *Grundnorm* can in this sense be viewed as serving a plurality of functions.

Most crucially, the *Grundnorm* comes into play as the necessary hypothesis by which to ensure that the system's legality is not reduced to its social dimension, that is, to the efficacy of norms. By endowing the constitution with its own legal validity, the *Grundnorm* makes it possible to avoid reducing that validity to the social fact of compliance, for that would amount to deriving an ought from an is.[78] The *Grundnorm* thus offers a criterion on which basis the legal system and its norms can be recognized as having a specific validity different from social validity and irreducible to it. This is essential when it comes to spelling out why the "constitution" is "valid" (Alexy 2002a, 96) or why the norms making up a given legal order "ought to be obeyed" (Kelsen 1960b, 218). In Kelsen's view, as we saw, the problem of what makes the law binding or the constitution valid cannot simply be solved by pointing to the enactment and efficaciousness of law but also requires a normative foundation. Reflected in the basic norm is a need not to collapse the ought into the is: The basic norm tells us "which facts are to be regarded as law-creating facts," thus making it possible to move "into the realm of the law" (Alexy 2002a, 106, 105). The *Grundnorm* is the tool "for rejecting […] empirico-positivist legal theories" (Paulson 2000, 291),[79] that is, for explaining the bindingness of law

[77] This idea is informed by the transcendentalism of the Marburg school and its approach to the problem of the relationship between "the particularity of the single entity vis-à-vis the universality of concepts or of law" (Lamanna 1967, 16; my translation). This relationship is worked out by Cassirer—*Substanzbegriff und Funktionsbegriff* (Cassirer 1910, translated in 1923 as *Substance and Function*)—on the basis of what he called the serial principle, offering an answer to Hermann Cohen's search for "the *origin* of the objects of science" (Abbagnano 1999, 570–1; my translation): What enables multiple terms to be connected into unity as a system is a "basic productive relation" in virtue of which those elements can be ordered and understood when "they issue from an initial given element through a necessary succession […] in accordance with a rule of progression under which the single terms can each be produced from one another. Each member in the series is particular, while the universal lies in the principle from which springs the series itself" (Lamanna 1967, 17; my translation).

[78] In the second edition of the *Reine Rechtslehre*, Kelsen sets out the "basic norm syllogism": In order for it to be "legally prescribed that one behave in accordance with the constitution" (conclusion) if the constitution "has in fact been issued and is socially efficacious" (minor premise), there needs to be a major premise stating that "if a constitution has in fact been issued and is socially efficacious, then it is legally prescribed that one behave in accordance with this constitution" (Kelsen 1960b, 219). See Alexy 2002a, 96–8.

[79] Paulson (2000, 292) observes that although the *Grundnorm* "is telling against fact-based

without resorting to law's social dimension, and so for arguing that, contrary to the view espoused by 19th-century legal positivism, law cannot be reduced to facts. The basic norm is entrusted with transforming facts into law (or power into law) and with framing the dynamics by which norms are produced.[80] This transformative function sets up a complex relationship between facts, on the one hand, and validity and bindingness, on the other: In Kelsen's view, the basic norm qualifies a legal system as being in some way efficacious,[81] and in these systems the relation between efficaciousness and validity cannot fall below a minimum level.[82] The relationship between efficaciousness and validity is one of the problems that also calls into play the parallel relationship between facts and values: Even the *Grundnorm* can be described as a device by which to qualify law as objective. Indeed, because the *Grundnorm* is presupposed, it is to be understood not as a fact but as a hypothesis (Celano 1999, 374): This means that the *Grundnorm* is necessary if we are to "conceptualize" existing law as valid and binding.[83]

The *Grundnorm* makes it possible to fix the unity of the legal order and set out the criteria for inclusion in the system. By singling out the persons and the facts deemed to be productive of law, the *Grundnorm* on the one hand offers a criterion on which basis to define the system's identity and unity and, on the other, makes it possible to say which norms belong to the system: Just as the system finds its unity in the basic norm (and in its content),[84] norms

legal theories," it fails to offer an "argument for rejecting […] the morality thesis" as a basis on which to ground the bindingness of law.

[80] According to Alexy (2002a, 105) this role ascribed to the *Grundnorm* springs from the need to find a "category" for "transforming" an is into a legal ought. Indeed, without the "additional" premise of the basic norm, it would be a violation of Hume's law to attempt to move from the plain *fact* of the constitution to its *bindingness*, that is, from the fact that a constitution has been enacted which people comply with to the conclusion that such compliance is *owed*. On the function of the *Grundnorm* as a device for effecting a categorial transformation, see R. Dreier 1972.

[81] Efficaciousness is conceived by Kelsen (1922b, 93, 94; 2006, 119) as a necessary but insufficient condition of validity (a *condicio sine qua non* but not a *condicio per quam*). This is apparent in his analysis of revolutions, where we have to say which of the two competing orders is valid—the new one or the old one—and Kelsen (2001, 59–60) attacks this problem by directly invoking efficacy: We have to see which of the two orders elicits greater compliance. For some critics, such as Celano, the dynamic conception frames the relationship between efficaciousness and validity in such a way that the law "ultimately winds up being determined by the efficaciousness of coercive power," thus contradicting Kelsen's intent not to enable "power to […] determine law" (Celano 1999, 382–3).

[82] This only applies to the system *as a whole*: Its individual norms will still be valid even if they are inefficacious (i.e., disregarded).

[83] As has been noted, "the notion that the basic norm is 'presupposed' […] lends itself to two interpretations: It can be taken to mean that the jurist proceeds from either (1) a hypothesis—namely, '*If* N (the basic norm) is valid, then […]'—or (2) an assumption, namely, 'N (the basic norm) *is* valid; therefore […].'" (Celano 1999, 374; my translation). On the *Grundnorm* as a presupposition, see Bindreiter 2001.

[84] This content is mostly concerned with the form of government fixed by the constitution.

can be said to belong to the system only if valid, that is, only if they can be traced to the basic norm through a cascading process of normative production, meaning that they have been "authoritatively issued," or enacted "in the duly prescribed way by a duly authorized organ," and they do "not violate higher-ranking law" (Alexy 2002a, 95).[85]

The dynamic conception marks the point that Kelsen works up to in the period after World War I. On this basis he makes deep changes to a series of traditional concepts, all the while developing a definite theory of legal interpretation: The changes he introduces concern in particular a series of dualisms that characterized legal thought before Kelsen, while the theory of interpretation leads to an outcome that can be described as "sceptical," albeit only moderately so. It was Kelsen's view that earlier legal dogmatics had set out a series of dualisms deliberately loaded with ideological meaning, in that they were aimed at supporting specific agendas or positions of power. He was referring in particular to the distinction between *subjektives Recht* and *objektives Recht* ("subjective right" and "objective law," a distinction reflecting that between the individual and the community) and to the distinction between private and public law. Special attention was devoted by Kelsen to this latter distinction, since by rejecting it he could frame in a new way the relationship between law and the state (between which he sees no distinction) and between national and international law (giving primacy to the latter). The need to criticize this distinction also provided the initial spark for the school that was closest to Kelsen, the so-called *Brünner rechtstheoretische Schule* founded by Frantisek Weyr.[86] Indeed, in three articles written in the early 20th century, Weyr (1908, 1914a; 1914b) argues for the need to transcend this dichotomy by creating a unitary legal system grounded in a "normative" consideration, over against an ideological one.

Like the distinction between the individual and the community, the one between *subjektives Recht* and *objektives Recht* is regarded by Kelsen as ideologically laden, rather than as driven by a theoretical interest, since it tends to uphold the primacy of the subjective sphere with the specific aim of protecting private property: What underpins this primacy is really the idea "that the subjective right, which really means private property, is a category transcending the objective law" (Kelsen 2001, 40). Kelsen argues, by contrast, that

[85] The dynamic conception of law does not just address concerns of *theoretical* import but should also be seen as a response to the transformations the state was going through at the time. As Sordi has highlighted, the dynamic conception "prefigures a descriptive unit of a 'systemic' type […], giving birth to a view of the legal order where an increasingly complex public can find its place. In this sense, the unity the order finds in its dynamic coming-to-be turns out to be solely normative, in such a way that we can envisage a state open to private citizens and can identify a unifying platform that reaches beyond the traditional *Träger der Staatsgewalt* [bearers of state power]" (Sordi 1987, 248; my translation).

[86] On the *Brünner Schule*, see Kubes and Weinberger 1980. On Weyr see also Section 2.1 in Tome 1 of this volume.

> the subjective right is not different from objective law; it is itself objective law. For there is a subjective right (*qua* legal right) only in so far as the objective law is at the disposal of a concrete subject. Similarly, the legal obligation (the other form of law in the subjective sense) is itself objective law, for there is a legal obligation only in so far as the objective law aims—with the consequence it establishes for an unlawful act—at a concrete subject. (Ibid.)

This makes it possible to guard against any "ideological misuse" and to move away from the "historically conditioned formation of law in a capitalist system" (ibid., 44, 45). The contraposition between private and public law is instead linked to the central place the dogma of sovereignty and of the state's power occupies in German legal dogmatics. Kelsen underscores how this distinction, which grew out of the reception of Roman law,[87] is intended to set up two different sorts of relations among subjects,

> with private law representing a relation between coordinate subjects of equal standing legally, and public law representing a relation between a superordinate and a subordinate subject—between two subjects, […] one of which is of higher standing legally than the other. (Ibid., 92)

The relations set up by public law would thus be "power relations," based on the "higher standing" ascribed to the state: The state, by reason of its sovereignty and superiority, would be entitled to a right that brings into being legal relations different from the ordinary of relations obtaining in private law. The distinction between *jus privatum* and *jus publicum* entails a contraposition between law and the state, that is, "between law and non-law" and "between law and power." This framework, built on the idea of sovereignty, is superseded by virtue of the way the "pure theory of law […] relativizes the opposition between private and public law, transforming it into an intra-systemic opposition" based on the different "methods of creating law" (ibid., 94, 93). By doing away with these distinctions, Kelsen can argue for an identity between the state and the legal order, the former being "nothing other than the personification" of the latter. And by so identifying the state with the legal order, Kelsen can in turn affirm the primacy of international law: If there is no special sovereignty that can be recognized for certain subjects (the states), then international law, as an all-encompassing order, must "logically" be regarded as superior to all partial orders (ibid., 101, 107ff.).

Finally, the dynamic construction entails, in Kelsen's own words, "significant consequences for the problem of interpretation" (ibid., 77). There is wide latitude in the implementation of a higher norm by way of a lower one: Even if the former can determine the "content" of the latter, "this determination," as Kelsen sees the matter, "is never complete." This consideration—in which, as we have

[87] In criticizing Laband's analysis, Kelsen links that reception to "the development of the absolute state" and to "the desire of the German Kaiser and the German princes to gain the status of the Roman sovereign: that of *legibus solutus*," meaning that the sovereign is not bound by the laws (Kelsen 1913b, 60; my translation; see also Kelsen 1913a).

seen, lies the basic reason that drove Kelsen to introduce the dynamic conception—translates into a moderate sceptical view of the process by which laws are interpreted, in that "the norm to be applied is simply a frame within which various possibilities for application are given." These possibilities are not, however, boundless: The statement of "the meaning of the norm" means, "within this frame, the cognition of various possibilities for application" (ibid., 78, 80).

8.5. Law and the State in France: Carré de Malberg, French Legicentrism, and "Organistic Tiering"

Kelsen's pure theory of law had a direct impact on the European debate and became one of its main reference points. Even French legal thinkers engaged with the pure theory. A case in point is Raymond Carré de Malberg (1861–1935), the most significant exponent of French *positivisme juridique*.[88] His engagement with the pure theory was direct, and it took place in the second phase of his thought, where the point of departure was not the paradigm of the rule of law—as it had been in his 1920 *Contribution* (Carré de Malberg 1920)—but the sovereignty of law and of the general will.[89] Carré de Malberg's legal positivism draws directly on the German school of public law:[90] It is built on a method aimed at separating nonlegal elements (natural law, morality, history, politics, and suchlike: see Galizia 1973) from the sphere of legal knowledge,[91] and its general reference point lies in the concept of the *État de droit*, or rule of law (Mineur 2012, 1). It is here that Carré de Malberg develops his best-known theses, from that of national sovereignty to that of a self-limiting government (see Fioravanti 2001, 594–6; Laquièze 2007). His engagement with Kelsen takes place thirteen years after the 1920 *Contribution* and is developed in light of the ideas expounded in his 1931 *La loi expression de la volonté générale* (Law as an expression of the general will: Carré de Malberg 1931), where he argues for a monist theory of the parliamentary regime (Calamo Specchia 2008, XXXIX–XL),[92] placing popular sovereignty at the foundation of the system.

Carré de Malberg proceeds on this basis to develop two main criticisms of Kelsen's theory: The first is a methodological criticism, while the second

[88] For an overall analysis of Carré de Malberg's work, see Section 12.4 in Tome 2 of this volume.

[89] Whether there actually exist two phases in Carré de Malberg's thought is a matter of debate: Schönberger 1996 and Mineur 2012 say they do exist, while Calamo Specchia (2008, LI) rejects that interpretation.

[90] Mineur sees Carré de Malberg as "the one who more than anyone else has contributed to bringing German legal thought into France" (Mineur 2012, 1; my translation).

[91] On this approach, the law is understood to be made up of "commands" (*commandements*) backed by "the state's coercive force" (*la force coercitive de l'État*). See Galizia 1973, 364.

[92] On the distinction between the monist and the dualist theory of the parliamentary regime, see Calamo Specchia 2008, XXXIXff.).

is aimed at highlighting the role of the different organs through which law is made (this is the sense of his "organistic tiering,"—"*gradation des organes*"—on which see Carré de Malberg 1933, par. 104). His methodological criticism builds on a broad, widely shared theme in the European debate, taking issue with the abstractness of Kelsen's construction, its substantial "unrealism" (*irréalisme*: Amselek 2007, 9), and its "abstract logicism" (Chimenti 2003, XVI). These features are brought to light by showing how Kelsen's analysis of the legal system does not hold up in light of positive law: As has been underscored, for Carré de Malberg "every legal theory needs to be held up to scrutiny in light of the live experience of a posited legal system, and each theoretical element is good only to the extent that it corresponds to a posited datum" (ibid.; my translation).[93] The second criticism is developed with a view to advancing beyond a "purely normative conception" (ibid., XVII; my translation), arguing that the system's hierarchy describes not its norms but its organs: What matters is where the norms come from. In his view

> the shortcomings of the *Stufentheorie* (hierarchical-structure theory), or rather, the excesses that make it liable to criticism, are owed to the fact that the theory rests on arguments based exclusively on norms, without first taking into account the organs or authorities from which those norms are issued. (Carré de Malberg 1933, par. 104; my translation)

In this sense, the hierarchy

> of norms, such as that of the functions and acts, derives not from the degree of quality inherent in each type of norm considered in itself, but from the degree of power exercised by the organs or authorities from which the norm has been issued, from the function performed by those organs or authorities, or from the act carried out. (ibid., par. 16; my translation)

So, according to Carré de Malberg, "the tiering of norms is to be understood as having its actual cause in the organistic considerations to which the formation of law is subjected in the positive legal system" (ibid.; my translation). It follows that "a ranking proper cannot be established except among powers, acts or norms of the same kind and nature" (ibid., par. 44; my translation). This means that the decisive role is played "by the system and by the organization of legal phenomena insofar as they are connected with the problem of sovereignty" (Chimenti 2003, XII; my translation), and so the hierarchy of norms depends on "the 'quality of the powers' exercised by the public organs" (Amselek 2007, 24). Carré de Malberg's criticism is clear: Kelsen's hierarchical-structure theory fails to take sovereignty and power relations into account, and

[93] This analysis was criticized by Weyr, commenting that "a legal system is not tasked with positing theories, and it cannot be invoked either for or against a given scientific conception. In his book, Carré de Malberg attempts a comparison between incomparable things, namely, a system of norms, on the one hand, and a scientific theory, on the other" (Weyr 1934, 236; my translation, quoted in Amselek 2007, 9).

for this reason it cannot express the "'radical distinction' separating acts that express sovereignty from those that do not" (Chimenti 2003, XVII; my translation). On Carré de Malberg's organistic approach, if we are to clarify a system's hierarchy, we will have to identify sovereignty, which, as the power to make law, lies at the system's foundation.

This role is entrusted to the parliament, having a "sovereign quality" owed to its "representative character."[94] From the sovereignty of the parliament comes that of the law. It follows that "all expressions of will coming from organs other than the parliament, and so from nonsovereign organs, must be subordinated to the law" (ibid., XIX; my translation). The same goes for the constitution: The law cannot be seen as the application of the constitution, because law "comes into being by virtue of an autonomous power, a power whose material object or purview the constitution does not even try to define"(ibid.; my translation).[95] The law comes from the power of the parliament, which is "an original or inborn power, not a conferred one" (Carré de Malberg 1933, par. 39; my translation): It therefore cannot "be defined as an application of the constitution," for it is "the product or manifestation of the general will" (ibid., par. 41; my translation). The legislative power can thus be said to be stronger than the constitution, for it is "an inceptive power the parliament is vested with from the outset qua representative of the nation and of its sovereign will" (ibid., par. 43; my translation).

On Carré de Malberg's conception, then, "the hierarchical structure of norms of the Vienna school is displaced by a sort of *organistic* tiering (Chimenti 2003, XXII; my translation, italics added):[96] The basic problem is that of the foundation of power, which is argued to rest with the parliament as the basic expression of popular sovereignty. This question of the foundation of power and of sovereignty (a question almost invariably treated by taking Kelsen as a polemical target) is one that finds itself at the centre of the European debate, especially in the Weimar Republic.

8.6. The Weimar Debate between Law and Politics: Rudolf Smend, Carl Schmitt, and Hermann Heller

In Weimar Germany the debate in legal philosophy revolved around two main problems within a broader set of issues arising out of the need to interpret the

[94] Carré de Malberg 1933, arguing that this does not apply to executive power, for this is "the power of a simple authority devoid of representative power" (par. 44; my translation).

[95] For Carré de Malberg, "the laws cannot be argued to derive from the constitution in the same way that, for example, regulations derive from the laws by which they are authorized" (1933, par. 38; my translation).

[96] Chimenti points out as well that "also essential to Carré de Malberg's theory is the relation between normative production and popular representation, and the exercise of popular sovereignty trumps other considerations" (2003, XXII; my translation).

new politico-constitutional situation: On the one hand there was the problem of the method of legal science (the "*Methodenstreit*," or "quarrel over method": see Stolleis 2004, 139ff.; Bauer 1968, 15ff.); on the other, the problem of the foundation of law and of the relation between law and the state. The debate unfolded for the most part within the *Staatslehre* (the theory of the state): It is within its boundaries that the main positions were staked out, aligned on the one hand with legal positivism (Stolleis 2004, 146ff.) and on the other with anti-positivism (ibid., 161ff.).[97] The positions in this latter camp were mainly aimed at criticizing Kelsen's doctrine, which was found to be deeply at fault on account of its method (regarded as overly formalistic), as well as for identifying law with the state and presupposing a *Grundnorm* (or basic norm) as the foundation of the makeup of the legal system. Of course, legal positivism was not just championed by the Vienna school but was a strong current throughout the German-speaking world.[98] It was nonetheless Kelsen's doctrine that became the main focus of criticism (see Caldwell and Scheuerman 2000, 10–1). As was just remarked, this criticism was mainly concerned with the question of method and with that of the foundation of law: A number of common traits can be highlighted in the criticism offered in treating the first question, whereas the criticism centred on the second question came in from a variety of angles. This holds true for the authors who can be singled out as the main proponents of the anti-positivist response, namely, Rudolf Smend, Carl Schmitt, and Hermann Heller.[99]

From the methodological point of view, the common theme unifying the anti-positivist stance can be captured in its opposition to the neo-Kantian method and in the consequent distinction between *Sein* and *Sollen*.[100] This opposition can be appreciated in the effort to reprise the Hegelian tradition (Korb 2010, 24ff.; Stolleis 2004, 68, 167; Caldwell 1997, 54, 128–9; Bauer

[97] The anti-positivist positions were advanced proceeding from a variety of philosophical and political approaches (Korb 2010, 63ff.).

[98] In commenting on Laband, Caldwell characterizes German legal positivism as "statutory positivism," that is, as "a school founded on a specific method of interpreting statutes, understood as the highest expression of the state's will, through concepts such as 'dominion' (*Herrschaft*) and 'contract'"—pointing to Richard Thoma and Gerhard Anschutz as "representatives of statutory positivism in the Republic" (Caldwell 1997, 3ff.). On positivism in the Weimar Republic, see Stolleis 2004, 146ff.; Caldwell and Scheuerman 2000, 8ff.

[99] Others in the anti-positivist camp are Heinrich Triepel and Erich Kaufmann (Stolleis 2004, 162–3, 166–7).

[100] Seitzer and Thornill point out, in the Weimar period, the "decline of neo-Kantianism," the development of an "increasingly intense aversion to neo-Kantianism," and the fact that "the major neo-Kantian whose influence survived into the Weimar era was Hans Kelsen" (Seitzer and Thornill 2008, 3, 5–6). McCormick sees the Weimar debate as a contraposition "between forms of neo-Kantianism and strands of what can be identified for heuristic purposes as kinds of neo-Nietzschean *Lebensphilosophie*. There was the abstract concern with normative formalism, on the one hand, and with existential substance as such—that is, positivism versus existentialism—on the other" (McCormick 1997, 9).

1968, 146ff.), and even more so in the need to reopen legal research "to the social sciences and the humanities, especially ethics, politics and history" (Stolleis 2004, 142).[101] Reprising these themes meant that it was no longer possible to maintain the distinction between the factual and the normative (between *Sein* and *Sollen*) or to investigate law by proceeding from a purported form of methodological purity.[102] What instead comes into the foreground is an effort to reconstruct the legal theory of the state by proceeding from nonlegal ideas and through a cross-fertilization with the methods of the other sciences.

From a more strictly legal point of view, the anti-positivist positions denied, in the *Staatslehre*, the possibility of equating law with the state—as Kelsen's normativism, by contrast, tried to do[103]—and they argued that there needs to be an independent investigation into the foundations of the state. The point of departure lay in the view that power cannot be reduced to law:[104] This impossibility forms the basis on which to call for an independent reflection on the state. From this perspective, the legitimacy of law cannot be reduced to legality, and that makes it necessary to understand the reality and the features of the state.[105] The effort, in other words, was to single out the foundations on which rests the legitimacy of the state (and so of law) and to evaluate its functioning. This need forms the basis on which to analyze the concept of a constitution, which was prevalently being conceived in a "material" sense (however much

[101] At work here is an assumption opposite to the neo-Kantian one: On the latter conception, it was felt necessary "to make state law theory into a field that was 'scientific' in the strict sense of the word, by freeing it once and for all from all extra-legal elements and concentrating on the normative level" (Stolleis 2004, 142ff.).

[102] As Korb observes, the criticism aimed at neo-Kantianism, on the one hand, and at the Kelsenian theory, on the other, both entail the need to "transcend the distinction between *Sein* and *Sollen*" (Korb 2010, 61–2; my translation).

[103] For Kelsen and normativism, "the distinction between state and law was no longer meaningful" (Stolleis 2004, 142). Vinx (2007, 16–7) shows that the reason why Kelsen rejects "dualist theories of the law-state relationship" is that in his view these theories lay "scientifically unjustifiable ideological obstacles in the path of the full realization of the rule of law," all the while denying the possibility of "subjecting the state as fully as possible to constraints against uncontrollable exercise of power". Somek sees the identification between law and the state as growing out of a need for a "deontologization" and "demystification of the state" (Somek 2006, 754–5).

[104] Stolleis notes that "to all others the duality of power and law was as indissoluble as the duality of 'is' and 'ought' was to the normativists" (Stolleis 2004, 142).

[105] The two concepts of legality and legitimacy, as is known, form the title of a work by Carl Schmitt (2004b). Seitzer and Thornill (2008, 9) summarize this contrastive pair by underscoring that, for Schmitt (unlike what is the case for the neo-Kantian positivist view that "legality is the constitutional determinant and precondition of all legitimacy"), legality is no more than "a formal condition that must be given meaning and content by a prior structure of legitimacy: legitimacy is obtained only through the representation of the united will or the historical experience of the people, and this must be presupposed as the origin of the constitution, and indeed of all law." This means that "law […] cannot constitute legitimacy on its own," and so that "politics is before the law." On the evolution and meaning of this contraposition in Schmitt, see Hofmann 1992.

with various inflections), and on this basis, that is, as an expression of social and ethico-normative phenomena, the constitution was analyzed as a possible foundation of the unity of the state.[106] On these approaches, the state is not just an entity independent of law but is instead seen as its foundation. In this way, legal analysis must start out from the question of the foundation of law, and that in turn makes it necessary to analyze the state and the constitution.

So, proceeding from the premise that law cannot be identified with the state, the anti-positivist *Staatslehre* offered different solutions to the problem of the nature of law and the state. In the theory of law, the debate can be said to have centred around the question of the foundation of the validity of legal norms: Kelsen's basic norm (regarded as a formalistic expedient by which to reduce power to law) was replaced with other bases on which to explain the state's power (these bases ranged from the idea of sovereignty as an expression of the people's unity to the people's capacity to form into an integrated whole).[107] As previously noted, these solutions can all be viewed as standing in opposition to the reduction of legitimacy to legality, and so to an understanding of law as a simple normative order. The different anti-positivist conceptions were put forward within a discussion of very broad scope, to be sure, but they can be grouped under two main orientations: The first of these underscored the political dimension and the idea of the state's sovereignty, whereas the second focused on the role of the social and cultural process the state goes through as a "value-bearing (*werthaftig*) structure of meaning that could be experienced subjectively" (Stolleis 2004, 142–3). The conceptions centred on the state's sovereignty can be distinguished from one another by looking at the way they understood not only the foundation of that sovereignty but also the limits the law can impose on sovereign power. In other words, there were conceptions on which the state is a "legally ordered sovereign power" (ibid.) and others on which the political dimension must prevail over the legal one. Depending on which of these two themes were stressed, different aspects of the state's reality would come into focus: This in turn might result, for example, in greater emphasis being placed on the problem of lawmaking and of popular sovereignty than on that of the acceptance of norms, or it might mean that the problem of the unity of the system would push that of pluralism in the background (ibid.), or vice versa.

Rudolf Smend's reflection starts out from the need to base the *Stasstsrechtslehre* no longer on the legal method but on that of the human sciences: The analysis of public law was thought to need a "foundation in a theory of the

[106] Caldwell notes that precisely this question engaged the two key figures in the debate that unfolded under the Weimar Republic, namely, Kelsen and Schmitt, who "dealt with the theoretical issue of how to conceive of the constitution as foundation of the state" (Caldwell 1997, 9).

[107] As Caldwell points out, high on the list of concerns for the Weimar authors was "the theoretical problem of what the 'foundation' or 'source' of the system was" (Caldwell 1997, 2).

state and of the constitution conceived as a human science," with a view to constructing a "material theory of the state" (Gozzi 1987, 131; my translation).[108] Smend accordingly saw the state as a "living reality" (Stolleis 2004, 165), that is, as a "complex of lived experiences, the object of a sense relation, or even as the human social form" (Gozzi 1987, 132; my translation). From this perspective, and working from the conception expounded by Theodor Litt in *Individuum und Gesellschaft* (The individual and the community: Litt 1924),[109] the state is viewed as a "geschlossener Kreis" (Smend 1994, 131), that is, as a self-enclosed circle, meaning a "structure of connections whose parts are all interconnected" (Gozzi 1987, 135; my translation) on the basis of a specific sense relation.[110] The sense relation the state consists in "is the way in which values are realized"; in other words, "the sense (or meaning) of the acts carried out by those who belong to the state arises out of their making reference to values, that is, to cultural norms forming the bedrock of the political community" (ibid., 136; my translation). Smend thought that this dimension lies at the foundation of the state: The state's life depends on an assertion and realization of values (Smend 1994, 160–1). This dimension of the state is dynamic: It is a "process of constant renewal" (ibid., 136; my translation) aimed at achieving a "lasting union of men" (Gozzi 1987, 145; my translation); it is the process that Smend (1994, 136ff.) calls integration. It is on this basis, he argues, that the normative dimension (positive law) can be said to consist in no more than

[108] Smend (1994, 121ff., 124) describes this need as arising out of the "crisis of the theory of the state," a crisis that in turn, in his view, grew out of the shortcomings of the "legal formalism" propounded in the line extending from Jellinek to Kelsen. Smend not only argued that it was necessary to move away from this brand of legal positivism but also showed an "aversion that became idiosyncratic in his antipathy toward the Vienna school" (Stolleis 2004, 164). Kelsen would reply to Smend's criticisms in *Der Staat als Integration*, in which Smend's work is defined as "aphorismatic" and marked by a "complete lack of systematic closure, a certain insecurity in the conception, avoiding any commitment to clear and unambiguous positions, preferring to ramble on through vague allusions, and saddling with cautious caveats any position that might have some degree of intelligibility; then, too, his writing is obscure and overworked, interlarded with loanwords that cannot be understood in full" (Kelsen 1930, 8; my translation). But Kelsen was not the only target of Smend's criticism, which also takes on the theories of Max Weber, Ernst Troeltsch, and Freidrich Meinecke (La Torre 2006, 143). On Smend see also Section 6.4 in Tome 1 of this volume.

[109] As has been observed by La Torre (2006, 140), Litt is the author most quoted or cited in Smend's *Verfassung und Verfassungsrecht* (Smend 1994). Bartlsperger (1964, 4ff.) sees Litt's phenomenologically oriented conception as the "foundation" of Smend's work. It should also be noted, however, as Gozzi (1987, 136) points out, that unlike Litt, Smend "equates […] the sphere of sense, or meaning, with that of value."

[110] Smend (1994, 128) held that "the life of the group is not causally deducible from the lives of its individual members" and, in the same vein, he argued that society "should not be understood as a substance simply structured on a supra-individual level; rather, it should be understood as supported by individuals, and as living only in them." On these aspects, see La Torre 2006, 141–2. Gozzi points out that this approach is geared toward superseding the "distinction between personal reality and the social bond," as well as that "between part and whole," but without reducing the state to a "supraindividual person" (Gozzi 1987, 135).

the concretization of integrative processes, in which lies the true object of any analysis of the state.[111]

On the conception developed by Smend (ibid.), the integrative processes unfold on three levels (with three corresponding types): There is the level of personal integration, that of functional integration, and that of material integration. These three levels and processes involve different dynamics: The first of these revolves around the role and figure of the political leader;[112] the second, around the processes through which the political will is formed (as well as around the interpretation of representation);[113] the third, around material contents, meaning values, on which rests the life of the state. On this third level is found the most important form of integration, which is mainly realized in the constitution, where the community's material contents find their full expression. The constitution can in turn be analyzed under a number of headings (Gozzi 1987, 158ff.), but what matters is its role in expressing the community's (dynamic) values. On this conception, the constitution and the state exist as a synthesis that precedes and grounds law: a synthesis between the acts carried out by different subjects (institutional and otherwise) and the values condensed in the constitution itself. These values are expressed in the fundamental rights enshrined in the constitution: They provide the foundation of material integration and define the conditions for this possibility.[114] So, as much as Smend's reflections may unfold within an occasionally contradictory framework,[115] they do clearly develop with a view to showing that law cannot be analyzed independently of the material contents, or values, expressed in the constitution governing a given society—the values espoused by the subjects who can realize that constitution.

[111] Smend (1994, 139; my translation) underscores the "dual nature of the state's life," which is concretized in "the spirit's activity of legislating on value" (*Wertgesetzlichkeit des Geistes*) and in the "state's positive law." The latter is no more than "a positivization of the possibilities and tasks that derive from the laws of the spirit, and so it is only in light of these laws that the state can be understood." From this perspective, "the values espoused by the political community function as the condition of the normative system's validity," and so "the law does not belong to the processes through which the state achieves its integration": We are looking as "two independent dimensions" (Gozzi 1987, 154, 163; my translation).

[112] For Smend (1994, 142–148), the political leader can be personified in any number of figures (such as ministers, parliamentarians, party officials, and administrative functionaries), but it does not entail any specific form of government.

[113] Of course, this aspect relates to the problem of parliamentarianism: Unlike Schmitt, Smend saw this as "an institution that is still viable, but only if based on shared material values" (Gozzi 1987, 153).

[114] The role that rights play as the decisive moment in the process of material integration is underscored by Gozzi (1987, 168ff.); Caldwell (1997, 9), notes that "Smend's theory was important for the interpretation of basic rights" insofar as "a hierarchy of rights […] could be derived from the basic values of the community in relation to other values"; Bauer 1968, 310ff.

[115] Caldwell underscores the "political ambiguity" of Smend's theses, which may also be seen as simultaneously "asserting the primacy of the community and the duty of individual to conform" (Caldwell 1997, 122).

The role of sovereignty and the state was a subject of interest to both Carl Schmitt (1888–1985) and Hermann Heller (1891–1933).[116] Their analyses proceed from entirely different political perspectives, to be sure, but they share a conception of law (and of the constitution) as phenomena that cannot be understood without analyzing the political reality and that of the state.

In his *Constitutional Theory* (*Verfassungslehre*),[117] Schmitt underscores the inadequacy of those conceptions that view the constitution as an exclusively legal construct, without taking into account its political dimension.[118] According to Schmitt, neither an "absolute" nor a "relative" concept of constitution is tenable.[119] By absolute constitution he means the constitution as an "integrated whole," and he criticizes the legal-normative understanding of that idea, on which the constitution is a self-enclosed system of norms,[120] with the constitution figuring as the "norm of norms," for it serves as the basis of the system's unity and guarantees the validity of the lower norms (Schmitt 2008, 62ff.). As Schmitt (ibid., 64) argues, what makes this understanding inadequate is that it forces us to ground the justification (and validity) of norms on "a principle of justice (as natural law theory does)"; otherwise validity must be shown to derive from "the sovereign's concretely existing will, and that amounts to grounding validity in the constituent power" (Pietropaoli 2012a, 71; my translation). Also untenable is the "relative" understanding of the constitution, so called because relative to the individual constitutional laws and not to the constitution as a whole.[121]

[116] On Schmitt and Heller see also, respectively, Chapter 8 and Section 7.4 in Tome 1 of this volume.

[117] Unlike other works by Schmitt, his *Constitutional Theory* seeks to be systematic (see Schmitt 2008, 53). As Kennedy (2008, XVI) notes, "Schmitt offers […] a system that demonstrates the relationship of law and politics to each other, not just in this one German constitution, but in all constitutional states of the 'liberal rule of law' type." Similarly, she notes, "the *Verfassungslehre* was intended as neither 'a commentary nor series of monographic studies' but aimed to found a new science of constitutions, their law and politics" (Kennedy 2004, 122). On the systematic nature of Schmitt's work, see Hofmann 1992, 124–5; Pietropaoli 2012a, 71.

[118] Staff (1981, 390) argues that this understanding of the constitution, not as a norm, but as a guiding idea is something that Schmitt drew from Hauriou's 1925 theory of institutions (Hauriou 1933).

[119] Schmitt (2008, 57ff.) identifies four main concepts of constitution: absolute, relative, positive, and ideal. The only adequate one, in his view, is the positive one. On this question, see Dyzenhaus 1997, 52; Hofmann 1992, 124ff.

[120] The legal understanding of the absolute constitution—described by Schmitt (2008, 59ff.) as a "condition of political unity and order"—is only one of four such understandings. The other three are those of the constitution as a "concrete, collective condition" of unity; as a "state form"; and as a "principle of emergence of dynamic unity."

[121] Through this concept, Schmitt (2008, 67ff.) introduces the distinction between the constitution (*Verfassung*) and constitutional laws (*Verfassunggesetze*): "Rendering relative the concept of constitution means that instead of a unified constitution in its entirety, there is only the individual constitutional law." Constitutional law is such in virtue of "formal characteristics that are external and peripheral." Hofmann (1992, 126) remarks that this distinction seems entirely obvious to us today, as it was not in Schmitt's day. On this distinction, see Caldwell 1997, 100ff.

Here, too, what matter are a norm's formal properties—such as its being written and rigid, an aspect that Schmitt (2008, 72–3) develops in discussing the "amendment procedure"—and his argument is that the *converse* relation actually holds: The constitution is a value-bearing norm and as such is protected, rather than bearing value as a result of being protected (Pietropaoli 2012a, 72; my translation). If we are to understand the constitution, Schmitt (2008, 75) argues, we have to bring into play the notion of a "constitution-making power,"[122] and through that decision-making power (held by the constitution-makers) we ought to accordingly understand the constitution itself: This is the "positive" concept of "the constitution as the complete decision over the type and form of the political unity" (ibid.). This decision determines the "form" of "a political unity that is assumed to exist" (Pietropaoli 2012a, 72; my translation). It can thus be claimed that "the state's political unity preexists the constitution,"[123] serving as its foundation: The constitution is the outcome of a decision and so cannot be reduced to a norm (ibid.; my translation). Or, otherwise stated, the constitution fundamentally expresses the will of the constituent power and its underlying political unity. This power, as Schmitt conceives of it, is permanent and inexhaustible: It stands above the constitution and can always express itself.[124] Since the French Revolution, the subject of the constituent power has always been the people.[125] Schmitt held that there are two ways in which the people can achieve political unity (of which the constitution is the basic expression): This could be done through identity or through representation. Political unity, in other words, could be the expression of a homogeneous identity, or it could be achieved through the mediation of "some specific individuals" (Pietropaoli 2012a, 76; my translation). Depending on which of these two principles prevails, one form of state will emerge rather than another (for example, democracy as against monarchy or aristocracy), though Schmitt does stress that neither principle is ever realized in an absolute way (that is, fully excluding the other). This dynamic can be observed in particular in the model serving as a blueprint for the constitutions of the 19th and 20th centuries: This is the "bourgeois Rechtsstaat"

[122] Dyzenhaus (1997, 69) comments that Schmitt's project is "to provide a theory of the politics of constitutional power."

[123] On Schmitt's conception, the fundamental political decision—the one through which the constituent power creates the constitution—could not even be contemplated without considering its relation to the state's institutional instruments, and so the instruments through which power is concentrated in the state. Only the state "can transform a political decision into a decision capable of founding an order" (Bisogni 2005, 161; my translation). An adequate understanding of the constitution, Schmitt (2008, 59) argues, requires "that the meaning of the term 'constitution' be limited of the constitution of the state." It follows that on this conception, on which the political sphere is equated with that of the state, there can be no constitution without a state.

[124] The constituent power is conceived by Schmitt (2008, 125ff.) as a permanent, unitary, and unlimited will.

[125] Kennedy (2004, 126) points out that the people are conceived by Schmitt as "a subject capable of decision" and of producing "political unity."

based on the rule of law and informed by two liberal principles providing for (*a*) rights existing *prior to* the state and (*b*) the separation of powers, the first a "principle of distribution" ("the individual's sphere of freedom is presupposed as something prior to the state"), the latter an "organizational principle," for it organizes the exercise of powers (Schmitt 2008, 169ff.). As Schmitt (ibid.) sees it, however, this sort of organization does not bring about any specific "form" of state but only offers itself as an intermediate solution between the sovereignty of the monarch (representation) and that of the people (identity). The "bourgeois Rechtsstaat" effects a "commixture between the principle of identity and that of representation within the parliamentary system, all the while relativizing both principles" (Pietropaoli 2012a, 76; my translation). On a juridical level, this translates into the idea of the rule of law, where law is no longer regarded as the expression of a sovereign will but as the outcome of a set of procedures governed by norms. These procedures, as is known, are regarded by Schmitt as unfit to achieve a true political unity within democratic societies: Parliamentarianism is regarded inadequate and as an obstacle to the formation of a people's political unity, while the rule of law is reduced by him to a simple "myth."[126] Schmitt proposes to solve this problem by moving beyond the parliamentary democratic system and looking to a subject capable of "representing" the unity of the people.[127] Schmitt's reflection is thus aimed at underscoring that law cannot be reduced to its normativity alone and that there needs to be a sovereign and political element in the constitution (Fioravanti 1999, 149; Scheuerman 1999, 69–70; Kennedy 2004, 6).

[126] Kennedy observes that liberal institutions, in Schmitt's view, are no longer adequate for a pluralist society, in that "the organizational principles of liberalism are shown to conflict in specific instances with democratic equality" (Kennedy 2004, 123). The literature on Schmitt's criticism of parliamentarianism is virtually boundless: an introduction to this question and a summary list of sources can be found in Kennedy 2000; Staff 1981, 382ff.

[127] It should be noted here that in suggesting two ways for a people to achieve political unity—through identity and through representation—Schmitt holds up the latter as being better suited to that end. His logic in making that judgment is Hobbesian: The people, understood as a "substantial homogeneity" and as the holder of the constituent power, come into being "only through the representation provided by the subject historically […] entrusted with harnessing the political energy carried by the people and channelling that energy toward the fundamental decision that will create the constitution" (Bisogni 2005, 150; my translation). On this conception, "the people are not anything specific" (Preterossi, 1996, 13; my translation): They are an "unreal ideality," one that for this reason "must be shaped into form, which for Schmitt means that it must become an object of 'decision' and 'representation'" (Bisogni 2005, 149; my translation). It is fair to say that only this principle makes it possible to "body forth the people's political unity": The people "cannot be said to exist unless they are represented," and without representation they "cannot decide on their own to be brought into existence" (ibid. 158; my translation). This view carries immediate implications as concerns the institutional makeup, for it makes it necessary to identify the "organ" capable of acting as the subject that will represent the people and express their unity. It is therefore necessary to figure out who, within the state, will assume "the ruling position" and will have "the last say": In Schmitt's view, the true command and law are those that issue from "the organ designated by the constitution as the one that will represent the peoples' political unity" (ibid, 193; my translation).

The need to criticize the attempt to reduce the *Staastslehre* to a normative consideration of law forms the point of departure for Hermann Heller, too. Like Smend, Heller took critical aim at Hans Kelsen's doctrine, with its collapsing of the state into law and the consequent depoliticization of the theory of the state.[128] Heller criticized both the method of Kelsen's normativism and its account of the role played by the state.[129] In *Die Krisis der Staatslehre* (The crisis of the theory of the state: Heller 1971a), Heller argued that Kelsen's pure theory—regarded as "the late heir of logico-legal positivism, as the coherent fulfilment of the sociological and value-neutral programme set out by Laband" (ibid., 15–6; my translation), as well as by Gerber—leads to a "stateless doctrine of the state," a conception in which the general theory of the state is reduced to a "universal theory of law" (ibid., 18; my translation). This, he argued, is an outcome that flows from Kelsen's method, by virtue of its "tending to radically eliminate all substantive elements from legal concepts," a method predicated on the lack of "any mediation between is and ought" and exclusively devoted to a quest for "pure [legal] forms" (ibid., 16; my translation).[130] The "purity of method" translates into an impossibility to work through the "substantive" issues and concerns in the theory of the state, that is, "the problem of the nature, reality, and unity of the state and that of its aim and justification, as well as the analysis of the relation between law and power and the problem of the state as such vis-à-vis society" (ibid., 10; my translation). By collapsing the state into the law, Kelsen's method turns these aspects into "metalegal" concerns and reveals his pure normative science to be useless in any attempt to construct a theory of the state.

Heller stressed the need to transcend the distinction between *Sein* and *Sollen* and a reliance on a single method: The state, he argued, needs to be analyzed by drawing on the methods developed in different disciplines.[131] This

[128] Caldwell (1997, 128, 130) notes that in this respect Heller aligns himself with Smend and Schmitt, but that from 1928 onward Heller's criticism shifts focus by turning to Fascism (on this aspect, see also La Torre 2009, 68ff.). Dyzenhaus points out that on the one hand Heller is close to Smend and Schmitt—in virtue of the idea that "all conceptions of law are fundamentally political and tied to particular historical and social contexts"—but at the same time he is in sympathy with Kelsen for the high regard in which he holds "respect of law" and "legality" (Dyzenhaus 1997, 162–3).

[129] The debate between Kelsen and Heller flared up at a meeting that in 1928 the Association of German Professors of Constitutional Law held under the title "The Concept of the Statute in the Reich's Constitution": Heller gave a speech critical of Kelsen, who in his reply confessed his "astonishment" at this criticism. An account of the episode can be found in Dyzenhaus 1997, 161–2. See also C. Müller 1985 on the dispute and the relationship between the two thinkers.

[130] Heller contended, in this connection, that Kelsen's method forecloses the possibility of "any psychology or sociology that might be worked out in the human sciences" (Heller 1971a, 16; my translation).

[131] The "preference for methodological syncretism" in Heller 1971c is discussed in Bisogni 2005, 97. Bauer (1968, 364) observes that Heller's new method draws on Freyer 1930 and on Freyer's analysis of the dual nature of spiritual reality (*geistige Wirklichkeit*) as an effective context of sense (*Sinn- und Wirkungszusammenhang*).

approach should make it possible to solve the most important question in the analysis of the life of the state, namely, how the state can express a "unity within the multiplicity" (Bisogni 2005, 95; my translation; cf. Pasquino 1987, 6). The problem, in other words, is to figure out how the state can embody a multiplicity, all the while being "capable of operating in a unitary way" (Heller 1970, 229). Heller started out from a "conflictual" view of social life and saw the state's and the political unity as the form through which this diversity is structured (Pasquino 1987, 6).[132] But two conditions are necessary for this to happen: On a societal level, there needs to be some form of homogeneity, one that (without blotting out all plurality) is expressed by "the group that makes up the state's strong core" (Bisogni 2005, 108; my translation),[133] while on an institutional level there needs to be a "juridical" capacity to keep that social power in check. In Heller's view, it is not enough for there to be a group "imposing […] on its adversaries a shared core of values and aims creating a bond among its adherents and enabling them to stand united" (Heller 1970, 240; my translation): It is also necessary for such a power to be legitimate, and therein lies the specific task of law. For the law, according to Heller, is not just the expression of mainstream values: It also embodies "the community's ethico-legal principles" (Bisogni 2005, 113; my translation).[134] On Heller's conception, social homogeneity needs to be expressed through legal principles informed by values shared by the whole of society. In a nutshell, Heller can be said to assign two parallel tasks to the theory of the state, for it must recognize, on the one hand, the social groups that assert themselves in the political exchange and, on the other, the need for these groups to express legitimate values and principles as participants in the state's organization, where the criterion of legitimacy lies in the ability of those values and principles to be generalized.[135] On Heller's conception, the state acts as a sort of coalescent and coordinator, thus

[132] Dyzenhaus (1997, 191–2) points out that homogeneity—a condition where the parties forming the political unity all recognize one another as part of that unity—should not be taken to mean that there will no longer be any conflict.

[133] Caldwell notes that "the sense of being in a collective (*Wirbewusstsein*) was the substantive prerequisite for the legitimacy of the rules governing state activity," and that in Heller's view, "all political systems require a 'certain degree' of social homogeneity" (Caldwell 1997, 130).

[134] According to Dyzenhaus (1997, 165), "the key legal distinction in Heller's work is between positive law and fundamental principles of law." These principles (as mentioned in Heller 1971c, 251) can be described as "suprapositive, logical and ethical, fundamental principles of law" (ibid.). Staff (1981, 404, 407) underscores the dialectical relation between the actual decision-making unity and the normative system: The latter is an ideal construct, limiting the state's power through the constraints of justice. In a discussion of Heller (1971b, 70, 107–8; 1970, 221–6), Caldwell comments that "at the point where will and norm came into contact, Heller introduced a 'Smendian' moment. The will of the organ […] was limited not only formally […] but also by extralegal, ethical, and sociological considerations. The ethical considerations in particular […] served as basic, unwritten norms shared by a community" (Caldwell 1997, 131–2).

[135] As Dyzenhaus (1997, 198–200) points out, the law so understood acts as a constraint on sovereign power, and that makes it possible to bring about a "substantive legality."

serving an organizing function (Bisogni 2005, 104)[136] that makes it possible to achieve some sort of social homogeneity by holding up shared and general values that can limit the action of the subjects through which that homogeneity is expressed.[137]

8.7. Legal Institutionalism: Santi Romano and the "Illegitimate" Rendition of Carl Schmitt

Highly influential among the currents of the first half of the 20th century was institutionalism. The approach was conceived in France by Maurice Hauriou (1856–1929) and in Italy by Santi Romano (1875–1947) and was then taken up in Germany by Schmitt, who developed it within a different theoretical and ideological framework.[138] Institutionalism is sometimes understood as a critical reaction to legal positivism. That, however, can only be said of positivism in its "normativist" version. To see this, one need only look at the institutionalism expounded by Romano, who clearly avowed his adherence to legal positivism.[139] So, too, Romano worked directly in legal theory:[140] This is unlike what in some respects can be said of Hauriou,[141] but it also means that Romano would seek

[136] Caldwell (1997, 131) argues that, contrary to Smend and Schmitt, Heller viewed the state and the nation as "dialectically related through a complicated process of organization." This is "an 'ordered structure for acting' (*geordnetes Handlungsgefüge*) that allowed cooperation […] and coordination of individuals and groups involved in the whole." Staff (1981, 403–4) points out that order in the state's ordinary life has a sociological dimension to it that lies in an explicit or implicit union of wills (*Willensvereinigung*) and in a political and state unity that take shape through the action of decision-making organs. The state can in this sense be understood as an effective unity (*Wirkungseinheit*) of state and citizen organs. Bauer (1968, 379, 383ff., 390ff., 400ff.) argues that organization means a self-determination (*Selbstbestimmung*) aimed at realizing the common good (*Gemeinwohlverwirklichung*). This is achieved through the state's central decision-making organization (*zentrale Entscheidungsorganisation*). In this framework, the constitution acts as an *Entscheidungsordnung*: It is the order that fixes the criteria for the state organs' decision-making.

[137] For a critical analysis of the shortcomings of Heller's construction, see Bisogni 2005, 114ff., pointing out, on the one hand, the missing link between the state, sovereignty, and general ethico-legal principles and, on the other, the high abstraction of many of the concepts he deploys, starting from that of social homogeneity.

[138] As we will see, the argument that Schmitt cannot properly be listed as an institutionalist along the lines of Romano (whence the idea of an "illegitimate" rendition of Schmitt) is set out in La Torre 2009. On Romano see also, respectively, Sections 12.2 and 11.4 in Tome 1 of this volume. On Hauriou see Section 1.1.4.2 in this tome and Section 12.2 in Tome 1 of this volume.

[139] Romano held that the jurist "must start out" from "positive law" and stated that he himself proceeded "within the framework of a positive conception of law," rejecting "all manner of natural law" (Romano 1946, 21, 79; my translation).

[140] Indeed, in Romano 1946, 1, he presents his work as falling within the "general theory of law," that is, as an effort to conceptualize "the reality of all law and of all experience, on the premise that the theory of the legal order is meta-temporal and not historically determined" (Tarello 1988b, 184; my translation).

[141] As we will see, these two authors not only had two different understandings of what an

to develop a positivist "conception of law as it is in reality, and not as it ought to be according to certain principles," and that the same conception would be based on "a clear distinction between the spheres of law and of morals" (La Torre 2010, 98).[142] This is an objective that Romano would pursue by underscoring the limits of normativism and by fleshing out the idea of a legal order as an institution, an idea on which basis he would outline an account of law.

Romano started out in this enterprise by highlighting what he took to be the legal-theoretical "inadequacy" of the "concept and definition of law" as "a set of norms" (Tarello 1988b, 184; my translation): This view of law shuts out the possibility of developing "any other aspect of law, one that is more fundamental and, even more importantly, antecedent, not only in view what is logically required by the *concept* of law but also in view of an accurate assessment of *reality*" (Romano 1946, 4–5; my translation, italics added). Romano's critical investigation closes in on a series of key assumptions of normativism, in such a way as to highlight both its various shortcomings and its fundamental limit. He thus observes that by analyzing law on the sole basis of norms, we end up with a concept that filters out anything that is not a norm, thereby limiting our field of vision to the law taken into account by the courts. What is more, the normative definition of law will be of "little or no use" to "specific legal disciplines," and in particular to international, constitutional, and ecclesiastic law (ibid., 6; my translation). Here Romano emphasizes that this normative definition may work for private law, but not "for some branches of public law." This is a major limit, considering that, in Romano's view, "law […] is mainly public law," and for this reason, "the elements of the concept of law […] ought to be extracted from public law more so than from private law" (ibid., 7–8; my translation).[143] On top of these criticisms, Romano adds the core substantive argument, which concerns the idea of law as an order (*ordinamento*): When law "is considered in light of an entity's overall legal order," the expedient is "to conceive each such order as a set or complex of norms" (ibid., 10; my translation). But this is only a fallback: As Romano argues, if we are to properly define a legal order, "we will have to […] strike the keynote, putting our finger on the nature of this complex or whole," from which it follows that the

institution is but also proceed from different starting points. As Millard (1995, 387ff.) has observed, among the sources Hauriou uses as bases on which to develop his theory is Émile Durkheim's sociological theory of institutions. Fassò accordingly notes that "in Hauriou's theory, the concept of an institution, or at least the name, […] had a manifestly sociological origin" that cannot be found in Romano (Fassò 2001, 285; my translation).

[142] Romano sees as "inexistent" the "dependence […] of positive law on morality" (Romano 1946, 101; my translation). Barberis underscores that Romano "belongs to the legal positivist tradition because of his evident acceptance of its two basic tenets: (1) the Separation Thesis, in which law and morals have no necessary connection, as well as (2) the Social Sources Thesis, where law is a man-made phenomenon" (2013, 27).

[143] On the role the study of public law played in the writing of Romano's *L'ordinamento giuridico* (The legal order: Romano 1946), see Cassese 1972; Catania 1996, 90, n. 6; La Torre 2009, 69.

legal order "is not the sum of its parts, regardless of whether these are simple norms, but is rather a unity in itself—a concrete and effective […] unit" (ibid.; my translation). So the attempt must be to consider law as a "global unit wherein norms figure as elements" (Tarello 1988b, 185; my translation): It is this unit that Romano identifies as the order (*ordinamento*), thus transcending the idea of the order as a system or as existing in "the fact that norms are coordinated": The order is rather "a complex, one whose norms are not simply accidental elements but function" (of the order itself); the order is "a complex consisting of 'norms,' 'organization,' 'force,' 'authority,' and 'power'" (ibid., 185–6; my translation).[144] In this way, "the legal order becomes […] the name for any organized complex of authority, power, and norms—an objective complex that transcends the individual (this is the impersonality of power) and is coercive (ibid., 186; my translation):[145] It is this ordered complex that Romano identifies as an institution.[146]

Romano proceeds from two basic presuppositions in defining law as an institution (La Torre 2010, 101–2): The first of these is that law exists only in relation to society; the second, that it exists as an organizational phenomenon. More to the point, the only way to make sense of law is in relation to society as "a concrete unity distinct from the individuals that make it up, an effectively constituted (effectively organized) unity." This means that "the concept of law […] must contain the idea of social order" and that Romano's entire conception is based on the "assertion of the social nature of the phenomenon of law and the conception of sociality as 'organization'" (ibid.). As La Torre puts it, "law, before being norm, is organization": This is what distinguishes a legal system and so an institution. Indeed, as was just noted, an institution (or order) is for Romano "any entity or social body" (Romano 1946, 34; my translation).[147]

[144] Tarello (1988, 186; my translation) comments that only "this complex would be both 'objective'—securing the 'impersonality of power' even absent any norms proper (in an order 'that had no place for the legislator but only for the judge')—and 'coercive,' this even if none of its norms were individually backed by the threat of punishment" (the words and phrases enclosed within single quotation marks are from Romano 1946, pars. 7, 8; my translation throughout). La Torre points out that on Romano's conception, "the legal order is not a mere sum of norms," nor is it "a sum of legal relationships" (La Torre 2010, 99).

[145] Romano (1983, 82) understands an institution to be "any stable and permanent social entity or body that forms a body in itself and has a life of its own."

[146] Romano holds that "the concept of an institution and that of a legal order, understood as a unitary whole, stand in a relation of complete identity to each other" (Romano 1946, 33–4; my translation)

[147] La Torre lists five properties that something must exhibit so as to be considered an institution (or order), quoting Romano 1946, par. 12, for each of the properties listed. "(a) it must be objectively and concretely existent: 'however immaterial it may be, its individuality must be exterior and visible.' (b) It must be a 'manifestation of the social, rather that reflecting the pure nature of man.' (c) It must be 'a closed entity that may be considered in and for itself, solely on account of its being an individuality in itself' […]. (d) It must be a 'a fixed, permanent unit […] even when its individual elements change.' (e) The concept of institution implies that of organiza-

On the basis of these premises five consequences are extracted which apply to the way law ought to be analyzed and which are all rooted in the understanding of law as a socially embedded phenomenon and in the idea of organization.

In the first place, we cannot derive the law as something willed or commanded by an institution. Romano can thus be said to espouse an anti-voluntarist, anti-imperativist conception of law (La Torre 2010, 101), from which follows the fundamental role he ascribes to the idea of a *ius involontarium*.[148] At the foundation of an institution we find "a sort of 'material constitution' or 'tacit law,' founded on the 'normative force of fact,'" thus making it so that an institution is based on "a sort of material necessity" (ibid., 105).[149]

In the second place, we cannot derive any central role of punishment in the life of the order, which as we have seen is instead centred on its organizational dimension (La Torre 2010, 122).[150] Indeed, Romano conceives an organiza-

tion. The institution is, in particular, organization of force […] for Romano […] the concept of force […] is […] more or less coinciding with that of 'social force'" (La Torre 2010, 102–3).

[148] As Catania points out, "Santi Romano repeatedly resorts to the so-called *ius involontarium* (customs and principles) in explaining the concept of an order or institution," and in this connection he notes that "the crux of his thought lies in the unbreakable bond between *ius involontarium* and *organization*." This is a conception on which "an organization […] looks more like the outcome of fulfilled intentions than the making of the organization itself by way of men expressing their intention or willingness to support that enterprise" (Catania 1996, 96, 97; my translation).

[149] Croce points out that Romano rejects the idea of the legal system as "a set of imperative norms equipped with corresponding punishments," in its place ushering in the idea of the legal order as the "*skeleton of a social body*, the organic context within which subjective relations take on a specific physiognomy." An order so conceived is a "'concrete and effective […] unity,' the tangible form of a preexisting social unity in which different people stably engage in specific types of relations and practices, making them concrete and protracting them over time." An order can in this sense be understood as "the complex of forces, values, convictions, and knowledge forming the basis of any stable and lasting social group," and "law, and specifically the legal order, coincides with the very phenomenon in virtue of which a social complex is materially organized." This means that, on Romano's institutionalist conception, "law is consubstantial with the phenomenon of the social order […]: The legal order does not guarantee order but is rather the expression of an order already at work within the social body." And so "law is a social meta-institution:" It is the "condition that makes possible the broader phenomenon of social organization" (M. Croce 2010, 85–7; my translation).

[150] On these premises Romano criticizes Hauriou's theory of institutions and his definition of an institution in corporative terms as an "objective social organization that in itself has realized the highest legal situation, in that it simultaneously embodies the sovereignty of power, the constitutional organization of power by statute, and the autonomy of law," making an institution "a certain way of being of social organization," where we find a "permanent systematization in which organs empowered to rule are set up to serve the purposes of the social group within which they exist" (Hauriou 1916, 111; my translation). La Torre summarizes under four headings the criticism that Romano levels at Hauriou: "(i) the limitation of the denotation of the concept of 'institution' solely to the organizations Hauriou calls 'corporative', that is, organizations that have reached a high degree of development, which is to say modern States, is injustified. (ii) b) it is even more incorrect to identify 'institution' with bodies organized according to the constitu-

tion as a "structure" that makes it possible to "rein in the social energy flowing from the aggregation of its individual members." In this sense, "what is organized […] is this force itself." So what we are looking at is not so much an "exclusively coercive or physical force" as a "*social* force; that is, what matters is not so much the aim of the institution as the energies it sparks and attracts" (Viola and Zaccaria 2003, 29; my translation, italics added).[151]

In the third place, once we do away with the idea that we need to single out the one original source of law, we will be able to bring into relief the existence of several legal institutions. Romano thus espouses the thesis of the plurality of legal orders, which exist both as "every element in the organization of an independent state and as […] every nonstate organized body" (Tarello 1988b, 187; my translation).[152]

In the fourth place, the conception makes institutions prior to norms: "Norms do not represent the central element in the phenomenon of law," and "they are no more than an externalization or manifestation of the *institution*, which is the primary and fundamental reality of law" (La Torre 2010, 106). However, institution and norm "are not mutually incompatible notions." They are rather "mutually integrated" phenomena: the institutional dimension of law "is always accompanied by a body of norms (even if not explicitly formulated)" (ibid., 107).[153]

Finally, law can be identified independently of specific "substantive conditions (specific normative contents or particular institutional configurations" (ibid., 109). This is because Romano does not understand law as having any functions or purposes to serve.[154]

tional/representative model. (iii) It is inaccurate to maintain that the institution is a source of law, or that one is the cause of the other, since there is 'perfect identity' between the two concepts and phenomena. (iv) […] Hauriou's conception that the 'institution' is a 'sorte de chose' is obscure" (La Torre 2010, 102). But Romano does credit Hauriou with "having put forward the idea of working into the legal world the concept of an institution broadly understood," and with "having freed that concept from that of legal personality, which may overlap with the former when certain conditions obtain, but which can just as well be absent" (Romano 1946, 26–7; my translation).

[151] La Torre (2010, 109) points out that "Romano's 'anti-sanctionism' is espressed in the denial that sanction is a distintive or central element of legal norm, or better, the legal experience as a whole."

[152] Tarello notes that in "Italian institutionalist pluralism" the concept of an order was developed "in addressing two theoretical problems: That of finding and identifying *an* objective legal order, and that of working out the relations among *several* objective legal orders" (Tarello 1988b, 179–80; my translation).

[153] La Torre points out that "Romano […] recognizes two concepts of law": The first is the fundamental one as a complex of institutions; "the other (subordinate to the former) is that of law as a set of precepts or norms." And corresponding to them are "two different concepts of legal validity: Law as an institution, or as an 'order,' is valid only insofar as it is effective […]. Law as a norm […] is instead valid insofar as it is in some way […] connected with law as an 'order'" (2010, 105).

[154] In commenting the analysis offered in Gavazzi 1977, La Torre lists six features that can

In the early 1930s, Carl Schmitt (2004a) embraced institutionalism in the form of his theory of concrete-order thinking (*konkretes Ordnungsdenken*). This is a change in Schmitt's thought that marks the passage from his previous decisionism to a conception of law that draws on the work of Hauriou and Romano.[155] This passage can be said to have been prompted, from a legal-theoretical perspective, by Schmitt's realization that his previous decisionist way of understanding law was inadequate, or at least that it needed to be integrated (see Schwab 1970, 115; Pietropaoli 2012b, 2; Croce and Salvatore 2013, 1).[156] At the root of his institutionalist turn lay not only the difficulties that decisionism came up against in bridging "the abyss which was created by Kelsen's antithesis between jurisprudence and politics" (Schwab 1970, 115), but also the theory's specifically legal problems, and in particular its inability, on the one hand, to set out "the conditions of existence of a stable and effective legal order" (Croce and Salvatore 2013, 3) and, on the other, to "construct a theory of the international legal order" (Pietropaoli 2012b, 2; my translation). Decisionism, in other words, reveals itself to be a limited theory in two respects, for it can neither explain the stability of legal-political systems nor offer an understanding of the different branches of law.[157]

On the new conception embraced by Schmitt (2004a, 54–7), law is understood as that which ensures "the production of stable and common standards of correctness in a given collectivity" (Croce and Salvatore 2013, 3). It is therefore a conception that, unlike the previous one—on which law exclusively "depends on the *arbitrary* and *unquestionable* decision of a sovereign" (M. Croce 2011, 48)—underscores the need for stable structures as conditions absent which there could be no law. Law, on this conception, is understood to "arise from previous social practices which the concrete order must preserve and promote" (ibid.), and "institutions are *social* products emerging from the stable reiteration of specific behaviours so that they become part of

sum up Romano's theory of law. This theory "is (*a*) positivist (anti-natural law), (*b*) realist, (*c*) moderately anti-normativist, (*d*) anti-statist but not imperativist (pluralist and pan-juridicist), (*e*) formalist, and (*f*) non-sanctionist" (La Torre 2010, 106).

[155] This passage was prefigured as early as in Schmitt 2005 in relation to Hauriou: "I now distinguish not two but *three* types of legal thinking; in addition to the normativist and the decisionist types there is the institutional one. I have come to this conclusion as a result of discussions of my notion of 'institutional guarantees' in German jurisprudence and my own studies of the profound and meaningful theory of institutions formulated by Maurice Hauriou" (Schmitt 2005, 2–3).

[156] It should be mentioned, however, that this shift from a decisionist stance to an institutionalist one in Schmitt's legal perspective has been read from a prevalently political angle and in connection with his adherence to Nazism. See also, in this regard, Chapter 8 in Tome 1 of this volume.

[157] Pietropaoli (2012a, 112–5) argues that Schmitt's new analysis of law needs to be viewed in relation to the "crisis of the state" and the attempt to understand the reality that will develop "after" and "beyond" the state.

a common cultural background" (ibid., 50). These are "sedimented customs which deserve to be protected since they are the *ethical and ethnical matrix* of a collectivity" (ibid.). On Schmitt's analysis, then, law is derived from "social formations […]: the concrete *legal* order is meant to reflect and preserve the concrete *social* order, the latter representing the very grounds of the former" (ibid.).[158] Law and norms are a tool for ensuring the continuity of these social orders (institutions): They serve as "custodians" of the concrete order and as tools making its reproduction possible. It is thus fair to say that "law is both the custodian of social reality and a condition of possibility for institutions to subsist and flourish" (Croce and Salvatore 2013, 4). In Schmitt (2004a, 90ff.), this latter role of law (to enable institutions to subsist and flourish) is tied to the possibility of offering a unitary interpretation of law (and in particular of its general clauses). This can be done "only if there is a sole legitimate interpreter." In Schmitt's view, this is the Führer (M. Croce 2011, 52), who is empowered to decide what these clauses mean and what they don't mean. This is a strong decisionist element that Schmitt's idea of the concrete legal order does not do away with but rather situates and concretizes: Law, for Schmitt, is *both* the concrete legal order and the making of decisions—only secondarily is it also a norm.[159]

However, as La Torre argues, Schmitt's institutionalism can be characterized as an illegitimate (unorthodox) rendition for "its specific use of 'institution' as a basic concept is idiosyncratic and contested" (La Torre 2009, 68). Even if Schmitt's analysis does resemble institutionalism in several respects, the differences outweigh the similarities, especially if we compare it with the institutionalism expounded by Romano.[160] Indeed, as much as the common

[158] Schmitt (2004a, 75ff.) lists as examples of institutions marriage, the family, the guild, the church, and the army.
